HECO urges the court to construe the underlined clause in claim 1 as follows:

The inclination of the bin walls above the horizontal must be sufficient to meet this requirement. Thus, the bin wall cannot have a flat horizontal portion adjacent the conveyor, or any curve that is not downwardly inclined toward the conveyor (i.e., as one travels inward along the bin wall, each point along the bin wall toward the conveyor must be lower than the points farther from the conveyor).

JCCC at 23. Cives and Monroe construe the clause as follows:

The bin walls each have an inclination that is sufficient to cause material on the bin walls to slide spontaneously to the conveyor by reason of irregular, rapid or violent action resulting from the movement of the vehicle.

Id.

The court shall adopt HECO's construction. The specification makes clear that the bin wall cannot have a flat horizontal portion adjacent the conveyor or any curve that is not downwardly inclined toward the conveyor. The specification states:

According to one feature of the invention, a spreader vehicle with a bin for containing material to be spread and having a floor-mounted conveyor positioned within the bin to extract such material, has bin walls of a specially shaped configuration. Each of the sidewalls is provided with a curved configuration that bends inwardly towards the conveyor, commencing from a height that is above the height of the conveyor. The curvature of this surface terminates at a second, lower height that is, as well, above the height of the conveyor. The bin surface then continues with a relatively flat, terminal region to the edge of the conveyor. This preferably flat terminal region is upwardly angled, proceeding outwardly from the conveyor, at an
inclination that is sufficient to cause the material to be spread contained thereon to slide spontaneously to the conveyor, under the agitation arising from vehicular motion.

The advantage of this configuration is that a greater amount of sand may be carried than with flat-tapered bottom bins, while both maintaining the center of gravity of the vehicle below a predefined limit, and ensuring that all of the load in the bin will slide spontaneously towards the central conveyor.

A typical bin width for a vehicle is 88 to 96 inches, with a bin depth of approximately 51 inches to the top of the conveyor. It has been found that in such a vehicle, an incline angle of between 15 to 18 degrees, preferably 16 degrees, is suitable for the inclined terminal regions leading up to a 25 inch conveyor width. The width of this region, measured in the transverse plane of the bin may be in the range 4-6 inches, preferable 4 inches. The curved portion of the bin may then have a circular radius of 35 to 40 inches preferably 37 inches, positioned to terminate virtually tangentially with an optional, vertical, upper bin wall portion (typically 14 inches in height), and virtually tangentially with the inclined, terminal flat region.

By combining a curved portion to the bin bottom with an inclined terminal region that ends at the conveyor boundary, the capacity of the bin is maximized while ensuring substantially complete discharge of the load into the conveyor.

'900 Patent, col. 1, ll.64-66, col.2, ll. 1-42 (emphasis added). In other words, as one travels inward along the bin wall, each point along the bin wall toward the conveyor must be lower than the points farther from the conveyor.

Colgate asserts Claim 27 of the '591 patent, which claims:

An oral care implement comprising: a base with a gripping region and an oral engaging region, the gripping region including a rear segment and a front segment inclined relative to the rear segment wherein the front segment is inclined relative to the rear segment at about 20 to 40 degrees thereby defining the inclined portion; a resilient grip surface being disposed on the rear segment; and a grip body extending through an aperture in the base and spaced from the grip surface, the grip body forming opposite finger gripping surfaces on the inclined portion of the base.

The parties dispute the meaning of the phrase "a rear segment and a front segment inclined relative to the rear segment wherein the front segment is inclined relative to the rear segment at about 20 to 40 degrees thereby defining the inclined portion." This phrase shall be construed to mean "the front segment of the gripping region is inclined at an angle of about 20 to about 40 degrees relative to the rear segment of the gripping region." 2

Footnotes:

2 "In some cases, the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood words." Phillips v. AWH Corp., 415 F.3d 1303, 1314 (Fed. Cir. 2005) (citing Brown v. 3M, 265 F.3d 1349, 1352 (Fed. Cir. 2001)). Ranir proffers a claim construction which derives no support from the specification or prosecution history. The court is disinclined to narrowly construe the disputed phrase without support in the intrinsic record. See Merck & Co. v. Teva Pharms. USA, Inc., 347 F.3d 1367, 1371 (Fed. Cir. 2003) ("A fundamental rule of claim construction is that terms in a patent document are construed with the meaning with which they are presented in the patent document. Thus claims must be construed so as to be consistent with the specification, of which they are a part.") (citations omitted). The court further notes that, during the prosecution of the '591 patent, the patent examiner stated in an Office Action, "[t]he angling of segments of a handle (claim 12) is very well known in the art of toothbrushes . . . ." (D.I. 42, Tab 12 at JA00240.)
9. "includes a plurality of sub-members"

McHugh asserts that this term does not require construction, while H&B asserts that it does. Nevertheless, as there is a controversy regarding this term, this Court will construe the term "includes a plurality of sub-members." See Markman, 517 U.S. at 374.

Claim 12 of the patent claims a grip as in Claim 1, wherein "the elongated member includes a plurality of sub-members each configure to fit adjacent to the base of the user's fingers." (6:1-3.) McHugh argues that no construction is required, but to the extent that a construction is required, it should mean "includes two or more sub-members." H&B argues that "includes a plurality of sub-members" should mean "includes two or more small grips incorporated into the long and narrow grip."

The Court has already found that "member" does not mean "grip." However, even substituting "member" for "grip" in H&B's construction, does not make it more correct. Claim 12 refers to an embodiment of the invention wherein the grip is actually segmented into multiple separate grips, each designed to fit at the base of the user's fingers. In the patent specification, Figure 5B shows a "glove 54 here grip 20 is broken up into four small grips 56a-d that provide support to one finger each. This is accomplished by incorporating four grips … into each of the four fingers of a glove near the base of the fingers, as shown." (4:39-44.) Therefore, in this embodiment of the invention, the member is actually composed of two or more sub-members. Both McHugh and H&B offer constructions which state that the member "includes" sub-members, but this is confusing because it is unclear under both proposed constructions whether the member has sub-members attached to it, or whether the member is composed of sub-members. The patent specification clearly indicates that in this embodiment, the member is composed of sub-members. (Id.)

Accordingly, the Court the term "includes a plurality of sub-members" to mean: "is composed of two or more sub-members.”

J. Term 14: Includes the intensity level setting of the control device controlling the intensity level of the lamp (as used in claims 27, 58, and 80).

Lutron contends either no construction is necessary for Term 14, or alternatively, that it means "The status includes, but is not necessarily limited to, the intensity level setting of the control device controlling the intensity level of the lamp." Control4 contends the term means "Includes information about the intensity level setting of the controllably conductive device."

The parties dispute whether the "intensity level setting of the control device" means "the intensity level setting of the controllably conductive device." Control4 contends that it is the controllably conductive device that controls a lamp's intensity level. Consequently, that phrase should be included in the construction rather than the broader "control device" phrase.

The language in the relevant claims refers to the control device, not the controllably conductive device. The specification states the objective of "controlling at least one electrical device" is achieved through a control device that is connected to an electrical device. 34 It then states the control device includes both a controllably conductive device, and "a radio frequency transmitter/receiver and antenna coupled thereto for adjusting the status of the electrical device in response to control information." 35 This indicates that it is the control device, not just the controllably conductive device, that controls the lamp's intensity level. Referring only to the controllably conductive device would impermissibly limit the meaning and scope of the relevant claims.
Toro charged White with infringement of claims 16 and 17 of the '528 patent (bracketed numerals added):

16. A convertible vacuum-blower comprising:
   [1] a housing having an air inlet and an air outlet;
   [2] a motor supported in said housing
   [3] an impeller having a plurality of impeller blades supported for rotary motion in said housing, in fluid communication with said air inlet and said air outlet, and rotatably driven by said motor;
   [4] a removable air inlet cover for covering said air inlet, said air inlet cover having apertures for passage of air through the cover;
   [5] attachment means for removably securing said air inlet cover to said housing; and
   [6] said cover including means for increasing the pressure developed by said vacuum-blower during operation as a blower when air is being supplied to said impeller through said apertured cover.

17. A convertible vacuum-blower in accordance with claim 16 wherein
   [7] said pressure differential increasing means includes a ring carried by said cover and disposed sufficiently close to said impeller to prevent air spill over between the high pressure side and low pressure side of said impeller blades during rotation of said impeller.

The district court construed the claims, as mandated by Markman v. Westview Instruments, Inc., 517 U.S. 370, 38 U.S.P.Q.2D (BNA) 1461, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). The court then granted Toro's motion for summary judgment that claim 16 of the '528 patent was literally infringed by the accused devices. Toro conceded that claim 17 was not literally infringed. The charge of infringement under the doctrine of equivalents was not reached during the summary proceedings.

CLAIM CONSTRUCTION

White argues that the district court incorrectly construed the terms "air inlet cover" and "attachment means for removably securing" in claim clause [5], and "cover including means for increasing the pressure" in clause [6]. White states that on this incorrect construction, summary judgment of infringement was improperly granted.

The district court applied the general rule that words in patent claims are given their ordinary meaning in the usage of the field of the invention, unless the text of the patent makes clear that a word was used with a special meaning. See Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1477, 45 U.S.P.Q.2D (BNA) 1429, 1432 (Fed. Cir. 1998) (“It is the person of ordinary skill in the field of the invention through whose eyes the claims are construed. Such person is deemed to read the words used in the patent documents with an understanding of their meaning in the field, and to have knowledge of any
special meaning and usage in the field.")]; Hoechst Celanse Corp. v. B.P. Chems. Ltd., 78 F.3d 1575, 1578, 38 U.S.P.Q.2d (BNA) 1126, 1129 (Fed. Cir. 1996) ("A technical term used in a patent document is interpreted as having the meaning that it would be given by persons experienced in the field of the invention, unless it is apparent from the patent and the prosecution history that the inventor used the term with a different meaning."); Carroll Touch, Inc. v. Electro Mechanical Sys., Inc., 15 F.3d 1573, 1577, 27 U.S.P.Q.2d (BNA) 1836, 1840 (Fed. Cir. 1993). In the '528 specification no special meaning in the field of the invention is attributed to the words "cover," "included," "attachment," and "removable." However, words of ordinary usage must nonetheless be construed in the context of the patent documents. Thus the court must determine how a person of experience in the field of this invention would, upon reading the patent documents, understand the words used to define the invention.

Toro and White had each relied on dictionary definitions of the common words "cover," "attachment," "removable," and "included," each choosing definitions that favored its position. As this case well illustrates, the dictionary definitions of common words are often less useful than the patent documents themselves in establishing the usage of ordinary words in connection with the claimed subject matter. This is not an issue of the richness of language, or variety or imprecision in the usage of words. Determining the limits of a patent claim requires understanding its terms in the context in which they were used by the inventor, considered by the examiner, and understood in the field of the invention.

In judicial "claim construction" the court must achieve the same understanding of the patent, as a document whose meaning and scope have legal consequences, as would a person experienced in the technology of the invention. Such a person would not rely solely on a dictionary of general linguistic usage, but would understand the claims in light of the specification and the prior art, guided by the prosecution history and experience in the technologic field.

A

The district court relied on the dictionary definition of "cover" as "something that protects, shelters or guards; . . . something that is placed over or about another thing," and construed "cover" as it relates to the claimed vacuum/blower as "that which functions to overlay and conceal the air inlet and serves to guard the impeller." White does not challenge this definition, but argues that its device does not have an "attachment means" whereby its cover is "removably secured" to the housing, as required by clause [5]. White states that its cover is hinged and latched and thus is different from and not equivalent to the "attachment means for removably securing" the cover, shown in the specification as a twist-lock tab and detent system. White states that its hinged cover is shown in a prior art patent to Mattson, and suggests that the tab and detent system was adopted by Toro in order to differentiate its device from that of Mattson. Toro agrees that a hinged cover is shown in Mattson, which is mentioned in column 1 of the '528 patent. However, Toro argues that this reference provides support for viewing the hinge as an equivalent attachment means in terms of '112 &6.

The district court construed the "attachment means for removably securing said air inlet cover to said housing" of clause [5] as including the hinge of the White device whereby the cover, when lifted from the air inlet, remains attached to the housing. White points out that the cover in its device is not removable from but remains attached to the impeller housing, and argues that the specification of the '528 patent shows that the Toro inventor did not intend to include such structures, which were in the prior art Mattson patent. The district court held that "White fails to distinguish between the cover and the attachment means. With the use of a hinge and latch, the cover is removable from the housing covering the air inlet, even though the attachment means, the hinge and latch, are still attached to the housing." The court held that the term "removably securing" does not require that the cover be entirely separated from the housing, but simply refers to removal of the cover from the air inlet.

This question can not be decided by a dictionary. Dictionaries are useful additional sources, as is the guidance of technical/scientific experts and other relevant evidence, in addition to the patent documents themselves, that may aid the judge in achieving the understanding and viewpoint of a person having experience in the field of the invention. However, dictionaries provide general definitions, rarely in sufficient detail to resolve close questions in particular contexts.

White argues that the attachment means of clause [5], illustrated in the specification as a tab-and-detent structure, does not reach the latch and hinge whereby the cover is attached to the housing and secured to the air inlet opening in the White device. The district court correctly held that it is irrelevant whether the cover in the accused device is attached to the housing, for clause [5] relates only to the attachment means for removably securing the cover to the air inlet opening.
Applying '112 &6, the district court did not clearly err in ruling that the hinge and latch of the accused device is equivalent to the tab-and-detent illustrated in the '528 patent. The use of a latch with a hinged cover is shown in the prior art, performing the identical function of securing the cover to the air inlet during use as a blower, using known interchangeable structures. Cf. Rite-Hite Corp. v. Kelley Co., 819 F.2d 1120, 1124, 2 U.S.P.Q.2d (BNA) 1915, 1918 (Fed. Cir. 1987) (equivalence of rack-and-pinion with ratchet-and-pawl). Although White argues that section 112 &6 requires that the asserted equivalent is described in the specification, that is an incorrect statutory interpretation, for such a requirement would render the statutory provision meaningless.

The district court's interpretation of the attachment means of clause [5] is affirmed.

B

White also argues that its pressure increasing means, the restriction ring, is not "included" in the cover as required by claim clause [6] because the ring is not attached to the cover but is an entirely separate component. The district court held that the term "including," correctly construed, "suggests the containment of something as a component or subordinate part of a larger whole," and comprehends a separate restriction ring that is not part of the cover but is separately inserted and removed. The court construed "cover" to "include" both the flap that closes over the air inlet and the restriction ring, explaining that each "overlays" and "guards" the impeller. Thus the court construed clause [6] to mean that the cover includes the restriction ring whether or not the ring is attached to the cover.

The dictionary definitions of "cover" and of "including" do not shed dispositive light on whether the phrase "cover including means for increasing the pressure" is correctly construed as requiring a mechanical attachment between the cover and the restriction ring. Whether clause [6] requires that the ring be attached to the cover is not a question of '112 &6. It is a matter of interpretation of the words "including" and "cover" to determine whether, as a matter of law, the claim requires that the cover and the ring are attached to each other. The specification and drawings show the restriction ring as "part of" and permanently attached to the cover. No other structure is illustrated or described. The specification describes the restriction ring as "built . . . as part of the air inlet cover," and does not suggest that the cover and the ring may be two distinct components to be inserted and removed separately. To the contrary, the specification describes the advantages of the unitary structure as important to the invention.

The specification shows only a structure whereby the restriction ring is "part of" the cover, in permanent attachment. This is not simply the preferred embodiment; it is the only embodiment. Thus although Toro argues that it is irrelevant whether the ring and the cover are one part or two, in the specification Toro stressed that they are one:

"Accordingly, building the flow restriction ring as part of the air inlet cover, on which it is needed, but leaving a similarly shaped ring off the vacuum nozzle is also advantageous in that it automatically restricts the size of air inlet depending upon which operation is being conducted without having the operator manually insert or remove a replaceable ring."

'528 patent col. 7 lines 6-12 (citations to drawings omitted). The description of the invention states that the ring is inserted and removed "automatically" when the cover is inserted or removed. Thus when the cover is closed for operation in the blower mode, the ring that is "attached to the inside of the air inlet cover by a plurality of screws" is thereby put into place. It is inserted simply by closing the cover; it is removed by opening the cover.

The specification does not describe an invention broader than this description of the cover and the restriction ring "automatically" inserted and removed together. Nowhere in the specification, including its twenty-one drawings, is the cover shown without the restriction ring attached to it. Nor is the restriction ring shown other than attached to the cover. The specification states that the restricting ring is automatically inserted and removed by the cover to which it is attached, and illustrates only this structure in the drawings. See 37 C.F.R. § 1.83(a) ("The drawing in a nonprovisional application must show every feature of the invention specified in the claims."); M.P.E.P. 608.02(d) (Complete Illustration in Drawings). No other, broader concept was described as embodying the applicant's invention, or shown in any of the drawings, or presented for examination.

The claim word "including" is not construed in a lexicographic vacuum, but in the context of the specification and drawings. E.g., Adams v. United States, 383 U.S. 39, 49, 15 L. Ed. 2d 572, 86 S. Ct. 708 (1966) ("it is fundamental that claims are to be construed in light of the specifications and both are to be read with a view to ascertaining the invention"); Smith v. Snow,
294 U.S. 1, 14, 79 L. Ed. 721, 55 S. Ct. 279 (1935) ("if the claim were fairly susceptible to two constructions, that should be adopted which will secure to the patentee his actual invention"); Abtox, Inc. v. Exitron Corp., 122 F.3d 1019, 1027, 43 U.S.P.Q.2d (BNA) 1545, 1551 (Fed. Cir. 1997) ("because the claim language, as interpreted in light of the specification, limits the microwave devices to a single gas-confining chamber, this court affirms the district court's grant of summary judgment").

This is not a case of limiting the claims to a "preferred embodiment" of an invention that has been more broadly disclosed. It is well established that the preferred embodiment does not limit broader claims that are supported by the written description. E.g., Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865, 9 U.S.P.Q.2d (BNA) 1289, 1299 (Fed. Cir. 1988) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations."). Nor is this a case of limiting claims to immaterial details of a broader invention as set forth in the specification. See, e.g., SRI International v. Matsushita Electric Corp., 775 F.2d 1107, 1118, 227 U.S.P.Q. (BNA) 577, 583 (Fed. Cir. 1985) (method of operation described in specification improperly read into structural claims). No such broader invention is here described. Instead, the invention is described throughout the specification as it is claimed, whereby the cover "includes" the ring, so that the ring is inserted by closing the cover and removed by opening the cover, "automatically." There is no basis for construing "including" the ring to mean not including the ring.

Toro invokes the doctrine of claim differentiation, pointing to claim 17 which is specific to the restriction ring as "carried by the cover," as supporting a broader scope for the word "including" in claim 16. White responds that there is no support in the body of the specification for such broader meaning of "including," and points out that claim 17 not only replaces "including" with "carried by," but also specifies that the restriction ring is "disposed sufficiently close to said impeller to prevent air spillover between the high pressure side and low pressure side of said impeller blades."

The doctrine of claim differentiation can shed light on the proper scope to be afforded a claim limitation, for "there is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims. To the extent that the absence of such difference in meaning and scope would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference between claims is significant." Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1023, 4 U.S.P.Q.2d (BNA) 1283, 1288 (Fed. Cir. 1987). However, the doctrine of claim differentiation does not serve to broaden claims beyond their meaning in light of the specification, see Multiform Desiccants Inc. v. Medzam Ltd., 133 F.3d 1473, 1480, 45 U.S.P.Q.2d (BNA) 1429, 1434 (Fed. Cir. 1998), and does not override clear statements of scope in the specification and the prosecution history. These documents require that clause [6] be construed to mean that the restriction ring is permanently affixed to and included as part of the cover. On this construction, the claims can not be literally infringed by a device having a separate restriction ring that is inserted and removed as a separate part.

The summary judgment of literal infringement is reversed.

RADER, Circuit Judge, dissenting.

The court today determines that the verb "include" in the '528 patent requires an "attachment relationship." However, the court's interpretation of "including" cannot be justified by examination of the ordinary meaning of that word or of its accepted use in patent claims, or, especially, by a careful reading of the '528 patent.

It is axiomatic that terms in a claim must be given their ordinary meaning unless it is apparent that the inventor used them differently in the patent. Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1387 (Fed. Cir. 1992). While the court acknowledges that "dictionaries are useful additional sources," it did not consult one to establish the ordinary meaning of "include," a procedure suggested by Hoganas AB v. Dresser Indus., Inc., 9 F.3d 948, 951 (Fed. Cir. 1993). When the parties themselves consulted dictionaries, both emerged with similar definitions of "include," incorporating the concept of "take in or comprise as a whole." Combining this modern definition with the origin of "include" in the Latin Includere, to shut in, confine within, or hold as in an enclosure, BLACK'S LAW DICTIONARY, 6th ed. (1990), leaves no doubt that the ordinary meaning of "include" does not require physical attachment.
* In its rejection of the use of common definitions of, e.g., "included," the court notes also that technical terms must be given the meaning that would be understood by persons "experienced in the field of the invention." However, the court admits that "no special meaning in the field . . . is attributed to the words . . . 'included,' [and] 'attachment.'" Nor does the court rely on any testimony by either party on the question of whether any meaning, other than the ordinary meaning, is appropriate for these words in the context of the patent.

In patent claims, "including" is normally a comprehensive term, used in a way similar to "having" or "comprising." JOHN LANDIS, MECHANICS OF PATENT CLAIM DRAFTING, section 7. In a claim element, use of the forms "comprising," "having," or "including," commonly means that whatever element is comprised, had, or included, is not necessarily the only element encompassed by the subject of the clause that contains that verb. See Robert C. Faber, The Winning Mechanical Claim, 426 PLI/P 231, 353 (1995). "Including," in a claim, thus signifies a relationship broader than "attachment." In the invention of the '528 patent the concept of the flow restrict or, which allows the user to adjust the air flow during the blower mode of operation, is original. '528 patent, col. 2, ll. 29-32. Thus, the choice of the word "including" was appropriate to give the applicant the broad coverage sought and deserved for his original concept.

Finally, a careful reading of the '528 patent also demonstrates that "including" does not here require attachment. The court mistakenly takes the described embodiment to be unique, inferring that the specification teaches that embodiment alone. The court notes that "the specification shows only a structure whereby cover and ring are permanently attached to each other. This was not simply the preferred embodiment; it was the only embodiment." On the contrary, the specification does not claim such uniqueness and describes another embodiment, specifically one in which the flow restriction ring is not permanently attached to the cover. Everywhere the word "embodiment" is used to denote what is described in the specification of the '528 patent, it is used in the phrase "a preferred embodiment." More important, the inventor contrasts the preferred embodiment not, as the court thinks, with disadvantageous prior art, but rather with a less-preferred embodiment of the invention at hand: a blower with a replaceable, i.e., non-attached, ring. As the inventor states, the method of construction of the preferred embodiment, in which the flow restriction ring is indeed built into, and thus "part of," the air inlet cover, is advantageous in that "it automatically restricts the size of air inlet . . . without having the operator manually insert or remove a replaceable ring." '528 patent, col. 7, ll. 6-12. But as noted above, there is no prior art for the flow restriction ring, so that such a ring in any form was part of the invention. In particular, an owner-replaceable ring, i.e., one not attached, was clearly part of the invention, and is described by element [6] of claim 16 of the '528 patent. In short, an "included" but definitely not "attached" flow restriction ring is a feature of an embodiment of the invention, but not the preferred embodiment.

The term "including," in the context of the '528 patent, does not imply "attachment," and the claims of this patent should not be limited to the preferred embodiment with its attached restricting ring.

The Court held a Markman hearing and subsequently issued a Memorandum opinion (Docket No. 138) in which the Court construed the disputed claim terms of the '981 Patent and the '306 Patent. At issued were the following claim terms of the '981 Patent and the '306 Patent: 1) "Frame"; 2) "Formed Integrally Within"; 3) "Integrally Formed Within"; 4) "Integrally Formed With"; 5) "Including"; 6) "Attached"; and 7) "Manifold". The Court construed the terms as follows:

"Frame": "the underlying structure of the cone crusher to which other constituent parts may be fitted, attached or integrated."

"Formed integrally within" and "Integrally formed within": "created or constructed within or as a part of the frame."

"Integrally formed with": "created or constructed within or in combination with the frame."
"Attached": "fastened or affixed."

"Including": "to take in or comprise as a part of a whole."

"Manifold": "a fitting or a passage that has a plurality of openings for making connections."

2. The '260 Patent

The '260 patent describes a latch closure mechanism very similar to that disclosed in the '041 patent. The only apparent dispute between the parties regarding the language of that patent involves the following language from claim 1:

(a) a resilient and elongate latch tongue including pawl means 2 forming a recess thereacross;

(b) a bar sized and shaped to be received substantially entirely and flushly within said recess;

'260 patent (emphasis added).

As with the "having" term used in claim 4 of the '041 patent, defendant asserts that the term "including" in claim 1 of the '260 patent requires both the upper and lower portions of the pawl means 3 to be a part of the tongue structure of the latch mechanism. Because nothing in the claims, the patent specification, or the prosecution history suggests otherwise, and further because plaintiff neither contests defendant's proposed interpretation nor offers an alternate definition of the term "including," the court construes that term in light of its plain and ordinary meaning.

According to Webster's, "including," the present participle of the verb "include," is defined as "to take in, enfold or comprise as a discrete or subordinate part or item of a larger aggregate, group, or principle." Webster's Third New Int'l Dictionary 1143 (1986); accord Webster's Collegiate Dictionary 588 (10th ed. 1999) (defining "include" as "to take in or comprise as a part of a whole" or "to contain between or within"). In the absence of any objection from plaintiff, the court construes the term "including" as requiring both the upper and lower portions of the pawl means to be contained by, and therefore to comprise, as a part of the whole, the tongue structure in this case.
The court notes that this construction of the word "including" is entirely consistent with, and therefore reinforced by, the patent illustrations and the language set forth in the patent specification. Indeed, all of the drawings included in the patent description depict tongue structures from which two projections extend. Moreover, the specification expressly states that "the principal objects of the present invention are: . . . to provide such a container including a latch tongue having pawl projections defining a latch recess. . . ." '260 patent at 3:16-18 (emphasis added). Additionally, in describing three of the patent's illustrations, the specification explains that "the tongue 28 includes an upper pawl 30 and a somewhat similar lower wedge like formation or lower pawl 31 separated by a latch bar receiving recess or notch 32 extending across the tongue 28." Id. at 5:68-6:4 (emphasis added).

Moreover, a construction of the phrase "pawl means forming a recess thereacross" further supports the conclusion that the upper and lower portions of the pawl means must project or extend from the tongue structure. Citing that language, defendant argues that, unless the pawl means consists of two projections from the tongue structure, no recess can be formed across the tongue. The court agrees.

Although neither party specifically offers a construction of the term "recess," according the word its plain and ordinary meaning, a recess is "an indentation in a straight line or in a surface bounded by a line conceived of as straight: cleft." Webster's Third New Int'l Dictionary 1894 (1986); accord Webster's Collegiate Dictionary 975 (10th ed. 1999) (defining "recess" as "indentation, cleft."). Thus, for a recess to be formed by the pawl means across the tongue, there must be an indentation across the tongue's surface, and no such recess can be formed across the tongue structure by the pawl means unless both portions of the pawl means are themselves a part of the tongue.

B. Interpretation and Infringement Analysis of the Term "Incompressible" Contained in the '048 Patent.

In the context of the '048 patent, the term "incompressible" is used to refer to the material used to form the outer layer of the print blanket. The term appears throughout the body of the description, as well as in claims 1 and 3. Independent claim 1 states in relevant part:

. . . the blanket comprising an outer layer of material, an inner layer of material, and an intermediate layer of material, the outer layer of material being a continuous tubular layer of incompressible material indented by the printing plate at the nip. . . .

Dependent claim 3 states: "The offset printing press as recited in claim 1 wherein the outer layer comprises an incompressible polymeric material."

Mitsubishi contends that the term "incompressible", properly interpreted, refers to a material that retains its original thickness when subjected to vertical pressure, or, in this case, as it moves through the nip. In support of this interpretation, Mitsubishi points to the file history of the '048 patent; specifically, to a portion of a patent application that eventually evolved into the '048 patent and which states "the printing layer is incompressible, and thus retains its original thickness as it moves through the nip." ('668 patent application, p. 16, Ins. 21-22). Mitsubishi contends that the above definition is consistent with that attributed to the term "incompressible" by those skilled in the art. Thus, Mitsubishi concludes that "incompressible" must refer to a material which does not change thickness as it passes through the nip.

This Court has already been called upon once before to interpret the term "incompressible" as it relates to the outermost layer of the printing blanket described in the '048 patent. After considering evidence similar to that now before the Court, we adopted the definition presented in WEBSTER'S NEW RIVERSIDE UNIVERSITY DICTIONARY, and concluded that a material is "incompressible" if it is not made smaller when subjected to squeezing. Heidelberg Harris, 1996 WL 189398 at *11. We now refine that definition.

It is axiomatic that, in construing terms contained in a claim, the court looks primarily to the intrinsic evidence before it, including the patent's claims, specifications and prosecution history. Vitronics Corp. v. Conceptor, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). The court is directed to look first to the words of the claims themselves, keeping in mind that, "although words are generally given their ordinary and customary meaning, a patentee may choose to be his own
lexicographer and use terms in a manner other than their ordinary meaning, as long as the special definition of the term is clearly stated in the patent specification." Vitronics, 90 F.3d at 1582. Thus, "the specification acts as a dictionary when it expressly defines terms used in the claims or defines terms by implication." Id. Consequently, the specification is, at a minimum, always extremely relevant to the construction analysis and, more often than not, actually dispositive. Id.

Guided by the above principles, we turn to the '048 patent in refining our earlier definition. Throughout the specification, the term "incompressible" is used to refer to a material whose volume does not change when deflected. Specifically, the patent specification states "since the outer layer is formed of an incompressible material, the volume of the outer layer itself does not change when the outer layer is resiliently deflected by the plate cylinder. . . ." 2 ('048 patent, col. 11, lns. 8-12). By contrast, the patent defines a "compressible" material to be one whose volume decreases when force is applied. (’048 patent, col. 8, lns 9-12). 3 Nowhere in the specification of the '048 patent is "incompressible" used to refer to material which does not change thickness when subjected to force. In light of the clear definition set forth in the patent's specification, we will not look to extrinsic evidence, such as expert testimony, to modify the meaning of the term as defined, nor will we use one line excerpted from a patent application several generations removed to replace the definition explicitly provided in the instant patent. Thus, in keeping with the definition presented in the '048 patent, we hold that the term "incompressible" refers to a material that does not change volume when subjected to pressure or force.

--- Footnotes ---

2 Additionally, the patent states:

Deflection of the tubular outer layer results in the printing blanket occupying a volume which is less than its original or undeflected volume. However, the total volume of the outer layer remains constant. . .

(’048 patent, col. 11, lns. 66-68; col. 12, lns. 1-2).

3 Specifically, the patent states: "When a force is applied to the compressible material of the printing blanket the volume of the compressible material decreases."

--- End Footnotes ---

2093

G. Claim 6: "said stretch film has increased strength characteristics due to stretching"
Defendant Sigma asks me to limit the term "increased strength characteristics" to "ultimate strength." It bases this argument on language found in the specification. (’393 Patent, Col. 4., ll. 15-16) ("It is well known that most plastic films when stretched above their yield point gain significantly in ultimate strength"). Pliant now asks me to turn to extrinsic evidence, namely the declaration of its expert, to construe the proper meaning of "strength characteristics." However, I find that the inventor defined the strength characteristic relevant to the invention within the specification. Because this intrinsic evidence provides clear guidance as to the meaning of the term "strength characteristics," I need not look to extrinsic evidence in order to construe the term. "Increased strength characteristic" means "an increase in the ultimate strength of the film."

2094

"the thickness of the generally annular region increases as the region approaches the pumping member"

Claim 12 of the '882 Patent contains the term "the thickness of the generally annular region increases as the region approaches the pumping member." Defendants contend that the term is indefinite. After a review of the arguments and relevant evidence, the Court concludes that the term "the thickness of the generally annular region increases as the region approaches the pumping member" meets the definiteness requirement of 35 U.S.C. § 112, P 2.

Defendants contend that although the specification describes the generally annular region as an increasingly thickened
convolute where "the portion of the convolute which is radially remote from the pumping member is more thin or less thick than is the portion of the convolute which is radially close to or adjacent the pumping member," the specification lacks any guidance as to the location and size of these "portions." '882 Patent, col. 3:39-43. Thus, Defendants argue that without any indication of where these "portions" are located in the generally annular region, a person skilled in the art would be unable to determine how to avoid infringing the patent.

The claim words of the disputed term are sufficiently definite to inform the public of the bounds of the invention. Defendants' argument essentially alleges that the "portions" discussed in the "Summary of the Invention" are not adequately defined elsewhere in the specification. However, Defendants' allegation does not bear on the question of Claim 12's definiteness because the allegedly objectionable "portions" language is from the specification, not from Claim 12. The definiteness requirement requires the scope of claims to be sufficiently definite, and the claim words of the disputed term at issue are readily understood with reference to the specification.

Indeed, the generally annular region is expressly identified in at least three different drawings of the '882 Patent. SHURflo points to Figure 7 in arguing that the term is adequately described in the specification. In Figure 7, produced below, the generally annular region 86 is shown in a cross-sectional view of the pumping member. The words "annular region" indicate a ring-shaped area. This is supported by the specification, which describes the generally annular region as something that "circumscribes central piston surface 64 and which flexes when the pumping member 37 moves between inlet and discharge strokes." '882 Patent, col. 6:11-12, see also '882 Patent, col. 3:30-34 ("In yet another aspect of the present invention, the gasket or diaphragm includes a generally annular zone or region, preferably substantially circumscribing a pumping member which flexes when the pumping member is driven by a drive."). After examining Figure 7 in view of the specification, any further ambiguity regarding the generally annular region is clarified in Figure 5, produced below, which shows three pumping members--indicated by the labeled central piston surface 64--and the generally annular region 86 that circumscribes each member. In operation, the generally annular regions flex to accommodate the motion of the pumping member moving back and forth perpendicular to the plane of the diaphragm 33. See '882 Patent, col. 6:10-13.

[SEE [Figures 5 and 7 of the '882 Patent] IN ORIGINAL]

In addition, relative to the overall pumping mechanism, one of ordinary skill in the art may envision operation with reference to Figure 2, produced below, which shows both the generally annular region 86 and the pumping member--indicated by labeling of central piston surface 64 and head portion 62. Finally, in view of the specification, one of ordinary skill in the art would find the relative location of the generally annular region(s) and the pumping member(s) in both Figures 3 and 6, which reveal these items with less precise labeling.

[SEE [Figure 2 of the '882 Patent] IN ORIGINAL]

Once the identity and nature of the generally annular region are understood, the assessment of the "thickness" increase is relatively straightforward. The disputed claim term states that "the thickness of the generally annular region increases as the region approaches the pumping member." This term may be assessed with reference to the cross-sectional view of Figure 7 where the generally annular region 86 visibly thickens as it gets closer to the pumping member 37. In addition, the written specification clearly describes the thickening, which may be understood at least with reference to Figures 5 and 7. For example, in describing the preferred embodiment, the specification states that, "[t]he thickness of diaphragm 33 progressively increases in annular zones 86 from a point remote from the pumping member 37 to a point adjacent the pumping member." '882 Patent, col. 6:22-26. Thus, at least from Figures 5 and 7, and the written specification, it is clear that the meaning of the claim is discernible and the term is not insolubly ambiguous.

While the term is not insolubly ambiguous, a dispute remains as to the term's construction. SHURflo contends that the term means "at least some portion of the annular region which is radially close to or adjacent the pumping member is thicker than at least some portion of the annular region which is radially remote from the pumping member." Defendants assert that SHURflo's proposed construction amplifies the ambiguity that exists in the specification, rather than clarifying the claim language. Defendants further argue that SHURflo's proposed construction would allow "an untold number of portions giving rise to a wide variety of thickness profiles, not just those that are increasing or progressively increasing in the direction of the pumping member." Defendants' Definiteness Brief, at 10. Moreover, Defendants contend that SHURflo's proposed construction is inconsistent with the plain language of the claim because "the increasing thickness limitation is unambiguously made with respect to the entire generally annular region . . . not just portions of it." Defendants' Responsive
In yet another aspect of the present invention, the gasket or diaphragm includes a generally annular zone or region, preferably substantially circumscribing a pumping member which flexes when the pumping member is driven by the drive. In one embodiment, this region can be considered to be a convolute which facilitates the movement of the pumping member in the intake and discharge strokes, while reducing the amount of stress on the diaphragm caused by this motion. This facilitates maintaining a long effective life of the gasket or diaphragm. In a particularly useful embodiment, the thickness of the convolute increases, more preferably progressively increases, as the convolute approaches the pumping member. In other words, the portion of the convolute which is radially remote from the pumping member is more thin or less thick than is the portion of the convolute which is radially close to or adjacent the pumping member. Having a convolute which is thicker and more durable close to the pumping member is effective in offsetting the increased stress that exists close to the pumping member.

'882 Patent, col. 3:30-50 (emphasis added).

Since the claim calls for the "thickness of the generally annular region" to increase and the generally annular region must be annular (i.e. ring-shaped), then the Court must conclude that it is the ring-shaped area that must increase in thickness with radial proximity to the pump head. To be clear, the Court concludes that the claim requires exactly as it states--that the thickness of the whole circumscribing ("annular") region increases as the region approaches the pumping member.

Defendants propose that, should the term require construction, it means "the thickness of the generally annular region progressively increases in the direction of the pumping member." SHURflo counters that Defendants' proposed construction is unduly narrow in that "progressively increases" is used to describe a preferred, not a limiting, embodiment in the specification. '882 Patent, col. 3:39-43. "[P]articular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments." Electro Med. Sys., S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994); see also Phillips, 415 F.3d at 1323. The Court agrees with SHURflo that Defendants' provisional construction is too narrow because the increase in thickness need not be uniform or progressive. As the claim states, the thickness must simply increase as the pumping member is approached.

In order to avoid further disputes between the parties, the Court will explain further. To show infringement, SHURflo must prove that Defendants' product comprises a ring-shaped region with a pumping member generally within the ringed-area. The ring-shaped area need not be a perfect circle but one should be able to define radial lines emanating from the pumping member and extending like radii through the annular region. For any such radius, when moving along the radius in the generally annular region, the thickness of the generally annular region must increase from a point in the annular region most remote from the pump member, to a point in the annular region most proximate to the pump member. Furthermore, since the claim states "the thickness of the generally annular region increases as the region approaches the pumping member," the thickness of the region may not decrease along any such radius. The Court provides this explanation so that the claim term may neither be interpreted so narrowly as to require a "progressive" thickness increase, nor so broadly as to allow thickness to decrease with radial proximity to the pumping member.

Because Defendants have not shown by clear and convincing evidence that the term “the thickness of the generally annular region increases as the region approaches the pumping member” is indefinite, Defendants' Motion for Summary Judgment of Indefiniteness of the '882 Patent (Docket No. 74) is DENIED. In addition, the claim language is clear and understandable to the fact finder, and any substitute for the claim language is likely to cause confusion rather than aid. Thus, the Court declines to define this term. However, the Court has resolved the parties' disputes in accordance with O2 Micro International Ltd. v. Beyond Innovation Technology Co., 521 F.3d 1351 (Fed. Cir. 2008), and to the extent that this claim term arises at trial, the Court instructs the parties to tailor their trial arguments to conform with this Order.
"Increases in Rigidity After Expansion of Said Balloon"

The meaning of the term "increases" appears to be undisputed. Therefore, the following ordinary meaning of "increases" is adopted as consistent with the intrinsic record: becomes progressively greater in size, amount, number or intensity. (Webster's Ninth).

Cordis contends that "rigid" means "[d]eficient in or devoid of flexibility" (Webster's Ninth); or "stiff or unyielding; not pliant or flexible," or "firmly fixed or set" (Random House). Cordis' selected definition for "expansion" is "the act or process of expanding" (Webster's Ninth), and "after" means "following in time" (Webster's Third). Cordis' position is that under the ordinary meaning of the claim language, the material that is provided in the sleeve must increase in rigidity, i.e., become more stiff and less flexible, and this increase in rigidity must take place following the act or process of expanding the balloon. Cordis argues that these definitions are consistent with the surrounding text, because the next step in the claim 2 method involves the act of "maintaining said balloon in an expanded condition in the vessel while said sleeve increases in rigidity." According to Cordis, the language used in that step confirms that an increase in rigidity must take place following expansion of the balloon.

AGR has asked the Court to consider the following definitions of "rigidity": (1) "deficient in or devoid of flexibility;" or "appearing stiff and unyielding" (Webster's Ninth); (2) stiff or unyielding; not pliant or flexible; hard;" or "firmly fixed or set" (Random House); (3) "not easily bent; inflexible" ("as, rigid in death"); or "not moving; firmly fixed; set;" or "not deviating or relaxing; rigorous" ("as, rigid regulations") (Webster's Twentieth); (4) "lacking flexibility; stiff; hard; inflexibility set; unyielding" (Webster's Intermediate); (5) "resisting change of form; stiff; severe; fixed" (Funk & Wagnalls); (6) "the quality or state of being rigid" (Webster's Ninth) (defining "rigidity").

AGR maintains that by arguing that this limitation requires an increase in rigidity after the full or complete expansion of the balloon, Cordis seeks to limit the claim terms. There are multiple dictionary definitions for the phrase "after," all of which are consistent with the use of the word in claim 2. For example, AGR offers that Webster's Twentieth defines "after" as "later in time" and "according to the direction and influence of." AGR argues that this limitation is satisfied as long as there is some increase in rigidity after any expansion of the balloon, even if the doctor is still in the process of expanding the balloon. Cordis responds that this interpretation confuses "after" with "during."

The Patent, specification and file history have been examined to determine the meanings of the words "rigidity," "after" and "expansion" in context. There is no language or other evidence that requires that the balloon be fully expanded before the material in the sleeve starts to increase in rigidity. Dr. Rockey describes, with respect to the preferred embodiment depicted in Figure 9, that "[t]he sleeve space 63 contains a fluid plastic material 66 which is caused to become solidified, preferably to a semirigid state after the balloon has been expanded." (Description of the Preferred Embodiment, 6:22-24) (emphasis added). He also wrote that "[t]he inflation pressure is maintained for a period sufficient for setting of the liquid 66 in the sleeve space 63 to become solidified into its semirigid state." (Id. at 6:52-54). And, he disclosed that "[a]fter the sleeve material has solidified into a semirigid structure, the balloon is deflated through the catheter." (Id. at 6:57-59). Finally, he wrote:

It is contemplated that the catalyst for setting of the material 66 can be encapsulated and mixed with the base and caused to release from such encapsulation upon the pressure applied thereto by expansion of the balloon 50. Another alternative is to introduce the settable material 66, including mixed catalyst, into the space through the tube 64 after the sleeve has been manipulated into position.

(Id. at 7:3-10) (emphasis added).

At no point during this discussion does Dr. Rockey require that the balloon be fully expanded before any increase in rigidity takes place in the sleeve, especially considering that the trigger that causes the catalyst to begin the process of making the sleeve rigid is the first expansion of the balloon. Dr. Rockey specifically discusses how the sleeve material does not achieve a semirigid state until after the balloon has expanded (past tense), but this does not mean that there was no increase in rigidity while the balloon was expanding. Full expansion is not required for there to be an increase in rigidity. The
progressive change in rigidity begins to occur as soon as the balloon begins to expand, which is what sets off the catalyst.

Dr. Rockey's use of the word "expansion" rather than "expanded" is telling. In describing the increase in rigidity, he refers to the process of "expansion" of the balloon, which is followed by the increase in rigidity of the sleeve material. In other parts of the specification, however, Dr. Rockey refers to a "fully expanded" sleeve (Brief Description of the Drawings, 3:9-11; 4:52). This suggests that had he meant "fully expanded," he would have said so.

The next step in the claim 2 method involves the act of "maintaining said balloon in an expanded condition in the vessel while said sleeve increases in rigidity." Contrary to Cordis' assertions, this step does not confirm that an increase in rigidity must take place following complete expansion of the balloon. The increase in rigidity takes place after the balloon begins to expand, and once the balloon has been fully expanded, the balloon is maintained in the inflated condition while the sleeve achieves the semirigid state required before the balloon may be removed. That is how Dr. Rockey described the process involved in his invention, and therefore, that is how the claims are to be interpreted.

The ordinary meanings of "rigidity" and "after" that are most consistent with the intrinsic record are as follows:

1. "Rigidity" means the quality or state of being deficient in or devoid of flexibility, stiff and unyielding, hard, or firmly fixed or set. (Webster's Ninth; Random House).
2. "After" means "following in time." (Webster's Third).

Accordingly, the phrase "increases in rigidity after expansion of the balloon" requires that the material contained in the sleeve or added to the sleeve during the procedure increase in rigidity after the balloon begins to expand.

CLAIM 1:

Plaintiff's fastener is comprised of two halves, a female half and a male half. A donut shaped magnet, referred to as the magnetic member, is mounted on the female half. A rivet is positioned at the periphery of the hole in the magnet, leaving the hole in the magnet at least partially unobstructed. The male half is made of magnetically attractive material. It contains a rivet protruding outward that fits within the hole of the magnet to fasten the two halves together. At least one of the two rivets contain a small hole. The purpose of the hole is the central focus of the parties' dispute as to claim one, the only independent claim at issue.

The last element of claim one provides:

said magnetic member creates a magnetic circuit which passes at least through a periphery of said first rivet of said female member, which said small hole in said one of said first and second rivets increasing the magnetic attraction of said magnetic member by modifying a resistance to said magnetic circuit at said first and second rivets. (emphasis added).

Plaintiff maintains that the underlined portion of claim one should be interpreted to mean that the purpose of the rivet hole, in the context of the closure, is to provide an increase in magnetic attraction. Defendants contend that this language must be construed to mean that the small hole in at least one of the rivets, and no other element, causes the increase in magnetic attraction of the magnet itself, i.e., that the power of the magnet is intensified.

The claim language does not speak in terms of increasing the power of the magnet. Rather, it states that the magnetic attraction is increased. The dictionary defines "attraction" as "the act or capability of attracting" and defines "attract" as "to cause to draw near or adhere; direct to or toward itself or oneself . . . " The American Heritage Dictionary of the English Language at 120 (Houghton Mifflin Co. 3d ed. 1996). Although it is possible to increase magnetic attraction, it is impossible to increase a magnet's power to attract. The inherent strength of a magnet is fixed. The magnetic attraction, as opposed to the magnet's power, can be enhanced as a result of the physical surroundings in which the magnet is placed. For example, it
is common knowledge that the further away a magnet is placed from a metal object, the less attraction they will have to each other. That is, the ability of the magnet to draw the metal object toward it is decreased as a result of the distance. If a piece of wood, or other non-magnetic barrier, is placed between the magnet and the metal, the magnetic attraction is similarly decreased.

Defendants are correct in noting that the claim language does indicate that the magnetic attraction of the magnet is amplified. It does not state that the magnetic attraction between the magnet and the male half is increased. The flaw with defendants' argument, however, is that they focus on the word increase as it relates to the phrase magnetic member, instead of the claim limitation as a whole, in context. See e.g., Quantum Corp., 65 F.3d at 1581 (citing United States v. Teleelectronics, Inc., 857 F.2d 778, 781 (Fed.Cir. 1988)). The claim language continues with the explanation as to how the magnetic attraction is able to be enhanced. It states, "by modifying a resistance to said circuit at said first and second rivets." The specific language of the claim does not purport that the rivet hole alone acts to strengthen the magnetic attraction by increasing the inherent strength of the magnet. Rather, the small hole affects the circuitry when the male and female halves are brought together. Defendants' contention that the small hole, and no other element or feature of the fastener, causes the increase in the magnetic attraction is untenable. Absent the surrounding environment in which the rivet hole is situated, no magnetic circuit could be obtained. It is the location of the rivet hole, within the overall physical structure formed when the two halves are brought together, that creates a change within the magnetic circuitry, not a change to the magnet itself. Such a modification enables the inherent power of the magnet to be harnessed in such a manner as to allow the magnet to operate more efficiently, thereby increasing the attraction of the male half toward the magnet.

Nothing within the specification or prosecution history indicates that the claim should be interpreted to mean that the small hole in at least one of the rivets causes the magnet's inherent power to grow stronger. The specification states:

"The utilization of the small hole through the center of the rivet modifies an interference or resistance to magnetic lines of flux (magnetic circuit) which pass through at least a periphery of the rivet and are caused by a permanent magnet of the female member. By modifying the resistance to the magnetic circuit, the magnetic attraction of the magnetic member is increased.

Similarly, in the abstract portion of the patent, it states: "at least one of the rivets can include a small hole which serves to modify a resistance to a magnetic circuit created by the magnetic member and thereby increase a magnetic attraction of the magnetic member."

Defendants argue that these passages support their contention that the claim must be read as to require that the magnetic attraction of the magnet itself is increased. The claim, as well as these portions of the patent relied on by defendants, would have been clearer had it been drafted to state that the magnetic attraction between the magnet (located on the female half) and the male half is increased. Other passages in the specification do indicate that the magnetic attraction refers to the two halves of the fastener, not to the magnet itself. The specification also states, "the small holes extending substantially through at least one of the rivets modifies resistance to the magnetic circuit and thereby enhances the magnetic attractions between the male and female members . . ." The specification additionally provides:

"The magnetic circuit flows through at least a periphery of the rivets . . . By utilizing small through holes . . . substantially through at least one of the rivets . . ., an interference to the magnetic circuit at the center of the rivet . . . can be modified. The modification in interference at the center will cause a modification in the resistance to the magnetic circuit and thereby increase the magnetic attraction. Accordingly, the provision of having a small hole drilled at least substantially through at least one of the rivets . . . will modify a resistance to the magnetic circuit and thereby increase the magnetic attraction and holding power of the magnetic snap lock.

These excerpts indicate that the increase in the magnetic attraction is between the two halves of the fasteners when in a closed position. The male half contains no magnet and therefore has no ability to attract. The magnet is the instrumentality by which the ability to attract is derived. Therefore, the specification merely indicates that the magnetic attraction, emanating from the magnet itself, is increased. That increase occurs within the context of the magnetic circuit created as the male and female halves come together at the rivets when the fastener is in the closed position.

The prosecution history does reveal that the purpose of the rivet hole was a central issue in obtaining the patent. When the patent was initially submitted to the PTO for consideration, claim 1 did not contain the disputed language. The examiner
rejected Claim 1 as unpatentable given the existence of a prior similar patent, i.e., U.S. patent No. 5,042,116 ("the '116 patent"). The '116 patent fastener has a male projection pin with a recess that houses the female pin when the device is closed. The PTO found that the hole in the pin, in the '116 patent, is equivalent to the small hole in one of the rivets in the '773 patent fastener. Therefore, since the applicant had "not claimed or defined that the 'small hole' in one of the rivets solves any stated problem or is, for any particular purpose," claim 1 was rejected.

Defendants argue that the patentee added the language that the rivet hole increases the magnetic attraction in an effort to overcome the examiner's rejection and to distinguish this fastener from the '116 patent. The prosecution history demonstrates that the disputed language was not an afterthought added by the patentee as a direct result of the examiner's comments in initially rejecting claim 1. In the original draft of the patent application, claim 7 dealt with the increase of magnetic attraction by a change within the magnetic circuit at the site of the rivets. It read as follows:

A magnetic snap lock according to Claim 1, wherein said magnetic member creates a magnetic circuit which passes at least through a periphery of said first rivet of said female member, said first and second rivets increasing a magnetic attraction of said magnetic member by reducing a resistance to said magnetic circuit at said first and second rivets.

Although proposed claim 7 did not specifically address the existence of the rivet hole and its purpose, the original specification did. It stated:

The magnetic circuit flows through at least a periphery of the rivets . . . by utilizing small through-holes . . . substantially through at least one of the rivets . . ., an interference to the magnetic circuit at the center of the rivet . . . can be reduced. The reduction in interference at the center will cause a reduction in the resistance to the magnetic circuit and thereby increase the magnetic attraction. Accordingly, the provision of having a small hole drilled at least substantially through at least one of the rivets . . . will reduce a resistance to the magnetic circuit and thereby increase the magnetic attraction and holding power of the magnetic snap lock.

In seeking reconsideration by the PTO, the applicant's amending papers noted:

Claim 1 has been amended to include further minor clarifying amendments with respect to features of the small hole set forth in Claim 7. During the interview, the Examiner indicated that these clarifying amendments were acceptable and would place Claim 1 in condition for allowance. As noted in the Official Action, and agreed upon by the Examiner at the personal interview, the applied references are not believed to show or suggest the specific combination of elements set forth in amended Claim 1 including the features of the small holes which modifies a resistance to the magnetic circuit at the first and second rivets. In the present invention, the presence of the small hole in the center of the rivet modifies the flux density of the magnetism through the rivet to a desired value consistent with the material of which the rivet is constructed and the desired properties of the device.

Based on this amendment, as well as others, the invention was granted a patent. Notwithstanding defendants' contention to the contrary, the prosecution history fails to reveal that the amendment to claim 1 was intended to limit the claim only to magnetic fasteners that have at least one rivet hole which solely operate, separate and apart from anything else, to increase the magnetic attraction by increasing the power of the magnet.

Accordingly, the Court finds that the last element of claim 1 is interpreted to mean as follows:

and in which the magnet causes lines of magnetic flux to pass through at least the outer sides of the rivet in the female half, and the small hole(s) in one or both rivets modifies their resistance to the flux and thereby increases the magnetic attraction.
4 Defendants had no objection to the introduction in evidence of the dictionary excerpts, X-14 through 16.

This term is used in claim 16 of the '990 patent, which asserts in pertinent part:

'A wet compression power augmentation apparatus … comprising: means for nebulizing water… adapted to modify the mass flow of nebulized water in a plurality of nebulized water mass flow increments

(emphasis added).

Defendants assert that, in the context of this claim, the term increment includes a time-and-function element, i.e., "a period of time of sufficient length to allow each component of the turbine to reach thermal equilibrium." (Defendants' Markman Brief at p. 8). In support of this contention, Defendants rely on the purpose of the water increments stated in the specifications. See '990 Patent, column 4 at line 3 and column 6 at line 8.

Again, "increment" is a commonly used term. According to Webster's Collegiate Dictionary (X-15), increment means the action or process of increasing, especially in quantity or value; something gained or added; or the amount by which something changes. The time between increments may relate to the intended result or function, but time is a separate concept.

The file history also supports this conclusion. Dow defined "increment" in the context of an apparatus that operates to add nebulized water to a compressor, in more than a single, definable "increment"… (See X-3B at 62). The examiner similarly found that "as is clear from the specification, and the general meaning of the term 'increment,' an increment is a step or quantity of mass flow." (X-3C at page 50).

Thus, the Court construes the term increment to mean:

A unit or a discrete amount.

2098

1. "Incrementally"

In the present case, the court must first construe the term "incrementally." The term "incrementally" is found in claims 1, 8, 13, 14, and 20 of the '281 patent. In the context of these claims, FECO urges the court to construe "incrementally" as follows:

The proper construction of the term 'incrementally' as used in the '281 patent is that the spinner assembly be moveable fore and aft through a series of minute additions or imperceptible augmentations, ie. that it be infinitely adjustable (adjustable to any position between full extension and full retracted positions).

HECO essentially agrees with FECO's proposed construction of "incrementally" to the extent that it requires "a screw that adjusts the spinner apparatus through an essentially infinite series of minute adjustments," as compared with "a spinner that translates or moves only to a very small number of discrete locations where it is fixed for use." HECO disagrees, however, with FECO's construction of "incrementally" to the extent that FECO urges the court to include a limitation that "the screw must adjust the spinner to any position between full extension or full retraction." In support of its position that such a limitation should be included in the court's construction of "incrementally," the defendant points out that "[t]he specification does indicate . . . that the spinners can be adjusted to any position between full extension and full retracted positions." After considering the parties respective recommendations as to the term "incrementally," the court construes the term to require that the spinner assembly be moveable fore and aft through an essentially infinite series of minute adjustments.

FECO, however, states that the infinite series of minute adjustments must cause the device to be adjustable to any position between "full extension and full retracted positions." FECO Brief at 11. However, absolutely nothing in the claim language
supports this additional limitation on the claim construction. The claim language simply identifies a rotatable screw between
the main supporting frame and subframe whereby manual rotation of the screw incrementally adjusts the position of
the moveable subframe and spinner. It is obvious that in plaintiff's preferred embodiment, the screw jack performs this function
as the primary method by which the device moves fore and aft. It is equally obvious that the relatively small screw in the
accused device is not the primary mechanism for moving the device fore and aft (the lever does not) but, rather, the rotatable
screw in the accused device performs relatively minor or "fine-tune" adjustments. Nothing in the claim language for claim 1
limits the protection for the use of a rotatable screw based on whether the screw is primarily or secondarily responsible for
the fore and aft movement.

2099

1. "Incrementally Engaging and Disengaging"

Claims 1, 23, 33, 62, 64, and 66 of patent '024 recite that the modulating clutch is incrementally engaged when a measured
speed difference between the primary and secondary drivelines is greater than a predetermined amount and is incrementally
disengaged when the speed difference between these drivelines is below that amount. The parties' dispute is over the
meaning of the phrase "incrementally engaging and disengaging."

BorgWarner:

"Incrementally engaging and disengaging" is a closed loop control strategy that incrementally increases the clutch
engagement when the slip is above a predetermined amount and incrementally decreases the clutch engagement when the
slip is below that amount. This incrementally engaging and disengaging is done in discrete steps, which may be the same or
different sizes. (Plaintiff's Markman Brief, at 14).

NVG:

"Incrementally engaging and disengaging" means discrete steps that are fixed (pre-set prior to using the system). The size
of the step is not dependent on the magnitude of the wheel slip and therefore not continuously variable. (Markman Reply
Brief of NVG, at 8).

The issue regarding this claim distills down to the definition of "incrementally": whether it can describe steps of varying
sizes or must mean step of fixed sizes. As noted above, we begin with the "heavy presumption" that a claim term carries its
ordinary and customary meaning. Teleflex, 299 F.3d at 1325. To discern the ordinary and customary meaning of a term we
may look to dictionary definitions of the word. Kopykake Enterprises, Inc. v. Lucks Co., 264 F.3d 1377, 1382 (Fed. Cir.
2001). Dictionaries, as noted earlier, may always be relied on by the court to determine the meaning of the claim terms "so
long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent
documents." Id., quoting Vitronics, 90 F.3d at 1584 n. 6.

In this case, the parties offer a buffet of dictionary definitions. BorgWarner's sampling is geared toward a definition of
"increment" as "the finite increase of a variable quantity." Webster's New Twentieth Century Dictionary, at 926 (2nd ed.
1978). 3 Accordingly, BorgWarner argues that the "ordinary and customary meaning of the word 'incrementally' refers to
stepwise changes and that these changes may be variable (or different) sizes." (Plaintiff's Markman Brief, at 15). Not
surprisingly, NVG's selections refer to changes in steps of fixed or constant sizes. For example, NVG points to the Oxford
Modern English Dictionary's definition of increment as "an increase or addition, esp. one of a series on a fixed scale."
(Markman Brief of NVG, at 10, citing Oxford Modern English Dictionary, at 539 (1992)). From the court's perspective, the
difference is merely one of context.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 Plaintiff cites additional dictionary definitions to support its interpretation as follows:

Other dictionaries provide similar meanings. The American Heritage Dictionary of the English Language defines
"increment" as "1. An increase in number, size, or extent; growth; enlargement. 2. Something added or gained. 3. A small
increase in quantity. 4. Mathematics. A small positive or negative change in a variable." (Ex. 14.) The Compact Edition of
the Oxford English Dictionary defines "increment" as an "amount of increase; an amount or portion added to a thing so as to
increase it, an addition… ." (Ex. 15.) Webster's Third New International Dictionary defines "increment" as "1: an increasing
or growth in bulk, quantity, number, or value: enlargement, increase 2 a: something that is gained or added: an added
quantity or character b: one of a series of regular consecutive additions of like or proportional size or value. (Ex. 16.).

(Plaintiff's Markman Brief, at 15).

- - - - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

BorgWarner argues that words in a claim are entitled to their broadest dictionary definition, citing Rexnord Corp. v. Laitram
Corp., 274 F.3d 1336, 1342 (Fed.Cir. 2001). (Plaintiff's Post Markman Brief, at 2). We cannot disagree that, generally, an
increment could be of "variable quantity, as BorgWarner argues, of different sizes. There is a specific context here, however,
which a definition such as that of the Oxford Modern English Dictionary addresses. Beyond that, we are not really resolving
the issue of what "increment" means, but what "incrementally" means as used to describe "engaging and disengaging."

We are dealing with "increment" as the root of the adverb "incrementally," which is used to modify "engaging" and
"disengaging." While the noun "increment" may refer to a single, step, addition, or unit of increase which may be of any
size, the adverb "incrementally" must be applied to the process of engaging and disengaging. Then, we are not speaking of
an "increment," but a potential series of increments. Once the size of an increment is determined, "incrementally" would
refer to a series of steps or additions of that determined size: one increment following another. Ordinarily and customarily,
one might refer to such a process as occurring "in increments of. . ." followed by a single amount, as in "increments of 5." It
is doubtful, or would at least be rare, that the phrase would ever be followed varied amounts, as in "increments of 5, 7, and
10."

As BorgWarner describes that process, once the microcontroller determines the amount of slip, it compares it to a
predetermined amount of allowed slip. If the actual slip is greater than the predetermined amount, the microcontroller
causes the modulating clutch to be engaged a "discrete" amount, and the analysis is repeated. If the slip is still above the
predetermined amount, the amount of engagement of the modulating clutch is increased again; if the slip is below the
predetermined threshold amount, the modulating clutch is disengaged, again by a "discrete" amount. Certainly, these
"discrete amounts" would be "increments," but to suggest they would be of a random or variable size would be
counterintuitive. If they could be, the analysis spoken of could simply be performed a single time and the slip corrected for
in whatever "increment" was called for. According to BorgWarner, such a single step correction is "very apparent to the
driver and undesirable." (Plaintiff's Markman Brief, at 8-9 n.5). It would seem that at least one supposed innovation of the
patents-in-suit, the unnoticed correction of slippage, would be defeated by the interpretation BorgWarner advances here. 4

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

4 At the risk of oversimplification, if the slippage is at a value of ten, BorgWarner suggests that it need not be corrected in
five increments of two, but perhaps by one increment of two and an increment of eight. This, one would think, would be
nearly as noticeable as a single correction in one increment of ten.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

This dispute, then, is resolved by the ordinary and customary meaning of "incrementally engaging." Clearly, the
"increments" by which the clutch engages or disengages must be of the same size: "Incrementally engaging and
disengaging" means discrete, fixed steps.

GO BACK

2100

C. Openings, Indentations and Bore

As an initial matter, to the extent any of the below phrases include the phrase "spaced apart", we direct the reader to our
discussion immediately above. Here, we construe this group of claim phrases by focusing on the difference between
openings and indentations. Specifically, the parties dispute whether openings and indentations can be used interchangeably. We find that they cannot be. Rather we find that in the '932 Patent, an opening is a hole through which something can pass, while an indentation is a recess or concave area into which something can be inserted, but not pass. It follows that a bore is an opening that has depth by virtue of either being cut through a thicker solid surface or several pieces of material with holes in them being aligned and stacked on top of one another. We reach our conclusion by reviewing the language of the '932 Patent itself.

Two specific openings are described in the patent: first, the two openings in the side plates which receive two different drive pins, col. 1, lns. 40-41, col. 2, lns. 57-60, cl. 1 at col. 4, lns. 6-7, and cl. 2 at col. 4, lns. 55-56; and second, the two openings in the female lug's lips and the one opening in the male lug's tongue that, when aligned, form a bore which receives the swivel pin, col. 1, lns. 53-57, col. 3, lns. 5-9, cl. 1 at col. 4, lns. 20-24, and cl. 2 at col. 5, lns. 2-6. In both contexts, the openings allow a pin to pass all the way through them in order to connect or anchor various structures to each other.

Only one indentation is described in the patent: the indentation in the flight heads that receives either the first ends or the second ends of the drive pins. Col. 1, lns. 60-62, Col. 1, ln. 67 to col. 2, ln. 2, col. 3, lns. 14-17 and 29-32, cl. 1 at col. 4, lns. 28-31 and 36-39, cl. 2 at col. 5, lns. 10-13 and col. 6, lns. 4-7. In this context, the indentations allow the ends of a pin to sit inside the flight head in order to connect the flight to the link assembly. If the drive pin were to pass all the way through the flight head, then the "ends" of the drive pin would no longer reside in the flight head, but outside of it.

As explained above, the term openings and the term indentation are used consistently throughout the '932 Patent. Based on these consistent usages, it is clear that an opening allows something to pass through it, while an indentation does not.

There is, however, the aberrant usage of the term "hole" twice in the patent. The term "hole" does not appear in either claim of the patent. However, it does appear twice in the specification; both times in conjunction with the term "indentation". And both times the phrase describes how the drive pins connect to the flights: "...the [drive] pins are extended still further, to fit into the indentations or holes in the flights." Abstract, 4th sent., and col. 3, ln. 53.

When questioned at the claim construction hearing about this anomaly, Joy argued that the appearance of the phrase "indentations or holes" reflected that the terms "indentation" and "opening" were used interchangeably in the '932 Patent. Accordingly, Joy contended that the phrase "indentations or holes" further supported its proposed construction that would define indentation to include areas through which something could pass. Not surprisingly, CMM argued that the phrase "indentations or holes" indicated that indentations and holes were two different things; one indicating recessed areas and the other indicating areas through which something could pass.

Based on our review of the entire patent, including especially the claims, we agree with CMM. The term "indentation" is not interchangeable with the term "hole" in the '932 Patent. As summarized above, the term "indentation" is consistently used to indicate a recess, while the term "opening" is consistently used to refer to an area through which something can, and does, pass. As such, it is a more consistent reading of the patent that in the phrase "indentations or holes" the term "holes" was used as a substitute, perhaps inadvertently, for the term opening, not as a synonym for the word indentation.

In summary, we find that "opening" indicates a hole through which something can pass, while "indentation" indicates a recessed or concaved area. We apply those definitions in the below claim constructions.
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

Jumpsport proposes that the term "plural independent pole" be construed as: "more than one structurally supportive member that is elongated and often cylindrical (or pieces of the same that connect together to form one pole) wherein each pole is not connected to another pole above the surface of the mat in a substantively inflexible manner."

Defendants propose: "a plurality of vertically extending posts each with a free upper end." 1

Footnotes
1 The parties agree that the term "post" in the '207 patent is to be construed identically to the term "pole" in the '845 patent.

The main issue in the construction of this claim is whether U-shaped, or arched poles can be considered "independent poles," or if Jumpsport gave up that construction during the prosecution of the patent.

PROSECUTION HISTORY

In the prosecution history, Jumpsport originally sought to claim the following:

80. A trampoline having a safety enclosure therearound, comprising:

   a frame;
   a rebounding mat coupled to the frame by plural spring members;
   plural U-shaped support members supporting the frame above the ground, each of said support members having first and second legs extending upwardly from the ground and coupling to the frame;
   plural independent poles, each coupled to one of said legs of the U-shaped support members;
   the safety enclosure comprising a flexible material coupled to said independent poles; . . .

   and

81. A trampoline having a safety enclosure therearound, comprising:

   a frame;
   a rebounding mat coupled to the frame by plural spring members;
   plural independent poles, each extending above the rebounding mat;
   the safety enclosure comprising a flexible material coupled to said independent poles and to the rebounding mat . . .

Amatruda Decl. Exh. E at 12; JSPORT 114453 (emphasis added).

The patent examiner rejected claim 80 as fully anticipated on all claims by the Bailey '132 patent, stating that Bailey disclosed a trampoline with a safety enclosure around it that featured a frame, a rebounding mat coupled to the frame by springs, a plurality of components which created a U-shaped support member, a plurality of independent poles, coupled to the legs of the U-shaped support members, and a flexible safety net tied to the poles. Amatruda Decl. Exh. F at 5, JSPORT 114477. Thus, the patent examiner agreed that Bailey's U-shaped support members could properly be considered "plural independent poles," as the term was used by Jumpsport. 2

Footnotes
2 While defendants present a strong argument that a U-shaped support member is inconsistent with the plain meaning of

- 2554 -
"pole," the court finds the patent examiner's determination to the contrary more persuasive evidence of the plain meaning of the term "pole" as it is understood by those skilled in the relevant art.

The examiner allowed claim 81 because it required that the enclosure be attached to the mat, which Bailey did not. Amatruda Decl. Exh. F at 5, JSPORT 114477. Claim 81 was renamed claim 82, and ultimately became claim 1 of the '845 patent. Id. at Exh. G at 1, JSPORT 114491; id. at Exh. H at 2, JSPORT 114566.

After the issuance of the '845 patent, Jumpsport then filed a continuation application based on the same specification, Amatruda Decl. Exh. I, and asserted the following new claims by preliminary amendment:

65. A trampoline system comprising: . . . plural vertically extending independent poles, each pole being coupled to a leg, each pole having an upper end portion at an elevation above the frame, . . .

66. A trampoline system according to claim 65 further comprising a flexible loop that links the upper end portions of the poles;

67. A trampoline system according to claim 66 wherein the loop comprises a line that is made of a flexible material, that extends pole-to-pole and that connects the upper end portions of the poles such that the line permits constrained movement of upper end portions of two adjacent poles relative to one another;

68. A trampoline system according to claim 67 wherein the line is made of a substantially inelastic material.

Amatruda Decl. Exh. J at 1-2, JSPORT 114059-60 (emphasis added)

The examiner rejected claims 65 and 68, again finding that the Bailey patent anticipated all elements. The examiner stated, "As broadly claimed the examiner considers each inverted U-shaped member as an independent pole being coupled to a leg and loops as flexible line portions of the flexible wall portion." 3 Amatruda Decl. Exh. K at 2, JSPORT 114081.

3 Claims 66 and 67 were initially rejected on other grounds, which are not at issue here.

Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

Jumpsport argued in response that the Bailey "inverted U-shaped member" was not a "pole," as that term was used in claims 65-68, and claimed that the Bailey inverted U-shaped members were more properly considered "panel assemblies." "Poles' look and behave differently than 'panel assemblies." Amatruda Decl. Exh. L at 9, JSPORT 114094. Nonetheless, Jumpsport agreed to distinguish its invention from Bailey by amending the third paragraph of claim 65 to cover " . . . plural vertically extending independent poles, each pole being coupled to one of the legs, each pole having an upper end portion at an elevation above the frame, and each pole being spaced apart from the other poles without interconnecting members that inhibit bowing of the poles . . ." Id. at 7, JSPORT 114092 (emphasis added).

With this amendment, claims 65-68 were allowed. Id. at Exh. M, JSPORT 114099. The examiner specifically stated that the prior art did not show vertically extending independent poles coupled to only one trampoline leg. Id. at 2, JSPORT 114102.

ANALYSIS

Upon reconsideration, the court agrees that the Bailey patent does not anticipate the '845 patent and that the basis for the initial construction of the term was incorrect. Defendants argue that the court's ruling remains correct, though, because
Jumpsport conceded that a U-shaped support member could not constitute a "plural independent pole" when Jumpsport affirmatively stated in the prosecution of the '207 patent that "[the Bailey U-shaped support] panel assemblies are not poles." See Amatruda Decl. Exh. L, JSPORT 114094.

The court must limit the ordinary meaning of a claim "if the intrinsic evidence shows that the patentee distinguished that term from prior art on the basis of a particular embodiment, expressly disclaimed subject matter, or described a particular embodiment as important to the invention." CCS Fitness, 288 F.3d at 1367; see also Rheox, Inc. v. Entact, Inc., 276 F.3d 1319, 1325-27 (Fed. Cir. 2002) (broader ordinary meaning of term nonetheless limited based on statements made during prosecution to overcome prior art); Standard Oil Co. v. Am. Cyanamid Co., 774 F.2d 448, 452 (Fed. Cir. 1985) ("the prosecution history (or file wrapper) limits the interpretation of claims so as to exclude any interpretation that may have been disclaimed or disavowed during prosecution in order to obtain claim allowance"). Thus, Jumpsport is bound by its statements in the prosecution history for all the claims in the patent, unless the prosecution history clearly indicates an intent to limit the scope of the disclaiming statements made. Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579 (Fed. Cir. 1995) ("Arguments made during prosecution regarding the meaning of a claim term are relevant to the interpretation of that term in every claim of the patent absent a clear indication to the contrary.").

In reading the file wrapper as a whole, it is clear that Jumpsport expressly limited its statements concerning Bailey to the vertically extending independent poles at issue in claims 65-68 only. Therefore, this claim is not limited by prosecution history estoppel. The court thus adopts Jumpsport's position, and construes the term "plural independent poles" as more than one structurally supportive member that is elongated and often cylindrical (or pieces of the same that connect together to form one pole) wherein each pole is not connected to another pole above the surface of the mat in a substantively inflexible manner.

4 Furthermore, even if defendants' position were correct, the defendants do not adequately explain how a subsequent statement in the prosecution of the junior patent, the '207, would retroactively bind any interpretation of the term "pole" in the '845 patent.

--- Footnotes ---

7 See, e.g., '154 patent, col. 1, ll. 60-62; col. 4, ll. 52-55.

--- End Footnotes ---

1. Claims 1 and 11 of the '548 Patent

The relevant portion of Claims 1 and 11 of the '548 Patent reads, "at least some of the appliances are marked to indicate their order of use." Align argues the Red, White & Blue system meets this limitation because the initial appliance is marked with a red dot, the intermediate appliance is marked with a white dot, and the final appliance is marked with a blue dot.

The parties disagree about the construction of this claim. Ormco argues it means the order must be apparent, i.e., pointed out
with more or less exactness, from the markings themselves. Ormco further contends the markings themselves must reveal the order of use, rather than the markings plus some other source of information. Ormco supports this construction with the fact the specification fails to cite any example of markings other than sequential numbers.

Ormco's definition impermissibly limits this claim. First, the word "indicate" in the claim language conveys there may be an inferential step between the markings and the order of use. Second, Ormco does not offer a convincing argument why, based on dictionary definitions, the specification, or the prosecution history, the claim should be interpreted otherwise. Third, the specification expressly describes the option that "written instructions may accompany the system which set forth that the patient is to wear the individual appliances in the order marked on the appliances. . . ."

The Red, White & Blue system consists of an initial appliance marked with a red dot, an intermediate appliance marked with a white dot, and a final appliance marked with a blue dot. The sequence the appliances are to be used is apparent from the product's name and from the written instructions provided to the patient. These appliances are "marked to indicate their order of use," and Align's motion for summary judgment of infringement on Claim 1 and 11 of the '548 Patent is GRANTED.

d. "indication device"

i. The Parties' Proposed Construction

Smiths argues that the meaning of "indication device" is "a device located in a remote commander, providing at least one of a visual indication, an audible indication or a tactile indication." (D.I. 165 at 28.) Smiths argues that the claim language, specification, and prosecution history support this construction. (D.I. 190 at 33-36.) It argues that the term "indication device" has "no stated physical relationship to any other elements in the claim." (Id. at 33.) Smiths also argues that the purpose of this invention is to conceal the pump, specifically noting that the specification states that "one of the objectives of this invention is to provide an external pump 'capable of being concealed from view when being remotely commanded.'" (Id. (citing '798 patent, Abstract).) Further, Smiths argues that the specification lists multiple uses of an RF (radio frequency) programmer or indicator. (Id. at 34 (citing '798 patent, col. 5:38-40, 6:54-58, 8:18-21).) Smiths also argues that, during the prosecution of the patent, the patentee "disclaimed coverage of embodiments in which the indication device is located in or on the infusion pump." (Id.)

MiniMed argues in response that nothing in the claims requires a remote "indication device." (D.I. 214 at 34.) In addition, it argues that the specification lists many preferred embodiments that do not use a remote "indication device." (Id. at 35.) Lastly, MiniMed argues that the portions of the prosecution history cited by Smiths were either cited out of context or do not apply to the claims at issue. (Id. at 35-38.)

ii. The Court's Construction

The plain meaning of "indication device" in this case is "a device providing at least one of a visual indication, an audible indication or a tactile indication." 19 Looking to the rest of Claim 1, I see nothing that warrants the inclusion of Smiths' proposed additional limitation. Other elements of the claim are required to be located on the housing, such as a processor coupled to the housing." ('798 patent, col. 30:38.) There is nothing in the claim, however, that prevents the indicator from being connected to the housing. (Id., col. 30:38-47.) Contrary to what Smiths argues, all this proves is that the processor must be attached to the housing and the indicator may or may not be attached to the housing.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

19 Smiths' proposed meaning strays from the plain meaning of "indication device." This is supported by their repeated attempts to show how the patentee redefined the term in the specification or disclaimed certain subject matter during the prosecution of the patent. (See D.I. 190 at 33-36.)

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -
With respect to the specification, it is important to remember that although "examples disclosed in the preferred embodiment may aid in the proper interpretation of a claim term, the scope of a claim is not necessarily limited by such examples." Ekchian v. Home Depot, 104 F.3d 1299, 1303 (Fed. Cir. 1997) (internal citation omitted). In the "798 patent specification, in addition to numerous examples of the invention using a remote indication device, there are also numerous instances of the indication device being attached to the housing of the pump. ("798 patent, col. 4:6-18, 6:25-58, 11:52-12:4, 13:1-34, 15:1-3, 15:53-58, 28:11-12.) Smiths itself states that it is only "one of the objectives" of the invention to use a remote "indication device," it is not the sole objective. (D.I. 190 at 33.)

Additionally, the prosecution history does not show "both [a] clear and unmistakable" disavowal of claim scope. Omega, 334 F.3d at 1325-26. Two of the sections cited by Smiths discuss how the invention uses a remote programmer, while the prior art does not. (D.I. 190 at 34-35 (citing D.I. 193, Ex. 41 at 4-)5.) These two cited sections point to the invention as a whole, however, and not the specific claims at issue. (See D.I. 193 at 5 (beginning the discussion of specific claims at the bottom of page 5).) It is true that, the cited document, the patentee discusses a claim that is not at issue in this case that explicitly requires "remotely generated commands." 20 But it is reasonable to understand that the mention of a remote programmer related to the specific claim in connection with which it was discussed, and not a later claim that made no reference to such a capability.

20 Both parties agree that during prosecution Claims 1, 10, and 12 were labeled as 35, 52, and 54, respectively. (D.I. 190 at 34; D.I. 214 at 35.)

Lastly, Smiths cites an office action where the patentee stated that the pump can be concealed from view "when being remotely commanded." (D.I. 190 at 35-36 (citing D.I. 193, Ex. 37 at 26-27).) This passage, however, is aimed directly at overcoming the rejection of claims not at issue in this case. (See D.I. 193, Ex. 37 at 26-27.) 21 These cites provided by Smiths do not show both a "clear and unmistakable" action on the part of the patentee to limit the definition of the term "indication device." See Omega, 334 F.3d at 1325-26. Consequently, I hold that "indication device" means "a device connected to the infusion device or in a remote, providing at least one of a visual indication, an audible indication or a tactile indication." 22

21 That passage refers to Claim 1. Smiths, however, made it clear that Claims 1, 10, and 12 were labeled as 35, 52, and 54 during prosecution. (D.I. 190 at 34.) Consequently, Claim 1 in that document refers to a claim not at issue in this litigation.

22 The term "externally supplied values" is listed in the Joint Claim Construction Chart as disputed. (D.I. 165 at 27.) In the parties' briefing, however, there is no discussion of this term. Therefore, I presume that the parties no longer have a dispute as to the meaning of this term.

H. Term 10: Status indicator (as used in claims 1, 4, 32, 62, 66, and 84).

Lutron contends that Term 10 means "A display element, such as an LED or screen, for indicating the status of the electrical device." Control4 contends the term means "A display element for indicating the true status of the electrical device." Control4 wants the word "true" included before the word "status," while Lutron opposes this addition due to limitations it might unintentionally introduce, such as a timing element. In turn, Control4 opposes inclusion of the word "screen" for the same reason stated in sections I.B and I.G above.
The status indicator is located on the master control unit in each of the relevant claims. In the Vantage Controls, Inc. case, Lutron stipulated that the status indicator reflects the "true status" of the electrical device. 24 Based on this stipulation, Control4 contends Lutron should be estopped from arguing against inclusion of this phrase.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - 

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - 

After the parties stipulated to the construction of certain terms in the Vantage Controls, Inc. case, Vantage Controls, Inc. then argued that "true status" reflected a timing element because "there is no way to verify that the status has actually changed until after the change has actually occurred." 25 Lutron opposed this statement on the ground "that the term only requires that the master control unit be correctly updated, whether the electrical device is being controlled from the control device or the master control unit." 26 In its Markman order in the Vantage Controls, Inc. case, the court concurred with Lutron, and rejected Vantage Controls, Inc.'s attempt to include a timing element. 27 Lutron therefore opposes including "true status" in this case to avoid the same problem.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - 

26 Id. This is the same argument offered by Lutron in this case.

27 Id.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - 

The United States Court of Appeals for the Federal Circuit has concluded that the rulings in a prior case on claim construction do not necessarily "preclude a patentee from arguing for a different claim construction in an action brought" later. 28 Three factors the Federal Circuit has considered to determine whether a prior claim construction has preclusive effect include: (1) whether a party was fully heard during an evidentiary hearing in the prior action regarding the claim construction; (2) whether the court "put the parties on notice that the orders could have preclusive effect;" and (3) whether the court entered a final order that approved settlement if the case ended before trial. 29

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - 

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - 

In Vantage Control, Inc., Lutron stipulated to use of the phrase "true status," and had the opportunity to oppose Vantage Control, Inc.'s construction during the Markman hearing. The first element therefore has been met. Notably, however, the court concurred with Lutron that "true status" does not incorporate a timing element. Thus, while the first element is met, it weighs in favor of excluding the word "true" to avoid the same problem in this case.

The latter two elements are not met because the court did not indicate its order would have a preclusive effect, nor did the court approve the final agreement between the parties when the Vantage Control, Inc. case settled. As a result, Lutron may argue for a different claim construction than the one to which it previously stipulated. Furthermore, the Court concurs with the prior ruling in Vantage Controls, Inc. that a timing element was not included by Lutron when it referred to status as "true status." 30 To avoid the potential for adding in this limitation, the Court declines to insert the word "true" in its construction.
30 See discussion in section I.F above.

With respect to including an LED or screen as examples, the patent diagrams and specification specifically refer to an LED when discussing a status indicator. 31 The type of status indicator is not limited just to an LED, however, and a screen falls within the scope of the term. The Court therefore construes the term to mean "A display element, such as an LED or screen, for indicating the condition of the electrical device."

31 See e.g., '442 Patent, col. 23:17-37.
specifications, which taken together lead to the inescapable conclusion that what was invented, and what is being described, are devices and methods that use pressure sensitive variable conductance material. That is not to say that valid arguments of infringement under the doctrine of equivalents can, or can not be made. Those are matters for a later time.

The complete phrases presented to the court do not need to be construed because the plain and ordinary meaning is clear. However the court will instruct the jury as follows:

"Individual buttons" as used in '802 patent, claims 12-13, and "individual button" as used in '802 patent, claims 14-15, refer to: "One or more buttons on a pressure-sensitive variable conductance analog sensor."

H. Term 14: "individual hydraulic drive motors . . ."

The Court construes the term "individual hydraulic drive motors operatively engaged to each of the ground engaging wheels" in claims 1, 9, 15, and 24 of the '325 patent, and claims 1, 9, 11, and 14 of the '664 patent, to mean:

A single hydraulic drive motor operatively engaged to each of the ground engaging wheels.

This is essentially the construction proposed by Toro (though Toro advocates "one and only one" rather than the word "single"). Toro Opening Br. at 42. This construction reflects the most natural reading of the word "individual" given that it is paired with the adjective "each" in the relevant claim language.

Textron, however, contends that the word "individual" in this disputed term means "one or more." Textron Opening Br. at 50. Textron points out that claim 24 of the '325 patent claims a device that includes not only "individual hydraulic drive motors operatively engaged to each of the ground engaging wheels on the first end of the frame" -- the disputed term -- but also "at least one individual hydraulic drive motor operatively engaged to the ground engaging wheel(s) on the second end of the frame." Textron Opening Br. at 51-54. According to Textron, the phrase "at least one" makes no sense if "individual" is construed to mean "one and only one" -- or, necessarily, the synonymous word "single." Id. at 52.

The Court disagrees with Textron that, in light of claim 24, an "individual" motor cannot be a "single" motor. One could substitute the phrase "at least a single motor" for the phrase "at least one individual motor" without doing any violence to the latter phrase's meaning. Further, claim 24's reference to "at least one individual" motor differs significantly from the disputed term "individual hydraulic drive motors" because claim 24 pairs the phrase "at least one individual hydraulic drive motor" with "the ground engaging wheel(s)." '325 patent claim 24 (emphasis added). The disputed claim language, however, pairs the phrase "individual hydraulic drive motors" with "each of the ground engaging wheels." The word "individual" in the disputed term, in light of the corresponding adjective "each" modifying "wheels," is best understood as denoting a single motor engaged to each wheel.

1. Individual Light Control

Genlyte argues that "individual light control" should be construed separately, with one construction for "individual" and a second construction for "light control." Lutron argues that this proposed construction "parses what is clearly a unified term for a specific device into two parts."

Genlyte argues that "individual" should be construed to mean "functionally separate from one or more other light controls," and that "light control" should be construed to mean "apparatus comprising one or more raise/lower switches, where each of the raise/lower switches controls one or more dimmers." However, the words of the specification foil Genlyte's attempts to construct "individual" separately from "light control," as the specification uses the terms "individual light controls 10," "light controls 10," and "individual controls 10" interchangeably.
Based on this intrinsic evidence, the Court agrees with Lutron that "individual light control," should not be construed separately, but must be construed together. Additionally, there is no evidence that the applicants intended to use the term "individual" in any manner not consistent with its ordinary meaning. Therefore, no construction is needed of the term "individual."

Regarding the construction of the term "individual light control 10," Lutron argues that no construction is needed, as the term claims "a device for controlling the light intensity setting in a single room, no more, no less." Lutron points to the language of the specification which states that "the light controls 10 each act separately to control the lighting in their respective rooms when the individual rooms are defined by the partitions." Genlyte, on the other hand, asks the Court to construe "individual light control 10" to mean "apparatus comprising one or more raise/lower switches, where each of the raise/lower switches controls one or more dimmers," and where 'raise/lower switch' is actually 'a master raise/lower switch or an individual raise/lower switch."

Genlyte relies on the specification in arguing to include the raise/lower switches in the definition of "light control." For example, at column 5, lines 17 through 19 of the specification (the form of which below will be col. 5, ll. 17-19), the specification states that "[a] light control 10 typically has several raise/lower switches that each control a dimmer for a light within the room." Additionally, at col. 4, ll. 34-35, the specification states that "individual controls 10 often have a number of raise/lower switches to control different types of lighting." Lutron, however, argues that construing "light control" to mean "apparatus comprising one or more raise/lower switches, where each of the raise/lower switches controls one or more dimmers," would improperly import language into the claim.

While Lutron argues that the word "typically" shows only that the light controls sometimes include a raise/lower switch, necessarily meaning that at other times, no raise/lower switch is included, the specification states that a light control 10 typically has "several raise/lower switches" (emphasis added). Additionally, the language in the specification states that the light controls 10 "often have a number of raise/lower switches" (emphasis added). This language indicates that while the light controls normally have more than one raise/lower switch, they always have at least one raise/lower switch. Also, col. 5, ll. 15-17 of the specification state that the "Lytemode Systems line" of lights is an example of the individual light controls 10. The evidence shows that at the time of the patent application, Lytemode light controls had several raise/lower switches for determining light control. Therefore, this intrinsic evidence shows that the individual light controls 10 of the '731 patent each had one or more raise/lower switches for controlling light intensity.

However, Genlyte's attempt to further define "light control" as "controlling one or more dimmers" is not supported by the intrinsic evidence. Genlyte relies on the specification's statement that "[a] light control 10 typically has several raise lower switches that each control a dimmer for light within the room" as the basis for its argument (emphasis added). Genlyte cites case law from the Federal Circuit which states that while the article "a" may in fact mean "one," "a" can mean "more than one" depending on the context in which the word is used. See Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 977 (Fed. Cir. 1999). However, Genlyte has presented nothing in the intrinsic evidence which indicates that "a dimmer" should refer to "one or more dimmers." Without this evidence, the term "a" will carry its ordinary meaning, which does not refer to more than one dimmer. Genlyte also wishes to have "raise/lower switch" defined as "master raise/lower switch or an individual raise/lower switch." This definition is not supported by the intrinsic evidence, and likewise fails.

Therefore, the term "individual light control" is defined by the intrinsic evidence to mean "an apparatus comprising one or more raise/lower switches."

The last phrase in Claim 1, which is also in dispute, reads as follows: "said plate members each being constructed as individual structural parts releasably connectable to said opposing surfaces of said side members." Id. at col.6 l.28-30. CPT argues this phrase imposes two limitations on the plate members: (1) each must be an individual structural part and (2) releasably connectable to the opposing surfaces. IKN's primary objection to CPT's proposed construction focuses on the meaning of the term "releasably connectable"; it does not believe the phrase "said plate members each being constructed as individual structural parts" needs further elaboration. Without belaboring the construction of the limitation requiring the plate members be constructed as individual structural parts, a fair reading of the entire specification shows the purpose of
the invention is to allow individual parts to be replaced as they become worn. Thus, I will construe the phrase "said plate members each being constructed as individual structural parts" to mean: "Every one of the plate members is an independent structural part, constructed separate and apart from every other plate member."

C. "Individual Visual Indicator"

Universal contends that the claim teen "individual visual indicator" in claim 24, which is dependent on claim 13, is in means-plus-function format. Universal argues that the term is a functional description of the claimed element and fails to recite sufficient structure for performing its function. Plaintiffs propose the following construction of the term "individual location indicator":

An "individual visual indicator" is a device that provides a visual indication corresponding to each location.

(Docket Entry No. 40, p. 27). This court has found that the term "indicator" recites sufficient structure to avoid section 112, P 6. The parties do not challenge the ordinary meaning of the terms "individual" and "visual." Both are adjectival qualifications placed on the structure connoted by the term "indicator," that narrow the scope of that structure. These functional limitations do not make the structure connoted by the term "indicator" any less definite, such that section 112, P 6 applies. Rather, the limitations make the structure more definite by restricting the "indicator" to visual embodiments such as a light, dial, or flag. See Personalized Media, 161 F.3d at 705; Apex, 325 F.3d 1364, 2003 WL at *7.

Universal seeks to limit the term "individual visual indicator" to "a light at each location on the assembly machine for a compartment." This definition impermissibly limits the term "individual visual indicator" to one possible embodiment, ignoring the various types of visual indicators suggested by the technical dictionary definitions of "indicator." This court adopts plaintiffs' construction of the term "individual visual indicator."

B. "An Induction Heatable Element"

The parties next dispute the proper construction of the term "an induction heatable element" from the claims of the '585 Patent. TSI seeks to construe the term to mean a structure or portion of a structure that is made of a material capable of being magnetically heated. Defendants argue for the following construction: an inductively heatable metallic alloy: (i) having a Curie point temperature below the pre-selected regulation temperature causing the alloy's load impedance to change significantly over the temperature range it experiences; and (ii) being a distinct structure enclosed within the food delivery container such that the alloy does not contact the food in said container.

Based on its proposed construction, TSI defines "induction heatable" as being "capable of being magnetically heated." At the hearing before the Court, defendants stated that they agreed with that definition of "induction heatable." Therefore, the Court will include that definition in its construction of "an induction heatable element."

TSI appears to define "element" as "a structure or portion of a structure," while defendants substitute "structure" for "element" in their construction. Neither side has supported that part of their construction with any citation to intrinsic or extrinsic evidence of the meaning of "element" here. Nor have the parties explained why the word "element" needs further definition or would not be understood by a person schooled in the relevant art. Accordingly, the Court declines to define the word "element" as used in the claim terms.

Defendants also seek to add the following four limitations in their construction of "element": (1) the element is a metallic alloy, (2) with a Curie point temperature below a pre-selected regulation temperature, (3) that is a distinct structure (4) enclosed within food delivery container so as not to contact the food. Again, defendants cannot identify any disclaimer or disavowal of claim scope to support these limitations, and thus they rely solely on application of the Microsoft standard.
The parties' primary dispute is whether the element must be separate and distinct from the "object" or whether the element can be a non-separable part of the object to be heated. (TSI apparently claims that a layer within defendants' cookware infringes the patent on this basis.) Defendants argue that the specification shows that the invention's "element" is distinct and separable from the container (the "object"). Defendants cite to various portions of the specification in which the thermal device is described as being "within" or "in" the container or the container is described as being "equipped with" the thermal device. See '585 Patent at 1:11-16, 2:4-26, 2:18-22, 2:65-67, 5:24-26. Those descriptions, using "within" or "equipped with", do not necessarily require a separate element or exclude a container containing the thermal device "within" it as a part of the container, however. Nor does the reference to a "lightweight" container, see id. at 2:10-11, clearly require a separate, non-included element. The specification's figures that show containers with recesses or velcro for holding the element in place, cited by defendants, represent mere embodiments and do not describe the invention as a whole as requiring a separate and distinct element. See id. at 7:11-21, 12:2-6, 12:59-61. Thus, the specification does not repeatedly and consistently describe the invention as having this limitation urged by defendants. 4

4 Defendants also cite to the provisional application for the '585 Patent, which states that the energy source is not in contact with the pizza box or pizza, but those descriptions refer to mere embodiments and not necessarily the invention as a whole. The Court also rejects defendants' argument based on inventor Clothier's description of the '585 Patent in another patent, for a number of reasons: in citing the '585 Patent, Mr. Clothier stated that one method was to insert or incorporate the heat-retentive body into the container, and thus he did not limit his '585 Patent invention to a system with an element separate from the container; Mr. Clothier was not really defining the scope of the '585 Patent's claim in the other patent; and defendants have not shown that the other patent is related to the '585 Patent. See Ormco Corp. v. Align Technology, Inc., 498 F.3d 1307, 1314 (Fed. Cir. 2007) (statements in familial patent applications may be relevant), cert. denied, 128 S. Ct. 2430, 171 L. Ed. 2d 230 (2008).

Accordingly, the Court concludes that defendants have not shown that this term should be construed with the limitation of an element distinct and separate from the food container under the Microsoft standard. Nor have defendants adequately supported their other urged limitations with citations to intrinsic or extrinsic evidence. The fact, noted by defendants, that the specification never discusses any contact between the element and the food certainly does not constitute a clear disclaimer of scope or a consistent and repeated description of the invention with that limitation. Defendants do not offer any argument or citation to the record to support the other two limitations urged in their construction. Therefore, the Court rejects all of the limitations included in defendants' proposed construction.

The Court construes the term "an induction heatable element" from the '585 Patent to mean an element made of a material capable of being magnetically heated.

1. "Infinitely Adjustable" (claims 5 and 7).

Claim 5 states that the "connection means has adjustment means thereon for infinitely adjusting the tracking of the mower by adjusting the output" of one of the hydraulic pumps, all without stopping the mower. Filing No. 61, Defendants' Index of Evid., Ex. D, '961 Patent, col. 7, lines 1-5 (hereafter, '961 Patent). Claim 7 states that the "connection means include[s] adjustment means for infinitely adjusting the tracking of the mower by adjusting the output" of one of the hydraulic pumps. Id., col. 8, lines 27-30.
Toro argues that this "infinitely adjustable" language creates a means-plus-function element under 35 U.S.C. § 112, P 6. When an element in a claim is "expressed as a means or step for performing a specified function" without reciting supporting structure, material, or acts, then the element "cover[s] the corresponding structure, material, or acts described in the specification and the equivalents thereof." 35 U.S.C. § 112, P 6. Use of the term "means" in a claim creates a presumption that the means-plus-function limitation applies. Al-Site Corp. v. VSI Intern., Inc., 174 F.3d 1308, 1318 (Fed. Cir. 1999). The presumption is overcome, however, "if the claim itself recites sufficient structure or material for performing the claimed function." Id.

Toro maintains that the corresponding structure that performs the function of "infinitely adjusting" the mower's tracking is detailed in the patent's specification, which states:

Adjustment knob 120 is threadably mounted on the upper end of control rod 94. . . . Although it is preferable that an adjustment knob 120 be utilized, adjustment knob 120 could be replaced by other suitable means which would permit the length adjustment of the control rod 92, with respect to arm 56, without the use of tools.

'961 Patent, col. 3, lines 56-58, 60-64. Toro says that the adjustment means is therefore defined as a knob or other device that can be manually adjusted without tools during mowing. The term "infinitely adjusting" relates to the movement of the adjustment mechanism between two limits. . . . The adjustment knob can be stopped at any position between the stop limits set in the specific example of the preferred embodiment by swivel 114, nut 104 and compression spring 108." Plaintiffs' Markman Brief at 14-15. Accordingly, Toro states, "infinitely adjustable" should be defined as "full movement in clockwise and counterclockwise directions of an adjustment member that can be readily adjusted manually." Id. at 15.

Scag contends, however, that for a means-plus-function limitation to apply, a claim element must contain a definite, specific structure that will perform the function -- not merely state that the patent will cover any structure that might perform the function. The statement in the specification that the adjustment knob could be replaced by "other suitable means," none of which are defined or even described in the specification, would, according to Scag, preclude application of the means-plus-function limitation. 4

4 Scag contends, moreover, that the "other suitable means" language of the claim would encompass the adjustment means on Exmark's prior art. According to Scag, the only difference between the adjustment means on the two mowers is the replacement of a jamb nut on the earlier mower with patent '961's "adjustment knob threadably mounted on the upper end of the control rod." Given the interchangeability of the adjustment means mechanism, Scag believes the proper interpretation of the claim term "infinitely adjustable" would allow adjustments "at any location along the threaded portion of the control rods of the invention," Defendants' Markman Brief at 11, whether by the jamb nuts, the adjustment knob, or some "other suitable means." Thus, Scag maintains, the prior art adjustment means must also have been infinitely adjustable.

Toro disputes that the jamb nuts of the prior art fall within the adjustment means elements of claims 5 and 7. Since jamb nuts are not described in the specification, Toro contends the jamb nuts cannot be corresponding structures covered under section 112, P 6. Moreover, since jamb nuts cannot be adjusted without tools, they cannot be equivalents of the adjustment means described in claims 5 and 7.

I find that this dispute is outside the confines of a Markman hearing and need not be resolved at this time. Determining whether the claim term "infinitely adjustable" includes prior art would require the court to reach the ultimate issues of the patent's validity or infringement. Like other issues discussed below, this dispute can be better resolved in motions for summary judgment or at trial.

The court concludes that Scag's position is correct. The specification does not limit the adjustment mechanism on the mower to an "adjustment knob," but instead concedes that the function of the adjustment knob could be accomplished "by other suitable means." Since those other suitable means could conceivably take a number of forms, the means-plus-function limitation of § 112, P 6 cannot apply. Accordingly, the court finds that the term "infinitely adjustable" means that the

- 2565 -
tracking adjustment can be made at any location along the threaded portion of the control rods of the invention with full
movement in clockwise and counterclockwise directions of an adjustment member. 5

5 This definition pointedly does not address whether the adjustment is to be made manually, without the aid of tools, or
while the mower is in motion.

4. Inert Gas Atmosphere

The fourth disputed claim term "inert gas atmosphere" is found in Claims 1 and 35 as set forth above.

Erbe's Proposed Definition: A cloud of inert gas formed by a not directed, nonlaminar flow of inert gas.

Canady's Proposed Definition: A gas cloud, i.e., the rather small space between the electrode and the tissue to be
coagulated is completely filled by an inert gas cloud in order to remove air, but not in order to perform a substantial
mechanical action to fluid at the tissue.

(Docket No. 42, p. 3). Interestingly, the parties both generally define the term "inert gas atmosphere" as a cloud of gas. Id. I
agree with Erbe that the term should also include the qualifying term "inert." Beyond that, however, I find that Erbe is
attempting to read limitations into the term from the specifications, which is not permitted. Phillips, 415 F.3d at 1323.
Canady, on the other hand, defines the term and then attempts to define it more specifically, which I find to be duplicative
and unnecessary. Consequently, I construe the claim term "inert gas atmosphere" to mean a cloud of inert gas.

2115

A.

As noted above, the district court interpreted the claim term "inflation input" to mean the point at which air enters the
passageway. On appeal, as they did in the district court, defendants argue that, in addition to being the point at which air
enters the passageway, the inflation input must be the end of the coupling that is most distal from the end of the inflatable
body. They base this construction on the argument that claim 9 and claim 12 of the '726 patent specify that the valve for
controlling the transfer of air must be "disposed between the interior [of the inflatable body] and the inflation input." As a
result, defendants reason, the inflation input must be above or below, and not within, the valve. Hence, according to
defendants, this means that the inflation input must be the end of the coupling that is most distal from the end of the
inflatable body. 4 Aero responds that the district court's construction of "inflation input" in claim 9 is correct because the
plain language of claim 9, as well as the supporting specification and drawings, teach that the "inflation input" is "the place
where air enters the passageway."

4 Defendants appear to assert that there would be no infringement under their proposed construction of "inflation input"
because the top of the short inner cylinder in the accused Intex device, see the above drawing of the accused device, where
air enters, is within the valve, rather than at the top of it, as the claims require. Thus, so the argument goes, there is no
infringement because, in the valve of the accused Intex mattress, the "inflation input" is not at the coupling that is most
distal (furthest away) from the end of the air mattress.
Claim 9 of the '726 patent claims "an inflatable support system" that comprises an inflatable body having an interior, an exterior, and an inflation input for transfer of air between the interior and exterior. '726 patent, col. 10, ll. 48-50. Claim 9 states that the inflatable support system has "a one-way valve, disposed between the interior and the inflation input, for controlling the transfer of air" and that the valve includes "a passageway having a general circular cross section and a first end in communication with the interior and a second end in communication with the inflation input." Id., col. 10, ll. 51-58. The claim further states that the inflatable support system has "a generally circular coupling defining the passageway, the coupling having an open end defining the inflation input and a flared end, contiguous therewith, providing the circular lip, so that (i) the coupling at the open end has a smaller internal diameter than at the flared end and (ii) the diaphragm can be pushed axially to open the valve by reaching into the open end of the coupling." Id., col. 11, ll. 4-11. This is most clearly illustrated in Figure 15 of the '726 patent. Claim 12 of the '726 patent claims "an inflatable body" that comprises "an inflatable bladder having an interior and an inflation input." Id., col. 11, ll. 27-29. Claim 12 further states that the "inflatable body" comprises "a one-way valve disposed between the interior and the inflation input," as well as "a passageway having a generally circular cross section and a first end in communication with the interior and a second end in communication with the inflation input." Id., col. 11, ll. 30-31, 34-37. We see nothing in the language of claims 9 and 12 that limits the term "inflation input" to anything other than "where air enters the passageway." Moreover there is certainly nothing in the claim language that limits the location of the inflation input to the end of the coupling that is most distal from the end of the inflatable body, as urged by defendants. 5

5 We see no error in the district court's construction of the term passageway ("a way that allows a passage of air to and from the interior of the bed"), which defendants do not challenge on appeal. See Markman Order, 2004 U.S. Dist. LEXIS 1202, at *12.

The specification further supports this conclusion. Figures 3, 15, and 17 demonstrate possible embodiments with inflation inputs. Id., figs. 3, 15, & 17. These embodiments do not require a definition of "inflation input" that limits the location other than to "where air enters the passageway." Indeed, all three of the figures show the inflation input as a place where air enters the passageway. The rest of the specification also supports this interpretation, as it explains that "[i]nflation is provided to the mattress [] by means of the inflation input . . . ." Id., col. 3, l. 68, to col. 4, l. 2. Finally, there is nothing in the prosecution history that would alter this meaning.

In sum, the claim language, the specification, and the prosecution history support the district court's construction of the term "inflation input." Accordingly, we will not disturb that construction. 6

6 We reject defendants' claim that the district court erred by construing the term "inflation input" in light of the accused device. There is no basis for the argument that the district court improperly relied on the accused device. Although the court revealed an awareness of the accused device, the court's awareness of the accused device is permissible. See Wilson Sporting Goods Co. v. Hillerich & Bradsby Co., 442 F.3d 1322, 1326-27 (Fed. Cir. 2006) ("While a trial court should certainly not prejudge the ultimate infringement analysis by construing claims with an aim to include or exclude an accused product or process, knowledge of that product or process provides meaningful context for the first step of the infringement analysis, claim construction."); Scripps Clinic & Research Found. v. Genentech, Inc., 927 F.2d 1565, 1580 (Fed. Cir. 1991) ("Of course the particular accused product (or process) is kept in mind, for it is essential to focus on the construction of only the disputed elements or limitations of the claims.").

Defendants also argue that the district court amended its claim construction because the court refused to allow defendants to argue to the jury that, in the accused device, the top of the tall outer cylinder was the "inflation input" and "open end" of the coupling. We do not agree. During trial, Intex was prohibited from rearguing the claim construction or attempting to use the naked language of the claims--instead of the district court's claim construction. Thus, when counsel for Intex addressed infringement by referring to the claim language, instead of the court's claim construction, the district court warned him that "I've now construed the claim and asking questions which would suggest that my construction is somehow at variance with
the claim is unfair." The court did not stop defendants from discussing infringement or referring to the court's construction. In short, we do not read the colloquy between counsel and the district court as evidence of a revised claim construction of "inflation input" at trial.

D. "inhibiting compression"; "such that compression of said fork is inhibited"

I have already determined that "compression" requires no further construction. The disagreement with respect to these phrases centers on the words "inhibiting" and "inhibited." Both parties argue a plain meaning interpretation; Fox for "prohibit" and SRAM for "restrain." "Inhibit" is used to describe the state of the suspension system when fluid is not permitted to freely flow from one part of the system to another, thus not permitting compression. Fluid flow can take place under certain circumstances, however; it is not completely prohibited, merely limited or restrained. To the extent "inhibit" requires construction, these phrases should be read as "restraining compression" and "such that compression of said fork is restrained."

2117

Claim 31 continues:

and an injection port communicating with the interior of the chamber for admitting fluid into the chamber to expand the chamber.

The parties agree that the injection port has an opening connected to the interior of the chamber that allows fluid to enter the chamber. The court finds that this limitation means "a sealable opening, located either remote from or in the flexible wall means, connecting to the interior of the chamber allowing the entrance of fluid into the chamber to expand the chamber."

2118

(a) "An injector"

Claim 1 includes the following element "an injector for transporting protons from the source to the accelerator." (Rosenberg Decl. Ex. 1, '287 Patent at 14:7-8.) Plaintiff Optivus sites general dictionaries and technical treatises in support of its construction. (Optivus P.&A. at 9:14-10:9.) Plaintiff defines the term "injector" quite broadly as "an apparatus that introduces or feeds protons from the source to the accelerator." (Id. at 10:11-14.) Defendant Ion Beam, on the other hand, insists on a much narrower definition - limiting the term "injector" to a certain type of injector. (See, e.g., Lennox Decl. P 15.) Ion Beam proposes this element be construed to mean "a device for transporting protons from the source to the accelerator, such as a radio frequency quadrupole linear accelerator ("RFQ Linac"), that increases the energy of the protons emerging from the source to the initial energy required by the accelerator before the protons are introduced into the accelerator." (Ion Beam P.&A. at 4:5-9.)

In support of its construction of the term "injector," Plaintiff provides the following definitions from general, non-technical dictionaries: (1) "a person or thing that injects," (2) "to force (a fluid) into a passage, cavity or tissue"; and (3) "to place into orbit, trajectory, or stream." (Optivus P.&A. at p. 9; Airhart Decl. Ex. H, Random House Dictionary; and Ex. I, Webster's II New Riverside University Dictionary.) Because these definitions are quite broad, the court turns to the technical treatises supplied by the parties. Optivus offers the following passage from the definition of the term "cyclotron": "Particles are injected near the centre of an evacuated space between two D-shaped boxes placed between the poles of a stronger permanent magnet." (Airhart Decl. Ex. J, Dictionary of Physics at 163.) The quoted passage is taken from a more lengthy definition of the term "cyclotron." (Id.) While the passage states "[p]articles are injected," it does not describe the term
"injector," or the device that does the injecting. (See id.) The passage provides context but does not precisely define the term "injector." (See id.)

Both parties also rely on a passage taken from a learned treatise, authored by Dr. John J. Livingood, describing an "Alvarez type (1946)" accelerator ("Livingood Treatise"). (Id. at Ex. K, John J. Livingood, Principles of Cyclic Particle Accelerators (D. Van Nostrand Co., Inc. 1961) at p. 167; and Rosenberg Decl. Ex. 14.) The Livingood Treatise describes early forms of particle accelerators, including the "Alvarez type (1946)" accelerator and concludes that "Alvarez type" accelerators are "also employed as an injector, that is, as an auxiliary device to give the necessary initial energy to projectiles before they are introduced into the main accelerator known as a synchotron." Id. Defendant's expert, Dr. Lennox, relies on that passage, among others, to support her proffered construction of the term "injector." (Lennox Decl. at P 19:24-28.)

Dr. Lennox initially defines the term "injector" as "a device designed to increase the kinetic energy of the protons after emerging from the proton source to the initial kinetic energy required by the accelerator before the protons are introduced into the accelerator." (Lennox Decl. at P 14.) However, Dr. Lennox and Ion Beam suggest the term "injector" should be further limited to the following definition: "a device for transporting protons from the source to the accelerator, such as a radio frequency quadrupole linear accelerator ("RFQ Linac"), that increases the energy of the protons emerging from the source to the initial energy required by the accelerator before the protons are introduced into the accelerator." (See Ion Beam P.&A. at 4:5-9; Lennox Decl. at P 15.) Dr. Lennox cites a series of articles, including an article authored by Plaintiff Loma Linda, to support this construction. (Rosenberg Decl. Ex. 17, Loma Linda University Medical Center, Proton Therapy Facility Engineering Design Report (Feb. 1987)). Dr. Lennox takes special note of the following passage taken from the article authored by Loma Linda: "The source of protons is a 40-KeV duoplasmatron. The 40 Kev beam passes through a solenoidal focusing system and is injected into a 1.7-MeV radiofrequency quadrupole linear accelerator (RFQ) operating at 425 MHz." (Rosenberg Decl. Ex. 17 at p. 422.) 5 Similarly, in a paper cited by Dr. Lennox and entitled Proceedings of the 1987 IEEE Particle Accelerator Conference (Id. at Ex. 18), the patent applicants stated ["a]s injector we chose an RFQ linac." (Id. at p. 1985.) 6

5 Academic articles do not necessarily qualify as "treatises" as that term is used by the Federal Circuit. A simple internet search will return thousands of articles, published and unpublished, on the claim term at issue here. This sort of material is best classified as "extrinsic" information, unless it could be elevated to some sort of canonical text or treatise that might have been used by the relevant person in the art.

6 Dr. Lennox points out that Dr. James Slater of Loma Linda authored an article in 1988 wherein he described the technology: "The source of protons is a 40 KeV duoplasmatron. The 40 KeV beam passes through a solenoid focusing system and is injected into a 2 MeV radiofrequency quadrupole linear accelerator (RFQ) operating at 425 MHz. At 2 MeV the beam is transported to the synchotron by a transport system that includes a debuncher to reduce momentum speed. (Lennox Decl. P 23; quoting Rosenberg Decl. Ex. 20 at p. 765.) Dr. Lennox cites the article to support her opinion that the term "injector" should be defined as the type of injector that increases the kinetic energy of a proton beam. (Lennox Decl. P 23.) As noted, similar information is supplied by the patentee on the face of the '287 patent itself. The '287 patent states "the source 10 comprises a duoplasmatron ion source providing a 40 KeV proton beam. The beam is focused by solenoidal lenses at 48 to match the beam into a radiofrequency quadrupole linear accelerator (RFQ) 50. The RFQ accelerates protons to 1.7 MeV for transmission to a debuncher 52 through a quadrupole 54. The debuncher functions to reduce the momentum spread of the beam . . . to approximate the design momentum spread of the beam for injection into the accelerator." (Rosenberg Decl. Ex. 1, the '287 patent at 3:27-35.)

While Dr. Lennox' efforts are appreciated, most of this information is referenced in the '287 patent summary itself. (See, e.g., id. at Ex. 1, the '287 Patent at 3:19-25.) In the description section of the '287 patent, the patentees plainly state their preference for an RFQ accelerator. (Id.) In other words, Dr. Lennox and Ion Beam invite the court to consult the written description or in the alternative, purely extrinsic information, as a threshold step in the claim construction process in order to narrow the claims, and thereby invite a violation of Federal Circuit precedent. See, e.g., Texas Digital Sys., 308 F.3d at 1204. The court declines their invitation.
The term "injector" is not limited or qualified by any language in the claims section of the '287 patent. (Rosenberg Decl. Ex. 1, '287 Patent at 14:7-8.) The court does not find it appropriate to import a limitation from the written description of the patent, or otherwise limit the scope of the patent based on expert testimony of Dr. Lennox. The court notes that the claim terms "source of protons" and "protons from the source" are equally broad as the claim term "injector." (See id. at 14: 5 & 14:7-8.) However, neither party is suggesting the claim term "source" be limited to mean "a duoplasmatron ion source providing a 40 KeV proton beam" as described in the specification. There is nothing in the plain meaning of the claim terms to suggest the term "injector" should be limited as Defendant suggests. Indeed, literature cited by Dr. Lennox indicates there are many different types of injectors. (See, e.g., Rosenberg Decl. Ex. 16, Proceedings of a Medical Workshop on Accelerators for Charged Particle Beam Therapy at p. 414.) 7 But there is nothing in the claim terms indicating that the general term "injector" should be limited to the specific type of injector suggested by Dr. Lennox and Ion Beam.

7 Plaintiff's rebuttal expert, Dr. Lundy, confirms this point: "Injectors come in many different sizes and types. Injectors can be large facilities or they can be small devices." (Lundy Decl. at P 22.) Moreover, the court notes the Livingood treatise stated an Alvarez type accelerator could be used as an injector, but presumably not for a proton therapy system. (See Rosenberg Decl. Ex. 14, at p. 167.) This confirms there is more than one kind of injector.

In the court's view, it would probably be error to restrict the claim term in the manner suggested by Defendant. As the Federal Circuit stated in Renishaw PLC v. Marposs Societa' Per Azioni, 158 F.3d 1243, 1249: "[W]hen a claim term is expressed in general descriptive words, we will not ordinarily limit the term to a numerical range that may appear in the written description or in other claims. . . . Nor may we, in the broader situation, add a narrowing modifier before an otherwise general term that stands unmodified in a claim." The Renishaw court included a very instructive explanation important to the construction of the claim term "injector" in the '287 patent:

For example, if an apparatus claim recites a general structure (e.g., a noun) without limiting that structure to a specific subset of structures (e.g., with an adjective), we will generally construe the claim to cover all known types of that structure that are supported by the patent disclosure. See, e.g., Va. Panel Corp. v. MAC Panel Co., 133 F.3d 860, 865-66, 45 U.S.P.Q.2d (BNA) 1225, 1229 (Fed. Cir. 1997) (claim term "reciprocating" is given its ordinary meaning and not limited to mere linear reciprocation); Sjolund v. Musland, 847 F.2d 1573, 1581-82, 6 U.S.P.Q.2d (BNA) 2020, 2027 (Fed. Cir. 1988) (refusing to limit claim term "baffle" to only rigid baffles and term "panel" to only panels of lattice construction).

Renishaw, supra, 158 F.3d at 1249 (emphasis added). The Federal Circuit in Renishaw, stated two important canons of claim construction: (a) the court "may not read a limitation into a claim from the written description, but (b) one may look to the written description to define a term already in a claim limitation, for a claim must be read in view of the specification." Id. at 1249. A patent applicant may also elect to be a lexicographer by providing an explicit definition in the specification for a claim term. Id. However, if a patentee "has chosen to be his or her own lexicographer," she must clearly set forth an explicit definition for the claim term. See, e.g., Johnson Worldwide Associates, Inc. v. Zebeco Corp., 175 F.3d 985, 990 (Fed. Cir. 1990.)

Comparing Figures 1 and 2, as well as the patent specification, it appears the patentees preferred using a "radiofrequency quadrupole linear accelerator" as an injector. (Compare id. at 2:38-40; 3:25-41; Figures 1 & 2.) The patentee also included a more general description of the technology at issue. (Id. at 2:35-60, and Figs. 1 & 2.) The patentees did not clearly express in the specification their intent to define or limit the term injector to the parameters suggested by Ion Beam. (See id. at 3:27-33.) Accordingly, as in Renishaw, 158 F.3d at 1249 the court adopts a broader definition of the term "injector" and hereby defines the term as "an apparatus that introduces protons from the proton source to the accelerator." (See Rosenberg Decl. Ex. 14 at p. 167; Ex. 17 at 422-23; Ex. 1, the '287 Patent at 15:7-9; and Airhart Decl. Ex. H, Random House Dictionary; and Ex. I, Webster's II New Riverside University Dictionary.)

As Dr. Lundy points out, there are many different kinds of accelerators, including accelerators that feed a non-accelerated beam into an accelerator. (Lundy Decl. at PP 22, 24 & 25, and Ex. 4.) 8 The court declines to introduce any limitation, based on extrinsic information or the '287 patent description, on the type of injector claimed by the patentees. There is nothing in the text of the claim terms to suggest the claim term "injector" should be limited to a type of injector that provides an
increase in kinetic energy.

8 Furthermore, it is possible to describe a "A 15 mA, 15 keV, proton Duoplasmatron source" as an injector. See, e.g., http://www.barc.ernet.in/btdg/appd/ion.html; see also Robinson and Hamm, Flourine 18 Production, (1997) at 3. This would seem to indicate that an injector, by definition, does not necessarily add kinetic energy to particles emitted from a duoplasmatron ion source. See also http://www.barc.ernet.in/webpages/organization/appd/microwave_ion_source.htm (stating "A 15 mA, 15 keV, proton Duoplasmatron source was developed as an injector to the Radio Frequency Quadrupole (RFQ) Linac.") By comparison, the '287 patent states "the source 10 comprises a duoplasmatron ion source providing a 40 keV proton beam." (Rosenberg Decl. Ex. 1, the '287 Patent at 3:27-35.)

2119

I.

The '957 patent discloses an ink jet printer with an improved ink sprayhead design. The improved sprayhead prints an image and its mirror image on opposite sides of a substrate. This dual-sided mirror image technique facilitates the printing of backlit signs and billboards. With ink applied to both sides of a substrate, backlit signs do not appear washed out when illuminated.

The claimed ink sprayhead design features one pressurized air source to control ink delivery onto the substrate and a second low-volume, high pressure air source to continuously clean the ink nozzle during printing. The prior art ink sprayheads, including those of the '522 patent, contain only a single, pulse-width modulated air source for delivery of the ink to the substrate and lack a second, high pressure air source for cleaning the nozzles.

According to the '957 patent, the second air source facilitates continuous printing of large signs without color variations or clogging of the nozzles. The '957 patent states that the prior art (specifically the '522 patent) "is incapable of producing an enlarged image having the desired color scheme" because it lacks this second, high pressure air source. Col. 2, ll. 33-36. See also, col. 2, ll. 10-22. Both the dual-sided mirror image printing technique and the dual air source ink sprayhead are novel features of the '957 patent. Claim 1, the only independent claim in the '957 patent, claims:

1. An apparatus for reproducing an image on a first side of a substrate and a mirror image on a second side of said substrate, comprising:

   a frame;

   means for generating control signals representative of said image;

   ink delivery means positioned on opposite sides of said substrate, said ink delivery means fluidly communicating with an ink source;

   means mounted on said frame for supporting said ink delivery means;

   means mounted on said frame for driving said ink delivery means relative to said substrate; and

   means, responsive to said control signals, for controlling said ink delivery means to produce said image on said first side of said substrate and said mirror image on said second side of said substrate.

(emphasis added)

As required by statute, the magistrate interpreted these means-plus-function elements by referring to the structure described in the patent.
in the patent specification for performing the recited functions. See 35 U.S.C. § 112, P 6 (1994). Specifically, the magistrate limited "ink delivery means" to an ink sprayhead containing a "second, high pressure air source." The magistrate primarily based this limitation on the background and summary of the invention sections of the '957 patent which distinguished the invention from the prior art, including the '522 patent. The '957 patent describes its improvement over the prior art by emphasizing its use of two air sources - one for applying the ink and one for removing excess ink from the nozzles. In particular, the '957 patent states explicitly that the ink delivery system of the '522 patent is "incapable of producing an enlarged image having the desired color scheme" because of its lack of a second air source for cleaning the nozzles. Col. 2, ll. 33-36. The magistrate therefore concluded:

By consistently describing its invention - in the Abstract, Background of Invention, Summary of Invention, and Detailed Description sections of the specifications - as one that solves the ink accumulation problem inherent in the prior art, the ink delivery means cannot be interpreted apart from the essential, cleaning, high-pressure air source.

Vutek's allegedly infringing printers use ink sprayheads identical to those embodied in the '522 patent and therefore contain only a single, pulse-width modulated air source. Consequently, based on the foregoing interpretation, the magistrate determined that Vutek's device did not literally infringe the '957 patent because it lacked the second, high-pressure air source required by the "ink delivery means" of claim 1.

Having found one element of the claim missing from the accused device, the magistrate could have concluded the literal infringement analysis. However, the magistrate proceeded to address the "means for generating control signals" and "means for controlling the ink delivery means." Because, as set forth below, this court agrees with the magistrate's finding concerning the lack of "ink delivery means" in the accused device, as required by claim 1 of the '957 patent, this court need not address the other means-plus-function claim limitations.

On Vutek's counterclaim against Signtech for infringement of its '522 patent, Signtech stipulated to infringement of the '522 patent, if valid. Signtech also stipulated to basic damages of $ 140,000 as part of the Pretrial Order. The magistrate determined that the '522 patent was valid and also found that Signtech had willfully infringed. The magistrate therefore trebled the damage award to $ 420,000 and added pre-judgment interest as well as costs and attorney fees. Those findings are not before this court on appeal. In its judgment, however, the magistrate's wording apparently awarded $ 420,000 enhanced damages in addition to the basic $ 140,000 damage award, stating that Vutek "is entitled to a basic damage award of $ 140,000 for infringement of the '522 patent, prejudgment interest . . . plus enhanced damages of $ 420,000 for [Signtech's] willful infringement." The parties have resolved this issue by agreeing that the $ 420,000 enhanced damages should include the $ 140,000 basic damage award, in accordance with the statutory requirements of 35 U.S.C. § 284 as interpreted by this court's case law.

The magistrate also entered a permanent injunction against Signtech "for any further infringement of the '522 patent." Signtech complains that the terms of this injunction violate Fed. R. Civ. P. 65(d) which provides specificity requirements for injunctions.

II.

The magistrate correctly interpreted the "ink delivery means" limitation of claim 1 of the '957 patent. Title 35 of the United States Code, section 112, P 6, states that

an element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding
structure, material, or acts described in the specification and equivalents thereof.

Typically, if the word "means" appears in a claim element in combination with a function, it is presumed to be a means-plus-function element to which § 112, P 6 applies. See Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1427, 44 U.S.P.Q.2D (BNA) 1103, 1109 (Fed. Cir. 1997); Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583, 39 U.S.P.Q.2D (BNA) 1783, 1785 (Fed. Cir. 1996). However, according to the language of the statute, § 112, P 6 governs only claim elements that do not recite sufficient "structure, material, or acts in support [of the means- or step-plus-function element]." 35 U.S.C. § 112, P 6. See Sage, 126 F.3d at 1427.

In this case, the claim element "ink delivery means" uses the term "means" in association with a function, namely "ink delivery." Although the phrase "means for" is not used, the phrase "ink delivery means" is equivalent to the phrase "means for ink delivery," because "ink delivery" is purely functional language. Furthermore, the claim does not recite disqualifying structure which would prevent application of § 112, P 6. The magistrate therefore correctly applied § 112, P 6 to the interpretation of this claim element.

The "ink delivery means" of the preferred embodiment described in the specification expressly includes a second, high pressure air source. Although patentees are not necessarily limited to their preferred embodiment, see Serrano v. Telular Corp., 111 F.3d 1578, 1583, 42 U.S.P.Q.2D (BNA) 1538, 1542 (Fed. Cir. 1997), interpretation of a means-plus-function element requires this court to consult the structure disclosed in the specification, which often, as in this case, describes little more than the preferred embodiment. Furthermore, although the magistrate looked to the structure of the preferred embodiment to help determine the scope of the "ink delivery means" element, the magistrate's interpretation did not rely solely on that part of the specification. In particular, the magistrate also looked to the background and summary of the invention sections of the specification which describe the improvements of the ink delivery means of this invention over the prior art (including the accused ink delivery structure of Vutek's '522 patent). These sections of the specification, in addition to the disclosure of the preferred embodiment, led the magistrate to conclude that the "ink delivery means" of claim 1 was limited to an ink sprayhead having a second, high pressure air source.

Specifically, the summary of the invention section of the '957 patent states that the invention "is capable of producing a sectioned image on the substrate in one continuous print because its sprayhead design prevents ink jet clogging." Col. 3, ll. 26-28. The specification attributes this unique capability to the invention's use of two separate air sources - one pulse-width modulated air source for controlling delivery of the ink to the substrate and a second low-volume, high pressure air source for continuous cleaning of the ink jets. See Col. 3, ll. 29-48. Additionally, in the background section, the specification of the '957 patent explains that "the design of the '522 patent is such that the ink accumulation is not prevented. The '522 patent does not solve the ink accumulation problem because it uses a single constant air pressure source." Col. 2, ll. 12-15. The '957 patent specification goes on to declare that "the system disclosed in the '522 patent is incapable of producing an enlarged image having the desired color scheme." Col. 2, ll. 34-36. The accused ink delivery structure in Vutek's printers is identical to the structure described in the '522 patent - a structure explicitly distinguished by the '957 patent.

By choosing means-plus-function language to recite the "ink delivery means" claim element, the patentee necessarily restricted the scope of this element to the structure disclosed in the specification and its equivalents. Furthermore, by stating that the accused structure was "incapable" of achieving the desired results of the invention, the patentee expressly excluded it as an equivalent of the disclosed structure. Because § 112, P 6 requires a court to interpret a means-plus-function claim according to the structure disclosed in the specification and its equivalents, the magistrate's limitations on claim scope, with reference to the preferred embodiment and the explicit disavowal of prior art structure, correctly construed the invention.

Hoping to rescue itself from this unfortunate predicament, Signtech points to a portion of the '957 patent specification describing an alternative "ink delivery means" (shown in Fig. 8) which does not include the second, high pressure air source. See col. 10, ll. 30-47. This alternative embodiment is significantly different than Vutek's accused device, however. Specifically, the ink sprayhead embodiment of Fig. 8 uses a single constant air flow and a pulse-width modulated ink flow to control delivery of the ink to the substrate. Vutek's accused device, on the other hand, uses pulse-width modulated constant pressure air flow to control ink delivery. Signtech's alternative structure is therefore so different from Vutek's accused device that no reasonable jury could find it an equivalent structure. Thus, even if this court interpreted the "ink delivery means" element of claim 1 to include this alternative embodiment, it would not cover the accused structure.

Signtech also points to the prosecution history in an effort to redeem its choice of claim language. Specifically, Signtech
identifies a species restriction requirement in the parent application of the '957 patent. During the prosecution of the application which became U.S. Patent No. 5,294,946 (the '946 patent) (parent application to the '957 patent), the patent examiner directed Signtech to select one set of claims from the following three possible inventions described in the application:

A. A single side ink jet printer with two pressure flows to propel the ink and maintain cleanliness of the nozzles, claims 1-6, 27-32.

B. A two side ink jet printer, claims 18-20.

C. A two side ink jet printer with two pressure flows to propel the ink and maintain cleanliness of the nozzles, claims 7-17, 21-26.

Signtech argues that the '946 patent embodied the election of species C, while the '957 patent was the result of a continuation application directed toward species B. Specifically, Signtech contends that it expressly included claim elements for the dual air sources in the '946 patent application but intentionally removed them from the claims of the '957 patent application. Therefore, Signtech argues, it is unfair to limit the claims of the '957 patent to an invention elected for prosecution in an earlier application when the examiner explicitly required separation into separate applications.

Although the prosecution history serves as a tool for claim interpretation, see In re Hayes Microcomputer Products, Inc. Patent Litigation, 982 F.2d 1527, 25 U.S.P.Q.2D (BNA) 1241 (Fed. Cir. 1992), the statutory requirements of 35 U.S.C. § 112, P 6 nonetheless apply to means-plus-function claims. The specification limits the meaning of means-plus-function claim elements; and in this case, the specification expressly limits the invention in the manner described previously.

Thus, this decision, like many others emanating from this court, see Sage, 126 F.3d at 1425, emphasizes the importance of careful language choices in the specification and, particularly, in the claims. To avoid having its claims limited to exclude the embodiments disclaimed in the specification, the claim drafter for this patent might have chosen language to avoid application of 35 U.S.C. § 112, P 6. Otherwise, assuming that no intervening statutory bars had arisen, Signtech could have filed a new application directed toward the species B invention without limitation in the specification or claims to the dual air sources. It did neither. Therefore, because of the statutory limitations governing the meaning of means-plus-function elements, courts must limit the scope of these claim elements to the corresponding structure disclosed in the specification and its equivalents. Signtech's arguments are therefore unavailing and this court affirms the magistrate's interpretation of the "ink delivery means."

The government also challenges the trial court's construction of the claim limitation "ink permeates through the sheet from said printed front surface to said back surface to provide the indicia in mirror image form on said back surface" that requires ink "on or at the back surface," appearing in all three asserted claims. The government asserts that the limitation requires permeation of the ink through the back surface of the top sheet. Paymaster replies that the limitation requires only penetration of the ink to the back surface such that the ink resides on the back surface of the sheet - not through the back sheet. We agree with the trial court's construction that ink must reside on or at the back surface of the sheet - but does not have to permeate through the back surface of the sheet.

In so construing this claim limitation during a hearing on summary judgment (of invalidity under the on-sale bar and of co-ownership), the trial court noted that, prior to claim construction, it had "met with the parties and received a list of those phrases and aspects of claims that were in dispute, and this was not one of them." During the summary judgment hearing, then, the court construed the limitation. "There is no question[ ] in my mind . . . that that claim . . . requires the ink to be on or at the back surface," While an argument could have been made that the government waived any disagreement with the court's construction, it was not made. Moreover, liability turns on the correctness of the construction. Hence, we will review
The claim language itself of the limitation "ink permeates through the sheet from said printed front surface to said back surface to provide the indicia in mirror image form on said back surface" supports the trial court's interpretation. While it is true that the claim limitation contains the term "through," this word cannot carry the government's argument. For example, claim 10 states that the ink permeates "through the sheet" - not "through the back of the sheet." Claim 10 further explains how far the permeation goes - "from said . . . front surface to said back surface." Thus, the ink travels to the back surface of the sheet - not through the back surface of the sheet. Thus, the claim language provides no support for the government's argument. Indeed, it refutes the argument.

The specification further bolsters the correctness of the trial court's construction. In the Description of a Preferred Embodiment, the written description discloses that the ink "permeate[s] from the upper to lower surface of the top sheet." '283 patent, col. 5, ll. 19-20. Later, the written description explains what "through the sheet" means and how far the ink must travel - "the ink permeates through the top sheet from its front surface to its back surface." Id. at col. 7, ll. 49-51 (emphasis added). In yet another instance, it teaches that the ink "permeate[s] through the paper sheet . . . from the front to the back." Id. at col. 7, ll. 56-57 (emphasis added). Thus, in each instance, the specification explains how far the ink permeate[s] - through the sheet, but only to the back of the sheet - not through the back of the sheet. Nor does the prosecution history require a different construction.

The extrinsic evidence of dictionary definitions supplied by Paymaster strengthens this distinction between "to" and "through" as well. "To" means: "in a direction toward," "reaching as far as," "to the degree or extent of," "towards a specific state," "in contact with," and "in front of." Webster's II New College Dictionary (2d ed. 1999) (emphasis added). These definitions indicate that "to" means something that has not penetrated through another thing, but rather something that travels "toward something" and "contacts" it to be "in front of" it. The government does not supply contrary definitions of "to" and does not offer any definitions of "through."

Moreover, the government's argument is impractical, for if the ink came out the back side of the sheet, it would smear the surface below. Therefore, it is difficult to understand how the government can expect us to accept its argument which lacks support in the claims, the written description, dictionaries, and practicality.

D. "inlet orifice"

Claim 1(a) of the 736 patent requires "first and second vacuum chambers separated by a wall, said first vacuum chamber having an inlet orifice therein." Claim 14(b) requires the "directing said ions through an inlet orifice in an inlet wall into said first space." Micromass contends that because the claims require that the inlet orifice must be in the first vacuum chamber, the inlet orifice must be the beginning of that part of the mass spectrometer held below atmospheric pressure. Put differently, Micromass is relying on its interpretation of "first vacuum chamber" as "the vacuum chamber proceeding all other vacuum chambers," and arguing that because the inlet orifice must be the inlet to the first vacuum chamber and because the first vacuum chamber must be the first chamber held below atmospheric pressure, the inlet orifice must be the inlet to the first chamber held below atmospheric pressure.

AB/Sciex contends that the term "inlet orifice" refers to "an orifice that provides an inlet into the claimed first vacuum chamber for the passage of ions and neutral gas molecules."

Micromass's proposed construction is unconvincing because it is premised upon its construction of "first vacuum chamber," which has been rejected by the court. Essentially, Micromass seeks a definition of "inlet orifice" such that if an empty vacuum chamber were to precede the ion guide (as in the Quattro Ultima), the "first vacuum chamber" could not possess both an inlet orifice and a rod set, as required by the claims of the patent. But the court has construed "first vacuum chamber" to mean "a vacuum chamber." Therefore, the ion guide vacuum chamber can be the "first vacuum chamber" and any preceding vacuum chamber does not alter this result. Thus, the "inlet orifice" to the "first vacuum chamber" need not be
the entrance to the first chamber held at less than atmospheric pressure. Instead, the court will adopt AB/Sciex's proposed construction, which is consistent with the court's earlier construction of "first" and "second."

Maxcess argues that the district court erred in its claim construction by failing to construe claim 1 as requiring a three-part sandwich structure, with an "inner body portion" between the top decorative layer and the layers of brown kraft paper. Maxcess contends that the "inner body portion" cannot consist of brown kraft paper and must have a single uniform appearance that contrasts with the decorative surface layer. Maxcess further contends that the claimed "integral contrasting border" must be formed solely by removing the edge of the decorative surface layer to expose the "inner body portion" to view.

Tate Access responds that the claimed "inner body portion" should not be limited to the three-part structure disclosed in the preferred embodiment and that the district court misconstrued "inner body portion" as requiring a "uniform appearance," which is a limitation found in dependent claim 2, not claim 1. Tate Access further contends that the district court's construction of the term "integral contrasting border" is essentially consistent with Maxcess's proposed construction, except that the district court's construction does not require that the inner body portion be exposed to view. Tate Access also argues that Maxcess is estopped from challenging the district court's claim construction because Maxcess is asserting a new claim construction that was not presented to that court, and because the court adopted the definitions of "inner body portion" and "integral contrasting border" that were proposed by Maxcess.

In interpreting claims, a court "should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1577 (Fed. Cir. 1996). Absent an express intent to impart a novel meaning, "terms in a claim are to be given their ordinary and accustomed meaning." Renishaw PLC v. Marposs Societa' Per Azioni, 158 F.3d 1243, 1249, 48 U.S.P.Q.2D (BNA) 1117, 1121 (Fed. Cir. 1998); Carroll Touch, 15 F.3d at 1577, 27 U.S.P.Q.2D (BNA) at 1840 ("The words of a claim are generally given their ordinary and accustomed meaning, unless it appears from the specification or the file history that they were used differently by the inventor.").

a) Inner Body Portion

As an initial matter, we do not agree with Maxcess's assertion that the term "inner body portion" must be construed as requiring a three-part sandwich structure. The ordinary meaning of the term "inner" does not require the "inner body portion" to be located in the middle of a three-part structure. Rather, given its ordinary meaning, the term "inner" merely denotes that the "inner body portion" is located inside or within the decorative surface layer. See, e.g., Webster's New World Dictionary 947 (3d ed. 1988) (defining "inner" as "located farther within; interior; internal [inner organs]").

This interpretation is supported by the specification. The abstract of the disclosure, for example, states that "the laminate is provided with a decorative exposed surface and an inner body portion rearwardly therefrom having a color contrasting with the decorative exposed surface," '491 patent, Abstract (emphasis added). 2 Similarly, the written description states that "rearwardly of the decorative paper, the floor covering material is provided with layers of material having a contrasting color with respect to the decorative paper." Id. at col. 1, ll. 63-65. Thus, in light of the specification, we conclude that the term "inner body portion" simply means the layers of laminated material that are located "rearward," i.e., below, the decorative surface layer, and that contrast in color with the decorative surface layer.

2 Aside from its appearance in the claims, the only other reference to an "inner body portion" is found in the abstract. However, as we have previously stated, in determining the scope of a claim, the abstract of a patent is a potentially useful source of intrinsic evidence as to the meaning of a disputed claim term. See Hill-Rom Co. v. Kinetic Concepts, Inc., 209 F.3d 1337, 1341 n.*, 54 U.S.P.Q.2D (BNA) 1437, 1440 n.1 (Fed. Cir. 2000).
We also do not agree with Maxcess that the "inner body portion" must have a single uniform appearance, and cannot consist of brown kraft paper. Claim 1 requires that the floor covering provide "an inner body portion having an appearance contrasting with the appearance of said decorative surface layer." Id. at col. 5, ll. 4-7 (emphasis added). Noticeably absent from the claim language is any requirement that the inner body portion have a single "uniform appearance," 3 or that it not consist of brown kraft paper. Rather, the claim merely requires that the inner body portion have an appearance that contrasts with that of the decorative surface layer.

3 The absence of a "uniform appearance" limitation in claim 1 is further emphasized by the presence of a "uniform color" limitation in dependent claims 2 and 5.

Our conclusion is further supported by the written description, which states that although the four backing layers immediately beneath the decorative layer may be black in color (as in the preferred embodiment), they "may also be formed of other colors, which should preferably contrast with the color of the decorative surface layer." Id. at col. 4, ll. 52-57. The written description also states that "it is desirable that these backing layers, even if formed of other colors, be uniform in their color." Id. at col. 4, ll. 57-59 (emphasis added). It, however, does not state that the entire "inner body portion" must be uniform in appearance, or that the "inner body portion" cannot consist of brown kraft paper. Moreover, we note that even in the preferred embodiment, "immediately below the lowermost layer of black paper 29 are several layers of brown paper 31 and 32." Id. at col. 3, ll. 28-30. We thus conclude that an "inner body portion" is not limited to a single uniform appearance, 4 and may consist of brown kraft paper.

4 While Maxcess argues that the use of the indefinite articles "a" and "an" in the specification requires that the "inner body portion" have a single color or appearance, this contention goes too far. As we have previously explained, it is generally accepted in patent parlance that "a" or "an" can mean "one or more." See, e.g., Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 977, 52 U.S.P.Q.2D (BNA) 1109, 1112 (Fed. Cir. 1999). In view of the embodiment disclosed in the specification, it is clear that this was the meaning intended by the inventors.

Maxcess alternatively argues that the claimed "inner body portion" cannot consist of only brown kraft paper because, in the preferred embodiment, the "integral contrasting border" is formed by exposing black paper layers while avoiding exposure of brown layers. See id. at col. 3, ll. 54-58. Although claims must be read in light of the specification of which they are a part, see Renishaw, 158 F.3d at 1248, 48 U.S.P.Q.2D (BNA) at 1120, it is improper to read limitations from the written description into a claim, see Kemco Sales, Inc. v. Control Papers Co., 208 F.3d 1352, 1362, 54 U.S.P.Q.2D (BNA) 1308, 1314 (Fed. Cir. 2000). Moreover, "although the specification may well indicate that certain embodiments are preferred, particular embodiments appearing in the specification will not be read into the claims when the claim language is broader than such embodiments." Id. Absent from claim 1 is any claim language precluding the inner body portion from consisting solely of brown kraft paper, or paper of any other color for that matter. See '491 patent, col. 5, ll. 4-11. We therefore agree with Tate Access that the claimed "inner body portion" is not limited to the specific structure disclosed in the preferred embodiment and thus may consist solely of brown paper. See id. at col. 3, ll. 21-30, Fig. 4.
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

in turn, forms the body of the sleeping bag. ('828 Patent, col. 1, lines 20-22; col. 2, lines 5-8.) Thus, the warmth-retaining means surrounds the inner cavity. Id. col. 1, lines 8-11; figs. 1, 4, and 5.

Relying on the figures included in the patent specification, Mountain Hardwear argues that the inner cavity is not clearly defined. (Def.'s Opp'n at 2; Motion for Partial Summary Adjudication by Mountain Hardwear, Inc. ("Def.'s MSJ") at 5-6, 8-9.) Mountain Hardwear's argument is premised on its argument that the drawings attached to the '828 patent do not show the elongated inner chamber prior to its being compressed by the elastic means. (Def.'s MSJ at 8.) Mountain Hardwear contends that the inner chamber must be defined as that having a "normal cross-sectional area;" only then, it argues, can the elastic means compress the inner chamber to reduce the cross-sectional area of that chamber. Id. at 9.

In order to conceptualize the function of the elastic means, one must consider the inner chamber as resting in an existing or relaxed state prior to a user entering the cavity. The cross-sectional area of the inner cavity in that existing state is that which is reduced to a compressed state through the functioning of the elastic means. The patent specification and claims make clear that the inner chamber is defined by the inner lining of the warmth-retaining means and that such inner chamber is compressed while the user is in the sleeping bag. The specification also makes clear, however, that the elastic members allow the inner chamber to expand or "deform" in order to follow the changes in the sleeper's position and without restricting the sleeper's movement within the bag. ('828 Patent, col. 3, lines 21-27 and lines 40-44.) The Court finds that the inner cavity is that which is formed by the inner lining of the warmth-retaining means, whether in a relaxed, compressed, or expanded state. The Court declines to read the words "normal cross-sectional area" into the patent claims.

4. Inner Portion

Finally, K-C seeks to define "inner portion" as "a portion inward and toward the center of the product, discrete from any channel or channel portion." In other words, it wants to clarify that the channel(s) do not comprise any part of the inner portion. The purpose for this reading is that Tyco may seek to assert an invalidity argument based on the inner portion of the Megison patent found in the prior art.

Tyco appears to concede that the channel(s) are distinct from the portions themselves, noting that such a reading would actually strengthen its claim that the channel must be a single, completely encircling channel. (It also notes that this question might best be left for the infringement stage.) In any event, there is ample support for K-C's interpretation. The channel is what defines the boundary between the inner and outer portion; as such, the inner portion does not also include the channel within its boundary. The plain text of the patent indicates that the channels are distinct from the inner portion, and I will accordingly adopt K-C's preferred construction.

* * *

2. "Inner portion" means "a portion inward and toward the center of the product, discrete from any channel or channel portion."

2. "inner sleeve"

<table>
<thead>
<tr>
<th>Disputed Term</th>

<tbody>
<tr>
<td>inner sleeve</td>
<td>a rigid structure disposed between the front end and the back end of the inner assembly having multiple optical fibers protected by the rigid structure</td>
<td>construed in accordance with its plain and ordinary meaning</td>
</tr>
</tbody>
</table>

The dispute over the construction of "inner sleeve" pertains to whether the inner sleeve must be a tube-like and rigid structure. FSI proposes that this phrase be construed as "a rigid structure disposed between the front end and the back end of
the inner assembly having multiple optical fibers protected by the rigid structure.” AOSI argues that this phrase should be construed in accordance with its plain and ordinary meaning (e.g., a tube or tube-like part fitting over or around another part, and fitting at least partially within another part).

FSI’s proposed construction of “inner sleeve” is inconsistent with the plain meaning of “sleeve” and is both too narrow and too broad in certain respects. For instance, the court finds nothing in the claims, specification, or prosecution history indicating that the “inner sleeve” must be a rigid structure. Consequently, the court refuses to read a rigidity requirement into the term as FSI suggests. At the same time, the plain meaning of “sleeve” suggests a tube or tube-like structure, and FSI’s construction does not require this. The drawings show the inner sleeve as a tube-like structure, and the court similarly finds that the “inner sleeve” is a tube or tube-like structure. See, Fig 15-16, 23. Accordingly, the court defines “inner sleeve” as “a tube-like structure disposed between the front end and the back end of the inner assembly having multiple optical fibers protected by the structure.”

3. Inner Spatial Volume

As set forth above, Claim 1 of the ’813 patent claims “an inner spatial volume disposed proximate the distal end of the catheter body member.” Claim 1 of the 204 patent also requires “an inner spatial volume disposed proximate to the distal end of the catheter body member.” The parties propose the following constructions:

* * *

The parties disagree about (1) whether the polymeric film wall must be distensible; and (2) whether the solid radionuclide must be spherical. In Xoft, the Court looked to the specifications of the ’813 and ’204 patents for a definition and concluded that “[i]n all embodiments … the boundary of the inner volume is either a polymeric film wall or the edge of a solid sphere.” Accordingly, the Court construed “inner spatial volume” as an inner volume that is “either enclosed by a polymeric film wall or defined by the outside surface of a solid radionuclide sphere.” SenoRx contends that the “inner spatial volume,” when defined by a polymeric film wall, must be further limited to a “distensible” polymeric film. With respect to the definition of an “inner spatial volume” that is defined by outside wall of a solid radionuclide, Hologic argues that the outside surface need not be spherical.

SenoRx supports its proposed “distensible” requirement by pointing to the specification of the ’204 patent for support. For example, the summary of the invention states: “In different embodiments, the inner spatial volume can be defined by a distensible polymeric wall containing radioactive source material . . . .” ’204 patent, col. 2:56-60. Different embodiments also describe distensible polymeric film walls. See id., col. 3:66-col.4:3. The ’813 patent also contains a distensible chamber. ’813 patent, Abstract; col. 3:39-41. Finally, SenoRx contends that non-distensible polymeric walls are not described in the patents and the inventors did not conceive of such an invention.

Hologic asserts that adding “distensible” improperly narrows the claim to a preferred embodiment. Additionally, the ’813 and ’204 patents both suggest use of non-distensible walls. For example, in describing the preferred embodiment, the patents recite that “[a]ffixed to the tubular body proximate to the distal end thereof is an inner spatial volume which may be defined by a generally spherical polymeric film wall.” ’813 patent, col. 2:33-36; ’204 patent, col. 3:57-59 (emphasis added). The specification does not say that the polymeric wall must be "distensible." Additionally, Hologic contends that the claims were broadened during prosecution to eliminate the "distensible" requirement. Ex. I at 1.2. The claims as originally filed recited that the "inner spatial volume is an inner closed, distensible chamber." The "distensible" requirement was subsequently removed so that the claim called for an "inner spatial volume" that "is an inner closed chamber." Finally, Hologic notes that the "distensible" requirement is a limitation only used in certain claims. For example, Claim 9 of the ’204 patent states “wherein the inner spatial volume is an inner closed distensible chamber defined by a further radiation transparent wall.” The intrinsic record does not support importing the limitation of the term "distensible" into the definition of "inner spatial volume." Accordingly, the Court does not construe the term to require "distensible" polymeric film walls.

SenoRx also contends that the radionuclide must be a sphere. SenoRx argues first that the only solid radionuclide described
in the '813 and '204 patents is a spherical one. For example, the '204 patent describes using a solid spherical radiation emitting material as the inner spatial volume. It specifically refers to radioactive micro spheres of the type available from the 3M Company of St. Paul, Minnesota as ones that could be used. '204 patent, col. 4:44-50. Similarly, the '813 patent states that "a solid spherical radiation emitting material" can be the "inner spatial volume." '813 patent, col. 2:56-63. SenoRx argues that because the inventions generally use a spherical outer balloon, the radionuclide must be spherical to preserve the constant spacing between the inner volume and outer and yield a uniform radiation profile. If a non-spherical radionuclide were enclosed in an outer volume of the same shape, SenoRx asserts that the dose distribution would still be non-uniform because of the greater self-absorption of a solid non-spherical radionuclide in a longitudinal direction than in other directions. Orton Decl. P 24.

Hologic contends that the radionuclide does not need to be spherical. Hologic asserts that the intrinsic evidence supports its position. For example, the patents state that "[i]t is not essential to the invention that the chambers 30 and 34 [the inner and outer volumes] have spherical walls . . . ." '813 patent, col. 3:9-10; '204 patent, col. 5:13-16. Additionally, the patents describe radioactive particles as solids. See '813 patent, col. 3:3; col. 4:6-7. Hologic also points to Claim 13 of the '813 patent as evidence that the patentee could impose a spherical limitation but chose not to.

Each expert asserts that one of ordinary skill in the art would support his understanding of the shape of the solid radionuclide. Dr. Orton suggests that a person of ordinary skill in the art would know that a non-spherical source would yield a non-uniform dose distribution. Orton Decl. P 24. Dr. Verhey, on the other hand, states that a person of ordinary skill in the art would know that "in a typical brachytherapy procedure using a solid radionuclide, the radionuclide is not necessarily spherical in shape and does not need to be." Verhey Decl. 3:27-4:1

The intrinsic evidence shows that spherical radionuclide solids were contemplated, not required. Furthermore, Dr. Orton's testimony concerning the ordinary skill in the art is hard to square with the pill-shaped inner volume in Figure 3 of the '813 patent, which would seemingly be subject to the same longitudinal self-absorption -- and resulting non-uniform dose profile -- as a non-spherical radionuclide solid.

The Court adopts Hologic's proposed definition of "inner spatial volume": "a region of space surrounded by an outer spatial volume and either enclosed by a polymeric film wall or defined by the outside surface of a solid radionuclide."

"Inner spatial volume"
Cytyc's proposed construction A region of space surrounded by an outer spatial volume that is defined by a closed inflatable chamber
Xoft's proposed construction Inner balloon in two-balloon device or spherical solid radionuclide in one-balloon device

The summary of the invention provides that

it is possible to deliver a desired radiation dose at a predetermined radial distance from a source of radioactivity by providing a first spacial 3 volume at the distal end of a catheter and a second spacial volume defined by a surrounding of the first spatial volume by a polymeric film wall where the distance from the spatial volume 4 and the wall is maintained substantially constant over their entire surfaces. One of the inner and outer volumes is filled with either a fluid or a solid containing a radionuclide(s) while the other of the two volumes is made to contain either a low radiation absorbing material, e.g., air or even a more absorptive material, such as an x-ray contrast fluid. Where the radioactive material comprises the core, the surrounding radiation absorbing material serves to control the radial profile of the radioactive emissions from the particular one of the inner and outer volumes containing the radionuclide(s) so as to provide a more radially uniform radiation dosage in a predetermined volume surrounding the outer chamber. Where the core contains the absorbent material, the radial depth of penetration of the radiation can be tailored by controlling the core size.

'813 patent, col. 1, l. 50-col. 2, l. 3. The first two claims of the '813 patent read:

1. Apparatus for delivering radioactive emissions to a body location with a uniform radiation profile, comprising:
(a) a catheter body member having a proximal end and distal end;

(b) an inner spatial volume disposed proximate the distal end of the catheter body member;

(c) an outer, closed, inflatable, chamber defined by a radiation transparent wall affixed to the body member proximate the distal end thereof in surrounding relation to the inner spatial volume with a predetermined constant spacing between said inner spatial volume and the radiation transparent wall;

(d) a material containing a radionuclide(s) disposed in one of the inner spatial volume and outer chamber; and

(e) means disposed in the other of the inner spatial volume and outer chamber for rendering uniform the radial absorbed dose profile of the emissions from the one of the inner spatial volume and outer chamber containing the radionuclides.

2. The apparatus as in claim 1 wherein said inner spatial volume is an inner closed, chamber defined by a further radiation transparent wall.

'813 patent, col. 4, ll. 32-54. Since all claims of this patent other than claim 1 depend from claim 1, construction of "inner spatial volume" is critical.

3 Presumably all occurrences of "spacial" in the '813 patent should be read as "spatial."

4 Presumably this "spatial volume" should be taken to be the first spatial volume, which would mean that the polymeric film wall forms the outer boundary of the second spatial volume and that the second spatial volume is of a uniform thickness on all sides of the first spatial volume. Such a reading would comport with claim 1(c).

In most embodiments of the invention disclosed in the patent specification, the inner spatial volume is a region of space surrounded by an outer spatial volume that is defined by a closed inflatable, chamber. See '813 patent, col. 2, ll. 44-63; col. 3, ll. 9-16, 42-48; col. 4, ll. 16-20; figs. 1, 3-5. However, the patentee drafted the claims in such a way as to make clear that the inner spatial volume was not necessarily so limited:

Those skilled in the art will appreciate that instead of having the inner spatial volume 30 defined by a generally spherical polymeric film wall as at 32, the catheter body member 12 may have a solid spherical radiation emitting material in which event that solid sphere would be surrounded with the outer spherical wall 36 with the spatial volume therebetween occupied by a radioactive ray absorbent material, such as air, water or a contrast material.

'813 patent, col. 2, ll. 55-63.

Although somewhat awkwardly worded, the language of the patent allows for the inner volume to be defined by something other than a region enclosed by a polymeric wall. As Cytyc points out, Xoft's construction conflates the boundary of the volume with the volume itself. Cytyc's proposed construction, however, is a paraphrasing of the language of claim 1 that only clarifies a little the language of the patent. Furthermore, Cytyc's proposed construction would exclude an inner volume defined by a solid sphere, and thus cannot be correct.

Xoft objects that an abstract concept like a region of space cannot be part of an apparatus. Xoft is correct. However, the language of the patent does not imply that the inner volume is ever defined by something other than a physical object. In all embodiments of the invention disclosed in the '813 patent, the boundary of the inner volume is either a polymeric film wall or the edge of a solid sphere. Furthermore, it would seem difficult to fill one volume with radioactive liquid and the other with another fluid if the two volumes were not separated by some structure (which would necessarily be the outer boundary of the inner spatial volume.) See '813 patent, col. 1, ll. 57-62. The patent is even entitled "Double-Wall Balloon Catheter for Treatment of Proliferative Tissue." Xoft's expert, Dr. Lovoi, acknowledged that an "inner spatial volume" is a volume that is
The court defines "inner spatial volume" as "a region of space surrounded by an outer spatial volume and either enclosed by a polymeric film wall or defined by the edge of a solid radionuclide sphere."

### Claim Language vs. Court's Construction

<table>
<thead>
<tr>
<th>Claim Language</th>
<th>Court's Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;inner spatial volume&quot;</td>
<td>a region of space surrounded by an outer spatial volume and either enclosed by a polymeric film wall or defined by the outside surface of a solid radionuclide sphere</td>
</tr>
</tbody>
</table>

This phrase is found in Claim 16. Plaintiff proposes the following construction: "inner surface of the curved section of the U-shaped terminal." Defendants assert that the phrase need not be construed, and the Court agrees. Because the Court see no ambiguity as to the meaning of the phrase "inner surface of said base" and because its ordinary and customary meaning is clear to one skilled in the art, the Court declines to construe the phrase as it is used in the '015 Patent.

Claim 1, which is representative of the claims at issue, is set forth below (emphasis added):

1. A writing instrument comprising: a front tubular member having a writing tip at the front end thereof; advancing means axially displaceable in forward and rearward directions for incrementally advancing a writing medium lengthwise in the forward direction through the writing tip in response to forward axial displacement of the advancing means; an inner tubular member having a front portion disposed within and encircled by the front tubular member and having a rear portion; a rear tubular member disposed over and encircling the rear portion of the inner tubular member; means mounting the rear and inner tubular members for axial displacement together as a unit in forward and rearward directions relative to the front tubular member to effect forward axial displacement of the advancing means to thereby incrementally advance the writing medium; means mounting the rear tubular member for angular displacement in opposite directions relative to the front and inner tubular members; holding means disposed within the inner tubular member for releasably holding an elongate eraser; and means mounting the holding means to undergo axial displacement in forward and rearward directions within the inner tubular member in response to angular displacement of the rear tubular members in opposite directions to thereby axially retract and extend the eraser relative to the rear end of the rear tubular member.

Claim 36 depends from claim 1, adding the limitation "wherein the inner tubular member is one piece." As noted above, claim 36 was determined to be allowable in reexamination. Accordingly, Pentel and the PTO agree that if "inner tubular member" in the rejected claims is interpreted to be a "one piece inner tubular member," then all of the rejected claims are allowable.

**DISCUSSION**

Claim construction is a matter of law over which we exercise complete and independent review. Markman v. Westview Instruments, Inc., 52 F.3d 967, 979, 34 U.S.P.Q.2d (BNA) 1321, 1329 (Fed. Cir. 1995), aff'd, 116 S. Ct. 1384 (1996). To determine the meaning of claims, we consider the claim language, the specification, and the prosecution history. Id. In a reexamination proceeding, claims must "be given their broadest reasonable interpretation consistent with the specification." In re Yamamoto, 740 F.2d 1569, 1571, 222 U.S.P.Q. (BNA) 934, 936 (Fed. Cir. 1984). Pentel addresses only claims 1 and 18, and does not separately argue the patentability of claims 2-10, 19-35, 37-38, and 40. Consequently, all claims stand or fall together with independent claims 1 and 18, from which the others depend. See, e.g., In re King, 801 F.2d 1324, 1325, 231 U.S.P.Q. (BNA) 136, 137 (Fed. Cir. 1986).
The '111 patent specification states that the tubular members "are commonly referred to in the art as barrels." It does not, however, state whether the inner tubular member may comprise more than one piece. The patent drawings show only a one-piece member. The claims and specification state that the inner tubular member has a front portion disposed in the front tubular member and a rear portion disposed in the rear tubular member. The PTO agrees that the preferred embodiment illustrated in the specification shows a one-piece inner tubular member, but argues that this embodiment does not restrict the claims. Accordingly, the PTO's position is that that broadest reasonable interpretation of "inner tubular member" is an inner tubular member that may include more than one piece.

The specification also states that the invention described should not be limited to the specific embodiment described. It continues: "For example, if it is desired to construct the eraser dispenser as a separate device which is not incorporated in a writing instrument, . . . the inner barrel 3 would be severed . . . ." (emphasis added). The statement that the inner barrel 3 would have to be severed to form a separate eraser device suggests that this inner tubular member is one piece when incorporated in a writing device. Because each of the claims recites a writing instrument or pencil, this suggests that the claimed "inner tubular member" is one piece.

The fact that the specification only discloses a one-piece inner tubular member and nowhere indicates that multiple members are contemplated is strong evidence of what the claim language means. Moreover, the asserted advantage of the invention requires a long inner tubular member. The claim differentiation argument of the PTO is also not persuasive because there is no indication that claim 36, which expressly recites a one-piece member, was intended to be narrower than claim 1. There was in fact indication that it was added for tactical reasons related to the reexamination.

CONCLUSION

For all of the foregoing reasons, we conclude that the term "inner tubular member" in the rejected claims is properly interpreted as "one piece inner tubular member." The decision of the Board is reversed, and the case is remanded for further proceedings consistent with this opinion.

2130

22. The term "inner wall," properly construed, applies to any of the inner surfaces of an ink tank. This includes the inner surface of the cover or lid. This interpretation is consistent with the use of the term in the patent specification including its claims. For example, claims 78 and 79 of the '377 patent at issue here clearly set forth that the term "inner wall" includes the inner surface of the cover.

23. Claims 19-21 of the '148 patent, also, use the term "inner wall surface" to include the inside surface of the cover. The claims of the '658 patent do not use the term "inner wall," but refer to the term "wall" in a similar manner.

C. Inner Wall of the Annulus Fibrosus

Smith & Nephew proposes that "inner wall of the annulus fibrosus" should be construed to mean "the portion of the annulus fibrosus which is comprised primarily of fibrous material and includes the transition zone between the nucleus and the annulus, where the catheter encounters more resistance to penetration than in the nucleus." ArthroCare would interpret "inner wall of the annulus fibrosus" to mean "the location in the disc where the catheter encounters more resistance to penetration and bends into a radius less than that of the external wall of the annulus fibrosus." The parties agree that the patentees acted as their own lexicographer and defined "inner wall of the annulus fibrosus" in the specification. They dispute, however, which words in the specification are actually the definition.

The disputed portion of the specification contains two sentences. The first sentence states:

"For purposes of this specification, the inner wall of the annulus fibrosus can include the young wall comprised primarily
of fibrosus material as well as the transition zone which includes both fibrous material and amorphous colloidal gels. . . ."

U.S. Patent No. 5,980,504, Column 7:10-15. The second sentence states:

"Functionally, that location where the catheter of the present invention encounters more resistance to penetration and bends into a radius less than that of the external wall of the annulus fibrosus is considered to be the 'inner wall of the annulus fibrosus.'"

U.S. Patent No. 5,980,504, Column 7:15-20. Smith & Nephew argues that the definition of "inner wall of the annulus fibrosus" is the first sentence of the quoted material plus the first clause of the second sentence. ArthroCare argues that the second sentence is the correct definition.

The first sentence begins with the words "[f]or purposes of this specification." Clearly the patentees intended this sentence to be the definition of the "inner wall of the annulus" and the court will use it as the term's definition.

The court interprets the second sentence as a functional definition, describing how the "inner wall of the annulus" can be found using one disclosed embodiment. As discussed in part III B., the claims must be read to envision the invention's being practiced in a manner that does not necessarily involve bending the catheter around the inner wall of the annulus. If there are ways of practicing the invention without bending the catheter around the inner wall of the annulus, the radius of the catheter cannot be central to a general definition of the inner wall of the annulus.

If the second sentence is merely a functional definition that applies to a particular disclosed embodiment, Smith & Nephew's proposed definition is flawed because it incorporates part of the functional definition. The court adopts the definition in sentence one to define the "inner wall of the annulus" as "the young wall comprised primarily of fibrosus material as well as the transition zone which includes both fibrous material and amorphous colloidal gels."

2132

2. "[A]n inner zone on the anterior face circumscribed by the peripheral zone and surrounding the optic zone." Used in '740 patent, claim 1.

"[A]n inner zone circumscribed by the peripheral zone." Used in '903 patent, claims 29, 34 and 38.

"[T]he anterior face including an inner zone circumscribed by the peripheral zone, and an optic zone in the inner zone. Used in '746 patent, claim 1.

"[A] second zone circumscribing the optical [optic] zone." Used in '753 patent, claim 15; '174 patent, claim 16.

The parties agree that "second zone" is interchangeable with "inner zone." The parties also agree that certain zones must be defined on the anterior face of the lens and may include the optic zone, the inner zone and the peripheral zone.

CooperVision argues that these terms should be defined as "a portion of the lens circumscribed by the peripheral zone and that surrounds the optic zone and [a Transition Area] between the inner zone and the peripheral zone." CIBA contends that these terms mean "a zone or region on the anterior face of the lens that is circumscribed by the peripheral zone and surrounds the optic zone (or has a portion that surrounds the remainder of the inner zone that makes up the optic zone). The inner or second zone is separated from the optic zone (or the portion of the inner zone that makes up the optic zone) by a boundary. The outer edge of the inner or second zone (where the inner or second zone meets the peripheral zone) is also separated from the peripheral zone by a boundary, which is the only identifiable boundary between the peripheral edge of the lens and the boundary of the optic zone."

CooperVision defines a Transition Area as "a rounded or curved transition or a discrete boundary, discontinuity, or corner (a 'Transition Area') between zones on the lens." In the interest of the jurors, the court will adopt but reword CooperVision's proposal for readability purposes.
Moreover, for the reasons discussed above, the court will not import CIBA's proposed limitation that there be only one identifiable boundary between the peripheral edge of the lens and the boundary of the optic zone, when the claim language discusses only the inner zone.

The court defines these terms as follows:

"[A]n inner zone on the anterior face circumscribed by the peripheral zone and surrounding the optic zone" and "an inner zone circumscribed by the peripheral zone." and "[T]he anterior face including an inner zone circumscribed by the peripheral zone, and an optic zone in the inner zone" and "a second zone circumscribing the optical [optic] zone" means: A zone or region on the anterior face of the lens located adjacent to the peripheral zone, and that circumscribes and is separated from the optic zone by either a curved or rounded transition or by a discrete boundary, discontinuity or corner.

The trial court also interpreted the insert as hollow. Only claim 15, however, requires a hollow insert, and then, only implicitly. Claim 15 calls for "a hollow bat." Because the insert is part of the internal structure of the bat, the insert must be hollow for the bat itself to be hollow. The preferred embodiment shown in the specification has a hollow insert to minimize "the machining and cold working problems associated with titanium." '398 patent, col 4, I. 68 - col. 5, I. 2. This court, however, declines to read a limitation from the written description into the claims. SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1340 (Fed. Cir. 2001). Here, the context in which "bat" is used in claim 15 is instructive as to the nature of the insert required for that claim. However, "insert" can be defined broadly enough to encompass both a hollow and a solid insert, and yet have the same meaning in all claims.

The term "rigid" appears in connection with "insert" only once. The term appears that single time in uncontested claim 3, "wherein the insert is rigid." This single use of the term "rigid" does not, however, import a "rigid" limitation into all other claims. Rather it implies that the term "insert," when used elsewhere in the patent, does not inherently carry a "rigid" limitation. See Phillips, 415 F.3d at 1314 ("The claim in this case refers to 'steel' baffles, which strongly implies that the term 'baffles' does not inherently mean objects made of steel.")

Rigidity, as employed in this patent, is a measure of resistance to shearing. '398 patent, col. 3, II. 33-35 ("the insert undergoes substantial tensile, as well as bending stress"). The specification of the '398 patent lists a wide range of materials as appropriate for the insert: aluminum, titanium, "other metals, composite materials," and "plastics." '398 patent, col. 5, II. 7-10. In oral argument on appeal, it became apparent that even a pressurized rubber balloon could in some cases be "rigid." "Rigid" is a very relative term. In fact, the specification states only that the insert must be rigid enough for the invention to work. '398 patent, col. 3, II. 29-35; col. 4, I. 61 - col. 5, I. 10. And again, that description would seem to apply only to claim 3.

However, the trial court noted that the inventor distinguished his invention from a prior art reference, U.S. Patent No. 5,180,163 (the '163 patent), during prosecution of the patent, in a way that would suggest that use of the word "rigid" requires that characteristic in all claims. The inventor characterized the prior art as having a "spine" which was "collapsible and positioned in a bat handle to deaden shock at the bat handle." In contrast, the inventor noted, the insert of the '398 patent "is rigid and positioned in a bat impact portion to heighten the response of the impact portion to a batted ball." Because of the timing and context of this statement, however, this statement suggests only that "rigid" implies "not collapsible upon impact." Indeed, the specification states that the insert snaps back "which increases the force and velocity of the rebound." '398 patent, col. 3, II. 42-43. Understanding "rigid" to mean only a measure of resistance to shearing is consistent with an insert that snaps back. Furthermore, in amending both claims 3 and 15 to distinguish the '163 patent, the inventor included "rigid" only in claim 3, but specifically did not include "rigid" in claim 15. Instead, the inventor amended claim 15 to point out that the structural insert "defines an annular gap with the inside wall of the impact portion of the bat," again suggesting merely that the insert would not collapse upon impact, but could respond by resisting shearing without being completely unyielding.

Based on this prosecution history, however, the trial court inferred that "rigid" carried great significance for the invention. The trial court opined that "[a] non-rigid structure would not snap back to increase the slugging capacity of the bat," and that the materials listed in the specification as being appropriate for the insert would "have to be rigid in order to avoid..."
deadening the impact of the ball." This commentary restates the function of the insert without clarifying the "rigid" limitation. Because it is superfluous and undefined, "rigid" adds nothing to the meaning of the claim, and does not belong in this claim interpretation. See, e. g., United Carbon Co. v. Binney & Smith Co., 317 U.S. 228, 233, 63 S. Ct. 165, 87 L. Ed. 232, 1943 Dec. Comm'r Pat. 758 (1942) ("To sustain claims so indefinite as not to give the notice required by the statute would be in direct contravention of the public interest which Congress therein recognized and sought to protect.").

Nothing in the claims or specification indicates, explicitly or implicitly, that the inventor intended to impart a novel meaning to "insert." The record also contains no evidence that "insert" has a particular meaning in the field of art encompassed by the '398 patent. As with "annular," an ordinary and customary meaning for this term in this art field and within the context of this patent is: "something inserted or intended for insertion." Webster's II New College Dictionary (3d ed. 2005).

**k. "said pivot structure is insert-molded on said post"

The term "said pivot structure is insert-molded on said post" means the pivot structure, where it extends transversely at the lower end of the insert-molded body, is molded in place about the post.

**c. Insert-Receiving Area.

The term "insert-receiving area" appears in asserted claims 1, 3, 6, 11, and 16 and in unasserted claims 4, 15, 21, 22, 24, and 27, and is used consistently throughout these claims. The term's use in claim 1 is representative:

A vibratory assembly for imparting a vibratory force to a pile, comprising:

- a housing having at least one counterweight receiving means;
- a counterweight rotatably carried in said receiving means for rotation about a rotational axis, said counterweight having a cylindrical gear portion and an eccentric weight portion integral with said cylindrical gear portion, said eccentric weight portion having at least one insert-receiving area formed therein, said counterweight being made of a first metal;
- a solid insert member securely positioned in one of said at least one insert-receiving areas said solid insert member being made of a second metal having a specific gravity greater than the specific gravity of said first metal, and a melting point temperature of 328 degrees C. or greater; and
- at least one driving means operatively connected to said counterweight and adapted to rotate said counterweight about its rotational axis.

Doc. 26, Exhibit A, '964 Patent, col. 9, ll 33-53. (emphasis added)

The insert receiving area in the '964 patent allows a heavier high-melting point metal such as tungsten to be inserted into the counterweight in order to increase the eccentric moment, and, hence, vibratory force, without bulking up the device impractically. The claims (1, 6, 11, 16) describe the eccentric weight portion as having at least one "insert-receiving area," but do not describe the cylindrical gear portion as having an insert-receiving area. J&G's position is that the invention only claims that the inserts run through the structure extending forward from the gear structure, which it has argued is the "eccentric weight portion." J&G concludes that "the plain language of the claim limits the insert-receiving area to the eccentric weight portion of the counterweight and excludes an insert receiving area from the cylindrical gear portion." Doc. 27 at 18. APE's position is that because the eccentric weight portion can share volume with the cylindrical gear portion, claiming the insert-receiving area for only the eccentric weight portion does not prevent the insert from running through the entire counterweight. APE argues that there is no such limitation of the insert receiving area to the eccentric weight portion.
of the counterweight nor exclusion of an insert receiving area from the cylindrical gear portion of the counterweight. APE cites the use in the patent of the "open-ended term 'comprising' in transitioning from the preamble to the body of the claim." Doc 31, at 6. Because, APE argues, "the term 'comprising' has been construed to mean 'including the following elements but not excluding others,' Faber, Landis on Mechanics of Patent Claim Drafting, Sec. 2:5 (5th ed. July 2008) (Emphasis added); M.P.E.P. Sec. 2111.03 (Rev. 6, Sept. 2007)," additional unrecited elements are not excluded from the scope of the claim. Doc 31, at 6. The claims do not explicitly limit the insert receiving area to the eccentric weight portion, nor do the claims explicitly exclude insert-receiving areas from the cylindrical gear portion. Relying on the plain language and ordinary meaning of the claim terms, the Court finds that "insert-receiving area" means "a region of the eccentric weight portion that is capable of receiving an insert, as opposed to receiving material being poured into the region." GO BACK

2136

(3) Insert-Receiving Area

The phrase "insert-receiving area" appears in asserted claims 1, 3, 6, 11, and 16, as well as unasserted claims 4, 15, 20, 21, 22, 24, and 27. APE seeks to define the phrase as "a region of the eccentric weight portion that is capable of receiving an insert." (Joint Disputed Claim Terms Chart.) Geoquip seeks to define the phrase as "a bore extending into the eccentric weight portion and shaped to receive the solid insert." Id. 9

- - - - - - - - - Footnotes - - - - - - - - - - - - - - -

8 The phrase appears in claims 4 and 15 in its plural form.9 The dispute over the meaning of "insert-receiving area," i.e., whether or not it may be wholly contained within the cylindrical gear portion, is closely tied to the construction of "eccentric weight portion," and whether that too may be so contained. This court has found that the "eccentric weight portion" must be physically distinct from the "cylindrical gear portion," see supra Part II.B. (3), and the court is mindful of that construction in its analysis of "insert-receiving area."

- - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

In construing "insert-receiving area," the court looks first to the claims themselves. Claim 1, which is representative of the asserted claims, describes a "counterweight having a cylindrical gear portion and an eccentric weight portion integral with said cylindrical gear portion, said eccentric weight portion having at least one insert-receiving area formed therein." 964 Patent, col. 9, ll. 39-43. In other words, at the very least, the "insert-receiving area" is located, at least in part, within the "eccentric weight portion." Moreover, claim 3, which is dependent on claim 1, recites the "vibratory assembly of claim 1 wherein said at least one [sic] insert-receiving area is a bore in said eccentric weight portion and said solid insert member is a tungsten rod." Id. at ll. 56-59. Although the court believes the phrase "insert-receiving area" to be used consistently in the remainder of the claims, the claims do not define the phrase explicitly. Thus, the court turns next to the specification.

The specification provides the following description:

The bottom portion 104 of the counterweight 40 is cast having insert receiving areas or bores 112 substantially parallel to the center bore 106 and extending fully through the gear portion 41 and fully through the eccentric weight portion 43. In the preferred embodiment, two insert receiving bores 112 are formed in the eccentric weight portion of the counterweight 40, although the number of bores can be varied.

Id. at col. 5, ll. 61-68. Although this passage describes the "insert-receiving area" as fully extending through both the gear portion and the eccentric weight portion, the court finds no other evidence within the specification to suggest that the insert-receiving area must extend completely through both portions. After considering the claims and specification as a whole, the court finds that the essential attributes of the "insert-receiving area" are, first, that it is shaped to receive an insert; second, that it is located, at least partially, within the eccentric weight portion; and third, that it may extend into the cylindrical gear portion, as is the case in the preferred embodiment. Neither party's proposed construction, however, succeeds in capturing these three attributes. 10 As such, the court construes the phrase "insert-receiving area" to mean "a bore located, at least in part, within the eccentric weight portion that is shaped to hold securely a solid insert member."
5. "Insert-Receiving Area"

This phrase appears in asserted claims 1, 3, 6, 11 and 16, as well as in unasserted claims 4, 15, 21, 22, 24 and 27. 12 APE argues that the proper construction of this phrase is "... a region of the eccentric weight portion that is capable of receiving an insert, as opposed to receiving material being poured into the region." Doc. No. 37 at 6. ECA counters that "insert-receiving area" should be construed as "a bore extending into the eccentric weight portion and shaped to receive a solid insert." Doc. No. 41 at 2. The Northern District of California construed the phrase to mean "a bore formed in the eccentric weight portion of the counterweight, which extends fully through the gear portion and fully through the eccentric weight portion of the counterweight, capable of receiving a solid tungsten rod." Bay, 632 F. Supp. 2d 956, 2009 WL 1684611, at *10. In order to construe the phrase properly, this Court first turns to the language of the claims themselves.

A reading of all the claims shows that the phrase "insert-receiving area" is used consistently throughout the claims of the patent, and that its definition is meant to be the same in all of the claims. Furthermore, it is notable that whenever the location of the insert-receiving area is mentioned in the claims, it is consistently described as being formed in the eccentric weight portion. The claims also repeatedly describe the insert-receiving area in connection with securely holding a solid insert member. However, there is no part of the claims that gives an explicit definition of the insert-receiving area, so this Court, in accordance with case law, turns to the specification of the '964 Patent for guidance.

The specification states:

The bottom portion 104 of the counterweight 40 is cast having insert receiving areas or bores 112 substantially parallel to the center bore 106 and extending fully through the gear portion 41 and fully through the eccentric weight portion 43. In the preferred embodiment, two insert receiving bores 112 are formed in the counterweight 40, although the number of bores can be varied. The insert receiving bores are shaped 112 to receive the solid insert 45, wherein the solid insert is manufactured from a metal that has a density or specific gravity that is greater than the density or specific gravity of the metal used to form the remainder of the counterweight 40. The preferred solid insert 45 is a tungsten rod machined to close tolerances such that the solid insert fits snugly within the insert receiving bore 112.
In light of the language of the specification, and given this Court's above construction of "eccentric weight portion" as being able to share structure with the "cylindrical gear portion," this Court recommends that the phrase "insert-receiving area" be construed to mean: "a bore, formed in the eccentric weight portion of the counterweight, which is designed to receive and securely hold one solid insert member made of a second metal having a specific gravity higher than that of the first metal and a melting point temperature of 328[degree] C or greater."

13 Like this Court, Judge Hamilton of the Northern District of California also found this passage, up to column 6, line 5, to be instructive in making her construction of this term. See Bay, 632 F. Supp. 2d 956, 2009 WL 1684611, at *9. Curiously, however, the quotation of this paragraph of the specification, as transcribed into that opinion, lacks the phrase "and fully through the eccentric weight portion 43" from column 5, lines 64-65 of the '964 Patent. Bay, 632 F. Supp. 2d 956, 2009 WL 1684611, at *9.

This phrase appears in asserted claims 1, 6, 11. The phrase also appears in unasserted claims 21, 22, 24 and 27. APE contends that the phrase should be construed to mean "a region of the eccentric weight portion that is capable of receiving an insert, as opposed to receiving material being poured into the region." Bay contends that the phrase should be construed to mean "an area shaped to receive the solid insert and extending fully through either the gear portion or the eccentric weight portion. Both the gear portion and the eccentric weight portion have an insert receiving area. This limitation defines insert receiving area as the insert receiving area of the eccentric weight portion as opposed the insert-receiving area of the gear portion."

The court begins its analysis by first turning to the claims themselves. The phrase "insert-receiving area" is first introduced in claim 1, which states: "A vibratory assembly for imparting a vibratory force to a pile, comprising: . . . counterweight having a cylindrical gear portion and an eccentric weight portion integral with said cylindrical gear portion, said eccentric weight portion having at least one insert-receiving area formed therein, said counterweight being made of a first metal; a solid insert member securely positioned in one of said at least one insert-receiving areas said solid insert member being made of a second metal . . ." Claim 2 provides that the first metal is steel and the second metal is tungsten. The phrase "insert-receiving area" also appears in claims 6, 11, 16, 21, 22, 24 and 27.

Reviewing all the claims in which the phrase "insert-receiving area" appears, the court finds that, while the precise language of each claim differs, the language of claim 1 is representative of the other claims, and that the phrase is meant to have the same meaning in each claim, since there is no indication that the phrase is to be given a specific definition in any one claim versus another, and no indication that the phrase has been particularly defined, or referred to in a materially different way, in any specific claim. Accordingly, because none of the claims specifically define the phrase, the court turns to the specification for added insight.

The specification states that:

The bottom portion 104 of the counterweight 40 is cast having insert receiving areas or bores 112 substantially parallel to the center bore 106 and extending fully through the gear portion. In the preferred embodiment, two insert receiving bores 112 are formed in the counterweight 40, although the number of bores can be varied. The insert receiving bores are shaped 112 to receive the solid insert 45, wherein the solid insert is manufactured from a metal that has a density or specific gravity that is greater than the density or specific gravity of the metal used to form the remainder of the counterweight 40. The preferred solid insert 45 is a tungsten rod . . .
The essence of the dispute is whether the insert-receiving area extends through both the gear portion and eccentric weight portion of the counterweight. After reviewing the claim language and the specification, the court declines to adopt either party's proposed construction of the phrase "insert-receiving area." Instead, the court construes the phrase "insert-receiving area" to mean: "a bore formed in the eccentric weight portion of the counterweight, which extends fully through the gear portion and fully through the eccentric weight portion of the counterweight, capable of receiving a solid tungsten rod."

2139

2. The "insert within the aperture" limitation

Although Lamson's products were found to have satisfied the "insert within the aperture" limitation under the doctrine of equivalents, Intermatic argues that that limitation is literally met under the proper interpretation of its claims. Intermatic contends that the district court erred in its construction of the "insert within the aperture" limitation by excluding a preferred embodiment of the invention, and that the proper interpretation of that limitation is that the claimed "insert" is comprised of not only what it styles as the "insert plate," which is what the district court found to be the actual "insert," but also includes the flange and the raised ledge connected to it. Lamson responds that the court properly construed the "insert within the aperture" limitation to exclude the flange and the raised ledge because the specification teaches that those structures are separate from the claimed "insert."

We conclude that the district court properly construed the "insert within the aperture" limitation to exclude the flange and the raised ledge. When the meaning of a term used in a claim is sufficiently clear from its definition in the patent specification, that meaning shall apply. Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1477, 45 U.S.P.Q.2d (BNA) 1429, 1432 (Fed. Cir. 1998); Intelicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1388, 21 U.S.P.Q.2d (BNA) 1383, 1387 (Fed. Cir. 1992). The specification states that

the insert 14 has a top edge 42, a bottom edge 44 and two side walls 46 and 48. A flange 50 extends around the periphery of the insert. The flange 50 is sized and adapted to fit securely within the recess 40 of the base plate 12 in order to form a connection with the base plate 12. A raised ledge 51 is located on the face of the insert 14 around the periphery of the aperture 26 and flange 50.

135 patent, col. 4, II. 5-12 (emphasis added). The specification therefore makes clear that the claimed "insert" is something separate from, but connected to, the flange and the raised ledge. Accordingly, the district court did not err in interpreting the "within the aperture" limitation to require the plate-like structure comprising the "insert." which does not include the flange and raised ledge, to fit within the aperture of the base plate.

2140

Biomet urges a construction of "insertable into and through the tissue" to mean the anchor member steers itself into the tissue, and is not steered into and through the tissue while contained in a needle. Indeed, according to Biomet, the claim language calls for two devices that are insertable into and through tissue, pointing to the preamble, which describes an apparatus for insertion into and through tissue, and the remainder of the claim, which calls for an elongated anchor member that, it argues, must be independently insertable into and through the tissue.

In addition, during oral argument Biomet pointed to a few references of the disputed claim language in the specification as support for its argument that the claim describes an anchor member that is separately insertable into and through the tissue. Those references are: "The anchor member is inserted through the tissue with the suture extending therefrom to provide a mechanism for manipulating the tissue within the joint," Ex. A, col. 2, 1. 5-8 (emphasis added); "The limiting mechanism is manipulated so that the tube may be pushed forward to the tip of the needle, thereby expelling the anchor member from the tip of the needle into or behind the piece of tissue to be anchored," id., col. 2, 1. 31-34 (emphasis added); and "A rigid anchor member may be lodged within cartilage or other tissue (i.e., as opposed to being inserted between cartilage and bone) by expelling the anchor member substantially straight into the tissue and pulling on the suture," id., col. 7, 1. 51-55
Smith & Nephew responds that neither the specification nor the prosecution history supports Biomet's argument that for an anchor to be "insertable into and through the tissue" it must be capable of "steering" itself or "being projected." Instead, according to Smith & Nephew, the specification explains how the needle can be used to "deposit" the anchor. Ex. A, col. 8, 1. 49-54. In addition, while "tissue" was given an explicit meaning, no definition for "into and through the tissue" appears in the specification or in the prosecution history, and the phrase does not involve any terms of art. Smith & Nephew also contends that plaintiff Dr. Hayhurst wanted to avoid damaging nerves or blood vessels by controlling the position of the anchor member, and this goal would be undermined if the anchor member were to steer itself or be projected into tissue. Id., col. 8, 1. 59-63; see CVI/Beta Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1160 (Fed. Cir. 1997) (in construing claims, the problem the inventor was attempting to solve is relevant).

Finally, at oral argument, Smith & Nephew explained that the specification citations do not indicate whether the anchor member is inserted into and through the tissue while in the needle or while outside the needle. Insertion while in the needle is still insertion. The claim is silent as to whether the needle carries the anchor or not.

According to Smith & Nephew, the phrase "anchor member insertable into and through the tissue" should be construed to mean,

An anchor member that goes both into and all the way through cartilage, tendons, ligaments and similar tissue. Further, the construction should permit the anchor members to be carried into and through the tissue by the needle-to be consistent with the disclosed embodiments -- but should not read the disclosed embodiments into the claim to require that a needle be used.

Smith & Nephew's Corrected Reply Brief at 7.

I do not find support for Biomet's claim construction in the language of the claim or in the specification, and Biomet does not point me to any relevant prosecution history. The specification supports a construction of the claim that permits the needle to carry the anchor member into and through the tissue. E.g. "The anchor member is inserted through the tissue with the suture extending therefrom to provide a mechanism for manipulating the tissue within the joint," Ex. A, col. 2, 1. 5-8; "The preferred means of inserting the anchor member includes a hollow needle having a sharp tip and an open butt," id., col. 2, 1. 11-13; "The needle tip pierces the tissue to be anchored and passes substantially through the tissue," id., col. 2, 1. 29-30.

Furthermore, the language of the claim does not contemplate two devices that must be separately insertable into and through tissue. Instead, the preamble's description of the claimed invention as an "apparatus for insertion into and through tissue" merely states the purpose or intended use of the invention. Indeed, the words "characterized by" in the preamble are intended to be "open-ended and [do] not exclude additional, unrecited elements or method steps" such as an insertion means for inserting the anchor member into and through the tissue. See Mars, Inc. v. H.J. Heinz Co., L.P., 377 F.3d 1369, 1376 (Fed. Cir. 2004), citing Manual of Patent Examining Procedure, 8th ed., rev. 1 § 2111.03 (2003).

Accordingly, I find the claim simply requires that the elongated anchor member go into and through tissue, and that the language of the claim is silent as to the means with which the anchor member does so.
Nephew asserts that when read in context with the entire patent, it unambiguously requires the claimed nail be a "multi-use" nail, such that the same nail can be used to treat various fractures of a left and right femur. (Id.)

Plaintiff points to language in the title, abstract, background, summary, and detailed description to demonstrate that the Marcus Patent "consistently and without exception" emphasizes that the invented nail is for treating fractures of both the left and right femurs, not just specific fractures of one or the other. (Id.; Pl.'s Resp. to Def.'s Opening Markman Br. 6-7; D.E. 58.) In particular, Plaintiff states that "[t]he specification...demonstrates that the ability of a single nail to repair a variety of types of fractures of a left or a right femur is not an optional feature or non-limiting embodiment, but is the essence of the claimed invention." (Pl.'s Opening Markman Br. 10; D.E. # 57.) Plaintiff contends the written description plainly demonstrates that the disclosed embodiment is the invention, not just a preferred embodiment. (Pl.'s Resp. to Def.'s Opening Markman Br. 8; D.E. 58.) Specifically, Plaintiff states that when the specification refers to examples or preferred embodiments of the invention, these items are couched in conditional language, such as "preferred," "preferably," and "as an alternative." (Id. at 8-9.) Plaintiff also asserts that in looking at the prior art, the Patent Office found Zimmer's multi-use nail distinguishable due to its capability of treating various fractures of both the left and right femurs. (Pl.'s Opening Markman Br. 11; D.E. # 57.)

On the other hand, Defendant Zimmer's proposed construction is: "The nail is insertable into the canal of the femur called the medullary canal." (Def.'s Opening Markman Br. 13; D.E. # 56.) Specifically, Zimmer asserts that these terms should be assigned their ordinary and plain language meaning, as the claim does not contain any language limiting the nail to use in both the left and right femur and reading such a requirement into this language would violate the rule that limitations found within the specification should not be read into the claims. (Id. at 13-14.) Defendant states that claim 1 merely recites a nail, with a plain and specific structure, and does not require it to be compatible with both left and right femurs. (Def.'s Resp. to Pl.'s Opening Claim Construction Br. 2; D.E. # 59.)

Although the specifications of the patent describe a nail capable of being inserted in the left and right femur, Defendant asserts that the specifications merely present the best mode by which to recreate the invention, but not every mode the invention is capable of embodying. (Id.) In so doing, the specifications of the Marcus lay out an invention (1) capable of treating multiple types of fractures located in different parts of the femur, (2) possessing an alignment mechanism so that tools can be accurately aligned with the various screw holes, and (3) capable of use in both a left and right femur. (Id.) Defendant asserts that while aspects one and two are spelled out in claim one, aspect three is not mentioned until claim 9, which depends from claim 1. (Id. at 3.) Defendant contends that the patent merely encompasses a nail that can be used to repair fractures from the femoral neck to the supracondylar region, which has a securing arrangement for driving and guiding tools, so as to easily maintain the angular position during the insertion of the nail. (Id. at 3-4) Zimmer states that the nail's capability of use in fractures of the left or right femoral neck is just one example/aspect of the invention. (Id. at 4.) According to Zimmer, claim 1 speaks for itself, as it indicates nothing requiring the nail be used in both the left and right femurs. (Id. at 5.)

b. Claim Construction Analysis

Based on the principles of claim construction and the intrinsic evidence currently before the Court, the Court finds this claim language should be construed to mean: The nail is insertable into the canal of the femur called the medullary canal. When looking to the claim in context with the written description, the Court finds that the limiting language found in the patent's written description should not be imported into the broader language found within the claim. 50 In conducting a claim construction analysis, it has been repeatedly emphasized that restrictive interpretations typically occur when there are repeated and definitive remarks throughout the specification that demonstrate a limitation on a broader claim's scope. 51 This principle remains true when a patent's specification discloses only a single embodiment, as narrow descriptions should not necessarily limit broader claim language. 52 Although there is language within the written description that discloses a nail capable of being used in both the left and right femur, the Court finds these instances do not demonstrate the patentee's intent to limit the invention to such a nail through the use of repeated and definitive remarks to that end. 53 Also noteworthy is that the majority of the patent refers to a nail capable of use in the left or right femur, which connotes choice. Instead, the use of the more inclusive conjunction and is frequently found in the arguments contained within Plaintiff's brief as opposed to the actual patent. Moreover, the patentee may choose to disclose a limited preferred embodiment although the patent's claim language reveals a broader invention. 54
50 See Phillips, 415 F.3d at 1315 (stating that although the specifications are the single best guide to the meaning of disputed terms, it remains a bedrock principle of patent law that the claims of the patent define the invention to which the patentee is entitled the right to exclude).

51 See Computer Docking Station Corp., 519 F.3d at 1374; Liebel-Flarsheim Co., 358 F.3d at 907.

52 See Saunders Group, Inc., 429 F.3d at 1331; Intamin Ltd., 483 F.3d at 1335 (citing Phillips, 415 F.3d at 1323).

53 See Computer Docking Station Corp., 519 F.3d at 1373-74; Liebel-Flarsheim Co., 358 F.3d at 909.

54 See Saunders Group, Inc., 492 F.3d at 1331; Intamin Ltd., 483 F.3d at 1335 (citing Phillips, 415 F.3d at 1323).

In looking to the patent's prosecution history, it does not appear that the patentee distinguished his invention from the prior art on the basis of its capability of use in both the left and right femur. Instead, the Court finds the patent history repeatedly emphasized that his invention was distinguishable, because it was capable of treating a variety of different fractures in a variety of different regions within a single femur. "In the past, different nails and nailing arrangements have been used to repair fractures in different portions of the femur...." (Letter/Memorandum from the United States Patent and Trademark Office on Multi-Use Femoral Intramedullary Nail, Docket No. 10-33, to Randal E. Marcus (Mar. 5, 1985) 3; D.E. # 57-9.) In fact, the patent application describes prior art that utilizes this same "left or right" capability language, only the prior art nail's sole purpose was treatment of fractures in the intertrochanteric region of the femur as opposed to multiple regions of the femur. (Id. at 4.) For example, in comparing the Marcus patent with the previous Ender patent, the patent office stated:

[The Marcus nail] can be used to repair substantially any femoral fracture of either the right or left femur with provisions for inserting transverse locking screws into the femoral neck, the introchanteric region and the distal femur region….The Ender patent discloses a femoral nail including a head, a slotted intermediate body portion and a distal end. A pair of transverse screw receiving openings 14, 15 are provided at angles such that transverse screws may be inserted in the intertrochanteric region of either the left or right femur. No suggestion is made that a transverse screw be inserted into the femoral neck.

From the portions of the prosecution history before the Court, it cannot be said that the patentee made a clear and unmistakable disavowal of the scope of the patent during prosecution. 55

55 Computer Docking Station Corp., 519 F.3d at 1371 (quoting Purdue Pharma L.P., 438 F.3d at 1136).

Furthermore, as patentees may draft different claims to cover different embodiments, a court is not required to construe a single claim to be limited to a structure that is capable of achieving all of the patent's objectives. 56 This becomes especially apparent and applicable when applying the doctrine of claim differentiation to the claim at issue. As previously stated, a patent containing both independent and dependent claims carries with it the presumption that each claim is different in scope. 57 This presumption is rebutted in circumstances where evidence favoring a different interpretation is strong. 58 Additionally, differentiation is strongest when a comparison of the independent and dependent claims reveals the limitation from the dependent claim that is sought to be read into the independent claim is the very same limitation that makes the claims different. 59 Claim 9 sets forth the physical limitations of a nail capable of insertion into both the left and right femur. "An intramedullary nail according to claim 1 wherein said nail curves anteriorly, said openings in said head have their axes in a common plane, and said openings in said head are symmetrical about a plane normal to said common plane." (U.S. Patent No. 4,622,959 (filed Nov. 18, 1986).) Nothing in claim 1 requires the nail to (1) curve anteriorly, (2) have the axes of the openings in the head in a common plane, or (3) have the openings placed symmetrically about a plane normal to said common plane. Differentiation in this instance is at its strongest, since the elements set out in claim 9 are the very same elements that make it different from claim 1, and any other reading of claims 1 and 9 would make claim 9 redundant and...
b. "insertable storage medium having information stored therein"

"Insertable storage medium" is not a means-plus-function element. It would therefore be improper to define this term solely with reference to "corresponding structures" found in the specification.

Plaintiff believes that the correct interpretation of this phrase is simply "any insertable storage medium." Pl.'s Opp. Memo. on Claim Construction, at 6. The Court rejects plaintiff's interpretation because it does not contribute to the task of claim construction. The parties have filed numerous briefs arguing about the definition of "insertable storage medium." Its meaning is not self-evident. Plaintiff's tautological suggestion is not helpful in resolving the difficult issues presented in this case.

Plaintiff also suggests in his motion papers that the medium in which the information is stored is irrelevant to the patent: that the "software" "can come from any type of medium." Id. at 16 (emphasis in original). Similar statements were made elsewhere, for instance that "it makes absolutely no difference to the result which medium is used. The medium is as insignificant to the invention as the choice between UPS and the Postal Service is to the delivery of a package." Plaintiff's Memo. in Opposition to Defendants Motion of Non-Infringement ("Pl.'s Opp. Memo. on Infringement") at 5; see also id. at 10 ("The medium could be anything"); id. at 5 ("The medium can be a floppy disk, a hard disk, a tape, a broadcast from a cable company, or next year's favorite medium"). Plaintiff appears to be suggesting that the term "insertable storage medium" should actually be defined as "any storage medium" (or perhaps "any medium"). This is confirmed by a brief submitted by plaintiff during the prosecution of his patent, see Pl.'s Opp. Memo. on Claim Construction, Ex. 1, at 3. (arguing that some of the claims, including the one in issue here, "are broad enough to cover any storage medium"). To the extent plaintiff believes that "insertable storage medium" should be construed to mean "any storage medium," the Court rejects that view because it seeks to read the term "insertable" out of the claim. See Becton Dickinson & Co. v. C.R. Bard, Inc., 922 F.2d 792, 798 (Fed. Cir. 1990) (all limitations in a claim are material). Defining "insertable storage medium" as "any storage medium" would erase the distinction drawn in the claim between internal and insertable storage media. See, e.g., Patent '857, Figures 1 and 2 (showing insertable ROM cartridge 12 and internal RAM 24, auxiliary RAM 24a and ROM 24b). Words in a patent are to be given their ordinary meaning, unless it is clear that the patentee intended a special definition. See Vitronics Corp. v. Conceptoric Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1997). There is no indication in the patent that plaintiff used "insertable" in a special or unusual manner. To the contrary, the term is used in an ordinary manner elsewhere in the patent. For instance, the patent uses the following terminology to mean the same thing: compare "when a cartridge is first placed in the machine . . . .), Patent '857, col. 2, line 10-11; with "when a new cartridge is inserted into the machine . . . ." col. 4, line 9; and "the cartridge is insertable into an appropriate slot in the machine . . . .", col. 3, lines 38-39. Because "insertable" is used in the ordinary sense of the word, the Court will not construe the claim language to entirely disregard a meaningful term. In addition, construing the phrase to mean "any storage medium" does not advance the cause of claim construction, because that phrase is broad to the point of ambiguity. To the extent that a broad reading of a claim renders it ambiguous, the claim should be construed against the patentee and given a
narrower construction. See Chisum on Patents § 18.03[2][f][iii], at 18-149 (citing cases).

As discussed above, defendant asks to the Court to construe this claim limitation to mean "a physical device which stores information and is inserted into a machine by the user." Def.'s Reply Memo. on Claim Construction, at 1. The first place the Court will look to understand the meaning of the claim phrase is the words of the claim itself. It is clear that the phrase "insertable storage medium having information stored therein" envisions that the storage medium or storage device itself must store information. This seems indisputable -- after all, the medium is a "storage" medium, and it has "information stored therein."

It is also evident from the plain language of the claim that this information-storing medium or device is itself insertable into the machine. 3 It is not an external cable or connector that is "insertable," but rather the storage medium itself is "insertable." In the Court's view, the ordinary meaning of the words "insertable storage medium having information stored therein" dictates this construction: the device having the information stored on it is itself insertable. This conclusion is bolstered by the examples of insertable storage media that the specification and claims disclose: a video game cartridge and a disc. 4 See Patent '857, col. 1., lines 52-58. The way that the patent uses the term "inserted" and "insertable" also supports this reading of the claim language. Both parties agree that a video game cartridge is an example of an insertable storage medium. Such a cartridge is clearly conceived of as a physical, memory-storing device that is itself placed into the machine by the user. See id., col. 1, lines 13-15 ("a cartridge, containing a ROM, is inserted in a slot provided for this purpose"); col. 2, line 10-11 ("When a cartridge is first placed in the machine . . ."); col. 4, line 9 ("When a new cartridge is inserted into the machine . . ."). The specification then states that not only cartridges, but "other types of insertable storage media" may be used to implement the invention. Col. 1, line 55. The other type of "insertable storage medium" disclosed is a "program[] furnished on discs designed for use with a microcomputer." Col. 1, lines 57-58. The clear implication of this is that insertable storage media are information-holding physical devices that are themselves "inserted into" or "placed in" the machine. Defendant's expert, Dr. Thomas A. Berson, also agrees with this interpretation. See Berson Declaration P 9.

3 The word "machine" is used extensively throughout the patent. The patent uses "machine" to mean the entire system shown by Figures 1 and 2, excluding the cartridge (12) and its contacts (15).

4 For reasons discussed below, the Court believes that the patent's reference to a "disc[]" can only be construed to mean a floppy diskette.

The conclusion that the storage medium itself is insertable, rather than merely connected to the machine by means of a cable, is further supported by the language of the specification the specification draws a distinction between a television display monitor which is "connectable" to the machine, and a memory-containing cartridge that is "insertable" into the machine. Compare Patent '857, col. 3, line 26 with col. 3, line 38; see also col. 1, lines 13-14 (a video game unit is "connected to a television receiver, and a cartridge, containing a ROM, is inserted in a slot"). Plaintiff has not pointed to any aspect of the claim, specification or prosecution history which contradicts this common-sense reading of the claim language.

The Court also finds that the claim envisions that the storage medium is a physical device that is inserted into the machine in order to operate the machine. See col. 8, lines 35-36 (machines operate "responsive to insertion of the same storage medium"); col. 8, lines 19-21 (data processing means accesses information from "inserted storage medium"). This construction of the plain language of Claim 5 is confirmed by the examples of insertable storage media given by the patentee: a video game cartridge and a "disc[]," a term which, as indicated earlier, can only be interpreted to mean floppy diskette.

Plaintiff has argued that the reference in the specification to an alternate embodiment employing a different storage medium, see col. 1., lines 56-58 ("the principles of the invention may be applied to programs furnished on discs designed for use with a microcomputer"), would call to mind, to one skilled in the art at the time of the patent application, disk drives.

The Court finds that the reference in the patent to "programs furnished on discs" must be construed to mean floppy diskettes, not disk drives. The claim language requires that the "insertable storage medium" have "information stored therein."

\[endfootnotes\]
therein" and that the system operated "responsive to insertion" of the storage medium. However, a disk drive does not have information stored on it (only the disk itself does), see Declaration of Berson P 19, and computers do not operate in response to disk drives, but rather in response to information on disks. See id.; see also id. P 21. In construing the language of the patent claims, the court "interprets words in a claim as one of skill in the art at the time of the invention would understand them." Eastman Kodak, 114 F.3d at 1555 (citing Intellicall, 952 F.2d at 1387); accord Markman, 52 F.3d at 986. Defendant's expert argues persuasively that in the context of a claim referring to "a plurality of mass-produced identical systems" each working "responsive to insertion of the same storage medium," the phrase "insertable storage medium" would call to mind, to one skilled in the art in 1981, a storage device such as a floppy diskette, a cartridge or a cassette, not a disk drive. See Declaration of Berson PP 10-11, 19, 22-23. Based on the foregoing and his understanding of the usage of computer terminology in the early 1980's, defendant's expert testified that one skilled in the art would not believe that the term "discs" referred to a disk drive. See id. PP 19, 24, 25.

The testimony of plaintiff's expert does not undermine this conclusion. Mr. Dubner admits in his declaration that the word disk only refers to a hard disk drive if the word is used "loosely." Dubner Declaration P 8. In the Court's view, this admission and Mr. Dubner's deposition testimony reveal that even he believes it is a bit of a stretch to contend, as plaintiff does, that "disk" equals hard disk drive. See Def.'s Reply Memo. on Infringement, Ex. S at 49-50, 52-53, 58-59. Faced with a choice between an ordinary definition of a word and a strained or "loose" definition offered only during litigation (rather than in the patent itself), the Court must -- according to well-established principles of claim construction -- adopt the ordinary definition of the word. See Digital Biometrics, 149 F.3d at 1344 ("Without an express intent to impart a novel meaning to claim terms, an inventor's claim terms take on their ordinary meaning."); see also Quantum Corp. v. Rodime PLC, 851 F. Supp. 1382, 1385 (D. Minn. 1994) ("the meaning which the investor gives to his words can not be made to depend upon subsequent events, but should appear when the application is filed") (citations omitted), aff'd, 65 F.3d 1577 (Fed. Cir. 1995) 5

5 Although plaintiff has provided the Court with computer product catalogue and articles that use the word "disk" to refer (apparently) to a disk drive, these do not alter the proper construction of the term. The occasional use of synecdoche in popular speech does not transform the fundamental meaning of a word, especially a technical term. In addition, as defendant points out, several of the publications that plaintiff has provided the Court actually draw a distinction between a disk and a disk drive. See Def.'s Memo. in Support of Non-Infringement at 10.

Although not relying upon these decisions in its claim construction, the Court notes that its interpretation of these terms comports with the terminology employed by other courts. See Rodime, 174 F.3d at 1297 (drawing a distinction between a hard disk and a hard disk drive); Conner Peripherals, Inc. v. Western Digital Corp., 1993 U.S. Dist. LEXIS 20418, No. 93 Civ. 20117, 1993 WL 645932, at *2 (N.D. Cal. Aug. 16, 1993) (drawing a distinction between a hard disk and a hard disk drive); cf. Tandon Corp. v. U.S. Intern. Trade Com'n, 831 F.2d 1017, 1019 (Fed. Cir. 1987) (drawing a distinction between a floppy diskette and a hard disk drive); Conner Peripherals, Inc. v. Western Digital Corp., 1993 U.S. Dist. LEXIS 20148, No. 93

Therefore, the Court finds that the phrase "insertable storage medium having information stored therein" must be construed to require that the storage medium is a physical device which itself stores information; and that the storage medium is itself inserted into the machine (rather than being connected in some other manner) in order to operate it.

The Court recognizes that during the forthcoming infringement analysis under the doctrine of equivalents, distinctions that may be found or implied in this claim construction may not be dispositive in conducting that analysis.

2. "Inserting the preassembly into a tubular body of metal so as to be in centered, spaced, relation to the interior wall of said body." Consistent with the claim language and its ordinary meaning, 3 the specification, 4 and the prosecution history, 5 the court construes "inserting the preassembly into a tubular body of metal so as to be in centered, spaced, relation to the interior wall of said body" to mean "introducing or placing the preassembly into the tubular body so that the preassembly is
not in contact with the interior wall of the body."

3 D.I. 148, ex. 6 at 592 (defining "insert" as "to put or thrust in" and "to put or introduce into the body of something"); D.I. 151, ex. E at 625 (same), 1129 (defining "spaced" as "to place at intervals or arrange with space between").

4 The specification presents differing descriptions of preassembly compression, or the lack thereof, during insertion. Compare '264 patent, col. 1, ll. 52-54; col. 2, l. 67 - col. 3, l. 1; col. 4, ll. 66-68; col. 5, ll. 24-27; fig. 5 with '264 patent, col. 2, ll. 31-34; col. 3, ll. 25-27; col. 4, ll. 63-66. The specification describes "spaced" components as separated and not in contact. '264 patent, col. 2, ll. 52-55; col. 4, ll. 14-18. The specification describes the preassembly as being longitudinally and radially "centered". '264 patent, col. 2, l. 67 - col. 3, l. 1; col. 3, ll. 27-29.

8. "insulated lead wire having first and second ends"

Claims 1, 12, and 17 of the '919 Patent disclose an "insulated lead wire having first and second ends." Philips asserts that this term should be defined as "a round wire covered by an electrically insulating material, such as polyvinyl chloride, and having two ends used to connect two points in a circuit." Cardiac Science maintains that a "lead wire" is a "conductive wire, trace, or strip."

The Court finds no support for Philips' assertions that the term should be construed to include a "round" wire covered by a specific insulating material. These descriptors merely impart limitations from the preferred embodiment into the claim construction. In the specification, the "wire lead" deals with the electrical contact that is made between the gel layer and the AED. However, this need not be a lead wire with "two ends used to connect two points in a circuit." The Court finds that the term is properly described as an "insulated conductive wire."

2. "insulated lid"

a. The Parties' Proposed Construction

The dispute over the proper construction of the term "insulated lid" concerns how to read the specification. Capresso asks the Court to construe the term as "lid with an external cavity that may be filled with foam or other insulative material to further enhance the thermal properties of the lid." DeLonghi interprets the term as an insulated lid that has "either an airtight seal or has its internal cavity filled with foam." In contrast, Sunbeam proposes that the term be construed as "heat retaining top."

The specification states: "the internal cavity of the lid may be filled with foam or other insulative material to further enhance the insulative properties of the lid." FIG 5 & col. 3, lines 50-52. According to Defendants, Sunbeam's construction (heat retaining top) is incomplete because it ignores the part of the patent that specifically discusses what provides the required insulation. Capresso maintains that one skilled in the art reading the claim and patent specification together would understand claim 1 to require the lid to include some additional material to enhance its thermal properties.

In contrast, Sunbeam maintains that while an insulative material such as foam is the preferred embodiment of the invention,
it is impermissible to read this limitation into the patent. Sunbeams notes that the language of the specification -- "may" and "further" -- is permissive, not mandatory. According to Sunbeam, the insulative properties are already present before the addition of any material such as foam. Furthermore, Sunbeam maintains that the insulated lid does not require an air-tight seal. Although the preferred embodiment would prevent air transfer to the greatest extent possible, it is not a requirement of the claim that an absolutely air tight seal satisfies the invention. Instead, Sunbeam claims, it is sufficient that the top helps retain heat inside the carafe when it is properly sealed.

b. The Court's Construction

The Court is mindful that the specification is highly relevant to claim construction and can be the best guide to the meaning of a disputed term. Vitronics, 90 F.3d at 1582. At the same time, the Federal Circuit has cautioned about the danger of importing limitations from the specification into the claim. The emphasis in term interpretation is on how a person of ordinary skill in the art would understand the claim terms. Phillips, 415 F.3d at 1323. That a specification describes a specific embodiment does not confine the claim to that embodiment. Id. Frequently, the purpose of an embodiment is to provide an example of how to practice the invention in a particular case. Id. Courts read the specification to determine whether the embodiment described is meant to be an illustrative example or whether the specification is to be strictly co-extensive.

In the present case, the term "insulated lid" is not specifically defined in the patent but the specification suggests that the lid may be filled with foam or other insulative material. However, the use of the permissive "may" and "further" indicates that the specification is illustrative of a possible specific, enhancing or augmenting embodiment, not limiting. The specification indicates that the lid itself already has insulating properties, with or without the additional insulative material. To read the specification to require the lid to have foam would import a limitation into the claim. The Court construes the term "insulated lid" to mean a heat retaining top.

3. "Insulating housing"

The term "insulating housing appears in claim 1 of the '641 patent as follows:

1. A modular jack to be mounted on a circuit board, said modular jack comprising:

   a printed board containing an electronic element for suppressing noise;

   a contactor for contacting with a plug, said contactor being electrically connected with the electronic element by a wire on the printed board;

   a terminal for contacting with the circuit board, said terminal being electrically connected with the electronic element by a wire on the printed board; and

   an insulating housing for encasing the printed board.

Murata argues that "insulating housing" means "a covering which has a high electrical resistance and which can serve to prevent a short circuit between components." Murata's Opening Brief, at 22. Bel Fuse argues that "insulating housing" means "an enclosure for separating a part or mechanism from an electrical conductor by means of an electrical non-conductor to prevent transfer of electricity between the part or mechanism and the conductor." Bel Fuse's Responsive Brief, at 29. The primary difference between the proposed constructions is that Murata's would require the housing to be made of non-conductive material while Bel Fuse's would not require non-conductive material as long as the housing still performed the function of insulating.

Again, the court begins with a review of the specification of the '641 Patent. When describing the first preferred embodiment, the specification states: "[A] modular jack has an insulating housing 12 which comprises a base 14 and a lid 16 which are engaged by interlocked coupling. Both the base 14 and the lid 16 are made of an insulating material such as plastic." '641 Patent, col. 3, 11 3-7. The specification is otherwise silent on the insulating properties of the housing.
Murata argues that the housing must be made of insulating material because if it were made of conductive material, the preferred embodiment would be inoperable. See, e.g., Pfizer, Inc. v. Teva Pharmaceuticals, USA, Inc., 429 F.3d 1364, 1374 (Fed. Cir. 2005) ("A claim construction that excludes a preferred embodiment is rarely, if ever, correct.") (internal quotations and punctuation omitted). As shown in Figure 1 of the '641 patent, the contactor 35 and terminals 36 are both in direct contact with the housing. Thus, if the housing were made of conductive material, the contactor and terminals would short circuit with the housing, rendering this embodiment inoperable. However, the court disagrees that Bel Fuse's proposed construction would exclude the preferred embodiment because Bel Fuse's construction permits, but does not require, the housing to be made of conductive material. Because under Bel Fuse's proposed construction the housing could be made of non-conductive material, the preferred embodiment would still fall within the scope of the claim 1.

That being said, the court nevertheless finds that a person of ordinary skill in the art would find that an "insulating housing" as that term is used in claim 1 of the '641 Patent must be made of insulating material. Bel Fuse spends much of its brief on this term arguing the merits of its inequitable conduct defense n7 and gives short shrift to explaining how a person of ordinary skill in the art would have interpreted this term.

n7 In briefing the construction of several of the disputed terms, Murata has suggested what it believes are Bel Fuse's motives for offering its proposed constructions, and Bel Fuse has argued (at least in part) the merits of some of its defenses. The court notes that it has not considered the merits of those defenses or the impact of the court's claim construction on those defenses in reaching its decision.

Bel Fuse's only argument of substance is a grammatical one. Citing The English Language Center of the University of Victoria's ("the Center's") website, Bel Fuse argues that "insulating" is a so-called "purpose adjective." The Center's website states that "a purpose adjective describes what something is used for" and that such adjectives end in "-ing," such as "sleeping" in sleeping bag or "roasting" in roasting tin. Ex. 32 to Bel Fuse's Responsive Brief. The Center states that a "material adjective describes what something is made from," such as wooden, metal, cotton, or paper. Id. According to Bel Fuse, "insulating" as used in the claim term "insulating housing" is a purpose adjective and not a material adjective because it is a modified form of the verb "to insulate" with an "-ing" ending. Thus, Bel Fuse argues that as a purpose adjective, an "insulating housing" refers to "a housing for the purpose of insulating." Bel Fuse's Responsive Brief, at 29.

Even if the court accepts Bel Fuse's grammatical argument, however, the court must still reject Bel Fuse's proposed construction. The court fails to see how a housing made of conductive material could be used for the purpose of insulating. Bel Fuse posits that the housing can still be insulating if separated from the components by a non-conductive insert or by air. However, in those cases, it seems that the insert or the air has the purpose of insulating, not the housing. For the housing to have the purpose of insulating, it must perform that function itself, and the only way it can do so is to be made from insulating material. n8 Thus, the court finds that the "insulating housing" as used in claim 1 of the '641 Patent must be made of insulating material. This limitation is supported both by the language of the claim which requires an insulating housing and by the specification, which states that the housing of the preferred embodiment is made of an insulating material such as plastic. Accordingly, "insulating housing" means "a covering which has a high electrical resistance and which can serve to prevent a short circuit between components."

n8 The court recognizes that a housing could serve the purpose of insulating by physically separating the conductive components, such that the space between them (i.e., air) insulates them. However, it is difficult to see how such a configuration would be operable in a modular jack. Bel Fuse has not provided the court with any examples of modular jacks which show a housing made from conductive material. Instead, as relevant to its inequitable conduct defense, it cites U.S. Patent No. 4,789,847 which discloses a filter connector. Claim 1 of that patent includes the elements of a "conductive shell" and an "insulating insert."

Bel Fuse has not provided any suggestion that a person of ordinary skill in the art would interpret "insulating housing" in the modular jack of the '641 Patent as being made of conductive material, and has not shown that a modular jack with a
conductive housing would even be operable. Under claim 1 of the '641 Patent, the modular jack includes a contactor for contacting with a plug, and the contactor is electrically connected with electronic element for suppressing noise by a wire on the printed board. The printed board is encased in the insulated housing. It is difficult to imagine how the housing for the jack could be made of conductive material and still be insulated from the contactor; the same holds true for the terminals. Thus, the court finds that a person of ordinary skill in the art would find that "insulating housing" refers to a housing made of non-conductive material.

Integral

Claim 24 of the 851 patent and claim 12 of the 537 patent reads:

"said central opening of said first end cap bounded by an annular flange integral with said first end cap."

"Said central opening of said end cap assembly having a smaller diameter than said central opening of said second end cap, and being defined by an annular flange integral with an inner surface of said end cap assembly…"

Parker construes "integral" as "composed of integrated parts." Baldwin construes "integral" as "formed in a single piece."

Parker argues "integral" is not the same as unitary which is what Baldwin contends. Parker argues the patent language differentiates between integral and unitary, citing '851 claim 19 which states, "… an annular flange integral with said first end cap…wherein said at least one protrusion is unitary with the first end cap." This demonstrates, according to Plaintiff, that the terms express different meanings in the patent claims. In Applied Med. Res. Corp. v. U.S. Surgical Corp. 448 F.3d 1324, 1333 n. 3 (Fed. Cir. 2006) the Federal Circuit stated, "the use of two terms in a claims requires that they connote different meanings." However, the Court stated that such connotation applies when there is no evidence to the contrary.

In Wix, the Court construed the term "integral" as "formed in a single piece." The Wix Court acknowledged that the prosecution history shows Parker challenged the idea that "integral" and "unitary" are synonymous during the patent process. The Wix Court determined that the prosecution history was not helpful because it was ambiguous, in that the PTO originally disallowed the claim terms "unitary" and "integral" as they were synonymous. According to the Wix Court, the prosecution history shows Parker withdrew the term "integral" yet the patent issued with the term "integral" in the claim. Furthermore, the embodiments all show the flange as formed as a single piece with the top end cap.

The Court departs from the holding of the Wix Court here. First, the patent claims use separate terms and the prosecution history demonstrates that Parker consistently argued for their separate meanings. In patent cases, patent writers are permitted to act as their own lexicographers (giving a claim term the writer's own definition), and the prosecution history demonstrates Parker intended "integral" to mean something different than "unitary." Furthermore, an example by Baldwin gives support to Parker. Citing the '851 specification at Col 4, lines 12-14, it states, "the flange and protrusions can be easily formed with the end cap such as by molding the end cap as a unitary component." This specification's use of the term "such as by molding the end cap as a unitary component" clearly contemplates some form that is not formed as a unitary component. Finally, Merriam Webster's defines integral as "formed as a unit with another part." Merriam-Webster Online Dictionary, 2010. http://www.merriam-webster.com/dictionary/integral. Therefore, the Court adopts Parker's definition that "integral" means "composed of integrated parts."

b. Integral

Claim 1 states "said counterweight having a cylindrical gear portion and an eccentric weight portion integral with said
APE contends that "integral" means "composed of portions, parts, or pieces that together constitute the whole." J&G contends that the term "integral" should be understood as meaning "cast of one-piece." J&G's construction is based less upon the ordinary and customary meaning of the word, whose dictionary definition lists a number of alternatives, than upon its arguments 1) that claim differentiation illustrates its construction of the disputed term is the correct one (Doc. 27, at 21); 2) "integral" and "connected to" are used in the same independent claims to indicate different relationships between the cylindrical gear portion and the eccentric weight portion (Doc 27, at 21-22); 3) APE disavows a multi-part counterweight in the specification (Doc 27, at 22-23); and 4) the file history, previously discussed with reference to "eccentric weight portion," defines a one-piece counterweight (Doc 27, at 23-24).

In examining the claim language, APE also invokes "claim differentiation," which holds that "each claim of a patent constitutes a separate invention and gives rise to separate rights." Kustom Signals, Inc. v. Applied Concepts, Inc., 995 F. Supp. 1229, 1234 (D. Kan 1998), aff'd, 264 F.3d 1326 (Fed. Cir. 2001). Thus, although reference may be made to other claims in the same patent to determine the intended meaning of a disputed term in a claim, limitations from other claims may not be read into an independent claim. Id. APE points out that independent claim 16 recites "an eccentric weight portion connected to said cylindrical gear portion," and argues that this phrase "may suggest a two-piece counterweight where two pieces are 'connected to' each other. Doc 26, at 12. On the other hand, claim 19, which depends from claim 16, recites the "eccentric weight portion is integral with said cylindrical gear portion." Id. APE's point is that under the differentiation of claim concept claims 16 and 19 differ in "scope and are directed to a two-piece counterweight that can also be integral," thus negating "the notion that 'integral' necessarily connotes a 'one-piece' counterweight." Id.

J&G counters APE's claim differentiation arguments with its own. It argues that APE, although correctly stating the rule of claim differentiation, does not follow it because, pursuant to 35 U.S.C. 112(4), the dependent claim, 19, must narrow the scope of the independent claim 16.

Therefore, by statute, "integral" must further narrow or limit the "connected to" language for claim differentiation to properly apply. Thus it naturally follows that "connected to" means a "two-piece" counterweight. Thus, despite Plaintiff's contention, claim differentiation actually illustrates that 'integral' means formed or cast of one piece.

Doc 27, at 21

APE refutes J&G's argument of claim differentiation in footnote 10 of its claim construction reply brief in which APE points out that claim 19 is narrower than claim 16, not because "integral" must further narrow or limit the 'connected to' language," but "because the claim recites the first metal as cast steel and the second metal as tungsten." Doc 31, at 16, footnote 10.

APE begins its argument for its construction of the term "integral" by pointing out that "if the cylindrical gear portion and the eccentric weight portion share common structure," as APE described in its construction of "eccentric weight portion," then it goes without saying that "the eccentric weight portion is integral with the cylindrical gear portion. That is true whether the counterweight is a one-piece unit or comprised of several parts secured together." Doc 27, at 11.

J&G argues, however, that "[i]ndependent claims 1, 6, and 11 recite both the terms "integral" and "connected to" in the claim language. As an example 9, J&G references claim 1's use of "integral" in the description of "the relationship between
the eccentric weight portion and the cylindrical gear portion." Doc 27, at 21. Claim 1 uses "connected to" in the description of "the relationship of the driving means to the counterweight." Doc 27, at 21-22. APE maintains that the term "connected to" in claim 1 "refers specifically to separate items . . . that are joined together," (Doc 26 at 16), but J&G argues, never addresses why, if it intended to cover a two-piece counterweight, it used "integral" and not "connected to" in claims 1, 6, 11 when describing the relationship between the cylindrical gear portion and eccentric weight portion. J&G maintains, the claim language itself indicates "that the term 'connected to' in claims 1, 6, and 11, was selected to refer to two distinct components, and the term 'integral' was selected to refer to a one-piece counterweight." Doc. 27 at 22. Essentially, J&G's position is that if the cylindrical gear portion and the eccentric weight portion are formed or cast of one piece into a counterweight, the patentee used the term "integral" to describe their working relationship, but if the cylindrical gear portion and the eccentric weight portion are two or more pieces put together into a counterweight, then, the term "connected to" is used to describe their working relationship. This construction does not, however, follow from the language of the claims themselves, and this court finds that J&G's construction of the disputed claim term "integral" is an effort to convince the Court to redraft the claims to include unjustified limitations. Cf. Process Control Corp. v. HydReclaim Corp., 190 F.3d 1350, 1357 (Fed. Cir. 1999).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

9 Claims 6 and 11 also use "connected to" to describe the relationship between the driving means and the counterweight.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

J&G does not dispute that APE's statement in its opening claim construction brief (Doc. 26, at 12) that "In the industry and as described in the specification, counterweights were/are known where the gear portion and the eccentric portion are either two-piece or unitarily formed," citing '964 patent, col. 1, line 39 to col. 2, line 9. Cf. Doc. 27, at 22. APE states, without apparent contradiction by J&E, that the language of the claims does not require that the counterweight be cast integral or as a single unit, but J&G argues, that because APE is critical of two-piece assemblies in the specification, it has disavowed a multi-part counterweight. Cf. Astrazeneca v. Mut. Pharm. Co., 384 F.3d 1333, 1340 (Fed. Cir. 2004).

APE counters with its argument that J&G is relying upon a statement made in the Background of the Invention part of the '964 Patent, but has taken the statement out of context. Column 1, lines 39-51 of the '964 Patent discusses the disadvantages of both two-piece and one-piece vibratory devices. In order "to establish a specification disclaimer that surrenders subject matter from the scope of the claims" (Doc 31 at 10) it must be shown that the patentee intended "to deviate from the ordinary and accustomed meaning of a claim by including in the specification expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope." Teleflex, Inc. v. Ficosa North America Corp, 299 F.3d 1313,1325 (Fed Cir. 2002). Discussion in the background section of the patent of the disadvantages of a two piece device does not disavow the coverage by the patent claims of a two-piece device certainly when the background section also discusses the disadvantages of a one piece device.

Finally we return to the prosecution history of the patent, specifically to Reexamination Control No. 90/007,337, for U.S. Patent No. 5,355,964 File History, Reply to Office Action, June 6, 2006. Doc. 27, Exhibit A. F&G argues that the file history demonstrates that "integral" should be construed to mean "formed or cast of one-piece. Doc. 27, at 23. In the reexamination APE argued that the '964 patent was distinguishable from the prior art Hornstein patent "because the independent claims recited a further limitation of an eccentric weight portion that is integral with said cylindrical gear portion." APE argued:

In other words, the claims recite that the counterweight has "a cylindrical gear portion and an eccentric weight portion" and that these two components are "integral"--i.e., they are simply components of a 'one-piece' counterweight. . . . This requirement of the integral--i.e., one-piece--nature of the eccentric weight portion is not disclosed by Hornstein.

[Doc 27] Exhibit A at 6 (emphasis added)

Doc 27 at 23

J&G argues further that APE's position in the reexamination was "that this 'integral' limitation was distinguishable to the eccentric weights taught by the prior art because in the prior art reference those weights were added (or removed) to create
an eccentric moment." Id. J&G interprets this to mean that "the eccentric weight portion of the '964 patent was not added or removed from the counterweight because it was 'integrially formed' with the cylindrical gear portion." Id. J&E posits that "if the eccentric weight portion could be added to the gear portion (i.e., a separate piece) then it would not be the 'one-piece' counterweight that the patentee argued for in the file history." Id. J&E concludes that this language found in the prosecution history binds APE to the construction that "integral" means formed or cast of one-piece. Hockerson-Halberstadt, 222 F3d at 956.

APE responds with the argument that J&G has once again pulled an isolated statement in the prosecution history out of context, and that "an examination of the prosecution history as a whole will demonstrate that this argument is misplaced." Doc 31, at 13. The reader is now referred to pages 15-17 of this opinion that discuss the second and third arguments made by APE to the Patent Office, distinguishing the '964 patent from Hornstein.

In the Office Action mailed August 18, 2006 (Doc. 26, Exhibit C. [Reexamination Control No. 90/007,337 For U.S. Patent No. 5,355,964 File History Office Action Dated August 18, 2006]) the examiner responded to the Reply to Office Action in Reexamination submitted by APE June 6, 2006. In that Office Action the examiner rejected APE's characterization in the June Reply to Office Action of the term "integral":

Nothing in the specification of the subject patent states that "integral" means "one-piece." Thus, this term must be given its broadest reasonable interpretation.

In In re Larson, 340 F.2d 965, 52 C.C.P.A. 930, 1965 Dec. Comm'r Pat. 177, 144 U.S.P.Q. 347 (CCPA 1965), the court agreed with the construction of the term "integral" such that it read on several parts rigidly secured together as a single unit. Id. At 349.

...Thus, whether "integral" is defined as "one-piece" or several parts rigidly secured together as a single unit, it does not read on the structure of Hornstein... .

Exhibit C to Plaintiff's Opening Claim Construction Brief, Doc. 26-4 at p. 11.

APE maintains that "[a]lthough the examiner agreed that Hornstein '514 '[did] not teach an eccentric weight portion integral with a cylindrical gear portion,' the examiner disagreed with the 'one-piece' characterization of the term 'integral' and applied a definition for integral as one-piece or several parts rigidly secured together as a single unit." Doc.31, at 16, citing Doc. 26, Exhibit C at 9-11. Because APE acquiesced in the definition set out by the examiner for the remainder of the prosecution, that is the definition that should prevail for the disputed claim term "integral." APE asks the Court to view the prosecution as a whole and agree that "one skilled in the art or a competitor could not reasonably believe that the patentee had surrendered the relevant subject matter. Pharmacia, 170 F.3d at 1377. The claims were not amended; the examiner rejected a definition set forth in an argument, and the patentee acquiesced in the rejection and embraced the definition. The Court does not find J&G's counter arguments found on pages 23 and 24 of its Reply Brief (Doc. 27) persuasive and agrees with APE that there was no clear and unmistakable surrender of the subject matter; the patentee has not limited the term "integral" to mean "formed or cast of one-piece." The Court adopts the plaintiff's construction of the term "integral."

"Integral" is construed to mean "composed of portions, parts, or pieces that together constitute the whole. The portions act together to function as the counterweight."

**2149**

1. "An integral assembly of a multiplicity of spaced reagent tubes arranged in an elongated ... series ... and a corresponding multiplicity of correspondingly spaced independent seal caps" (Claims 1, 15, and 17)

SSI's Proposed Construction
a contiguous component comprising a
d series of reagent tubes spaced
apart ... a series of [aligned] 1
components where the length of the 
series is greater than the

TFS's Proposed Construction
a one-piece article of manufacture of a
number of spaced reagent tubes arranged
in an elongated series and a
corresponding number of spaced
independent seal caps and excludes an
dimensions of the individual article of manufacture where the reagent components . . . individually manipulable seal caps that correspond in number to the reagent tubes, the spacing of the seal caps corresponding to a spacing of the reagent tubes, the number of seal caps and reagent tubes each being more than one

1 SSI omits the word "aligned" in its proposed construction for this language as it appears in claim 15.

The '553 patent repeatedly refers to the claimed invention as an "integral assembly," and the terms "integral" and "integraally" appear frequently in the specification and claims. At the core of many of the disputed terms is a disagreement between the parties about the meaning of the word "integral." SSI contends that "integral" means (circularly) "forming a unit such as to be complete and composed of integral parts" and that "integral assembly" refers to a series of individual elements coming together (i.e. assembled) to function as a contiguous component (i.e. operating in an integral manner). TFS contends that "integral assembly" refers to a one-piece article of manufacture.

2 Indeed, the words appear so frequently in some places that it is difficult to see how they are not redundant or circular. See, e.g., '553 Patent at 1:67 to 2:4 ("an integral 'live' hinge integrally interposed in the tether . . . enabling flexible manipulation of each . . . cap . . . from an angularly related integral extended condition to an integral superimposed tube-sealing condition"); id. at 4:56-57 ("the thin hinge portion is integral with the remainder of the strap with which it is integrally formed").

Despite the terms' frequent usage, neither "integral" nor "integraally" is defined in the patent. In discussing the background of the invention, the inventor states:

"It is particularly advantageous in the handling of reagent-containing vials or tubes, such as microcentrifuge tubes, that the tubes and the independently tethered caps for sealing the tubes constitute a unitary assembly. Accordingly, it is one of the objects of the present invention to provide a unitary assembly of multiple hollow tubes integrally connected to one another and to a corresponding number of seal caps independently tethered to an associated tube so that the integral assembly of tubes and caps may be handled as a unit while enabling each of the seal caps to be independently sealed or unsealed from the tube to which it is independently integrally tethered."

'553 Patent at 1:36-47 (emphasis added). Thus, it appears that the goal of providing for an "integral assembly" is to allow the apparatus to be handled as a unit. This is similar to SSI's definition of "integral," but the proposed construction "contiguous component" is seemingly too broad. The terms "integral" and "integraally" frequently modify words that already imply that two pieces are contiguous, such as in the phrases "integrally connected," "integrally tethered," "integral connection," and "merges integrally." E.g., id. at 1:41-42, 2:27, 2:55-56, 3:60, 3:65, 4:26. Thus, "integral" and "integraally" must mean something more than "contiguous."

Depending on the context, courts have construed the term "integral" to broadly mean forming a unit or to narrowly refer to being formed in one piece. See, e.g., Vanguard Prods. Corp. v. Parker Hannifin Corp., 234 F.3d 1370, 1371, 1373 (Fed. Cir. 2000) ("formed as a unit with another part"); In re Hotte, 475 F.2d 644, 647 (C.C.P.A. 1973) ("sufficiently broad to embrace constructions united by such means as fastening and welding"); Am. Piledriving Equip., Inc. v. Bay Mach. Corp., 632 F. Supp. 2d 956, 965 (N.D. Cal. 2009) ("formed or cast of one piece"); Parker-Hannifin Corp. v. Wix Filtration Corp., 2008
U.S. Dist. LEXIS 24540 at *27 (E.D. Cal. Mar. 14, 2008) ("formed in a single piece"). TFS urges the court to follow Parker-Hannifin, which construed "integral" to mean "formed in a single piece." The patent at issue in Parker-Hannifin used language such as "integral end cap assembly" and "an annular flange integral with said first end cap," 2008 U.S. Dist. LEXIS 24540 at *19-20. The specification stated that the flange should be molded as a single unit with the top end cap. Id. at *22. The court held that such single-unit construction was consistent with the term "integral," and "[t]here is nothing in the claims or specifications that indicate that 'integral' requires more than one part." Id. at *22-23. Thus, like other cases that limit "integral" to a one-piece article, Parker-Hannifin involved a patent that clearly indicated the elements should be formed in one piece. While the only embodiment discussed in the '553 patent involves a one-piece article of manufacture, the specification does not explicitly limit the invention to that structure, nor is it clear that "integral" refers only to a single injection-molded piece as described in the preferred embodiment.

TFS argues that the specification uses "integral assembly" synonymously with "unitary assembly" and uses "unitary" in the sense of a single structure. The only language regarding a single structure is the statement, describing the preferred embodiment, that "the flexible hinge straps, the integrally connected tubes, and the seal caps are all preferably formed as a single unitary structure by injection molding from a suitable synthetic resinous material." '553 Patent at 4:30-33 (emphasis added). Far from limiting either "integral" or "unitary" to a single structure, this language suggests that the apparatus is preferably a single unitary structure but need not be. TFS's argument that "preferably" modifies "injection molding" rather than "single unitary structure" is unpersuasive. Although the inventor was often liberal with his use and positioning of adverbs, TFS's interpretation greatly strains the rules of grammar. Moreover, the inventor earlier states that the preferred embodiment "comprises a multiplicity . . . of tubes, injection molded from a suitable plastic," id. at 3:25-37, suggesting that the new preference being expressed is that of forming the entire article, from tubes through seal caps, as a single structure.

TFS also relies on the prosecution history to argue that the invention must be a single structure. During prosecution, the examiner rejected certain claims under 35 U.S.C. § 103 as being unpatentable over Irwin, et al. (United States Patent No. 3,139,208) in vew of Berg (United States Patent No. 2,949,203). Springer Decl., Ex. F P 4. Specifically, the examiner found "[i]t would have been obvious to one of ordinary skill in the art to have employed the cap open position taught by Berg, Fig. 2, in the construction of the device of Irwin, et. al., motivated by the ease of molding such." Id. In response, the inventor argued:

> the flat plate 8 of Irwin et al is integral with the tubes 6, the flat plate configuration being chosen specifically to retain the associated receptacles 6 for paint materials associated with one another to permit "paint by the numbers" facility to the user of the assembly. Additionally, the Berg structure illustrated in FIG. 2 is a separate manufacture from the container 10, and is disposed removably on the neck of the container 10 for purposes of convenience. Thus, attempting to mold the injection molded part of Berg as illustrated in FIG. 2 into the structure of Irwin et al, which presumably is also injection molded, would serve no useful purpose revealed by Irwin et al, would not be simpler or more easy, but much more complex, and certainly therefore a logical inference cannot be deduced that the molding process and structure resulting therefrom would be facilitated by the proposed re-design and reconstruction. If anything it would be made more complex and difficult, therefore teaching away from the proposed reconstruction.

Springer Decl., Ex. G at 14. TFS argues that this excerpt (1) uses "integral" to refer to the one-piece unit in Irwin and (2) states that converting the inventor's one-piece unit of manufacture into a structure with parts of separate manufacture would be teaching away from the invention. It is true that Irwin describes a one-piece unit and in fact touts his invention as "lend[ing] itself to inexpensive production as a unitary molding . . . by reason of the fact that the [pieces] are all formed integrally with one another," Irwin at 1:21-25. However, using the word "integral" to refer to a one-piece unit of manufacture does not imply that "integral" cannot also describe something else. In addition, the inventor never argues that a structure with parts of separate manufacture were not contemplated by his invention. He argued that there was no motivation to combine Irwin with Berg, i.e. that the invention was non-obvious. This is fully consistent with an argument that the invention included multi-part units. Thus, the prosecution history does not support TFS's narrow definition of "integral."

In conclusion, the '553 patent uses "integral" to mean more than a one-piece article but less than anything that is contiguous. The court finds that "integral" and "integrally" refer to pieces joined in such a way as to form a single unit. Thus, the court construes the language at issue as "a number of spaced reagent tubes arranged in an elongated series with a corresponding number of individually manipulable seal caps, the spacing of the seal caps corresponding to the spacing of the reagent tubes, all joined so as to form a unit."
The term "integral" appears in asserted claims 1, 6, and 11, as well as unasserted claims 19, 21, and 27. APE proposes the following construction:

Integral -- means composed of portions, parts, or pieces that together constitute the whole.

The eccentric weight portion and the cylindrical gear portion act together to function as the counterweight.

(Joint Disputed Claim Terms Chart.) Geoquip proposes that "integral" means "formed or cast of one-piece." Id.

The court begins its analysis by looking to the claims themselves. Claim 1, which is representative of the asserted claims, describes a "counterweight having a cylindrical gear portion and an eccentric weight portion integral with said cylindrical gear portion." '964 Patent, col. 9, ll. 39-41. The term is used consistently throughout the claims, and there is no reason to believe that the term is used differently in one claim vis-a-vis another. See Innova, 381 F.3d at 1119 ("Unless otherwise compelled, when different claims of a patent use the same language, we give that language the same effect in each claim."). Thus, the court looks to the claims as a whole to determine the meaning of the term "integral."

The relationship between claims 16 and 19 provides strong evidence as to the meaning of "integral." Claim 16, which does not contain the term "integral," describes a counterweight having "an eccentric weight portion connected to said cylindrical gear portion." '964 Patent, col. 11, ll. 13-14 (emphasis added). Claim 19, which is dependent on claim 16, describes: "The counterweight assembly of claim 16 wherein said eccentric weight portion is integral with said cylindrical gear portion, said first metal is cast steel, and said second metal is a [sic] tungsten." Id. at ll. 30-33 (emphasis added). Because dependent claim 19 uses the term "integral" rather than the phrase "connected to" to describe the relationship between the eccentric weight portion and the cylindrical gear portion, the term "integral" presumably limits claim 19 in a manner that claim 16 is not so limited. See Phillips, 415 F.3d at 1315 ("[T]he presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim.").

Although the phrase "connected to" will be discussed further below, the court construes that phrase to mean "joined together, united or linked." Thus, claim 16 contemplates a two-piece counterweight in which the cylindrical gear portion and the eccentric weight portion are joined together. Under APE's proposed construction, the term "integral" in claim 19 would then limit the phrase "connected to" by requiring that the eccentric weight portion and the cylindrical gear portion function together to constitute the whole counterweight. The court fails to see, however, how this definition of "integral" in any way meaningfully limits the definition of "connected to" as found in claim 16. Claim 16 describes the two portions of the counterweight as being joined together; presumably, the two portions also must function together or the invention would be ineffectual. Nevertheless, as the claims themselves do not define the term explicitly, the court turns to the prosecution history for further guidance.

During the 2006 reexamination of the '964 Patent, the examiner initially rejected claims 1-3, 5, 6, 8-14, and 16-19 on the grounds that the invention was unpatentable for obviousness in light of United States Patent No. 3,224,514 (the "Hornstein patent"). (Pl.'s Opening Claim Construction Br. Ex. L, "Office Action in Ex Parte Reexamination," at 2.) 6 The Hornstein patent discloses a vibratory pile driver in which the counterweights contain a number of counterbalancing cylinders so that the counterweights themselves possess no eccentric weight absent the insertion of metal rods. (Pl.'s Opening Claim Construction Br. Ex. M, "Reply to Office Action in Reexamination," at 5.) In order to distinguish the Hornstein patent from the present invention, the patentee argued that Hornstein did not disclose an eccentric weight portion "integral" with the gear portion: "This requirement of the integral-i.e., one-piece-nature of the eccentric weight portion is unquestionably not disclosed by Hornstein. As explained above, Hornstein teaches a system in which weights may be added (or removed) in order to balance or unbalance the rotating rotor. . . . Hence Hornstein's eccentric is not integrally formed." Id. at 6 (emphasis added). Therefore, in order to distinguish prior art, the patentee argued that the term "integral," within the context of the '964 Patent, meant that the cylindrical gear portion and the eccentric weight portion were formed or cast of one piece. See id. The court finds this to be a clear and unmistakable disavowal by the patentee limiting the term "integral" to one-piece
counterweights. See, e.g., Computer Docking, 519 F.3d at 1374 (noting a patentee may limit a claim term by clearly characterizing the invention in a certain way to overcome rejections based on prior art). Therefore, after taking into account both the language of the '964 Patent and its prosecution history, this court construes the term "integral" to mean "formed or cast of one piece," as Geoquip proposes.

6 Pagination is that of the original document rather than of the exhibit. As the patentee never recanted in any way from the position that "integral" meant "formed or cast of one piece," the court finds the examiner's response to the patentee to be irrelevant. See, e.g., Springs Window Fashions LP v. Novo Indus., L.P., 323 F.3d 989, 995 (Fed. Cir. 2003) ("In any event, the examiner's remarks do not negate the effect of the applicant's disclaimer.").

2151
(2) integral

As demonstrated in the claims set forth above, the term "integral" appears throughout the claims as describing the relation between the cylindrical gear portion and the eccentric weight portion of the counterweight: the eccentric weight portion in each instance is described as "integral with the cylindrical gear portion." Claims 1, 6, 11, 19, 21, 27. Plaintiff proposes that the term be construed to mean "composed of portions, parts, or pieces that together constitute the whole" Joint Disputed Claim Terms Chart, Dkt. # 29-2, p. 3. Defendants proposed that it be construed to mean "formed or cast of one piece." Id. Neither party suggests that the term have a different meaning in any claim; the usage is consistent throughout the claims.

In support of its proposed construction, plaintiff refers the Court to an examiner's comment in the reexamination action, wherein the examiner stated that "[n]othing in the specification of the subject patent states that 'integral' means 'one-piece'." Id., p. 4. However, this examiner's comment is not determinative of the question. More significance is placed on the patentee's response during the reexamination, in which it was represented that claims 1, 6, and 11 recite that the eccentric gear portion and cylindrical gear portion are "integral," meaning they are components of a one-piece counterweight. Patentee's Remarks, Dkt. # 31, Exhibit A, p. 6. The patentee cited this one-piece or "integral" nature of the eccentric weight portion as "unquestionably" distinguishing the invention from the prior art of Hornstein. Id. Further, as defendants contend, the patent itself criticized two-piece counterweights with the eccentric weight and cylindrical gear portion bolted together. This criticism may be deemed a disavowal of that aspect of the prior art. '964 patent, col 1, lines 39-45.

The term is not defined in the claims, but the word integral has an ordinary meaning which may be found in the dictionary. For example, the adjective is defined in the Merriam-Webster New Collegiate Dictionary 3 as follows:

integral:

1 a: essential to completeness: constituent

b (1): being, containing, or relating to one or more mathematical integers (2): relating to or concerned with mathematical integrals or integration

c: formed as a unit with another part

2: composed of integral parts

3: lacking nothing essential: entire

- 2607 -
3 The Court has consulted both the Tenth Edition (1998) and the on-line edition and found that they do not differ.

Nothing in the claims suggests that a different meaning was intended. Indeed, the use of the term throughout the claims is consistent with the meaning "formed as a unit with another part." Certain claims themselves describe "forming" the counterweight with a first metal (i.e., one metal) (claim 21), and "casting" the counterweight with a first metal (claim 27), in each instance creating a counterweight with the eccentric gear portion integral with the cylindrical gear portion.

The specification, in describing the preferred embodiment of the invention, defines the counterweight as a "one-piece component that is cast with a predetermined metal." '964 patent, col. 5, lines 49-52. Nowhere in the specification is any embodiment other than a one-piece unit suggested. The only variation or modification mentioned is the use of a metal other than tungsten for the rods inserted into the counterweight. '964 patent, col 9, lines 22-30.

The Court finds that "the specification read as a whole suggests that the very character of the invention requires the limitation [to a one-piece unit] to be a part of every embodiment." Alloc, 342 F.3d at 1370. This finding recognizes both the disavowal of two-part counterweights found in the prior art discussion, and the entire discussion of the preferred embodiment. It is proper in this instance to limit the claims to the scope of the invention as it is described in the specification, because "the claims cannot be of broader scope than the invention that is set forth in the specification. On Demand Machine, 442 F.3d at 1340.

The Federal Circuit court in Phillips clarified the law regarding claim construction and resolved prior conflicts within the Federal Circuit regarding the importance of specifications in claim construction. On Demand Machine, 442 F.3d at 1337, citing Phillips v. AWH Corp., 415 F.3d at 1310. The court in Phillips, resolving the conflict, "stressed the dominance of the specification in understanding the scope and defining the limits of the terms used in the claims." Id. at 1338, citing Phillips, 415 F.3d at 1313. In recognizing the dominant role of the specification in defining the limits of the claimed invention, the Court in this analysis of the term integral is not improperly importing limitations from the specification into the claims, but relying on the law of claims construction as it has been clarified in Phillips. Id. As noted there, the patent statute requires that the specification "describe the claimed invention in 'full, clear, concise, and exact terms.'" Id. at 1316; citing 35 U.S.C. 112 P 1. The counterweight described throughout the specification is a one-piece unit, formed or cast of a single metal.

The Court concludes that defendants' proposed construction of the term integral is consistent with the usage in the claims and the specification. The Court therefore construes the term to mean "formed or cast of one piece."

2152

3. "Integral"

The term "integral" appears in asserted claims 1, 6 and 11. It also appears in unasserted claims 19, 21 and 27. APE proposes the construction: "... composed of portions, parts, or pieces that together constitute the whole. The portions act together to function as the counterweight." Doc. No. 37 at 5. ECA responds that the term should instead be construed "formed or cast of one-piece." Doc. No. 41 at 2. The Northern District of California construed the term as "formed or cast of one-piece." Bay, 632 F. Supp. 2d 956, 2009 WL 1684611, at *9.

In order to construe this term, this Court first turns to the language of the claims. "Integral" first appears in claim 1, which recites, inter alia, "[a] vibratory assembly for imparting a vibratory force to a pile, comprising ... [a] counterweight having a cylindrical gear portion and an eccentric weight portion integral with said cylindrical gear portion ..." '964 Patent, col. 9, ll. 33-42. The language of claim 1 is representative of the use of the word "integral" as a descriptor of the structural relationship between the cylindrical gear portion and the eccentric weight portion throughout the claims.

ECA points to claim 16, and claim 19, which depends from 16, as evidence supporting their definition of "integral." Claim 16 recites ". . . an eccentric weight portion connected to said cylindrical gear portion . . ." while claim 19 recites "[(]he counterweight assembly in claim 16 wherein said eccentric weight portion is integral with said cylindrical gear portion . . ."
Judge Hamilton of the Northern District of California found the context created by unasserted claims 21, 23 and 27 to be helpful to that court's construction of the term "integral." See Bay, 632 F. Supp. 2d 956, 2009 WL 1684611, at *7. These claims describe a method for producing the counterweight involving casting, which the Northern District of California determined was supportive of the Defendant's argument that "integral" was properly construed to mean "one piece." See id.; see also '964 Patent, col. 11, ll. 38-55, col. 12, ll. 1-7, 13-15, 27-54. This Court is not convinced that these claims, which recite one method of production for the counterweight, necessarily limit the patentee's right to exclude to counterweights produced through only that method. As such, given that the term "integral" is not explicitly defined in the claims, this Court must turn to the specification for guidance.

"Integral" is mentioned in several places within the specification. Like its use in the claims, the term is used in the specification to describe the structural relationship between the cylindrical gear portion of the counterweight and the eccentric weight portion of the counterweight. See e.g., '964 Patent, col. 5, ll. 27-33 (stating "[i]n the preferred embodiment . . . the counterweight 40 has a large mass integral to and projecting from the bottom portion 104 of the gear portion 41 . . ."); see also '964 Patent, col. 3, ll. 44-46 (stating "[e]ach counterweight 40 has a gear portion 41 and an eccentric weight portion 43 that is integral to the gear portion").

Judge Hamilton cites to several passages from the specification in the course of construing the term as meaning "formed or cast of one-piece." First, her opinion cites that "'[t]he present invention … provides a method of making a counterweight assembly adapted to rotatably fit in a vibratory assembly. The counterweight assembly having a cylindrical gear portion and an integral eccentric weight portion is cast with a first metal such as steel.'" Bay, 632 F. Supp. 2d 956, 2009 WL 1684611 at *8 (quoting '964 Patent, col. 2, ll. 52-57). The above quotation, however, appears to be a summation of claims 21, 23 and 27, which provide a method for producing the invention through casting, but does not conclusively limit the right to exclude to embodiments of the invention that are produced in such a manner. As such, this passage of the specification provides little useful guidance.

Judge Hamilton's opinion next references the following passages in the specification: "'[t]he eccentric weight portion 43 of the counterweight 40 . . . is formed integral with the gear portion 41 . . ." '964 Patent, col. 5, ll. 20-22, and:

"[i]n the preferred embodiment, the counterweight 40 is a one-piece component that is cast with a predetermined metal, such as steel . . . '[t]he bottom portion 104 of the counterweight 40 is cast having insert receiving areas or bores 112 substantially parallel to the center bore 106 and extending fully through the gear portion 41 and fully through the eccentric weight portion 43.

'964 Patent, col. 5, ll. 51-53, 61-65. 8 Both of these passages refer to the preferred embodiment of the invention. 9 As such, this court does not believe that these passages would necessarily lead a person having ordinary skill in the art to believe that any embodiments of the counterweight would need to be cast of one piece in order to fall within the scope of the patent

8 The phrase "41 and fully through the eccentric weight portion 43," '964 Patent, col. 5, ll. 64-65, was not in Judge Hamilton's claims construction opinion, and was included by this Court in order to preserve the complete language of the cited passage of the specification. See Bay, 632 F. Supp. 2d 956, 2009 WL 1684611, at *8.

9 Indeed, just a few lines before the passage "'[t]he eccentric weight portion 43 of the counterweight 40 . . . is formed integral with the gear portion 41 . . ." from '964 Patent, col. 5, ll. 20-22, the language of the specification refers the reader to Figures 3A and 3B. See '964 Patent, col. 5, l. 17. Prior to this passage in the specification, those Figures are clearly identified as relating to the preferred embodiment of the invention. See '964 Patent, col. 3, ll. 9-23.
Finally, Judge Hamilton's claim construction opinion points to the fact that the specification references cast, one-piece counterweights having integral eccentric weight portions in the prior art as evidence that the inventor contemplated only that embodiment of the invention. See Bay, 632 F. Supp. 2d 956, 2009 WL 1684611, at *8 (citing '964 Patent, col. 1, ll. 45-48). However, a reading of the full paragraph surrounding that section of the specification reveals that the inventor cited to prior art that involved bolting as well, implying that the inventor contemplated bolted embodiments of his invention. See '964 Patent, col. 1, ll. 39-48. Furthermore, the fact that the inventor mentioned all of the descriptive terms "cast," "one-piece," and "integral," in the same passage in order to describe the prior art could very well mean that a person having skill in the art would not view those terms to be synonymous. Given the ambiguity of the specification, this Court, seeking more evidence, turns to the prosecution history.

In 2006, the PTO reexamined the validity of the claims of the '964 Patent. In an attempt not to have the claims invalidated, the patent owner argued that claims 1, 6, and 11 were distinguished from prior art (specifically U.S. Patent No. 3,224,514, issued to Hornstein) because they recited an invention in which "the counterweight has a cylindrical gear portion and an eccentric weight portion and that these two components are integral - i.e., they are simply components of the one-piece counterweight." See APE's Claim Construction Reply Br., Ex. A (Doc. No 35-2), at 7. Seemingly, this would serve as a clear limitation of the scope of the term "integral" by the patent owner in the prosecution history. However, in the PTO's following office action, this proposed limitation of "integral" was explicitly rejected by the examiner. Finding no explicit definition in the specification of "integral" meaning one piece, the examiner gave the term its broadest possible meaning, concluding "[t]hus, whether 'integral' is defined as 'one-piece' or several parts rigidly secured together as a single unit, it does not read on the structure of [the Hornstein Patent]." See APE's Opening Claim Construction Br., Ex. C (Doc. No. 30-4), at 14. There is no evidence in the record of the patent owner contesting this interpretation of the term "integral" at any subsequent point in time.

As stated above, the Federal Circuit has held that, in order for a statement made by a patent owner in the prosecution history to limit the scope of his or her patent protection, that statement must be a "clear and unmistakable disavowal" of a broader scope of protection. See Purdue Pharma, 438 F.3d at 1136. It is well established that the prosecution history is evidence of the process of negotiations between an inventor and the PTO and, as such, it can be less clear than the specification in determining the proper construction of disputed terms and phrases. See Phillips, 415 F.3d at 1317.

In reading the prosecution history of the patent-in-suit, as a whole, this Court has determined that the statement made by the patent owner implying that "integral" means "one-piece" does not constitute a clear and unmistakable disavowal of a broader definition for two reasons. First the patent examiner explicitly rejected the narrow "one-piece" definition. Second the patent owner never contested that rejection.

Having reviewed the above intrinsic evidence, this Court is convinced that any construction of the term "integral" must include embodiments of the mentioned counterweight that are formed or cast of one piece. It is also clear that "integral" must, in some way, limit the previously-construed phrase of "connected to." See supra Part II.C.2. However, this Court remains unconvincing the persons having ordinary skill in the applicable art would necessarily believe that the '964 Patent's scope would cover solely embodiments of the counterweight that are formed or cast of one piece. As such, this Court will not limit the construction of this disputed term in such a manner, which, based on the available evidence, would be an improper reading of limitations from the specifications upon the language of the claims. See Sjoland, 847 F.2d at 1581-82. Given the language of the claims and the specification, and paying specific attention to the nature of the cylindrical gear portion and the eccentric weight portion as parts of the whole counterweight, this Court recommends that the term "integral" be construed in the following manner: "forming a complete structural whole."

3. "integral"

This term appears in asserted claims 1, 6 and 11. The term also appears in unasserted claims 19, 21 and 27. APE contends that the term should be construed to mean "composed of portions, parts, or pieces that together constitute the whole. The portions act together to function as the counterweight." Bay contends that the term should be construed to mean "formed or cast of one-piece."
To begin its analysis, the court first turns to the claims themselves. The term "integral" is first introduced in claim 1, which provides: "A vibratory assembly for imparting a vibratory force to a pile, comprising: . . . a counterweight having a cylindrical gear portion and an eccentric weight portion integral with said cylindrical gear portion . . ." Substantially similar language appears in claims 6, 11, 19, 21 and 27.

Reviewing all the claims in which the term "integral" is used, it is apparent that the term is meant to have the same meaning in each claim, since there is no indication that the term is to be given a specific definition in any one claim versus another, and no indication that the term has been particularly defined in any specific claim. The court, however, finds that the usage of the term in claims 21, 23 and 27 provides illumination as to the meaning of the term when read together with claims 16 and 19.

Claim 21 provides: "A method of making a counterweight assembly of a vibratory device for imparting a vibratory force to a pile, comprising the steps of: forming with a first metal a counterweight having a cylindrical gear portion and an eccentric weight portion integral with the cylindrical gear portion . . ." Claim 23 provides: "The method of claim 21 wherein said step of forming the counterweight comprises casting the counterweight." Claim 27 provides: "A method of making a counterweight assembly of a vibratory device for imparting a vibratory force to a pile, comprising the steps of: casting with a first metal a counterweight having a cylindrical gear portion and an eccentric weight portion integral with the cylindrical gear portion . . ."

The court construes the language in unasserted claims 21, 23 and 27 as supporting Bay's proposed construction insofar as these claims indicate that the counterweight is made by forming or casting the "cylindrical gear portion" and "eccentric weight portion" with one metal, i.e., the "cylindrical gear portion" and "eccentric weight portion" are "formed or cast as one-piece." This conclusion is also supported by the language of claims 16 and 19.

However, claim 16 provides: "A counterweight assembly for use in a vibratory pile . . . comprising: a cylindrical gear portion having a plurality of gear teeth around its circumference, . . . an eccentric weight portion connected to said cylindrical gear portion at a position radially outward of the axis of said cylindrical gear portion . . ." Claim 19, which depends from claim 16, provides: "The counterweight assembly of claim 16 wherein said eccentric weight portion is integral with said cylindrical gear portion, said first metal is cast steel, and said second metal is a tungsten."

This language suggests that the term "integral" is not interchangeable with the phrase "connected to" inasmuch as claim 19 would be superfluous if "integral" and "connected to" meant the same thing. The doctrine of claim differentiation supports this construction. That doctrine creates a presumption against constructions that would render a claim meaningless in its entirety by making it identical in scope to another claim. Sinorghem Co., Shandong v. Int'l Trade Comm'n, 511 F.3d 1132, 1139 (Fed. Cir. 2007). In other words, claim differentiation creates a presumption that each claim in a patent has a different scope. Kraft Foods, Inc. v. Int'l Trading Co., 203 F.3d 1362, 1368 (Fed. Cir. 2000). Thus, the presence of the limitation "integral" in claim 19 gives rise to the presumption that this limitation is not present in claim 16, which supports the determination that the meaning of "integral" is not the same as "connected to." As discussed more fully below, because the court construes the term "connected to" to mean "joined together, united or linked" conveying the joining, uniting or linking together of two separate pieces or parts, the court construes the claim language to support the conclusion that the term "integral" means "formed or cast as one-piece." Nevertheless, because the claim language does not specifically define the term "integral," the court examines the specification for added insight.

The specification states that "[t]he present invention . . . provides a method of making a counterweight assembly adapted to rotatably fit in a vibratory assembly. The counterweight assembly having a cylindrical gear portion and an integral eccentric weight portion is cast with a first metal such as steel." '964 Patent, col. 2, lines 52-57. The specification further states that "[t]he eccentric weight portion 43 of the counterweight 40 . . . is formed integral with the gear portion 41." '964 Patent, col. 5, lines 20-22. In addition, the specification states: "In the preferred embodiment, the counterweight 40 is a one-piece component that is cast with a predetermined metal, such as steel. . . . The bottom portion 104 of the counterweight 40 is cast having insert receiving areas or bores 112 substantially parallel to the center bore 106 and extending fully through the gear portion."

Based on the foregoing, the court finds that the specification also supports the conclusion that the term "integral" means "formed or cast as one-piece."
Moreover, as Bay points out, the prosecution history also supports this conclusion. During reexamination of the '964 Patent, the patentee represented to the PTO that claims 1, 6 and 11 "recite that the counterweight has 'a cylindrical gear portion and an eccentric weight portion' and that these two components are 'integral' - i.e., they are simply components of a 'one-piece' counterweight." Bay's Claim Construction Brief, Exh., C at 6. Specifically, the patentee distinguished the claims of the '964 Patent from U.S. Patent No. 3,224,514 issued to Hornstein, with the statement that Hornstein did not disclose the "requirement of the integral - i.e., one-piece - nature of the eccentric weight portion. Id. The patentee further stated that "there is no 'integral' or 'one-piece' relationship when Hornstein provides eccentric force" because "Hornstein teaches a system in which weights may be added or removed in order to unbalance the rotating rotor." According to the patentee, because a second metal [which may be made of a different material] must be inserted into the rotor to render Hornstein's device capable of providing eccentric forces, his "eccentric is not integrally formed." Id. With these statements, the patentee expressly acknowledged, in order to distinguish his invention from prior art, that the "cylindrical gear portion" and an "eccentric weight portion" are components of a one-piece counterweight.

In sum, for all the reasons stated above, the court concludes that Bay's proposed construction of the term "integral" is most consistent with both the '964 Patent's language and the prosecution history. The court therefore construes the term "integral" to mean: "formed or cast of one-piece."

B. "Integral."

The term "integral" appeared in claim 17. Claim 17 depended from claim 1 and read as follows (col. 6:15-16):

17. The apparatus according to claim 1 wherein said body portion and said closure are of integral construction.

Paczonay contends that integral should mean "of or pertaining to, or belonging as a part of the whole; constituent or component." He argues that this term is defined in the specification in the following passage: "[a]pparatus is of integral construction and is formed of resilient, flexible material such as rubber or plastic" (col. 3:13-15). Paczonay also refers to figures depicting the invention. Defendants propose that integral should mean "functioning as a solitary article." From the specification, defendants cite the same passage as Paczonay, and in addition, cite the passage that stated "[i]ntegrally connected to the body portion at the fluid outlet end thereof and extending across the fluid outlet end is a deformable closure 24 . . . " (col. 3:23-26). The term is also used in the specification describing the bite-valve closure (col. 3:39-48):

"[p]ortion 34 is in the form of a strip of resilient flexible material integrally connected to the remainder of the closure at opposed strip ends . . . application of the opposed forces will deform the closure . . . and cause portion or strip 34 to form an outwardly projecting arch between the ends of the portion or strip."

As mentioned above, claim 17 depended from claim 1. Claim 1 read "a hollow body portion . . . and a deformable closure connected to said body portion and extending across the fluid outlet . . . " (col. 4:64-5:4). Claim 17 indicated that the deformable closure and the body portions are "integrally connected." Also, parties agree that the term "unitary construction" as used in claim 20 is defined as "construction of a single object" (Joint Stmt. at 2). Looking at the claims and specification as a whole, it is clear that "integral" must mean something more than merely connected, but something less than made from a single object. Defendants' proposed definition captures such a relationship. "Integral" means that the objects must function as a single unit. They need not be formed of a single piece.

This interpretation is consistent with the term's commonly-understood, plain meaning. As to dictionary definitions, both parties cite the definition that reads "of, pertaining to, belonging as a part of the whole; constituent or component." Joint Stmt. at 5-6. Similarly, integral is defined as "formed as a unit with another part." Merriam-Webster, Ninth New Collegiate Dictionary, 1984. All of these definitions comport with the concept that the parts must function together as a single unit, but need not be comprised of a single part. Accordingly, "integral" is held to mean "functioning as a single article."
A. "Integral"

Plaintiff argues that the term "integral" must be given the meaning found in the specification, that is, that the blocks 14 are "formed with or joined to" the insulation member 12. In other words, the blocks are either formed as part of the insulation member or formed separately and then joined to the insulation member. Defendant argues that the term "integral" must be held to mean "being a part of and made of the same material."

The dictionary definition of the adjective "integral" is: "necessary to make a whole complete; essential or fundamental" and as "included as part of a whole rather than supplied separately." The Oxford Dictionary of English (revised edition). Ed. Catherine Soanes and Angus Stevenson. Oxford University Press, 2005. The first definition suggests that plaintiff's interpretation of "integral" is correct; the second leans more toward defendant's.

It is important, however, to construe the claims in light of the specification. In particular, the specification provides, as already noted above, that the board member "may be formed by cutting away portions thereof . . . to form the desired configuration of blocks and channels" or the blocks "may be formed separately and adhered to a rectangular solid block of the insulating material[.]") Whether the blocks forming the venting channels are carved out of the insulation material or formed separately and attached, they are an integral part of the patented invention, without which the invention would be meaningless and ineffective. In other words, the blocks are "necessary," "essential," "fundamental," and "part of [the] whole" invention. Without the blocks, the invention isn't the invention.

Defendant's interpretation that the blocks must be made from the same material as the insulation member improperly imports a limitation from the embodiment depicted in Figure 3. See PrimaTek II, supra, 318 F.3d at 1148.

Accordingly, the Court construes the term "integral" as meaning "formed with or joined to."

Claim 1 is the only independent claim in the patent; claims 2, 4, 6 and 11 depend from it. The only dispute before us involves the meaning and scope of Claim 1. The claim reads in full as follows:

1. In combination with a settling tank for a wastewater treatment, said tank including an inlet line for feeding wastewater therein, means to remove sludge from the tank and an outlet zone defined by an effluent trough, at least one side of which has a weir to permit clarified water to spill into the trough; and an outlet to remove clarified water from said trough; an arrangement for preventing noxious gases generated in the wastewater from being discharged into and fouling the atmosphere, said arrangement comprising:

   A. a hood which is supported over the trough to define a confined region to capture said gases, said hood having a side wall which protrudes into the water in said settling tank at a position spaced from the weir side of the trough, said side wall protruding into the water to a depth below the upper edge of the weir to form a scum baffle integral with the hood; and

   B. means to treat the captured gases to render them inactive, and to prevent the discharge of said noxious gases into the atmosphere.

This case was originally tried in the district court in June, 1991. The court held that the '704 patent was not invalid, and found that Delta's odor control system did not infringe the asserted claims of the patent, either literally or under the doctrine of equivalents. The court noted that the accused system, unlike the patented system, contained an air gap between the scum baffle and hood. The court held that the air gap prevented the hood from defining a "confined region" and that it prevented the hood from being "integral with" the baffle.

The case was appealed to this court. In our March 17, 1994 decision, we vacated the trial court's finding of noninfringement.
under the doctrine of equivalents and its finding that the patent was not proven invalid. We rejected the district court's restrictive interpretation of the terms "confined region" and "integral" in Claim 1, holding that the court unduly limited the term "confined region" to regions that are "completely sealed" and the term "integral" to "one-piece" constructions. We held that the district court did not clearly err in its finding of no literal infringement, but we remanded for a determination of whether, under our claim interpretation, there was infringement under the doctrine of equivalents. On remand, the district court found that Delta's odor control system did not infringe under the doctrine of equivalents. The court also found no contributory infringement, noting that the Delta device was capable of substantial noninfringing use.

At the same time, the court concluded that Delta's good-faith belief that its design did not infringe the '704 patent precluded a finding that Delta knowingly induced infringement. Lastly, the court held that the '704 patent was not invalid.

Warminster urges us to reverse the district court's doctrine of equivalents determination, arguing that the court misapplied our earlier interpretation of the terms "integral" and "confined region." Warminster also challenges the district court's findings of no contributory infringement and no inducement of infringement. For its part, Delta cross-appeals on the validity issue.

II.

We review the district court's claim construction de novo, see Markman v. Westview Instr., Inc., 52 F.3d 967, 979 (Fed. Cir. 1995), aff'd, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996), and its findings relating to alleged infringement under the doctrine of equivalents for clear error, see Hilton Davis Chem. Co. v. Warner-Jenkinson Co., 62 F.3d 1512, 1521 (Fed. Cir. 1995), cert. granted, 116 S. Ct. 1014 (1996). After careful consideration, we hold that the district court's claim construction is in accord with our earlier decision. We further find that the district court's finding of no infringement under the doctrine of equivalents is not clearly erroneous. Because we affirm the district court's finding of no infringement, we need not address the issues of inducement of infringement or contributory infringement.

First, we disagree with Warminster's interpretation of the term "integral." Warminster would like us to interpret the term "integral" as meaning functionally as opposed to physically integral. Such a reading would be directly contrary to our earlier interpretation of the term "integral" as defining a "structural relationship."

Tecnol contends that the limitation of Claim 4 which requires the back portion to be "integral" with the side portion excludes multi-piece collars in which the pieces are permanently attached together. To support this construction, Tecnol relies upon the following dictionary definition:

Formed as a unit with another part (as the main part) -- often used with: used esp. of a part of a tool or mechanism < the pin is [integral] with the pump body -- H.F. Blanchard & Ralph Ritchen> <<heat transfer through tubes with [integral] spiral> fins -- Transactions of Amer. Society of Mech Engineers> <<the steam chest may be an [integral] part of the turbine casing or may be bolted to it -- B.G.A. Skrotzki & W.A. Vopat>.

[TX 59].

Tecnol submits that a person of ordinary skill in the art would draw a distinction between "integral" and "permanently attached." Eyrick opined that items that were casted or molded together would be two examples of items that were "integral." [Eyrick Tr. at 1918]. Tecnol also relies upon the language of dependent claim 10 to support its desired distinction:
10. The cervical collar of claim 1 including an integral tab centrally dependent from the upper edge of said front portion of said band and permanently attached to the central undersurface of said chin support brace.

[PX 520 at 6/17-21]. Tecnol contends that this claim language demonstrates that Garth was aware of the difference between "integral" and "permanently attached" and thus claim 4 does not cover permanently attached multi-piece bands.

The Court finds that the ordinary meaning of "integral" may encompass items which are permanently attached. Prior art in the same field as the '219 patent uses the term "integral" in such a fashion. [U.S. Patent No. 3,530,853, DX 0031 at 3/56-57 ("A downwardly extending apron is integrally connected or situated with the neck encircling portion. . .")). Moreover, Courts have ruled that the term "integral" may encompass permanent attachment. Advanced Cardiovascular Systems Inc. v. Scimed Life Systems, Inc., 887 F.2d 1070, 1072 (Fed. Cir. 1989); 14 In re Hotte, 475 F.2d 644, 647 (CCPA 1973) ("'Integral' is sufficiently broad to embrace constructions united by such means as fastening and welding.").

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

14 In Scimed the Federal Circuit reversed the district court, which had granted summary judgment in favor of the alleged infringer upon construing the term "integral" to mean one piece. The Federal Circuit found that a genuine dispute of fact did exist with respect to the meaning of the term integral. Claim construction is a matter of law and the Federal Circuit reviews claim construction determinations de novo. The Court does not rely upon Scimed for the proposition that the meaning of "integral" as it is used in the '219 patent involves factual disputes, nor does it understand Scimed to hold that "integral" always includes "permanently fastened" as a matter of law regardless of the claims, specification, and prosecution history of the specific patent-in-suit. Rather, the Court relies upon Scimed for the proposition that the ordinary meaning of "integral" may include "permanently fastened."

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

The Court does not find that "integral" cannot mean "permanently attached," but does find that as used in the '219 patent "integral" does not mean "permanently attached." In the initial '619 patent application, claim 4 depended from claim 1. Subparagraph (a) of claim 1 claimed "an elongated neck encircling band formed of stiff, flexible sheet material having a front side and back portions." [PX 521 at 14]. Claim 4 further claimed "the cervical collar of claim 1 wherein said back portion is integral with one of said side portions." [Id.]. The sole difference between claims 1 and 4 was the addition of the "integral" limitation. Garth explained this difference in the specification:

In its preferred embodiment, the elongated band is asymmetric about its lateral axis 23 with the back portion 18 of band being integral with one side portion 14 . . . .

[PX 521 at 9 (emphasis added)]. The portions of the patent drawings referred to by number in the specification indicate that "being integral" meant "one piece."

By looking to the specification to explain the meaning of "integral" as used in Claim 4, the Court is not impermissibly reading limitations from the specification into the claim 4, but rather, is using the specification to confirm that Garth used "integral" to mean "one piece," which is the only logical definition possible for this patent. "One piece" is the only logical definition because it is the only definition which would make Garth's original dependent claim 4 narrower than Garth's original claim 1. Garth's original claim 1 did not specify how the front side and back portions were connected. The subsequently added "entirely" limitation was not present. Garth's original claim 1, therefore, would have covered a multi-piece band. Claim 4 was intended to be narrower than Claim 1 in that it excluded the possibility of attachment of multiple pieces and focused on one-piece design, which was the subject of Garth's preferred embodiment.

Claim 4 would later be amended and rewritten as an independent claim, and at that time the "asymmetrical" limitation would be added, but the meaning of "integral" would receive no further explanation. The only further usage of "integral" would occur with the addition of Claim 10, in which Garth would once again draw a distinction between "integral" and "permanently attached." 15
The cervical collar of claim 1 including an integral tab centrally dependent from the upper edge of said front portion of said band and permanently attached to the central undersurface of said chin support brace.

[PX 520 at 6:17-21].

As discussed previously, Garth would later put a similar one-piece limitation in claim 1 by adding the "formed entirely" limitation during the '219 reissue patent prosecution. The "formed entirely" limitation of claim 1 and the "integral" limitation of claim 4 have the similar effect of limiting both claims to collars with one-piece bands. Claims 1 and claim 4 are not identical in scope, however, because the presence of the "asymmetrical" or side closure limitation in claim 4 differentiates it from claim 1.

Accordingly, the Court finds that the permanently attached front and back band sections of the 911 collar do not form "an elongated neck encircling band having a front, side and back portions . . . with said back portion integral with said side portion," and for this reason finds that the 911 collar does not literally infringe Claim 4.

16 Likewise, the hypothetical Tecnolband formed solely out of the front band section and a Velcro strap would not literally infringe claim 1 because the Velcro strap back portion would not be formed of "stiff, flexible sheet material" and would not be "integral" with the front band section.

The dispute here is over the meaning of the term "integral." PolyVision's proposed construction is based upon a dictionary definition of the term "integral," and a similar definition from Vanguard Products Corp. v. Parker Hannifin Corp., 234 F.3d 1370 (Fed. Cir. 2000). Smart contends that the specification, drawings, and prosecution history inform the proper meaning, which is a single piece. Smart notes that the specification distinguishes "integral" from "separate": "Base 14 may be . . . separate or integrally formed with peripheral flexible wall 22." (Col. 3, ll. 27-28.) Smart also points out that the drawings differentiate between the base and flexible sections formed as a single piece (integral) and formed as separate pieces joined together. Fig. 3B depicts a digitizer in which the base and flexible sections are formed as a single piece, while Fig. 7 shows the base and flexible sections formed of separate pieces joined together. The specification recognizes this distinction when it states that "digitizer 10b, FIG. 7, is constructed similarly to digitizer 10a with the exception that peripheral wall 22b is not integral with base 14b." (Col. 4, ll. 40-44.)

The Court finds that Smart's proposed construction, which is based upon the specification, is consistent with Phillips and accurately reflects the inventors' intent to limit the term "integral" to a one-piece construction of the base and flexible member. The Court will thus adopt that construction.
C. "Integral Construction."

The phrase "integral construction" was used in claim 17. As stated in previous section construing the term "integral," it must mean "functioning as a single unit." Here, parties seem to have little dispute over the actual meaning of the term "construction," agreeing that it refers to the way the article is made. Thus, this order holds that "integral construction" means "made such that components function as a single article."

2160

b) Integral Contrasting Border

We next turn to Maxcess's contention that the claimed "integral contrasting border" must be formed solely by removing the edges of the decorative surface layer "to expose" the inner body portion. Tate Access responds that Maxcess's proposed construction is largely consistent with that of the district court, except for its requirement that the inner body portion be exposed to view.

We conclude that the district court did not err in construing the term "integral." Claim 1 recites that an "integral contrasting border" is provided by removing the edges of the decorative surface layer "to expose" the inner body portion. See id. at col. 5, ll. 7-11. The district court also correctly construed the term "to expose" to mean "to uncover or to reveal," and the term "integral" to mean that "the edges are formed by the laminated floor covering without a separate border of trim." J.A. at 28. The court's construction of those terms is consistent with their ordinary meaning. See, e.g., Webster's New World Dictionary 479 (3d ed. 1988) (defining "expose" as "to allow to be seen; disclose; reveal"); id. at 701 (defining "integral" as "made up of parts forming the whole").

The district court's interpretation is also consistent with the written description, which states that "the surface layer of protective material and the layer of decorative paper are cut away along the edge of the floor covering to expose the inner layers." See '491 patent, col. 1, l. 67 to col. 2, l. 4. Moreover, it is clear from the written description that the edges of the decorative surface layer are removed to expose the inner body portion in order to make the backing layers visible and to provide a trim that is aesthetically pleasing. See id. at col. 1, ll. 39-40; col. 1, ll. 52-56; col. 2, ll. 16-17. We therefore conclude that the term "integral contrasting border" should be construed as an edge or trim formed by removing the edges of the decorative surface layer to uncover or reveal the inner body portion.

As for Tate Access's argument that Maxcess is estopped from challenging the district court's construction of the terms "inner body portion" and "integral," we need not deal with that argument because we agree with Tate Access's arguments regarding claim construction.

2161

Construction of Claim 7

The limitations upon which both Vardon and Golfsmith focus with respect to Claim 7 read as follows:

[a] means to reinforce the face wall and enlarge the effective hitting area of the golf club

Col. 10, lines 54-56. As noted above, the use of the word "means" presumptively invokes Paragraph Six and the means-plus-function interpretive analysis. In this claim, as in Claim 3, the language of the claim ties a function ("to reinforce the face wall and enlarge the effective hitting area of the golf club") to the word means. Consequently, the presumption of applying Paragraph Six is not overcome on this basis. The claim phrase also recites a structure, which unlike Claim 3 is very specific. The structure is described as:

[1] an integral perimeter wall extending rearwardly from and surrounding the face wall defining a cavity in the rear of the head, and
[2] a progressive face wall reinforcing element in the cavity extending from the approximate center of the rear of the face wall outwardly in the cavity to the perimeter wall, said element being integral with both the face wall and the perimeter wall, said reinforcing element incrementally increasing in height from the approximate center of the rear of the face wall to the perimeter wall,

[3] whereby the club face is supported by at least one structural arch. 2

Col. 10, lines 56-68 (emphasis added). This structure is sufficiently detailed to take interpretation outside of the language of Paragraph Six. See, e.g., Cole v. Kimberly Clark Corp., 102 F.3d 524, 527 (Fed. Cir. 1997). Since the structure described is sufficiently detailed, it is not necessary to also link the means to also link the means to a structure described in the patent specification or its equivalents. Id. Claim construction here focuses on the language itself.

Footnotes

2 As described below, the second and third elements are actually the same. This memorandum opinion refers to them separately to parallel the arguments as presented by the parties.

Properly construed, Claim 7 requires a wall extending back from and surrounding the perimeter of the club face. Two dictionary definitions are instructive. The word "surround" has been defined as follows: "1. To inclose on all sides; to encompass; to environ. 2. To lie or be on all sides of; to encircle; as, a wall surrounds the city." Webster's Revised Unabridged Dictionary (cited from: www.dictionary.com/cgi-bin/dict.pl?term=surround) (visited May 31, 2000). Similarly, another dictionary defines the verb surround as follows: "1. To extend on all sides of simultaneously; encircle. 2. To enclose or confine on all sides so as to bar escape or outside communication." American Heritage Dictionary of the English Language (3d Ed. 1996). Both of these definitions suggest that surround is an all-or-nothing proposition. While the phrase "completely surround" has been used without being self-consciously redundant, see, e.g., In re Ogiue, 517 F.2d 1382, 1389 (C.C.P.A. 1975) and the term "partially surround" has been used without being self-consciously oxymoronic, see, e.g., In re Erickson, 53 C.C.P.A. 706, 351 F.2d 661, 663 (C.C.P.A. 1965), the unmodified word "surround" or "surrounding" suggests that the wall must completely encircle the perimeter of the club face. This construction is also buttressed by language elsewhere in the '021 Patent. See Col, 7, lines 19-21 (describing a perimeter wall that extends "completely there-around [the club face]").) Properly construed, Claim 7 requires a wall that goes completely around the rear cavity of the club head.

2162

CLAIM CONSTRUCTION

The '854 patent is directed to an electromagnetic interference shielding gasket. Claim 1, the broadest claim, describes the gasket as having two elastomeric layers: a thick inner layer and a thin metal-filled outer layer "integral therewith":

1. In a gasket shield for countering electromagnetic interference comprising a flexible gasket element, the improvement wherein said gasket element comprises a relatively thick elastomeric layer of good elasticity and high tear resistance, and a relatively thin elastomeric outer layer integral therewith, said outer layer being metal filled and providing a high degree of attenuation of electrical energy.

The dispositive issue of claim construction is whether the term "integral therewith" requires that the product be made by co-extrusion, 2 the method of manufacture described in the specification. The accused shielding gasket is conceded by Parker Hannifin to contain inner and outer elastomeric layers of the same properties as described and claimed in the '854 patent, but the method of manufacture differs in that for the Parker Hannifin gasket the outer layer is applied to the inner layer by dip-coating.

Footnotes

- 2618 -
2 Co-extrusion is a known method of forming a composition of two materials by forcing them through a set of appropriately positioned forming dies.

The district court ruled, on review of the '854 specification, the prosecution history, and a dictionary definition of "integral," that the claimed gasket shield is not limited to manufacture by co-extrusion. The court instructed the jury as follows:

"Integral" is used here in its ordinary sense to mean formed as a unit with another part, and therefore, "integral therewith" means that the outer layer of the gasket is formed as a unit and in direct contact with the inner layer of the gasket.

Parker Hannifin argues that "integral therewith" requires the use of co-extrusion to manufacture the gasket, the only process shown in the specification, and that a claim not so limited would read on the prior art and would violate the written description requirement of 35 U.S.C. § 112 &1. Parker Hannifin states that the district court improperly resorted to a dictionary definition of "integral" to broaden the meaning of this term from the context in which it was used. Parker Hannifin also states that the dictionary was improper extrinsic evidence.

A dictionary is not prohibited extrinsic evidence, and is an available resource of claim construction. Although a dictionary definition may not enlarge the scope of a term when the specification and the prosecution history show that the inventor, or recognized usage in the field of the invention, have given the term a limited or specialized meaning, a dictionary is often useful to aid the court in determining the correct meaning to be ascribed to a term as it was used. See Hockerson-Halberstadt, Inc. v. Avia Group Int'l, Inc., 222 F.3d 951, 955, 55 U.S.P.Q.2D (BNA) 1487, 1490 (Fed. Cir. 2000); Multiform Dressicants Inc. v. Medzam, Ltd., 133 F.3d 1473, 1478, 45 U.S.P.Q.2D (BNA) 1429, 1432 (Fed. Cir. 1998).

We discern no error in the district court's determination that "integral" was used in the '854 patent in its ordinary dictionary meaning. See Optical Disc Corp. v. Del Mar Avionics, 208 F.3d 1324, 1335, 54 U.S.P.Q.2D (BNA) 1289, 1295 (Fed. Cir. 2000) (a dictionary provides objective definition when words are used in their ordinary meaning). The '854 specification shows that the term was used to describe the product, and not as a designation of a specific manufacturing process.

Parker Hannifin argues that the prosecution history shows that the Vanguard inventors viewed co-extrusion as "fundamental" to manufacture of the claimed gasket, thereby imposing this process of manufacture upon the product claims. Parker Hannifin states that the inventors argued the benefits of co-extruded layers in order to overcome the prior art of Zulaf, Severinsen, and Bogan, and thus must be deemed to have disclaimed other methods of producing the gasket.

However, review of the prosecution history shows that during examination the examiner as well as the applicant treated the product claims as directed to the product itself, and examined the application accordingly. For example, in responding to the Zulaf reference the inventors pointed out that the Zulaf product was porous while theirs was solid, and pointed to other differences between the claimed and reference products. In addition, the inventors distinguished the Severinsen and other references in the Information Disclosure Statement based on the structure and composition of the products. Severinsen, for example, describes a metal-filled elastomer embedded with knitted wire mesh, and was criticized by the inventors for its poorer performance and higher cost. The examiner did not cite any reference directed to co-extrusion or the method of manufacture.

The prosecution history shows that the inventors extolled the economy of manufacture and superior product made by co-extrusion, and told the examiner that "our system requires only a one-step process as a result of the co-extrusion and tri-extrusion process." However, the prosecution history does not support Parker Hannifin's argument that the Vanguard inventors "expressly disclaimed" claim scope beyond products made by co-extrusion. Patent claim 10 specifically describes the gasket layers as "co-extruded." The district court correctly declined to read this limitation into claim 1. See Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1023, 4 U.S.P.Q.2D (BNA) 1283, 1288 (Fed. Cir. 1987) (claims containing different limitations are presumed to be of different scope).

The method of manufacture, even when cited as advantageous, does not of itself convert product claims into claims limited to a particular process. We agree with the district court that the word "integral" describes the relationship between the elastomeric layers, not the means of joining them. This word did not limit the claim to the manufacturing process set forth in the specification. A novel product that meets the criteria of patentability is not limited to the process by which it was made. See 3 Donald S. Chisum, Chisum on Patents § 8.05, at 8-79 (2000) and cases cited therein.
Parker Hannifin states that the district court inappropriately relied on Serrano v. Telular Corp., 111 F.3d 1578, 42 U.S.P.Q.2D (BNA) 1538 (Fed. Cir. 1997), and failed to correctly apply Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 34 U.S.P.Q.2D (BNA) 1673 (Fed. Cir. 1995), in its claim construction. These criticisms are not well founded.

The Serrano litigation concerned both a product (system) and a process, and also involved "means-for" terms under 35 U.S.C. § 112 6. The district court herein correctly recognized these differences and correctly applied the reasoning of Serrano to distinguish product and method limitations. In Southwall the claims required a "sputter-deposited dielectric," thereby including the sputter-deposit method as an explicit limitation in the invention as it was claimed. This is analogous to claim 10 of the '854 patent. However, the co-extrusion limitation is not included in claim 1.

We discern no error in the district court's reading of the patent and its prosecution history, and application of law and precedent. We conclude that the district court correctly construed claim 1 in the instruction to the jury. On this claim construction the jury verdict is not appealed. The judgment entered thereon is affirmed.

2163

MAYER, Chief Judge, dissenting.

I would reverse. The district court relied on the plain meaning of the term "integral therewith" and properly refused to read the limitations of the preferred embodiment, i.e., co-extruded inner and outer layers, into the claims. However, "the prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution." Southwall Techs. v. Cardinal IG Co., 54 F.3d 1570, 1576, 34 U.S.P.Q.2D (BNA) 1673, 1676 (Fed. Cir. 1995) (citations omitted). Vanguard submitted its supplemental amendment before the notice of allowance issued, and argued that the amended claims were patentable over Zulauf because, inter alia, "the Zulauf system is at least a two-step manufacturing process . . . . Our system requires only a one-step process as a result of the co- and tri-extrusion process, and will therefore be more cost effective with regard to labor input." Through this response, Vanguard effectively disclaimed all but one-step processes, thereby precluding a claim construction of "integral therewith" that embraces any configuration which is "formed as a unit." Vanguard argues that the amendment was not required to secure allowance of the original claims because the notice of allowance did not refer to the supplemental amendment. This is irrelevant because Vanguard chose to amend its claims rather than wait for a response to its request for reconsideration, and the amendment was filed prior to the issuance of the notice of allowance. The arguments distinguishing the amended claims over the prior art are part of the prosecution history that the public has a right to rely on in determining the scope of the claims. See Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1303, 41 U.S.P.Q.2D (BNA) 1364, 1368 (Fed. Cir. 1997).

When the term "integral therewith" is properly construed to mean an inner and outer layer "formed as a unit through a single step process," the CHO-SEAL 3000 gaskets, which were produced by a multi-step dipping process to add the outer layer to the premade silicone core, lack the "integral therewith" limitation and thus do not literally infringe Claims 1, 3-6, and 9 of the '854 patent. We have held that "by distinguishing the claimed invention over the prior art, an applicant is indicating what the claims do not cover, he is by implication surrendering such protection." Ekchian, 104 F.3d at 1304, 41 U.S.P.Q.2D (BNA) at 1368 (citations omitted). The same statements in the supplemental amendment that limited the claim construction of "integral therewith" to mean "formed as a unit through a single step process" act as an estoppel barring the application of the doctrine of equivalents to the material that was surrendered during prosecution, namely inner and outer layers of gaskets formed as a unit through a multi-step process. Infringement by the doctrine of equivalents should not have been submitted to the jury because prosecution history estoppel bars expanding the claims to include the gaskets with an outer layer formed by dipping as in the CHO-SEAL 3000.

2164

8. "Integral therewith"

The plaintiff proposes "the tear-wettable surface layer is bound to, or otherwise connected to, the lens body so as to not easily separate from it." The defendants propose "the tear-wettable surface layer and the hydrophylic lens body directly
contact each other and are affixed to each other to form the contact lens."

The Court construes the term to mean "the tear-wettable surface layer is bound or affixed to the lens body." The Court incorporates by reference its construction of "tear-wettable" and "surface layer."

2165

2. Interpretation of "Integral with said Interior Lower Wall Portion"

The relevant language of Claims 1 and 12 of the '843 patent and Claim 1 of the '277 patent state that "the interior surfaces of said pylons are integral with said interior lower wall portion ...." The Court construes this element to mean that the interior portion of the pylons must form a unit with, or physically connect to, the lower wall portion.

2166

(2) Limitation (ii): "Distal Tip Integral With The Distal End of the Stem"

(a) Claims Construction

(i) Patent Language and Specification

Limitation (ii) of claim 1 states that the 023 patent improvement consists of "a distal tip integral with the distal end of the stem." Patent at 6:65. In order to construe the limitation, the terms "distal tip," "integral" and "distal end of the stem" have to be interpreted.

Referring to the drawings included in the specification, the patent describes the stem, reference number "22", as that portion of the femoral prosthesis that is inserted into the resected femur. At the proximal end of the stem are the prosthetic neck and the wedge-shaped affixation area, both of which are "unitary with the stem." Patent at 3:23-26. The stem is inserted into the passage reamed by the surgeon (called the "cavity"), and is advanced downwards until the stem is fully within the passage. Patent at 3:35-38. By definition, the "distal" end of the stem is that portion of the stem furthest from the point of attachment at the hip joint.

Located at the distal end of the stem is a tip, which the patent calls the "distal tip," referred to as number "40" in the specification references. The specification describes the location of the distal tip in the following manner:

A distal tip is located at the distal end of the stem, spaced axially downwardly from the affixation surface, so as to extend downwardly into [the] passage and be positioned so that [the] distal tip is seated within harder portions of the bone of the wall of [the] femur, namely, within either dense cancellous bone or cortical bone, when the affixation surface is seated properly within the cavity.

Patent at 3:45-52.

The 023 patent's claims limitations and specification further describe the distal tip as comprising of the following characteristics:

First, the distal tip is "integral" with the distal end of the stem. The term "integral" will be explained below.

Second, the distal tip is constructed of a bio-compatible material, such as a cobalt-chrome steel alloy.

Third, the distal tip has a generally cylindrical external peripheral surface extending along the length of the distal tip. The axial length of the external peripheral surface of the tip must be long enough to provide an area of contact between the distal tip and the wall of the cavity large enough to maintain a relatively low level of stress on the wall of the femur at the location.
of the distal tip in response to transverse forces at the distal tip. As explained above, the axial length of the distal tip's external surface must also be short enough to expose a segment of the stem shaft above the distal tip and below the affixation surface in order to enable flexing of the shaft by means of a shaft diameter that is smaller than the diameter of the external surface of the tip.

Fourth, the external peripheral surface has a diameter complementary to the cavity in which it sits, so that the external peripheral surface of the distal tip engages, or presses against, the harder bone of the cavity wall and is confined against transverse movements within the cavity.

Fifth, the external peripheral surface has a fixation-resistant surface finish which prevents the distal tip from affixing to the wall of the cavity, thus allowing (i) the distal tip and distal end of the stem to rotate around the tip's central axis relative to the wall of the femur, and (ii) axial movement of the distal tip and distal stem relative to the wall of the femur, in response to forces applied to the prosthesis. The fixation-resistant finish is described as "a very smooth surface finish, such as that which is attained by polishing and buffing the cobalt-chrome steel alloy." Patent at 4:1-3.

Sixth, the distal tip's central bore has a taper which is complementary to the taper on the distal end of the stem, thus allowing securing of the tip onto the stem by slipping the central bore of the distal tip over the distal end of the stem. This method of securing prevents movement of the distal tip relative to the distal end of the stem.

In addition to the above, the patent provides for the distal tip to be modular. As used in the industry, "modularity" means that the distal tip can be removed and replaced by another tip on the same stem. In this way, distal tips having bigger external peripheral surface diameters but the same central bore diameter can be fitted onto one stem, thus providing the surgeon with a variety of tip sizes to accommodate the patient's inner femur cavity without having to use a different sized stem for each different sized proximal portion of the prosthesis.

Modularity in the 023 patent is created through use of the complementary tapers between the distal end of the stem and the central bore of the distal tip, which is also the method that secures the tip onto the distal end of the stem. Claim 4 of the 023 patent provides that the distal tip described by claim 1 must include "securing means for securing the distal tip to the stem for selective removal and replacement of the distal tip." Patent at 7:30-32. The specification states that "it is preferable that [the] distal tip be removable selectively from [the] stem." Patent at 4:47-49. Towards this end, through the use of the complementary tapers for securing the tip onto the stem, the distal tip can be "selected from a series of distal tips offered in a range of outside diameters so that a surgeon may choose the diameter for [the] external peripheral surface appropriate for the size of the passage into which the distal tip will be fitted." Patent at 4:64-68. The specification also describes the advantages and benefits of modularity:

The ability to remove and replace the distal tip with another distal tip selected from distal tips offered in a range of sizes enables greater versatility in fitting in that a wide variety of size combinations is made available in the joined stem and distal tip so as to enable independent sizing at the proximal portion of the stem without multiplying the number of stems needed to achieve such versatility. In providing such modularity between the stem and the distal tip, a greater choice is made available in the materials selected for the stem, as well as for the distal tip, so that the stem can be made even more flexible for better accommodation of loads during use.

Patent at 6:31-43.

Dr. Burstein explained the concept of "distal modularity" as described in the 023 patent for the Court in the following manner:

THE COURT: I heard a lot mentioned about modularity. What does that mean in lay language?

THE WITNESS: It means, Your Honor, that for every component that fits the proximal end of the femur, there are more than one component that can be put on the distal end, more than one diameter. So if we have a patient that has this size canal up on top and a big canal on the bottom, we can select a big tip, put it on the prosthesis, and put the prosthesis in the patient.

What that means is that this one part, the proximal portion, will fit people with different size canals and fit each one with a complete fit which will prevent toggling and allow it to move up and down, and these tips fit not only this size end, not
only this size proximal end, but bigger proximal ends and smaller proximal ends. So with about five sizes on the proximal
end and about five sizes on the distal end, you can fit 25 different sized patients. So you go into the operating room, instead
of 25 different prostheses, you have five prostheses and five tips, but you can still fit 25 different size patients.

(Tr. at 363-364).

With these characteristics of the distal tip in mind, the term "integral" can be better understood. As used in the claim
limitation, integral means that when the distal tip is secured to the stem, the tip and stem act in a unified manner. The patent
specification explains that the "distal tip is integral with the distal end of the stem, so that all movements of the distal end of
the stem result in corresponding movements of the distal tip." Patent at 4:44-46 (emphasis supplied).

In order to provide such unitary movement of the tip and stem in response to forces acting on the prosthesis, or to put it
another way, in order to prevent any movement of the stem relative to the distal tip, claim 5 provides that the means for
securing the distal tip to the stem include "a securing mechanism responsive to relative axial movement between the stem
and the distal tip for securing and releasing the distal tip and the stem." Patent at 7:33-36.

Thus, in the Court's view the phrase "distal tip integral with the distal end of the stem" means that there is a tip secured to
the distal end of the stem, such that the tip and stem act as one unitary piece.

This interpretation of "a distal tip integral with the distal end of the stem" is also supported by the patent's prosecution
history. In response to the Patent Examiner's rejections of initial 023 patent claims 1-6 on the ground that the claims were
unpatentable over the Witzel patent, the 023 patent applicants distinguished the Witzel device by, among other things,
pointing to the fact that the sleeve of the Witzel device was uncoupled to the stem and did not act in a unitary fashion with
the stem:

In Witzel, a small sleeve of synthetic resin material is first secured in the medullary canal, and then the shaft of a femoral
stem is inserted into the sleeve. The shaft can move relative to the sleeve, but there is no displacement of the sleeve relative
to the bone of the femur during service. In the construction of the present claims, the distal tip is affixed to the distal end of
the stem prior to insertion into the medullary canal, and flexing of the shaft of the femoral stem during service is
accommodated by displacement of the distal tip relative to the surrounding bone of the femur. Among those advantages is
the distribution of stresses during service and the ability to use a material other than the synthetic resin material disclosed by
Witzel to accommodate those stresses. Thus, in the Witzel construction, the articulating surfaces between the stem and the
sleeve are of limited area, resulting in relatively higher stresses and the possibility for the formation of resin debris as the
sleeve wears during use.

(Plaintiff's Exh. 568 at 50-51).

Dr. Burstein also corroborated this interpretation of "integral" by explaining that the patent uses the term integral to describe
the attachment of the distal tip to the stem, and to describe the motion of the tip and stem relative to the bone:

Q Now, would you explain in lay terms what the patent teaches in column 4, lines 44 to 46?

A The patent is teaching the function and meaning of the attachment between the tip and the stem. The patent is saying
that the tip and stem must be integral, and integral is defined two ways in the patent. It is what would happen if the tip and
the stem were made of one piece. That's one example of integral given in the patent. So that would be if you just made it
without any junction at all and didn't assemble them together but made it as a simple piece. That's what the patent means by
integral.

Also, integral should be thought of as having each motion of the stem correspond to a motion of the tip itself. That is,
there should be no relative, no meaningful relative motion between the tip component and the stem. So we can think of it in
either way as a unitary or integral.

(Tr. at 152-53).
3. "an attachment structure integral with the knife body"

Plaintiff proposes the attachment structure lies in the implement plane and comprises a gate attachment, an attachment arm, and a gate. The gate attachment and attachment arm are part of the attachment plate. The attachment structure is integral with the knife body in the sense that it is fixed and immovable relative to the knife body. The attachment plate cannot be integral with either of the sides of the knife, in the sense that they cannot be part of the same piece of material.

Defendant proposes "a structure integral with the knife body, the structure's shape being well suited for attaching the knife body to objects."

The court finds this language to be clear on its face and that no claim construction is needed.

The '401 and '666 patents each contain only one independent claim. For purposes of this appeal, the key limitation in each claim is that the in situ ribs are required to be "integrally bonded . . . free of adhesive" to the panels.

--- Footnotes ---
1 The '401 and '666 patents are continuations of the same application and have the same written descriptions.
2 Claim 1 of the '401 patent (with the disputed claim language emphasized) reauds as follows:

1. A multi-channel transparent jacket for accommodating microfilm strips having a predetermined thickness and a predetermined width and whose length is no greater than the length of the jacket, said jacket comprising:

   (A) top and bottom rectangular panels in superposed relation formed of flexible, polyester film having predetermined polymeric properties; and

   (B) a plurality of in situ ribs formed of moldable plastic material compatible with the material of said panels and integrally bonded thereto to form a unitary structure free of adhesive or other bonding agents and in which the properties of said panels are unimpaired, said ribs maintaining said panels in parallel planes to define open-end channels whose width is substantially equal to the width of said strips, said ribs having a thickness substantially equal to the thickness of said strips, each channel having an entry slot cut into said bottom panel adjacent the front end of the jacket.

Claim 1 of the '666 patent (with the disputed claim language emphasized) reads as follows:

1. A method of producing individual multi-channel transparent jackets for accommodating microfilm strips having a predetermined thickness and a predetermined width and each jacket being composed of front and rear rectangular panels in superposed relation formed of flexible transparent polyethylene terephthalate film having predetermined polymeric properties, the method comprising the steps of:

   (A) directing a plurality of spaced extruded molten streams of moldable polyester material . . . onto the surface of a first web . . . ;

   (B) advancing said first web carrying said streams concurrently with a second web of panel material into combining rolls having an adjustable nip . . . ;
Bell & Howell sued Keystone, its president George Wrabel, and Altek Systems 3 alleging, inter alia, infringement of the '401 and '666 patents, and moved for a preliminary injunction. The court held a preliminary injunction hearing in which it received evidence relevant to the construction of the claims and to infringement. Keystone conceded the patents' validity for purposes of the preliminary injunction motion.

The hearing focused on the meaning of the expression "integrally bonded . . . free of adhesive." In construing the claims, the court considered the patents' specifications and prosecution histories, and the testimony of expert witnesses. Keystone offered the testimony of Dr. Robin McCarley, a professor of chemistry, and Bell & Howell offered the testimony of Dr. John Muzzy, a professor of chemical engineering. McCarley testified that there are several types of bonding in the field of chemistry, including "mechanical bonding" and "integral bonding." He explained that "mechanical bonding" occurs between two substances when one flows into and fills the "nooks and crannies" on the surface of the other and then hardens, such that the hardened substance is anchored to the other. In contrast, "integral bonding" results when the molecules of the two substances cross the interface between them and "intermingle" such that the interface is obliterated. Thus, Keystone argued that because its jackets have a clearly discernible interface between the ribs and panels with no intermingling of the rib and panel materials, their jackets involve "mechanical," not "integral," bonding and do not infringe either of the claims.

Muzzy testified for Bell & Howell that Keystone's jackets were "integrally bonded" as that term is defined in the patents. He later clarified his position in an affidavit, in which he explained that the patents disclose a bonding in which the rib material itself serves as the adhesive without the use of separate layers of adhesives or bonding agents. Muzzy's affidavit explained further that the term "integrally bonded" was used by the patentee to distinguish over the paper-ribbed prior art in which adhesives were used to secure pre-formed paper ribs to the panels. In effect, Muzzy, while not arguing with McCarley's definitions of "integrally bonded" and "mechanically bonded" generally, argued that the term "integrally bonded" as used by the patentee in the '401 and '666 patents should be construed in the mechanical sense.

The court essentially adopted Keystone's construction. In support, the court noted that it is clear "that chemists have a clear definition of 'integral bonding.' It means exactly what both Dr. Muzzy and Dr. McCarley agreed that it means: that the two surfaces unite by an exchange of molecules so as to obliterate the interface between them." The court further noted that the term "integrally bonded" could not be construed to mean bonded without adhesive, because this would render the claim language "free of adhesive" superfluous. The court thus "interpreted the claims of the '401 and '666 patents for purposes of [the preliminary injunction] hearing to require actual integral bonding into a single unitary piece of material." Because the court found it clear that the rib of Keystone's accused product was mechanically rather than integrally bonded to the panels, it determined that Bell & Howell "failed to establish a clear likelihood of success in showing infringement of either the '401
or '666 patents."

The court also determined that the balance of hardships favored Keystone, a "fledgling" company that would be put out of business if a preliminary injunction issued, and that the much smaller Keystone could only cause limited harm to the much larger Bell & Howell. The court further determined that the impending erosion of the microfiche market in light of optical disk technologies would naturally eliminate competition between the litigants and minimize long term damage to Bell & Howell. Accordingly, the court denied Bell & Howell's motion for a preliminary injunction.

Bell & Howell appeals to this court, arguing that the district court erred in denying its motion for a preliminary injunction. We have jurisdiction pursuant to 28 U.S.C. § 1292(c)(1) (1994).

DISCUSSION

The grant or denial of a preliminary injunction pursuant to 35 U.S.C. § 283 (1994) is within the discretion of a district court. Novo Nordisk of N. Am., Inc. v. Genentech, Inc., 77 F.3d 1364, 1367, 37 U.S.P.Q.2D (BNA) 1773, 1775 (Fed. Cir. 1996), cert. denied, 139 L. Ed. 2d 310, 1997 U.S. LEXIS 6493, 66 U.S.L.W. 3324, 118 S. Ct. 397 (U.S. 1997). A court's decision to deny a preliminary injunction will be overturned on appeal only upon a showing that the court "abused its discretion, committed an error of law, or seriously misjudged the evidence." Smith Intl', Inc. v. Hughes Tool Co., 718 F.2d 1573, 1579, 219 U.S.P.Q. (BNA) 686, 691 (Fed. Cir. 1983). An abuse of discretion may be established by showing that the court made a clear error of judgment in weighing the relevant factors or exercised its discretion based upon an error of law or clearly erroneous factual findings. Novo Nordisk, 77 F.3d at 1367, 37 U.S.P.Q.2D (BNA) at 1775; see also Polymer Techs., Inc. v. Bridwell, 103 F.3d 970, 973, 41 U.S.P.Q.2D (BNA) 1185, 1188 (Fed. Cir. 1996).

As the moving party, Bell & Howell had to establish its right to a preliminary injunction based on four factors: (1) a reasonable likelihood of success on the merits; (2) irreparable harm if the injunction were not granted; (3) the balance of relative hardships tips in its favor; and (4) whether and how an injunction would impact the public interest. Nutrition 21 v. United States, 930 F.2d 867, 869, 18 U.S.P.Q.2D (BNA) 1347, 1348-49 (Fed. Cir. 1991); Hybritech, Inc. v. Abbott Lab., 849 F.2d 1446, 1451, 7 U.S.P.Q.2D (BNA) 1191, 1195 (Fed. Cir. 1988).

A. Likelihood of Success:

In order to demonstrate likelihood of success, Bell & Howell must show that, in light of the presumptions and burdens that will inhere at trial, it will likely prove that Keystone infringes its patents. 4 See New England Braiding Co. v. A.W. Chesterton Co., 970 F.2d 878, 882-83, 23 U.S.P.Q.2D (BNA) 1622, 1625-26 (Fed. Cir. 1992). If Bell & Howell clearly established a likelihood of success, it was entitled to a rebuttable presumption that it would be irreparably harmed if a preliminary injunction were not to issue. Polymer Techs., 103 F.3d at 973, 41 U.S.P.Q.2D (BNA) at 1188.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - 

4 Usually, a patentee would also have to show that it would likely withstand any alleged infringer's challenge to the validity and enforceability of the patent. See New England Braiding Co. v. A.W. Chesterton Co., 970 F.2d 878, 882-83, 23 U.S.P.Q.2D (BNA) 1622, 1625-26 (Fed. Cir. 1992). However, Keystone contested only infringement in opposing the preliminary injunction motion.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

Bell & Howell argues that the district court erred in construing the expression "integrially bonded . . . free of adhesive." Specifically, Bell & Howell argues that this expression means that the ribs adhere to the panels by themselves without the use of a separate layer of adhesive. Bell & Howell asserts that this construction is supported by the intrinsic evidence, viz.,
the patents' specifications and file histories, see Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1581-82, 39 U.S.P.Q.2D (BNA) 1573, 1576-77 (Fed. Cir. 1996), and that the district court, despite this evidence, improperly relied on the expert testimony of McCarley and Muzzy to construe the expression otherwise.

Keystone responds that the court's construction was reasonable. In support, Keystone notes that both experts agreed that the term "integrimly bonded" means that the rib and panel material must be "integrated," i.e., mixed at the molecular level, and that nothing appears in the intrinsic evidence to suggest that the inventor intended to impart an extraordinary meaning to this phrase. Keystone also argues that the district court does not have to make a final interpretation of the claims to deny a preliminary injunction, and that, at this stage of the litigation, we should determine only if the court's claim construction provided an "adequate basis" for denying the preliminary injunction.

We agree with Bell & Howell that the court erred in relying on expert testimony to construe the expression "integrimly bonded . . . free of adhesive" because the intrinsic evidence is clear and unambiguous. The intrinsic evidence supports Bell & Howell's claim construction, and the district court therefore erred as a matter of law in construing this expression to require an "exchange of molecules" between the rib material and the panel material.

When construing a claim, a court should look first to the intrinsic evidence, i.e., the claims themselves, the written description portion of the specification, and the prosecution history. See Vitronics, 90 F.3d at 1582-83, 39 U.S.P.Q.2D (BNA) at 1576-77. The intrinsic evidence should usually be sufficient to enable one to determine the meaning of a claim term. See Markman, 52 F.3d at 986, 34 U.S.P.Q.2D (BNA) at 1335 (noting that "ideally there should be no ambiguity in the claim language to one of ordinary skill in the art that would require resort to evidence outside the specification and prosecution history" and citing the disclosure requirements of 35 U.S.C. § 112 (1994) in support). When the intrinsic evidence is unambiguous, it is improper for the court to rely on extrinsic evidence 5 such as expert testimony for purposes of claim construction. Vitronics, 90 F.3d at 1583, 39 U.S.P.Q.2D (BNA) at 1577. The rationale for this rule is that:

the claims, specification, and file history, rather than extrinsic evidence, constitute the public record of the patentee's claim, a record on which the public is entitled to rely. In other words, competitors are entitled to review the public record, apply the established rules of claim construction, ascertain the scope of the patentee's claimed invention and, thus, design around the claimed invention. Allowing the public record to be altered or changed by extrinsic evidence . . . , such as expert testimony, would make this right meaningless. The same holds true whether it is the patentee or the alleged infringer who seeks to alter the scope of the claims.

Id. at 1583, 39 U.S.P.Q.2D (BNA) at 1577 (quotations and citations omitted). The testimony of an inventor and his attorney concerning claim construction is thus entitled to little or no consideration. The testimony of an inventor often is a self-serving, after-the-fact attempt to state what should have been part of his or her patent application; the testimony of an attorney "amounts to no more than legal opinion--it is precisely the process of construction that the court must undertake." Markman, 52 F.3d at 983, 34 U.S.P.Q.2D (BNA) at 1332-33.

5 "Extrinsic evidence is evidence which is external to the patent and file history, such as expert testimony, inventor testimony, dictionaries, and technical treatises and articles." Vitronics, 90 F.3d at 1584, 39 U.S.P.Q.2D (BNA) at 1578. Prior art may also constitute extrinsic evidence. See id. at 1584-85, 39 U.S.P.Q.2D (BNA) at 1578-79.

Once a dispute over claim construction arises, "experts" should also not be heard to inject a new meaning into terms that is inconsistent with what the inventor set forth in his or her patent and communicated, first to the patent examiner and ultimately to the public. Patents should be interpreted on the basis of their intrinsic record, not on the testimony of such after-the-fact "experts" that played no part in the creation and prosecution of the patent. See Southwall Tech., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1578, 34 U.S.P.Q.2D (BNA) 1673, 1680 (Fed. Cir. 1995) ("Evidence extrinsic to the patent and prosecution history, such as expert testimony, cannot be relied on to change the meaning of the claims when that meaning is made clear by those documents."). Use of expert testimony to explain an invention may be useful. But reliance on extrinsic evidence to interpret claims is proper only when the claim language remains genuinely ambiguous after consideration of the intrinsic evidence, Vitronics, 90 F.3d at 1584, 39 U.S.P.Q.2D (BNA) at 1578, i.e., when the intrinsic
evidence is "insufficient to enable the court to construe disputed claim terms." Id. at 1585, 39 U.S.P.Q.2D (BNA) at 1579. Accordingly, any expert testimony that is inconsistent with unambiguous intrinsic evidence should be accorded no weight. Id. at 1584, 39 U.S.P.Q.2D (BNA) at 1578 (citing Southwall, 54 F.3d at 1578, 34 U.S.P.Q.2D (BNA) at 1678); Markman, 52 F.3d at 983, 34 U.S.P.Q.2D (BNA) at 1333.

These patents do not suffer from the malady of ambiguous intrinsic evidence. The specifications set forth that the invention is an improvement over, inter alia, the paper-ribbed prior art because it does not use a separate adhesive layer between the ribs and the panels:

In the jacket [of the prior art], preformed plastic or paper ribs are adhesively secured to the top and bottom panels. Hence, the . . . ribs act as carriers for an adhesive agent to effect lamination.

. . . .

In view of the foregoing, it is the main object of this invention to provide a . . . jacket for microfilm wherein the channels are defined by in situ ribs which are integral with the panels of the jacket . . .

'401 patent, col. 1, l. 51 to col. 2, l. 13; '666 patent, col. 1, l. 49 to col. 2, l. 13. The bond between the ribs and the panels in the invention disclosed in the specifications clearly does not involve a separate adhesive or other bonding agent, but rather fusion of the molten rib to a solid panel:

These problems are overcome in the present invention by creating ribs . . . in situ, streams of rib material in molten form being extruded and being sandwiched between the top and back [panels] in combining rolls, whereby the ribs are formed in place and fused to the panel, the resulting ribs being integrally bonded to the panels to form a unitary jacket structure free of adhesive or any other bonding agent.

'401 patent, col. 7, ll. 6-15; '666 patent, col. 7, ll. 8-16.

The prosecution history 6 also aids in construing the meaning of the disputed claim language. Several references in the prosecution history show that by using the term "integrally bonded," the patentee was attempting to distinguish its claims over the paper-ribbed prior art that used a separate adhesive layer between the ribs and the panels. See, e.g., prosecution history, Serial No. 463,814 (Feb. 5, 1977) ("Clearly, a preformed rib which is joined by an adhesive substance to a panel is not 'integrally bonded' thereto, as called for in the claims . . . ."). In response to the examiner's contention that the term "integrally bonded" could include the use of an adhesive, the patentee added the "free of adhesive" language: "The expression 'adhesive-free' is intended to define more clearly and to point up the fact that the claimed product (wherein 'in situ ribs' are integrally bonded to the top and bottom panels) is characterized by the absence of undesirable adhesive." Id. (May 15, 1977); see also id. (Feb. 28, 1977) ("As pointed out in the remarks accompanying this amendment, the expression 'adhesive-free' is not a new limitation in the claim, but only serves to define more clearly the existing limitation 'integrally bonded.'"). This last statement (and others of similar effect) from the prosecution history makes it clear that the expression "integrally bonded . . . free of adhesive" operates as a single limitation. Therefore, the district court's conclusion that Bell & Howell's proffered claim construction would render the word "integrally" superfluous because being "free of adhesive" is already recited in the claims is not sustainable. Moreover, defining a state of affairs with multiple terms should help, rather than hinder, understanding. Being "integrally bonded" and "free of adhesive" are mutually reinforcing definitions rather than being superfluous.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

6 We refer to the prosecution history without reference to the patent to which it pertains, i.e., the '401 or the '666. The parties have not drawn a distinction between these two patents and neither will we.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

The specifications and the prosecution history therefore provide clear indication of the meaning of the disputed claim language. Thus, the theoretical testimony of experts concerning the nature of chemical bonding, and referring to testing methods not even known when the patents' specifications were drafted, was totally unnecessary, merely creating confusion
where none truly existed. Because the intrinsic evidence unambiguously defines the disputed claim limitation, the district court's reliance on the expert testimony of McCarley and Muzzy to contradict the intrinsic evidence when interpreting the claims was error. See Vitronics, 90 F.3d at 1583, 39 U.S.P.Q.2d (BNA) at 1577. We thus conclude that the intrinsic evidence unambiguously defines the expression "integrally bonded . . . free of adhesive" to mean that the ribs bond to the panels without the use of a separate adhesive layer between the ribs and the panels. The court's contrary construction was legal error, leading to an abuse of discretion in denying the motion for a preliminary injunction.

2169

(3) Integrally Cast

Various claims involving the ’274, ’698, and ’917 Patents state that the rollers are integrally cast with the channel. Innovative argues that in accordance with its customary and ordinary meaning, integrally cast means "formed by cast molding as part of the same piece." In support of this reading, Innovative cites to the dictionary definition of cast ("something that is formed by casting in a mold or form") and the definition of integral ("formed as a unit with another part").

Defendants assert "integrally cast" means "formed using a one-step process." Defendants derive this extraneous and limiting definition from an amendment to the ’917 Patent. Innovative contends that this definition is taken out of context because the statement in the amendment was intended to emphasize the difference between the two-step process of the prior art and the single step process required by integral casting. The purpose of consulting the prosecution history is to exclude any interpretation that was previously disclaimed during the prosecution. ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1580 (Fed. Cir. 1988). Since there was no disclaimer, it would be improper to limit integrally cast as meaning formed using a one-step process.

The court will refuse to improperly limit the term and will adopt Innovative's construction to find that "integrally cast" means "formed by cast molding as part of the same piece" in accordance with its customary and ordinary meaning.

2170

D. "Integrally Connected."

The phrase "integrally connected" appeared in claim 2 which depended from claim I. It recited (col. 5:20-23):

2. The apparatus according to claim I wherein said at least one portion comprises a strip of resilient flexible material integrally connected to the remainder of said closure at opposed strip ends.

Again, the term "integrally connected" relies on the construction of "integral," as described above. Plaintiff proposes that the term be defined as "made as one continuous piece," while defendants propose that it should mean "connected such that the component parts function as a solitary article." Plaintiff's proposed definition conflicts with this order's definition of "integral." The parts must function as a single piece; they must not be made of a single piece (as a molded unit, for example). Thus, importing the prior definition of "integral" into this claim, this order holds that "integrally connected" is construed to mean "joined to function as a single article."

2171

A. "Integrally Connected."

The phrase "integrally connected" appeared in claim 21 which recited (col. 8:28-45):

21. Apparatus for controlling the flow of fluid through a fluid passageway, said apparatus comprising a pressure-activated valve for receiving fluid from a fluid flow passageway and including a tubular housing member formed a resilient molded
material and a deformable diaphragm formed of resilient molded material integrally connected to said tubular housing member and movable between a first position wherein said diaphragm is closed and forms a substantially fluid-tight seal preventing fluid flow through said tubular housing member and a second position wherein said diaphragm defines an opening responsive to fluid pressure within said tubular housing member, said pressure-activated valve additionally including a wall providing a hinged interconnection between said tubular housing member and said diaphragm, said wall inverting when said diaphragm moves between said first and second position.

The term appeared in the same context in claim 24. In contrast, claim 26 recited "a tubular housing member and a deformable diaphragm of resilient material connected to said tubular housing member and moveable responsive to a change in fluid pressure" (col. 9:28-10:3). The term also appeared in claim 14, which recited "[t]he apparatus according to claim 13 wherein said diaphragm is integral with said outer tubular housing member" (col. 7:63-65). Claim 13 recited an apparatus where the outer housing member was formed of a hard, inflexible material, and the inner tubular was formed of a flexible, resilient material.

Plaintiff contends that this term should mean "joined to the tubular housing to form a single part or piece; the tubular housing, diaphragm, and the wall surrounding the diaphragm are all molded into a single integral part or component called the pressure activated apparatus." In support, Paczonay points out that the specification stated "[t]ypically, closures of this type employed on containers utilize multiple piece [sic] housings or bodies in which the valve is mounted. While closures used for such applications may function generally satisfactorily, in some applications it is desirable not to employ multiple piece [sic] constructions" (col. 1:16-20). This statement shows that constructing the valve from a single piece of material was desirable, but this limitation never appeared in the claims.

In response, defendants argue that "integrally connected" means "connected such that the component parts function as a solitary article," the same construction that defendants proposed for the term "integral" as used in the '207 patent. Defendants cite to the specification, which states "[A] wall 54 is positioned within the tubular housing and provides a hinged interconnection between the diaphragm and the tubular housing, the wall being integrally formed with the diaphragm and the tubular housing and of course constructed of the same material" (col. 4:31-35).

Both parties cite the following passage from the specification describing a preferred embodiment in support of their respective definitions: "[d]iaphragm 84 and outer tubular housing member along with wall 91 interconnecting same are integrally molded. The housing members 88,90 are secured together during a molding process wherein the housing member 88 is molded in situ on housing member 90" (col. 5:66-6:3, Fig. 5). From the figure, it appears that the housing members are secured inside one another to form a single unit.

Defendants interpret this language to indicate that Paczonay necessarily intended that the two pieces be molded separately, then joined together such that they function as a unit. Paczonay argues in response that this indicates that the pieces were molded together to form a single unit. Paczonay also contends, without presenting supporting evidence, that one skilled in the art would know that the pieces are intended to be molded as one piece. It seems that here, Paczonay is attempting to read a limitation from the specification into the claims. The specification mentions the desirability of molding the two pieces together, but doing so is never mentioned in the claims. Simply put, both parties are trying to find definitions for the term in the specification that are not there. Accordingly, the specification of the '128 patent does not indicate that "integral" should be given anything other than its plain-language meaning.

The term "integrally connected" does not require that an article be formed of a single, continuous piece, as plaintiff argues. Defendants' proposed definition, that the parts must be joined to function as a single article, adequately captures the plain meaning of the term. Here, "integrally connected" is held to mean that the pieces are joined to function as a single article, including, but not limited to, a molded unit.
In the '230 patent, the flange portions are attached to the receiving portion by intermediate portions "integrially connecting" the separate sections. (230 patent, col. 4, l. 56.) Plaintiff proposes that the term "integrially connecting" means "the joining together of parts to form a whole." (Pl.'s Br. at 17.) Defendant proposes that the term "requires a rigid, one-piece connection between the intermediate portion, a corresponding flange and the receiving portion. The integral connection between the intermediate portion, the flange and the receiving portion performs the function of securely and stably holding the bore of the receiving portion immovable relative to its flange with a single integrated piece construction." (Def.'s Br. at 21-22.) The central point of disagreement between the parties as to the construction of the term "integrially connecting" is whether the connecting of two originally distinct pieces (as by welding, for example) is, as Plaintiff argues, sufficient for those pieces to become "integrially" connected, or whether, as Defendant argues, 17 an integral connection requires that the connected elements be formed as one piece (as by casting, for example). 18

17 Defendant's proposed construction, which unhelpfully attempts to define "integrially" by requiring an "integral connection" and "a single integrated piece construction," (Def.'s Br. at 21-22), does not on its face state that welding fails to satisfy the integral connection criterion. Defendant's written submissions make clear, however, that it believes the construction of "integrially connected" requires a unitary construction, as by casting.

18 The common definition of "integral" supports either construction. See Webster's New Int'l Dictionary 1173 (3d ed. 1993) (defining "integral" as, inter alia, "of, relating to, or serving to form a whole," "formed as a unit with another part," or "essential to completeness").

As an initial matter, Plaintiff's proposed definition, which simply requires that parts be joined to form a whole, is insufficiently specific to capture the meaning of "integrially connecting" in the context of the '230 patent. As one court recently explained when rejecting a similar proposed construction 19 as insufficient to construe the significance of the term "integrially":

The definition offered by BMS just does not go far enough. It would include any type of connection, including exterior screws attaching a connecting plate, a loose dowel with removable discs, a C-clamp, or one of the wide black clips used to bind papers . . . . [I]f "attached" or "connected" is all that is meant, then what purpose is served by "integrially?" . . . "Integrially" implies something that is part of the whole or is needed for completeness. See Merriam-Websters Collegiate Dictionary 606 (10th ed. 2002). However, . . . integrally is not being used in this patent merely in the sense of a cog inside a machine, which is "integral" to the mechanism, but is a separate moving part.

Burns, Morris & Stewart Ltd. Partnership v. Masonite Intern. Corp., 401 F. Supp. 2d 692, 699-700 (E.D. Tex. 2005). As in Burns, the construction of "integrially connecting" in the '230 patent must amount to more than the mere attachment to form a whole, if the word "integrially" is to have any significance. The term "integrially connecting" requires that the connected pieces be joined "so as to make up a single complete piece or unit, in such a way that the connection becomes part of [the single complete unit]." Id. at 701 (emphasis added).

19 The proposed construction was "[c]onnected together so as make up a single complete piece or unit, or so as to work together as a single complete piece or unit." Burns, Morris & Stewart Ltd. Partnership v. Masonite Intern. Corp., 401 F. Supp. 2d 692, 699 (E.D. Tex. 2005).

On the other hand, the insufficiency of Plaintiff's proposed construction does not, as Defendant argues, indicate that the patent's "integrially connecting" criterion can be satisfied only through single-piece construction, as by casting out of molten metal. 20 First, in light of the fact that claim 2 of the '230 patent, which is dependent upon claim 1, provides the additional limitation of "[a]n interconnection device according to claim 1, wherein the flange and receiving portions are each formed from one of cast iron, steel or aluminium," (230 patent, col. 4, l. 65-67), the doctrine of claim differentiation forecloses a
construction of "integrally connecting" that requires construction by casting. See Phillips, 415 F.3d at 1314-15 ("the presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim"). 21

20 Once again, Defendant relies upon the testimony of the inventors regarding their intent behind the use of the term "integrally connecting" in its claim construction analysis. As the Court noted, supra, such testimony is "irrelevant" to the claim construction questions before the Court. Howmedica, 540 F.3d at 1346-47.

21 Contrary to Defendant's argument, the prosecution history of the '230 patent does little to clarify the meaning of the term "integrally connecting." It is true that the term was added in response to a prior rejection by the Patent Office, but the emphasis in the patent applicant's representations to the patent examiner was on the '230 patent's dual, parallel intermediate portions, not on the concept of integral connection:

An advantage of two flange portions each having a respective intermediate portion integrally connecting a location surface of the flange portion with the receiving portion as recited in claim 5, is that the receiving portion is more securely and stably supported than if connected to the flange portion at only a single position. . .

(Def.'s Br. Ex. G at 9-10) (emphasis added). The stage at which the "integrally formed" language was added to the '230 patent does not, in this case, clarify what the language encompasses; it merely begs the question of what "integrally connecting" means. The Court of Appeals for the Federal Circuit has cautioned against relying upon the prosecution history to narrow the scope of a claim "where the alleged disavowal of claim scope is ambiguous," or where remarks made by an inventor to overcome a rejection may be viewed "as amenable to multiple reasonable interpretations." Omega, 334 F.3d at 1324. Given that the emphasis in the above-quoted prosecution history focuses on the fact that the '230 patent provides for flange portions connected at two points to the receiving portion, the Court finds that it illuminates little as to the proper construction of the term "integrally connecting."

More generally, the Court of Appeals for the Federal Circuit has made clear that the term "integrally" is not inherently so limited:

[O]ur predecessor court had on several prior occasions interpreted the term "integral" to cover more than a unitary construction. See, e.g., In re Kohno, 55 C.C.P.A. 998, 391 F.2d 959, 157 USPQ 275 (CCPA 1968), In re Dike, 55 C.C.P.A. 1172, 394 F.2d 584, 157 USPQ 581 (CCPA 1968), In re Larson, 52 C.C.P.A. 930, 340 F.2d 965, 144 USPQ 347 (CCPA 1965), and In re Clark, 41 C.C.P.A. 974, 214 F.2d 148, 102 USPQ 241 (CCPA 1954). This court has also endorsed that interpretation. See, e.g., Advanced Cardiovascular Sys. v. Scimed Life Sys., 887 F.2d 1070, 1074 (Fed. Cir. 1989) (nothing of record limited "integral" to mean "of one-piece" construction).

The Court is thus unpersuaded by Defendant's argument that the term "integrally connecting" is limited to "unitary construction," as by casting from molten metal, In re Morris, 127 F.3d at 1055, but it agrees with Defendant that the term requires more than the mere attachment of two objects to form a whole. As Plaintiff recognized at the Markman hearing, a person of ordinary skill in the art would recognize that being "integrally connecting" connotes something more than simply being connected - it requires, as Plaintiff conceded, a more permanent type of fastening. This is consistent with the commonly understood meaning of "integral," which is "essential to completeness," Webster's New Int'l Dictionary 1173 (3d ed. 1993); if a constituent part of an integrated whole is essential to the unit's completeness, the term "integral" signifies a state of permanence or, at minimum, an inability to sever the connected portion without destroying the unit. This aspect of the construction of "integral" was recognized in Burns, Morris & Stewart Ltd. Partnership v. Endura Products, Inc., wherein the court construed the term "integrally formed" to mean "connected together so as to make up a single complete piece or
unit, or so as to work together as a single complete piece or unit, and so as to be incapable of being easily dismantled without destroying the integrity of the piece or unit." No. 04-23, 2005 U.S. Dist. LEXIS 46839, 2005 WL 6217425, at *8 (E.D. Tex. May 11, 2005) (emphasis added).

Based on the foregoing considerations, the Court will construe the term "integrally connecting" as follows: "joined together so as to make up a single, complete, and substantially permanent piece or unit, such that the connected components become an essential part of the complete unit, and such that the complete unit is incapable of being easily dismantled without destroying the unit."

1. Integrially Formed

Plaintiffs provide an ordinary and customary construction of the term "integrally formed": "formed as a unit." As plaintiffs pointed out during the Markman hearing, "that is the plain meaning of this language." (Markman Tr. at 45.)

Defendants assert that plaintiffs' plain meaning of the term is too simplistic and not reflective of the "claim language, specification and drawings, the prosecution history and the plaintiffs' own brief." Id. at 62. In contrast to the plain meaning definition, defendants' proposed construction of "integrally formed" is "the strands of the netting arrangement are knit into the physically divisible stockinette member to form a unit." Defendants first point to Figure 1 of the patent which shows a netting arrangement standing alone. With their proposed construction, defendants further contend they are relying on the claim itself which indicates that the strands of the netting arrangement are to be knit into the threads of the stockinette member to create an integrally formed structure. Id. at 62-63. But defendants' proposed construction does not take into account the patent's second preferred embodiment which demonstrates that two separate structures are unnecessary.

Here, plaintiffs have not demonstrated an intent to deviate from the ordinary and customary meaning of "integrally formed" by redefining the term. Based on claim language, the Court construes "integrally formed" as "formed as a unit."

5. Claim 1, Element 5, "integrally formed"

Earlier patents had been issued for wooden building components and substitutes for whole pieces of lumber, which were constructed, or engineered from smaller pieces. These involved joining pieces of wood together, to form larger, usable pieces, which were not intended to be disassembled, although they could be cut and shaped like solid pieces of lumber. See e.g. United States Patent No. 5,074,092 ("092" or "Norlander"). The patent in dispute describes a similar process, but includes the addition of a "second portion" made of a moisture and insect resistant material. However, it is clear from the claim language, the rest of the specification, and the drawings, that what is described and intended is a frame with side jambs which are constructed as single complete pieces - for all intents and purposes as though they were made from single pieces of lumber.

BMS proposed the following definition for "integrally formed":

"Referring to the attachment of the upper and lower portions of a side jamb such that the upper and lower portions are attached to one another so as to achieve a completed side jamb."

Endura's proposed definition is:

"Shaped or formed into a single, indivisible, whole unit, as opposed to an assembly of components attached with removable fasteners, such as screws or staples."

At the Markman hearing counsel for Endura agreed that its use of "formed" in the definition of integrally formed could be
considered circular, although counsel later noted that some dictionaries use a word to define itself. The court does not find this approach particularly helpful, especially since definitions are intended to help a jury, not keep it on a revolving train of thought.

Claim 1 states that the upper and lower portions are "integrally formed." While this indicates a joinder of the portions, it is not clear from this language alone how the joinder is accomplished, and what, if any limitations are implied. It is therefore necessary to construe the term in light of other intrinsic evidence.

The specification uses "integrally" to describe: "connected" (in the abstract and Col. 1, l. 14); "formed" (Claim 1, Col. 3, l. 46); and "joined" (Claim 4, Col. 4, l. 4-5). The patentee chose not to define these terms as equivalent or identical in the specification.

The "Background of the Invention," describes fingerjointing small pieces of wood and joining them "end to end to produce a single long piece . . . ." Col. 1, l. 47-48. The specification also stated that the wood and durable portions are "connected end to end with a glued finger joint or other mechanical connection to assemble the component." Col. 2, l. 6-7. The specification also states that the assembly of the wood portion with the durable portion "forms a complete side jamb 1 or 2." Col. 3, l. 13. These references support a definition which implies that the wooden portion and the durable portion are put together to form a single piece or unit, which is intended to be used like the single piece of lumber formerly used for door jambs.

The '209 patent is a continuation of the '943 patent and the language of claim 1 in each patent is the same except for describing the lower durable piece in the '209 patent as made of "a second material" instead of "A wood particulate that is mixed with resins" as in the '943 patent.

The prosecution history indicates that the application for what would become the '943 patent, initially merely indicated that the side jambs would have an upper and lower portions, with no reference to how they were attached. The Patent Examiner rejected the claim "under 35 U.S.C. § 102(e) as being anticipated by RAYNAK in view of HSU." RAYNAK (United States Patent No. 5,437,130) discloses a jamb made from pieces of lumber. HSU (United States Patent No. 5,553,438) discloses a wooden pole with the bottom section being pressure treated and then covered with thermoplastic.

BMS argued that the invention in this case was different, in that the durable portion was not merely pressure treated wood, or wood wrapped in plastic, but rather was "formed from" a wooden portion and a durable portion. BMS also submitted photos of the jambs showing them finger jointed to form a single piece. The Examiner issued an amendment which inserted "that are integrally formed" after "jambs having upper and lower portions . . . ." The court concludes that the claim cannot be interpreted as a wooden jamb with a piece of durable material wrapped around the wood, or as a durable piece which may be added to a wooden jamb at the discretion of the house builder or carpenter. The durable portion must be attached in a relatively permanent fashion, so that the jamb may be shortened by cutting (just like a solid wood jamb) or otherwise shaped with a tool (just like a solid wood jamb) but not merely disassembled as though the wood portion and the durable portion were interchangeable parts.

Endura argues that the definition should contain the following limitation: "as opposed to an assembly of components attached with removable fasteners, such as screws or staples." The preferred embodiment does describe finger jointing and gluing. Col. 3, l. 2-3. However, the Specification also states that "other wood joints are contemplated, such as edge gluing or their equivalents." The summary uses the phrase "connected end to end with a glued finger joint or other mechanical connection to assemble the component." Col 2, l. 6-7. 1

Endura raised in their Reply brief and at the Markman hearing an argument that the court should not consider any new language in the '209 patent specification, which was not present in the '943 parent application because it constitutes new subject matter. Endura asserts BMS did not follow the MPEP guidelines when they submitted the continuation application. At the Markman hearing, BMS responded that the issue is not whether the court should consider the language, but might be whether the application was actually a continuation or continuation in part. Endura decided to wait until the Reply Brief and Markman hearing to raise this issue, so it has not been fully presented. Therefore, the court reserves any ruling as to new subject matter, inequitable conduct, or whether the continuation is a continuation in part.
These references indicate that connections other than finger joints may be used. The fact that the preferred embodiment happens to use finger joints does not import that limitation into the claim language. While these references would not broaden the claim language to allow an easily disassembled jamb, or a structure composed of interchangeable parts, they also do not limit the claim to joints without metal fasteners. For example metal dowel rods or screws might be inserted in the end of a durable portion, running parallel to the portion into the end of the wooden portion to strengthen the glued joint. Other possibilities could be contemplated to form a joint that was relatively permanent.

Therefore the court construes this claim term as follows:

"integrally formed" means: "connected together so as to make up a single complete piece or unit, or so as to work together as a single complete piece or unit, and so as to be incapable of being easily dismantled without destroying the integrity of the piece or unit."

B. Claim 1

The only claim term in dispute are the words "integrally formed" in claim 1. This claim is set out below with the disputed term highlighted in BOLD

Claim 1 reads: A frame, comprising: a top jamb; two side jambs having upper and lower portions that are integrally formed, said upper portion being made of wood, said lower portion being a durable moisture, decay, and insect resistant material made from a second material.

1. Claim 1, "integrally formed"

Earlier patents had been issued for wooden building components and substitutes for whole pieces of lumber, which were constructed, or engineered from smaller pieces. These involved joining pieces of wood together, to form larger, usable pieces, which were not intended to be disassembled, although they could be cut and shaped like solid pieces of lumber. See United States Patent No. 5,074,092 ("092" or "Norlander"). The patent in dispute describes a similar process, but includes the addition of a "second portion" made of a moisture and insect resistant material. However, it is clear from the claim language, the rest of the specification, and the drawings, that what is described and intended is a frame with side jambs which are constructed as single complete pieces -- for all intents and purposes as though they were made from single pieces of lumber. 1

1 The parties agreed, and the court concludes that a person of "ordinary skill in the art in the subject matter of the 209 patent would have three to five years' experience in the woodworking arts, including various manufacturing techniques such as setting up and operating the necessary machinery to produce frames and wood joining techniques." See Claim Construction Hearing Transcript, p. 29-30.
The Hon. Robert Bryan, in the case of Trinity Glass International Inc. v. Burns, Morris & Stewart Limited Partnership, Civil Action No. C04-5330 (W.D. Was.), construed "integrally formed" as follows:

Permanently connected together so as to make up a single completed piece or unit, so as to be incapable of being dismantled without destroying the integrity of the piece or unit and/or on or both of the constituent portions.

The prior construction of this court, and of Judge Bryan, are instructive, and provide a basis for analysis by this court, but they are not binding on this court. See Texas Instruments, Inc. v. Linear Technologies Corp., 182 F. Supp. 2d 580, 586 (E.D. Tex. 2002). Additionally, the court must consider the impact of Phillips, which has since been decided. Finally, the parties have presented new arguments. Accordingly, the claim term will be analyzed de novo.

a. Masonite's Position

Masonite's proposed definition is:

Permanently connected together so as to make up a single complete piece or unit having a uniform peripheral contour, or so as to work together as a single complete piece or unit, and so as to be incapable of being easily dismantled without destroying the integrity of the piece or unit or one or both of the constituent portions making up the piece or unit.

Masonite argues that the definition should contain the limitation of being "permanently connected together." As noted above, the definition adopted by Judge Bryan included "permanently." This court, in its earlier opinion construing this same term of this patent, noted during the hearing that "integrally formed" denoted something that was "relatively permanent."

The preferred embodiment, and the photos submitted to the examiner, do show finger jointing and gluing. 209 patent, Col. 3, 1. 2-3. This is a permanent type of joinder according to the testimony. However, the specification also states that "other wood joints are contemplated, such as edge gluing or their equivalents." The summary uses the phrase "connected end to end with a glued finger joint or other mechanical connection to assemble the component." 209 patent, Col 2, 1. 6-7.

These references indicate that connections other than finger joints may be used. The fact that the preferred embodiment happens to use finger joints does not import that limitation into the claim language. While these references would not broaden the claim language to allow an easily disassembled jamb, or a structure composed of interchangeable parts, they also do not limit the claim to joints that could never be disassembled or joints without metal fasteners. For example a double pointed screw might be inserted in the end of a durable portion, running parallel to the portion into the end of the wooden portion to make a joint, or to strengthen a glued end to end joint. Other possibilities could be contemplated to form a joint that was not easily dismantled but was not "permanent."

Upon further reflection, and careful examination of the prior rulings of Judge Bryan and this court, it seems that the term in dispute is more correctly defined without a temporal element such as "permanently." As noted at the hearing, nothing is truly "permanent" and anything can be dismantled if one just gets a "bigger hammer." The court needs to be careful about confusing the jury by using a word such as "permanently" that could easily be understood by jurors as placing more of a limitation than the claim actually has.

Masonite argues that statements made by BMS in the prosecution of its patent before the European Patent Office ("EPO") should estop BMS from claiming anything but a "permanent joinder." Representations to a foreign patent office may be considered, when they comprise relevant evidence in the context of considering the doctrine of equivalents. See Caterpillar Tractor Co. v. Burko, S.P.A., 714 F.2d 1110, 1116 (Fed. Cir. 1983). However, in the context of claim construction, differences in international requirements for patent prosecution could make reliance on representations before foreign patent offices inappropriate. See Ti Group Automotive Sys. (N. Am.), Inc., v. VDO N. Am., L.L.C., 375 F.3d 1126, 1136 (Fed. Cir. 2004). Additionally, adopting Masonite's argument in this regard would require the court to rely upon extrinsic evidence of what happened before a foreign patent office, without a complete presentation of such evidence, nor a complete understanding of what happened before the foreign body and why that was important under foreign law. Therefore, while Masonite may raise this argument, should the doctrine of equivalents become important, the court will not use the incomplete evidence in the record on this issue as a basis for defining a claim term at the Markman hearing.

Masonite also makes a claim of improper conduct or inequitable conduct because BMS stated that the 209 patent was a
"continuation" rather than a "continuation in part." (Masonite Claim Construction Brief, p. 24). Again, this is a Markman hearing, for the purpose of claim construction. Whether BMS could be found to have committed inequitable conduct, or a "fraud on the PTO" is a matter dealing with the issue of infringement. See Warner-Jenkinson Co., Inc. v. Hilton Davis Chemical Co., 520 U.S. 17, 117 S. Ct. 1040, 137 L. Ed. 2d 146 (1997). Whether the patent is properly classified as a "continuation" or "continuation in part" and whether such classification was a mislabeling which somehow violated the statute, and is in the nature of a "fraud in the PTO," or inequitable conduct, may have to be decided, at least in part, under the clear and convincing evidence standard of proof. See, Burlington Indus, Inc. v. Dayco Corp., 849 F.2d 1418, 1422 (Fed. Cir. 1988). The court will reserve any such determination until later.

Finally, Masonite argues that the definition should also include a limitation of "having a uniform peripheral contour." On close questioning by the court, counsel for Masonite admitted that such words could not be found in the claim itself, the specification, nor in the prosecution history. Masonite argued that such limitation should be implied from the use of the word jamb, because most door jambs are uniform. In the first place, just because most door jambs are uniform rectangles does not mean that all door jambs are necessarily so. For example, it would not be surprising to find a door jamb and other building elements which did not have uniform contours in a building designed by Gaudi or a student of his modernist style. Regardless of this, the court cannot import or imply limitations on the claim language which are neither found in the claim itself, nor even hinted at in the specification and prosecution history.

b. BMS's Proposal

BMS proposed the following definition for "integrally formed:

Connected together so as make up a single complete piece or unit, or so as to work together as a single complete piece or unit.

The definition offered by BMS just does not go far enough. It would include any type of connection, including exterior screws attaching a connecting plate, a loose dowel with removable discs, a C-clamp, or one of the wide black clips used to bind papers. 2 Claims should not be read to ensnare prior art. Harris Corp. v. IXY Corporation, 114 F.3d 1149, 1153 (Fed. Cir. 1997). Claims should, "if practicable . . . be so interpreted as to uphold and not destroy the rights of the inventor." Nazomi Communications, Inc. v. Arm Holdings, PLC, 403 F.3d 1364, 1368 (citing Turril v. Mich. S & N. Ind. R.R., 1 Wall 491, 68 U.S. 491, 510, 17 L. Ed. 668 (1863)) (emphasis in original). The court may not rewrite a claim to preserve validity. See Nazomi, 403 F.3d at 1368. However, a patent is presumed to be valid, and the court may consider the actions of the Patent Examiner and amendments required by the Examiner in defining a disputed term during the prosecution history. See Phillips, 415 F.3d at 1317-18.

2 BMS, at the Markman hearing, offered an alternate definition: "generally constructed to remain connected together so as to make up a single complete piece or unit." The court rejects this formulation for the same reasons it rejects the original proposal.

In this regard the court takes into account the rejection of the initial application by the Patent Examiner, and the addition of the words "integrally formed" to the claim language. The 209 patent is a continuation of the 943 patent and the language of claim 1 in each patent is the same, except for describing the lower durable piece in the 209 patent as made of "a second material" instead of "a wood particulate that is mixed with resins" as in the 943 patent. The prosecution history indicates that the application for what would become the 943 patent, initially merely indicated that the side jambs would have upper and lower portions, with no reference to how they were attached. The Patent Examiner rejected the claim "under 35 U.S.C. § 102(e) as being anticipated by RAYNAK in view of HSU." RAYNAK, United States Patent No. 5,437,130, discloses a jamb made from pieces of lumber. HSU, United States Patent No. 5,553,438, discloses a wooden pole with the bottom section being pressure treated and then covered with thermoplastic.

BMS argued to the Examiner that the invention in this case was different, in that the durable portion was not merely pressure treated wood, or wood wrapped in plastic, but rather was "formed from" a wooden portion and a durable wooden
portion. BMS Appendix, p. 154-155. BMS also submitted photos of the jambs showing them finger jointed to form a single piece. BMS Appendix p. 158-160.

The Examiner required an amendment which inserted "that are integrally formed" so that the claim language now is: "Two side jambs having upper and lower portions that are integrally formed. . . ." The court does not see how, and nobody has argued that, "formed," in the context of fastening pieces of wood and a durable material, can mean anything other than "attached" or "connected." While the durable portion may be a plastic or some other extruded substance, there is no hint in the intrinsic or extrinsic evidence that the wood portion could be extruded together with the durable portion, like putty or clay, or melted together like plastic or metal, to be shaped by pressure or a mold.

On the other hand, if "attached" or "connected" is all that is meant, then what purpose is served by "integrally?" "Integrally" modifies "formed," and therefore puts some limit on the type of joinder involved.

BMS argues that integral was defined in In re Morris, 127 F.3d 1048 (Fed. Cir. 1997) and cases cited therein. These mostly describe definitions used by the Patent Office in deciding whether to issue a patent, and all involve different technologies. The court is not going to rely on these definitions. See Medrad Inc. v. MRI Devices Corp., 401 F.3d 1313, 1320 (Fed. Cir. 2005).

The parties agreed at the hearing that the term "integrally formed" was not a term of art which would have a meaning to carpenters, wood workers, or those skilled in the art in question, which is different from the meaning ascribed in ordinary usage by lay persons. Recognizing that the claim must be defined as understood by one skilled in the art, in light of the language used in the patent documents, this is a case in which reference to a general purpose dictionary may be helpful. See Phillips, 415 F.3d at 1314.

"Integrally" implies something that is part of the whole or is needed for completeness. See Meriam-Websters Collegiate Dictionary 606 (10th ed. 2002). However, as noted by Judge Bryan, integrally is not being used in this patent merely in the sense of a cog inside a machine, which is "integral" to the mechanism, but is a separate moving part. The durable part and the wooden part of the side jambs, as described in the claim and specifications, are joined, and do not move in relation to each other.

The claim cannot be interpreted as a wooden jamb soaked in preservative or with a piece of durable material wrapped around the wood. The claim does not contemplate a kit of interchangeable parts, some of which are durable, to be assembled at the job site to fit variously sized openings. Any of these interpretations would contradict the statements made by BMS to the examiner to distinguish prior art, and would render "integrally formed" nugatory.

The "Background of the Invention," describes fingerjointing small pieces of wood and joining them "end to end to produce a single long piece. . . ." 209 patent, Col. 1, 1. 47-48. The specification states that the wood and durable portions are "connected end to end with a glued finger joint or other mechanical connection to assemble the component." 209 patent, Col. 2, 1. 6-7. The specification also states that the assembly of the wood portion with the durable portion "forms a complete side jamb 1 or 2." 209 patent, Col. 3, 1. 13. These references support a definition which implies that the wooden portion and the durable portion are put together to form a single piece or unit, which is intended to be used like the single piece of lumber formerly used for door jambs.

The durable portion must be attached to the wooden portion, in such a way that the jamb may be shaped with a tool (just like a solid wood jamb), or perhaps even shortened by cutting, although, with a pre-hung door, this would be unusual. Unless "integrally formed" is useless surplusage, the attachment cannot just be something like an exterior clip or a wrap of tape. The attachment or connection must become a part of the whole, like glue, or be interconnected with the whole, like a finger joint or a lap and groove type joint. The use of glue and interconnected joints in combination is clearly contemplated. One or more screws running between the wooden piece and the durable piece, parallel to the length of the jamb, might take the place of, or be used with, glue.

Therefore, the court construes the claim term in dispute as follows:

"Integrally formed" means: "connected together so as to make up a single complete piece or unit, in such a way that the connection becomes part of, or is interconnected with, the piece or unit, as by gluing, an interconnecting joint, or internal
screws. The connector is not merely attached to, or wrapped around, the outside surface of the piece or unit.

Since this definition modifies the prior one issued by this court, and the one given by Judge Bryan, a very experienced judge, it is worth discussing the reasons for the differences. As stated earlier, there seems to be no basis in the patent documents for including a temporal limitation which requires, or implies, some type of permanence. Nothing is truly permanent, and the court does not want to confuse a jury with a term which may have to be defined as not implying "to the end of time" or "indestructible."

This court previously included in its definition "incapable of being easily dismantled without destroying the integrity of the piece or unit." Judge Bryan adopted this formulation without the word "easily." On further reflection, neither formulation adds much to the definition. Anything can be dismantled. Glue can be dissolved, fasteners can be undone, joints can be taken apart, and pieces can even be broken. But whether "easily" or not, once the jamb (the "piece or unit") is dismantled, its integrity is, by definition, destroyed.

DISCUSSION

As a preliminary matter the parties disagree about the proper claim construction methodology to be employed by the PTO. Appellants argue that this court's in banc decisions in Markman v. Westview Instruments, 52 F.3d 967, 34 U.S.P.Q.2D (BNA) 1321 (Fed. Cir. 1995) (in banc), aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384, 38 U.S.P.Q.2D (BNA) 1461 (1996), and In re Donaldson, 16 F.3d 1189, 29 U.S.P.Q.2D (BNA) 1845 (Fed. Cir 1994) (in banc), require the PTO in the course of prosecution to interpret claims in the same manner as courts are required to during infringement proceedings. The Solicitor responds by arguing that our past decisions permit the PTO to give claim language its "broadest reasonable interpretation" during prosecution, citing In re Zletz, 893 F.2d 319, 13 U.S.P.Q.2D (BNA) 1320 (Fed. Cir. 1989), In re Yamamoto, 740 F.2d 1569, 222 U.S.P.Q. (BNA) 934 (Fed. Cir. 1984), and Burlington Indus. v. Quigg, 822 F.2d 1581, 3 U.S.P.Q.2D (BNA) 1436 (Fed. Cir. 1987).

The Solicitor is correct, and we reject appellants' invitation to construe either of the cases cited by appellants so as to overrule, sub silentio, decades old case law. Some cases state the standard as "the broadest reasonable interpretation," see, e.g., In re Van Geuns, 988 F.2d 1181, 1184, 26 U.S.P.Q.2D (BNA) 1057, 1059 (Fed. Cir. 1993), others include the qualifier "consistent with the specification" or similar language, see, e.g., In re Bond, 910 F.2d 831, 833, 15 U.S.P.Q.2D (BNA) 1566, 1567 (Fed. Cir. 1990). Since it would be unreasonable for the PTO to ignore any interpretive guidance afforded by the applicant's written description, either phrasing connotes the same notion: as an initial matter, the PTO applies to the verbiage of the proposed claims the broadest reasonable meaning of the words in their ordinary usage as they would be understood by one of ordinary skill in the art, taking into account whatever enlightenment by way of definitions or otherwise that may be afforded by the written description contained in the applicant's specification.
Donaldson itself pointed out that the court's holding is readily harmonized with that principle. Requiring the PTO to what is described in the specification and equivalents thereof, according to the PTO, would conflict with this practice. See, e.g., In re Prater, 56 C.C.P.A. 1381, 415 F.2d 1547, 1552, 42 U.S.P.Q. (BNA) 541, 550-51 (CCPA 1969). Limiting claims written in accordance with § 112 P6 to what is described in the specification and equivalents thereof, according to the PTO, would conflict with this practice. Donaldson itself pointed out that the court's holding is readily harmonized with that principle. Requiring the PTO to

It would be inconsistent with the role assigned to the PTO in issuing a patent to require it to interpret claims in the same manner as judges who, post-issuance, operate under the assumption the patent is valid. The process of patent prosecution is an interactive one. Once the PTO has made an initial determination that specified claims are not patentable (the prima facie case concept, see In re Oetiker, 977 F.2d 1443, 1448, 24 U.S.P.Q.2D (BNA) 1443, 1447 (Fed. Cir. 1992) (Plager, J. concurring)), the burden of production falls upon the applicant to establish entitlement to a patent. See In re Spada, 911 F.2d 705, 708, 15 U.S.P.Q.2D (BNA) 1655, 1658 (Fed. Cir. 1990); In re King, 801 F.2d 1324, 1327, 231 U.S.P.Q. (BNA) 136, 138 (Fed. Cir. 1986) (burden shifts to appellant after the PTO establishes a prima facie case of anticipation). This promotes the development of the written record before the PTO that provides the requisite written notice to the public as to what the applicant claims as the invention. As the Supreme Court recently affirmed, public notice is an important objective of patent prosecution before the PTO. See Warner-Jenkinson Co. v. Hilton Davis Chem. Co., 137 L. Ed. 2d 146, 117 S. Ct. 1040, 1051 (1997) (establishing a rebuttable presumption of prosecution history estoppel when the public record is unclear as to whether the prior art precipitated an amendment to the claims in order to give "proper deference to the role of claims in defining an invention and providing public notice.").

Although In re Donaldson comes closer to the present case, it still fails to prove appellants' point. In Donaldson, this court considered the question of how the PTO is required to interpret claims drafted pursuant to 35 U.S.C. § 112 P6, claims in so-called "means-plus-function" language. See 35 U.S.C. § 112 P6 (1994) ("An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of the structure, material, or acts in support thereof."). The PTO argued that they were permitted to interpret the claims as broadly as the claim language permitted without the constraint of the written description contained in the specification. The Donaldson court, in banc, noted that the statute requires that claims so written "shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof." Donaldson, 16 F.3d at 1193, 29 U.S.P.Q.2D (BNA) at 1848-49. The court found no basis in the statute or legislative history for exempting the PTO from this statutory mandate. Therefore the PTO is required to consult the specification during examination in order to determine the permissible scope of the claim.

It is enough to point out that this case does not involve claims written in means-plus-function language to distinguish Donaldson from the present case. There is no comparable mandate in the patent statute that relates the claim scope of non-§ 112 P6 claims to particular matter found in the specification. See Eastman Kodak Co. v. Goodyear Tire & Rubber Co., 114 F.3d 1547, 1552, 42 U.S.P.Q.2D (BNA) 1737, 1740 (Fed. Cir. 1997) ("The claim language itself defines the scope of the claim.").

We need not simply rely on this distinction, however, for the Donaldson court went on to dispose of the precise argument that appellants now make. The PTO had argued that our prior case law, as discussed above, permitted examiners to give claims their "broadest reasonable interpretation" during prosecution. See, e.g., In re Prater, 56 C.C.P.A. 1381, 415 F.2d 1393, 1404-05, 162 U.S.P.Q. (BNA) 541, 550-51 (CCPA 1969). Limiting claims written in accordance with § 112 P6 to
interpret claims in light of the specification "merely sets a limit on how broadly the PTO may construe means-plus-function language under the rubric of 'reasonable interpretation.'" Donaldson, 16 F.3d at 1194, 29 U.S.P.Q.2D (BNA) at 1850. Therefore, it cannot reasonably be argued that Donaldson overruled our long line of case law that permits the PTO to give claims their "broadest reasonable interpretation."

The question then is whether the PTO's interpretation of the disputed claim language is "reasonable." Appellants contend that the Board's interpretation is unreasonable when the claim language is properly construed in light of the specification and other extrinsic evidence. In particular, appellants argue that the phrase "integrated as a portion of" requires the compliance area to be "fused together" with the housing "to form a single part--such as by casting them as a molded article, machining a single piece of material to form them, welding them together, or otherwise joining them in a firm and substantially permanent manner." Brief for Appellants at 18. Because the elastomeric pad of Brown is "removably coupled," according to appellants, Brown does not anticipate claim 1 when properly construed. Id.

We conclude that the PTO's interpretation is reasonable in light of all the evidence before the Board. As the cases cited above demonstrate, our predecessor court had on several prior occasions interpreted the term "integral" to cover more that a unitary construction. See, e.g., In re Kohno, 55 C.C.P.A. 998, 391 F.2d 959, 157 U.S.P.Q. (BNA) 275 (CCPA 1968), In re Dike, 55 C.C.P.A. 1172, 394 F.2d 584, 157 U.S.P.Q. (BNA) 581 (CCPA 1968), In re Larson, 52 C.C.P.A. 930, 340 F.2d 965, 144 U.S.P.Q. (BNA) 347 (CCPA 1965), and In re Clark, 41 C.C.P.A. 974, 214 F.2d 148, 102 U.S.P.Q. (BNA) 241 (CCPA 1954). This court has also endorsed that interpretation. See, e.g., Advanced Cardiovascular Sys. v. Scimed Life Sys., 887 F.2d 1070, 1074, 12 U.S.P.Q.2D (BNA) 1539, 1542 (Fed. Cir. 1989) (nothing of record limited "integral" to mean "of one-piece construction"). Appellants' attempt to distinguish these cases misses the point. Absent an express definition in their specification, the fact that appellants can point to definitions or usages that conform to their interpretation does not make the PTO's definition unreasonable when the claim language is properly construed in light of the specification.

Appellants argue that their claim does not just require that the acoustic compliance area be integrally formed from the support member. Instead, claim 1 requires that the area be "integrated as a portion of" the support member. This does not change our conclusion. Portion is defined as a "part or share of something." Webster's Third New International Dictionary 1768 (1986). Thus this term tells us nothing about whether the acoustic compliance area is removable or separable from the support member. A slice of pie can be considered a 'portion of' the pie while also being removable. We conclude that the added limitation does not overcome the rejection.

The appellants urge us to consult the specification and some of the cited prior art, including Brown, and interpret the disputed language more narrowly in view thereof. When read in light of this material, according to applicants, the "true" meaning of the phrase emerges. We decline to attempt to harmonize the applicants' interpretation with the application and prior art. Such an approach puts the burden in the wrong place. It is the applicants' burden to precisely define the invention, not the PTO's. See 35 U.S.C. § 112 P2 ("The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention."). While it is true that the claims were not rejected on the ground of indefiniteness, this section puts the burden of precise claim drafting squarely on the applicant.

The problem in this case is that the appellants failed to make their intended meaning explicitly clear. Even though the appellants implore us to interpret the claims in light of the specification, the specification fails to set forth the definition sought by the appellants. Nowhere in the technical description of the invention does the application use or define the phrase "integrated as a portion of." The phrase briefly appears in the "Summary of the Invention" and again in a description of the "advantages of the present invention." In neither case is a drawing referenced or a precise definition given.

The prosecution history is equally unhelpful in divining the interpretation sought by appellants. In all cases the appellants
first describe their invention followed by a general description of the prior art reference. They then conclude with a conclusory statement such as "It is clear that Applicants' inventive concept, as recited in claim 1 (amended), is not anticipated by the prior art," or, even more vaguely, "it is clear that the base plate and housing arrangement disclosed in Brown '888 is completely different in structure than the acoustic isolator apparatus recited in Applicants' claims." Never do the appellants particularly distinguish their claimed invention (as compared with their "inventive concept," whatever that means) from the prior art. We interpret this as a veiled attempt to avoid the potential future effects of prosecution history estoppel. Such evasiveness we cannot condone, particularly when the public must rely on the written record to define the resulting property right. See Warner-Jenkinson, 117 S. Ct. at 1040.

We understand the difficulties that can arise in prosecution. This appeal is a case in point. The PTO initially rejected claim 1 in light of Brown. Appellants amended their claim to add the limitation that the compliance area was "integrally formed on" the support member. This amendment seemed to overcome the examiner's rejection because in response the examiner produced a new ground for the rejection (i.e., Biermeier). That reference showed a thinned-down region of a supporting top member. The examiner's own actions suggested that the applicants had properly distinguished Brown on the ground that the Brown pad was not "integrally formed" from the support member, which necessitated the new ground of rejection.

Appellants were apparently able to overcome this new rejection by adding the further limitation that the acoustic isolator eliminated "selected frequencies of acoustic noise" and arguing that Biermeier did not accomplish this claimed function. At this point the applicants had no reason to believe that Brown could properly be the basis for a 102 rejection, having previously distinguished it as well as Biermeier. When the examiner renewed his previous ground of rejection based on Brown, the appellants were no doubt of the view that Brown was distinguishable. Nonetheless, they made their third and final amendment, adding the limitation that the acoustic compliance area be integrally formed "as a portion of" the support member, in an attempt to assuage the examiner. Surely they must have thought this amendment would distinguish Brown, and reasonably so given what had previously transpired. Unfortunately they were mistaken.

Nonetheless, when the examiner renewed the rejection the applicants had an obligation to either demonstrate that the examiner's interpretation of the claim language was unreasonable or amend their claim to distinguish the prior art. This they did not do. It is apparent that the appellants knew how to claim their invention so as to avoid the prior art since several claims were allowed, some very similar to claim 1. The PTO was not only permitted but obligated to reject claim 1 when appellants failed precisely to define in the written description the disputed language, and there was a reasonable alternative definition.

The decision of the Board is

AFFIRMED.

The Court held a Markman hearing and subsequently issued a Memorandum opinion (Docket No. 138) in which the Court construed the disputed claim terms of the '981 Patent and the '306 Patent. At issued were the following claim terms of the '981 Patent and the '306 Patent: 1) "Frame"; 2) "Formed Integrally Within"; 3) "Integrally Formed Within"; 4) "Integrally Formed With"; 5) "Including"; 6) "Attached"; and 7) "Manifold". The Court construed the terms as follows:

"Frame": "the underlying structure of the cone crushe to which other constituent parts may be fitted, attached or integrated."

"Formed integrally within" and "Integrally formed within": "created or constructed within or as a part of the frame."

"Integrally formed with": "created or constructed within or in combination with the frame."

"Attached": "fastened or affixed."

"Including": "to take in or comprise as a part of a whole."
"Manifold": "a fitting or a passage that has a plurality of openings for making connections."

The phrase "not integrally formed with the unit" here most plainly means that the reservoir is not required to be of a specific size or shape to be used with the unit. Defendant attempts to limit the meaning of this term to "removable." However, this interpretation ignores the plain meaning of the words in the phrase. The verb "to form" means to give form or shape to, or to give a particular shape to. If a reservoir is "not integrally formed with the unit" then its shape is not dictated by the unit. Defendant's interpretation ignores entirely the use of the term "any typical" to modify "bottle" in the phrase "designed to attach to any typical bottle." Reading the cited passage as a whole, defining "not integrally formed" as referring to shape rather than removeability is the logical interpretation, especially since the quoted passage in two places stresses that the invention is usable with any bottle with compatible threads, and the claim itself uses the term "alternate fluid reservoir." Because the '106 patent requires use of an internal reservoir of specific size and shape, the '495 patent's elimination of this requirement is not taught by the prior art and claim 2 is not anticipated.

--- Footnotes ---

7 Webster's Ninth New Collegiate Dictionary (1985). The complete definition is:

form vt 1: to give form or shape to: FASHION 2 a: to give a particular shape to: shape or mold into a certain state or after a particular model: ARRANGE b: to arrange themselves in c: to model by instruction or discipline 3: DEVELOP, ACQUIRE 4: to serve to make up or constitute: be a usu. essential or basic element of 5 a: to assume an inflection so as to produce (as a tense) b: to combine to make (a compound word) 6: to arrange in order: DRAW UP vi 1: to become formed or shaped 2: to take form: come into existence: ARISE 3: to take on a definite form, shape, or arrangement syn see MAKE

--- End Footnotes ---

3. Claim 4, Element 3, "integrally joined"

While the word joined differs from the word "formed" as used in "integrally formed" defined above, nothing in the claim language, the rest of the specification, nor in the prosecution history indicates that they have different meanings. The door jamb of claim 1, which is "integrally formed," is not molded or extruded, but rather is shaped by cutting, like a piece of wood. The "formed" refers not to shaping but to the relatively permanent connection of the wood portion to the durable portion. The same applies to the construction components of claim 4. The wood and durable portions are connected in a relatively permanent fashion. Accordingly, for the reasons set out above in discussing the definition of "integrally formed" the court construes this claim term as follows:

"integrally joined" means: "connected together so as to make up a single complete piece or unit, or so as to work together as a single complete piece or unit, and so as to be incapable of being easily dismantled without destroying the integrity of the piece or unit."

b. "integrally molded on"

Honda argues that this term should be construed to mean "formed together," and Coast argues that the term should be construed to mean "the engine block includes the cylinder barrel and a portion completely encircling the entire periphery of one end of a crankshaft, cast as a single piece."
The Court begins with the claim language, which suggests that the first bearing portion is molded on to the first case half as a unit, which lends support for Honda's proposed construction. See, e.g., Webster's at 628 (defining integral as "formed as a unit with another part"). However, in the specification, the inventors also clearly distinguish between the terms "integrated molded" and "formed integrally." (Compare '273 Patent at 1:64-66, 3:5-9 with id. at 4:13, 4:24-25, 5:23-25, 5:41-43.) Thus, the specification demonstrates that the inventors gave the term "integrated molded" a meaning different from the term "formed integrally." Although the parties do not cite to the prosecution history, the record also demonstrates that the inventors initially used the term "formed by molding" in the claim, but amended the claim language to "integrated molded." (See Shariati Decl., Ex. M at 2.) Again, this prosecution history demonstrates that the term "molded" means something different from the word "formed."

Accordingly, the Court construes the term "integrated molded on" to mean: "formed together by molding."

2. "Integrally secured"

Claim 1 states that the invention includes "at least one light emitting source integrally secured within said housing adjacent the plug receiving opening thereof to provide visual verification of the status of the electrical connection." The parties dispute the meaning of this part of the claim. Maxconn asserts that the term "integrally secured" means "permanently secured" such that the LED cannot be removed from the connector unit. "Secured," it argues, connotes a sense of permanence while "integrally" signals that the LED is not secured in a removable or insubstantial way, but forms an inseparable single unit.

a. Claim language

To interpret the disputed language, the court first looks to the words of the claims to define the scope of the patented invention. See Vitronics, 90 F.3d at 1582. As stated above, words will be given their ordinary and accustomed meaning unless it appears that the inventor used them differently. Envirotech Corp., 730 F.2d at 759.

Plaintiffs argue that Maxconn is seeking to have the Court adopt a claim interpretation that includes additional, unclaimed limitations which are not required by the ordinary meaning of the claim language, the patent specification, or the prosecution history. They argue the term "integrally secured" should be given its ordinary meaning as denoting that the LED cannot be removed from the connector unit. "Secured," it argues, connotes a sense of permanence while "integrally" signals that the LED is not secured in a removable or insubstantial way, but forms an inseparable single unit.

The Court agrees with Plaintiffs. Nothing in the ordinary meaning of the term "integral" indicates that the parts must be permanently fused together. The ordinary meaning of the term "integrally secured" suggests that the RJ connector housing and the LEDs move together as one unit, and not that the LEDs cannot, with some degree of effort, be extracted from the housing. 2 Nothing in the claim language itself denotes a "permanency" limitation.

2 Plaintiffs argue that the Court of Appeals for the Federal Circuit has in at least one instance interpreted the ordinary meaning of the term "integral" and held that it does not denote one piece. In re Morris, 127 F.3d 1048, 1055-56 (Fed. Cir. 1997). Following oral argument, Defendant submitted with leave of Court a brief arguing that the Morris analysis is irrelevant to the present matter. The Court agrees that the Morris analysis is certainly less relevant to the present claims construction than is the intrinsic evidence now before it. Because the Court relies entirely on intrinsic evidence to interpret this phrase, it does not reach the question whether Morris should be considered persuasive authority on the interpretation of the word "integral."

b. Specification
The second step in the analysis is to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning. See Vitronics, 90 F.3d at 1582. The specification acts as a dictionary when it expressly defines terms used in the claims or when it defines terms by implication. See id. (citing Markman, 52 F.3d at 979). It is the single best guide to the meaning of a disputed term. Id.

Extraneous limitations appearing in the specifications should not be read into a claim. See E.I. DuPont De Nemours & Co. v. Phillips Petro., 849 F.2d 1430, 1433 (Fed. Cir. 1988); see also Loctite Corp. v. Ultraceal Ltd., 781 F.2d 861, 867 (Fed. Cir. 1985) (“Generally, particular limitations or embodiments appearing in the specifications will not be read into the claims.”). "Extraneous" refers to a limitation read into a claim from the specification wholly apart from any need to interpret what the patentee meant by particular words or phrases in the claim. DuPont, 849 F.2d at 1433.

The specification of the Pocrass '317 patent is consistent with the interpretation that "integrally secured" does not require that the LED be permanently secured within the connector housing so as to form an inseparable unit. The specification states that "an opening may be molded in the modular style connector and then the LED indicator placed therein and adhesively cemented in place, if needed." Pocrass '317 patent, col. 4, ll. 7-10 (emphasis added). The specification thus teaches that fixing the LED with adhesive is optional. The specification also indicates that the LED indicator is "placed" inside the connector housing, and nowhere indicates that the LED is inextricably fixed inside the housing.

Because the specification does not include a "permanency" limitation, that limitation should not be read into the claim.

c. Prosecution history

Next, the court considers the prosecution history of the patent. The history contains the complete record of all proceedings before the Patent and Trademark Office, including any express representations made by the applicant regarding the scope of the claim. See Vitronics, 90 F.3d at 1582. The prosecution history limits the interpretation of claims so as to exclude any interpretation that may have been disclaimed or disavowed during prosecution in order to obtain claim allowance. See Specialty Composites, 845 F.2d 981, 988 (Fed. Cir. 1988). Patent claims may not be interpreted one way in order to obtain their allowance and a different way against accused infringers. Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir. 1995).

During the prosecution of the patent, the examiner noted the similarity of certain aspects of the invention to a device disclosed in the prior art. The prior art was a patent issued to Clark for a cartridge holder and connector system. In responding to the patent examiner, one of the ways Pocrass distinguished the claims of the '317 patent over the system disclosed by the Clark patent was that the LEDs in his invention are "integrally secured" within the connector housing in the claims. Pocrass based his distinctions on the fact that in the Clark device, the LEDs are not secured in any way to the housing of the device to form an integral unit, but instead are secured to the PC board. In that device, the connector housing slides over the tops of the LEDs.

Defendant argues that the examiner required the addition of the phrase "integrally secured" to distinguish the feature of the Clark patent where the LEDs slide into indentations in the connector housing. However, a close reading of the history reveals that the phrase "integrally secured" was meant to distinguish the fact that the LEDs in the Clark patent were secured to a location remote from the RJ connectors. The history further reveals that the patentee intended the LEDs to be "integrally secured" "by injection molding or by other adhesive or mechanical means within the housing." Amendment mailed December 28, 1989 at 7. Pocrass explained that Clark's LEDs were "merely are slid into open indents" and that those indents "[do not] integrally secure the . . . LEDs within the housing. . . . [The] LEDs [] are positioned on the PC board [], and the housing member [] is slidably placed over the tops thereof." Amendment mailed December 28, 1989 at 7. In other words, if the housing of the Clark device is removed from the PC board, the LEDs will stay in place on the board because they are not an integral part of the housing.

The prosecution history demonstrates that "integrally secured" means that the LEDs move as one unit with the housing of the connector as opposed to being fixed on the PC board as in Clark. Therefore, the Court finds that the prosecution history does not limit the interpretation of claim 1 so as to require that the LEDs be permanently fixed within the housing so as to form an inseparable unit. Rather, the term "integrally secured" means that the connector body and LEDs move together as one unit.

- 2645 -
d. Extrinsic evidence

There is no need for the Court to consider any extrinsic evidence as to this phrase.

e. Interpretation

The Court adopts Plaintiffs' interpretation as follows: "The light emitting source is held in place in the housing of the connector near the opening in the front wall which receives the plug so that the light emitting source is a part of the connector unit."

2183

2. "intelligent safe"

Tidel proposes this term means "a safe that can supervise and account for user transactions at another safe." FKI proposes that intelligent safe means "safe having a mounted PC board with a CPU." The specification provides:

In addition, the illustrated PC board 114, CPU 116 and associated software have the capacity to serve and process from a plurality of bill receiving and validating units 16. Consequently, economy models of the safe (i.e., comprised of just a safe and a unit 16, without a PC board and printer) can be placed at various locations throughout a retail establishment and coupled to the above-described "intelligent" safe for processing of data by bill receiving unit and by totals.

[4:23-34].

FKI argues that "intelligent safe" is depicted by Figure 3 and described in the specification from Col. 2, 1. 8 to Col. 4, 1. 25. Further, the specification distinguishes "economy safes" from "intelligent safes" by the absence of a PC board and printer. Further, FKI argues that a PC board is necessary to process the data.

Tidel argues that the specification is clear that an intelligent safe only needs the ability to couple to an "economy safe" to process data; there is no requirement of a PC board. The "above described" safe in the specification is the preferred embodiment. While the preferred embodiment does include a PC board, FKI's argument that one is necessary to process the data is unpersuasive. Neither side addresses what, if anything, could be used for processing the data other than the PC board. The patent, however, does not restrict "intelligent safe" in such a way. The specification describes "intelligent safe" relative to an "economy safe," and by what it does; that is for "processing of data by bill receiving unit and by totals." [4:28-30] The court, therefore, construes "intelligent safe" to mean "a safe that can supervise and account for user transactions at another safe."

2184

I. Pair of interconnected receptacle support straps

Claim 36 of the '552 patent recites as one of its limitations a "pair of receptacle support strap straps [that] are interconnected." Id. col. 14, ll. 44-46. In its Markman Order, the district court construed the phrase to mean that "the straps may be connected at any position on the receptacle as long as when the straps are connected, the first end of the support surface is at an angle with respect to the second end of the support surface. The first end of the support surface is not required to rest against the straps at an angle with respect to the second end of the support surface."

Markman Order, 2002 U.S. Dist. LEXIS 5734 at *6-7. On this construction, the jury found that the Bouncenette and Magic Motion products use the same mechanism to adjust the angle of the infant-supporting receptacle, and therefore infringe.

Safety 1st's argument with respect to the interconnected support straps limitation rests entirely on its contention that Fisher-Price disclaimed the two strap configuration used in the accused product when it amended claim 36 during prosecution in view of the prior art Bigo patent, United Kingdom Patent Application GB2163045A ("Bigo"). Safety 1st thus rests its
argument on the doctrine of prosecution history estoppel, asserting that "the district court failed to acknowledge that the
construction of that limitation is controlled by the prosecution history."

In support of its prosecution history estoppel argument, Safety 1st contends that "the text of Bigo . . . disclosed other
embodiments, including the one used by Safety 1st, where there is a pair of buckled straps on either side." Therefore, argues
Safety 1st, the amendment to claim 36, which was made in light of Bigo, "must thus be construed to exclude an infant-
supporting device with two pairs of 'buckled straps' where, as was described in Bigo, one pair suspends the left side of the
angled support surface and the other pair suspends the right side."

The problem with this argument, as Fisher-Price notes, is that Bigo makes only a passing reference to "self gripping or
buckled or knotted straps." Bigo, p.1, ll. 92-98. The Bigo reference does not, in its text or drawings, describe how such
"buckled or knotted" straps would be configured. While a reference is useful as prior art for all that it discloses, it cannot be
read to disclose what is not apparent to one skilled in the art. Electro Med. Sys., S.A. v. Cooper Life Sciences, Inc., 34 F.3d
1048, 1052 (Fed. Cir. 1994) ("[A] challenger must prove that [a characteristic] is necessarily present in the [prior art]
disclosure, and that it would be so recognized by persons of ordinary skill."). After reviewing the Bigo reference, we believe
that Safety 1st reads far too much into Bigo when it asserts Bigo "discloses [an embodiment where] one pair suspends the
left side of the angled support surface and the other pair suspends the right side." In short, we do not find compelling
Safety's 1st's prosecution history estoppel argument. As a final matter, Fisher-Price notes that Safety 1st presented no
testimony from any witness that Bigo disclosed interconnected straps, either expressly or inherently; it offered only attorney
argument. Fisher-Price, 279 F. Supp. 2d at 539.

The district court did not err in its construction of the "pair of receptable [sic] support strap straps [that] are interconnected"
limitation. In addition, substantial evidence supports the jury's factual finding that the Bouncenette 1 and 2 products meet
this claim limitation.

13. Said regions of high and low vision correction powers being interconnected in an optical sense by transition regions

The final phrase Vistakon seeks construction of is "said regions of high and low vision correction powers being
interconnected in an optical sense by transition regions" from claim 14 of the '461 patent. Vision Advancement once again
contends that "vision correction power" has already been construed, and the parties have agreed on the proper construction
for "transition regions." Therefore, according to Vision Advancement, this phrase does not require any further construction.
Vistakon, on the other hand, posits that the term should be construed as, "the regions of high and low vision correction
powers are connected by a transition region in a fashion to provide usable vision correction." In essence, Vistakon seeks
construction of the portion of the phrase that states "interconnected in an optical sense." Vision Advancement does not
contend that phrase has already been construed.

The Court agrees with Vistakon that the phrase "interconnected in an optical sense" requires construction. While the Court
agrees that Vistakon's proposed construction, for the most part, is appropriate for "interconnected in an optical sense," and
supported by the portions of the '461 patent cited by Vistakon, the Court finds the word "useable" to be vague. Therefore,
the Court construes the term "said regions of high and low vision correction powers being interconnected in an optical sense
by transition regions" to mean "the regions of high and low vision correction powers are connected by a transition region in
a fashion to provide vision correction."

- 2647 -
1. Connection between liquid and granular systems

Claim 1 describes, among other things, "a liquid delivery system interconnected to [the] granular delivery system for supplying liquid material." '125 Patent col. 10 ll. 55-57. Bristol contends that the term "interconnected" includes a liquid delivery system that is connected "electronically, hydraulically, or mechanically" to the granular system. Bosch claims the connection must be hydraulic.

In support of Bristol's argued construction, it notes that the summary section of the patent expressly uses this "electronic, hydraulic, or mechanical" language. Bristol Br. at 16-17; see also '125 Patent col. 2 ll. 60-62 ("The liquid delivery system is mechanically, electronically or hydraulically connected to the granular delivery system."). Bristol also points out that the preferred embodiments include both mechanical and hydraulic connections, making clear that the connection is not limited to hydraulics. Bristol Br. at 17; see also '125 Patent col. 4 ll. 58-65 ("The liquid pump 40 of the liquid delivery system 25 is mechanically connected through a gear box 46 to a shaft of the conveyor 20 in a mechanical embodiment. (FIG. 3). In the hydraulic embodiments of FIGS. 5 through 10, the pump 40 is mechanically connected to the liquid system motor 38, which is in fluid communication with the hydraulic system 28 of the granular delivery system 23."). Thus, Bristol contends, "interconnected" should be read to include all three connection types.

Bosch, on the other hand, dismisses what it calls a "passing statement" to electronic, hydraulic, and mechanical connection and argues that the embodiments and descriptions in the patent for performing the functions of reducing the feed rate of the granular system or selecting a ratio of liquid to granular material are all hydraulic. Bosch Br. at 11-12. Bosch relies on the following language in the patent specification:

In all of the embodiments discussed, reduction of the feed rate of the granular delivery system 23 resulted from diversion of hydraulic fluid to the liquid delivery system 25. It is also contemplated in the embodiment shown in FIG. 10 of the present invention to reduce the feed rate of the granular delivery system 23 by diverting hydraulic fluid from the conveyor motor 26 in a proportional amount and returning the hydraulic fluid to the reservoir 34 rather than to the liquid delivery system 25.

'125 Patent col. 9 ll. 42-50.

I adopt Bristol's construction. In determining the meaning of a claim term, I read the term "in the context of the entire patent, including the specification." Phillips, 415 F.3d at 1313. The specification is "the single best guide to the meaning of a disputed term." Id. at 1315 (quotations and citation omitted); see also Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995) ("The specification contains a written description of the invention that must enable one of ordinary skill in the art to make and use the invention. For claim construction purposes, the description may act as a sort of dictionary, which explains the invention and may define terms used in the claims."). Here, the specification could not be clearer: "The liquid delivery system is mechanically, electronically or hydraulically connected to the granular delivery system." '125 Patent col. 2 ll. 60-62.

Bosch's attempt to look to the specific embodiments to override this clear language is improper. As an initial matter, it is not clear that the portion of the specification relied on by Bosch deals with the general connection between the systems. Rather, it appears to bear on the manner in which the specific reduction in feed rate is accomplished. But even assuming the language deals with the connection issue, restricting the meaning of a claim term to that described in an embodiment constitutes what the Federal Circuit has called "one of the cardinal sins of patent law -- reading a limitation from the written description into the claims." SciMed Life Systems, Inc. v. Advanced Cardiovascular Systems, Inc., 242 F.3d 1337, 1340 (Fed. Cir. 2001); see also SuperGuide Corp. v. DirecTV Enterprises, Inc., 358 F.3d 870, 875 (Fed. Cir. 2004) ("Though understanding the claim language may be aided by the explanations contained in the written description, it is important not to import into a claim limitations that are not a part of the claim. For example, a particular embodiment appearing in the written description may not be read into a claim when the claim language is broader than the embodiment."). This claim element is not written in means-plus-function format, requiring some link between the claim term and a specific structure. Rather, the question is simply what the word "interconnected" means in the context of the entire patent. As the specification provides a clear definition, that is the definition I must apply.
Plaintiff proposes that "interconnected with" be construed to mean "two parts or components that are connected without regard to the form or realization of the connection (e.g., integral, jointed, rigid or pivotal)." Defendant proposes the definition "integral with or the equivalent" and contends that the term should be construed to "exclude relative movement between two components that are interconnected." I construe the phrase "interconnected with" to mean a connection between two components, without regard to the form of the connection.

The ordinary meaning of the word "interconnect" is to "connect with each other." New Oxford American Dictionary 884 (2001). Although a patentee may choose to be his own lexicographer, he need not assign a claim term a narrower meaning than the ordinary one. Defendant argues that "interconnected with" should require an integral connection between rails and the crankcase housing and between slots and the counterbalance weight because the figures shown in the 166 patent all display integral connections between these elements. However, because the ordinary meaning of the claim language is broader than the embodiments shown in the specification, the embodiments alone cannot be used to read limitations into the claim. Tate Access Floors, Inc., 222 F.3d at 966.

Furthermore, the written description militates against defendant's proposed construction of the term. The description states that a "rail could alternately be formed on weight (26) and the slot or recess formed integral or otherwise interconnected with the crankcase housing." '166 patent, col. 3, Ins. 11-13 (emphasis added). The language of the specification indicates that an integral connection is just one example of how interconnecting a rail with the crankcase housing. Contrary to defendant's assertion, it is not the only means by which such an interconnection can be achieved. Therefore, I will construe the phrase "interconnected with" to mean a connection between two components, without regard to the form of the connection.

The parties also dispute the meaning of "cross-member interconnected with said clamp means," as stated in Claim 1 of the '248 patent, and "securing a member" as stated in Claims 9 and 32 of the '588 patent. I address these terms together because the parties' dispute concerning these terms and their opposing constructions of them are the same.

The parties agree that both of these terms address the means by which a cross-member (snowguard) is attached to the clamps mounted on the standing seam of a metal roof. Their dispute is whether these terms require the cross-member to be directly attached to the clamps using a set screw or whether it may be attached to the clamps by any suitable means, including through use of an intermediate structure such as the brackets employed in Contek's accused products.

Webster's Third New International Dictionary defines "interconnect" to mean "to connect mutually or with one another" and "secure," as relevant here, to mean "to make fast." Webster's Third New Int'l Dictionary at 1177, 2053; see also Random House College Dictionary 1190 (rev. ed. 1980) (defining "secure" to mean "to make firm or fast, as by attaching"). CFE argues that these broad definitions preclude the narrow interpretation of these terms urged by Contek and supports its broader interpretation. As further support for its position, CFE points to statements in the specifications for the '248 and '588 patents that "any suitable means may be utilized for interconnecting" the clamp and cross-member, '248 patent, col. 7, ll. 62-63; '588 patent, col. 9, ll. 23-24, and the disclosure in each specification of different ways that the cross-member can be interconnected or secured to the clamp, including through use of an intermediate device that extends from the clamp to the cross-member. See '248 patent, col. 3, l. 52 - col. 4, l. 33 & Figures 2b, 6a; '588 patent, col. 4, ll. 40-58 & Figures 2b, 6a. CFE also invokes the doctrine of claim differentiation to support its interpretation, based on a comparison between independent Claim 1 and dependent Claim 14 of the '248 patent. n8
n8 Claim 14 recites:

The apparatus of claim 1, further comprising first and second extension means detachably connected to said first and second clamp means, respectively, for directly engaging said first cross-member, wherein said first and second extension means allows for increasing distance between at least a portion of said first cross-member and at least one base portion.

'C48 patent, col. 12, ll. 50-56.

CFE argues "interconnected with," as used in independent Claim 1 must be broad enough to encompass the use of extensions for attaching a cross-member to the mounting clamp, as Claim 14 provides, because otherwise this dependent claim could not exist.

Contek responds that both "interconnected with" and "securing" are not subject to standard claim construction but rather must be construed under the special rules applying to means-plus-function claim elements. Under these rules, Contek asserts, both terms must be narrowly construed to encompass only a connecting or securing of the cross-member and the clamp that involves the use of a set screw threaded through the mounting body.

A claim is written in a means-plus-function format if it portrays a function to be executed but provides no instructions as to the structure or materials for executing this function. See Phillips, 415 F.3d at 1311. 35 U.S.C. § 112, P 6 restricts claim limitations written in this format to those structures, materials, or acts disclosed in the specification that perform the claimed function, and their equivalents. Personalized Media Commun., LLC v. ITC, 161 F.3d 696, 703 (Fed. Cir. 1998). In other words, a claim using the means-plus-function format "will cover only the corresponding step or structure disclosed in the written description, as well as the step or structure's equivalents. CCS Fitness, 288 F.3d at 1369.

The use of the word "means" triggers a rebuttable presumption that § 112, P 6 applies, and the absence of that term creates a rebuttable presumption that it does not apply. CCS Fitness, 288 F.3d at 1369; Personalized Media, 161 F.3d at 703-04. Here, the disputed claim terms do not employ the word "means," thereby triggering the rebuttable presumption that the terms are not in the means-plus-function format and that § 112, P 6 does not govern.

Contek may rebut the presumption by demonstrating that the disputed terms fail "to recite sufficiently definite structure or else recite[] a function without reciting sufficient structure for performing that function." CCS Fitness, 288 F.3d at 1369 (internal quotations omitted). The presumption against finding a means-plus-function form when the word "means" is absent, however, "is a strong one that is not readily overcome." LG Elecs., Inc. v. Bizcom Elecs., Inc., 453 F.3d 1364, 1372 (Fed. Cir. 2006). As a result, the Federal Circuit has observed that it has "seldom held that a limitation not using the term 'means' must be considered to be in means-plus-function form." Lighting World, Inc. v. Birchwood Lighting, Inc., 382 F.3d 1354, 1362 (Fed. Cir. 2004).

Contek asserts "interconnectable," "interconnected with" and "securing" are all means-plus-function limitations because they describe the function of securing the cross-member and the clamp without disclosing any "actual structure" to perform this function. Contek's Br. re: Interpretation of Pls.' Patents (Doc. 35) at 30. The Federal Circuit, however, has held that this approach is too restrictive, and that a claim recites sufficient structure to avoid application of § 112, P 6 "if the claim term is used in common parlance or by persons of skill in the pertinent art to designate structure, even if the term covers a broad class of structures and even if the term identifies the structures by their function." Lighting World, 382 F.3d at 1359-60. "What is important is whether the term is one that is understood to describe structure, as opposed to a term that is simply a nonce word or a verbal construct that is not recognized as the name of structure and is simply a substitute for the term 'means for'.” Id. at 1360.

The Federal Circuit applied these principles in Lighting World, Inc. v. Birchwood Lighting, Inc., 382 F.3d 1354 (Fed. Cir. 2004), to find that the term "connector assembly for connecting each pair of adjacent support members" denoted sufficient structure to avoid construction as a means-plus-function limitation. Id. at 1358-63. To reach this conclusion, the court looked to the dictionary definitions of "connector," defined as "something that connects," and "connect," defined as "to join, fasten, or link together usu. by means of something intervening." Id. at 1361. The court found that these definitions
demonstrated that the word "connector" as used in the disputed claim had a generally understood meaning as a unit that joins, fastens, or links each pair of adjacent support members. Id. This meaning, the court held, denoted sufficient structure to avoid application of § 112, P 6, notwithstanding "[t]he fact that more than one structure may be described by that term, or even that the term may encompass a multitude of structures." Id. The court found the term "connector" was a description of structure generally understood by persons in the art, even though it might encompass "any structure that performs the role of connecting." Id.

As described above, the terms "interconnected with" and "securing" have essentially the same meaning as "connector" as examined by the Federal Circuit in its Lighting World decision. As a result, I also find that they describe sufficient structure to avoid being considered means-plus-functions terms subject to construction under the special principles of § 112, P 6.

Considering the dictionary definitions of these terms, the claims in which they are used, the specifications and prosecution histories, I further find no support for Contek's narrow interpretation of these terms under the ordinary rules of claim construction. Accordingly, I find that these terms, as used in Claim 1 of the '248 patent and Claims 9 and 32 of the '588 patent, mean attaching a member to a roof clamp, either directly or through another device or assembly.

2190

c. Interengagable notches

The parties dispute the meaning of interengagable notches as recited in the claim. The lock-up means element describes "the first end of the locking member and the open end of the tubular member having interengagable notches thereon that are adapted to be engaged when the first end of the locking member is in its first position, with engagement between the notches permitting the diaphragm to move from its infold position to its outfold position but preventing the diaphragm from returning to its infold position." Col. 7, 43-51. Then, when so desired, e.g., when the air filter is replaced, the resetting mechanism is activated so that the interengagable notches disengage and the diaphragm returns to its infold position. See col. 7, lines 52-55.

The Court sees nothing in the claim language itself or specification to suggest that the patentee used the words "interengagable" and "notches" in anything other than their ordinary meanings. Nowhere in the patent is either term specifically defined. Rather, the Description explains the placement of and engagement between the notches on the locking member and those on the inner adjacent wall portion of the guiding member. To that effect, the Description describes a locking member "having notches formed on its side" and "corresponding complementary protruding ridges or notches" on an "inner adjacent wall portion of the guiding member." Col. 5, lines 8-12. The Description goes on to explain that the notches need be "so formed that relative upward movement of [the locking] member is permitted but it is locked against downward movement by interengagement of said notches [on the member and the guiding wall]." Col. 5, lines 12-16. Thus, the Description is wholly consistent with the claim language and the Court need only determine the ordinary meaning of "interengagable notches" to one skilled in the art of air filter manufacturing.

"Notch" is defined by Webster's as a "concave or V-shaped cut or indentation in an edge or across a surface." Webster's New World Dictionary, 2d ed. (1970); accord, The American Heritage Dictionary, New College Ed. (1976). "Engage" is defined as "to interlock with or mesh together." Id. Thus, interengagable notches would be complementary concave or V-shaped cuts or indentations on the locking member and tubular member which are capable of engaging or interlocking with one another. This Court adopts those definitions here, adding only that the notches must be so formed as to comply with the claim's requirement that interengagement of the notches permits progressive movement in one direction while preventing movement in the opposite direction (absent selective force through the resetting means).

2191

B. Area and Band[s] of Interference Fit

Phrase: area of interference fit and band[s] of interference fit
Construction: An area of interference fit is the place where the outer surface of the sleeve and the inner surface of the bit holder meet. A band of interference fit is a specific type of structure used to create an area of interference fit. A band of interference fit must be shorter than the entire length of the sleeve. One band creates one area of interference fit. Two discrete bands create two different areas of interference fit.

Reasoning: The real dispute between the parties regarding these claim terms is whether, when more than one band of interference fit is being used, there is a limit on the sum total length of the bands in relation to the sleeve. According to plaintiffs, the patents require only that the area of interference fit created by any particular band be less than the entire length of the sleeve. Plaintiffs argue that numerous bands of interference fit could be used, and they could, combined, be essentially equal to the total length of the sleeve provided no one band itself equaled the entire length of the sleeve. In contrast, defendant contends that where multiple bands of interference fit are used, the sum total of all areas of interference fit created by the bands must be 'substantially less than' the entire length of the sleeve.

Defendant's position has some support in the specification and prosecution history, both of which speak to "limiting the length over which interference exists." In addition, the figures illustrate only structures that have both areas of interference fit and areas of non-interference fit, which results in the sum total of all areas of interference fit being noticeably less than the entire length of the sleeve. However the specification can also be read in a way that supports plaintiffs' position. When the patentee speaks to limiting the length of interference, he could be referring to limiting the length of a single area of interference fit ("By providing [multiple] bands of interference instead of an [one] interference fit along the entire length of the sleeve." Col. 3, Ins. 6-7, emphasis added).

Regardless, the claims appear to resolve this dispute, and in plaintiffs' favor. Phillips, 415 F.3d at 1312 (specifically endorsing referring to the claims in determining claim construction); Fisher-Price, Inc. v. Graco Children's Prods., 154 Fed. Appx. 903, 2005 WL 2899289, *5 (Fed. Cir. 2005) ("Even if it could be said that a conflict exists within the specification, it is resolved by the unambiguous claim language").

Claim 1 does not address the length of the interference fit, at all. Instead, it defines the interference fit by what it will do, and how. According to Claim 1, the interference fit must, alone, prevent movement of the sleeve, while at the same time, allow for manual removal. Claims 2 and 3 both depend from Claim 1. Claim 2, which calls for "at least one band of interference fit," explicitly requires that the band be "shorter than [the sleeve]." When claim 3 introduces the concept of using "at least two discrete bands of interference fit" no limitation is placed on the total length of the bands or areas of interference fit in relation to the sleeve. See also Claims 8, 9 and 10.

This claim drafting structure indicates several things. First, that the independent and dependent claims follow the doctrine of claim differentiation. Dependent Claim 2 adds a length limit to independent Claim 1, Nazomi Communications, Inc. v. Arm Holdings, PLC, 403 F.3d 1364, 1370 (Fed. Cir. 2005) ("claim differentiation 'normally means that limitations stated in dependent claims are not to be read into the independent claim from which they depend.'"). Second, that the inventor was aware that the length of interference fit was a relevant consideration to his invention. Third, that when the inventor wanted to place limits on the length of the area of interference fit created by the bands in relation to the sleeve, he knew how to, and did. To illustrate, when a single band was claimed, its length was limited; when multiple bands were claimed, no limit on the total length of the bands was imposed. Therefore, we cannot import a so-called "sum of the bands" limitation from defendant's reading of the specification, and the preferred embodiments therein, including the figures, into the claims. MBO Labs, 474 F.3d at 1333; Logitech, 254 F.3d at 1342; Phillips, 415 F.3d at 1323.

1. "interior compartment"

Tidel proposes this term means "compartment interior to the housing having an inner door and lock mechanism." FKI proposes the term means "a compartment inside a safe." FKI argues that Tidel is trying to limit the claim to the preferred embodiment.

The specification describes the "inner compartment 58 is denoted in dashed outline [in Fig. 3] to indicate an approximate
location. This compartment is used to hold manual drops, and is protected by its own inner door and lock mechanism."

[4:41-44] Further, the specification provides:

An outer door provides the first line of physical security. An inner door is any door that cannot physically be opened unless an outer door is first opened. The use of one or more inner doors allows general access to the safe for getting tills, change, and so forth while allowing larger deposit funds or valuables to remain secured behind an inner door.

[3:54-59]

Tidel's construction is an attempt to limit the inner compartment to the preferred embodiment; that is one having a lock. The claim language is "a housing having an interior compartment for securing money, and an outer door . . ." [10:62-63] While a lock is one way to secure contents of the compartment, there may be other ways. For example, the compartment may provide security by being hidden. The court, therefore, construes "interior compartment" to mean "a compartment inside a safe."

GO BACK

3. "Construction of "interior surface"

Medtronic contends that "interior surface" should be construed as being inwardly tapered at the bottom. Defendants begin by examining other claim language relating to the interior surface. First, they note that the claim includes "a second intervening member positioned in the bore between said curvate head and said interior surface." ('089 Patent, col. 13, ll. 46-47.) Then, without intervening analysis, Medtronic jumps to its conclusion: "Thus, the critical part of the interior surface is the part at the bottom of the axial bore where the screw head resides." (Defs.' Br. 27.) Medtronic provides no support for this conclusion, nor explanation of how this implies the proposed "inwardly tapered" limitation.

Medtronic next points to this claim language: "a force applied to said first intervening member urges said curvate head to translate axially. . ." ('089 Patent, col. 13, ll. 48-49.) Defendants argue that this must imply an inward taper because, if there is no inward taper, the screw and second intervening member will be pushed out the bottom. This is unpersuasive, as it rests on the unargued and unsupported assumption that the only kind of interior surface that would result in a functional device is one with an inward taper at the bottom. Medtronic demonstrates, however, why this cannot be presumed: their depiction of their M8 bottom loading screw appears to show a device in which there is a first intervening member above the screw head (the "crown"), a second intervening member (the "c-ring") between the screw head and an interior surface (the recessed groove in which the "c-ring" sits), such that a force applied to the first intervening member causes the screw head to translate axially and, assuming that Medtronic is defending its right to sell a functional device, the screw and second intervening member are not pushed out the bottom. (Defs.' Br. 8.) Medtronic's illustration of its own M8 screw, thus, appears to show an interior surface that does not have an inward taper, but the screw and second intervening member are not pushed out the bottom. This Court cannot conclude that the cited claim language implies a requirement of an inward taper to the interior surface.

Medtronic next offers the "only one way" specification argument for the inward taper. In the absence of language in the specification which constitutes a clear redefinition by implication, this Court has rejected this argument.

Medtronic has provided no basis for this Court to conclude that "interior surface" should be construed as being inwardly tapered at the bottom.

3. "wherein the insert body is interlocked to the inner sleeve to form a single fixed structure"

Disputed Term F SI Proposed Construction
wherein the insert body is a portion of the insert body is
interlocked to the inner sleeve to form a single fixed structure

locked to a portion of the inner sleeve to provide a structure formed when a portion of the insert body is locked with a portion of the inner sleeve

Disputed Term

wherein the insert body is interlocked to the inner sleeve to form a single fixed structure

AOSI Proposed Construction

a portion of the insert body is physically connected to a portion of the inner sleeve such that the insert body is incapable of any movement relative to the inner sleeve

The disputed phrase "interlocked" is used throughout the claims and specification. The dispute pertains to whether a lack of movement is required when objects are "interlocked." FSI suggests that a lack of movement or immobility is not required. AOSI contends that "interlocked" requires a complete lack of movement.

The court rejects both parties' proposed constructions. FSI's proposed construction does not find support in the specification and ignores the "single fixed structure" limitation in allowing for significant movement. If a construction of "interlocked" permitted significant movement, the interlocked bodies would not form a "single fixed structure." Likewise, AOSI's proposed construction, precluding any movement, is inconsistent with the specification. The specification supports a definition of "interlocked" precluding substantial movement between elements. 4 AOSI's own brief acknowledges this, stating that "[o]nce interlocked, no substantial movement occurs between the insert body and inner sleeve, or between the retainer body and inner sleeve, thereby resulting in a single fixed structure." 5 The court rejects AOSI's contention that there is a distinction between "interlocked with" and "interlocked to." The specification supports the court's construction that "interlocked with" and "interlocked to" have the same meaning, and requires that the insert body and inner sleeve directly interlock to one another. 6

------------------ Footnotes ------------------

4 See, '849 patent, Fig. 23; tabs 136, 138 function to interlock the inner sleeve with the insert or retainer body which are in the shape of hooks. These tabs engage within a retaining lip portion or groove to interlock the inner sleeve to the insert body and retainer body. Id.

5 AOSI's responsive claim construction brief at 21 (emphasis added).

------------------ End Footnotes ------------------

Accordingly, the court defines "interlocked" in the context of the phrase "wherein the insert body is interlocked to the inner sleeve to form a single fixed structure" to mean "a portion of the insert body is physically connected to a portion of the inner sleeve such that the insert body is incapable of any substantial movement relative to the inner sleeve."

C. "Interlocking Features"

The parties propose:

. Plaintiff: One or more portions of the lid and the rim of the main body that cooperate to create[,] as the lid and the main body are engaged[,] a constraint that helps maintain the engagement of the lid and the main body.
1. The parties' disputes

Many of the parties' disputes seem to have been resolved in the course of briefing. Defendant expressed concern that plaintiff’s construction removed a requirement that the “interlocking features” be on the inboard side and improperly broadened the meaning of interlocking features to include features held together by friction. In response, plaintiff has stated that it agrees that "interlocking features" must be on the inboard side and it does not challenge defendant's contention that interlocking features do not include features held together by friction. Dkt. # 31, at 9, 12. (Plaintiff states that it agrees with defendant that a friction fit is different from a snap fit and it does not challenge defendant's contention that "interlocking features" requires more than a friction fit.)

What is left is minor. Plaintiff takes issue with defendant's use of the word "secure" because that word is not clear enough to be helpful. (In the previous lawsuit, I rejected defendant's proposed construction incorporating the word "secure" on the same ground, First Years, 07-cv-558-bbc, dkt. # 27, at 37.) Although defendant contends that the word "secure" is "defined" by the surrounding language it proposes ("positively constrain"), this just shows that the word "secure" is redundant in defendant's construction. If "secure" means simply "positively constrained," there is no need to use both terms.

The only other question is whether the phrase "positively constrain" is more accurate than the word "constrain" in describing the role of the "interlocking features." I agree with plaintiff that the word "positively" does not add anything except confusion. For one thing, it is not clear what it means to "positively" constrain something. To the extent it suggests that the interlocking features must remain in constant contact during assembly, I have already rejected that construction. Id. at 27-28. As for the suggestion that the word "positively" makes it clear that the constraint required must involve more than friction, I am not persuaded. To use defendant's example, a cork in a bottle (a friction fit) is "positively constrained."

Defendant's concern about allowing mere friction fits to count as "interlocking" is better addressed by describing the constraint with more specific terms. Defendant describes a few such alternatives, such as constraints that "hoo[k], interlac[e] or interweav[e]." I find, however, a description that plaintiff suggests describes the needed limitation more clearly: the constraint must be "created by an obstruction between structures of the interlocking features" as opposed to mere friction of the structures. Dkt. # 31, at 12.

2. The court's construction

Having addressed the parties' disputes, I conclude that plaintiff's proposed construction of the term "interlocking features", properly describes the limitations of the term, once it is modified to address defendant's concern regarding friction fits. The court's construction is: "One or more portions of the lid and the rim of the main body that create an obstruction between each other as the lid and main body are engaged, resulting in a constraint that helps maintain the engagement of the lid and the main body."

1. "Interlocking . . . Members"

The term "interlocking . . . members" is used in all of the independent claims at issue. Rhino contends that this term means "distinct parts of a whole which intersect and are closely joined." (Doc. 81 at 8.) Berg argues that this term should be construed as "separate individual pieces or parts, distinct from the structure as a whole, that interlock to each other to form an interior structure." (Doc. 75 at 8.) The language of the claims and specification supports a definition that excludes Berg's proposed limitation requiring separate individual pieces.

--- Footnotes ---

8 Berg seeks construction of the specific phrase "interlocking vertical cross members." (Doc. 75 at 8.) However, this specific phrase is used only in claim 1, subpart (b). (Doc. 1, Ex. A at col. 4, line 46.) Claims 1, 6, and 8 also use the phrases
"interlocking cross members," "interlocking longitudinal and transversal cross members," and "interlocking members." (Doc. 1, Ex. A at cols. 4-6.) In its brief in opposition to Rhino's proposed claim construction, Berg refers to claims 1, 6, and 8 with respect to its proposed construction of this specific phrase. Therefore, the court will construe the general term "interlocking . . . members" to cover all variations of the term in claims 1, 6, and 8.

The parties agree that the term "interlocking" means "to engage or interlace, one with another." (Doc. 32 P 51; Doc. 74 P 51.)

Berg argues that interlocking "only makes sense . . . if the term refers to separate individual pieces." (Doc. 75 at 9.) In support of this argument, Berg quotes language from claim 1, which reads "cross members . . . being fashioned in such a manner as to accommodate interlocking transversal members." (Doc. 1, Ex. A at col. 58-64.) Berg also refers to figures 4 and 5 of the '889 patent, which illustrate separate, individual cross members. This argument, however, disregards the language of the entire '889 patent. See Phillips, 415 F.3d at 1313 ("[T]he person of ordinary skill in the art is deemed to read the claim term not only in the context of the particular claim in which the disputed term appears, but in the context of the entire patent, including the specification." (emphasis added)).

Berg also states that the claims use both "interlocking" and "interconnected" to describe the relation of the cross members. (See Doc. 75 at 8-9.) However, the term "interconnected" is used only to describe the connection between the cross members and the sides, inclined, rear, and top surfaces of the ramp. (See Doc. 1, Ex. A.)

The '889 patent clearly discloses, and claims, a plastic molded ramp. Language from claim 1, as Berg cites, certainly cannot be used to impose a limitation on the phrase "interlocking . . . members" in claims 6 and 8. See Callicrate v. Wadsworth Mfg., Inc., 427 F.3d 1361, 1371 (Fed. Cir. 2005) ("[T]his court interprets claim terms consistently throughout various claims of the same patent."). The same can be said for a limitation appearing in drawings of a particular embodiment of the invention. A person of ordinary skill in the art reading the phrase "interlocking . . . members" in the context of the entire '889 patent would not impose the "separate individual parts" limitation, as such a limitation is inconsistent with a plastic molded ramp.

Accordingly, the court will construe "interlocking . . . members" as "distinct parts of a whole, not necessarily separate individual parts, which engage or interlace, one with another."
carrying rail of said at least one pair of carrying rails." '350 patent col.8 l.49-55. Thus, according to claim 1, the magnets surrounding the intermediary have at least "alternating" polarities.

Intamin argues that adjacent pairs of magnets with alternating polarities must mean two magnets on the same rail with opposite polarity, as shown in Figure 6 of the '350 patent. Thus, according to Intamin, anything between the magnets of opposite polarity is an intermediary, whether magnetic or not. Magnetar argues that "adjacent pairs of magnets" means any two magnets next to each other or abutting each other on the rail, as shown in Figure 6. Further, according to Magnetar, the term "alternating" does not require that such magnets have opposite polarity as shown in Figure 6. Thus, because adjacent magnets are any two magnets abutting each other on a single rail, Magnetar argues that another magnet cannot be an intermediary. Under its interpretation, Magnetar's Soft Stop brakes would not infringe claim 1 because they lack an intermediary.

The district court construed the term "intermediary" without determining the meaning of "adjacent magnets with alternating polarities." The parties disagree therefore about the meaning the district court actually gave to the term "intermediary." Intamin argues that the district court determined that the intermediary could not be magnetic, thus precluding infringement. Magnetar disagrees that the district court made such a determination.

In any event, the parties agree that this court cannot interpret "intermediary" without addressing the polarities of the adjacent magnets. Specifically, an intermediary cannot be another magnet if this court construes "adjacent pairs of magnets" as two magnets abutting each other with polarities that alternate at some degree such as found in a Halbach array. In other words, an intermediary can only be a magnet if the limitation "alternating polarities" means "opposite polarities." Under that interpretation, some magnets become "adjacent pairs" and other magnets in between become "intermediaries." In addition, "adjacent pairs of magnets" with opposite polarities, as in Figure 6, would need some separation. Intamin argues that another magnet can provide this separation.

--- Footnotes ---

1 At oral argument, Intamin's counsel, in response to a question regarding the meaning of and the necessity for an "intermediary," stated that "the intermediary serves the purpose to provide spacing and support for the magnets of the magnet elements which are the magnets of alternating polarity [because] for physics reasons there has to be spacing between those two magnets of alternating polarities and also the magnets are so strong that if there in not something in between they tend to spin into a new location." Thus, whether another magnet can be an intermediary may depend on whether it can serve as a spacing and support element. Arguably, none of Magnetar's magnets are used as spacing and support elements; rather, all are necessary to create the one-sided flux of the Halbach array.

--- End Footnotes ---

The district court adopted Magnetar's proposed claim construction: "In short, ordinary meaning supports Defendant's construction, and neither the specification nor the prosecution history changes the ordinary meaning." Initial Decision, slip op. at 4. On its face, the district court construed the term "intermediary" to mean "a member between others." Id. at 3-4. In reaching that conclusion, the district court dismissed Intamin's proposed claim construction that the intermediary can be a magnet between two other magnets. Id. In fact, the trial court specifically points to language in the patent that the intermediary is non-magnetic. Id. Thus, the district court apparently construed the term "intermediary" to mean something non-magnetic between the adjacent magnets.

The first step in an infringement analysis is the determination of the scope of the claims. Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). This court construes claims according to the principles set forth by this court in Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005) (en banc). As such, the court consults primarily the claims themselves in context, with much of that context supplied by the specification and the prosecution history. Id. at 1312.

In this case, the claim language itself does not require a non-magnetic "intermediary." Just as in the Phillips case itself, the claim uses a broad term with an understandable meaning. As the district court noted, the term "intermediary" standing alone means a "member between others." Initial Decision, slip op. 4. This term takes on additional meaning, however, in the context of magnetized members. The context of the rest of the patent helps show that additional meaning, namely whether
the intermediary may be magnetic.

In Phillips, this court noted that dependent claims can supply additional context for construing the scope of the independent claims associated with those dependent claims. 415 F.3d at 1314. An independent claim impliedly embraces more subject matter than its narrower dependent claim. In this case, dependent claim 2 modifies the term "intermediary." Claim 2 of the '350 patent discloses "[t]he braking device of claim 1 wherein said intermediary is magnetic." This dependent claim shows both that the claim drafter perceived a distinction between magnetic and non-magnetic intermediaries and that independent claim 1 impliedly embraced non-magnetic intermediaries. See Innova/Pure Water, Inc. v. Safari Water Filtration Sys. Inc., 381 F.3d 1111, 1123 (Fed. Cir. 2004).

The district court initially did not consider the context supplied by claim differentiation because Intamin did not raise this argument until reconsideration. Reconsideration Decision, slip op. at 2. Even without the enlightenment supplied by claim differentiation, however, the overall context of claim 1 does not limit the broad language to non-magnetic intermediaries. At one point, the '350 patent describes an embodiment of the invention with a "non-magnetic" intermediary. '350 patent col.4 ll.16-18. The district court seized on this disclosure to limit the term "intermediary" to non-magnetic substances only. Initial Decision, slip op. at 4. As this court has repeatedly noted, see SRI Int'l v. Matsushita Electric Corp., 775 F.2d 1107, 1121 (Fed. Cir. 1985) (en banc) (plurality opinion), a narrow disclosure in the specification does not necessarily limit broader claim language. Phillips, 415 F.3d at 1323. The overall context of the patent, in this case, does not specifically disavow magnetic intermediaries. See e.g., SciMed Life Sys. Inc. v. Advanced Cardiovascular Systems Inc., 242 F.3d 1337, 1341 (Fed. Cir. 2001). The single reference does not expressly limit the entire invention but only describes a single embodiment. Moreover, the term "intermediary," like the term "baffle" in Phillips, embraces more than the limited specification disclosure.

Thus, this court finds that the term "intermediary" can embrace magnetic substances, albeit only if the additional term requirement of "alternating polarity" allows for it. Accordingly, this court vacates the district court's construction of this term. However, this court has not reached an additional question on which the trial court has yet to provide a decision for review. Specifically this court renews its right to determine whether the patent limits the term "adjacent magnets of alternating polarity" to magnets of opposite polarity. With the understanding that an "intermediary" may be magnetic, the trial court may revisit its finding of non-infringement.

2198

c. "Intermediate"

The parties dispute whether the sprocket recesses as defined by the '158 and '518 patents must be located midway between the pivot axes, or whether they need only be located somewhere between the pivot axes. Essentially, the parties dispute whether the claim term "intermediate" means "midway" or "somewhere between." Only claims 1 and 10 of the '158 patent state that the sprocket recesses are "intermediate the pivot axes." The asserted claims of the '518 patent do not similarly indicate the location of the sprocket recesses.

Although the specifications to both the '158 and '518 patents state that the sprocket recesses are "located midway between the pivot axes," such a statement does not operate to limit the scope of the asserted claims. The specification can be used to define terms in a claim, Vitronics, 90 F.3d at 1582, but cannot operate to enlarge, diminish or vary the limitations in the asserted claims. Markman, 52 F.3d at 980; Loctite Corp. v. Ultraseal Ltd., 781 F.2d 861, 867 (Fed. Cir. 1985). Here, nothing in the record indicates that Laitram used the word "midway" to define the claim term "intermediate," which in any case is only used in claims 1 and 10 of the '158 patent. Instead, the specifications' statement that the sprocket recesses are located midway between the pivot axes merely represents the preferred embodiment of the invention.

Accordingly, the court will not read the limitation of sprocket recesses located midway between the pivot axes into the asserted claims of the '158 or '518 patents.

GO BACK
B. Claim 2

Claim 2 includes a "means for pivoting the shaft in a direction away from the torso as the person presses on the handle, said means for pivoting being positioned on the device and intermediate the first end and second end of the shaft." The parties dispute the construction of (1) "intermediate the first end and second end of the shaft" and (2) "means for pivoting the shaft."

1. Construction of "intermediate"

Kor-CT argues that if any part of the pivoting means falls in between the two ends of the shaft, the pivoting means are "intermediate" and covered by the claim. In other words, according to Kor-CT, if even the smallest portion of the pivoting means falls anywhere within the two extremities of the shaft, the entire pivoting means is then "intermediate" the shaft. It is difficult to imagine how, under this construction, a manufacturer could ever securely attach his pivoting means to the shaft of the device, without making the means "intermediate." As a practical matter, therefore, it looks as though Kor-CT's construction would mean any three-dimensional pivoting means, if attached to the shaft, would automatically be "intermediate" the shaft ends.

The intrinsic evidence, including the prosecution history of the '425 patent, indicates a more limited, and more straightforward, construction of the term "intermediate." Specifically, a pivoting means is intermediate the ends of the device's shaft, if, at least at some point during the operation of the device, a length of shaft protrudes on either side of the pivoting means.

To start with, this construction is the one indicated by the ordinary meaning of the phrase "said means for pivoting being positioned on the device and intermediate the first end and second end of the shaft." The phrase indicates that the entire "means" is to be positioned "intermediate" the shaft ends; it does not say, as one would expect if Kor-CT's interpretation were correct, that some part of the means is to be positioned "intermediate" the shaft ends.

Moreover, this construction is indicated by the prosecution history, which makes clear that claim 2 was refined to capture the concept that the shaft would pass through both ends of the pivoting means. The original claim language described the shaft as moving through the housing. This was then refined to state that the pivot means would be intermediate the shaft. In both cases, the intent was to narrow the claim to avoid the Van Straaten patent - which disclosed a device where the shaft could not protrude below the pivoting means - by clarifying that the ends of the shaft of the '425 device would protrude from either side of the pivoting means or "housing" at some point during the operation of the device.

--- Footnotes ---

1 Kor-CT submitted, less than a day before oral argument, the expert report of Kazem Kazerounian, who states that he believes the term "intermediate" refers to the position relative to the ends of the shaft of the "bore," i.e., the hole into which the shaft goes. As a threshold matter, I am not permitted to consider this extrinsic evidence, because the intrinsic evidence is perfectly clear. Vitrionics, 90 F.3d at 1583. Furthermore, though undeniably the bore of the 6 Second Abs is intermediate the ends of the shaft, equally undeniably the "bore" of the Van Straaten invention is intermediate the ends of the shaft of that invention. As noted above, during the course of prosecution the inventor explained that his invention differed from Van Straaten's because, in the '425 invention, the shaft passes through both bores of the housing. In light of this prosecution history, it is not possible that Mr. Kazerounian's construction is correct.

Kor-CT submitted, also on the eve of oral argument, a declaration by Ned Gvoich, the inventor of the '425 patent, to the effect that the addition of the "intermediate" language was prompted by some other concern of the patent examiner, not obvious from the prosecution history. As just explained, I am not permitted to consider this evidence because the intrinsic evidence is perfectly clear. Moreover, even when courts consider external evidence, they are generally skeptical of considering the self-serving testimony of inventors about what "really happened" at the patent office. Bell & Howell DMP Co. v. Altek Sys., 132 F.3d 701, 706 (Fed. Cir. 1997) ("The testimony of an inventor often is a self-serving, after-the-fact attempt to state what should have been part of his or her patent application"); see also Vitrionics, 90 F.3d at 1583 (intrinsic
evidence "constitutes the public record of the patentee's claim, a record on which the public is entitled to rely . . . allowing
the public record to be altered or changed by extrinsic evidence . . . would make this right meaningless").

12. Intermediate vision correction power; High vision correction power; Low vision correction power; Near vision
correction power; Far vision correction power; and Predetermined vision correction power

Vistakon seeks a construction of the above terms, found in Claims 1, 14 and 19 of the '461 patent, and Claim 1 of the '711
patent. However, the Court has already construed the terms "vision correction power" and "progressive" and finds that these
terms sufficiently convey to the jury all that is necessary to understand these additional terms. The Court sees no need to
construe the terms further to add terms of relativity or specific distance. Thus, the Court concludes no further construction is
necessary.

1. Intermediate width

Habasit contends that the term "intermediate width" means "the width of the intermediate section at either the web portion
or the corrugated portion." (D.I. 55 at 16; D.I. 62 at 4.) Habasit contends that, since the intermediate section consists of a
web portion and a corrugated portion, and the intermediate width extends from one wall to the other, its proposed
construction is more complete.

In contrast, Rexnord contends that "intermediate width" means "the width of the intermediate portion of the belt module." (D.I. 57 at 19.) Rexnord argues that Habasit's construction attempts to establish two, separate intermediate widths, a concept
not found in the '941 patent. Rexnord argues that the '941 patent has only one intermediate width--i.e., the middle portion of
the intermediate section, absent the link ends.

After reviewing the claim language, specification, and prosecution history of the '941 patent and the parties' respective
positions, the Court agrees with Habasit's interpretation of the language. The claim language clearly indicates that
intermediate width may be measured at the web or corrugated portion: "the intermediate section comprises a web portion
extending across the intermediate width" and "a corrugated portion extending across the intermediate width." (‘941 patent,
col. 6.) Furthermore, Rexnord admits in its Opening Brief that all the independent claims describe the intermediate section
as having two portions, a web portion and a corrugated portion, and that each portion "extend[s] across the 'intermediate
width'." (D.I. 57 at 19.) The intermediate width; is "defined by the first and second walls" (‘941 patent, col. 6) and,
therefore, its measurement must include the widths at both the web and corrugated portions. Rexnord is correct that there is
only one method for measuring intermediate width; however, the value of that width changes depending on the cross section
measured. Thus, the Court concludes that "intermediate width" means "the width of the intermediate section at either the
web portion or the corrugated portion."

1

NFA is the owner of the ‘586 patent for a method of manufacturing elastic waistbands with an intermeshed pull cord. The
only claim in dispute is claim 5, which reads as follows:

A method of constructing a band comprising:
(A) forming an elongated web of material elastic in as [sic] longitudinal direction by interconnecting elastic threads having an orientation in said longitudinal direction;

(B) intermeshing with a portion of said web in said longitudinal direction a pull cord having a length greater than the length of said portion of said web in said longitudinal direction in its unstretched condition; and

(C) bunching said pull cord at spaced intervals.

'586 patent, col. 4, ll. 23-34 (emphasis added).

Asheboro Elastics Corp. (Asheboro) markets its own version of a pull cord elastic band combination, which it manufactures by two different processes. In both Asheboro processes, the pull cord is sewn, by means of cover threads, onto the outside of an elastic web that is formed in a prior step. The parties dispute whether this technique reads on the "intermeshing" step of claim 5.

The district court construed "intermeshing" to mean that "the pull cord can be embedded within the web or can be entrenched, emplanted [sic], or engrafted on the web by means of cover threads either sewn or knitted to the web." Tr. of Jury Instructions at 88, NFA Corp. v. Asheboro Corp., No. 96-225 (W. D. Va. June 4, 1997) (hereinafter "Jury Instructions").

The jury returned a special verdict form, in which it found that Ashboro's processes do not infringe claim 5 of the '586 patent, either literally or under the doctrine of equivalents. Following this verdict, NFA renewed its motion for judgment as a matter of law (JMOL) and moved for a new trial on the ground that the court's jury instructions were erroneous and prejudicial. The district court denied both motions, and NFA appealed to this court. We have jurisdiction pursuant to 28 U.S.C. § 1295(a)(1) (1994).

II

This court will upset a jury verdict if the record lacks substantial evidence to support the verdict. See Al-Site Corp. v. VSI Int'l, Inc., 174 F.3d 1308, 1315, 50 U.S.P.Q.2D (BNA) 1161, 1164 (Fed. Cir. 1999). We review a district court's decision on a motion for JMOL de novo, reapplying the JMOL standard. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 975, 34 U.S.P.Q.2D (BNA) 1321, 1326 (Fed. Cir. 1995) (en banc), aff'd, 517 U.S. 370, 38 U.S.P.Q.2D (BNA) 1461, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). JMOL is appropriate when "a party has been fully heard on an issue and there is no legally sufficient evidentiary basis for a reasonable jury to find for that party on that issue." Fed. R. Civ. P. 50(a)(1).

NFA argues that the district court interpreted the "intermeshing" limitation incorrectly and that, under the interpretation NFA proffers, Asheboro's processes infringe claim 5. Because a correct infringement analysis requires a correct claim interpretation, we begin our review of the jury's verdict with a de novo review of the district court's claim interpretation. See Augustine Med., Inc. v. Gaymar Indus., Inc., 181 F.3d 1291, 1297, 50 U.S.P.Q.2D (BNA) 1900, 1904 (Fed. Cir. 1999). Terms in a claim are to be given their ordinary and accustomed meaning, within the context of the claim, unless (1) a different meaning is clearly set forth in the written description or the prosecution history; or (2) the meaning of the term is unclear from the context of the claim. See Johnson Worldwide Assoc., Inc. v. Zebco Corp., 175 F.3d 985, 989-90, 50 U.S.P.Q.2D (BNA) 1607, 1610 (Fed. Cir. 1999).

Step B of claim 5 states that the pull cord must be intermeshed "with a portion of said web." It is clear that "said web" refers to the web described in step A, namely "an elongated web of material elastic" which is formed by "interconnecting elastic threads having [a longitudinal] orientation." We conclude from this language that step B requires the pull cord to be intermeshed with at least some of the threads that form the elastic web in step A. We reach this conclusion in part because the meaning of "intermeshing" involves a degree of intertwining or entangling that is distinct from more generic terms such as "attaching" or "affixing." The prefix "inter" indicates "between or among." The American Heritage Dictionary (1st Ed., 1981). The word "mesh" (when used as an intransitive verb) means, "to be or become entangled . . . engaged or interlocked" with. Id. These dictionary definitions strongly suggest that the pull cord must be intertwined, interwoven or otherwise disposed between the threads that form the elastic web in part A.

NFA argues that the meaning of "intermeshing" is broad enough to cover Asheboro's technique of sewing a pull cord onto an elastic web with additional cover threads. According to NFA, the additional cover threads used to attach the pull cord to the
web actually become part of the elastic web itself, such that the draw cord is then intermeshed with "a portion of said web" as required by claim 5. Because NFA asserts a meaning of "intermeshed" that is different from what we construe to be the ordinary meaning, we turn to the specification for clarification. See Johnson, 175 F.3d at 990, 50 U.S.P.Q.2D (BNA) at 1610-11.

There are several examples of "intermeshing" in the specification in which the pull cord is disposed between the elastic threads of the web. In contrast, there are no examples in the specification showing that intermeshing could include sewing a pull cord onto the outside of the web. In fact, the specification refers to sewing as "affixing," see '586 patent, col. 2, ll. 10-20, which lends further weight to the conclusion that the '586 specification does not teach a meaning of "intermeshing" that is broad enough to include sewing.

Finally, the prosecution history indicates that the applicant, in order to overcome prior art cited by the examiner, distinguished his invention on the ground that the pull cord is disposed between the elastic threads of the web. Specifically, in overcoming the "Turner" reference, the applicant amended step A of claim 5 to include the phrase "by interconnecting elastic threads having an orientation in said longitudinal direction." The applicant argued to the examiner that this amendment "recites that the cord is disposed between two adjoining elastic threads [and] distinguishes over Turner, in which the braid C is not disposed between adjoining elastic threads, but is spaced above the elastic threads."

Based on the forgoing analysis, we construe "intermeshing" to mean that the pull cord must be disposed between the longitudinal elastic threads of the web created in step A. Because Asheboro's processes do not result in a pull cord that is disposed between the longitudinal elastic threads of an elastic web, as required by claim 5, they cannot literally infringe the '586 patent. See Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1535, 19 U.S.P.Q.2D (BNA) 1367, 1369 (Fed. Cir. 1991) ("The failure to meet a single limitation is sufficient to negate infringement of the claim.").

4. "components requiring intermittent physical access"

This term appears in the '366 patent claims 15, 16, and 39.

Rackable asserts that "components requiring intermittent physical access" means "features that would normally be accessed in use from the rear of the main board in a standard computer chassis, such as I/O connectors, and accessible data drives if present." Supermicro contends that "components requiring intermittent physical access" is indefinite under 35 U.S.C. § 112 due to the word "intermittent," or alternatively, means "parts of the computer requiring occasional physical access by a user or operator."

Supermicro again argues that this phrase is indefinite, based on the term "intermittent." It argues that the term does not adequately describe the degree of access required, and is therefore ambiguous. Supermicro further asserts that Rackable's definition itself makes the phrase increasingly vague and ambiguous. It argues that the terms "normally" and "standard" are themselves subjective and ambiguous. Alternatively, Supermicro argues that the term "intermittent" should be replaced with "occasional," based on the dictionary definition of "intermittent."

Rackable responds that Supermicro's "reason for pretending there is ambiguity is [to] move the claims away from main board features to instead require non-main board features, such as the socket for the power plug, to be on front, even though the socket is not a main board feature, the plug and power source is not a peripheral device, and the front panel power and reset buttons confirm the lack of need for intermittent access to a socket."

The '366 patent abstract, suggests that "intermittent" is synonymous with "periodic." It provides in part:

By placement of access space to all elements which require periodic attention at the front of each computer, the need for significant space at the rear of the computer is eliminated.

'366 patent. Additionally, in the summary of the invention, the specification provides, regarding the elements that should be located at the front of the computer, that: "Desirably, those [attachments] which require physical access periodically or
would significantly hinder forward removal of the machine from a rack in which it may be placed are provided for at the front of the chassis." '366 patent, 4: 9-12.

However, the patent's reference to "periodic" does not save the term from indefiniteness. That is because both terms -- "periodic" and "intermittent" -- suggest time frames, and a certain regularity that depends on a user's purpose. However, as discussed above regarding the term "front," because a user's purpose is highly subjective and variable, the terms "periodic" and "intermittent" do not provide the type of "objective anchor" required by 35 U.S.C. § 112. n1

n1 The court also rejects Supermicro's alternative construction of "intermittent" as "occasional." Both "intermittent" and "periodic" suggest some regularity, which is not reflected in the term "occasional."

For these reasons, the court declines to adopt either parties' construction, and concludes that "components requiring intermittent physical access" is indefinite under 35 U.S.C. § 112.

2204

B. The Meaning of "Intermittent Wind" in the 416 Patent

Homedics argues that the term "said power source to generate intermittent wind" in claim one of the 416 Patent" should be construed as "said power source to generate wind at random intervals." Excellent Inventions contends that it is error to construe "intermittent" in the 416 Patent as limited to "random intervals" and argues that the proper definition of "intermittent wind" is "wind stopping and starting at irregular intervals."

The term "random" is not found within claim one, which refers to "a control circuit for controlling said power source to generate intermittent wind" that cause chimes to emit sound. The term "random" is found within claim two, which refers to "chimes that move in response to wind from programmed power generated by said power source to simulate random wind." The summary of the invention and the detailed description of the preferred embodiments use the word "intermittent" to describe power generated in some of the different embodiments and to describe wind; the word "random" is used to describe a type of generator and to describe the nature of actual wind. The preferred embodiments include magnetically-powered wind chime that can operate "at predetermined times or randomly"; water-generated movement of the chimes that occurs when water "intermittently" passes the chimes; wind-generated movement of the chimes in which the wind is created by a "random generator" driving a motor that in turn drives a fan that causes the chimes to move, in a fashion that can be "more recurrent or continuously" or "at irregular intervals that may also rotate at different speeds or in different directions to create the effect of random wind moving the chimes." A fourth preferred embodiment uses a wind generator powered by water moving across wheels at "intermittent times" to drive the fan "intermittently." A fifth embodiment uses an ionic wind generator to move the chimes, using a "random generator" to create the sensation of "intermittent wind." (Docket Entry No. 24, Ex. B, col. 4, 11. 16-18).

During the prosecution of the 416 Patent, Petruzzi argued to the examiner that it was not invalidated by the Japanese Patent, which claimed a chime that operated at regular intervals to mark time. Petruzzi stated:

Japanese patent JP 11084037 published March 26, 1999 showing an alarm clock that signals an alarm with a chime moved by generated wind and a regular half hour or hourly chiming function. It fails to show or teach the use of an intermittent or random generator or programmable circuit for simulating the random nature of actual wind.

(Docket Entry No. 24, Ex. E, p. 3). Petruzzi contrasted a chime moved by wind generated at predictable, regular, preset intervals from a chime moved by wind created by an "intermittent or random generator or programmable circuit." Wind generated by an "intermittent or random generator or programmable circuit" is contrasted to the kind of regular, predetermined chiming noise necessary to function as an alarm clock. Wind that is generated at regular, predetermined

- 2663 -
intervals can be used to operate chimes that serve as an alarm clock, but this is in contrast to "intermittent wind" that simulates the "random nature of actual wind." "Random wind" can be created by either an "intermittent or random generator or programmable circuit." Petruzzi made it clear that "intermittent wind" meant wind that was not continuous nor regular. The prosecution history does not, however, require the conclusion that "random" only means at intervals, whether regular or irregular, as opposed to occurring in a manner that is so irregular as to be lacking in pattern or predictability.

The specifications support a construction that "intermittent wind" means wind that blows at irregular intervals, while "random" appears to mean irregular or unpredictable occurrences that can be continuous or at intervals. Several of the specifications show that "random wind" includes wind that may blow continuously, but at varying and unpredictable speeds and directions. (See Docket Entry No. 24, Ex. B, Fig 4 and col. 3, 11. 26-44). By contrast, "intermittent wind" means wind that blows at intervals, that are defined in the 416 Patent to mean only intervals that are irregular. (See Id. col. 2, 36-67, col. 3, 1-6, col.3, 26-45, col. 4, 1-17). n6

n6 Webster's Ninth New Collegiate Dictionary defines "random" as ". . . lacking a definite plan, purpose or pattern." On Dictionary.com, "random" is similarly defined as "having no specific pattern, purpose or objective." McGraw Hill's Scientific and Technical Dictionary defines random paired with several other words, including:

random forecast [METEOROLOGY] A forecast in which one of a set of meteorological contingencies is selected on the basis of chance; it is often used as a standard of comparison in determining the degree of skill of another forecast method.

random mating [GENETICS] A mating system in which there is an equal opportunity for all male and female gametes to join in fertilization.

By attempting to find a reliable dictionary definition of "random," this court runs into two of the problems the Federal Circuit warned of in Phillips: that the extrinsic evidence is less useful than intrinsic evidence because it is not created "for the purpose of explaining the patent's scope and meaning" and "there is a virtually unbounded universe of potential extrinsic evidence of some marginal relevance that could be brought to bear on any claim construction question." Phillips, 415 F.3d 1303, 2005 WL 1620331 at *11.

This court concludes that "intermittent wind" in claim one of the 416 Patent means wind that blows at irregular intervals.
the brushing action along the slits into several free-standing strands of a thinner width resembling grass blades.” ’689 patent, 5:26-31. In other words, SCG wants to import a manufacturing operation performed on the slits to create the free-standing strands of thinner width into the definition of the slits. This is not proper. Accordingly, the Court adopts FieldTurf’s proposed construction of “openings or cuts in the ribbons in an intermittent pattern.”

FieldTurf’s Proposed Construction: "Mixed"

SCG’s Proposed Construction: "Thoroughly mixed together"

The Court’s Claim Construction: "Intermixed"

The Court believes that it is unnecessary to provide further definition to "intermixed." It properly conveys the concept, described in the specification and claims, of a bottom course with both hard and resilient particles mixed together. ’689 patent, 7:7-8; 9:58-59; 10:33. SCG relies entirely on its characterization of Figure 1 as depicting a bottom course 5 that is "completely homogeneous, with no variations, gaps, or other breaks." First, this description of Figure 1 is not accurate. Rather, the bottom course 5 appears to have significant variations and randomness throughout. Moreover, SCG fails to point to anything in the specification that requires a completely homogeneous bottom course with no variations, gaps, or other breaks. 15

--- Footnotes ---

15 Although it is not entirely clear how “thoroughly mixed together” differs from "mixed” or "intermixed,” it is apparent that SCG interprets it to be something approaching "completely homogeneous, with no variations, gaps, or other breaks."

--- End Footnotes ---

D. Internal Bore

I did not construe this term, or any of the remaining terms at issue in this case, in the July 25 opinion and order. The dispute regarding the term "internal bore" is whether it encompasses an "internally threaded bore." Plaintiff argues that it does not because the ordinary meaning of "bore" connotes something that is hollow and smooth. Defendant disagrees, pointing out that one of the examples of a bore that plaintiff discusses in its brief, the bore of a firearm barrel, is not smooth. Regardless of the ordinary meaning of bore, however, the patent uses the term "threaded bore" to describe the inside of a nut. This suggests that, in the patentee’s lexicon, a "bore" can be threaded or smooth. If the patentee did not want "bore" to encompass threaded objects, he should have used a word other than "bore" to describe the inside of a nut. Alternatively, if he wanted to limit the compression ring to smooth objects, he should have used the term "internally smooth bore."

As defendant points out, it is a basic principle of logic that a genus necessarily includes one of its species. Thus, the genus "bore" must encompass the species "threaded bore." Plaintiff cannot escape the effect of this basic principle by arguing that all of the preferred embodiments have a compression ring with a smooth internal bore. It is well-settled that a court may not read limitations from the specification into the claims. Anchor Wall Systems, Inc. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1308 (Fed. Cir. 2003); Specialty Composites v. Cabot Corp., 845 F.2d 981, 986-87 (Fed. Cir. 1988) (patent that used term “plasticizer” covered both “internal plasticizers” and "external plasticizers" even though the patent provided examples of "external plasticizers" only). An "internally threaded bore" is an "internal bore."

E. Constant Diameter Internal Bore/Non-tapered Internal Bore
These terms appear to be the most hotly contested in this case. The parties agree on their literal meaning: a "non-tapered" bore is one that does not gradually diminish in one direction and a "constant diameter" bore is one that has a diameter that does not vary from one end of the bore to the other. However, the parties disagree on how an ordinary person of skill in the art would understand the terms in the patent. Defendant argues that the words "non-tapered" and "constant diameter" are non-technical terms that should be given their ordinary, literal meaning. Plaintiff argues that one of ordinary skill in the art would not give the terms their literal meaning, but would understand that the terms were subject to the inherent limitations of the materials and processes used in manufacturing.

Defendant is correct that there is a heavy presumption that terms in a claim should be given their ordinary meaning, particularly when the terms are non-technical. See Middleton, Inc. v. Minnesota Mining and Manufacturing Co., 311 F.3d 1384, 1387-88 (Fed. Cir. 2002). However, at the claim construction hearing, experts for both sides admitted that it would be impossible to create a compression ring with a perfectly constant diameter. In addition, both experts addressed the necessity of using draft angles when making compression rings out of plastic, one of the materials used in the preferred embodiments of the '194 patent. See Pat. '194, col. 3, lines 31-35 (stating that parts of cable connectors in preferred embodiments may be made of plastic). Although the experts disagreed on the degree of the appropriate draft angle for plastic parts in a cable connector, they did agree that it would be almost impossible to make a perfectly non-tapered plastic compression ring. Thus, if the terms "constant diameter" and "non-tapered" were limited to mean perfectly constant and perfectly non-tapered, the '194 patent would not cover its own preferred embodiments. Moreover, claim 2 would not apply to any products in the real world because no cable connectors have parts with perfectly constant diameters.

The principles of claim construction do not require such an absurd result. Courts may reject a literal definition if doing so is necessary to remain consistent with the object of the invention as expressed in the specification. See Bausch & Lomb, Inc. v. Barnes-Hind/Hydrocurve, Inc., 796 F.2d 443, 450 (Fed. Cir. 1986) (rejecting definition of "smooth" as "absolutely ridge-free" because one of ordinary skill in art would understand that "smooth means smooth enough to serve the inventor's purposes"); see also Quantum Corp. v. Rodime, 65 F.3d 1577, 1581 (Fed. Cir. 1995) (assuming that one of ordinary skill in relevant art would understand "600 tpi" to mean "approximately 600 tpi").

It is true, as the Court of Appeals for the Federal Circuit has recognized, that the appropriate manufacturing tolerances for a particular product should be determined by contract and not through claim construction. Middleton, 311 F.3d at 1389; Senmed, Inc. v. Richard-Allan Medical Industries, Inc., 888 F.2d 815 (Fed. Cir. 1989). In accordance with these cases, I agree with defendant that plaintiff is not entitled to read into the claims its chosen manufacturing tolerances. However, the question before the court is not what the appropriate manufacturing tolerances are but whether one of ordinary skill in the art would take into account real world constraints when defining terms. When it is impossible to create a completely flat or unvarying surface, it is not difficult to surmise, even without expert testimony, that one of ordinary skill in the art would understand the terms "non-tapered" and "constant diameter" to include not only the perfect manifestations of these terms, but also objects that are as close to perfection as available technology can reasonably achieve.

Further, I disagree with defendant's suggestion that, under this approach, competitors would not have fair notice whether they are infringing. By necessity, companies that employ a particular material in manufacturing will know that material's inherent limitations. So long as the scope of the term extends only as far as necessary to accommodate the inherent limitations of the materials (rather than what is cost effective, see Senmed, 888 F.2d at 820 n.10), potential competitors will not be left to guess what infringes and what does not.

In sum, I am persuaded that one of ordinary skill in the art would know that cable connectors are manufactured in the real world and not in the mind of God. Accordingly, I construe "non-tapered internal bore" to mean a "a bore that does not gradually diminish in one direction, subject to the inherent limitations of the materials and processes used in the manufacture of the compression ring." I construe "constant diameter internal bore" to mean "a bore with a diameter that does not vary, subject to the inherent limitations of the materials and processes used in the manufacture of the compression ring."
Next for interpretation by the Court is the term "internal surface" that appears in claims 1, 10, 21, 22, and 28 of the '579 patent. The Plaintiffs state that the term means "an interior face." (Pls.' Open Br. PX-1 3.) Pergo states that "internal surface" means "an inner surface of the locking groove closest to the joint edge making a right angle with the underside of the groove panel, and configured so that a play exists between the internal surface and a locking surface of the locking element." (Unilin's Open. Br. 25-26.)

Claim 1 of the '579 patent states:

A mechanical locking system for locking a first edge of a first panel to a second edge of an identical second panel that are arranged on a subfloor, the mechanical locking system comprising: means on the first edge and the second edge for forming a first mechanical connection locking the first and second edges to each other in a first direction at right angles to a principal plane of the panels; a locking device arranged on an underside of the first and the second edges, the locking device forming a second mechanical connection locking the first and the second edges to each other in a second direction parallel to the principal plane and at right angles to the edges; the locking device including a locking groove which extends parallel to and spaced from the second edge, the locking groove being open at the underside of the second edge and including an internal surface; the locking device further including a strip extending from the first edge, the strip extending throughout substantially an entire length of the first edge and being provided with a locking element projecting from the strip; the strip, the locking element, and the locking groove being configured such that when the second edge is pressed against an upper part of the first edge and is then angled down against the subfloor, the locking element can enter the locking groove; the locking element has a locking surface which faces the first edge and is configured so that it can contact the internal surface of the locking groove when the first and second edges are joined together to prevent substantial separation of the joined first and second edges; and the locking element further including an outer portion which is most distant to the joined edges and is not in contact with the locking groove when the first and second edges are joined together.

('579 patent, 10: 35-67.) (Emphasis added). The key portions of the proposed definitions of the Plaintiffs and Pergo are similar -- "interior face" and "inner surface." However, the Plaintiffs' proposed definition is preferable since it does not include the word "surface" that is part of the phrase which it defines. The remaining portions of Pergo's definition are drawn from the specification's discussion of the figures or preferred embodiments and are not central to the claimed invention. Therefore, the Court defines "internal surface" as "interior face."

2. "Internal Threads"

a. Claim Term:

"... a female end of said PVC pipe; a first enlarged interior diameter of said PVC pipe at said female end, said first enlarged interior diameter ... having internal threads to mate with said external threads of said male end for said similar adjacent PVC pipe ..."

b. Parties' Contentions

CertainTeed's proposed construction of "internal threads" is "helical or spiral ribs or grooves disposed on the interior surface of the female end of the PVC pipe to mate with helical or spiral ribs or grooves on the outer surface of the male end of a similar adjacent PVC pipe." In support, CertainTeed points out that the claim plainly states that the first enlarged diameter section has "internal threads to mate with said external threads of said male end for [sic] said similar adjacent PVC pipe." (emphasis added). CertainTeed's proposed construction incorporates this language. However, CertainTeed argues that Modern Products is seeking to rewrite this claim element by substituting the word "which" for the word "to" in the claim. CertainTeed contends that the language of this claim in unambiguous, and there is no basis in the intrinsic record for deviating from that language or altering the ordinary meaning.

Modern Products' proposed construction of "internal threads" is "helical or spiral ribs or grooves disposed on the interior surface of the female end of the PVC pipe which mate with corresponding helical or spiral ribs or grooves on the outer
surface of the male end of a similar adjacent PVC pipe." Modern Products asserts the same argument as made for the construction of the term "external threads." See supra.

c. Court's Construction

This Court concludes that the term "internal threads" means "helical or spiral ribs or grooves disposed on the interior surface of the female end of the PVC pipe which mate with corresponding helical or spiral ribs or grooves on the outer surface of the male end of a similar adjacent PVC pipe." This term is construed in accordance with the claim and specification, and dictated by its ordinary and customary meaning. For many of the same reasons stated in the discussion of the claim term "external threads," the Court agrees with Modern Products' proposed construction because it is supported by the claim language and construed in accordance with the specification. Additionally, this construction is not inconsistent with the term's ordinary and customary meaning. See supra pg. 7.

The independent claim in Mid-America's '060 patent, Claim 1, includes five elements: [a] a mounting bracket, which is placed behind the siding of the subject building; [b] a flange member, which is inserted from outside the building, through a hole in the siding, onto the mounting bracket; [c] "a cover piece received within the wall of said flange member"; [d] "said cover piece being interposed between said flange wall of said flange member and said back wall of said bracket;" and [e] interengaging means on the inner surface of the mounting bracket's peripheral wall and the outer surface of the flange wall of the flange member, such that the bracket can be set at different openings.

The '060 patent also includes three dependent claims. Claim 2 consists of the wall mount assembly described in Claim 1 with a cover piece that has an opening so that the assembly can fit over a pipe or faucet. Claim 3 calls for a cover piece consisting of a plastic socket cover for an electrical box. And Claim 4 specifies an electric socket cover with hinged covers over the socket openings, for safety and cleaning.

As described in the background and summary section of the '060 patent, the patented design has several advantages over its predecessors. First, only the flange member is visible, allowing the bracket member to be made of a less expensive material and permitting the bracket member to be a different color from the siding. This makes color coordination easier and less costly. Second, the '060 mounting bracket can be used with existing short wires and electric boxes, eliminating the prior need to extend them. Finally, the '060 can be used with faucets. In such use, a cover piece is used to hide the hole in the siding through which the pipe extends. This cover piece can be color-coordinated with the flange member to be the same color as the siding.

Elements [c] and [d] of Claim 1, relating to the design and placement of a cover piece, are the center of controversy. The parties do not dispute that Richwood's product contains the first two elements of Claim 1. However, Richwood maintains that while its product may receive a standard-sized cover piece, it cannot receive a cover piece "interposed" between the flange member wall and the back wall of the base of the bracket, in the manner that the patented device does. According to Richwood, the accused flange member would not connect to the bracket if a cover piece were interposed.

Mid-America counters that Richwood's assembly can be used with a cover piece in the same way as the '060 patent. Mid-America says that "interposed" does not require the cover piece to be trapped or held in place by the flange member, but merely to be placed between the flange member and bracket.

As Markman established, claim interpretation is a matter of law which I must decide. Markman at 1393. I am thus called upon to determine the meaning of the word "interposed" as used in Claim 1 of the patent (element [c]) above. A court must give a word its ordinary meaning, in the absence of any specialized definition in the patent. Vitronics Corp. v. Conceptronic, 90 F.3d 1576, 1582 (Fed. Cir. 1996). Merriam Webster's Collegiate Dictionary defines "interpose" as, "to place in an intervening position." Merriam Webster's Collegiate Dictionary (10th ed. 1995).

As far as the use of the assembly to mount a faucet, Mid-America's argument holds little water. Mid-America clearly requires a cover piece of the same color as the house's siding, having a central opening with a slit that fits over the faucet. Richwood's device needs no such cover since it in effect incorporates a hinged cover piece which fits directly over the
faucet. Mid-America argues that since the built-in cover of Richwood's device can be knocked out and a cover made of the house's siding adapted for use, it can be used identically to Mid-America's device. But as discussed below, Mid-America has not shown any evidence that Richwood's device is so used or that Richwood encourages such use.

When used to mount electrical socket covers, the devices are employed in a more similar fashion. In both, the socket cover is not "trapped." As shown in the patent drawings, the "interengaging means" specified in Claim 1 [e] above) of the '060 patent permit the flange member and bracket to be spaced far enough apart to accommodate an electrical socket cover in a way similar to Richwood's device.

However, Richwood persuasively argues that the background language in the patent limits construction of the claim. The background section indicates that the patent sought to create an assembly where the back wall of the bracket was not visible, so that it could be made of less expensive material and not need to be color-coordinated with the house. The cover piece is "interposed" in the '060 assembly in the sense of being "trapped by" the flange so that it is held against the bracket and completely obscures the back wall. This distinguishes it from the accused device, where the back wall is made of the same material as the flange member and is visible.

Richwood's interpretation is supported by language in the patent. See United States Patent 5,326,060, "Background and Summary of the Invention," column one, line 54 and "Description," column two line 61-62. Plaintiff cites numerous cases to the effect that the scope of a claim may not be limited by patent drawings and specifications. However, I do not here impose a narrower scope on the claim. Plaintiff's device must hold a cover piece fully eclipsing the back wall of the bracket. No "broader" use overlapping with the accused device is possible.

The difference between the devices may be one of form rather than substance, but as Southwall teaches, "To establish literal infringement, every limitation set forth in a claim must be found in an accused product, exactly." Southwall at 1575.

Because the accused device does not in any application use a cover piece in the same manner as called for by the '060 patent, I cannot find literal infringement.

2211

The crux of the parties' dispute as to the construction of these related terms is the meaning of the terms "interrupting" and "disconnecting," and whether these terms require a physical disconnection. Plaintiff's position is that "interrupting" and "disconnecting" do not require a physical disconnection but instead require only that the functions of the device stop operating, whereas Defendants' construction requires a physical disconnection of the relevant components.

First, Plaintiff argues that "interrupting" of the existing floor call transmitter line from the elevator control does not mean a physical disconnection, but is merely a switch from the elevator control being controlled by the traditional floor call transmitter to the new computing unit and modernizing device. Therefore, Plaintiff contends that the concept of "interrupting" relates to a means of stopping the elevator control from operating in order to upgrade to the computing unit and modernizing device.

Plaintiff cites to the following language from the specification in support of its interpretation:

[T]he existing electrical floor call transmitter line 16, 16' to the floor call transmitter . . . or the existing car call transmitter line 18, 18' to the car call transmitter 13, 13' is interrupted at the input of the elevator control 14, 14'

('465 Patent, col. 10:28-33.) (emphasis added). Plaintiff argues that this "interruption" merely requires that the elevator control stop operating based on output from the traditional floor call transmitter.

Second, Plaintiff argues that although the term "disconnected" is not defined in the specification, it is analogous to the term "interrupting." Plaintiff reiterates its argument that this disconnection limitation is intended to stop the elevator control from operating based on output from the traditional transmitters in order to effectuate a changeover so that it is controlled by the computing unit via the modernizing device. Thus, Plaintiff contends that only a "functional" or "operational" disconnection is contemplated, rather than a physical disconnection.
Defendants respond that the Patents-in-Suit contemplate that the floor call transmitters are physically disconnected from the elevator control in order for a new connection by way of an electrical line with an output device. Defendants argue that a physical disconnection is directed because the floor call transmitters and car call transmitters are completely removed upon installation of the new connection. Defendants cite to the following language contained in the specification in support of its construction:

[T]he existing electrical car call transmitter line 18, 18' to the car call transmitter 13, 13' is interrupted at the input of the elevator control 14, 14' and this input of the elevator control is instead, connected by way of an electrical line with an output of the [modernizing] device 36, 36' ('465 Patent, col. 10:31-35.) (emphasis added). Defendants contend that this language indicates that a physical disconnection occurs with respect to the elevator control and that this interpretation is supported by the fact that the floor call transmitters are removed subsequent to the "interruption."

Similarly, Defendants argue that the ordinary meaning of the term "disconnected" directs that it be interpreted as meaning physically disconnected. Defendants note that the specification explains that after the car call transmitter line is "interrupted," the "input of the elevator control is, instead, connected by way of an electrical line with an output of the [modernizing] device." (Id. col. 10:28-35.) Defendants argue that this description contemplates a physical severance of the lines.

Plaintiff's interpretation attempts to limit the meaning of the terms "interruption" and "disconnected" in a way that does not comport with the natural reading of the words in light of the specification. The fact that the Patents-in-Suit, through the specifications, clearly contemplate connecting the input of the elevator control with a separate electrical line connected to the modernizing device indicates that the previous connection with the floor call transmitter line would be physically severed, rather than merely disabled. Therefore, the Court will adopt Defendants' proposed construction that the terms "interrupting" and "disconnected" require a physical disconnection as this meaning is more consistent with the context of the specification.

2212

c. "movement interruption"

Durr argues that "movement interruption" means "any occurrence which causes the spraying device and the conveying device to halt in non-specific terminal positions, i.e., the relative positions of the spraying device and conveying device may no longer be synchronized." (Am. Joint Claim Construction Chart at 1, FANUC's Ex. 1.) FANUC, drawing from its argument related to the preamble, argues that the term should be construed to mean "movement being interrupted in the event of a power supply failure." (Id.) As discussed above, the court has rejected FANUC's argument that movement interruption must be caused only by a power supply failure, and thus will not accept its proposed construction here.

FANUC also objects to Durr's use of the phrase "any occurrence," because it contradicts Durr's proposed construction of "power supply failure." (FANUC Resp. Br. at 20.) Specifically, Durr proposed that "power supply failure" should mean "any unscheduled automatic, manual, or inadvertent termination of power." (Am. Joint Claim Construction Chart at 2, FANUC's Ex 1.) FANUC therefore argues that, at a minimum, the word "unscheduled" should be imported into Durr's proposed construction. (FANUC Resp. Br. at 20.) Notwithstanding the fact that the court has declined to read the Preamble as a limitation, and therefore has declined to construe the phrase "power supply failure," FANUC's argument is well-founded that "movement interruption" includes a qualifier that the interruption is unscheduled. As discussed above, the specification includes multiple references to the fact that the Patent is intended to relate to unscheduled interruptions. (See '538 Patent, at abstract, 2:5-10, 2:33-3, 3:6-7.) Accordingly, the court will add the word "unscheduled" to Durr's proposed construction.

After accepting the argument that the movement can be caused by "any unscheduled occurrence," and rejecting the argument that the interruption must be caused by a power supply failure, the court perceives no substantive disagreement by FANUC to the rest of Dorr's proposed construction, which requires that the occurrence must cause "the spraying device and conveying device to halt in non-specific terminal positions, i.e., the relative positions of the spraying device and conveying
device may no longer be synchronized." This construction is consistent with the claim language and the purpose of the Patent as expressed in the specification. Absent any substantive objection from FANUC, the court will adopt it.

Thus, the court will essentially adopt Durr's proposed construction of "movement interruption," with only the minor modification of adding the word "unscheduled." The final construction, therefore, reads: "any unscheduled occurrence which causes the spraying device and the conveying device to halt in non-specific terminal positions, i.e., the relative positions of the spraying device and conveying device may no longer be synchronized."

---

4. Rajala Patent No. 5,940,887 — "intersect"

Rajala Patent '887 relates to disposable absorbent garments where the leg and crotch elastics are configured in manner that minimizes leakage and improves fit. For the disputed claim term found in Claims 1, 14, 19 and 20, KC and First Quality both agree that "intersect" means "cross over or overlapping." The dispute centers on First Quality's addition of the phrase "within a common layer." First Quality contends that its proposal is consistent with the ordinary meaning of the word "intersect." (doc. 168 at pg. 77.) KC counters insisting that First Quality is attempting to insert a limitation that is not supported by the intrinsic evidence. (See doc. 197 at pg. 18.) After review, we agree with KC.

First Quality's bases its construction not on the intrinsic evidence, but rather on the usage of the word "intersect." Defendants argue that in ordinary usage, "one would not describe a corridor on the second floor as intersecting with a corridor on the third floor, even if the third floor corridor 'crosses over' the second floor." (doc. 168 at pg. 77.) This is true. However, by agreeing that "intersect" means to "cross over or overlap," First Quality is implicitly refuting the common usage of "intersect", which is typically defined as "to pierce or divide by passing through or across." Webster's Third New International Dictionary (unabridged) 1182 (1981). More importantly, neither the claim nor specification language provide that the elastics must be within a common layer. By adding this language, First Quality seeks to add a limitation into a claim that is not supported by the evidence. Since the parties agree that "intersect" means "cross over or overlapping", we will construe the term as such.

---

2. "intersect"

Braun construes "intersect" to mean "to have one or more points in common from at least one perspective." (D.I. 74 at 16) Terumo construes the term to mean "to pierce or divide by passing through or across, but not merely touching or overlapping." (D.I. 71 at 14) I recommend adopting Braun's proposed construction.

Both parties agree that the issue is whether "intersect" as used in the patent claims requires that items "pierce or divide" one another. 6 Braun's proposal would allow for items to "intersect" without piercing or dividing one another, provided that the items appear to have at least one point in common when looking at them from some perspective. (See, e.g., D.I. 99 at 10 (Braun explaining its construction "capture[s] the requirement that two arms appear to have at least a common point, shown in the embodiments as crossing") (emphasis added).) Terumo, by contrast, insists that items which "intersect" must pierce or divide one another.

---

6 It had previously appeared that the parties also disputed whether "intersect" as used in the patent claims requires that items touch one another. After the hearing, however, this issue no longer seems to be in dispute. (See Tr. at 64 (Braun stating it is prepared to accept a construction requiring touching, such as "to have one or more points in common from at least one perspective, but not merely touching"); Tr. at 62 (Terumo's counsel not insisting on touching, stating "[t]hey don't have to be touching").
The claim language refers to a "proximal wall" having "two arms that intersect one another and extend distally of the proximal wall in the ready to use position." ('613 patent, col. 16 lines 12-13) This claim language itself does not preclude either party's proposed construction.

Turning to the specification, most relevant are Figures 10A and 10B, which depict a preferred embodiment. ('613 patent at BBM-TER0000014) In this preferred embodiment, the arms (122 and 124 in Figure 10A) do not touch, pierce, or divide one another. ('613 patent, col. 9 lines 28-34 & col. 10 lines 12-14) From the perspective depicted in Figures 10A and 10B, however, the two arms do appear to share a point in common (that is, the spot where the two arms appear to "cross" over one another). Thus, the embodiment disclosed at Figures 10A and 10B would be excluded from the claims if Terumo's construction were adopted. As a general matter, a claim interpretation that excludes a preferred embodiment is not a correct interpretation. See generally Osram GmbH, 505 F.3d at 1358 ("[A] claim interpretation that would exclude the inventor's device is rarely the correct interpretation."). Such a result would be all the more anomalous here because, according to Terumo, this Figure 10 design "is the only version of the clip that worked." (Tr. at 22-23; see also D.I. 97 at 12 n.8.)

Much attention has been devoted by the parties to the prosecution history of a patent related to the '613 patent-in-suit. The parties are in agreement that the prosecution history of a continuation-in-part patent is irrelevant. See Tr. at 49, 55; D.I. 71 at 19-20; D.I. 97 at 13; see also Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1350 (Fed. Cir. 2004) ("Any statement of the patentee in the prosecution of a related application as to the scope of the invention would be relevant to claim construction, and the relevance of the statement made in this instance is enhanced by the fact that it was made in an official proceeding in which the patentee had every incentive to exercise care in characterizing the scope of its invention.").

Terumo finds within the file history of U.S. Patent Application No. 10/734,931 (the "'931 application"), which is a continuation-in-part of the '613 patent, a prosecution disclaimer. 7 "Under the doctrine of prosecution disclaimer, a patentee may limit the meaning of a claim term by making a clear and unmistakable disavowal of scope during prosecution." Purdue Pharma L.P. v. Endo Pharms. Inc., 438 F.3d 1123, 1136 (Fed. Cir. 2006).

--- Footnotes ---

7 The specifications of the '613 patent and the '931 patent application are essentially identical. (Tr. at 49, 55)

--- Footnotes ---
Braun responds that Terumo's purported prosecution "disclaimer" is "no disclaimer at all, but rather an attempt to distinguish the prior art in a manner consistent with Braun's proposed construction." (D.I. 99 at 10) Braun adds that the statements made during prosecution "were made to explain that the two cited prior art references did not teach or disclose 'intersecting arms' using the ordinary meaning of that term." (D.I. 99 at 12) My review of the file history leads me to conclude that Braun is correct. I find no clear and unmistakable disavowal of the otherwise broad scope of the claim term "intersect."

With respect to extrinsic evidence, both parties cite to dictionary definitions of "intersect." Unsurprisingly, both parties have found dictionaries that support their own proposed constructions. 9 These are not particularly helpful and do not alter the conclusion I have reached above, on the basis of the intrinsic evidence.

9 Braun's dictionary definitions are: "intersect" means "to have one or more points in common" and "intersection" means "point or line of contact between two lines." (D.I. 74 at 16) (citing Webster's Universal College Dictionary (2003) and Webster's New International Concise Dictionary of the English Language (1997)) Terumo relies on Webster's Ninth New Collegiate Dictionary (1991) (defining "intersect" as "to pierce or divide by passing through or across"); Webster's Third New International Dictionary of the English Language Unabridged (1993) (defining "intersect" as "to pierce or divide by passing through or across"); Random House Webster's College Dictionary (1995) (defining "intersect" as "to cut or divide by passing through or across"); and The American Heritage Dictionary (3d ed. 1993) (defining "intersect" as "to cut across or through"). (D.I. 71 at 15)
contends that "meet or touch" is the common understanding of "intersect." (Id.) Further, ICU criticizes RyMed's proposed construction, contending that the limitation of "successive" is both unwarranted by the claim language, as well as redundant. (Id.) RyMed contends that ICU's use of the word "meet" to construe the word "intersect" is ambiguous, and that "intersect" means only that the arcuate segments "touch." (D.I. 116, at 30-31.) Further, RyMed contends that its use of the word "successive" is supported by, and required by, Figure 9. (D.I. 165, at 28.)

In the Court's view, ICU's construction is more persuasive because RyMed offers no support to read in the "successive" limitation. This limitation is not grounded in the claim language or in the Common Specification, since the words "intersect" or "intersecting" do not appear anywhere in the Common Specification. Accordingly, the limitation seems to be based on nothing more than RyMed's interpretation of what Figure 9 illustrates. Thus, the Court concludes that "arcuate segments intersecting one another" means "arcuate segments that meet or touch."

---

Cytyc's proposed construction | Xoft's proposed construction
---|---
"Interstitial" (no construction required) | Site in natural or surgically created cavity in body.

"Brachytherapy"
Cytyc's proposed construction | Xoft's proposed construction
Radiation therapy delivered by a spatially confined radiation source at or near the site of the diseased tissue. | Radiation therapy delivered by a spatially confined radionuclide at or near a tumor or other proliferative tissue disease site.

"Interstitial brachytherapy"
Cytyc's proposed construction | Xoft's proposed construction
Brachytherapy applied directly to the interspaces of a body tissue, where the interspaces are not naturally occurring. | Radiation therapy delivered by a spatially confined radionuclide at or near a tumor site in a natural or surgically created cavity in a body.

Cytyc argues that "interstitial" and "brachytherapy" should be constructed together; Xoft seeks a separate construction for each word. Cytyc also complains that Xoft seeks to limit "brachytherapy" to radionuclides, arguing that the definition should encompass any radiation source. However, the patent provides a clear definition of "brachytherapy": "The term 'brachytherapy,' as used herein, refers to radiation therapy delivered by a spatially confined radioactive material inserted into the body at or near a tumor or other proliferative tissue disease site." '204 patent, col. 1, ll. 30-33. Here, the patentee clearly acted as his own lexicographer, and Cytyc's arguments for a broader definition do not acknowledge this clear definition. The court construes "brachytherapy" to mean "radiation therapy delivered by a spatially-confined radioactive material inserted into the body at or near a tumor or other proliferative tissue disease site." 9

---

9 This definition does not resolve the parties' dispute over whether "radioactive material" should be read to encompass only "radionuclides" (as Xoft wishes) or any "radiation source" (as Cytyc urges). As the parties have separately sought construction of "radioactive material," the court will address construction of that phrase below.

---

Xoft argues that "interstitial" means any body cavity, while Cytyc argues that "interstitial" should be limited to only non-naturally-occurring cavities. As Xoft points out, one medical dictionary defines "interstitial" as "1. Placed or lying between. 2. Pert. to interstices or spaces within an organ or tissue." TABER'S CYCLOPEDIC MEDICAL DICTIONARY, 1007 (Clayton M. Thomas, ed., 17th ed. 1993). Although not cited by the parties, a British oncology text indicates that
"interstitial" has a particular meaning in the field of the invention:

Two main techniques are used for the delivery of radiation which is given either as an external beam or as short range radiation from an implanted radioactive source. External beam radiation usually involves megavoltage produced by linear accelerator as photons or electrons or from cobalt sources in the form of relative low energy X-rays or gamma rays. The latter are often used to treat relatively superficial lesions such as basal cell carcinoma or recurrences within the skin. High energy radiation can be used to treat deeply located lesions such as prostatic carcinomas without delivering an excessive dose to adjacent normal tissue. . . .

Interstitial implant irradiation gives a high local dose to the tumour and usually employs sources such as radium, iridium, or caesium used in the form of needles or wires implanted in the tumour. This technique is widely used in the treatment of head and neck cancers to deliver a high tumour dose without irradiation to sensitive organs such as the lens of the eye or the spinal cord.

However, Cytyc points out that regardless of any generally-accepted meaning of "interstitial" in the field of the invention, the patentee limited "interstitial" during prosecution to refer to only surgically-created cavities (and similarly defined "intercavital" to refer to natural body cavities):

Turning to the cited prior art, the Ishiwara device comprises a thermotherapeutic apparatus having a catheter body member, an inner lumen surrounded by an outer lumen, and a radiation source contained within the inner lumen. . . . Ishiwara's apparatus is inserted into a body cavity. Hence, the apparatus does not provide interstitial radiation treatment, as Applicant's invention requires, but rather intercavital radiation treatment.

Su Decl. (dkt. # 49), Ex. C (Amendment & Resp.) at 11 (citations omitted). This is consistent with the background section of the patent, which mentions surgical cavities several times but not natural ones. '204 patent, col. 1, ll. 19, 23, 25, 63, col. 2, 1. 1. Also, although the summary section does not specify what type of cavities the apparatus claims are directed to, the summary makes clear that the method claims are directed to a method that "includes surgically creating access to the proliferating tissue within a patient and surgically resecting at least a portion of the proliferating tissue to create a resection cavity within body tissue." Id., col. 3, ll. 3-6.

The parties did not brief the issue of how much weight the court should afford the prosecution history in this instance. The Federal Circuit has instructed that "[a]lthough prosecution history can be a useful tool for interpreting claim terms, it cannot be used to limit the scope of a claim unless the applicant took a position before the PTO that would lead a competitor to believe that the applicant had disavowed coverage of the relevant subject matter." Schwing GmbH v. Putzmeister Aktiengesellschaft, 305 F.3d 1318, 1324 (Fed. Cir. 2002). Here, the patentee clearly disavowed coverage of intercavitary radiation treatment when arguing to the PTO. Given the intrinsic evidence is of primary importance and all supports Cytyc's position, the court construes "interstitial" to mean "involving a surgically-created cavity in a body."

10 In its recent en banc explanation of the evidence to be used in construing claims, the Federal Circuit devoted a paragraph to prosecution history:

In addition to consulting the specification, we have held that a court "should also consider the patent's prosecution history, if it is in evidence." Markman, 52 F.3d at 980; see also Graham v. John Deere Co., 383 U.S. 1, 33, 86 S.Ct. 684, 15 L.Ed.2d 545 (1966) ("[A]n invention is construed not only in the light of the claims, but also with reference to the file wrapper or prosecution history in the Patent Office."). The prosecution history, which we have designated as part of the "intrinsic evidence," consists of the complete record of the proceedings before the PTO and includes the prior art cited during the examination of the patent. Autogiro, 384 F.2d at 399. Like the specification, the prosecution history provides evidence of how the PTO and the inventor understood the patent. See Lemelson v. Gen. Mills, Inc., 968 F.2d 1202, 1206 (Fed. Cir. 1992). Furthermore, like the specification, the prosecution history was created by the patentee in attempting to explain and
obtain the patent. Yet because the prosecution history represents an ongoing negotiation between the PTO and the applicant, rather than the final product of that negotiation, it often lacks the clarity of the specification and thus is less useful for claim construction purposes. See Inverness Med. Switz. GmbH v. Warner Lambert Co., 309 F.3d 1373, 1380-82 (Fed. Cir. 2002) (the ambiguity of the prosecution history made it less relevant to claim construction); Athletic Alternatives, Inc. v. Prince Mfg., Inc., 73 F.3d 1573, 1580 (Fed. Cir. 1996) (the ambiguity of the prosecution history made it "unhelpful as an interpretive resource" for claim construction). Nonetheless, the prosecution history can often inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution, making the claim scope narrower than it would otherwise be. Vitronics, 90 F.3d at 1582-83; see also Chimie v. PPG Indus., Inc., 402 F.3d 1371, 1384 (Fed. Cir. 2005) ("The purpose of consulting the prosecution history in construing a claim is to 'exclude any interpretation that was disclaimed during prosecution.'"), quoting ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1580 (Fed. Cir. 1988); Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir. 1995).

Phillips v. AWH Corp., 415 F.3d 1303, 1317 (Fed. Cir. 2005) (en banc).

11 The extrinsic evidence that Cytyc used "intercavitary" in literature and advertising in a manner that encompasses the definitions of "interstitial" and "intercavitary" it advances now, see Tr. at 93, is of little weight in this situation. Similarly, evidence presented by Cytyc that Xoft represented to the FDA that the term "interstitial" "is a more appropriate word for a cavity that is surgically created as compared to a natural body cavity," (see Decl. of Henry Su Supp. Cytyc's Supplemental Claim Construction Br., Ex. A, is not entitled to significant weight although it does suggest that one skilled in the art construes the term as Cytyc proposes.

--- End Footnotes ---

In light of the constructions of "interstitial" and "brachytherapy" above, no further construction of "interstitial brachytherapy" is necessary.

GO BACK

2217

5. The term "intervening cooling procedure" in claim 1 is construed as: "cooling of the product between step (a) and step (b) or between step (b) and step (c) that is not 'incidental heat loss.'" This is defendant's proposed construction. Dkt. # 51, at 19. Plaintiff's proposed construction is "[a]n interventional step, different from ambient temperature processing of the product, wherein a product cooling system is used for the purpose of bona fide heat removal." Dkt. # 49, at 5. The Court finds that its construction of the term has the same meaning as plaintiff's, but would be less confusing for a jury.

GO BACK

2218

4. **Construction of "first intervening member"**

Medtronic contends that "first intervening member" should be construed as "the cap portion of the two-piece interlocking coupling element." In support, Medtronic relies first on the "only one way" specification argument. In the absence of
language in the specification which constitutes a clear redefinition by implication, this Court has rejected this argument.

Medtronic next points to the applicant's phrasing in two sets of proposed amendments with this single, cryptic statement: "In the file history, Fastenex alternately claimed the two-piece interlocking coupling element as an 'upper socket portion and lower socket portion', or 'a first intervening member and second intervening member.'" (Defs.' Br. 28-29.) This is too unclear to respond to.

Medtronic next argues that the examiner understood "first intervening member" to have the proposed limitation, pointing to the office action of April 29, 2003, in which the examiner used this phrase in a list: "a threaded 'upper socket portion' 45 (alternatively the 'first intervening member')." (Gleason Dec. Ex. 10 at 8.) Medtronic does not explain, nor does this Court perceive, how this phrase supports its proposed construction.

Medtronic has provided no basis for this Court to conclude that "first intervening member" should be construed as "the cap portion of the two-piece interlocking coupling element."

5. Construction of "second intervening member"

Medtronic contends that "second intervening member" should be construed as "the tapered and slotted socket portion of the two-piece interlocking coupling element, which completely encircles the curvate head." Again, in support, Medtronic relies first on the "only one way" specification argument. In the absence of language in the specification which constitutes a clear redefinition by implication, this Court has rejected this argument.

Medtronic next attempts to bring its "slot" argument into play. Medtronic refers vaguely to "the Examiner's finding that, whatever one calls the structure between the head of the screw and the interior surface of cylindrical body [sic], it cannot be an incomplete circle." (Defs.' Br. 29.) This appears to be a reference to the examiner's statement in the April 29, 2003 office action, already discussed: "The specification contains no disclosure or illustration of a locking collar with a slot extending the entire length of the collar and thus forming an incomplete circle as recited. Therefore, such an embodiment is not enabled by the disclosure." (Gleason Dec. Ex. 10 at 4.) As already stated, even if there was some legal basis for this Court to consider the examiner's interpretation here, the examiner's comments about a locking collar and slot in a rejected claim have too remote a connection to shed light on the meaning of "second intervening member" in claim 21.

Medtronic has provided no basis for this Court to conclude that "second intervening member" should be construed as "the tapered and slotted socket portion of the two-piece interlocking coupling element, which completely encircles the curvate head."

A. The 047 Patent

1. The Claims and Specifications

The claims of the patent provide the starting point for the Court's analysis. See Comark Commun., Inc. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998); Fromson v. Advance Offset Plate Inc., 720 F.2d 1565, 1571 (Fed. Cir. 1983). "The claim language should be construed in context, however, and the other claims, the patent specification and the prosecution history must be considered in determining what the claim means." Dow Chem. Co. v. Astro-Valcour, Inc., 47 F. Supp. 2d 294, 297 (N.D.N.Y. 1999) (citing cases).

Courts must look to the wording of the claims and "neither broaden nor narrow the claims to give the patentee something different than what he has set forth." Autogiro Co. of Am. v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 395-96 (Ct. Cl. 1967). Accordingly, the Court first considers the wording of the claims and their use within the context of the specifications as a whole.

Patent 5,543,047 (the "047 patent") is entitled "Filter with Over-Laid Pleats in Intimate Contact." The disputed term is contained in independent claims 1, 54 and 92.
Claim 1 of the 047 patent states:

1. A filter comprising:

   a cylindrical filter element having a longitudinal axis, first and second end surfaces, and a plurality of longitudinal pleats, each of the pleats having a pair of legs, each of the legs having a first and a second surface, the pleats being in a laid-over state in which the first surface of one leg of one pleat is in intimate contact with the first surface of an adjoining leg of said one pleat and the second surface of said one leg is in intimate contact with the second surface of an adjoining leg of an adjacent pleat over substantially the entire height of each leg and over a continuous region extending for at least approximately 50% of the axial length of the filter element; and

   a first impervious end cap connected to the first end surface of the filter element.

Claim 54 states:

54. A filter for separating one or more substances from a fluid flowing therethrough, the filter comprising: a pleated filter element having an interior, a longitudinal axis, first and second end surfaces, and a plurality of longitudinal pleats, wherein each of the pleats has a curved configuration and includes a crown, a root, and a pair of legs and each of the legs has a first surface and a second surface, the legs of each pleat being joined to one another at the crown and joined to a leg of an adjacent pleat at the root and the pleats being in a laid-over state in which the first surface of one leg of one pleat is in intimate contact with the first surface of an adjoining leg of said one pleat and the second surface of said one leg is in intimate contact with the second surface of an adjoining leg of an adjacent pleat over substantially the entire height of each leg and over a continuous region extending for at least approximately 50 percent of the longitudinal length of the pleated filter element and wherein the pleated filter element comprises at least first and second layers, wherein the second layer comprises a filter medium, and first and second end elements sealingly arranged with the first and second ends, respectively, of the pleated filter element, at least one of the end elements comprising an open end element.

047 patent, col. 30, lines 1-22.

Claim 92 reads as follows:

92. A filter for separating one or more substances from a fluid flowing therethrough, the filter comprising:

   a pleated filter element, including an outer diameter (D), an inner diameter (d), a longitudinal axis, first and second end surfaces, and a plurality of longitudinal pleats, wherein the pleated filter element comprises a pleated composite having a thickness (t) and including an upstream drainage layer, a downstream drainage layer, and a filter medium disposed between the upstream and downstream drainage layers, the upstream drainage layer having an edgewise flow resistance which provides a lower pressure drop in the upstream drainage layer than the pressure drop across the filter medium, thereby providing an even distribution of fluid along an upstream surface of the filter, wherein each of the pleats has a curved configuration and includes a crown, a root, and a pair of legs and each of the legs has a first surface and a second surface, the legs of each pleat being joined to one another at the crown and joined to a leg of an adjacent pleat at the root and the pleats being in a laid-over state in which the first surface of one leg of one pleat is in intimate contact with the first surface of an adjoining leg of said one pleat and the second surface of said one leg is in intimate contact with the second surface of an adjoining leg of an adjacent pleat over substantially the entire height of each leg and over a continuous region extending for at least approximately 95% of the longitudinal length of the pleated filter element, and wherein the height of each pleat is greater than (D-D)/2 and is no greater than (D<2>-d<2>)/4(d+2 t), and

   first and second end elements sealingly arranged with the first and second ends, respectively, of the pleated filter element, at least one of the end elements comprising an open end element.

047 patent, col. 32, lines 19-54.

- 2678 -
Turning to the patent specification, the term "intimate contact" is repeatedly used to describe the manner in which the filter material is packed. For example, the specification provides as follows:

The opposing surfaces of adjoining legs [11a] of the pleats need not be in intimate contact over the entire axial length of the filter element [10], but the greater is the length in the axial direction of the region of intimate contact, the more effectively used is the space between the inner and outer periphery of the filter element [10]. Therefore, adjoining legs [11a] are in intimate contact over a continuous region which preferably extends for at least approximately 50%, more preferably at least approximately 75%, and most preferably approximately 95-100% of the axial length of the filter element.

According to Cuno, the term "intimate contact" has no particular meaning to one skilled in the art and thus it contends that the term should be construed such that there shall be no gaps between the laid-over pleats other than the triangular gaps defined between adjacent crowns or roots of the pleats. At the Markman hearing, the Court heard expert testimony addressing the components of the filter element, the use and arrangement of various types of drainage materials used, the degrading effects of "nesting" of drainage materials, the formation of radial flow channels or flow paths in directing the medium through the filter and the relative impact of such factors on the Court's construction of the term "intimate contact" as set forth in the patents.

Pall presented testimony by numerous experts regarding explicit references made in the 047 claims and the accompanying specifications regarding the filter's components and the laid-over pleating of the components to direct the flow of the medium through the filter. Referring to column 4, line 67 of the patent, expert Ken Williamson noted that the 047 patent describes a filter element comprised of a filter medium and a drainage means. Tr. at 64-65, lines 23-25; 1-3. (Williamson testimony). Drainage means or materials could consist of woven meshes - "where filaments are woven like a cloth" - or extruded mesh, all of which must be folded over to form radial flow channels in order for them to work. Tr. at 72, line 12; 73, lines 1-25. (Williamson testimony). He testified that the laid-over pleating as described at length in the patent is essential to avoid "nesting" which would otherwise occur as a result of drainage material containing directional strands being folded against themselves in such a way that the space between the strands is filled with the material thus impeding the flow and causing a degradation of performance. Tr. at 82 (Williamson testimony). Reading from the patent at column 6, line 28, Mr. Williamson testified that nesting was to be avoided because it "degrades the drainage properties of the mesh and decreases [its] ability to provide drainage [for] the filter medium." Tr. at 74, lines 14-15 (Williamson testimony).

Pall's expert Dr. Craig Bartels testified that the "pleat" in Palls 047 patent is expressly comprised of a "filter element consisting of a medium and at least one drainage layer, longitudinal axis being the long axis of the filter pleats as an individual portion of the filter element when it's folded over, and the first and second surfaces of the pleats." Tr. at 173, lines 3-8 (Bartels testimony). He further testified that "intimate contact in the patent in suit...is describing when two pleats are in contact with one another such that the drainage means on their surfaces are touching together and you have strand to strand contact and you still have ability to have flow into those pleats such that the flow can access all of the filter medium that is in the pleat." Tr. at 172, lines 16-22 (Bartels testimony). He further testified that

The radial flow channels in the laid-over pleat is formed with the drainage layer material. The drainage layer material prevents the filter media from coming in contact with itself and thereby provides a passageway for the fluid to flow through that drainage material and contact - to get down into the pleat, contact the entire surface area of that - of the filter media in the pleat.

Tr. at 222, lines 10-16 (Bartels testimony).

It is clear from the above-referenced excerpts that there is nothing in the claims or the specifications requiring that there be no gaps other than the triangular gaps between adjacent crowns or roots of the pleats, as Cuno suggests. Rather than provide for "no discontinuities" as asserted by Cuno's expert (see Tr. at 284, lines 23-24) (Shoemaker testimony), the claims plainly state that the provision for the inner surfaces of the pleats extend "over a continuous region extending for at least approximately 50% of the axial length of the filter element." The accompanying specifications assert that the "intimate
contact" would encompass "a continuous region which preferably extends for at least approximately 50%, more preferably at least approximately 75%, and most preferably approximately 95-100% of the axial length of the filter element." The claims do not state the limitation proposed by Cuno and the Court shall not read such a limitation into the patent for to do so would be in error. See E.I. du Pont de Memours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir. 1988) ("Courts can neither broaden nor narrow the claims to give the patentee something different than what he has set forth… courts do not rework claims. They only interpret them."); cert. denied, 488 U.S. 986, 109 S. Ct. 542, 102 L. Ed. 2d 572 (1988); Dow Chem. Co., 47 F. Supp. 2d at 297-98 (refusing to read in a requirement of "dimensional stability" into the claim); see also Am. Standard Inc. v. Pfizer Inc., 722 F. Supp. 86, 93 (D. Del. 1989) (refusing to read additional requirement of bone tissue growth into prosthesis patent).

The Court adopts Pall's reading of the claims. The meaning of the term "intimate contact" and the examples set forth in the specifications require a layering of drainage and filter materials and laid-over pleating such that contact between the adjacent pleat legs would be substantially continuous; that is, over at least 50 percent of the axial length of the filter element. There is no extraneous limitation regarding radial flow channels set forth in either the claim or the specifications; rather, the patent specifies that all of the drainage layers have radial flow channels which permit the flow of fluid to the filter surfaces. See, e.g., 047 patent, col. 18-20.

2. The Prosecution History

As noted by the Federal Circuit Court of Appeals in Markman, courts have "broad power to look as a matter of law to the prosecution history of the patent in order to ascertain the true meaning of language used in the patent claims." Markman, 52 F.3d at 980. Following the same principle applied above, prosecution history, although relevant to the instant inquiry, "cannot be used to rewrite claims to impose a requirement not found in the claim language." Dow Chem. Co., 47 F. Supp. 2d at 299 (citing Intervet Am., Inc. v. Kee-Vet Labs., Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989). Moreover, there is a presumption of validity that "the examiner did his duty and knew what claims he was allowing…. [and] it is not for the courts to say that they contain limitations which are not in them." Intervet, 887 F.2d at 1054.

At the Markman hearing, Cuno relied heavily on the prosecution history to support its proposed construction. The Court finds, however, that Cuno's expert, who testified about his review of the prosecution history and speculated about the examiner's conduct during the patent approval process, lacks credibility. Cuno's sole witness, Wells Shoemaker, testified that in his view the patent's use of the term "intimate contact" is unclear. Based on his review of the prosecution history, he concluded that intimate contact had a "very specialized meaning, it meant absence of radial flow channels along the actual [sic] and no discontinuations, no interruptions along the length of the axial length of the cartridge." Tr. at 284, lines 10-14. He further testified that he believed that the contact "must be completely continuous along the length of the axis…" Tr. at 285, lines 1-2 (Shoemaker testimony). When questioned regarding the basis of his conclusion, Shoemaker testified that he had not relied on anything in the patent specification to reach his conclusion.

Q. It's my understanding that it is your position that the Pall patent claims are limited to only materials that do not have radial flow channels, right?

A. I believe that's correct.

Q. And that that position is based solely on statements made in the prosecution history?

A. Yes, sir.

Q. Is that correct?

A. Yes, sir.

Q. You are not relying in support of that position on anything that appears in the patent specification; is that correct?

A. That is correct.

Q. You agree in fact, do you not, that the patent specification contains information which is not consistent with your
position?

A. If - I think that you may be referring to the nesting rings; is that correct?

Q. I'm referring, for example, to the disclosure of drainage materials which do indeed form radial flow channels.

A. I gather you're asking me if I feel that the materials disclosed in the patent form radial flow channels and I disagree with it.

Q. You don't believe that any of the materials that Pall disclosed in column 17 and 18 form radial flow channels?

A. I would agree they form flow paths, but they do not form direct radial flow channel.

Q. So that, okay. So would you agree that the Pall patent claims include whatever is formed by the use of the materials disclosed in column 17 or 18 through 20 of the Pall patent?

A. Would you ask that question, would you ask a specific rather than a general question.

Q. Okay. Turn to column 18 of the 047 patent.

A. Yes, sir.

Q. There are a number of drainage materials disclosed there, right - starting on the bottom of column 18, and then going over to column 19?

A. Yes. All right. I have it, sir.

* * *

Q. And now, considering these examples, when these materials or some of these materials are used in an aid-over or pleat cartridge, don't they form flow channels?

A. In my definition they form flow paths but not channels.

Tr. at 297-99 (Shoemaker testimony).

The Court declines to adopt the expert's proffered distinction between flow channels and flow paths and disagrees with his assertion that the prosecution history shows that the examiner intended that a limitation be imposed that there be no radial flow channels along the axial length of the cartridge. Cuno asserts that in applying for the 047 patent, Pall distinguished its invention from the prior art, primarily the "Briggs" patent, which provided for radial flow channels. Mr. Shoemaker testified that the Briggs patent expressly provided for radial flow channels that would direct the flow through the filter medium but which would result in "discontinuities" i.e., gaps at the outer periphery of the filter element. Tr. at 291 (Shoemaker testimony). This argument is essential to Cuno's defense, as it asserts that the Delnet material employed in its filters, oriented at 90 degrees with respect to the central axis of its filter element -- as distinguishable from the 047 patent -- form radial flow channels between the opposed pleat surfaces. Upon examination of the prosecution history, the Court finds that no limitation excluding inventions providing for radial flow channels was expressed into the patent and no such limitation shall be imposed by the Court.

Moreover, on cross examination, Pall elicited testimony from Cuno's expert which clearly undermines Cuno's position. First, Mr. Shoemaker testified that the prior art, the Briggs patent, involved a patent for a filter which consisted of an embossed filter pleated to form radial flow channels which made no reference to a drainage material of any sort. Tr. at 292-93 (Shoemaker testimony) (referring to Plaintiff's Exs. 7, 8 and 9). Second, Cuno has failed to rebut the presumption that the Examiner knew what claims she was allowing. The Examiner clearly set forth her reasons for allowing the 047 patent -- without limitation regarding radial flow channels - and in view of the Briggs patent, the prior art. "The closest art of reference, Briggs or Harms III, fails to disclose or teach in any proper combination a cylindrical filter element having
longitudinal laid-over pleats in intimate contact with one another over the height of the legs of the pleats and a continuous region existing for 50 percent of the axial length of the filter element." See Pltf.'s Ex. 2, p. 366.

In an attempt to explain the absence of any reference to the exclusion of radial flow channels from the 047 patent, Cuno's expert offered no more than speculative testimony. Mr. Shoemaker testified that, upon examination of the three separate file histories, he concluded that Pall's attorney had submitted two amendments which showed that a "deal" had been struck between the Examiner and Pall such that the patent would be allowed if Pall excluded reference to radial channels. Tr. at 284-85 (Shoemaker testimony). Upon cross examination, however, Mr. Shoemaker acknowledged that, although required to do so, the patent Examiner had not required that Pall include such an amendment or limitation into the patent, even after reviewing the Briggs patent and its reference to radial flow channels. Tr. at 301-02 (Shoemaker testimony). Consequently, the Court discredits Shoemaker's testimony and finds nothing in the prosecution history to support Cuno's contentions.

The prosecution history indicates that the Examiner allowed independent claims 1, 54 and 92 of the 047 patent without imposing a reference to the absence of gaps within the pleats, as Cuno argues. See Pltf.'s Ex. 2, p. 366. In fact, Pall had specifically pointed out that the claims required intimate contact only over "substantially the entire height" and a "continuous region" of the pleat length (id., p. 388) (and noting that "there may be small regions over the height of the legs of the pleats, for example...where the legs are not in intimate contact") before they were finally issued.

2. The 765 Patent

Patent 5,690,765 (the " 765 patent") expressly relates to the 047 patent and sets forth the specifications for the manufacture of Pall's filter. The 765 patent is entitled "Methods of Assembling a Filter." The disputed term is contained in independent claims 1, 8 and 39-41.

Claim 1 of the 765 patent states:

1. A method of assembling a filter comprising: repairing a corrugated filter composite comprising a filter medium having upstream and downstream sides and at least one of an upstream drainage layer on the upstream side of the filter medium and a downstream drainage layer on the downstream side of the filter medium;

forming the composite into a cylindrical filter element having a center and pleats extending along a longitudinal axis, each pleat having first and second legs, each leg having first and second surfaces;

forming the pleats of the cylindrical filter element into a laid-over state in which the first surface of one leg of one pleat is in intimate contact with the first surface of an adjoining leg of said one pleat and the second surface of said one leg is in intimate contact with the second surface of an adjoining leg of an adjacent pleat over substantially the entire height of said one leg and over a continuous region extending for at least approximately 50% of the length of the filter element….

765 patent, col. 26, lines 29-49.

Claim 8 describes

8. A method of making a filter comprising laying over and arranging a plurality of pleats including a filter medium into a cylindrical configuration to form a filter element having axially extending pleats, including intimately contacting a first surface of a first leg of one pleat with the first surface of an adjoining leg of said one pleat and a second surface of said first leg with the second surface of an adjoining leg of an adjacent pleat over substantially the entire height of said one leg and over a continuous region extending for at least approximately 50% of the axial length of the filter element, and sealing at least a first end of the filter element to prevent axial flow along the pleats at the first end.

765 patent, col. 27, lines 24-35.

Claims 39 through 41 similarly make use of the phrase "intimate contact" and describe the arrangement of pleats with "intimately contacting" surfaces. See, e.g., 765 patent, col. 31, lines 12-20 (describing the arrangement of pleats "into a cylindrical configuration, laying the pleats over, intimately contacting a first surface of a first leg of each of the plurality of pleats with the first surface of an adjoining leg of said pleat and a second surface of said first leg with the second surface of
an adjoining leg of an adjacent pleat over as substantial portion of the height of the first leg and over a continuous region extending for at least approximately 95% of the axial length of the pleats to form a filter element…

The Court finds that this language is consistent with that employed in the 047 patent, and, as such construes the term "intimate contact" in favor of the plaintiff.

CONCLUSION

For the reasons stated herein, the Court finds that Pall's proposed construction of the term "intimate contact" as used in the 047 and 765 patents is supported by the claim language, the patent specification and the prosecution history. The term is construed as requiring that there be intimate contact over "substantially" the entire pleat height rather than imposing a limitation that there be no gaps within the pleats, in which case the claimed filter would not work and would be rendered useless. All of the drainage layers in Pall's patent provide for radial flow channels which permit the flow of fluid to the filter surfaces. This constitutes the decision and Order of the Court.

5. "In intimate contact with said second surface"

a. Parties' Positions

The term is found in claim 3 of the '631 Patent. Plaintiff proposes the same construction for "bonded to said second surface" and "in intimate contact with said second surface," asserting both terms mean "thermally connected to the second surface." Defendants assert "in intimate contact with said second surface" means "in contact with, but not integral with, the second surface." Defendants assert an alternate construction is "in contact with but distinct from the second surface."

<td>In contact with, but not integral</td>
</tr>
<tr>
<td>second surface</td>
<td>with the second surface.</td>
</tr>
</tbody>
</table>

b. Court's Construction

The parties dispute what the word integral means. The parties agree that an epoxy or glue is non-integral. Plaintiff asserts extrusion and dip brazing are integral bonding techniques. Defendants assert dip brazing, if one wants to call it integral, still has glue or some alloy between it allowing a person to attach two separate pieces together. Defendants argue extrusion is completely different; rather than starting with two separate pieces and putting them together, extrusion starts with one piece of metal.

The claim language and the specification describe using a bondant and bonding techniques such as dip brazing, soldering, and metal-filled epoxy. Plaintiff's proposed construction proposes a thermal connection, or a connection that transfers thermal heat. Defendants maintain this proposal is too broad because it would cover situations where there are two plates that are not touching or bonded but that are thermally connected. According to Defendants, two plates could be thermally connected if one put between them a gas which could transfer heat.

The Court agrees that Plaintiff's construction is too broad. It reads out the limitation of intimate contact. In claim 3, at least two fin structures are in intimate contact with the second surface. Contact requires the touching of two or more distinct parts, and contact between the planar member and the fin supports requires touching of these distinct parts. The Abstract also supports Defendants' alternate proposed construction, each such embodiment uses a thermally conductive plate having exposed exterior surfaces, one for receiving the component to be cooled and one for receiving the fin structures. A solid object, such as an extruded heat sink, cannot be in contact with itself.

In light of the foregoing, the Court construes "in intimate contact with said second surface" to mean "in contact with, but distinct from the second surface."

- 2683 -
Once again, Plaintiff argues that the term is unambiguous and requires no definition. Again, Defendants propose a definition, i.e., "physically attached to and retained by." 4

4 The Court notes that Defendants propose this same definition for the term "a lever arm contacting said leaves" from Claim 7, Issue 1.

Neither party cites to the patent specification or claim language to support a definition of this term. Defendants direct the Court to that portion of the prosecution history which provides that the lever arm "attaches to the leaves of the binder." (Plf. Ex. A at 58.) The Court notes that Defendants define "into engagement with" and "a lever arm contacting said leaves" from Claim 7, Issue 1 with exactly the same definition -- "physically attached to and retained by." As Plaintiff notes, however, the term "engage" is broader than the term "attach." For example, as noted by Plaintiff, two gears of a machine can be engaged with each other without being attached to each other.

"Engagement" is defined, inter alia, as "the state of being in gear or in such contact that motion may be transmitted[.]" Webster's Third New International Dictionary, 751 (2002). Plaintiff's analogy and argument are sound. Defining the term engagement as physically attached and/or retained by is too narrow. The Claim 1 language at issue provides "a lever arm extending from said finger plate into engagement with said leaves to allow for movement of said leaves when said finger plate is actuated by user . . . ." ('729 patent at col. 5, ll. 3-6.) The Court finds the term "into engagement with" as used in this Claim to be unambiguous. It is a term that does not require claim construction.

B. "intra-oral radiological site(s)"

This term is used in Claims 1, 2, and 4 as follows:

1. A method of displaying stored intra-oral radiographs, comprising:
   - displaying a representation of an intra-oral radiograph holder including target intra-oral radiological sites arranged according to anatomical location of said sites;
   - selecting one of said target intra-oral radiological sites; and
   - displaying a stored intra-oral radiograph corresponding to said selected target intra-oral radiological site.

2. A method for storing and displaying intra-oral radiographs, comprising:
   - generating and displaying intra-oral radiographs of dentition;
   - generating and displaying a representation of an intra-oral radiograph holder including selectable intra-oral radiological sites arranged according to anatomical location of said sites;
   - storing said intra-oral radiograph images responsive to selection of intra-oral radiological sites in said representation.
along with indicia of respective selected intra-oral radiological sites; and

subsequently retrieving and displaying said intra-oral radiographs responsive to selection of respective intra-oral radiological sites in said representation.

4. A device for storing and displaying intra-oral radiographs, comprising:

a display;

means for generating and displaying on said display a representation of an intra-oral radiograph holder including selectable intra-oral radiological sites arranged according to anatomical location of said sites;

means, responsive to selection of said selectable sites, for displaying corresponding stored x-ray images.

Plaintiffs argue that "intra-oral radiological sites" are "icons or sites included in a representation of an intra-oral radiograph holder designating respective anatomical regions of the dental arch." Defendants contend that it means "intra-oral anatomical sites or regions which may correspond to positions within a radiograph holder."

Defendants argue that the patent requires intra-anatomical sites to be arranged "according to anatomical location of said sites," but locations on a display monitor do not have an anatomical relationship to one another, only locations within a patient's anatomy do. Defendants concede that Plaintiffs' construction "appears to be the plain meaning of this claim phrase," but argue that "the specification clearly sets forth a meaning different from the apparent meaning of the claim language." Defendants' Claim Construction Brief at 18. Defendants assert that the specification defines "sites" as "anatomical sites or regions," not positions on the film holder representation. In support of its position, Defendants note that the specification states that "each mounting position in a dental film holder corresponds to a particular anatomical site or anatomical region" and that the abstract "confirms this definition" by stating that "the positions of the film holder correspond[] to anatomical sites readily recognized by dentists." Id. at 19. Further, Defendants argue, the specification discusses how the user can use the film holder representation to select an anatomical site associated with a recently taken x-ray ("The system user uses [the film holder representation] to select the anatomical site . . . to be associated with [an x-ray taken by the dentist] . . . ") and explains how the user can select positions within the film holder representation to display an x-ray of an anatomical location, such as a tooth or teeth ("The system user selects an image to be displayed by selecting the appropriate anatomical site . . . "). Thus, Defendants assert, the patentee has acted "as his own lexicographer" and has provided a definition of "intra-oral radiological sites" that means "intra-oral anatomical sites or regions." Last, Defendants argue that Plaintiffs' proposed construction is so broad that, if accepted in conjunction with Plaintiffs' proposed broad construction of radiograph holder, it would include a depiction of a dental arch, a limitation surrendered by Plaintiffs during the patent's prosecution.

Looking to the claim language, in Claims 1, 2, and 4, the "intra-oral radiological sites" must be "arranged according to anatomical location of said sites." Since sites within the mouth have anatomical locations but icons do not, this language lends some support to Defendant's construction. However, the patent's background section explains that "interpretation of . . . mounted radiographs is facilitated by mounting each film in normal anatomic relation to each other." This language indicates that the patentee regarded the films as being arrangeable by anatomical relation, and this functionality in the representation of the film holder was a key feature of the patent. Moreover, the balance of the claim language supports Plaintiffs' construction. The clearest support for Plaintiffs' construction lies in Claim 2. Claim 2 encompasses a method for storing and displaying intra-oral radiographs, comprising "generating and displaying a representation of an intra-oral radiograph holder including selectable intra-oral radiological sites arranged according to anatomical location of said sites," "storing said intra-oral radiograph images responsive to selection of intra-oral radiological sites in said representation along with indicia of respective selected intra-oral radiological sites n5" and "subsequently retrieving and displaying said intra-oral radiographs responsive to selection of respective intra-oral radiological sites in said representation." Thus, Claim 2 teaches that the intra-oral radiological sites are in the representation of an intra-oral radiograph holder, not within the mouth as Defendants urge. Further, Claims 2 and 4 make clear that the "intra-oral radiological sites are "selectable" and that images are stored, retrieved, and displayed "responsive to" selection of "intra-oral radiological sites." Because icons on the computer screen are selectable (by keyboard, mouse click, etc.), and images are stored, retrieved, and displayed in response to selection of the icon, whereas the same cannot be said regarding anatomical sites or regions, this claim language further supports Plaintiffs' construction.

- 2685 -
n5 The Court recognizes that there is some ambiguity and inconsistency within the specification regarding use of this term. For example, in column 5, line 27, the specification states that the captured image is stored along with indicia of the associated location in the icon, suggesting that "selected intra-oral radiological sites" is a location in the icon. However, in the abstract, it states that the radiograph is stored "along with indicia of the selected anatomical site," suggesting that an intra-oral radiological site is an anatomical site. However, the balance of the claim and specification support the construction that an intra-oral radiological site is a site within the film holder representation, not a site within the mouth. This construction is consistent with the claim language, while Defendants' construction is not, and thus Plaintiffs' construction is the preferred construction. Vitronics, 90 F.3d at 1582. Moreover, part of the confusion may be due to the fact that the specification describes the original patent application, which included an image of dentition/anatomy as the representation, whereas the final patent does not include these, and thus some of the language was broad enough to cover the patentee's original intention that intra-oral radiological sites would include positions within a film holder that correspond to anatomical sites and positions within a representation of anatomy/dentition.

The Court agrees with Plaintiffs that other language in the specification also generally supports Plaintiffs' construction. The specification states "The display of the stored images is facilitated by use of a representation or icon of anatomical sites, or of the portion of the anatomy, from which the images were taken. The system user selects the image to be displayed by selecting the appropriate anatomical site from the representation of anatomical sites or portion of anatomy . . . ." Column 2, lines 20-26 (emphasis added). Thus, when the specification refers to anatomical site, it means the anatomical site within the representation or icon, not within the mouth.

Thus, when the claim uses the term "intra-oral radiological sites" it refers to the icons in the representation of an intra-oral radiograph holder, and those icons correspond to anatomical sites within the mouth and are arranged according to their anatomical relation to each other. Accordingly, the Court construes "intra-oral radiological sites" as "icons or sites, included in the representation of an intra-oral radiograph holder, that designate respective anatomical regions of the dental arch."

B. Applying this analysis of claim construction, we conclude that (1) the trial court did not abuse its discretion when it
admitted the extrinsic evidence offered by Markman -- Markman's testimony and the testimony of Markman's "patent expert" -- on the issue of claim construction, and that (2) the trial court properly rejected this extrinsic evidence to the extent it contradicted the court's construction of the claims based on the specification and prosecution history. Although in this case the trial court might have granted Westview's motion for directed verdict and should have instructed the jury as to the meaning of the claims (including the disputed term "inventory"), its failure to do so was rendered harmless by the court's subsequent response to Westview's post-trial motion.

We agree with the trial court that the term "inventory" refers, at least in part, to articles of clothing, contrary to Markman's contention that "inventory" may be limited to just cash or inventory receipts. As the district court noted, the claim phrase "detect and localize spurious additions to inventory as well as spurious deletions therefrom" does not make sense using Markman's definition of "inventory." Dollars or invoice totals are not "localized" since dollars do not travel through the cleaning process and the location of invoices is irrelevant. Location is relevant to clothing, since it moves through and sometimes without the establishment, where it can be lost, stolen, or damaged. Also, "spurious" additions and deletions logically relate to clothing because "dollars" would not be spuriously added to a dry-cleaner's inventory. Thus, the language of the claim itself suggests the conclusion that the dry-cleaner's "inventory" includes clothing.

The patent specification confirms this. The specification is pervasive in using the term "inventory" to consist of "articles of clothing." Rather than set forth each instance, we refer the reader to a few examples:

This invention relates to inventory control devices capable of monitoring and reporting upon the status, location and throughput of inventory in an establishment. [Col. 1, lines 12-17.]

The best inventory control and management reporting information systems has [sic] the ability to determine and report the current location of any given article[12 ] in inventory. [Col. 5, lines 14-17.]

12 It is undisputed that "article" means "article of clothing."

Every transaction is recorded, including identification of the articles placed in inventory. [Col. 5, lines 8-10.]

Incoming articles to be placed in inventory are accumulated over a counter . . . . [Col. 6, lines 7-8.]

Articles to be cleaned are associated with a unique bar code indicia for later automatic or semiautomatic optical scanning and data input, whereby the progress of articles through the laundry and drycleaning systems can be completely monitored. [Col. 2, lines 53-57.]

The prosecution history is also in accord. During prosecution of the original patent application in this case, Markman amended claim 1 in order to overcome an obviousness rejection by adding limitations reciting among other things “whereby said system can detect and localize spurious additions to inventory as well as spurious deletions therefrom.” Markman argued in his remarks to the examiner that

unlike the usual system in which apparatus generates non-unique indicia (e.g., Stewart's price indicia) and/or indicia that is [sic] not produced concurrently with the commencement of a transaction (e.g., pre-printed tags), applicant's system is operable to keep a running reconcilable inventory total by adding input articles and subtracting output articles, and also protects against the possibility of undocumented or spuriously- documented articles entering the system. [Emphasis in original.]

Markman also referred the examiner to "features present" in claim 1, explaining:

Means are also provided for reconciling the very same unique and concurrently-generated indicia at later points during processing whereby the entry or exit of inventory articles in irregular ways can be localized.
Also, the prosecution history of the patent on reissue conflicts with Markman's argument now that claim 1 does not require "tracking" of articles of clothing. In order to obtain other claims in the reissue patent broader than claim 1, which was carried through to the reissue patent, Markman explained the scope of the original claims thusly:

1. Tracking of Individual Articles

   It may be argued that the claims are limited to a system that tracks individual articles such as individual pieces of clothing brought by a single consumer to a drycleaning establishment or the like. I believe that tracking of a transaction whether it involves one article or several is properly disclosed and allowable. The claim language recites entry of "descriptions of each of said articles associated with the transactions". This passage is more limited than I had a right to claim because, although individual articles, e.g. a pair of pants, could be accounted for by individual marking, scanning and reconciliation in reports, the grouping of such articles into sets for tracking (e.g., a suit comprising pants under jacket and/or a suit and a Dress or other spearable [sic] articles grouped together) is reasonably disclosed as forming part of the invention and is allowable over the prior art.

   It is evident from Markman's explanation of the claims to the examiner that he used "inventory" in the patent and the examiner understood "inventory" to consist of "articles of clothing." The prosecution history thus confirms the meaning of "inventory" as including "articles of clothing."

Markman argues that the extrinsic evidence of record provides substantial evidence in support of the jury's and his claim construction. Markman testified as an inventor of the patent in suit and as one of ordinary skill in the art (or, perhaps more accurately, one of "extraordinary" skill in the art) that "inventory" did not need to include articles of clothing. Markman's "patent expert" testified likewise, when giving his opinion on the proper construction of the claims. Finally, Markman argues that the testimony of Westview's president and some of its sales literature also support such claim construction. We do not find Markman's arguments persuasive.

First, the testimony of Markman and his patent attorney on the proper construction of the claims is entitled to no deference. For example, they both testified as to how the patent should be construed based on the text of the patent. This testimony about construction, however, amounts to no more than legal opinion -- it is precisely the process of construction that the court must undertake. Thus, as to these types of opinions, the court has complete discretion to adopt the expert legal opinion as its own, to find guidance from it, or to ignore it entirely, or even to exclude it. See Becton Dickinson & Co. v. C.R. Bard, Inc., 922 F.2d 792, 797, 17 U.S.P.Q.2D (BNA) 1097, 1100 (Fed. Cir. 1990). When legal "experts" offer their conflicting views of how the patent should be construed, or where the legal expert's view of how the patent should be construed conflicts with the patent document itself, such conflict does not create a question of fact nor can the expert opinion bind the court or relieve the court of its obligation to construe the claims according to the tenor of the patent. This opinion testimony also does not change or affect the de novo appellate review standard for ascertaining the meaning of the claim language. Thus, to the extent they were testifying about construction itself, we reject Markman's and Markman's patent expert's testimony as having any controlling effect on what the court below and we perceive to be the meaning of "inventory" as used in the patent and prosecution history.

Second, the extrinsic evidence of record cannot be relied on to change the meaning of the claims. In this case, as fully discussed above, the patent and prosecution history make clear that "inventory" in claim 1 includes in its meaning "articles of clothing." The district court exercised its discretion in finding unhelpful Markman's testimony that he meant "inventory," or that one of ordinary skill in the art would understand "inventory," to mean something to the contrary, and furthermore the district court rejected the testimony as conflicting with the meaning derived from the patent and prosecution history. In our construction of the claim term "inventory," we too find unhelpful and reject Markman's testimony. Similarly, even if they in fact used "inventory" to mean other than articles of clothing, Westview's sales literature and the testimony of its president do not dissuade us from our legal construction of the claim, based on the patent and prosecution history, that the claim term "inventory" means articles of clothing.

2. Inverted
The parties also dispute the meaning of the term "inverted." The Plaintiff contends that "inverted" should be construed to mean, "to turn inwardly, fully or partially, during operation of the machine." Defendants seek to construe "inverted" to mean, "to turn inside out." Plaintiff Minuteman argues that its construction of "invert" is consistent with the specification's disclosure that the degree of inversion is dependent on the extent of the use of the machine (therefore, whether the molded pocket inverts fully or partially is dependent on the extent of the use of the machine). Additionally, Plaintiff contends its construction of "invert" is consistent with the definition provided by Webster's New Collegiate Dictionary, wherein "invert" is defined as, "to turn inward." Defendants, however, contend that while the Webster's Third International Dictionary has a range of meanings for invert, including, "to turn inside out or upside down", "to turn inward", and "reverse in position, order, or relationship", the specification identifies "turn inside out" as the meaning of invert. Furthermore, Defendants contend that the use of the phrase "to turn inside out" does not indicate the process of inversion must all occur in one instantaneous motion.

The specification of the '094 patent describes the inversion procedure in the following manner:

As spent solution is accumulated in the recovery tank it builds along the concave exterior surface of the vertical end wall; and as the clean solution is removed from the solution tank, the level of recovered solution will eventually rise above the clean solution and act on the molded pocket, causing it to invert—that is, turn itself inside out so that the pocket is translated into the clean tank as it does so. See Def. Ex. A, Col. 2, lines 20-27 (emphasis added). Therefore, based on the language of the specification, the Court will define "invert" to mean "to turn inside out." Contrary to Plaintiff's argument in its briefs and at the October 30, 2003 Markman Hearing, the use of the phrase "to turn inside out" does not indicate that the process of inversion of the molded pocket must occur is one instantaneous action or that the molded pocket must turn itself completely inside out.

3. Transporting multiple containers in an inverted stack to said collection site and lifting said first container from said inverted stack with said rotating fork lift truck

Regarding this phrase, the parties agree that "transporting" is construed to mean moving from one location to another. (Markman Hr'g Tr. 38.) In addition, as discussed above, the parties agree that "multiple" is construed to mean more than one. (Id.) Finally, the parties agree that "collection site" is construed as a location where several collection surfaces may be located. (Id. 10.)

The parties disagree as to the meaning of "inverted stack" as used in the phrase "transporting multiple containers in an inverted stack" and "lifting said first container from said inverted stack." After review of the parties' arguments, the court adopts substantially the construction put forth by ADA Enterprises.

Caponey's proposed construction of "stack" is "an orderly arrangement." (Id. 5.) ADA Enterprises' construction of stack is "an orderly arrangement of more than one container." (Id.). The court agrees with the parties' definition of "stack" as "an arrangement" and agrees with Caponey's addition of "more than one container." However, the court also finds that "stack" implies verticality in this context and pursuant to the ordinary and customary meaning of the word. Thus, the court construes "stack" to be a vertical arrangement of more than one container.

In addition, the court agrees with ADA Enterprises' construction of "inverted." ADA Enterprises' proposed construction of inverted is "open end down, the reverse position from that in which a container functions as a container." (Def.'s Claim Construction Br. 7.) Caponey's proposed construction of "inverted" is "rotated from a first position to a reverse position." (Pl.'s Response Def.'s Claim Construction Br. 9.)

Caponey's construction of "inverted" is so broad as to render the word meaningless in the context of the language of the claim. Caponey urges the court to construe "inverted" to mean that a stack is inverted if it has ever been rotated from one position to another. Thus, under Caponey's construction, an inverted stack "is not limited to a particular position" and could refer to a stack of containers with the open side facing up or a stack of containers with the open side facing down. (Pl.'s Claim Construction Br. 9.)
The court finds that in the context of claim one of the '400 patent, "inverted" is construed to mean open end down, the reverse position from that in which a container functions as a container. This construction is consistent with the ordinary and customary meaning of the word as "to turn inside out or upside down." (Id. Ex. F (AMERICAN HERITAGE DICTIONARY Excerpts 9).)

In addition, this meaning is dictated by the logic and the language of the claim. The rotating step of the claim indicates that the containers in the inverted stack are stacked open end down and subsequently rotated into an open-side up position in order to collect refuse. Further, the use of the word "inverted" to describe the stack indicates a fixed rather than a relative meaning that indicates containers which are upside down from their normal, upright position. If the word is construed to mean containers that have been rotated from one position to another at some point in time, the word is an unnecessary and meaningless addition to the claim language.

Finally, this meaning is supported by the prosecution history and prior art of the '400 Patent. The examiner initially rejected claim one of Caponey's patent application, noting that

[i]t would have been obvious to one of ordinary skill in the art, at the time of invention that the stacking containers . . . can be inverted on the delivery vehicle and be retrieved from the vehicle as a stack by a set of fork receiving members in the open top of the container or one at a time by means of the fork receivers at the closed bottom of the container.

(Def.'s Claim Construction Br. Ex. C, Part 1 (Prosecution History 43).) In response, Caponey argued that "only from the present disclosure does one find a motivation for inverting a stackable container for transport and storage. Only in light of the present teachings are the advantages of rotating a stackable container to an inverted position appreciated." (Id. Ex. C, Part 2 (Prosecution History 3).) In this exchange, both the examiner and Caponey use "inverted" to refer to containers oriented with the open end down, and Caponey's arguments based on this meaning weigh in favor of a finding that "inverted" should be construed to mean open end down. See Seachange Int'l, Inc. v. C-Cor, Inc., 413 F.3d 1361, 1372-73 (Fed. Cir. 2005) ("Where an applicant argues that a claim possesses a feature that prior art does not possess in order to overcome a prior art rejection, the argument may serve to narrow the scope of otherwise broad claim language."). Based on the foregoing, the court construes "inverted" as open end down, the reverse position from that in which a container functions as a container.

Inverted Trunnion

Molon Motor and Merkle-Korff propose the following constructions of the term "inverted trunnion":

. Molon's proposed construction of "inverted trunnion" -- inward directed pins or pivots on which something can be rotated or mounted.

. Merkle-Korff's proposed construction of "inverted trunnion" -- two independent inward directed integral supports on which something can be rotated or mounted.

Molon asserts that Merkle-Korff wrongly inserts the words "independent" and "integral" into the definition. Merkle-Korff counters that Molon's definition is overly broad because the language of Claim 2 itself calls for "inverted trunnions, connected at one end to the first cover and connected at an opposite end to the gearbox, for stabilizing the pinion transfer gear." ('785 patent).

Merkle-Korff argues that the specification supports its construction of the term. The specification reads:

Instead of extroverted trunnions supports used in the prior art, the transfer gear of the present invention has internal space provided at its end for supports that extend inside the transfer gear, thus shortening the supported length of the transfer gear, when compared to the prior art which uses transfer gears that are virtually unsupported except at the very tips of their ends. Consequently, the invention provides a more stable mesh operation.
Merkle-Korff continues, stating that the 785 patent "makes plain" that Claim 2 requires two trunnions, by quoting the 785 patent specification in further detail:

A pair of internal trunnions 40 and 42 makes the transfer gear 34 stable by extending therein and engaging longitudinally the inside thereof from opposite ends. The one trunnion 40 is molded at one end to the first cover 16 while the other trunnion 42 is molded at its opposite end to the gearbox 14.

Merkle-Korff again attempts to add a claim limitation from the specification. Molon's proposed definition properly describes the claim.

Finally, the parties dispute the proper construction of "inverting said first container such that said refuse enters a collection bin of a collection truck." Caponey proposes to construe the step as "reversing the position of first container to such a degree that refuse enters a collection bin." (Pl.'s Resp. Def.'s Claim Construction Br. 14.) ADA Enterprises proposes to construe "inverting" to mean "invert the position of the first container, now containing refuse, from the position in which it is used to collect refuse (open side up) to the reverse position (open side down)." (Def.'s Claim Construction Br. 14.) Pursuant to the plain language of this step of claim one, the court construes the step as reversing the position of first container from an open side up position to an open side down position to such a degree that refuse enters a collection bin. This construction maintains the consistency of the word "invert" throughout the claim, with the addition of the modifying clause that indicates the container is inverted "such that said refuse enters a collection bin of a collection truck." Further, this construction is mandated by logic. In order to empty collected refuse from the container, the container is necessarily inverted from an open side up to an open side down position.

Every claim of the '664 patent calls for engageable fastening means that are "invisible" when the earring is worn. Zettl argues that the claim merely requires the fastening means to be hidden from view only to the casual onlooker. Defendants, on the other hand, read the claims to require that the fastening means be completely hidden from view. In support, the Defendants cite to the prosecution history where Zettl distinguished the claimed invention from prior art by insisting that the fastening means of the '664 patent are "completely invisible." (Amendment After Final Rejection, Sept. 17, 1986, at 7; Appellant's Brief on Appeal, Nov. 29, 1986, at 8).

"Invisible" is ordinarily understood to mean "inaccessible to view" or "of such small size or unobtrusive quality as to be hardly noticeable." Webster's at 1190. Therefore, the proffered interpretations of both Zettl and the Defendants are within the ordinary meaning of the term. However, Zettl's stance before the Examiner that the fastening means are to be "completely invisible" indicates that the term is to be used in the more restrictive sense - i.e. inaccessible to view - rather than merely unobtrusive or hardly noticeable. Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir. 1995) ("The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution.") Therefore, "invisible," as used in the '664 patent, is to be understood as meaning completely inaccessible to view.
a. Parties' Positions

The parties propose the following constructions for "inwardly facing surface," which is present in each asserted claim. Dkt. No. 114.

<table>
<thead>
<tr>
<th>RTI</th>
<th>BD</th>
</tr>
</thead>
<tbody>
<tr>
<td>A surface that faces the inside of the syringe</td>
<td>A surface in the wall that faces toward the center of the syringe and is parallel to the direction of the plunger motion</td>
</tr>
</tbody>
</table>

RTI contends this term should not be restricted to a surface that is parallel to the motion of the plunger, as such would improperly restrict the term to a preferred embodiment. Dkt. No. 111 at 29. RTI contends that the '733 specification attaches no significance to the fact that the preferred embodiment's surfaces happen to be parallel to the plunger's motion. Id. Additionally, RTI contends that claim differentiation precludes such a limitation, as the patentee chose to specifically align these surfaces in certain claims of the '011 Patent. Id. (citing '011, 13:40-43 (claim 3)).

In response, BD contends that every embodiment described or depicted in the '733 Patent demonstrates surfaces that are parallel to the vertical direction of the plunger motion. Dkt. No. 112 at 23-24. In addition, the Summary of the Invention within the '733 Patent also aligns these surfaces with the plunger motion. Id. (citing '733, 2:64-65 (inwardly and outwardly facing surfaces meet "along an interface oriented in the direction of retraction"). Alternatively, BD argues that during prosecution RTI took a narrower view of the scope of this term to overcome prior art. Id. As such, BD argues that RTI has surrendered broader, non-parallel coverage. Id.

b. Court's Construction

As discussed above, limitations from the preferred embodiment generally should not be imported into the claim language, unless the claims and the embodiments in the specification were meant to be strictly coextensive. Phillips, 415 F.3d at 1323. While the descriptions and depictions of the invention in the '733 Patent generally show an inwardly facing surface that is parallel to the plunger motion, this Court finds no evidence that such embodiments are strictly coextensive with the claimed invention. Indeed, the '011 Patent, from which the '733 Patent is a continuation-in-part, expressly claims such an orientation. '011, 13:40-43 (claim 3: "The tamperproof retractable syringe of claim 2 wherein said frictional holding [inwardly and outwardly facing] surfaces comprise a linear interface aligned in the direction of retraction"). Thus, when the patentee wished to limit the alignment of surfaces, he expressly claimed such. Accordingly, this Court finds that it would be improper to import an alignment limitation into claims where such is not expressly present.

Accordingly, this Court finds that the term "inwardly facing surface" means "a surface that faces toward the center of the syringe."

2. Construction of "Irradiate"

Defendants argue that the irradiation step described in the patent claims at issue requires irradiation for the purposes of sterilization. Howmedica argues that the irradiation step may also include irradiation which is not for the purposes of sterilization.

'934 Patent, claims 23, 50; '814 Patent, claim 7: "said material irradiated to create free radicals"

'814 Patent, claim 19: "irradiating said material . . . to create free radicals"

'308 Patent, claim 1: "irradiating the polyethylene material forming said implant to create free radicals"
'308 Patent, claim 12: "creating free radicals in the polymer chain by irradiating the ultra-high molecular weight polyethylene material"

'308 Patent, claim 24: "said material . . . which has been irradiated to create free radicals"

'020 Patent, claims 1, 6: "irradiated ultra-high molecular weight polyethylene"

'020 Patent, claims 7, 10, 11, 12: "ultra-high molecular weight polyethylene . . . irradiated"

Howmedica proposes that "irradiated" means "is exposed to radiation, including but not limited to gamma ray, x-ray or electron beam radiation." Defendants propose that the term "irradiated" means "sterilization irradiated, i.e. exposed to radiation for purposes of sterilization." Defendants seek to narrow the term's meaning by referring to the predominant (but not exclusive) usage of the term irradiation in the specifications: irradiation "for purposes of sterilization." The Court rejects defendants' argument.

a. '934 Patent, claims 23, 50; '814 Patent, claims 7, 19; '308 Patent, claims 1, 12, 24

The ordinary meaning of the term "irradiate," without modification, does not inherently connote "irradiate for the purpose of sterilization." Irradiate means to expose to radiation, plain and simple.

Express limitations in related dependent claims also do not support defendants' narrow definition of the term "irradiated" in claims 23 and 50 of the '934 Patent. Dependent claim 28 of the '934 expressly limits independent claim 23 to radiation treatment of sufficient strength and type to sterilize the polymer: it is for "[t]he medical implant as set forth in claim 23 wherein the irradiation is a high energy beam of a dose capable of killing bacteria, viruses, or other microbial species." '934 Patent, claim 28. The limitation in the dependent claim strongly implies that "irradiated" in claim 23 includes exposure to radiation insufficient or inappropriate to sterilize the material. See Phillips, 415 F.3d at 1314-15 ("the presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation is not present in the independent claim"). Accordingly, the Court interprets the term "irradiated" in claims 50 of the '934 Patent consistently with claim 23, that is, to mean "exposed to radiation." Such meaning includes, but is not limited to, "sterilization irradiation."

In addition, claims 23 and 50 of the '934 Patent, claims 7 and 19 of the '814 Patent, and claims 1, 12 and 24 of the '308 Patent all state that the claim requires the material to be irradiated "to create free radicals" or that the claim is for a method for "creating free radicals . . . by irradiating" the material. Since the express purpose of the irradiation process described by the claims is the production of free radicals, not sterilization, the claims themselves do not support defendants effort to limit the process to "sterilization irradiation." The Court finds that the meaning of the term "irradiation" is consistent throughout the '934, '814, and '308 Patents: "irradiate" is not limited to "sterilization irradiation."

b. '020 Patent, claims 1, 6, 7, 10, 11, 12

The term "irradiated" in claims 1, 6, 7, 10, 11, and 12 of the '020 Patent is not clearly defined by the context of the other claims of that Patent. Though, as defendants point out, the '020 Patent's specification contemplates the process of irradiating the polymer material solely in the context of sterilization, '020 Patent, 3:40-7:37, the Court does not conclude that the specification is intended by the inventor to define "irradiation" only as "sterilization irradiation." Because the other, related patents used the term "irradiated" more broadly than "sterilization irradiation," the Court will give the term its ordinary, broader meaning in the '020 Patent as well. See Inline Connection Corp. v. AOL Time Warner Inc., 302 F. Supp. 2d 307, 324 (D. Del. 2004) (construing term "tranceiver" uniformly, as having broad ordinary meaning, through entire patent family). In all of the claims at issue, the Court interprets "irradiated" to carry its ordinary meaning: "exposed to radiation." 7

7 The Court rejects Defendants attempt to use the prosecution histories of the '049 and '748 Patents to limit the disputed claims to sterilization radiation for the reasons recited above. The '049 Patent contains distinct claim terms, and the '748 Patent communication does not amount to a clear limitation of "radiation" to "sterilization irradiation."

7 The Court rejects Defendants attempt to use the prosecution histories of the '049 and '748 Patents to limit the disputed claims to sterilization radiation for the reasons recited above. The '049 Patent contains distinct claim terms, and the '748 Patent communication does not amount to a clear limitation of "radiation" to "sterilization irradiation."

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -
1. Irradiation and Heating of Polymer / Implant

Defendants contend that the disputed patent claims require that only finished orthopedic components be heated and irradiated. Howmedica argues that the claims also allow for heating and irradiation of pre-formed polymer materials. The Court discerns that this issue potentially arises in all twelve of the independent claims at issue:

'934 Patent, claim 23: "medical implant comprising an ultra-high molecular weight polyethylene material . . . , said material irradiated . . . and then heated"

'934 Patent, claim 50: "medical implant comprising a formed olefinic material . . . , said material irradiated . . . and then heated"

'814 Patent, claim 7: "device comprising an ultra-high molecular weight polyethylene material . . . , said material irradiated . . . and then heated"

'308 Patent, claim 1: "method of treatment for the ultra-high molecular weight polyethylene material forming a medical implant . . . comprising . . . irradiating . . . and heating the polyethylene material forming the implant"

'308 Patent, claim 12: "method for processing ultra-high molecular weight polyethylene . . . comprising . . . irradiating . . . and heating the polymer"

'308 Patent, claim 24: "medical implant comprising . . . an ultra-high molecular weight polyethylene material . . . , said material . . . which has been irradiated . . . and then heated"

'020 Patent claim 1, 6: "medical implant comprising an irradiated ultra-high molecular weight polyethylene"

'020 Patent, claims 7, 10, 11, 12: "medical implant comprising an ultra-high molecular weight polyethylene . . . irradiated and annealed"

Defendants argue that the scope of the above claims should be limited to medical implants or devices, which are irradiated and heated after they have been formed and/or machined. Howmedica argues that these claims also encompass processes whereby a polyethylene material is irradiated and heated before it is formed and/or machined into a medical implant.

Howmedica relies upon the language of the patent claims for its interpretation. Defendants support their construction by arguing that the four patents' specifications limit the patent claims. Because the specifications only expressly set forth a process whereby fully finished orthopedic components are irradiated and heated, defendants maintain that the claims should be limited to that process.

a. '934 Patent, claims 23, 50; '814 Patent, claim 7; '308 Patent, claims 12, 24; '020 Patent, claims 1, 6

Claims 23 and 50 of the '934 Patent, claim 7 of the '814 Patent, claims 12 and 24 of the '308 Patent, and claims 1 and 6 of the '020 Patent clearly and unambiguously contemplate irradiation and heating before final forming and machining of the implant. The Courts interprets each of these claims by looking towards its ordinary meaning, grammar, syntax, and context. To narrowly construe these claims, whose language unequivocally establishes their meaning, would be to commit the "cardinal sin" of claim construction: to import limitations from the specification into the claim. SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1340 (Fed. Cir. 2001). In contrast, the express language of claim 1 of the '308 Patent clearly limits that claim to irradiation and heating of finally formed medical implants.

Claims 23 and 50 of the '934 Patent, claim 7 of the '814 Patent, and claim 24 of the '308 Patent all distinguish between (1) the "implant" or "device" and (2) the "material." These four claims unambiguously refer to the irradiation and heating of "said material"; they do not refer to the treatment of the "implant" or "device." Had the inventor intended to limit the scope
of these claims to the heat and radiation treatment of "finished orthopedic implants," he would have stated that the implant, not the "material," was to be irradiated and heated. The Court reads these claims to include the treatment of the constituent polyethylene material before it has been formed and machined into its final form as an implant.

Claim 12 of the '308 Patent expressly states that it is for a "method of processing . . . polyethylene." Never does claim 12 refer to processing a medical implant, finished or unfinished. It clearly describes a method of heating and irradiating a "polymer," and is not limited to the treatment of finished implants. 4

4 This is especially clear when the language of claim 12 of the '308 Patent is juxtaposed with claim 1 of that Patent, which is so limited. See infra.

Claims 1 and 6 of the '020 Patent refer to a medical implant comprised of "an irradiated ultra-high molecular weight polyethylene." The Court finds that this claim clearly expresses that the polyethylene is irradiated, and imposes no requirement that the irradiation step occur after the medical implant has been finished.

b. '308 Patent, claim 1

In contrast, the Court finds that claim 1 of the '308 Patent is limited to irradiation and heating of a finished implant, because it is for "irradiating . . . and heating the polyethylene material forming the implant." Claim 1 clearly contemplates that the polyethylene material has already been formed into an implant before it is irradiated and heated. The Court's interpretation is bolstered by comparing claim 1 to claim 12 of the '308 Patent, which describes a process identical to that described by claim 1 -- except that it refers to the irradiation of the "polymer" and not the finished implant. 5

5 Unless otherwise stated, the dependent claims at issue are construed in accord with this opinion's reading of the respective independent claims. As example, claims 27, 29, and 52 of the '934 Patent, claim 12 of the '814 Patent, claims 21 and 23 of the '308 Patent, and claims 2, 3, and 5 of the '020 Patent are not limited to the processing of finished implants. Dependent claim 10 of the '308 Patent is limited to the irradiation and heating of the finished implant.

c. '020 Patent, claims 7, 10, 11, 12

Unlike the '934, '814, '308, and '020 Patent claims discussed above, claims 7, 10, 11, and 12 of the '020 Patent are ambiguously phrased. These latter claims describe a "medical implant comprising an ultra-high molecular weight polyethylene . . . irradiated and annealed." It is not grammatically clear if these claims could involve irradiating and heating the polyethylene material, or if they are limited to treating finished implants made of the material. From the claims alone, the Court cannot discern whether the "medical implant" or the "polyethylene" are modified by the term "irradiated and annealed."

Faced by ambiguous claim language, the Court looks to the context of these claims. The Court has already determined that claims 1 and 6 of the '020 Patent do not require that only the finished implant may be irradiated. See supra. Claims 7, 10, 11, and 12 are clearly intended to parallel claims 1 and 6, which the Court has construed to disclose heat and radiation treatment of both the polymer and finished implants. Notably, claims 7, 10, 11, and 12 include an annealing (heating) step that makes their grammar and syntax more ambiguous. As example, claim 1 describes a "medical implant comprising an irradiated ultra-high molecular weight polyethylene," while claim 7 describes a "medical implant comprising an ultra-high molecular weight polyethylene . . . irradiated and annealed." Since the only material difference between the two sets of claims is the annealing step, the Court interprets claims 7, 10, 11, and 12 of the '020 Patent consistently with claims 1 and 6. Claims 7, 10, 11, and 12 of the '020 Patent are not limited to the irradiation and annealing of finished implants.
d. Prosecution History

The Court finds unconvincing the Defendants' reference to the prosecution of the '049, '748 and '020 Patents. Defendants seek to limit terms of the patents-in-suit by pointing to limitations made during the course of the prosecution of the '049 Patent, an ancestor patent of the patents-in-suit. Unlike the '934, '814, '308, and '020 Patents, all of the '049 Patent's claims clearly describe a process whereby a finished implant is irradiated and heated. The '049 Patent does not share the relevant claim terms with the patents-in-suit. See Advanced Cardiovascular, 265 F.3d at 1305-06. As example, a typical claim of the '049 Patent states:

A method for producing a medical implant . . . comprising the steps of:

- sealing the implant in an oxygen impermeable package . . . ; and

- radiation sterilizing the said packaged implant; and

- heating said packaged implant . . . at a temperature of between about 37 C and the melting point of [the] olefinic material . . . . 6

'049 Patent, claim 1. Unlike the patents disputed here, all the '049 Patent claims clearly and unambiguously refer to a process where the finished, packaged implant is irradiated and heated. The Court will not limit the scope of the descendant patents on the basis of representations made during the prosecution of the ancestor patents, when the ancestor patent's claims differ so materially from those of the descendant patent.

--- Footnotes ---

6 All of the independent claim in the '049 Patent are similar in that they expressly describe irradiating and heating a finished, packaged implant. '049 Patent, claims 1, 12, 19, 25, 31, 36.

--- End Footnotes ---

Defendants also cite Howmedica's communications to the examiner during its prosecution of the '020 and '748 Patents. Neither of these statements is particularly relevant here. At the examiner's request, Howmedica cancelled certain patent claims "directed to an ultra-high molecular weight polyethylene." (See Defs.' Exs. J, K.) Contrary to defendants' assertions, Howmedica's did not restrict the invention to irradiation and heat treatment of formed medical implants. The '748 Patent prosecution statements to which defendants point, which sought to distinguish that patent from prior art, are not properly characterized as disclaimers. (See Defs.' Ex. N.) By no means do they clearly disclaim the treatment of the polymer before it is formed.

GO BACK

2233

C. "Said Stream is Directed Outwardly Toward Said Annular Inner Surface and then Redirected Upwardly and Inwardly Toward the Incoming Ladle Stream."

Claim 1, in part, describes the structure of CCPI's impact pad with regard to its function; that is the '551 patent claims an impact pad with a structure whereby the falling stream of molten metal from the ladle shroud is "directed outwardly toward [the] annular inner surface [of the impact pad] and then redirected upwardly and inwardly toward the incoming ladle stream." D.I. 36 at Exh. A, col. 7, ll. 56-59. CCPI maintains this language is unambiguous--it means what it says. API concedes none of the words at issue here are vague or nebulous, as they are used in common parlance. But API argues when the impact pad is observed while in use, the language is hopelessly indefinite. API has thus proposed its own interpretation: the "downwardly directed stream of molten metal" must be "redirected back into itself in an upward direction to create two opposed vertical streams or counter current flows in and above the pad which interact with each other to such a degree that they significantly slow each other down." D.I. 37 at 5.

1. Claim language
As noted earlier, the first consideration is the claim language itself and, specifically, whether it is ambiguous. See Eastman Kodak Co., 114 F.3d 1547 at …, 1997 U.S. App. LEXIS 11831, 1997 WL 261364, at *3. In its briefing, API urged the entire phrase "directed outwardly toward [the] annular inner surface [of the impact pad] and then redirected upwardly and inwardly toward the incoming ladle stream" was ambiguous. When pressed at oral argument, counsel for API narrowed its position somewhat; API now contends use of the word "toward" is unclear. API does not argue the language itself is ambiguous. Rather, API submits the way the impact pad affects the flow of molten metal makes it impossible to determine if the molten metal is redirected toward the incoming ladle stream; thus, according to API, "toward" is ambiguous.

API has introduced a videotaped demonstration of the '551 impact pad at work 14 and the testimony of the inventor, Karl J. Saylor in an effort to show the flow pattern of the metal after it enters the impact pad makes it is impossible for anyone--Saylor included--to determine when the stream of molten metal is "directed outwardly toward [the] annular inner surface and then redirected upwardly and inwardly toward the incoming ladle stream." In fact, API argues, the stream has no discernable "direction" at all; it resembles a cloud which disperses throughout the impact pad.

14 Water was used in the demonstration instead of molten metal.

As CCPI points out, API is trying to create ambiguity in the claim language with the use of extrinsic evidence. This is a formidable obstacle in itself, but API's more pressing barrier is that its argument is more appropriately characterized as an indirect attack on the validity of the '551 patent. As the Federal Circuit Court of Appeals has cautioned, "ambiguity, undue breadth, vagueness, and triviality are matters which go to claim validity for failure to comply with 35 U.S.C. § 112- P 2, not to interpretation or construction." 15 Intervet Am., Inc., 887 F.2d at 1053; see also Markman v. Westview Instr., Inc., 52 F.3d 967, 986 (Fed. Cir. 1995), aff'd, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996).

15 35 U.S.C. § 112, P 2 states: "The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention."

"Toward," although not defined in the '551 patent, has an ordinary and well-recognized meaning. "Toward" is commonly defined as "in the direction of: to a point approaching." WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 2417 (1971). While it may be difficult--and API suggests it is well-nigh impossible--to determine the direction taken by the stream of molten metal after it strikes the impact pad of the '551 patent, this consideration goes to validity, and is best left for another day. For now, it is sufficient to describe the claim language as clear and unambiguous; it means precisely what it says.

16 See supra note 10.

2. Specification

As rehearsed above, the language in the claim is lucid; nevertheless, the Court examines the specification to see if CCPI, acting as its own lexicographer, defined the terms at issue in any manner inconsistent with their common usage. API points to various passages in the specification to support its proposed interpretation. For example, in the invention summary, the patent states "the incoming stream is redirected back into itself and a flow pattern is created which directs the reversed flow of metal away from the ladle shroud." D.I. 36 at Exh. A, col. 2, ll. 56-61. Similar statements are scattered throughout the
specification. 17

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

17 For example, column three, lines 21-26 of the patent state: 
"[A] pad constructed in accordance with the present invention redirects the pouring stream back into itself causing the counter current flows to slow each other down thereby minimizing turbulence and inhibiting high velocity flow within the tundish." Further: 
"The vertical upward movement of the stream caused by the tundish pad significantly slows down the stream of molten metal as the two opposed vertical streams have a partially cancelling effect on one another." D.I. 36 at Exh. A, col. 5, ll. 44-48. Still further: 
"It will thus be appreciated that the tundish impact pads of the present invention cause the incoming ladle stream to be completely reversed in an upward direction thus significantly slowing the stream and preventing undesirable high velocity flows and turbulence within the tundish." Id. at col. 6, ll. 29-34. Finally: 
"Any geometric shape which fully encloses or defines and [sic] endless boundary for an interior space of the pad and redirects the incoming molten metal flow back into itself and creates a flow pattern away from the ladle shroud will perform similarly to the illustrated embodiments." Id. at col. 7, ll. 34-39.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

This again presents the tightrope the Court traversed in section III(B)(2) of this opinion. On one hand, courts are encouraged to use the specification to provide appropriate context for the claims. On the other hand, courts are dissuaded from adding to claims those limitations that appear only in the specification. API cloaks its appeal in the raiments of using the specification to interpret; when laid bare, however, it is a plea for a limitation not found in the claims. As noted earlier, there is nothing murky in the language and the Court cannot consider issues such as ambiguity or vagueness which relate to claim validity during claim construction. See Markman, 52 F.3d at 986; Intervet Am., Inc., 887 F.2d at 1053.

3. Prosecution history (or file wrapper)

Although the claim language is clear, API exhorts the Court to scrutinize the prosecution history. A patent owner cannot take a position about a claim term during litigation that is inconsistent with the position it took during prosecution; statements made during prosecution may commit the patent owner to a particular meaning for a patent term. CVI/Beta Ventures, Inc., 112 F.3d 1146 at , 1997 WL 214809, at *11. Extrapolating from this tenet of claim construction, API argues CCPI limited its claims--to an impact pad that reversed a falling stream of molten metal back into itself--in an effort to gain approval from the Patent Examiner ("the Examiner").

CCPI originally submitted claim 1 without a functional description. 18 Again, as stated earlier, the idea of an impact pad was nothing new, and the Examiner disallowed each of the product claims 19 under 35 U.S.C. § 103 as being unpatentable over a prior art patent, U.S. Patent No. 3,887,171 (referred to as "the Neuhaus patent," after its inventor) in view of another patent, U.S. Patent No. 5,169,591 (called "the Schmidt patent" after one of its inventors). 20 D.I. 36 at Exh. C, p. 44.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

18 In other words, claim 1, as originally submitted, disclosed:

A tundish impact pad formed from a refractory composition capable of withstanding continuous contact with molten metal, said pad comprising a base having an impact surface and an endless outer side wall extending upwardly therefrom and fully enclosing an interior space having an upper opening for receiving a stream of said molten metal, said outer wall including an annular inner surface having at least a first portion extending inwardly and upwardly toward said opening.

D.I. 36 at Exh. C, p. 32. The next phrase, "whereby when a downwardly directed stream of molten metal from a ladle outlet disposed above said impact pad strikes said impact surface, said stream is directed outwardly toward said annular inner surface and then redirected upwardly and inwardly toward the incoming ladle stream[,]" was not added to the claim until after it had been rejected.

19 Claims 1 through 20 are directed to the impact pad itself, while claim 21 is directed to the method of preventing turbulence. Claim 21 was the only claim not rejected by the Examiner under 35 U.S.C. § 103 as unpatentable over the Neuhaus patent in light of the Schmidt patent.
20 35 U.S.C. § 103(a) states:

A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title [governing conditions for patentability], if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains.

The Examiner also rejected each of the claims as anticipated by the Schmidt patent. The prosecution history does not reveal anything damning to CCPI's position here in comparison to the arguments it presented to the Examiner to distinguish the '551 patent from the Schmidt patent. D.I. 36 at Exh. C, pp. 60-62. Therefore, the Court limits its consideration to the arguments made by CCPI to distinguish the Neuhaus patent in view of the Schmidt patent.

The Schmidt patent, which issued in 1992, disclosed a horseshoe-shaped impact pad with an aperture aimed directly toward the outlet at the bottom of the tundish. 21 See D.I. 49 at Exh. A. This design differs from the design of the impact pad of the '551 patent; the impact pad of the '551 pad is fully enclosed, 22 as opposed to shaped like a horseshoe, and the only means of egress from the impact pad for the molten metal is through an opening located at the top of the impact pad. Similar to the '551 patent, the Schmidt impact pad had an upward and inward slope along its inner surface for "receiving and reversing the direction of the radiating fluid flow generated by an incoming ladle stream." Id. at col. 2, ll. 18-20.

The Neuhaus patent, which issued in 1975, also disclosed a horseshoe-shaped impact pad. D.I. 37 at Exh. 7. Similar to the '551 patent (but unlike the Schmidt patent), the flow from the Neuhaus impact pad was aimed toward the ladle shroud above it so the flow of molten metal would not drain directly into the tundish outlets. From the sketches in the Neuhaus patent, it appears the ladle shroud extended into the horseshoe-shaped impact pad; the ladle shroud in the '551 patent, on the other hand, does not descend into the area fully enclosed by the impact pad. Finally, unlike in Schmidt or the '551 patent, the inner surface of the impact pad in Neuhaus did not possess an upward and inward slope.

CCPI tried to remedy the flaws in its spurned claims by adding the following functional description of the impact pad:
"whereby when a downwardly directed stream of molten metal from a ladle outlet disposed above said impact pad strikes said impact surface, said stream is directed outwardly toward said annular inner surface and then redirected upwardly and inwardly toward the incoming ladle stream." D.I. 36 at Exh. C, p. 54. It is in this amendment, and in the statements CCPI made to accompany this amendment, that API finds the limitations it proposes for the impact pad--that is, it must redirect the stream of molten metal "back into itself . . . to create two opposed vertical streams of counter current flows in and above the pad which interact with each other to such a degree that they are significantly slowed down." D.I. 37 at 5.

First, as API points out, in a summary of the invention included in the amendments, CCPI stated the "end result" of the structure of the impact pad was that "flow velocities of molten metal exiting the interior volume of the pad are significantly slowed down by the cancelling effect of the incoming ladle stream." Id. at 57. Contrary to API's arguments, however, this statement does not reveal a disavowal by CCPI of a broader claim interpretation, nor does it limit the claim. It simply describes, in a general fashion, a function of the impact pad.

API's best argument is rooted in the statements made by CCPI to distinguish the impact pad of the Neuhaus patent. CCPI stated that an "upward and inward" portion on the inner surface of the Neuhaus impact pad, like the one on the impact pad of the '551 patent, would escalate turbulence. Turbulence would increase, CCPI argued, because the flow of molten metal

- 2699 -
would collide with the ladle shroud, which descended into the enclosed interior area of the impact pad itself. API derives from this a statement never explicitly made by CCPI: the Neuhaus patent is distinguishable from the '551 patent because, unlike the '551 patent, the ladle shroud in the Neuhaus patent blocks the ability of the outgoing and incoming streams to interact and slow each other down. Only after this supposed advantage was pressed to the Examiner, argues API, was approval of the '551 patent given.

While this contention has its appeal, it is unavailing. The above statement, when read in context with the other arguments made by CCPI in support of its amended claims, reveals CCPI simply reiterated many of the distinguishing features of the '551 patent that failed to sway the Examiner at the initial hearing. 23 CCPI did not limit itself to an impact pad that functions in the manner API suggests. CCPI has not taken a position in this litigation that is inconsistent with the position it took during prosecution of the '551 patent. Put bluntly, the key phrases API wants to use to limit the claims--"back into itself" and "significantly slow each other down"--are nowhere to be found in the arguments CCPI made to win approval from the Examiner. At bottom, then, API's arguments about the prosecution history are simply another attempt to interpolate limits onto claim language that API may feel is hopelessly obscure in practice, but is plain on its face.

--- Footnotes ---

23 The full argument presented by CCPI to the Examiner that the amended application should not be rejected as anticipated by the Neuhaus patent in view of the Schmidt patent is as follows:

As further pointed out and agreed to by the Examiner at the interview, there is no suggestion in either the Neuhaus or Schmidt et al. patents for combining them in such a way as to lead to the present invention. In the Office Action the Examiner apparently suggests that the Schmidt et al. disclosure would lead one of ordinary skill in the art to place an undercut portion on the trough of Neuhaus to avoid "excessive turbulence." However, there is absolutely no suggestion in the prior art that an undercut portion on the trough [now, the impact pad] of Neuhaus would lessen turbulence. In fact, an undercut portion on the trough of Neuhaus is more likely to increase turbulence by causing flow to impact against the outlet tube [now, the ladle shroud]. In any event, the use of an undercut portion on the trough of Neuhaus would be in direct contradiction to the teachings of Neuhaus himself since the slow outward flow would be inhibited by an undercut portion on the trough. In short, there is no teaching or suggestion for combining the Neuhaus and Schmidt et al. patents under any rationale to come up with the pad of the present invention. Applicant therefore respectfully requests that this rejection be withdrawn by the Examiner.

D.I. 36 at Exh. C, pp. 63-64.

--- End Footnotes ---

Accordingly, the Court declines the invitation to tinker with the phrase "said stream is directed outwardly toward said annular inner surface and then redirected upwardly and inwardly toward the incoming ladle stream." The language is plain, and it means what it says. 24

--- Footnotes ---

24 Because the intrinsic evidence unambiguously describes the scope of the patented invention, the Court need not address the extrinsic evidence submitted by API, namely Saylor's deposition testimony. See Vitronics, 90 F.3d 1576 at 1583.

--- End Footnotes ---

A. "Isolated From Any Exposure to Said Atmosphere"

Defendants seek construction of the claim limitation "isolated from any exposure to said atmosphere." Defendants contend the court may use dictionary definitions to give claim terms their customary and ordinary meaning. Accordingly, defendants rely on The American College Dictionary (1964) to define the words "isolate," "any," and "atmosphere." 1 The dictionary
defines "isolate" as "to set or place apart; detach or separate so as to be alone." The word "any" is defined as "(with a negative) none at all" or "in any degree; to any extent; at all." The term "atmosphere" is defined as "the gaseous fluid surrounding the earth; the air." Defendants assert the context of the claim language applies the term "atmosphere" to mean the atmosphere being monitored. Based on the dictionary definitions, defendants argue the proper construction of the claim limitation "isolated from any exposure to said atmosphere" is "separated so that there is no exposure at all to the air being monitored to any degree or extent." Defendants contend this construction is consistent with the '166 patent specification, which shows the second counter electrode is separated from exposure to the atmosphere by use of a plug that seals the chamber, or by total encasement of the electrode in the frame. In both cases, defendants assert there is no way for the outside air to reach the counter electrode. Finally, defendants contend there is no disclosure in the 166 patent that teaches the counter electrode can be exposed to the outside air in any manner, and there is nothing in the prosecution history to contradict defendants' proposed construction.

--- Footnotes ---

1 Defendants also purport to provide a dictionary definition for "exposure." This definition is not in fact provided.

--- End Footnotes ---

Dicon argues defendants' use of extrinsic evidence, dictionary definitions, to interpret the '166 patent claims is inappropriate. Dicon contends the specification makes clear the second counter electrode, while isolated from direct outside air, is exposed to an enclosed volume of scrubbed or otherwise uncontaminated air. Dicon asserts, without citation to the record, the specification teaches that the outside air may pass to the counter electrode after being scrubbed by an electrolyte. Therefore, Dicon argues defendants inappropriately ignore the broad context of the intrinsic evidence and seek a construction that inappropriately limits the patent's scope.

The appropriate role of dictionary definitions in claim construction is somewhat unclear. The Federal Circuit has held dictionaries may be relied upon to construe patent claims:

When a patent is granted, prosecution is concluded, the intrinsic record is fixed, and the public is placed on notice of its allowed claims. Dictionaries, encyclopedias and treatises, publicly available at the time the patent is issued, are objective resources that serve as reliable sources of information on the established meanings that would have been attributed to the terms of the claims by those of skill in the art. Such references are unbiased reflections of common understanding not influenced by expert testimony or events subsequent to the fixing of the intrinsic record by the grant of the patent, not colored by the motives of the parties, and not inspired by litigation. Indeed, these materials may be the most meaningful sources of information to aid judges in better understanding both the technology and the terminology used by those skilled in the art to describe the technology.

Tex. Digital Sys. v. Telegenix, Inc., 308 F.3d 1193, 1203 (Fed. Cir. 2002) (emphasis added). Texas Digital explains that, because dictionaries may have multiple definitions for a term that do not apply to the claim, the interpreting court must refer to the intrinsic record to determine which definition is most consistent with the words used by the inventor. Id. Indeed, the dictionary definition must be rejected if it is inconsistent with the intrinsic record. Id. at 1204. "In short, the presumption in favor of a dictionary definition will be overcome where the patentee . . . has clearly set forth a clear definition of the term different from its ordinary meaning." Id. Therefore:

By examining relevant dictionaries, encyclopedias and treatises to ascertain possible meanings that would have been attributed to the words of the claims by those skilled in the art, and by further utilizing the intrinsic record to select from those possible meanings the one or ones most consistent with the use of the words by the inventor, the full breadth of the limitations intended by the inventor will be more accurately determined and the improper importation of unintended limitations from the written description into the claims will be more easily avoided.

Id. at 1205. Accordingly, defendants have provided their limitation interpretations based on dictionary definitions that were in existence as of April 16, 1990, when the '166 patent was filed.

In contrast, C.R. Bard, Inc. v. U.S. Surgical Corp., No. 04-1135, 388 F.3d 858, 2004 U.S. App. LEXIS 22738 (Fed. Cir. Oct. 29, 2004), emphasizes that the intrinsic record alone remains the primary source for determining claim meaning. 2004
U.S. App. LEXIS 22738 at *8. C.R. Bard notes that other cases, including Texas Digital, suggest the intrinsic record should be consulted only after determining the ordinary and customary meaning of claim terms with dictionary assistance. 2004 U.S. App. LEXIS 22738 at *9-12. Instead, C.R. Bard contends that the intrinsic evidence is the single most reliable guide to construe disputed claims. 2004 U.S. App. LEXIS 22738 at *9-12.

The Federal Circuit has granted an en banc rehearing to broadly address the law of claim construction. Phillips v. AWH Corp., 376 F.3d 1382 (Fed. Cir. July 21, 2004). Specifically, the court intends to clarify seven issues, including the following three:

1. Is the public notice function of patent claims better served by referencing primarily to technical and general purpose dictionaries and similar sources to interpret a claim term or by looking to the patentee's use of the term in the specification? If both sources are to be consulted, in what order?

2. If dictionaries should serve as the primary source for claim interpretation, should the specification limit the full scope of claim language (as defined by the dictionaries) only when the patentee has acted as his own lexiographer or when the specification reflects a clear disclaimer of the claim scope? If so, what language in the specification will satisfy those conditions? What use should be made of general as opposed to technical dictionaries? How does the concept of ordinary meaning apply if there are multiple dictionary definitions of the same term? If the dictionary provides multiple potentially applicable definitions for a term, is it appropriate to look to the specification to determine what definition or definitions should apply?

3. If the primary source for claim construction should be the specification, what use should be made of dictionaries? Should the range of the ordinary meaning of claim language be limited to the scope of the invention disclosed in the specification, for example, when only a single embodiment is disclosed and no other indications of breadth are disclosed?

Id. at 1383. There is no need to await the forthcoming en banc decision before construing the '166 patent claims. While the extent to which dictionaries may be used is unclear, dictionaries may still be used, to some degree, to determine the ordinary and customary meaning of claim terms. See e.g., Texas Digital, 308 F.3d at 1203-05. C.R. Bard teaches dictionaries should not be relied upon before, or to the exclusion of, intrinsic evidence. However, the use of dictionaries does not mean intrinsic evidence has been ignored; dictionaries and intrinsic evidence together may assist the court in construing claims. Indeed, the specification remains "highly relevant to the claim construction analysis" and "is usually dispositive; it is the single best guide to the meaning of a disputed term." Vitronics, 90 F.3d at 1582. The court will not construe the disputed claims with dictionary definitions alone; review of the intrinsic evidence remains a fundamental part of the court's analysis.

Review of the intrinsic evidence shows defendants' claim construction is sound. The claims and specification are clear that the first electrode is exposed to the atmosphere being monitored, while the counter electrode is not exposed to the monitored atmosphere. See Def. Mot. at Ex. A, Col. 4, Ins. 17-25; Col. 6, Ins. 64-67-Col. 7, Ins. 1-5; Col. 13, Ins. 43-48. Dicon fails to offer a claim construction of its own. Its criticism of defendants' construction essentially asks the court to read "isolated from any exposure to said atmosphere" to mean "isolated from any exposure to air that has not been stripped of a contaminate gas." While the specification indicates that in one embodiment of the invention the second counter electrode may be exposed to a contained volume of cleaned or scrubbed air, Id. at Col. 5, Ins. 1-7; Col. 8, Ins. 23-32, the court does not limit, broaden or re-write claims. Netword, LLC v. Centraal Corp., 242 F.3d 1347, 1352 (Fed. Cir. 2001); K-2 Corp. v. Salomon S.A., 191 F.3d 1356, 1364 (Fed. Cir. 1999). The inventors' use of the word "atmosphere" throughout the specification and in the claims was deliberate and the court must give effect to the terms chosen by the patentee. K-2 Corp., 191 F.3d at 1364. Indeed, the inventors used terms such as "cleaned or scrubbed air," and "uncontaminated air," throughout the specification, but chose the words "isolated from any exposure to said atmosphere" for the claim limitation. Def. Mot. at Ex. A, Col. 13, Ins. 43-48 (emphasis added). The court construes the limitation "isolated from any exposure to said atmosphere" to mean "separated so that there is no exposure at all to the air being monitored to any degree or extent."
In construing these terms, it is difficult for the Court to ignore the language in the prosecution history of this patent reading that "when issued, the tangible medium is removed or decoupled from the means that stores information therein, and so each tangible medium provides an independent and audible record of one voting session." (Defs. Ex. 4b at 21; Amendment under 37 C.F.R. §1.111 (Oct. 28, 2003)). The medium referred to is the smart card and the printed paper. (Col. 17, ll. 59-61; Col. 20, ll. 31-37.)

The Court construes the terms "issue," "issued" and "issuing" in Ref. No. 14 as:

Remove or decouple the tangible medium from the means that stores the information therein, so the tangible medium provides an independent record of a voting session.

(1). "Item" and "Movie" Require No Definition.

Turning now to a closer consideration of "item rental queue" and "movie rental queue," Blockbuster urges the court to define the terms "movie" and "item." A district court need not construe every single disputed word. "Claim construction is a matter of resolution of disputed meanings and technical scope, to clarify and when necessary to explain what the patentee covered by the claims, for use in the determination of infringement." U.S. Surgical Corp. v. Ethicon, Inc., 103 F.3d 1554, 1568 (Fed. Cir. 1997). As these are commonly-understood English words, they need no clarification.

The term "item" is defined explicitly in the specification of the '450 patent, which stated "'[a]s used herein, the term 'items' refers to any commercial goods that can be rented to customers" (col. 4:1-3). Absent that, a juror would still understand through everyday experience that "item" used in this context would not include, for example "cups of coffee" which cannot be rented, but could include "bowling shoes" which can be rented to customers. Jurors would also understand that the term "movie," as used in the patents, was intended to include media such as documentaries, television series, cartoons, music videos, concert performance films, and instructional and educational programs. This list was recited in claim 13 of the '381 patent (col. 13:59-64).

7. "items containing information"

The parties dispute the proper construction of the phrase "items containing information" as that phrase is used in Claim 19 of the '992 Patent.

In addition to the phrase "items containing information," the specification of the '992 Patent uses the following related phrases: "items," "information from items," "items in the source material library," "information in the items," "items having information," and "items of information."

In the July 12 Order, the Court construed the phrase "items containing information" as follows:

"The Court construes the term "items containing information" to mean "items containing information in analog or digital format." The limitation requiring the information be stored in analog or digital format is necessary as the conversion means element 113 only converts analog and digital inputs into a "formatted data" output. n4

(July 12 Order at 11, citing '992 Patent, figure 2a.)

n4 The Court inserted this footnote following the definition: "Neither the claims nor the specification of the '992 patent
disclose any structure for converting information in the 'items' to analog or digital form as required by the 'conversation means,' before the items are stored in the library means. The claims and the specification disclose structure (figure 2a (113)), which converts only analog or digital information. Before the items are stored, the information in the 'items' stored in the library means must out of necessity already be in analog or digital format." (July 12 Order at 11, n. 6.)

The current dispute is whether the word "items" as used in the '992 Patent refers to physical items. The specification refers to "items" as follows:

The source material library 111 may include different types of materials including television programs, movies, audio recordings, still pictures, books, computer tapes, computer disks, documents of various sorts, musical instruments, and other physical objects. These materials are converted to or recorded on a media format compatible to the digital and analog inputs of the system prior to being compressed and stored in a compressed data library 118.

('992 Patent, Col. 6:10-19.) The Court finds that a proper reading of the specification renders that the word "items" means physical objects and not the "information" which might be contained in the physical objects. n5 For example, a computer file, would be information. The media used to store the computer file, such as a computer disk or a computer tape, in the source material library would be a physical item containing the information.

n5 A literal reading of Claim 19 is that the user requests "items containing information" (e.g., a video tapes) and that the items are "to be sent" from the transmission system to receiving systems. Thus, under this literal reading, the video tapes themselves would be sent. However, the specification makes it clear that the invention is not one in which the video tape is sent, but one in which movies are extracted from the video tapes, processed, and only the movies (information) are sent to the receiving systems.

The Court defines "items containing information" as follows:

In a distribution method as disclosed in Claim 19 of the '992 Patent, in which, responsive to requests from a user identifying "items" in a transmission system "containing information," information is sent from the transmission system to receiving systems at remote locations. The phrase "items containing information" means "physical items, such as video tapes, film, or computer disks, which contain audio information, video information or both."
Defendant also contends, without apparent dispute, that the border must be an "uninterrupted" line or zone. (Joint Statement, Def.'s P&A at 24). In other words, there may not be a break in the border; rather, at some point throughout the iris, the jagged border must delineate a noticeable change in shade between the outer and inner portions of the iris. This interpretation appears to be consistent with the location of the border described in claims one and thirteen. Each requires that the jagged border be located at a distance of between 5% and 95% of the radial width of the iris from the outer perimeter of the iris. (Shull Decl., Ex. B at 59, col. 10, ln. 8-14, ln. 54-59). As such, the specification appears to provide great flexibility as to the exact location of the jagged border within the iris, but does not allow for a break in such border. For that reason, the Court finds Defendant is correct that the 477 patent requires that the jagged border be uninterrupted. However, as stated supra, the patent merely requires that there take place a "noticeable change of shade" at the border. It does not limit the 477 patent to one where elements of the first shade cannot appear throughout the iris.

Turning to "jarring," the specification discloses a vending process that is "achieved in a smooth continuous manner without . . . imputing any jarring blows or forces to the container." See e.g. '930 Patent, col. 43, ll. 63-67. As with previous terms, the context provided by the claims and the specification adequately define the term. See '930 Patent, col. 24, ll. 46-56; col. 43, ll. 63-67.

The court defines "jarring" as "striking the beverage container with sufficient force to cause immediate effervescence and overflowing of carbonated beverages upon opening, or damage to a container/product such that the container or product is no longer suitable for consumption or sale."

1. The '694 Patent

In relevant part, the '694 patent claims a "vehicle for moving at least one wheeled cart, the vehicle comprising: . . . two jaws protruding from the front plate, wherein said jaws operate to engage corresponding vertical frame members of the at least one wheeled cart." (Robbennolt Aff. Ex. A at 8 ('694 Patent).) 1 In simpler terms, this limitation claims a set of two jaw-like structures that emerge from the front of the retrieval vehicle to attach to the legs of a shopping cart and hold the cart in place.

1 Ameritech also contends that its vehicle does not infringe on a second claim in the '694 patent. The success of that contention, however, depends entirely on whether Ameritech infringes the claim discussed below.

In the embodiment of the '694 patent, this element is depicted as a single metal bar with J-shaped hooks on either end. (See Defs.' Opp'n Mem. at 4 (reproducing '694 patent figure 6).) The hooks face the same direction and, according to the illustration, the legs of the shopping cart fit into the hooks. The legs are secured in the hooks with a moveable pin that is situated across the open portion of one of the hooks. The wheels of the shopping cart rest on the ground.

In Ameritech's vehicle, the shopping cart is attached to the vehicle by the use of cups. (See id. at 11 (reproducing photographs of Ameritech's vehicle).) The rear wheels of the shopping cart rest in the cups, and the front wheels of the cart are on the ground. The cups are hinged, allowing the wheels to move in response to the terrain over which the cart is moving. A moveable pin holds the wheel in place. Bumpers above the cups on the front of the vehicle rest against the frame of the shopping cart, further holding the cart in place.
Dane argues that the cups on Ameritek's vehicle, together with the bumpers, constitute "jaws" that "engage" the shopping cart and therefore that Ameritek's vehicle infringes this limitation of Dane's '694 patent. Dane contends that the Court should give "jaw" its ordinary meaning, namely "something resembling the jaw of an animal for holding or engaging something else." (Pl.'s Supp. Mem. at 13 (citing Merriam-Webster's Collegiate Dictionary).) The Court has no doubt that the word "jaw" in the claim limitation was intended to have its ordinary meaning. However, that ordinary meaning simply does not encompass the cups used by Ameritek. A cup is defined as "a small open container." Random House College Dictionary at 326 (rev. ed. 1982). A "small open container" does not "resemble the jaw of an animal" and thus does not constitute a "jaw." Dane has failed to show that it is likely to succeed on its claim that Ameritek's Golden Retriever infringes Dane's '694 patent.

b. Claim Construction

In Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005), the Federal Circuit clarified the proper approach to claim construction and set forth principles for determining the hierarchy and weight of the definitional sources that give the patent its meaning. These sources include "the words of the claims themselves, the remainder of the specification, the prosecution history, and extrinsic evidence concerning relevant scientific principles, the meaning of technical terms, and the state of the art." Id. at 1314 (quoting Innova/Pure Water, Inc. v. Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1116 (Fed. Cir. 2004)). The words of a claim are to be given their "ordinary and customary meaning" as a person of ordinary skill in the art in question would understand them. Phillips, 415 F.3d at 1312-13 (citing Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996)).

Determining the meaning of the terms at issue here is a relatively straightforward task, as the parties do not dispute the appropriate definitions. First, the term "jaw" is expressly defined in the file history of the '691 patent. In an argument filed on July 22, 2002, the applicant stated that

the most appropriate definition for this term is "either of two mechanical parts that open and close to grip or crush something, as in a monkey wrench or vise."

(Stecher Aff., Ex. E). Second, the parties agree that the term "between" should be given its ordinary meaning of "in or through the space that separates."

Thus, the language at issue in this case--"a jaw mechanically interengaged with and carried by said bracket for movement between said first and second flanges"--is properly construed as follows: (1) "either of two mechanical parts that open and close to grip or crush something, as in a monkey wrench or vise, (2) mechanically interengaged with and carried by said bracket (3) for movement in or through the space that separates the first and second flanges." 5

5 It was plaintiff who initially proposed the "movement in or through the space that separates" construction in its motion for summary judgment. Nonetheless, in its opposition to defendant's motion for summary judgment, plaintiff contends that [the language at issue in this case] describes how the jaw is mounted, but not how it moves during a clamping operation. Movement during clamping is described later in the claim as being "towards said first flange to thereby clamp said side wall therebetween." In short, a distinction is drawn in claim 1 between how the jaw is mounted, and how it moves to effect clamping.

(Pl.'s Opp. Summ. J. at 1) (emphasis in original) (internal citation omitted). It thus appears that plaintiff is attempting to read the "movement between" limitation out of the disputed claim. This argument, however, is foreclosed by the claim language itself, which explicitly requires that the jaw be carried for "movement between" the flanges. Moreover, it is unclear how the jaw could be "mounted" for "movement between" the flanges unless it, in fact, so moved.
I. Disputed Patent Claim Term "Jig"

McDavid's proposed construction for the claim term "jig" is "the structure for holding the elements in place and standing proud while the substrate layer is applied thereto." (Dkt. No. 97, Pl. Rebuttal Mem. Claim Construction 8.) Nike argues that a "jig" should be defined as "a tool used to hold and locate a material upon which work is performed, specifically the spaced separate elements, during production operations -- it is not part of the work piece, including excess work piece material." (Dkt. No. 94, Def. Resp. Claim Construction Br. 11.) The primary dispute of the parties as to the claim term "jig" centers on whether the excess material between the spaced separate elements may serve as the jig or whether a separate tool -- different from the material upon which work is performed -- must be used during the patented manufacturing process. The court agrees with Nike that the claim term "jig" as used in the '325 patent is a different device from the material upon which work is performed during the patented manufacturing process.

The plain language of the '325 patent teaches that a "jig" is a device or tool that is introduced to the patented manufacturing process to perform the function of holding the elements in place. It is not a by-product of the process such as the excess material that remains after the cutting step forms the elements. Indeed, in the '325 patent a jig is never referred to as excess material, nor is the excess material ever referred to as a jig. Instead, in claim 1, a "jig" is referred to as something that is "provided" after a sheet of resilient material is provided to create the spaced separate elements. (325 patent, col. 6:42-43.) The term "provided" ordinarily means "to supply or make available." Merriam-Webster's Collegiate Dictionary 673 (11th ed. 2005). The court agrees with Nike that the term "provided" in the claims of the '325 patent suggests that the "jig" will be supplied in a separate step during manufacture. Proper claim construction mandates that every word have a meaning. See Foremost in Packaging Sys. v. Cold Chain Techs., 485 F.3d 1153, 1156 (Fed. Cir. 2007). A court should not disregard a word as if it was not included in a patent's claim language at the risk that that disregarded word may change what the patentee originally described. Courts cannot broaden or narrow the claims of a patent or give the patentee something different than the patentee originally described.

The relevant extrinsic evidence also weighs in favor of excluding the excess material in the construction of the claim term "jig." Although the Federal Circuit emphasizes that intrinsic evidence is the most significant source for claim construction, district courts are authorized when necessary to consider extrinsic evidence, which includes expert and inventor testimony. Phillips, 415 F.3d at 1317. As a result, the court has considered the extrinsic evidence for more guidance as to how a person of ordinary skill in the art would define the term "jig." Mr. Beall, McDavid's expert, testified that he was unaware of any definitions of "jig" which include the material upon which work is performed. (Beall Dep. 30:1-4, June 9, 2009, attached as
Ex. M to Hill Decl.) In addition, Dr. Brookstein, Nike's expert, stated that a person of ordinary skill in the art would not understand a "jig" as part of the work material. (Brookstein Decl. P 20.) Consequently, the extrinsic evidence indicates that a "jig" is traditionally considered a tool that is different than the material on which the manufacturing process is performed.

As support for its proposed construction, McDavid argues that because the term "jig" is limited in other claims, under the doctrine of claim differentiation "jig" should be given a broad meaning in claim 1. See SunRace Roots Enter. Co., Ltd. V. SRAM Corp., 336 F.3d 1298, 1303 (Fed. Cir. 2003). For example, claim 2, which is dependent on claim 1, describes "using a cutter, which acts as the jig" ('325 patent, col. 6:50-51), whereas claim 1 simply discloses "a jig provided to hold the elements in place," (id. at col. 6:42-43). While the court agrees that the term "jig" is not limited to a cutter under the doctrine of claim differentiation, this doctrine does not allow an expansion of the definition of "jig" beyond what a person of ordinary skill in the art would understand. Thus, the doctrine of claim differentiation does not support McDavid's broad interpretation of the claim term "jig."

The court similarly finds that certain prior art on which McDavid relies does not demonstrate that a jig may include the material upon which work is performed. In its brief, McDavid identifies several patents, including U.S. Patent Nos. 4,127,692 ("692 patent") and 3,492,808 ("808 patent"), which refer to certain items acting as jigs. (See Dkt. No. 97, Pls.' Rebuttal Mem. Claim Construction 11.) For example, the '692 patent references a "coating" which acts as a jig, and the '808 patent discusses a "hole wall" which acts as a jig. (692 patent, col. 3:7-9; 808 patent, col. 4:50-52.) According to McDavid, these references demonstrate that the term "jig" can mean any structure that holds the elements in place, including a part of the material upon which work is performed. Neither of these patents, however, indicates that these items are jigs, but simply that they perform a jig-like function. Moreover, the fact that the '692 and '808 patents specifically identify a part of the material upon which work is performed as acting as a jig suggests that a person of ordinary skill in the art would not understand that the term "jig." under its plain and ordinary meaning, would normally encompass the material upon which work is performed. Notably, unlike the '692 and '808 patents, the '325 patent does not indicate that the material upon which work is performed could act as a jig. Thus, the prior art does not support McDavid's argument that an item that performs the function of a jig necessarily is a jig.

Lastly, McDavid's proposed construction includes an additional limitation that a "jig" is a "structure for holding the elements in place and standing proud while the substrate layer is applied thereto." This additional language is unnecessary in construing the term "jig" because subsequent claim language states that the "jig" facilitates standing proud and bonding. ('325 patent, col. 6:42-45); see Linear Tech. Corp. v. U.S. Int'l Trade Comm'n, 566 F.3d 1049, 1056 (Fed. Cir. 2009) (excluding proposed additional language from the court's final construction because the proposed language was clear from the remaining claim language). This limitation, therefore, is superfluous and not included in the court's construction.

Therefore, for the reasons stated above, the court construes the '325 patent claim term "jig" to mean "a device or tool that is different from the material on which the manufacturing work is performed that holds the elements created by the patented manufacturing process in the correct position during the manufacturing process."

2. "joined [in a cooperative relation]"

Floe contends that this term should be construed as "brought together or connected in a functional relationship." Newmans, on the other hand, asserts that this term should be construed as "directly connected." Floe contends that its construction is consistent with the way that "joined" is used in Claim 1. Additionally, Floe asserts that its construction is consistent with standard dictionary definitions, in which "join" means "to put or bring together so as to form a unit" or "to put or bring together into close association or relationship." See Merriam-Webster’s Collegiate Dictionary 630 (10th ed. 2001); American Heritage Dictionary 460 (4th ed. 2001). Floe also asserts that Newmans' proposed construction imports an unclaimed limitation--""directly""--into the term. Newmans, on the other hand, asserts that its construction of the term is consistent with the way "joined" is used in Claim 7 and in the specification. Additionally, Newmans contends that Floe disclaimed any type of non-directly connected structure in the prosecution history.

Here, the ordinary meaning of "joined" is apparent from the language in Claim 1. Claim 1 requires "a ramp member joined to said deck support member in a cooperative relation to said longitudinal deck support surface." The Court finds that the
ordinary meaning of "joined" in Claim 1 is "brought together or connected in a functional relationship."

The Court rejects Newmans' contention that Claim 7 is instructive regarding this term. In discussing the "longitudinal lower member" and the "lip member," Claim 7 states: "a longitudinal lower member . . . joined along said elongated web member . . . and a lip member . . . joined to said longitudinal lower member . . . " (379 Patent, c. 7, ll: 58-63.) Based on this language, Newmans contends that "joined" does not allow for intervening items. Rather, according to Newmans, "joined" means "directly connected." Claim 7, however, does not describe "joined" in the same way as Claim 1. Specifically, Claim 7 does not use the phrase "in a cooperative relation," and thus is not instructive. Thus, to add "directly" would add an unstated limitation to the term.

The Court also rejects Newmans' assertions that the specification and drawings support construing "joined" as "directly connected." The Court finds that Newmans' request to include "directly" would import an unclaimed limitation into the term and limit the claim to the preferred embodiment. Finally, the Court rejects Newman's assertion that Floe disclaimed any type of non-directly connected structure in the prosecution history. In particular, Newmans mischaracterizes the patentee's intent by altering the prosecution history quoted in its brief. Additionally, Newmans refers to a statement in the prosecution history that addressed Claim 11, not Claim 1. Thus, the Court finds that this evidence does not constitute a disclaimer.

A. Term 1: "affixed," "joined," and "connected"

The parties have agreed to treat the terms "affixed," "joined," and "connected" as essentially synonymous and have identified these terms, taken together, as the first disputed term to be construed. Am. JCCS Sched. B at 1. For the reasons given below, the Court does not believe that these terms need to be construed; instead, the Court construes the claims of the '291 patent as follows:

The phrase "first and second occluding disks" means "physically distinct and separate first and second occluding disks."

The phrase "first and second disks" means "physically distinct and separate first and second disks."

All of the claims of the '291 patent relate to a device with "first and second occluding disks" or "first and second disks." Independent claims 1, 24, and 30 are device claims drawn to a device with "first and second occluding disks." Independent claim 17 is a method claim that includes the step of "selecting a closure device comprising first and second occluding disks." And independent claim 28 is a method claim that includes the step of "providing a closure device comprising first and second disks." The remaining claims depend from one of these five independent claims and thus include the limitations found in the independent claims.

3 Claim 28, as originally proposed, referred to "a closure device comprising first and second occluding disks," as does claim 17. JA 376. Claim 28 was later amended and the word "occluding" was stricken. JA 418. Neither the patentee nor the examiner specifically discussed this amendment.

Different claims use different terms to describe the relationship between the first and second disks. Some claims use forms of the word "affix"; others use forms of the word "join"; others use forms of the word "connect"; and some use more than one of these words. 4 Specifically (relevant words italicized):

According to claim 1, "each disk compris[es] a . . . membrane," and "a central portion of the membrane of the first disk [is] affixed to a central portion of the membrane of the second disk to define a conjoint disk . . . ."

Claim 4 refers to "the affixed central portions of the membranes," which "define a generally circular conjoint disk."

Claim 17 says that "a portion of the structure of the first disk [is] joined to a portion of the structure of the second disk by
Claim 23 says that "a central portion of the flexible structure of the first disk [is] affixed directly to a central portion of the flexible structure of the second disk to define said conjoint disk . . . ."

Claim 24 says that "a portion of the membrane of the first disk [is] joined to a central portion of the membrane of the second disk," and then refers to "the affixed central portions of the first and second disks."

Claim 25 refers to "the joined central portions of the first and second disks," which "comprises [sic] a conjoint disk."

Claim 28 says that "a portion of the first disk [is] connected to a portion of the second disk by a tubular segment . . . ."

Claim 30 says that "a central portion of the membrane of the first disk [is] affixed to a central portion of the membrane of the second disk by a tubular segment . . . ."

4 Some claims more precisely describe the relationship between the two disks. Claim 2 provides that "the central portions of the membranes are bonded directly to one another to define the conjoint disk." Claim 5 provides that "the central portions of the first and second membranes are sewn together to define the conjoint disk." Claim 6 provides that "the central portions of the first and second membranes are fixed to one another by a biologically compatible adhesive."

These particular terms -- "bonded," "sewn," "fixed" by adhesive -- are not in dispute. But they support the Court's claim construction because they all suggest that the two disks are physically distinct things that must somehow be joined to one another.

The Court agrees with the University that these words are ordinary English words, used in their ordinary sense, and therefore do not need to be construed. See Univ. Opening Br. at 15-16 [Docket No. 68]. The essence of AGA's argument, however, is not that the words themselves are unclear and need to be construed. Rather, AGA argues that these words carry a clear implication that should be made explicit.

AGA proposes making this implication clear by construing "being affixed to," "being joined to," and "being connected to" to mean: "Two physically discrete and separate disks are physically connected to one another." Am. JCCS Sched. B at 1; AGA Opening Br. at 18 [Docket No. 65]. Such a construction is, of course, impossible: "being affixed" and the like are present-participial phrases functioning as adjectives, and an adjective cannot be construed as a sentence any more than it can be construed as a noun. 5 Further, AGA has failed to explain why the ordinary English words "affixed," "joined," and "connected" as used in the '291 patent are so unclear that the Court should construe them.

5 For instance, "happy" (adjective) cannot be construed to mean "joy" (a noun) or "a person is smiling" (a sentence).

But AGA's central point -- that the '291 patent covers a device with physically separate disks, and that this property of physical separateness is entailed by the patent's use of the words "affix," "join," and "connect" -- is well taken. To begin with, this fact of separateness follows from the ordinary meaning of these words -- the very meaning that the University ascribes to them. Univ. Opening Br. at 15-16. Specifically, the third edition of the American Heritage Dictionary ("AHD Third") defines "join" to mean "[t]o put or bring together so as to make continuous or form a unit: join two boards with
SYNONYMS: join, combine, unite, link, connect, relate, associate. These verbs mean to fasten or affix or become fastened or affixed. Join applies to the physical contact, connection, or union of at least two separate things and to the coming together of persons, as into a group . . . . Combine suggests the mixing or merging of components . . . . Unite stresses the coherence or oneness of the persons or things joined . . . . Link and connect imply a firm attachment in which individual components nevertheless retain their identities . . . .

Id. Similarly, the note on synonyms following the entry for "join" in Webster's Third New International Dictionary ("Webster's Third") says:

Although they are used to signify a more specific union, link, connect, join, and conjoin in their nonphysical application may suggest a bringing or coming together as general and unspecified as that implied by relate or associate but tend more, esp[ecially] in physical application, to signify a junction of some kind, often an inseparable junction as by a chain or by bonding. Connect is the most general of these four and suggests a loose attachment, esp[ecially] one that preserves the identity of the elements and the evidence of the connection . . . . Link suggests a slightly closer coupling esp[ecially] in the physical application of the word in which is implied inseparability but of still clearly identifiable separate elements . . . . Join usu[ally] suggests strongly the idea of physical or moral contact or junction or the making of a continuity of two or more things . . . .
The Court's claim construction is also supported by the use of the term "conjoint disk" throughout the '291 patent. The specification uniformly describes the "conjoint disk" as something that results from bringing together the first and second disks. See, e.g., '291 patent col. 3:17-20 ("The affixed central portions of the two membranes define a central 'conjoint disk' of the device . . . .").

Finally, both the domestic and foreign prosecution history of patents related to the '291 patent indicate that the terms "joined," "affixed," and "connected" have their ordinary meaning, a meaning which entails that the things being "joined," "affixed," or "connected" are physically distinct and separate things. In pursuing the first patent application in this family -- application 07/822,951 -- the University said: "A septal defect closure device of the invention utilizes two disks which are each formed of a membrane and a frame. . . . [A]pplicant attaches the membranes of the two disks essentially directly to one another . . . ." JA 976. In referring to "two disks" that "each" had the same components and that were attached "to one another," the University was plainly describing a device made by bringing together two similar, separate, physically distinct disks.

Further, in connection with an application to the European Patent Office for a patent on a device like the one covered by the patents-in-suit, the University distinguished its claimed invention from a Russian device by saying:

[The Russian device] has flanges . . . made in one piece with a tubular part . . . . Each flange is equipped with a resilient element . . . . This arrangement certainly does not comprise two disks with a central portion of a first disk being affixed to a central portion of the second disk as required in the main Claim [of the University's application].

Vandenburgh Decl. [Docket No. 66] Ex. 8 at AGA_PROD084893-94 (emphasis in original). This particular piece of extrinsic evidence, standing alone, would not be dispositive, because the Russian device being distinguished in the quoted passage differs in two ways from the patentee's device: The Russian device is both tubular and made in one piece. But the University emphasized -- as it did in prosecuting the patents in suit -- the "two disks" that make up the University's patented device.

In short, a person of ordinary skill in the art (or, for that matter, anyone of ordinary skill in the English language) would read the '291 patent as covering only a device made up of two physically separate disks that are attached to one another. The University admits that the words "joined," "affixed," and "attached" should be given their ordinary meaning. The University must therefore also accept that those words carry their ordinary implications, particularly since nothing in the '291 patent or its prosecution history suggests otherwise. It follows that the "first and second" disks referred to in the '291 patent's claims must be physically distinct and separate disks.

2245

a. the first and second flexible printed circuit boards are joined by hot bar soldering

LGD contends that this term describes a process by which the circuit boards are joined, and is thus, a process limitation. LGD contends that the term "the first and second flexible printed circuit boards are joined by hot bar soldering" means
both flexible printed circuit boards are connected to each other by a soldering process where the circuit boards are heated with a bar to melt the solder at multiple points simultaneously along each circuit board while pressure is applied to the connection.

D.I. 1388 at P 541.

In response, AUO contends that this term is not a process limitation, but a structural limitation. In this regard, AUO contends that claim 1 does not include any of the typical product-by-process language and is a pure product claim defined solely by structural limitations. Thus, AUO contends that "joined by hot bar soldering" means "joined by solder material." D.I. 1384 at 45. Alternatively, AUO contends that if this term is construed as a process limitation, it should be construed as the first and second printed circuits made on flexible film are joined by a soldering process where the solder and flux are applied to the contact area and the contact area is heated with a bar to melt the solder.

D.I. 376 at Exh. 0-4. AUO contends that LGD's construction is overly narrow, because hot bar soldering does not require "pressure" beyond that which is necessary to hold the two items being soldered together and does not require melting solder at "multiple" contact points.

"Courts must generally take care to avoid reading process limitations into an apparatus claim . . . ." Baldwin Graphic Systems, Inc. v. Siebert, Inc., 512 F.3d 1338, 1344 (Fed. Cir. 2008). "Even where terms are amenable to interpretation as a procedure of manufacture, apparent 'process' terms should be interpreted as structural limitations when used in an adjective non-process sense and define a physical characteristic of the apparatus." R2 Medical Sys., Inc. v. Katecho, Inc., 931 F. Supp. 1397, 1425 n.5 (N.D. Ill. 1996) (citing 2 Donald S. Chisum, Patents § 8.05 [5], at 8-96 (1994)); Biacore v. Thermo Bioanalysis Corp., 79 F. Supp. 2d 422, 456 (D. Del. 1999) ("The mere use in a claim of structural or characterizing terms derived from processes or methods, however, does not prevent a claim from being considered a true product claim.")

Considering the claim language in light of the specification and prosecution history, the Court concludes that the limitation "joined by hot bar soldering" does not amount to a process limitation, but instead describes the structural relationship between the first and second flexible printed circuit boards. Claim 1 of the '506 patent was distinguished over the prior art based on the limitation requiring that solder material join the two flexible printed circuit boards rather than a foldable flat cable. AUO-12 at AUO-LGD 1948. Thus, the Court views the soldering described in this claim as a structural limitation. Accordingly, the Court construes the phrase "first and second printed circuit boards are joined by hot bar soldering" to mean that the "first and second printed circuit boards are joined by solder material." 3

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 Even if the Court concludes that this phrase is a process limitation, the Court concludes LGD's proposed construction is too narrow. In reaching this conclusion, the Court credits the testimony of Dr. Silzars regarding the hot bar soldering process. Specifically, Dr. Silzars explained that hot bar soldering requires applying a hot bar to a solder joint. However, this does not require that multiple joints be soldered simultaneously, and the Court finds no support for this additional limitation in the patent specification or prosecution history. Tr. 320:19-322:11, 336:11-18 (Silzars).

GO BACK

2246

1. first and second circumferentially extending walls, said first and second chuck walls forming a juncture therebetween, said can end comprising: ('826 patent, claim 13);

providing a rotatable chuck comprising first and second circumferentially extending walls, said second chuck wall depending from said first chuck wall so as to form a juncture therebetween; ('875 patent, claim 50)

Crown's proposed construction is "[f]irst and second walls encircling the chuck forming a place between them at which they meet." 11 Rexam's proposed construction is "[w]hen looking at a cross section of a seaming chuck, an upper wall and a
lower wall of a seaming chuck (also referred to as the first and second walls) meet at a point (juncture) to form a distinct angle." 12

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

11 D.I. 325 at 1-2.

12 Id. In the parties' stipulation regarding claim terms which were, and were not, still in dispute, submitted after the Markman hearing, the parties each had slightly different verbiage for their proposed constructions regarding the juncture of the seaming chuck walls recited in claim 13 of the '826 patent and claim 50 of the '875 patent. See Id. at 9. Despite those slight variations, the parties' proposed construction for each of these claims maintained the primary differences described above and the court will construe the seaming chuck wall "juncture" limitations consistently for both claims.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Crown's proposed construction is adopted by the court. The primary difference between the parties' proposed constructions of these terms with whether the juncture at which the first and second chuck walls meets is a point or a place, with Rexam's proposed construction requiring the juncture forming "a distinct angle."

Neither the claim language nor the specification indicates that the "juncture" between the first and second chuck walls is defined by a "point to form a distinct angle" as Rexam proposes. 13 Indeed, the common specification contradicts Rexam's proposed construction. In table 4, the chuck walls are described as meeting at a "sharp transition" or a "blend [radius]," R, of 0.5 millimeters. 14 The common specification also recites:

Typically:--As shown in FIG. 8 the chuck comprises a cylindrical land of length 'l' typically 1.9 mm (0.075") and frustoconical drive surface 32 inclined at an angle Y [degree], typically 43 [degree], to the cylindrical [land] to which it is joined by a radius R typically 0.5 mm (0.020"). Angle "X" is typically 90 [degree]. 15

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

13 The only time "juncture" is mentioned in common specification is the description of figure 5 that "[f]urther drive is obtained at the juncture of chuck wall 32 and cylindrical wall 33 . . . ." '826 patent, 4:63-64.
14 '826 patent, 7:35-38.
15 '826 patent, 8:9-14. The court disagrees with Rexam's assertion that the blend radius is neither a chuck wall nor a juncture. The blend radius is a juncture, or place, where one chuck wall (the "cylindrical land") meets a second chuck wall (the "frustoconical drive surface 32").

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The word "juncture" is not defined in the common specification and the court declines to narrowly construe the disputed term as proposed by Rexam. Crown's proposed construction encompasses both a point at which a distinct angle is formed where the first and second chuck walls meet (a "sharp transition") and a place where the first and second chuck walls meet (a "blend radius"). The court, therefore, agrees that the proper construction of these disputed claim terms are: "first and second walls encircling the chuck forming a place between them at which they meet."

9. Terminating...Just After...Full Saturation

The meaning of the word "terminating" is in dispute. It appears in the following context: "terminating the introduction of concentrated detergent solution into said wash chamber just after said fabric has reached a full saturation level at said spin speed." ('370 patent, claims 8, 15.)
Whirlpool seeks the following construction: "This claim step means that the introduction of concentrated detergent solution into the wash chamber is stopped shortly after the fabric reaches a full saturation level at the spin speed. Full saturation at the spin speed means that the fabric has absorbed an amount of detergent solution to come to equilibrium with respect to detergent solution retention at the particular spin speed. There is no requirement that the introduction is terminated for any particular reason."

LG argues for the following construction: "Terminating the introduction of concentrated detergent solution (i.e., not fresh water) into the wash chamber just after sensing that the fabric in the wash chamber has reached a full saturation level at the recited spin speed (i.e., not as a result of maintaining a predetermined liquid level in the wash chamber).

LG does not dispute Whirlpool's interpretation of the phrase "just after full saturation" as meaning "shortly after" the fabric has reached a full saturation level at the recited spin speed. The issue is whether the claim contains the limitation that the termination not be the result of maintaining a predetermined liquid level in the wash chamber.

The Court agrees with Whirlpool that the claim does not include LG's proposed limitation of the word "terminating." The plain language of the claim requires only that the direction of concentrated detergent solution terminate just after the machine senses that the fabric has reached a "full saturation level at said spin speed." Nothing in the claim language limits the word "terminating" to any particular reason or cause, so long as the machine senses that the fabric is fully saturated, and LG has pointed to nothing in the intrinsic evidence suggesting differently. Also, LG does not contest Whirlpool's construction of "full saturation at said spin speed" as meaning that the fabric has absorbed sufficient detergent solution so as to come to equilibrium saturation at that particular spin speed. LG points out that its machine's system of pooling clothes in solution makes it impossible to "sense" whether the clothes are "fully saturated," but that is an argument (perhaps a strong one, given this Court's ruling on the meaning of "sensing") for the infringement case, not for claim construction.

Accordingly, the Court adopts Whirlpool's construction of these claim terms.

D. Juxtaposed

Tessera's proposed construction of "juxtaposed" is "placed close together or side by side." Samsung's proposal is "placed side by side." Joint Claim Construction Statement at B6:1. Samsung contends that each time the term "juxtaposed" is used in the specification, it refers to elements that are "side by side." This is incorrect. Samsung's proposed construction is unnecessarily restrictive and would exclude configurations in which some other layer is placed between the two chips or between the backing element and the first chip. Tessera's construction is consistent with the preferred embodiment of the multi-chip package, shown on Fig. 29 of the '893 patent. There are various lawyers interposed between the chips. '893 patent at 33:16-37. Samsung's construction would exclude this package from the claims. The Court construes "juxtaposed" to mean "placed close together or side by side."

C. Disputed Claim Term - "First and second juxtaposed drain ports"

Oatey asserts that the phrase "first and second juxtaposed drain ports" is clearly and explicitly defined in the specification of the Oatey Patent to mean "an opening or portion of an opening into a passageway for the flow of fluid." Parties' Jt. Cl. Constr. IPS argues that the phrase "first and second juxtaposed drain ports" means that the "ports" are "separate and distinct" openings that are adjacent or near each other - "not two portions of a single opening." Parties' Jt. Cl. Constr. IPS contends that the reference to an alternative embodiment in the specification cannot alter the meaning of what is actually claimed in the patent.

1. The Claim Language - Ordinary Meaning
As noted above, claim construction analysis begins with the claims themselves. See CCS Fitness Inc. v. Brunswick Corp.,
288 F.3d 1359, 1366 (Fed. Cir. 2002). The Court must give those terms the common and ordinary meaning one of ordinary
skill in the art would afford them. Id. There is no suggestion that the phrase "first and second juxtaposed drain ports," or any
of the individual terms used therein have any specialized meaning in the relevant art. Accordingly, and because the briefing
in this matter occurred pre-Phillips, the parties first looked to dictionaries for definitions of the various words used in this
disputed claim. In so doing, the parties agreed that common-use dictionaries, as opposed to technical dictionaries or
treatises, were a fair starting point to determine the common meaning of the words employed in the patent. Especially in
cases such as this, where the terms at issue are readily within the ken of a layman, Phillips neither prohibits the use of
dictionaries, nor counsels against reference to them as a first resort, which the Court now does.

The Merriam-Webster Online Dictionary defines "port" as: "2a: an opening (as in a valve seat or valve face) for intake or
exhaust of a fluid; b: the area of an opening in a cylinder face of a passageway for the working fluid in an engine; also such
as a passageway." www.merriamwebster.com. Most notably, this definition does not state that a port can be a "portion" of a
larger opening. While Oatey concedes that this definition is consistent with the common and ordinary meaning of the term
"port" and that it does not expressly contemplate a "port" being a portion of some larger opening, it asserts that this
definition also does not impose the "separate and distinct" limitations suggested by ISP. 5

5 Oatey also asserts that, although the dictionary definitions do not state explicitly that a port can be a "partial opening," the
definition does not exclude it either. Oatey's Const. Br. At 14. This argument is not particularly meaningful, however. Most
definitions fail to exclude multiple alternatives; the definition of a horse does not expressly exclude other animals, and the
definition of a bed does not expressly exclude a chair, etc. The important question is what a definition includes -- by express
inclusion or express exclusion.

While Oatey may be correct in its reading of the dictionary, the "separate and distinct" limitations arise from other sources,
most particularly from the immediate context in which the term "port" is used. As Phillips instructs, "the claims themselves
provide substantial guidance as to the meaning of claim terms." Phillips, 415 F.3d at 1314. Thus, when construing claim
terms, it is appropriate to look to the context in which the claim term is used and the surrounding text. Arlington Indust. v.
Bridgeport Fillings, 345 F.3d 1318, 1325 (Fed. Cir. 2003) (context of surrounding words must be considered in determining
plain and ordinary meaning); Hockerson-Halberstadt, Inc. v. Converse, Inc., 183 F.3d 1369, 1374 (Fed. Cir. 1999) (stating
that claim construction requires "interpretation of entire claim in context, not a single element in isolation"). Thus it is
appropriate to also look at the ordinary meanings of the other words used in conjunction with the term port -- i.e., "first,"
"second," and "juxtaposed" -- and to examine the manner in which "port" is used in relation to the text surrounding that
term.

The Federal Circuit has explained that use of "the terms 'first' and 'second' is a common patent-law convention to distinguish
between repeated instances of an element or limitation." Free Motion Fitness v. Cybex International Inc., 423 F.3d at 1348
(quoting 3M Innovative Props. Co. v. Avery Dennison, 350 F.3d 1365, 1371 (Fed. Cir. 2003)). The dictionary definitions of
the terms "first" and "second" also support the conclusion that use of those terms is intended to convey a multiplicity of the
element modified by those words -- in this case, the drain ports. The Merriam-Webster Online Dictionary defines "first" as
"preceding all others in time, order or importance" and "second" as "next to the first in place or time, one that is next after
the first in rank." In the patent, the term "ports" is always preceded by the words "first," "second" or "both," again indicating
distinct elements which are either discussed separately, or discussed collectively as two passageways, not as a portion of a
whole. 6

6 The Merriam-Webster Online Dictionary defines "both" as "being the two: affecting or involving the one and the other
"<<both feet>> "<<both his eyes>>." www.merriam-webster.com.
The fact that these first and second drain ports are described as "juxtaposed" to one another further supports the notion that they are separate elements, moreover. "Juxtapose" means "to place side by side." www.merriam-webster.com. There would be no need to define the ports as "side by side" if they were one and the same. If the Court were to accept Oatey's proposition that the meaning of the term "ports" includes a "partial opening," the passageways could overlap at any point in the "oblong opening" referenced in the claims, rendering use of the term "juxtaposed" meaningless. The Court finds that the phrase "first and second juxtaposed drain ports," when read as a whole conveys to the reader -- regardless of their level of skill in the art -- that the patent claims two openings that are identifiable from one another. 7

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

7 This conclusion is supported by reference to Oatey's own drawings. Each pictorial referring to "ports" and every reference to "ports" is depicted by identifiable ports 54 and 56. ('850 Patent, col. 3, lines 61-63; col. 4, lines 2-5, 10-14, 26-30, 58-61; col. 5, lines 20-23, 30-34, 35-37, 45-47, 53-56.)

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

Other basic principles of claim construction support this conclusion, moreover. Claim 1 provides for "first and second juxtaposed drain ports" as well as a "tailpiece extending completely around both of said drain ports." Claim 5, which depends from claim 1, further provides for "an elongated opening communicating with both of said drain ports" and a "tailpiece" surrounding that "elongated opening." Because the drain ports and the "elongated opening" are defined as acting in communication with one another, a person of ordinary skill in the art necessarily would view the terms "drain ports" and "elongated opening" as distinct elements; it would be nonsensical to describe the drain ports (or the "elongated opening") as "communicating" with themselves (or itself). Because Oatey used different language, moreover, to describe the structure of the tailpiece surrounded, i.e., claim 1 states that the "tailpiece" extends around "both of said drain ports," while claim 5 states that the "tailpiece" surrounds the "elongated opening," there is a presumption that there is a difference in meaning between the two terms or phrases and, thus, that the tailpiece is surrounding different things in the two claims. See Tandon Corp. v. United States Int'l Trade Comm'n., 831 F.2d 1017, 1023 (Fed. Cir. 1987) (noting that claim differentiation presumes a difference in meaning and scope when different words or phrases are used in separate claims). If the Court were to accept Oatey's position that "drain ports," as used in claim 1, are actually just portions of the "elongated opening" of claim 5, the limitations in the two claims would be the same -- i.e., both claiming one oblong opening surrounded by a tailpiece through which fluid flows. That construction would mandate the conclusion that claim 5 is no narrower than claim 1, from which it depends. That result would impermissibly read one or the other of those claims out of existence. See Innova/Pure Water, Inc. v. Safari Water Filtration, 381 F.3d 1111 (Fed. Cir. 2004) (noting that dependent claims narrow independent claims). 8

Put simply, Oatey's invitation to read "first and second juxtaposed drain ports" and "elongated opening" as one and the same would require the Court to ignore significant aspects of Oatey's claim drafting.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

8 Oatey also resorts to the principle of claim differentiation in support of the proposed reading of the claims. Oatey asserts that IPS' proposed reading of claim 1 is too narrow, and limits claim 1 to the embodiment of the invention contemplated in dependant claim 6, where the drain ports are used in conjunction with a test cap. IPS's proposed reading of "first and second juxtaposed drain ports" in claim 1 as two separate passageways does not demand that those passageways be defined only by the test caps disclosed in claim 6, however. The passageways of claim 1 can be "separate" whether or not a test cap is used to define that separation.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

2. Oatey as its own lexicographer.

Oatey asserts that, even if IPS's reading of the claim language were otherwise correct, the Court should ignore that reading and adopt Oatey's alternative construction for that language. This is so, Oatey claims, because Oatey asserts that it acted as its own lexicographer by defining the claim term "drain port" to be an "opening or a partial opening." Essentially, Oatey asserts that it used the specification to define away any "separate and distinct" character to the drain ports which use of the phrase "first and second juxtaposed drain ports" might otherwise convey. 9

- 2717 -
The specification in the '850 patent does state more than once that "it should be understood that the test cap 52 may be omitted and the oblong opening 50, in combination with the tailpiece 22, may instead define the drain ports 54 and 56." '850 Patent, col. 4, lines 23-26. While Oatey concedes that this language does not explicitly redefine the claim term "port" to mean a "partial opening," Oatey asserts that it did so by implication and the Court is bound by Oatey's description of its own invention. Presumably, Oatey would contend that Phillips' emphasis on the importance of the specification to a proper reading of claim language lends further support to this argument.

Oatey's lexicographer argument has two prongs. First, Oatey asserts that a patentee can be its own lexicographer by defining a claim term by implication, and second, that by defining an alternative embodiment of its invention, Oatey did just that - impliedly redefined the term "drain ports" as used in claim 1 to include a "partial opening" of a larger single structure.

It is true that a claim term may be redefined in a specification "by implication." In Bell Atlantic Network Services, Inc. v. COVAD Comm. Group, Inc., 262 F.3d 1258, 1268 (Fed. Cir. 2001), the Federal Circuit held that "when a patentee uses a claim term throughout the entire patent specification, in a manner consistent with only a single meaning, he has defined that term "by implication."" Id. at 1271. In other words, the written description of the preferred embodiments "can provide guidance as to the meaning of the claims, thereby dictating the manner in which the claims are to be construed, even if the guidance is not provided in explicit definitional format." Scimed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1344 (Fed. Cir. 2001). Following this principle, the Federal Circuit repeatedly has found that a claim term which appears otherwise broad on its face may be narrowed by implication where the specification makes clear that the patentee intended to give that term the narrower meaning. See, e.g., Nystrom v. Trex Co., 424 F.3d 1136, 1145 (concluding that the term board could not be afforded a broad meaning, despite support in dictionary for same, because specification consistently limited use of the term board to mean a wood board).

Accepting Oatey's initial legal proposition as true, however, does not require acceptance of Oatey's conclusion that the '850 fits within the bounds of that proposition. Oatey neither used a definitional format within its specification (as it concedes) nor impliedly redefined the term drain ports through consistent and clear use of that term in the specification. Notably, all of the cases upon which Oatey relies are cases where the Federal Circuit concluded that a careful reading of the specification mandated the conclusion that a claim term should be afforded a meaning which is narrower than the broadest dictionary definition or "ordinary meaning" which might otherwise attach to that term. See Nystrom, 424 F.3d at 1145 (intrinsic record may narrow the range of "ordinary meanings" which may be afforded a particular claim term where it is clear no alternative meaning was contemplated); see also Aquatex Industries, Inc. v. Technical Solutions, 419 F.3d 1374, 1380 (Fed. Cir. 2005) (context of specification can make clear that patentee did not intend term to have broader meaning even where such broader meaning is not expressly disavowed).

Oatey has not cited this Court to a single case (and this Court has not found one) where the Federal Circuit relied on the specification to find an implied broadening of a claim term whose ordinary meaning is otherwise clear. The absence of supportive case law is particularly telling, moreover, when one considers that Oatey not only seeks to broaden its chosen claim terms by reference to its specification, but seeks actually to rewrite them so as to exclude those chosen terms.

At the Markman hearing, Oatey conceded (as it did repeatedly in its brief) that, rather than redefine the term "ports," the specification disclosed alternative embodiments to the invention -- one using "ports" and one not using "ports": "The patent discloses specifically the drain ports to be one of two embodiments or two different embodiments." (Tr. at p.6). Thus Oatey concedes that it is not asking this Court to use the specification to help it define the term "port," it is asking the Court to read the term "first and second juxtaposed drain ports" out of the claims. Essentially, Oatey argues that the Court should not import limitations from the chosen claim terms into the specification. While Phillips may have done much to raise the stature of the specification in the claim construction process, it did not go that far. Indeed, as noted above, the exercise in which Oatey asks this Court to engage in is inconsistent with very basic principles of patent law, none of which have been changed by Phillips. See McClain v. Ortmayer, 141 U.S. at 424 (specification may be referred to in order to limit a claim, but can never be relied upon to expand it.); see also SRI International v. Matsushita Elec. Corp., 775 F. 2d 1107, 1121 n. 14 (Fed. Cir. 1985) ("Specifications teach. Claims claim.").

Oatey's position is similar to that of the patent holder in Johnson v. Johnston, supra, where the specifications recognized certain alternative forms of the invention, but the claims did not embody them. The Federal Circuit concluded that patent holders must bear the cost of their own failure to seek protection for foreseeable alterations of their claimed structure. Id. at
1059. Quite simply, acknowledgment of a possible alternative structure in the specification is not the same as claiming that alternative structure. Oatey chose its claim language; it may not use its specification to now "imply" it out of existence.

Ultimately, the Court concludes that when Oatey claimed "first and second juxtaposed drain ports," it claimed two separate identifiable physical elements that are adjacent or near each other. The Court construes the claim language accordingly.

9 While the parties' briefs debate the meaning of the terms "in said bottom wall" and "integrally formed", the parties did not address these terms at the Markman hearing and, as noted, conceded at the hearing that the Court's construction of the single term addressed in this opinion would resolve the parties' dispute. Consistent with the principle that the Court is only to construe those terms whose meanings are in dispute, the Court does not address those additional two terms here. See Vivid Techs., Inc. v. Am. Sci. & Eng'g, Inc., 200 F.3d 795, 803 (Fed. Cir. 1999) (explaining that "only those terms need be construed that are in controversy, and only to the extent necessary to resolve the controversy." (citation omitted). Should the parties deem it necessary to do so, the Court is prepared to issue a supplement to this Order addressing those terms.

B. Separable From and In Juxtaposition

The '078 Patent provides that the "rigid plate" should be "separable from" the second frame member to allow the bag to move from its contracted to its expanded position. (Col. 7, lines 64-67.) Paragon argues that in order to be "separable from" the frame, the plate must be adjacent to the frame. (Def. Reply at 4.) The Court disagrees. Separation is relative, and given its plain meaning, "separable" does not imply attachment nor adjacency. Even if two components are not near each other, they can still be separated further and could be described as "separable." However, "separable from" must be read in context of the entire claim, which states that the plate must be "separable from" the frame between positions in which the plate is "in juxtaposition" with the frame. The real issue is not what "separable from" means but rather what "in juxtaposition" means.

Paragon points to language in the specification that describes the plate as "slidably overlying" the frame members (col. 2, line 11), to figure 7 in the patent that shows plate 82 in relation to the frame members, and to the "side by side" language in dictionary definitions of juxtaposition, and argues that "in juxtaposition" should be read to mean "adjacent and parallel." (Def. Mem. at 6.) Briggs & Riley argues that "in juxtaposition" simply means near or close to, rather than adjacent. (Pl. Mem. at 12.) Paragon would have the Court narrow the ordinary meaning of juxtaposition, while Briggs & Riley generally supports the ordinary meaning.

The primary definition of "juxtaposition" is "the action of placing two or more things close together or side by side, or one thing with or beside another: the condition of being so placed." OED available at http://www.oed.com. Briggs & Riley is correct that generally stated "juxtaposition" simply means near. Paragon's narrower "adjacent and parallel" definition is not supported by the plain language, the claim, the specification, nor the prosecution history. Adjacent simply means "lying near or close to; adjoining; continuous bordering." OED available at http://www.oed.com. Briggs & Riley objects to "adjacent" to the extent that it implies contact. (See, e.g., Pl. Mem. at 12 (objecting to a requirement of "immediately adjacent to or attached to").) However, the plain meaning of adjacent, while it does not preclude contact, does not require it. To the extent that "adjacent" is consistent with juxtaposition," it is not objectionable.

The specification makes clear, however, that the plate need not be "parallel" to the frame (and indeed, ordinarily cannot be precisely parallel). The invention requires fastening means such as fastex buckles or velcro and describes how the plate "slidably overlies" these fasteners. (Col. 4, lines 11-40.) The presence of these fastening means between the plate and frame in the bag's contracted position would necessarily raise the plate at a slight angle. By the Patent's terms, the plate need only generally "extend in a plane perpendicular to the frame members." (Col. 3, lines 62-63.) Moreover, contrary to Paragon's suggestion, nothing in the prosecution history requires that the plate be parallel. The amendments made during the patent process to include "slidably overlies" and "in juxtaposition" were designed to distinguish the covered invention from an existing bag whose stiffening members pivoted into the bag's interior to lay flat in the bottom of the case. (Tr. at 28.) These
amendments do not require that the plate be exactly parallel to accomplish the intended improvement over prior art by allowing a user to expand the bag while packed with minimal disturbance to the bag's contents, but need only be secured so as not to pivot except slightly as described in the specification (col. 5, lines 4-10).

Accordingly, the intrinsic evidence dictates that "in juxtaposition" should be given its ordinary meaning of two or more things placed close together or near.

Claim Construction

In this case, the question of infringement turns primarily on the interpretation of the phrase "Kaufman-type ion beam source" in claim 1 of the '849 reissue. Litton contends that the appropriate interpretation of "Kaufman-type ion beam source" encompasses any broad-beam, multi-apertured, gridded ion beam source. Litton's proposed construction, however, is inconsistent with the prosecution history of the '849 reissue. See York Prods., Inc. v. Central Tractor Farm & Family Ctr., 99 F.3d 1568, 1575, 40 U.S.P.Q.2d (BNA) 1619, 1624 (Fed. Cir. 1996) ("In a literal infringement analysis, prosecution history is relevant to claim coverage."); see also Howes v. Medical Components, Inc., 814 F.2d 638, 645-46, 2 U.S.P.Q.2d (BNA) 1271, 1275-76 (Fed. Cir. 1987).

In the course of prosecuting the '849 reissue, Litton argued that the term "ion beam source" in its original claims could not "properly be construed to refer to any other ion beam gun but the Kaufman gun." Paper No. 15 at 8. Moreover, a declaration accompanying Litton's remarks plainly stated: "Those skilled in the coating arts . . . would reasonably construe these claims to refer . . . only to the Kaufman-type ion-beam guns referred to in the specification of this application." Paper No. 16 at 7. Thus, Litton defined "ion beam source" to mean only the Kaufman-type gun. This definition acquires even more credibility when Litton later amended its claims to cover a "Kaufman-type ion beam source." If, as Litton insisted, one of skill could only construe the broad term to mean a Kaufman-type gun, certainly the specific term encompasses nothing more.

At column 4, lines 44-57, the reissue's specification describes a Kaufman-type ion beam source:

The ion beam gun 4 is a commercially available ion emitting apparatus generally known in the art as a Kaufman [sic] type ion beam gun. The gun's cathode 6 is a thermionic emitter, i.e., it emits electrons by passing an electric current through it which heats the wire. The cathode 6 emits electrons which are accelerated towards the anode 8. The electrons being accelerated from the cathode to the anode strike argon atoms and in so doing dislodge electrons from the argon. The results are positively charged argon ions which are accelerated away from the anode and towards the grids 12 and 14. Permanent bar magnets 10 attached to the anode introduce a magnetic field into the area between the cathode and the anode . . . (Emphasis added.) Thus, this court interprets the phrase "Kaufman-type ion beam source" to include a thermionic (hot-wire) cathode, an anode, grids, and magnets.

This court detects no legally significant distinction between the phrases, "Kaufman-type ion beam source" and "Kaufman-type ion beam gun." During the prosecution of the reissue, Litton used the terms "gun" and "source" interchangeably. For example, in response to one of the examiner's rejections, Litton stated: "Applicants need not add the words 'Kaufman gun' or 'Kaufman source' to claim 1 because claim 1 cannot properly be construed to refer to any other ion beam gun but the Kaufman gun." Paper No. 15 at 8.

In sum, after consideration of the primary sources for construing patent claim meaning, this court interprets the phrase "Kaufman-type ion beam source" to encompass any ion beam gun with the four stated components: a hot-wire cathode, an anode, grids, and magnets.
Plaintiffs propose for the above terms the following construction: "an element that protrudes or projects from the surface of another element and that can engage or actuate another mechanism or element." "Keys is the plural of key." Defendants propose the following construction: "projection attached to the second end cap at the cylindrical portion or the annular base or both." Defendants construe "Keys" as "projections attached to the second end cap at the cylindrical portion or the annular base or both." Plaintiffs argue the specifications do not limit the keys to any particular size or shape. Baldwin wants limiting language requiring the keys be connected to the cylindrical portion, annular base or both. The claims do not place this requirement on the keys according to Plaintiffs. Plaintiffs cite to claims 1 & 7 of the 692 patent, wherein the keys are fixed to and supported by the second end cap and not the annular base or cylindrical portion or both. Defendants contend every figure in the patent shows the keys attached to the cylindrical portion or annular base.

The Wix Court

The Wix Court construed keys as "protrusions that unlock or release a latch device and also engage or actuate valve device."

The Court's Construction

The parties main dispute in the construction question before the Court is not predominately what the keys do, rather, it regards whether they are required to be attached to the cylindrical portion, annular base or both. The Wix Court did not construe, nor does it appear, the parties sought a limitation regarding the placement of the keys.

In the Abstract, the keys are described as part of the valve-actuating portion, and "spaced around the annular base and projecting radially inward from the cylindrical portion and axially outward from the base." '623 patent, Abstract. The specifications describe the position of the keys in the Detailed Description as

[a] plurality of keys, as at 116, are provided internally of the valve-actuating portion 102 extending axially outwardly from the second central opening 110 and flat annular base 108 toward the first central opening 101. . . . Each key has one radially outer edge attached directly to the cylindrical portion 104 and another axially inner edge attached directly to the annular base 108, although the keys could be attached to just one of these elements." Id. at col. 8, ins. 43-55.

The Summary of the Present Invention and Detailed Description sections of the specification place the keys:

internally of the cylindrical portion of the lower end cap . . . . [which] includes an annular base dimensioned to fit within the cylindrical portion, and a plurality of thin, flat keys projecting axially away from the annular base." Id. at col. 3, ln. 66-col. 4, ln. 3; see also id. at col. 8, ins. 43-44 (keys are "provided internally of the valve-actuating portion (102)).

According to Defendants, "Every figure of the '692 and '623 patents that shows the valve-actuating portion and keys illustrates the keys as being attached within the interior of the valve-actuating portion, to either the cylindrical portion, the annular base, or both. Id. at Figures 1, 2, 4, 5, 6, 7, 17, and 18.

However, federal case law holds that while the specification may make clear that a claimed invention is narrower than the claim language, see Alloc, Inc. v. Int'l Trade Comm'n, 342 F.3d 1361, 1370 (Fed. Cir. 2003), ultimately, because it is the claims of the patent that define the scope of the patent invention, a construing court must be careful not to read into the claims limitations that may appear in the specification. See Interactive Gift, 256 F.3d at 1331-32. Keeping these principles in mind, the Court finds that Baldwin's proposed construction of key and keys limiting their placement on the cylindrical portion or annular base is a limitation imported from a specific embodiment that is not so limited in the claims themselves. Therefore, the Court adopts the Wix description without the additional limitation of attachment to the annular base or cylindrical portion sought by Defendant.

I. "Kit"

The first step in claim construction is to look at the language of the claim itself. Bell Atlantic, 262 F.3d at 1267. Claim terms are given their ordinary and accustomed meaning as understood by one of ordinary skill in the art.Id. Dictionary definitions
may be examined to determine a claim term's ordinary meaning. CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002). Here, dictionary definitions support both parties' interpretations of the term "kit." For example, "kit" can be defined as "a set of parts to be assembled," which does not imply a container requirement, but it can also be defined as "a packaged collection of related material." Webster's Ninth New Collegiate Dictionary 663 (1991). Zimmer points to a dictionary defining "kit" as "a collection of equipment and often supplies typically carried in a box or bag." Webster's Third New International Dictionary 1246 (1986). While DePuy correctly notes that the term "typically" in that definition means that a box or bag is not required to turn a collection into a kit, it also implies that the ordinary and accustomed meaning--the way the term is typically used--includes a common container. Thus, reference to dictionary definitions here is inconclusive as to the ordinary meaning of the term "kit."

When there is more than one ordinary meaning for a claim term, the patent specification serves to point away from improper meanings and toward the proper meaning. Renishaw PLC v. Marposs Societa' Per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998). Here, the specification points to the basic definition of "kit" as "a set of parts to be assembled." For example, the specification describes the kit as consisting of stem members, body members, and head members that are "separate components … adapted to be assembled together to form a custom prosthesis." (3:8-13.) The specification repeatedly refers to the assembly of a prosthesis from the parts in the kit, but fails to mention a common container for the parts. Even when specifically describing the "kit concept" and the "kit form," the patent explains only that the benefits of such a concept or form include a reduction in the inventory required to be maintained by a hospital and increased flexibility by providing for assembly of a prosthesis that may otherwise be unavailable. (3:50-55.) There is no indication that the kit concept or kit form includes a common container. Because the term "kit" in the claim has more than one ordinary meaning, but the specification points only to the ordinary meaning of "a set of parts to be assembled," that is how I construe the claim. The parts are not required to be collected in a common container.

c. The disputed term in Claim 26: "Knit lines"

i. Claim language. The next claim term in the '909 patent that is "in dispute" at this time is in Claim 26. That disputed claim term is "knit lines." Claim 26, with the disputed term highlighted, states the following:

26. The plastic washing machine basket of claim 25, wherein the basket lacks knit lines on the inner surface.

The '909 patent, Claim 26 (emphasis added).

Although Maytag identified "knit lines" as a term "in dispute" in the Corrected Joint Claim Construction Statement (docket no. 67), at 8, Maytag offered no argument in support of its construction of this term in its initial Markman brief. Instead, Maytag argued in its rebuttal brief that "knit lines" is not a term in dispute for infringement purposes, because Maytag is not even asserting infringement of Claim 26. In its surrebuttal, Electrolux contended that this claim term is "in dispute" for purposes of its invalidity challenge, even if it is not in dispute for purposes of Maytag's infringement claims. In its tentative draft ruling, provided to the parties prior to the Markman hearing, the court concluded that this term was not "ripe" for construction, because Electrolux had not shown that the term was "in dispute" for infringement or for any other purpose. However, following the hearing, the court revised that conclusion, and found above, in Section II.A. 1.b., beginning on page 36, that this term is also "in dispute" at this time for purposes of Electrolux's "enablement" challenge to the validity of the '909 patent. Therefore, the court must now construe this term, as well.

ii. The parties' definitions and arguments. Pursuant to the court's September 6, 2005, Order (docket no. 61), the parties both offered constructions of this term. The parties' proffered definitions of this term are the following, with bold font indicating differences between their definitions. Again, the authority on which each party relies for its construction is shown just below that party's definition.

"KNIT LINES"

| Maytag's Definition | Electrolux's Definition |
| "a line that visually indicates a defect on a molded plastic article caused by the meeting" | "lines that may or may not be visible to the human eye that form when the molten plastic" |
of two flow fronts during the molding operation"

Maytag's Authority

'909 patent, col. 1, 11, 24-25;
col. 1, 11, 22-25; col. 5, lines 48-56; col. 6, lines 55-59; ProtoMold website

At Markman hearing, Maytag focused on the specification, pointing out that the purposes of the invention are, inter alia, to produce a washing machine basket with a smooth inner surface and to eliminate "knit lines" that "visually indicate defects." Thus, Maytag contends that the appropriate construction of "knit lines" requires a limitation to "visible knit lines" or "knit lines that visually indicate a defect," not "invisible" lines. In response, Electrolux argued that there is no "visible" or "visual" limitation on "knit lines" anywhere in the claims or specifications of either patent. Thus, Electrolux contends that it would plainly be inappropriate to import a "visibility" limitation into the construction of "knit lines." While Electrolux concedes that "knit lines" may be visible, Electrolux argues that nothing in the patent requires that they be so construed.

iii. Analysis. The court, once again, begins its construction of this term with the points of agreement between the parties. The parties agree that "knit lines" are formed when two flow fronts of molten plastic meet during the molding operation, for example, when the molten plastic flows around the core pins. Compare Maytag's definition ("a line that [is] caused by the meeting of two flow fronts during the molding operation"), with Electrolux's definition ("lines that form when the molten plastic flows around the core pins and then solidifies"). Maytag's definition is insufficiently specific in this regard, because it does not explain that the "flow fronts" are the flow fronts of molten plastic, where plastic is the material from which the patented washing machine baskets are made. On the other hand, Electrolux's definition is too specific in this regard, in that it suggests that "knit lines" are only formed by the flow of the molten plastic around the core pins, where there is no such limitation to be found anywhere in the patent. Thus, in it is conceivable that "knit lines" could be formed elsewhere in the plastic washing machine basket, as the mold fills, even if there is only a single nozzle 116 to inject molten plastic into the mold. Thus far, therefore, the court construes "knit lines" to be "lines formed when two flow fronts of molten plastic meet during the molding operation."

The crux of the parties' dispute over the construction of this term, however, is whether or not the "knit lines" must be "visible." While the parties appear to agree that it is impossible, with present technology, to eliminate "knit lines" entirely, Maytag contends that only the "visible" knit lines matter to the claimed invention. It is true that the "Background To The Invention" states, "Knit lines cause reduced structural integrity and visually indicate defects." The '909 patent, col. 1, ll. 24-25 (emphasis added). However, this statement refers to what "knit lines" visually indicate, not to whether "knit lines" are themselves only significant if they are "visible." Indeed, the statement also recognizes that "knit lines cause reduced structural integrity," without any limitation on whether or not the "knit lines" are visible. Furthermore, nowhere else in the patent specification or claims is there any limitation of the "knit lines" in question to "visible knit lines," even where the patent specification or claims refer to "undesirable knit lines," see, e.g., id. at col. 1, ll. 36, 44-45, or to the claimed invention of a plastic washing machine basket that is "without knit lines" or "lacks knit lines." Id. at col. 1, l. 48 & Claim 26. While it is possible, even probable, that the patentee's focus was on "visible" knit lines, because it is or may be impossible, with present technology, to eliminate "invisible" knit lines, that is not what the patentee actually claimed. If the court were to construe "knit lines" everywhere the term appears in the patent to mean only "visible knit lines," the court would be grossly modifying what was claimed.

Finally, while it may be undisputed--and even true--that "knit lines cause reduced structural integrity and visually indicate defects," see id. at col. 1, ll. 24-25, the court finds it unnecessary and inappropriate to import such a limitation into the construction of "knit lines." Even without the possible inappropriate and incorrect suggestion that this statement means that only "visible" knit lines matter in the '909 patent, importation of such a limitation would improperly import or read a limitation from the specification into construction of the claim term. See Playtex Prods., Inc., 400 F.3d at 906 ("The court must take care in its analysis, when locating in the written description the context for a disputed term, not to import a limitation from that written description. It must use the written description for enlightenment and not to read a limitation from the specification [into the construction of the term].") (citing Comark Comms., 156 F.3d at 1186-87). Finally, the consequences of refusing to read a "visible" limitation into the construction of "knit lines"--for example, for purposes of
Electrolux's "enablement" defense--are irrelevant to claim interpretation. See, e.g., PPG Indus., 156 F.3d at 1355 (the inevitable imprecision of patent claims "does not mean that a court, under the rubric of claim construction, may give a claim whatever additional precision or specificity is necessary to facilitate a comparison between the claim and the accused product"); see generally Markman, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (patent claim construction is a question of law for the court that is separate from determination of whether infringement has occurred). Thus, "visibility" of the "knit lines" is simply not part of the proper construction of the term.

Therefore, the court construes the term "knit lines" to mean "lines formed when two flow fronts of molten plastic meet during the molding operation."

D. "L-shaped"

The Court does not find the claim language, specification or prosecution history limit the connector element or member to a part having only two legs, and therefore rejects Defendants' proposed construction requiring that the connector element or member have only two legs. The Court finds the term "L-shaped" is in its simplest form and that Plaintiff's proposed construction does not add any clarity to the term.

The Defendants further request that the Court develop a construction for "engagement member including an L-shaped member." The proposed construction, however, primarily involves Defendants' assertion that "L-shaped" is limited to two legs connected as substantially a right angle. As explained above, the Court does not find that "L-shaped" is limited solely to a part having two legs.

C. "L-shaped"

The Court does not find the claim language, specification or prosecution history limit the connector element or member to a part having only two members joined at a 90 degree angle, and therefore, rejects Defendants' proposed construction, which is: shaped like an L without regard to any particular type font style - i.e., with two linear members that are joined at one end at a 90 degree angle. The Court finds the term "L-shaped" is in its simplest form and that Plaintiff's proposed construction does not add any clarity to the term.

2. "L-Shaped" as used in claims 5 and 6

Plaintiff's proposed construction: "bent from the vertical"

Defendant's proposed construction: "bent at a 90 [degrees] angle"

 Courts's construction: No construction necessary at this time.

Defendant contends that the term "L-shaped" must be construed to have only a 90 [degrees] angle because an "L" is always bent at a 90 [degrees] and because figure 11 in the specification illustrates the "L-shaped" tabs as bent at 90 [degrees] angles. I disagree. As an initial matter, a description or depiction of a preferred embodiment in the specification does not require importing a limitation unless the patent expressly discloses this limitation. Moreover, defendant cites no language in the claim language or specification that identifies an "L-shape" as having to be 90 [degrees]. The closest example defendant identifies is a passage in the specification in which the L-shaped tabs are "bent over to secure the base portion of the bearing members 42 against the lower face fo the platform . . ." '420 Pat., col. 4, lns 32-34. Defendant reasons that because the tab
must be bent over to secure the bearing it can only be at 90 [degrees]. However, defendant offers no evidence that corroborates its reasoning and it is not readily apparent that a tab must be at 90 [degrees] to secure the bearing member to the platform.

At the same time, plaintiff's proposed construction is far too broad and contradicts both the claim language and the dictionary definition of "L-shaped." An "L" is defined as "a shape like that of a capital L." New Oxford American Dictionary, 943 (2d ed. 2005)(emphasis added). Although this definition borders on syllogistic (i.e., an "L" is something like an "L"), it is helpful in that it shows that the common usage of the term does not require an L-shaped tab to be exactly 90 [degrees]. However, if "L-shape" simply meant "bent from the vertical" it could encompass any angle from 0 [degree] to 90 [degrees]. As with defendant's proposed construction, no language in the claim or the specification suggests this interpretation either. In describing the claimed element the patentee choose the term "L-shape" as a means of limiting the possible angles at which the tab could be bent. Because neither party has offered a construction that clarifies the disputed term, I will not construe the term "L-shaped" at this time.

2258

Claims 6-9 of the '661 Patent

Claims 6, 7, 8, and 9 of the '661 patent further describe the corner piece apparatus. Claim 6 includes a limitation describing "a flange portion . . . with an L-shaped edge portion being offset at an angle less than 90 degrees from the corner section front surface so that said L-shaped edge extends rearwardly in a direction from said corner section front surface to said corner section rear surface." (Emphasis added). The Court construes this language to require the L-shaped portion to extend rearwardly at an angle less than 90 degrees. Further, the L-shaped portion is to extend from the front surface of the corner section to the rear surface of the corner section.

2259

3. The Proper Construction of the Term of an "L-Shaped Guide Rod" as Used in the Claims of Both the '203 and '885 Patent.

The Parties' Proposed Claim Construction of an L-Shaped Rod. 2

2 Neither party argues that a substantial difference exists between the term an "L-shaped guide rod" used in the '885 patent and the terms an "L-shaped femur guide rod" and an "L-shaped tibia guide rod" used in the '203 patent. In addition, the specification states that the L-shaped tibia guide rod and the L-shaped femur guide rod are identical. ('203 patent, Col. 2, Lines 17-19). Thus, the discussions and arguments concerning the L-shaped rod applies to all three structures.

Defendants assert that a proper construction of the term an "L-shaped guide rod" would be "a slender, integral, round bar with two straight portions joined at 90 degrees to each other in the shape of an 'L'." Defendants emphasize that the rod is made entirely out of one piece.

Plaintiff argues that the term "an L-shaped rod" should be construed to mean the following. "A two portion structure. The first portion is generally the longer portion of the guide rod and is adapted to be inserted into the medullary canal. The second portion is generally the shorter portion of the guide rod and is at approximately right angles to the first portion." Thus, plaintiff emphasizes that one leg of the "L" could be formed by attaching a separate part to the straight rod. Plaintiff argues that defining the "L-shaped rod" by using the term a "bar" contradicts the patent's claims and specification because a "rod" defines one type of structure found in plaintiff's claims and a "bar" describes another type of structure found in plaintiff's claims. Furthermore, plaintiff argues that limitations not expressly appearing in a claim should not be read into
plaintiff's claims.

In support of defendants' construction of an L-shaped rod, defendants submit that the ordinary meaning of the term "rod" is "a slender, straight, round stick or metal bar." Oxford American Dictionary, 786 (1980). Extrinsic evidence such as a dictionary may not contradict the meaning of a term used in a claim. Multiform Desiccants, Inc. v Medzam, Ltd., 133 F.3d 1473, 1478 (Fed. Cir. 1998). In the '885 patent claims, an L-shaped rod, a tibia bar, and a femur bar are three distinct structures found within the claims. (See claims 1, 2, and 4). Moreover, the court finds that the term "rod" is common word possessing a customary meaning. "Words in a claim are generally given their ordinary and customary meaning." Vitronics, 90 F.3d at 1582. Therefore, the court finds that defining the L-shaped rod by using the term "bar" would be inappropriate.

Next, plaintiff argues that limitations not appearing in a claim should not be read into a claim. See, Comark Communications, Inc. v Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998). (Claims are to be interpreted in light of the specification and with a view to ascertaining the invention; however, it does not follow that limitations from the specification may be read into the claims). Plaintiff submits that the limitation of "one integral piece" modifying the term of "an L-shaped rod" does not expressly appear in the prosecution history, the written disclosure, or in the claim language. Thus, plaintiff asserts that the intrinsic evidence imposes no limit on the number of pieces that can be fastened or joined together to make up the claim element of "an L-shaped guide rod." Similarly, plaintiff asserts that the express words of "straight, slender, or round" do not appear anywhere in the claims or in the written disclosure.

Defendants counter by submitting that figures 1a, 2a, 2e, 3, 6, and 7b of the patents do illustrate an L-shaped guide rod bearing all four of those characteristics. The drawings along with the written disclosure and original claims constitute the specification. Vitronics, 90 F.3d at 1584. Therefore, the structures described in the specification including the drawings guides a court in construing the literal scope of the terms used in the claims, but do not restrict the scope to solely those structures. "In construing a claim, a court does not impart additional limitations into a claim from reviewing the specification; rather, the court looks to the specification to aid the court in interpreting the meaning of a term already in a claim." Ethicon Endo Surgery Inc. v U.S. Surgical Corp., 93 F.3d 1572, 1578 (Fed. Cir. 1996). Thus, this Court must examine the claim language in light of the specification to determine the literal scope of the disputed term.

The Language of the Patents' Claims Concerning an L-shaped Guide Rod.

The term, an L-shaped guide rod, appears in claims 1 through 5 of the '885 patent and claims 1, 2, 3, 7, and 8 of the '203 patent. Claim 1 of the '203 patent typifies the term's use in the claims. Claim 1 recites: "Inserting an L-shaped femur guide rod into the medullary canal of the femur, the femur guide rod having a first portion and second portion disposed at right angles with respect to the first portion." (Emphasis added.). Claim 1 of the '885 patent uses the term, an L-shaped guide rod, in a similar manner. Claim 1 recites: "An L-shaped guide rod having a first elongated portion adapted to be inserted into the medullary canal of the femur and a second portion disposed at a right angle to the first portion." (Emphasis added.) Literally, claim 1 recites "An L-shaped *** rod *** to be inserted," which implies that the rod is a single piece with two portions when inserted rather than a multiple piece rod that forms the 'L' shape when the guide member attaches. When two equally plausible interpretations exist of disputed term in a claim, then the court should adopt the narrower interpretation. Athletic Alternatives, 73 F.3d at 1579.

Claim 2 of the '885 patent uses the term an "L-shaped guide rod" in this context. "A femur bar *** being adapted to being mounted on the second portion of the guide rod. Claim 2 supports plaintiff's argument that the patent considers a "bar" a distinct structure from a "rod."

The Specification's Use of an L-shaped Guide Rod.

The specification discloses that "the guide rod has a 90 degree angle bend and is adapted to be inserted into the femur for use in aligning the guide member." ('203 patent, Col. 2, Lines 5-11.) A second identical guide rod is provided along with a tibia adapter and a tibia bar for use with a guide member." ('203 patent, Col. 2, Lines 17-19.) As noted above, the Figures 1a, 2a, 2e, 3, 6, and 7b in the '203 and '885 patents illustrate an integral, straight, slender, and mostly round L-shaped guide rod. The term, "L-shaped guide rod," is pervasively used throughout the specification; yet, the specification neither expressly nor implicitly indicates that the L-shaped guide rod may be formed from two distinct parts fastened together. Similarly, the specification does not expressly or implicitly indicate that the portions of the rod that form the "L" shape may be anything but straight.
The Prosecution History Concerning an L-shaped Guide Rod.

In the prosecution history of the '203 patent, plaintiff did not disclaim any interpretation of the term of "an L-shaped guide rod." Plaintiff told the examiner in his Amendment that "the guide rod includes two portions, a first portion which inserts into the femur and a second portion at a right angle to the first portion. A guide member is affixed to the second portion of the guide rod." Thus, plaintiff merely restated to the examiner the claimed elements that make up the term an "L-shaped guide rod."

Defendants' proposed construction of a "round" L-shaped guide rod is not entirely accurate. The specification describes the L-shaped guide rod as having a threaded portion possessing a flat portion along one side thereof. "The flat portion of the L-shaped rod having sets of measurement marks to indicate the thickness of tibia components." ( '885 patent Col. 5, Lines 37-40.) The described embodiment in plaintiff's patent depicts a rod that is substantially round but also possesses a flat segment on the second portion of the guide rod. (See also Figure 3.) Therefore, defendants' proposed claim interpretation of "a round bar" would not include the specification's described embodiment within the literal scope of the claim. A claim interpretation that would exclude the patentee's device is rarely the correct interpretation. Modine Manufacturing Co. v. U.S. Intern. Trade. Com'n., 518 U.S. 1005, 75 F.3d 1545, 1550 (Fed. Cir. 1996).

Conclusion of the Meaning of an L-shaped Guide Rod.

The court finds that the specification does not use the term "L-shaped guide rod" in a special or unique way. The court finds that plaintiff did not disavow any interpretation of the L-shaped guide rod in his effort to obtain the patent. Therefore, the ordinary meaning of the L-shaped guide rod term to one skilled in the art controls as long as the described embodiment in the patent specification falls within the literal scope of the claim language. The court finds that no express evidence exists in the claims or specification to sustain plaintiff's assertion that the rod may be formed from multiple pieces. Similarly, the court finds that the use of the term "L-shaped guide rod" in the claims does not dictate reading the non-express limitations of "slender" or "round" into the construction of the term. Thus, the court construes the term, "L-shaped guide rod" to possess the following meaning: "an integral rod having two straight portions joined at approximately 90 degrees with respect to each other. One portion of the rod is elongated and used for insertion into the femur or the tibia and the other portion is used for receipt of a guide member."

13. "L-shaped magnet liner"

This term is contained in an independent claim in the 117 patent. 137

As to this term, the Court construes the following meaning: the liner itself is in the actual shape of the letter "L." The specification supports this interpretation: "Fig. 10 illustrates a side view of an L-shaped magnet liner," 138 as does the drawing in Figure 11. Construction of this phrase involves little more than the application of the widely accepted meaning of commonly understood words used in the patent.
D. Laid-Over State

The term Laid-Over State is construed to mean a condition in which the pleats have leg surfaces in intimate contact and pleat heights that are greater than the distance between the outer and inner peripheries of the filter element. This construction, proposed by Cuno, is directly supported by the intrinsic evidence.

The claims do not define the term "laid-over state." The parties agree, however, that, in this instance, the inventors of the patents have acted as their own lexicographers and provided a definition of the term "laid-over state," and that definition is controlling. See Novo Nordisk, 2000 U.S. Dist. LEXIS 3384, at *4. The parties disagree, however, as to that definition. Cuno, citing to the description of the preferred embodiments in the specification, argues that "laid-over state" means "a condition in which the surfaces of the legs of the pleats are in intimate contact and the height of each pleat is greater than the distance between the inner and outer peripheries of the filter element." Pall, citing to the Summary of the Invention, seeks to add the following to Cuno's proposed construction: "(i.e., \([D-d]/2\)) so that the resulting pleat has a height and surface area usable for filtration much greater than that of a conventional filter of the same dimensions."

The Summary of the Invention provides that "[b]ecause the pleats are in a laid-over state or because the height of each pleat is greater than the difference between the outer and inner radii, the height of the pleats is much larger than that of a conventional filter of the same dimensions." '047 patent, col. 2, lines 23-27. In this section, the patent teaches that the term "laid-over state" means a condition in which the height of each pleat is greater than the difference between the outer and inner radii. This condition - laid-over state - involves pleats whose heights are much larger than that of a conventional filter. Further, in the description of preferred embodiments, the inventor explicitly defines laid-over state.

The condition illustrated in FIGS. 2 and 3 in which the surfaces of the legs 11a of the pleats 11 are in intimate contact and in which the height \( h \) of each pleat 11 is greater than the distance between the inner and outer peripheries of the filter element (i.e., \([D-d]/2\) in FIG. 2) will be referred to as a laid-over state.

'047 patent, col. 4, lines 18-23. The inventor expressly and unambiguously defined "laid-over state" as a condition in which the surfaces of the legs of the pleats are in intimate contact and in which the height of each pleat is greater than the distance between the inner and outer peripheries of the filter element. The language that Pall proposes to add to this definition applies to one preferred embodiment - (i.e., \([D-d]/2\)) - and compares its filter to other filters. Since the patentee chose to expressly define this term, such definition controls and the Court declines to include the proposed limitations in the definition. See Aqua Prods., 2007 U.S. Dist. LEXIS 41496, at *6 ("the patentee's definition of the term controls the claim construction over any general meaning for a term") (citing Vitrionics, 90 F.3d at 1582); see also Phillips, 415 F.3d at 1323.

13. "Laminator Apparatus"

The phrase "laminator apparatus" is construed to mean, "Equipment that is used to unite two or more layers of material, such as the core, by the application of heat and pressure."

The specification of the '207 patent notes that the laminator apparatus is used for "the manufacture of plastic cards including at least one electronic element therein." '207 patent, col. 2:16-20, and that it is used to unite the plastic core sheets and the electronic element, col. 4:22-5:5.

Plaintiff proposes that the specifications and the prosecution histories of the Patents indicate that a "laminator apparatus" is "equipment that is used to unite two or more layers of material, such as the core, by the application of heat and pressure." (Pl. Br. at 23-24.) Defendant does not object, so I adopt Plaintiff's definition. (Pl. Br. at 23-24.)

4.1 The Claim Language of Claim 1(b.1)

(b.1) lamp support means located within said reflector means at the base end thereof for supporting a plurality of compact fluorescent lamps substantially equally angularly displaced about said center line within said reflector means between the base end and the light-emitting end thereof,

4.2 Claim Interpretation Analysis: Applicability of §112, P6

A claim limitation may be expressed in means-plus-function format in accordance with 35 U.S.C. § 112, paragraph 6, which reads as follows:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

The use of the word "means" "triggers a presumption that the inventor used this term advisedly to invoke the statutory mandate for means-plus-function clauses." York Prods., Inc. v. Cent. Tractor Farm & Family Ctr., 99 F.3d 1568, 1574, 40 USPQ2d 1619, 1623 (Fed. Cir. 1996). This presumption may be overcome in two ways. First, "a claim element that uses the word 'means' but recites no function corresponding to the means does not invoke § 112, P 6." Rodime PLC v. Seagate Tech., Inc., 174 F.3d 1294, 1302, 50 USPQ2d 1429, 1434 (Fed. Cir. 1999). Second, "even if the claim element specifies a function, if it also recites sufficient structure or material for, performing that function, § 112, P 6 does not apply." Id.; see Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531, 41 USPQ2d 1001, 1006 (Fed. Cir. 1996) ("To invoke § 112, paragraph 6, the alleged means-plus-function claim element must not recite a definite structure which performs the described function."). A claim term recites sufficient structure if "the 'term, as the name for structure, has a reasonably well understood meaning in the art.'" Watts v. XL Sys., Inc., 232 F.3d 877, 880-81, 56 USPQ2d 1836, 1838 (Fed. Cir. 2000) (quoting Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583, 39 USPQ2d 1783, 1786 (Fed. Cir. 1996)). The mere use of the word "means" after a limitation, without more, does not suffice to make that limitation a means-plus-function limitation. Cole, 102 F.3d at 531, 41 USPQ2d at 1006.

In the present case, the "lamp support means" of Claim 1(b) uses the word "means" and thereby presumptively implicates § 112, P6. In addition, the "lamp support means" claim limitation recites a function (for supporting ...), an additional requirement to support the application of § 112, P6. The question then becomes whether this claim element also recites sufficient structure or material for performing that function such that § 112, P6 does not apply. Rodime v. Seagate, supra, 174 F. 3d 1294, 1302. These presumptions can be rebutted if the evidence intrinsic to the patent and any relevant extrinsic evidence so warrant. See, e.g., Cole v. Kimberly-Clark Corp., 102 F.3d at 524, 531, 41 USPQ2d 1001, 1006 (Fed. Cir. 1996) (noting that whether § 112, P 6 is invoked involves an analysis of the "patent and the prosecution history," and consulting a dictionary definition of "perforation" to understand if one of skill in the art would understand this term to connote structure). Personalized Media Communications v. International Trade Commission, 161 F.3d 696, 703 (Fed. Cir. 1998).

When evaluating whether sufficiently definite structure has been recited in this "lamp support means" claim limitation, the Special Master must determine whether the structure recited in that claim limitation is capable of performing entirely the recited function. Sage Products Inc. v. Devon Industries Inc., 126 F.3d 1420, 1427-1428; 126 F.3d 1420, 44 USPQ2d 1103 (Fed. Cir. 1997). The Special Master will initially evaluate the "lamp support means" claim language to identify the function being performed by the "lamp support means" itself.

As indicated in Claim 1(b) quoted above, the "lamp support means" support limitations includes two elements: The first element (b.1) recites the "means" while the second element (b.2) specifies the structural characteristics of the "lamp support surfaces" which is defined as "being includ[ed] within the scope of said lamp support means." The functions performed by the non means-plus-function structural element identified as the "lamp support surfaces" are not relevant to an interpretation of the separately defined element b.1 "lamp support means."
As to the element b.1 "lamp support means" claim limitation, two separately identifiable functions are recited as: 1) supporting a plurality of compact fluorescent lamps substantially equally angularly displaced about said center line [i.e., the centerline of the reflector means defined in the reflector means claim limitation]; and 2) supporting a lamp within said reflector means between the base end and the light-emitting end thereof.

Element 1) of the b.1 "lamp support means" claim limitation states that it supports "a plurality of compact fluorescent lamps." The term "plurality" is a term frequently used and well understood by patent attorneys to mean "two or more" of something. In claim element (b.2), "at least two" lamp support surfaces are specified. Since the two element b.2 lamp support surfaces perform only the function of supporting two lamps, the non-means "lamp support surfaces" perform only the second function of supporting those lamps within the reflector. The fact that the two lamp support surfaces are defined as supporting lamps "on opposite sides" of the "lamp support means" defines a 180 [degrees] angle between the two "opposite" 1 lamps. The lamp support surfaces therefore also perform the first function of supporting at least two lamps. So the non-means "lamp support surfaces" define structure performing both functions required to be formed by the "lamp support means." That result rebuts the presumption that § 112, P6 applies to this "means" claim limitation.

--- Footnotes ---

--- End Footnotes ---

The placement of the two words "lamp support" to the left of the word "means" virtually by itself specifies readily understood physical structure capable of supporting a lamp, i.e., a compact fluorescent lamp. This conclusion is demonstrated by the written description of the '414 patent itself. At Column 4, In. 65, the written description defines the relevant structure itself as a "lamp support." That intrinsic evidence demonstrates that the words "lamp support" define specific structure. See also, Col. 5, In. 13. At Column 10, line 3, where the written description alternatively refers to the same structure depicted in the patent drawings as "lamp support means."

In Allen Engineering Corp. v. Bartell Indus., Inc., 299 F.3d 1336, 1343 (Fed. Cir. 2002), the Federal Circuit was presented with virtually the same category of claims where clearly structural and readily understood words such as "seat," "rigid frame," "motor," "blade," and "gear box" were juxtaposed with the term "means," virtually exactly as done by the patent owner in the present case by juxtaposing the well understood structural term "lamp support" with the term "means." In Allen Engineering, the Federal Circuit observed that Allen Engineering's patent attorney was clearly enamored of the word "means." The same is true with the '414 Tickner patent as was demonstrated above in connection with use of the term "reflector means" which merely specifies a reflector.

In Allen Engineering, the Court ruled that because "[m]ost of these putative means-plus-function limitations contain far too much structure to claim the benefit of § 112, § 6," the original presumption that § 112, P6 applied raised by the use of the word "means" was overcome by the recitation of sufficient structure to preclude § 112, P6 treatment.

As was the case in the Allen Engineering and Cole v. Kimberly Clark cases, Tickner's detailed recitations in claim element b.2 of the structure which performs both of the two recited functions rebuts the that presumption and precludes the application § 112, P 6 to the interpretation the "lamp support means." The dictionary meaning of the term "support" as meaning "to bear the weight of or "to hold in position so as to keep from falling, sinking or slipping" 2 is fully consistent with the conclusion that § 112, P6 does not apply here.

--- Footnotes ---

The "lamp support means" shall therefore be interpreted as a structural support for a lamp located inside the reflector near the base end which performs the function of supporting two or more compact fluorescent lamps at an elevation between the base end of the reflector and the light emitting end of the reflector. The "lamp support means" also supports the two or more compact fluorescent lamps to maintain substantially equal angular spacing between adjacent lamps within a horizontal plane passing through the centerline of the reflector the term "substantially equal" means "approximately equal" or "more or less equal."

The phrase "about said centerline" further characterizes the "lamp support means" as extending around the reflector center line and supporting the compact fluorescent lamps laterally spaced away from the centerline.

(4) "Lamp Support Means"

Defendants object to the Special Master's construction of "lamp support means" as it appears in Claim One of the ‘414 Patent. The relevant language at issue reads in pertinent part:

lamp support means located within said reflector means at the base end thereof for supporting a plurality of compact fluorescent lamps substantially equally angularly displaced about said center line within said reflector means between the base end and the light-emitting end thereof, said lamp support means included at least two lamp support surfaces on said lamp support means on opposite sides thereof and angled toward the base end of said reflector means for causing compact fluorescent lamps supported thereby to extend outwardly at an angle from said center line toward the light-emitting end of said reflector means to substantially parallel said reflector means.

Specifically, Defendants object to the Special Master's recommendation that the presumption created by 35 U.S.C. § 112, P6 (“112/6”) due to the use of the word "means" in combination with "lamp support" is rebutted due to a finding that the claim (Claim One) recites sufficient structure or material for performing the function. However, in reviewing the Special Master's determination, the Court finds that the Special Master's finding is without error.

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

As noted by the Special Master, the presumption of the application of 112/6 created by the use of the word "means" in conjunction with a claim term may be rebutted if: (1) the claim element that uses the word "means" recites no function corresponding to the means, or (2) the claim element also recites sufficient structure or material for performing the function. Rodime PLC v. Seagate Tech, Inc., 174 F.3d 1294, 1302 (Fed.Cir. 1999) (citation omitted). In the instant case, the Special Master determined that the latter basis applied to rebut the 112/6 presumption because the claim recites sufficient structure as the described structure is capable of performing entirely the recited function. The Special Master made this determination because the following functions recited in the above language are provided with the sufficient structure to perform their function: (1) to support a plurality of compact fluorescent lamps substantially equally angularly displaced about the center line, or the vertical axis of the fixture and (2) to support the lamps within the reflector between the base and light-emitting end so that they are substantially parallel to the reflector.
As noted by Defendants, the Special Master did not note the function of supporting the lamps so that they are substantially parallel to the reflector, but the Court finds this omission to be insignificant as this function falls within the scope of the Special Master's construction and rebuttal of the 112/6 presumption.

In opposition to the Special Master's finding, the Defendants argue that it was error because "there is no evidence to demonstrate (and rebut the presumption) that the 'lamp support surfaces' are 'sufficiently definite' structure for performing entirely the above-mentioned functions." (Defendants' Objections, p.11) (Emphasis original). In support of this argument, Defendants cite that the recited function completely omits any reference as to how the "lamp support means" "support" the lamps. In addition, Defendants contend that the Special Master fails to consider how the "lamp support surfaces" support the lamps "about said centerline." In other words, and as articulated at oral argument, Defendants contend that the most basic issue of how the lamps are actually supported, i.e., fastened, is an open question and is wholly absent from the claim language, thus bringing "lamp support means" within the scope of 112/6.

The Defendants' argument ignores the relevant evidence that this Court may consider in determining and construing the language of a claim. In determining whether the 112/6 presumption is properly rebutted this Court considers "evidence intrinsic to the patent and any relevant extrinsic evidence so warrant." Personalized Media Communications, LLC v. International Trade Com'n, 161 F.3d 696, 704 (Fed.Cir. 1998), see also, Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531 (Fed.Cir. 1996) (noting that whether [112/6] is invoked involves an analysis of the "patent and the prosecution history," and consulting a dictionary definition of "perforation" to understand if one of skill in the art would understand this term to connote structure). The intrinsic evidence clearly answers the Defendants' questions regarding the support to the lamps identified in Claim One. For instance, and as conceded at oral argument by the Defendants, the specification of the '414 Patent defines what would constitute sufficient "lamp support." The Special Master noted such in the Report and Recommendation by stating that "the written description defines the relevant structure itself as a "lamp support."" (Report and Recommendation, p.9 (citing '414 Patent, Col. 4, 1. 65)). In addition, as noted by Plaintiff, the specification identifies that the "compact fluorescent lamps" include both the lamps and the sockets to support and secure them. ('414 Patent, Column 8, Lines 49-52 - "[t]he base end of the fixture is divided into eight equal segments 125/126 to provide a mounting surface or lamp support surface for mounting compact fluorescent lamps 40/45 on each of the surfaces..."). As such, the Defendants' argument is not well taken on this point as it fails to consider the relevant intrinsic evidence in determining the application of the 112/6 presumption raised by "lamp support means." Moreover, this intrinsic record also rebuts Defendants' argument regarding any alleged inconsistency between the prosecution history of the '414 Patent and the inapplicability of the 112/6 presumption. In fact, it is relevant to note that Mr. Tickner, in support of his reissued application, provided a declaration to the USPTO that "it was never [his] intention to define this element using functional language under [112/6]." (Defendants' Markman Hearing Exhibits, Exhibit 12, GT 003701).

As such, because the Special Master properly applied and rejected the presumption of 112/6 raised by "lamp support means," the Court will overrule Defendants' objections to the Report and Recommendation in this respect.

2. "Lanced"

Second, Bridgeport argues that, because the production of the spring locking members on its adaptor involves the removal of metal, rather than only the cutting thereof, the process does not constitute "lanc[ing]," as required by claims 2, 3, and 4 of Patent '050 and claims 4 and 5 of Patent '164.
The quick connect fitting of claim 1 wherein said spring locking members are integral with and lanced out of said circular spring metal adaptor.

(Doc. 83, Exs. A, B (emphasis added)). Turning again to reference materials to ascertain plain meaning, Webster's Third New International Dictionary defines "lance" as "to make an incision," see WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 1268, and technical manuals define "lancing" as "cutting a slit of any shape part way across [a] strip or blank … [in order] to free a section of the piece so that it can be bent," see ARTHUR D. ROBERTS & SAMUEL C. LAPIDGE, MANUFACTURING PROCESSES (1977). These materials do not state that "lancing" cannot also include the removal of metal. To the contrary, according to these definitions, a "lanced out" member of an adaptor is a portion formed by one or more cuts in the metal of the adaptor, with or without the removal of additional material.

The context in which the term is used supports this interpretation. The claim language mandates that the spring locking members be not only "lanced out" of but also "integral with" the adaptor. This additional limitation requires that the members be a part of the same piece of metal as the adaptor, see WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 1173 (defining "integral" as "formed as a unit with another part" and giving as an example "the steam chest may be an integral part of the turbine casing or may be bolted to it"), but it does not suggest, as Bridgeport contends, that metal cannot be removed during or after the lancing process. 11 Neither the general and technical reference materials nor the claims and specifications support Bridgeport's interpretation that no metal may be removed during the production process. Accordingly, the court will not read such a limitation into the claim language. See Specialty Composites v. Cabot Corp., 845 F.2d 981, 987 (Fed. Cir. 1988). Hence, the court will construe "lanced" to mean a process in which one or more cuts are made in the metal of the adaptor to form a spring locking member, with or without the removal of additional material.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

11 For example, cutting additional metal from the end of a spring locking member would not detach it from the adaptor, rendering it no longer "integral with" it, but would only lessen the size of the piece.

雅汶华建议将术语"land"定义为"载体带之间的区域"。3M提出较窄的定义，"较平坦的、较低的区域在载体带的表面之间。"雅汶华声称3M的图可以证明"lands"是实际存在的，3M不反驳，但认为这些区域不只是空的，而是有目的的结构，在注明是需要更具体地描述。雅汶华指出，专利中强调了冲压设计的灵活性，包括凹痕的深度。此外，专利考虑到冲压过程中产生的凹痕，包括冲压后在相片的冲压部分。因此，这过程中涉及的金属不会被去除并称为"lancing." 这一运动并举，将"lanced"定义为"在金属中制作一个过程，其中形成一个弹簧锁定成员，带有或没有去除额外的材料。

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

Applying this construction, and considering the evidence in the light most favorable to Arlington, a reasonable jury could conclude that Bridgeport's product literally infringes on Arlington's patents. Bridgeport's design requires the making of several cuts into the metal of the adaptor to allow certain sections, the spring locking members, to be bent away from the plane of the adaptor. That this process involves the removal of metal does not disqualify it as "lancing." The motion for summary judgment on these claims will be denied.

III. Lands

Avery proposes defining the term "land" as "the area of the carrier web between ridges." 3M proposes a narrower definition of "relatively planar, lower regions on the surface of the carrier web between the ridges." Avery asserts that the diagrams of 3M's product demonstrate that the lands are, literally, the areas between the ridges. 3M does not disagree, but contends that the lands are not just empty space, but are intentionally created structures that should be more specifically described in light of the specification.

The Court finds that lands need not be "relatively planar." On one occasion, the specification describes the lands in figure 3 as "relatively planar lands 27, i.e. large squares that have been depressed from the initial surface of liner." (Col. 4 line 67.) However, the descriptor "relatively planar" is not used at any other point in the patent, including in connection with the nine other references to lands 27. This leads the Court to conclude that the one reference to relatively planar amounts to no more than an adjectival phrase describing the particular lands in figure 3. Further supporting the Court's view that the lands need not be "relatively planar" is the patent's emphasis on the flexible design of the embossing creating the lands, including the depth of the embossed pattern. (Col. 6 11. 5-62.) Finally, the Court notes that the patent contemplates depressions created by
the first embossing of varying depths. (Col. 3 11. 16-18.) A very deep depression may, given the total thickness of the carrier web, render the land not relatively planar. In light of the above, the Court defines lands as "areas of the surface of the carrier web between the ridges."

C. Patent '795

Patent '795 describes a "Z-Fold Mailer with Reusable Reply Envelope." Central States has asked the Court to construe the terms contained in independent Claim 1: "said first line of weakness spaced from said first fold line a distance large enough to contain postal address bar coding between said first line of weakness and said first fold line on said first face." The claim describes an area on the lower right-hand corner of the completed mailer in which a postal barcode is placed by the sender. Central States argues that the "distance large enough" language should read to mean "at least 5/8." Central States arrives at a 5/8" distance using the United States Postal Service ("USPS") guide, Designing Letter Mail ("the Guide"), Publication No. 25, Aug. 1995, which outlines the design criteria for bar-coded mail pieces. Central States asserts that a person reasonably skilled in the art would interpret the claim terms to mean that the mailer must comply with USPS regulations. Moore disagrees, arguing that the distance is large enough as long as the a barcode can be placed within the space.

Before a court can rely upon extrinsic evidence, it must first decide whether the intrinsic evidence gives meaning to the terms. See Vitronics, 90 F.3d at 1582. The only indication of the claim's meaning is found in the patent's description of the drawings. The description states that the distance is "about one half inch." Patent '795, col. 6, line 7. No other claims, specifications, or prosecution history evidence shed light on the meaning of the term "distance large enough." Therefore, it is appropriate to read the limitation of "about one half inch" into the claim as the "distance large enough."

Since the intrinsic evidence does not fully answer what is a "distance large enough," but merely indicates an approximate distance, it is appropriate to rely on extrinsic evidence. "Distance large enough" is an example of a common, but imprecise, term that will be given its meaning as one ordinarily skilled in the art would interpret it. See Conopco, 46 F.3d at 1561. This Court believes that a person ordinarily skilled in the art would rely upon the USPS's postal regulations to define the term since the regulations outline the requirements for postal bar codes. Therefore, the USPS design Guide can properly be considered.

The USPS Guide states that the "Conventional Lower Right Barcode Clear Zone" is 4 3/4" wide and 5/8" tall and is located in the far lower right corner of the mailing. A conventional, lower right barcode containing recipient zip-code information must be printed within this area. The USPS's Guide states that the first bar of the barcode must appear between 3 1/2" and 4 1/4" from the right edge of the mail piece. Id. at 54. An additional limitation is applied to five-digit barcodes, which must begin between 4 1/8" and 4 1/4" from the right edge of the mail piece. Id. The Guide further graphically illustrates that the barcode must be within an area from 3/16" to 7/16" from the bottom of the mail piece. Id. at 55, ex. 5-8. The Guide states that the barcodes "must be positioned to meet the specifications." The top of the barcode must then be under 7/16" from the bottom of the mail piece.

A primary purpose of disclosure in patents is "to guard against unreasonable advantages to the patentee and disadvantages to others arising from uncertainty as to their rights." General Electric Co. v. Wabash Corp., 304 U.S. 364, 369, 82 L. Ed. 1402, 58 S. Ct. 899 (1938). To allow vague and uncertain claims would "be in direct contravention of the public interest which Congress therein recognized and sought to protect." United Carbon Co. v. Binney & Smith Co., 317 U.S. 228, 232, 87 L. Ed. 232, 63 S. Ct. 165 (1942). Notice requires that the "reasonable competitor" have notice of a patent's limitations. See generally, Hoganas AB v. Dresser Indus., 9 F.3d 948, 952 n.15 (Fed. Cir. 1993).

A reasonable competitor could conclude that "a distance large enough to contain postal address bar coding" would include at least the area designated by the USPS Guide as the proper location for barcoding. Any alternative interpretation would fail to provide adequate notice to reasonable competitors. Therefore, the language "a distance large enough to contain postal address bar coding" means at least 7/16". Moreover, this complies with the patent description of "about one half inch."
D. "a large plurality"

"A large plurality" is the term used to describe the quantity of glitter the coating contains. The parties offer differing constructions. Nichols asserts that the term is not ambiguous and proposes the dictionary definition: "a large number or quantity." Defendants on the other hand contend that the term "a large plurality" is inherently ambiguous and propose the following construction which they argue flows from the language of the claim and the specification: "there must be sufficient glitter to cover essentially the entire light receiving surface of the lure body so that substantially all light incident on the lure body is reflected."

The Court agrees that the term "a large plurality" is ambiguous. Nichols' proposed construction, essentially a synonym, is equally vague. Defendants' proposed construction is more reasonable in view of the specification.

The specification identifies a perceived problem with the prior art; namely, that the lures did not reflect enough light because the number and spacing of glitter particles was insufficient. ( '160 Patent, col. 1, lines 64-67, col. 2, lines 1-3.) The patentee's solution to this problem is to include enough glitter in the coating so that the coating reflects "substantially all of the light incident on the body." ( '160 Patent, col. 2, lines 10-12.) Thus, the amount of light reflected is a function of the number of glitter particles in the coating. Nichols' assertion that light is also reflected by the resin, and therefore reflection is not a function of the number of glitter particles, is contradicted by the language of the claim. The claim clearly states that the resin coating itself is transparent. ( '160 Patent, col. 5, lines 24-25.) Therefore, all light that is reflected must be reflected by glitter particles embedded in the coating.

Accordingly, the term "a large plurality" is properly construed to mean that the coating must contain a sufficient number of glitter particles to reflect substantially all light incident on the portions of the body that are covered by the coating.

3 The Court has modified Defendants' proposed construction to remove extraneous limitations on elements which are not the subject of dispute in this litigation.

2. Larger Than Said Simple Geometric Figure (Claims 22 and 23)

Matsushita argues "larger than said simple geometric figure" should be construed as "having a greater area than said simple geometric figure." Mediatek argues "larger than said simple geometric figure" should be construed as "having a greater area than the area of the simple geometric figure of the first planarizing pattern so that the number of figures and the amount of data in the planarizing patterns is reduced."
The Court finds, for the reasons stated by Matsushita, "larger than said simple geometric figure" is properly construed as "having a greater area than the area of the simple geometric figure of the first planarizing pattern."

The court will construe "latched position" as "a position of mechanical engagement with the supporting structure."

Claim 1 describes a mounting shaft that is "linearly displaceable along said central axis between a latched position and a released position." In other words, the mounting shaft slides back and forth along the barrel of the firearm. When the mounting shaft is in the latched position, the accessory clamp ceases to pivot.

Defendant argues that when the device is in the latched position, the accessory must be in use. For "latched position," Defendant therefore proposes, "position in which the accessory receiver is engaged such that a sighting device held by the accessory receiver would be in use." This construction would prevent the device from being locked into an inactive position. Such a device would be quite inconvenient.

In defense of its interpretation, Defendant notes that (1) the '152 Patent's summary uses the term "locked" or "engaged" as synonyms to describe the action that latches the mounting base, and (2) the "engaged" / "disengaged" dichotomy is used elsewhere in the Patent to distinguish the active from the inactive position of the accessory clamp. Defendant therefore argues that a "latched" mounting base implies an "engaged" accessory clamp. But a number of different elements (including the mounting base) may be capable of being "engaged" or "disengaged" during the use of a device. This does not mean that all those features are always simultaneously engaged or simultaneously disengaged. Defendant's proposed construction will therefore be rejected.

Plaintiff does not propose any alternative language. However, it is clear from the description of the invention that the mounting shaft is in the latched position when a locking shaft or ratchet assembly makes contact with the support member. Such contact is what prevents the accessory receiver from moving linearly. See the '152 Patent, col. 6, lines 11-17. When construing patent claims, "the court should look first to the intrinsic evidence of record, i.e., the patent itself[.]") Vitronics, 90 F.3d at 1582. The court therefore adopts its own construction consistent with such description of the latching mechanism, as set forth above.

For the same reasons, the court will construe "released position" as "a position free from mechanical engagement with the supporting structure."

The court will construe "released position" as "a position of mechanical engagement with the supporting structure."

The seventh disputed claim language states:

said latching apparatus comprising pin engaging bores formed on an abutting surface of said cover member;

Joint Statement, Table X, at 74. The language is clear and does not need construction. The language describes a latching apparatus that includes the bores that engage the pins to secure the cover member. Sukup argues that the phrase must be interpreted under the means plus function method. The Court disagrees. The word "means" is not used so there is no presumption. The language also describes a specific structure, the holes or bores on the cover member. The means plus function analysis therefore does not apply.
16. Claim 4 - "latching structure"

Bradford proposes that "latching structure" means "a number of parts put together in a particular way for fastening, the combination of parts linked, connected, or joined to the body for fastening at least one of the side structures in an erected position." Defendants contend that "latching structure" is limited to "a bar that fits into a notch or slot." The Court rejects Defendants' construction of "latching structure".

The first problem with Defendants' proposed construction of "latching structure" is that dependent claims 5 and 6 impose further limitations on this term. Specifically, claim 6 states:

The container of claim 5 wherein said aperture is in the form of a slot, the member comprising a latching bar movably coupled to the side structure, a portion of the latching bar being configured to slide into the slot.

'096 Patent, col. 14, ll. 1-4. 2 Because dependent claim 6 claims a bar and slot latching mechanism, there is a presumption that this limitation should not be attributed to claim 4. See Nazomi Commc'n's, Inc. v. Arm Holdings, PLC., 403 F.3d 1364, 1370 (Fed. Cir. 2005) ("[C]laim differentiation 'normally means that limitations stated in dependent claims are not to be read into the independent claim from which they depend.'" (quoting Karlin Tech., Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971-72 (Fed. Cir.1999)); Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380 (Fed. Cir. 2006) ("Beyond the independent/dependent claim scenario, this court has characterized claim differentiation more generally, i.e., as the presumption that each claim in a patent has a different scope.").(internal quotation marks omitted). Moreover, the specification specifically recognizes that the invention might utilize latching mechanisms other than a bar and slot configuration. '096 Patent, col. 12, ll. 20-22. Accordingly, contrary to Defendants' arguments, the Court finds that the specification does not limit "latching structure" to a bar and slot configuration.

--- Footnotes ---

2 Claim 5 is an dependent claim of claim 4.

--- End Footnotes ---

Defendants then argue that if the Court accepts Bradford's construction of "latching structure", then claim 4 should be construed as a means-plus-function limitation because it does not define any structure. The Court must begin with the presumption, however, that claim 4 is not a means-plus-function claim because it does not contain the word "means". Apex, Inc. v. Raritan Computer, Inc., 325 F.3d 1364, 1371 (Fed. Cir. 2003). 3 Because of this presumption, the burden is on Defendants to show that one of ordinary skill in the art would understand that claim 4 fails to recite sufficiently definite structure or else recites a function without reciting sufficient structure for performing that function. Id. at 1373. However, the presumption flowing from the absence of the term "means" is a strong one that is not readily overcome. Lighting World, Inc. v. Birchwood Lighting, Inc., 382 F.3d 1354, 1358 (Fed. Cir. 2004)(citing Al-Site Corp. v. VSI Int'l, Inc., 174 F.3d 1308, 1318-19 (Fed. Cir. 1999)). The trial court may resort to a dictionary to ascertain what a person of ordinary skill in the art would understand. Lighting World, 382 F.3d at 1360-61.

--- Footnotes ---

3 To repeat, Claim 4 states:

The container of claim 1 further comprising a latching structure coupled to the body for securing at least one of said side structures in the erected position.

'096 Patent, col. 13, ll. 60-62.
The Court notes that at least one dictionary supports Defendants' construction of latching structure. Webster's Third New International Dictionary states that a latch is "a device that holds something into place by entering a notch or cavity." WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 1275 (1971). On the other hand, Webster's Ninth New Collegiate Dictionary, while essentially repeating the above definition, also states that a latch is "any of various devices in which mating mechanical parts engage to fasten but usu. not to lock something." WEBSTER'S NINTH NEW COLLEGIATE DICTIONARY 675 (1987). This definition is broad enough to encompass both Defendants' definition of "latching structure" and yet recites sufficient structure to Bradford's use of "latching structure" in claim 4 because it is descriptive of a range of latching mechanisms. See Lighting World, 382 F.3d at 1359-60 ("In considering whether a claim term recites sufficient structure to avoid application of section 112 P 6, we have not required the claim term to denote a specific structure. Instead, we have held that it is sufficient if the claim term is used in common parlance or by persons of skill in the pertinent art to designate structure, even if the term covers a broad class of structures and even if the term identifies the structures by their function."). The Court, therefore, finds that a person of ordinary skill in the art would understand that "latching structure" is not limited to "a bar that fits into a notch or slot." Indeed, Bradford's proposed construction of "latching structure" is nearly identical to the definition of "latch" given by Webster's Ninth. Accordingly, Defendants have failed to rebut the presumption that claim 4 is not a means-plus-function limitation.

The Court holds that "latching structure" means "a number of parts put together in a particular way for fastening, the combination of parts linked, connected, or joined to the body for fastening at least one of the side structures in an erected position."
court confused the term "lateral" as it relates to fins with "lateral" as it relates to the fixing formations. FCS also relies on the testimony of its expert on claim construction and infringement, Mr. Michael Neft, who testified at the claim construction hearing that with respect to the claimed "fixing formation," the word "lateral" refers to "any side of a shape except for the top and bottom."

Although we agree with FCS that the terms "lateral" and "side" may not necessarily have the same meaning in the context of a fixing formation that they indisputably have in the context of a surfboard fin, our review of the intrinsic record in this case leads us to the conclusion that FCS's argument ultimately fails.

First, we begin with the presumption that the same terms appearing in different portions of the claims should be given the same meaning unless it is clear from the specification and prosecution history that the terms have different meanings at different portions of the claims. See Phonometrics, Inc. v. N. Telecom, Inc., 133 F.3d 1459, 1465, 45 U.S.P.Q.2d (BNA) 1421, 1426 (Fed. Cir. 1998). In this case, the use of the term "lateral" in the claims when referring to the surfboard fins is entirely consistent with the district court's interpretation of "lateral" in the context of the fixing formations. The claim recites a "fin having a pair of lateral surfaces and an end surface," 359 patent, col. 4, ll. 44-45, and there can be no question that the "lateral surfaces" of the fin are those "on the side of the median vertical plane, passing through the longitudinal axis of the surfboard between the front and the rear," in perfect harmony with the district court's interpretation.

The district court's interpretation is also consistent with the usage of the terms "laterally engaging" and "lateral forces" in the prosecution history of the '359 patent and in the prior art of record during prosecution. Specifically, in an Office Action dated November 28, 1994, the Examiner rejected some of the originally-filed claims as obvious under 35 U.S.C. § 103 in view of U.S. Patent No. 4,493,665 ("Liddle") partly on the basis that Liddle taught "a releasable means 20 laterally engaging the fixing formation within the cavity." Our review of the record reveals that the "releasable means 20" in Liddle engages Liddle's "fixing formation" from the side, in a manner perfectly consistent with the district court's interpretation.

Finally, U.S. Patent No. 4,379,703 ("Mizell"), a prior art reference cited during the prosecution of the parent patent to the '359 patent-in-suit, confirms that the meaning of "lateral forces" to people of ordinary skill in the art of surfboard manufacturing is consistent with the district court's interpretation:

It will be understood that the flange 28, which in the embodiment illustrated in the accompanying figures completely surrounds the entrance to slot 30, provides added resistance to the lateral forces normally applied to the fins during surfing and transmitted to the fin boxes into which the fins are inserted.

Mizell '703 patent, col. 3, ll. 9-14 (emphasis added). This passage is consistent with the district court's interpretation, and it actually confirms the notion that the term "lateral forces" has the same meaning in the context of "fixing formations" and "fin boxes" that it has in the context of "fins." The relevant figures from Mizell are reproduced below:

GET DRAWING SHEET 1 OF 1.

There can be no doubt that the "lateral forces" discussed in Mizell refer to forces coming from the side of the surfboard, consistent with the district court's interpretation of "lateral."

In response to the foregoing, FCS argues that the plain language of the claim conclusively establishes that "lateral" refers to any side of a fixing formation except for the top or bottom. This argument proceeds from the undisputed fact that the term "lateral" is also used in the claim to refer to sides of surfboard fins, which allegedly have no front or rear surfaces. According to FCS, it makes sense to construe "lateral" narrowly to refer to the left and right sides of a surfboard fin because there are no other sides to be described. In contrast, according to FCS, "lateral" should be construed more broadly when the shape being described has sides other than simply a left side and a right side (e.g., when the shape is a star or a cross). Thus, according to FCS's logic, assuming arguendo that surfboard fins had front surfaces and rear surfaces, those surfaces would have also been referred to as "lateral surfaces." This argument is undercut by the written description of the '359 patent, which specifically addresses the "front" and "rear" directional components of the surfboard fins without any mention of the words "lateral" or "side." For example, at column 1, lines 36-44 of the '359 patent, a prior art fin is described as having a "front" (line 41) and a "rear" (line 42), and a prior art fin box mounting structure is also described as having a "rear" end (line 44).
For the above reasons, we discern no error with the district court's interpretation of the terms "releasable means laterally engaging said formation," "applying lateral force," and "to a side wall of said cavity" in claim 13 of the '359 patent.

3. Lateral Constraining Device Limitation

Based on the claim language, the specification of the '514 patent, and relevant testimony of expert witnesses, the "lateral constraining device," which includes a "support element and inclined surface . . . distinct from said skirt and second annular surface" of claim 55 of the '514 patent, and as the language would be understood by those skilled in the pertinent art, must be construed to mean that the lateral constraint is distinct and independent from the axial constraint provided by the confronting annular surfaces of the patented probes. See PP 84-85, 88, 90-91 supra.

IV. "in at least one of the lateral edges thereof"

Lifescan proposes "in at least one of the two edges on a side of the strip," while Roche proposes "in at least one of the side (perimeter) edges of a strip." The dispute here centers around whether the notches can be on any side of the strip -- including the ends -- or whether the notches can only be located on the long sides of the strip.

The Court defines this term as "in at least one of the edges on a side of the strip." The Court disagrees with Lifescan's limitation of "the two edges . . ." because the claim expressly states that the strip has "at least two lateral edges." '420 patent at 2:4-5 (Reexamination certificate). Both parties agree that "lateral" means "side," and have included "side" in their proposals. The Court finds Roche's proposal of "(perimeter)" unnecessary and confusing because "perimeter" -- which means "the boundary of a closed plane figure" -- has a broader meaning than "lateral edge." See Merriam-Webster's Online Dictionary, http://www.m-w.com/dictionary/perimeter.

3. Lateral opening

Plaintiffs contend that the phrase "lateral opening", if determined to need further definition, should be defined as an "opening, situated on, directed towards, or coming from the side." Defendants contend that a lateral opening should be construed as a "side opening." Webster's Third New International Dictionary defines the term "lateral" as, "of or relating to the side: situated on, directed toward, or coming from the side." Therefore, the Court will construe "lateral opening" to mean, "an opening situated on, directed towards, or coming from the side."

A. "Lateral Sharp Edges"

Claim 1 of the '534 Patent claims: "[a] strap having a coating means for covering lateral sharp edges of the strap to prevent abrasion of objects that come into contact with the edges of the tie . . ." ('534 Patent Col. 2, Lines 31-34.) Band-It characterizes the reference in claim 1 to "lateral sharp edges" as a claim limitation. Band-It looks to the "Background of the Invention" section of the specifications to define this claim limitation. That section explains that "coated metal ties do not require the relatively expensive manufacturing step of forming a smooth radius on the sharp edges of each tie after it is slit from the stock, thus decreasing the manufacturing cost of the coated ties." ('534 Patent Col. 1, Lines 11-15.) Band-It therefore concludes that the "lateral sharp edges" language limits the Patent's claims and requires that the strap not have
undergone the "manufacturing step of forming a smooth radius on the sharp edges."

Panduit disputes Band-It's assertion that the reference to "lateral sharp edges" is a claim limitation. The court finds it unnecessary to decide the issue, however, because whether the words "lateral sharp edges" are claim limitations or not, those words are neither defined nor limited by whether or not the product has been through a manufacturing step to smooth its edges.

Even if Band-It were right that "lateral sharp edges" is a claim limitation, the method by which Band-It seeks to define the term violates the clear principle that, although a claim is to be read "in view of the specification[s]," Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995), the limitations of a specification should not be read into the claims. Thomson Consumer Electronics, Inc. v. Innovatron, S.A., 43 F. Supp. 2d 26 (D.D.C. 1999). There is but one reference in all of the '534 Patent to the manufacturing step that forms smooth edges on the otherwise sharp edges of the straps. This reference is in the specifications, not in the claims, and it is not written as a definition of the term "lateral sharp edges." ('534 Patent Col. 1, Lines 11-15.) Furthermore, to construe it as such requires a leap that ignores the remainder of the language in the specifications, as well as the language in the claims.

Again, to the extent that "lateral sharp edges" is a claim limitation, it has to be interpreted according to the settled principle that claim construction begins with the wording of the claims, and the words and phrases of the claim are to be given their customary, ordinary meanings, unless it appears that the inventor intended otherwise. See, e.g., Thomson, 43 F. Supp. 2d at 30; Bell Communications Research, Inc., v. Vitalink Communications Corp., 55 F.3d 615, 620 (Fed. Cir. 1995). Band-It has not suggested, nor does the court find any reason to believe, that "sharp edges" means anything other than "sharp edges" as those words are regularly understood. This is certainly not a term "so amorphous that one of skill in the art can only reconcile the claim language with the inventor's disclosure by recourse to the specification." Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998), noting E.I. du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir. 1988) (stating that the specification can supply understanding of unclear terms, but should never trump the clear meaning of the claim terms). Band-It has presented no reasoning to suggest that the term "lateral sharp edges" requires further interpretation, and to the extent it does, the court finds that the most plausible definition of "lateral sharp edges" in the context of the entire '534 Patent is: edges capable of cutting or causing abrasion.

The term "lateral sharp edges" simply does not require reference to the specifications to enlighten the reader as to its meaning. Putting that fact aside, however, the meaning proffered by Band-It strains logic. Every reference in the '534 Patent to "lateral edges," "sharp edges" or "lateral sharp edges" is paired with the claim limitation "coating means" and its identified function of preventing abrasion with objects that come into contact with the tie. This is consistent with the object of the invention, defined in the patent summary as: "the provision of a cable tie having coated lateral edges to protect objects that come into contact with the lateral edges of the tie where the coating does not interfere with the effectiveness of the locking mechanism of the tie." ('534 Patent Col. 1, Lines 26-30.) Throughout the '534 Patent, the clear goal and function of the coating means is to prevent abrasion, not to avoid the extra mechanized step of smoothing the edges. Absent specific language to suggest it, it makes little sense to presume that Panduit only intended to prevent abrasion that results from the fact that the edges have not undergone a mechanical process to create smooth edges. If the ties have been through a mechanized smoothing process, but for whatever reason still have edges capable of causing abrasion, as with the accused Band-It ties, nothing in the '534 Patent suggests that these ties are outside of its scope. Band-It's suggestion otherwise, contrary to settled principle in this area of law, ignores a clear, plain reading of a phrase in favor of a strained interpretation.

Rather than defining or limiting the term "lateral sharp edges," the single reference in the specifications to avoiding the mechanized smoothing process is properly characterized as citing an advantage of the "coating means." In this court's view, it would be "improper to read this advantage from the specifications into the claims as a requirement of the inventions themselves." Dow Chemical Company v. Astro-Valcour, Inc., 47 F. Supp. 2d 294, 299 (N.D.N.Y. 1999). The court concludes that whether or not a cable tie's edges have been through a mechanized smoothing process does not affect whether or not such ties fall into the '534 Patent's claim regarding a "strap having a coating means for covering lateral sharp edges of the strap." Thus, Band-It is unable to distinguish its accused product from the '534 Patent claims merely by reference to the phrase "lateral sharp edges."

Notably, a different conclusion on this issue would not require summary judgment in favor of Band-It. In this court's view, the accused Band-It products do have "lateral sharp edges" as that term is used in the '534 Patent. Although Band-It utilizes a mechanized process to smooth the edges of the ties, this fact alone is not determinative of whether or not there are "lateral
sharp edges." Band-It itself acknowledged in its reply in support of its motion for summary judgment that it does not "fully radius," or fully round the edges. (Band-It's Reply in Support of Its Motion for Summary Judgment of Non-Infringement ("Band-It's Reply") at 3.) This acknowledgment is consistent with the deposition testimony of Band-It's Rule 30(b)(6) witness, Hans Hinnen, that the lateral edges of the accused straps are sharp. (Hinnen Deposition, at 74:22-75:2.) Band-It argues that "there is no indication that Mr. Hinnen defined 'sharp' consistent with the proper construction of that term in the '534 Patent," and that "Panduit's counsel never instructed Mr. Hinnen regarding the correct meaning of the term." (Band-It's Reply at 3.) In light of this court's determination that the phrase "lateral sharp edges" in the '534 Patent should be read to have its ordinary meaning, however, the witness did not require any special instruction. Further evidence that the edges of Band-It's cable ties are sharp within the meaning of the '534 Patent is that Band-It coats them: Band-It's Rule 30(b)(6) witness testified that the coating prevents "chaffing or damaging." (Hinnen Deposition, at 74:22-75:2.) Significantly, Band-It offers no explanation as to why it would coat its cable ties at all if not to prevent abrasion caused by the lateral sharp edges.

7. Lateral Strand

The proper construction of "lateral strand" according to plaintiffs is "strand or strands which run perpendicularly to longitudinal strand(s) around the circumference of the tube of the netting structure." In contrast, defendants construe the term as "strands forming the netting arrangement extending in the lateral direction which does not form rows of regular loops and are not immediately next to another parallel lateral strand."

Like their definition of "longitudinal strand," plaintiffs rely on a plain and ordinary meaning for the term "lateral strand", which defendants assert is unsupported. (Defendants' Responsive Claim Construction at 15-16.) But as previously noted, "claim terms take on their ordinary and accustomed meanings unless the patentee demonstrated an intent to deviate from the ordinary and accustomed meaning of a claim term by redefining the term or by characterizing the invention in the intrinsic record using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope." Teleflex, 299 F.3d at 1327.

Defendants point to the prosecution history where plaintiffs distinguished their invention from the Lombardi prior art to support their definition of "lateral strand" as not formed with rows of regular loops. (Markman Tr. at 71-72.) As defendants explain, because the stockinette member is formed of rows of regular loops, the lateral strand, being a component of the netting structure, cannot form rows of regular loops. Id. "If the lateral strands did form rows of regular loops, we don't see how a checkerboard pattern could result in a meat product." Id. at 71-72. The Court disagrees. When "strand" is construed without regard to the weight of the yarn, and the stockinette member is not required to be comprised of rows of regular loops, a lateral strand would function in a manner that would create the netting arrangement's intended pattern and would not become part of the stockinette member shield.

Defendants' proposed inclusion of language that the netting arrangement strands are "not immediately next to another parallel lateral strand" is based upon the claim language which provides that the netting arrangement is comprised of a "second plurality of spaced strands" in the lateral direction. But as with defendants' argument concerning their proposed construction of longitudinal strands, i.e., they are "not immediately next to another parallel longitudinal loop," defendants are using the term "strand" as a component rather than as a structure. As set forth in the claim language, the structure of lateral strands is spaced. Defendants have not offered any intrinsic or extrinsic evidence that shows plaintiffs intended to deviate from the plain and ordinary meaning of the term. Accordingly, no additional defining terms are needed.

The Court construes "lateral strand" as "strand or strands which run perpendicularly to longitudinal strand(s) around the circumference of the tubular casing."
a. Claim Term:

"A single piece polyvinyl chlorine (PVC) pipe of a predetermined interior diameter that has lateral strength when connected to a similar adjacent PVC pipe . . ."

b. Parties' Contentions

CertainTeed's proposed construction of "lateral strength" is "when connected to a similar adjacent pipe, a pipe 2 inches in diameter has sufficient lateral strength so that a lateral force of 1,000 pounds must be exerted before the pipe will start leaking." CertainTeed argues that Modern Products' proposed construction would render this claim term meaningless because any two lengths of pipe connected to each other have some degree of lateral strength. Thus, if the term "lateral strength" simply means some strength to resist lateral forces, then it is essentially meaningless because all connected lengths of pipe have some "lateral strength."

The specification of the '480 patent states that this invention is noteworthy because it has a high degree of lateral strength, as opposed to other pipes. Specification of '480 patent, col.1, lines 45-47. The "lateral strength" limitation was added to overcome prior art rejections. PI's Markman Brief at 8. It is CertainTeed's assertion that the answer to how much "lateral strength" is necessary is found in the specification, which states "it was found that laterally pushing on the pipe, a force of 1,000 pounds has to be exerted before the pipe will start leaking." Specification of '480 patent, col.1, lines 48-50. Further, the only embodiment described in the specification is a pipe 2 inches in diameter, so CertainTeed claims that it is fair to assume that this level of strength applies to a pipe 2 inches in diameter. This is how CertainTeed arrived at its proposed construction. CertainTeed avers that in this case, Modern Products clearly disclaimed an interpretation of the phrase "lateral strength" to mean just any or some lateral strength, and the only guidance as to how much strength is sufficient is found in the specification. Consequently, CertainTeed's proposed construction is consistent with the specification.

Modern Products' proposed construction of "lateral strength" is "the strength of connected PVC pipe which will resist forces exerted on the pipe in a direction perpendicular to the length of the pipe." Modern Products argues that the term "lateral strength" does not lend itself to quantitative measurement. The plain and ordinary meaning of the phrase "lateral strength" refers to a material's solidity or toughness in resisting forces from the side. Also, the dictionary does not define "strength" in quantitative terms. It is a qualitative characteristic. Thus, when Claim 1 recited that a PVC pipe has "lateral strength," it refers to a quality of toughness that resists forces exerted on the pipe from the side.

The term "lateral strength" must be construed in the context of the surrounding words of the claim. In the context of Claim 1, lateral strength results from connecting the pipes together and the length of the second enlarged interior diameter. Modern Products acknowledges that the average pipe has some degree of lateral strength, however, what distinguishes the '480 patent is the lead-in section of the pipe, what is referred to as the "second enlarged interior diameter" section of the pipe. In connection with this, the "long enough" limitation increases the surface area of the joint resisting lateral forces by half because it is long enough to cover most of the external threads that mate before they are threaded together. Modern Products alleges that this construction is reinforced by the prosecution history, and because the prosecution history consistently intertwined the "lateral strength" and "long enough" limitations, they must be construed together and not in isolation.

The only quantitative construction that can justifiably be given to "lateral strength" is already described in the claim; that construction being the requirement that the pipe have a lead-in section long enough to receive most of the threadable external threads from the similar adjacent PVC pipe before they are threaded. Modern Products states that this quantitative limitation increases by half the surface area able to resist lateral forces. Modern Products urges that CertainTeed's proposed construction is clearly erroneous, is not the plain meaning of the phrase, violates the long-standing claim construction rule against importing extraneous limitations from the specification into the claim, and imports limitations from dependent Claim 4, rendering it superfluous.

c. Court's Construction

The Court concludes that "lateral strength" means "the strength of connected PVC pipe which will resist forces exerted on the pipe in a direction perpendicular to the length of the pipe." The Court agrees with Modern Products that this construction is supported by the plain and ordinary meaning of the words and is supported by the specification and prosecution history.
Further, CertainTeed seeks to add quantitative limitations to the claim, which violates the rules of construction. See Liquid Dynamics Corp. v. Vaughan Co., 355 F.3d 1361, 1368 (Fed. Cir. 2004) (citing Comark Communications v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998)). The passages cited by CertainTeed do not expressly or by clear implication restrict the scope of the invention as suggested in CertainTeed's proposed construction. See Liebel-Flarsheim Co. v. Medrad, Inc. 358 F.3d 898, 908 (Fed. Cir. 2004). Therefore, the Court will define "lateral strength" without a quantitative limitation.

12. Laterally linked strands

FieldTurf's Proposed Construction: "The slit portions of the ribbons are attached to each other by relatively laterally oriented sections"

SCG's Proposed Construction: "Distinct flat brushed split sheet having slits placed across the width of the sheet, the slits being located along a longitudinal axis of the sheet and being connected at the sides of each other"

The Court's Claim Construction: "Strands that are connected at the sides"

The first part of SCG's proposed definition is based on its claim that "strand" is synonymous with "ribbon" and thus strand should have the same claim construction as "ribbon." The claim language in which this instance of "strand" occurs states as follows: "a lower portion of the ribbons having slits extended open forming laterally linked strands disposed in a lattice structure enmeshing the surrounding particulate material." The specification describes "brushing . . . to open a lower portion of the ribbons and extend the slits open forming laterally linked strands disposed in a lattice structure enmeshing the surrounding particulate infill." '689 patent, 5:23-26. Clearly the strand is a part of the ribbon but it is not synonymous with ribbon. Rather it is adequately defined within the claim and needs no further explanation. 17 With respect to "laterally linked," the Court does not perceive a significant difference in this portion of the parties' definitions. Because "connected at the sides" conveys the concept without repeating the word "laterally," the Court finds that overall construction of "laterally linked strands" is "strands that are connected at the sides."

17 Similarly, the Court finds FieldTurf's "slit portions of the ribbons" to be redundant of the rest of the claim.

A. Claim Construction

As explained by the Federal Circuit, both intrinsic and extrinsic evidence may be properly used for guidance in claim construction. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (1996). Intrinsic evidence consists of the patent itself: the claims, the specification, and the prosecution history, if in evidence. Extrinsic evidence includes expert testimony, inventor testimony, dictionaries, treatises, and prior art not cited in the prosecution history. See Zodiac Pool Care, Inc. v. Hoffinger Indus., Inc., 206 F.3d 1408, 1414 (Fed. Cir. 2000). It is well-settled that the court should look first to the intrinsic evidence of record. See Vitronics, 90 F.3d at 1582.

In their papers the parties focus on the term "laterally offset relative to the axis of said bore." Saeilo's proposed statement of the claim interpretation reads:

The term "laterally offset relative to the axis of said bore" means "having a cross-section in the region where the trigger will pass by the lug the central axis of which is off-set laterally from the central axis of the bore."
From this definition I am supposed to understand that the claim is met so long as the lug is offset in the area where it passes by the trigger. This definition, however, is not evident from an examination of the intrinsic evidence.

An examination of the claim itself requires a review of the precise words chosen by the patentee. Although the patentee may choose to be his own lexicographer, words in a claim are usually given their ordinary meaning. See Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578 (Fed. Cir. 1996). In this case, the patentee has not provided special definitions for any of the words in question. Where a technical term is used, such term "is interpreted as having the meaning that it would be given by persons experienced in the field of the invention." Id.

"Laterally offset" refers to the gun's "lug," and is defined in relation to the central axis of the barrel's bore. These words do not indicate the meaning sought by Saeilo, to wit: merely a portion of the lug may be offset. Rather, their plain meaning indicates that the lug is laterally offset for the entire length of the bore. As the axis of the barrel's bore naturally runs the entire length of the bore, and the lateral offset is defined in relation to this axis, without further specificity, it follows that the lateral offset is intended to run the full length of the lug. As correctly pointed out by Colt, if the inventor intended this language to describe an offset in a portion of the lug rather than extending the entire lug length, the claims should have been written more broadly. See Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1425 (Fed. Cir. 1997) ("As between the patentee who had a clear opportunity to negotiate broader claims but did not do so, and the public at large, it is the patentee who must bear the cost of its failure to seek protection for this foreseeable alteration of its claimed structure.").

Although my review of the claim alone would be determinative in this instance, the specification "is the single best guide to the meaning of a dispatched term." Vitronics, 90 F.3d at 1583. Moreover, the Federal Circuit has held that questions of claim construction require an examination of the specification. See id. at 1582 (holding that "it is always necessary to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning"). The specification functions so well as a guide because it is meant to describe the invention in less technical terms. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 ("The specification contains a written description of the invention that must enable one of ordinary skill in the art to make and use the invention.").

In this instance, the specification includes detailed drawings of a handgun employing the '075 Patent. The specification further describes the preferred embodiment of the '075 Patent by way of reference to these drawings. For instance, the specification reads, "the barrel cam lug 28 is staggered or laterally offset relative to the axis of the barrel bore 18 as shown in FIG. 2." This drawing clearly depicts a recess running the full length of the lug. 2 Saeilo has requested that I consider the words of the specification rather than solely the referenced drawings. In particular, Saeilo points to the description of the lateral offset:

The lateral offset of the barrel cam lug 28 provides a space or notch 37 between an associated one of the inner surfaces 29 and an opposing face 39 on the barrel cam lug 28.

Despite inclusion of the word "notch," the specification does not convey that Claim 1 of the '075 Patent provides for the barrel cam lug to be laterally offset for any length less than the full length of the lug. For Saeilo to succeed in this patent infringement action, Claim 1 must be construed to include any offset which provides sufficient space for the trigger and cam lug to pass unobstructed. I do not read the plain language of the claim in this manner, however, even in view of the specification.

--- Footnotes ---

2 Figure 2:

[SEE FIG. 2 IN ORIGINAL]

--- End Footnotes ---
in the claim in a manner inconsistent with their ordinary meaning. In fact, my review of the specification confirms my determination under the exact words of the claim.

3 Although Saeilo is technically correct, the manner in which it addressed this issue was disingenuous. On page five of Saeilo's reply brief, in an attempt to convince me that Claim 1 should not be limited to the specific embodiment shown in the drawings, Saeilo inaccurately quoted the Federal Circuit's decision in Markman: "The specification does not limit the right to exclude." The actual language of Markman reads: "The written description part of the specification does not delimit the right to exclude." 52 F.3d at 980 (emphasis added). Such omissions ought to be indicated.

The prosecution history of the patent, to the degree that it has been entered into evidence, reveals that the claims filed with the original patent application did not include "laterally offset" language. 4 The original claim was rejected by the Patent Examiner under 35 U.S.C. § 102(b) as structurally readable on prior art. 5 The revised claim, as it now appears in the patent, was accepted without further comment. Saeilo asserts that Claim 1 was not amended so as to avoid confusion over prior art. Rather, it alleges that the inventor successfully argued this point with the Examiner. According to Saeilo, the fact that the Examiner refrained from further comment on the subject of prior art indicates the success of Saeilo's argument. I do not find this persuasive. What is clear to me is that the revised Claim 1 does not include any of the language that the Examiner found objectionable. In his original application, the inventor used the term "notch." That term does not appear in the revised Claim 1, and instead is replaced by the troublesome term "laterally offset." As there is no evidence of the Examiner's acceptance of the term "laterally offset" to mean "notch," I am unwilling to import that meaning at this time.

4 The original Claim 1 of the application reads:

In a semi-automatic handgun, with a breech locking barrel, a trigger and a trigger bar, a structure which eliminates potential interference between the trigger bar and the barrel and provides a compact handgun, comprising camming lugs for providing rotation of said barrel, said lugs defining a notch, said trigger bar being attached to one side of said trigger, trigger bar and barrel to be positioned in close proximity to each other.

5 In particular, this prior art is (1) Patent No. 3,756,120 and the limited-circulation Colt pistol based on that design ("Roy Patent"), and (2) Patent No. 1,618,510 and the Browning pistol based on that design ("Browning Patent").
To construe the meaning of the disputed limitation, the court looks first to the words of the claims themselves. Vitronics Corp. v. Concteptron, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). The district court correctly began with the plain words of the claim and recognized that the dispute centers around how "laterally offset" should be applied to "lug." The claim language requires that the lateral offset of the cam lug be gauged relative to the axis of the bore. The district court reasoned that since the lateral offset is defined relative to the bore axis, and since the bore axis runs the entire length of the bore, the lateral offset must extend for the entire length of the lug.

While one might find fault with the district court's syllogism, we agree with its conclusion. As the district court appreciated, this dispute boils down to whether "laterally offset" must refer to the entire lug, or only to a portion of the lug. The claim language requires only that the "lug" be laterally offset from the bore axis. Between "the entire lug" and "a portion of the lug," we think the former is the more natural reading of the plain term "lug." When language is used precisely and naturally, a piece or portion of a lug is not a "lug." Moreover, we note that the drafter of Saeilo's claims knew how to couch elements in the appropriate language when he or she contemplated that the claim language should be so interpreted. When describing how the trigger assembly passes by the offset lug in the unlocked position, claims 1, 3, and 9 refer to "a portion" or "portions" of the trigger and trigger bar. The fact that no such proviso appears with respect to the cam lug suggests that "lug" should be given its most natural meaning--a lug in its entirety.

Having considered the plain meaning of the claim language itself, the district court next looked to the specification to determine whether the inventor had used any terms in a manner inconsistent with their ordinary meaning. The specification refers the reader to Figure 2 of the drawings for a demonstration of the lateral offset. As conceded by Saeilo at oral argument, Figure 2--like all other figures in the patent--shows only a lug of uniform cross-section that is laterally offset from the bore axis along its entire length. Although Saeilo objects that construing "laterally offset" by reference to the preferred embodiment would import a limitation from the specification into the claims, the specification provides no support at all for Saeilo's proposed definition. Neither the specification nor the prosecution history makes any reference to the cross-section of the lug, to any means of calculating the central axis of the lug, or to a region of the lug where the trigger will pass by the lug. Moreover, Saeilo's proposed definition requires that the cam lug have more than one central axis, and neither the specification nor the prosecution history makes reference to more than one central axis. Since the specification provides no support for Saeilo's proposed definition, we think the district court did not err by referring to the embodiments disclosed in the specification to reinforce its construction of the disputed claim language.

Saeilo, seizing on the district court's use of "notch" to describe Colt's design, relies heavily on a single passage in the specification reading:

The lateral offset of the barrel cam lug 28 provides a space or notch 37 between an associated one of the inner surfaces 29 and an opposing face 39 on the barrel cam lug 28.

075 patent, col. 3 ll. 5-9. Like the district court, we find little support for Saeilo's proposed definition in this language. At the outset, we are not inclined to accord much weight to the use of the term "notch," since we have no indication what "notch" means. Simply because the parties and the court have used the nondescript term "notch" to describe Colt's design does not mean that "notch" as used in the 075 specification bears any relation to the accused device.

In any event, this language does not literally describe a notch in the lug itself or equate the lateral offset to a notch; rather, this passage says only that the face of the lug and the inner surface of the receiver define a space or notch. The simplest interpretation of this language is simply that "notch" refers to the space bounded by the offset lug and the receiver housing, as shown in Figure 2 of 075. Such a "notch" may be formed simply by the apposition of the cam lug and the receiver housing, without removing any material from the lug itself. In other words, this language suggests only that a space or notch may be created by the spatial relationship of the lug and receiver elements, but not by any peculiarity or variation in their cross-section. Thus, one need not interpret the use of "notch" in the patent text as corresponding to the "notch" in Colt's design, which could be defined as a "notch" without reference to the receiver housing.
Moreover, the language pointed to by Saeilo was absent from 075 as originally filed. As originally written, the specification did not include the language quoted above. Instead, the specification described the novel feature of the invention in the following terms:

the cam 28 as shown in FIGS. 2 and 3 particularly, is staggered, with notch 30 defined in the location shown in the drawings as a cut in the camming lugs of the barrel.

But the "notch" in this passage is not the space that allows for the trigger assembly to pass, and is not a "notch" in the sense used by Judge Duffy to describe Colt's lug design. As clearly shown in the original Figure 3, "notch" in the application as filed referred to the space between the cam lugs into which the camming pin fits when the barrel recoils--that is, the operative cam surface. In the application as originally filed, the term "notch" did not relate to the lateral offset of the cam lug. As recognized by Saeilo's patent attorney during prosecution, the amendments to the specification could not have introduced new matter beyond that already found in the specification and claims as filed. Thus, we cannot view the new language "space or notch" as suggesting any structure not already inherent in the application as originally filed. We conclude that the 075 specification does not support Saeilo's proposed claim construction.

Also like the district court, we find the amendments in response to the initial rejection by the PTO are of little relevance to determining the literal scope of the "laterally offset" limitation. Colt argues at some length that Saeilo disclaimed coverage of Colt's "notch" design when Saeilo substituted a new claim lacking the term "notch" for its original claim, and when Saeilo traversed a section 102(b) rejection over the Roy reference (U.S. Patent No. 3,756,120). As we explain above, the fact that Saeilo replaced an original claim containing the word "notch" with an amended claim lacking the word "notch" is not relevant, since the term "notch" in the original application had no relation to the lateral offset at issue here.

Neither did Saeilo's traversal of the Roy reference explicitly surrender any subject matter. In the Roy design, the cam lug is positioned well forward of the trigger assembly, even when the barrel is fully recoiled. Roy provides a cut-out in the barrel itself--not a cut-out in the cam lug--to provide space for the trigger and trigger bar when the barrel recoils backwards. Since, in Roy's design, the trigger and trigger bar are always positioned behind the lug, overlap between the trigger assembly and the cam lug is not an issue. This much was recognized by Saeilo's patent attorney, who argued that "the problem solved by applicant's claimed structure does not exist in the Roy structure." Consequently, Saeilo's traversal of the rejection over Roy cannot be said to have disclaimed any elements of Colt's design. Since the prosecution history provides no insight to how the term "laterally offset" ought to be construed, the district court properly limited its analysis to the claim language and the specification.

Thus, considering first the plain language of the claim, and second, the 075 specification, we arrive at the same conclusion reached by the district court. Namely, that "laterally offset" as used in claims 1 and 9 imposes a limitation on the entire cam lug, and not on merely a portion of the lug. We are not persuaded by Saeilo's argument that such a construction is improper because it allows Colt to escape infringement by adding "extra metal" to a lug that is otherwise infringing. The "extra metal" of Colt's lug is an integral part of the lug design, not an extraneous addition. Moreover, even under Saeilo's proposed definition, one could avoid infringement by adding or removing metal from other regions of the lug such that the central axis of a cross-section, however that might be defined, would not be laterally offset from the bore axis.

2284

15. Laterally Sliding and Snapping the Cooperative Coupling Parts Together

The parties also requested that the Court interpret the term "laterally sliding and snapping the cooperative coupling parts together" which appears in claims 23, 29 and 65 of the '486 patent. Unilin states that "laterally sliding and snapping the cooperative coupling parts together" means "the panels are joined by moving them towards each other in substantially a common plane and coupled via a snap action." (Unilin Open. Br. 28-29.) Unilin states that this is similar to the phrase "shifting them laterally towards each other." (Id. at 28.)

Alloc initially proposed a different construction. However, in its response brief Alloc states that it has no substantial disagreement with Unilin's proposed construction. (Alloc Resp. Mem. 13-14.)
A representative use of the phrase appears in claim 23 of the '486 patent as follows: "A floor covering panel according to claim 1, wherein the coupling parts are configured such that two identical ones of said floor panel can be selectively coupled either by laterally sliding and snapping the cooperative coupling parts together or by turning one panel relative to the other with their cooperative coupling parts partially engaged, whereby additional ones of said floor panel can be sequentially coupled to previously coupled ones of said floor panel by laterally sliding each additional panel into a previously coupled panel, or by relative turning motions of an additional panel relative to a coupled panel." ('486 patent, 15:63-67; 16:1-7) (emphasis added.)

Unilin's proposed definition is consistent with the patent claims and specification and, therefore, the Court adopts that definition. Thus, in claims 23, 29 and 65 of the '486 patent "laterally sliding and snapping the cooperative coupling parts together" means "the panels are joined by moving them towards each other in substantially a common plane and coupled via a snap action."

BACKGROUND

The '532 patent is entitled "Transparent Laminated Product" and issued on August 22, 1989. It contains only one claim which is reproduced below:

1. A transparent laminated product comprising a transparent substrate and a 5-layered transparent coating composed of a first ZnO layer formed on the substrate, a second Ag layer formed on the first layer, a third ZnO layer formed on the second layer, a fourth Ag layer formed on the third layer and a fifth ZnO layer formed on the fourth layer, and having a visible ray transmission of at least 60%, wherein the thickness of each Ag layer is from 60 to 250 [angstrom].

'532 pat., col. 10, ll. 58-67.

The alleged infringing Cardinal product is called "LoE2." Both the Cardinal and AFG products include thin, optical coatings that are deposited in successive layers on glass for the purpose of reflecting infrared energy and thereby reducing heat transfer through the glass. Cardinal's product contains depositions of zinc oxide ("ZnO"), silver ("Ag"), and titanium oxide ("TiO"), while AFG's patent claims a five-layer filter composed of alternating layers of zinc oxide and silver.

AFG sued Cardinal, alleging that Cardinal's LoE2 product infringed the '532 patent. The district court, however, granted Cardinal summary judgment, holding that, as a matter of law, Cardinal's LoE2 product does not infringe the '532 patent, either literally or under the doctrine of equivalents. AFG appeals that judgment. We have jurisdiction under 28 U.S.C. § 1295(a)(1) (1994).

DISCUSSION

The district court granted summary judgment to Cardinal, holding that under Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 34 U.S.P.Q.2D (BNA) 1673 (Fed. Cir. 1995), Cardinal's LoE2 product must be viewed as containing seven layers of zinc oxide, silver and titanium oxide, and therefore does not infringe the '532 patent which calls for five layers, consisting of alternating layers of zinc oxide and of silver. We hold that the district court's apparent construction of "layer" is incorrect. In addition, other disputed terms were not defined at all. We therefore vacate the district court judgment and remand the case for further claim construction and such further proceedings as may be necessary.

As is well known, "the determination of infringement is a two-step process. First, the language of the claim must be interpreted. Second, the accused device must be compared to the claim language as interpreted." Read Corp. v. Portec, Inc., 970 F.2d 816, 821, 23 U.S.P.Q.2D (BNA) 1426, 1431 (Fed. Cir. 1992). The first step, claim construction, is a matter of law exclusively for the court, see Markman v. Westview Instruments, Inc., 52 F.3d 967, 970-71, 34 U.S.P.Q.2D (BNA) 1321, 1329 (Fed. Cir. 1995) (in banc); the second step involves a question of ultimate fact, see Fromson v. Advance Offset Plate, Inc., 720 F.2d 1565, 1569, 219 U.S.P.Q. (BNA) 1137, 1140 (Fed. Cir. 1983). Thus, before the district court could properly have analyzed AFG's allegation that Cardinal's LoE2 product infringed, the court would have had to interpret correctly the disputed terms in the claim.
The only discussion of claim construction in the district court's summary judgment opinion focuses on the meaning of the term "layer." Yet, no clear and correct definition is given in the district court's decision. The court merely quotes Southwall's discussion of the "layers" in the Cardinal product, as viewed in the context of the Southwall patent. No definition of the term "layer" is actually given in the Southwall case, the source exclusively relied upon by the court to discuss "layer." Moreover, even if Southwall clearly defined the term "layer," that definition would not be dispositive of the correct definition of "layer" in the '532 patent. The Southwall and AFG patents use "layer" in different contexts. For example, the '532 patent appears to distinguish between "layer," a claim term, and "interlayer," which appears only in the written description. That distinction could be critical in this case. Therefore a precise and correct definition of "layer" is needed.

1 Moreover, the court may need to define other disputed terms, such as "composed of," "formed on," and "5-layered."

--- Footnotes ---
1 Moreover, the court may need to define other disputed terms, such as "composed of," "formed on," and "5-layered."

--- End Footnotes ---

1. "Layer" (all asserted claims) (Claim Elements 1, 7, 8)

a. The Parties' Positions

ATI proposes that the ordinary meaning of the term "layer" be adopted. Dkt. No. 81 at 7-8. Defendants, however, propose that the term "layer" should construed as "a separate and distinct layer." Dkt. Nos. 83 at 6-9; 84 at 10-14, 19-20. Specifically, Sharp argues that the terms "upon" and "atop" support this proposed construction for "layer." Dkt. No. 83 at 6-9. Sharp argues that a "layer" disposed "upon" or "atop" some other material must be "separate and distinct" from what it is disposed "upon" or "atop." Id. Sharp relies upon the patent drawings and specification to support its claim that a "layer" should be considered "separate and distinct." Id. at 7. Sharp also argues that if its proposed construction for "layer" is not adopted, then a "layer" could be arbitrarily drawn "so that it is indistinct from other layers and can be intermixed with or made from the same materials as other layers." Id.

DNP argues that the plain meaning of the term "layer" supports a construction that a "layer" must be "separate and distinct" from other layers. Dkt. No. 84 at 10-14, 19-20. DNP also argues that the specification, claims, prosecution history, and patent drawings support such a construction. Id. at 10-11. By way of example, DNP argues that because the layer of substantially opaque material is, by definition, not transparent, it must be "separate and distinct" from the transparent first substrate. Id. at 19-20.

In response to Defendants' arguments, ATI argues that importing the limitation that a layer be "separate and distinct" is improper and contradicts the ordinary meaning of the term "layer." Dkt. Nos. 81 at 7-8, 88 at 7-8. ATI argues that the words "separate and distinct" are not included anywhere in the claims, the specification, or the prosecution history and that the terms "separate and distinct" are never defined for the jury. Dkt. No. 88 at 7-8. ATI also argues that with the construction of "layer" being a "separate and distinct" layer, Defendants leave no room for a situation where the first layer may incidentally or partially "blend" into a second layer that the first layer is placed "upon" or "atop." Id.

In its Sur-Reply Brief, Sharp reiterates its argument that the limitation of "separate and distinct" is consistent with the plain meaning of the term "layer." Dkt. No. 91 at 1. DNP argues that if a "layer" is not considered "separate and distinct," then the '682 and '711 Patents cannot be distinguished from the prior art. Dkt. No. 90 at 2.

b. Construction

There are two concerns that must be addressed in determining whether the claim term "layer" should be construed as "separate and distinct." First, there is the concern that adopting such the construction of "separate and distinct" would unjustifiably and unnecessarily restrict the scope of the claims. Such unjustified and needless restrictions are specifically prohibited by Phillips and the Federal Circuit's caselaw. Phillips, 415 F.3d at 1312 ("if we once begin to include elements
not mentioned in the claims, in order to limit such claim . . . we should never know where to stop”) (quoting McCarty v. Lehigh Valley R.R. Co., 160 U.S. 110, 116, 16 S. Ct. 240, 40 L. Ed. 358, 1895 Dec. Comm'r Pat. 721(1895)). This is especially a concern in this case where Defendants have offered no definition or proposed construction for the terms "separate" or "distinct," and the '682 and '711 Patents do not include the terms "separate and distinct" anywhere in the claims or in the specification. Counsel for Sharp even admitted at the claim construction hearing that the words "separate and distinct" appear nowhere in the '682 or '711 Patents:

The Court: Mr. Adams, does the term "separate and distinct" appear anywhere in either 682 or '711 Patents?

Mr. Adams: Those exact words do not, Your Honor. However, everything in the patent is consistent with that meaning . . .

Claim Construction Hearing Transcript ("Hearing Transcript") at 45-46.

Second, as raised by Defendants, there is the concern that, unless this Court adopts their proposed construction that a "layer" is "separate and distinct," the term "layer" may be rendered meaningless. For example, if a "layer" were not considered "separate and distinct," then the Parties could argue at trial that the term "layer" be interpreted as several layers which are co-mingled and which are not considered either separate or distinct. Such a construction would contradict the ordinary meaning of the term "layer." Vitronics, 90 F.3d at 1582; Phillips, 415 F.3d at 1313. This is especially true where, as here, the intrinsic evidence supports a construction that the layers are "separate." For example, in both the '682 and '711 Patents, the inventor chose to use the words "upon" and "atop" to describe where the layers are placed. See, e.g., Col. 11, Line 29. Such terminology indicates that one layer is separate from another layer. Additionally, the inventor detailed the process for forming this liquid crystal display which involves placing several different types of layers upon other layers. See, e.g., '682 Patent, Col. 11, Lines 17-45 (Claim 22 of the '682 Patent). This terminology also indicates that the layers should be considered "separate."

Accordingly, this Court finds that the proper construction for the term "layer" is a "separate layer." Claim Element 1 is construed to read as follows: "Placing a separate layer of material, that substantially prevents transmission (or passage) of light, upon one side of the first substrate." Claim Elements 7 and 8 are also construed to include the word "separate" before the term "layer." 4 In adopting this construction, this Court does not find that the layers must be entirely separate such that there could never be microscopic or incidental overlap between the layers. Such a minuscule overlap would be consistent with this Court's construction that these layers are still considered "separate" layers. 5

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

4 Claim Elements 7 and 8 will be more thoroughly addressed later in this construction.

5 In its sur-reply brief, even Sharp recognized that with such a small overlap, the layers would still remain "different elements and layers." Dkt. No. 91 at 1. At the claim construction hearing, DNP also recognized that these layers would have some amount of overlap: "Sure, there's going to be some type of adhesion between the two different surfaces." Hearing Transcript at 100.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - -

Finally, it is also important to note that, at the claim construction hearing, ATI suggested that the term "separate" is not appropriate because the layers in these patents are defined in terms of functions, not in terms of chemical composition. Hearing Transcript at 102. Because of this distinction, ATI suggested that instead of the term "separate," a more appropriate term is "distinguishable." Id. Specifically, ATI stated that the term "distinguishable" is more appropriate due to the following: "It's not terms of exact separateness and no one that is skilled in the art would understand when these layers are put down there is some sort of, you know, precise line of demarcation between these layers." Id.

This Court notes three problems with ATI's proposal to adopt the term "distinguishable." First, while these layers are defined in terms of their functions (e.g., "conductive layer"), the inventor used the terms "atop" and "upon" to define the placement of the layers. The plain meaning of the terms "atop" and "upon" indicate that this process involves placing one layer on another layer and that although there may not be a "precise line of demarcation," the layers are considered separate layers. Second, ATI's suggested term "distinguishable" is too vague to provide any guidance to the jury in construing these claims.
Markman, 52 F.3d at 979 (holding that claim construction is decided as a matter of law by the courts). Specifically, ATI provided no proposed construction for the term "distinguishable," and there is no indication if the layers are to be considered chemically, functionally, spatially, or otherwise "distinguishable."

Third, the specification and the patent drawings in the '682 and '711 Patents support Defendants' argument that these layers are not only "distinguishable" but are "separate." As noted in Phillips, intrinsic evidence (including the specification) is "highly relevant" to the claim construction analysis. Phillips, 415 F.3d at 1315. In the present case, the specification separately describes and separately explains the different layers in the '682 and '711 Patents. See, e.g., Col. 4, Lines 50-67. For example, the inventor detailed the placement of separate layers in the specification: "Disposed upon said substrate 12 is a layer of substantially opaque material 14" (Col. 4, Lines 50-51) and "Thereafter, a layer of a transparent, conductive material, such as a transparent conductive oxide material 30 of FIG. 3B, is disposed upon the passivation layer 26" (Col. 7, Lines 39-41). The inventor also explained forming openings in a separate layer: "Formed in said layer of substantially opaque material 14 is at least one opening 16 which extends through said layer 14 to the substrate." (Col. 5, Lines 1-2). Accordingly, these descriptions in the specification provide support for this Court's construction that these layers should be considered separate.

The patent drawings, another type of intrinsic evidence, also provide further support for a construction that these are separate layers. While these drawings may not be used to define the "precise proportions of the elements," "may not be relied on to show particular sizes," and may not be used to import limitations from the specification to the claims, the drawings are a part of the intrinsic evidence that may be used to inform this Court's construction of the terms in this patent. Hockerson-Halberstadt, Inc. v. Avia Group Int'l, 222 F.3d 951, 956 (Fed. Cir. 2000) (holding that the patent drawings should not be relied upon as being "drawn to scale"); MBO Laboratories, Inc. v. Becton, Dickinson & Co, 474 F.3d 1323, 1333 (Fed. Cir. 2007) (relying upon the intrinsic record, including the figures in the patent, to support its reversal of the district court's claim construction). This is especially true where, as here, the drawings include solid lines indicating separate layers, and the language in the claims and the specification use terms such as "upon" and "atop" which define a separateness between the layers.

Plaintiff asserts that all of Defendants' EDLC ultracapacitors infringe on the '074 Patent. Doc. No. 13 at 2. Plaintiff relies on its expert report and numerous declarations by John Miller, which contains scanning electron micrograph (SEM)/Auger experiments allegedly supporting that the accused infringing products have a primary coating of a conductive carbon, and a secondary coating of activated carbon, as recited by claim 1 of the '074 Patent. Id.

In response, Defendants dispute that its EDLC ultracapacitors meet the limitations claimed in the '074 Patent, arguing that "layers and coatings" are not synonymous. Doc. No. 47 at 8. Defendants also contend that Plaintiff's experiments are deficient because the particular technique used by Miller "is not well-suited for an examination of the structure of the ultracapacitor electrodes, as viewed in cross section." Id. at 8-9.

Determining the likelihood of patent infringement on a preliminary injunction motion requires two steps: 1) construction of the relevant claims; and 2) comparison of the construed claims to the accused product(s). Pfizer, 429 F.3d at 1372. Because of the nature of a preliminary injunction proceeding, claim construction at this stage is itself preliminary because of the incomplete record provided to a reviewing court. 1 The Federal Circuit recognizes the difficulty of claim construction at the preliminary injunction stage because of the incomplete record. See Gillette Co. v. Energizer Holdings, Inc., 405 F.3d 1367, 1374-75 (Fed. Cir. 2005), citing to CVI/Beta Ventures, Inc. v. Tura, LP, 112 F.3d 1146, 1160 n.7 (Fed. Cir. 1997); Bayer AG v. Biovail Corp., 279 F.3d 1340, 1349 (Fed. Cir. 2002); Metaullics Sys. Co. v. Cooper, 100 F.3d 938 (Fed. Cir. 1996). Because of this, a district court may issue a "tentative" or "rolling" claim construction when faced with the task of claim construction on an expedited basis. Oakley, Inc. v. Sunglass Hut Intern., 316 F.3d 1331, 1344 n.3 (Fed. Cir. 2003), citing to Jack Guttmann, Inc. v. Kopykake Enters., Inc., 302 F.3d 1352, 1361 (Fed. Cir. 2002). As in any patent infringement suit, the burden lies with the patentee in establishing infringement by the accused product in a preliminary injunction motion by a preponderance of the evidence. Id. at 1340. However, if Defendants "raise[] a substantial question concerning … infringement … i.e. asserts an infringement … defense that the patentee cannot prove "lacks substantial merit," the

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

1 On July 21, 2007, Defendants filed the prosecution file history for the '074 Patent as an exhibit to Michael Cima's declaration. See Doc. No. 119-3, Exh. C. The prosecution file wrapper for the '074 Patent was not submitted in conjunction with Defendants' opposition to the motion for preliminary injunction. See Doc. No. 47, filed February 1, 2007. At the evidentiary hearing, this Court permitted the parties to submit supplemental declaration regarding new evidence presented by Defendants, and for Plaintiff to submit additional evidence on this limited scope. See Rough Transcript at 95-96. The Court did not permit the parties to submit additional evidence or declarations on claim construction, especially in light of this filing occurring almost six months after Defendants' initial opposition was filed. Defendants provide no excuse for the late filing of this evidence, nor do they explain how this evidence relates to the limited scope of the evidentiary hearing regarding scanning electron micrograph technology. Accordingly, this Court will not take into consideration the prosecution file history of the '074 patent to tentatively construe the claims of the '074 Patent.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

i. Claim Construction - First and Second Coatings

Defendants argue that the accused products do not infringe Claim 1 of the '074 Patent because coating and layers are not synonymous. Doc. No. 47 at 7. Defendants conclude that because it uses only one coating of a mixture of activated and conducting carbon, it does not meet the limitations of the '074 Patent. Id. In response, Plaintiff states that claim 1 of the '074 Patent is not a process claim, but a device claim. Accordingly, even if Defendants only apply its carbon slurry in one mixture, it will infringe the '074 Patent if the mixture nonetheless forms two layers, or coatings, on the aluminum current conductor. Doc. No. 66 at 3.

A review of the patent specification supports Plaintiff's construction of "coating" as including both layers and coatings. First, Plaintiff is correct that Claim 1 is a device or product claim, and not a process or method claim. The claim, for example, describes physical properties and characteristics of the device, and not a method or process of making the device. As such, Defendants' method of applying a mixture of activated and conductive carbons, instead of as layers as taught in the '074 Patent, is irrelevant if it possesses the structural limitations of Claim 1. See AFG Industries, Inc. v. Cardinal IG Co., Inc., 375 F.3d 1367, 1370 (Fed. Cir. 2004) (A product claim covers any infringing structure "however it is made or however it is used.").

In addition, Defendants' contention that layers are not synonymous with coatings lacks merit in light of the patent specification. Claim construction requires that a reviewing court read the claims "in view of the specification, of which they are a part." Nystrom, 424 F.3d at 1142 (Fed. Cir. 2005). "The construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction." Phillips, 415 F.3d at 1316. Here, the specification repeatedly uses the terms "layers" and "coatings" interchangeably:

The first layer … is of a "conducting carbon …" '074 Patent at 7:19-20

The second layer is of an "activated carbon …" Id. at 7:32

The first layer is formed onto the surface of the current collector. Id. at 7:48

The second layer is formed onto the first layer … Id. at 7:60

The first step involves applying a first layer (or primary coating) … Id. at 9:8-9

The primary coating reduces the interfacial resistance and serves as a seed coat for a secondary coating. Id. at 9:25-26

The second layer (or secondary coating) is applied over the primary coating. Id. at 9:58-59.
As can be seen, the first layer and the second layer are coated onto the foil, with the three lanes having been cleared of the first layer and the second layer by the set of wipers. Id. at 11:37-40.

Thus, Defendants' argument that "layers" and "coatings" are not synonymous lack merit in light of the specification's interchangeable use of the terms. Accordingly, this Court construes Claim 1 as a product claim, and the disputed term "coating" to include "coatings or layers." However, as discussed, because the record is not complete, this Court is mindful that any claim construction at this stage is preliminary and tentative.

Guardian's Position

Guardian argues that there are seven relevant claim terms in dispute. Guardian's interpretations are listed below.

Heated Treated Coated Article: a coated article that has been heated to a temperature for a sufficient period of time to enable thermal tempering, bending or heat strengthening of the articles.

Layer: a region of material having a thickness and the composition of which is chosen to provide desired properties.

Oxidation Graded: having a change in the relative oxygen content in a region such that one portion contain more oxygen than another portion.

Progressively More Oxidized: having a trend of increased relative oxygen content.

More Oxidized at a Location Further From the Layer Comprising Ag Than at a Location Closer to the Layer Comprising Ag: these precise words do not appear in the asserted claims of the patents-in-suit, and therefore, they do not require interpretation.

Metal or Metal Nitride Contact Layer: metal or metal alloy, contact lawyer means a layer contacting another layer, metal nitride is a material including both metal and nitrogen.

More Metallic: having more relative metal content in a region compared to reactive non-metals such as oxygen or nitrogen.

AFG's Claim Interpretations

AFG groups the terms in dispute into four categories: (1) coated article claim elements; 2) layer claim elements; (3) oxidation graded claim elements; and (4) nitride claim elements.

Coated Article: all of the coated article definitions ("heat treated coated article," "coated article," and "after being heat treated (HT) said coated article") should be interpreted as: "an article which has been coated" with either: a) "and has been heated to a temperature sufficient to enable thermal tempering, bending, or heat strengthening"; or b) "with a heat treatable coating."

Layer: "a thickness of material having a function and chemical composition bounded on each side by an interface with another thickness of material having a different function and/or chemical composition."

Oxidation Graded: all of the oxidation graded claims ("oxidation graded," "is more oxidized at a location further from the [first] layer comprising Ag than at a location closer to the [first] layer comprising Ag," "is more metallic at a location closer to the silver inclusive layer than at another location further from the silver inclusive layer," and "is more metallic at a location closer to the metal or metal nitride contact layer than at another location further from the metal or metal nitride contact layer") should be interpreted as, "a layer that is progressively more or less oxidized through its thickness" with the appropriate variations in language used in the different claims.

Nitride layer: all of the nitride layer ("nitride layer," "comprises silicon nitride," "layers which comprises a nitride," and "layer comprises Si-rich Si[x]N[y] where x/y is from .76 to 1.5") is "a layer containing a silicon nitride compound, and not containing oxygen."

The two parties proposed interpretations of the term "layer" contain a number of differences. The first difference lies in whether the court should adopt Guardian's "the region of material having a thickness" interpretation or AFG's proposed "thickness of material" interpretation. Both sides agree that a layer has a "thickness" and is made with a certain "material," the difference lies in whether the word "region" should be incorporated into the interpretation.

This court was unable to find any mention of the term "region" in the patents' claims or specifications. Instead, when describing "layers" the patents' claims, tables, and specifications all refer to the type of material used in the specific "layer"
and its "thickness." For example, the '349 specifications discuss "exemplary preferred thickness and example materials for the respective layers on the glass substrate." '349, Col. 7, lines 65-66. The patent also provides a chart that outlines the "preferred range," the "more preferred range" and "example" of thickness for each material. '349, Col. 8, lines 1-18.

In a case involving patents related to the same type of glass, the Federal District Court defined "layer" as a "thickness of material of substantially uniform chemical composition…." AFG v. Cardinal, 239 F.3d 1239, 1250 (Fed Cir. 2001). Although these are different patents at issues, this court believes that the Federal Appeals Court's decision is instructive on how a person skilled in the art of these types of inventions would interpret the term "layer."

As a result of the claims' terms, the specifications, and the guidance of the Federal Court's decision in the 2001 AFG case, this court refuses to adopt the "region of material" interpretation proposed by Guardian. Instead, the court will adopt the "thickness of material" interpretation.

Another point of contention, is whether the "layer" interpretation should include AFG's proposed "bounded on each side by an interface with another thickness of material having a different function and/or chemical composition." Guardian's proposed interpretation says nothing about a layer's spatial relationship to other layers.

Guardian argues that AFG's interpretation is faulty for a numerous reasons, including that AFG's interpretation would cause an absurd situation. In a Southern District of New York case, the patent interpretation principle of construing claim language in a manner that causes the claim to make sense in the context of the patent. Leighton Techs. LLC v. Oberthur Card Sys, S.A., 358 F.Supp.2d 361, 366. Guardian argues that the "bounded on each side" language would cause just such an absurd situation, i.e. the coating would continue ad infinitum since each layer is bounded by another layer on the other side.

Guardian also points out that AFG's position on the interpretation of the term "layer" has changed since the Federal Circuit opinion in 2001. AFG v. Cardinal, 239 F.3d 1239 (Fed Cir. 2001). In that particular case, AFG argued against defendant Cardinal's proposed definition of "a thickness of material of uniform chemical composition bounded by a material of different chemical composition" and instead advocated for the proposed definition of "a thickness of material of uniform composition." Id. at 1250. The Federal Circuit noted that the patent in question did not limit the term "layer" to a deposit bounded by a material of a different chemical composition, thus declining to include such a limitation in the construction of the term "layer." Id.

Similarly, the specification of the patents in this case do not limit the term "layer" to a deposit bounded on each side by an interface with another thickness of material having a different function and/or chemical composition. At times in the patents' claims and specifications, the term layer is mentioned in connection with its physical relationship to other layers. For example, the silver and NiCrOx layers are said to contact each other in certain patent specifications. In patent '349 claims, the infrared reflecting layer is said to be "contacting and sandwiched between first and second layers, said second layer comprising an oxide of NiCr." '349, Col. 23, lines 52-54. However, the vast majority of both the claims and specifications do not place physical limitations on the term "layer." Thus, the Court refuses to adopt this aspect of AFG's proposed interpretation.

Another difference between the parties proposed "layer" interpretation is Guardian's "the composition of which" versus AFG's "chemical composition." The Federal Circuit in the 2001 AFG case included within its "layer" interpretation "of material of substantially uniform chemical composition." Id. at 1250. The court came to this conclusion discussing whether the term "layer" should include in its interpretation the word "uniform":

[F]ocusing on the chemical uniformity of a deposit, rather than its optical properties, constitutes a departure from the disclosures and teachings of the patent. Nowhere does the patent refer to chemical "uniformity" as a characteristic of a layer… we do not think that the incorporation of trace amounts of silver or zinc oxide into titanium deposit would disqualify that deposit from constituting a layer. Accordingly, we hold that the chemical composition of a layer must only be "substantially uniform," rather than uniform.

Id. The court concluded that consistent with the specification that the term layer should be interpreted as: "a thickness of material of substantially uniform chemical composition, but excluding interlayers having a thickness not to substantially affect the optical properties of the coating." Id.
Even though the 2001 opinion left open the question of whether sequential applications of a single material produce a layer or multiple layers, that question was later answered in the same case in a 2004 decision by the Federal Circuit. AFG, Industries, Inc. v. Cardinal IG Company, Inc., 375 F.3d 1367 (Fed. Cir. 2004). The court determined that the term "layer" was not affected by the method of creation, i.e. whether it was deposited in a single sputtering operation or in multiple operations. Id. at 1373. The court stated that the only way the multiple depositions would only be relevant was if the multiple depositions affected the structure and optical properties. Id. Thus, the court concluded that the "unitary structure of the same material that constitutes a 'layer' does not become multiple layers because the manufacturer decided to deposit it in multiple passes rather than in a single pass." Id.

Guardian's interpretation of "the composition of which is chosen to provide desired properties" comes closer to what this court believes is the proper interpretation. AFG's interpretation separates "function" and "chemical composition," whereas Guardian's interpretation meaningfully connects the two in the spirit of the patents' intent. The patent makes clear that each chemical composition is chosen for certain functions that it gives the glass and coating. AFG's interpretation simply acknowledges that each layer is comprised of a certain chemical composition and each layer also has a function without saying that one is the reason for the other.

Similar to the AFG (2004) case, this court also believes the when determining what constitutes a layer the focus should be on the layer's function as opposed to its method of production. Thus, the sputtering of multiple depositions would not be cause to categorize something as more than a layer unless the sputterings affected a different function. This court is not using the prior cases definitions to define the term "layer" in these patents, but the court does believe that the opinions do give this court a better idea of how a person skilled in the art may interpret the patents' claims.

A. Layer

1. Claim Construction

Creo's argument that the Clarus WL lacks a third "layer" of amorphous PET hinges on its proposed construction of this disputed term. Relying primarily on dictionary definitions, Creo argues that "layer" means "a uniform thickness of a material applied to a surface." Presstek denies that a layer must be either uniform or applied. Thus, it asserts that a layer is nothing more than "a thickness of a material." I adopt Presstek's proposed construction.

Creo cites definitions from two general purpose dictionaries and one technical dictionary to support its proposed construction. The American Heritage Dictionary of the English Language defines "layer" as "a single thickness of a material covering a surface or forming an overlying part or segment," 4th ed. 2000, while the Oxford English Dictionary defines it as "a thickness of matter spread over a surface." 2d ed. 1989. In the technical realm, Grant & Hack's Chemical Dictionary defines "layer" as "a mass of uniform thickness covering an area." 5th ed. 1987.

These dictionary definitions do not resolve the interpretive problem. Instead, at most, they suggest the possibility that Creo's proposed interpretation could be correct. First, the cited definitions are themselves subject to various interpretations. For example, it is unclear whether "single," as used in the first definition, means "uniform," as Creo contends, or whether it means "one," as opposed to several. The definitions also fail to clarify whether the terms "covering a surface" or "spread over a surface" refer to the layer's method of construction or its relative position. Second, the idea that a layer must be either uniform in thickness or applied is not supported by other definitions, which suggest that a layer is "one thickness course, or fold laid or laying over or under another," Webster's Third New International Dictionary (1993), or "a sheet or thickness of a material, typically one of several, covering a surface. Compact Oxford Dictionary (3d ed). More fundamentally, dictionary definitions alone can never resolve a claim construction dispute because claim terms must be construed in the context in which they are used in the claims and specification. Accordingly, I turn to the language of the patent itself to discern the contextual meaning of the disputed term.

Although "layer" is used numerous times both in the claims and the specification, nowhere do the inventors use it in a way that suggests that a layer must be uniform. While the specification identifies application techniques that can be used to create layers of uniform thickness (see, e.g., '705 Patent col.9 ll.37-39, col.10 1.4-5, col.11 ll.55-64), these references merely
indicate that layers can be created in ways that produce layers of uniform thickness. They do not suggest that uniformity is a definitional characteristic of a layer. For similar reasons, the inventors' use of figures that are not drawn to scale to illustrate preferred embodiments does not suggest that a layer must be of uniform thickness simply because the figures depict layers that appear to be uniform.

Creo's argument that a "layer" must be applied suffers from similar deficiencies. While it is clear from numerous references in the claims and the specification that the layers specified in the invention can be created through application (see, e.g., '705 Patent col.5 ll.55-68, col.11 ll.52-55, col.14 ll.3-4), these references do not imply that this is the only way that layers can be created. Layers obviously can be formed in other ways and the specification does not suggest that a thickness of a material that underlies another material cannot be a layer unless it is formed by application. The '705 Patent claims a device with layers having specified locations and properties. It does not claim any particular method of layer formation.

In summary, neither the intrinsic evidence nor the extrinsic evidence supports Creo's argument that a layer must be either uniform or applied. In each of its construction arguments, Creo attempts to use the characteristics of preferred embodiments to give the disputed claim term a meaning that it does not ordinarily have. This approach violates the core principle of claim construction that patent claims should not be arbitrarily limited by preferred embodiments. See Phillips, 415 F.3d at 1323. Accordingly, Creo's arguments are unavailing and I construe the term "layer" to mean "a thickness of a material."

--- Footnotes ---

5 Not surprisingly, the parties cite conflicting experts to support their respective positions. Although I have read their opinions, these self-serving reports effectively counter one another. As such, they do not influence my decision.

--- End Footnotes ---
makes no attempt to tie the patents to the patents-in-suit and does not cite to any portion of the specification as supporting its construction. As with SCG's argument regarding the "course" below, there appears to be no actual language in the specifications of the cited references to support SCG's construction but the Court is supposed to perceive that two-dimensional pictures require the proffered language.

With respect to the portions of the parties' claim constructions that are in substantial agreement, the Court will adopt a "Distinct, substantially continuous covering of particulate material." Because a layer can be defined as two layers or courses, '689 patent, 8:10-21, it makes sense that layers would be "distinct." As it is the particulate matter that serves as the infill for an artificial surface, '689 patent, 9:33-56, it also is a reasonable construction to include the term of a "covering" and for the covering to be "substantially continuous." The Court also agrees with FieldTurf that the modifier "substantially" continuous is appropriate, since the layer is constructed of particles, which, by their nature, are unlikely to form an entirely continuous surface. '689 patent, 7:63-8:9; 11:45-12:5; 12:13-19.

Summary of the Parties' Contentions

The parties have narrowed this dispute to what is the correct interpretation of "inner layer", "outer layer" and "air pockets" as used in the patent document.

Plaintiff argues that the '533 patent is for a composite, double knit fabric having two distinct layers, referred to as the "inner layer" and the "outer layer". "Inner" and "outer" are used simply as terms of reference to distinguish the two layers of fabric. Plaintiff urges that the layers of fabric must be distinguishable by mutually exclusive terms. It urges close scrutiny of the claims which do not recite any use of the fabric. To define the claim terms by reference to orientation of the fabric on the body would render the claims nonsensical, it contends.

Plaintiff asserts that because the term "outer layer" is used interchangeably in the specification with other terms, including "outer knitted web", and "inner layer" with "inner knitted web", it should be determined that the patent is describing a fabric and not a knit good. Plaintiff asserts that the prosecution history proves that the terms are simply terms of reference, as they were not the focus of any patentability issues during prosecution.

The parties also dispute the proper construction of the claim term "air pockets". Plaintiff argues that the term "air pockets" is synonymous with and means the voids formed on one layer of the fabric. The claims do not limit or restrict how the air pockets, formed by tuck stitches, are to be used, nor how they are to be oriented in any finished product of the garment, plaintiff contends, contrary to defendant's position.

Defendant argues that plaintiff is trying to change the nature of its invention. The words "inner" and "outer" have specific meanings and are not interchangeable. Defendant's claim interpretation places the air pockets of the inner layer of the fabric next to the body, to trap body heat and provide insulation. Defendant asserts that in all of its shirt product accused of infringement, the air pockets are on the outside, for aesthetics, and thereby serve no insulating purpose. Turning to the dependent claims for support, defendant also asserts that Claims 2, 5, and 7, require the inner layer to be hydrophobic and the outer layer to be hydrophilic, so that moisture migrates in a certain way, in this instance to draw moisture away from the skin.

It is illogical, defendant urges, for the "inner layer" of the '533 fabric to be the outer layer of the fabric in a shirt facing outwardly when the shirt is worn, etc. The '533 patent is concerned with a knit good constructed with the fabric, and it only makes sense, it contends, that the terms "inner" and "outer" refer to the fabric in the context of the knit good. The invention results in a thermal layer, and the specification, it argues, is not just the embodiment of the invention, but the invention itself. Defendant points to one use of the word "garment" in the patent specification as a candid expression of the true meaning of "fabric" as recited in the claims.

Extrinsic Evidence
Testimony of Mr. Hunneke, co-inventor, and Mr. Marker, co-inventor and expert witness, was received at hearing. Mr. Hunneke's testimony was fairly limited on direct and on cross-examination to a description of plaintiff's business, his involvement in fabric development including on behalf of plaintiff, his association with the co-inventor, Ulrich Marker, and his exuberant enthusiasm for the fabric and method claimed in the '533 patent.

Particular aspects of the art implicated by the disputed terms were addressed by the witness. Mr. Hunneke testified on direct examination to his understanding that the disputed terms "inner layer" and "outer layer" are terms of reference. He testified that thermal fabric is but one of four different types of fabric construction and that there are a multitude of uses for thermal fabric, including dishcloths and children's leotards.

He testified that he did not believe at time of application that the fabric of the '533 patent had uses limited to warmth purposes nor was it his intention to so limit it. When approached to develop and/or make a prescribed fabric, the prospective purchaser oftentimes is reticent to disclose the final end product for confidentiality reasons and, therefore, approximately one-half the time, he does not know how plaintiff's fabric will be used by its purchaser.

On cross-examination Mr. Hunneke testified that the disputed patent terms "inner layer" and "outer layer" are used as reference terms and that, in the art of textile knitting, the knitter has the option of referring to the fabric sides in any way.

Ulrich Marker, the co-inventor and expert witness testifying on behalf of plaintiff, testified to his extensive experience in the fabric trade. Through oral testimony and reference to his videotaped demonstration of a circular knitting machine, Mr. Marker's testimony was used to develop the court's understanding of the art. Mr. Marker testified to his expertise in circular knitting and designation "knitting technologist," carrying with it the ability to analyze knitted fabrics. He explained that expertise in warp knitting does not necessarily also mean expertise in the different art of circular knitting, where this witness's particular expertise lies, as amply demonstrated by his qualifications.

The enthusiasm of Mr. Marker also for the fabric at issue paralleled that of Mr. Hunneke on the witness stand. This witness, involved in the drafting of the patent application, also considers the fabric to be a unique creation, with aesthetic and functional qualities and cost-effective attributes.

The process of knitting fabric on a circular knitting machine was described to the court, resulting in a tube of fabric. The witness testified that when the fabric is cut, as it must be so that the fabric may be laid flat, a skilled knitter would be able to identify the inner layer if he or she was in possession of the '533 patent because the inner layer is described as the side with the air pockets.

If the fabric is positioned so that the inner layer faces against whatever the fabric rests upon at the time and then picked up and flipped so that the side with the air pockets faces outwards, Mr. Marker testified there is no difference in the fabric construction. Orientation of the fabric does not matter. Regardless of its orientation against a cutting table, a floor, a body, whatever, the fabric is the same construction, he testified.

Mr. Marker testified that defendant's proposed definitions of "inner layer" and "outer layer" render the patent nonsensical. By inserting defendant's proposed definitions, which presume a final fabric product, such that "inner layer" and "outer layer" mean in orientation to the wearer's body, claim 6, for example, is a technical impossibility as a circular knitting machine can make only fabric, not a fabric product like a garment worn on the body. The claims of the patent refer to a fabric and its construction and not, Mr. Marker repeatedly testified, to a knit good or garment.

On continued direct examination the witness parsed other claims to reiterate that the terminology refers to fabric and a method for making fabric. Mr. Marker testified that the terms "inner layer" and "outer layer" are not terms of the art which
refer to a particular type of knit construction. "Inner layer," the witness testified, is simply the chosen designation for the layer of fabric with the air pockets and "outer layer" for the smooth side, not what is finally done with the fabric. Mr. Marker testified that in his opinion an expert ordinarily skilled in the art of circular knitting would not understand the '533 patent to describe a knit good or garment.

The air pockets, he testified, are formed through the making of tuck stitches which function to tie the two layers together, forming the open spaces. The witness testified that air pockets are not usually formed when a garment is made from fabric.

--- Footnotes ---

6 As to the meaning of "tuck, stitches", the parties' previously noted joint stipulation filed with the court July 20, 2001, recites agreement that "neither the definition of 'tuck stitches', nor the presence of 'tuck stitches' in Sears' accused garments are in contention." However, "the parties may still argue how the tuck stitches relate to how the Court is to interpret the disputed claim terms 'inner layer', 'outer layer', and 'air pockets.'"

--- End Footnotes ---

Mr. Marker testified with reference to the type of fabric at issue that there are many uses of thermal fabric. He testified to its aesthetic qualities and appearance and texture features.

This witness was requested to focus further upon the patent document on both direct and cross-examination. Mr. Marker provided lengthy testimony in this respect, taking up much of the remainder of the full day set aside December 5, 2001 for this hearing.

Plaintiff used Mr. Marker's testimony to parse repeatedly the language of the claims and, also, to refer to the specification's instructions, including as to some uses of the thermal fabric. Mr. Marker alluded to references in the specification to fabric performance, including its thermal properties. The specification, he testified, does not understand the fabric to have purpose only in its insulating effect. The witness was directed to the patent figures, including Figure 3, which shows the checkerboard pattern on the inner layer of the fabric created by the arrangement of air pockets or voids and, the witness later testified, this also is a part of the fabric's aesthetics and performance.

The '533 patent claims initially were rejected by the USPTO as being a violation of U.S. PATENT NO. 5,119,644 ("the Strauss patent"). Mr. Marker testified as to the inventors' dialogue with the USPTO concerning this patent versus the Strauss patent, and that the terms "inner layer" and "outer layer" were not ever at issue; rather, the tuck stitches were the primary focus of this exchange.

Mr. Marker on cross-examination testified that fabric has uses other than in a knit good (for example, a shirt) and reiterated that the patent does not disclose a garment, only fabric. The witness testified that several statements in the specification, including in column 3 at lines 43-45 and lines 54-56, which make reference to a fabric construction, are merely examples of the fabric's utility. The witness described reference to "garment" in column 3 beginning at line 14, where the term "inner surface" is linked to "garment", as nothing more than poor choice of word. He testified that the word "fabric" should have been placed there instead of "garment" and reiterated direct testimony that, in his opinion, one schooled in the art would understand reference to a fabric by the sentence's inclusion of the terms "courses" and "wales", which are not used in their ordinary meaning to describe a garment construction but rather, a fabric construction.

--- Footnotes ---

7 As previously noted, the parties' joint stipulation defines "courses" as "rows of loops in a knit fabric" and "wales" as "columns of loops in a knit fabric."

--- End Footnotes ---

Mr. Marker testified that fabric possesses qualities or properties inherent to it when it lies on the cutting table. Fabric may possess thermal properties, and this is explained at column 3, lines 47-51 where the specification recites "because the composite fabric has inherent thermal properties not found in conventional jersey knit fabrics, it can be used as a substitute.
for separate jersey knit and jersey layers which are bonded together in conventional fabrics." How the fabric is used is not determined until it is made into a garment or good, the witness testified.

The witness testified that statements in the prosecution history, including at page 59 which recites the claims as having been amended to distinguish the Strauss patent so as "to more particularly point out and distinctly claim the pattern of tuck stitches which gives the fabric its insulating qualities and which is not disclosed in the Strauss patent," and preceding lines in this part of the history which recite that "it is this alternating pattern of tuck stitches which gives the fabric of the present invention its inherent insulating qualities," do not support defendant's construction of the claim terms "inner layer" and "outer layer" as being oriented with respect to the use and position of the fabric on the body.

Mr. Marker testified that the air pockets are not limited to serving only to provide an insulating effect. The specification, including at column 3, beginning at line 22, where it is stated "the voids or pockets 28 provided on the inner layer enable the entrapment of air to form an insulating or thermal layer", does not teach this as the only use.

Construction of the '533 Patent

The undisputed starting point for analysis of the disputed terms of the patent is with the language of the claims. See, e.g., Pitney Bowes, 182 F.3d 1298, 1305. Claim 1 is directed to the composite fabric, and claims 4 and 6 to method for making the fabric. Nowhere in the claims are the terms "inner layer" and "outer layer", at the core of this dispute and terms without defined meaning to the ordinarily skilled artisan, used to refer to anything different from or more than the respective sides of the composite fabric. There is no mention of any knit good, no statement of any particular fabric function, nor is there recitation of any fabric use in any of the claims. The claims only define a composite fabric and its method of construction.

The fabric has two layers, distinguished by mutually exclusive terms "inner" and "outer", which repeat themselves as terms of reference in the claims, distinguishing one fabric layer from the other. Each layer is made of a different knit construction with the invention revealing itself as the two layers of fabric and how they are joined together. The claims support the construction advanced by plaintiff of the disputed terms as terms of reference, not limited to a knit good.

Two rules laying out the general relationship between patent claims and the written description are as follows: (1) one may not read a limitation into a claim from the written description; but (2) one may look to the description to define a term already in a claim limitation, for a claim must be read in view of the specification of which it is a part. Renishaw PLC v. Marposs Societa per Azioni, 158 F.3d 1243, 1248 (Fed. Cir. 1998). Examination of the written description and drawings is necessary to confirm that the patentee's use of the disputed terms is consistent with the meaning given by the court and also to determine whether the patentee has disclaimed subject matter or otherwise limited the scope of the claims. Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1343-44 (Fed. Cir. 2001). Confirmatory measures must be taken also with reference to the prosecution history. Id. at 1343.

There are many uses of the disputed terms throughout the patent, including in the specification, which refer consistently to a layer of fabric and not an end use. There are a few references which mention a fabric use orienting the inner layer of the fabric against the skin. The construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction. Renishaw, 158 F.3d 1243, 1250.

Of necessity, the two sides of the composite fabric, the side with the air pockets and the smooth fabric side, must be distinguished in the patent document. The words chosen, "inner" and "outer", in their ordinary usage, undisputably may derive meaning from orientation with respect to something or someone but these words must be construed here in the context of the patent documents. See Toro Co. v. White Consolidated Industries, Inc., 199 F.3d 1295, 1299 (Fed. Cir. 1999). The task for the court is to determine how a person of experience in the field of this invention would, upon reading the patent documents, understand the words used to define the invention. Id. The court in Toro, where the terms "cover", "included", "attachment", and "removable" were at issue discounted the utility of a dictionary of general linguistic usage with comment that "dictionaries provide general definitions, rarely in sufficient detail to resolve close questions in particular contexts." Id. at 1300.

The written description describes the fabric construction, terming the two layers "outer layer 12" and "inner layer 14". The written description uses "outer layer" and "inner layer" interchangeably with other terms, including "web". "Outer layer" is referred to as "outer knitted web" or "outer web" and "inner layer" as "inner knitted web" or "inner web".
The written description describes how the fabric can be made on a circular knitting machine having cylinder and dial needles. The fabric is produced in the form of a tube. The "outer layer" appears here as the layer of the tube of fabric knitted by the cylinder needles, and the "inner layer" as the layer knitted by the dial needles.

There is nothing in the written description advancing "inner knitted web" or "outer knitted web" in reference to garment construction. The word "fabric" appears four times in the first two sentences under "Description of the Preferred Embodiment", where the terms "inner knitted web" and "outer knitted web" are introduced as interchangeable reference terms. There appears no linkage in this part to a "knit good". There is nothing that informs a "knit good" can be made on a circular knitting machine, either.

Limitation derived from end use, as urged by defendant, restricting the terms "inner layer" and "outer layer" to meaning in the context of a knit good or garment, seemingly would reduce the terms "inner layer" and "outer layer" as used in describing the manufacturing process to nonsense. So, too, would this construction ignore repeated references in the specification to a particular side of the fabric clearly not contemplated as being a part of any knit good.

The patent drawings demonstrate fabrication of the layers, the checkerboard pattern created by the inner layer, and how the yarns of the layers may be fed into the cylinder and dial needles in fabric construction. "Inner layer" and "outer layer" as demonstrated in the drawings refer to the two layers of the composite fabric. No drawing appears related to any end use. 8

8 With reference to the checkerboard pattern shown in Figure 3, described as "a schematic illustration of the inner layer of the composite fabric", the specification at column 3, beginning at line 1, makes pointed references to a depiction of fabric, including that the air pockets are present "on the inner surface of the composite fabric, that the distinct rows and columns in the pattern are revealed on the "inner surface of the composite fabric," and that the wales of the inner layer forming short checks "are laterally spaced across the width of the fabric". There is one mention of garment here, "looking at the inner surface of the garment, the alternating checks 26 and air pockets 28 are arranged in rows which are seven courses in length and columns approximately 2 wales wide." The meaning of "row" and "column" follow, with the term "row" described as meaning "a horizontal band of checks 26 and pockets 28" and the term "column" described as meaning "a vertical band of checks 26 and air pockets 28." Mr. Marker testified that the isolated reference to garment in one sentence here, where the word "fabric" was intended, is insignificant as those schooled in the art understand that fabric is being referred to by the sentence's inclusion of the terms "courses" and "wales", which are not used in their ordinary meaning to describe a garment construction but rather, a fabric construction. As previously noted by the court, the parties have stipulated that "courses" should be interpreted as "rows of loops in a knit fabric" and "wales" as "columns of loops in a knit fabric". As to the terms "rows" and "columns", also appearing in this sentence and defined in the ones that follow with reference to a particular configuration of checks and air pockets, there was no showing that either of these terms ordinarily is used to describe a garment construction, either.

The concluding sentence in the first paragraph appearing at column 3, beginning at line 25, referring to Figure 3, reading "when worn on the body, the air pockets 28 on the inner layer 14 of the fabric 10 provide an insulating effect which is greater than conventional jersey knit fabrics of similar weight," which could at first glance be read to support defendant's position, upon a more considered examination endorses holding that the disputed term "inner layer" refers to a side of a fabric not limited to a fabric used in a knit good. By beginning "when worn on the body, the air pockets 28 on the inner layer 14 of the fabric 10...", the insulating quality enabled by the voids or pockets is promoted as but one example of fabric use, effective conditioned upon the inner layer of the fabric being positioned so that it is worn on, or against the body. Where the term "inner layer" appears in description of fabric use, there is other broad promotion with references like "one useful embodiment", preceding discussion in this instance where hydrophobic yarns are used for the inner layer lying against the skin in this example.

Too, there is instruction that the fabric is "especially useful for making polo sweatshirts and the like", and summary comment that the invention should reduce "costs associated with the production of thermal-lined knit goods," which make reference to thermal properties. The argument defendant seeks to advance, that the '533 patent requires the "inner layer" of
the fabric to be situated in the knit good, oriented against the wearer's skin, and functioning to trap the wearer's body heat through the air pockets on the inside of the fabric, appears built largely around these few references. However, defendant's construction seemingly ignores the language of the claims, imports unnecessary functional limitations into the claims not supported by the specification, and promotes an analysis that is contrary to law.

While the preferred embodiment disclosed in the patent may have a particular configuration, a patent claim is not necessarily limited to a preferred embodiment disclosed in the patent. Transmatic, Inc. v. Gulton Industries, Inc., 53 F.3d 1270, 1277 (Fed. Cir. 1995), citing Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations.").

In recent decisions the Federal Circuit affirmed these cautionary pronouncements concerning the care which must be taken to avoid reading limitations from the specification into the patent claims. See, e.g., Interactive Gift Express, Inc. v. Compuserve Inc., 256 F.3d 1323, 1331-32 (Fed. Cir. 2001); Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182 (Fed. Cir. 1998). In Comark, before commenting as to the fine line between interpreting claim language in light of the specification and reading a limitation from the specification into the claim, the court reiterated determination that "while … claims are to be interpreted in light of the specification and with a view to ascertaining the invention, it does not follow that limitations from the specification may be read into the claims." 156 F.3d 1182, 1186, quoting Sjolund v. Musland, 847 F.2d 1573, 1581 (Fed. Cir. 1988).

While reversing the trial court's determination of infringement upon adoption of a more narrow interpretation, this aspect of the analysis undertaken by the court in Toro highlights an important distinction and not, as defendant seems to suggest, some recent development in law:

This is not a case of limiting the claims to a "preferred embodiment" of an invention that has been more broadly disclosed. It is well established that the preferred embodiment does not limit broader claims that are supported by the written description E.g., Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865, 9 USPQ2d 1289, 1299 (Fed Cir. 1988)("References to a preferred embodiment, such as those often present in a specification, are not limitations."). Nor is this a case of limiting claims to immaterial details of a broader invention as set forth in the specification. See, e.g., Sri International v. Matsushita Electric Corp., 775 F.2d 1107, 1118, 227 USPQ 577, 583 (Fed. Cir. 1985)(method of operation described in specification improperly read into structural claims). No such broader invention is here described. Instead, the invention is described throughout the specification as it is claimed, whereby the cover "includes" the ring, so that the ring is inserted by closing the cover and removed by opening the cover, "automatically." There is no basis for construing "including" the ring to mean not including the ring.

199 F.3d 1295, 1301-2. Here, the invention claimed, a composite fabric, is more broadly disclosed than defendant argues, and there is basis in the patent document for construing the terms "inner layer" and "outer layer" as terms of reference applicable to the composite fabric invention, not limited to what is done with the fabric as the preferred embodiment in the written description.

In recent decision, while affirming that the claims do not enlarge what is patented beyond what the inventor has described as the invention, the Federal Circuit also reiterated pronouncements that the specification need not present every embodiment or permutation of the invention and that the claims are not limited to the preferred embodiment. Netword, LLC v. Centraal Corp., 242 F.3d 1347, 1352 (Fed. Cir. 2001).

In Netword, a patent for a system of locating and retrieving information on a distributed computer system through use of "aliases" to denote resources was at issue. A claim was construed at the trial level to require the local server computer to maintain a cache of aliases in light of the specification which states that the local server computer functions to cache or store frequently accessed alias records, to obtain updates from the central registry computer, and to transmit records from the cache, Id. at 1352-53. There are repeated references in the specification to the local server's storage performance. The patentee sought to discount the intermediary functions of the local server premised upon a part of the specification which described a smaller-scale implementation utilizing a single machine. Id. at 1353. The Federal Circuit determined that the claim at issue was correctly construed to require a local server computer performing the described storage and transmittal
functions, in view of the repeated references to these intermediary functions in the specification and where they were the focus of attention during prosecution. Id.

Netword emphasizes the import of what the inventors actually invented and intended to claim and in that case it was a prescribed computer network in which the local server played a vital role as an intermediary computer. Id. at 1352. The intrinsic evidence in this case evidences the inventors of the '533 fabric intended to claim a composite fabric, not a "knit good". Regardless of orientation of the fabric in a knit good, it is of the same construction and properties as that fabric possesses when the tube of fabric is removed from the circular knitting machine and sliced lengthwise. Fabric was invented, with a smooth side, termed the "outer layer" and a side opposite with air pockets or voids arranged in a distinct checkerboard pattern, termed the "inner layer", joined together, and that composite fabric is what the inventors intended to claim, also as revealed in the specification.

Defendant cites to a number of cases where the Federal Circuit determined language in a specification describing an invention in a certain manner compelled the more narrow claim construction, in support of its position. However, cases like Scimed Life Systems, Inc. v. Advanced Cardiovascular Systems, Inc., 242 F.3d 1337 (Fed. Cir. 2001); Watts v. XL Systems, Inc., 232 F.3d 877 (2000); Cutilor Corp. v. A.E. Stalev Manufacturing Co., 224 F.3d 1328 (Fed. Cir. 2000); Wang Laboratories, Inc. v. America Online, Inc., 197 F.3d 1377 (Fed. Cir. 1999); and Phonometrics, Inc. v. Northern Telecom, Inc., 133 F.3d 1459 (Fed. Cir. 1998), do not support directly the argument attempted to be made. Some of these cases establish that whether limitations in a specification should be read into a patent's claims depends upon the facts and circumstances surrounding the particular patent and its prosecution and where the inventor has specifically limited the definition, as in Scimed, 242 F.3d 1337, Watt, 232 F.3d 877, Cutilor 224 F.3d 1328, and Phonometrics, 133 F.3d 1459, where the court determined the more narrow construction appropriate. This result largely rested upon finding the written descriptions carefully explained explicitly claimed limitations. This is not true here. In other cases, that conclusion is reached in situations where the prevailing party tenders expert testimony on claims construction consistent with how the disputed terms are used in the specification, as in Wang, 197 F.3d 1377, and in Netword, 242 F.3d 1347, a case discussed previously. No expert testimony was received here consistent with the narrow construction advanced by defendant. The expert testimony instead supported construction of the disputed terms not limited to a knit good.

In Renishaw, 158 F.3d 1243, cited earlier for pronunciation of certain claim construction canons, the court found both parties offered claims construction for the word "when" not inconsistent with its use in the claims and specification. Id. at 1251. However, descriptions in the specification of an instantaneous process, supported defendant's narrower construction that the word meant simultaneously or nearly simultaneously in the patent. Id. at 1250-53. That is made explicit in the written description which" shows "that the patentee's invention directed at a machine that produces very accurate, very precise probe readings by maintaining tight control over the position of the stylus and in the context of the invention, such readings can only be obtained if the probe triggers very, very soon after contact", Id. at 1251-52, and "the patentee's extremely detailed account of his invention in that written description shows that his aim was to generate a signal as soon as possible after contact...". Id. at 1252-53. The inventor confirmed in his testimony that the patented probes signal as soon as possible when the stylus tips contacts the workpiece, too. Id. at 1253.

Here, there is no explicitly claimed limitation as urged by defendant. Use of the disputed terms "inner layer" and "outer layer" are not limited to a knit good. There is consistency with the patent's use of these terms defined as ones of reference, to distinguish the two fabric sides, and there is inconsistency in the patent document in defendant's claim construction is adopted. No support for a narrow interpretation limited to a knit good is found in the extrinsic evidence, including the co-inventors' testimony. Defendant's proposed construction also places inappropriate reliance upon a perception that logic and common sense are defied by construing the terms "inner layer" and "outer layer" as terms of reference only, distinguishing the two sides of the composite fabric.

One must accept that the entire '533 patent is concerned with a knit good made with a fabric having a thermal/insulating lining, which does not find support in the patent document, prosecution history, or in the extrinsic evidence, to advance the perception. If one correctly understands the '533 patent to claim only a composite fabric, comprised of two layers which of necessity must be distinguished by terms of reference, and its method of manufacture, logic and common sense are not challenged by having the "inner layer" of the '533 fabric appear as the outwardly visible layer of fabric comprising a shirt, or the "outer layer" of the '533 fabric appear as that inner layer of fabric comprising a shirt which faces against the wearer's body. 9
worn on the body, the air pockets on the inner layer of the fabric provide an insulating effect which is greater than voids. On this defendant places much emphasis. It is noted in the specification that "the voids or pockets..." instead of "odd/even", "one/another", or "first/second", as it suggests, to describe the two layers of a composite fabric, toppers in this respect more on word play than on meaningful claim analysis.

The final category of intrinsic evidence, the prosecution history, evidences that the terms are ones of reference. The terms "inner layer" and "outer layer" were not the focus of any patentability issues during prosecution. The record reveals that these terms were part of the original claim language and were not added to any of the claims to define over the prior art. The original application was rejected with explanation by the USPTO that the Strauss patent "discloses a knit fabric where there are two layers of fabric connected by alternating courses and wales of interlock stitches..." In the ensuing dialogue, leading to issuance of the patent upon amendment informing as to use of the tuck stitches to join the two layers of the '533 fabric, the inventors of the '533 patent consistently referred to the two layers of the Strauss fabric as being inner and outer layers and not with any reference to its end use.

Consulting the extrinsic evidence, catalogued in the foregoing, to assist the undersigned in understanding the technical aspects, and mindful that "it is important that the viewing glass through which the claims are construed is that of a person skilled in the art," Interactive Gift Express, 256 F.3d, 1323, 1332, the court finds nothing that disputes or contradicts the basis for construing "inner" and "outer" as used in the '533 patent as terms of reference to distinguish between the two respective layers or sides of the '533 fabric or that the term "air pockets" means voids.

The inventors' testimony, including that of Mr. Marker, an expert in the field, is undisputed that in the art the knitter has the option of referring to the fabric sides in any way. Testimony that the terms "inner layer" and "outer layer" are not terms of the art which refer to any particular type of knit construction, also is not controverted. Uncontroverted testimony as to multiple uses for thermal fabric, one of four different types of fabric construction, also was received. There is no difference in the fabric construction attributable to orientation, both witnesses also testified. Mr. Marker also testified that a circular knitting machine can make only fabric and not a garment. Reference to a fabric is understood by one skilled in the art, where the terms "courses" and "wales" are used. Thermal fabric has aesthetic qualities and appearance and texture features, and, Mr. Marker also testified, fabric can possess thermal properties inherent to it. Testimony also was received that air pockets are not usually formed when a garment is made, rather, they are formed in the making of the fabric.

Turning now to that final term in dispute, plaintiff's proffered construction for "air pockets" is that the term means voids formed in the fabric. As set forth in the patent claims, air pockets are formed by the tuck stitches. Claim 1 describes the air pockets as being formed in the inner layer of the fabric. It describes laterally spaced rows being staggered with respect to the air pockets in the adjacent rows. Claim 1 contains no restriction as to use or orientation in a garment. Claim 6, claiming a method for making the composite fabric, describes the arrangement of air pockets in the fabric as "checkerboard fashion."

Figure 3, discussed in detail in the foregoing, also describes this pattern on the inner layer of the fabric. Further mining the written description, of which the drawings are a part, it appears that the term "air pockets" or "pockets" is used interchangeably with "voids". The distinctness of the pattern is referred to in the description: "This produces a checkerboard pattern having distinct rows and columns on the inner surface of the composite fabric 10 which is shown schematically in FIG. 3."

The resulting pattern, forming a part of the structure of the fabric, is a function of the air pocket or void arrangement. Another function described in the specification reveals itself in the description of the insulating effect of the air pockets or voids. On this defendant places much emphasis. It is noted in the specification that "the voids or pockets 28 provided in the inner layer enable the entrapment of air to form an insulating or thermal layer." The written description continues, "when worn on the body, the air pockets 28 on the inner layer 14 of the fabric 10 provide an insulating effect which is greater than
conventional jersey knit fabrics of similar weight."

Defendant's argument takes this part of the description and reads it into the claims to support contention that "inner layer" as used in the patent means that layer of necessity resting against the body. For those reasons discussed above, which will not be repeated here, there is insufficient support in the patent document for this position, and it is contrary to law.

The prosecution history discloses, too, that the term "air pockets" was not the focus of any patentability issues during prosecution. That term also is a part of the original claims. After making application, in dialogue with the USPTO, the inventors referred to the inherent insulating qualities of the air pockets, but, as discussed in the foregoing, there is no mention in the prosecution history of "air pockets" in a context other than a general description of the invention. So, too, is there no mention of the terms "inner layer" or "outer layer" in a context other than a general description of the invention.

Plaintiff also constructs an argument that where the USPTO examining staff classified the '533 patent into three subclasses all within class 66, "Textiles: Knitting", where all of the subclasses fall under the general subclass 169, "Fabrics or Articles," and where examination procedures included a search of two other fabric subclasses for potential prior art, it is manifest that the USPTO considered the '533 patent to cover a fabric and not a garment. With the classification and fields of search appearing on the front page of the '533 patent document, this is intrinsic evidence which should be considered by this court, it urges.

Defendant refers to the classifications listed on the face of the patent as procedural tools of the USPTO which are not part of the claims, the specification, or the prosecution history, and as such cannot be considered as intrinsic evidence. Defendant makes reference to the classifications in the context of the subjective intent of the USPTO and urges such is not relevant or even appropriate in patent construction, with deference to Markman and its pronouncement that "no inquiry as to the subjective intent of the applicant or PTO is appropriate or even possible in the context of a patent infringement suit." 52 F.3d at 985, aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996).

Scrutiny of this part of the court's decision in Markman, however, reveals this sentence to come within a discussion of extrinsic evidence along lines of whether it would be appropriate to consider the subjective intent of the inventor when he used a particular term and, similarly, whether it would be appropriate to obtain the views of the government not reflected in the prosecution history. The court answers both questions in the negative, as quoted above, concluding discussion with cite to MPEP § 1701.01 ("Office personnel not to testify"). Id. at 985-86. It does not appear, then, that the court was addressing the question presented here by plaintiff's argument predicated upon matters disclosed on the face of the patent document.

However, as neither party can cite to any authority or case law which speaks to the propriety of this court considering the classification codes printed on the front page of the patent as probative of the meaning of the claims, conceded to present an issue of first impression, this novel argument is accorded no significance in the face of the compelling intrinsic evidence not in dispute.

IV. CONCLUSION

The court RECOMMENDS finding that the '533 patent is for a composite, double knit fabric having two layers, referred to as the "inner layer" and the "outer layer", which are terms of reference to distinguish the two layers of fabric. The term "inner layer" refers to the layer of the fabric with the air pockets. The term "outer layer" refers, to the layer opposite the inner layer. The term "air pockets" as used in the '533 patent means voids.

Remaining at issue with respect to infringement in this case is whether the four products tested by Emslander meet the following elements of claim 1 of the '041 patent:

An art reproduction comprising a substrate, a textured colored sheet comprising a color layer and a flexible thermoplastic
layer, and a flexible adhesive disposed between the substrate and the sheet, wherein the color layer of the sheet is exposed, and the thermoplastic layer of the sheet is laminated to the substrate, and wherein said reproduction has sufficient elongation so that when it is stretched, the adhesive and thermoplastic sheet elongate with the substrate to the breaking point of the substrate, and the reproduction does not crack.

Brushstrokes argues that the four reproductions at issue 1) do not have the claimed thermoplastic color layer, 2) are not "exposed" because a coating was applied to each image and 3) do not stretch to the breaking point of the canvas substrate. Because Baratto has failed to adduce admissible evidence showing that the thermoplastic color layer element is present in the accused products, he cannot prevail on his infringement claims. Gabapentin, 503 F.3d at 1259 (to prove infringement, patent plaintiff must prove that each claim element is present in accused product). Therefore, it is unnecessary to address Brushstrokes's arguments with respect to the other 2 elements ("exposed" and elongation) of the claim.

The claim language requires that the art reproduction have a "colored sheet comprising a color layer and a flexible thermoplastic layer." The parties disagree about the meaning of this term, leaving it to the court to decide. When construing disputed terms in a claim, a court generally should give the terms their ordinary and customary meaning. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). The ordinary and customary meaning of terms "is the meaning that the term would have to a person of ordinary skill in the art in question at the time of the invention." Phillips v. AWH Corporation, 415 F. 3d 1303, 1313 (Fed. Cir. 2005). The Court of Appeals for the Federal Circuit has held that the person of ordinary skill in the art would read a term both in the context of the claim in which it appears and "in the context of the entire patent, including the specification." Id. (citing Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1477 (Fed. Cir. 1998)). Additionally, a patent's prosecution history can be relevant to construing disputed terms of a patent because it "provides evidence of how the PTO and the inventor understood the patent." Phillips, 415 F.3d at 1317.

Brushstrokes believes that the colored sheet described in claim 1 must be comprised of two plastic layers fused together as opposed to a single plastic layer that is printed with non-thermoplastic ink. Baratto contends that the "color layer" is not necessarily a second thermoplastic layer but rather can be the printed ink itself, which has thermoplastic properties. I agree with Baratto's construction.

The patent specification instructs that the "colored sheet of the invention comprises a thermoplastic layer and a printed color layer that is also thermoplastic." Col. 5, Ins. 28-30. It further states that thermoplastic means "the material exhibits plastic deformation or flow when heated." Id. at Ins. 30-33. The specification later clarifies that "the thermoplastic layer or film is printed to provide a colored sheet, i.e., a printed sheet, having a thermoplastic layer and a printed or colored image layer." Col. 6, 47-51. Nothing in the claim language or the specification states that the colored sheet has to include 2 plastic layers. One layer may be comprised of the ink and the other of polystyrene or another similar plastic product. I agree with Brushstrokes that the color layer must be thermoplastic, but the specification makes clear that thermoplastic means that the material--in this case, the ink--exhibits plastic deformation or flow when heated. Thus, the material does not have to be plastic in order to be thermoplastic; it only needs to act like plastic when heated.

The parties' dispute centers on the term "fabric." According to plaintiff, "fabric" means "a cloth made by weaving, knitting, or felting fibers." Plaintiff additionally proposes that "[t]he following materials are excluded from the 'group consisting of:' individual fibers, tissue, and non-woven fabric." For their part, defendants construe "fabric" as "a sheet-like material produced from woven fibers, knitted fibers, or non-woven matted fibers."

Understanding the rationale for plaintiff's proposal requires a certain amount of mental gymnastics. Plaintiff begins straightforwardly enough, identifying as a Markush group the limitation introduced by the phrase "group consisting of." See Abbott Laboratories v. Baxter Pharmaceutical, 334 F.3d 1274, 1280 (Fed. Cir. 2003) ("A Markush group is a listing of specified alternatives of a group in a patent claim, typically expressed in the form: a member selected from the group consisting of A, B, and C.") Plaintiff then argues that everything not included in the Markush group "woven fibers, fabric, knits, and fleece" is excluded from the group. See Gillette Co. v. Energizer Holdings, Inc., 405 F.3d 1367, 1372 (Fed. Cir. 2005)(phrase "group consisting of" signals Markush group, which "by its nature is closed"). This portion of plaintiff's
argument is unobjectionable. Thereafter, however, the argument becomes more tenuous.

Plaintiff's next proposition is that "as a matter of grammar, 'woven' modifies each of the types of fibers in the claimed Markush group, including fabric." Plaintiff's reply brief, at 12. In other words, plaintiff parses the limitation "woven fibers, fabrics, knits and fleece" as claiming "woven fibers, [woven] fabric, [woven] knits, and [woven] fleece." If plaintiff applied its proposed rule of grammar to an earlier iteration of the Markush group, however (the '285 application claimed "the group consisting of individual fibers, woven fibers, fabric, knits, and fleece"), the limitation would be read to claim "individual fibers, [individual] woven fibers, [individual] fabric, [individual] knits, and [individual] fleece." Plaintiff does not suggest that the claim as it appeared in the '285 application should be given such an implausible construction; yet that is the only interpretation available under plaintiff's proposed rule of grammar.

Plaintiff also cites the description in the specification of an absorbent layer "comprising individual fibers or a weave, fabric, knit, preferably a fleece," and argues that the "or" in this phrase reveals an intent to contrast individual fibers (including non-woven materials) with various types of woven materials (including fabric). This taxonomy, the argument goes, demonstrates that the patentee implicitly excluded "non-woven fabric" from the group of materials--weave, fabric, knit, and fleece--named on the far side of the "or." However, this exceedingly strained interpretation imbues the structure of the phrase with far too much substantive meaning.

Finally, plaintiff argues that the chart reproduced below, which purports to show the "progression" of certain claims over the course of the prosecution history reveals that the patentee intended to surrender non-woven materials:

<table>
<thead>
<tr>
<th>'184 Application Claim 3 (Abandoned)</th>
<th>'285 Application Claim 1 (Cancelled)</th>
<th>'613 Patent Claim 1 (Issued)</th>
</tr>
</thead>
<tbody>
<tr>
<td>the group consisting of fleece, non-woven fabric, woven fabric, and fleece,</td>
<td>the group consisting of individual fibers, woven fibers, fabric, and fleece,</td>
<td>the group consisting of knits, and fleece,</td>
</tr>
<tr>
<td>knit fabric and film</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

7 I reproduce plaintiff's chart as it was presented at oral argument. A similar chart that misquoted the issued claim in a way that does not appear to be material to plaintiff's argument was presented in plaintiff's brief.

According to plaintiff, this chart demonstrates that the patentee replaced the term "non-woven fabric" with the term "individual fibers," so that the later surrender of "individual fibers" effectively disclaimed non-woven fabric.

Defendants, of course, tell a different story. According to them, the "individual fibers" claimed in the '285 application were not a substitute for the term "non-woven fabric" in the '184 application. Instead, the word "fabric" in the '285 application was used in place of "non-woven fabric, woven fabric, [and] knit fabric," while "individual fabric" was claimed (and later abandoned) as a separate matter in the '285 application.

While both interpretations are perhaps plausible, defendants' explanation is the more obvious. In any event, disavowal of claim scope requires a far clearer statement of intention than the ambiguous inferences that might be drawn under plaintiff's analysis. See Omega Engineering, Inc. v. Raytek Corp., 334 F.3d 1314, 1326 (Fed. Cir. 2003) (disavowal of claim scope based on prosecution history must be unmistakable and unambiguous). Abbott Laboratories, v. Sandoz, Inc., 566 F.3d 1282 (Fed. Cir. 2009), on which plaintiff relies to support its theory that the patentee disclaimed non-woven fabric when it disclaimed individual fibers, is not to the contrary.

In Abbott, the patentee first filed an application that described and claimed Crystal A and Crystal B, then filed a later application (which issued as the patent-in-suit in that case) with broader claims that arguably encompassed both Crystal A and Crystal B, but whose specification referred only to Crystal A. The Abbott court upheld a construction confining the scope of the claims-in-suit to Crystal A, reasoning that because "Abbott knew exactly how to describe and claim Crystal B compounds," but did not do so, the claims were properly limited to Crystal A. Id. at 1289.
Plaintiff's reliance on Abbott here oversimplifies the Abbott court's holding, which was based on language in the specification that identified the invention as Crystal A. Because the written description revealed that "Crystal A was synonymous with the invention," the court applied the exception, rather than the rule against importing limitations from the specification into the claims. In this case, the specification provides no such clear basis for excluding non-woven fibers from the scope of the invention.

For all of these reasons, I reject plaintiff's proposed construction. Plaintiff does not appear to contest defendants' proposal, other than to the extent it covers non-woven fabric. Because I find that non-woven fabric appropriately falls within the scope of the term "fabric" as used in the '613 patent, however, I adopt defendants' construction of the term as "a sheet-like material produced from woven fibers, knitted fibers, or non-woven matted fibers."

G. Layer-Defining-Mold-Cavity-Section

The parties dispute the meaning of "layer-defining-mold-cavity-section." The claims recite this term repeatedly, and refer to both a first and a second layer-defining-mold-cavity-section. Steps (a)-(b) of claim 1 are illustrative:

(a) injecting a quantity of first plastic into the first mold cavity so that the first plastic flows in the first-layer-defining-mold-cavity-section in a first predetermined general direction,

(b) solidifying at least partly the flowed first plastic in the first-layer-defining-mold-cavity-section to thereby form said first plastic layer having a first-direction-flow-record.

'268 Patent, col. 8, lines 19-26. Koito asserts that the "layer-defining-mold-cavity-section" is the area of the mold cavity that forms a layer of the product. As a corollary, Koito also asserts that the layer-defining-mold-cavity-section is the entire section in which plastic flows in the mold cavity adjacent the flow channel. In other words, Koito proposes that the layer-defining-mold-cavity-section occupies the remainder of the mold cavity not used as a flow channel. In contrast, Turn-Key argues that a layer-defining-mold-cavity-section is simply a section of the mold cavity that defines and forms a layer of a cross-laminated section of the product. Under Turn-Key's construction, the layer-defining-mold-cavity-section need not be coextensive with the portion of the mold cavity not used as a flow channel.

The plain meaning of "layer-defining-mold-cavity-section" favors Turn-Key's proposed definition. This is so because the ordinary meaning of "section" refers to a part or portion of a whole. Oxford English Dictionary (2d Ed. 1989) (defining section as "[a] part separated or divided off from the remainder; one of the portions into which a thing is cut or divided" (emphasis added)); Webster's Third New International Dictionary 2053 (defining section in pertinent part as "a part that is, may be, or is held to be separated" (emphasis added)). It follows that a layer-defining-mold-cavity-section is a part of the mold cavity-not necessarily the whole mold cavity (as would be required were the layer-defining-mold-cavity-section to be interpreted as forming a layer of the product as a whole, rather than simply a layer of the cross-laminated section of the product).

The choice between the two parties' positions also depends upon the meaning attached to the word "layer," specifically, whether it refers to a layer of the product as a whole, or whether it refers only to a layer of the cross-laminated section of the product. As discussed above, the layers referred to in the claims are first mentioned in the preamble (and are later defined in the body of the claims) as being part of the cross-laminated section of the product: "a plastic product, with a cross-laminated section that includes a first plastic layer and a second plastic layer . . . ." Id., lines 11-13. Thus, as used in the claims, "layer" refers to one of the two or more layers that form the cross-laminated section. The court has construed "cross-laminated section" to refer to a section of the product that contains both a first and a second plastic layer, where the first and second plastic layers have positively different flow records. Under the court's construction, the cross-laminated section can, but need not be co-extensive with the layer of plastic forming the entire product, i.e., the claims do not require the entire product to be cross-laminated, but instead require cross-lamination in only a "section" of the product. It follows that the layers forming the cross-laminated section need not encompass an entire layer of the product, but rather need only be large enough to form the cross-laminated section of the product. Hence, the "layer-defining-mold-cavity-section" is not, as Koito argues,
a portion of the mold cavity that defines a layer of the product, but rather is a portion of the mold cavity that forms a layer of the cross-laminated section of the product. There is, of course, no reason why one or both of the layers could not also be an entire layer of the product itself. The court merely holds that the claims themselves are not so limited, and by their plain terms can include one or more layers that extend only to the boundaries of the cross-laminated section, and not beyond.

For the reasons discussed above, the court construes the term "layer-defining-mold-cavity-section" to mean a section of the mold cavity that defines and forms a layer of a cross-laminated section of the product.

2. "a layer of flexible material that is minimally porous to macromolecules"

The Court construes the term "layer" as "a single layer." For the phrase "that is minimally porous to macromolecules," the Court agrees with Defendants and construes the phrase as "that is substantially impermeable to macromolecules." However, the Court disagrees with Defendants that the phrase "minimally porous to macromolecules" modifies the term "layer"; instead, the Court concludes that the phrase "minimally porous to macromolecules" modifies the term "material."

A. Parties' Construction Arguments

For the term "layer," Plaintiff argues the term has a plain meaning and is readily understandable so it requires no construction. In the alternative, Plaintiff argues the Court should construe the term to mean "any thickness of material" (with no other physical or structural limitations than those otherwise in the claims). In support, Plaintiff's argument is the extrinsic evidence supports such a construction. Plaintiff relies on a dictionary definition that defines "layer" as a "thickness of material covering a surface or forming an overlaying part or segment." See The American Heritage Dictionary of the English Language 1022 (3rd ed. 1992). Plaintiff argues the Court should not adopt Defendants' construction that reads "a single layer (one and only one layer)." Plaintiff's reasoning is that the claim uses the open-ended "comprising" language, so the Court should not construe the claim to prohibit the addition of features or structures beyond those recited in the claim.

Regarding the phrase "that is minimally porous to macromolecules," Plaintiff argues the specification provides clear guidance for the meaning of the phrase. The specification states that the material of the layer is "minimally porous as described above such that it is capable of substantially containing macromolecules on one side of the device." 15:56-58. Plaintiff argues this supports a construction of "capable of substantially containing macromolecules on one side of the material." Plaintiff also argues the language "minimally porous to macromolecules" modifies the term "material" in the phrase "a layer of flexible material that is minimally porous to macromolecules." 22:33-34.

Defendants seek a construction of "layer" that reads "a single layer (one and only one layer)." Defendants primarily rely on multiple representations in the specification and prosecution history where the term "layer" is stated to be a single layer and is distinguished from other two layer devices. For the phrase "minimally porous to macromolecules," Defendants seek a construction of "substantially impermeable to macromolecules." 1 Defendants cite the specification where it states "[t]he device itself must be substantially impermeable to macromolecules." 13:42-43. However, the major disagreement regarding the phrase "minimally porous to macromolecules" is whether it modifies the term "layer" or "material." Defendants argue the phrase modifies the term "layer."

- Footnotes -

1 Note that in Defendants' brief they incorporate the agreed upon construction of "macromolecules" in their construction of the present phrase by stating "substantially impermeable to molecules with a molecular weight of at least approximately 500 Daltons" instead of "substantially impermeable to macromolecules." The Court has removed the incorporation of the construction for "macromolecules" for the reason of brevity here.

- End Footnotes-
The Court construes the term "layer" as "a single layer." The intrinsic record supports a conclusion that the inventor has limited the layer to a single layer. As the Federal Circuit stated in Phillips, 415 F.3d at 1316, “[i]n [some] cases, the specification may reveal an intentional disclaimer, or disavowal, of claim scope by the inventor. In that instance . . . , the inventor has dictated the correct claim scope, and the inventor's intention, as expressed in the specification, is regarded as dispositive." Further, "[t]he patentee is held to what he declares during the prosecution of his patent." Gillespie v. Dywidag Sys. Int'l, 501 F.3d 1285, 1291 (Fed. Cir. 2007). In the specification of the patent-in-suit, the inventor clearly limited the scope of the term layer to a single layer. The specification states multiple times that the "present invention" is "single-layered." See, e.g., 6:26-27 ("The present invention is provided as a single-layered malleable fixation device . . . ."). Additionally, the inventor had a previous invention, and consequently prior art for the patent-in-suit, that consisted of two layers. See U.S. Patent No. 5,466,262 (filed Aug. 30, 1993). In the specification of the patent-in-suit, Plaintiff stated the invention of the patent-in-suit "is a single, thin layer of material as opposed to the structure of the Malleable Fracture Stabilization Device with Micropores for Directed Drug Delivery [the '262 patent] shown in FIG. 1b [which clearly shows two layers]." 13:58-63. Indeed, the inventor notes that eliminating one of the layers on the older two-layer device, and thus making it a single layer, is advantageous:

Because a fundamental tenant of surgical practice to [sic] keep the amount of foreign material placed within the body to an absolute minimum, any decrease in the amount of implant used is of benefit to the patient. Therefore, the elimination of an entire layer while maintaining function is a highly significant improvement in design. 7:47-52. Thus, the inventor limited the scope of the term layer to a single layer in the specification by expressly limiting the invention to a single layer and distinguishing prior art on the basis of the single layer. In addition, the inventor limited the layer to a single layer during the prosecution of the patent. The inventor distinguished the invention in the patent-in-suit from the prior art because it was "a single layer rather than two layers." See, e.g., Applicant's 9/13/96 Response to Examiner's 6/12/96 Office Action, at 5, attached as Ex. 13 to Defendants' Amended Answering Brief, Dkt. No. 102. Based on its review of the intrinsic record, the Court concludes that the inventor disclaimed the scope of "layer" to a single layer, and so the Court construes the term "layer" as "a single layer."

The Court rejects Plaintiff's argument that the Court should not construe "layer" as "a single layer" because the claims, such as claim 1, use the open-ended "comprising" language. As discussed above with the claim term "device," the term "comprising" is a transitional term in patent law that is inclusive or open-ended and does not exclude additional elements or steps. CollegeNet, 418 F.3d at 1235. As with "device," the Court need not construe "layer" in a way to reflect the open-ended nature of the "comprising" language. Of course, Plaintiff will be able to take advantage of the "comprising" language when proving infringement of those claims including that transitional phrase. However, the Federal Circuit has warned that while "a transitional term such as 'comprising' . . . does not exclude additional unrecited elements . . . , [c]omprising' is not a weasel word with which to abrogate claim limitations." Spectrum Int'l, Inc. v. Sterilite Corp., 164 F.3d 1372, 1379-80 (Fed. Cir. 1998) (internal quotes omitted); see also Dippin' Dots, Inc. v. Mosey, 476 F.3d 1337, 1343 (Fed. Cir. 2007). Hence, Plaintiff may not use the "comprising" language for the purpose of getting around the disclaimer that the "layer" is "a single layer," and thus disregarding the Court's construction of "layer."

For the phrase "that is minimally porous to macromolecules," the Court agrees with Defendants' proposed construction reading "that is substantially impermeable to macromolecules." The intrinsic record supports this construction. The specification specifically states that the device must be "substantially impermeable to macromolecules:" 2 The Court disagrees with Plaintiff's proposed construction that reads "capable of substantially containing macromolecules on one side of the material." Plaintiff's citation to the specification is misleading because the specification reads "one side of the device" and not "one side of the material" as Plaintiff proposes. See 15:56-58. Also, Plaintiff's construction adds ambiguity to the phrase by inserting the words "on one side" of the material. By stating "on one side" it implies that the macromolecules may be contained on either side of the material; however, the specification teaches that the macromolecules are to be preferentially contained on the specific side that is adjacent to the interfragmentary space. See 13:22-25 ("This invention is designed to keep . . . the macromolecules . . . in the space between the fracture fragments, i.e., the interfragmentary space . . . ."). Therefore, the Court construes the phrase "that is minimally porous to macromolecules" as "that is substantially impermeable to macromolecules."
Since the word "porous" means the opposite of "impermeable," if something is "minimally porous" it can be said to be "substantially impermeable." Compare Merriam-Webster's Collegiate Dictionary 966 (11th ed., Merriam-Webster, Inc. 2006) (defining "porous" as "permeable to fluids" or "capable of being penetrated"); id. at 624 (defining "impermeable" as "not permitting passage (as of a fluid) though its substance").

The Court agrees with Plaintiff that the language "that is minimally porous to macromolecules" modifies the term "material" and not "layer" in the claim phrase "a layer of flexible material that is minimally porous to macromolecules." 22:33-34. As Plaintiff points out, the specification states "[t]he only requirements are that the material be . . . 3) minimally porous as described above . . . ." 15:50-58 (emphasis added). A plain reading of the claim language in claim 1 also supports an interpretation where the phrase modifies the word "material" and not "layer." The specific phrase in claim 1 reads "a layer of flexible material that is minimally porous to macromolecules, said layer having a first and second major surface, the layer being capable of being shaped in three dimensions by manipulation by human hands . . . ." 22:33-35 (emphasis added). Under a plain reading of the phrase, when the language is referring to the layer, it says "said layer" or "the layer." But there is no qualifying language such as "the layer" before the phrase "that is minimally porous to macromolecules." If the patentee wanted the phrase to modify the layer, then the patentee could have written "a layer of flexible material, the layer being minimally porous to macromolecules" as the patentee did in the latter part of the phrase, yet the patentee did not include such language. See 22:33-34. So the Court concludes that the phrase modifies the word "material" and not "layer."

Finally, Defendants also seek the Court to clarify that "a layer of flexible material that is minimally porous to macromolecules" does not encompass a layer on a stent that leaves uncovered mesh holes which allow macromolecules to freely move through them. The Court refuses to do so. Defendants' issue regarding a stent that leaves uncovered mesh holes is discussed at length in the Court's discussion below of the disputed phrase "the device being capable of substantially restricting the through passage of at least one type of macromolecule therethrough."

1. "A first layer of foam"

The '810 patent suggests broad parameters for "a first layer of foam." It must be "breathable," and can be of variable thickness. It may include (but is not limited to) "open-cell, hydrophilic" foam, or "reticulated" foam. (See '810 patent, col. 2, lines 65-67; col. 3, lines 1-3.) Specific examples of open-cell hydrophilic foam are those that go by the trade names "Aquazone" and "Comfortemp." (See id. at col. 4, lines 29-30.)

Is not entirely clear what dispute the parties have about this claim element. At the May 13 Markman hearing, neither party highlighted the definition of "a first layer of foam" as one that was in dispute. In pre- and post-hearing filings, however, Plaintiffs allude to a dispute over whether the specification limits the types of foam to the named embodiments. To the extent this is an issue, the Court finds that the foams that may compose the "first layer of foam" are not limited to those specifically identified. See Toro Co. v. White Consol. Indus., 199 F.3d 1295, 1301 (Fed. Cir. 1999) ("it is well established that the preferred embodiment does not limit broader claims that are supported by the written description"). The specification offers only one explicit criterion for the composition of the first layer of foam, and that is that it be "breathable."

Plaintiffs urge that the foam must also possess "moisture transfer qualities." To support this proposition, they refer to language in the specification that describes moisture "traveling" through "the first foam material." However, unlike material that "causes" moisture to pass through it, material that merely allows moisture "to travel" through it does not fall within the Court's definition of material having active "moisture transfer qualities." Although some of the foams named as preferred embodiments explicitly possess such qualities, such as "hydrophilic" foam, there is no intrinsic or extrinsic evidence supporting Plaintiffs' claim that all such foams must possess them.

The Court therefore construes "a first layer of foam" to indicate a layer of foam that is breathable as defined in this claim construction, and that includes, but is not limited to, reticulated foam and open-cell hydrophilic foam. Foams known by the trade names "Aquazone" and "Comfortemp" are specifically included.
b. "surrounded by a layer of material"

As the Court has noted, five of the claims at issue state that the polymer material is processed while surrounded by a layer of material that prevents contact with oxygen:

'934 Patent, claims 29, 52: "material is surrounded by a layer of material whose function is to prevent said . . . material from contact with oxygen and said layer is heated"

'814 Patent, claim 12: "device as set forth in claim 7 wherein a layer of material is provided to prevent said polyethylene material from coming into contact with oxygen"

'308 Patent, claim 10: "polyethylene implant material is surrounded by a layer of material whose function is to prevent said polyethylene material from coming into contact with oxygen, said layer of material is heated"

'308 Patent, claim 21: "polyethylene is surrounded by a layer of material whose function is to prevent said polyethylene material from said contact with oxygen, said layer of material is heated"

The ordinary meaning of these claim terms is narrower than the seven claims the Court examined earlier, which merely involved an unspecified method of isolation from oxygen. However, the Court's analysis of these claims is similar to the analysis it employed earlier.

i. '934 Patent, claims 29, 52

The Court finds that claims 29 and 52 of the '934 Patent, which specify that the polymer is segregated from oxygen by a layer of material, are not limited to processes that segregate the polymer from oxygen by a packaging material. This is because the doctrine of claim differentiation suggests that when two distinct claims depend from one independent claim, they should not be read to place the same limitations on that independent claim. Otherwise the dependent claims would render one another superfluous.

Claims 29 and 33 both depend from independent claim 23 of the '934 Patent, but limit claim 23 differently. Dependent claim 29 limits claim 23 of the '934 Patent to processes whereby the polymer "is surrounded by a layer of material" to segregate from oxygen. In contrast, dependent claim 33 of the '934 Patent limits dependent claim 23 to processes whereby an "oxygen impermeable packaging material is the layer used to prevent the polyethylene material from contacting oxygen." The doctrine of claim differentiation strongly suggests that claim 29 is distinct from, and broader than, claim 33.

Similarly, claims 55 and 52 both depend from independent claim 50 of the '934 Patent. Dependent claim 55 of the '934 Patent limits independent claim 50 to processes wherein an "oxygen impermeable packaging material is used to prevent the olefinic material from contacting oxygen," while dependent claim 52 of the '934 Patent only limits claim 50 to processes whereby the polymer is segregated from oxygen by "a layer of material." This implies that claim 52 is broader in scope than claim 55.

The Court therefore finds that claims 29 and 52 of the '934 Patent, unlike claims 33 and 55, are not limited to processes whereby the polymer is isolated from oxygen by an airtight package.

ii. '308 Patent, claims 10, 21

Applying identical reasoning, the Court finds claims 10 and 21 of the '308 Patent, which specify that the polymer is segregated from oxygen by a "layer of material," are not limited to using an airtight package to prevent the polymer from contacting oxygen.

Claims 3 and 10 both depend from independent claim 1 of the 308 Patent. Dependent claim 3 of the '308 Patent expressly
limits independent claims 1 of that patent to processes wherein the method for preventing the polyethylene material's contact with oxygen is "a packaging material." In contrast, dependent claim 10 limits claim 1 of that patent to processes whereby "a layer of material" prevents the polyethylene material's contact with oxygen. The doctrine of claim differentiation suggests that the language of claim 10 is intended to convey a broader scope for that claim than the precise and narrow language of claim 3 of the '308 Patent.

Dependent claims 21 and 14 both depend from independent claim 12 of the '308 Patent. Dependent claim 14 of the '308 patent expressly limits independent claim 12 of the '308 Patent to processes whereby the method for preventing the polyethylene material's contact with oxygen is "a packaging material." This implies that claim 21, which specifies that a "layer of material" segregates the polymer from oxygen, is intended to be broader in scope than the narrowly defined claim 14 of the '308 Patent.

Neither claim 10 nor claim 21 of the '308 Patent require the polymer be heated "in an airtight package." In other words, the material used to segregate the polymer from oxygen does not have to be a packaging material.

iii. '814 Patent, claim 12

The meaning of "layer of material" in claim 12 of the '814 Patent is not so easily construed in the context of that patent's other, related claims. Even so, the Court will not interpret the term to require the polyethylene material be isolated from oxygen by an airtight package. First, the language of claim 20, referring to an "oxygen impermeable barrier around said material," suggests that "layer of material" is distinct from and broader than "in an airtight package." Second, because the related '934 and '308 Patents used the term "layer of material" more broadly than "an airtight package," the Court will not narrow the term merely on the basis of a specification that does not clearly limit the invention to the embodiment. See Inline Connection Corp. v. AOL Time Warner Inc., 302 F. Supp. 2d 307, 324 (D. Del. 2004). The Court interprets "layer of material" to mean exactly what it says and no more. The phrase does not restrict claim 12 to sterilization and heating "an airtight package."

2298

B. "Leaf Spring Portion"

ADC and Switchcraft debate the meaning of the claim term "leaf spring portion." Claim 1 teaches that a switch includes "at least one conductive movable portion defining a leaf spring portion." '378 patent at 10:20-31.

ADC argues the phrase should be construed to mean "a spring formed by a thin strip or leaf." ADC notes that Merriam Webster's Collegiate Dictionary defines leaf spring as "a spring made of superimposed strips or leaves." Supra at 707 (11th ed.).

Switchcraft argues a leaf spring should be interpreted as a portion "that is firmly anchored at one end with a large deflection at another end." Switchcraft's Proposed Claim Constructions (Switchcraft Markman Brief [Docket No. 46], Ex. G). This proposed interpretation is based on the definition for leaf spring in the McGraw-Hill Dictionary of Scientific and Technical Terms: "[a] beam of cantilever design, firmly anchored at one end with a large deflection under a load. Also known as a flat spring." Supra at 1123 (5th ed. 1994). Switchcraft argues leaf spring is a narrower term than "movable portion" because, after the claim was originally filed, it was specifically added to denote a specific type of movable portion. Switchcraft also supports this argument by noting that claim 1 teaches "said switch including at least one conductive movable portion defining a leaf spring portion" while claim 16 subsequently recites, "said switch including a plurality of conductive movable portions." '378 patent at 10:30-31, 14:9-10. Switchcraft argues that an interpretation of leaf spring as a configuration suitable for conducting electrical signals which is also movable renders superfluous the recitation of a conductive movable switch portion. Finally, Switchcraft argues all of the leaf springs shown in the preferred embodiment are shown and described as having free ends and subject to "deflecting forces." See 4:38, 57-58, 64-65.

ADC proposes "leaf springs" should be interpreted as "a spring formed by a thin strip or leaf." ADC argues claim one describes a spring as a leaf to convey its general shape: a thin or flat piece of material. ADC stresses Merriam-Webster's Collegiate Dictionary defines "leaf spring" as "a spring made of superimposed strips or leaves." Supra at 707. In addition,
the definition cited by Switchcraft in the McGraw-Hill Dictionary of Scientific and Technical Terms states that a "leaf spring" is "also known as flat spring." Supra at 1123.

The '378 specification refers to switch elements 42a and 44a as "flexible leaf springs" but later refers to the same elements as including "spring contacts." See '378 patent 4:32-34, 52. ADC argues the use of "spring contacts" supports its construction of "leaf springs" because spring contacts are defined as "a contact made from flat, metal spring stock; it is usually bent or curved" or as "a relay or switch contact mounted on a flat spring, usually of phosphor bronze." The Illustrated Dictionary of Electronics, TAB Books, Inc., 477, 215 (3rd ed. 1985); McGraw Hill Dictionary of Scientific and Technical Terms, supra at 1896. ADC argues the common emphasis in all of these definitions is the thin or flat shape of the spring. In the specification, six elements, 42a, 44a, 50a, 52a, 70a, and 70b, are identified as leaf spring portions and are shaped as thin strips or leaves. '378 patent 4:31-33, 50-51, FIGS. 5, 6.

Switchcraft and ADC debate whether the definition of "leaf spring" must reflect its functional use. Switchcraft argues "leaf spring" is a term of art that describes both the structural and functional elements of the spring. Switchcraft contends ADC's definition only reflects the structure and not the function of a "leaf spring." ADC counters that if the definition of "leaf spring" encompasses the functional language included in Switchcraft's definition, the phrase "at least one conductive movable portion defining a leaf spring portion" would be redundant. ADC claims the functional limitation is included by the term "moveable."

The Court finds "leaf spring" should be interpreted as "a spring formed by a thin strip or leaf." This interpretation is consistent with the use of "leaf spring" in the specification. Although the preferred embodiment does show leaf springs that are anchored at one end, nothing in the claim recites that leaf springs must be anchored at one end or have a large deflection at the other end. Limitations shown in the preferred embodiment are not to be read into claims. Burke Inc. v. Bruno Indep. Living Aids, Inc., 183 F.3d 1334, 1340 (Fed. Cir. 1999). The claims emphasize only that leaf springs are movable. Furthermore, the Court's construction reflects the common feature of the definitions for "leaf spring" - a thin or flat shape. In addition to the quoted dictionary definitions, other jurisdictions have also defined leaf springs as "flat pieces of tensed metal" and "flat (or leaf) springs." Cool-Fin Electronics Corp. v. Intl Electronic Research Corp., 491 F.2d 660, 661 (9th Cir. 1974); Turbocare Div. of Demag Delaval TurboMachinery Corp. v. General Electric Co., 264 F.3d 1111, 1121-22 (Fed. Cir. 2001). The claim uses "leaf spring" to describe the element's structural aspect while "movable" describes its functional element.

Switchcraft argues adapting this interpretation ignores the stated preference for scientific dictionaries when defining technical terms. See AFG Indus. v. Cardinal, 239 F.3d 1239, 1248 (Fed. Cir. 2001). However, it is critical the interpretation reflect the use of the term in the patent specification. Teleflex, Inc., 299 F.3d at 1325. The construction proposed by Switchcraft is itself a variance from the definition found in the technical dictionary. Switchcraft's construction includes a large deflection at one end while the technical dictionary does not specify the location of said deflection. Additionally, ADC presented several examples of leaf springs that would not be covered by Switchcraft's definition, and in at least one case, the technical dictionary's definition. These examples include leaf springs that are anchored on both sides with a deflection in the middle, such as those commonly used in van and truck suspension or described as leaf spring 130 in JP Patent No. 4-24642. See Pl.'s Markman Brief at 10; Pl.'s Oral Argument Slide Nos. 40-41. It also includes the leaf springs that are not anchored at either end, such as the leaf spring 15 of GB 1224234 discussed by the Federal Circuit in Turbocare. 264 F.3d at 1121-23; Pl.'s Oral Argument Slide No. 42. Switchcraft argues for a construction it claims is commonly understood by those skilled in the art. However, without greater intrinsic evidence that the patentee intended to limit the use of "leaf spring," it is inappropriate to impose such a definition given the many common examples of leaf springs that fall outside the ambit of its proposed definition.

2299

7. Lead Screw

The ordinary meaning of "lead screw" is a threaded shaft used to convert rotation to longitudinal motion. The patent figures are consistent with this meaning, displaying the lead screw as a threaded shaft. Relying on the prosecution history, Volovik claims that the inventor, Giter, defined "lead screw" as a finely threaded rod with a nut other than a ball nut.
It is well established that the prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution. Springs Window Fashions LP v. Novo Indus., L.P., 323 F.3d 989, 994 (Fed. Cir. 2003). An inventor's statements distinguishing the claimed invention from prior art acts as a disclaimer by revealing what the claimed invention does not cover. Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1304 (Fed. Cir. 1997). A disclaimer must reasonably clear and deliberate. Springs Window Fashions, 323 F.3d at 994; N. Telecom Ltd. v. Samsung Elecs. Co., 215 F.3d 1281, 1294-95 (Fed. Cir. 2000).

In this case, the examiner rejected Giter's application for the '562 Patent because United States Patent 4,566,868 (Menzies) "teaches driving a piston with a rotary stepper motor, threaded piston rod 20, and ball screw 17." Giter responded:

Menzies does not disclose a lead screw. There is no disclosure in Menzies that the ball screw 17 is capable of the fine gradations in linear movement which [Giter's] lead screw provides. It is well known in the art that lead screws may be made with extremely fine pitch, which would provide [Giter's] invention with very precise control of the longitudinal position of the piston 38, which is required for accurate dispensing of very tiny volumes.

The examiner rejected Giter's argument, stating that the "threaded rod 20 [in Menzies] is read as the lead screw." Giter appealed the examiner's rejection of his application. On appeal, he raised several arguments relating to Menzies, including:

Menzies [does not] disclose[] a lead screw. . . . There is no indication that the ball screw 17 of Menzies is equivalent to a lead screw. There is no disclosure in Menzies that the ball screw 17 is capable of the fine gradations in linear movement which [Giter's] lead screw provides.

Giter also argued that Menzies was non-analogous prior art, and that there was no suggestion to combine Menzies with another prior art reference relied on by the examiner. The examiner allowed the claims in light of the arguments Giter presented on appeal.

The prosecution history does not support Volovik's proposed construction of lead screw. Giter distinguished Menzies based on the ability to perform fine gradations of linear movement. Giter's assertion that there is "no indication" that Menzies' ball screw is equivalent to a lead screw falls far short of a reasonably clear and deliberate disclaimer of the use of a ball nut in the '562 Patent. The Court therefore rejects Volovik's contention that Giter defined "lead screw" to exclude use of a ball nut, and construes the term as a threaded shaft used to convert rotation to longitudinal motion.

The term "lead shot-filled closed front end" first appears in the phrase: "urging in movement said lead shot-filled closed front end of said tubular projectile body fully into said projectile compartment to an extent causing said tail thereof to contact against said closed 12 gauge shotgun shell end and said lead shot-filled closed front end to expand radially into contact with said 12 gauge shotgun shell cylindrical wall so as to assume said cylindrical shape thereof characterized by a blunt front end." '086 patent, 5:13-20.

Defendants' proposed construction of "lead shot-filled closed front end" is "the closed front end portion of the projectile body forward of the constriction/delineation that is filled with lead shot and has a diameter that is less than the interior diameter of the 12 gauge shotgun shell." Def. Op. Br. at 15. Defendants note that, in order for the projectile body to "expand radially" when it is shoved inside the shell casing as stated in the claim, the "front end" must be narrower than the shell casing.

Plaintiff responds that it is not necessary for the entire "lead shot-filled closed front end" to be narrower than the casing in order for some portion of the front end to "expand radially" inside the shell casing. Plaintiff notes that "claims must be construed so as to be consistent with the specification, of which they are a part." Merck & Co. v. Teva Pharms. USA, Inc., 347 F.3d 1367, 1371 (Fed. Cir. 2003); see also Modine Mfg. Co. v. U.S. Int'l Trade Comm'n, 75 F.3d 1545, 1550 (Fed. Cir. 1996) ("[A] claim interpretation that would exclude the inventor's device is rarely the correct interpretation; such an interpretation requires highly persuasive evidentiary support.…"), cert. denied, 518 U.S. 1005, 116 S. Ct. 2523, 135 L. Ed. 2776.
2d 1048, overruled on other grounds, Festo Corp. v. Shoketsu Kinzoku Kogyo Kabushiki Co., 234 F.3d 558, 574 (Fed. Cir. 2000). Plaintiff argues that defendants' construction is incorrect because it would exclude from the claim the preferred embodiment of the invention described in the patent specification, in which the preferred maximum projectile width is 1" and preferred shelling case width is 3/8". '086 patent, 3:55-60.

First, as a matter of physics, the projectile body, including the front end, must be very slightly narrower than the shell casing at the point that the projectile enters the shell casing in order for one to fit inside the other. This does not require, however, that the entire front end be narrower than the casing prior to insertion. Nothing in the claim requires that the entire section of the projectile body forward of the constriction (i.e., the "lead shot-filled closed front end") have a diameter that is less than that of the 12 gauge shotgun shell prior to its insertion into the shell casing. The front end could initially be wider than the casing and could be narrowed at the point where it enters the casing.

Plaintiff is correct that the claim only requires that some portion of the "lead shot-filled closed front end" "expand radially" inside the shell casing. Only the very tip of the closed front end must be narrower than the shotgun shell in order for the closed front end portion to "expand radially" once inside the shell casing. The construction of "lead shot-filled closed front end" that is consistent with the ordinary meaning of the claim language is therefore "the closed front end portion of the projectile body forward of the constriction/delineation that is filled with lead shot, some portion of which has a diameter that is less than the interior diameter of the 12 gauge shotgun shell at the time that the portion is inserted into the shotgun shell.

7. "lead wire extending from the package"

Claim 1 of the '919 Patent describes a "first lead wire extending from the package to enable the second end to be interconnected to a defibrillator prior to the opening of the package and use of the first electrode." Claims 12 and 17 contain similar language. Philips asserts that the "lead wire extending from" language means that the insulated wire starts inside the package, and continues through and beyond the package periphery. Cardiac Science contends that "lead wire extending from" language should be construed as "the wire is configured to enable electrical connection to a defibrillator through an unopened electrode package."

Consistent with the Court's construction of the "electrode connection means" of the '884 Patent, supra, the Court finds that the term "lead wire extending from the package" is properly construed as "the insulated wires or leads start inside the envelope and extend from the inside to the outside of the envelope."

11. "lead wires with connectors extending from the package"

Claims 1, 3, 4, and 10 of the '571 Patent describe "lead wires with connectors extending from the package." Philips asserts that this term should be construed as "a round wire covered by an electrically insulating material, such as polyvinyl chloride, and having two ends used to connect two points in a circuit, the lead wires having connectors on the end that are outside the package." Cardiac Science contends that this term should be construed as "lead wires and connectors extend from electrode package."

The electrodes are sealed in packages that must remain sealed so that the gel on the electrodes (which ultimately forms the contact with the rescue patient) does not dry out. Yet, the self-test requires electrical contact between the AED and the packaged electrodes, so that the self-test can reach the electrodes inside and determine whether electrical conductivity still exists. The lead wires and the connectors extending from the package provide this contact.

The patent specification describes the preferred embodiment as follows:
Insulated lead wires 56 extend from each electrode 50, and have a first end connected to the conductive sheet and a second end connected to connector 58. Connector 58 is configured to releasably mate with the electrode connector 32 in electrode compartment 26. Electrodes 50 are sealed within a polymer or polymer-metal laminate package 60 such as that shown in FIG. 2. Lead wires 56 and connector 58 extend from package 60.

(Id. at c. 2, ll: 50-58.) Based on this language, Philips argues that the wires extend from the package, with the connectors completely outside the package. Cardiac Science, on the other hand, asserts that the connectors may merely reach outside the package with the lead wires contained completely within the package.

The Court finds that the claim language contemplates that the connectors extend outside the package. However, the connectors do not have to "completely" extend outside the package, as Philips contends. The Court need not limit the claim construction to the preferred embodiment. Consistent with the plain language of the claim, the Court construes this term as "the lead wires and the connectors extend, at least partially, from the electrode package."

4. "Leading Seal Edge"

Formula proposes a construction of this term to mean the edge of the seal that leads the travel of the piston from the first end of the cylinder toward the second end of the cylinder and that passes the timing port during that travel. Relying upon inferences drawn from a claim where the term does not appear, Formula's construction rests on its assertion that the piston can move only in an axial direction within the cylinder and that the seal can only move in lockstep with the piston. Formula's construction also assumes a seal for which all points of the circumference are equidistant from the second end of the cylinder, so the entirety of the seal would lead the piston assembly during travel from the first end of the cylinder to the second end.

SRAM contends that the term refers to the forward edge of the seal that interacts with the timing port such that the movement of hydraulic fluid into the reservoir is cut off, causing pressurization within the chamber and actuating the brake system. This construction focuses not on whether the edge of the seal leads the piston's movement but instead on the movement of the seal edge with regard to the timing port, independent of whether the position of the piston vis-a-vis the timing port also changes. The term appears in the context of three claims involving adjustment of the dead band, a system that is dependent on the relationship of the seal and the timing port. The claim on which Formula relies (claim 13) 2, by contrast, addresses actuation of the brake, a process that is dependent upon the movement of the entire piston through pressure on the brake lever, taking the piston assembly through a much larger portion of the cylinder to create differing amounts of force within the braking system and therefore a greater degree of slowing of the bicycle overall. SRAM's construction is more closely rooted in the context that a person skilled in the art would use to determine the meaning of this term, making it the more suitable of the parties' advanced positions. Accordingly, we construe the term "leading seal edge" to mean the forward edge of the radial seal that interacts with the timing port.

Footnotes

[2] In pertinent part, claim 13 reads as follows: "A master cylinder for a hydraulic disc brake, the master cylinder comprising: a housing defining a cylinder, the cylinder having a first and second end;...a piston received in the cylinder having a radial seal, the piston being movable between a select starting position with the seal between the first end and the port opening with the seal a select distance from the port opening and a pressurized position with the seal between the port opening and the second end, the radial seal preventing fluid flow between the cylinder and the reservoir when positioned between the port opening and the second end to pressurize the second end;...[and a] dead band adjustment means operatively associated with the piston for moving the radial seal to adjust the select distance between the port opening and the seal...."

This term appears in asserted Claim 11. The definition of this phrase depends greatly on the definition of the term "housing" as it is used in the patent and as the court set forth in Section A(1). In that discussion, the court found that the term "housing" in the context of this patent means "a case covering, protecting, or enclosing other parts of the fuel cap." The court declined to read into this basic definition any of the limitations proposed by Gerdes, instead finding that nothing in the patent's claims or specification dictated the structures that were, or were not, a part of the housing.

This definition of the term "housing" in turn affects the meaning of the phrase "leaving said housing and said second flange intact to seal said neck." Taking into consideration this definition, in its simplest form, Claim 11 claims a fuel cap on which an impact to the outer cover fractures the breakable portion of the first flange and leaves the "case covering, protecting or enclosing other parts of the fuel cap" as well as the second flange intact to seal the fuel fill neck. Reexamined 097 patent, col. 1, 11. 58-61. Next, the court must also take into account other important terms in this phrase including: "leaving" and "intact." The most pertinent dictionary definition of the term "leave" is "to cause to be or remain in some specified condition," in this case "intact to seal said neck." See Webster's Third, Gerdes Ex. 233. "Intact" is defined, in part, as "untouched" or "left complete or entire." Webster's Third, Gerdes Ex. 232.

Both the claims and the written description of the invention in the patent make clear that in order for this invention to accomplish its purpose, a portion of the cap must break at the time of impact. See reexamined 097 patent, col. 1, 11. 58-60; 097 patent, col. 1, 11. 38-47. It is equally clear that when this break occurs the second flange, and at least a portion of the housing, must remain in place to seal the filler neck and prevent fuel spillage. See reexamined 097 patent, col. 1, 11. 60-61; 097 patent, col. 1, 11. 43-47. In order to accomplish these functions, the cap consists of a breakable first flange or a breakable portion of the housing itself. Reexamined 097 patent, col. 1, 11. 58-60; col. 2, 11. 43-49.

Dependent Claims 24 and 25 specifically discuss the frangible portion of the housing itself. The court agrees with Gerdes in that nothing in these two claims dictates that the frangible portion of the housing break in every impact. That is, "an impact on the outer cover of the fuel cap may fracture the frangible portion of the first flange (as recited in claims 11 and 24) without fracturing the frangible portion included in the housing and leave the housing with its frangible portion intact to seal the neck." Gerdes Reply Brief on Claim Construction, p. 22. Contrary to Gerdes' argument, however, Claims 24 and 25 aid the court in interpreting the phrase at issue here. Specifically, if the patentee claimed the cap of Claim 11, and incorporated by reference into Claim 24, "wherein the housing includes a frangible portion," then it simply does not make sense to hold that the housing of the cap in Claim 11 must always remain unbroken. This does not mean that the breakable portion of the housing -- formed as is claimed in Claim 24 -- must break in every impact, but rather that it may break in certain instances. Thus, regardless of whether the first flange is a part of the housing, the housing must at least in certain situations be capable of breaking at a designated point; something a housing that must remain unbroken clearly cannot do.

For this reason, in order to give meaning to Claims 24 and 25, the court finds that "leaving said housing and said second flange intact to seal said neck" cannot require that the housing must remain untouched or complete as the ordinary meaning of the term "intact" suggests. Instead, the housing must remain only as complete as necessary to, in combination with the second flange, seal the neck. Under this definition, the cap may fracture at either the breakable portion of the first flange or the breakable portion of the housing in response to the impact and, as a result, the housing may or may not break so long as the housing and second flange continue to seal the filler neck. This finding is consistent with both the claims of the reexamined 097 patent as well as the specification of the 097 patent and the reexamined 097 patent.

Therefore, the court finds that the definition of "leaving said housing and said second flange intact to seal said neck" means that after the impact the "case covering, protecting, or enclosing other parts of the fuel cap" and the second flange must remain complete enough to perform their function of sealing the filler neck to prevent fuel spillage.
B. Claim 37 -- Literal Infringement

Both parties contend that they are entitled to summary judgment on the issue of infringement of claim 37 based on their respective interpretations of the term "ledges." (See Ariens Co.'s Mem. of Law in Supp. of its Mot. for Summ. J. of Non-Infringement at 20-21 ("Def.'s Supp. Infringement Mem."); Toro's Mem. in Opp'n to Ariens's Mot. for Summ. J. of Non-Infringement at 1-7 ("Pl.'s Opp'n Infringement Mem.").) Ariens argues that because its accused product has surfaces that extend outward but without any discontinuity in the surface of the rear wall, they are part of a continuous curve and cannot be characterized as "ledges." (See Def.'s Supp. Infringement Mem. at 20-21; Def.'s Reply Infringement Mem. at 11-13.) Toro responds that Ariens is not entitled to summary judgment with regard to claim 37 because: (1) Ariens's proposed construction of the term "ledges" is improper because it would add limitations to claim 37; (2) the accused product literally infringes claim 37 even under the proposed construction of the term "ledges" advanced by Ariens; and (3) the accused product infringes claim 37 under the doctrine of equivalents. (See Pl.'s Opp'n Infringement Mem. at 1-7.)

Element (d) of claim 37 describes: "two downwardly facing ledges located on the rear wall of the housing beneath the upper edge of the housing, wherein the ledges are positioned on each side of the snow collecting chamber to lie above the end sections of the impeller." ( '726 Patent column 18, lines 54-58.) Although claim 37 contains three other elements (see id. column 18, lines 37-58), the only one in dispute is element (d).

A claim of literal patent infringement requires a two-step analysis: claim construction, which is a question of law, and a determination of whether the accused product infringes the asserted claim, as properly construed, which is a question of fact for the jury. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1581-82 (Fed. Cir. 1996); see also Markman v. Westview Instruments, Inc., 52 F.3d 967, 976 (Fed. Cir. 1995) (en banc), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). In interpreting a claim, a court first looks to the intrinsic evidence, such as the claims themselves, the specification, and the prosecution history. Vitronics, 90 F.3d at 1582 (citing Markman, 52 F.3d at 979). In construing the language in a claim, a court is guided by the principle that:

Although words in a claim are generally given their ordinary and customary meaning, a patentee may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning, as long as the special definition of the term is clearly stated in the patent specification or file history.

Id. (citing Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578 (Fed. Cir. 1996)). If the meaning of the claims to be construed is clear from an examination of the language of the claims at issue, the patent specification, and the prosecution history, it is inappropriate for a court to consider extrinsic evidence, such as expert testimony. Id. at 1584 ("In most situations, an analysis of the intrinsic evidence alone will resolve any ambiguity in a claim term. In such circumstances, it is improper to rely on extrinsic evidence."); see also Pall Corp. v. Micron Separations, Inc., 66 F.3d 1211, 1216 (Fed. Cir. 1995), cert. denied, 520 U.S. 1115, 1117 S. Ct. 1243, 137 L. Ed. 2d 326 (1997); Hormone Research Found., Inc. v. Genentech, Inc., 904 F.2d 1558, 1562 (Fed. Cir. 1990).

--- Footnotes ---

1 Toro's Amended Complaint does not specify whether it is alleging literal infringement of the '726 Patent or infringement under the doctrine of equivalents. In its Memorandum in Opposition to Ariens's Motion for Summary Judgment of Non-Infringement ("Pl.'s Opp'n Infringement Mem."), however, it argues that Ariens's accused product infringes both literally and under the doctrine of equivalents. (See Pl.'s Opp'n Infringement Mem. at 5-7, 15-16, 30-31.) The Court will address both arguments in turn.

2 Claims 38-42 are dependent on claim 37, the only remaining independent claim at issue. (See '726 Patent.) Accordingly, if the Court finds that Ariens is entitled to summary judgment with regard to whether the accused product infringes claim 37, it must also grant summary judgment with regard to claims 38-42. See Wolverine World Wide, Inc. v. Nike, Inc., 38 F.3d 1192, 1199 (Fed. Cir. 1994) (if non-infringement is found with regard to independent claim, it must also be found with regard to all claims dependent thereon); see also Wahpeton Canvas Co. v. Frontier, Inc., 870 F.2d 1546, 1553 (Fed. Cir. 1989) ("It is axiomatic that dependent claims cannot be found infringed unless the claims from which they depend have been found to have been infringed . . .").

--- End Footnotes ---
To interpret the term "ledges," the Court must first look to the plain meaning of the term in question, and apply that construction of the term unless intrinsic evidence indicates that it is to be construed differently. See In re Paulsen, 30 F.3d 1475, 1480 (Fed. Cir. 1994). The definition of the term "ledge" is: "A horizontal projection forming a narrow shelf on a wall." American Heritage Dictionary 721 (2d ed. 1985). 3 Ariens argues that a "ledge" connotes a discontinuity in a surface, and because the protrusions in the accused product are part of the same unbroken surface, they cannot be considered "ledges." (Def.'s Supp. Infringement Mem. at 21.) Toro argues that the accused product literally infringes claim 37 because, even under Ariens' proposed construction of the term "ledges," the protrusions in the accused product constitute discontinuities in the surface of the rear wall. (See Pl.'s Opp'n Infringement Mem. at 3-4; see also Pl.'s Mem. in Supp. of its Mot. for Summ. J. that its Patent is Not Invalid Under 35 U.S.C. §§ 102 or 112, P 1 and that Ariens Infringes Claim 37 at 15-18 ("Pl.'s Supp. Infringement Mem.").)

Because the Court finds no substantive difference between the two definitions (and because Toro concedes that its proffered definition "varies only slightly" from Ariens' definition), the Court will consider both definitions in its construction of the term "ledges."

Ariens urges the Court to examine the drawings contained in the '726 Patent and, from them, to construe the term "ledge" to require a discontinuity in an otherwise smooth surface. To the extent that the requirement of a discontinuity differs from the requirement that a device "project" in order to constitute a ledge, the Court rejects Ariens' contention. Ariens cites to no authority that a Court may use the drawings contained in a patent to add limitations to that patent's claims. See In re Paulsen, 30 F.3d 1475, 1480 (Fed. Cir. 1994) ("Although it is entirely proper to use the specification to interpret what the patentee meant by a word or phrase in the claim, this is not to be confused with adding an extraneous limitation appearing in the specification, which is improper.") (citations and ellipses omitted). This question, however, is not crucial to the resolution of the instant Motions, because the term "discontinuity," as used in the parties' briefs, has substantially the same meaning as the term "projects" or "projection," which Toro agrees comprises a part of the meaning of the term "ledge." Because, as discussed below, the accused product does not use a projection or projecting device to prevent snow spit or dribble, the Court finds that claim 37 is not infringed.

The Court construes the term "ledge" to require some sort of projection or protrusion, and finds that the common meaning of the term (and the constructions offered by the parties) necessarily contains such a concept. Without a projection into a space or protrusion from a surface, an item does not fit within any reasonable construction of the term "ledge." Ariens' accused product contains a means of combating forward snow spit that does not project into the stream of snow spit but fits relatively tightly around the impeller, thereby preventing the snow from "spitting" or "dribbling" off of the impeller. Because there is no "projection," the means used by Ariens for this purpose cannot be considered "ledges." 4

4 The Court finds, therefore, that even if it were to accept verbatim Toro's proposed construction of the term "ledge," (see
Toro's Proposed Definition of "Ledge"), no reasonable finder of fact could come to the conclusion that the accused product has "ledges," as that term is used in claim 37, because it does not project in any way.

Toro argues that the accused product does have a discontinuity -- where the arcuate surface of the rear wall of the housing begins. (See Berner Decl. Ex. C.) The edge of the housing, according to Toro, constitutes the discontinuity or projection that renders the device a ledge. According to this interpretation, however, virtually any physical object would constitute a ledge, because it necessarily has an outer edge. As counsel for Ariens aptly put it, however, "[a] ledge is not an edge." (See Ariens Co.’s Reply to Toro’s Mem. of Law for Markman Hearing at 5-6 & n.5.)

The accused product addresses the problem of snow spit or dribble not by using ledges that project outward to knock down snow and prevent it from escaping but by including a arcuate surface that fits relatively tightly around the impeller, thereby confining more of the snow to the impeller and eliminating the need for ledges to knock escaping snow down. Simply put, there is no part of the accused product that "projects forward and protects (or checks) against snow being thrown upward and out of the front of the snowthrower." (See Toro's Proposed Construction of Claims 37-41 for Presentation to Jury; see also Toro's Proposed Definition of "Ledge;" Pl.'s Opp'n Mem. at 3 ("The parties generally agree on the ordinary meaning of a ledge as a horizontal projection.").) Not only does the accused product use a tightly-fitting arcuate surface around the impeller instead of a horizontal projection, it also does not knock down escaped snow, but instead prevents the snow from escaping from the impeller. Because the accused product includes no such horizontal projection, the Court finds that no reasonable jury could conclude that the accused product infringes.

Claim Construction

Central to the flexure patents is the term "leg." Before the § 256 hearing was conducted both parties believed that no claim construction was necessary. However, given the significance of the term and inasmuch as the parties now dispute the meaning of the term, it has become necessary for the Court to construe this term.

Plaintiff contends that the term "leg," as used in these patents, means "a branch or extended part of the flexure." Plaintiff does not cite to any support for this construction.

Defendants argue that the term "leg" should be construed to mean "an appendage that extends downward from the body of the flexure and supports the flexure in an elevated state." Defendants argue that this construction is supported by the ordinary use of the term "leg," as shown in particular by the dictionary definition of "a limb of an animal used especially for supporting the body and for walking." Merriam-Webster Online Dictionary.

Defendants argue that the "leg" and the "flexure" must be non-planar in relation to one another. Plaintiffs argue that nothing in the patent prevents a planar relationship.

43. Words used in a claim are given their ordinary meaning unless the context, specifications, or file history indicate that a different meaning should apply. Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615 (Fed. Cir. 1995).

44. The construction must stay true to the claim language and naturally align with the patent's description of the invention and with what the inventor intended to envelop with the claim. Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998).

45. Given its ordinary meaning as referred to by several dictionaries, the word "leg" refers to a structure that supports another structure, as in a piece of furniture, a human or animal body, or a geometric figure. For example, one dictionary alternately defines "leg" as "one of the appendages of an animal that are used chiefly in supporting the body and in moving from point to point esp. by walking" and "something resembling an animal leg in form or use: as a pole or bar serving as a support (as in a tripod) . . ." Webster's Third New International Dictionary (1986). Both of these definitions encompass the
concept of "support," which is consistent with Defendant's proposed construction of a non-planar appendage. An appendage that is planar with the structure it is supposed to support can not offer any support. There is no dictionary language that supports the proposed construction by Plaintiff.

46. The language of the claims does not suggest any meaning for "leg," other than its ordinary meaning. The claim language requires the legs to spread farther apart when pressure is applied to the body of the device. ('724 patent, cl. 7). If the legs were aligned in the same plane as the body of the flexure, rather than located below it, they could not spread apart when pressure was applied to the body. In order to spread apart when pressure is applied to the body, the legs must be in a different plane than, and below, the body of the flexure. In claim 1 of the '950 patent the "legs" are "coupl[ed]" to the "bridge" by "spring regions." A "spring region" would have no function if the overall structure is planar. This element of the claim is consistent, rather, with an overall structure which is intended to be non-planar.

47. The specifications show that the inventor intended that the legs of the flexure would be non-planar, relative to the body of the flexure. Figure 1 of the '724 patent shows an embodiment of an optoelectronic package assembly with a two-legged flexure which is not planar. In the patent specifications referring to Figure 2, the specifications describe Figure 2 as "a side sectional view of the frame assembly of Fig. 1 before planarization." ('724 patent, col. 2, line 7 (emphasis added).) Figure 5A of the '724 patent shows a four-legged flexure, also with non-planar legs attached to the body of the flexure.

48. The Court construes the term "leg" to mean an appendage to the body of the flexure which extends downward, supporting the structure above it.

A. "Length"
Insight states that It now agrees with Glock that "length" means "the measurement or extent of something along its greatest dimension." Glock states in the appendix to its response brief that it did not offer that construction. Instead, Glock asserts that no construction is required but does not indicate whether the construction proposed by Insight is appropriate. SureFire also states that the meaning is clear and does not require construction.
"Length" is used only in claims 1 and 32. There, "length" is part of the description of the housing of the auxiliary device which has two "structural members" that extend upward and extend "along at least a portion of a length" of the side of the housing. In addition, the structural members "are substantially parallel to a central, longitudinal axis extending along a length of the housing." As used in the claims, "length" refers to a longitudinal dimension, meaning in the direction of the long axis of the body.

length of a sheet of paper stored in the binder

Plaintiff argues that this term is unambiguous and readily comprehensible to a finder of fact; it requires no definition.
Defendants propose that the term be defined as: "longitudinal length of the paper selected by the user of the binder and placed within the binder by the user."

The Court agrees with Plaintiff -- no definition is required for this term.

2309

1. '589 Patent Claims 1 and 9; and '703 Patent Claim 15: "(a) a length of multi-strand [pre-stressed steel] cable defining a bolt shank"

Gillespie asks the court to construe Claims 1(a), 9(a) and 15(a) "to mean a length of cable that includes multiple strands and that serves as a bolt shank." (See Pl.'s Brief, at 8-9.) DSI argues that Gillespie's proposed construction is "overly broad in that it would encompass a mine roof bolt that includes a cable with a single-stranded portion that defines a bolt shank." (See Def.'s Brief, at 13.) In his response, Plaintiff asserts that this is "certainly not what Gillespie seeks[""] rather, he "simply wants the jury to understand that a multi-strand cable is one made up of multiple strands." (Pl.'s Resp. Brief, at 2.)

The '589 and '703 Patent specifications explain that the "improved mine roof bolt of the present invention is constructed of a length of pre-stressed steel strands spirally wrapped around a seventh steep strand." (See '589 Patent, col. 2, In. 65 - col. 3, In.1; '703 Patent, col. 3, In. 36-41.)

Moreover, the '589 and '703 Patent specifications further explain, in regard to FIG. 1 of the patent drawings, that "the improved mine roof bolt . . . comprises a shank 12 made up of a length of pre-stressed steel stranded cable, which in the embodiment shown, is made up of six peripheral steel strands 14 spirally wrapped around a central steel strand 16 (as depicted in FIG. 2)." (See '589 Patent, col. 3, In. 39-46; '703 Patent, col. 4, In. 63-68 - col. 5, In. 1-2.)

The parties are therefore in agreement that the strand is a multi-strand cable and not a single cable. Based on this agreement, the ordinary meaning, and the written specification of the claimed embodiment, the court construes claims 1(a), 9(a) and 15(a) to mean a length of multi-strand cable that defines the bolt shank.

2310

5. lengthwise-extending locating surfaces

P&M construes the term "lengthwise-extending locating surfaces" as "longitudinal projections protruding inwardly from the interior of the casing." (Pls. Opening Mem. at 26.) P&M explains that these lengthwise-extending locating surfaces are the structure which corresponds to the locating means in the '886 patent. Rose Art construes the term as "three fins projecting from the inner wall of the casing used to position the marker" because that configuration is mentioned in the specification. (Def. Pre-Markman Hr'g Br. at 39, citing '300 patent, col. 3, ll. 10-12.) However, the specification provides several examples of the lengthwise-extending locating surfaces which can be used as the locating means claimed by the '300 patent: fins extending inwardly from the inner surface of the casing, an interior casing with three flat sides, an oval interior casing, or an inner tube. ('300 patent, col. 2, ll. 42-53 and col. 3, ll. 10-12.) The Court cannot adopt a construction of this term which would restrict the claim to one of the preferred embodiments. Rodime PLC, 174 F.3d at 1303. Accordingly, "lengthwise-extending locating surfaces" is construed as "longitudinal projections protruding inwardly from the interior of the casing.

2311

K. "Lens" (Claims 3 - 4)

Plaintiff's Proposed Construction: A device for altering the path of electromagnetic radiation. For the apparatus of claim 3, it includes a device that has the capacity for internal reflection so that when a certain type of material (for example a
fingerprint) touches the outside of the lens, at the point of touch the internal reflection is destroyed and an image of where the internal reflection is destroyed is transmitted.

Defendants' Proposed Construction: A body that has two opposite regular surfaces, at least one of which is curved, that is structured and positioned to form an image by focusing a beam of electromagnetic radiation.

The issue here is whether a lens has at least one curved surface. As with all other construction disputes, Plaintiff argues broadly that a lens includes any device used for altering the path of electromagnetic radiation. Plaintiff finds support for this construction in the specification. When referring to a lens, the specification states that a fingerprint reader "has a lens . . . which must have the capability to cause a proper refraction of the fingerprint . . . . While there are several lens that will cause such an effect, such as, magnifying lens placed in the proper location and angles, it is believed the best device for the refraction lens is a half circle." '474 Patent at 9:25-32. Plaintiff argues, therefore, that the specification contemplates the use of several suitable lenses and should not be limited to a lens with a curved surface.

As has been repeatedly stated, a claim term should be given the ordinary and customary meaning "that the term would have to a person of ordinary skill in the art in question at the time of the invention." Phillips, 415 F.3d at 1313 (emphasis added). In 1995, when the '474 Patent was filed, one skilled in the art would have understood that a lens would have at least one curved surface. Furthermore, although the specification states that "several lens" may be used, '474 Patent at 9:29-30, the preferred lens disclosed in the specification of the Patent is described as being a "half circle." Id. at 9:34-40; Fig. 1. The only other type of lens disclosed in the specification is a "magnifying lens," id. at 9:30, which would also include at least one curved surface. Therefore, one skilled in the art at the time of the invention would interpret the plain language of the claim and specification to determine that "lens," as used in Claims Three and Four, refers to "a body that has two opposite regular surfaces, at least one of which is curved, that is structured and positioned to form an image by focusing a beam of electromagnetic radiation."

4. "A lens body comprising a hydrogel material and having an anterior face, a posterior face, and a rounded outer peripheral edge surface." Used in '706 patent, claim 13.

"A lens body comprising a hydrophilic silicone-containing material having an anterior face, a posterior face having a rounded outer peripheral edge surface . . . " '538 patent, claim 1 and 7.

CooperVision defines these terms to mean "a contact lens with an anterior face and a posterior face having a surface in a general shape of an insert tool that includes a first surface portion and a convexly curved peripheral edge surface." CIBA's proposed construction is the same as its definition for "contact lens having a rounded edge," namely "an edge that is shaped like a portion of a circle in which every part of the surface or the circumference is equidistant from a center point." These definitions substantially reproduce the dispute regarding the meaning of "contact lens having a rounded edge," discussed above, in claim 4 of the '706 patent.

Claim 13 of the '706 patent contains different language from claims 1 and 7 of the '538 patent. It describes a lens with an "anterior face, a posterior face, and a rounded peripheral edge surface extending from the anterior face to the posterior face." Claims 1 and 7 of the '538 patent recite only a "posterior face having a rounded outer peripheral edge extending from the anterior face to the posterior face." CooperVision argues that the difference in language between claim 13 of the '706 patent and claim 1 and 7 of the '538 patent does not alter the scope of the claim. CooperVision concludes that a "rounded outer peripheral edge surface" in claim 13 describes the shape of the posterior surface of the lens formed by a back surface tool with a convexly-curved peripheral edge surface.

The patentee in this case had unbridled discretion in his choice of words, and he chose not to modify "a rounded outer peripheral edge" with the word "posterior face" in Claims 1 and 7 of the '538 patent. Therefore, CooperVision cannot successfully argue that the outer peripheral edge must be created by a back surface tool and that it must be part of the posterior lens simply because another claim in another patent uses a similar term. Rather, the patents indicate that a rounded outer peripheral edge extends from the anterior face of the lens to the posterior face of the lens. See '538 patent, col.8, ll. 13-15; '706 patent, col. 9, ll. 9-12.
As stated above when construing the "rounded edge" element of Claim 4 of the '706 patent, even if CooperVision is correct that the anterior face may contain a point after being made in the conventional manner and that the claim term refers to the posterior surface edge of a contact lens, this does not mean the court should define the edge in terms of a specific tool.

For the reasons also discussed above, CIBA's definition may mislead a reader into thinking that the edge is restricted to a circle, or an approximately circular shape. For that reason, it also is not adopted.

Having considered all relevant factors, the court finds that:

"A lens body comprising a hydrogel material and having an anterior face, a posterior face, and a rounded outer peripheral edge surface . . ." means: a lens body comprising a hydrogel material and having an anterior face, a posterior face, and a substantially smooth, curved outer peripheral edge . . ."

"A lens body comprising a hydrophilic silicone-containing material having an anterior face, a posterior face having a rounded outer peripheral edge surface . . ." means: a lens body comprising a hydrophilic silicone-containing material having an anterior face and a posterior face having a substantially smooth, curved outer peripheral edge . . ."

2. "Lens Window Means" Limitation

Ultrak and REI argue over whether a "lens window means" includes a covering of glass, plastic, or other translucent or transparent material. The written description discloses (col. 3, ll. 15-21) housing for a video camera, which "includes a cover with a window therein such that a video camera can be functionally contained within the housing with the cover closed . . . . Cover also includes a microphone and housing includes a heating coil for keeping condensation from forming on the lenses of the video camera and window in the cover."

Condensation obviously cannot form on an opening, but requires some type of cover. Requiring such a covering for a "window" comports with its ordinary meaning. A window is defined as "an opening constructed in a wall or roof and functioning to admit light or air to an enclosure, usually framed and spanned with glass mounted to permit opening and closing." The American Heritage Dictionary of the English Language 1467 (1969). We agree with the district court that "lens window means" is properly defined as "an opening which is covered with glass or plastic or other translucent or transparent material." Because none of REI's models have such a covering for the opening, substantial evidence supported the jury's verdict that no Bus-Watch (R) model literally infringes any asserted claim.

6. "Less Than a Complete Circle"

Finally, Bridgeport argues that summary judgment is warranted because its adaptor includes a circumferential gap in a "tongue and groove" configuration, not a gap with straight, parallel lines, as purportedly mandated by the "less than a complete circle" limitation of claims 1, 2, 4, and 5 of Patent '050 and claims 1, 2, 3, 4, 5, 8, and 9 of Patent '164:

Said circular spring metal adaptor being less than a complete circle 17 that is of a relaxed diameter less than the diameter of the hole into which it is to be inserted with said spring locking members extending radially outward beyond the diameter of the hole into which they are to be inserted . . .

(Doc. 83, Exs. A, B (emphasis added)). According to Webster's Third New International Dictionary, "less" means "of reduced … extent[or] degree" or "inferior." WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 1296. It further defines "complete" as "entire," "perfect," or "fully realized," and a "circle" as a figure bounded by a single "closed curve," called the "circumference." See id. at 408, 465. Thus, the phrase "less than a complete circle" refers to a rounded figure that
is not entirely bounded by a single circumferential line. Nothing in the claim language contradicts this meaning, and, in fact, claim 14 of Patent '164 expressly equates "divided circumference" with being "of less than a complete circle." (Doc. 83, Ex. A).

Footnotes

17 In claim 1 of Patent '164, the phrase "less than a complete circle" is immediately proceeded by the clause "when on the electrical connector." (Doc. 83, Ex. A).

Against this plain meaning, Bridgeport argues that the patentee provided an express definition of the phrase in the illustrations included in the specifications section, several of which show circular adaptors with their circumference "broken by a gap with straight, parallel sides." However, while this illustration certainly shows a possible embodiment of the invention, it does not purport to limit the methods by which a "less than complete circle" may be produced. See E-Pass Techs., 313 F.3d at 1369 (cautioning against "importing limitations from the specifications into the claims"). A curved cut, no less than a straight cut, produces a complete division in the circumference of the adaptor, rendering the adaptor "less than a complete circle" as required by the claims. The court will construe the phrase "less than a complete circle" to mean a rounded figure in which the circumferential line is divided or broken by any means.

Bridgeport's adaptor includes a circumferential divide (Doc. 83, Ex. G), facially meeting the limitations described in the claims of the Arlington's patents. Even if the gap is formed in a tongue and groove configuration, the Bridgeport design involves an adaptor that is "less than a complete circle," permitting a finding of infringement by a reasonable jury. Thus, the court will deny the motion for judgment as a matter of law on these claims.

The plaintiff proposes "an anticoagulant composition, having less resistance to flow than blood, in the proximal portion of the guide wire tube is allowed to coat the surface of the guide wire in the distal portion of the guide wire tube." The defendant contends that "is allowed to coat" is a method step requiring that a less viscous anticoagulant coat the guide wire. As to the remainder of the terms, the defendant contends that no construction is required.

The plaintiff argues that construing the term as a method claim would invalidate the claim because a single patent claim cannot mix apparatus and method elements. See IPXL Holdings, L.L.C. v. Amazon.com, Inc., 430 F.3d 1377, 1384 (Fed. Cir. 2005). According to the plaintiff, claims are to be interpreted to preserve their validity when reasonably possible, Whittaker Corp. by Technibilt Div. v. UNR Indus., Inc., 911 F.2d 709, 711 (Fed. Cir. 1990), and, therefore, the term cannot be a method claim. The plaintiff also argues that the claim language confirms that the structure of the catheter determines whether the anticoagulant in the distal portion of the guide wire lumen is able to coat the guide wire.

The defendant argues that the specification supports its construction. Specifically, it states that the "anticoagulant 'wipes' the guide wire clean." '358 patent, 6:41-42. According to the defendant, this describes a method step that occurs when the catheter is fed onto the guide wire. The defendant also points to the prosecution history where the claim originally read "can coat" and was changed to "allowed to coat." The defendant interprets this to mean that the claim is limited to more than just the capability of being coated and must mean an actual method step of coating the surface of the guide wire with the anticoagulant. The defendant also argues that, even though it may invalidate the claim, its construction should be adopted because it is the only construction that is consistent with the intrinsic evidence.

In reply, the plaintiff argues that the discussion in the prosecution history refers to structural limitations, not to methods or actions.

The Court concludes that this phrase is not a method step. Nowhere in the claims, specification, or prosecution history is
this phrase referred to as a method. The defendant does not dispute the plaintiff's definition of viscous. Accordingly, the Court adopts the plaintiff's proposed construction.

GO BACK

2316

6. "a less viscous anticoagulant is allowed to coat the surface of the guide wire within the distal portion of the guide wire lumen"

The plaintiffs propose "an anticoagulant composition, having less resistance to flow than blood, in the proximal portion of the guide wire tube is allowed to coat the surface of the guide wire in the distal portion of the guide wire lumen." The defendants propose "a less viscous anticoagulant is allowed to fill and remain in the reservoir during the procedure so as to coat the surface of the guide wire within the distal portion of the guide wire lumen."

As with the "the lumen having a first diameter..." term discussed above (disputed term # 4), the defendants argue that the court should read in a reservoir limitation. See Defendants' Response Brief at 7-11. In support of its construction, the defendants argue that statements in the patent and the prosecution history show that the function of the wherein clause is to create a reservoir. The defendants also asserts that judicial estoppel applies.

For the same reasons discussed with respect to disputed term # 4 above, the defendants' arguments are unpersuasive. After carefully considering the arguments raised by the parties in this case, the court will not alter its construction from the Cordis case. See Cordis Order at 8-10. Accordingly, this term means "an anticoagulant composition, having less resistance to flow than blood, in the proximal portion of the guide wire tube is allowed to coat the surface of the guide wire in the distal portion of the guide wire lumen."

GO BACK

2317

2. "A Lever"

Plaintiff argues that the claim language "a lever" in claim 1 of the '685 patent means "[a] rigid member that pivots about one point and that is used to move an object at a second point by force applied at a third." (Doc. # 51, at 22). Plaintiff refers the Court to the specification to show that the patentee did not intend to depart from the common and ordinary meaning of the term. As such, plaintiff relies on dictionary definitions to support its proposed construction. In opposition, defendant argues that the term "a lever" means "a lever having a head." (Doc. # 51, at 22). Defendant asserts that the '685 patent specification states that "[t]he actuating lever . . . includes an enlarged head . . . ." (Doc. # 51-2, '685 patent, col. 5, lines 27-28). Defendant also notes that every figure in the '685 patent specification, which includes a lever, depicts the lever as having a head. (Doc. # 51, at 23).

The claim language provides no definition of the term "a lever." The first embodiment includes the specification statement that defendant highlights. Additionally, as defendant noted, nearly every figure that includes a lever illustrates a lever as having a head. (Doc. # 51-2, at 6-8, 10-13, 15-23, 32, 34-37). "Occasionally specification explanations may lead one of ordinary skill to interpret a claim term more narrowly than its plain meaning suggests. Nonetheless, [the Federal Circuit] will not countenance the importation of claim limitations from a few specification statements or figures into the claims." Computer Docking Station Corp. v. Dell, Inc., 519 F.3d 1366 (Fed. Cir. 2008), citing Phillips, 415 F.3d 1303, 1323. In the instant case, the patentee explicitly states that "[t]he embodiments described [were] given by way of example and in no way limit the scope of the invention." (Doc. # 51-2, '685 patent, col. 15, lines 54-55). The patentee also explains that "[t]he term[] . . . 'including' [was] intended to be inclusive and mean that there may be additional elements other than the listed elements." (Doc. # 51-2, '685 patent, col. 16, lines 2-4). Therefore, the specification demonstrates that the preferred embodiments and figures do not narrow the scope of the term "a lever" to include a lever having a head.

Because the claim language, specification, and prosecution history do not make clear the meaning of "a lever," the Court will consult a dictionary to determine the term's ordinary and customary meaning. "Lever" is defined as "a bar or rigid body used to lift weight and operating on the principle that force or power applied at one point to lift a resistive weight or force at
a second point tends to rotate the bar in opposite directions about a fixed axis or fulcrum." RANDOM HOUSE COLLEGE DICTIONARY (1980). The dictionary definition supports plaintiff's proposed construction. Accordingly, the Court adopts plaintiff's construction, and construes "a lever" in the '685 patent to mean "a rigid member that pivots about one point and that is used to move an object at a second point by a force applied at a third."

n. "Lever Movement Blocking Element" (Claim 1)

101. This claim terminology, which is only used in this claim, has the same meaning as "blocking element" defined above. Thus, as used in the claims, "lever movement blocking element" means the cantilever arm which is formed as an integral part of the lever which blocks movement of the lever.

q. "Lever Moving Element" (Claim 31)

110. This claim limitation defines a lever moving element "for positively driving said lever toward said cam in response to continued dial rotation after said combination has been entered, whereby said lock is unlocked by rotation of said dial after entry of said combination and said lever is positively manipulated by dial rotation . . . ". Thus, the lever moving element is defined in terms of an element for performing the described functions. Although this claim element does not use the term "means" it is still in means-plus-function format. Merely because an element does not include the word "means" does not automatically prevent that element from being construed as a means-plus-function element under § 112 P6. Cole v. Kimberly-Clark Corporation, 102 F.3d 524, 1996 U.S. App. LEXIS 31360, *17-18 (Fed. Cir. 1996). Whether § 112 P6 applies is to be decided upon an element-by-element basis, based upon the patent and its prosecution history. Id.

111. This term is neither used nor defined in the description of the '656 patent. The terminology appears for the first time in the claims where the element is defined in purely functional terms. There is no evidence that a "lever moving element" or "moving element" has a well-understood meaning in the art. Cf., Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996) ("detent mechanism" had well-understood meaning in the field).

112. Statements made during the prosecution relating to structures disclosed in the specification are also relevant to determining the meaning of the means-plus-function limitations of claims. Alpex Computer Corp. v. Nintendo Co., Ltd., 102 F.3d 1214, 40 U.S.P.Q.2D (BNA) 1667, 1672 (Fed. Cir. 1996). Whether the inventor used terminology interchangeably is a factor to be considered in claim construction. Amhil Enterprises Ltd. v. Wawa Inc., 81 F.3d 1554, 1559 (Fed. Cir. 1996). The prosecution history of the '656 patent shows that the patent applicants intended to use the terms "means" and "element" interchangeably since many of the claims were amended to change from one term to the other. See PX 45, p. 23, (claim 11, "moving means" to "moving element"); p. 129 (claim 1, "means" to "a substantially non-resilient lever moving element"); p. 130 (claim 4, "lever moving means" to "moving element"); p. 130 (claim 5, "lever moving means" to "moving element"); p. 132 (claim 10, "lever moving means" to "lever moving element"); p. 132 (claim 11, "means" to "element"); p. 132 (claim 14, "means" to "a lever controlling element"); p. 133 (claim 16, "maintaining and moving means" to "lever controlling element"); p. 133 (claim 17, "maintaining and moving means" to "lever controlling element"); p. 133 (claim 18, "maintaining and moving means" to "lever controlling element"). According to the applicants, these changes were made to either define over the prior art (PX 45, p. 141), or characterized as only "minor changes" (PX 45, p. 142).

113. The claims of the '656 patent also use the terms "means" and "element" interchangeably. See, e.g., Claims 1, 17, 19, 20 ("lever operating means"); Claim 5 ("lever moving means"); Claims 2, 8, 20, 24, 31 ("lever moving element"); Claims 12, 25 ("lever controlling element"). These terms are all used to described the same mechanical structure, and should therefore be construed in the same way under § 112 P6.

114. The legislative history demonstrates Congress' intent that the word "means" need not be used to invoke the means-plus-function interpretation of § 112 P6. See, In re Fuetterer, 50 C.C.P.A. 1453, 319 F.2d 259, 264, n. 11 (C.C.P.A. 1963) ("all the
elements of a combination now will be able to be claimed in terms of what they do as well as in terms of what they are”).

115. This demonstrates that in the ’656 patent, the term "element" is synonymous with "means". Consequently, "lever moving element" should be treated as the equivalent of "lever operating means" and subject to § 112 P6.

116. This claim element is further described primarily in terms of what it does, i.e., its function, rather than what it is -- its structure. All of the terms modifying "element" are phrased in functional language, principally in terms of three functions: (1) positively driving the lever toward the cam in response to continued dial rotation after the combination has been entered; (2) unlocking the lock by rotation of the dial after entry of the combination; and (3) positively manipulating the lever by dial rotation to engage the dial-operated cam only after entry of the combination. Thus, the use of the "element for" format also shows an intent to use the § 112 P6 "means for" style of claiming.

117. In the ’656 specification, the lever moving element or means is described in terms of when the solenoid is actuated. The solenoid housing (also called a rigid body or element) slides in a channel to positively drive the lever from its disengaged position to a position for engaging the nose part of the lever with the slot on the cam wheel in response to the dial rotation after the combination has been entered. When the solenoid is activated, after entry of the proper combination, the solenoid housing is driven through a detent ball by rotation of the dial cam to push against the lower end of the cantilever arm, causing the lock lever to rotate about its pivot point. The solenoid immediately returns to its unactuated position when the protrusion on the dial cam passes the detent ball.

GO BACK

2320

Claim 3 requires, inter alia:

a substantially non-resilient lever moving element for moving the lever from its disengaged position for engaging the protrusion of the lever with the cam surface on the cam wheel so that the rotation of the cam wheel thereafter in the given direction changes the locking mechanism from the locked condition to the unlocked condition; . . . .

'656 pat., col. 9, l. 64 - col. 10, l. 2 (emphasis added). The district court determined that this claim limitation, although not reciting the term "means for," is in means-plus-function format and therefore must be interpreted using section 112, P 6. See Mas-Hamilton, slip op. at 53. La Gard contests this determination.

La Gard asserts that the "lever moving element" should not be construed as claimed in means-plus-function format because it does not employ the catch phrase "means for." La Gard relies on Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 39 U.S.P.Q.2D (BNA) 1783 (Fed. Cir. 1996), and Ethicon Endo-Surgery, Inc. v. U.S. Surgical Corp., 93 F.3d 1572, 40 U.S.P.Q.2D (BNA) 1019 (Fed. Cir. 1997), for the proposition that if the claim does not use "means for" followed by a statement of function, one should presume that the claim does not invoke section 112, P 6. See e.g. Greenberg, 91 F.3d at 1583, 39 U.S.P.Q.2D (BNA) at 1785.

Although such a presumption is helpful in beginning the claim construction analysis, it is not the end of the inquiry. In the instant case, even though the catch phrase is not used, the limitation's language does not provide any structure. The limitation is drafted as a function to be performed rather than definite structure or materials. See 35 U.S.C. § 112, P 6; Chiuminatta, 145 F.3d at 1307, 46 U.S.P.Q.2D (BNA) at 1755.

La Gard asserts that a "lever moving element" is a known structure in the lock art, but the district court determined otherwise. While true that "many devices take their names from the functions they perform," Greenberg, 91 F.3d at 1580, 39 U.S.P.Q.2D (BNA) at 1786, the "substantially non-resilient lever moving element" of claim 3 is not one of them. The district court determined that a "lever moving element" had not been shown to have a generally understood structural meaning in the art. See Mas-Hamilton, slip op. at 54. We agree. See Greenberg at 1583, 39 U.S.P.Q.2D (BNA) at 1786, (holding that "what is important is not simply that [the element at issue] is defined in terms of what it does, but that the term, as the name for a structure, has a reasonably well understood meaning in the art."). La Gard has not directed this court to any evidence demonstrating that the district court erred in determining that the term "lever moving element" lacks a reasonably well understood meaning in the relevant lock art.
In addition, in Greenberg, we emphasized that:

section 112(6) is triggered [not] only if the claim uses the word "means." The Patent and Trademark Office has rejected the argument that only the term "means" will invoke section 112(6), see 1162 O.G. 59 N. 2 (May 17, 1994), and we agree, see Raytheon Co. v. Roper Corp., 724 F.2d 951, 957, 220 U.S.P.Q. (BNA) 592, 597 (Fed. Cir. 1983) . . . (construing functional language introduced by "so that" to be equivalent to "means for" claim language).

91 F.3d at 1584, 39 U.S.P.Q.2D (BNA) at 1786-87. We also have noted that while traditional "means" language does not automatically make an element a means-plus-function element, conversely, lack of such language does not prevent a limitation from being construed as a means-plus-function limitation. See Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531, 41 U.S.P.Q.2D (BNA) 1001, 1006 (Fed. Cir. 1996).

In the instant case, the claimed "lever moving element" is described in terms of its function not its mechanical structure. If we accepted La Gard's argument that we should not apply section 112, P 6, a "moving element" could be any device that can cause the lever to move. La Gard's claim, however, cannot be construed so broadly to cover every conceivable way or means to perform the function of moving a lever, and there is no structure recited in the limitation that would save it from application of section 112, P 6. See Cole, 102 F.3d at 530-31, 41 U.S.P.Q.2D (BNA) at 1006 (reaffirming that an element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof).

Thus, we hold that the district court was correct in applying section 112, P 6 to limit the "lever moving element" to structures disclosed in the specification and equivalents thereof that perform the identical function.

Referring to the specification to identify the corresponding structure that performs the specified function, we construe the "lever moving element" to include at least the solenoid that provides the power to move the lever. '656 pat., col. 7, l. 24 - col. 8, l. 7. As already discussed with respect to claim 1, the X-O7 lock uses a stepper motor instead of a solenoid. The stepper motor is not the structural equivalent of the solenoid and hence the "substantially non-resilient lever moving element" limitation is not met. We therefore hold that the accused X-O7 lock does not literally infringe claim 3 of the '656 patent. Similarly, we conclude that the accused X-O7 lock does not equivalently infringe claim 3 of the '656 patent because, under the analysis applied with respect to claim 1, it was not clear error for the district court to determine that the solenoid of claim 3 operates in a substantially different way than the stepper motor of the X-O7 lock.

Claim 31 also requires "a lever moving element." '656 pat., col. 16, l. 65. Hence, under the above analysis, the district court did not clearly err in determining that claim 31 is neither infringed literally nor under the doctrine of equivalents. We therefore affirm the district court's finding of no literal or equivalent infringement of claim 31 by the X-O7 lock.

Lever For Deforming A Grommet

The district court construed this term as "a lever pivotally mounted to a ligation tool body such that the lever pivots about a fulcrum pin which is substantially perpendicular to the direction in which the preformed endless loop is pulled during the tightening operation." Claim Construction Order, 217 F. Supp. 2d at 1110. The district court reached this definition because the preferred embodiment in the specification speaks "of a 'lever pivotally mounted on the body of the tool.'" Id. The claim itself, however, does not include the specific language limiting the pivotally mounted "lever" to a particular embodiment.

The claim language itself suggests that a "lever pivotally mounted on said tool body for deforming a grommet" refers to a bar like structure (i.e., a lever) mounted on the tool body so that, when pivoted during operation, it is capable of deforming a grommet. The straightforward mechanical technology and understandable claim language give that meaning to this term. See Phillips, 415 F.3d at 1314 ("In some cases, the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood words.") (citing Brown v. 3M, 265 F.3d 1349, 1352 (Fed. Cir. 2001)).
The specification also indicates that the patent applicant did not limit "lever" to the one configuration identified by the district court. Rather, the '553 patent states:

In a preferred embodiment, the tool includes a lever which is biased against the grommet located in a receptacle in the receiving end of the tool. The pressure exerted by the lever prevents the grommet from inadvertently being mispositioned prior to and during the operation of the tool. Furthermore, when sufficient tension is put on the endless loop and consequent pressure is applied to the body part to be severed, the lever is used to deform the grommet upon and/or around the endless loop to secure the loop around the animal's body part.

'553 patent, col. 4, ll. 32-41. This language does not require a fulcrum pin. Nor does this language require a fulcrum pin substantially perpendicular to the pulling direction of the endless loop. In sum, the claim language and the specification description are both broader than the district court's definition for "lever." While claims are indeed to be construed in light of the specification, as in the Phillips case itself, the district court in this case improperly imported limitations from the specification into the claims, thereby restricting the claims to coverage of a single embodiment. See Phillips, 415 F.3d at 1312 ("If we once begin to include elements not mentioned in the claim, in order to limit such claim . . . we should never know whereto stop.") (quoting McCarty v. Lehigh Valley R.R.Co., 160 U.S. 110, 116, 16 S. Ct. 240, 40 L. Ed. 358, 1895 Dec. Comm'r Pat. 721 (1895)); see also Eolas Techs. Inc. v. Microsoft Corp., 399 F.3d 1325, 1337 (Fed. Cir. 2005) (commenting that it is improper to limit claims to the preferred embodiment).

In sum, when properly construed in the context of the specification, this term means a bar like structure (i.e. a lever) that is mounted on the tool body so that, when pivoted during operation, it is capable of deforming a grommet.

The technology in this case relates to robotic tape storage systems. These systems consist of a pivoting mechanism, such as a robotic arm, located in the center of a roughly cylindrical housing. Shelves on the inside of the housing surround the pivoting mechanism and hold videotapes or computer data tapes. A gripper on the robotic arm can selectively remove a tape from a shelf and place it on another shelf or in a tape player/recorder. The tape storage systems are highly automated and are used in commercial settings, e.g., for playing television commercials automatically or for computer tape archiving.

The '151 patent discloses a tape handling system that uses a rotating carriage to load tapes into--and unload tapes from--a tape storage system. The rotating carriage is mounted in an opening in the wall of a tape storage library. The carriage provides access to the tapes from one side of the opening (exterior of the library) and then rotates to provide access to the tapes from the other side of the opening (interior of the library). Odetics asserts claims 8, 9, and 14 in this litigation. Claim 9 recites (emphasis added to disputed elements):

A tape cassette handling system comprising:

a plurality of tape transports;

a housing including a cassette storage library having a plurality of storage bins and at least one cassette access opening for receiving cassettes to be moved to the storage bins or to the tape transports, or for receiving cassettes to be removed from the library or from the tape transports;

a rotary means rotatably mounted within the library adjacent the access opening for providing access to the storage library, the rotary means having one or more holding bins each having an opening for receiving a cassette, wherein the rotary means is rotatable from a first position in which the opening of at least one holding bin is accessible from outside of the housing to a second position in which the opening of at least one holding bin is accessible from inside the housing; and cassette manipulator means located within the housing for selectively moving cassettes between the rotary means, said storage bins and said tape transports.
Claims 8 and 14 are similar in all relevant respects. In particular, claim 14 recites "a housing including a storage library," and claim 8 recites "a library housing containing a storage library." In addition, claim 14, like claim 9, recites a "rotary means rotatably mounted within the library," while claim 8 recites a "loading housing rotatably carried within the library housing."

STK manufactures large tape storage systems that consist of multiple "library storage modules" linked together in a matrix-like formation. Each module is generally cylindrical and contains a pivoting robot arm, several columns of tape shelves, and tape players/recorders. Where two modules touch, they are interconnected by a Pass-Thru Port. A Pass-Thru Port is a device that has several shelves on which tapes may be placed by a central rotating gripper. A Pass-Thru Port moves from a position in which its contents can be reached by the gripper of one module to a position in which its contents can be reached by a gripper in the adjoining module. This movement is accomplished through rotation and linear translation through the wall separating the two modules. Through computerized coordination of the Pass-Thru Ports, STK's systems can track tape locations and optimize system performance, for instance, by passing a requested tape from a busy module to a module that has an available player. The infringement issue in this case concerns whether STK's Pass-Thru Ports are the same as, or equivalent structures of, the "rotary means" recited in the asserted claims.

In 1995, Odetics sued STK for direct and contributory infringement and for inducing infringement of claims 8, 9, and 14 of the '151 patent. On cross-motions for summary judgment of infringement, the district court ruled that the claims were not literally infringed, based on the court's interpretation of the term "library," which is common to all the asserted claims. The issues of validity and of infringement under the doctrine of equivalents were tried to a jury. When instructing the jury, the court defined the claim terms "library" and "rotary means rotatably mounted." The jury found the claims not invalid, but also not infringed under the doctrine of equivalents.

Before trial, STK also moved for summary judgment of laches based on the delay between Odetics's discovery of STK's allegedly infringing products in 1987 and Odetics's filing suit in 1995. The court concluded that laches applied, but limited the defense to cover only sales and use by STK and its customers before Odetics gave STK notice of its alleged infringement, and not to post-notice use by STK's customers of machines purchased before the notice. Odetics appeals the infringement rulings and STK cross-appeals the laches ruling.

II

Determining whether a patent claim has been infringed involves a two-step examination: "First, the claim must be properly construed to determine its scope and meaning. Second, the claim as properly construed must be compared to the accused device or process." Carroll Touch, Inc. v. Electro Mechanical Sys., Inc., 15 F.3d 1573, 1576, 27 U.S.P.Q.2D (BNA) 1836, 1839 (Fed. Cir. 1993). Odetics argues that the district court misconstrued the "library" and "rotary means rotatably mounted" claim limitations, thus affecting the findings of noninfringement. We consider each limitation in turn.

A

The district court defined "library" as a "collection . . . of places that store information, and you can have a single control or common handling system." The court apparently accepted STK's argument that the meaning of "library" is informed by U.S. Patent No. 4,654,727 (the '727 patent), a parent of the '151 patent that was incorporated by reference into the '151 patent as a description of the operation of the sequencing system and manipulator. STK had argued, in support of its motion for summary judgment of noninfringement, that the '727 patent describes a library which includes all the cassettes under common computer and robotic control in the automated system. From that description, STK concluded that the library and the control system had to be equal in their reach.
The court ruled that the library consists of whatever is covered by a common control system. The court's construction of "library" is significant because, under that construction, STK's many library storage modules would make up a single library and the Pass-Thru Ports, which merely pass tapes back and forth between individual modules, would not provide "access to the storage library," which is an express requirement of the "rotary means" in the claims. After carefully analyzing the claims, specification, and prosecution history of the patent, we conclude that the district court erred.

We begin our analysis, as we must, with the words of the claims. See Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 620, 34 U.S.P.Q.2D (BNA) 1816, 1819 (Fed. Cir. 1995). Although the library and control system are coextensive in the embodiment disclosed in the '151 patent, the claims do not require such a relationship. Indeed, the claims do not mention the control system at all. Instead, the claims describe the tape handling system in terms of the structural relationships among its component parts. Claim 9 recites a housing that includes a library, which in turn has tape transports, storage bins, a cassette access opening, and a rotary means adjacent the access opening. Each of these objects must be arranged in the library so as to be accessible by a cassette manipulator means located within the housing. The access opening and rotary means provide access to the library from areas outside the library, and must therefore be mounted in the periphery of the library. The claims place no other limitations on the structure of the library. The claims thus indicate that a library is a distinct, enclosed space containing at least one cassette manipulator means and a plurality of storage bins accessible by the manipulator means.

We next consider the effect of the specification on the claim construction. See Minnesota Mining & Mfg. Co. v. Johnson & Johnson Orthopaedics, Inc., 976 F.2d 1559, 1566, 24 U.S.P.Q.2D (BNA) 1321, 1327 (Fed. Cir. 1992) ("In defining the meaning of key terms in a claim, reference may be had to the specification, the prosecution history, prior art, and other claims."). Here, the issue is not open-and-shut because, in the specification, the library is coextensive with the control system, and the access opening in which the rotary means is mounted connects the library with an operator outside the system. Thus, the drawings show only one module connected via the rotary means to the outside world, not multiple modules connected to each other. Nevertheless, the specification, like the claims, defines the library according to the structural relation of its parts, and is fully consistent with the definition suggested by the claims. The specification does not equate the library and the control system even though it shows them as being coextensive in the disclosed embodiment. The specification, like the claims, thus permits a construction in which the library is a distinct enclosed space and in which the control system may expand to cover several libraries.

Likewise, the prosecution history supports the same construction. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). In distinguishing their invention from the prior art, the applicants during prosecution further defined their invention in terms of the functional cooperation of the parts within the library. The applicants did not, however, limit their broad claim coverage in any way that would alter the construction of the term "library" as construed above.

We are not aided by STK's analogy to real-world libraries. STK argues that its library storage modules are analogous to the separate floors in a library building and its Pass-Thru Ports are like elevators in the building, allowing motion only within the library. However, STK's "real-world" definition can also support the claim construction above. First, library buildings can have multiple libraries inside. For example, a law school "library" with a single circulation desk, or control system, may consist of different "libraries" that contain special collections and are named after prominent instructors or donors. Viewed in this light, the analogy would define each of STK's modules as a single library, and STK's Pass-Thru Ports would grant access to the libraries, as required by the claims. Second, separate library buildings, such as those on a large university campus, are often connected by a common computerized tracking and control system. Under this view, a book transferred on inter-library loan would travel by courier from one library to another while remaining at all times within the electronic control system. Neither library (analogous to a library storage module) would be coextensive with the control system, and the courier (analogous to a Pass-Thru Port) would provide access to each library. In the end, STK's analogy does not advance our inquiry.

STK correctly points out that the '151 patent does not disclose, teach, or even suggest a modular library system. Nevertheless, the claims are not limited in any way to a single module system. Nor do the claims require that a human operator handle the tapes on the other side of the access opening. STK may not escape infringement simply by adding another library on the other side of the opening when the claims are worded as broadly as Odetics's are here. See Atlanta Motoring Accessories, Inc. v. Saratoga Techs., Inc., 33 F.3d 1362, 1366, 31 U.S.P.Q.2D (BNA) 1929, 1932 (Fed. Cir. 1994). The Pass-Thru Ports in STK's accused systems therefore provide access to the library through a cassette access opening, as
"Lid"

As to the term "lid," the Court adopts the definition purportedly agreed upon by the parties, with some clarification. To a degree, the parties agree that the definition of a "lid" is "something that covers the opening of a hollow container (as a vessel or box); a movable cover." (Defs.' Br. at 14; Pls.' Opp'n at 7.) However, while defendants assert that this definition is self-explanatory, Ricoh argues that the definition is only correct "so long as [it] is understood to be consistent with the teachings of the '963 patent." (Pls.' Opp'n at 7.) Lurking behind this apparent consensus are two very different views of what it means for the lid to be a "movable cover."

Claim construction is distinct from, and a prerequisite to, an anticipation analysis. Nonetheless, the parties' arguments with respect to the Pritchitt patent reveal fundamental differences in their interpretations of "movable cover." Defendants believe that something is a "movable cover" so long as it is capable of being moved at some point, possibly in relation to a toner cartridge bottle. As example, the valve disclosed in Pritchitt is movable because it is screwed onto the toner bottle before the bottle is mounted into a photocopier. (Defs.' Reply at 13.) Defendants do not believe that the lid as a whole needs to be "movable" while mounted to the copying apparatus. See id.

In contrast, plaintiff interprets "movable cover" to mean that the lid as a whole is movable when mounted to the image-forming apparatus. (Pls.' Opp'n at 9.) More specifically, plaintiff appears to require that the "movable cover" move, while mounted, so as to selectively open and close a toner bottle. See id. at 9-10.

In light of this disagreement, the Court finds that the definition provided by defendant must be amended to further define "movable cover." Both the intrinsic evidence and common sense support a definition of "lid" requiring that the lid, as a whole, be movable when the lid is mounted onto the image-forming apparatus, in a position to selectively plug and unplug the discharge mouth of a developer container.

The Court finds that one of ordinary skill in the art would understand "lid" to have this meaning for two reasons. First, the intrinsic evidence repeatedly and invariably describes the invention as a lid capable of being removed and replaced after it is placed within a photocopier. See Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998) ("[t]he construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction."). Second, if the term "lid," were given the broad definition suggested by defendants, any object that is at some time placed over an opening in a hollow container would constitute a "lid." This definition would include objects that are attached so as to permanently close an opening. That meaning is both inconsistent with ordinary usage of the term "lid" and is also illogical in the context of a patent that concerns the flow of toner out of a toner bottle.

The patent consistently describes a lid that may be removed from and replaced onto the mouth of the toner bottle once the bottle is mounted in the image-forming apparatus. (See e.g., '963 Patent, figs. 4A, 4B, 4C, 4G, 6A, 9B, 10B, 11B, 13A, 17B, 18B, 27, 28, 30; '963 Patent, col. 7, ll. 12-47; col. 8, ll. 31-39; col. 11, ll. 56 to col. 12, ll. 17; col. 12, ll. 39-52; col. 24, ll. 28-42.) In the "summary" section of the written description, the patent outlines the "present invention[s]

unprecedented advantages," which include:

(1) Holding means for holding a developer container is rotatable in a substantially horizontal plane for the replacement of a developer container [sic]. . . .
(2) A lid is automatically attached to and detached from a mouth portion included in the developer container. Therefore, only if a person mounts the developer container to the holding means, a developer can be replenished. [sic] This not only facilitates the replacement of the developer container, but also prevents the developer from falling from the mouth portion of the developer container. In addition, the developer deposited on, for example, the inner surface of the mouth portion is prevented from falling to the outside.

(3) While the holding means is held in a position for mounting the developer container, the container can be removed from the mouth portion thereof sealed by a lid. This also prevents the developer deposited on the inner surface of the mouth portion from falling to the outside.

Every written and visual depiction of the invention describes a lid that is constructed to be moved once it has been placed inside the copier. Moreover, as the "summary" reflects, this invention improves on the existing art by providing for a lid that can be removed and replaced after the toner bottle is placed horizontally in the copier. This improvement avoids toner leakage when the developer container is mounted horizontally. This evidence describes more than a preferred embodiment of the invention. See Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295, 1301-02 (Fed. Cir. 1999); SciMed, 242 F.3d at 1343. Rather, the ability of the lid to be removed and replaced once mounted is essential to the invention described by the patent.

Moreover, even in the absence of evidence from the specification, this definition is dictated by common sense, particularly given the general subject matter of the patent. If by "movable cover" all that is conveyed is a cover that is movable at some point in space and time, the definition would apply to objects that do not satisfy any basic notion of a lid. As example, a solid metal top that is soldered onto an open metal box during assembly of the box may be movable when first placed on the box, but it is no longer movable once soldered. It would be misleading, if not downright inaccurate, to call the thing that is now soldered to the box a "lid" because it was, at some point moved onto the top of the box. Otherwise, at some point during assembly or installation, any cover would be "movable."

In other words, to say that the cover need be "movable" without any further clarification is to render meaningless the adjective "movable," because virtually any cover is moved at some point. The resulting definition is too broad to be meaningful. See Nikken USA v. Robinsons-May, Inc., 51 Fed. Appx. 874, 883-84 (Fed. Cir. 2002) (rejecting construction that merely required that an object be "attachable," because anything could be "attachable"). It follows that to be a "lid," a cover must be movable during a specific period of time or when performing a certain activity. Upon reading the '963 patent, one of ordinary skill in the art would understand that the context of the invention described by the patent is the selective delivery of photocopier toner from a toner bottle. He or she would, against this background, understand that a "lid" is an object which is movable so as to selectively open and close the toner cartridge. As clearly set forth in the patent, that activity is only performed once the lid (along with the bottle) is mounted into the copier.

Next, Zyliss argues that OXO mischaracterizes the brake disc of the Zyliss spinner as constituting part of the lid because the accused product does not have a brake assembly that is "engageable with the lid to apply a frictional force to the lid," as required by claim one. Zyliss contends, based upon the definition provided by its expert Dr. Karvelis, that the ordinary meaning of the term "lid" is "something that covers the opening of a hollow container" and something that "does not contemplate any interconnected or non-connected additional structure." This is significant because the claim states that the brake assembly is engageable with the lid to apply a frictional force to the lid. This language along with analysis of Figure 22 of the '883 patent indicates some form of direct contact between the brake assembly and the lid. Conversely, the Zyliss spinner does not use direct contact between the brake assembly and the lid in order to stop rotation of the basket assembly. Instead, the Zyliss spinner uses indirect contact via the brake disc, which is a separate and distinct apparatus from the lid itself.

The ordinary meaning of the word "lid" is "something that covers the opening of a hollow container." See, e.g., WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 1305 (1993). OXO states that the "lid" of the Zyliss
spinner includes both the brake disc and the clear portion that spins the basket. OXO's assertion fails as OXO does not explain how its description of the "lid" of the accused product takes into account the ordinary meaning of the term or how the intrinsic evidence justifies straying from the ordinary meaning to include other objects that do not fall within the common definition of "lid." When viewing the accused product, it is evident that the lid is the clear plastic object that makes contact with the basket. The lid is secondarily attached to the disc, that in turn makes contact with the brake assembly. To assert that the disc is actually part of the lid itself, constitutes a leap in logic that we are not convinced we should take.

D. Claim 18

The thermal carafe of claim 10 further comprising a lid seal contactable with a throat flange.

a. The Parties' Proposed Construction

Capresso constructs the phrase to mean "resilient seal in the lid which forms a seal when it interacts with a protruding rim or edge of the container." In contrast, Sunbeam reads the phrase to mean "top or lid that forms a roughly air tight closure when it interacts with a protruding rim or edge of the container." DeLonghi offers no construction.

Capresso maintains that one of ordinary skill in the art understands that something forms a "seal" when it forms a closure that prevents liquid and/or air from escaping. Capresso asserts that there is no support in the patent for anything less than a true seal. In fact, Capresso argues that the patent's purpose of providing a lid that prevents steam vapors from escaping is thwarted if only a "rough" seal is created.

Sunbeam counters that Defendants confuse the preferred embodiment of the invention with a limitation of the claim. According to Sunbeam, the goal of the patent is to reduce or minimize heat loss. To accomplish its goal, it is not necessary that a perfect seal be formed. In fact, to suggest that only a perfect seal fulfills this goal would make it nearly impossible for any device to infringe.

b. The Court's Construction

The patent does not specifically define "seal." The Court is skeptical that it should construe the lid to be a perfect, air tight seat. Nothing in the intrinsic evidence available to the Court requires such a construction. As Sunbeam notes, a seal in which a small amount of vapor seeps out would still fulfill the patent's goal. As a practical matter, taking the extreme position that the seal must be perfect would in effect make it impossible for other coffee makers to infringe the patent. The Court construes the term as "top or lid that forms a roughly air tight closure when it interacts with a protruding rim or edge of the container."

2. "static state data"/ "life of the business office device"

The next two disputed terms appear together in various claims of the '289, '618 and '120 Patents. For example, Claim 22 of the '289 Patent claims a business office device that includes "a memory which stores static state data including data which does not change over a life of the business office device." '289 Patent, Claim 22. The parties primarily dispute the meaning of the "life of the business office device."

Relying on the expert opinion of Adams, Ricoh asserts that the claim term refers to "the period of time the manufacturer intends the device to be deployed." (Chart at 25). Ricoh argues that from the perspective of an engineer, and based on the context of the patent, "the design objective of the static state data is met so long as other modules of a device or other devices can rely on the fact that the data will not change during a particular deployment of the device." (Ricoh Reply at 21). In contrast, Pitney argues that in the context of a consumer product, "life of the device" typically refers to the "time the
business office device is created to the time it is scrapped." (Chart at 25; Tr. of Markman Hr'g at 57:6-20). Pitney further argues that there is no nothing in the intrinsic evidence that would support importing a temporal limitation in the definition.

The Court is again being asked to construe a claim term which the patentee fails to reference in the specification. Thus, the Court is left to make its determination based on the information provided by the parties -- namely, a general dictionary definition of "life," i.e. "the period from birth to death," (Pitney Br. at 37) (citing MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY 672), or the expert declaration of Adams. Both sources fall into the less reliable category of claim construction tools -- i.e., extrinsic evidence. Mindful that the Court must construe the term in the manner a person of ordinary skill in the art would understand the term after reading the patent, in this case the Court will attribute greater weight to the expert declaration, rather than the general dictionary definition of "life" since the dictionary definition is one that is detached from the context of the specification.

Adams explains that a person of ordinary skill in the art would understand the "life of the device" to mean "the time the manufacturer intends the device to be deployed" since the design objectives are met every time a device is "remanufactured and given a new identification or model number, and [] then redeployed as a new device." (Declaration of Adams PP54-55). The Court finds nothing in the intrinsic evidence to contradict this proposition. Thus, the Court is persuaded by Adams' opinion and therefore adopts Ricoh's proposed construction. Accordingly, "life of the device" means "the period of time the manufacturer intends the device to be deployed."

The next limitation at issue is the lift frame means limitation which claims:

. . . lift frame means including a lift frame and plurality of work units spaced along said lift frame, said lift frame including at least an integral center frame section extending to either side of the centerline of the implement in the use position; . . .

Col. 18, lines 53-57.

The parties dispute whether this claim is written in means-plus-function format. Kinze contends this is not a means-plus-function clause because it describes the structure of the lift frame means and does not refer to any function that is to be performed by the structure. Conversely, Case urges the use of the term "means" in this clause gives rise to a presumption this is a means-plus-function clause and contends Kinze has fallen short of rebutting this presumption. Case proposes an interpretation of the lift frame means clause which includes the following functions: (1) to support in a manner permitting lifting and rotation of a plurality of work units spaced along the lift frame of the lift frame means, and (2) to centrally support the center frame section on the center line of the implement in the use position. In support of its position, Case directs the court to the specification and to the prosecution history, which Case asserts emphasize the necessity for having the center frame section centrally supported to ensure equal weight distribution. Case contends one skilled in the art, having read the specification and the prosecution history, would have understood the function of centrally supporting the center frame section to be critical to the claimed subject matter and a required limitation of the "lift frame means" clause.

The court recognizes that while Kinze's use of the term "means" in this clause gives rise to a presumption "the inventor used the term advisedly to invoke the statutory mandates for means-plus-function clauses," York Prods., 99 F.3d at 1574, this presumption is not conclusive. Sage Prods., 126 F.3d at 1427. When a claim uses the word "means" but recites no corresponding function for the "means," the claim does not implicate § 112, P6. Id. (citing York Prods., 99 F.3d at 1574) (construing "means" in claim without reference to § 112, P6). Moreover, when a claim recites a function but then proceeds to articulate "sufficient structure, material or acts within the claim itself to perform entirely the recited function, the claim is not in means-plus-function format." Id. (citation omitted).

Looking to the language of the claim, this limitation begins with the words "lift frame means," but what follows is a detailed recitation of structure. The language of the claim provides that the "lift frame means" includes a "lift frame and plurality of work units spaced along the lift frame" with "at least an integral center frame section extending to either side of the center.
line of the implement in the use position." Thus, while this limitation does in fact use the term "means," the claim language does not link the term "means" to any function. Instead, the claim language describes the structures that make up the lift frame means. The court therefore concludes the use of the term "means" in this limitation does not invoke § 112, P6. See York Prods., 99 F.3d at 1574 (holding that § 112, P6 does not apply when claim uses term "means" without including in claim a function identified with the term "means").

In light of its conclusion the "lift frame means" limitation is not subject to § 112, P6, the court must apply the standard rules of claim construction to interpret the claim language. Thus, the court begins with the presumption that the terms used in the claim take on their ordinary meaning. Accordingly, the term "frame" refers to a structure that is composed of parts fitted together and united, see Webster's Ninth New Collegiate Dictionary 489 (3rd ed. 1983), and "lift" refers to raising from a lower to a higher position. See id. at 690. A "means" is a "method or course of action or instrument through which some act can be accomplished or some end achieved." The American Heritage Dictionary, Second College Ed. 775 (2d ed. 1982). The term "plurality" means "a large number or quantity," while the term "integral" means "essential or necessary for completeness." Id. at 878, 657. "Center" refers to "the middle part," id. at 178 , while "section" means "one of several component parts that may be assembled or reassembled," id. at 1036, and "extend" means "to stretch out in distance, space or time." Id. at 402. Giving the terms used in the "lift frame means" limitation their ordinary meaning, this limitation claims a structure or instrument that moves from a lower to a higher position that includes a number of work units spaced along the structure and includes, as an essential part, a center structure that reaches to either side of the centerline of the implement in the use position. The court's review of the specification and the prosecution history does not suggest a different interpretation of this claim language. The court therefore declines to impose the additional limitations urged by Case.

2328

B. Claim Construction of "Light"2

1. Claim Language

The first place to start the claim construction is with the language of the claim itself. The term "light" is used throughout the '454 Patent but the primary claim language can be found in Claim 1. Specifically, limitation (c1) of Claim 1 states "a stationary light source capable of generating a light beam directed towards the wafer from a side of the wafer contacting the polishing pad." ('454 Patent, Col. 16, lines 32-34).

Plaintiff argues that there is no ambiguity as to the meaning of the terms "light," "light source," and "light beam" and that the term "light" encompasses both laser light and broadband light. Defendants argue that the term "light" in the patent refers only to light from a laser. Defendants do not address the issues of claim language but instead rely heavily on imputing the restriction from the specification into the claim language.

In analyzing the language of the claim, the Court must determine what a person of ordinary skill in the art would understand the term "light" to mean. The ordinary and plain meaning of the term "light" is broader than, and not limited to, a laser.3 A lay person would also understand that a light source is not restricted to only a laser. Defendants have completely ignored that "light" has a "widely accepted meaning" that is readily apparent even to lay judges which would not require the court to look at the written description in the specification. Phillips, 415 F.3d at 1314. ("In some cases, the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood terms.").
While the Court determined that there was not a need for expert testimony, it is telling that Defendants' expert witness, Dr. Gutmann, conceded that no ordinary person of skill in the art would ever have understood the ordinary meaning of "light" to be limited to "laser." (Gutmann Tr. 36:2-7).

In addition to the plain language of the claims themselves, it is also important to note key differences between related claims. Claim differentiation can be a "useful guide in understanding the meaning of particular claim terms." Id. at 1314-15. The terms "light" and "laser" are used in the '454 Patent in different claims to mean two different things. Independent Claim 1 defines the apparatus to be used with a light source. Dependent Claim 8 specifically delineates the type of light to be used for Claim 1 as a laser source: ":[t]he apparatus of claim 1, wherein the light source comprises a laser and the light beam is a laser beam." ('454 Patent, Col. 16, lines 62-63). This particular limitation "gives rise to the presumption that the limitation in question is not present in the independent claim." Id. Additionally, independent Claim 9 describes "generating a light beam." ('454 Patent, Col. 17, line 4). However, dependent Claim 11 describes "the method of claim 9, wherein the step of generating a light beam comprises generating a laser beam." ('454 Patent, Col. 17, lines 17-18).

By construing the term "light" in Claims 1 and 9 to constitute a "laser," the Court would render Claims 8 and 11 superfluous and redundant. Comark Communs. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998) (quoting Tandon Corp. v. U.S. International Trade Com., 831 F.2d 1017, 1023 (Fed.Cir.1987)) ("There is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims. To the extent that the absence of such difference in meaning and scope would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference between claims is significant.")

2. Specification

The Court must also look at the specification to determine the proper construction of the claim language. The '454 Patent specification clearly expresses that the embodiments shown and described in the figures were "preferred embodiments":

. "Preferred embodiments of the invention will now be described with reference to the drawings" ('454 Patent, Col. 6, lines 25-29).

. "Figure 2 depicts a portion of a CMP apparatus modified in accordance with one embodiment of the present invention." ('454 Patent, Col. 6, lines 29-30).

. Summary section states that "the present invention is directed to a novel apparatus and method for endpoint detection which can provide this improved accuracy. The apparatus and method of the present invention employ interferometric techniques for the in-situ determination of the thickness of material removed or planarity of a wafer surface, during the CMP process." ('454 Patent, Col. 2, lines 46-51).

(emphasis added).

In Liebel-Flarsheim, the court stressed the inherent tension between determining whether a statement is a clear lexicographic definition or a description of a preferred embodiment. 358 F.3d at 905. "The problem is to interpret claims 'in view of the specification' without unnecessarily importing limitations from the specification into the claims." Id. The court in Liebel-Flarsheim found that even though the written description of the invention was narrow, the claim language was sufficient to maintain a general interpretation. "Even when the specification describes only a single embodiment, the claims of the patent will not be read restrictively unless the patentee has demonstrated a clear intention to limit the claim scope using words or expressions of manifest exclusion or restriction." Id. at 906 (internal quotations and citations omitted).

Defendants are seeking to do expressly what Phillips cautioned against: using the specification to import limitations into the claims. The Phillips court recognized that sometimes there is a "fine line between reading a claim in light of the specification and reading a limitation into the claim from the specification." Id. at 1323 (citing Comark Communs. v. Harris Corp., 156 F.3d 1182, 1186-87 (Fed.Cir. 1998). However, the court focused on several examples that go directly to the matters in this case:
For instance, although the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments. In particular, we have expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment. That is not just because section 112 of the Patent Act requires that the claims themselves set forth the limits of the patent grant, but also because persons of ordinary skill in the art rarely would confine their definitions of terms to the exact representations depicted in the embodiments.

Id. at 1323 (internal citations omitted).

The specification only deals with the "preferred embodiment" and nothing in the written description uses the term "light" in a manner inconsistent with its ordinary meaning.

3. Prosecution History

Next, the Court must look to the prosecution history "to determine whether it contains statements that narrow the scope of the claims." Phillips, 415 F.3d at 1317. During the prosecution of the patent, parties may make statements that clearly restrict the scope of the patent. "This may occur, for example, when the patentee explicitly characterizes an aspect of his invention in a specific manner to overcome prior art." Id. (internal citations omitted). During the prosecution of the '454 Patent, there is no evidence that Plaintiff made any explicit disavowal of scope during prosecution. The prosecution history actually shows that Plaintiff sought to increase the scope of the '454 Patent by changing several instances of the term "laser" to "light." These changes are clearly delineated. For example:

- On March 26, 1997, in an Amendment, the term "laser beam" was replaced with "light beam" in Claim 1. Remarks section points out that the patentees have "amended the claims to more particularly point out and distinctly claim the invention." Patent Office reviewed the Amendment and allowed the relevant new claims.

- The original Claim 1 was cancelled and added a new proposed Claim 45 that dropped requirement of laser and instead used an "interferometer which generates a light beam..."

- Dependent Claim 47 further required that it be a "laser interferometer" and that the light beam "is a laser light beam"

- In a Preliminary Amendment - in 22 different claims, "laser" terms were crossed out and replaced with the word "light."

Plaintiff argues that these changes show that the Patent Office examiners and inventors understood that the terms "light," "light source" and "light beam" were not being restricted to lasers. Defendants argue that the examiners did not understand the nature of the changes in the claim language because there is no affirmative showing by the Patent Office to suggest a broader claim scope for the word "light." Essentially, Defendants argue that the examiner "simply reiterated the claim language without commenting on its meaning" and that the examiner was, in essence, silent as to the broader meaning of the word "light." (Def. Claim Construction Mem. at 16). While the Court does not find that the prosecution history clearly explains that the examiners were in agreement with the inventors as to the effect of the changes, the Court must presume that the Patent Office examiners have done their job. There is no basis to conclude that examiner failed to understand and agree to proposed changes. Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1327 (Fed. Cir. 2003) ("We must presume the examiner did his job, and if he truly thought that the specification taught or enabled only the use of exogenous DNA, the asserted claims would not have issued.") Therefore, the changes that were accepted by the office must have been considered and found to be sufficient.

4. Extrinsic Evidence

Because the Court finds that the claim language is clear and supported by the specification and prosecution history, there is no need to consider extrinsic evidence. However, in keeping with Vitrionics and Phillips, the Court finds it appropriate to use the dictionary to define the term "light." Phillips, 415 F.3d at 1324 ("Nor is the court barred from considering any particular sources or required to analyze sources in any specific sequences, as long as those sources are not used to contradict claim meaning that is unambiguous in light of the intrinsic evidence."). Merriam-Webster dictionary defines light as "electromagnetic radiation of any wavelength and traveling in a vacuum with a speed of about 186,281 miles (300,000 kilometers) per second; specifically: such radiation that is visible to the human eye." (emphasis in original). Defendants
argue that it is inappropriate to use dictionaries. However, the Court is not attempting to use a dictionary definition in place of analysis of the intrinsic evidence. The dictionary definition is to be used to provide a working definition of a commonly understood word. This definition does not "contradict any definition found in or ascertained by a reading of the patent documents." Vitronics, 90 F.3d at 1584.

The Court finds it problematic that Defendants wish to restrict the term "light" to "laser" based only on the specification. Defendants interpret Phillips too narrowly and ignores the plain meaning of the claim language. The court in Phillips emphasized the importance of the specification but not at the expense of the ordinary and plain meaning of the claim language. The plain and ordinary meaning of the word "light" is clear to a lay person and is not restricted to only light from a laser source. The specification and prosecution history also provide support that Plaintiff had no intention of restricting the term to only include laser light. "The construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction." Id. at 1316. Accordingly, the Court FINDS that the term "light" as defined in the '454 Patent is the spectrum of electromagnetic radiation which can be seen by the human eye and is not limited to lasers.

G. "light bar"

The plaintiff proposes "an elongated device attached to a motorized vehicle for producing warning light signals that identify the vehicle as an emergency or utility vehicle." Defendants propose "an elongated base, two or more warning signal lights, a cover protecting the warning lights and associated structure for mounting to a vehicle." The parties agree that the construction should include "elongated" to distinguish from hemispherical warning signal lights.

The plaintiff argues that the specification discusses light bars as emergency lights seen on police cars, fire trucks, and ambulances. '269 patent, 1:11-14; '865 patent, 1:13-16. In addition, the plaintiff argues that Defendants' construction narrows the phrase to a specific embodiment by requiring a cover.

Defendants argue that every depiction of a light bar includes a cover and that a light bar is clearly an assembly of components with a cover to protect the warning signal lights and other internal components. See '269 patent, Fig.1 and Fig. 2, 7:12; '865 patent, Fig. 1 and Fig. 2, 13:2. Defendants also argue that there is no reason to limit "light bar" to a particular function. Finally, Defendants point to the prior art referred to in the Background of the Invention section of the patents-in-suit, specifically the Jincks patent, which discloses light bars with a cover. n2

n2 In reply, the plaintiff contends that the claims in the Jincks patent disclose light bars with and without a cover or casing.

The Court agrees with the plaintiff that nothing in the claims or specification requires the limitation of a cover. The Court will not import limitations from a preferred embodiment into the construction of claims. Accordingly, "light bar" means "an elongated device attached to a motorized vehicle for producing warning light signals." The Court incorporates by reference its definition of "warning light signals."

A. "Light device"

Yanova contends, pursuant to the prosecution history, the ordinary meaning of the term, and text of the Claim itself, "Light Device" should be defined narrowly:
[A] fully operative and self-contained equipment for generating light (e.g. as a flashlight or pen light) and not just a light source such as a bulb or LED.

Yanova's Memorandum in Support of Motion for Proposed Claim Construction ("Yanova Memo") at 15. Defendants argue that Yanova places multiple impermissible limitations on the ordinary meaning of the term when a broad construction of the term is necessary. According to Defendants, the term should be construed as:

[A] piece of equipment or mechanism that is a source of light perceptible to the human eye.

Defendants Memorandum In Opposition to Plaintiff and Counterclaim Defendants' Motion for Proposed Claim Construction ("Def's Memo") at 9-10.

The term "light device" is not limited to certain, specifically enumerated, devices such as flashlights or light bulbs or a switch and battery. The term consists of two parts, (i) light and (ii) device. First, Merriam Webster's Dictionary defines "light" as "something that makes vision possible; the sensation aroused by stimulation of the visual receptors; an electromagnetic radiation in the wavelength range including infrared, visible, ultraviolet, and X rays and traveling in a vacuum with a speed of about 186,281 miles (300,000 kilometers)." Merriam Webster's Dictionary at http://www.m-w.com/cgi-bin/dictionary (last visited at 12/02/2004). Similarly, the American Heritage Dictionary, Fourth Edition (2000), defines "light" as "electromagnetic radiation that has a wavelength in the range from about 3,900 to about 700 angstroms and that may be perceived by the unaided, normal human eye."

Second, the term, "device," as defined by Webster's II New Riverside University Dictionary (1994), means "something constructed or devised for a particular purpose, esp. a machine used to perform one or more relatively simple tasks." The America Heritage Dictionary (2000) similarly defines "device" as "a contrivance or an invention serving a particular purpose, especially a machine used to perform one or more relatively simple tasks." In addition, the McGraw-Hill Dictionary of Scientific and Technical Terms, Sixth Edition (2003), defines "device" as "[a] mechanism, tool or other piece of equipment designed for specific uses.

With the plain meaning of the terms "light" and "device" as guides, the term "light device" in the asserted claims of the patents-at-issue is construed to mean:

"A piece of equipment or mechanism that is a source of light perceptible to the human eye."

(Taffert, Tr. 14:17 -- 15:2). The definition is consistent with the claim language, which never disavows the nature or type of equipment or mechanism employed, or the means by which the device acts as a source of light.
The court finds this limitation means "the cover including a portion that is capable of increasing in size by the initial fluid
completely excluded from the scope of this patent.
understand the "conventional manner" before the possibility of a non-completely emptied "collapsed position" could be
however, is referred to twice in the written description. (Col. 2, lines 22-24;col. 6, lines 53-54). It may be important to
it implies that all of the saline solution in the device is removed. The "conventional manner" for the method of implantation,
33-34)(emphasis added). Since this phrase does not say that "some saline" is removed, or even simply "saline" is removed,
written description notes that the surgeon is to "withdraw the saline solution" from the chamber to collapse it. (Col. 5, lines
col. 4, lines 54-55) and where it is not folded (col. 7, lines 44-46). The second mention of "collapsed" comes when the
Cir. 1998). The written description notes both embodiments where the cover is folded when collapsed (col. 3, lines 63-64;
Second, the district court erred by importing unnecessary functional limitations into the claim. The court limited claim 1 to a
lighting fixture configured to be attached to a vehicle by horizontal and vertical walls; however, the claim contains no
limitations concerning how the device may be attached to a vehicle. The court also considered significant the apparently
different air flow characteristics of the patented and accused devices. Again, this consideration was irrelevant because the
claim contains no limitations regarding air flow. While differences in the way the patented invention and accused device
function certainly are relevant to a doctrine of equivalents analysis, these considerations are not legally relevant to whether
Gulton's device falls within the literal language of the asserted claim.
Without these extraneous structural and functional limitations, claim 1 reads directly on Gulton's device. We are persuaded
that the flange in Gulton's device is simply an extension of the light housing and thus part of it. Gulton's own design
drawings labeled the flange as part of the light housing. Gulton's recharacterization of its light housing as being comprised
of two separate components, light housing and flange, appears to be a litigation-induced interpretation to avoid
infringement. Further, the light housing (with flange) clearly defines a longitudinal margin of the lighting fixture. Gulton's
device therefore includes "a light housing that defines one longitudinal margin of the fixture." As this is the only claim
limitation in dispute, we conclude that no reasonable fact-finder could conclude that Gulton's product does not meet each
and every limitation of claim 1 of the '415 patent.
Clearly, there was no genuine issue of material fact when the parties cross-moved for summary judgment. The structure of
the accused device was undisputed; the parties' disagreement over the meaning of the claim did not preclude a grant of
Cir. 1992) ("Disagreement over the meaning of a term within a claim does not necessarily create a genuine issue of material
fact."). Resolution of the literal infringement question turned solely on the court's interpretation of claim 1. Had the court
properly construed claim 1, summary judgment in favor of Transmatic would have been required. We therefore reverse the
court's finding of no literal infringement.

The next limitation in claim 31 requires:

the cover including a first limited expansion portion expandable by initial fluid injected through the port and into the
chamber from a collapsed implantation position to a taut position above the collapsed position
The parties agree that the limited expansion portion is a part of the cover that is expandable by the initial fluid injected
through the port and into the chamber from a collapsed implantation position to a taut or tight position above the collapsed
position. Defendants, however, would like to construe "collapsed" as meaning "compactly folded" while the plaintiff would
like to construe "collapsed" as meaning "folded down to a more compact shape or closed together."
The parties disagree as to the interpretation of "collapsed" as used in both claim 31 and claim 24. Generally, the same word
in a patent has the same meaning each time it is used. Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1345 (Fed.
Cir. 1998). The written description notes both embodiments where the cover is folded when collapsed (col. 3, lines 63-64;
col. 4, lines 54-55) and where it is not folded (col. 7, lines 44-46). The second mention of "collapsed" comes when the
written description notes that the surgeon is to "withdraw the saline solution" from the chamber to collapse it. (Col. 5, lines
33-34)(emphasis added). Since this phrase does not say that "some saline" is removed, or even simply "saline" is removed,
it implies that all of the saline solution in the device is removed. The "conventional manner" for the method of implantation,
however, is referred to twice in the written description. (Col. 2, lines 22-24;col. 6, lines 53-54). It may be important to
understand the "conventional manner" before the possibility of a non-completely emptied "collapsed position" could be
completely excluded from the scope of this patent.
The court finds this limitation means "the cover including a portion that is capable of increasing in size by the initial fluid
injected through the port and into the chamber from collapsed implantation position to a taut position over the collapsed position "where "collapsed," at this time and without the knowledge of the "conventional manner," means the device is empty of fluid.

2333

2. Term 2: "limiting structure"

The second term the parties dispute is "limiting structure," which is found in claim 2 3 of the '252 patent and is a claim dependent on claim 1. Lightspeed argues that "limiting structure" is a means-plus-function term subject to Title 35 of the United States Code section 112, paragraph 6, and therefore must be "construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof." Lightspeed's Opening Claim Construction Br. at 11 (quoting 35 U.S.C. § 112 P 6). Specifically, Lightspeed proposes that the Court construe the term "limiting structure" to include the two embodiments referenced in the specifications - plastic fingers and wire mesh, while Bose does not support the inclusion of the two embodiments.

--- Footnotes ---

3 Claim 2 of the '252 patent is as follows:

A headset in accordance with claim 1 and further comprising limiting structure limiting the maximum excursion of the diaphragm so that the voice coil remains at least partially in said gap.

--- End Footnotes ---

There is a rebuttable presumption that Title 35 of the United States Code section 112, paragraph 6 does not apply unless the claim uses "means" or "means for" language. Personalized Media Commc'ns, LLC v. Int'l Trade Comm'n, 161 F.3d 696, 703-04 (Fed. Cir. 1998) (stating "cases have clarified that use of the word 'means' creates a presumption that § 112, P 6 applies . . . and that the failure to use the word 'means' creates a presumption that § 112, P 6 does not apply"). "These presumptions can be rebutted if the evidence intrinsic to the patent and any relevant extrinsic evidence so warrant." Id. at 704. Unfortunately here, as elsewhere in the law of patents, the Federal Circuit is imprecise in the use of the term "presumption." The court is not speaking of presumptions as that term is used in Federal Rule of Evidence 301. Rather, it is allocating the burden of actual proof to the party seeking to rebut the so-called "presumption." Personalized Media Commc'ns, LLC, 161 F.3d at 703-04. The court's focus in determining whether a party has rebutted either presumption "remains on whether the claim as properly construed recites [a] sufficiently definite structure to avoid the ambit of § 112, P 6." Id. at 704.

The term "means" is not used in claim 2; therefore, Lightspeed bears the burden of proving that section 112, paragraph 6 applies. To demonstrate that the term "limiting structure" does not recite a "sufficiently definite structure," Lightspeed offers an expert affidavit to show that the term does not have meaning to a person of ordinary skill in the acoustic arts. Lightspeed's Opening Claim Construction Br. at 12; Lightspeed's Opening Claim Construction Br. Ex. E, Decl. of Dr. Marshall Buck PP 9-10; see CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1369 (Fed. Cir. 2002) (stating "[t]o help determine whether a claim term recites sufficient structure, we examine whether it has an understood meaning in the art").

Bose counters Lightspeed's expert affidavit by providing testimony given by Lightspeed's expert witness in prior litigation involving the same '252 patent and claim 2 in which the expert discussed the term "limiting structure" in a manner demonstrating he understood what the term meant. Bose's Claim Construction Reply Br. at 11-12. Bose also provides its own expert affidavit in the acoustic arts to declare that a person of ordinary skill in this field would understand the meaning of the term as recited in claim 2 to connote a particular structure for diaphragm excursion. Id. at 13-14; Bose's Claim Construction Reply Br. Ex. 10, Decl. of Gary H. Koopmann PP 11-12.

As is virtually invariably the case, the expert witnesses for each party reach opposite conclusions in this case as to whether "limiting structure" is a term understood by "a person of ordinary skill in the art in question at the time of the invention . . . ." Phillips, 415 F.3d at 1312-13. Affidavits, of course, bear about as much relation to reality as does a

These conflicting affidavits on the claim term cancel each other out and require this Court to examine further intrinsic evidence to determine whether section 112, paragraph 6 applies. The '252 patent specifications provide guidance as to how the Court ought construe this term. The specifications repeatedly refer to the term "structure" in explaining how the diaphragm excursion is limited.

For example, the patent specifications state that "[t]he invention avoids the suction or under-pressure problem by locating a structure in the earcup over the diaphragm to limit voice coil excursion." The '252 patent at 3:28-30 (emphasis added). The specifications further state that "[t]his structure is positioned such that, during the normal range of excursion of the driver diaphragm, the diaphragm does not touch structure and motion is unimpeaded." Id. at 3:30-33 (emphasis added). Additionally, "[s]tructure is located close enough to the driver such that it contacts the diaphragm before it is pulled so far that the voice coil is pulled fully from the gap." Id. at 3:33-36 (emphasis added). Also, "[t]he structure is preferably small enough so that it does not cause diffraction or otherwise affect the sound pressure detected by the active noise reduction system's microphone except at high frequencies (over 10 KHz)." Id. at 3:39-43 (emphasis added).

The specifications then state that "[t]he present invention accomplishes [limiting diaphragm excursion] by using small fingers of plastic positioned to symmetrically contact the diaphragm along the circle where the voice coil is glued to it." Id. at 3:43-47. The specifications further state that "[a]n alternative embodiment for the structure to stop diaphragm movement is a fine wire mesh screen shaped so as to contact as much of the surface of the diaphragm as possible at its position of maximum allowed outward excursion." Id. at 3:50-54. Thus, the specifications indicate that the plastic fingers and wire mesh are types of elements that could make up the structure required to limit diaphragm excursion, but there does not seem to be a restriction excluding other ways to accomplish this same purpose.

Finally, dictionary definitions offer extrinsic evidence to assist the Court in determining whether "limiting structure" is a "sufficiently definite structure to avoid the ambit of § 112, P 6." Personalized Media Commc'ns, LLC, 161 F.3d at 704. "Limiting" is defined as restrictive. Merriam-Webster Online Dictionary, http://www.merriam-webster.com/dictionary/limiting. "Structure" is defined as "the aggregate of elements of an entity in their relationships to each other." Merriam-Webster Online Dictionary, http://www.merriam-webster.com/dictionary/structure. Thus, a "limiting structure" is in essence a restrictive aggregate of elements of an entity. This suffices as a sufficiently definite structure "since a term need not connote a precise physical structure in order to avoid the ambit of [§ 112 P 6]." CCS Fitness, Inc., 288 F.3d at 1370.

After weighing all the intrinsic and relevant extrinsic evidence, this Court rules that section 112, paragraph 6 does not apply here.

Bose proposes that the Court construe "limiting structure" as "[a] structure or component that limits diaphragm excursion, but does not otherwise interfere with diaphragm movement." Bose's Opening Claim Construction Br. at 19. Thus, in addition to the word "structure," Bose includes the word "component" in its proposed claim 2 construction. A "component" is defined as "a constituent part." Merriam-Webster Online Dictionary, http://www.merriam-webster.com/dictionary/component. Constructing the term "limiting structure" as a "component" does not comport with the definition of structure, which is an aggregate of parts, or components.

Furthermore, Bose includes language in its construction that the limiting structure "does not otherwise interfere with diaphragm movement." In claim construction, if a claim term is not readily apparent (e.g., "limiting structure" is not readily apparent in this case based on the above analysis), the court must look to the words of the claims themselves before looking to the remainder of the specifications. See Phillips, 415 F.3d at 1314. Claim 2 does not include language concerning this additional functional limitation. Following from the analysis above that the claim term "limiting structure" is not readily apparent, the Court looks to the specifications to construe the term.

The '252 patent specifications state that certain limiting elements "are positioned along the driver axial direction of motion
so as to limit displacement of the diaphragm" and that the diaphragm is "free to translate axially without obstruction." The '252 patent at 1:59-60. The specifications also state that the "limitation elements do not interfere with the normal range of motion of diaphragm." The '252 patent at 4:18-20. The patent specifications state this when describing how the apparatus functions. Id. at 4:13-20.

Thus, the specifications include the functional limitation that the limiting structure does not interfere with the diaphragm movement. Based on the above reasoning, 
the Court's construction of "limiting structure" is "a structure that limits diaphragm excursion to allow the voice coil to reside at least partially in a gap mounted on the baffle without interfering with the normal range of motion of the diaphragm."

b. "limits"

The term "limits" appears in claim 1. Boston Scientific proposes that "limits" be construed as "restricts within bounds." ev3 does not propose an alternative construction. The Court construes "limits" as "restricts within bounds."
The other cases cited by the plaintiff do not undermine the Court's authority to engage in construction at this stage in the litigation. In Wilson Sporting Goods Co. v. Hillerich & Bradsby Co., 442 F.3d 1322 (Fed. Cir. 2006), there was no evidence in the summary judgment record about the accused products. Without such evidence, the Federal Circuit could not tell whether the district court had limited itself to construing appropriate claim terms. The lower court opinion therefore resembled an advisory opinion because there was nothing to suggest that the matters on which it expounded were necessary to resolve the suit. Id. at 1327. Such concerns are not present here, where both parties have submitted evidence about the accused product and agree on the relevance of the two terms that the Court construes.

The plaintiff also relies on Bayer AG v. Biovail Corp., 279 F.3d 1340 (Fed. Cir. 2002), but that case is inapposite. In Bayer, the district court held that it had implicitly construed a disputed term in a prior opinion. The Federal Circuit disagreed, holding that there was no implicit construction of the disputed term and stating that it would be "premature" for it to engage in claim construction without a lower court construction to review. Id. at 1349. Bayer therefore speaks to the proper timing for appellate review, not the district court's construction.

The plaintiff's final argument is that it would be inefficient to construe "gap" now because of the possibility that construction of additional claim terms will be needed at a later stage. The Court believes that it would be more inefficient for the parties to conduct discovery that the Court's construction might render irrelevant. The Court will revise its construction if it becomes necessary, but the plaintiff has not explained how such a revision would cause the Court or the parties undue hardship. Further, the Court believes that such a possibility is unlikely, given the unambiguous usage of the terms in the patent.

III. Claim Construction

Claim construction begins with the intrinsic evidence of record: the patent's claims, specification, and prosecution history. Goldenberg v. Cytogen, Inc., 373 F.3d 1158, 1164 (Fed. Cir. 2004); Bell Atlantic Network Servs. v. Covad Commc'n's Group, Inc., 262 F.3d 1258, 1267 (Fed. Cir. 2001). In construing patent terms, there is a heavy presumption that they carry their ordinary and customary meanings as would be understood by one of ordinary skill in the art. Goldenberg, 373 F.3d at 1164. Where a claim term has no ordinary and customary meaning, a court must resort to the remaining intrinsic evidence to obtain the meaning of that term. Id. If ambiguity persists, a court may look to extrinsic evidence, such as expert or inventor testimony, dictionaries, and technical treatises and articles. Bell and Howell Document Mgmt. Prods. Co. v. Altek Sys., 132 F.3d 701, 706 & n.5 (Fed. Cir. 1997). Where the intrinsic evidence is unambiguous, it is improper for a court to rely on extrinsic evidence. Id. at 706.

The Court therefore begins with the language of the claims of the '961 patent, which contains one product claim and one process claim.

The product claim states that the invention comprises three layers that are bonded together along plural concentric lines, which form a barrier resistant to the egress of fluid out of the periphery of the pad. Col. 9, ll. 16-28. Each concentric line includes at least one line segment and at least one gap, which serves to enhance the flexibility of the pad. Col. 9, ll. 28-30, 35-36.

The patent also claims the process of producing the invention described in the product claim. Col. 10, ll. 23-59. Dependent claims 26 and 27 describe two methods of forming the line segments: pressure and thermal bonding. Col. 11, ll. 5-12.

The plain language of the claims reveals that the layers of the pad are bonded together along concentric lines, but not at every point along the line. Instead, there are "gaps" in the bonding that enhance the flexibility of the pad. "Line segment," therefore, refers to a space along a concentric line where the pad's layers are bonded together, and "gap" refers to a space along a concentric line where there is no bonding.

Dependent claims 26 and 27, then, teach that the bonding that forms the line segments can be accomplished by pressure and thermal bonding, for example. This reading is consistent with the specification's discussion of several embodiments of the invention, containing line segments formed by various methods of bonding. See, e.g., col. 5, ll. 24-45; col. 7, ll. 45-50; col. 8, ll. 45-48. 4

- 2808 -
The defendants agree with the Court's proposed construction. 5 The plaintiff objects to the Court's definition, proposing that the Court define "line segment" as "a portion of a plural concentric line at which the top-sheet, fluid absorbent core, and cover sheet are bonded together to form a barrier resistant to the egress of fluid" and "gap" as a "portion of a plural concentric line at which the top-sheet, fluid absorbent core, and cover sheet are not bonded together to form a barrier resistant to the egress of fluid, regardless of how or when such portion is formed."

5 In their summary judgment brief, the defendants argued that "line segment" referred to "compressed portions" and "gap" to "uncompressed portions." When the specification summarizes the invention, however, "pressure" or "compress" are mentioned only once—in a description of "one aspect of the method" of the invention. Col. 2, ll. 44-48. And no form of the words "compress," "pressure," or "density" is mentioned in either independent claim. The Court therefore believes that the defendants' original construction would improperly confine the meaning of claim terms to their usage in a specific embodiment of the invention. See, e.g., Phillips, 415 F.3d at 1323.

The Court rejects the plaintiff's definitions for several reasons. First, the phrase "regardless of how or when such portion is formed" is unnecessary. The Court's definition does not, contrary to the plaintiff's fear, mandate how or when the gap must be formed, but instead only requires that a "gap" lack bonding.

Second, the plaintiff's definitions stem in part from a misreading of the patent. In the plaintiff's view, "line segments" are barriers preventing the egress of fluid, while "gaps" are segments of the pad that are not barriers. The barriers referenced in the claims, however, are the plural concentric lines, which include both line segments and gaps and prevent fluid from exiting the pad. Col. 9, ll. 26-30; col. 10, ll. 45-51. See also col. 2, ll. 40-43 ("The plural concentric lines form a barrier resistant to the egress of fluid out of the periphery of the pad and include at least one gap therein. . ."); Pl.'s Resp. to the Court's May 9, 2007 Letter at 10 (referring to "concentric lines[,] of which the line segments and gaps are part."). In other words, the gaps and the line segments collectively form a "barrier" that prevents fluid from leaking out of the pad. This runs counter to the plaintiff's definition of "gap" as a place where a "barrier" is lacking. 6

6 A line segment may, of course, be a "barrier" in the sense that it "serve[s] as a wall across which fluid cannot flow." Col. 6, l. 28. But the patent's claims refer unambiguously to the barrier formed by the concentric lines—the combination of gaps and line segments—that prevents fluid from exiting the pad. The specification is in accord, referring, for example, to the "unbroken portions of the concentric barrier lines," indicating that the concentric barrier lines contain both broken and unbroken portions—gaps and line segments. Id. ll. 26-27.
differentiated from, and juxtaposed with, these bonded line segments. A "gap" is therefore a space defined by the absence of bonding. Interpreting the gaps as containing bonding would contradict the claims, which state that the absence of bonding at the gaps increases the flexibility of the pad. If the gaps do, in fact, contain bonding, then this feature of the invention would be eliminated.

Because "line segment" and "gap" are used unambiguously in the patent, the Court declines to refer to extrinsic evidence. 7

7 The only piece of extrinsic evidence cited by the parties is the plaintiff's quotation from dictionary definitions of "gap." The Court rejects these definitions to the extent that they are inconsistent with the usage of "gap" in the claims. The Federal Circuit has warned against resorting to non-scientific dictionaries to ascertain the meaning of claim terms, stating that claim construction should focus not on a term's abstract meaning but rather its use in the patent. Bell Atlantic, 262 F.3d at 1267; Phillips, 415 F.3d at 1321.

An appropriate order follows.

ORDER

AND NOW, this 24th day of July, 2007, upon consideration of the parties' submissions on claim construction, and after oral argument on the defendants' motion for summary judgment heard on March 2, 2007, IT IS HEREBY ORDERED that the terms "gap" and "line segment" in the '961 patent are construed as follows:

1. Line Segment: a space along a concentric line where the pad's layers are bonded together;
2. Gap: a space along a concentric line where there is no bonding.

2336

B. Claim 24

In their Joint Statement the parties identified seven disputed terms within Claim 24. Again, the parties contentiousness was considerably larger than their actual disagreement. Most of the terms they imagined were in dispute were not differences that related to claim construction at all but to the capabilities of the ARx10, which is not relevant to the present inquiry. At the hearing on this motion the parties isolated two disputed terms which require construction by this court: 1) "linear" in the context of "linear magnetron-enhanced sputter device" and "linear magnetron-enhanced ion source" and 2) "reciprocating" in the context of "means adapted for reciprocating the substrate carrier past the work stations a plurality of times." Each will be addressed in turn.

1. A linear magnetron-enhanced sputter device and a linear magnetron-enhanced ion source device

AVL maintains that linear should be understood in its ordinary sense, which it defines as resembling a straight line, long and narrow. Joint Statement at 9. Thus, in order to infringe, an accused device must employ long and narrow, even rectangular, magnetron-enhanced sputter devices and ion source devices. AVL makes much of the patent language which depicts deposition and reaction within "long narrow axial zones" as supporting its position that the devices at issue be linear. In response to OCLI's contention that the devices can be either linear or planar, AVL asserts that the words are not coterminous and that planar is broader, so that to the extent the magnetrons are planar they must also be linear.

OCLI asserts that the patentees exercised their right to be their own lexicographers in this instance and clearly defined "linear" to encompass the term "planar." They point to the repeated use of planar to modify magnetron and the seeming interchangeability of the terms linear and planar throughout the patent specification. They also cite their putative expert Bryant P. Hichwa as one with ordinary skill in the art who understands a circular planar magnetron to meet the definition of a linear magnetron. Deposition of Bryant P. Hichwa at .6 At oral argument OCLI sought to demonstrate its interpretation
of linear by rotating a piece of paper to reveal how it can be at once linear and planar depending on the position from which one views it. It also distinguished the magnetron from the zone of treatment; the latter, it agreed, must be long and narrow.

--- Footnotes ---

6 OCLI quotes Dr. Hichwa to this effect in its opposition memorandum and cites page 108 of his deposition which it attaches to the Declaration of Mr. Laycock as Exhibit J. However, nothing on page 108 of Dr. Hichwa's excerpted deposition discusses the meaning of linear.

--- End Footnotes ---

AVL is correct that the '095 patent distinguishes itself from the prior art by effecting the deposition and reaction in long narrow axial zones adjacent the periphery of the carrier. '095 Patent at col. 2, lines 45-48. However, the language of the patent specification does; not seem to require linear magnetrons to accomplish this effect. To the contrary, the specification allows for any ion source, for example, configured to produce such an effect, "such as the linear magnetron, or a suitably configured ion gun." '095 Patent at col. 2, lines 56-58. Moreover, elsewhere the specification calls for at least one "preferably linear" cathode plasma generating device. '095 Patent at col. 3, lines 22-23. Clearly the embodiments disclosed all use a linear magnetron sputter device and linear magnetron ion source device to achieve the required long narrow reaction zones, 7 but contrary to AVL's contention, AVL reply at 11-12, nothing in the specification language requires this combination.

--- Footnotes ---

7 In fact, all the disclosed embodiments use rectangular devices.

--- End Footnotes ---

Despite the fact that the specification language does not require linear magnetrons, the claim language certainly does. The question for the court is the construction of linear in that context, and specifically whether linear and planar are interchangeable terms within the '095 patent. Both parties point to the fact that the specification describes the magnetron sputtering stations as "linear/planar." AVL reads the slash to mean "and" while OCLI reads it to mean "or." Both are plausible interpretations. And OCLI is correct that the terms appear to be used interchangeably elsewhere in the specification. Unlike the subtle distinctions evident between "selected" and "selectively" noted above, the patent does not seem to similarly distinguish linear and planar. The most telling use of both terms together suggests that planar should be understood as a subset of linear rather than the other way around: "The substrates are moved past a set of processing stations comprising (1) at least one preferably linear cathode plasma generating device (e.g., a planar magnetron or a Shatterproof rotating magnetron) . . . ." '095 Patent at col. 3, lines 20-25.

While it is true that patentees can be their own lexicographers, Markman, 52 F.3d at 980 (citing Autogiro Co. of Am. v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 397 (Ct. Cl. 1967)), the catch is that special definitions must be clearly defined in the specification. Id. Given that linear and planar normally have quite distinct meanings that are not interchangeable, this court does not find that the specification is explicit enough to support the interpretation of linear offered by OCLI. It would indeed be relevant if one of ordinary skill in the art understood the term linear to encompass the planar, however, the portion of Dr. Hichwa's deposition that plaintiff cites for this purpose is evidently miscited and nothing of the sort appears on the page provided. Furthermore, reference to the meaning of linear by OCLI's other putative experts are framed as legal opinion or go to literal infringement and are therefore not helpful to this court. 8 Accordingly, the court does not construe linear as interchangeable with the term planar. To the extent a device is planar, it must also be linear to infringe the '095 patent.

--- Footnotes ---

8 Dr. Carniglia does not say that linear also means planar to one of ordinary skill in the art. Instead, he asserts that the term linear is "defined in the '095 patent" to mean planar. Decl. of Charles K. Carniglia at P 49. This is precisely the legal determination the court is to make and constitutes legal opinion of no use to the court. See Markman, 52 F.3d at 983. OCLI's final expert, patentee James W. Sesser, does not make any claims about the meaning of linear; rather, he opines that the
ARx10 incorporates a linear magnetron. Decl. of James W. Sesser at PP 20-22. This evidence goes to the second step of the infringement analysis and is therefore irrelevant to the present inquiry.

(3) In order to satisfy claim 1, the fogging mist must have a "linear velocity of between 110 and 140 m/s" at the point where it is released or discharged from the fogging device. Plaintiffs maintain that "linear velocity" need not be construed or, in the alternative, should be construed as "velocity." Defendants object to the proposed deletion of the word "linear" and seek to have the phrase construed as "velocity along a straight line."

One can measure the rate of change in a particle's position from a number of vantage points, including along the particle's path (linear velocity) or as a ratio of the angle traversed (angular velocity). The inventors clearly specified the perspective from which the speed of the droplets should be measured: removing the "linear" limitation from the phrase "linear velocity" is unjustified and could cause confusion. The Court therefore rejects plaintiffs' proposed construction. On the other hand, a particle can have linear velocity even if it is not moving in a straight line. A person standing on the surface of the Earth, for example, is moving in a giant arc around the Earth's core (i.e., not in a straight line) and has both angular and linear velocities. To the extent defendants' proposed construction would require the droplets to be moving in a straight line, it is rejected.

"Linear velocity" is not defined by the inventors, and neither party has identified any intrinsic evidence that is relevant to the construction of this phrase. Luckily "linear velocity" is a common term that has meaning to lay judges as well as to those skilled in the art. The phrase will be construed as "the rate of change of a body's position in a particular direction over time." No further construction is necessary other than to clarify that, although linear velocity has a directional component, a body can have linear velocity even if it does not continue moving in the same direction over time. The direction in which the body is traveling may change moment to moment, as with the person standing on the surface of the Earth. Nevertheless, the person possesses an instantaneous linear velocity in the direction of the tangent to the curve, even as his or her direction changes with the Earth's rotation.

"Linearly Driving the Actuator"

The "actuator" mentioned in claim 29 is an arm connected to a sensor head which is used to position the sensor head across the surface of a disk inside of a computer's hard drive. Plaintiffs argue that the term "linearly driving the actuator" does not require construction, whereas defendants propose that it means "moving the actuator along a straight line." Because the claims do not define the term "linearly driving the actuator," we look to the specification for guidance.

Figure 9A diagrams a preferred embodiment of the patent and includes a drawing of a stepping motor linearly driving an actuator. The actuator depicted in Fig. 9A is clearly being driven in a straight line, as the drawing depicts a guide rod connected to the actuator to ensure that it is restricted in its path of travel. We are not assuming that this one embodiment places a limitation on the claims. See Liebel-Flarsheim, 358 F.3d at 906. Rather, the embodiment merely provides insight into whether or not the patentee was acting as his own lexicographer by using the term "linear" in a manner other than its ordinary usage. See Phillips, 415 F.3d at 1316. The example provided in Fig. 9A suggests that he was not.

The argument for construing the term "linearly driving" to mean "driving in a straight line" is further supported by the specification's description of the "sensor head" that is connected to the actuator. Although the actuator in Fig. 9A is described only as moving "linearly," the sensor head is described as moving both "linearly" and "angularly." 922 patent at 8:25-28. Therefore, we can assume that, in the context of the patent, "linear" movement is different than "angular" movement. This also comports with the plain meaning of the word "linear," which Webster's Dictionary defines as "following a straight course: being or going in a straight direction." Webster's Third New International Dictionary, 1315
Accordingly, we find that a person of ordinary skill in the art at the time of invention would understand "linearly driving the actuator" to mean driving the actuator in a straight line.

CDF asserts a patent infringement claim with regard to Shield Pack's multi-layer, gusseted, plastic bags, which Shield Pack refers to as its "Quad bags." 2 Shield Pack argues that its Quad bags do not infringe CDF's '121 patent because their oblique seals curve at the end, instead of "being linear," as required by the '121 patent. The picture of the Quad bags' oblique seals shows that they are straight for approximately twenty-seven (27) of their thirty-one (31) inch length, and curve gently for approximately the last four (4) inches.

2 There is some disagreement between the parties as to whether Shield Pack also makes Quad bags with oblique seals that are straight along their entire length. Regardless, Shield Pack seeks a judgment of non-infringement for its Quad bags with curved-end oblique seals only [Doc. No. 42, p. 10], and the Court refers only to those bags throughout this Ruling.

claim 1 of the '121 patent describes how the oblique seal portions are formed, and it includes the clause, "the oblique seal portion being linear." [Doc. No. 1-3, p. 27]. The specification does not define "linear," but describes the oblique seal portions as "having a straight band-shape." [Doc. No. 1-3, p. 16].

Shield Pack argues that the plain meaning of "linear" is "straight," and that this interpretation of the claim is supported by the patent specification which actually uses the word "straight." CDF argues that the term "linear" as used in the '121 patent means "relating to a line that is substantially straight over the majority of its length," and, thus, has a broader meaning than "straight." CDF also argues that, during prosecution, the phrase "having a straight band-shape" was changed to "linear" to make the claim less restrictive. 3

3 CDF further argues that Figure 2 of the '121 patent shows that the seals actually bend and curve at the corners when the bag is filled, and, therefore, construing "linear" to mean "perfectly straight over the entire length" would effectively exclude the preferred embodiment of the patent. Although Figure 2 does show somewhat rounded corners when the bag is filled, Figure 1 shows that the oblique seals portions are straight at the corners when lying flat. The Court finds that the figures are not clear enough to assist the Court in construing "linear" as used in the patent claim.

The language of claim 1 explaining the oblique seal portions describes them as being formed between two arbitrary points, implying that the "linear" oblique seal is a straight line between those points. Additionally, the "triangular" fin portions of the claimed product are formed on one of their three sides by the oblique seal portions. Triangles are three-sided figures bounded by straight lines. See Triangle Definition, merriam-webster.com, http://www.merriam-webster.com/dictionary/triangle (last visited Aug. 27, 2010).

The Court's construction of "linear" is also supported by extrinsic sources. Merriam-Webster's dictionary defines "linear" as "of, relating to, resembling, or having a graph that is a line and especially a straight line: STRAIGHT." Linear Definition, merriam-webster.com, http://www.merriam-webster.com/dictionary/linear (last visited Aug. 27, 2010). The first definition of "linear" in the New Shorter Oxford English Dictionary is "of or pertaining to a line or lines"; however, the third definition is "arranged or measured along a (straight) line; extended in a line or in length; spec. in Math & Physics, involving
The Court finds that a person of ordinary skill in the art would interpret the term "linear" to mean "straight." Therefore, the Court construes "linear" in the '121 patent claim to mean that the oblique seal portion forms a straight line between the two arbitrary points indicated. Because the oblique seals on Shield Pack's Quad bags do not form a straight line, no reasonable trier of fact could find that they literally infringe the '121 patent.

6. Liner

Defendants' Proposed Construction: A "liner" is a paper or plastic web which has a "release layer" that is in contact with a pressure sensitive adhesive.  
Plaintiff's Proposed Construction: Leave undefined.  
The Court's Claim Construction: A "liner" is a material which has a layer that allows for the release of the liner from the adhesive on the back of the placard and is in contact with a pressure sensitive adhesive.

Defendants point first to the patent. Claim 1 refers to a liner that covers the adhesive coating of the placard and is removed from an adhesive coated face. The specification describes a liner preferably made of paper with a release layer. (’790 patent, col. 2, ln. 13-15). The liner is removed to expose the adhesive coated face which is then used to apply the placard to a container. (’790 patent, col. 1, ln. 55-58; col. 2, ln. 46-49). 
Defendants' definition incorporates its earlier definition for "release layer." Because the Court did not adopt a definition for "release layer," it is necessary to consider Defendants' definition here:

A "release layer" is a layer on the 'liner' that allows for the release of the liner from the adhesive on the back of the placard so that the placard may be adhered to the container. The release layer may be either a 'release coating' as defined above or it may be a film that has inherent release properties such as Teflon(R) film.

As was discussed in detail above, the Court does not accept Defendants' attempt to distinguish a coating from a film. However, the first half of Defendants' definition of release layer is not inconsistent with the claims and the specification. Combining the two definitions results in the following:

A "liner" is a paper or plastic web which has a layer that allows for the release of the liner from the adhesive on the back of the placard and is in contact with a pressure sensitive adhesive.

MPT simply wants the Court to leave "liner" undefined. MPT's only argument is that liner has no special meaning in the art and should therefore be left for the jury to ascertain its plain English meaning. Defendants counter with a number of definitions from technical references:

"RELEASE LINER The component of the pressure sensitive label stock which functions as a carrier for the pressure sensitive label. Prior to application, it protects the adhesive, and readily separates from the label immediately before the label is applied." (TLM p. 50).

"Release Liner (backing, backing paper, carrier, liner) The component of the [pressure sensitive] laminate which functions as the carrier for the label. It protects the adhesive prior to application, and it readily separates from the label immediately before the label is applied to the substrate." (Fasson p. 35).

Industry sources and an MPT representative agree that these definitions accurately represent the industry definition of a release liner. (T. Kennedy Dep. p. 63-64; Macuga Dep. p. 16-17). In light of MPT's refusal to provide any evidence or argument from any source to the contrary, the Court agrees. A person of ordinary skill in the art would recognize that a liner has a layer that is in contact with an adhesive and allows for the release of the liner from the adhesive. However, none of these definitions require the "paper or plastic web" of Defendants' definition. Therefore, the Court construes a "liner" as "a material which has a layer that allows for the release of the liner from the adhesive on the back of the placard and is in contact with a pressure sensitive adhesive."
3. Liner

(a) no definition necessary

(b) a structure that covers or lines a surface of another structure

ITW a structure that covers or lines a surface of another structure and is formed without any pleats, corrugations, seams, joints or gussets, or any grooves at the internal junction of the side walls

ITW maintains on the basis of patent disclaimer that the term liner as used in this patent only encompasses a structure "without any pleats, corrugations, seams, joints or gussets, or any grooves at the internal junction of the side walls." 3M responds that ITW's efforts at limiting the definition of liner are misplaced and that ITW misrepresents the prosecution history of the patent.

The doctrine of patent disclaimer prevents a patentee, in this case 3M, from recapturing a specific meaning that it disclaimed during the prosecution. See Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1323 (Fed. Cir. 2003). For 3M to have disclaimed a meaning, however, it must have "unequivocally disavowed" a broader definition of the term in its efforts to obtain the patent. Id. at 1324.

During its prosecution of this patent, 3M needed to distinguish a patent that already existed for a different disposable liner system, the Kaltenbach system. That system worked in a similar manner as 3M's PPS system, but the liner in the Kaltenbach mechanism is not cup-shaped like the 3M liner. The Kaltenbach liner is instead pouch shaped: the sides of the liner gradually come closer together until closing in a straight seam. 3M distinguished its system from the Kaltenbach system by specifying in the patent that the PPS liner has "a shape that is a close fit within the interior of the reservoir prior to adding a fluid to the liner," which it argued was an improvement over the Kaltenbach liner because there are no grooves or seams to trap paint in the PPS liner.

ITW, nevertheless, argues that the definition of liner should be limited to an object without pleats, corrugations, seams, joints, gussets, or grooves because that is how it is described in the preferred embodiment. It also argues that this is the basis on which 3M distinguished the Kaltenbach liner from its product. Those arguments, however, ignore the fact that the liner is already limited in the claims as, among other things, having a shape that is a close fit within the interior of the reservoir and that remains solid when outside of the reservoir. This is the basis on which 3M distinguished the PPS system from the Kaltenbach system and there are no grounds on which to narrow the definition any further, especially considering that any evidence resulting in a narrowed definition must be "unmistakable" and "unambiguous." Omega, 334 F.3d at 1325. The Court disagrees with 3M's position that a definition is unnecessary but adopts its proposed definition.

The parties agree that a "liner" under Claim 8 possesses so-called "moisture transfer qualities," and that the '810 patent also teaches a liner that is "breathable." They disagree, however, whether there is a distinction between these two terms. Plaintiffs contend they are different, and that the specification requires that the liner possess the distinct qualities of moisture transfer and breathability. Defendants believe that the Claim describes only a liner that is permeable to moisture vapor, and that breathability means the same thing.

The '810 patent does not define "breathable" or "moisture transfer." However, the specification employs the term "breathable" in the context of permeability to moisture vapor. "An object of the present invention," the specification reads, "is to provide … a more breathable liner … This object … is realized by providing a lining system having lining materials which act as a moisture transfer system. Moisture vapors are transferred through the liner from one side to the other side."
(‘810 Patent, col. 1, lines 37-47.) “Breathable” is also used in contradistinction to "waterproof." For instance, the patent refers to "a waterproof/breathable membrane,” which it defines as a membrane permeable to moisture vapor in one direction, but impervious to moisture or moisture vapor in the other. (Id. at col. 5, lines 52-62; see also col. 4, lines 59-61; col. 8, lines 43-49.) Thus, the Court defines "breathable" as "permeable to water vapor."

Plaintiffs distinguish permeability to water vapor from "moisture transfer," however. One skilled in the art, they argue, would know that "moisture transfer" is an active function encompassing "wicking," "absorbing," "adsorbing," "siphoning," and other actions involving the conduction of moisture. "Breathability," by contrast, is merely a passive function, according to Plaintiffs, such that fabric that merely allows moisture vapor to pass cannot be said to have "moisture transfer qualities" if it does nothing actively to conduct the moisture through the material.

Intrinsic evidence supports Plaintiffs' construction. The specification discusses a number of fabrics that "have good moisture transfer characteristics" that prevent "excessive moisture built-up [sic]." (See ‘810 Patent, col. 3, lines 55-57.) The "moisture transfer characteristics" of these fabrics "causes [sic] moisture vapors to be passed from a rider's body through" the first liner layer. (Id. at col. 3, lines 58-60.) (emphasis added) "To cause" is an active verb, suggesting that the materials having "moisture transfer qualities" conduct moisture vapor away from the rider, and not simply that they passively allow moisture vapor to travel through them.

Plaintiffs also point to extrinsic evidence to support their reading. Technical descriptions of these moisture transferring fabrics, produced by their manufacturers and placed in the record by Plaintiffs, describe the materials' ability to conduct moisture via wicking, absorption, adsorption, capillary action, siphoning and so forth.

The Court finds Plaintiffs' arguments persuasive, and Defendants offer no counterargument. The Court therefore concludes that the liner taught by Claim 8 must possess moisture transfer qualities that are distinct from its permeability to water vapor. Accordingly, the Court construes "liner" in Claim 8 as a composite material that is permeable to water vapor and that conducts moisture via any one of number of water-transferring processes, including but not limited to wicking, absorbing, adsorbing, siphoning, capillary action and the like. 1

1 Plaintiffs insist that "each and every layer" of the Claim 8 liner must possess these qualities. The Court does not agree. While "breathability" must necessarily be a quality of every layer of a breathable liner, it is not obvious why "moisture transfer" must be. Plaintiffs fail to point to a portion of the specification supporting such a requirement, and the Court rejects it.

e. "a second end cap sealing portion lining the outer annular surface of said second end cap"

The phrase "a second end cap sealing portion lining the outer annular surface of said second end cap" appears in claim 1 of the '366 Patent. Donaldson asserts this phrase has a meaning readily understood by one of skill in the art and construction of the language is not necessary. Baldwin asserts that the phrase should be construed as "the outside annular portion of the second end cap that forms a radial compression seal with the housing." Baldwin argues that a compression type radial seal is required given use of the term "annual" and the following specification language:

In certain preferred arrangements, . . . the second end cap includes an outer annular compressible portion and the housing includes an annular sealing surface against which the second end cap outer annular compressible portion is sealed, when the air filter arrangement is operatively assembled for use. Such a seal is referred to herein as a peripheral or annular radial seal, around the second end cap. That is, in this context the term "annular" refers to a sealing portion around the outside of the end cap, which seals under radial compression.

The Court declines to adopt Baldwin's proposed construction. The plain language of the claim requires that the sealing portion line the outer annual surface and that it form a radial seal against a sealing surface of a housing, when the filter element is mounted in a housing. The claim language does not require a particular type of radial seal. Further, the specification does not support the addition of the limitation that the annular portion form a "radial compression seal." The specification language cited by Baldwin is in a paragraph that begins "in certain preferred arrangements." Thus, the type of sealing discussed is an example. Because the language of the claim is clear and is not limited to a particular form of contact, the Court declines to import any such limitations appearing in the specification. See Phillips, 415 F.3d at 1323. Accordingly, the Court declines to adopt Baldwin's proposed construction and does not construe the phrase "a second end cap sealing portion lining the outer annular surface of said second end cap."

2344

(5) "link arms"

Claims 2, 4 and 6 do not define the term "link arms," which is not a term with an ordinary meaning. The parties have not suggested that the term has any "particular meaning in [the] field of art." Phillips v. AWH Corp., 415 F.3d 1303, 1313 (Fed. Cir. 2005). Therefore, I turn to the specification itself, which "necessarily informs the proper construction of the claims." Network Commerce, Inc. v. Microsoft Corp., 422 F.3d 1353, 1359 (Fed. Cir. 2005).

The '166 patent's abstract claims "two spaced link arms that engage two respective eccentrics of the crankshaft." The written description states that the invention comprises "at least one link arm that couples the counterbalance weight to the crankshaft. In the preferred embodiment, two spaced link arms are used." '166 patent, col. 1, Ins. 52-54. Although the embodiments shown in the patent specification show link arms that are separate mechanical components from the counterbalance weight, the specification does not require the link arms to be separate pieces of machinery, but it identifies their purpose as coupling the counterbalance weight to the crankshaft. Relying on the description of the link arms' purpose provided by the written description, as well as the non-limiting language of the claim itself, I construe "link arms" to be components that couple the counterbalance weight to the crankshaft.

2345

. "A linking means, the linking means operably connecting the wheel braking device with the actuating mechanism to facilitate setting and releasing the wheel braking device"

a chain or shaft that connects the wheel braking device with the actuating mechanism

2346

5. "Links."

Consistent with the claim language and its ordinary meaning, 6 the specification 7 and the prosecution history, 8 the court construes "links" to mean "short separate structures that run transverse to the long axis of the stent in order to connect adjacent longitudinal bands."

8 D.I. 230, Ex. 40 at 5, 6; D.I. 280. Ex. 42 at BSC11646.
D. "Lip"

The parties' disputes regarding "lip" relate to three terms: "lip," "a first lip projecting radially outward from the lid" and "a second lip projecting radially inward from the outer surface of the rim of the main body." Their proposed constructions for the three terms are as follows:

"lip"

. Plaintiff: (Plaintiff does not propose a specific construction, but does state that "the only requirement regarding the lips is that they protrude such that they form a nominal radial interference.")

. Defendant: A protrusion that projects away from a surface by a sufficient amount so that it is clearly and noticeably away from the surface.

"a first lip projecting radially outward from the lid into the groove"

. Plaintiff: The first lip is a protrusion on the inboard side of the inner surface of the groove defined about the edge of the lid where each point of the protrusion extends from the inner surface of the groove in a direction along a radius away from the center of the lid into the groove.

. Defendant: A first lip that projects outwardly in the radial direction from the lid into the groove.

"a second lip projecting radially inward from the outer surface of the rim of the main body"

. Plaintiff: The second lip is a protrusion on the inboard side of the outer surface of the rim of the main body where each point of the protrusion extends from the outer surface of the rim in a direction along a radius toward the center of the main body.

. Defendant: A second lip that projects inwardly in the radial direction from the outer surface of the rim of the main body.

1. The parties' disputes

a. "lip"

The parties' principal dispute relates to the meaning of "lip." Plaintiff contends that it is enough to require that the lips "protrude" in a way that allows them to form a "nominal radial interference" as the claim requires." Plaintiff's construction suggests that "lip" has little meaning on its own. The claim language requires explicitly that the lips "produce a nominal radial interference," so it would be superfluous to define them as being capable of producing nominal radial interference. The only other thing plaintiff's construction accomplishes is to describe the lips as "protrusions."

The parties agree that a lip must be a "protrusion." What defendant's construction adds is that the protrusion must project away from the surface "clearly and noticeably." However, as plaintiff points out, the phrase "clearly and noticeably" is vague and appears to be a subjective standard. Neither vague nor subjective standards help explain the scope of the claim term.

Defendant seeks to hold plaintiff to earlier statements. First, in the previous lawsuit, a Rule 30(b)(6) witness of plaintiff's stated that a lip had to be "totally away from the surface" and drew the following diagram in explanation:

[SEE DRAWING IN ORIGINAL]
Dkt. # 23, Exh. 2D, at 142, exh. 3. The problem is that the Rule 30(b)(6) witness was not providing expert testimony. Plaintiff should not be held to that witness's position on technical matters. I explained this to defendant in the previous suit. First Years, 07-cv-558-bbc, dkt. # 241, at 52.

Next, plaintiff made certain arguments about the meaning of "lip" in the previous lawsuit; in particular, plaintiff argued that a diagram from the prior art, United States Patent 2,833,324, does not show a lip:

Plaintiff acknowledges that the '324 patent does not disclose a "lip," but explains that its definition would not include surfaces such as those disclosed in the '324 patent as "lips" because such surfaces are "projections of a surface" whereas plaintiff's definition requires a "lip" to be a "protrusion from a surface." Dkt. # 31, at 15 (emphasis in original). I agree with plaintiff that it is enough to describe "lips" as "protrusions" from a surface to distinguish them from mere angled surfaces.

Although defendant would add the requirement that the "lip" be "clearly and noticeably away" from the surface, the claim requires only that the "lips" produce a nominal radial interference; it includes no special size requirements on the lips. Indeed, defendant cannot point to any intrinsic or extrinsic evidenceto support placing an arbitrary minimum on the amount of protrusion necessary to qualify as a "lip."

b. "projecting radially"

The other dispute between the parties involves the direction of the "lip." The claim language requires that the lips "projec[t] radially." (The lip on the lid projects "radially outward" and the lip on the cup projects "radially inward.") Neither parties' construction is satisfactory. Defendant's construction simply rearranges the words already in the patent: "projects . . . in the radial direction." Plaintiff's construction is confusing: "each point of the protrusion extends . . . in a direction along a radius." As defendant notes, a point cannot extend. Plaintiff clarifies its position in its response brief, explaining that "the construction only means that if you pick a representative point on the surface of the lips, the lip points or extends either toward or away from the center, that is, along a radi[us]." Dkt. # 31, at 18. This explanation is not very helpful.

What does help somewhat is plaintiff's explanation that the term "radially" refers to the radius from the center of the cup (or lid), so "projecting radially" means "along a line to (or from) the center." Defendant does not disagree, but points out that plaintiff's definition of "projecting radially" point-by-point allows for the possibility of an infinite number of different projecting points from different radii. Plaintiff's attempt to describe the projection on a point-by-point basis must come from the fact that not all the points of the lip can be in a single line pointing toward the center of the cup (or away from the center of the lid).

Plaintiff's general idea seems correct. The confusion lies in describing how these "points" extend away from or toward the center. Perhaps that confusion could be cleared away by explaining where each of these points must be with respect to the center and the surface from which the lip protrudes. However, it is not clear whether such a point-by-point analysis is necessary or required by the patent. Defendant does not suggest that it is and plaintiff does not explain why it would be. To the extent plaintiff is concerned that not all the points on the lip will be along the same "radius," defendant has not raised that argument and a "single radius" requirement would not be a practical reading of the term "radially." At this point, rather than repair the constructions proposed, it makes more sense to simply decline to construe the term. If the parties continue to dispute the meaning of the term at summary judgment, they can describe their concerns more clearly and provide more precise definitions at that time.

2. The court's construction

As I explained above, I will not construe those terms related to "projecting radially" at this stage. As for "lip," it is enough to describe it as a "protrusion." Defendant's additional limitations are not supported by the extrinsic or intrinsic evidence and plaintiff's additional language is unnecessary in light of the surrounding claim language imposing the restrictions plaintiff describes.
"Lip"

The proposed constructions are in Table 7.

<table>

<td>(Correll's Mem. in Opp. (93) at 9.)</td>
</tr>
</tbody>
</table>

The ordinary meaning of the claim term "lip" is "a projecting edge on a container or other hollow object," and "any edge or rim." Webster's at 1120. Therefore, looking at the ordinary meaning alone, without consulting the specification, the meaning of lip would be a projection at the edge or rim of the table. But the specification shows that another construction might be correct. The specification reads:

As shown in the accompanying figures, the table top 12 may also include an outer lip 159 that is generally disposed about the outer periphery 144 of the table top 12. Preferably, the lip 159 forms at least part of an outer edge or boundary of the table top 12. One skilled in the art will appreciate that the lip 159 does not have to create the outer edge of the table top 12 and the lip can extend around all or only a portion of the table top 12. … The lip 159 is preferably disposed about the outer periphery 144 of the table top 12 and at least a portion of the lip extends in an opposite direction from the upper or working surface 16 of the table top.

(Keller Decl. (Nov. 25, 2003), Ex. B, '404 Patent at col. 12, lns. 10-18, 41-44 (emphasis added).)

The word "generally" in the phrase "generally disposed about the outer periphery" indicates that the lip will be located near the outer periphery of the table top, but need not be exactly at the periphery. This construction is supported by the specification statement that "one skilled in the art will appreciate that the lip 159 does not have to create the outer edge." (Id. at col. 12, lns. 15-16.)

The proper construction, would be that the lip must be near the periphery, but is not required to be exactly at the periphery, nor is it required to form the table edge.

b. Lip

Wedgewood suggests that dictionary definitions are of principal importance in defining the patent term "lip." In support of its position, Wedgewood notes the following definitions for "lip": "1. either of the two fleshy folds ... forming the edges of the mouth ... 2. anything like a lip, as in structure ..." (D.E. 26 at 10 (quoting Merriam-Webster's New World Dictionary at 824 (2d college ed. 1984)).) From this starting point, Wedgewood asserts that "the plain and ordinary meaning of lip is: either (i.e. meaning one or the other) of two fleshy folds that surround or form the edges of the human mouth." (D.E. 26 at 10.) Wedgewood then asserts (in response to Nike's commonsense objection that defining "lip" as "anything like a lip" would appear to suffer from substantial circularity problems) that its argument is not unfirm, because the "'as in structure' language only serves to state the obvious: the structure identified in the patents is not made of flesh and it does not form the edge of a mouth." (Id.) Wedgewood thereafter immediately proceeds--in what, in all respect, appears to be somewhat of a non-sequitur--to assert that, while its "lip" is not made of flesh and does not relate to a mouth, "it is a fold." (Id.)

This assertion is meaningful because Wedgewood then pivots to a definition of "fold," which states that "[a] fold is: 'a part
doubled or laid over another part: pleat."' (Id. (quoting Merriam-Webster's New Collegiate Dictionary at 479 (9th ed. 1989).) From this, Wedgewood asserts that a "lip" is simply a two-sided structure (D.E. 26 at 10), although Wedgewood also contends (with no recognition of the convoluted path its has wended simply to arrive at the "fold" definition, nor recognition that the "fold" definition does not appear even in Wedgewood's own view to answer the interpretative question presented) to make clear that a "lip" is certainly not "limited to a structure containing only two sides." (Id. at 10, n. 10.)

Nike also references certain dictionary definitions, but it principally bases its interpretive argument on evidence in the specification and other intrinsic evidence. In this regard, Nike highlights that both parties acknowledge that the term lip is not commonly used in the golf club industry and does not have a common meaning within that industry's lexicon. (D.E. 23 at 20 (citing D.E. 20, Ex. E (Stites Decl.) P 24 & Ex. O (Long Decl.) P 20); D.E. 30 at 13 (citing D.E. 27, Pl. Ex. A (Aldrich Decl.) P 20 (Plaintiff's expert acknowledging that "the term lip is not commonly used to describe structures within a golf club and does not have a common meaning within the lexicon."))). Nike suggests that the proper course is to look to the portions of the specification it highlights to ascertain how Wedgewood has defined the term "lip."

The Court begins by respectfully rejecting much of Wedgewood's proposed approach to the interpretive question, as it appears to suffer from multiple flaws. First, where, as here, it is clear that there is no settled understanding of the meaning of the term at issue in the relevant economic market or art, the Federal Circuit has cast grave doubt on the propriety of using generic dictionary definitions, at least where the intrinsic record appears to offer valuable guidance about the meaning of the disputed term. Specifically, in Venderlande Industries Nederland BV v. International Trade Commission, 366 F.3d 1311 (Fed. Cir. 2004), the Federal Circuit recently instructed:

"where evidence . . . demonstrates that artisans would attach a special meaning to a claim term, or, as here, would attach no meaning at all to that claim term (independent of the specification), general-usage dictionaries are rendered irrelevant with respect to that term; a general-usage dictionary cannot overcome credible art-specific evidence of the meaning or lack of meaning of a claim term."

Id. Given that there is no question that the term "lip" has no ordinary meaning within the golf club industry (see, e.g., D.E. 27, Pl. Ex. A (Aldrich Decl.) P 20 (recognition of Plaintiff's expert)), it would appear to be improper under applicable precedent to turn to generic dictionary definitions when, as explained further below, the intrinsic record provides more context-specific guidance. 13

13 Plaintiff's cited authority (D.E. 26 at 11) does not undermine the force of the Federal Circuit's recent teaching in Venderlande. In one of its cited cases, Optical Disc Corp. v. Del Mar Avionics, 208 F.3d 1324 (Fed. Cir. 2000), there was no argument even made (much less established, as is the case here) that those skilled in the relevant art would not ascribe any meaning to the term at issue. Optical Disk also acknowledged the significance of examining the intrinsic record to see if interpretive guidance were available there. Id., 208 F.3d at 1334-35 ("A technical term used in a patent is interpreted as having the meaning that it would be given by person experienced in the field of invention, unless it is apparent from the patent and the prosecution history that the inventor used the term with a different meaning.") (quoting Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578 (Fed. Cir. 1996)). Plaintiff's second case, CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359 (Fed. Cir. 2002), also did not involve any argument or showing that those versed in the relevant art or industry would not ascribe any meaning to the term at issue, necessitating a look at the intrinsic record. It also recognized that it may be appropriate and necessary to draw from the intrinsic record where the patentee has acted as his own lexicographer in relation to a particular term. Id., 288 F.3d at 1366-67.

Second, even if it were appropriate to look to general-purpose dictionary definitions, Wedgewood's argument on such a basis is flawed. To begin, Wedgewood's dictionary-based, plain meaning argument is rooted in awkward and unpersuasive jumps between the definition of "lip" (which at the end of the day, does very little in the analysis), the definition of "fold," and the notion that a fold has two sides. Even this does not provide any definitive guidance, even on Wedgewood's own terms, as it believes a "lip" can have more than two sides as well. The idea that a "lip" is simply a multi-sided structure would appear to include numerous disparate structures (e.g., octahedrons and pyramids) that could notreasonably be considered a "lip" and that cannot be reconciled with the intrinsic record.
In addition, the predicate for Wedgewood's argument is its use of a 1984 Merriam-Webster's New World Dictionary (2nd college ed.) for its definition of "lip," as being "anything like a lip, as in structure . . . ." As Nike points out, by the time the patents in dispute were issued, this aspect of the definition appears to have been removed from Plaintiff's own cited dictionary series. See D.E. 31, Ex. CC (Merriam-Webster's Collegiate Dictionary at 679 (10th ed. 1996)). Given that Plaintiff's proposed dictionary-based interpretation is predicated, at least in part, on a definition for the disputed term that was removed from Plaintiff's own cited dictionary series during the time period when the patents were applied for and issued (i.e., 1998-2001), Plaintiff's proposed interpretive approach rests on an infirm foundation that is likewise inconsistent with precedent. See Kopykake Enters. v. Lucks Co., 264 F.3d 1377, 1383 (Fed. Cir 2001) (objective interpretation calls for look at what those skilled in the relevant art would have understood disputed term to mean "as of the date the invention was constructively reduced to practice--the date the patent application was filed.") (emphasis added) (collecting cases); accord Plant Genetic Sys., N. V. v. DeKalb Genetics Corp., 315 F.3d 1335, 1345 (Fed. Cir. 2003). 14

As explained above, the Court finds Wedgewood's interpretive approach to the analysis of "lip" to be flawed. That stated, the Court notes that the parties' proposed definitions for "lip" are not wholly dissimilar. Nike suggests that "lip" should be construed to mean "an extension to the striking surface that is adjacent and approximately parallel to the striking surface and that extends above the top side of the mass region." (D.E. 23 at 18.) Wedgewood's proposed definition is that the lip is "a structure having a top side extending back from the striking surface and another side extending down toward the top side of a mass region," although it made clear that this definition would be capable of expanding to embrace multi-sided structures. (D.E. 26 at 10; id. at 10, n. 10.)

This competing definitions present two principal sub-issues--namely, whether the lip is an extension "to" the striking surface or whether it extends "from" the striking surface, and whether the lip is "approximately parallel" to the striking surface.

i. Words of the Claims

As Nike points out, the words of the claims are instructive in resolving the first sub-issue in its favor. The claims state that the "striking surface extends above a top side of [the] mass region to form a lip." (D.E. 20, Ex. A, Col. 6:55-56; accord Ex. C, Col. 6:57-58.) Claim 2 of the '446 patent and claim 5 of the '026 patent explain that the height of the lip is "the vertical distance between the top edge of said striking surface and the top side of said mass region, [and] is between about 1/8 inch and about 1/2 inch." (Id., Ex. A, Col. 7:3-6; accord Ex. C, Col. 7:10-13.) This language strongly suggests that the "lip" (or at least one side of it) is an extension "to" the striking surface. Such an understanding is confirmed by other parts of the intrinsic record, as discussed further below.

ii. Specifications

The specification makes several references to the "lip" in the claimed invention. The first states that a "lip is formed by providing that the striking surface extends above the top side of the mass region." (D.E. 20, Ex. A, Col. 3:2-4; accord id., Ex. C, Col. 3:6-7.) The bulk of the references to the "lip" in the specification come in one paragraph:

---

- 2822 -

---
The lip between the top edge of the striking surface and the mass region is formed by extending the striking surface above the top side of the mass region. The height of the lip, being the vertical distance between the top edge of the striking surface and the top side of the mass region, is preferably about 1/8 inch to about 1/2 inch. The lip increases the surface area of the face, thereby increasing the sweet spot of the face.

The lip also provides more weight to the striking surface near the heel region and the toe region than without the presence of lip, which increases the force behind those shots hit from those areas and thus increasing the margin for error for shots hit from those areas.

(Id., Ex. A, Col. 3:48-65; accord id., Ex. C, Col. 3:51-4:2. The further specification notes that the "mass region is connected to the striking surface at a lip extending between the two adjacent to the top edge of the striking surface." (Id., Ex. A, Col. 4:67-5:2; accord id., Ex. C, Col. 5:2-4.) These passages from the specification can be broken into two portions. Some of the references concern descriptive elements of the lip, including its location on the club and its size. Others discuss the purpose of the lip, namely, to increase the surface area of the face and to give more weight to the striking surface.

This language serves to confirm that the "lip" is an extension "to" the striking surface. The specification's guidance that "the lip . . . is formed by extending the striking surface above the top side of the mass region," (D.E. 20, Ex. A, Col. 3:48-50), dovetails with claim language that states that "said striking surface extends above a top side of said mass region to form a lip." (Id., Col. 6:55-56; accord id., Ex. C, Col. 3:52-54; Col. 6:57-58). Plaintiff seems to protest Nike's definition by arguing that the specification "does not define the lip--it simply describes the spatial relationship between the striking surface, top side of the mass region, and the lip." (D.E. 26 at 12.) But much of the language Nike refers to in the specification is also present in the claims themselves. Furthermore, it is unclear to the Court why Wedgewood contends that Defendant's proposed construction is an issue of spatial relationship, not definition. "Spatial relationship" and "definition" need not be mutually exclusive. One commonsense way to describe something is to state its location and relation to the surrounding areas; thus "Chicago" becomes "a large city on the Southeast tip of Lake Michigan." Plaintiff's argument is even less persuasive because its own proposed interpretation of "mass region" was largely a recitation of the mass region's spatial relationship to other parts of the club. Simply, the specification is consistent with the claim and the plain meaning of the debated term.

As explained immediately below, the Court is inclined to accept Nike's assertion that at least one side of a "lip" must be generally parallel with the striking surface--although this issue may lack little practical consequence because it is difficult to see how anyone could market a golf club whose lip was not at least generally parallel to the rest of the striking surface, as it would not provide a good potential for hitting a true shot. As also explained below, however, the Court will reserve judgment on this issue as it has been briefed in only passing fashion and can be addressed, as appropriate, as the case progresses.

First, with respect to the issue of the Court's inclination to credit Nike's "generally parallel" contention, the specification makes clear that the reason for a "lip" is to increase the sweet spot on the club so as to make it easier to hit a successful shot. Unless the lip is at least generally parallel to the remainder of the sweet spot, it is difficult to see how a "lip" becomes anything other than an impediment to hitting a true shot. See, e.g., Laitram Corp. v. Morehouse Indus., 143 F.3d 1456, 1463 (Fed. Cir. 1998) (holding that a "driving surface" is limited to a flat surface; this interpretations was supported by the specification's discussion of the invention's benefits, the benefits requiring a flat surface); see also Hockerson-Halberstadt, Inc. v. Avia Group Int'l. Inc., 222 F.3d 951, 956 (Fed. Cir. 2000) (commending district court's initial claim interpretation, which was "consonant with the purpose of the invention").

The Court will not definitively rule on the "generally parallel" issue, however, because the parties have not thoroughly briefed the issue. In particular, the parties have not briefed the question of the propriety vel non of interpreting a claim term so that it is consistent with (and perhaps even not antithetical to) the purpose of the invention as stated in the specification. Accordingly, the Court will reserve final judgment at this time.

iii. Prosecution History

As to the issue of whether the "lip" is an extension "to" the striking surface, neither party points to anything persuasive in the prosecution history that would lead the Court to disregard the interpretive guidance identified above. Plaintiff notes in passing in a footnote that one snippet in the '446 claim language--which states that the lip "extends between the striking
surface and the top side of the mass region"—was omitted from the '026 patent. (D.E. 26 at 8 n.7 (citing D.E. 20, Ex. C, Col. 6:56-58; compare id., Ex. A, Col. 6:56-58). The Court does not regard this difference as material. The two patents contain extensive, duplicative claim language that direct the claim interpretations set forth herein. See D.E. 20, Ex. A, Col. 6:55-56 (stating that the "striking surface [of the club] extends above a top side of said mass region to form a lip . . . ."); accord id., Ex. C, Col. 6:57-58; see also id., Ex. A, Col. 7:3-6 ("the height of said lip . . . is the vertical distance between the top edge of said striking surface and the top side of said mass region, [and] is between about 1/8 inch and about 1/2 inch."); accord id., Ex. C, Col. 7:11-13. There is also substantial evidence in the specification that provides guidance and a lexicography concerning the proper interpretation of the disputed terms. See, e.g., D.E. 20, Ex. A, Col. 3:48-54 (stating that the "lip between the top edge of the striking surface and the mass region is formed by extending the striking surface above the top side of the mass region"); accord id., Ex. C, Col. 3:52-58; see also Ex. A, Col. 4:66-5:4 (stating that the "mass region is provided behind the club head striking surface. The mass region is connected to the striking surface at a lip . . . "); accord id., Ex. C, Col. 5:1-6.

As for the "generally parallel" issue, the parties also do not identify anything in the prosecution history that is particularly material. The Court has conducted an independent review and has not identified anything either. Because the Court is not resolving this sub-issue at this time, however, the parties will have an opportunity to discuss the prosecution history and any alleged relevance in this regard at an appropriate juncture.

Based on the evidence and arguments presented, the Court recognizes the following construction for the term "lip" in Plaintiff's patent: "An extension to the striking surface adjacent to the striking surface, reaching or spanning between the striking surface and mass region, with a vertical distance between the top edge of the striking surface and the top side of the mass region of about 1/8 inch and about 1/2 inch."

Clinical next argues that Claim 1's requirement for a "liquid-air interface," cannot read upon the accused device because the Koala has an air-filled balloon that acts as a barrier between the air and liquid. According to Claim 1, the liquid column must have a "liquid-air interface" with the second air-filled volume. An interface is defined as "a surface regarded as the common boundary of two bodies, spaces, or phases." Id. at 993. There is no dispute that this liquid-air interface occurs in the first chamber of the 161 device between the amniotic liquid and the air from the second chamber. Clinical argues that such an interface requires molecule-to-molecule contact between the amniotic liquid and the air for such an interface to exist. Utah Medical asserts that such an interface is simply an exchange between two different surfaces, arguing that nothing in Claim 1 requires a direct molecule-to-molecule interface, and that the interface can exist even if a membrane (such as the balloon in the Koala) acts as a barrier between the air and the liquid. The description of the liquid-air interface in the claim specifications describe an interface between the partially filled liquid and air chamber (161 patent at column 5, line 68 to column 6, line 2), as well as a maintenance of pressure ratios between the air and the amniotic liquid to prevent the liquid from entering the air-filled second chamber (161 patent at column 13, lines 20-28). Because Claim 1 describes this interface in conjunction with the requisite liquid column, the Court finds that Claim 1 contemplates direct contact between the air and the amniotic liquid. Accordingly, the Court interprets Claim 1 to require an actual interface--molecule-to-molecule--between the amniotic liquid and the air. Applying this claim interpretation to the accused device, the Court finds that the accused device does not involve such an air-liquid interface and therefore does not literally infringe on this aspect of the 161 patent. Whether the accused device infringes under the doctrine of equivalents is a question of fact.

Relying on the Lawson specification, P&G asserts that the term "liquid impermeable" means that the BLC will contain liquid and solid waste during wearing by retarding the movement of liquids through the BLC. Paragon counters that this term must be defined according to its ordinary or dictionary definition because the patent does not evidence that this claim limitation has a special meaning to one of ordinary skill in the art. Citing the dictionary definition of "impermeable," Paragon asserts that "liquid impermeable" means impossible for liquid to flow through.
The Court agrees with P&G that the inventor's definition of "liquid impermeable" is clear from reading the specification. The purpose of the Lawson BLC is to contain body exudates that are not immediately absorbed by the absorbent core in the central portion of the diaper. [PTX 1, at 2:17-31]. Regarding the use of a "liquid impermeable" material for the BLC, the Lawson specification provides:

the barrier cuff may be rendered liquid impermeable so as to prevent the strikethrough of body exudates. A liquid impermeable barrier cuff retards the movement of liquid through the barrier cuff thereby making it more leakage resistant. The barrier cuff may be rendered liquid impermeable in any manner well known in the art such as selectively treating the barrier cuff, untreated the barrier cuff, or by securing a separate material to the barrier cuff.

Id. at 10:47-55 (emphasis added). 10

10 The specification further provides that a particularly preferred material is manufactured by the Crown Zellerbach Company and known as Celestra. Id. at 9:10-12. Celestra is a hydrophobic, spunbonded, untreated polypropylene material. [Tr. 218, 221-222, 459-60].

It is a well-settled tenet of patent law that a patentee may act as his own lexicographer. Vitrionics, 90 F.3d at 1582. Although the words used in a patent are generally interpreted according to their ordinary meaning, a court will construe terms used in a patent in accordance with a special meaning, provided that the special definition of this term is clearly stated in the specification. Id. It is clear from reading the Lawson specification that a BLC is "liquid impermeable" if it "retards the movement of liquid" from the central portion of the diaper above the absorbent core through the BLC to the edges of the diaper. There is nothing in the patent specification or the file history which contradicts this definition. Because this term is clearly defined in the patent specification, the Court may not resort to extrinsic evidence, such as the dictionary definition of "impermeable," to vary the definition provided in the specification. Accordingly, the Court construes the term "liquid impermeable," as it describes the BLC feature, to mean a material which is designed to prevent the strikethrough of body exudates by retarding the movement of liquid body exudates through the BLC to the outer portion of the diaper.

The Court construes the preamble to describe an apparatus used in surgery to locate an object within a definite area. The apparatus may also locate a surgical microscope within the same area.

The Court concludes that "localize" means to locate within a definite area, or to fix in a particular place. This definition is consistent with both the ordinary meaning suggested by Midco 21 and with the specialized medical dictionary definition suggested by Elekta. 22 In the particular field at issue, "stereotaxic localization" means "localization of intercerebral nuclei by coordinates with reference to anatomical landmarks in the brain." See Stedman's Medical Dictionary (26th ed.), Ct. Rec. 306, ex. E. In other words, the present device locates an object within a definite area; for example, it can "localize" a tumor within stereotactic space.
21 Citing the New Shorter Oxford English Dictionary at 1614 (1993), Midco argues that "localize" means "3. Fix in a particular place or district or in a particular part of a whole; esp. restrict or confine to a particular place, make local in range or currency. b. Concentrate (attention) on a particular spot. c. Identify with a particular locality. 4. Attribute (in thought or statement) to a particular place; find or invent a locality for, ascertain the locality of."

Although the object to be localized is typically a tumor, the microscope can also be localized within stereotactic space. The specification provides that when the second and third embodiments of the invention are practiced using infrared or ultrasonic sensing and emitting devices, then these devices are "employed to spatially locate and assist positioning of the microscope or beam localization embodiment in stereotactic space." '314 patent, col. 14, ll. 34-37.

2353

4. "localizing deformation"

Agere argues that the phrase "localizing deformation" should be construed as "capable of collecting or accumulating in a specific area an alteration in form or shape." Atmel argues that the phrase "localizing deformation" should be construed as "accumulating or restricting the deformation which occurs during the mounting step to the vicinity of the deformation absorbing member."

Agere offers no justification for including the term "capable" in the construction of this term, and the Court finds that it is unwarranted by the intrinsic evidence. As to the difference between Agere's use of the words "collecting or accumulating," and Atmel's use of the words "accumulating or restricting," the dispute appears to be disingenuous and unnecessary as both parties have relied upon a dictionary definition of the term "localize" as meaning "to collect or accumulate in or be restricted to a specific or limited area." See Webster's Third New Int'l Dictionary 1327 (1986). Furthermore, Agere's proposed construction refers to such localization occurring generally in a specific area, in accordance with the dictionary definition of the term "localize," while Atmel proposes that reference should be made to the specific area where such localization occurs, namely the vicinity of the deformation absorbing member.

It also appears that Agere has included within its proposed construction a definition of the term "deformation" ("an alteration in form or shape"), while Atmel has simply used the term "deformation" in its proposed construction without defining it. Finally, Atmel wishes to include a reference to the fact that such deformation occurs "during the mounting step," while Agere does not contend such a reference is necessary. The Court notes that the claim language itself does include a reference to the fact that the deformation in question occurs at a particular point in the process, but uses the language "during paddle downsetting," whereas the language proposed by Atmel, "during the mounting step," appears only in the specification. As it does not appear to the Court that the patentees intended this specification language to supercede the express language in the claim, there is no reason to substitute the specification language "during the mounting step" for the claim language "during paddle downsetting." 10

10 In fact, Atmel's own proposed construction of the term "deformation absorbing member" implicitly acknowledges that the deformation in question occurs, according to the claim language itself, "during paddle downsetting."
Thus, relying upon the significant degree of overlap between the parties' constructions, and based upon the reasoning set forth above, the Court will construe the term "localizing deformation" as follows: "collecting, accumulating, or restricting to a limited area, namely the vicinity of the deformation absorbing member, the deformation (or alternation in form or shape) that occurs during paddle downsetting."

The parties also dispute the meaning of the word "located" in claim 1 of the '731 patent, as it is used in the following clause:

   another elongate section having an axis of symmetry extending in a direction generally transverse of the first elongate section … and located between the center of the spherical mass and the first elongate section.

Pl. 12(M) P 7. Again, in construing a claim the court first looks to the intrinsic evidence of record. Vitronics, 90 F.3d at 1582. Neither the claims nor the specification define the term "located," so it should be given its ordinary and accustomed meaning. Lantech, 32 F.3d at 547. Brunswick argues "located" means wholly or entirely located; that is, for a second elongate section to be located between the center of the spherical mass and the first elongate section, the second elongate section must be located only between the center of the spherical mass and the first elongate section. Plaintiffs respond that Brunswick's interpretation of "located" is too narrow; plaintiffs suggest that a second elongate section is also located between the center of the spherical mass and the first elongate section when only a segment of the second elongate section is located between the center of the spherical mass and the first elongate section.

In support of their broader claim construction, plaintiffs offer the following analogy:

   In the city of Chicago, there is a subway line between Jackson and Monroe streets (the Blue Line). This line is located between Jackson and Monroe streets. However, the Blue Line is not entirely located between Jackson and Monroe streets. The Blue Line extends out northwest to O'Hare airport and west to Oak Park. The Defendant's argument of "located" meaning "entirely located" implies that to be located between Jackson and Monroe streets means that the subway cannot extend beyond those streets, and is "entirely located" between them. Such a conclusion is absurd.

Pl. Reply at p. 5. Were that defining words could be so easy. Alas, although the court must give "located" its ordinary and accustomed meaning, the ordinary and accustomed meaning of "located" -- like that of many words -- differs with the context and manner in which it used. "Located" can be used differently depending on the precision that is required by the audience or desired by the speaker. To be sure, plaintiffs' subway line analogy highlights one way in which we use "located." If a person asks another person in downtown Chicago where the Blue Line is located, the second person would likely respond, "between Jackson and Monroe." Indeed, the first person might be surprised if the second person hastened to add, "but it extends out northwest to O'Hare." That additional response would likely provide more precision and information than the first person sought in asking the question.

However, we also use "located" to convey the more narrow meaning suggested by Brunswick. If the first person asked "in what state is the Empire State Building located?", the second person might respond, "in New York," and the first person would understand that the Empire State Building was located entirely within New York. If the first person asked where the Sears Tower is located, the second person might respond, "between Jackson and Adams," and the first person would not expect to find the Sears Tower elsewhere. The point of the different analogies should be plain: in interpreting "located," context matters; both Brunswick's and plaintiffs' efforts to impart a universally broad or narrow meaning to the word "located" are thus futile.

The parties do not address the effect of the present context on the meaning of "located" at all. Instead, they present various dictionary definitions of "locate." According to the dictionaries, to locate means:

   to determine or indicate the place, site, or limits of;

   to set or establish in a particular spot;

   to station, situate, or place;
to fix or establish in a particular spot or position;

to show the position of.

Brunswick can point to elements of these definitions that favor its interpretation, particularly the references to "limits" and "particular" spots or positions. Plaintiffs respond that one can "situate" or "show the position of" an object without necessarily communicating that the object is entirely located in a particular spot or position. Of course, both parties can find support in the dictionary, because the dictionary definitions present multiple meanings; dictionaries cannot cure ambiguities.

Plaintiffs suggest that because "located" in claim 1 is not preceded by "entirely" (or one of its synonyms), the broader meaning of "located" is the required interpretation. This argument would have more force if elsewhere in the claims or specification for the '731 patent, words like "entirely" were used to qualify or modify the meaning of "located." However, the '731 patent provides no evidence of any pattern of usage with respect to the word "located." Under these circumstances, plaintiffs' argument -- that the broader interpretation of "located" is required because the word "entirely" does not precede it -- begs the question. The problem is defining the meaning of "located"; as the preceding discussion makes plain, that meaning depends on context.

Here, "located" is used to define the relative spatial position and orientation of sections of a weight block situated inside a bowling ball. Claim 1 of the '731 patent describes a weight block with

[a second] elongate section having an axis of symmetry extending in a direction generally transverse of the first elongate section and extending from the intermediate portion [of the first elongate section] and located between the center of the spherical mass and the first elongate section.

Pl. 12(M) P 7. Reading the highly precise language of this description, it seems unlikely that the claim is meant to communicate that only some of the second elongate section is located between the center of the spherical mass and the first elongate section. Rather, it seems probable that "located" is used in its more narrow sense, in order to establish a defined boundary, particular spot or position for the second elongate section.

If "located" is used in its more precise or narrow sense -- that is, entirely located -- then the meaning of the "located between" clause is direct and clear: the second elongate section is entirely located between the center of the spherical mass and the first elongate section.

However, if "located" is used in its more imprecise or broader sense -- that is, not entirely located -- then it becomes difficult to explain the purpose and the choice of the language "located between the center of the spherical mass and the first elongate section." The claim already states (1) the second elongate section has an axis of symmetry extending in a direction generally transverse of (i.e., perpendicular to) the first elongate section and (2) the second elongate section extends from the intermediate portion of the first elongate section.

If "located" does not communicate the boundaries of the second elongate section, then there is only one other possible purpose of the "located between" clause. That purpose would be to indicate, from a starting position on or near the intermediate portion of the first elongate section, which direction(s) the second elongate section extends along its (generally) transverse axis of symmetry. That is, under plaintiffs' construction of the claim, the only information provided by the "located between" clause is that the second elongate section extends toward the center of the spherical mass, not toward the surface of the bowling ball. The "located between" clause would be an exceedingly awkward, indirect, and risky way to communicate that the second elongate section extends toward the center of the spherical mass and possibly beyond the center, especially given the previously discussed ambiguity of the words "located between." Because Brunswick's interpretation gives the "located between" clause a more direct and clear meaning in this context, the clause should be read to define the limits of the location of the second elongate section.

Even assuming the meaning of the "located between" clause is still ambiguous, a narrow reading which excludes ambiguously covered subject matter must be adopted. Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 93 F.3d 1572, 1581 (Fed. Cir. 1996) (citing Athletic Alternatives, 73 F.3d at 1581). Plaintiffs urge that Ethicon is distinguishable because in that case ambiguity was introduced by different usage of a term in the claim, the specification, and the prosecution history of a patent. True, the facts creating ambiguity in Ethicon are not present in this case. The specification and prosecution history of the '731 patent do not offer inconsistent clues about the meaning of "located" as it is used in claim 1 (indeed, they offer no clues).
However, Ethicon does not indicate that its instruction to read ambiguous claims narrowly is applicable only where the identical (or similar) causes of ambiguity are present. Ambiguity can exist without inconsistent usage in the claim, specification, or prosecution history of a patent; a word can simply be ambiguous. In Athletic Alternatives, after all efforts at removing the ambiguity of a disputed term had failed, the Federal Circuit stated:

Were we to allow AAI successfully to assert the broader of the two senses of "between" against Prince, we would undermine the fair notice function of the requirement that the patentee distinctly claim the subject matter disclosed in the patent from which he can exclude others temporarily. Where there is an equal choice between a broader and a narrower meaning of a claim, and there is an enabling disclosure that indicates that the applicant is at least entitled to a claim having the narrower meaning, we consider the notice function of the claim to be best served by adopting the narrower reading.

Athletic Alternatives, 73 F.3d at 1581; see generally 35 U.S.C. § 112 (placing the drafting burden of distinctly claiming the subject matter on the patentee). Claim 1 of the '731 patent does not unambiguously cover bowling balls where the second elongate section is only partially located between the center of the spherical mass and the first elongate section. Accordingly, the court construes claim 1 of the '731 patent such that it requires the second elongate section to be entirely located between the center of the spherical mass and the first elongate section.

The current appeal centers around the meaning of "located between" in claim 1 of the '731 patent. The patent specification does not contain a definition of the term "located." The district court reasoned that in the context of defining the relative spatial position and orientation of sections of the disclosed weight block within a bowling ball, a narrow interpretation of "located" was required to give direct and clear meaning to the phrase "located between." See Zelinski, 996 F. Supp. at 761. Thus, the district court construed claim 1 to require that the second elongate section be located entirely between the center of the spherical mass and the first elongate section. See id. at 762.

Under this claim construction, the court concluded that Brunswick's annular ring could not be "a second elongate section located between the center of the spherical mass and the first elongate section" because most of the annular ring is not located between the center of the spherical mass and the first elongate section. Id. Consequently, the district court held that Brunswick was entitled to summary judgment on the issue of literal infringement of claim 1 since Zelinski could not demonstrate that each and every limitation of claim 1 was met by a corresponding element in Brunswick's StealthCore I and II bowling balls. See id.

The district court completed its analysis by addressing the issue of infringement under the doctrine of equivalents. The court read claim 1 to contain three limitations; it concluded that the only limitation in claim 1 without a literal counterpart in Brunswick's bowling balls was the "second elongate section." See id. at 763. Thus, the district court analyzed whether the annular ring in Brunswick's bowling balls is equivalent to the second elongate section described in the '731 patent. The court concluded that Zelinski failed to offer any factual evidence from which a jury could reasonably infer equivalence. See id. at 764. Furthermore, the district court concluded that Zelinski's purported lack of opportunity for discovery on equivalence was unsupported in the record. See id. For these reasons, the district court granted summary judgment to Brunswick of non-infringement under the doctrine of equivalents.

Zelinski appeals the grant of summary judgment of non-infringement to Brunswick. We have jurisdiction to hear this appeal under 28 U.S.C. § 1295 (1994).

DISCUSSION

Summary judgment is appropriate if there are no genuine issues of material fact and the moving party is entitled to judgment as a matter of law. See Fed. R. Civ. P. 56(c). We review without deference a trial court's grant of summary judgment, with all justifiable factual inferences drawn in favor of the party opposing the motion. See Anderson v. Liberty Lobby, Inc., 477 U.S. 242, 255, 91 L. Ed. 2d 202, 106 S. Ct. 2505 (1986).

The determination of infringement requires a two-step analysis: (1) claim construction to determine the scope and meaning of the claims asserted to be infringed, and then (2) a determination of whether the properly construed claims encompass the

A.

It is standard practice that in determining the proper construction of an asserted claim, the court looks first to the intrinsic evidence -- the patent specification, including of course the written description, and, if in evidence, the prosecution history. Absent an express definition in the specification of a particular claim term, the words are given their ordinary and accustomed meaning; if a term of art, it is given the ordinary and accustomed meaning as understood by those of ordinary skill in the art.

As noted, this case turns upon the meaning of the phrase "located between." The district court concluded that neither the claims nor the written description define the term "located;" thus the court was called upon to chose between Brunswick's and Zelinski's "ordinary and accustomed" meanings of that term. The district court adopted Brunswick's interpretation of "located between" to mean wholly or entirely located between. Thus, in the context of claim 1, the second elongate section "must be located only between the center of the spherical mass and the first elongate section." See Zelinski, 996 F. Supp. at 760.

On appeal, Zelinski alleges that the district court erred by reading "located between" too narrowly. Zelinski argues that its interpretation of "located between," which includes any weight that is in whole or in part between the center of the spherical mass and the first elongate section, is the construction one of ordinary skill in the art would ascribe to the phrase at issue.

In ascertaining the scope and meaning of claim 1, including the phrase "located between," we are guided by the written description. See Markman, 52 F.3d at 979, 34 U.S.P.Q.2D (BNA) at 1329. We agree that neither the claims nor the written description specifically define the phrase "located between." Similarly, the prosecution history of the '731 patent contains no relevant amendments or explanations. Thus, we must construe the phrase by its ordinary and accustomed meaning to one of ordinary skill in the art. See, e.g., Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1387, 21 U.S.P.Q.2D (BNA) 1383, 1386 (Fed. Cir. 1992).

Zelinski's argument is not without merit. Although the written description does not explicitly define "located between," there is language suggesting that the district court may have interpreted the phrase too narrowly. From our reading of the written description, it appears that the second elongate section need not be entirely located between the first elongate section and the center of the spherical mass. For example, the written description states that no portion of the weight block is disposed in the bottom portion of the ball. See '731 patent, col. 3, ll. 49-51. This statement is followed by a restatement of the concept in the positive; that is, the entire weight block is "relatively localized" in the top half of the ball. Id. at ll. 57-59. Thus, it seems that claim 1 is satisfied if the bulk of the second elongate section is between the first elongate section and the center of the spherical mass, and the entire weight block is in the top half of the ball. Nevertheless, we conclude that at most the district court's narrower interpretation is harmless error because, as we explain below, even with a somewhat broader interpretation of "located between," Brunswick's StealthCore I and II balls do not literally infringe claim 1 of the '731 patent. But cf. Athletic Alternatives, Inc. v. Prince Mfg., Inc., 73 F.3d 1573, 1581, 37 U.S.P.Q.2D (BNA) 1365, 1372 (Fed. Cir. 1996) (favoring narrow interpretation when a choice is presented).

2356

5. "Located Between Two Adjacent Disks"

The next issue is the meaning of "located between two adjacent disks," element 1(j), as that term refers to the "spacer." Fellowes reads this language to mean that "the spacer is positioned between two adjacent cutting disks." Michelin and Intek contend that "the spacer is positioned between each set of adjacent cutting disks," not just two of them. To resolve this dispute, the Court need look no further than the claims themselves. Unlike dependent Claim 9, which twice uses the phrase
"each adjacent disk," Claim 1 uses the phrase "two adjacent disks," and does not use the word "each." '780 Patent, cols. 3-4, lines 47-49, 1-4, 30-33 (emphasis added). Also in contrast to Claim 1, Claim 12 refers to "the distance between each adjacent disk," id. at col. 4, 44-47 (emphasis added). Accordingly, the Court FINDS that "located between two adjacent disks," element 1(n), means "the spacer is positioned between two adjacent cutting disks."

GO BACK

2357

(9) "the flanges are located behind the studs to further secure the auxiliary frame to the primary frame"

Plaintiffs construe the phrase "further secure" to mean "that the location of the flanges behind the studs further maintain the auxiliary frame in position on the primary frame so as to keep it from falling, sinking or slipping." JS, Exh. A at 30.

Defendant construes the instant phrase to mean that "the flanges on the arms or extensions hook over the studs on the primary frame contacting the rear surface of the extensions [sic]." Defendant's construction seeks to limit the instant phrase by requiring the flanges to hook over and contact the rear surface of the studs on the primary frame.

24 Presumably, Defendant meant to say "studs."

In this case, the Court has already held that there need not be physical contact between the downwardly extending flange of the auxiliary frame and the back side of the stud of the primary frame. See supra section "III B 2 b (4)". Therefore, the Court construes the instant phrase to mean that the flanges are located behind, but not necessarily in contact with, the rear surfaces of the studs to further fasten the auxiliary frame to the primary frame.

2358

B. "Said first portion is located generally on the outside of said iris section and said second portion is located generally on the inside of said iris section" (Disputed Terms 3 and 4)

4 The terms "first portion" and "second portion" refer to the portions of the elements of the pattern.

The interpretation of the second pair of related terms in dispute again involves the question of to what extent the elements of the first shade must be separated from the elements of the second shade. The Court has already found that the express terms of the specification provides for some overlap between the elements of the first and second shades (supra). Here, Defendant argues that the elements of the first shade cannot span the entire iris section, but rather are confined to the outer circumference of the iris.

As stated supra, there is substantial support in the specification that elements of the first shade may comprise a substantial area of the iris, thus providing for overlap between elements of the first and second shades. Apparently aware that its position is not supported by the specification, 5 Defendant asks the Court to disregard the specification because it is not supported by the plain language of the claims. (Def.'s Memorandum of Points and Authorities ("Def.'s P&A") at 18). Specifically, Defendant relies on the following terms in the claims themselves as supporting its proposed limitation:

1. "located generally" - Defendant argues that "because the respective portions are specifically claimed to be 'generally located' on either the 'outside' or the 'inside' of the iris section, the portions cannot be located over the entire iris section."
2. The required location of the "jagged border," where a "noticeable change of shade" occurs between elements of the first and second shades. The claim indicates this border must appear at a distance from the outer perimeter of the iris of between 5% and 95% of the radial width of the iris.

5 Although not in the Joint Statement, Defendant's memorandum does cite one statement in the specification in support of its position -- "the second portion of the elements…is surrounded by the first portion." (Def.'s P&A at 20; Shull Decl., Ex. B at 56, col. 4, ln. 54-58). That term states only that the elements of the second shade must be surrounded by the elements of the first shade. It says nothing as to whether the elements of the first shade may occupy the entire iris. It is completely consistent to say that the elements of the second shade both overlap and are surrounded by elements of the first shade. Furthermore, this construction is consistent with the specification, which states that the "outer portion" will be comprised solely of elements of the first shade. (Shull Decl., Ex. B at 57, col. 6, ln. 61-62).

6 In support of its argument that this Court should disregard the specification, the defendant cites Rheox Inc. v. Entact Inc., 276 F.3d 1319, 61 U.S.P.Q.2D (BNA) 1368 (Fed. Cir. 2002). Defendant's reliance is misplaced. In Rheox, the Federal Circuit held only that a claim construction eliminating coverage for one of the preferred embodiments may be correct where such a construction is required by the prosecution history. Id. 61 U.S.P.Q.2D (BNA) at 1374. Here, the prosecution history of the 477 patent does not demonstrate that Plaintiff clearly relinquished a claim that included the first preferred embodiment. Thus, that embodiment, as expressed in the specification, remains strong evidence of the scope of the patent.

The Court rejects Defendant's position. As to the term "located generally," the term merely requires that the elements of the first shade are generally positioned on the outside of the iris. The term does not limit the elements of the first shade from appearing anywhere in the iris, so long as those elements are more prevalent near the outside. As to the location of the jagged border, Defendant failed to point out that the jagged border represents only that area where there takes place a "noticeable change of shade" between the elements of the first and second shade. (Shull Decl., Ex. B at 56, col. 4, ln. 64-65). This change of shade may occur even should elements of the first shade appear throughout the iris, so long as those elements are more prevalent on the outside of the iris and elements of the second shade are more prevalent on the inside. The existence of an apparent jagged border between the two shades does not mean that elements of the first shade cannot appear throughout the iris.

For the reasons discussed, the Court finds Defendant's position is not supported by either the specification or the language of the claims. Rather, as stated supra in its discussion of claim one, the specification expressly supports Plaintiff's position that elements of shade one may appear throughout the iris, thus providing for substantial overlap between elements of the two shades. Moreover, as the intrinsic evidence is conclusive on this point, the Court does not consider extrinsic evidence.

7 Defendant also relies on the prosecution history of the 477 patent for the proposition that because prior patents contemplated overlapping patterns, the 477 patent cannot, or else it would be invalid. (Def.'s P&A, Ex. 5 at 83). The Court rejects this argument. It surely is possible that the 477 patent could have developed a specific pattern of overlapping shades that made it distinct from prior contact lens patents that also provided for overlapping colors.

Claim 9 includes "a contactor having a spring located inside the battery holder between the base of the battery holder and
the battery for biasing the battery toward the opening of the battery holder. . . " 900 Patent col.11 1.36-39 (emphasis added). Invisible Fence's proposed claim construction for the term "located inside" is that it means "partially or completely located inside or within," while Perimeter's proposed construction is that "the spring must be positioned completely within the battery holder and is not exposed outside of the battery holder." (Joint Statement 4.)

The language of claim 9 supports Perimeter's proposed construction, as the spring is "located inside the battery holder between the base of the battery holder and the battery." 900 Patent col.11 1.36-38. For the spring to be located between the base of the battery holder and the battery, it must necessarily be completely within the battery holder. Indeed, the language of the claim contains no indication that the qualifier "partially" should be read into claim 9. 15

15 The written specification does little to elucidate the definition of "inside," as the Summary merely provides that "the battery pack also includes a contactor having a spring located within the battery holder. . . " 900 Patent col.1 1.62-63.

Dictionary definitions also support Perimeter's proposed construction. For example, the Oxford English Dictionary defines "inside" as "the inner part, or the space within something; the interior," Oxford English Dictionary, available at http://dictionary.oed.com/ (2006), suggesting that an object is "inside" if it is located completely within the interior.

Therefore, the Court construes the term "located inside" to mean "the spring must be positioned completely within the battery holder and is not exposed outside of the battery holder."

2360

Claim 38 describes "[a] vending machine as claimed in claim 1, wherein said control unit is located remote from said vending machine." (400 Patent 18:17-19). In disputing the proper interpretation of the phrase "located remote from said vending machine," the parties raise essentially the same points made with respect to claim construction of the term "vending machine" and whether it must be construed as a single unit. The reasoning set forth in the construction of "vending machine" as well as the construction of "customer interface" dictate a similar finding in this case, namely, that the control unit is not simply remote from other components but -- as plainly stated in the claim -- from the vending machine itself.

Thus, the following construction:

2361

A. Claim 1 of the '592 patent

Claim 1 of the '592 patent states:

1. A device for feeding animals from a feed material containing reservoir, said device comprising:

an open top trough structure providing a pooling space in which feed material can pool; and

means for mounting the reservoir on said trough so that it can be mountably moved, while remaining attached to the trough, from a first mounted position thereof wherein it is at least partially nested in said trough pooling space, to at least another mounted position wherein the reservoir is located sufficiently clear of said trough pooling space, so that if a transfer of feed material from the reservoir to the pooling space be effected to pool feed material in the trough, an animal has
feeding access to pooled feed material in the trough.

'592 patent, col. 12, ll. 35-50 (emphases added). The district court construed the emphasized language in claim 1 to require a "feed transfer-effecting mechanism." Second Claim Construction Order at 3. In other words, the court found a valve structure limitation in the claim. The court stated that "a feed transfer-effecting mechanism is an essential component of the feeding device . . . ." Id. It further stated that the feed transfer-effecting mechanism "must be limited by the configurations disclosed in the specification[]." Id. Based on this claim construction, the district court determined that the HD device did not literally infringe claim 1 because the HD device did not have the feed transfer-effecting mechanism required by the claim. Summary Judgment Order at 10. In addition, the court determined that Mr. Wechsler had failed to raise a triable issue of fact as to whether the HD device infringed the '592 patent under the doctrine of equivalents. Id. at 14. Accordingly, the court granted summary judgment of non-infringement with respect to claim 1 of the '592 patent. Id.

On appeal, Mr. Wechsler argues that the district court erred in construing claim 1 as requiring a feed transfer-effecting mechanism. He contends that reading this additional limitation into claim 1 is inconsistent with the intrinsic evidence, which he asserts teaches that a feed transfer-effecting mechanism is optional. In response, Macke 2 argues that the district court correctly construed claim 1 as requiring a feed transfer-effecting mechanism.

2 Macke and Mr. O'Rourke are the only defendants who collectively filed a response to Mr. Wechsler's appeal. Petsmart is not a party to this appeal. In the balance of this opinion, we refer to Macke and Mr. O'Rourke collectively as "Macke."

We agree with Mr. Wechsler and hold that claim 1 does not require a feed transfer-effecting mechanism. First, nothing in the language of claim 1 requires such a limitation. As we have stated, "the claims define the scope of the right to exclude; the claim construction inquiry, therefore, begins and ends in all cases with the actual words of the claim." Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1248, 48 USPQ2d 1117, 1120 (Fed. Cir. 1998). Put another way, "the language of the claim frames and ultimately resolves all issues of claim interpretation." Abtox, Inc. v. Exitron Corp., 122 F.3d 1019, 1023, 43 USPQ2d 1545, 1548 (Fed. Cir. 1997). The relevant language in claim 1 states:

means for mounting the reservoir on said trough so that it can be mountably moved, while remaining attached to the trough, from a first mounted position thereof wherein it is at least partially nested in said trough pooling space, to at least another mounted position wherein the reservoir is located sufficiently clear of said trough pooling space, so that if a transfer of feed material from the reservoir to the pooling space be effected to pool feed material in the trough, an animal has feeding access to pooled feed material in the trough.

'592 patent, col. 12, ll. 40-50. Nothing in the quoted language requires us to construe claim 1 to require a "feed transfer-effecting mechanism." The district court relied on the following part of the quoted language to conclude that claim 1 requires such a limitation: "so that if a transfer of feed material from the reservoir to the pooling space be effected to pool feed material in the trough." Second Claim Construction Order at 3. Proper claim construction, however, demands interpretation of the entire claim in context, not just part of the claim language. See Hockerson- Halberstadt, Inc. v. Converse Inc., 183 F.3d 1369, 1374, 51 USPQ2d 1518, 1522 (Fed. Cir. 1999). When one considers all of the quoted language, it is clear that the language simply states that the claimed device requires a sufficient amount of clearance between the reservoir and trough to permit animal access to pooled feed material in the trough when the feed material is transferred to the trough from the reservoir during active use. In short, the quoted language does not require us to construe claim 1 as containing a feed transfer-effecting mechanism.

The specification also supports our conclusion. The specification states: "Coupling assembly 1 optionally includes a valve portion 4 to selectively prevent discharge of the contents within reservoir 2 by permitting positive closure of reservoir 2 from the outside." '592 patent, col. 5, ll. 24-27 (emphasis added). Thus, the specification does not suggest that a valve structure is required or is an "essential component" of the feeding device.

Finally, under the doctrine of claim differentiation, each claim in a patent is presumptively different in scope. Ecolab Inc. v. Paraclipse, Inc., 285 F.3d 1362, 1375, 62 USPQ2d 1349, 1358 (Fed. Cir. 2002) (citation omitted). This presumption is
especially strong where there is a dispute over whether a limitation found in a dependent claim should be read into an independent claim, and that limitation is the only meaningful difference between the two claims. Id. (citation omitted). In this case, claim 5 depends from claim 1 and states:

5. The device according to claim 1, further comprising:

valve means for selectively permitting and terminating a flow of said contents from said reservoir to respectively effect and prevent said transfer.

'592 patent, col. 12, ll. 64-67. Because the only meaningful difference between claim 1 and claim 5, a dependent claim, is the limitation of a valve means, claim 1 should not be read as requiring a valve structure limitation.

In sum, we hold that the district court erred when it construed claim 1 to contain a valve structure limitation. For the reasons just stated, the claim does not contain such a limitation. At oral argument, Macke conceded that the HD device would infringe claim 1 if we were to conclude that claim 1 does not have a valve structure limitation. Accordingly, we hold that the HD device infringes claim 1 of the '592 patent, reverse the district court's grant of summary judgment of non-infringement with respect to the HD device, and remand for further proceedings consistent with this opinion. 3

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
3 Because we have determined that the HD device infringes claim 1 of the '592 patent, we do not reach the issue of whether the HD device infringes any of the other asserted claims of the '592 patent.

2362

Claim 1(a) of the 827 patent describes the housing as "having a barrel, a nozzle, a handle and a trigger located thereon." All four of these parts are located on what Ohio Art calls the pistol subassembly. Accordingly, Ohio Art argues that the housing is comprised of only the pistol subassembly. The use of the term "having" indicates that additional elements may have meant to be included, although it cannot be presumed that the definition is open-ended, as use of the term "comprising" would have clearly indicated. Crystal Semiconductor Corp. v. Tritech Microelectronics Intl, Inc., 246 F.3d 1336, 1348 (Fed. Cir. 2001). Interpreting similar language in another patent dispute, the Federal Circuit has held that the use of the term "having," when combined with "housing," can be interpreted to be either closed or open, depending on the other language in the patent. Lampi Corp. v. American Power Products, Inc., 228 F.3d 1365, 1376 (Fed. Cir. 2000).

The language used in the limitation is that the barrel, nozzle, handle, and trigger are "located thereon." This implies that these components are not part of the housing, but are in some way attached to the housing. Later in the 827 patent, in claim 6, it is specified that the pump be "attached" to the main housing. Looking at this language, the 827 patent indicates that the pump is also located on the main housing. In addition, in the preferred embodiment of the 827 patent, the bladder and the slider, as well as other pieces, are also located on the main housing. Taking into account the language of the 827 patent and its preferred embodiment, this Court finds that the definition of main housing in claim 1(a) was meant to be open.

2363

b. "Storage area location"

I recommend that the term "storage area location" as used in claim 1 of the '110 patent be construed as McKesson proposes, to mean "a place in the storage area accessible to the picking means where packages are held." This conclusion follows from my recommendation that the Court adopt McKesson's proposed construction of the x, y terms.

The parties acknowledge the relationship between the x, y terms and "storage area location." (D.I. 361 at 10) 7 In fact, the
heart of the parties' dispute with respect to "storage area locations" is the same as the dispute over the x, y terms: whether "storage area locations" are only those areas where packages are stored and accessible to the picking means (McKesson's position) or whether they also include areas where packages are stored but are not accessible to the picking means (Swisslog's position). (D.I. 391 at 8) For the same reasons I agreed with McKesson in connection with the x, y terms, I also agree with McKesson on the "storage area location" term.

7 Indeed, the parties did not identify "storage area location" as a disputed term requiring judicial construction until after they exchanged opening claim construction briefs and saw each others' analyses of the x, y terms. (See generally D.I. 391; D.I. 421; D.I. 536.)

Swisslog proposes that "storage area location" be construed as "a location within the storage area where packages are held for storage." (D.I. 421) Swisslog's construction would result in portions of the "storage area location" being inaccessible to the picking means. Such a result is inconsistent with the claim language and is not in any way supported by either the specification or the prosecution history.

As McKesson observes, all five parts of claim 1 of the '110 patent refer to the "storage area location," and all of these parts provide guidance as to what the storage area location is and where it exists within the claimed system. (D.I. 391 at 2) Specifically, claim 1 provides:

a) a storage area comprised of a plurality of storage area locations each location having package holding means sized and configured to hold a plurality of individual packages each individual package . . . , the packages being held in a manner so that each package can be placed into and removed from the storage area locations . . . , each location having a distinct x, y coordinate;

b) automated picking means . . . to select packages from the storage area locations and place packages in the storage area locations in accordance with computer controlled instructions . . . ;

c) means for moving the automated picking means to selected storage locations;

d) a computer . . . for directing the picking means to chosen storage area locations and a database containing at least one x, y coordinate location in the storage area for each package held within the storage area . . . ; and
e) . . . wherein only one type of package is stored in each x, y coordinate location.

'110 patent, col. 13 lines 1-38 (emphasis added).

It is evident from this claim language that the term "storage area location" refers to the part of the storage area where the picking means travels to select or place packages -- not the entire storage area. Element a) provides that the packages in the storage area locations are "held in a manner so that each package can be placed into and removed from the storage area locations." (D.I. 391 at 3; '110 patent, col. 13 lines 6-8) Element b) requires that the picking means select packages from the storage area locations and place packages in the storage area locations. (D.I. 391 at 3; '110 patent, col. 13 lines 13-15) Elements c) and d) likewise demonstrate that the picking means must be able to move to and be directed to the selected storage area locations. (D.I. 391 at 3; '110 patent, col. 13 lines 24-28) As McKesson asserts, "[t]he linkage between the storage area locations and the picking means is thus undeniable. As a result, one of ordinary skill would understand that a 'storage area location,' in the context of the claimed invention, must be a place accessible to the picking means." (D.I. 391 at 3)

Although McKesson purports to find support for its construction in the specification and prosecution history, it does not identify any discussion in either place which is helpful to construing the term "storage area location." On the other hand, neither have I found anything in the specification or prosecution history that conflicts with the strong support found for McKesson's construction in the claim language itself. I agree, therefore, with McKesson's conclusion that "the specification
does not provide any suggestion that a storage area location can be a place holding packages but that the picking means cannot access." (D.I. 391 at 5) Given the weight of the claim language, this is a sufficient basis for me to recommend that the Court adopt McKesson's proposed construction of the term "storage area location."

Swisslog argues against McKesson's construction primarily by reviving the same arguments it makes in connection with the x, y terms. I am no more persuaded by these arguments in connection with "storage area location" than I was in connection with the x, y terms. Swisslog's primary additional contention is that McKesson confuses the definition of the term "storage area location" with a description of relationships among structures. (D.I. 421 at 2-7) In Swisslog's view, "[r]elationships between elements do not define the elements themselves." (Id. at 6 n.3) That is, Swisslog agrees with McKesson that claim 1 of the '110 patent "requires the picking means to access 'storage area locations,'" but Swisslog insists "this requirement does not come from the definition of 'storage area location.' It comes from other limitations in the claim that define relationships between the picking means and storage area locations." (Id. at 1) To Swisslog, then, it would be improper to include these relationships in the construction of "storage area location," because to do so "would render these [relational] limitations superfluous." (Id.)

I am not persuaded that Swisslog has identified a flaw in McKesson's proposed construction. The claim requires that the storage area location be accessible to the picking means. Whether this is viewed as a "relational" or "definitional" fact, adopting McKesson's construction does not eliminate this requirement -- to the contrary, it retains the requirement. There is no principle of claim construction of which I am aware that prohibits a term from being construed in a manner incorporating some relational content.

The parties have no objection to Judge Stark's construction of "storage area location" as used in claim 1 of the '110 patent to mean "a place in the storage area accessible to the picking means where packages are held." However, the explicit detail provided by claim 1 defines the precise nature of a "storage area location," and belies any need for further construction. Accordingly, the court concludes that no construction is required and overrules this recommendation.

The "first location" as used in the patent is a point on the first conveyor just past the shingling nip where the sheets actually first shingle. Shingling occurs when a faster conveyor conveys sheets to a slower conveyor. The process is complete only when the sheets reach the slower conveyor. Accordingly, shingling does not occur at the shingling nip and the nip cannot be the first location. Neither, however, is it reasonable to designate the entire first conveyor as the first location as suggested by the plaintiff. The patent language provides that the sheets are shingled "as they pass said location" clearly implying that the location is a point along the first conveyor beyond the shingling nip but not the entire first conveyor.

III. "Location Detector" as Used in the '689 Patent
Kensey appears to submit that "location detector" as used in the claims is a general term that refers to any device capable of percutaneously locating an arterial opening through blood visualization. See Pls.' Resp. at 18. Perclose submits that "location detector" as used in the claims refers to "means [which] detect[ ] the approximate location of the wall of a vessel, duct, or lumen [and] which comprise[] (1) an unattached 'sheath' having an open or free distal end, (2) an unattached removable elongated member that fits within the sheath, and (3) a passageway that extends from a fluid (e.g., blood) entry opening or window located at or close to the distal end of [the] sheath toward the proximal portion of the location detector." Def.'s Mem. at 46. Neither party offers expert testimony to indicate that "location detector" is a technical term. Hence, the term's meaning must be found in the patent.

Asserted Claims 1 and 25, the only independent claims in the patent, both use the term "location detector." The pertinent portions of Claim 1 read as follows:

"A system for sealing a percutaneous puncture in the wall of a [fluid-filled] vessel, duct or lumen of a living being…

the puncture comprising an opening in the wall of the vessel, duct or lumen and a tract contiguous with the opening and extending through tissue overlying the vessel, duct or lumen,

[a] said system comprising a closure device and a location detector,

[b] said location detector being arranged for introduction into the puncture to provide a perceptible signal indicative of the location of the wall of the vessel, duct or lumen, whereupon a desired position for said closure with respect to the vessel, duct or lumen may be determined,

[c] said location detector comprising means for insertion in the puncture tract to a position at which fluid within the vessel, duct or lumen is enabled to flow from the interior thereof into said location detector to provide a perceptible signal…"

'689 patent at 14:56-15:4 (emphasis and sentence division added). The pertinent portions of Claims 25 read as follows:

"A method for sealing a percutaneous puncture in the wall of a [fluid-filled] vessel, duct or lumen of a living being,…

the puncture comprising an opening in the wall of the vessel, duct or lumen and a tract contiguous with the opening and extending through tissue overlying the vessel, duct or lumen, said method comprising:

(a) providing a closure device and location detector;

(b) introducing the location detector into the puncture to a position whereupon the fluid within the vessel, duct or lumen is enabled to flow from the interior of the vessel, duct or lumen into the location detector to provide a perceptible signal indicative of the location of the wall of the vessel, duct or lumen, whereupon a desired position for the closure with respect to the vessel, duct or lumen may be determined….

Id. at 16:48-61.

Again, parsing the claims' language makes more apparent the limitations imposed on the definition of "location detector." First, sections (b) of Claims 1 and 25 specify that the location detector through introduction into the puncture provides a "perceptible signal of the location of the wall of the vessel, duct or lumen." As noted earlier "puncture" comprises the opening as well as tract leading to the opening. Second, sections (c) of both claims specify that the location detector referred to has some "means that enable insertion into the puncture" such that "fluid from the vessel, duct or lumen" can flow from the interior of the vessel, duct or lumen into the location detector. Third, sections (c) also specify that it is the flow of fluids from the vessel, duct or lumen into the location detector that allows for the perceptible signal. Thus, "location detector," as used in these claims refers to the class of devices

(1) that are introduced into the puncture, and that thereby provide a perceptible signal of the location of the vessel, duct, or lumen wall;
(2) through which fluid can flow from the interior of the vessel, duct, or lumen upon insertion into the puncture;

(3) that uses the aforementioned flow of fluid to provide the aforementioned perceptible signal.

Already the ordinary language of the claims establishes a definition narrower than that submitted by Kensey. However, as yet, the definition is broader than that submitted by Perclose.

Perclose points out that the claims Claim 1 uses the word "means" and argues that therefore "location detector" must be interpreted as a means-plus-function term under 35 U.S.C. § 112, P 6. Def.'s Mem. at 46-47. § 112, P 6 states that "an element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof." The Federal Circuit specifies that "if the word 'means' appears in a claim element in association with a function, this court presumes that [35 U.S.C.] § 112, P 6 applies. This presumption collapses, however, if the claim itself recites sufficient structure, material, or acts to perform the claimed function." Micro Chemical, Inc. v. Great Plains Chemical Co., Inc., 194 F.3d 1250, 1257 (Fed. Cir. 1999). Here the elements of the claims, which posit means for the location detector's positioning, explicitly use the term "means" to express a function and do not recite any structure, material, or acts to perform the claimed function. The other elements of the claims, those that state that fluid flow is to create a perceptible indication of the target position, do not use the term "means" to express a function but nonetheless rely on a functional term. Namely, the other elements of the claims explain the location of the target position by reciting that the location detector is "introduced" into the puncture. Neither claim explains how fluid flow works to create a perceptible signal of the target position. Consequently, the claims use "location detector" as a means-plus-function term.

Where a means-plus-function term recites a function to be performed rather than definite structure or material [or acts] for performing the function, the term must be construed to "cover the corresponding structure, material, or acts described in the specification and equivalents thereof." 35 U.S.C. § 112; accord WMS Gaming Inc. v. International Game Tech., 184 F.3d 1339, 1347 (Fed. Cir. 1999); see Chiuminatta Concrete Concepts, Inc. v. Cardinal Indus., Inc., 145 F.3d 1303, 1307-08 (Fed. Cir. 1998). The specification describes the location detector in great detail. I will outline the specification's description in brief.

The location detector has four essential elements: an introducer sheath, a conventional hemostasis valve, a sideport connected to a conventional stopcock, and a semi-tubular member. The location detector positions the closure device by positioning the introducer sheath. '689 patent at 9:13-15. The proximal end of the sheath terminates in a "conventional hemostasis valve." Id. at 9:11-16. The distal end of the sheath terminates in a free tubular end. Id. at 9: 16- 17. The sideport is affixed to the valve and connected to the stopcock. Id. at 9:17-20. Fluid flowing into the sheath will flow through the valve and sideport to the stopcock. Fluid will flow through the stopcock, when it is in an open position. The semi-tubular member is a "conventional dilator whose outer periphery has been modified to include a longitudinally extending flat" surface. Id. at 9:29-31. The distal end of the member is tubular.

The member is inserted into the sheath so that the distal end of the member protrudes outside the distal end of the sheath and leaves an opening between the sheath and the longitudinally extending flat surface of the device. Id. at 9:36-47. A slight gap between the distal end of the member and the distal end of the sheath creates an entry into the passageway between the extending flat and the sheath wall. Id. When the sheath, with member inside, is inserted into the puncture, blood (or fluid) will enter the passageway when the gap between the sheath and member enters a vessel (or duct or lumen). Id. at 48-10:9. The blood travels up the passageway, through the valve and sideport, and onto the stopcock. Id. The flow of blood through the stopcock signals the sheath's position inside the artery. Id. The user then removes the sheath and member until blood stops flowing through the stopcock. Id. This signals that the sheath is just outside the vessel. Id. The user closes the stopcock, withdraws the member from the sheath, and reinserts the sheath 10 mm so as to ensure that the distal end is within the artery. Id. The sheath can now accept insertion of the closure device. Id.

"Location detector" covers the embodiment described briefly above as well as two other similar embodiments of the member inserted inside the introducer sheath. See id. at 10:10-60. One member is similar to the one described above but has a different shape. Id. at 10:10-39. The second is a tubular, hollow member with an entrance port near the distal end and an outlet port that allows fluid communication with the sideport and stopcock. Id. at 10:40-60. The patent also contains an alternate embodiment of the introducer sheath which can be used with the above described members. See '689 patent 10:61-
11:34. Hence, in all there are six separate embodiments of the location detector specified as preferred embodiments.

For the purposes of this claim construction, the six embodiments and their equivalents define "location detector." See, e.g., Chiuminatta Concrete Concepts, 145 F.3d at 1307-08. The following definition generally sums up the meaning of "location detector" as used in the '689 claims: A device comprising

(1) an introducer sheath, a conventional hemostasis valve, a sideport connected to a conventional stopcock, and a semi-tubular member arranged within the sheath so as to allow fluid communication between distal end of the sheath and stopcock;

(2) which is used by inserting the sheath until fluid from the target vessel, duct, or lumen appears at the detector's stopcock and thereby indicates the sheath's entry into the artery and allows for an appropriate positioning of the sheath and thereby an appropriate positioning of the closure device.

This definition is in accord with the definition submitted by Perclose, but importantly, this definition is intended as nothing more than a general review of the specification's embodiments. In the event that litigation proceeds to an infringement analysis, the specification language describing the various embodiments of "location detector" and the equivalents of these embodiments shall serve to define the term.

2367

A. "Location Indicator"

1. Whether Section 112, P 6 Applies to the Term "Location Indicator"

Universal argues that section 112, P 6 covers the term "location indicator" in claims 1 and 13, because the term is nothing more than a functional description of structure purporting to cover any device that indicates location. Universal contends that "location indicator" fails to recite sufficiently definite structure, rebutting the presumption that "location indicator" is not in means-plus-function format raised by the absence of the word "means." Plaintiffs respond that the presumption remains because the term "location indicator" is not in means-plus-function format and the term "indicator" has a reasonably well-understood meaning in the art and recites sufficiently definite structure.

--- Footnotes ---

1 The '943 Patent alternately uses the terms "location indicator" and "position indicator." It is clear from the written description that these terms refer to the same element of plaintiffs' invention and are used interchangeably.

--- End Footnotes ---

The word "means" is not used in claiming the location indicator. The presumption that the claim of the "location indicator" is not in means-plus-function form applies. To rebut this presumption, Universal must show that the term "location indicator" fails to recite sufficiently definite structure or recites a function without reciting sufficient structure for performing that function. Apex, 325 F.3d 1364, 2003 WL at *5.

The term "indicator" is defined in several technical dictionaries. The NEW IEEE STANDARD DICTIONARY OF ELECTRICAL AND ELECTRONICS TERMS (5th ed. 1993) defines an "indicator" as a "device or variable that can be set to a prescribed state based on the results of a process or the occurrence of a specified condition. For example, a flag or semaphore." (Docket Entry No. 49, Ex. A, Ex. 2). The ILLUSTRATED ENCYCLOPEDIC DICTIONARY OF ELECTRONICS (2d ed. 1987) defines "indicator" as "any device, such as a gauge, dial, register, or pointer, that measures or records, and visibly indicates a value, condition, etc." (Id. at Ex. A, Ex. 4). The IBM DICTIONARY OF COMPUTING (10th ed. 1993) defines "indicator" as "a device that gives a visual or other indication of a defined state." (Id. at Ex. A, Ex. 1). The ILLUSTRATED DICTIONARY OF ELECTRONICS (6th ed. 1994) defines "indicator" as a "(1) Meter. (2) Monitor. (3) Annunciator. (4) In a computer, a device that can be set by a specific condition, e.g., by a negative result or error indicator." (Id. at Ex. A, Ex. 3).
These definitions lead to the conclusion that the term "indicator" has a well-known meaning to those skilled in the electrical arts. Personalized Media Communications, LLC, 161 F.3d at 704-05. "Indicator" is not a generic structural term, such as "means," "element," or "device." Nor is "indicator" a coined term lacking readily apparent meaning, such as "widget." Rather, the term "indicator" connotes structure, such as a gauge, dial, register, flag, meter, monitor, or annunciator. The fact that "indicator" does not define a particular structure does not invoke section 112, P 6. The dictionary definitions of the term "indicator" convey a variety of structures known to those knowledgeable in the art.

2 Universal cites the testimony of Thomas Rhyne, an expert in electrical engineering who testified for plaintiffs, as showing that the term "location indicator" does not define a type of structure. In light of the technical dictionaries' definitions of the term "indicator," reliance on such extrinsic evidence as Rhyne's testimony is unnecessary and inappropriate.

The finding that "location indicator" is not subject to means-plus-function analysis is consistent with the Federal Circuit's ruling in Personalized Media, LLC. The court in that case construed the term "digital detector." On appeal, plaintiffs sought to overturn the district court's finding that the term "digital detector" invoked section 112, P 6. The Federal Circuit affirmed, finding that the term "digital detector" connoted sufficiently definite structure to avoid the application of section 112, P 6. The Federal Circuit noted that the term "detector" had a well-known meaning, connotative of structure, based on the definitions of the term found in technical dictionaries. Those definitions included examples of "detectors," such as rectifiers and demodulators. Like the term "detector," the term "indicator" is defined in several technical dictionaries that use examples in the definitions. Like the term "detector," the term "indicator" connotes structure to one knowledgeable in the art.

The Federal Circuit similarly and recently held in Apex that the claim term "circuit" was not a means-plus-function claim. Section 112, P 6 presumptively did not apply because the claim using the term "circuit" did not include the word "means." The court found that the term "circuit" connoted structure based on a technical dictionary definition of the term. The definition did not give a specific or particular structure of a "circuit," but broadly defined a family of possible structures that could be formed by combining different numbers and types of electrical components to perform different functions. The term "indicator" similarly defines a variety of possible structures. That does not defeat the presumption against the application of section 112, P 6.

In Greenberg, 91 F.3d 1580, 1583, the issue was whether the section 112, P 6 applied to the claim term "detent mechanism." The court acknowledged that the claim defined the words "detent mechanism" in functional terms. The court relied on dictionary definitions which "make clear that the noun 'detent' denotes a type of device with a generally understood meaning in the mechanical arts." 91 F.3d at 1583. Although the term "detent mechanism" did not define a single well-defined structure, the term connoted structure so as to avoid the application of section 112, P 6.

The term "location" in claims 1 and 13 modifies the term "indicator." "An adjectival qualification placed on a term that otherwise sufficiently connotes structure does not reduce the sufficiency of the structure connotation for the purpose of section 112, P 6." Personalized Media, 161 F.3d 696, 705 (stating that the use of the term "digital" with the term "detector" placed a functional constraint on an adequately defined structure). The term "location" in claims 1 and 13 is an adjectival modifier of the term "indicator," placing a functional constraint on the various structures the term "indicator" suggests. Structures such as dials, gauges, meters, and others, called to mind by the term "indicator," indicate location.

Universal relies on Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1213-14 (Fed. Cir. 1998), for the proposition that a
claim "cannot be construed so broadly as to cover every conceivable way or means to perform [a] function . . . ." The disputed claim term in Mas-Hamilton Group was "lever moving element." The court stated that if section 112, P 6 did not apply, the term "lever moving element" would cover any conceivable way to move the lever contained in the invention. Id. at 1214. The court concluded that the patent holder had not presented evidence that the term "lever moving element" had a well-known meaning in the art. Id. As the Personalized Media court noted, the term "element" is a generic term. "Lever moving element" did not have a particularized definition in the mechanical arts. In the present case, by contrast, the term "indicator" does have a particular meaning connoting structure to those of skill in the electrical arts, defined in several electronics dictionaries, and is not merely "generic."

Universal also relies on Pennwalt Corp. v. Durand-Wayland, Inc., 833 F.2d 931, 934 (Fed. Cir. 1987), for the proposition that section 112, P 6 "rules out the possibility that any and every means which performs the function specified in the claim literally satisfies that limitation." The Pennwalt court construed the claim term "position indicating means," which Universal contends is nearly identical to the term "location indicator." This court disagrees. The term "position indicating means" used the word "means"; it was undisputed that section 112, P 6 applied to the claim. By contrast, the disputed claim term "location indicator" is not in means-plus-function format.

Universal alternatively contends that the term "location indicator" is in means-plus-function format because the structures connoted by the term cannot fully perform the functions recited in claim 1, being "responsive to the component identifier" and "producing an indication signal of the corresponding location of each compartment or component after the type of component has been identified." Universal argues that a "location indicator" cannot produce the signal to indicate location without some information processing structure, such as a computer.

Plaintiffs have claimed two versions of their invention, a three-element version and a four-element version. The three-element version consists of an automated assembly machine, a component identifier, and a location identifier. The four-element version consists of these three elements and an information processor. The written specification for the four-element version states that the component identifier identifies the type of component loaded into the automated assembly machine and transfers this identification to the information processor. The information processor then determines the proper location for the identified components, based on preprogrammed information and the information the component identifier provides. The information processor relays the location information to the location indicator, which indicates the position to place the identified components. ('943 Patent, col. 5, 1.48-1.63). In the three-element version, without the information processor, "the functions of the information processor [are] distribute[d] among the other elements." (Id. at col. 6, 1.8-1.10). The written specification suggests that some of the information processor functions could be included in the location indicator in the three-element version. The specification does not require the location indicator to include information processor functions. The specification states that "[f]or the purposes of a three-element system, th[e] comparison and determination [of the components involved and the location to place them] may take place either in the component identifier or in the position indicator." (Id. at col. 4, 1.58-1.61). The claims and the specification do not require the location indicator to contain a computer or other electronic logic to perform the recited function, as Universal claims. Universal has failed to rebut the presumption that section 112, P 6 is inapplicable. The '943 Patent recites sufficient structure for the location indicator to avoid application of section 112, P 6.

2. Claim Construction of "Location Indicator"

Because section 112, P 6 does not apply to the claim term "location indicator," conventional claim construction is required. This court refers first to the intrinsic evidence: the claims, specification, and prosecution history. Plaintiffs argue for the following construction:

A device that indicates a proper or corresponding location of an identified compartment or component.

(Docket Entry No. 40, p. 20). Universal responds that a "location indicator" is:

A device that indicates a proper or corresponding location of an identified compartment before placement of the compartment in a location.

(Docket Entry No. 59, p. 3). Universal seeks to add the words "before placement of the compartment in a location" to plaintiffs' proposed claim construction.
A court may not read limitations from a specification into claims, but must read claims in light of the specification. Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998). The written description of the preferred embodiments guides a court's interpretation of claim language as the court seeks to ascertain the invention. Bell Atl. Network Servs., Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1270 (Fed. Cir. 2001); Comark, 156 F.3d at 1186. Even if claim terms are clear on their face, a court must consult the specification to determine if the patentee redefined any of those terms. Watts, 232 F.3d at 883. The patentee may act as his own lexicographer, using the specification to define claim terms. The definition may be express or "by implication" arising from consistent use of the claim term in a particular way throughout the specification. Bell Atl. Network Servs., 262 F.3d at 1270. There is a fine line between reading a claim in light of a specification and reading a limitation into the claim from the specification.

Plaintiffs do not expressly define the term "location indicator" in the specification, but consistently describe "location indicator" throughout the specification as indicating to the machine operator where to place identified components or component compartments. See, e.g., '943 Patent, col. 4, 1.30-1.32 (location indicator "inform[s] the machine operator of the correct location of identified components."); col. 5, 1.1-1.5 ("After the proper location has been determined, it is conveyed to the machine operator. The operator will then load the first component type . . . "). col. 5, 1.64-1.68 (same). The error indicator described in claim 3, which depends on claim 1, "indicates if a compartment has not been placed in a corresponding location indicated by the location indicator." (Id. at col. 18, 1.58-1.61). This claim language implies that the components or compartment compartments are placed after the location indicator provides the location placement information to the machine operator. Reading the claims with a view to ascertaining the invention, it is clear that the location indicator is intended to indicate to the machine operator where to place the components. By adding "before placement of the compartment or component in a location" to the plaintiffs' proposed construction of the claim term "location indicator," this court is not reading particular limitations or particular embodiments of "location indicators" from the specification to construe the disputed claim term. Rather, this court is construing the claim term based on the consistent use of the term in the specification and the overall invention covered by the '943 Patent. See Bell Atl. Network Servs., 262 F.3d at 1270-73 (finding that the term "mode" was defined "by implication" based on its consistent use throughout the specification to mean only the three operational "modes" in the specification).

Universal also seeks to construe the term "responsive to the component identifier" in claim 1, as follows:

"Responsive to the component identifier" requires that the location indicator determine the corresponding location at which to place the component or compartment identified by the component identifier.

(Docket Entry No. 59, p. 5). No such limitation is found in claim 1 or in the written description. This interpretation of the term "responsive to the component identifier" would be inconsistent with the written specification. The section of claim 1 describing the location indicator does not require that the location indicator itself determine where components or component compartments are placed. The written description states that the software or logic circuitry determining the proper location for a component or compartment in the three-element system of claim 1 can be located entirely in the component identifier, entirely in the location indicator, or distributed between those two parts of the invention.

Based on this analysis, this court adopts the following construction of the claim term "location indicator":

A "location indicator" is a device that indicates a proper or corresponding location of an identified compartment or component before placement of the compartment or component in that location.

Universal also argues that the terms "proper location" and "corresponding location" are synonymous. The specification uses the terms "proper location," "correct location," and "corresponding location" alternately. The location indicator is alternately described as indicating the "proper," "correct," or "corresponding" location for components or component compartments. ('943 Patent, col. 2, 1.68-col. 3, 1.5 ("corresponding"); col. 4, 1.30-1.32 ("correct"); col. 5, 1.1-1.5("proper"); col. 5.1.55-1.58 ("proper"). A "corresponding location" is the correct location in which to place the identified components or component compartments.

The term "location indicator" is described somewhat differently in claim 1 from the way that same term is described in claim 13. In claim 1, the location indicator is described as "responsive to the component identifier." In claim 13, the location indicator is described as "connected to and controlled by the information processor." Unless a patent otherwise provides, a
3. Whether a Location Indicator Containing Structure to Determine the Proper Location to Load Components or Component Compartments Must Use the Algorithm Recited in the Specification

Universal alternatively contends that even if the term "location indicator" is not in means-plus-function format, the statement in the '943 Patent that "[r]eferring to FIGS. 8A, 8B, and 8C, presented is a flow chart displaying the method of operation of the present operation" limits the patent to the algorithm recited in the written description. (Docket Entry No. 59, p. 33 n.5; '943 Patent, col. 12, 1.25-col. 18, 1.31). Universal cites several cases for the proposition that an unequivocal statement in the patent specification concerning the method of operation of the invention as a whole limits the claims.

In Scimed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337 (Fed. Cir. 2001), the court had to decide whether the common description of three patents on balloon catheters limited the claims to catheters with coaxial lumens, or whether the patents covered both coaxial and dual lumen configurations. The district court limited the asserted claims to catheters with coaxial lumens. The Federal Circuit rejected the patentee's argument that the district court had impermissibly read limitations from the written description into the claims and upheld the district court's construction. The court emphasized the "most compelling portion" of the written description, which stated that "[t]he intermediate sleeve structure defined above [involving a coaxial lumen] is the basic sleeve structure for all embodiments of the present invention contemplated and disclosed herein . . . ." 242 F.3d at 1343. The patent distinguished the prior art on the basis of its use of dual lumen catheters, in contrast to the coaxial lumens used in the patents. Id. The court found a "clear case of disclaimer of subject matter that, absent the disclaimer, could have been considered to fall within the scope of the claim language." Id. at 1344.

The written description of the '943 Patent, in contrast to the patent in Scimed, does not have broad, unequivocal language of manifest exclusion or restriction, representing a clear disavowal of claim scope. See Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1327 (Fed. Cir. 2002)("claim terms take on their ordinary and accustomed meanings unless the patentee demonstrated an intent to deviate from the ordinary and accustomed meaning of a claim term by redefining the term or by characterizing the invention in the intrinsic record using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope"). The written description of the '943 Patent does not disclaim other algorithms for the patented assembly apparatus. The written description of the '943 Patent does not contain language distinguishing the algorithm described from other possible algorithms. Rather, the description states that "although the present invention has been described with reference to particular preferred embodiments, it will be understood by those of skill in the art that additions, deletions or changes could be made to the disclosed embodiment without departing from the scope of the present invention." ('943 Patent, col. 18, 1.32-1.37).

Universal also cites Watts, 232 F.3d 877, to support its argument. Watts does not require this court to limit the '943 Patent to the algorithm disclosed in the written description. In Watts, the court construed the term "sealingly connected," a limitation in a claim addressing joints between pipes. The court held that the "sealingly connected" limitation applied only to structures with misaligned taper angles because the specification stated that "the present invention utilizes [the varying taper angle] feature." This language in Watts resembles the language in the '943 Patent stating that Figures 8A, 8B, and 8C presented a "flow chart displaying the method of operation of the present invention." ('943 Patent, col. 12, 1.25-1.27). However, in Watts, the court found that the "sealingly connected" limitation was not clear on its face. In this case, by contrast, the term "location indicator" is clear on its face, based on both its use in the written description and the dictionary definitions of the term "indicator." The specification makes it clear that the location indicator need not perform the
processing to determine the proper location of an identified component, let alone follow a particular algorithm.

The prosecution history in Watts revealed that the patentee had distinguished prior art based on the invention's application to misaligned taper angles. In this case, by contrast, the prosecution history shows that plaintiffs originally sought to patent both the automated assembly apparatus and the method for its use. The patent examiner restricted the invention under 35 U.S.C. § 121 and required plaintiffs to elect between the apparatus and method claims. 4 (Docket Entry No. 41, Ex. B, Prosecution History of the '943 Patent, at AGU 00201). The examiner stated that the plaintiffs' apparatus and method claims were distinct because "the apparatus as claimed can be used in a materially different process of using that apparatus such as simply identifying components." Id. 5 The prosecution history reveals that the apparatus claimed by plaintiffs can be operated using different algorithms and can perform different tasks.

4 35 U.S.C. § 121 provides: "If two or more independent and distinct inventions are claimed in one application, the Director may require the application to be restricted to one of the inventions."

5 The examiner required plaintiffs to elect whether to pursue their apparatus or method claims in 1993, before the Federal Circuit's decision in In re Donaldson, 16 F.3d 1189 (Fed. Cir. 1994). Before In re Donaldson, the Patent and Trademark Office did not apply section 112, ¶ 6 during examinations of patents. 16 F.3d at 1194. In Donaldson, the Federal Circuit held that PTO examiners must look to the specification and interpret the claims in light of the structure, material, or acts described therein, or equivalents thereof. The claim in Donaldson was undisputedly a means-plus-function claim, in contrast to the location indicator claim. This court has found that section 112, ¶ 6 does not apply to the location indicator claim. The fact that the PTO did not apply section 112, ¶ 6 in interpreting the claims in the '943 Patent and requiring plaintiffs to elect between the apparatus and method claims in the original version of the patent is not relevant here. The fact that the PTO did not apply section 112, ¶ 6 in interpreting the '943 Patent does not diminish the significance of the examiner's decision to require plaintiffs to elect between their apparatus and method claims.

The written description of the '943 Patent does state that the algorithm flow chart presented is "the method of operation of the present invention." The written description, however, lacks words or expressions of manifest exclusion or restriction representing a clear disavowal of claim scope. The prosecution history shows that the apparatus of the '943 Patent can be used in ways that do not follow the algorithm of the written description. This court concludes that the '943 Patent is not limited to the operating algorithm presented in the written description.

The first term appears in Claim 1 of the '114 patent as follows:

A pre-paid calling card system to enable customers to purchase calling cards at predetermined locations and to use such calling cards to access . . . .

The second term appears in Claims 1 and 2 of the '768 Reexamination Certificate as follows:

Claim 1: A method to enable customers to obtain pre-paid calling card accounts from a plurality of point-of-sale locations and to . . . .

Claim 1 & 2: maintaining in the database information sufficient to identify: . . . a particular point-of-sale location at which the particular pre-paid calling card account is activated ("recharged" in Claim 2).
Defendants propose for both terms, "a retail or other establishment where a customer obtains a calling card." TGIP argues that neither of these terms need to be construed. If "predetermined location" is construed, TGIP proposes "a location determined beforehand." If "point-of-sale location" is construed, TGIP suggests "location at which the sale takes place."

At the hearing Defendants agreed with the court's proposal of "a business establishment or kiosk, which may be automated or staffed by one or more persons." TGIP objected, asking why a "point-of-sale location" could not include on line purchasing. Tr. p. 96. TGIP's counsel envisions customers activating cards from their personal computers by visiting a website. Tr. p. 97. But the court must construe the terms as understood by one skilled in the art, reading those terms in the context of the specification and file history.

Web sites were known when the first application was filed on June 6, 1994, and were well known by the time the reexamination certificate was issued in 2005. See http://www.matterform.com/macintosh software_company/old_sites.html (showing a Matterform Media website online in 1994). Nothing in the claims, nor in the prosecution history, nor even in the extrinsic evidence, including articles written by the inventor and announcements concerning his calling card systems hints at sales from a website. To the contrary the specification describes physical locations. See '114 Patent, col. 5, 11. 42-44.

In normal usage a "predetermined location" and a "point of sale location" refer to a place, such as the establishment of the retailer. If it was a disembodied electronic construct, such as a website, there would be no reason for Claims 1 and 2 to put such emphasis on the database maintaining "a particular point-of-sale location at which the particular pre-paid calling card account is activated [or recharged]." '114 patent, col. 1, 11. 41-43; '114 patent, col. 2, 11. 12-14. There would actually be no "point of sale" or "predetermined location. Rather the sale would be made wherever the user had a laptop.

The patentee had the opportunity to pick his language. He did not attempt to include incorporeal constructs like websites as possible locations. The court is not going to broaden the scope of the patents in such a way at this time. These terms will be defined as follows:

"Predetermined locations" and "Point-of-sale locations mean "a business establishment or kiosk which may be automated or staffed by one or more persons."

A. "Locking Barb"

For the following reasons, this court construes the claim term "locking barb" in claims 1, 15, 31-33, and 37-38 of the '543 patent, and in claims 1 and 14 of the '305 patent to mean:

A locking device or detent that contacts an attachment surface at at least one point.

The parties agree that a locking barb is a locking device on the transmission hanger that contacts an attachment surface of either another stackable hanger or an attachment surface, such as a telecommunications tower. The dispute is whether a locking barb contemplated to be located on the legs of the stackable transmission hanger is the same as a detent, as Andrew claims, or a non-detent type locking device, as Beverly claims. Andrew contends that there is nothing in the claims, specification, or prosecution history to limit the ordinary meaning of the term "locking barb" to a non-detent type device. In contrast, Beverly argues that the locking barb is an attempt to "overcome the limitations associated with the prior art detent locking devices," and that the specifications in the '543 and '305 patents "clearly teaches the advantages of the claimed locked barbs over the prior art devices. (Def. Mem. at 7, 8.)
Contrary to Beverly's interpretation of the specification of both the '543 and the '305 patents, the court does not find that the locking barb was meant to be a locking device that was superior to the prior detent. Instead, the patent distinguishes the prior art only with regard to the superiority of the two-locking-barb design as compared to the prior four-locking-barb design for reducing resistance. (Ex. 1 at Col. 7; Ex. 2 at Col. 8.) Cf. Tronzo v. Biomet, Inc., 156 F.3d 1154, 1159 (Fed. Cir. 1998) (construing limitation in term where "the specification clearly suggests the contrary [that shapes other than conical are necessarily part of the disclosure,] by asserting the advantages of the conical shape over prior art shapes." (brackets added)). The novelty of the patents does not relate to the locking bars as opposed to detents. The novelty of the patents is the easy installation of one-piece, stackable transmission line hangers capable of accommodating a large number of transmission lines. (Exs. 1 & 2, Col. 3.) Additionally, there is no language in the claims or specifications of either the '543 or '305 patents to suggest that a locking barb is different from a detent, nor does the prosecution history restrict the locking barb's definition. Hence, the intrinsic evidence does not import limitations into the ordinary meaning of the term.

Nor does the court accept Beverly's contention the term locking barb in the '543 patent should be construed differently than the same term in the '305 patent based on the teachings of the specifications. As identified by Beverly, the '543 patent specification states that "Each locking barb includes a barb contact point for contacting the attachment surface," while the '305 patent adds that "Each locking barb includes a barb contact point or line for contacting the attachment surface." (emphasis added) (Ex. 1 at Col. 5; Ex. 2 at Col. 6.) In oral arguments, Beverly clarified that it considered the difference between the '543 and the '305 patents to be that "the '305 patent is focused on multiple contacts. The '543 is focused on a single contact." (Tr. 40, ln. 15-6.) But the additional phrase of "or line" and any references to multiple points in the '305 patent specification are not enough to suggest that locking barb should be construed as different from the '543 patent. Phillips and other Federal Circuit cases instruct that the district courts should not generally rely on preferred embodiments in the specifications to confine claims unless the embodiment defines the outer limit of the claim. Phillips, 415 F.3d at 1323. There is nothing to support interpreting the specification in the '543 patent to define the outer limit of the claim term locking barb as limited to contact at a point as opposed to a line or multiple points. Moreover, the court's construction of locking barb to mean "a locking device or detent that contacts an attachment surface at at least one point" may include a preferred embodiment of either a point, a line, or multiple points.

Beverly additionally argues that the court should limit the locking barb to a structure equivalent to a notch that locks two transmission hangers together, as described in the specifications, asserting that there is no other reasonable structure for locking together two transmission hangers. Again, Beverly errs in seeking to limit the claims to a particular embodiment in the specifications despite the Federal Circuit's warning against this limitation when there is no evidence in the specification, claims, or prosecution history to suggest that the embodiments in the specifications define the outer limits of the claim term.

See, e.g., Phillips, 415 F.3d at 1323. Furthermore, the doctrine of claim differentiation, which holds that claims must be interpreted so that their differences are meaningful, requires the court to reject Beverly's construction of a locking barb as having a structure equivalent to a notch when two transmission hangers are attached. See Inpro II Licensing, S.A.R.L. v. T-Mobile USA, Inc., 450 F.3d 1350, 1354 (Fed. Cir. 2006). Only by rejecting Beverly's construction can dependent claims, such as claim 5 in the '543 patent referring to a lip and a notch, be given separate meaning in comparison to those claims that do not refer to the lip and notch structure, such as claim 1 in the '543 patent. See Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380 (Fed. Cir. 2006) (explaining the presumption that independent claims do not include the limitations added by their dependent claims). The court also notes that nothing in the language of the '543 or the '305 patents suggests that the transmission hanger has a different structure when attached to another hanger instead of a tower structure.}

6. Construction of "locking contact"

Although, in the briefs, the parties asked for claim construction of the entire phrase "translate axially within said bore and into locking contact with said second intervening member," the focus of the dispute is on the meaning of "locking contact." Again, as discussed in regard to "compression locked," the dispute concerns the question of whether such locking is limited to application of an inward radial force to squeeze and crush the retaining portion around the screw head.

Medtronic repeats the arguments offered in relation to "compression locked." Again, in support, Medtronic relies first on the "only one way" specification argument. In the absence of language in the specification which constitutes a clear redefinition by implication, this Court has rejected this argument. This Court also rejects the argument based on the examiner's comment.
about "expansion," for the reasons stated above.

Medtronic concedes that the claim language specifies that "the first intervening member . . . makes the head move farther down toward the bottom of the axial bore to lock the screw." (Defs.' Br. 31.) As discussed above, it is inconsistent then to maintain that the only locking process contemplated in the patent involves the application of inwardly directed radial force that crushes the second intervening member. Medtronic has conceded that locking involves the application of axial force and cannot unring that bell.

As above, this Court finds that Medtronic's construction of "locking contact" is inconsistent with the plain language of claim 21 and finds no basis to limit construction of this phrase as Medtronic proposes.

G. "Locking component slidably receiving said vertical lock spindle"

The parties also offer disparate definitions of the "locking component" element contained in Claims 10 and 18, with Pedicraft again offering breadth as opposed to Stryker's specificity. Pedicraft's definition would limit this claim to "a lock portion of the side rail positioning mechanism mounted to the frame through which the lock spindle slides as the side rail moves between the uppermost position or the lowermost position for precluding unwanted side rail travel." Dkt. 65, pp. 26-27. Stryker, in contrast, asserts that this claim limitation should be defined as "a lock fixed to the frame and having a mounting arm and a pair of grooves which slidably receives the vertical lock spindle." Dkt. 66, pg. 38.

The parties do not dispute that Claim 10 requires that the vertical lock spindle is slidably received by the locking component, which is fixed to the frame. However, Pedicraft argues that the broader language of Claim 10 should control over later, more specific claims requiring that the lock be fixed to the frame and have a mounting arm or pair of grooves that slidably receive the vertical lock spindle. Dkt. 65, pp. 26-27. Instead, Pedicraft argues that the specification and specific embodiment do not provide a specific and limited structure for the "locking component," but instead there is "no definitional form . . . and no statements . . . that can be regarded as clear and ambiguous [sic] surrender of alternatives other than the specific embodiment." Id. Under its broader definition of "locking component," which it claims is supported by Mr. Lockwood's testimony, such a component can include any number of "locking and latching systems known in the art for providing a locking point for a side rail." Id.; Dkt. 62, pg. 66 ("it's a pretty generic, general kind of concept, that can be configured in a number of ways . . . I look at Stryker's construction and it's focused again on the particular embodiment that's described in the spec."). The "locking component" in Claims 10 and 18 is not limited to the specification or specific embodiment in the '855 Patent, nor is it limited to the "catch and pass through groove limitations" expressly contained in Claims 16 and 17. See, e.g., '855 Patent, Col. 9, Claim 16 ("wherein said locking component includes a catch to allow upward vertical movement of one said of plurality of lock pins through said locking component while preventing downward vertical movement of said one of said plurality of lock pins through said locking component").

Stryker of course disputes Pedicraft's characterization of its attempts to define the "locking component" through a "catch and pass through" function. Instead, it argues that the '855 Patent specifically emphasizes the important safety features of the "locking component," defining the specially designed structure as including a pair of grooves and a mounting arm. '855 Patent, Cols. 2-3; 5-6. Figure 5 of the '855 Patent also displays the top view of the "locking component of the present invention," which includes a mounting arm and a pair of grooves. This important safety feature was further discussed by Dr. Dyro during his Markman testimony as including a mounting arm and a pair of grooves. Dkt. 63, pp. 23-24. In short, Pedicraft's own characterization of this safety feature as being important to the invention, and then describing it to include a mounting arm and grooves, gives the Court clear indication as to the proper construction of the "locking component" limitation. See The Toro Co. v. White Consolidated Industries, Inc., 199 F.3d 1295, 1301 (Fed. Cir. 1999); Vitronics, 90 F.3d at 1582.

The Court again agrees with Stryker's construction. Pedicraft's broad construction again provides the Court with little structure of the "locking component," instead attempting to define it as part of the vague term "side rail positioning mechanism," discussed supra, and stating vaguely that it precludes "unwanted side rail travel [while] permitting desired side rail travel." Such concepts do not assist the Court in giving definite structure to the claim terms, especially when a "locking
component" of the present invention is specifically presented throughout the '855 Patent -- i.e., in the description, specification, figures, and claims of the patent itself. Accordingly, Stryker's definition is supported by the intrinsic and extrinsic records, meaning that a "locking component" should be specifically construed to include a lock fixed to the frame, a mounting arm, and a pair of grooves which slidably receives the vertical lock spindle discussed above.

4. Locking Device

The term "locking device" appears in '579 patent claims 1, 2, 4, 8 through 11, 13, 17, 21, 22, and 28, and in RE '439 patent claims 1, 21, 22, and 33. The Plaintiffs assert that the proper construction is a locking element alone (as recited in the claim) or a locking element and a locking groove that together hold together two panels against separation. (Pls.' Open. Br. 25.)

Pergo proposes that "locking device" should be defined as "the parts that form the second mechanical connection comprising a strip, integrated with one panel, that has a locking element and a locking groove, on the underside of the mating floor panel, whereby the locking groove is inserted into the locking groove (i) the two panels are locked in the horizontal direction parallel to the principal plane of the panels and at right angles to the joint edges and (ii) a play exists allowing the joined panels to slide movably (i.e., be displaced) along the joined edges and disassembled by being rotated about the joint edge." (Unilin's Open. Br. 21-22.) In so contending, Pergo relies upon the Pervan specification as describing the locking device, as follows:

"a locking device arranged on the rear side of the panels forms a second mechanical connection locking the panels to each other in a second direction parallel to the principal plane and at right angles to the joint edges, said locking device comprising a locking groove which extends parallel to and spaced from the joint edge of one of said panels, termed groove panel, and which is open at the rear side of the groove panel,"

* * *

"the locking device further comprises a strip integrated with the other of said panels, . . . , such that when the panels are joined together, the strip projects on the rear side of the groove panel with its locking element received in the locking groove of the groove panel.

(RE '439 patent 4:1-18) (Emphasis added.)

Pergo states that in short, the "locking device" comprises "a strip" with a locking element," located on one panel, and a "locking groove," located on a mating panel, arranged so as to form the "second mechanical connection." The "second mechanical connection" requires that "a play exists between the locking groove and the locking surface on the locking element" that "is operative." (RE '439 patent 4:19-23.)

Having considered Pergo's proposed two-part definition, the Court concludes that the first part is overly detailed and imports the specification as demonstrated by claim 1 of the RE '439 patent. However, the second part of Pergo's proposed definition that includes the concept of play is consistent with Alloc and this Court's interpretation of the import of that decision. The Plaintiffs' suggested definition is also consistent with the claim terms and specification.

"Device" is defined as "[a] mechanism designed for specific uses." McGraw-Hill Dictionary of Scientific and Technical Terms, 553. Therefore, the Court interprets "locking device" as meaning "a mechanism consisting of a locking element alone (as recited in the claim) or a locking element and a locking groove that together hold together two panels against separation such that play exists."
The third term to be interpreted is "locking element," in the '486 patent, claims 1 and 2, 16, 19, 31, 51, 60, and 65 and in the '836 patent, claims 1 through 3, 6, 10, 13, 18, 20, 23, 26 through 28, and 30.

Unilin states that the term "locking element" should be defined as "a portion of a coupling part having the structure as recited in the claim that allows for engagement and locking." (Unilin's Open. Br. 15-16.) Alloc states the Court should apply the ordinary meaning of the terms to describe the various aspects of the locking elements, (Jt. Claim Constr. Charts, '486 chart 2), but does not suggest any definition.

Also, Alloc maintains that based on prosecution history, claims 1 and 65 of the '486 patent must be construed to require a connection such that when panels are joined together, "the contact surfaces tend to urge the panels together at their upper edges." (Alloc's Initial Claim Construction Mem. (Corrected)("Alloc Initial Mem.") 9-12.) Additionally, Alloc asserts that the claimed panels must be construed as panels that are able "to be readily assembled and disassembled by alternate procedures involving lateral sliding [of] the panels together or rotating the panels relative to each other with the coupling parts partially engaged." (Id. at 12.)

The Court's analysis begins with the claims of the patent. Phillips, 415 F.3d at 1312. Claim 1 of the '486 patent states:

said coupling parts including locking elements formed integrally in one piece with said core, said locking elements including cooperative contact surfaces arranged to be engaged when adjacent identical ones of said panel are coupled together with their coupling parts cooperatively engaged to prevent substantial separation of two coupled identical ones of said floor panels at said upper side edges in a direction perpendicular to the edges of the panel sides and parallel to the undersides of the coupled floor panels; said locking means comprising a locking element in the form of a downwardly extending protrusion located on the lower side of the tongue and an upwardly facing cooperating locking recess in the lower lip, said locking recess being located at a position that is at least partially distally beyond a distal edge at which the upper lip terminates.

('486 patent, 14:3-19)(emphasis added.)

Claim 1 of the '836 patent uses "locking element" as follows:

said coupling parts comprising substantially a tongue and a groove extending along panel side edges generally parallel to the panel underside and including integrated mechanical locking elements, said tongue, groove and locking elements formed in one piece with the panel, said tongue, groove and locking elements arranged to prevent drifting apart of the floor panel.

('836 patent, 13:64-67; 14:1-4)(emphasis added.)

The '486 patent specification discusses "locking elements" in the brief summary of the invention indicating that "the coupling parts are provided with integrated mechanical locking elements which prevent the drifting apart of two coupled floor panels into a direction perpendicular to the related edges and parallel to the underside of the coupled floor panels." ('486 patent, 2:18:22.) The specification further explains that: "[b]y integrated mechanical locking elements [it] is understood that these form a fixed part of the floor panels, either by being connected in a fixed manner to the floor panels, or by being formed in one piece therewith." ('486 patent, 2:26-29.)

The range of the "locking element" is revealed in the specification which indicates that "a first important preferred form of embodiment, the coupling parts are provided with locking elements which, in the engaged position of two or more of such floor panels, exert a tension force upon each other which force the floor panels towards each other." ('486 patent, 2:30-34.) Alternatively, according to a second important preferred embodiment, the coupling parts and locking elements are formed in one piece with the core of the floor panels. ('486 patent, 2:41-45.) In yet a third preferred embodiment (the characteristics of which may or may not be combined with the characteristics of the first and second preferred embodiments), "the floor covering is characterized in that the lower lip which limits or defines the lower side of the groove, extends beyond the upper lip in the plane of the panel; the locking elements are formed at least of a contact portion which inwardly slopes downward; and that this portion, at least partially, is located in the portion of the lower lip which extends beyond the upper lip." ('486 patent, 3:8-17.)
The locking elements appear in the specification drawings and are further described in the detailed description. For example, figures 2 though 4 depict "the integrated mechanical locking parts or elements 6 which prevent the drifting or sliding apart of two coupled floor panels 1 in a direction D perpendicular to the respective sides 2-3 and parallel to the underside 7 of the coupled floor panels 1." ('486 patent, 5:29-33.) The detailed description further states that "in the represented example, the locking elements 9 consist of a first locking element 11, formed by a protrusion with a bent round shape at the lower side 12 of the tongue 9, and a second locking element 13, formed by a recess with a bent hollow or downwardly concave shape in the lower wall 14 of the groove 10." ('486 patent, 5:56-61.)

In discussing figures 4 through 7, the detailed description explains that "the locking elements 30 do not have to be of the same nature as the locking elements 6." ('486 patent, 6:41-43.) Rather, "the locking means 30 consist of a snap-together connection with locking elements 33 and 34 which grip behind each other." ('486 patent, 6:47-49.)

Again, a different form of "locking means" is depicted in figures 8 and 9 which show, contrary to the locking elements 33-34 which consist of rather local protrusions, in the forms of embodiment of figures 8 and 9 "use is made of locking elements 46-47 which, in comparison to the total width B of the coupling, extend over a rather larger distance." ('486 patent, 7:17-21.)

An additional variant is represented in figure 11 which shows "the locking element 6 is formed by an upward directed portion 53 at the tongue 9, which as a result of a turning movement of the panel, is brought behind a downward-directed portion 54 on the upper wall 18." ('486 patent, 7:61-64.)

The claims and the specification support the definition of "locking element" as being "a portion of a coupling part having the structure as recited in the claim that allows for engagement and locking." However, a definition which does not use part of the term to be defined; namely, the word "locking," is more helpful. Lock is defined as "fasten." (See Jt. App. Ex. 4 (Webster's Ninth New Collegiate Dictionary (9th ed. 1983) 701). "Element" is defined as "constituent part" or "component." (Id. at 402.) "A portion" is similar to a "constituent part" or "component." The Court construes "locking elements" meaning "a portion of a coupling part having the structure as recited in the claim that allows for engagement and fastening."

In considering the additional limitations suggested by Alloc, the Court notes that "unless compelled otherwise, a court will give a claim term the full range of its ordinary meaning as understood by persons skilled in the relevant art." Gemstar-TV Guide Int'l, Inc. v. Int'l Trade Comm'n, 383 F.3d 1352, 1364 (Fed. Cir. 2004). The ordinary and customary meaning of a claim term may be determined by reviewing a variety of sources, which may include the claims themselves; dictionaries and treatises; and the written description, the drawings, and the prosecution history. Id. The presumption of ordinary meaning will be "rebuted if the inventor has disavowed or disclaimed scope of coverage, by using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope." Id. (citation omitted).

Alloc relies upon a portion of the patent prosecution history for the application which matured into the '486 patent and continued as the '836 patent, 5 as a basis for asserting that "locking elements" in claims 1 and 65 of the '486 patent must be construed to require a connection such that when panels are joined together, the contact surfaces tend to urge the panels together at their upper edges; and, 2) the claimed panels must be construed as panels that are able "to be readily assembled and disassembled by alternate procedures involving lateral sliding [of] the panels together or rotating the panels relative to each other with the coupling parts partially engaged." (Alloc Initial Mem. 12.)

5 "When multiple patents derive from the same initial application, the prosecution history regarding a claim limitation in any patent that has issued applies with equal force to subsequently issued patents that contain the same claim limitation." Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 980 (Fed. Cir. 1999).
Unilin maintains that it did not state that it was necessary to urge the panels together to avoid visible gaps. (Unilin Opp'n 4.) Rather, Unilin stated that it was a necessary characteristic of floor panels to have the upper side edges of the panels meet without any visible gaps. (Id.) Unilin notes that the absence of visible gaps may be achieved without urging the panels together, comparing figure 7 of the '486 patent which shows no gap without any urging to figure 22 of the patent which shows urging. 6 (Id.) Additionally, Unilin states that claims 19 through 21, which depend on claim 1, add the limitation of urging the panels together, and claim 23 adds the limitation of the assembly and disassembly by alternate procedures involving lateral sliding of the panels together or rotating the panels relative to each other with the coupling parts partially engaged. (Id. at 5.)

Unilin also states that its reference to a highly desirable characteristic of the floor panels is not a clear and unmistakable statement of disavowal. (Id. at 4.) Furthermore, Unilin states that its explanation of a possible advantage of the composite wood product core which "may" yield is not a clear disavowal of claim scope. (Id. at 5.)

Tracing the relevant prosecution history discloses that the patent examiner initially disallowed application claims 1 through 6, 9 through 11, 12, 14, 16 through 19, 23 and 24 as being anticipated by British Patent # 1 430 423 ("British patent"), which disclosed a floor covering panel consisting of adjacent rectangular/square panels each having opposite longitudinal sides that are provided with coupling parts that consist of a tongue and a groove and integrated locking parts. (Jt. App. Ex. C 210.) Application claims 7, 8, 15, and 22 were rejected for obviousness based on the British patent. (Id. at 211.)

In response, the applicants cancelled application claims 1 through 28 and submitted new application claims 29 through 94. (Id. at 216.) In the "remarks" section of the document, the applicant responded to the examiner's inquiries regarding the meaning of HDF (high density fiberboard) and MDF (medium density fiberboard), indicating that both were made up of the same materials -- a composite of finely ground up wood particles and resin that have been compressed and cured to result in a rigid, structural panel material described in the application. (Id. at 216.) The HDF had been compressed to a higher density than the MDF, to produce a harder and more rigid panel. (Id. at 217.)

The applicants argued that all of the new application claims were fully distinguishable from the British patent. (Id.) The applicants noted that the British patent disclosed a panel joint wherein the panel elements were made of plastic material and wherein the mutual line of intersection of the channel end groove extended vertically or perpendicularly with respect to the common plane including the panels. (Id.) The applicants stated, citing claim 29 as an example, 7 "that a perpendicular relationship was not desirable because it require[d] the panels and the coupling parts to be manufactured with extreme precision to ensure that the surfaces of the laminated panels will meet each other at contiguous upper side edges without any visible gap, a necessary characteristic of flooring panels." (Id. at 217-18.)

7 Application claim 29 is claim 1 of the '486 patent. (Alloc Resp. Mem. 5.)

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

The applicants explained that because the panels of the claimed invention were made of a wood product with a composite core "it is highly desirable to remove the effects of minor variations or tolerances in machining the panels from adversely affecting the appearance of the panels when joined together." (Id. at 218) (emphasis added.) Accordingly, explained the applicants, "the contact surfaces meet each other along a line or plane shown at L in the drawings which is inclined relative to the underside of the panels so that the contact surfaces tend to urge the panels together at their upper edges despite minor dimensional differences between the coupling parts of that panels that may arise during manufacturing process or that may result from atmospheric conditions that exist at the time the panels are assembled." (Id.)
The applicants further stated that the remaining claims were fully patentable, explaining that, while the composite wood product core was relatively rigid when inspected by the causal observer, during coupling of floor panels, "the tongue or the lip may yield slightly when they are coupled together." (Id.) The applicant stated that "this slight yielding, typically of the lower lip, enables the panels to be readily assembled and disassembled by alternate procedures involving lateral sliding of the panels together or rotating the panels relative to each other with the coupling parts partially engaged." (Id.)

Having carefully considered the portions of the prosecution history upon which Alloc relies, this Court concludes that such history does not limit Unilin's invention as Alloc asserts. In the first instance, Unilin was indicating that its invention was distinguishable from the British prior art because unlike the British invention, perpendicular joinder was not desirable, because the panels meet at an inclined underside which tended to urge the panels together to achieve the contiguous upper surface. Unilin's statement is not tantamount to a "manifest exclusion or restriction" that the panels must tend to urge the panels together at their upper edges. Similarly, Unilin's statement that its panels "may" yield during assembly allowing for assembly and disassembly by alternate procedures involving lateral sliding of the panels together or rotating the panels relative to each other with the coupling parts partially engaged is insufficient to constitute a clear restriction on the claim scope. Unilin did not limit claims 1 and 65 in the manner suggest by Alloc. See NTP, Inc., v. Research in Motion, Ltd., 418 F.3d 1282, 1308-09 (Fed. Cir. 2005).

The Court's conclusion is supported by the doctrine of claim differentiation which "creates a presumption that each claim in a patent has a different scope." Free Motion Fitness, Inc. v. Cybex Int'l, Inc., 423 F.3d 1343, 1352 (Fed. Cir. 2005)(internal quotation marks omitted). The doctrine provides a limited tool for claim construction, giving force to the presumption only as long as the resulting construction does not conflict with a clear meaning provided by the specification. See Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380-81 (Fed. Cir. 2006). The claim differentiation "tool" works best in the relationship between independent and dependent claims. Id. at 1380.

Under the claim differentiation doctrine, when dependent claims are limited to a particular meaning or scope, the independent claim is presumed to have a broader meaning and scope. Free Motion, 423 F.3d at 1351. Stated somewhat differently, under such doctrine, where a limitation sought to be read into an independent claim already appears in a dependent claim, there is a presumption that the limitation in question is not in the independent claim. Liebel-Flarsheim Co. v. Medrad, 358 F.3d 898, 910 (Fed. Cir. 2004).

Claims 19 through 21 (which depend on claim 1) add the limitation of urging the panels together. Furthermore, claim 23 states: "A floor covering panel according to claim 1, wherein the coupling parts are configured such that two identical ones of said floor panel can be selectively coupled either by laterally sliding and snapping the cooperative coupling parts together or by turning one panel relative to the other with their cooperative coupling parts partially engaged, whereby additional ones of said floor panel can be sequentially coupled to previously coupled ones of said floor panel by laterally sliding each additional panel into a previously coupled panel, or by relative turning motions of an additional panel relative to a coupled panel." Alloc has not offered an explanation for why the limitations found in the dependent claims, but not in the corresponding independent claim, should be read into the independent claim.

In summary, the Court determines that "locking element" means "a portion of a coupling part having the structure as recited in the claim that allows for engagement and fastening."
The term "locking element" appears in Claim 1 of the RE '439 patent, which is representative of the claims with that term, as follows:

A system for providing a joint between adjacent building panels, comprising: each of said building panels including a first edge and a second edge such that the first edge of each of said building panels forms a first mechanical connection with the second end of an adjacent one of the building panels locking the first and second edges of the building panels to each other in a first direction at right angles to a principal plane of the panels, and a locking device arranged on a rear side of the building panels forming a second mechanical connection locking the building panels to each other in a second direction parallel to the principal plane and at right angles to the first and second edges, said locking device fitting within a locking groove extending parallel to and spaced apart from the first edge of said building panels, and which locking groove is open at the rear side of the building panels, the locking device comprising a strip integrated with the second edge of each of said building panels, said strip extending throughout substantially an entire length of the second edge and being provided with a locking element projecting from the strip, such that when two adjacent building panels are joined together, the strip projects from the rear side of the second edge of the panels with its locking element received in the locking groove of an adjacent building panel, the building panels, when joined together, can occupy a relative position in said second direction where a play exists between the locking groove and a locking surface on the locking element that is facing the first and second edges and is operative in said second mechanical connection, the first and the second mechanical connections both allow mutual displacement of the building panels in a direction of the first and second edges, and the second mechanical connection enables the locking element to leave the locking groove if the respective building panel is turned about its first edge angularly away from the strip.

('439 patent, 10:35-67;11:1-7.) (Emphasis added).

Pergo's proposed construction includes a requirement that the projection be "up at right angles." (Unilin's Open. Br. 23-24.) That proposed requirement is drawn from the snippets of the specification, and its discussion of the figures and the preferred embodiments. The requirement is not central to the claimed invention and is, therefore, rejected. Furthermore, as demonstrated by the representative claim, the projection is well-described in the claim itself.

The Plaintiffs' proposed construction allows for the projection to be defined in the claim, but it is missing "play." Therefore, the Court construes the term "locking element" as "a projection at the edge of the panel as recited in the claim that engages a locking groove on another panel such that a play exists between the locking element and the locking groove."
following longitudinal strand of the netting arrangement wherein the longitudinal strands of the netting arrangement are not separated from one another by a row of regular loops."

"Intersection" or "intersecting" is not a term that is subject to construction here: "Both Plaintiffs and Defendants have agreed that the term 'intersecting' should be defined as having, as two geometrical loci, one or more points in common: intersecting strands." (Defendants' Opening Claim Construction at 21.) As noted above, plaintiffs' proposed construction of "locking engagement" is the mere intersection of the lateral and longitudinal strands - the strands of the netting arrangement having one or more points in common. This definition does not suggest that the intersection of strands is fixed in making the netting arrangement. Claim 1 speaks of the longitudinal and lateral strands of the netting arrangement "each intersecting in locking engagement"; therefore, "locking engagement" is the "how" the strands are meant to intersect, and not the intersection itself. As plaintiffs assert: "All we say is locking engagement means the intersection of longitudinal and lateral structures to form a netting arrangement. They have to be locked at the corners in order to be a net by definition." (Markman Trans. at 43. (emphasis added)) Plaintiffs' proposed construction does not define or even reference that the intersection of the netting arrangement strands is fixed or locked in any manner. Consequently, plaintiffs' construction is rejected.

Nevertheless, "locking engagement" has a plain and ordinary meaning within this patent, i.e., at the intersection of the lateral and longitudinal strands, the strands are fixed so as to prevent the strands from shifting. Relying on a "plain and ordinary meaning" may be inadequate when a term has more than one "ordinary" meaning but in the present case the term is not ambiguous nor have plaintiffs restricted the term in the specifications. See Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1327 (Fed. Cir. 2002) (requiring "words or expressions of manifest exclusion or restriction" before broad terms in a claim will be read narrowly in light of a narrow specification").

The term "locking engagement" was defined for the first time in the prosecution history and according to defendants, "[i]n order to more clearly distinguish Applicant's claimed invention over Henricus and Lombardi." (Defendants' Exh. B 148.) Plaintiffs amended what was then claim 15 "to specify that the longitudinal and lateral strands of the netting arrangement each intersect in locking engagement with one another to form a grid-like pattern comprising a plurality of four-sided shapes." Id.

Plaintiff further stated in the prosecution history:

As it is apparent from Figs. 1 and 2 of the present application, the longitudinal strands of 5 and the lateral strands of 7 each intersect with one another to form a grid-like pattern comprising a plurality of four-sided shapes. Each loop 9 of the lateral strands 7 is interlaced with an adjacent preceding loop and an adjacent following loop to thereby provide a locking engagement between the longitudinal and lateral strands at their point of intersection, the longitudinal stands 5 being formed by the interlaced aligned loops 9 . . .

(Defendants' Exh. B 148-149. (emphasis added))

Citing this amendment, defendants contend that their proposed construction of the term "locking engagement" is what plaintiffs explicitly defined in their amendment to claim 15, which became independent Claim 1: an interlacing of an adjacent preceding loop and an adjacent following loop of the longitudinal and lateral strands at their intersection. But the term "interlacing" is a means of creating a locking engagement but not necessarily the only means of creating a locking engagement and the first and second preferred embodiments do not demonstrate an interlacing of an adjacent preceding loop and an adjacent following loop

Defendants also contend that plaintiffs affirmatively stated what the term "locking engagement" did not include - rows of regular loops separating the "locking engagements" of the longitudinal strands. Defendants point to the prosecution history where plaintiffs distinguished their invention over Lombardi.

In Lombardi, each loop of special yarn [the netting arrangement] extending in the longitudinal direction does not intersect in locking engagement with each special yarn extending in the lateral direction to form a grid-like pattern. This is also apparent from Fig. 6 of Lombardi, where the aligned long loops of special yarn are each separated from one another by a row of regular loops [the stockinett member]. Accordingly, there is no teaching or suggestion whatsoever in Lombardi in respect of providing a knitted netting arrangement comprising a first plurality of spaced strands extending in the longitudinal direction and a second plurality of spaced strands extending in the lateral direction, wherein the longitudinal and lateral
strands each intersect in locking engagement with one another to form a grid-like pattern, as in Applicant's claimed invention.

(Defendants' Exh. at B 151. (underlining in original; italic added))

Once again, defendants are attempting to read a feature of the third preferred embodiment into the claim as a limitation while ignoring the first and second preferred embodiments.

Based on the unambiguous meaning of the term, the Court construes "locking engagement" as "fixed at each intersection."

6. Locking Groove

The next term for interpretation is "locking groove." The term appears in claims 1 through 3, 5, 10, 11, 12, 14, 19, 20, 23, 24, 27, 28, 31, 32, 35, 36, 39, and 40 of the '267 patent; in claims 2, 4, 6, and 8 of the '907 patent; in claims 1, 13, 14, 26, 27, 39, 40, 41, 49, and 50 of the '410 patent; in claims 1, 3, 4, 7 through 10, 12, 13, 16, 17, 21 through 23, and in claim 28 of the '579 patent; and, in claims 1, 16, 21, 22, 33, and 34 of the RE '439 patent.

The Plaintiffs maintain that "locking groove" means a channel or depression for fastening, contending that the Court should not read a "vertical" or a "90 degree" limitation into the claims. They state that the Court should rely on the meaning of "lock," which means fasten or hold fast, and the generally understood meaning of "groove." (Pls.' Open. Br. 34-35.) Pergo maintains that "locking groove" should be construed as "an open or recessed portion on the underside of a panel spaced away from the joint edge and configured to receive the locking element, including a surface closest to the joint edge making a right angle with the underside of the groove panel, and configured so that a play exists between the locking groove and the locking element." (Unilin's Open. Br. 25-26.)

Pergo's proposed definition of "locking groove" reads limitations into the claim term that are not supported by the specification. There is no particular panel position inherent in the term. An ordinary meaning of groove is "channel." Webster's II New Riverside University Dictionary 550. "Groove" is also defined as "a long, narrow channel on a surface." McGraw-Hill Dictionary of Scientific and Technical Terms, 879. The Court construes "locking groove" as "a channel for fastening" which is consistent with the ordinary meaning of the terms and the specification.

The final component of Claim 1 disputed by the parties is the claim language:

said rotatable joint comprising a locking mechanism cooperating with the central region for permitting selective rotation about said pivot axis and for maintaining a selected orientation of said handle portion relative to said central region during a cutting operation of the miter saw.

('976 Patent, Col. 4, ll. 64-67; Col. 5, ll. 1-2.) 7 The core of this dispute is the meaning of "permitting selective rotation" and "maintaining a selected orientation." One World proposes the simple constructions of "allowing the handle to be rotated to a position around the pivot axis" and "keeping the handle in a position relative to the central region," respectively. Rexon would construe the claim as requiring "a lock that, when unlocked, permits the user to selectively vary the rotational position of a portion of the handle, and, when locked, maintains or fixes, the handle portion at a selected position."

7 Rexon argues that the claim's reference to "said handle portion" is indefinite because it is not clear if that term refers to the entire handle, the D-shaped portion of the handle or the grip portion of the handle. One World asks me to construe "said handle portion" as referring to the handle in its entirety. That construction is consistent with the rest of the language of the
claim, and particularly, the language of the preceding phrase, which claims selective "handle" rotation. I do not find the term "said handle portion" to be indefinite, though I may reconsider this issue at a later stage.

The plain language of the claim calls not only for rotation of the handle but the ability of the handle to be maintained at a selected position once rotated. The sole disclosure of the locking mechanism in the specification states that "to facilitate rotation of [the] handle 66, a detente button 76 is provided which when depressed by the user to enable the handle to be rotated. When the detente button 76 is released, a conventional spring mechanism locks the handle in position." ('976 Patent, Col. 4, ll. 24-28.) During patent prosecution, the inventor stressed that this limitation allows the orientation of the handle to be fixed at any position selected by the user. The inventor also relied on the limitation to distinguish prior art.

I agree with Rexon that the claim requires a locking mechanism that permits the user to rotate the handle and fix it at a particular ("selected") position. One Word's proposed construction of the phrase "for maintaining a selected orientation" appears to loosen this requirement. Nonetheless, the specificity of Rexon's proposed construction arguably restricts the patent to only the preferred embodiment found in the specification. Therefore, I adopt a construction incorporating language from both parties' proposed definitions: "a lock that allows the handle to be rotated to a position around the pivot axis and maintains, or fixes, the handle portion at a selected position relative to the central region during cutting operation of the miter saw."

Rexon also insists that the lock be defined as part of the structure of the rotatable joint. This limitation is supported by the plain language of the claim. (See '976 Patent, Col. 4, ll. 64) ("said rotatable joint comprising a locking mechanism"). However, the fact that the lock is part of the rotatable joint does require that the rotatable joint constitute a separate component. A rotatable joint that is a place where two elements of the saw meet is as capable of comprising a locking mechanism as a rotatable joint that is a separate structure.

2. Claim 1, Element [b][iii]: a locking mechanism for maintaining rotation of said shaft of said spindle fixed in said cavity relative to said housing.

The dispute concerning this claim term is whether the claim language is drafted in means-plus-function form. The court has considered the claim language and notes that the failure to use the word "means" results in a presumption that the claim element is not drafted according to § 112 P 6. The court has also determined, given the claim language, that the element recites sufficient structure and that the defendant has failed to overcome the presumption that results from the failure to use the word "means." Therefore, the patentee is entitled to the full breadth of the definition of the term "locking mechanism."

The court is also not persuaded that the patentee's statements to the examiner regarding the Kerry prior art reference create an estoppel. The defendants argue that the patentee disclaimed the use of a squared off side as a locking mechanism for maintaining the rotation of the shaft fixed in the cavity relative to the housing. In response to a rejection, the patentee stated that Kerry provides a squared passage that prevents the rotational movement of the stem when a squared portion of the stem is received by the squared passage, and, as a consequence Kerry did not disclose or suggest "a locking mechanism for maintaining rotation of said shaft of said spindle fixed in said cavity relative to said housing." The patentee's principal argument against Kerry, however, was that Kerry did not include an electronic device. The prior art was distinguishable on this ground; therefore, the court cannot say that the patentee disclaimed the use of a squared off side in exchange for patentability, as the defendants contend. The parties have not urged the court to construe this term other as relates to the issues whether it is drafted in means plus function format and whether the statements regarding Kerry create an estoppel.
SRAM contends that I should construe "lockout mechanism" according to its ordinary meaning; that is, meaning "a mechanical device that locks and unlocks." Fox argues that Claim 16 itself defines the phrase, and that I should construe the phrase as including all the limitations listed in Claim 16. Fox's argument is circular: the term is used to define the limitation that defines the invention; see Allen Engineering Corp. v. Bartell Indus., 299 F.3d 1336, 1344 (Fed. Cir. 2002). Fox would have the limitation define the term. The plain meaning of the phrase makes sense in the context of the overall patent and is consistent with both the specification for the '049 Patent and the prosecution history. Fox provides no reason to deviate from that meaning. Additionally, the term "lockout mechanism" is used repeatedly in other claims of the '049 Patent, including claims that precede Claim 16. Terms used in different claims should be construed consistently unless there is a clear intention otherwise. Fin Control Sys. Pty., Ltd. v. OAM, Inc., 265 F.3d 1311, 1318 (Fed. Cir. 2001). Construing the term as Fox would have it would render earlier claims dependent on Claim 16, which is not permitted, 35 U.S.C. § 112, P 4. There is no indication that SRAM intended "lockout mechanism" to have one meaning for Claim 16 and another for the other claims of the patent. "Lockout mechanism" is defined as "a mechanical device that locks and unlocks."

"Lockout mechanism" is defined as "a mechanical device that locks and unlocks."
"Member" is defined as "a distinct part of a whole." Webster's II New Riverside University Dictionary, 740 (1984). Another definition of "member" is an element that belongs to a set. McGraw-Hill Dictionary of Scientific and Technical Terms, 1236 (5th ed. 1994). "Element" is defined as component. Id. at 668. "Member" is also defined as "any of the individual entities belonging to a set." Oxford English Dictionary, http://dictionary.oed.com/(last visited July 1, 2009). Furthermore, "locking" means "fastening." Webster's II New Riverside University Dictionary, 701. Having considered the specification and the ordinary definitions of the terms "locking" and "member," as well as the inclusion of play, this Court defines "locking member" as a "component of the fastening set that allows play." The Court also notes that the ordinary definitions of "first" and "second," respectively, are corresponding in order to the number one, id. at 481, and coming next after the first in order. Id. at 1054. And, the Court adopts those general definitions of the terms as modifying the term "locking element."

With respect to the means-plus-function contention Pergo raises, the Court notes that Claim 1 of the '907 patent claims:

A method of laying and mechanically joining floor panels in parallel rows, wherein relative positions of the panels during the method can be defined as including first and second mutual positions, a first mutual position in which (i) the two panels are held in an angled position relative to each other and (ii) upper portions of adjacent edges of the two panels are in mutual contact, and a second mutual position in which the two panels are (i) located in a common plane, (ii) mechanically locked to each other in a first direction that is at right angles to the common plane, (iii) mechanically locked to each other in a second direction, that is at right angles to said first direction and to the adjacent joint edges, as a result of a first locking member disposed at one of the adjacent edges being connected to a second locking member disposed at the other one of the adjacent edges, and (iv) being displaceable in relation to each other in the direction of the adjacent joint edges, wherein said method comprises the steps of:

(a) bringing a new one of the panels into an intermediary position where (i) a previously laid first one of the panels is located in a first row, (ii) a second one of the panels is located in a second row and is in said first mutual position in relation to the first panel, and (iii) the new panel is located in the second row and is in said second mutual position in relation to the second panel and is in a position relative to the first panel such that a mutual distance is present between the upper portions of the adjacent joint edges of the new panel and the first panel;

(b) while maintaining said second mutual position between the new panel and the second panel, displacing the new panel relative to the second panel into said first mutual position in relation to the first panel; and

(c) angling the new panel and the second panel together into said second mutual position in relation to the first panel.

('907 patent, 10:35-67; 11:1-3.) (Emphasis added).

The issue of whether claim 1 of the '907 patent and claim 39 of the '267 patent are means-plus-function claim elements was discussed in Alloc, 342 F.3d at 1372-73. Citing O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1583 (Fed. Cir. 1997), the court noted that, although typically considered in light of apparatus claims, § 112 P 6 is also applicable to the steps in a process claim. 342 F.3d at 1373. 16 The court declined to resolve the issue because the outcome of the appeal did not depend on whether or not the claims were interpreted under 35 U.S.C. § 112 P 6, because of the court's holding that the critical factor of play applied to claims of "either flavor." Id. at 1373.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

16 Alloc suggests that because the '907 and '267 patents are method patents, analysis would be more properly conducted under a "step-plus-function" framework of O.I. Corp., and its progeny. See Donald S. Chisum, 5A Chisum on Patents, § 18.03[5][e] n.1657 (2007). The concepts of "step-plus-function" and "means-plus-function" are closely related. Seal-Flex Inc. v. Athletic Track and Court Const., 172 F.3d 836, 848 (Fed. Cir. 1999) (Radar, J., concurring) (noting that although they require distinct analyses, the concepts are similar and that 35 U.S.C. § 112 P 6 suggests a strong correlation between the two). See also, O.I. Corp., 115 F.3d at 1583. Judge Radar's extensive Seal-Flex concurrence suggests using means-plus-function case law to "give guidance for determining whether a claim element is in step-plus-function form so as to invoke the statute's claim interpretation requirements." Seal-Flex, 172 F.3d at 848 (Radar, J., concurring).
Notwithstanding the Alloc court's position, the parties did not undertake a step-plus-function analysis. Moreover, at the April 3, 2009, Markman hearing, the parties were unified in their position that step-plus-function analysis has no relevance to the method patents at issue. Given the Alloc court's statements, the parties' position is somewhat puzzling. However, based on their position, the Court has not engaged in a "step-plus-function" analysis of the '907 or the '267 patent claims. Nonetheless, the Court notes that, with the exception of claim 13 of the '907 patent, the subject claims use the phrase "comprises of the steps of." See Masco Corp. v. United States, 303 F.3d 1316, 1326-28 (Fed. Cir. 2002).

However, in this instance, the parties also request construction of the terms "locking member," "first locking member," and "second locking member." Therefore, the Court will address the issue.

A means-plus-function limitation requires a court "first to identify the claimed function and then to determine the structure in the specification that corresponds to that function." Frank's Casing Crew & Rental Tools, Inc. v. Weatherford Intl, Inc., 389 F.3d 1370, 1376-77 (Fed. Cir. 2004); accord Gemstar-TV Guide Intl, Inc. v. ITC, 383 F.3d 1352, 1362 (Fed. Cir. 2004) ("We consult the claim language to determine the function of the limitation. . . . We then consult the written description to determine the corresponding structure necessary to accomplish the stated function."). The use of the word "means" creates a presumption that § 112, P 6 applies, while the absence of the word "means" creates a presumption that it does not apply. Personalized Media Commc'n's, LLC v. ITC, 161 F.3d 696, 703-04 (Fed. Cir. 1998); accord Lighting World, Inc. v. Birchwood Lighting, Inc., 382 F.3d 1354, 1358 (Fed. Cir. 2004).

DePuy Spine, Inc., 469 F.3d at 1023, notes that "the presumption flowing from the absence of the term 'means' is a strong one that is not readily overcome." (quoting Lighting World, 382 F.3d at 1358). "The use of the term 'means' is 'central to the analysis,' . . . and has come to be closely associated with means-plus-function claiming." Lighting World, 382 F.3d at 1358 (citations omitted). The presumptions can be overcome "if the evidence intrinsic to the patent and any relevant extrinsic evidence so warrant." Personalized Media, 161 F.3d at 704.

In the Pervan specification, the phrases "first locking member" and "second locking member," are presumptively not subject to 57 Ore. 541, 112 P 6 because they do not contain the term "means." See MIT, 462 F.3d at 1353; CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1369 (Fed. Cir. 2002). The word "means" also does not appear in claims 1 through 3 of the '907 patent or in claim 39 of the '267 patent. Thus, there is a presumption that § 112 P 6 does not apply. However, a limitation lacking the term "means" may overcome the presumption against means-plus-function treatment if it is shown that 'the claim term fails to 'recite sufficiently definite structure' or else recites 'function without reciting sufficient structure for performing that function.'" Id. (quoting Watts v. XL Sys., Inc., 232 F.3d 877, 880 (Fed. Cir. 2000)).

Pergo argues that the function of the first and second locking members is to mechanically lock two panels in the second "horizontal direction," but there is no structure to carry out this function. (Unilin's Open. Br. 39.) It asserts that because the only structures described in the Pervan patents to lock the panels in the horizontal direction are the "locking element" and "locking groove," a person of ordinary skill in the art would understand the "first locking member" and "second locking member" to correspond with the structures of the locking groove and locking member disclosed in the specification. (Id.)

Although Pergo cites MIT, 462 F.3d at 1353, it neither analyzes nor explains how the decision supports its contention. The "generic terms 'mechanism,' 'means,' 'element' and 'device,' typically do not connote sufficiently definite structure." Id. at 1354.

In MIT, the appellate court upheld the district court's conclusion that the presumption had been overcome and that the phrase "colorant selection mechanism" in a patent for a color processing system for producing color originals should be
construed as a means-plus-function limitation. Id. The court noted that the patentee had used "mechanism" and "means" as synonyms, at least one dictionary equated "means" with "mechanism," and that the term "colorant selection" which modified "mechanism" was not defined in the specification and had no dictionary definition and there was no suggestion that it has a generally understood meaning in the art. Id. Therefore, the appeals court determined that "colorant selection mechanism" did not connote sufficient structure to a person of ordinary skill in the art to avoid 57 Ore. 541, 112 P 6. Id.

In this case, Pergo has not demonstrated that the specification uses "member" as a synonym of "means." Furthermore, no functional language follows the claim term "locking member." Pergo has not overcome the presumption that "locking member" is not a means-plus-function claim term and, therefore, the Court will construe the terms as independent structural terms.

Claim terms are normally used consistently throughout a patent. Phillips, 415 F.3d at 1315. Therefore, the Court will define "locking member," "first locking member," and "second locking member" respectively as "a component of the fastening set that allows play," and as "the component, corresponding in order to the number one, of the fastening set that allows play," and "the components, coming next after the first in order, of the fastening set that allows play."

3) Locking Step

Utica asserts that the claim language does not limit the locking force to any particular device or to a single device, as long as the lateral and downward locking force components impose a locking force on at least a portion of the third planar surface of the cutting tool. Utica argues that this construction is consistent with the statement in the specification that the invention may be practiced other than as specifically described. '857 Patent, Col 7, ll. 21-24. Contrarily, Federal Broach asserts that the locking force is generated by a single locking member that must act alone to secure the tool in the tool holder. The relevant language of Claim 1 reads:

 said method comprising the steps of positioning said two planar abutment surfaces … whereby a predetermined accurate work position is established; and

 locking said broach cutting tool member in said predetermined accurate work position, by imposing a locking force on said at least a portion of said third planar abutment surface of said broach cutting tool member, said locking force having a force component directed towards said two planar abutment surfaces of said broach cutting tool member and a force component directed downward from said top surface towards said intermediate surface of said broach tool holder to securely hold said broach cutting tool member in said broach tool holder; '857 Patent, Col. 7, ll. 57-58, 65-67; Col. 8, ll. 1-11.

The parties do not dispute that Claim 1 is an independent method claim. Although the parties neither briefed nor argued its applicability, § 112, P6 is instructive. 2 By associating the word "steps" with two functions-establishing a predetermined accurate work position and locking the tool in the tool holder-Claim 1 contains express step-plus-function language to describe the locking element. This language creates the presumption that § 112, P6 governs the Court's construction of the locking force element. Relume Corp. v. Dialight Corp., 63 F. Supp. 2d 788, 798 (E.D. Mich. 1999) (citing Al-Site Corp. v. VSI Int'l, Inc., 174 F.3d 1308, 1318 (Fed. Cir. 1999)(holding that the use of "means for" or "step for" terminology typically invokes § 112, P6). The presumption that § 112, P6 applies is rebutted if the claim itself recites sufficient structures or materials to perform the stated function. Al-Site, 174 F.3d at 1318 (citing Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1427-28 (Fed. Cir. 1997)). A claim recites sufficient structure when it elaborates the structure, material, or acts necessary to perform entirely the recited function. See Sage, 126 F.3d at 1427-28.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

2 35 U.S.C. § 112,P6 reads:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding
structure, material, or acts described in the specification and equivalents thereof.

When construing a step-plus-function limitation pursuant to § 112, P6, the Court first must identify the function explicitly recited in the claim. Asyst Tech., Inc. v. Empak, Inc., 268 F.3d 1364, 1369 (Fed. Cir. 2001)(citations omitted). Next, the Court must identify the "corresponding structure set forth in the written description that performs the particular function set forth in the claim." Id. The proper application of § 112, P6, mandates reading the claim element to embrace distinct and alternative structures described in the specifications that perform the claimed element. Ishida Co. v. Taylor, 221 F.3d 1310, 1316 (Fed. Cir. 2000)(citing Serrano v. Tellular Corp., 111 F.3d 1578, 1583 (Fed. Cir. 1997)). § 112, P6, does not, however, "permit incorporation of structure from the written description beyond that necessary to perform the claimed function." Asyst Tech., 268 F.3d at 1370 (quoting Micro Chem., Inc. v. Great Plains Chem. Co., 194 F.3d 1250, 1257-58 (Fed. Cir. 1999)). Structural features that do not actually perform the recited function do not constitute corresponding structure and thus do not serve as claim limitations. Id. (citing B. Braun Med., Inc. v. Abbot Labs., 124 F.3d 1419, 1424 (Fed. Cir. 1997). Additionally, once the corresponding structures is identified, its scope cannot be extended solely by the inventor's statement that unspecified structures may perform the same function. See Fonar Corp. v. General Electric Co., 107 F.3d 1543, 1551-52 (Fed. Cir. 1997).

Since Claim 1 does not recite definite structures that will generate the locking force, the presumption that § 112, P6, applies is unrebutted. Al-Site, 174 F.3d at 1318. Therefore, the Court will construe the claim to cover the corresponding structures described in the specifications and their equivalents. Id. As an initial matter, the Court finds that the function of the locking step in Claim 1, is to provide adequate force to securely or firmly retain the cutting tool in the tool holder in the predetermined accurate work position, as that term was defined earlier in this Opinion. '857 Patent, Col. 8, ll. 1-2, 10-12; Asyst Tech., 268 F.3d at 1369.

The Court next must identify the corresponding structures that retain the cutting tool in the tool holder in the predetermined accurate work position. Id. The specifications indicate that a "wedge lock arrangement" generates the locking force. See, e.g., '857 Patent, Col. 4, ll. 8-9; Col. 5, ll. 54-61. The wedge lock arrangement "includes a wedge member having a first tapered edge, a second tapered edge, a threaded collar having a cross pin, and a retaining screw." '857 Patent, Col. 5, ll. 54-58. The specifications also reference "an optional configuration of the wedge lock arrangement" which would have only one tapered edge instead of two, however this configuration, the inventor notes, while functional, would not be optimal. '857 Patent, Col. 6, ll. 25-29. "Only one retaining device is required to hold the cutting tool in place …. By reducing the number of parts necessary to secure the cutting tool to a single wedge lock arrangement, the time and effort required to change the tools is greatly reduced." '857 Patent, Col. 6, ll. 59-60, 63-66. The specifications go on to state that "one skilled in the art may appreciate the use of other wedge locking configurations to mount the cutting tool to the tool holder." '857 Patent, Col. 6, ll. 32-34. Finally, the specifications state that "many modifications and variations of the present invention are possible … Therefore, within the scope of the appended claims, the present invention may be practiced other than as specifically described." '857 Patent, Col. 7, ll. 21-24.

Although the specifications state that other wedge-like configurations may be used, no such configurations are specified. Per § 112, P6, the method described in Claim 1 is, thus, limited to a wedge-like device and its equivalents. Accordingly, the Court finds that the locking step described in Claim 1 is limited to a single wedge-like device, with two tapered edges, or with one tapered edge as is described in the specification's optional configuration, and its equivalents. '857 Patent, Col 6, ll.25-27. Moreover, the Court finds that the scope of the corresponding structure to perform Claim 1's stated functions cannot be extended solely by the inventor's statement that "many modifications and variations are possible," or that unspecified structures may perform the same function. '857 Patent, Col. 7, ll. 21-24; see Fonar, 107 F.3d at 1551-52.

C. The "Locking" Limitations

Utica lastly argues that the district court erred in construing the "locking" limitations in claims 1 and 3 as step-plus-function limitations and, consequently, in requiring the use of a single wedge-like device or its equivalent to secure the cutting tool in the tool holder. Federal Broach agrees that the "locking" limitations should not have been construed as step-plus-function
limitations but argues that the district court's construction of those limitations is correct nonetheless because the specification requires the use of a single retaining device to secure the cutting tool in the tool holder.

We first address the applicability of 35 U.S.C. § 112, P 6 to the "locking" limitations of claims 1 and 3. That statute governs the construction of combination claims drafted in means- or step-plus-function format and provides as follows:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, materials, or acts, described in the specification and equivalents thereof.

35 U.S.C. § 112, P 6 (2000). In the context of method claims, use of the term "step for" signals the patentee's intent to invoke § 112, P 6 and thus gives rise to the presumption that the "step for" limitations are in step-plus-function format. Masco Corp. v. United States, 303 F.3d 1316, 1326 (Fed. Cir. 2002). Without "step for" language, however, a method claim is subject to the strictures of § 112, P 6 only if it recites steps for performing a specified function but does not recite any act in support of that function. See O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1583 (Fed. Cir. 1997).

In the present case, we agree with both parties that the district court erred in interpreting the "locking" limitations under § 112, P 6. To begin with, those limitations use the phrase "step of"- rather than the phrase "step for"-and therefore do not invoke the presumption that they are in step-plus-function format. See Masco Corp., 303 F.3d at 1327. Furthermore, the "locking" limitations are not step-plus-function limitations because they do not contain steps plus functions without acts. Although claim 1 specifies that the "locking" step performs the function of securing the cutting tool in the tool holder, it also explains how the tool is secured in the holder-by imposing a locking force on the tool's third planar abutment surface. The "locking" limitation of claim 1 thus contains an act in support of its specified function and, consequently, does not implicate § 112, P 6. The "locking" limitation of claim 3 is even farther removed from being in step-plus-function format: it does not expressly specify the function that the "locking" step is to perform, and it recites the act of imposing a locking force on a portion of the tool's third planar surface. We therefore conclude that the "locking" limitations of claims 1 and 3 are not step-plus-function limitations and that, as such, they should not be construed to cover only corresponding acts described in the specification and equivalents thereof.

Having determined that the "locking" limitations are not subject to the constraints imposed by § 112, P 6, we next consider whether they nonetheless require, as Federal Broach urges, the use of a single retaining device to secure the cutting tool in the tool holder. Although the claim language does not identify any particular structure for imposing the locking force, the specification expresses the patentee's clear intent to limit the claims to the use of a single retaining device for securing the cutting tool in the tool holder. The "Summary of the Invention" portion of the specification refers to "a securing device" in the singular, '857 patent, col. 2, l. 26, and further provides that one object of the invention is to provide a cutting tool retention device "that requires only a single retaining device in an effort to reduce the time and effort required to change tools," id., col. 3, ll. 4-7. More importantly, the specification distinguishes over the prior art-which required a plurality of socket head screws in addition to a radial positioning device-on the basis that the invention claimed in the '857 patent requires only one retaining device to hold the cutting tool in place. Id., col. 6, ll. 59-62. It goes on to explain that, by reducing the number of parts necessary to secure the cutting tool to a single device, the claimed invention greatly reduces the time and effort required to change tools. Id., col. 6, ll. 62-65. The specification makes clear, however, that the "single retaining device" need not consist of only a single component. On the contrary, it describes the preferred embodiment's "wedge lock arrangement"-which includes a wedge member, a threaded collar, a cross pin, and a retaining screw-as "one retaining device." Id., col. 5, l. 54 to col. 6, l. 24; id., col. 6, ll. 59-65. We therefore conclude that, consistent with the specification, the "locking" steps of claims 1 and 3 require the use of a single retaining arrangement to secure the cutting tool in the tool holder.

We do not agree with the district court, however, that the single retaining arrangement must include a wedge-like device. As noted above, claims 1 and 3 do not identify any particular structure for securing the cutting tool in the tool holder. And although the specification repeatedly discloses the use of a wedge for performing that function, e.g., id., col. 4, l. 59; id., col. 5, l. 54 to col. 6, l. 35; id., col. 6, l. 64, it does so in the context of describing two embodiments and even acknowledges that a wedge is only one example of a securing device, see id., col. 2, ll. 26-27 (referring to "a securing device, such as a wedge"). Moreover, the dependent claims contemplate the use of a structure other than a wedge-like device. Claim 5, which depends from claim 3, recites the use of a threaded member to impose a locking force between the cutting tool and the tool holder. Claim 7, which also depends from claim 3, separately recites the use of a wedging member to perform that function.
At the very least then, claim 3 should be construed to encompass the structures recited in the claims that depend from it, and we see no reason not to interpret claim 1 in a similar manner. We therefore conclude that the "locking" steps of claims 1 and 3 do not require the use of a wedge-like device.

5. Locking Surface

The next term for interpretation is "locking surface." The term appears in claim 49 of the '410 patent; in claims 1, 10, 21, 22, 27, and 28 of the '579 patent; and in claim 1 of the RE '439 patent. Initially, the Plaintiffs asserted that locking surface means "a surface for fastening." (Pls.' Open. Br. 34-35), stating that the Pervan specification is silent on whether the locking surfaces or the locking elements are at any particular angle, and that Pergo's argument is premised solely on figures in the patent. They asserted that it is improper to rely on the figures when any corroborating characterization is absent from the written specification.

Page nine of the joint comparison chart filed on February 17, 2009, provides the Plaintiffs' revised construction of "locking surface" as meaning "a surface that: 1) is directed or looking toward the first edge of the panel (i.e., the one that carries the strip), 2) that comes into contact with an internal surface of the locking groove[,] and 3) prevents substantial separation of the joined edges." While that construction was not argued in the Plaintiffs' briefs, the Defendants have not objected to it. Therefore, the Court has considered the Plaintiffs' revised construction.

Pergo maintains the term means "a vertical surface of the locking element that is closest to the joint surface and that can contact the opposing surface of the locking groove when the panels are pulled away from one another horizontally." (Unilin's Open. Br. 23-25.)

Pergo's definition is overly restrictive and reads restrictions into the term. The specification is silent on whether the locking surfaces or locking elements are at any particular angle. The specification section entitled "Technical Field," states that the invention is well-suited for use in the joining floor panels, but emphasizes that the invention is useful for joining other types of building panels, such as wall panels and roof slabs. If the panels were used in building a wall or a roof (depending on the slope of the roof), the directions of the panel would be different than when used to build a floor. The Plaintiffs' revised construction also reads restrictions into the term.

A dictionary definition of "surface" is "the exterior face of an object." Webster's II New Riverside University Dictionary 1165. Another definition of "surface" is "outer part." McGraw-Hill Dictionary of Scientific and Technical Terms, 1960. Considering these definitions in the context of the claims and specification, the Court construes "locking surface" as "an outer part for fastening."

S&N states that the district court's claim construction is incorrect, in that it departed from the magistrate judge's correct construction that the claim "does not preclude movement or manipulation after lodging." S&N points out that the magistrate judge rejected Ethicon's requested construction that no further movement or manipulation of the anchor is permitted by the claim. S&N also states that it is irrelevant whether further movement or manipulation of the anchor occurs within the bone, for that limitation is not included in the claim. Thus S&N argues that the district court erred in construing the claim as barring any movement or manipulation of the anchor by the surgeon after the anchor has been inserted in the bone.

We conclude that the magistrate judge correctly ruled that the term in claim 1 of "lodging the member within the hole by pressing the member with attached suture into the hole" does not bar the surgeon's tug and any ensuing small movement of the anchor after insertion. The claim construction was correct that "lodging" means that the anchor can not be withdrawn after it is pressed into the hole, and that "further movement . . . is permitted, but not required." This construction does not preclude the action whereby the surgeon tugs on the suture after insertion. Both sides agreed that any prudent surgeon would assure that an anchor is seated within the bone structure. In the S&N method the pull on the anchor tests whether it is
lodged, because the legs automatically spread into the cancellous layer of bone; the pull confirms that the legs have spread. There was evidence before the district court that both sides issue instructions that surgeons should perform such a pulling step.

The Ethicon anchor, according to Ethicon, is not lodged until after the surgeon pulls on the suture, Ethicon stating that it is the ensuing movement through the bone that spreads the legs, and that without this manipulation the Ethicon anchor is not "lodged within the hole" as set forth in claim 1. S&N disputes this view of the Ethicon method, and also argues that even if a pulling step were necessary to lodge the Ethicon anchor, the claims are infringed because all of the claim steps are performed, whether or not this additional pulling step is also performed.

Ethicon also argues that S&N is estopped from a claim construction covering a method that requires or employs manipulation or movement of the anchor after it is pressed into the hole, pointing to arguments made during prosecution of the 557 patent to overcome a reference to Freedland. Ethicon is partly correct, for estoppel arises, but not to the extent proposed by Ethicon. The Freedland reference shows a fastener inserted into a hole drilled into a broken bone at the fracture; the fastener serves not as a suture anchor, but as a device for holding the fracture together during healing. The Freedland fastener has arms that project into the cancellous bone tissue in the area of the fracture, but the arms of the fastener must be extended by manipulation. In the Freedland method the surgeon uses forceps to pull on a cord that extends through a tube, opening the Freedland fastener like an umbrella, thereby pinning itself inside the hole in the bone and stabilizing the bone against movement while the fracture heals.

During prosecution of the 557 patent the inventor, Dr. Hayhurst, argued that a difference between his invention and that of Freedland is that the 557 anchor is securely embedded simply upon pressing it into the hole where it resiles into the cancellous bone, and that no further manipulation of the anchor is necessary. At his deposition Dr. Hayhurst repeated this description of how his invention works. Ethicon states that the inventor thus disclaimed coverage of its anchor that requires manipulation to move it into place and open its legs. S&N responds that the Ethicon anchor does not require such manipulation, and that the surgeon's "pull" on both the 557 anchor and the Ethicon anchor after they are pushed into the hole is not a Freedland-type manipulation to open a closed device in a fracture, but a routine cautionary safeguard to assure that the anchor is in place in the bone. S&N states that the 557 inventor did not disclaim his own procedure which included this safeguard of pulling on the anchor, and that Dr. Hayhurst merely distinguished Freedland's elaborate manipulation that opens an umbrella-like fastener inside a fractured bone.

We agree with the magistrate judge that the 557 claims, correctly construed, neither exclude nor require a surgeon's tug to assure that the anchor is set within the cancellous bone, and do not preclude a small movement as a result of that tug. A claim interpretation that would exclude the reasonable practice of the method taught in the patent "is rarely the correct interpretation; such an interpretation requires highly persuasive evidentiary support." Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1550, 37 U.S.P.Q.2D (BNA) 1609, 1612 (Fed. Cir. 1996).

Ethicon is incorrect in its assertion that since a pulling step (sometimes called a "tensioning" step) is "necessary" to set the Ethicon anchor, the step of pulling on the anchor must be included in the 557 claims in order for the claims to be infringed. Our colleague in dissent has adopted Ethicon's argument, and would hold that since the step of tugging on the anchor is not stated in the 557 claims, the claims can not be infringed. However, claims are infringed when all of the steps thereof are performed, unless the invention itself is the elimination of additional steps. The 557 patent, its specification, prosecution history, and testimony in the summary judgment proceeding, make clear that the instruction to surgeons to tug on the anchor before using it is a matter of prudent surgical practice, not a limitation of claim 1.

Both parties point to claim 6 of the 557 patent, which includes the limitation that the anchor is not "manipulated":

6. A method of anchoring in bone a member and attached suture, comprising the steps of:

   providing a deformable member having a width dimension "D";

   attaching a suture to the member;

   forming a hole in a bone in a manner such that the hole has a diameter that is not greater than the width dimension "D";

   and
inserting the member into the hole with the member oriented such that the member lodges within the hole in the absence of any manipulation of the member other than inserting the member into the hole.

Ethicon states that claim 6 shows that S&N's invention excludes manipulation of any sort after insertion of the anchor, while S&N states that this claim describes a preferred embodiment, in accordance with the doctrine of claim differentiation. This doctrine reflects the presumption that separate claims are of different scope. See Irving Kayton, 1 Patent Practice (6th ed.) 3.1, 3.3 (1995):

Patent practitioners typically draft a series of claims approximating a spectrum of patent protection . . . . The first way in which a claim may be made narrower is by adding a limitation to it in the form of an additional element.

We discern no basis for reading claim 6 as countermanding the claim construction of the magistrate judge that claim 1 "[does not] preclude movement or manipulation after lodging."

We confirm the district court's claim construction, with the modification or clarification that claim 1 neither excludes nor requires the step of pulling on the suture after it is inserted. However, we also confirm the claim construction that the 557 claims do not cover a device whereby the suture must necessarily be manipulated and moved through the bone in order to open the anchor and spread the legs, for S&N is estopped by the prosecution history from covering a device that must be manipulated and opened in order to fix it in the bone. However, a device that resiles after insertion into the bone may be manipulated provided that "manipulation beyond pressing [is not] necessary in order to secure the member in the hole."

II

The signal that additional steps may be performed in carrying out a claimed method is the word "comprising." See Vivid Technologies, Inc. v. American Science & Engineering, Inc., 200 F.3d 795, 811, 53 U.S.P.Q.2D (BNA) 1289, 1301 (Fed. Cir. 1999) (the signal "comprising" is "generally understood to signify that the claims do not exclude the presence in the accused apparatus or method of factors in addition to those explicitly recited"); Moleculon Research Corp. v. CBS, Inc., 793 F.2d 1261, 1271, 229 U.S.P.Q. (BNA) 805, 812 (Fed. Cir. 1986) (stating "the general proposition that an accused method does not avoid literally infringing a method claim having the transitional phrase 'which comprises' (or 'comprising') simply because it employs additional steps"). Our esteemed colleague in dissent criticizes use of the signal "comprising," calling it a "weasel word" to somehow avoid precision in claiming. This signal nonetheless appears in the vast majority of patent claims, for it implements the principle that claims are intended to provide a concise statement of the claimed invention as distinguished from what has gone before; a claim is not a handbook for practice of the invention. Dr. Hayhurst's testimony and instructions that any prudent surgeon would test the anchor to assure that it is lodged beneath the cortical layer was not included in any claim. Nor was it required to be claimed. It is neither a "shortcoming" nor a "weaseling" to use "comprising" to recognize that inventions may be practiced with steps in addition to those listed in the claims.

A claim is not defective when it states fewer than all of the steps that may be performed in practice of an invention. See, e.g., Moleculon Research Corp., 793 F.2d at 1271, 229 U.S.P.Q. (BNA) at 812 (method as practiced can include steps in addition to those stated in the claim). Infringement arises when all of the steps of a claimed method are performed, whether or not the infringer also performs additional steps. See, e.g., Vivid Technologies, 200 F.3d at 811, 53 U.S.P.Q.2D (BNA) at 1301 (inclusion of steps in addition to those stated in the claim does not avoid infringement); Stiftung v. Renishaw PLC, 945 F.2d 1173, 1178, 20 U.S.P.Q.2D (BNA) 1094, 1098 (Fed. Cir. 1991) (claim using "comprising" reads on devices which add additional elements). This court did not hold in Maxwell v. J. Baker, Inc., 86 F.3d 1098, 39 U.S.P.Q.2D (BNA) 1001 (Fed. Cir. 1996) that unless all disclosed procedures are included in the claim, the patentee has "dedicated to the public" not only the unclaimed procedures but the entire claimed process. Our colleague in dissent, finding the disputed fact that Ethicon's method "indisputably requires the 'tensioning' step," proposes that Maxwell requires that by not including the tensioning step in the claims, S&N dedicated to the public the public any procedure in which that step is included. However, Maxwell does not treat such a situation. The issue in Maxwell was whether equivalent subject matter that was disclosed in the specification but not claimed can be reached under the doctrine of equivalents. 2 There was no issue in Maxwell of literal infringement when every step of the claimed method is in fact practiced by the accused infringer. In Maxwell the accused equivalent subject matter was disclosed in the patent but was plainly outside the scope of the claims. Such a situation is not here presented.
2 This question is being considered by this court en banc, in Johnson & Johnston Associates Inc. v. R.E. Service Co., 238 F.3d 1347 (Fed. Cir. 2001) (Order directing supplemental briefing on questions of "Whether and under what circumstances a patentee can rely upon the doctrine of equivalents with respect to unclaimed subject matter disclosed in the specification.")

III

The 557 invention is directed to an anchor with resilient legs that open and resile after the anchor is pushed into the cancellous bone, lodging the anchor against the cortical layer. Although Ethicon states that the legs of its anchor do not work in this way, there was evidence before the district court supporting S&N's statement that the Ethicon legs "are made of a highly resilient alloy called 'Nitinol,' which will spring back to its relaxed position automatically after being compressed," and that "No action of the surgeon is required to open the arcs." Brief at 32-33.

S&N points out that Ethicon's own product literature and patent do not require a "tensioning" step to move the anchor after insertion, instead stating that the anchor has no tendency to move when inserted. Indeed, the district court agreed with S&N, and ruled: "In sum, it is undisputed that the arcs of the accused suture anchors substantially return to their relaxed state upon being pressed into cancellous bone and can not be removed." We can not reconcile this ruling with the district court's apparent conclusion that the surgeon's pull on the Ethicon anchor is necessary to spread the legs and lodge the anchor. Ethicon's position that its anchor is not "lodged" until after it has been moved and manipulated within the bone was disputed, and was material to the summary judgment. On the record before the district court this disputed material fact could not be resolved adversely to S&N.

MICHEL, Circuit Judge, dissenting.

I have a much different view of this case. Because none of the seven claims here even remotely suggests that one need apply "tension" to the suture in order to make the legs of the claimed anchor member dig into the cancellous bone tissue and because our precedents counsel against using the term "comprising" to include disclosed but unclaimed subject matter, the district court correctly concluded that, as a matter of law, the 557 patent does not cover Ethicon's accused method, which indisputably requires this "tensioning" step. Indeed, one of the asserted claims in this case expressly disclaims the need for "any manipulation of the [anchor] member other than inserting the member into the bone."

And indeed, the inventor himself agreed (whether he realized it or not) with this construction, testifying that his claimed method for making the anchor member ready for tissue attachment does not require any post-insertion step -- like applying tension to the suture -- after the surgeon had inserted the anchor member into the bone hole. The majority cannot reasonably minimize this "tensioning" step as extraneous; as indicated, by disclosing the step in the specification but by failing to include it in the claims, Smith & Nephew simply dedicated that step to the public. A member of the public (Ethicon) so used it. S&N cannot now recover what it had previously dedicated. I must dissent.

I.

In Maxwell v. J. Baker, Inc., we reiterated the well-established rule that subject matter disclosed but not claimed in a patent application is dedicated to the public.' 86 F.3d 1098, 1106-07 (Fed. Cir. 1996) (quoting Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1562-63 (Fed. Cir. 1991) and citing Miller v. Bridgeport Brass Co., 104 U.S. 350, 352, 26 L. Ed. 783 (1881)). This rule, we held, prohibited both a finding of literal infringement and of infringement under the doctrine of equivalents because, otherwise, an applicant could "present a broad disclosure in the specification of the application and file narrow claims," thereby "avoiding examination of broader claims that the applicant could have filed consistent with the specification." 86 F.3d at 1107 (citing Genentech, Inc. v. Wellcome Found. Ltd., 29 F.3d 1555, 1564 (Fed. Cir. 1994); International Visual Corp. v. Crown Metal Mfg. Co., 991 F.2d 768, 775 (Fed. Cir. 1993)). In addition, the rule comports with (among other principles) the statutory requirement of distinctly claiming the "subject matter which the applicant regards as
his invention." Id. (quoting 35 U.S.C. § 112).

Applying the dedication-to-the-public rule, we determined that because the patentee there had merely disclosed, but not claimed, an "alternative" for having a shoe's "fastening tabs . . . stitched into the lining seam of the shoes," the patentee had thereby deprived the Patent and Trademark Office from considering the patentability of that alternative. 86 F.3d at 1108. Further, we reasoned that a person of ordinary skill in the "shoe industry" would conclude that the failure to claim the disclosed "alternate shoe attachment systems" meant the patentee there had simply "dedicated the use of such systems to the public." Id. Accordingly, we held that no complaint for literal infringement or for infringement by equivalents could lie. Id.

So too does the rule apply here. Like Ethicon's accused method and device, the 557 patent's "Summary of the Invention" and its "Description of Preferred Embodiments" both disclose embodiments that need to have "tension applied to the [anchor member's] suture" in order to have the "ends of the [anchor member's] legs dig into the bone and resist removal of the anchor member from the hole" drilled into the bone. (See, e.g., J.A. 150, Col. 3, Lines 1-6; see also Col. 9, Lines 45-49 ("With the outer edges of the legs bearing upon the bone, any tension applied to the suture causes the sharp edges to dig into the bone to secure the anchor member within the hole.").) But nowhere do any of the claims themselves recite a step about "applying tension to the suture" in order to have the claimed anchor member's legs dig into the bone. (See generally J.A. 154, Col. 11 and Col. 12.)

To the contrary, one of the asserted claims expressly disclaims any step of applying tension to expand the anchor's legs. Claim 6 -- a claim directed at applying the claimed method when, as here, one needs to set the member inside the bone -- claims the step of "inserting the [anchor] member into the [bone] hole . . . such that the member lodges within the hole in the absence of any manipulation of the member other than inserting the member into the hole." (See J.A. 154, Col. 12, Lines 17-20) (emphasis added). In other words, one practicing the invention need only insert the anchor into the hole to have the anchor legs automatically "resile" and dig into the bone. (See id.)

The other three independent claims require more or less, stating (among other things) the steps for "attaching tissue to the suture so that the tissue is secured against the bone" (claim 1), "deforming the [anchor] member in a manner such that the member resiles [expands] against the portion of the bone" (claim 2) and "lodging the [anchor] member within the hole by pressing the member with attached suture into the hole" (claim 3). But "more" in this case cannot mean (under the claim differentiation doctrine) that the claims engulf an entirely new and different step, the step of applying "tension" to the suture, see Kraft Foods v. International Trading Co., 203 F.3d 1362, 1368 (Fed. Cir. 2000) ("Claim differentiation cannot broaden claims beyond their correct scope") (citations omitted); to find otherwise would mean we could read any disclosed but unclaimed alternative into a claim, in derogation of our "well-established rule" about public dedications. Worse, it would mean that (as more fully discussed below) a court could return to the applicant what the applicant had also expressly disclaimed, both during prosecution and even later in litigation. Courts should merely give effect to the words used in a claim, not re-write or even resurrect them.

The majority states that the 557 patent instructs "surgeons . . . to tug on the suture after the anchor is pressed into the bone, to assure that it is securely seated." But its opinion does not identify whether that instruction appears in the claims, the written description or any other portion of the specification. In any event, that instruction certainly does not appear in the language of the claims, the most critical portion of the patent. And when the language about tugging on or applying pressure to the suture expressly appears in the written description, it does so for the purpose of asserting that a "tug" will cause or help cause the anchor to lodge itself within the bone, i.e., that tug does more than simply "assure" that the anchor is lodged within the bone. (See, e.g., J.A. 150, Col. 3, Lines 4-6 ("Whenever tension is applied to the suture, the ends of the legs dig into the bone . . . .") (emphasis added); J.A. 153, Col. 9, Lines 54-60 ("As a result, tension in the suture (in conjunction with the intrinsic resilient force of the anchor member 80 that forces the leg edges 87 apart) tends to lodge the edges 87 of the anchor-member legs beneath the cortical layer 97, rendering the anchor member substantially irremovable from this hole 100.") (emphasis added).

As even the disclosed-but-unclaimed language would have it, then, S&N's device and process would indeed "require a surgeon's tug to assure that the anchor is set within the cancellous bone," contrary to my esteemed colleagues' interpretation. Simply put, nothing in the claims or specification suggests that a surgeon should tug on or apply tension to the suture solely to "assure" or "confirm" that the anchor has become lodged in the bone. But again, the claims say nothing of "tensioning" for any reason, leaving it to the resiliency of the legs alone to complete the necessary "lodging" step.
II.

The majority also indicates that I have misapplied the public-dedication analysis and misread Maxwell, though a review of that decision shows (contrary to my colleagues' assertion) that Maxwell, its predecessors and its progeny apply with equal force to situations involving infringement by equivalents and literal infringement. E.g., 86 F.3d at 1107 ("We have frequently applied this [public-dedication] rule to prohibit a finding of literal infringement when an accused infringer practices disclosed but unclaimed subject matter.") (citing Env'tl. Instruments, Inc. v. Sutron Corp., 877 F.2d 1561, 1564 (Fed. Cir. 1989)). Further, the majority uses the term "comprising" to mean that the 557 patent requires not only the steps of lodging the member anchor and attaching tissue to the suture, but also the unclaimed step of applying "tension" to the suture.

True, we have recognized that "comprising" generally signifies that the "claims do not exclude the presence in the accused apparatus or method of factors in addition to those explicitly recited." See Vivid Tech., Inc. v. Am. Sci. & Eng'g, Inc., 200 F.3d 795, 811 (Fed. Cir. 1999). But as Ethicon correctly asserts, we have also held that an applicant cannot use this open-ended term to recapture what he had otherwise given away. See, e.g., Spectrum Int'l, Inc. v. Sterilite Corp., 164 F.3d 1372, 1380 (Fed. Cir. 1998) ("Neither may the term 'comprising' alter the scope of the merger element in the claim at issue here. 'Comprising' is not a weasel word with which to abrogate claim limitations."). Moleculon Research Corp. v. CBS, Inc., 793 F.2d 1261, 1271 (Fed. Cir. 1986) (rejecting as "far too broad" the argument that "comprising" opened the claims to additional steps and additional limitations not contained in the accused method).

And in this case, the majority is using this "weasel word," see Spectrum International, 164 F.3d at 1380, to obliturate our "well-established rule," see Maxwell, supra, against giving effect to disclosed but unclaimed subject matter. Thus, the majority implies that applicants may now avoid the Maxwell bar by simply including in every claim the term "comprising," as if that term alone can magically shore up whatever shortcoming (intentional or not) the claim had before it became the subject of litigation. I believe that our jurisprudence and indeed the statutory requirement for "distinctly claiming" one's invention require more than this simple flick of the "comprising" switch.

III.

The majority, in my view, also cannot reasonably equate the 557 patent's "lodge" or "lodging" claim limitation with the "tensioning" needed to have Ethicon's accused device kick-out its legs into the bone. The specification indicates that these are separate steps, ones that follow each other. But again, only the "Summary of the Invention" and the "Description of Preferred Embodiments" reference an embodiment that recites the need to have "tension applied to the suture [to] cause[] the sharp edges [of the anchor member] to dig into the bone to secure the anchor member within the hole." (E.g., J.A. 153, Col. 9, Lines 46-49.)

As discussed above, the claims omit this step. Claims 1-3 state only that one must "lodge the [anchor] member in the hole by pressing the member with attached suture into the hole . . . ." (See J.A. 154, Col. 11, Lines 7-8, 15-16 and Col. 12, Lines 1-2.) Claim 2, moreover, recites the method by which the anchor member does dig into the bone: By "deforming the member in a manner such that the member resiles against the portion of the bone that defines the hole." (See J.A. 154, Col. 11, Lines 18-20) (emphasis added). Read in context, this claim can only mean what the specification repeatedly indicates will occur when the anchor member's "resilient material" (J.A. 152, Col. 8, Line 58) or "intrinsic resilience of the anchor member" (J.A. 153, Col. 9, Lines 21-22; J.A. 153, Col. 10, Lines 51-52) is allowed to "relax" and assume its natural shape: the "resilient" anchor automatically kicks out its legs or "resiles," causing the legs to dig into the bone and thereby allowing for the next step of the claimed method (the attaching of tissue to the suture so as to secure the tissue against the bone) to go forward. (See, e.g., J.A. 153, Col. 10, Lines 50-54.)

Claim 6, as noted earlier, does not help Plaintiff-Appellant S&N, not only because S&N cannot rely on a narrower claim to incorporate an entirely new "tensioning" step; but also because that claim, too, merely confirms that the patent failed to claim this step. The claim makes clear that the anchor member will become "lodged within the hole in the absence of any manipulation of the member other than inserting the member into the hole." (See J.A. 154, Col. 12, Lines 18-20.) And again, this can only mean that the anchor member will automatically lodge into the bone and become ready for the subsequent attatching of the tissue, without any intermediate step of applying tension to the suture. This is not an insignificant element of the claimed invention. As the specification itself states, this claimed albeit "simple mechanism for [automatically] anchoring the anchor member in bone . . . [provides] a means for reattaching tissue to the bone to promote healing." (See
The extrinsic evidence confirms this reading of the 557 patent. The inventor, Dr. Hayhurst, admitted at his deposition that one would not be practicing claims 1, 2, 3 or 6 of the 557 patent if one had to perform any "further manipulation of the anchor member other than merely pressing it into the hole in order to lodge it within the hole." (See J.A. 6443-44.) And at the Markman hearing, Dr. Hayhurst conceded that his "device" was "ready to have tissue attached to it," i.e., ready to have the last stage of the claimed method performed, "without first pulling back on the suture." (See J.A. 7438) (emphasis added).

Stated differently, the 557 patent avoids the need to have tension applied to the suture or anchor member in order to have the anchor's legs resile, dig into and thereby lodge themselves within the bone; the resilient nature of the legs themselves causes them to automatically kick-out and thereby lodge themselves within the bone once the surgeon has "pressed [them] into the hole." (See J.A. 6443-55; J.A. 7438.) By relying on a novel standard of "reasonable practice of the method taught in the patent" and by therefore assigning the claims a contrary construction, the majority has (among other things) added a step that Dr. Hayhurst himself eschewed.

IV.

Finally, no genuine issue of material fact exists about whether Ethicon's accused method infringes the correctly construed 557 patent. Courts should grant summary judgment, of course, when no genuine issue of material fact remains and the movant warrants judgment as a matter of law. Vehicular Tech. Corp. v. Titan Wheel Int'l Inc., 212 F.3d 1377, 1381 (Fed. Cir. 2000). The non-moving party, moreover, cannot defeat summary judgment simply by insisting that a genuine dispute exists or even by proffering some evidence; in any case, the non-moving party (provided that this party bears the ultimate burden of proof, as with S&N here) must produce evidence that a reasonable jury could find sufficient to prove, e.g., that the accused device contains all the limitations set forth in the patent claims. See Zodiac Pool Care, Inc. v. Hoffinger Indus., Inc., 206 F.3d 1408, 1414-15 (Fed. Cir. 2000) (affirming summary judgment on claim alleging literal infringement when no reasonable juror could find, based on the evidence presented, that the accused devices contained all the limitations set forth in the claimed invention); see also Vehicular Tech. Corp., 212 F.3d at 1382.

The record here establishes beyond reason that, unlike the claimed invention, the accused method does require the additional step of tensioning the suture in order to fix the anchor within the bone hole and to thereby make it "ready" for the attachment of tissue. S&N has not identified any evidence that could reasonably rebut the packaging instructions that Ethicon included with every anchor, instructions that direct surgeons to pull back on (i.e., apply "tension" to) the anchor in order to ready it for tissue attachment. (S&N's product instructions, mentioned by the majority, do not factor into either the claims construction or infringement analysis. We examine the former using primarily the intrinsic evidence -- the claims, the specification and, if in evidence, the prosecution history; and in the rare case we will resort to extrinsic evidence. We examine the latter by analyzing whether the accused device contains all the limitations claimed by the patent at issue.) Nor did S&N offer any evidence that could rebut the expert testing results showing that Ethicon's anchor would move outwardly from the bone hole absent a tensioning step.

Equally significant, S&N offered no evidence that could reasonably rebut the evidence showing that movement of an unsecured anchor would result in failed surgeries. The advertising materials that S&N did offer still do nothing to change this conclusion. For one thing, Ethicon itself did not draft these materials, so they do not even necessarily constitute a party-opponent admission, let alone a damaging admission. And these advertisements say nothing, one way or the other, about having to apply tension to Ethicon's suture. No reasonable juror would take those advertisements and somehow convert their silence into an admission that contradicts the express instructions that Ethicon itself drafted. Nor should we.

And last, I find inapplicable our rule that an accused device will infringe the claimed invention so long as that device contains all the limitations claimed in the patent, even if the device merely adds more steps or features. As discussed, the 557 patent emphasizes the importance of having resilient legs, since that resiliency enables the claimed invention to lodge itself within the bone as soon as the anchor enters the soft, cancellous layer. But as the evidence shows, the accused device does not have legs that automatically kick-out or resile and thereby lodge the anchor within the bone; so rather than merely adding a step or feature to the invention claimed by the 557 patent, the accused device simply does not contain that step or feature at all, i.e., it does not contain all the elements claimed by the patent. See, e.g., Vehicular Tech. Corp. v. Titan Wheel Int'l, Inc., 141 F.3d 1084, 1089 (Fed. Cir. 1998) (infringement exists only if all limitations of the claim appear, either
literally or by equivalents, in the accused product or process).

The majority, however, brushes aside any detailed examination of the evidence actually offered by the parties. Merely disputing a material fact, or even pointing to Ethicon's advertising materials, should not defeat summary judgment when no reasonable juror could examine that evidence and find in S&N's favor. Because of today's decision, I fear that we have inadvertently and improperly raised the bar for summary judgment in actions alleging patent infringement.

V.

To summarize, the specification (other than the claims themselves) does disclose the need to have "tension" applied to the claimed suture in order to make the claimed anchor member ready for the attachment of tissue to the bone. But nowhere do any of these claims actually recite this step, meaning the patentee has dedicated it to the public. Ethicon, therefore, could reasonably conclude as such and could lawfully use that step in its accused method.

The use of the term "comprising" should not change this reading of the patent. Our precedents have cautioned that while "comprising" is an open-ended term, it is not a tool for recapturing what the applicant had otherwise surrendered. In this case, as noted, S&N did just that, dedicating to the public the step of applying tension to the anchor member's suture. Nor should we allow a "weasel word" like "comprising" to nullify the public-dedication rule, well settled in our precedent.

Further, the limitation "lodged" or "lodging" as used in the various claims excludes the disclosed-but-unclaimed tensioning step. The specification repeatedly refers to the "resilient" nature of the claimed anchor's legs and the claims themselves indicate that these legs will "resile" or expand automatically simply because of their resiliency, i.e., no additional tensioning step is needed after all. The testimony by the inventor Dr. Hayhurst himself confirms that, indeed, a surgeon or other person practicing the 557 patent does not need to apply tension to the suture in order to make the anchor's legs dig into the bone.

Last, S&N has failed to identify any evidence that would lead a reasonable juror to conclude that Ethicon's accused method similarly or literally requires that its accused anchor also automatically kick-out the legs after entering the hole in the bone. Again, Ethicon produced the instructions it included with every package of anchors and these instructions directed surgeons to apply tension to the anchor's suture. In addition, Ethicon produced expert testing results showing that a surgeon needed to apply this tension in order to set the anchor before attaching the tissue; otherwise, the unrebutted evidence shows, unsuccessful surgeries could result and patients would not heal.

The only evidence that S&N did offer in rebuttal -- advertisements drafted by a third party -- could not lead a reasonable juror to reach a different outcome. Ethicon itself did not draft these advertisements and nothing in the advertisements even contradicts what Ethicon's instructions and expert testing results established beyond genuine dispute.

I respectfully dissent.

5. "Long Enough to Provide Said Lateral Strength"

a. Claim Term:

"... a second enlarged interior diameter being larger than said first enlarged interior diameter and terminating said PVC pipe at said female end, said second enlarged interior diameter being ... (b) long enough to provide said lateral strength when connected to said similar adjacent PVC pipe ..."

b. Parties' Contentions

CertainTeed's proposed construction of "long enough to provide said lateral strength" is "the second enlarged interior diameter section must be long enough so that, when connected to a similar adjacent pipe, a pipe 2 inches in diameter has sufficient lateral strength so that a lateral force of 1,000 pounds must be exerted before the pipe will start leaking." Modern Products' proposed construction of "long enough to provide said lateral strength" is "the second enlarged interior diameter
section must be long enough so that, when connected to a similar adjacent pipe, the strength of the connected PVC pipe will resist forces exerted on the pipe in a direction perpendicular to the length of the pipe." In support of their proposed construction, CertainTeed and Modern Products rely on the arguments made in support of their construction of the term "lateral strength."

c. Court's Construction

The Court concludes that "long enough to provide said lateral strength" means "the second enlarged interior diameter section must be long enough so that, when connected to a similar adjacent pipe, the strength of the connected PVC pipe will resist forces exerted on the pipe in a direction perpendicular to the length of the pipe." The reasons for this construction are described in detail in the Court's discussion of the term "lateral strength." See supra pgs. 12-14.

3. On December 22, 2000, the court issued its construction of disputed claim terms as follows:

a. "Aluminum alloy sheet product." As understood by one of ordinary skill in the art, an aluminum product with a maximum thickness of 1/4 inches.

c. "Clad" and "cladding." Structures containing an outer layer that provides protection against corrosion. Claims without reference to "clad" or "cladding" apply to both clad and unclad products.

d. "Minimum" and "maximum." A level referring to guaranteeable property values established by repeated testing of many pieces of metal to establish consistent, uniform values.

e. "Long transverse yield strength." As understood by one of ordinary skill in the art, the stress, applied across the width of a product, that a product can sustain before yielding or breaking.

C. Longitudinal Axis

The Court construed "longitudinal axis" to mean "[a] fixed axis extending in the longitudinal direction of the retainer."

At the Markman hearing, plaintiff proposed construing "longitudinal axis" to mean "a center line that extends in the longitudinal direction of the retainer." (Def. Exhibit 537, at 3.) Defendant proposed construing "longitudinal axis" to mean "a fixed axis in a longitudinal direction across a top surface of an anchor pad." (Id.)

Because the Court construed the longitudinal axis to be fixed relative to the retainer (rather than the anchor pad), the Court declines to grant summary judgment to defendant on the "longitudinal axis" limitation. A reasonable jury could find that defendant's device has a "longitudinal axis" fixed relative to the retainer, even though the axis rotates freely with respect to the anchor pad.

B

Olympia also asserts the district court was incorrect when it construed the claim limitation "an elongate shank … defining a
longitudinal axis" to require a linear shank. Olympia argues against defining the claim element to require a straight tool shank and argues that "longitudinal axis" just means the line-curved, straight, or both- that is defined by the shank itself. We agree with the district court that the scope of the claims should be limited to cover pry bar shanks that are straight.

"Longitudinal" means "running lengthwise," Webster's, supra, at 1333, and "axis" is "a straight line about which a body or a 3-dimensional figure rotates or may be supposed to rotate," id. at 153. Other definitions of axis used in various technical fields also explicitly include a straight line. See id. In general math parlance, a coordinate system in three dimensions has an x, y, and z axis, which are straight lines that are perpendicular to each other and used as a reference system to define points in geometric space. See id.

Requiring "longitudinal axis" to mean the strict geometrical definition of an axis of rotation or axis of symmetry would read the embodiment disclosed in Figure 1 of the patent out of the claims. See '553, Figure 1 (disclosing a shank that does not have an axis of rotational symmetry). The "axis" in claim 19 does not include a requirement of rotational symmetry. An axis can simply be "a line actually drawn and used as the basis of measurements in an architectural or other working drawing" or "a main line of direction, motion, growth, or extension." Webster's, supra, at 153. These definitions incorporate the use of the word "line" and state that the line must be such that it can be used as a measurement reference or a direction. A line of reference is necessarily straight. In the specification, the axis is used to define various angles and distances, for example angle a and distances d and c in figure 1. The angle of the hook is measured in reference to the axis of the tool. Therefore, the ordinary meaning of the term "axis" as linear is supported by the specification.

Olympia argues that this meaning is contradicted by usage in the prior art, which it suggests teach axes that are not straight. The references relied on by Olympia actually teach the contrary, and show axes drawn as straight reference lines in the patent figures. See U.S. Patent No. 5,577,711, Fig. 1 ("the '711 patent" or "Shine"); U.S. Patent No. 4,844,416, Figs. 1-2 ("the '416 patent" or "Hand"). In fact, the Shine reference uses the "longitudinal axis" in measuring the length of the body of the tool, a linear dimension. '711, col. 3, ll. 5-7. The other reference that Olympia claims discloses a curved axis also shows a straight line. See '416, Fig. 1. The Hand reference actually discloses that "crowbar 10 includes a reference vertical plumb line or axis 12 and a reference horizontal line or axis 14, which is disposed normal to line 12." Id. at col. 2, l. 24. This description suggests an "axis" is a line that can be vertical, horizontal, plumb, or used as a reference. These terms are used in the context of a straight line. Olympia's own references to prior art do not support its assertion that an axis, as used in the prior art, can be curved or nonlinear; rather the art uses the term for straight lines.

Finding that the axis must be linear or straight does not improperly import limitations from the specification. It only incorporates the ordinary meaning of axis found not only in the dictionary but as used in the art. Therefore, the "longitudinal axis" in claim 19 is a straight line that follows the center of the shank lengthwise. Although Olympia argues that the shank curvature of the Alltrade tool is de minimus, they never put in evidence of the deviation. Because the court correctly found that the claim required a linear axis and that this axis is not present in the Cobra Bar, the court did not err in finding that Olympia had not demonstrated a likelihood of success on infringement.

2391

I.

Johnstown sued Trinity for infringement of United States Patent No. 4,361,097 (the '097 patent). The '097 patent is directed to a gondola car suitable for rotary unloading. The floor of the car that is the subject of the invention contains a pair of concave troughs running the length of the car and separated by a center sill.

Claims 1 and 6 are the only independent claims of the patent. Claim 1 reads as follows:

A railway car for carrying bulk materials having a pair of side walls and a pair of end walls supported by spaced trucks, the improvement comprising a floor structure having

(b) a center sill extending longitudinally over said trucks,

(c) a pair of concave floor panels between said trucks, each panel forming a longitudinal curvilinear trough having closed
ends, the longitudinal axis of each of said troughs extending parallel to the longitudinal axis of said center sill.

Claim 6 recites:

A floor for a railway car comprising a center sill and a pair of longitudinal curvilinear troughs having closed ends secured to opposite sides of said center sill with the longitudinal axes of said troughs extending parallel to the longitudinal axis of the center sill.

On September 13, 1993, Trinity moved for summary judgment, arguing that the accused gondola car, the Trinity Aluminator II, did not literally infringe the '097 patent and that Johnstown's doctrine of equivalents claim was barred by prosecution history estoppel. Johnstown, 865 F. Supp. at 1160.

On September 2, 1994, the district court granted summary judgment in favor of Trinity on the issue of literal infringement. Id. In so doing, the court focused on the question of whether the accused gondola met the limitation of claims 1 and 6 that the longitudinal axes of the troughs be parallel to the longitudinal axis of the center sill. 2 The court construed the claim term "axis" as defining "a line about which a geometrical figure is symmetrical." Id. at 1163 (quoting American Heritage Dictionary of Science 55 (1986)). The court determined that because the Aluminator II troughs slope up from either end of the car to the middle, a single axis about which each trough is symmetrical cannot be drawn. Id. The court thus adopted Dr. Glenn Sinclair's 3 interpretation that each trough of the Aluminator II has two axes, each of which slopes up at the angle of inclination of the troughs. Id. Accordingly, the court found that the Trinity Aluminator II does not literally infringe because the longitudinal axes of its troughs do not extend parallel to the longitudinal axis of its center sill. Id. at 1163-64.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

2 It was undisputed that the other limitations of claims 1 and 6 were met in the Aluminator II.

3 At the time he executed his affidavit, Dr. Sinclair was a professor of mechanical engineering at Carnegie Mellon University. Id. at 1163.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

Addressing the issue of infringement under the doctrine of equivalents, the district court concluded that prosecution history estoppel did not bar the application of the doctrine. Id. at 1165-66. The court reasoned that although the term "longitudinal axis" was added during prosecution, the parallelism requirement existed before the claims were amended. Id. The court opined that the amendment was not made to overcome prior art, as Trinity contended, 4 but rather to "simplify and clarify the parallelism requirement." Id. at 1165.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

4 Trinity argued that the limitation that the longitudinal axes of the troughs extend parallel to the longitudinal axis of the center sill was added to overcome a 35 U.S.C. § 102 rejection based on United States Patent No. 1,412,660 (the Kuehner patent). Id. at 1164-65.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

Because the court did not resolve the doctrine of equivalents issue on motion for summary judgment, a trial on the merits ensued. During the trial there were a number of objections to the admissibility of evidence. Requests by both parties for JMOL were denied. The court instructed the jury, with objections by both parties, on the issue of infringement under the doctrine of equivalents. On August 15, 1996, the jury returned a verdict of noninfringement under the doctrine of equivalents. Johnstown filed a JNOV motion and in the alternative a motion for a new trial. On September 13, 1996, the court denied the motions. This appeal followed.

II.

Determining whether a patent is infringed entails a two-step analysis. "First, the claim must be properly construed to

In this case, the district court decided the issue of literal infringement on motion for summary judgment. Summary judgment is appropriate when "there is no genuine issue as to any material fact and . . . the moving party is entitled to a judgment as a matter of law." Fed. R. Civ. P. 56(c). We review the district court's grant of summary judgment de novo. Lantech Inc. v. Keip Mach. Co., 32 F.3d 542, 545, 31 U.S.P.Q.2D (BNA) 1666, 1669 (Fed. Cir. 1994). Because there are no material facts in dispute, the issue before us is one of law: the correct construction of the "longitudinal axis" limitation of claims 1 and 6.

As already seen, claims 1 and 6 recite the limitation that the longitudinal axes of the troughs extend parallel to the longitudinal axis of the center sill. Neither the specification nor the prosecution history sheds light on the term "longitudinal axis." Recognizing this, the district court adopted what it perceived to be the common definition of the term "axis." We agree that if a patentee does not define a term in the specification or prosecution history, it is proper for the trial court to ascribe to the term its common meaning. See Envirotech Corp. v. AI George, Inc., 730 F.2d 753, 759, 221 USPQ 473, 477 (Fed. Cir. 1984) ("Words in a claim will be given their ordinary and accustomed meaning, unless it appears that the inventor used them differently." (citation omitted)). We conclude, however, that the district court erred in adopting a definition for "axis" that corresponds to the definition of "axis of symmetry" as opposed to the definition of "longitudinal axis." Whereas the district court's definition implicitly requires that the body through which the axis penetrates be symmetrical, the dictionary definition of "longitudinal axis" conveys no such requirement. Instead, the definition, which defines "longitudinal axis" as "an axis along the lengthwise direction of the figure or body, usually passing through its center of gravity," only requires an ascertainable lengthwise direction in which the longitudinal axis can be drawn. Cyril M. Harris, Dictionary of Architecture & Construction 500 (2d ed. 1993).

Therefore, reading the claim in light of the common meaning for the term "longitudinal axis," we conclude that if a lengthwise direction can be ascertained for a given trough, then a single longitudinal axis can be drawn. If a longitudinal axis can be drawn for each trough, such that the longitudinal axis of each trough is parallel to the longitudinal axis of the center sill, then the parallelism limitation of claims 1 and 6 is satisfied.

E. "longitudinal axis of said mounting base"

The court will construe "longitudinal axis of said mounting base" as "a line extending between the front and rear edges of the base member and perpendicular to both edges."

Claim 1 provides that the "longitudinal axis of said mounting base is in substantial alignment with a barrel of said firearm." Defendant would construe "longitudinal axis of said mounting base" as "the line extending the length of the mounting base along which the mounting base is symmetrical." Plaintiff objects that the proposed definition would limit the device by imposing a symmetry requirement on the mounting base. The claim does not require strict longitudinal symmetry, and Defendant's proposed construction is therefore too limiting.

Plaintiff does not propose any alternative language. However, Claim 1 elsewhere describes the longitudinal axis of the base member as a line "extending between said front edge and said rear edge" of the base member. When construing patent claims, "the court should look first to the intrinsic evidence of record, i.e., the patent itself[ ]" Vitronics, 90 F.3d at 1582. The court will therefore adopt its own construction of the term "longitudinal axis" consistent with that description, as set forth above.

[GO BACK]
5. "longitudinal edge"

Here, the parties agree that "longitudinal" means "lengthwise." As discussed above, however, the parties disagree over the construction of "edge." Floe's proposed construction of edge, as stated above, is "border." Thus, according to Floe, "longitudinal edge" means "an edge (i.e., border) extending along the length of an object or structure." Newmans, as discussed above, asserts that an "edge" is a "boundary or point where a surface begins or ends." Thus, according to Newmans, "longitudinal edge" should be construed as "longitudinal boundary or point where a surface begins or ends."

Consistent with the Court's construction of "edge," as discussed above, the Court construes the phrase "longitudinal edge" as "longitudinal boundary or point where a surface begins or ends."

The language of Claim 1 that is in question states:

"... [the] said housing has a cover and a pair of side walls depending from said cover, each of said side walls forming a longitudinal groove adapted to cooperatively receive a respective pair of said header rails. ... (Pl's Ex. 1, emphasis added).

No where in Claim 1 is there language of "continuous groove" or "continuous sidewalls." Granted, the diagrams included within the preferred embodiment show a continuous edge on the body of the tilt-latch, implying that the sidewall, or groove, must be continuous. However, Ashland is correct that patent claims should not be limited to the preferred embodiment. See Transmatic, Inc. v. Gulton Industries, Inc., 53 F.3d 1270, 1277 (Fed.Cir. 1995) ("a patent claim is not necessarily limited to a preferred embodiment disclosed in the patent."); Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed.Cir. 1988) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations."); cert. denied, 490 U.S. 1068, 104 L. Ed. 2d 634, 109 S. Ct. 2069 (1989); Texas Instruments, Inc. v. United States International Trade Commission, 805 F.2d 1558, 1563 (Fed.Cir. 1986) ("This court has cautioned against limiting the claimed invention to preferred embodiments or specific examples in the specification.").

Since Claim 1 does not contain any limiting words, such as "continuous," it is broader than the preferred embodiment and the other claims. The narrower limitations of other claims cannot be read into Claim 1. Teletronics, 857 F.2d at 783 (Fed.Cir. 1988); SRI Int'l, 775 F.2d at 1122 (Fed.Cir. 1985); Deere & Co. v. International Harvester, Co., 658 F.2d 1137, 1141 (7th Cir. 1981), cert. denied, 454 U.S. 969, 70 L. Ed. 2d 386, 102 S. Ct. 514 (1981). Therefore, the plain language of the claim does not require a continuous groove.

B. The Specification
While the specification describes the design with the continuous sidewalls diagramed in the preferred embodiment, Ashland argues that the specification does not require such a continuous wall. (Pl's Mem. in Support, p.13). Claim 1 is broader than both the preferred embodiment and the specification; however, that does not mean that Claim 1 must be limited, for it is improper to read limitations from specifications into the claims. The law does not require every conceivable embodiment to be included in the specification. (Pl's Mem. in Support, p. 15).

Ashland's argument is correct. The courts have found that "where a specification does not require a limitation, that limitation should not be read from the specification into the claims." Specialty Composites v. Cabot Corp., 845 F.2d 981, 987 (Fed.Cir. 1988). If everything in a specification were required to be read into the claims, or the patent was limited only to the design in the specification, then there would be no need for claims. SRI Int'l, 775 F.2d at 1121 (Fed.Cir. 1985). While the specification for '291 describes a model with a continuous groove, the benefits of the patented design can be gained from a non-continuous wall, as long as the walls are significantly longer than the flare tabs of the prior art Ro-Mai design. MEC even admitted at oral argument that the specification could be read to include this noncontinuous design. (Hearing Transcript, pp. 45-46).

Finally, the specification does not have to include every possible design under the patent: "The law does not require the impossible. Hence, it does not require that an applicant describe in [her] specification every conceivable and possible future embodiment of [her] invention. The law recognizes that patent specifications are written for those skilled in the art, and requires only that the inventor describe the 'best mode' known at the time to [her] of making and using the invention." SRI Int'l, 775 F.2d at 1121 (Fed.Cir. 1985) (citing 35 U.S.C. § 112). In the present case, the "best mode" seems to be continuous grooves or sidewalls in order to provide the maximum strength against bending and disengagement. However, the "best mode" does not preclude a slightly weaker design of noncontinuous grooves that are longer than the flare tabs of the prior art Ro-Mai tilt-latch.

C. Prosecution History

The prosecution history does not shed light on this issue of the continuous groove. Ashland states that the United States Patent and Trademark Office allowed Claim 1 to be filed as is, and MEC points out that there is nothing in the history that contradicts the claim or the specification. In other words, the prosecution history is silent on this issue.

D. Extrinsic Evidence

Both parties conceded that it is not necessary for the court to review extrinsic evidence, for any ambiguity in the terms of Claim 1 is eliminated by reviewing the intrinsic evidence. (Pl's Mem. in Support, pp.17-18; Dft's Mem. in Support, p.8). However, both sides still offered several pieces of extrinsic evidence to the court.

Ashland presented window end pieces from other manufacturers with window tracks that had noncontinuous grooves in order to demonstrate that within the window hardware industry, grooves can have either continuous or noncontinuous sidewalls. (Pl's Mem. in Support, p.18). MEC presented definitions from Webster's dictionary of "groove," "longitudinal," "cooperate," and "receive," as well as pieces of Ashland's sales literature. (Dft's Mem. in Support, p. 8-10).

Since the court finds that a review of the claim, the specification, and the prosecution history clarify any ambiguity in Claim 1, it is not necessary to examine the extrinsic evidence of either side. 3

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 At the hearing, both parties became involved in a discussion of the definition of "groove." After an examination of the definition presented by MEC, ". . .a long narrow hollow or channel made artificially in a surface," the court finds that the definition does not require the groove to be continuous for any specified length.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - -

Conclusion

After an examination of the claim, the specification, and the prosecution history of the '291 patent, it seems clear to the
court that the '291 patent does not require that a groove be continuous for the patent to apply. Therefore, the court construes the meaning of "a longitudinal groove adapted to cooperatively receive a respective pair of said header rails" in Claim 1 to be defined as:

"a recess formed along the exterior side of each of the side walls which receives a respective one of the opposed header rails along the length of the housing, wherein each of the recesses is defined by two spaced recess walls which cooperate to receive one of the header rails, and each of the recess walls is defined by one or more projections which extend substantially along the length of the side wall." (Pl's Mem. in Support, p. 3).

B. The "Groove".

The parties dispute the meaning of the phrase in Claim 1 that states "each of said side walls forming a longitudinal groove adapted to cooperatively receive a respective pair of said header rails" (Pl.'s Mem. at 2; Def.'s Mem. at 6-7) (emphasis added). The parties agree that the "groove" referred to in this phrase is the recess (Patent Fig. 2, element 64) created between the overhang of the cover (Patent Fig. 2, element 50) and one or more projections on the side wall (also known as the side wall rail) (Patent Fig. 2, element 62). Both parties also agree that the groove does not have to be "continuous" to fall within the scope of the patent: that is, they agree that it need not extend for the full length of the side wall (Pl.'s Mem. at 9-10; Def.'s Mem. at 8-9). The parties disagree, however, on two specific points: they dispute what portions of the recess can properly be called a "groove," and how far the projections must extend along the side wall.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

5 Judge Coar used the term "projections" to describe the side wall rail, which is the structure forming the bottom side of the groove. This structure has also been defined as a "surface" in some of the briefs. For the purposes of this opinion, the word "projections" will be used.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -

Ashland contends that the length of the groove is to be measured from the beginning of the first projection to the end of the last projection, regardless of the number or size of the gaps in between. As to the length of the groove, Ashland advocates adoption of Judge Coar's construction, which Ashland reads as saying that the groove must extend "substantially" the length of the side wall. Ashland further argues that what is "substantially" is a question of fact for the jury and not of law for the Court.

Ro-Mai, on the other hand, contends that the length of the groove must be measured by adding the aggregate length of each of the projections, and that gaps between the projections on the side walls must be disregarded in making that calculation. As to what is "substantial," Ro-Mai urges a construction that would require the groove (and thus the projections) to extend three-fourths of the length of the side wall.

In resolving these disputes over construction, the Court follows the teaching of Markman and considers in turn the claim language, the specifications, the prosecution history, and any extrinsic evidence.

1. The Claim Language.

Claim 1 of the '291 patent describes an invention containing a "longitudinal groove adapted to cooperatively receive a respective pair of said header rails." The phrase "adapted to cooperatively receive a respective pair of said header rails" is not disputed, and simply means that the groove (the subject of the sentence) is positioned and formed in a manner that it can accept the header rail. Nor do the parties contest the meaning of the term "longitudinal." The plain and ordinary meaning of the term "longitudinal" is "placed or running lengthwise." Merriam Webster's Collegiate Dictionary 687 (10th ed). Both parties agree that the groove runs lengthwise along the latch. Thus, the sole term being disputed is the term "groove." The plain and ordinary meaning of "groove" is "a long, narrow channel or depression." Webster's, at 514 (emphasis added).
The claim language, however, is silent as to how to measure the length of the groove in the event that there is one projection on the side wall that does not run the full length. Likewise, the claim language provides no guidance on how to measure the length of the groove if it is formed by two or more discontinuous projections. Nor does the claim language state how far the groove must extend along the length of the side wall to fall within the patented invention. Thus, we turn to the specification to attempt to glean further understanding on these points.

2. The Specification.

The specification sheds little light on the intended meaning of the word "groove." Nothing in the patent specification indicates that the term "groove" is being used in a manner inconsistent with its ordinary meaning. The preferred embodiment of the latch disclosed in the patent specification has a groove created by a continuous projection on each side wall (Patent Fig. 2, element 62). It is clear from the specification that the purpose of the groove is to better engage the header rail; the implicit assumption is that the longer the groove, the more securely the latch will be retained. Moreover, the specification notes that by the use of a groove (that is, a "long, narrow channel"), Ashland sought to differentiate its invention from the Ro-Mai prior-art latch, which used a small, single tab as the sole means of engaging the header rail at the side wall of the latch.

However, as Ashland correctly points out, the preferred embodiment should not be read to limit the claims. SRI Int'l, 775 F.2d at 1121. An inventor is not required to disclose every possible embodiment of his invention. Id. The preferred embodiment -- a continuous groove extending the full length of the side wall -- is one way of achieving the differentiation from the Ro-Mai prior art, and the attendant benefits of the invention claimed by the '291 patent. But, as Ro-Mai admits, it is not the only way.

In the situation where the projections creating the groove are non-continuous (or there is a single projection that is shorter than the full length of the side wall), the Court agrees with Ro-Mai that no "groove" is created where there is an absence of projections to create a recess with the cover. Put another way, literally speaking, a groove is not created where there is no projection to create the groove. The Court believes that this construction is consistent with the specification, which indicates that the intent of the '291 patent was to provide a means of engagement that improved upon the tab used by Ro-Mai. As Ashland admitted in oral argument, its proposed construction -- which would include the space (or "gaps") between the projections in calculating the length of the groove -- would bring within the patent a latch with two tabs positioned at the far ends of the side wall (Def.'s Mem., Ex. C, Fig. H, reproduced to the right), even if those projections were collectively only slightly longer than the Ro-Mai prior-art tab.

Ashland's definition is in direct conflict with the plain and ordinary meaning of the word "groove" -- Figure H simply does not literally present a "long, narrow channel or depression." The Court finds that this aspect of Ashland's proposed construction would extend the patent beyond its literal scope, and thus rejects Ashland's proposed construction on this point in favor of that offered by Ro-Mai.

However, we reach a different result on the issue of how far the groove (and thus the projections) must extend along the side wall. Neither the claim nor the specification support Ro-Mai's attempt to place a fixed numeric limit (75 percent or otherwise) on the length of the groove -- or on the length of the projections needed to create the groove. We agree with Judge Coar's observation that "the benefits of the patented design can be gained from a non-continuous wall, as long as the walls are significantly longer than the flared tabs of the prior art Ro-Mai design." MEC, 1999 WL 184652, at *4. As Ashland correctly points out, what constitutes "substantially the length of the side wall" is a question of fact that should be left for the trier of fact. Markman, 517 U.S. at 384. If courts were to set out such strict constructions of patent claims, juries would function as mere rubber stamps in infringement cases; there would be no need for the jury at all. While patent claims do need to be sufficiently clear to allow competitors to know what is patented, there is no case law to support Ro-Mai's assertion that absolute mathematical precision is required here. See Vitronics, 90 F.3d at 1583 (competitors are entitled to review the public record, apply the established rules of claim construction, ascertain the scope of the patentee's claimed invention and, thus, design around the claimed invention).

3. The Prosecution History and Extrinsic Evidence.
Both parties agree that the prosecution history does not contain any information relevant to the construction of Claim 1 (except for some minor changes, the patent was accepted as filed). Other than the dictionary definitions discussed above and the samples of latches submitted by the parties, the Court does not find any extrinsic evidence, except for a dictionary, helpful in construing the claims -- and the parties have pointed to none.

* * *

Therefore, upon consideration of the relevant intrinsic and extrinsic evidence, we adopt Ashland's proposed construction that requires -- as Judge Coar also has held -- that the projections "extend substantially along the length of the side wall." MEC, 1999 WL 184652, at *5. However, as we discussed above, we emphasize that it is the projections themselves (and not the gaps between them) that literally create the groove, and that must extend substantially along the length of the side wall.

2396

B. "Longitudinal Slot"

TBC proposes that the claim term "longitudinal slot" be defined as: "A narrow channel with an essentially flat bottom and upstanding side walls formed within an extrusion or rail and extending along a length of the extrusion or rail." Forecast rejects TBC's proposal that a longitudinal slot must be "narrow" and have "an essentially flat bottom and upstanding side walls." Instead, Forecast proposes that "longitudinal slot" be defined as: "A slot formed within an extrusion or rail and extending along the length of the extrusion of rail." As set forth below, the Court agrees with Forecast, as TBC's construction impermissibly imports limitations from a mere preferred embodiment into the claim term.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

13 The term "longitudinal slot" is found in claims 1, 6, 7, 8, 9, 13, 14, and 15 of the '712 patent; claims 1, 5, 6, 7, 9, 10, 11, and 12 of the '088 patent; and claims 1, 2, 3, 4, 5, 7, 9, 11, 13, 15, 16, 17, 18, 19, and 20 of the '803 patent.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

TBC appears to be arguing that the definition of longitudinal slot should be limited to something akin to the "T-shaped slots" disclosed throughout the specification. The specification, however, is clear that a T-shaped slot is merely a "preferred" embodiment of the Forecast patents; it does not constitute an outer limit of the claim term.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

14 The Court notes that certain aspects of TBC's proposed definition are vague. Even if the Court were to agree with the substance of TBC's proposed limitation, it would be difficult to apply such requirements as an "essentially" flat bottom or a "narrow" channel to an accused device.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

First, both the claims and the specification refer to longitudinal slots that "preferably are T-shaped" or simply to "T-shaped" longitudinal slots. ("712 patent; col. 3, lines 2-3; Claims 7 & 14). The use of T-shaped to modify the claim term longitudinal slots thus suggests that the meaning of longitudinal slot, standing alone, is not so confined. See Phillips, 415 F.3d at 1324 (finding that claim language providing that "baffles" may be "oriented with panel sections disposed at angles" to deflect incoming projectiles, makes it likely that the patentee did not contemplate the term "baffles" already contained that specific limitation).

Second, when read as a whole, the Forecast patents do not disclose an intention to limit the longitudinal slots to a specific shape or size. The specification itself recites that various fingers must be "sized to fit within and engage" the relevant longitudinal slots -- suggesting that not all slots have the same simple narrow structure proposed by TBC. ("712 patent; col. 5, lines 64-66.) And TBC points to no evidence from the prosecution history to suggest that Forecast relied on any specific
The very character of the invention requires that a "finger" sufficiently engage a "longitudinal slot" to support the component and permit its horizontal adjustment; it does not require either to be (as explained above) the particular type or shape disclosed in the specification as the patentee's preferred construction. Thus, the Court agrees with Forecast's proposed definition and defines longitudinal slot as: "A slot or channel formed within an extrusion or rail and extending along a length of the extrusion or rail."

Plaintiffs seek to have the Court construe the term "longitudinal strand" as "strand or strands which run in the length-wise direction of the netting structure." Defendants propose the term be defined as "strands forming the netting arrangement extending in the longitudinal direction which do not include any stitch loops and are not immediately next to another parallel longitudinal loop." 2

Plaintiffs base their definition on the plain and ordinary meaning because "the term has no special meaning." (Plaintiffs' Opening Claim Construction at 16.) Defendants contend that plaintiffs provide no support for their construction, either intrinsic or extrinsic. (Defendants' Responsive Claim Construction at 15.) But according to plaintiffs, defendants' construction is premised on a preferred embodiment. A particular embodiment appearing in the written description may not be read into a claim when the claim language is broader than the embodiment. Electro Med. Sys. S.A. v. Cooper Life Sci., Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994).

In explaining why the definition of "longitudinal strand" should not include any stitch loops, defendants state that stitch loops are "the little loops in the lateral strands that connect to the regular loops of the stockinette." (Markman Tr. at 73.) "When the meat product is stuffed into the netting, the heavy yarn will be pulled tight, causing these little loops to disappear so that the heavy yarn with be firmly pressed against the product. So if these lateral strands disappear when the meat goes in there, we don't think they should be construed as a longitudinal strand." Id. Defendants do not "feel that a stitch loop can contribute to a four-sided shape when it disappears - when its longitudinal component disappears when it is stretched." Id. at 74. Defendants provide no intrinsic or extrinsic evidence to support their belief and the Court finds none in the claim language, specifications or prosecution history. As a result, the construction of "longitudinal strand" does not require the inclusion of "which do not include any stitch loops" language.

Defendants also seek to include language that the netting arrangement strands are "not immediately next to another parallel longitudinal loop" based upon the claim language which provides that the netting arrangement is comprised of a "first plurality of spaced strands" in the longitudinal direction. The dispute becomes whether a strand is a single yarn or whether a strand can be composed of several yarns. Plaintiffs argue that "[a] strand is a very broad concept and doesn't refer to one individual filament or 2 or 3 or 20, or however many you wanted to use. The strand is the structure itself; it's not the components of the structure." (Markman Tr. at 88.) Plaintiffs' interpretation is based on how the term "strand" is used in Claim 1 and how it is used throughout the patent. The Court agrees. Although the claim language requires that the longitudinal strands be spaced in order to create the checkerboard pattern, defendants seek to limit longitudinal strands to a single component, i.e., an individual strand, by including language that strands are "not immediately next to another parallel longitudinal loop." Defendants point to Figure 12 which "basically shows no spacing between the longitudinal strands and basically cannot create a checkerboard pattern." (Markman Tr. at 74.) It appears defendants are using the term "strand" as a component rather than as a structure. When "longitudinal strands" are considered as a structure, the claim language
requiring that those strands be spaced needs no further definition of the kind defendants suggest. Defendants have not offered any intrinsic or extrinsic evidence to support this construction.

The Court construes "longitudinal strand" as "strand or strands which run in the lengthwise direction of the tubular casing."

The only dispute between the parties is whether Medtronic's Premier infringes one limitation of claim 1 literally or under the doctrine of equivalents. Claim 1 states:

1. A bone plate assembly comprising;
   a fixation plate . . ., a locking plate, and a bone fastener . . ., and

   wherein the locking plate . . . is longitudinally adjustable along said longitudinal axis from a first position wherein the bone fastener can be fixed to said bone to a second position in which the bone fastener is locked into position by the locking plate.

   (Finkelstein Decl. Ex. A at col. 5.)

Plaintiff argues the words "from a first position . . . to a second position" should be construed to mean the locking plate can be fixed in only two positions. The Court disagrees. The plain language of the claim requires the locking plate be able to be fixed in two positions, but it is not limited to two positions. The language does not exclude the ability of the locking plate to be fixed in an intermediate position between the position where the bone fastener is fixed to the bone and the position where the bone fastener is locked into place.

The Court agrees with Plaintiff the word "a" refers to a single first position and a single second position. That there must be one first position and one second position does not exclude intermediate positions from the scope of the claim.

"a longitudinally extending center flange"

The term "longitudinally extending center flange" refers to a single, vertically planar projecting rim or rib located along the middle part or the centerline of the support and extending along the longitudinal length of the vehicle on which the detent plate structure is formed or attached. This structure is not attached to the inside of a supporting sidewall or a walled arrangement.

While noting that the article "a" can mean "one or more" in patent claims, see AbTox, Inc. v. Exitron Corp., 122 F.3d 1019, 1023 (Fed. Cir. 1997), the Court finds the specification language to express a singular embodiment of the invention's center flange. Notwithstanding Plaintiff's arguments comparing the use of "a" in this term to indefinite terms in other patents found to potentially contemplate the existence of multiple elements, the "center flange" element in this term is described more like the patent term "a cup" at issue in Insituform Techs., Inc. v. Cat Contracting, Inc., 99 F.3d 1098 (Fed. Cir. 1996) than the elements at issue in the cases cited by Plaintiff. The claim language and the specification in Insituform were interpreted as suggesting "a cup" was meant to encompass only one cup. There, the asserted claim repeatedly described a single cup, using the term "the cup" and describing a process in terms of a single cup. Insituform, 99 F.3d at 1105-06; See also AbTox, 122 F.3d at 1023-24 (interpreting the article "a" in the claim term "a metallic gas-confining chamber" as suggesting a single chamber). In Claims 1 and 5 in the '538 patent, the "center flange" element is referenced back to as "said center flange" and "the center flange," suggesting a single flange. ('538 patent, col. 5, at lines 40-41; col. 6, at lines 7-8, 11). Additionally, neither the specification nor the drawings of the '538 patent reveal the use of more than one center flange.

However, this interpretation does not create the outcome that any product containing an additional, unrecited structure in the
support (such as another flange or a wall) would not infringe upon the patent. The specific claim term construed here only refers to a single center flange, but the term "comprising" in these claims permits the claims to include additional elements. Use of the transitional term "comprising" in patent claims indicates that the claims are inclusive or open-ended and may be supplemented by additional, unrepeated elements. See Renishaw P.L.C. v. Marposs Societa' Per Azioni, 974 F. Supp. 1056, 1083 (E.D. Mich. 1997). Thus, an accused product need not exactly meet every limitation to infringe a patent claim that contains the term "comprising" in its preamble. Modification by merely adding elements cannot negate infringement if the accused device has otherwise adopted the basic features of the patent. Id. Nevertheless, in accordance with the stated objectives of the '538 patent, any modified version of the support covered by these claims must provide an open structure facilitating the mounting of the shift lever to the same extent as the invention to solve certain specified problems with known shifter support structures having a cup-shaped section. A support within the scope of Claims 1 and 5 must reduce weight and save material, as well as alleviate the semi-blind assembly problem. ('538 patent, col. 1, at lines 33-39).

2400

4. Claim 8 ("longitudinally extending cutting edge")
As noted above, Claim 8 of the '544 Patent uses the term "longitudinally extending cutting edge" in the following context: "An ultrasonic instrument according to claim 6, wherein the curved blade surface includes a longitudinally extending cutting edge." '544 Patent, Claim 8 (emphasis added). Plaintiff proposes construing the term as "the edge of the blade surface that engages tissue to achieve cutting and extends along the lengthwise dimension." Defendant proposes: "Edge adapted for cutting that extends outwardly and downwardly in the distal direction."

First, the Court notes that Claim 8 is a claim dependent on Claim 6, which is discussed above. The "curved blade surface" claim term from Claim 6 and dependent Claim 8, however, is distinct from the "longitudinally extending cutting edge" that is at issue here. Specifically, as defendant's counsel explained at the Markman hearing, "[what] claim 8 is adding to the independent claim [6] is [that] you can have a cutting edge which is longitudinally extending" on the curved blade surface. Markman Tr. at 118-19. This is because, the "blades" are designed for cutting with harmonic energy and therefore, "the blade can be . . . quite blunt or flat," id. at 118, and thus claim 8 adds a longitudinally extending cutting edge to the curved blade surface claimed in Claim 6.

It is clear from the claim language and other intrinsic evidence that the customary and ordinary meaning of "cutting edge" is a "blade surface designed for cutting," and thus, the Court will incorporate that description in its construction. Additionally, while the specifications of the '544 Patent describe the cutting edge as one that curves "downwardly and outwardly in the distal direction," '544 Patent 4:31-55, Figures 4 & 11, the Court will not import that limitation from the specifications into the claim language where there is no indication in the intrinsic evidence that the cutting edge must be curved in the downward and outward direction, particularly where counsel for Ethicon acknowledged that the cutting edge could extend upwards. Thus, the Court construes the term as: "The edge of the blade surface designed for cutting that extends along the lengthwise dimension."

2401

1. "Longitudinally flexible stent." Consistent with its ordinary meaning 1 and the specification, the court construes "longitudinally flexible stent" to mean "a stent that is flexible along its longitudinal axis (i.e. length) to facilitate delivery through tortuous body lumens." 2

--- Footnotes ---

1 See American Heritage Dictionary 741 (2d ed. 1984) (defining "longitudinal" as "of or pertaining to length"); id. at 513 (defining "flexible" as "capable of being bent or flexed; pliable").

2 Plaintiffs argue that "to facilitate delivery through tortuous body lumens" is an unnecessary restriction. However, the intrinsic evidence supports the conclusion that having longitudinal flexibility alone is not enough to meet the restrictions of the Lau design; a stent must be flexible enough to be delivered through "tortuous body lumens" before it will be considered to meet the "longitudinally flexible" limitation of the Lau patents.
"Longitudinally spaced" (’063 Patent):

Requiring a spacing surface providing at least enough separation between seating surfaces to enable a paddler seated on one seating surface to paddle without interfering with another paddler or passenger.

3. "Loop"

I have construed "loop" to mean "a C- or U-shaped structure." 111 The presence of such a loop is required by all asserted claims. Guidant argued in a letter preceding its motion that the Penta does not infringe these claims because its Access-Link is actually a five-turn "S-shaped" structure. 112 However, Guidant does not make this argument in its motion. 113

In any case, Guidant's argument is at odds with the clear language of my claim construction and the asserted claims themselves. First, Medinol is correct that the phrase "C- or U-shaped structure" does not by its terms exclude C-or U-shapes that happen to be part of an S-shape. 114 Second, the claims themselves only require that there be at least one loop between consecutive first meanders, clearly contemplating that there may be instances where there is more than one loop between first meanders of a stent based on the patents-in-suit. For these reasons, the Penta's Access-Links constitute "loops" for the purpose of these motions. 115

(4) "Loop." A structural element that turns back on itself.
The terms "loose hair" and "non-loose hair" appear in claim 1, and throughout the '540 Patent. Plaintiff argues that "loose hair" should be construed to mean "hair that is inactive and not growing," and that "non-loose hair" should be construed to mean "hair that is active and growing." Plaintiff states that these proposed constructions are supported by the claim language and specification, the prosecution history, and expert testimony. Defendants suggest that "loose hair" should be construed to mean "hair that is not attached or fastened to the furry pet," while "non-loose hair" should be construed to mean "hair that is attached or fastened to the furry pet." Defendants argue that these proposed constructions are based on the plain language of the patent and specification, in addition to expert and inventor testimony, and the construction of terms in prior litigation. The Court has determined that the proper construction of the term "loose hair" is "hair that is inactive and not growing," and likewise, that the proper construction of the term "non-loose hair" is "hair that is active and growing." The Court will review the arguments set forth by the Parties in their briefs and in oral argument, in order to establish the basis for the Court's conclusion.

Plaintiff makes numerous arguments in support of its proposed construction of the claim terms at issue. First, Plaintiff asserts that defining "loose hair" to mean "hair that is inactive and not growing," and defining "non-loose hair" to mean "hair that is active and growing," is consistent with the language of the '540 Patent. Specifically, Plaintiff points out that the claim terms are consistently used in the following context: "the blade edge being adapted to engage the loose hair of the pet and pull it from the pet without cutting or pulling the non-loose hair from the pet." ('540 Patent, doc. # 1-3, p.8 col.4 ll.29-31 (emphasis added)). Plaintiff argues that, as used in the patent language, "loose hair" must include hair that is capable of being "pulled" from the pet. Hair that is not attached or fastened to the pet inherently cannot be included in this category, because there is no need to "pull" hair that is not somehow connected to the pet. This Court finds Plaintiff's argument persuasive, considering that Phillips instructs courts that "the context in which a term is used in the asserted claim can be highly instructive." Phillips v. AWH Corp., 415 F.3d 1303, 1314 (Fed. Cir. 2005).

Similarly, Plaintiff also asserts that its proposed construction is supported by the prosecution history of the '540 Patent. During the prosecution of the '846 Patent, the initial patent in the relevant family of patents, Plaintiff argued to the Board of Patent Appeals that "a blade that is too dull will not pull the loose hair from the furry pet." (Pl.'s Ex. 2, doc. # 101-3, p.3 (FURMO 577) (emphasis added)). Thus, Plaintiff now argues that "loose hair" must include hair that is at least partially within the hair follicle, in order to explain the use of the phrase "will not pull the loose hair from the furry pet" during the patent prosecution. The Court again finds Plaintiff's argument persuasive, considering that Phillips instructs courts that "the prosecution history can often inform the meaning of the claim language by demonstrating how the inventor understood the invention." Phillips, 415 F.3d at 1317.

Finally, Plaintiff argues that its proposed constructions of "loose hair" and "non-loose hair" are consistent with prior art cited in the '540 Patent. Specifically, Plaintiff cites to United States Patent Number 6,055,938 ("the '938 Patent"), which was issued less than one month before the '846 Patent application was filed. The '938 Patent discusses the growth cycle of hair, which is the basis for Plaintiff's proposed constructions of "loose hair" and "non-loose hair." Specifically, the '938 Patent provides: "the hair on cats and dogs go through growth and resting cycles (anagen and telogen phases, respectively) that occurs asynchronously (each follicle cycles independently) and continuously in the majority of breeds. There are similar processes in humans." ('938 Patent, doc. # 101-4, p.6 col.1 ll.13-19). Plaintiff argues, and this Court agrees, that this patent language provides evidence of what a person of ordinary skill in the art would understand about the hair growth cycle, and about the desirability of removing hair that is no longer growing, but that is still in the hair follicle. 3 Of course, determining the understanding of a person of ordinary skill in the art is the ultimate goal of the Court in construing claim terms. See Phillips, 415 F.3d at 1312-13 (noting that "the words of a claim are generally given their ordinary and customary meaning" and that "the ordinary and customary meaning of a claim term is the meaning that the term would have to a person of
ordinary skill in the art in question at the time of the invention"). Therefore, the Court finds that Plaintiff's proposed constructions are not only consistent with the specification and prosecution history, but also with the ordinary and customary meaning of the claim terms.

3 It is generally understood that inventors are considered to be persons skilled in the field of the invention. Phillips, 415 F.3d at 1313.

Defendants' arguments in support of their proposed constructions of the claim terms "loose" and "non-loose," on the other hand, are not persuasive. First, the Court rejects Defendants' argument that the '540 Patent uses the words "loose" and "shed" interchangeably. These two words are used in two very different contexts; "shed" is used in the background section, while "loose" is used in the actual patent claims. The term "shed" does not appear anywhere within the claims that this Court is charged to construe. Additionally, even if "shed" did appear in the actual claims, the Court would not necessarily find the word to be synonymous with "loose" because "[i]n the absence of any evidence to the contrary, we must presume that the use of . . . different terms in the claims connotes different meanings." CAE Screenplates Inc. v. Heinrich Fiedler GmbH & Co. KG, 224 F.3d 1308, 1317 (Fed. Cir. 2000). Ultimately, the words "shed" and "loose" are not generally considered to mean the same thing, so it is not proper to make such an assumption.

In addition to their argument that "loose" is synonymous with "shed," Defendants cite to the testimony of Angela Porter, one of the named inventors on the '540 Patent, to support their proposed construction. The Court does not find such testimony persuasive, considering that the Federal Circuit has instructed courts that "[t]he testimony of an inventor 'cannot be relied on to change the meaning of claims.'" Howmedica Osteonics Corp. v. Wright Med. Tech., Inc., 540 F.3d 1337, 1346 (Fed. Cir. 2008) (quoting Markman v. Westview Instruments, Inc., 52 F.3d 967, 983 (Fed. Cir. 1995) (en banc)). Additionally, Defendants cite to a joint claim construction statement that was filed in another case in the Eastern District of Missouri, involving the same parties, FURminator, Inc. v. Kim Laube & Co., Inc., Case No. 4:06CV01314 RWS (dismissed by stipulation, January 15, 2008). Even though a joint statement was filed, a Markman hearing was never actually held in that case, because briefing was delayed by the filing of Plaintiff's Motion to Voluntarily Dismiss, which was ultimately granted. While the Court recognizes that claim terms in related patents should be interpreted consistently, see generally Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1347-49 (Fed. Cir. 2004), this does not mean that a joint claim construction statement that was never actually examined or adopted by the presiding court has any bearing on the construction of claims in this case.

The Court has set forth and analyzed the arguments made by the Parties in support of their respective proposed constructions, and has concluded that Plaintiff's proposed constructions are proper. Therefore, the Court will construe the claim term "loose hair" to mean "hair that is inactive and not growing," and likewise, will construe the claim term "non-loose hair" to mean "hair that is active and growing."

4 The Court notes that the Parties included extensive extrinsic evidence (particularly expert testimony) in their briefs to support their proposed constructions. The Court finds that it is unnecessary to examine this extrinsic evidence in order to construe the claim terms, and thus exercises its discretion not to consider it. Phillips, 415 F.3d at 1319.

H. Low Modulus Material

Tessera argues that "low modulus material" means "a material with a relatively low elastic modulus (also known as Young's Modulus an/or shear modulus), which is a material property that is defined as the amount of stress needed to produce a
given amount of strain." Samsung originally proposed "low modulus material" to mean "a material with a low elastic modulus (also known as Young's Modulus), which is a material property defined as the amount of stress needed to produce a given amount of strain (deformation)." Joint Claim Construction Statement at B3:2-3. Samsung changed its position to eliminate reference to Young's modulus in its proposed construction, now proposing that the term means "a material with low elastic modulus, which is a material property defined as the amount of stress needed to produce a given amount of strain (deformation)." As such, Tessera and Samsung agree that measures of both normal and shear forces are proper.

The remaining difference between the parties is whether low modulus is a relative or absolute measure. The specification repeatedly refers to low modulus as an absolute, not relative value. '977 patent at 4:28-36, 17:40-49, 17:66-18:7, 18:43-47, 19:2-3, 24:25-26, 27:27-31, 27:67-28:3, 30:10-12. Nothing in the specification requires or suggests that modulus value is a relative measurement. Thus, the Court construes "low modulus material" to mean "a material with low elastic modulus, which is a material property defined as the amount of stress needed to produce a given amount of strain (deformation)."

6. Low Flow Rate

The sixth disputed claim term "low flow rate" is found in Claims 1 and 35 as set forth above.

Erbe's Proposed Definition: A flow rate that causes the gas exiting through the opening at the distal end of the flexible tube to be a non directed, non laminar stream that forms an inert gas atmosphere.

Canady's Proposed Definition: Much smaller than one liter per minute and producing flow velocities less than 19 km/hour. 5

(Docket No. 42, p. 7). The claim language set forth in Claim 1 describes the characteristics of a low flow rate as being" less than about 1 liter/minute." Docket No. 42, Ex. 1, col. 11, II. 42-43. Erbe's proposed construction ignores the plain claim language in Claim 1, which defines the characteristics of the term as a rate "of less than about 1 liter/minute." Docket No. 42, Ex. 1, col. 11, II. 42-43. The claim language set forth in Claim 35 describes a low flow rate in terms of what it produces: "a not directed, non laminar stream…." Id. at col. 16, l. 14. Canady's proposed construction ignores this description. Consequently, I turn to the specification to determine the proper construction.

5 I note that this proposed construction differs from the claim terms chart. In its Brief, Canady added the additional phrase "and producing flow velocities less than 19 km/hour," to the proposed construction. (Docket No. 66, p. 27). Erbe responded to the newly proposed construction in its Reply Brief. (Docket No. 68, p. 15). As a result, I will consider such proposed construction.

The abstract provides the following: "Argon or another inert gas is supplied from a source of gas through the tube to the exit opening with such a flow rate that gas exiting through the exit opening is a non laminar stream which forms an inert gas atmosphere…." Id. at Abstract. Canady argues, however, that the term "much smaller" should be included in the construction. (Docket No. 66, p. 27.) I disagree. While it is true that the specification uses the term "much smaller," 6 using this limiting term to construe "low flow rate" would be importing an impermissible limitation. Phillips, 415 F.3d at 1323 (warning against confining the claims to those listed in the embodiments).

6 The specification provides as follows: "Whilst the flow-rate scale for gas volume flow on the argon gas valve used in connection with equipment for open surgery normally indicates flow rates between e.g. 1 to 10 l/min, the actual flow rate is much smaller in the case of the described use in combination with an endoscope,…In a practical embodiment…the actual flow rate during an above described coagulation was 0.2 l/min. However, depending on desired condition,…flow rates may
be adjusted..." Id. at col. 9, II. 5-22 (emphasis added). Thus, the flow rates may be changes depending on the conditions such that a limitation of "much smaller" is improper. Phillips, 415 F.3d at 1323 (warning against confining the claims to those listed in the embodiments).

Canady next argues that based on the prosecution history, the term "low flow rate" is necessarily defined in terms of the flow velocity. (Docket No. 66, pp. 27-29). Canady points to Erbe's June 27, 1997 Amendment and Response after the patent officer rejected the claims based on Canady's '675 prior art reference. Id. at 28, citing Docket No. 63, Ex. 19, pp. 10-11. Therein, Erbe attempted to distinguish its low gas flow rate from the prior art in the '675 patent to the patent officer. "A flow rate of 1 liter per minute leads to a flow velocity of 19 m/h," and that "[s]uch velocities in Canady would certainly be classified as laminar jets..." (Docket No. 63, Ex. 19, pp. 10-11). Because the '745 patent is limited to low flow rates that avoid the production of laminar jets and produce only non laminar, inert gas atmospheres (Id.), Canady argues that Erbe necessarily limited its flow velocities to lower than the 19 km/hour it claimed was described in the '675 patent. Thus, Canady argues, the '745 patent is limited, necessarily, to flow velocities less than 19 km/hour. Erbe does not respond to this argument. See, Docket No. 54, pp. 22-24, and Docket No. 68, p. 15. I find Canady's rationale set forth in the prosecution history compelling and persuasive.

Consequently, I construe the term "low flow rate" as meaning a rate of flow of less than about 1 liter/minute and producing flow velocities less than 19 km/hour such that the gas exiting through the distal end opening forms a non laminar inert gas atmosphere.

2410

Plaintiffs focus on the term "low pressure" and define it as "any pressure below atmospheric pressure." Defendant's position is that the whereby clause is meaningful and is limiting. . . . Defendant originally argued that the term "low pressure" is a relative term that is vague in the context of claims 9 and 15 because it lacks a reference point. In its response brief, Defendant suggested that the specification and prosecution history dictate a meaning of "less than approximately 100 mbars." . . .

Although the court does not agree with Defendant's reasoning, the court does agree that the whereby clause has meaning as a limiting clause. Of the three terms in that clause on which Defendant focused, only one, "low pressure," requires much discussion. The court begins there. One dictionary definition of the word "low" is "[b]elow a standard or average." Webster's II New Riverside University Dictionary 706 (1984). 12 The court is convinced that atmospheric pressure (1000 millibars or 1 bar) is a standard recognized by persons skilled in the art of the patent. Accordingly, the definition proposed by Plaintiffs, "any pressure below atmospheric pressure," provides the term with its ordinary meaning. The term is easily understood and is not vague.

"[U]nless compelled otherwise, a court will give a claim term the full range of its ordinary meaning as understood by persons skilled in the relevant art." A court should not narrow a claim term simply based on descriptions of the invention in the specification and prosecution history. Rather, the ordinary meaning applies unless the patentee expressly narrows it, for example, by providing his own definition, by distinguishing the claim term from a prior invention, or by disclaiming certain subject matter. The party seeking to narrow the definition bears the burden of overcoming the presumption in favor of the term's ordinary meaning.

Defendant's efforts to narrow the meaning to cover only pressures below 100 millibars are unavailing for several reasons. First, the doctrine of claim differentiation supports the conclusion that different claims have different scopes. "Our court has made clear that when a patent claim does not contain a certain limitation and another claim does, that limitation cannot be..."
read into the former claim in determining either validity or infringement. In this case, only claim 1 is limited to pressures below 100 millibars. If not for this difference, claims 9 and 15 could have been written as dependent claims on claim 1.

Second, the specification supports a broad reading of "low pressure." In one place, the specification calls for pressure in the range of .5 millibars to 100 millibars, stating: "[O]ne result achieved by the invention is that a partial vacuum will prove sufficient resulting advantageously in a reduced pressure of between 0.5 mbars and 100 mbars." However, in another embodiment, it is contemplated that "depression on the order of 1 to 100 mbars, which optionally might not exceed a low pressure value of about 900 mbars" could be used under certain circumstances. In light of this second embodiment, the first does not evidence an intention to depart from the full range of ordinary meaning. Rather, the two references together support a finding that the patentee intended for low pressure to carry a broad meaning.

Third and last, the prosecution history indicates that the patentee relinquished a portion of the full range of meaning attributable to the term "low pressure" with regard only to claim 1. Upon application, the examiner rejected claims 1-3 over U.S. Patent No. 4,718,459 ("Adorjan"). Interestingly, the rejected claim 3 included a pressure requirement of 0.5 to 100 millibars. The examiner explained that Adorjan discloses a double-casing pipe for subsea pipelines, an annular sealed space, coaxially-arranged pipes, flexible open-pore microporous material, and a free passageway for gas flow. With regard to low pressure, he noted that Adorjan "described that the gas can be at 0.896 Pascals in certain water depths, which suggests at lesser depths lesser pressure is needed, and that this pressure falls between the range set forth in claim 3."

In his responsive amendment, the patentee made several changes to claim 1, but did not amend the low pressure requirements. Instead, he argued that Adorjan requires that high pressure, not low pressure, be maintained in the annular space, in order to keep water out. In response to this attempt to traverse his rejection by distinguishing Adorjan, the examiner stated:

"With respect to the gas pressure, applicant only claims low pressure, which is a relative term, and therefore the pressure set forth in Adorjan is considered to be a low pressure. Also, due to the fact that the pressure of Adorjan is dependent upon depth of the pipe in water, a pipe used for shallow water depths would have a relatively low gas pressure needed, and would still meet applicant's claim language.

Thereafter, the patentee acquiesced and added the limitation to claim 1 requiring that pressure below 100 millibars be maintained. This amendment also contained two previously dependent claims rewritten into what eventually became claims 9 and 15. Neither contained the 100 millibar limitation. The patentee explained the changes to claim 1, "In order to overcome [the] rejection, Claim 1 has been amended to make it clear that the self-sustaining plate is made of an open-pore microporous insulating material and that low pressure below 100 mbars is maintained throughout the annular space in which the self-sustaining plate is located." In addition, the patentee again argued against the examiner's position that Adorjan employs low pressure in the annulus:

"Contrary to the present invention, Adorjan teaches that a high pressure should be maintained throughout the annular space.

... The Examiner relies upon a typographical error... wherein Adorjan states, 'at 300 feet (91.4 meters), the external pressure on a pipeline will be 129.9 pounds per square inch (0.896 Pa).

Thus, gas in the annulus must be pressurized to a value greater than 129.9 psi (0.896 Pa).'

This statement contains an error because the text should read, '0.89 MPa' and not merely 0.896 Pa. If one thinks about it, the value of 0.896 Pa is completely absurd since a person of ordinary skill in this technology knows that 91.4 meters of water produce a pressure of about 9 bars which is 0.9 MPa. Thus, the apparent inadvertent deletion of the M creates an error by a factor of approximately 1 million.

Ultimately, the examiner approved the '547 patent with the additional low pressure limitation in claim 1, but not in claims 9 and 15. The discourse between patentee and examiner suggests at least two plausible reasons for approval; either the two clarifications to claim 1 satisfied the examiner or the patentee convinced the examiner that he had misread Adorjan. Either way, the examiner allowed the patentee's choice of words in claims 9 and 15, which facially did not include the limitation that the pressure be below 100 millibars. The court concludes from this fact that claims 9 and 15 were patentable (because
of other limitations they contained), without narrowing the bounds of "low pressure." Defendant conceded as much during the Markman hearing.

From a close review of the prosecution history, the court concludes that the only clear disavowal of subject matter in the prosecution history relates to claim 1. Even though prosecution history estoppel affects claim 1, it does not preclude the construction of "low pressure" advanced by Plaintiffs and recommended by this court or otherwise limit claims 9 and 15 in any way.

... In summary, the court recommends that "whereby low pressure is maintained throughout said annular space" be construed to refer to pressure below atmospheric pressure that is preserved within the annular space, which includes both the free passageway and the microporous insulation.

2005 U.S. Dist. LEXIS 39078, 2005 WL 3542577, at *9-*12 (internal citations and footnotes omitted; footnote added); see also ITP, Inc. v. BP Corp. North America, Inc., 2005 U.S. Dist. LEXIS 39074, 2005 WL 3542575, *2 (S.D. Tex. 2005) ("Contrary to BP's position, the Court finds that the recommended interpretation reflects the claim construction principles outlined in Phillips. That is, although Magistrate Judge Johnson consulted a dictionary definition in arriving at the ordinary meaning of the word "low," the recommended interpretation of the entire phrase was tested against the intrinsic evidence in the '547 patent. Specifically, the M & R addresses the language of the claims themselves and applies the doctrine of claim differentiation. Judge Johnson then considered in depth the patent's specification and found that it supported the recommended interpretation. Finally, the M & R explains that the prosecution history of the patent supports the recommended result. Thus, it is clear to this Court that intrinsic evidence was the primary source for generating the proposed construction. In light of the M & R's reliance on the intrinsic evidence, the Court finds that the proposed claim construction is appropriate and fully consistent with the guidance provided by the Federal Circuit in Phillips.").

--- Footnotes ---

11 This case is a published decision which this Court properly relies upon as persuasive authority.

12 This Court notes that another definition of "low" is "[a] region of depressed barometric pressure." Id.

--- End Footnotes ---

When one considers that atmospheric pressure is pressure caused by the weight of the atmosphere and, at sea level, has a mean value of one atmosphere, 13 see Webster's II, New Riverside University Dictionary, 135 (1984)(defining atmospheric pressure as "[a]n exerted pressure of 1 atmosphere."), it is understandable that the district court in ITP, Inc., supra, would construe the claim term "low pressure" as any pressure below atmospheric pressure since such definition is obviously broad enough to encompass the limitation in claim 1 of pressures below 100 millibars as well as the specification reference to "a low pressure value of about 900 mbars[.]" 14 Given that claims 9 and 15 are not dependent on claim 1 and further given that claims 9 and 15 refer simply to low pressure, this Court finds that the definition given "low pressure" by the ITP, Inc. court in the Southern District of Texas appropriately underscores the claim construction principle of reading the claims in view of the specification in order to give proper context to claim language. Accordingly, this Court, consistent with the ITP, Inc. court, defines "low pressure" as "any pressure below atmospheric pressure[.]"

--- Footnotes ---

13 One skilled in the art of the patent would recognize that one atmosphere equals exactly 1013.25 millibars (mb). www.unc.edu/rowlett/units/dict.A.html; see also http://ww2010.atmos.uiuc.edu/(Gh)/guides/mtr/prs/def.xml ("1013.25 mb = 29.92 "Hg = 1.0 atm . . . Average pressure at sea level is 1013.25 millibars.").

14 The defendant has supplied this Court with the declaration of Dr. Douglas Smith, same reading, in relevant part, as follows: "For microporous insulation, pressures of less than 100 mbar are required to eliminate 90% of the gas phase conduction and pressures less than 10 mbar are required to eliminate essentially all of the gas phase conduction. For this
reason, a person of ordinary skill in the art of microporous insulation, such as myself, would understand that the term 'low pressure' in the context of microporous insulation means 100 mbar or less." (Doc. 33, Exhibit G, Declaration of Douglas Smith, Ph.D., at P 5) This Court declines, however, to define "low pressure" as "100 mbar or less" inasmuch as such definition does not take into account the specification reference to "a low pressure of about 900 mbars" and, therefore, would be contrary to the claim construction principle that the specification is to give proper context to the claim language (i.e., the claim language in Claims 9 and 15).

7. "low pressure chemical vapor deposition"

The parties agree that the term "chemical vapor deposition" means "a process in which one or more gases chemically react with each other and/or with a surface material thereby producing a solid substance (such as tungsten)." See Joint Statement of Claim Terms at 2. Agere argues that the phrase "low pressure chemical vapor deposition" (or "LPCVD") should be construed as "chemical vapor deposition that is carried out at reduced pressure relative to atmospheric pressure." Atmel argues that the phrase "low pressure chemical vapor deposition" should be construed as "chemical vapor deposition that is carried out at pressures below approximately 2 torr."

According to the expert testimony provided during the Markman hearing, chemical vapor deposition refers to a process in which a silicon wafer is placed in a reactor, certain gases are pumped into the reactor, and the gases react with each other (and may also react with the substrate) resulting in the deposition of a layer of tungsten on the substrate. See Tr. 12/05/02 at 55-56. It is also undisputed that the term "low pressure" preceding the term "chemical vapor deposition" describes the range of pressure inside the reactor at which the patentee intended the chemical vapor deposition to occur. The dispute here concerns the precise pressure range to which the term "low pressure" refers. Agere contends that "low pressure" means any pressure below atmospheric pressure (or 760 torr). Atmel, on the other hand, contends that the term "low pressure" refers to some smaller and more precise pressure range, although Atmel has been unable to settle on a precise proposed range. 4

4 In its initial Claim Construction Brief, Atmel argued that "low pressure" refers to a range between 0.5 and 1 torr. See Atmel Corporation's Opening Claim Construction Brief ("Def.'s Opening Brief") at 35. In its second Claim Construction Brief, Atmel argued that "low pressure" could refer to a range between 0.1 and 100 Militorr, or to a range between 0.25 and 2.0 torr, or to a range between 0.5 and 1 torr, emphasizing that "low pressure" refers to systems which operate "well below atmospheric pressure." Def.'s Second Brief at 33. At the Markman hearing, Atmel's expert witness explained that, practically speaking, low pressure chemical vapor deposition is not performed at pressure levels approaching atmospheric pressure because the deposition rate at such high pressure levels would be undesirably slow. See Tr. 12/05/02 at 222-23. Atmel's expert witness testified that the typical range for low pressure chemical vapor deposition "is somewhere around one torr," with pressures as high as "a few torr" and as low as "maybe .2 torr." Id. at 223. There is even a discrepancy between Atmel's present proposed construction of "low pressure" in its Revised Proposed Order Regarding Claim Construction ("chemical vapor deposition that is carried out at pressures below approximately to 2 torr") and its Post-Hearing Brief ("CVD at pressures below 1 torr"), see Def.'s Post-Hearing Brief at 10. In fact, even in its Post-Hearing Brief, Atmel "acknowledges that, because LPCVD is defined more often by example than explicitly, an upper limit of approximately 2 torr to 5 torr may be appropriate." Id.

The Court must determine the ordinary and accustomed meaning of the technical phrase "low pressure chemical vapor deposition" as it would have been understood by one of ordinary skill in the art at the time of the invention. See Bell Atlantic, 262 F.3d at 1267. The '335 patent arises from a patent application originally filed in 1986. The only evidence offered by Agere to support its construction of "low pressure" is the definition set forth on a current website. See Exhibit A26-27 from 12/05/02 Hearing. Agere has not shown that such a definition would have been applicable at the time of the invention. Atmel, on the other hand, has offered a number of pertinent definitions from treatises. The first edition of the
treatise Microchip Fabrication, printed in 1984, 1985 and 1986, states that "LPCVD systems operate in a pressure range from 0.1 Millitorr -- 100 Millitorr." Peter Van Zant, Microchip Fabrication 181 (1st ed. 1986). The second edition, with a copyright date of 1990, provides that one particular LPCVD system (the "Horizontal conduction-convection-heated LPCVD") operates in "a pressure range of 0.25 to 2.0 torr." Peter Van Zant, Microchip Fabrication 309 (2d ed. 1990).

The evidence and expert testimony introduced by the parties clearly establishes that a person of ordinary skill in the art at the time of the invention would have understood the term "low pressure" to refer only to an approximate pressure range well below 760 torr, and not to any precise pressure range with specifically defined lower or upper limits. The evidence and expert testimony also indicates that at the time of the invention, low pressure chemical vapor deposition would typically have been carried out at pressures no higher than 2 or 3 torr. Thus, the Court construes "low pressure chemical vapor deposition" to mean "chemical vapor deposition that is carried out at pressures well below atmospheric pressure (760 torr), typically at pressures below approximately 2 or 3 torr."

C. "Low Profile"

For the claim terms "low profile traction teeth" and "teeth being in low profile," '047 Patent, col.4, l.58, col.5, l.33-34, & col.6, l.10, 59, & 64, the parties dispute how to describe conventional spikes at the relevant time period for the patent, and whether the appropriate measurement for comparing spikes is length or depth.

1. The Parties' Contentions

Greenkeepers contend that the conventional spikes against which their "low profile traction teeth" must be compared, as of 1996, were eight millimeters long and metal. (Pls.' Opening 16-18.) Greenkeepers also aver that the relevant measurement is depth, not height, because the advantage of the cleats is that they bring the golfers lower to the ground, for which vertical height of the spikes while under load, which is measured by depth, and not the overall length of the spikes, is critical. (Pls.' Resp. 14-17; Pls.' Reply 10-11.)

Defendants first take issue with the fact that Greenkeepers' construction compares their spikes to "metal" ones, and argue that neither intrinsic nor extrinsic evidence supports the inclusion of this adjective, for example by using the word "metal" to describe conventional prior art spikes in the '047 Patent's specification. (Defs.' Opening 19, Defs.' Resp. 13.) In addition, ECCO, though agreeing with Plaintiffs that the relevant time period is 1996, contends that the conventional spikes were six millimeters in length, not eight millimeters, as is evident from the fact that the patent specification purportedly describes as prior art a six millimeters spike. (ECCO Opening 23-24, Resp. 17.) ECCO, relying on its own expert testimony, also argues that the relevant measure is overall length, not depth, because length determines damage to the greens, which is what the '047 Patent states that it aims to avoid. (ECCO Opening 24-26, ECCO Resp. 18-19.)

2. Analysis

"[I]n a case tried to a jury, the [C]ourt has the power and obligation to construe as a matter of law the meaning of language used in the patent claim," Markman, 52 F.3d at 978-79; however,
claims are often drafted using terminology that is not as precise or specific as it might be. As long as the result complies
with the statutory requirement to "particularly point[] out and distinctly claim[] the subject matter which the applicant
regards as his invention," 35 U.S.C. § 112, para. 2, that practice is permissible. That does not mean, however, that a court,
under the rubric of claim construction, may give a claim whatever additional precision or specificity is necessary to
facilitate a comparison between the claim and the accused product. Rather, after the court has defined the claim with
whatever specificity and precision is warranted by the language of the claim and the evidence bearing on the proper
construction, the task of determining whether the construed claim reads on the accused product is for the finder of fact.

In PPG Industries, the Federal Circuit determined that the district judge "properly left it to the jury to determine whether the
amounts of iron sulfide in SMG glass have a material effect on the basic and novel characteristics of the glass," because "the
patent is silent about iron sulfide and what constitutes a material effect on the properties of the glass." Id. at 1357. This is
exactly the situation the Court now faces in construing "low-profile traction teeth" and "teeth that are low in profile." The
claims did not specify whether the conventional spikes in relation to which the '047 Patent's covered cleats are "low profile," are metal, six or eight millimeters in length, or measured in height or depth. The Court will not read such additional
precision into the claims, and will not usurp the jury's "task of determining whether construed claim reads on the accused
product." Id. at 1355. Accordingly, the Court construes "low profile traction teeth" and "teeth that are low in profile" to be
"traction teeth that are shorter than conventional spikes as of 1996."

Said outlet duct being configured to radially expand said airflow to a low velocity and said return duct being configured for
low radial flow return velocity to said high pressure compressor

Key to both phrases above is the term "low velocity." While a person or ordinary skill in the art arguably would understand
that the air flow exiting the low pressure compressor is at a very high velocity, the parties disagree as to how the outlet and
return ducts in the '499 Patent are designed to slow the velocity. Thus, the Court will construe the term "low velocity" first.

Low velocity

Claim 1 specifies that the outlet duct of the low pressure compressor is configured to radially expand air flow "to a low
velocity" and the return duct is configured for "low radial flow return velocity." Rice contends that the term "low velocity"
should be construed to mean "a decreased air flow velocity." Rolls-Royce, on the other hand, wants a specific numerical
value and contends that the low velocity term means air flow velocity "less than approximately 200 ft./sec."

Notably, the claim language is not "to a lower velocity" or "to a reduced velocity." Rice, however, points out that dependant
claim 9 includes the specific numerical limitation of less than approximately 200 ft./sec. Rolls-Royce counters that claim 9
specifies "said low velocity of less than approximately 200 ft./sec." which indicates that the prior use of low velocity was
meant as "less than approximately 200 ft./sec." Rolls-Royce further identifies in the specification where Rice described the
preferred embodiment as having air flow velocity of about 200 ft./sec. See Def's Br. 33-35.

However, there is no indication in the descriptive passages cited by Rolls-Royce that a velocity less than approximately 200
ft./sec. is critical to the invention. While the reduction in velocity is identified as being advantageous to "reduce inlet
pressure loss" (col. 8, line 27), nowhere does the specification indicate that the velocity of 200 ft./sec. is in and of itself a
necessary parameter to be met in order to realize the gas generator of the invention. Rather, the specification indicates that
the low pressure loss benefit resulting from a lower air flow velocity between the low and high pressure compressors is
made possible by the additional radial space made available by the increased pitch-line radius, r, as a consequence of the
intercooler. See col. 8, lines 28-38. The description in the '499 patent specification of the air flow velocity is unlike the
situation identified in Toro Co. v. White Consolidated Industries, Inc., 199 F.3d 1295 (Fed. Cir. 1999), wherein the
specification described the advantages of a unitary structure of a ring permanently attached to a cover as being important to
the invention.

Rolls-Royce also relies upon the prosecution history for support of its proposed construction of "low velocity." Specifically,
Rolls-Royce identifies that the July 7, 1989 Amendment added the "low velocity" recitation to the claims and argues that Rice's remarks indicate that a low velocity of less than 200 ft/sec. was needed. Examination of Rice's remarks indicate that Hull was being distinguished on the basis of an absence of an external counterflow intercooler. Rice first points out that the compressed air being cooled in Hull's heat exchanger 16 and the coolant flow in the same direction. Rice then offered that Hull did not have a low pressure drop heat exchanger and ducting, which are realized by the claimed counterflow externally mounted intercooler. Amendment 8.

When Rice turned to the DuPont prior art, Rice again argued that a counterflow externally mounted intercooler was absent just as in Hull. Rice also pointed out that the discharge of the axial flow fan 18 of DuPont was directly to heat exchanger 26 and would be high. Similarly, the velocity to downstream heat exchanger 28 would be high "because there is very little change in the cross-sectional flow area shown." Amendment 9. Rice's remarks indicate nothing more than the prior art did not include the ducting that would radially expand the air flow to a lower velocity. His remarks do not indicate that either Hull or DuPont were being distinguished on the basis of the specific air flow velocity through the heat exchanger and ducting of each. The import of Rice's remarks do not extend beyond the requirement that the ducting radially expand the air flow to slow it to a lesser velocity. The remarks clearly do not amount to a clear disclaimer of air flow velocities through the intercooler and associated ducting above 200 ft./sec. Thus, the Court adopts Rice's construction for "low velocity" as being "a decreased air flow velocity."

Having adopted Rice's construction of low velocity, the Court turns to the disputed term "to radially expand." Rice proposes the construction "to cause air flowing away from the axis of the shafting to increase in volume." Rice argues that a person of ordinary skill in the art would understand that "radially expand" means something expands as it moves away from the axis, in contrast to "axial" which indicates a direction along the axis. Rolls-Royce, on the other hand, proposes the construction "to increase the cross-sectional flow area in a direction generally perpendicular to the axis of the gas generator."

However, the embodiment disclosed in figure 7a of the '499 patent depicts a duct that "radially expands" the air flow from the low pressure compressor. The air flowing radially through the duct in figure 7a is not perpendicular to the axis of the gas generator. Further, the specification describes how the direction of the flow with respect to the radial position can be "curved backwards" and vary in angle to accommodate the different structures. Col. 14, lines 44-50. Nothing requires that the expansion occur only when the air is flowing perpendicular to the axis. Thus, the Court adopts Rice's plain meaning "to cause air flowing away from the axis of the shafting to increase in volume."

The parties previously requested no construction for the term "outlet duct;" therefore, the Court will not construe that term. The Court previously construed "return duct" to mean "conduit for conveying air back from the externally mounted intercooler."

In sum, the Court construes the disputed term, "said outlet duct being configured to radially expand said air flow to a low velocity" to mean "said outlet duct shaped and positioned to cause air flowing away from the axis of the shafting to increase in volume resulting in a decreased air flow velocity."

Both parties dispute the meaning of the term "lower end." Plaintiff claims that the term "lower end" means below the ground surface and the term "upper end" means opening to the atmosphere above the ground surface. Defendants argue that the term "lower end" means the underground terminal point of the conduit and the upper end means the portion of conduit opening to the atmosphere.

First, the Court looks at the claim language to interpret the meaning of the terms "lower end" and "upper end." The ordinary
meaning of the term "end" is "... 1a ... (2): the extreme or last part lengthwise ... (the rear end of an automobile) ...." WEBSTER'S THIRD NEW INTERNATIONAL UNABRIDGED DICTIONARY ((c) 1961, 1993) at 748. The Court further notes that limitations to the term "end" are found in the claim language. The claim provides that the collection elements are connected to the "lower end" of the conduit. The collection elements are located within the contaminated area and this contaminated area is located underground. Combining the limitation in the claim that the collection elements are located underground and the ordinary meaning of the term "end", the Court concludes that the term "lower end" means the extreme or last part of the conduit located underground.

The Defendants would like the Court to construe the term "lower end" as a specific "point" located underground. The Court refuses to add the limitation of a specific "point." The Court believes that the issue of whether a specific "point" is the "lower end" is a question of fact, which should be decided during the infringement analysis.

The meaning of the term "upper end" is straight forward. The claim provides the limitation that the "upper end" opens to the atmosphere. Hence, the Court concludes that the term "upper end" must be construed to mean the portion of the conduit opening to the atmosphere.

4. "lower portion"

Floe contends that this phrase should be construed as "a portion of a structure that is physically located below another portion of the structure." In support of its construction, Floe maintains that the plain meaning of "lower portion" is a portion of a structure that is physically located below another portion of the structure. Floe asserts that the specification uses "lower portion" in this context, and thus supports a construction that gives "lower portion" its ordinary meaning. Floe also points out that its broad proposed construction is consistent with the Federal Circuit's construction of "portion." See Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1348 (Fed. Cir. 2001) (construing "portion" as "a part of any whole, either separated from or integrated with it.")

Newmans, on the other hand, asserts that this phrase should be construed as "a lower structural element that is one of three different structural components of the ramp member." Newmans does not refute the asserted plain meaning of "lower portion." Instead, Newmans maintains that the patentee disclaimed the plain meaning of "lower portion." Instead, Newmans maintains that the patentee disclaimed the plain meaning of "lower portion" in the prosecution history. The Court disagrees.

In support of its disclaimer argument, Newmans points to statements that the patentee made in response to a rejection by the Patent Trademark Office ("PTO"). Newmans, however, takes statements between the patentee and the PTO out of context. Further, Newmans asks the Court to rely on numerous statements and multiple inferences in the prosecution history in order to find that the patentee disclaimed the scope of "lower portion." The prosecution history, however, does not refer to "a lower structural element that is one of three different structural components of the ramp member." On this evidence, the Court does not find that the patentee clearly and unmistakably made such a disclaimer. Thus, consistent with the plain meaning of "lower portion" and the specification, "lower portion" should be construed as "a portion of a structure that is physically located below another portion of the structure."

A. "Lower Substrate" and "Conductive Layer Formed Over Said ... Substrate"

The disputes concerning these two terms are closely connected because a determination of the meaning of one term will almost automatically yield a determination of the meaning of the other. Paradigm contends that these terms connote a horizontal, planar surface only, so that the conductive layer is literally over, or on top of, the nonconductive substrate. In Paradigm's view, the conductive layer in its cylindrical array is not formed "over" the nonconductive layer, but inside it. Paradigm asserts that the nonconductive layer in its array is not "lower" than the conductive layer, but rather is an outer ring.
LDAI disagrees. According to LDAI, when the conductive layer is formed onto the surface of the nonconductive layer, it is formed "over" the nonconductive layer, regardless of whether the structure is planar or cylindrical.

After reviewing the evidence, and in particular the claims of the '951 patent itself, as well as the expert testimony concerning how these terms would be understood by a person of ordinary skill in the art, I agree with LDAI's interpretation of these terms. I believe that the words "lower" and "over," as used in the patent, do not mean that one layer is physically above, or higher than the other, but simply that one layer is applied or formed onto the surface of the other.

The word "over" has many different meanings. When used to describe the relative position of two objects, it can mean that one object is physically higher than the other, e.g., "the lamp hangs over the table." It can also be used, however, to connote that a surface is covered with some substance. If one were to say, for example, "the ceiling was stained, so I painted over it," that would not mean that the person painted above the ceiling, but only that he covered its surface with paint. In that example, the paint would, strictly speaking, physically be beneath the ceiling.

In my view, that is a more logical interpretation of the terms at issue here. The patent indicates that one begins with a nonconductive layer, and then forms a conductive layer "over" it. That simply means that one surface of the nonconductive layer is covered with a conductive layer. The fact that the nonconductive layer may be cylindrical does not mean that it cannot be covered "over" in this manner.

Likewise, the nonconductive layer can be described as "lower" than the conductive layer for the same reason: the conductive layer has been formed "over" it. Again using the analogy of a painted ceiling, one could speak in terms of what lies "beneath" the surface of the paint, even though the ceiling itself is physically higher off the ground than the paint that covers it.

Paradigm's interpretation of these terms is not persuasive, because according to Paradigm's logic, one could theoretically construct a laser diode array exactly like those made by LDAI, flip it upside down, and claim that it does not infringe the '951 patent because the conductive layer is physically lower than the nonconductive layer. Such a result is obviously absurd. Clearly, then, these terms are not meant so much to describe the physical position of these layers, but rather the order in which they are formed. The nonconductive layer is formed first, and then the conductive layer is formed "over" it, i.e., on the surface of the nonconductive layer. I conclude, therefore, that as used in Claim 1 of the '951 patent, "lower substrate" refers to the base or foundation on which the rest of the structure is built, and "conductive layer formed over" the substrate means that the conductive layer covers the surface of the substrate.

4 I also note that, as pointed out by LDAI, Paradigm's arrays are actually constructed of two identical pieces, each of which is shaped roughly like a half-cube with a semicylindrical concavity running along one side. Those pieces are made of a nonconductive material, and the concave surface is covered with a conductive layer. The two pieces are then joined together, with the concavities facing each other, to make the final product. See Fig. 3 (taken from the drawing sheets of the '850 patent). Even using Paradigm's own interpretation of these claim terms, then, the two halves, considered individually, could arguably be considered to have a conductive layer "over" the "lower" nonconductive layer.

3. "Lower surface"

Microthin contends that "lower surface" should be construed to mean "surface of the plastic sheet that faces or contacts the surface on which the mat or pad rests, the underside or bottom." SiliconeZone argues that "lower surface" has a plain and ordinary meaning in the context of the patent that requires no special construction.

While the plain meaning of "lower surface" may seem clear to a person of ordinary skill in the art, Microthin's construction adds greater clarity in light of the specification. The specification actually speaks of different lower surfaces such as the
lower surface of the main plastic sheet, the lower surface of an ink coating applied to the plastic sheet's lower surface, or, in some embodiments, the lower surface of the entire mat that includes a non-slip coating adhered to the bottom after the ink coating has been applied. See Memorandum, Ex. F(a), Patent No. 5,942,311, at 2:5-21. Which "lower surface" is actually the bottom depends upon which embodiment is used as disclosed in the specification. Because of the differing embodiments disclosed in the patent, a person of ordinary skill in the art would understand that "lower surface" speaks more generally of the bottom or underside of the mat that faces, if not actually contacts, the surface on which the mat rests. See Johnson Worldwide Assocs., Inc. v. Zebeco Corp., 175 F.3d 985, 991 (Fed. Cir. 1999) ("Varied use of a disputed term in the written description demonstrates the breadth of the term rather than providing a limited definition"). Therefore, the Court construes "lower surface" to mean "surface of the plastic sheet that faces or contacts the surface on which the mat or pad rests, the underside or bottom."

B. Claim 4

ASE argues that it is entitled to a judgment as a matter of law that its products do not infringe claim 4 of the '143 patent
because its products are based on the prior art of the Le Vine patent, rather than the teaching of the '143 patent. Issued claim 4 states as follows:

A gas concentration sensor system comprising:

a conductive metal oxide gas sensor having resistance which is variable in response to gas concentration, including concentration of a target gas;

means connected to the gas sensor for measuring a first resistance of the gas sensor at a lower temperature;

means connected to the gas sensor for intermittently heating the gas sensor from the lower temperature to a higher temperature;

means connected to the gas sensor for measuring a second resistance of the gas sensor at the higher temperature;

means connected to the measuring means for determining target has concentration as a function of both the first and second resistances;

register means for accumulating values of target gas concentrations exceeds a selected value; and

means for subtracting values from the register means when target gas concentration is less than selected value.

1. Scope of Claim 4

ASE first claims that it is entitled to summary judgment as to claim 8 because its sensors measure resistance only after the low temperature cycle. ASE asserts that it is practicing the Le Vine method of using high/low cycles to purge the sensor, rather than utilizing the '143 patent's methodology requiring measurements at the conclusion of both cycles. ASE concludes:

By the words of the claim itself, the second resistance measurement cannot be taken at any temperature higher than that of the low temperature cycle. The claim is restricted to a resistance measurement taken during or immediately following the high temperature cycle of the device.

ASE admits that it makes more than one measurement, but states that the second measurement is taken within one millisecond of the first measurement to ensure that an accurate measurement has been made. ASE asserts that the difference between the two temperatures at the times of measurement is infinitesimal.

Quantum responds that ASE's detectors infringe claim 4 because they measure resistance at one temperature and take a second measurement at a different temperature. Quantum argues that claim 4 does not designate a particular order or sequence of measurement. Quantum asserts that a millisecond time span between measurements and an infinitesimal temperature drop cannot be presumed because the period where the heater shut off is at least four seconds. Quantum questions the plausibility of ASE's claim that it makes the second measurement for accuracy purposes. According to Quantum, the true reason for the second measurement is to compensate for humidity effects, just as the '143 patent teaches.

The first step of the analysis, determining the scope of the patent, involves principally two questions: First, does claim 4 require a measurement to be taken after the high temperature cycle or does claim 4 only require that the two measurements be taken at different temperatures? The second question to be answered, assuming that a measurement need not be taken after the high temperature cycle, is whether there is a limit as to how small the differential in temperatures may be.

As to whether claim 4 requires that a resistance measurement be taken after the high temperature cycle, the language of the patent is examined first. Claim 4 requires a means to heat the sensor "from the lower temperature to the higher temperature" and means "for measuring a second resistance of the gas sensor at the higher temperature." From this language, it would appear that the second resistance measurement must be taken at the temperature to which the sensor is heated. The specification, however, states that the period between the pulses when the current is not flowing may be used for the measurement of the sensor's resistance. The preferred embodiment further notes that "although the method has been described in terms of measuring two resistances at two different temperatures, it will be apparent that enhanced results may
be provided by making three or more measurements at different temperatures."

To be consistent with this language, claim 4 must be interpreted to mean that the higher temperature measurement need not be taken precisely at the end of the high temperature cycle. The purpose of the high temperature cycle is to purge the sensor and return it to its high impedance state -- this is the teaching of the Le Vine patent. The teaching of the '143 patent is that two measurements at different temperatures allow "the effect due to humidity . . . [to] be deduced by suitable computation, and compensation can be mathematically performed." The specification states that "the resistance measurements made just after the high current interval are more dependent on ambient temperature and humidity than carbon monoxide concentrations." Therefore, claim 4 requires only that measurements be taken at different temperatures during a non-pulse period so that they are capable of being used in a calculation to deduce the effects due to humidity and ambient temperature.

Quantum argues that claim 4 does not include a humidity compensation limitation, but the specification expressly provides that the '143 patent's "improvement [over Le Vine] compensates for response changes due to changes in ambient temperature and humidity . . . without the need for additional compensating elements." If claim 4 is read to exclude this limitation, then there is no improvement on the Le Vine methodology.

Quantum also argues that claim 4 does not require any specific differential in temperature because the language of claim 4 refers only generally to "higher" and "lower" temperatures. The language of claim 4 does not limit the these temperatures to specific ranges, therefore it would be improper to read specific numerical range into claim 4. But similarly, the patent's stated innovation over Le Vine cannot be ignored. See Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1303 (Fed. Cir. 1997) (although term not limited in claim language, within the context of patent "conductive liquid-like medium," means a medium sufficiently conductive to perform its stated function as a variable capacitor plate). The temperature differential between the two measurements must be large enough to deduce the effects due to humidity and ambient temperature through a mathematical calculation, but this differential is not limited to the differential stated in the preferred embodiment.

2420

The parties' central argument is over the phrase "water-miscible lubricant," which appears in both independent claims and throughout the dependent claims. While the patent defines "water-miscible" substances as those "sufficiently water-soluble or water dispersible so that when added to water at the desired use level they form a stable solution, emulsion, or suspension," (Cleveland Decl. Ex. A at col. 2, ll. 46-50), the patent is silent as to the meaning of the word "lubricant." To resolve the meaning of the word "lubricant" in this phrase, the parties have advanced both dictionary definitions and the declarations of several individuals with experience in the testing and development of conveyor lubricants. It is a cannon of claim construction that claims are construed as one skilled in the art would understand them in light of the specification of which they are a part. See Orthokinetics, Inc. v. Safety Travel Chairs, Inc., 806 F.2d 1565, 1575 (Fed. Cir. 1986). While the Court has not explicitly been asked to define who constitutes "a person with ordinary skill in the art" in this case, the parties' expert declarants possess, at the very least, a college chemistry background and several years of practical experience with conveyor lubricants. For the purposes of this motion, therefore, the Court will assume that a person with ordinary skill in the art possesses at least these qualifications.

Ecolab offers the definition of "lubricant" from Webster's Ninth New Collegiate Dictionary: "a substance (as grease) capable of reducing friction" or "something that lessens or prevents friction or difficulty." (Pl.'s Mem. Supp. Prelim. Inj. at 17.) Ecolab also relies heavily--especially in its testing of Dowanol DPM--on the "understanding" of Ecolab Senior Chemist Amy McBroom that "a lubricant is a substance that produces a COF [coefficient of friction] 3 lower than that produced using water alone." (McBroom Decl. P16.) Ms. McBroom has three years of college chemistry and has spent three and a half years formulating, testing, and analyzing conveyor lubricants. Ecolab provides no support, other than Ms. McBroom's Declaration, for her definition of "lubricant."

3 A coefficient of friction is a physics concept that deals with measuring the ease with which two surfaces slide against each other. (McBroom Decl. P7.) In technical terms, it is expressed:

\[
\text{Coefficient of Friction} = \frac{\text{(Friction Force Caused by Drag)}}{\text{(Load Mass (Normal Force))}}
\]
JohnsonDiversey advances a definition of "lubrication" from Hawley's Condensed Chemical Dictionary (14th Ed.)--a source used by Ms. McBroom for the definition of Dowanol DPM, but not thereafter. Hawley's defines "lubrication" as:

The introduction of a substance of low viscosity between two adjacent solid surfaces, one of which is in motion (bearing). From an engineering point of view, the chemical nature of the substance is not of critical importance. Thus, materials as diverse as air, water and molasses could theoretically be used as lubricants under appropriate conditions. Air and water have been used, as well as some solids such as graphite, but in general oils, fats, and waxes are utilized. The ability of a substance to act as a lubricant is sometimes called lubricity.

(Osswald Decl. P14.) Under this definition, whether or not a given substance is a "lubricant" depends on whether it, in fact, provides lubrication in a particular application. If "air, water, and molasses could theoretically be used as lubricants under appropriate conditions," then any of those substances could be counted as "lubricants" under the Hawley's definition so long as they lubricate a specific function.

In addition, JohnsonDiversey provides the definition of "lubricant" put forth by Jacques Rouillard, a current group manager of research and development at JohnsonDiversey and a former senior chemist. Mr. Rouillard's college education included eighteen credits in organic, inorganic, physical, and analytical chemistry, and he has worked with conveyor lubricants for over twenty-three years. His definition reads:

Lubricant. A substance applied to track surfaces to materially improve the mobility of containers through the filling process. Suitability for use as a lubricant in a given application is a factor to be considered by the person of ordinary skill in the art in determining whether or not a given chemical or compound can be used as a "lubricant" in that application.

(Rouillard Decl. P10.)

The Court finds none of these definitions to be entirely satisfactory. Ecolab's definitions, which strain to define lubricant in wholly function-neutral terms, fail to take into account the context in which the method disclosed by the '494 patent is actually applied. If materials such as air and molasses can be lubricants given the proper application, then the word "lubricant" clearly requires reference to its function to be properly understood. While Ms. McBroom's definition avoids such a reference, the totality of her declaration--especially her experiments with containers and a conveyor belt--makes clear that reference to a substance's application is crucial to determine whether it qualifies as a lubricant. In this context, Ms. McBroom's choice of water as a baseline for determining relative coefficients of friction fails to advance the Court's inquiry. Not only is the choice of water entirely arbitrary, but its use as a baseline is directly contradicted by Hawley's--a source cited by Ms. McBroom--which lists water as a potential lubricant. Obviously, a lubricant cannot be both water itself and "a substance that produces a COF [coefficient of friction] lower than . . . water." (McBroom Decl. P16 (emphasis added).)

JohnsonDiversey's definitions also present their share of problems. While Hawley's offers the most promising option, it never actually defines "lubricant," indicating, on one hand, that a lubricant is a "substance of low viscosity," and, on the other, that it could be almost anything at all. Likewise, Rouillard's definition is helped by reference to the method recited by the '494 patent, but it also imports a subjective component, relying, as it does, on an on-the-fly determination by a person of ordinary skill in the art on the "suitability of use" of "a given chemical or compound" "as a lubricant." Needless to say, this begs, rather than answers, the question.

Lurking behind all these definitions, however, is a fairly basic concept. The declarants all agree that a lubricant must, at bottom, lower the coefficient of friction of a given application. If it does not, then it is not a "lubricant" in terms of that application. Indeed, the specification of '494 patent itself, referring to the "lubricant coating," that the mixture of the water-miscible silicone and lubricant ultimately creates, states:

The invention provides a lubricant coating that reduces the coefficient of friction of coated conveyor parts and containers and thereby facilitates movement of containers along a conveyor line.
(Cleveland Decl. Ex. A at col. 2, ll. 2-5.) While this understanding of lubricant, drawn from the specification itself, refers to the "lubricant coating," the Court finds that it corresponds to the declarations before it and is applicable to the "water-miscible lubricant" set forth in claims 1, 21, and the dependent claims. Indeed, it seems clear that a "water-miscible lubricant" could not be a "lubricant" in the context of the '494 patent if it did not reduce the coefficient of friction of that "lubricant coating" with regard to "coated conveyor parts and containers."

Thus, the Court concludes that a person of ordinary skill in the art would understand the word "lubricant," as used in the phrase "water-miscible lubricant" in claims 1 and 21 of the '494 patent, as follows: "a substance that materially reduces the coefficient of friction of the lubricant coating with regard to coated conveyor parts and containers."

"Lug"

For similar reasons, the Court accepts Ricoh's definition of the term lug as "a projection or handle by which something may be grasped." 6 As discussed above, the patent repeatedly and invariably describes a lid that is removed and replaced so as to plug and unplug the discharge mouth of a developer container. It also repeatedly and invariably describes a lid containing a lug that is grasped so as to remove and replace the lid. (See, e.g., figs. 4a, 4b, 4c, 9a, 9b, 13a; col. 7, ll. 12 - 47; col. 11, ll. 12-16, 60-63; col. 12, ll. 2-10; col. 12, ll. 2-10; col. 13, ll. 13-45; col. 19, ll. 23-42.) Defendants' proposed construction -- "a projection with which the copier interacts" -- adds ambiguity to the term "lug" that does not exist in the patent. The patent not only conveys that the copier "interacts with the projection on the lid," but consistently specifies how the copier interacts with the lug of the lid: the copier grasps the lug.

6 The Court's August 2, 2005 opinion construed "phrases related to a 'lug' protrusion of a developer container." 380 F.Supp.2d at 430. Those phrases and the Court's analysis of them concerned the location on the lid from which the lug must protrude. Id. at 430-31. The Court did not directly address the definition of the term "lug," which the parties now dispute.

The Court is not persuaded by defendants' argument that the term "lug" must have a broader meaning because it is used elsewhere in the specifications to describe a projection on the bottle that is never grasped. (Defs.' Br. at 25.) The claims cover only a "lid." As used in those claims, the term "lug" refers only to the projection on the lid. The specifications uniformly describe that projection as being grasped. The other use of the term "lug" -- to describe a projection on the toner bottle -- appears only in the specifications, with reference to a structure that is not part of the claimed subject matter and is never discussed in the claims. Even where the same term appears more than once in the claims, the written description may support different definitions for the term. See, e.g., Pitney Bowes, Inc. v. Hewlett-Packard, Co., 182 F.3d 1298, 1310 (Fed. Cir. 1999). Here, the use of the term "lug" is entirely consistent within the claims; the other use of "lug" appears in the specification with reference to a portion of the toner bottle not claimed by the '963 patent. The Court finds that the proper construction of the claim term "lug" is "a projection or handle by which something may be grasped."
Nothing in the plain language of Claims 1 or 6 suggests such a limitation. Thus, the court is permitted to look to the specification to determine if the patentee intended to give the term a specialized meaning. Vitronics, 90 F.3d at 1582. The court is not, however, permitted to read the particular formulations and examples in the specification into the claims themselves. Advanced Cardiovascular Sys., Inc., 261 F.3d at 1338-39. This is exactly what Gerdes is asking the court to do. The court cannot find any language in the specification that demonstrates the patentee's intention to give "lug" a specialized meaning, nor could Gerdes provide any such citation to the court. Instead, Gerdes points only to Figure 1 in which two driven lugs are attached to a certain ring at only one end and asks the court to read this limitation into the term "lug" itself. This is clearly an improper use of the preferred embodiment. Thus, the court finds that the term "lug" should be given its ordinary meaning, that is, "a small projecting part of another member."

The reflector body has lugs on a side nearest the light emission window

The parties are not far apart on the meaning of "lugs". Philips urges that it means "small projecting parts of the reflector body used for positioning the light source." Iwasaki advocates that it means "projections, pads or ridges". Based upon my review of the specification and without reading a non-existent functional limitation into the claim language, I conclude that lugs, in the context of the claim language, means "small projecting parts of the reflector body". 7

The parties disagree as to the meaning of "on a side nearest" in the phrase "the reflector body has lugs on a side nearest the light emission window". Philips argues that it means the lugs are positioned at the front or top end of the reflector body closest to the light emission window. Iwasaki urges that it means a side at the front end of the reflector body.

The claim language describes the relationship of the lamp to the reflector body: "the electric lamp being fixed in the reflector body with the first end portion inside the neck-shaped portion, while the cavity lies within the reflecting portion and the electric element is on the optical axis wherein the reflector body has lugs on a side nearest the light emission window." There is no dispute that the "light emission window" means a part of the reflector body through which light is emitted outside. At first review, the use of the indefinite article "a" -as in "a side"--and the superlative "nearest" in the phrase "lugs on a side nearest the light emission window" appears ambiguous. The use of both terms assumes the possibility of multiple. Furthermore, the claim language does not differentiate between reflector bodies that, at the end through which light is transmitted, are circular in shape and those that are rectangular in shape. Thus, there can be multiple sides to a given reflector body. In claim 6, the term "front side" is employed and, for the reasons that will later be explained, I construe that term to mean the side that faces in the same direction as the emitted light I will not construe "a side nearest the light emission window" to be synonymous with "front side". I construe the term "a side nearest the light emission window" to mean any side that is at or near the end of the light emitting end of the reflector body and includes the "front side" as defined below, as well as the outer circumference of the reflector body at points closest to the light emitting end.

2. "Luminal attachment and intussusception means"

Independent claims 1 and 11 include the following language:

a luminal attachment and intussusception means coupled to said housing for attachment and inversion of a portion of the
lumen to be removed;

(emphasis added). The parties agree, as do I, that "a luminal attachment and intussusception means" is a means-plus-
function limitation recognized by 35 U.S.C. § 112, P6. Construing means-plus-function claims requires two steps: (1)
identifying the claimed function(s); and (2) identifying the corresponding structure identified in the written description

Here, I think that "luminal attachment and intussusception means" involves two functions: (1) attaching the lumen 2; and (2)
intussusception - or inversion - of the lumen. The parties do not appear to disagree over the recited functions. Instead, the
dispute lies in the corresponding structures. "In order to qualify as corresponding, the structure must not only perform the
claimed function, but the specification must clearly associate the structure with performance of the function." JVW
1106, 1113 (Fed. Cir. 2002).

As to the first function - that of attachment, I find that the corresponding structure consists of the annular groove. The
specification explains that, with respect to the first embodiment:

the bowel is attached to the central post 14, such as by tying the bowel portion to the central post at the annular groove
with a ligation member 26.

Col. 3, line 66 - Col. 4, line 2 (emphasis added). Ravo and Nicolo urge that the structure consists of the "central post" and
that the reference to the annular groove is simply intended to be an example of where on the central post the lumen could be
attached. At first glance, this argument holds some appeal. Yet, each of the drawings which correspond to the first
embodiment (Figures 1 - 3) shows the lumen attached to the central post at the annular groove. Accordingly, I read the use
of "central post" as Ravo's and Nicolo's short hand reference for "the annular groove located on the central post." Indeed,
the use of the shortened phrase "central post" in the '148 Patent does not occur until after the more thorough definition of
the annular groove located on the central post. Further, if, as Ravo and Nicolo suggest, the annular groove is not the
corresponding structure for attachment of the lumen, it is curious that the '148 Patent teaches that:

following the mobilization and resection of the mesentary, the surgical tool 10 is positioned into the bowel through the
anus such that the annular groove 16 of the central post 14 is aligned midway along the segment of the colon to be resected.

Col. 3, lines 59-66 (emphasis added). Clearly, the reference to the "annular groove" when positioning the device is vital
because the lumen will be attached to the annular groove.

The second embodiment also reveals the lumen being attached at the annular groove:

[a] surgical tool 50 includes an annular groove 56 around the housing 52 with the annular groove 56 being analogous to
the annular groove 16 on the central post 14 of the surgical tool 10 described above. The annular groove 56 is provided to
receive ligation member 26 for attaching the bowel to the surgical tool 50 as will be described hereinafter.

The colon can then be attached to the housing 52 at the annular groove 56 with the ligation member 26, as shown in FIG.
4, substantially in the same manner as discussed above in connection with surgical tool 10.

Col. 5, lines 54-58 and Col. 6, lines 34-37 (emphasis added). The illustrations also confirm that the lumen is to be attached
to the annular groove. See Figures 4, 5 and 7. 3 While Ravo and Nicolo argue that the first and second embodiments differ
and that only the second embodiment calls for attachment at the annular groove, the specification itself notes that the
attachment in the second embodiment occurs in "substantially the same manner" as in the first embodiment. Consequently, I
do not find their argument to be persuasive. 4

--- Footnotes ---

3 I note that, for attachment to be complete, an additional item is required - something external to the device itself. The '148 Patent teaches that the item could consist of glue or a ligation member. As the item is not part of the device, though, I do not consider it to be part of the "corresponding structure."

4 I note that Ravo and Nicolo cite to Col. 7, line 4 of the '148 Patent in support of their contention that the structure corresponding to performing the function of attaching the lumen is the central rod. See Plaintiffs' Brief, p. 18. Yet I read this passage as explaining, not how the lumen is attached for purposes of intussusception, but of how the lumen is gathered in, after intussusception, for purposes of stapling and resection. Indeed, the suture noose is offered as an alternative to the use of the carrier arms, which come into play "following intussusception of the bowel." See Col. 6, line 58.

--- End Footnotes---

As stated above, the "luminal attachment and intussusception means" references a second function as well - intussusception. The parties agree, as do I, that the term "intussusception" means a telescoping of the lumen, where the lumen is pulled inside itself. Ravo and Nicolo argue that the structure which corresponds to this function consists of the central post and the casing or other rigid member over or around which the lumen is inverted, and the equivalents thereof. See Plaintiffs' Brief, p. 18-19 and Docket No. 22, p. 4-5. Ethicon counters that the annular groove is also involved in intussusception.

As stated above, I have already concluded that the annular groove is part of the device to which the lumen is attached. The phrase at issue is "a luminal attachment and intussusception means." The plain meaning of the use of the conjunctive "and" is that the same structure is used both for attachment and intussusception. Consequently, then, the annular groove is used to accomplish intussusception.

I do, however, agree with Ravo and Nicolo that the '148 Patent uses the term "central post" to describe the structure which performs the function of intussusception. Indeed, with respect to the first embodiment, the '148 Patent reads that:

following ligation of the bowel to the central post 14, the central post 14 is moved relative to the annular housing 20 a distance approximately equal to one-half the length of the bowel to be resected…. With the bowel completely immobilized and attached to the central post 14, this relative movement will cause the intussusception of the segment of the bowel to be removed….

Col. 4, lines 9-20. Thus, with the understanding that the annular groove is part of the central post which plays a vital role in the attachment of the lumen, I find that the structure which performs the function of intussusception consists of the central post as a whole as well as the casing or other rigid member over or around which the lumen is inverted, and the equivalents thereof:

With respect to the second embodiment, the corresponding structure would involve the annular groove and the stapling assembly, see Col. 6, lines 37-47 (stating that "following the attachment of the colon to the surgical tool 50, the portion of the colon to be resected is intussuscepted by relevant movement of the stapling assembly 61 relative to the annular groove 56 as shown in FIG. 5. In the surgical tool 50 illustrated in FIG. 5, the stapling assembly 61 is advanced relative to the housing 52 by a threaded connection. The relevant portion of the bowel will be intussuscepted by a withdrawal of the distal end of the surgical tool 50 corresponding to the advancement of the stapling assembly 61 relative to the annular groove 56 and housing 52."), and the equivalents thereof.

--- End ---

4. "the lumen having a first diameter for the distal portion of the guide wire tube and a second diameter larger than the first diameter for the proximal portion of the guide wire tube"

The plaintiffs propose that this term carry its plain meaning. The defendants propose "the lumen having a first diameter for
the distal portion of the guide wire tube and a second diameter for the proximal portion of the guide wire tube that is greater than the first diameter such that a reservoir is created in the guide wire lumen."

The plaintiffs argue that this term is similar to the "proximal portion of a second length longer than the first length" term that the court declined to construe in the Cordis case. See Cordis Order at 10-11.

The defendants argue that according to Phillips and SciMed "the claims cannot be read so broadly as to cover balloon catheters without such a 'reservoir.'" Defendants' Response Brief at 4. The defendants provide three arguments in support of this construction. First, the lone embodiment of the patent, as shown in Fig. 7, includes a reservoir. The brief description of the drawings states that the Fig. 7 shows "the reservoir formed inside the guide wire lumen." '358 Patent at 3:21-22. The defendants cite to the plaintiffs' brief in the Cordis case, as well as the plaintiffs' expert's declaration in the Cordis case, to show that the plaintiffs agree that there is only one disclosed embodiment. Defendants' Response Brief at 4-5 (citing Plaintiffs' Opening Brief in the Cordis case at 7).

Second, the defendants argue that the prosecution history makes it "clear that the large diameter portion of the claimed guide wire lumen must form a 'reservoir.'" Defendants' Response Brief at 5. The statements that the defendants point to in the prosecution history are contained in excerpts from the inventor's notebook. As an example, the inventor's notebook contains a statement that "[t]he larger diameter lumen acts as a reservoir supplying heparin lubricant to the tip of the catheter." Id. at 5-6 (citing Wu Decl. Ex. 9 at MEDBSC00002727).

Finally, the defendants argue that the plaintiffs' statements to this court in the Cordis case result in the plaintiffs being judicially estopped from arguing that "the guide wire lumen need not possess a reservoir." Id. at 7. The statements relied on by the defendants come from the plaintiffs' briefing in the case. Id. at 6.

It is noteworthy that the definition proposed by the defendants is nearly identical to the claim language with the addition of the limitation "that a reservoir is created in the guide wire lumen." Notwithstanding the plaintiffs' statements made in the Cordis case, the defendants' proposed construction results in improperly importing limitations from the specification. In essence, the defendants' argument boils down to asking this court to limit the claims of the patent to the sole disclosed embodiment.

The court also notes that the language of claim 3 counsels against the defendants' proposed construction. Claim 3, which depends from claim 1, adds the limitation that "the guide wire lumen is adapted to receive an anticoagulant solution." '358 Patent at 7:43-45. Including the limitation of a reservoir in claim 1 as urged by the defendants would render claim 3 redundant.

With respect to the defendants' prosecution history argument, there is no evidence that the inventor made a clear and unmistakable disavowal of the claim scope. The inventor's notebook that contains the statements relied on by the defendants was provided by the prosecuting attorney to support an invention date that swore behind the reference relied on by the examiner.

The defendants' "judicial estoppel" argument is likewise unpersuasive. As this term was not in dispute in the Cordis case and the court did not address the issue of a reservoir, judicial estoppel simply does not apply here. New Hampshire v. Maine, 532 U.S. 742, 750-51, 121 S. Ct. 1808, 149 L. Ed. 2d 968 (2001) (discussing the general considerations in applying judicial estoppel, which include: (1) a party taking a position "clearly inconsistent" with its earlier position; (2) the party's success in persuading a court to accept that earlier position, and (3) whether the party would derive an unfair advantage or impose an unfair detriment on the opposing party if not estopped).

This term is straightforward as written and will be easily understood. Therefore, no construction is needed.

D. "lumen-traversing region of the resilient structure"

The parties dispute the phrase "lumen-traversing region of the resilient structure" from claims 37 and 38. As explained in an
earlier footnote, the lumen is the inner open space or cavity of a tubular organ. Used here, it is simply the open space within a fallopian tube.

CONCEPTUS'S PROPOSED CONSTRUCTION
"region of the resilient structure that crosses the width of the fallopian tube"

HOLOGIC'S PROPOSED CONSTRUCTION
"a section of the resilient structure that crosses the entire length of the fallopian tube lumen"

The parties could not be more diametrically opposed on the meaning of the phrase "lumen-traversing region." Conceptus argues that it refers to the part of the contraceptive device that traverses the entire width -- meaning the diameter or cross-section -- of the lumen, while Hologic contends that it pertains to the portion of the device traversing the entire length of the fallopian tube. As explained below, neither construction seems entirely correct.

Only some embodiments of the present invention have a clearly denoted "lumen-traversing region." In the embodiment shown in FIG. 1 (reproduced again below), the area denoted by number 24 is the "lumen-traversing region" (col. 9:7-12).

On either side of the lumen-traversing region are the "anchors" of the device, with the "proximal anchor" denoted by 20 and the "distal anchor" denoted by 22. These anchors serve their named purpose -- they keep the contraceptive device "anchored" in the fallopian tube so that the device is not expelled.

When the embodiment shown in FIG. 1 is inserted into the fallopian tube, the anchors are actually not curled -- rather, they held in a straight position to ease the insertion of the device. When the device is placed within the fallopian tube, the proximal and distal anchors are ideally placed on either side of the narrowest part of the tube (col. 8:43-53). That way, when the anchors are unfurled, the device is held snugly within the tube. FIG. 10 below illustrates the placement of the FIG. 1 embodiment within the fallopian tube.

In FIG. 10 shown above, the narrowest part of the fallopian tube, called the "isthmus," is denoted by 80, while the proximal and distal anchors of the FIG. 1 embodiment are shown as 92 (the proximal anchor) and 90 (the distal anchor).

Given this intrinsic evidence, it is clear that Hologic's proposed construction cannot be correct. The device shown in FIG. 10 clearly does not traverse the entire length of the fallopian tube. Rather, there are portions of the fallopian tube beyond the distal anchor of the contraceptive device (shown in FIG. 10 as 90) that the device does not occupy. Moreover, the specification expressly stated that the invented device could span various other portions of the tubal lumen (see cols. 3:49-52, 8:55-58). In sum, Hologic's proposed construction is contrary to the teachings of the specification, and improperly excludes numerous disclosed embodiments. As such, it must be rejected. See Vitronics, 90 F.3d at 1583 (holding that a construction that excluded a preferred or disclosed embodiment would be "rarely, if ever, correct and would require highly persuasive evidentiary support"); see also Verizon Servs. Corp. v. Vonage Holdings Corp., 503 F.3d 1295, 1305 (Fed. Cir. 2007) (if a disputed claim term has multiple ordinary meanings, the court should adopt the ordinary meaning that includes the disclosed examples in the specification).

Conceptus's proposed construction is also problematic. In claim 35 (which is not asserted in this action), the "lumen-traversing region" is expressly defined by the claim as the region "extending between the proximal and distal anchors" (col. 23:31-37). This is exactly as the "lumen-traversing region" is described for the embodiments in FIGS. 1 and 6 (col. 9:11-13).

Nothing in claim 36 or the specification requires that the contraceptive device "cross [] the width of the fallopian tube" to be permanently affixed within the fallopian tube. Granted, crossing the width of the fallopian tube might maximize the interaction of the device with the surrounding luminal wall, which might be ideal in ensuring that the device is permanently affixed within the tube (especially for those embodiments that promote tissue ingrowth). The intrinsic evidence, however,
does not require limiting the claims to such an ideal embodiment.

Indeed, a person having ordinary skill in the relevant art at the time the patent was filed would have understood, after reading the entire patent, that the lumen-traversing region of the contraceptive device could be lodged against one side of the fallopian tube (and not cross the entire width of the lumen) and still be entirely capable of becoming permanently affixed within the tube. This is because fallopian tube cross-sections can vary significantly in size, and the invention contemplates various means of affixing the device within the fallopian tube without mentioning any requirement that the device cross the entire width of the fallopian tube (see cols. 11:42-45, 16:52-54, 17:52-58). Moreover, it is unclear what Conceptus would consider the "width" of the lumen, given the fact that the lumen (depicted as "L" in FIG. 15A below) contains numerous folds.

[SEE FIG. 15A. IN ORIGINAL]

Since the specification failed to clearly define or denote the term "lumen-traversing region," this order will construe "lumen-traversing region" as it is defined by the language in claim 36. As such, the phrase "lumen-traversing region of the resilient structure" shall be construed as the "region of the resilient structure that interacts with the wall of the fallopian tube lumen to permanently affix the resilient structure within the fallopian tube lumen." 2

2 This order does not rely on the expert testimony of Dr. Mark Glasser to construe this, or any disputed phrase. As such, Hologic's evidentiary objections to Dr. Glasser's testimony are denied at moot.

b. "the luminal portion of the tunica mucosa"

ACell argues that the district court erred in construing the term "the luminal portion of the tunica mucosa." ACell asserts that this term was defined by the patentee through the '389 patent's incorporation by reference of the procedure for preparing intestinal submucosa as detailed in U.S. Patent No. 4,902,508 (the "'508 patent"). According to ACell, the '508 patent specification defines "the luminal portion of the tunica mucosa" as "layer G" which includes the lamina epithelialis mucosa (or the epithelium layer) and its lamina propria. Thus, ACell asserts that the term "the luminal portion of the tunica mucosa" in the '389 patent should be given the same meaning, i.e., the epithelium layer and the tunica propria layer.

5 The parties and patents at issue refer to this layer as the tunica or lamina propria and either reference is understood to refer to the same tissue layer.

Appellees argue in response that the phrase "at least the luminal portion of the tunica mucosa" does not require a special definition and accuse ACell of "fishing" for a special definition. Further, appellees assert that there is no basis for importing a definition, even assuming the term is defined as ACell alleges, of the term from the '508 patent into the '389 patent because the '508 patent is directed to SIS whereas the '389 patent is directed to UBS. Appellees assert that the district court's construction of the term as "the epithelial cells" should be affirmed.

The phrase "urinary bladder submucosa" is present in all three claims at issue. Based on our construction of that term as meaning "urinary bladder submucosa delaminated from . . . at least the luminal portion of the tunica mucosa," our construction of "the luminal portion of the tunica mucosa" applies to all three claims with equal force. We begin with the representative claim language from claim 1 of the '389 patent, which states:
1. A composition comprising urinary bladder submucosa delaminated from both the abluminal muscle layers and at least the luminal portion of the tunica mucosa of a segment of a urinary bladder of a warm blooded vertebrate.

’389 patent, col. 5, ll. 20-23 (emphases added). The ‘389 patent specification informs our inquiry into the meaning of the claims. The "BACKGROUND AND SUMMARY OF THE INVENTION" section discloses that "[t]he wall of the urinary bladder is composed of the following layers: the tunica mucosa (including a transitional epithelium layer and the tunica propria), a submucosa layer, up to three layers of muscle and the adventitia (a loose connective tissue layer)--listed in thickness crossection from luminal to abluminal sides." Id. at col. 1, ll. 49-55. The "DETAILED DESCRIPTION OF THE INVENTION" section sheds considerable light on the issue before us. It states:

The preparation of UBS from a segment of urinary bladder is similar to the procedure for preparing intestinal submucosa detailed in U.S. Patent No. 4,902,508, the disclosure of which is expressly incorporated herein by reference. A segment of urinary bladder tissue is first subjected to abrasion using a longitudinal wiping motion to remove both the outer layers (particularly the abluminal smooth muscle layers) and the luminal portions of the tunica mucosa layers—the epithelial layers). The resulting submucosa tissue has a thickness of about 80 micrometers, and consists primarily (greater than 98%) of a cellular, eosinophilic staining (H&E stain) extracellular matrix material.

Id. at col. 2, ll. 17-28 (emphasis added). That paragraph makes clear that "the luminal portions of the tunica mucosa layers" 6 were defined by the patentee as the "epithelial layers" and that "the procedure for preparing intestinal submucosa" as detailed in the ’508 patent is expressly incorporated by reference into the ’389 patent specification.

Footnotes

6 While we recognize that the phrase in the specification refers to the luminal portions and the claim language refers to the luminal portion, this section of the specification sheds the most light on how the patentee chose to define the claim term.

End Footnotes

The term "epithelial layers" may arguably be subject to two interpretations. On the one hand, it refers to "layers" which appears to reflect that it was meant to encompass more than just the transitional epithelium layer, i.e., the transitional epithelium layer and the tunica propria layer, the only other layer that the ’389 patent teaches is part of the tunica mucosa. See id. at col. 1, ll. 51-52. On the other hand, as recognized by the district court, the epithelium in the urinary bladder is made up of multiple layers of epithelial cells. Markman Order, slip op. at 10. Even accepting that the disclosure in the ’389 patent specification itself is less than clear as to which interpretation is correct, the second important disclosure of the ’389 specification is dispositive. As noted, the ’389 patent specification expressly incorporates by reference the procedure for preparing intestinal submucosa from the ’508 patent.

"Incorporation by reference provides a method for integrating material from various documents into a host document . . . by citing such material in a manner that makes clear that the material is effectively part of the host document as if it were explicitly contained therein." Advanced Display Sys., Inc. v. Kent State Univ., 212 F.3d 1272, 1282 (Fed. Cir. 2000) (citations omitted). "To incorporate material by reference, the host document must identify with detailed particularity what specific material it incorporates and clearly indicate where that material is found in the various documents." Id. (citations omitted). Whether and to what extent material has been incorporated by reference into a host document is a question of law. Id.

The relevant portions of the ’508 patent specification are as follows:

Layers E, F, and G collectively represent the so-called tunica mucosa. Layer E is a layer of smooth muscle cells known as the lamina muscularis mucosa. Layer F, the stratum compactum, consists of a cellular collagen and elastin fibers. Layer G consists of the lamina epithelialis mucosa and its lamina propria, which together and arranged in villous processes, a series of finger-like outgrowths of the mucous membrane.

The tissue graft material of this invention is prepared by abrading intestinal tissue to remove the outer layers including
both the tunica serosa and the tunica muscularis (layers B and C in FIG. 1) and the inner layers including at least the luminal portion (layer G) of the tunica mucosa (layers E through G in FIG. 1).

'508 patent, col. 3, ll. 13-20, 53-58 (emphases added).

GET DRAWING SHEET 1 OF 1.

Id. at fig. 1.

As this disclosure makes clear: (1) "the luminal portion of the tunica mucosa" is represented by "layer G" in Figure 1 of the '508 patent, and (2) layer G in that figure corresponds to the lamina epithelialis mucosa and its lamina propria. Id. Even acknowledging appellees' argument that the layers of the wall of the intestine are somewhat structurally different than the layers of the wall of the bladder, neither party disputes that the basement membrane of the transitional epithelium is located between the epithelialis mucosa layer and its lamina propria layer in both organs. Thus, because the basement membrane is located between the two tissue layers explicitly identified, "the luminal portion of the tunica mucosa" must also refer to the basement membrane. Therefore, "the luminal portion of the tunica mucosa" means the lamina epithelialis mucosa (or transitional epithelium layer), the basement membrane, and the lamina propria.

The '389 patent's incorporation by reference of the '508 patent's procedure for preparing intestinal submucosa, in combination with the '508 patent's disclosure pertaining to which tissue layers are removed by that procedure, leads to the conclusion that the patentee's definition of the claim term as reflected in the '389 patent as the epithelial layers and in the '508 patent as the lamina epithelialis mucosa and its lamina propria was intended to refer to the same structures, i.e., the lamina epithelialis mucosa (or transitional epithelium layer), the basement membrane, and the lamina propria.

The district court's reasoning is contradicted by its own analysis. Relying on a medical dictionary, the district court recognized that the tunica mucosa comprises the epithelium, basement membrane, lamina propria mucosae, and lamina muscularis mucosae. Markman Order, slip op. at 10-11. The court then rejected ACell's proposed construction that "the luminal portion of the tunica musoca" means the epithelial cells (i.e., the transitional epithelium), the basement membrane, and the lamina propria because the term "would not require the entire tunica mucosa including the basement membrane, tunica propria and all epithelial cells to be removed as ACell contends." Id., slip op. at 11.

That statement by the district court reflects that it believed ACell's proposed construction of that term encompassed the entire tunica mucosa, rather than just "the luminal portion" as the claim requires. The district court's reasoning, however, overlooks the fact that ACell's construction permits the retention of the lamina muscularis mucosae layer of the tunica mucosa. This construction is consistent with both the medical dictionary's list of layers that comprise the tunica mucosa, and the teachings of the '508 patent, which specifically refer to that layer as "layer E" of the tunica mucosa. '508 patent, col. 3, ll. 14-15. As this discussion indicates, ACell's proposed construction does not require removal of the entire tunica mucosa as the district court's opinion suggests, but rather removal of only a portion of the tunica mucosa. 7 Therefore, we construe "the luminal portion of the tunica mucosa" to mean "the lamina epithelialis mucosa (or transitional epithelium layer), the basement membrane, and the lamina propria."

7 The district court also relied upon extrinsic evidence in the form of testimony from a Dr. Harbin who convinced the court that there was no compelling reason on the part of Cook to remove the basement membrane, lamina propria, or any other non-cellular component of the bladder wall layers. Markman Order, slip op. at 11. In light of the discussion above, however, such extrinsic evidence cannot override the patentee's definition of the term contained in the intrinsic evidence of the '389 and '508 patent disclosures.

GO BACK

2428

2. "an attachment plate lying between the two implement-support plates"
 Plaintiff proposes a construction of

a plate separate from, and positioned between the implement-support plates that form the sides of the knife. The attachment plate is between the support plates and keeps them spaced apart. The attachment plate is a separate member from a liner lock, a liner lock being a different element. If both an attachment plate and a liner lock are found in the same knife, they are separate components positioned laterally adjacent to each other.

Defendant proposes a construction of "a plate that supports an attachment structure, the plate lying between the two implement-support plates."

The court finds that this language is clear on its face and requires no construction.

2429

3. "macromolecules" (claims 1, 4, 8, 15, and 16)

Plaintiff argues that "macromolecules" should be construed as "molecules having a molecular weight of at least 500." Defendant argues that the term should be construed as "molecules larger than about 500 molecular weight." The specification states that the "cardinal feature" of the patent is its ability to restrain macromolecules. See 7:39-41. The specification further states that "the precise size of the molecules that the minimally-porous sheet can restrain is not important, for the purposes of this invention, the pores should be small enough to restrain molecules greater than around 500 Daltons." 8:3-6. In light of the intrinsic record, the court defines "macromolecules" as "molecules with a molecular weight of at least approximately 500 Daltons."

2430

2. "Made of Film"

The Special Master next observed that "claims 5-6, 15, 35, 39-42, and 44 of the '668 Patent each call for either sheets or sections of material that 'are made of film.'" (R&R at 66.) The limitation "made of film" has been construed by this Court to mean "made at least partially of film." (8/4/04 Order accepting and adopting Special Master's R&R, as supplemented by 7/15/04 R&R.) The Special Master properly observed that TRW's noninfringement position here was likewise "founded upon its manufacturing process." (R&R at 67.) "According to TRW, its manufacturing method provides two separate reasons why film does not play a role in the formation of the compartments of its OPW airbags: First, because the film is applied after the chambers have already been formed, and second, because the compartments are formed in the interior of the airbag, while the film is applied to the exterior of the airbag." (R&R at 67.) The Special Master rejected TRW's arguments, finding that they sought to impermissibly limit the product claims of the '668 Patent by their method of manufacture. (R&R at 68, citing 3M Innovative Properties Co. v. Avery Dennison Corp., 350 F.3d 1365, 1371 (Fed. Cir. 2003), and Vanguard Prods., 234 F.3d at 1372.) Considering governing Federal Circuit case law and the wording of the '668 Patent, the Special Master concluded that "the scope of claims 5, 6, 15, 35, and 39-42, and 44 is not restricted to any particular method of manufacturing the claimed product." (R&R at 68.) "When these product claims call for sheets or sections of material that 'are made of film,' they are therefore referring to a passive, structural feature of the claimed air bag. These product claims do not require that the claimed airbags be manufactured via any particular sequence of steps, and in particular that each of the airbag's components be incorporated into the product simultaneously." (R&R at 68.) Accordingly, the Special Master recommended that TRW's motion for summary judgment of non-infringement be denied as to these claims. This Court accepts and adopts this recommendation. TRW's objections are overruled.

The Special Master then observed that claims 25 and 43 of the '668 Patent "calling for sections of material 'made out of film' are drafted in process format" and "concern a method for manufacturing an airbag for a vehicle. . . ." (R&R at 69.) He rejected TRW's argument that the limitation calling for a "sheet of film" must be performed simultaneously with an initial joining of sections of material. "The language of claims 25 and 43 'neither grammatically or logically indicate[]' that the steps must be performed in any particular order." (R&R at 70, quoting Altiris, Inc. v. Symantec Corp., 318 F.3d 1363, 1370 (Fed. Cir. 2003).) Accordingly, the Special Master recommended that TRW's motion for summary judgment of non-
infringement be denied as to these claims. (R&R at 70.) This Court accepts and adopts this recommendation and overrules TRW's objections.

B. The Proper Construction of the Claim Element "Net Supporters Made of PFA, FEP or EPE" Excludes Any Material Other Than PFA, FEP or EPE.

43. The words "net supporters made of PFA, FEP or EPE" in the context of the 041 patent means that the net supporters must be made wholly of PFA, FEP or EPE, and cannot include any other fluorocarbon resin (e.g., PTFE) therein. In other words, the claimed "net supporters" cannot (1) be a mixture of two or more of the three materials specified or (2) contain a material other than PFA, FEP or EPE, e.g., PTFE. Tr. 125-26, 128.

44. Similarly, the claims also use the same "made of" language in connection with a PTFE membrane. PTFE filter membranes have always contained 100 wt.% PTFE. Thus, the use of the "made of" language in claim 1 connotes a component made wholly of one material (100 wt.% PTFE in the case of the membrane). PTX 1; Tr. 123-24.

45. The words "made of" in the context of the 041 patent mean that materials other than those specifically recited in the claim should be excluded. Tr. 94-96, 123-25.

46. This construction is also consistent with the specification and prosecution history of the 041 patent. Tr. 126-28; PTX 14, 15.

47. The specification refers to the net supporters as being provided from a single thermoplastic fluorocarbon material, with the filter membrane also being provided from a single fluorocarbon material:

The filter membrane of a fluorocarbon resin, especially PTFE, is placed between thermoplastic fluorocarbon resin net supporters in a sandwich form. These supporters are a spacer for the filter membrane.

As a material for the net supporter, there are used thermoplastic fluorocarbon resins such as . . . PFA . . . FEP . . . ETFE . . . PCTFE . . . ECTFE . . . PVDF . . . PVF . . . EPE . . . . Particularly preferred ones are PFA, FEP and EPE in terms of chemical resistance and temperature resistance.

PTX 14 at col. 3, ll. 16-19 and 31-47. The specification does not disclose the use of any non-thermoplastic fluoropolymer (e.g., PTFE) as a net supporter material. Tr. 372.

48. The only example of a filter provided by the Miyagi 041 patent includes a 100% PTFE membrane and 100% EPE net supporters superimposed above and below the filter membrane. PTX 14 at col. 5, ll. 44-49; Tr. 368.

49. The specification of the patent does not disclose the net supporters, filter material, or any other component of the filter element as being prepared from a mixture of two or more fluorocarbon resin materials. PTX 14; Tr. 126-27.

50. Since their introduction, none of the all-fluorocarbon filter cartridges commercialized by Kurabo and PTI under the 041 patent contained any net supporters prepared from a mixture of two or more of these fluorocarbon resins identified in the 041 patent as being suitable for the net supporter, e.g., at least two of PFA, FEP, ETFE, PCTFE, ECTFE, PVDF, PVF and EPE. Tr. 223, 331, 351-52, 367

51. The prosecution history provides further support for the claim construction. Tr. 127-28. The claims of the 041 patent as originally filed were broad, covering "net supporters made of a thermoplastic fluorocarbon resin" and "a filter membrane made of a fluorocarbon resin." PTX 15 at 15-17.

52. The U.S. Patent and Trademark Office ("Patent Office") rejected those claims over an earlier Pall patent, U.S. Patent 4,154,688. The Examiner asserted that Pall's 688 patent taught a filter cartridge in which all of the components are made of the same fluorocarbon material. PTX 15 at 46-47; Tr. 127-28.
53. The 041 patentees, in response to the rejection, changed the language of claim 1 to "a filter membrane made of PTFE" and "net supporters made of PFA, FEP or EPE." The patentees also told the Examiner that:

All of the constituents of the filter element now claimed are not the same. The membrane material is PTFE but the net, seal, etc. are not because there is risk that the filter membrane would be damaged if melting at a welding temperature is attempted.

PTX 15 at 52-54 (emphasis added); Tr. 127-28.

54. A Declaration was also submitted with the patentees' response. The Declaration contains an experiment which the patentees' characterize as being in accordance with "the present invention." The membrane used in the experiment is a 100% PTFE membrane. PTX 15 at 56; Tr. 309.

55. The significance of the prosecution history is two-fold. First, the patentees' remarks in the Amendment affirmatively state that the membrane material "is" PTFE, i.e., it constitutes 100% PTFE. The Experiment in the Declaration, which is characterized as "the present invention," uses 100% PTFE as the membrane and 100% PFA net supporters. PTX 15 at 52-54; Tr. 309-10. Thus, the evidence elicited at the hearing and arguments offered by the parties indicates that there is no dispute that the "filter membrane made of PTFE" recited in claim 1 refers to a filter membrane that is 100% PTFE. Tr. 96, 123-24, 29-10. One must therefore conclude that the words "made of" in relation to the filter membrane element mean made wholly of, or 100% of, PTFE. The net supporters, which include the same "made of" language, must be construed in a consistent manner. Tr. 123-25. The claimed "net supporters" therefore include 100% of one of the three recited thermoplastic fluorocarbon resins, PFA, FEP or EPE. Tr. 94-98, 109-10, 123-25, 128.

56. Second, the patentees' remarks distinguished the filter membrane material from that of the net supporters in order to obtain allowance of the claims over the Pall 688 patent. PTX 15 at 52-54. In stating that the membrane material is PTFE but the net is not, the 041 patentees indicated that the claimed "net supporters" do not include any PTFE. PTX 15 at 54.

2432

2. "Whereby said cutting edge surface is made thinner than a thickness of said cutter blade." Consistent with the plain language used in the claim and the teachings of the specification, the court construes the phrase "whereby said cutting edge surface is made thinner than a thickness of said cutter blade" to mean that "the horizontal thickness of the cutting edge surface after formation of the recess is thinner than the original horizontal thickness of the cutter blade." The specification states that the thickness of the cutting edge "will be the thickness of the cutter blade, which is referred to by A in Fig. 8." (Id. at ll. 4-6; see Fig. 8) Figure 8, in turn, shows the original horizontal thickness of the inner blade prior to formation of the recess.

GO BACK

2433

d. "Made to Engage" in Claim 11

Lastly, the Court must interpret the phrase "made to engage" found in claim 11, Col. 12, lines 24 and 26. The relevant claim language states: ". . . (j) a right elongated flexible member . . . made to engage said right one way clutch and said left elongated flexible member . . . made to engage said left one way clutch." Col. 12, lines 21-26 (emphasis added). The claim language is again silent as to what type of connection was contemplated by the inventor at the time of the invention. The specification and prosecution history are also unhelpful insofar as determining how such a structure is "made to engage" a right or left one way clutch. Finding no indication to the contrary in the intrinsic evidence that the claim language should be construed more narrowly, and again applying the customary meaning of "engage," the Court construes the terms "made to engage" to refer to the making of a mechanical connection, by means of coming into contact, interlocking, or meshing, between a right or left elongated flexible member with a right or left one way clutch.
A. "Magnet"

Plaintiff argues that the term "magnet" in Claims 1 and 4 means "either a permanent magnet or a ferromagnetic material capable of acting as a magnet or equivalents." (Joint Statement at p.5.) Conversely, Defendants argue that the term "magnet" means a permanent magnet. (Joint Statement at p.14.)

Following Vitronics, the Court should first look to the words of the claim itself to define the scope and meaning of the patented invention, then to the patent specification and prosecution history. The claims, specification and prosecution history of the '913 patent do not define the term "magnet;" they simply use the word. The ordinary meaning of "magnet" is "a body having the property of attracting iron and producing a magnetic field external to itself and "something that attracts." Webster's Ninth New Collegiate Dictionary (1986). (Radparvar Supp. Decl. at Ex.1; Williams Decl. at Ex.A.) "Permanent magnet" is defined as "a magnet that retains its magnetism after removal of the magnetizing force." Merriam-Webster Online Dictionary. (Trojan Decl. at Ex.4.) A "ferromagnetic material" is a material that is attracted by a permanent magnet, e.g., iron, nickel and cobalt. See Miracle Claim Construction Order at 19 n.9. The phrase "ferromagnetic material" is not used in the claims or the specification.

The ordinary meaning of "magnet" is essentially a permanent magnet, a body that attracts other materials and retains that attractive capability after the magnetizing force is removed. The ordinary meaning of "magnet" contrasts with the definition of "ferromagnetic material," which is a material that is attracted by a permanent magnet, rather than a material that attracts certain materials. The Court does not find that the ordinary meaning of magnet should be construed to include ferromagnetic materials.

Plaintiff argues that "magnet" should be construed to include ferromagnetic materials because "a review of the entire file history of the 913 patent demonstrates that no rejection can be found based upon the type of magnetic material used." (Opening Brief at 7:13-15.) This argument is irrelevant, because the fact that the patent examiner did not issue a rejection based on the type of magnetic material used has no bearing on the interpretation of the term "magnet." 2

--- Footnotes ---

2 This argument by Plaintiff was previously rejected in related litigation, Revolution Eyewear, Inc. v. Aspex Eyewear, Inc. et al., No. CV 02-01087 LGB (CWx), Order Construing Claims of U.S. Patents 6,343,858 and RE 37,545, May 5, 2003. The Court stated that "[t]he patent applicant in this case used the term 'magnets' in his application; and the most logical assumption is that the patent examiner simply considered 'magnets' to mean permanent magnets, and thus would have had no reason to consider other interpretations of that term." (Trojan Decl. at Ex.3, 15:8-13.)

--- End Footnotes ---

Plaintiff relies on the Court's construction of the phrase "magnetic members" in the case of Aspex Eyewear, Inc. v. Miracle Optics, Inc., CV 01-10396, 2003 U.S. Dist. LEXIS 26355, Order Construing Claims of U.S. Patents RE 37,545 and 6,109,747, February 14, 2003 (hereinafter "Miracle Claim Construction Order"). (Trojan Decl. at Ex.2). In the Miracle Claim Construction Order, the Court interpreted the phrase "magnetic member" to mean "a permanent magnet or a ferromagnetic member, but at least either the first or second magnetic members must be a permanent magnet." (Trojan Decl. at Ex.2, 20:5-8). The Court explained that the definition of "magnetic" includes "capable of being magnetized or of being attracted by a magnet." Miracle Claim Construction Order at 16. Plaintiff argues that based on the Miracle Court's construction of "magnetic," the Court should construe the term "magnet" as used in the '913 patent as either a permanent magnet or ferromagnetic material capable of acting as a magnet.

Plaintiff's reliance on Miracle is misplaced, because the words used in the patents at issue in Miracle and the '913 patent are different. Nowhere in the Miracle Claim Construction Order did the Court state or suggest that it was construing the noun "magnet." In fact, the Court in Miracle acknowledged the difference between the words "magnetic" and "magnet," stating "the Court agrees with Plaintiffs that the use of both 'magnet' and 'magnetic material' in the [claim] language [] counsels against limiting the phrase 'magnetic material' to a 'magnet.'" (Trojan Decl. at Ex.3, 41; 24-27.) The operative word at issue
in the '913 patent is the noun "magnet," not the adjective "magnetic." The only term used to describe the '913 patent in the claims and the specification is "magnet," not "magnetic member" or "ferromagnetic material." The definition of the adjective "magnetic" relied on by the Court in Miracle is different from the definition of the noun "magnet." The definition of "magnetic" specifically includes materials that are capable of both being magnetized and being attracted by a magnet. In contrast, the definition of "magnet" states only that the body has the ability to attract certain materials, and includes no reference to the body being attracted by certain materials. For the foregoing reasons, the Court also rejects Plaintiffs assertion that Defendant Aspex is estopped from asserting that the ordinary meaning of the term "magnet" used in the '913 patent claims does not include ferromagnetic materials.

In related litigation, Revolution Eyewear, Inc. v. Aspex Eyewear, Inc. et al., No. CV 02-01087-LGB (CWx), Order Construing Claims of U.S. Patents 6,343,858 and RE 37,545, May 5, 2003, the Court construed the term "magnet" found in Plaintiffs U.S. Patents 6,343,858 to mean "permanent magnet" (hereinafter "'858 Claim Construction Order"). (Trojan Decl. at Ex.3.) The '858 patent is a continuation-in-part of the application leading to the '913 patent, and both the '858 and '913 patents used the term "magnet" in the patent claims and specification. In the '858 Claim Construction Order, the Court distinguished the Miracle Claim Construction Order, because the latter construed the term "magnetic," rather than the term "magnet" that was used in the '858 patent. The Court found that the ordinary meaning of "magnet" is essentially a permanent magnet, a "body that attracts certain materials, as iron, by virtue of a surrounding field of force created by the motion of its atomic" and "[o]ne that attracts." (Trojan Decl. at Ex.3, 14.) In the '858 Claim Construction Order, the Court distinguished the meaning of "magnet" from "ferromagnetic material," finding that the ordinary meaning of "magnet" "cannot be ferromagnetic material because it needs to have the ability to attract certain material like iron" and a ferromagnetic material is a material attracted by a permanent magnet. Id.

Plaintiff disagrees with the ordinary meaning of magnet as construed in the '858 Claim Construction Order. However, this Court agrees with the prior court's construction of the term "magnet." In addition, the Court finds that since the '858 and '913 patents are related, the common term "magnet" should be construed consistently to mean a permanent magnet.

12. "Magnet liner"

This term is contained an independent claim in the 117 patent, 130 as well as a dependent claim in the 117 patent. 131

As to this term, the Court construes the following meaning: an individual separating device, distinct from the protector, which is inserted into a tool body recess, and then has a magnet placed into it. This interpretation is supported by the summary of the invention. 132 The specification also supports this interpretation: "A magnet liner is positioned inside each recess in contact with the surface... A magnet member is placed above the liner, and securing lugs are placed over the magnet..." 133 "Each magnet liner is configured to match the profile of the magnet, the recess and the lugs." 134 "Each magnet protector has a first surface which contacts the liner..." 135 "Each recess holds a liner and a magnet." 136 The drawing in the 117 patent also supports this interpretation. Construction of this phrase involves little more than the application of the widely accepted meaning of commonly understood words used in the patent.

As to this term, the Court construes the following meaning: an individual separating device, distinct from the protector, which is inserted into a tool body recess, and then has a magnet placed into it. This interpretation is supported by the summary of the invention. 132 The specification also supports this interpretation: "A magnet liner is positioned inside each recess in contact with the surface... (4) "magnetic member" (claims 12, 16 and 24)

Plaintiffs argue that the term "magnetic member" in claims 12, 16 and 24 means "a magnet or magnetically attractive material." JS, Exh. B at 10, 19, 33, 42 and 51. Conversely, Defendant argues that the phrase "magnetic member" is limited to a magnet. Id., Exh. D at 1, 2, 4, 5 and 6.

Defendant contends that the magnetic members must be magnets because "[t]he specification requires that the magnetic members attract towards one another . . ." and ":[o]n [sic] 8 two magnets magnetically attract each other." Def. Response at 7:9.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

8 Presumably, Defendant intended to say "Only."

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

As counsel acknowledged at Oral Argument on February 7, 2003, the construction of the phrase "magnetic member" is heavily contested by the parties. Preliminarily, the Court finds it helpful to re-state the applicable law on claim construction. In the seminal case of Vitronics, the Federal Circuit established a three-tiered hierarchy of intrinsic evidence that a court must first consider in construing claim terms. See Vitronics, 90 F.3d at 1581-83.

First a court must "look to the words of the claims themselves, both asserted and nonasserted, to define the scope of the patented invention." Id. at 1582. In this case, claims 12, 16 and 24 of the '545 Patent do not expressly define the phrase "magnetic members." The ordinary meaning of "magnetic" is "having the properties of a magnet" and "capable of being magnetized or of being attracted by a magnet." Webster's II New College Dictionary ("Webster's"), Declaration of Michael A. Nicodema in Support of Plaintiffs' Opening Brief ("Nicodema Decl."), Exh. 5 at 140 (emphasis added). Additionally, dependent claim 13 states that the magnetic members are magnets. See Koo Decl., Exh. B, Col. 5, 11. 8-9. Under the doctrine of claim differentiation, where some claims are broad and others are narrow, the narrow claim limitations cannot be read into the broad claims. Yarway Corp. v. Eur-Control USA, Inc. 775 F.2d 268, 274-75 (Fed. Cir. 1985). On the basis of that doctrine, the construction of the phrase "magnetic member" includes a magnet but cannot be limited to only a magnet. Thus, based on the ordinary meaning of the claim terms and on the doctrine of claim differentiation, the Court initially construes the phrase "magnetic member" to be a magnet, a material with the properties of a magnet or a material capable of being attracted by a magnet.

Second, "it is always necessary to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning. The specification acts as a dictionary when it expressly defines terms used in the claims or when it defines terms by implication." Vitronics, 90 F.3d at 1582. In this case, the specification of the '545 Patent does not expressly or impliedly define the phrase "magnetic member" in a manner inconsistent with its ordinary meaning here, a magnet, a material with the properties of a magnet or a material capable of being attracted by a magnet.

Third, "the court may also consider the prosecution history of the patent, if in evidence. This history contains the complete record of all the proceedings before the Patent and Trademark Office, including any express representations made by the applicant regarding the scope of the claims." Id. at 1582 (internal citations omitted). During the prosecution of the '545 Patent, the applicant's attorney acknowledged that the magnetic members 14 and 22 are magnets which couple to each other. See Koo Decl., Exh. E, Pros. History, at 375 (the applicant's attorney stated to the PTO: ":[a]s clearly shown in Figure 7 of
the '207 patent, the two magnetic members 14 and 22 are in proximity of, coupled to, but not in contact with each other. Magnets are coupled to each other when they are in proximity of each other."). However, and as Plaintiffs' counsel pointed out during Oral Argument, that portion of the prosecution history dealt with the issue of whether magnetic engagement "without contact" was new matter, see id., and not with the construction of the phrase "magnetic member." Thus, there was no clear intent on the part of the patentee to limit magnetic members to magnets. See Schumer v. Lab. Computer Systems, Inc., 308 F.3d 1304, 1313 (Fed. Cir. 2002) ("the prosecution history limits even clear claim language so as to exclude any interpretation that was surrendered during prosecution, but only where . . . the patentee surrendered that interpretation with reasonable clarity and deliberateness.") (emphasis added).

Additionally, Plaintiffs' counsel argued at Oral Argument that the Court should consider U.S. Patent No. 5,416,537 (the "Sadler Patent") in construing the instant phrase. In Vitronics, the Federal Circuit stated that "[i]ncluded within an analysis of the file history, [i.e., in the third tier of intrinsic evidence to consider during claim construction], may be an examination of the prior art cited therein." Vitronics, 90 F.3d at 1583; see also In re Cortright, 165 F.3d 1353, 1358 (Fed. Cir. 1999) (stating that "[p]rior art references may be indicative of what all those skilled in the art generally believe a certain term means."). In this case, not only was the Sadler Patent referenced in the '545 Patent, see '545 Patent, Koo Decl., Exh. B, Col. 1, 11. 22-23, but it was also cited by the examiner during the prosecution of the '545 Patent and a copy of the patent itself was incorporated in the file wrapper of the '545 Patent. See July 15, 1999 Office Action, Koo Decl., Exh. E at 173-179. Thus, and consistent with Vitronics, the Court now considers the extent to which the Sadler Patent sheds light on the construction of the phrase "magnetic member."

The Sadler Patent discloses "magnetic means for securing auxiliary lenses to eyeglasses." See the Sadler Patent, Koo Decl., Exh. E at 174. Like the '545 Patent, the Sadler Patent employs the phrase "magnetic members" to refer to the "first" member in the primary frame and to the "second" member in the auxiliary frame. See the Sadler Patent, Koo Decl, Exh. E, Col. 2, 11. 43-54. Additionally, the Sadler Patent defines "magnetic member" as being made of permanent magnetic material or a ferromagnetic material. 9 See id. at Col. 3, 11. 21-23. However, "[a]t least one of the first and second magnetic members must be made of a permanent magnetic material in order for a magnetic attraction to exist." 10 Id. at Col. 3, 11. 23-25. Additionally, the Sadler Patent contains a dependent claim, claim 2, that narrows the construction of "magnetic member" to a permanent magnet. Thus, the phrase "magnetic member" in the Sadler Patent is clearly construed to be a permanent magnet or a ferromagnetic member, but at least one of the first or second magnetic members must be a permanent magnet.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

9 A ferromagnetic material is a material that is attracted by a permanent magnet, e.g., iron, nickel and cobalt. See A Review of Magnets and Magnetism at http://my.executec.com/rhoadley/magencyc.htm. (hereafter "A Review of Magnets and Magnetism").

10 This, of course, makes sense since two pieces of ferromagnetic material, e.g., two pieces of iron, will not attract each other.

- - - - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

As stated above, the Court initially construed the phrase in question to mean a magnet, a material with the properties of a magnet or a material capable of being attracted by a magnet. The first two parts of this construction, a magnet or a material with the properties of a magnet, are for all practicable purposes the same, a permanent magnet. The last part of this definition, a material capable of being attracted by a magnet, is but another way to describe a ferromagnetic material. However, the Court finds the use of the term "ferromagnetic" to be more precise and definite. 11 Therefore, the Court construes the phrase "magnetic member" to mean a permanent magnet or a ferromagnetic member, but at least either the first or second magnetic members must be a permanent magnet.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

11 A ferromagnetic material is not the only material that exhibits attraction to a permanent magnet. For example, a paramagnetic material, e.g., aluminum, also exhibits such attraction. However that attraction is much weaker than the one between a ferromagnetic material and a permanent magnet, and thus is inapplicable to the technology at issue here. See A Review of Magnets and Magnetism at 2.

- 2916 -
12 Defendant argues that Plaintiffs should be judicially estopped from asserting that the phrase "magnetic members" is anything other than magnets based on statements made by Plaintiffs' counsel in their appeal brief to the Federal Circuit in the case of Aspex Eyewear, Inc. v. Revolution Eyewear, Inc. See Def.'s Surreply at 2:2-6:20. The Court disagrees. Statements by an attorney do not override the meaning of the claims as finally worded and issued. See Intervet America, Inc. v. Kee-Vet Labs., 887 F.2d 1050, 1055 (Fed. Cir. 1989).

c. "Magnetic or magnetizable"

The parties next dispute the construction of the term "magnetic or magnetizable" in claim 1 of the '196 patent. Ideal asserts that no construction of this unambiguous term is required, even as an alternative to Rivard's proposed construction. Therefore, the chart that follows shows only the claim term and Rivard's proposed construction.

THE '196 PATENT

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Rivard's Proposed Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>c. Magnetic or magnetizable</td>
<td>The needle or needle piece has been magnetized to be a permanent magnet that produces a magnetic field, or has been magnetized in a magnetic field to maintain a residual magnetism that produces its own magnetic field that persists when the magnetic field is removed, prior to use of a detector. The term does not refer to stainless steel which is merely attractable to a permanent magnet.</td>
</tr>
</tbody>
</table>

i. Arguments of the parties. Rivard argues that claim 1 refers to stainless steel that is "magnetic or magnetizable," then thereafter refers to the "magnetism" of the needle. Rivard argues that, to be grammatically and substantively consistent, the term "magnetism" must relate back to and be produced by the stated "magnetic or magnetizable" feature of the needle cannula, and that the term "magnetism" does not refer to the mere capacity to be magnetized, but to something that actually operates as a magnet. Rivard also argues that the specification repeatedly refers to a magnetic needle or one that is magnetized before detection and to "magnetic stainless steel." From this language, Rivard apparently infers that "magnetic or magnetizable" means already made a magnet, not merely capable of becoming a magnet. Similarly, Rivard argues that the prosecution history shows (1) that the invention requires the needle to be magnetized not just to have the capability to be magnetized, and (2) that the patentee distinguished prior art that was merely capable of being magnetized and not actually magnetized because non-magnetized prior art needles did not provide increased detectability. Rivard's arguments in its rebuttal brief concerning the "magnetism" terms of the two patents, which were discussed in reference to construction of the "magnetism" terms of the '668 patent, are also asserted as to the "magnetic or magnetizable" terms of the '196 patent. Ideal, however, argues that "magnetic or magnetizable" is unambiguous and that the prosecution history reveals no intent to disavow any scope to the term.

ii. Analysis. Beginning with the words of the claim, Nystrom, 424 F.3d at 1142 (courts must "begin [their] claim construction analysis with the words of the claim"), it is apparent that "magnetic or magnetizable" refers to two possible, and different, conditions. See Merck & Co., 395 F.3d at 1372 (the court must construe claims so that no term becomes "superfluous," and "[a] claim construction that gives meaning to all the terms of the claim is preferred over one that does not do so."). The first problem with Rivard's construction, in the court's view, is that it improperly conflates the two stated conditions into a single condition, "magnetic."

The second problem with Rivard's construction of this phrase, in the court's view, is that "magnetic" and "magnetizable" do not have the same ordinary meaning, and nothing in the patent suggests that a specialized meaning conflating the latter term into the former one is appropriate. See Free Motion Fitness, Inc., 423 F.3d at 1348 (recognizing such use of a dictionary as appropriate, citing Phillips, 415 F.3d at 1320); Phillips, 415 F.3d at 1324 ("[A] judge who encounters a claim term while
reading a patent might consult a general purpose or specialized dictionary to begin to understand the meaning of the term, before reviewing the remainder of the patent to determine how the patentee has used the term.

More specifically, as to ordinary meaning, in the sense appropriate here from the intrinsic evidence of the patent, see Free Motion Fitness, Inc., 423 F.3d at 1348 ("The court must ensure that any reliance on dictionaries accords with the intrinsic evidence."). "Magnetic" means "magnetized" or capable of being magnetized, and "magnetize" means "to induce magnetic properties in." See MERRIAM WEBSTER'S COLLEGIATE DICTIONARY 700 (10th ed. 1995). Thus, "magnetic" means having been induced with magnetic properties, see OXFORD ENGLISH DICTIONARY (on-line ed. at dictionary.oed.com) ("magnetic" means, inter alia, "having the properties of a magnet"); and "magnetizable" means "capable of being magnetized." See OXFORD ENGLISH DICTIONARY (on-line ed. at dictionary.oed.com). While the definitions of "magnetic" and "magnetizable" overlap at the broadest definition of "magnetic" as "capable of being magnetized," Rivard argues that the appropriate meaning for both "magnetic" and "magnetizable" is the narrowest meaning of "magnetic" as "magnetized," which is a meaning that the term "magnetizable" simply will not bear. Moreover, in a context where both terms are used in succession, it is appropriate to read them to have different meanings. See Merck & Co., 395 F.3d at 1372 (the court must construe claims so that no term becomes "superfluous," and "[a] claim construction that gives meaning to all the terms of the claim is preferred over one that does not do so."). Thus, applying ordinary meanings, "magnetic" means "magnetized" or "induced with magnetic properties," and "magnetizable" means "capable of being magnetized" or "capable of being induced with magnetic properties."

Returning to intrinsic evidence, the court is unpersuaded by Rivard's argument that the subsequent references to "magnetism" in claim 1 mean that "magnetic or magnetizable" must refer to something that actually operates as a magnet, not to something that merely has the capacity to be magnetized. It is true that claim 1 does not include any limitation requiring that the "magnetic or magnetizable" needle actually be magnetized, even though it later refers to the "magnetism" of the needle. See the '196 patent, claim 1. 16 The subsequent references to "magnetism" in claim 1 are in an extended "so that" clause, which "simply expresses the intended result of a process step positively recited"; consequently, that clause is not given weight and does not state a material limitation in the method claim. Cf. Hoffer v. Microsoft Corp., 405 F.3d at 1326, 1329 (Fed. Cir. 2005) (explaining that a "whereby" clause is given "no weight" when it "simply expresses the intended result of a process step positively recited" in a method claim, but "when the 'whereby' clause states a condition that is material to patentability, it cannot be ignored in order to change the substance of the invention"). Here, the method claim is "a method of injecting an animal health product into flesh of a living food animal." The '196 patent, claim 1, Col. 8, ll. 58-60. The "process" step is "providing an injection means comprising a needle assembly . . . wherein the needle cannula is made of stainless steel which is magnetic or magnetizable . . . ." Id., Col. 8, ll. 61-67. The intended result is "so that . . . the magnetism . . . enables detection of the magnetism of the needle cannula or piece thereof in the flesh of the animal upon slaughter and processing into a food if the needle cannula or piece thereof were to break off in the flesh of the living animal during the injection." Id., Col. 9, ll. 4-12. The fact that this intended result may not actually follow if a "magnetizable" needle is not also claimed to be "rendered magnetic" is beside the point; the references to "magnetism" in the "so that" clause cannot alter the meaning of the limitation actually claimed, that "the needle cannula is made of stainless steel which is magnetic or magnetizable." Id., Col. 8, II. 66-67 (emphasis added). Moreover, the Summary of the Invention repeatedly refers to a "magnetic or magnetizable" needle, not merely one that "is magnetic" or "is magnetized." Consequently, it cannot be said that a "magnetic" needle is the fundamental invention to the exclusion of a "magnetizable" needle, such that the references to "magnetism" in the "so that" clause limit the claimed method in claim 1. Compare Hoffer, 405 F.3d at 1330 (the condition stated in the "whereby" clause was part of the "fundamental invention," based on the specification, and did limit the method claimed).

- Footnotes -

16 On the other hand, independent claim 8 does not include a "magnetic or magnetizable" limitation, but nevertheless expressly claims an invention "wherein the needle cannula or piece thereof is magnetized . . . ." The '196 patent, Claim 8, II. 13-5 (emphasis added). Similarly, claims 1, 7, 13, and 15 of the '668 patent expressly claim that the needle is "rendered magnetic" or "is magnetized," even though they do not include a "magnetic or magnetizable" limitation.

17 The court will return to the question of the weight to be given a "so that," "such that," or "whereby" clause in more detail infra, beginning at page 132.

- End Footnotes -

- 2918 -
The specification also supports distinguishing between the meanings of the two words "magnetic" and "magnetizable." See Aquatex, 419 F.3d at 1380 ("Where . . . the disputed claim term is technical or a term of art, '[t]he best source for understanding [it] is the specification from which it arose, informed, as needed, by the prosecution history.") (quoting Phillips, 415 F.3d at 1315); Phillips, 415 F.3d at 1314 (the specification is not only "highly relevant" to claim construction, "[u]sually, it is dispositive," and "is the single best guide to the meaning of a disputed term"). The Summary of the Invention repeatedly refers to a needle that is "magnetizable or magnetic," see the '196 patent, Col. II. 10, 29, 43, and Col. 4, l. 2, thereby reinforcing the notion that the two terms have different meanings and that both conditions that the terms describe are intended to be fundamental to the invention.

The court turns, next, to the question of what is meant by "magnetic or magnetizable," in the context of the patent. Again, as with other "magnetism" terms in the '668 patent, it is clear from the intrinsic evidence that "magnetic" or "magnetizable" would be understood by one of ordinary skill in the art reading the patent to mean that the needle is or is capable of becoming a permanent magnet or a residual magnet, that is, a magnet that retains its magnetic field for a period of time. For example, the Detailed Description identifies a preferred embodiment as one in which the "stainless steel alloy is an alloy that is permanently magnetic or magnetizable before detection," but also notes that, "[a]lternatively, the needle cannula of the present invention can comprise a stainless steel alloy that is not a permanent magnetic [sic] but is capable of being magnetized in a magnetic field to maintain a residual magnetism." See the '196 patent, Col. 5, ll. 50-63.

Rivard contends, as it did with other "magnetism" terms of the '668 patent, that the construction of this phrase must state that it "does not refer to stainless steel which is merely attractable to a permanent magnet." The court finds, however, that such a construction, while accurate, is superfluous, where the claim term unambiguously requires that the needle be or be capable of being made magnetic, not merely that it be attracted or attractable to a magnet.

Also as with the "magnetism" terms of the '668 patent, Rivard argued at the Markman hearing that the court's tentative construction of "residual magnet" in the '196 patent should be modified to add that a residual magnet is a magnet that retains its magnetic field for a period of time "when removed from the magnetizing field" and that the court should add to its tentative construction "that [the magnetism] makes it possible for the magnetism to be detected in a metal detector and magnetic detector." Ideal contended that the first proposed addition improperly requires the magnetization of the needle and withdrawal of the magnetizing field before the needle enters the metal detector, a matter of timing of the magnetization of the needle addressed above. Again, the court finds it unnecessary to add that a "residual magnet" is one that retains its magnetism for a period of time "when removed from a magnetic field," as Rivard proposes, and potentially improper to do so, because the court has found nothing in the record that disavows a construction that permits the needle to be rendered a residual magnet as it is detected, i.e., a circumstance in which the residual magnetism of the needle is detected before the needle is removed from the magnetizing field. The court finds it improper to add to the construction of "magnetic or magnetizable" that "[the magnetism] makes it possible for the magnetism to be detected in a metal detector and magnetic detector," because enabling detection is not a limitation in claim 1, but only language appearing in a "such that" clause, as explained more fully below, beginning on page 132.

iii. The court's construction. In summary, the court concludes that "magnetic or magnetizable" in claim 1 of the '196 patent must be construed as follows: "Is or is capable of becoming a permanent magnet or a residual magnet, that is, a magnet that retains its magnetic field for a period of time."

GO BACK

10. "magnetic reed relay switch"

Dependent Claim 23 of the '571 Patent discloses a "magnetic reed relay switch." Cardiac Science asserts that this term should be construed as "a magnetically operated switch." Philips contends that the term should be construed as "a reed switch combined with a coil to create a relay."

Both parties rely upon the same dictionary definition to support their constructions. The IEEE 100 defines "reed relay" as a "relay using glass-enclosed magnetically closed reeds as the contact members. Some forms are mercury wetted." IEEE 100 Authoritative Dictionary of IEEE Standards Terms at 941 (7th ed. 2000). Philips also asserts that magnetic reed relay switches are known in the art to be a particular type of magnetic switch that has reeds and a coil. However, aside from one
unsubstantiated Internet reference and another company's data sheet that cites a coil requirement, Philips offers no support from the patent itself. Neither the IEEE definition nor the patent makes reference to a coil or, more specifically, a copper coil. On the other hand, Cardiac Science's definition adds nothing to the meaning of the term. The Court construes the term "magnetic reed relay switch" as "a relay switch that uses magnetically closed reeds as the contact members."

Next, the parties dispute the meaning of the terms "[the needle] is rendered magnetic at [or to] a level that enables detection of the magnetism of the needle," which appears in claims 1 and 13 of the '668 patent, and "the needle is magnetized to a level which enables detection of the magnetism of the needle," which appears in claims 7 and 15 of the '668 patent. The parties competing constructions of these terms are shown in the following chart:

magnetic field to maintain a residual magnetism that produces its own magnetic field that persists when the magnetic field is removed, prior to use of a detector. The term does not refer to stainless steel which is merely attractable to a permanent magnet. It is the permanent or residual magnetism that must be detected by the detector in order to determine a needle or piece is present in the meat.

As the chart above reveals, Rivard argues that the same proposed construction applies to the pertinent language in claims 1 and 13 and to the slightly different language in claims 7 and 15 of the '668 patent. Indeed, Rivard contends that the same proposed construction should apply to the term "magnetic or magnetizable" in claim 1 of the '196 patent, and to the term "the needle cannula or piece thereof is magnetized to a level which enables detection of the magnetism of the needle cannula or piece thereof" in claim 8 of the '196 patent. See Chart of Constructions In Dispute, supra beginning on page 23, the '196 patent, disputed claim terms c. and h. Ideal, on the other hand, contends that all four claim terms must be given different constructions. For now, the court will confine its analysis to the "magnetism" terms of the '668 patent.

a. Arguments of the parties

Rivard argues that the claims and specification demonstrate that these claim phrases require (1) that the needle be magnetized so as to act as a magnet prior to the use of a metal detector, and (2) that it is the magnetism that is detected. Rivard argues that, during prosecution of the patents, the patentee argued that the invention did not encompass needles that merely had stainless steel metallurgy with the capacity to be magnetized, and that, instead, the needle had to be made into a magnet, and on that basis, distinguished prior art. Rivard surmises that Ideal is now arguing that no construction of these claims is required, so that Ideal can argue that the claims read on a needle that could be made into a magnet, but is not yet one. Implicit in Rivard's argument is a contention that there is no difference between "rendered magnetic," "is magnetized," "magnetic," and "magnetizable." Rivard points out that the Summary of the Invention repeatedly refers to a needle that "is magnetized" or that is "permanently magnetizable or magnetic." Similarly, Rivard points out that the Detailed Description recites that the invention uses either a permanently magnetic or magnetizable alloy or an alloy that can be magnetized for a period of time, i.e., made a residual magnet, prior to use of a metal detector, and also describes an embodiment in which a magnetizing device is located in the conveyor line ahead of the metal detector in order to magnetize any needle parts located in processed meat. Rivard also cites portions of the prosecution history, including the examiner's rejection of newly added independent claim 30 as incomplete, pursuant to 35 U.S.C. § 112, because it recited that the needle was magnetizable, but omitted the step of magnetizing the needle. Rivard asserts that, in response to this rejection, the patentee amended the patent to add the step requiring that the needle be magnetized, and then distinguished prior art on the basis that the prior art did not teach use of magnetized needles. Rivard contends that the prosecution history reveals that the examiner and patentee understood that the needle must, itself, be made into a magnet. As extrinsic evidence, Rivard points out that Ideal's vice president confirmed that Ideal was initially magnetizing the detectable needles in a separate operation.

Ideal argues that Rivard's construction cannot be correct, precisely because Rivard has offered the same construction for four different claim terms, in violation of well established canons of patent claim differentiation. For its own part, Ideal argues that neither the "rendered magnetic" nor the "is magnetized" term requires any construction, because the ordinary
The court agrees that there are obvious differences between the language of the claim term "[the needle] is rendered magnetic" to what became claims 1 and 13. Ideal asserts, nevertheless, that the addition of this language does not require the court to adopt Rivard's construction. Ideal contends that Rivard's proposed interpretation comprises language that represents an embodiment described in the specification rather than language expressly or implicitly disclaiming or disavowing claim scope. In summary, Ideal contends that Rivard's proposed interpretation of the "rendered magnetic" term is improper for the following reasons: (1) the language of the claim is clear and unambiguous, and thus, requires no interpretation; (2) the language that Rivard uses, which is the same language Rivard uses to interpret "magnetic or magnetizable," would reincorporate language that was amended out of the '668 patent; (3) the language that Rivard uses is the same as the language that Rivard uses for several entirely different claim terms; and (4) the language that Rivard uses would effectively negate the amendment to overcome the § 112 rejection. If some construction of the "rendered magnetic" term is required, Ideal offers an alternative, shown in the chart above, which Ideal contends, without explanation, is well supported by the intrinsic evidence.

Ideal also argues that the "is magnetized" term in claims 7 and 15 requires no construction, because its meaning is clear and unambiguous to one of ordinary skill in the art. Again, Ideal asserts that Rivard's construction of this term is wrong, because Rivard uses the identical construction for the completely different term "magnetic or magnetizable" in the '196 patent. Ideal also contends that the language of the "is magnetized" term in the '668 patent is obviously different from the "rendered magnetic" language in the same patent, as well as the "magnetic or magnetizable" language in the '196 patent, but does not explain the difference in meaning between "rendered magnetic" and "is magnetized." If the court deems some construction to be necessary, Ideal again offers an alternative construction, shown in the chart above, which Ideal contends, without explanation, is well supported by the intrinsic evidence.

In its rebuttal brief, Rivard again asserts that the constructions of all of the "magnetism" terms in the two patents should be similar, because they have a common import and associated meaning in the patents-in-suit. Rivard contends that Ideal's claim differentiation argument is overcome here by the presence of only minor differences in language and the requirement in both of the patents that the magnetism of the needles must be what is detected, so that the claim terms must be interpreted consistently. Rivard also argues that it is a critical and necessary aspect of the claims that the magnetism be brought to such a level prior to detection that it enables detection of the needle or piece thereof. Rivard argues that Ideal's response to rejections by the examiners demonstrates that Ideal conceded that the needle must be magnetized, so that the claim language cannot be construed to cover a needle that is merely capable of being magnetized, and must, instead, be construed to require that the needle be magnetized prior to the metal detector, not in the metal detector, as Ideal argues. Rivard also argues that the prosecution histories of both patents are relevant to construction of these related claim terms, because they are interwoven, with cancelled claims of the '668 patent application later reasserted in the '196 patent application.

In its rebuttal brief, on the other hand, Ideal argues that Rivard is slyly attempting to narrow construction of this term to require that the needle be rendered magnetic "prior to the detector" or "before the detection process," when the claim term and intrinsic evidence refer to rendering the needle magnetic "prior to detection." Ideal contends that this subtle difference is important, because the detector may itself include a means for magnetizing or enhancing the magnetism of the needle, as such a product and such a practice is commonly used in the industry. Ideal also contends that Rivard's constructions would send the court off on a red-herring attempt to determine when the "detection process" begins. Ideal contends that the prosecution history provides no indication of when the needle is either magnetized or rendered magnetic, other than before detection. Ideal also argues that absolutely nothing in the prosecution history could be construed as a disavowal of needles capable of being magnetized, when the prosecution history specifically states that the patentee identified needles that either are or are capable of being magnetized.

The time at which the needle is rendered magnetic or is magnetized was one of only four issues that Rivard addressed in the Markman hearing in light of the court's tentative ruling. The court will summarize Rivard's Markman argument on this issue below, in the pertinent part of the court's analysis.

b. Analysis

i. Difference in words or difference in meaning? Starting with the words of the two claim terms in the '668 patent presently at issue, see Nystrom, 424 F.3d at 1142 (courts must "begin [their] claim construction analysis with the words of the claim"), the court agrees that there are obvious differences between the language of the claim term "[the needle] is rendered
magnetic at [or to] a level that enables detection of the magnetism of the needle" in claims 1 and 13 and the language of the claim term "the needle is magnetized to a level which enables detection of the magnetism of the needle" in claims 7 and 15 of the '668 patent. The court is considerably less convinced, however, that there is any difference in meaning between "is rendered magnetic" and "is magnetized."

Consultation of an ordinary dictionary, to assist in understanding the commonly understood meaning of words, see Free Motion Fitness, Inc., 423 F.3d at 1348 (recognizing such use of a dictionary as appropriate, citing Phillips, 415 F.3d at 1320); Phillips, 415 F.3d at 1324 ("[A] judge who encounters a claim term while reading a patent might consult a general purpose or specialized dictionary to begin to understand the meaning of the term, before reviewing the remainder of the patent to determine how the patentee has used the term.")., reveals that "rendered," in the sense appropriate here in light of intrinsic evidence, see id., means "to cause to be or become: MAKE." MERRIAM WEBSTER'S COLLEGIATE DICTIONARY 990 (10th ed. 1995); OXFORD ENGLISH DICTIONARY (on-line ed. at dictionary.oed.com) ("render" means "to make, to cause to be or become, of a certain nature, quality, etc."). Thus "rendered magnetic" would mean "is made magnetic" or "is magnetized." Indeed, as the chart of proposed claim constructions, above, reveals, Ideal's alternative construction actually equates "is rendered magnetic" with "is magnetized," because Ideal construes the term "[the needle] is rendered magnetic . . . " to mean "the needle is magnetized . . . ."

The intrinsic evidence of the Summary of the Invention and the Detailed Description confirm the appropriateness of equating "is rendered magnetic" with "is magnetized." See Phillips, 415 F.3d at 1314 (the specification is "highly relevant" to claim construction, "[u]sually, it is dispositive," and it "is the single best guide to the meaning of a disputed term"). The Summary of the Invention uses only "magnetized" to describe the process of making the needle magnetic at a level that enables detection of the magnetism of the needle, see the '668 patent, Col. 2, ll. 28-29, 42-43, 57-58; see also id., Col. 3, ll. 24-25 (needle cannula comprising a stainless steel alloy that is magnetized"), and nothing else in the specification suggests a different meaning. The court finds the obvious equating of "is rendered magnetic" and "is magnetized" in the '668 patent overcomes any presumption that the different words were intended to have different meanings. Compare Andersen Corp., 474 F.3d at 1369 (different words used in separate claims are presumed to indicate that the claims have different meanings and scope).

Ideal is correct, however, that claim terms "rendered magnetic" and "is magnetized" not only use different language but have different meanings from the claim term "magnetic or magnetizable," which appears only in the '196 patent, precisely because the former terms from the '668 patent require that something be done to the needle in question to make it become magnetic, while the latter term from the '196 patent does not. Compare OXFORD ENGLISH DICTIONARY (on-line ed. at dictionary.oed.com) ("render" means "to make, to cause to be or become, of a certain nature, quality, etc.", so that "rendered magnetic" means "to be made magnetic"), with OXFORD ENGLISH DICTIONARY (on-line ed. at dictionary.oed.com) ("magnetic" means, inter alia, "having the properties of a magnet," and "magnetizable" means "capable of being magnetized."). The court will return to the meaning of "magnetic or magnetizable" in the '196 patent, below, but for now, concentrates on the meaning of the "is rendered magnetic" and "is magnetized" terms in the '668 patent.

ii. Permanent and residual magnetism. The court turns to the question of what "is made magnetic" or "is magnetized" means in the context of the '668 patent. It is clear from both parties' constructions, and more importantly, clear from the intrinsic evidence, that "is made magnetic" or "is magnetized" would be understood by one of ordinary skill in the art, reading the patent, to mean that the needle must be made into or become a permanent magnet or a residual magnet, that is, a magnet that retains its magnetic field for a period of time. For example, the Detailed Description identifies a preferred embodiment as one in which the "stainless steel alloy is an alloy that is permanently magnetic or magnetizable before detection," but also notes that, "[a]lternatively, the needle cannula of the present invention can comprise a stainless steel alloy that is not a permanent magnetic [sic] but is capable of being magnetized in a magnetic field to maintain a residual magnetism." See the '668 patent, Col. 5, ll. 46-59. Rivard contends that the construction of this phrase must state that it "does not refer to stainless steel which is merely attractable to a permanent magnet." The court finds, however, that such a construction, while accurate, is superficial, where the claim term unambiguously requires that the needle be or be made magnetic, not merely that it be attracted or attractable to a magnet.

At the Markman hearing, Rivard contended that the court's tentative construction of "residual magnet" should be modified to add that a residual magnet is a magnet that retains its magnetic field for a period of time "when the magnetizing field is removed." Ideal contended that this construction improperly requires the magnetization of the needle and withdrawal of the magnetizing field before the needle enters the metal detector, a matter of timing of the magnetization of the needle
addressed below. The court finds it unnecessary to add the language that Rivard proposes and potentially improper to do so, because the court has found nothing in the record that disavows a construction that permits the needle to be rendered a residual magnet as it is detected, i.e., a circumstance in which the residual magnetism of the needle is detected before the magnetizing field is removed.

iii. Capacity to be magnetized. The parties' arguments concerning the "is rendered magnetic" and "is magnetized" language in the '668 patent, and indeed, their arguments concerning "magnetic or magnetizable" in the '196 patent, also suggest concerns about the "capacity" or "capability" of the needle to be so magnetized. Rivard contends that, based on the specification and prosecution history, the "magnetism" terms of both patents do not apply to a stainless steel needle that merely has the capacity to be magnetized, but only to a needle that has been made into a magnet. Ideal argues that the claims, specification, and prosecution history make clear that the invention applies to a needle that merely has the capacity to be magnetized until it is rendered magnetic, as well as to a needle that is magnetic.

The words of the claims, see Nystrom, 424 F.3d at 1142 (courts must "begin [their] claim construction analysis with the words of the claim"), suggest that the needle must be magnetized either prior to injecting the animal or after slaughter. Specifically, claim 1(a) claims an injection means wherein the needle, not otherwise identified as already magnetic or made from a magnetic alloy, "is rendered magnetic to a level that enables detection of the magnetism of the needle," and claim 1(b) claims injecting a living animal with "the needle, which has been rendered magnetic prior to injecting the living animal or while in the flesh of the animal after slaughter." The '668 patent, Claim 1. Because the claim permits rendering the needle magnetic as late as after slaughter, it clearly contemplates that the needle was, until that time, only capable of being magnetized. Indeed, logic dictates that something that "is rendered magnetic" is capable of being magnetized until it is "rendered magnetic."

The intrinsic evidence from the specification also supports this construction. See Phillips, 415 F.3d at 1314 (the specification is "highly relevant" to claim construction, "[u]sually, it is dispositive," and it "is the single best guide to the meaning of a disputed term"). While there are numerous references in the specification to the needle being made from a magnetized or magnetic stainless steel alloy, there are also references to a needle or alloy that is "capable of being magnetized" or "magnetizable." For example, one alternative embodiment describes a needle cannula that is comprised of "a stainless steel alloy that is not a permanent magnetic [sic] but is capable of being magnetized in a magnetic field to maintain a residual magnetism." The '668 patent, Col. 5, ll. 56-59. Similarly, the Detailed Description includes a description of a particular embodiment in which the detection apparatus "can further comprise a means for producing a high magnetic field (not shown) to magnetize or enhance the magnetism of the stainless steel comprising needle cannula 12 or piece thereof in animal flesh or meat product after slaughter 200 before it enters metal detector 104." Id., Col. 6, ll. 42-48. Thus, the patent contemplates a needle that is capable of being magnetized, but is not actually rendered magnetic until after slaughter of the animal in which it has broken off, as well as a needle that is a permanent magnet or that is rendered magnetic at some time prior to use to inject a live animal.

Rivard, nevertheless, argues that the prosecution history reveals that the patentee disavowed a needle that was only capable of being magnetized or only had the capacity to be magnetized, citing a portion of the June 2, 2002, amendment to the application for what became the '668 patent. See Joint Appendix at 47-53. Rivard characterizes the patentee's argument therein as (1) asserting that the invention requires the needle to be magnetized, not just to have the capability to be magnetized, and (2) distinguishing prior art that was merely capable of being magnetized but not actually magnetized, because such non-magnetized prior art needles did not provide increased detectability. Although prosecution history certainly can be relevant to the construction of claim terms, see Nystrom, 424 F.3d at 1142 ("In addition to the written description, the prosecution history can often inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution, making the claim scope narrower than it would otherwise be.") (quoting Phillips, 415 F.3d at 1317), the court finds Rivard's characterization of this portion of the prosecution history to be strained at best.

Specifically, the cited portions of the amendment distinguish two prior art references, one for reusable stainless steel needles and one for Martensitic stainless steel, explaining,

[N]either suggests that the stainless steel be rendered magnetic and neither suggests that a magnetic stainless steel needle be used to inoculate animals because the magnetism of the magnetic needle would facilitate locating the a broken needle fragment in the flesh of a slaughtered animal in the event the needle should break during inoculation of the animal prior to
slaughter. Thus, neither prior art reference on its own teaches or suggests the applicant's claimed method for detecting broken needles in the flesh of slaughtered animals, which is using a needle comprised of a stainless steel that is magnetic.

Joint Appendix at 48-49. The amendment then argues that the combination of the two prior art references also would not render the claimed invention obvious, because there was no reason why one of ordinary skill in the art would have combined them. Id. at 49. At most, the patentee asserted that the two prior art references would have suggested making reusable needles from Martensitic steel, but would not have suggested rendering Martensitic steel needles permanently or temporarily magnetic to improve detectability. Id. at 49-52. The patentee certainly did not expressly or even implicitly disavow needles only capable of being magnetized by observing that nothing taught magnetizing needles made of an alloy capable of being magnetized.

In its rebuttal brief, Rivard again argues that, in response to a prior art rejection of application claims 16 and 23, Ideal argued "that the claim language itself already required that the needle be magnetized and did not cover a needle that merely had the capability of being magnetized." Rivard's Rebuttal Brief at 18 (citing Joint Appendix at 51-52). Rivard also argues that the patentee's contention that Martensitic stainless steel in the Hultin-Stigenberg prior art must be made permanently or temporarily magnetic in order for it to have a magnetic field that would render it more detectable means that the patentee disavowed needles that were only capable of being magnetized, because the Martensitic stainless steel of Hultin-Stigenberg would be capable of being magnetized. Rivard's Rebuttal Brief at 24-25. Such an argument completely mischaracterizes the patentee's argument, which was precisely that the prior art did not teach magnetizing needles made of alloys capable of being magnetized to improve detectability. See Joint Appendix at 51-52 ("There is nothing in the prior art that would have suggested that it would have been desirable to make Martensitic stainless steel permanently or temporarily magnetic for the purpose of making needles, the fragments of which would be more readily detected in the flesh of a slaughtered animal by a metal detector than would be nonmagnetic fragments."). Moreover, the patentee argued, "The applicant discovered that the ability of the detector to detect stainless steel needle fragments is enhanced by using needles which are magnetic or capable of being rendered magnetic in an electric field." Joint Appendix at 52 (emphasis added). Thus, the patentee expressly asserted that the invention was magnetizing needles capable of being rendered magnetic, as well as using magnetic needles, and an attempt to construe these statements as conveying exactly the opposite meaning, as express or implicit disavowals of needles capable of being rendered magnetic, is wholly unpersuasive.

Thus, the court finds no comments in the cited prosecution history expressly or implicitly disavowing needles made of stainless steel that had the capacity to be magnetized, even in the express assertions that what made the invention patentable was rendering the claimed needle magnetic. The proper construction does not require exclusion of needles capable of being magnetized, because the patent clearly contemplates needles with the capacity to be magnetized until they are rendered magnetic, as well as needles that are magnetic.

iv. Time at which the needle is rendered magnetic. The parties' arguments concerning the "is rendered magnetic" and "is magnetized" language in the '668 patent, and indeed, their arguments concerning "magnetic or magnetizable" in the '196 patent, also suggest concerns about the time at which the needle must be, become, or be made a permanent or residual magnet. Rivard argues that the needle must be rendered magnetic "prior to use of a [metal] detector." Indeed, this contention was one of only four arguments that Rivard asserted during the Markman hearing. Ideal argues that the claims, specification, and prosecution history make clear that the needle must be made magnetic prior to use to inject animals or after it has broken off in the flesh of an animal which has then been killed for slaughter, i.e., before detection, not before the detector.

Rivard may be on better ground when it asserts that the needle must be magnetized "prior to use of a detector." Logic suggests that, in order for the magnetism of the needle to be detectable, the needle must be rendered magnetic or magnetized before whatever does the detecting is used. Any uncertainty about what does the detecting is rapidly dissipated by copious intrinsic evidence that what does the detecting is a metal detector or a magnetic detector. See, e.g., the '668 patent, Summary of the Invention, Col. 1, l. 67, to Col. 2, l. 1 ("which enables the needle cannula to be detected in a metal detector"); Detailed Description, Col. 5, l. 46, to Col. 6, l. 19 (describing detection of magnetized needles by metal detectors or magnetic detectors, but suggesting that a drawback of a magnetic detector is that it cannot detect non-magnetizable metals). Indeed, no other method of detection is described anywhere in the patent. Furthermore, as noted above, the Detailed Description includes a description of a particular embodiment in which the detection "apparatus 100 can further comprise a means for producing a high magnetic field (not shown) to magnetize or enhance the magnetism of the stainless steel comprising needle cannula 12 or piece thereof in animal flesh or meat product after slaughter 200 before it enters metal detector 104," id., Col.
On the other hand, the court cannot simply import what is clearly a particular embodiment in the specification, see id., Col. 6, ll. 41-42 (stating that the apparatus described in ll. 42-48 is "[i]n particular embodiments"), into the construction of the claim term. See Playtex Prods., Inc., 400 F.3d at 906 ("The court must take care in its analysis, when locating in the written description the context for a disputed term, not to import a limitation from that written description. It must use the written description for enlightenment and not to read a limitation from the specification [into the construction of the term]." and "[i]t is axiomatic that claims, not the specification embodiments, define the scope of protection.") (internal citations and quotation marks omitted). Therefore, it is inappropriate to use the description of an embodiment in which the needle is magnetized by a high magnetic field before it enters the metal detector to limit the time at which the needle must be magnetized. See the '668 patent, Col. 6, ll. 41-48.

More importantly, the words of the claim, see Nystrom, 424 F.3d at 1142 (courts must "begin [their] claim construction analysis with the words of the claim"), suggest that the needle must be magnetized more generally either prior to injecting the animal or after slaughter. Specifically, claim 1(a) claims an injection means wherein the needle (albeit not otherwise identified as already magnetic or magnetizable or made from a magnetic or magnetizable alloy) "is rendered magnetic to a level that enables detection of the magnetism of the needle," and claim 1(b) claims injecting a living animal with "the needle, which has been rendered magnetic prior to injecting the living animal or while in the flesh of the animal after slaughter." The '668 patent, Claim 1 (emphasis added). None of the other claims in which either of the two claim terms at issue is used specifies precisely when the needle is magnetized, although each suggests that the detection of the magnetism of the needle occurs when the animal is slaughtered and processed. See id., claim 7, Col. 9, ll. 39-42; claim 13, Col. 10, ll. 22-24; claim 15, Col. 10, ll. 47-49.

In the tentative draft, the court concluded that the specification sheds no particular light on this question, either, despite its usual importance. See Phillips, 415 F.3d at 1314 (the specification is "highly relevant" to claim construction, "[u]sually, it is dispositive," and it "is the single best guide to the meaning of a disputed term"). The court found that this was so, because the specification refers once to a preferred stainless steel alloy "that is permanently magnetic or magnetizable before detection," see id., Col. 5, ll. 46-57 (emphasis added), and once, as noted above, to a preferred embodiment of the detection apparatus in which the stainless steel of the needle is magnetized "before it enters metal detector 104." Id., Col. 6, ll. 42-48 (emphasis added). The court found in the tentative draft that the specification does not otherwise specify when magnetism must be imparted to the needle or steel of which the needle is comprised.

Therefore, in light of the words used in the claim, the court concluded in the tentative draft that a proper construction of the "timing" aspect of these terms requires that the needle is magnetic or is made magnetic "either prior to injecting the living animal or while in the flesh of the animal after slaughter," as this language "stays true to the claim language and most naturally aligns with the patent's description of the invention." Nystrom, 424 F.3d at 1142 (quoting Phillips, 415 F.3d at 1316, in turn quoting Renishaw PLC, 158 F.3d at 1250); see also the '668 patent, claim 1(a) (claiming an injection means wherein the needle "is rendered magnetic to a level that enables detection of the magnetism of the needle"); id., claim 1(b) (claiming injecting a living animal with "the needle, which has been rendered magnetic prior to injecting the living animal or while in the flesh of the animal after slaughter").

At the Markman hearing, however, Rivard argued that the patents-in-suit and their prosecution histories make clear that the needle must be magnetized before the metal detector, not just before detection. First, Rivard takes issue with this court's observation, in a footnote in the tentative draft, that one portion of the Detailed Description--which describes a particular embodiment in which the detection "apparatus 100 can further comprise a means for producing a high magnetic field (not shown) to magnetize or enhance the magnetism of the stainless steel comprising needle cannula 12 or piece thereof in animal flesh or meat product after slaughter 200 before it enters metal detector 104," id., Col. 6, ll. 42-48 (emphasis added)--demonstrates that, contrary to Rivard's contention, the specification does describe an embodiment in which the needle is magnetized using the metal detector, or at least, is magnetized in an "apparatus for detecting metal" comprising a means for magnetizing the needle as well as the metal detector. See id. Col. 6, ll. 20-21 (describing the "apparatus 100" as "an apparatus for detecting metal in the flesh of an animal after slaughter"). Rivard argues that "apparatus 100" does not disclose an embodiment in which the needle is magnetized in the same device used for detecting metal, because "apparatus 100" is not a single component, but an assembly of multiple components. See the '668 patent, Col. 6, ll. 20-27 ("apparatus 100 compris[es] a conveyor means 102 for transporting animal flesh or meat products after slaughter 200 through metal
detector 104 for detecting whether animal flesh contains a broken piece of needle cannula 12 of the present invention

Indeed, Rivard argues that "apparatus 100" does not include any device for magnetizing a needle, although other
embodiments of the assembly may include such a device for magnetizing the needle before it enters the metal detector 104.
See id., Col. 6, ll. 41-47. As a matter of specificity, Rivard is correct: The description does not describe a single component
that both magnetizes and detects the magnetized needle. Nevertheless, Ideal argues that a metal detector itself may generate
sufficient magnetic field to magnetize a needle as the detector detects the needle. While Ideal's contention may be true, the
court does not find evidence either supporting it or disproving it in the record. Ultimately, however, whether or not the
patent discloses a method for magnetizing the needle with a metal detector is beside the point. The pertinent question is
what the patent discloses about when the needle must be magnetized.

Rivard argued at the Markman hearing that, because the needle can be magnetized to retain residual magnetism, and
residual magnetism is magnetism that persists after a magnetic field is removed, and because the magnetized needle is
described as detectable by a metal detector or a magnetic detector, it must be magnetized before the metal detector or
magnetic detector, and if it is not, it will not be detectable by both kinds of detectors. Finally, Rivard argued that, because
the patentee argued that the prior art does not disclose that the detectability of Martensitic needles would be improved by
magnetizing the needles, and indeed, the patentee argued that Martensitic needles that had not been magnetized would not
have improved the detectability of fragments from the needles, the claimed needles must be magnetized prior to the metal
detector.

8 A large portion of Rivard's argument concerning the time at which the needle is magnetized was illustrated using the
Horita patent incorporated into the '668 patent by reference. Rivard attempted to add the Horita patent to the record, but
Ideal resisted its inclusion. The court finds it unnecessary to address Rivard's arguments based specifically on the Horita
patent, as they are only illustrations of arguments otherwise summarized above in reference to the description and
prosecution history of the '668 patent.

These arguments are unpersuasive, however, because they fall well short of demonstrating that, in either the specification or
the prosecution history, the patentee disavowed magnetizing the needles at any time other than "prior to the metal detector."
See, e.g., Research Plastics, 421 F.3d at 1296 ("The purpose of consulting the prosecution history in construing a claim is to
"exclude any interpretation that was disclaimed during prosecution,"" quoting Rhodia Chimie, 402 F.3d at 1384, in turn
quoting ZMI Corp., 844 F.2d at 1580, and noting that "the prosecution history can reveal instances where the inventor
limited the invention in the course of prosecution and thus narrowed the scope of the claim."). To put it another way, the
court cannot find that language of the claims themselves--that is, language of claim 1(a) which claims an injection means
wherein the needle (albeit not otherwise identified as already magnetic or magnetizable or made from a magnetic or
magnetizable alloy) "is rendered magnetic to a level that enables detection of the magnetism of the needle," and language of
claim 1(b), which claims injecting a living animal with "the needle, which has been rendered magnetic prior to injecting the
living animal or while in the flesh of the animal after slaughter," the '668 patent, Claim 1 (emphasis added)--is contrary to
the portions of the specification or prosecution history on which Rivard relies. Thus, the court reiterates its conclusion that a
proper construction of the "timing" aspect of these terms requires that the needle is magnetic or is made magnetic "either
prior to injecting the living animal or while in the flesh of the animal after slaughter," as this language "stays true to the
claim language and most naturally aligns with the patent's description of the invention." Nystrom, 424 F.3d at 1142 (quoting
Phillips, 415 F.3d at 1316, in turn quoting Renishaw PLC, 158 F.3d at 1250); see also the '668 patent, claim 1.

v. Magnetized to a level that enables detection. The remaining question for these claim terms is the appropriate construction,
if any is required, for the phrase requiring that the needle be magnetized "at [or to] a level that enables detection of the
magnetism of the needle." Rivard contends that the construction of this phrase must state that "it is the permanent or
residual magnetism that must be detected by the detector in order to determine a needle or piece is present in the meat." Again,
the court finds this part of Rivard's construction to be superfluous, because the claim term itself clearly and
unambiguously states that what must be detected is "the magnetism of the needle."

Ideal, on the other hand, contends that, if any construction is required, the phrase "at [or to] a level that enables detection of
the magnetism of the needle" should be construed to mean "whereby the magnetism of the magnetic needle facilitates
locating a needle or needle fragment in the flesh of a slaughtered animal" or "to a level which facilitates locating a needle or needle fragment in the flesh of a slaughtered animal." The problem with Ideal's construction of this phrase, in the court's view, is that "enables" and "facilitates" do not have the same ordinary meaning, and nothing in the patent suggests that a specialized meaning of "enables" to mean "facilitates" is appropriate. See Free Motion Fitness, Inc., 423 F.3d at 1348 (recognizing such use of a dictionary as appropriate, citing Phillips, 415 F.3d at 1320); Phillips, 415 F.3d at 1324 ("[A] judge who encounters a claim term while reading a patent might consult a general purpose or specialized dictionary to begin to understand the meaning of the term, before reviewing the remainder of the patent to determine how the patentee has used the term."). As to ordinary meaning, in the sense appropriate here from the intrinsic evidence of the patent, "enable" means "to make possible, practical, or easy," or "to cause to operate." See MERRIAM WEBSTER'S COLLEGIATE DICTIONARY 380 (10th ed. 1995). "Facilitate," on the other hand, means "to make easier" or "help bring about." Id. at 415; see also Free Motion Fitness, Inc., 423 F.3d at 1348 ("The court must ensure that any reliance on dictionaries accords with the intrinsic evidence."). While the definitions of "enable" and "facilitate" overlap at the broadest definition of "enable," the one defining "enable" as "to make easy," it is inappropriate to select the broadest of the dictionary meanings as a matter of course. See id., 423 F.3d at 1348-49 (noting that use of the fullest range of a terms ordinary meaning does not mean that the term will presumptively receive its broadest dictionary definition or the aggregate of multiple dictionary definitions). The court also believes that "enable" in the context of the patent means "to make possible," not merely "to make easy." See, e.g., the '668 patent, Detailed Description, Col. 5, ll. 63-66 ("Thus, a needle cannula or piece thereof comprising a residual magnetism, which is embedded in the flesh of an animal or meat product, can be detected in a metal detector or magnetic detector . . . .") (emphasis added).

vi. The court's construction. In light of the foregoing, the court concludes that the proper construction of both "[the needle] is rendered magnetic at [or to] a level that enables detection of the magnetism of the needle," which appears in claims 1 and 13 of the '668 patent, and "the needle is magnetized to a level which enables detection of the magnetism of the needle," which appears in claims 7 and 15 of the '668 patent, is the following: "Either prior to injecting the living animal or while in the flesh of the animal after slaughter, the needle is magnetized to become a permanent magnet or a residual magnet, that is, a magnet that retains its magnetic field for a period of time, to a level that makes it possible for the magnetism of the needle to be detected by a metal detector or magnetic detector."

Looking first at claim construction, we agree with HoMedics that the district court correctly interpreted the phrase "magnetizable flexible sheet." Relying on that phrase's plain meaning and a dictionary definition, the court construed "magnetizable flexible sheet" to require that "the flexible sheet itself must be capable of being made a magnet." Summary Judgment Order at 13 (emphasis added). Indeed, that meaning is consistent with additional claim language, which requires the magnetization pattern to be "magnetized integrally into the sheet," '111 patent, col. 5, l. 46, as well as with the specification, which describes the curved magnetization pattern as being "magnetically imprinted" into "flexible magnetic sheet material," id. at col. 3, ll. 59-61; see id. at col. 4, ll. 61-63. Moreover, during prosecution the patent owner explained "magnetizable" as meaning "that the flexible sheet is capable of being magnetized." Nikken's argument that the court improperly required every aspect of the sheet to be magnetizable mistakenly focuses on how much of the sheet must be magnetizable; Nikken overlooks the fact that the sheet itself must be magnetizable. Thus, we conclude that the phrase "magnetizable flexible sheet" requires that "the flexible sheet itself must be capable of being made a magnet."

Looking first at claim construction, we agree with HoMedics that the district court correctly interpreted the phrase "magnetizable flexible sheet." Relying on that phrase's plain meaning and a dictionary definition, the court construed "magnetizable flexible sheet" to require that "the flexible sheet itself must be capable of being made a magnet." Summary Judgment Order at 13 (emphasis added). Indeed, that meaning is consistent with additional claim language, which requires the magnetization pattern to be "magnetized integrally into the sheet," '111 patent, col. 5, l. 46, as well as with the specification, which describes the curved magnetization pattern as being "magnetically imprinted" into "flexible magnetic sheet material," id. at col. 3, ll. 59-61; see id. at col. 4, ll. 61-63. Moreover, during prosecution the patent owner explained "magnetizable" as meaning "that the flexible sheet is capable of being magnetized." Nikken's argument that the court improperly required every aspect of the sheet to be magnetizable mistakenly focuses on how much of the sheet must be magnetizable; Nikken overlooks the fact that the sheet itself must be magnetizable. Thus, we conclude that the phrase "magnetizable flexible sheet" requires that "the flexible sheet itself must be capable of being made a magnet."

5. "main board"

This term appears in the '408 patent claims 1 and 9. Rackable asserts that "main board" means "main circuit board inside the computer that makes it possible for the other parts of a computer to communicate with each other, into which additional boards may be plugged if present." Supermicro asserts that "main board" means "a circuit board that contains the primary components of a computer."
The essence of this dispute is whether this term constitutes the principal board in the computer through which other parts of the computer communicate, as Rackable contends, as opposed to any printed circuit board having a processor, according to Supermicro.

Rackable explains that a computer may contain several printed circuit boards, but that the "main board" is "the largest printed circuit board in the computer" into which other circuit boards would plug. It asserts that many electronic devices contain circuit boards, but do not contain "main boards" as found in general purpose computers such as servers. In support, Rackable cites to extrinsic evidence, including several different print and online dictionaries. In addition to the dictionary definitions, in support of its construction, Rackable also argues that one of ordinary skill in the art "would expect a main board of the basic type that permits the level of functionality required of a general purpose computer, . . . also known as a 'motherboard'" and "would also know that the main board in a general purpose computer makes it possible for the other parts of the computer to communicate with each other."

Supermicro, in response, argues that specification language supports its construction, in addition to extrinsic evidence, including several computer and/or electronic dictionary definitions.

At the hearing, the parties agreed that "main board" is synonymous with "motherboard." Based on the admissions at the hearing, it is clear to the court that the parties agree that the "main board" includes "the primary components of a computer," and is distinguishable from a daughter board. In fact, Supermicro made a judicial admission that a "main board" is not the same thing as a daughter board. Thus, the real issue concerns the amount of detail that should be provided regarding the function of the motherboard or "main board" and its relation to other boards. As noted, per Rackable's construction, the "main board" should be construed to include language regarding communication, specifically that it is a circuit board that enables "other parts of a computer to communicate with each other," and should also be construed to note that additional boards, if present, may be plugged into it.

The only guidance in the specification itself appears to be several examples of "[p]referred main boards," which include "models N44BX, L44GX, 810, 810E and C440GX by Intel." However, the court cannot read limitations from the embodiment or the examples in the specification into the definition. Because analysis of the intrinsic evidence fails to resolve the ambiguity, the court will consider the extrinsic evidence -- most significantly, the dictionary definitions provided by the parties.

Rackable cites to five dictionary definitions in support of its construction, including: (1) a CNET.com definition (Ostapuk Decl., Exh. X); (2) Merriam-Webster's Online Dictionary (Exh. Y); (3) Free Online Dictionary of Computing (Exh. Z); (4) Microsoft Press Computer Dictionary (Exh. AA); and (5) an Answers.com definition (Exh. EE).

Supermicro cites to three different dictionary definitions in support of its construction, including: (1) Microsoft Computer Dictionary definitions of "main board" and "mother board;" (Yamashita Decl., Exh. D) (3) Dictionary of Computer and Internet Terms (Exh. F); and (4) the IEEE Standard Dictionary of Electrical and Electronic Terms (Exh. E).

Technical treatises and dictionaries are generally preferred over a definition in an ordinary dictionary based on "the principle that patents are to be construed by the hypothetical person skilled in the art." Kahrl, Patent Claim Construction, § 7.03[B], Technical Treatises (Aspen 2005 Suppl.); see also, e.g., Rambus, Inc. v. Infineon Technologies AG, 318 F.3d 1081, 1091 (Fed. Cir. 2003). "A technical treatise is more likely to provide a definition used by persons skilled in the art than an ordinary dictionary definition." Id. In defining electrical and computer terms, the Federal Circuit has employed computing dictionaries and the IEEE Standard Dictionary of Electrical and Electronic terms, as offered by Supermicro in this case. See Rambus, 318 F.3d at 1091; see also NeoMagic Corp. v. Trident Microsystems, Inc., 287 F.3d 1062, 1071 (Fed. Cir. 2002).

Here, the technical dictionaries overwhelmingly support Supermicro's construction of the term "main board," with one modification -- that the "main board" be "main" or "primary." Rackable's definition is unnecessarily complex and contains limitations on the definition of "main board" that are not universally present in the dictionary definitions.

For these reasons, the court adopts, with one addition, Supermicro's construction, and construes the term "main board" as a main circuit board that contains the primary components of a computer.
The parties dispute the meaning of the phrase "a core wire having a main body." Specifically, the parties dispute the proper construction of the phrase "main body." On the face of Claim 1, the core wire has a "main body" and a "distal portion" of the core wire. Except for its use in the claims of the '962 Patent, the phrase "main body" does not appear elsewhere in the specification.

The Court previously defined the phrase "core wire" in construing the elements of the '136 Patent. Based on the written description of the '962 Patent, the Court gives the phrase the same meaning here. 16

The guidewire comprises a core wire, and an elongate tip portion extending the core wire for a predetermined lineal extent. The tip portion is adapted to be packed into the vascular cavity to form the occlusion in the vascular cavity. The tip portion is coupled to the distal portion of the core wire.

('962 Patent, Col. 5:30-35.)

16 Although the Court gives core wire the same construction, the Court notes the following passage from the written description in the '962 Patent, which if taken literally would render all claims for which it may be used to define the phrase "core wire" arguably indefinite:

The core wire is adapted to being packed into the vascular cavity to form the occlusion in the vascular cavity and is coupled to the distal portion of the core wire.

The tip portion includes a first segment for disposition into the cavity and a second segment for coupling the first portion to the core wire. The second segment is adapted to be electrolysized upon application of current. An insulating coating is disposed on the first segment. The second segment is left exposed to permit selective electrolysis thereof. As a result, endovascular occlusion of the vascular cavity can be performed.

('962 Patent, Col.6:1-13.) If this passage is used to define "core wire," it would mean that "core wire" would include the elongate distal tip, which is contrary to the Court's earlier construction. Furthermore, the literal language of this passage has the "core wire" attached to the "core wire." The Court declines to include this passage in its construction of Claim 1 of the '962 Patent. Nor does the Court include this passage in its construction of "core wire" as it is used in the '136 and '578 Patents. Any party contending that the above passage has legal significance may file appropriate motions.

In the phrase "a core wire having a main body," as it is used in Claim 1 of the '962 Patent, the Court construes "main body" to mean:

the core wire not including the distal portion of the core wire.

1 "main case"

The parties dispute whether the scanner's main case necessarily contains the interface engine.

The mobile scanner disclosed by independent claim 13 comprises "a main case including an image sensing module and a
motion mechanism," "an interface engine coupled to the image sensing module and the motion mechanism" and "a universal serial bus." '506 patent, col 11, l. 39 through col 12, l. 11.

The parties originally agreed that "main case" means "a compact case that houses the image sensing module and the motion mechanism." Doc # 36, Ex 1 at 16. Plaintiff now rejects that construction and contends that "main case" means "a compact case that houses the image sensing module, the motion mechanism and the interface engine." Doc # 58-2 at 2 (emphasis original). Plaintiff argues that the previously agreed upon construction is inconsistent with dependent claim 14, which claims "the mobile scanner of claim 13, wherein the interface engine is enclosed in the main case and communicate[s] with the computing device through the universal serial bus." '506 patent, col 12, l. 12-14.

It is true that "the usage of a term in one claim can often illuminate the meaning of the same term in other claims." Phillips, 415 F3d at 1314; see also Fonar Corp v Johnson & Johnson, 821 F2d 627, 631 (Fed Cir 1987) ("[C]onstruction of disputed claims requires reference to the specification, the prosecution history, and the other claims."). But in this context, plaintiff's argument proves too much. The fact that claim 14 specifies that the main case houses the interface engine actually militates against implying such a spatial limitation into claim 13, for it suggests that the patentee contemplated that the interface engine would not necessarily be enclosed within the main case. See Phillips, 415 F3d at 1325 ("The inclusion of such a specific limitation on the term 'baffles' in claim 2 makes it likely that the patentee did not contemplate that the term 'baffles' already contained that limitation.").

This is confirmed by dependent claim 15, which specifies that interface engine is housed in "a separate case integrated with the universal serial bus." '506 patent, col 12, l. 12-17 (emphasis added). The additional and mutually exclusive limitations of claims 14 and 15 show that the location of the interface engine was not a limitation inherent to the "main case" language of claim 13. Hence, "main case" should not be construed so as to specify the interface engine location.

Plaintiff lastly contends that its construction is appropriate because this court found in the previous claim construction order that the "interface engine is enclosed in the main case." Id at 2-3. But the court merely observed that the claim language of the '506 patent "makes clear that the interface engine is contained within the main case in some embodiments." Doc # 57 at 17 (emphasis added). This observation is entirely consistent with the conclusion that the interface engine may be housed outside the main case, a possibility that should not be foreclosed in the manner plaintiff proposes.

In sum, the court declines to construe "main case" so as to import a limitation concerning the location of the interface engine into claim 13. Because (1) the location of the interface engine vis-a-vis the main case was the sole subject of dispute and (2) the parties agree that the main case is a compact case that houses the image sensing module and the motion mechanism, the court adopts the parties' previously agreed upon construction, which is amply supported by the claims and the specification. See '506 patent, col 2, l. 13-14 (proclaiming that the disclosed scanner fulfills the need for a "compact, energy-efficient and lightweight" scanner); col 2, l. 57-61 ("The main case houses the image sensing module and the motion mechanism ** *."); col 5, l. 41-42 (same); col 11, l. 31-40 (same).

The court construes "main case" as "a compact case that houses the image sensing module and the motion mechanism."

1. "Main Case"

Plustek asks the Court to construe this claim as "a compact case that can be made of light but rigid plastic material and that houses only a color image sensing module and a motion mechanism." [Alternatively, Plustek asks the Court to construe this term as "a compact case compatible with portability that can be made of light but rigid plastic material and that houses only a color image sensing module and a motion mechanism." (Emphasis added)]

Syscan argues for "a case compatible with portability that houses an image sensing module and a motion mechanism."

The specification clearly distinguishes the patented scanner from the prior art on the basis of the scanner's minimalist approach: "The disclosed invention, for the first time, provides a mobile scanner that has only the minimum components to operate." See Dang Decl., P 2, Ex. A ('124 Patent), 2:30-32, emphasis added. "It is disclosed that a mobile scanner includes
only the minimum components to operate as a scanner." See Dang Decl., P 2, Ex. A ('124 Patent), Abstract.

It should be pointed out that, fundamentally different from the scanners in the market, there is no microcontroller and other electronic components in main module to control the operation of the image sensor and the illumination source." See Dang Decl., P 2, Ex. A ('124 Patent), 7:3-7, emphasis added.

In summary, it is clear from the specification that the patentee intended only to claim scanners which contain only the components necessary to operate (an image sensing module and a motion mechanism) to distinguish the patented scanner from the prior art. The Federal Circuit has consistently held that "where the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent, even though the language of the claims, read without reference to the specification, might be considered broad enough to encompass the feature in question." SciMed Life Systems, Inc., 242 F.3d at 1341; see also CCS Fitness, 288 F.3d at 1366-67 ("a claim term will not receive its ordinary meaning if the intrinsic evidence shows that the patentee distinguished the term from prior art on the basis of a particular embodiment, expressly disclaimed subject matter, or described a particular embodiment as important to the invention.").

Therefore, the Court construes this claim as "a compact case that can be made of light but rigid plastic material and that houses only an image sensing module and a motion mechanism."
the main plateaus must make up the bulk of the interior of the cargo body or require a smooth-walled construction. Indeed, the patentee seemed rather keen on ensuring the broadest possible reach of his patent:

The various elements and combinations of elements described below and illustrated in the drawings can be arranged and organized differently to result in embodiments which are still within the spirit and scope of the present invention.

'564 Patent, 3:30.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

3 See also '564 Patent, 4:37-39 ("In reality, main plateaus 17, 18 . . . preferably make up the majority of panels 15, 16 and therefore, of an interior wall surface 38 of the trailer") and 4:42-44 ("in reality, the various sidewall panels preferably extend laterally a distance several times the width of joint 14.")

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

If the patentee had wanted to claim an invention having a panel with a "main" plateau that was proportionately larger in size than the spliced plateau, it would have been easy to say this in the claims. To the contrary, by stating in the specification that it preferred the main plateaus to comprise the bulk of the interior of a cargo body but then failing to incorporate this preference into the claims, the patentee essentially disavowed this limitation. See Halliburton Energy Services, Inc. v. M-I LLC, 514 F.3d 1244, 1251 (Fed. Cir. 2008) (specification's statement that gel drilling fluid "preferably" contain no organophilic clays strongly suggests that absence of clays was simply preferred embodiment); see also Acumed LLC v. Stryker Corp., 483 F.3d 800, 807 (Fed. Cir. 2007) (it is improper to read a feature of the preferred embodiment into the claims as a limitation). If anything, the patentee's word and phrase choices suggest that he was aiming for the broadest possible coverage of his patent.

Accordingly, I decline to construe the term "main" as expressing any relative size requirement.

B. Limitation to trailers or other cargo-carrying containers

In its initial motion for claims construction, plaintiff also asked the court to construe the term "main plateau" as a "portion of a trailer wall panel." Defendant objected, asserting that there is no language in the claims defining a "wall joint" (claim 1 of both patents) or in the claims defining a "cargo body" (claim 15 of the '564 patent and claim 16 of the '902 patent) that limits "main plateau" to trailers. Indeed, noted defendant, the patentee defined the term "cargo body" in the specification as referring to "the sidewalls of a trailer, cargo container, truck body or other cargo carrying body." '564 patent, 1:17-20. In response, plaintiff concedes that the claims are not limited to trailers but also apply to containers, cargo bodies or any other structure designed to contain cargo. Pl. Response, dkt. 33, at 3 n.2. Plaintiff appears to be taking the position that this limitation applies not only to the "cargo body" claims but even to the "wall joint" claims.

From the perfunctory nature of plaintiffs' response, along with defendant's assertion that the patent claims and the specification "do not support limiting the claims to a trailer," Def.'s Br. in Supp., dkt. 27, at 5, it is unclear whether an actual dispute remains regarding the scope of the claims. Absent a clear indication that a concrete dispute requiring construction remains, I decline to address this issue at this time. Plaintiffs may renew their request that the claims should be limited to trailers, containers or other cargo-carrying structures if they deem such a construction necessary at the summary judgment phase.

Court's construction: "main plateau" means "a portion of a panel."

GO BACK

2446

a. main sealant

LGD contends that "main sealant" means "sealant material that encloses the display region." D.I. 376 at Exh. I-3. LGD further contends that the term "encloses" means "to surround on all sides; to enclose or contain completely." D.I. 384 at 30;
D.I. 430 at 16. Thus, according to LGD, the main sealant must completely surround the liquid crystal in the display area, with no opening or fill points.

AUO contends that the term "main sealant" means "a segment of sealant for enclosing the liquid crystal in the LCD panel." D.I. 376 at Exh. I-3. CMO contends that the term "main sealant" means "sealant material necessary for confining liquid crystal from leaking out from between the substrates." Id.

The Court concludes that the term "main sealant" means "sealant material that encloses the display region" with the understanding that "encloses" means "to surround on all sides; to enclose or contain completely." In the Court's view, this construction is consistent with the specification and reduces the likelihood of ambiguity and confusion. '374 patent, col. 3, ll. 23-24 ("The main UV sealant acts as a sealant to confine the liquid crystal."). 37 (describing a "closed type main UV sealant"). AUO's construction, which permits multiple separate segments of sealant, is inconsistent with the specification and the purposes of the patent in that it reintroduces the problem of excess sealant and contamination that the claimed invention is designed to address. Id. at col. 5, ll. 5-7, 26-34; col. 2, ll. 62-67; Figs. 3B, 4A, 5A. In addition, the specification makes clear that the main sealant encloses the place where the liquid crystal must be deposited, meaning the display area. Id. at col. 5, ll. 31-32. Thus, the Court finds AUO's construction of enclosing the liquid crystal to be imprecise.

Similarly, CMO's construction, while addressing the function of the main sealant, does not explain whether the sealant must fully enclose the display area and interjects confusion because it may refer to only a portion of the seal or include a subsequent "plug" seal after vacuum injection is used to fill an injection hole. Such plugged holes are not contemplated in the '374 patent, which discloses a main sealant formed as a closed loop completely surrounding the display area with no injection fill ports or other openings. Id. at col. 2, ll. 38-40.

"maintain centering"

Xinyi also asks the Court to construe the term "maintain centering," which appears in asserted claims 14 and 15 of the '395 patent. According to Xinyi, not only must the claimed invention provide for "centering" as discussed supra, it also must "maintain centering," which, according to Xinyi "means that the lip portion of the spacer provides sufficient force to keep or prolong a constant gap of even width all around the glazing, which force must be sufficient to overcome other external forces on the glass."

Saint Gobain counters that no construction is required, and the Court agrees. Much of Xinyi's proposed construction (the portion referring to "a constant gap of even width all around the glazing") coincides with its interpretation of "centering" which, as explained herein, the Court rejects. As for the latter segment of Xinyi's proposed construction (the portion referring to a force sufficient to overcome external forces on the glass), this interpretation is unsupportable. The phrase "maintain centering" simply adds the term "maintain" to the previously-discussed claim term "centering." The Court finds that the term "maintain" has a plain and ordinary meaning to one of ordinary skill in the art and, when added to the term "centering," simply indicates that the centering function performed by the spacer is prolonged, i.e., that it is not fleeting or temporary. Xinyi's suggestion that the phrase "maintain centering" independently requires a force sufficient to overcome external forces on the glass finds no support in the intrinsic record and, therefore, Xinyi's proposed construction is rejected.

"said protective barrier provides reduction of wind force sufficient to maintain the integrity of said structure"

</table>
provides vulnerable parts of the building, including under the eaves or overhangs, on the walls, and on the windows and doors, so that the structure is maintained whole.

The dispute between the parties over the instant phrase "maintain the integrity of said structure" in the instant claim term is essentially the same as their dispute over "process for maintaining integrity of a structure" in claim 1's preamble. The Court incorporates by reference its prior discussion covering this latter dispute, which sets forth specification statements showing that structural integrity may be maintained, as contemplated by claim 1, even if only select portions of the structure are shielded or protected. Additionally, the Court incorporates by reference its prior discussion rejecting what this Court described as Defendants' single embodiment theory related to figure 1.

This Court concludes that a person of ordinary skill in the art would readily understand this claim term as is. It is clear to this Court that this claim term contemplates a protective barrier device that aims to sufficiently reduce wind forces in order to maintain a structure's integrity. To construe the phrase "maintain the integrity of said structure" to mean "to reduce wind forces affecting all the vulnerable parts of the building, including under the eaves or overhangs, on the walls, and on the windows and doors, so that the structure is maintained whole" would unnecessarily limit the claim language for reasons stated in the foregoing sections. Any additional construction by this Court is unwarranted and not necessary. Instead, this claim term should be given its plain and ordinary meaning.

4. "Maintained." Technip contends that the low pressure must be "actively" maintained by the longitudinal gas flow. To be sure, nothing in the intrinsic evidence directly supports the defendant's position that the pressure need be actively maintained by the longitudinal gas flow inasmuch as that word "actively") is used nowhere in the intrinsic evidence and maintained is nowhere defined in the intrinsic evidence. Looking to extrinsic evidence, it is clear that "maintain" means "[t]o continue," "carry on" or "[t]o preserve or keep in a given existing condition[.]" WEBSTER'S II, New Riverside University Dictionary, 717 (1984); see also BLACK'S LAW DICTIONARY, 973 (8th ed. 2004)("To continue (something)"). Given this definition, and the language in the specification which speaks to vacuum generation, the varying of vacuum strength and pressure, and the achievement 15 of reduced pressure, 16 it is clear to this Court that adding the modifier "actively" in front of maintained does nothing more than recognize the very purpose of the invention; if low pressure is not actively maintained by longitudinal gas/air flow along the microporous insulation, the pipeline will inevitably form solid deposits and lead to replacement of the pipeline. In other words, it is the intrinsic characteristic of this invention that low pressure is actively maintained by longitudinal gas/air flow along the microporous insulation. Accordingly, this Court must agree with the defendant that the low pressure must be actively maintained.

15 Achievement means "[s]omething that has been accomplished successfully, esp. by means of persistent endeavor," WEBSTER'S II, New Riverside University Dictionary, at 73. Similarly, "achieve" means "[t]o accomplish successfully" or "[t]o attain with effort[.]"] Id.

16 (See Doc. 33, Exhibit A, at Columns 3, 7 & 8 ("A striking feature of the invention is that the space occupied by the microporous material within the annular space between the two coaxial tubes maintains a free passageway for laminar airflow thus promoting suction and generating reduced pressure from one section to another through the entire pipe as applied from one end thereof. . . . Partial vacuum aimed at dislodging air contained in open pores of the microporous material through the encasing tissue is conveniently accomplished by longitudinal gas flow in this empty space. Vacuum is generated until a reduced pressure on the order of 50 millibars is obtained, through suction by a temporary flow tap communicating with a hole drilled at one end of the pipe, which hole is subsequently plugged by a weld joint. . . . One proceeds then with vacuum generation using the layer of 3 mm mean thickness that has maintained free nearby the outer tube, to achieve a reduced pressure of 50 millibars, as mentioned previously. . . . Once such a pipe is installed, the gas flow
passageway may still be accessed from either end of the pipeline to vary the vacuum strength during service lifetime thereof, and hence vary the efficiency of insulation. . . . In such an example, there is contemplated according to the invention a method for using a pipe thus made, essentially characterized in that pressure maintained within said annular space is varied between values as high as 50 bars early in service, and values in the range of 1 mbars and 900 mbars late in service for a pipeline formed from said pipes.

--- End Footnotes ---

2450

8. "such that said blunt-ended cylindrical shape is maintained during flight and prior to impact"

Defendants argue that this language in the claim requires that the projectile's shape is "maintained after firing for at least 20 yards and until impact." Def. Br. at 13. The numerical limit in defendants' construction is derived from the explanation in the patent specification of the possible uses for plaintiff's invention, such as by police officers managing an unruly crowd, who might "strike [an unruly] individual, typically at eight to twenty yards, with a low lethality munition." '086 patent, 2:30-32 (emphasis added). Defendants argue that plaintiff's projectile must therefore be capable of maintaining its flight shape for at least 20 yards.

There is nothing, however, in the claim language that refers to the length of the projectile's flight. In the absence of such limiting language in the claim, the numerical limitation of twenty yards suggested by the specification should not be read into the claim language. See Modine Mfg. Co., 75 F.3d at 1551 (noting that a "claim element that is claimed in general descriptive words, when a numerical range appears in the specification and in other claims, is not limited to the numbers in the specification or the other claims"). Plaintiff's proposed construction, that the shape is "maintained at least up to the point immediately before impact," Pl. Br. at "Ex. F," reflects the ordinary meaning of the claim language.

2451

Claim 5

Finally, Claim 5 is directed to "the miter saw of claim 4 wherein the handle is rotatable to the same extent that the arm is adjustable about the horizontal axis so as to enable the handle to be maintained in a horizontal orientation during a compound miter cut." ('976 Patent, Col. 5, ll. 15-18) (emphasis on disputed terms). Rexon would construe the disputed words as: "the handle is rotated in a one-to-one relation to the adjustment angle of the arm assembly so that the handle is fixed horizontally, without any deviation from the horizontal, during operation of the miter saw." Rexon's proposed construction appears more an attack on validity or a defense to infringement than an effort to construe the terms in light of the otherwise ordinary meaning of the terms. Moreover, One World's proposed construction ("to keep the handle in a horizontal position") fails to add any clarity to the ordinary and accustomed meaning of the claim language, confirming my impression that the language is clear on its face and does not require any further construction. Whether a handle that deviates slightly from the horizontal falls within the scope of the claim--an argument alluded to by both parties--is a matter for the finder of fact to determine at a later stage of the litigation.

2452

1. "maintaining" and "maintain"

Micromass asserts that the plain meaning of "maintaining" or "maintain" is "to carry on," "to continue," and "to keep unimpaired." Thus, it asserts that the proper construction of "means for maintaining the kinetic energies of ions . . . at a relatively low level" in claim 1(k) and "maintain such kinetic energy at a relatively low value" in claim 14(h) is one that requires "the kinetic energies be kept unimpaired at a relatively low level through the relevant region."
AB/Sciex contends that "maintaining" and "maintain" are common words used in their everyday manner and therefore require no further construction. It notes, however, that Micromass's proposed construction of those terms -- that "the kinetic energies be kept unimpaired" -- contains two implications not required by the claim language. First, AB/Sciex is concerned that Micromass intends to imply that the kinetic energy of ions can never vary through the region between the inlet orifice and the first rod set. It argues that this construction is not supported by the claim language. The court agrees. Read in whole, the claim limitations require that the kinetic energies of the ions be maintained at a relatively low level throughout the relevant region. The claims do not require that the kinetic energy of ions never fluctuate. Indeed, the kinetic energies of ions may fluctuate greatly, as long as the kinetic energy of those ions does not surpass the relatively low value or level required by the claim.

Second, AB/Sciex is concerned that Micromass's construction implies that the kinetic energies of all the transmitted ions be maintained at a relatively low level. Again, such a construction would be at odds with the claim language. Claim 1(k) requires only "maintaining the kinetic energies of ions . . . ." It does not say "all ions," but instead indicates the number of ions needed to meet the limitation only be expressing "ions" in the plural. Thus, the court concludes that only a plurality of ions need to be maintained a relatively low level to satisfy this limitation.

Thus, "maintaining" and "maintain" are used in their ordinary sense and require no further construction except to note that the use of these terms in claims 1(k) and 14(h) requires neither that (1) the kinetic energies of the ions never vary, nor (2) all ions satisfy this claim limitation.

2453

(1) "maintaining a predetermined drying speed for a predetermined time in an initial drying step"

The parties dispute the term "maintaining a predetermined drying speed for a predetermined time in an initial drying step," which appears in Claims 1 and 10. LG proposes construing the term to mean "maintaining a predetermined drying speed [i.e., a preset speed occurring during a drying step] for a predetermined time in an initial drying step [i.e., a first drying step in a sequence of drying steps]." (Chart at 23.) Whirlpool proposes instead that the term be construed to mean "spinning the drum at a preset speed that discharges water contained in the laundry for a predetermined time." (Id.)

The summary of the patent states that "[a]n object of the present invention is to provide a drying method for a drum-type washing machine which can prevent the drum from generating a flushing noise upon activation of a drying step, and which can also prevent laundry from sticking to the drum and thus becoming crumpled." ('731 Patent, col. 2, ll. 11-15.) "To achieve these and other advantages and in accordance with the purpose of the present invention, as embodied and broadly described, a drying method for a drum-type washing machine of the present invention includes . . . draining water from a load of laundry by maintaining a predetermined drying speed for a predetermined time in an initial drying step . . . ." (Id., col. 2, ll. 23-29.)

Figure 5 is "a flowchart showing a method of carrying out a drying stroke process by sensing an eccentricity in a drum washing machine according to the present invention . . . ." (Id., col. 3, ll. 8-10.) Figure 6 is "a graph showing characteristics of the drying stroke of [Figure] 5." (Id., col. 3, ll. 12-13.) The written description for Figures 5 and 6 states that "the predetermined speed R2 is maintained in steps 53S and 54S for a predetermined time tc in order to discharge the water contained in the laundry, thereby preventing an eccentricity from being generated due to the water contained in the laundry." (Id., col. 3, ll. 40-44.)

Based on the intrinsic evidence, the Court will adopt Whirlpool's construction of the term. It is clear that the patent uses the term "maintaining a predetermined drying speed" with respect to the spinning of the drum. It is also clear that the proposed invention engages in the initial drying step for the purpose of discharging water. The Court therefore construes the term "maintaining a predetermined drying speed for a predetermined time in an initial drying step" to mean "spinning the drum at a preset speed that discharges water contained in the laundry for a predetermined time."
5. "maintaining desired physical characteristics"

Agere argues that the phrase "maintaining desired physical characteristics" should be construed as "preserving the physical integrity of the paddle support arm." Atmel argues that the phrase "maintaining desired physical characteristics" should be construed as "preserving physical integrity of the paddle support arm by preventing a necked down region from forming." Clearly, the only significant difference between the two proposed constructions is Atmel's inclusion of the language "by preventing a necked down region from forming."

In support of its proposed construction, Atmel points to the patent description of Figure 2, where it is noted that as a result of the existence of the deformation absorbing member, "the desired electrical and physical characteristics are maintained after the forming operation as the paddle support arm does not form a necked down region." '269 Patent at col. 3:7-9. Atmel further refers to the testimony of its expert witness that he is unable to identify any physical phenomenon other than "necking down" which would constitute a potential threat to "maintaining desired physical characteristics." See Tr. 12/6/02 at 112. However, an expert witness's inability to conceive of, and the specification's lack of reference to, any other examples of a pertinent physical phenomenon which would constitute a potential threat to "maintaining desired physical characteristics" does not mean that such a limitation should be read into the claim language, which does not itself include any such limitation. See E.I. du Pont, 849 F.2d at 1433. Moreover, the specification expressly indicates that the patentee did not intend to limit the patent in this way. The Background of the Invention states: "The deformation will generally be in the form of a necking down, i.e., a constriction of paddle support arms in the transverse axial direction." '269 Patent at col. 1:44-46 (emphasis added). The description of Figure 2, which presents a deformation absorbing member that specifically prevents necking down, provides merely an example of the invention, and does not provide a sufficient basis for reading such a limitation into the claim language itself. Thus, the Court construes the phrase "maintaining desired physical characteristics" as "preserving the physical integrity of the paddle support arm."

110. Step 6. Micro-Waste asserts that the maintaining of temperature in the temperature maintenance zone in step 6 is by means of a heating device.

111. Micro-Waste's proposed limitation of a "heating device" is derived from language in the specification which states, "[i]n order to maintain a minimum temperature, the temperature maintenance chamber is preferably encased by a heating device."

112. Industries asserts that to "maintain' means 'to keep in an existing state." (quoting WEBSTER'S NINTH NEW COLLEGIATE DICTIONARY 718). Read together with the specification, which states that the "articles so heated are … held [to] at [] least the minimum temperature during a minimum residence time[,]" the "existing state" is that of a minimum disinfecting or sterilizing temperature.

113. The ordinary meaning of "maintaining" does not require the use of a heating device.

114. "Maintaining." in step 6, is not limited to the preferred embodiment disclosed in the specification. See Amgen, Inc., 314 F.3d at 1328 ("[O]ur precedent is clear that claims are not perforce limited to the embodiments disclosed in the specification."); Rhine, 183 F.3d at 1346.

115. Step 6, prescribing the "maintaining" of temperature, is construed to mean the holding of the temperature at the disinfecting or sterilizing temperature.
The dispute here seems to be whether the flow of gas must be perpendicular to the substrate all the way to the surface of the substrate, or whether only the initial flow of the gas need be perpendicular to the substrate. Claim 1 requires that there be an "apparatus comprising a member having a plurality of gas flow apertures passing therethrough for maintaining said flow of gas perpendicular to said substrate and creating a stagnation point flow at a center of said circular substrate . . . ." (‘165 patent 5:39-43.) The plain meaning of this language is that the apertures must be positioned so that they always create a flow of gas that is directed perpendicular to the substrate, and the gas must approach the substrate so that it creates a stagnation point flow at the center of the circular substrate. A person of ordinary skill in the art would not read this language to require that the gas flow must always be precisely perpendicular all the way to the surface of the substrate; at some point close to the surface of the substrate, the substrate will act like a wall and deflect the flow of gas. As Peltzer states in his expert report,

"The flow is directed toward (more specifically, perpendicular to) to the substrate initially as it exits from the gas flow apertures, but the streamlines soon begin to curve. Indeed, the nature of stagnation point flow is that the gas approaching the substrate divided into streamlines that become parallel, rather than perpendicular to the substrate, and proceed away from the central streamline."

(Peltzer Expert Report at 12.) This is illustrated in figure 3 of the ‘165 patent, which shows that:

The gas 11 initially has a generally uniform velocity directed perpendicular to the entire surface of the substrate 10. The solid substrate, as the gas 11 approaches the substrate, causes the velocity vector to become parallel to the surface of substrate 20 and flow away from the axis of symmetry.

(‘165 patent 3:45-51.) Although this language appears in the description of the preferred embodiment, it describes what would happen whenever a perpendicular flow of gas is directed at a solid surface.

Genus has no counter-argument, but contends that ASM is rewriting the claim language by containing that "maintaining said flow of gas perpendicular to said substrate" only requires that the initial direction of the gas flow be perpendicular to the substrate. Genus' argument ignores the context of the claim language. By requiring that the apertures maintain the flow of gas perpendicular to the substrate, the claim language simply requires that the gas flow apertures always direct the flow of gas in an initial direction that is perpendicular to the substrate. Moreover, the summary of the invention provides that "a gas, introduced at a preselected distance from a circular substrate, has an initial uniform velocity toward the substrate." (‘165 patent 2: 45-47 (emphasis added.).)

As ASM points out, the disputed language, "maintaining said flow of gas perpendicular to said substrate," was not in claim 1 as originally drafted. (‘165 Prosecution History at 98.) The claim was amended to add the phrase "said apparatus further having means for varying a distance between said apparatus and said substrate and maintaining said flow of gas perpendicular to said substrate." (Id. at 40.) The inventors explained that:

Claim 1 has been amended to incorporate the feature of a means for varying the distance between the substrate and the apparatus while maintaining at all varied distances the perpendicularity of the gas flow relative to the substrate surface.

(Id. at 42.) The claim language later was amended further, but the Court agrees with ASM that the purpose of adding the "maintaining" language was to ensure that varying the distance between the gas flow apparatus and the substrate would not change the perpendicularity of the gas flow when it first exits the gas flow apparatus.

Thus, the Court agrees with ASM's proposed construction. ASM's definition uses the phrase "the initial vector of the velocity," however, which is not a phrase that is likely to elucidate matters for the lay jury. Instead, the Court construes "maintaining said flow of gas perpendicular to said substrate" to mean that "the gas flow apertures always direct the flow of gas in an initial direction that is perpendicular to the substrate."
2 It is undisputed that velocity contains two elements: direction and speed. At oral argument, the parties agreed that instead of using scientific terms like "velocity vector" and "magnitude of the velocity vector" to construe the claims, the Court could use "direction of the flow" for "velocity vector," and "speed of the flow" for "magnitude of the velocity vector" in order to make it easier for the jury to understand the claims.

I. "maintaining said locked configuration by use of a pin"

Regarding the first term to be construed, plaintiff proposes "keeping the locking member in a locked position relative to the security slot by use of a pin," while defendants propose "preventing the locking member from returning to a position aligned relative to the security slot by use of a pin." The dispute centers around the construction of the term "maintaining" as "keeping" or "preventing."

Defendants also ask the Court to construe the terms "a pin proximate said locking member" and "a movable locking member" as part of the construction of "maintaining said locked configuration by use of a pin." During the prior round of claim construction briefs, however, defendants did not believe it was necessary to construe these terms as part of the "maintaining" step of the claim, and it is not clear to the Court how the meaning of the "maintaining" phrase could have changed in the meantime. In addition, the Court has already held that claim construction would be limited to the phrase "maintaining said locked configuration by use of a pin" due to defendants' failure to respect the Patent Local Rule deadlines. September 20, 2005 Order at 8-9 n.7. For these reasons, and because the Court does not believe that "pin" or "a movable locking member" need to be construed beyond their plain meanings, the Court will not construe these additional terms.

1 For example, the PTO consistently used the term "locking member" in its reexamination order, indicating that "locking member" has "a reasonably well understood meaning in the art," Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996), and is not a means-plus-function element.

A. Presumption in favor of the ordinary and customary meaning

In general, courts "indulge a heavy presumption that a claim term carries its ordinary and customary meaning." CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002). The Federal Circuit has held that dictionary definitions may establish a claim term's ordinary meaning. Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1344 (Fed. Cir. 2001) (using Random House Unabridged Dictionary to ascertain the ordinary meaning of "portion"); Kegel Co. Inc. v. AMF Bowling, Inc., 127 F.3d 1420, 1427 (Fed. Cir. 1997) (using Webster's Third New International Dictionary to define "assembly"); Vitrionics Corp., 90 F.3d at 1584 n.6 ("Although technical treatises and dictionaries fall within the category of extrinsic evidence . . . [j]udges are free to consult such resources at any time in order to better understand the underlying technology and may also rely on dictionary definitions when construing claim terms.").

Here, the dictionary definition of "maintaining" is "keeping in existing state." Merriam Webster's Collegiate Dictionary Tenth Edition (1997) at p. 702. While keeping in existing state may encompass defendants' proposed construction of "preventing" the locking member from returning to a certain position, the definition is by no means synonymous with such a construction. The dictionary definition of "maintaining" thus supports plaintiff's proposed construction of "keeping." Accordingly, the Court adopts plaintiff's construction as the claim term's plain and ordinary meaning and finds a heavy presumption in favor of defining "maintaining" as "keeping" or "keeping in existing state." See CCS Fitness, Inc., 288 F.3d

- 2940 -
B. Overcoming the presumption

Courts have recognized at least two ways for an accused infringer of a patent to overcome the heavy presumption in favor of the plain and ordinary meaning of a claim term. First, a claim term may receive a meaning separate from its ordinary meaning if the patentee acted as his own lexicographer and clearly defined the term in the specification or prosecution history. See, e.g., Johnson Worldwide Assocs., Inc. v. Zebeco Corp., 175 F.3d 985, 990 (Fed. Cir. 1999); Rexnord Corp., 274 F.3d at 1342. The second route, which defendants rely on in this case, applies where the term "chosen by the patentee so deprives the claim of clarity" as to require recourse to the intrinsic evidence for a definite meaning. Johnson Worldwide Assocs., Inc., 175 F.3d at 990.

Defendants argue that neither the claim term "maintaining" nor plaintiff's proposed construction of "keeping" provides a clear meaning to a person with ordinary skill in the art, because of variations present in the preferred embodiments described in the specification. 2 The Court disagrees, for two reasons. First, there is nothing unclear about the meaning of "maintaining" or about plaintiff's construction of "maintaining" as "keeping the locking member in a locked position." Second, defendants' construction would violate an established canon of claim construction. It is well settled that limitations from patent specifications cannot be read into patent claims. See Sjolund, 847 F.2d at 1582 (structural limitations in specification of improved crab trap not allowed to be read into claim to decide obviousness); E.I. du Pont de Nemours & Co. 849 F.2d at 1432-3 (copolymers' environmental stress crack resistance and impact strength disclosed in specification not proper for consideration in claim construction); Laitram Corp., 863 F.2d at 864-5 (shape of a key shaft in a claim not limited by an embodiment of a square key shaft in the specification).

2 Specifically, defendants rely on Figures 3 to 17 for the proposition that the pins function to prevent a crossmember from rotating back to an aligned position relative to the security slot, on Figures 24 and 27 for the proposition that the pins prevent two engagement arms from returning to an aligned position relative to the security slot, and on all of the figures to show that the pins prevent the locking member from returning to an aligned position relative to the security slot.

Here, even if defendants are correct in drawing from the preferred embodiments in the specification that the pins essentially "prevent" the locking member from returning to a certain position, it is not proper to read this construction into the claim in a limiting fashion. The construction of "preventing" is necessarily more narrow than "maintaining" because such a construction introduces a new element into the claim, i.e., a locking member that would presumably return to a position aligned with the security slot but for the use of a pin. The court therefore rejects defendants' construction to avoid improperly importing claim limitations from the specification.

Staples defines "majority of abutting wooden surfaces in a building having a frame constructed from wooden components comprising said wooden surfaces" as "more than half of the abutting length of the touching wooden surfaces that are susceptible to outside air infiltration." (Joint Claim Construction Statement, P. 2). Defendants define it as "more than 50% of the total abutting length of all of the touching wooden surfaces in a building frame that are susceptible to outside air infiltration."
infiltration." (Id.).

Upon consideration, the Court sees little difference between the parties' proposed constructions. In other words, although Staples claims Defendants "want the Court to require that the glue be applied to the majority of all the abutting wooden surfaces in a building--including abutting surfaces on the interior of a building that have no bearing on air infiltration" (Doc. No. 60, P. 13 (emphasis added)), the Court finds no such limitation in Defendants' proposed construction. 3 The Court will adopt Defendants' definition, as it is more precise, and more accurately reflects the teachings of the patent as found in the specification and claims.

3 To the contrary, Defendants' construction specifically addresses only those wooden surfaces "that are susceptible to outside air infiltration."

5. make selections by causing contact across the [a] planar surface of the work platform

This phrase appears in claims 25 - 53 of the '213 patent and in claims 10 - 12 of the '283 patent. The plaintiff proposes a construction of "the child can cause contact across the surface of the work platform, as opposed to being limited to specific locations on the work platform." The defendant asserts that this term fails to comply with the written description requirement of § 112. Alternatively, the defendant proposes "arrange blocks in a particular configuration by movement across the work platform."

The disagreement between the parties stems from whether the claimed device is configured to sense objects continually (i.e., make selections) as the objects are moved across the work platform, or whether the claimed device senses objects only after the objects are located in a final position. Although the written description does not offer much explicit help, it does state that "[w]hile a block is moved on the working platform, the working platform transmits the identification of the moved block and the new locations of the block on the working platform." '874 patent at 9:2-5. The written description additionally states, "the block location information and the character identification information [can be] continuously generated and transmitted to the processing device 22." Id. at 4:46-47. This recited functionality is distinct from the generation of location and identification information upon the actuation of a button, such as by depressing a button upon completion of spelling a word, which is also described in the specification. Id. at 4:47-50.

Claim 25 of the '213 patent, as well as claim 10 of the '283 patent, describe the ability of the educational toy to sense or detect the lateral movement of a contact across the work platform while the contact is maintained with the work platform. See '213 patent, cl. 15; '283 patent, cl. 10. In light of the claim language, combined with the specification's disclosure, the court concludes that this term means "making selections by causing a maintained contact across the planar surface of the work platform."

4. "MAKING AVAILABLE TO CONSUMERS A SPECIAL LOCK"

Independent claims 1 and 10 of the 728 patent recite methods for improving carrier baggage inspection including the step of: "making available to consumers a special lock." Independent claims 1, 9, 14, and 18 of the 537 patent refer, substantively, to the same step. Tropp's proposed construction of "making available to consumers a special lock" is "[c]ausing, or otherwise facilitating, a special lock to be made available to consumers." Travel Sentry proposes that the term "making available" means "[m]anufacturing, selling, offering for sale, or distributing locks."
Travel Sentry argues, essentially, that "making available to consumers a special lock" should be read and understood as making available such locks in a commercial context. (Markman Hr'g Tr. 7). Specifically, Travel Sentry states that "making available" should mean "manufacturing, selling, offering for sale, or distributing locks." Travel Sentry argues that the Tropp's proposed construction is vague and unsupported by the patents themselves or the prosecution histories. Tropp, for his part, argues that "making available" is plainly understood as being broader than simply "manufacturing, selling, offering for sale, or distributing locks".

The Court is in accord with Tropp that "making available" as used in the claim terms, does not restrict "making available" to "manufacturing, selling, offering for sale, or distributing locks." While claims 3 and 5 of the 537 patent, dependent to claim 1, recite that a step of making available to consumers involves "mass producing the special lock and selling the special lock to the consumers," independent claims 9, 14, and 18, which also contain the term, include no such limiting language. Furthermore, the 537 patent's specification gives no indication that "making available to consumers a special lock" is limited to the manufacture, sale, distribution, or offering for sale of the locks. The 537 patent is focused on teaching a method of improving airline luggage inspection, of which making a special lock available to airline travelers is one step to that method. 537 Patent, col. 2, 11. 28-32.

This reading is further bolstered by how the term is used in the 728 patent. See, e.g., Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1334 (Fed. Cir. 2003)(presumption that claim terms appearing in related patents contain the same construed meaning). Dependent claims 3, 7, 8, 9, 12, 18, 19 and 20 of the 728 patent demonstrate that the term was meant to at least include methods such as selling the lock directly or indirectly, 728 patent, col. 8, 11. 7-9, mass producing the lock for ultimate provision to the consumer, id. at 11. 16-19, providing the identification structure to a third party, id. at 11. 20-23, and causing the lock having the identification structure to be made available to consumers, id. at 11. 24-27. Claims 12, 18, 19, and 20 are dependent to claim 10 and contain identical language as claims 3, 7, 8 and 9. In other words, these claims recite the method of independent claims 1 and 10 and each adds a limitation to the term "making available to consumers a special lock." Under the doctrine of claim differentiation, there is a presumption that the independent claims in both patents are not interpreted to include the limitations of the dependent claims. While this doctrine is not a rigid rule, see. e.g., Laitram v. Morehouse Indus., 143 F.3d 1456, 1463 (Fed. Cir. 1998), there is a strong presumption that an independent claim is not restricted by the limitations found in a dependent claim, since that would render the dependent claim superfluous. Acumed LLC v. Stryker Corp., 483 F.3d 800, 806 (Fed. Cir. 2007); see also Andersen Corp. v. Fiber Composites. LLC., 474 F.3d 1361, 1369-70 (Fed. Cir. 2007); Robert L. Harmon, Patents & the Federal Circuit 390-93, § 6.7 (8th ed. 2007)("In the most specific sense, 'claim differentiation' refers to the presumption that an independent claim should not be construed as requiring a limitation added by a dependent claim"). The Court declines to narrowly construe "making available to consumers a special lock" to "manufacturing, selling, offering for sale, or distributing locks".

Read together, the claims of both patents strongly support a construction that does not limit "making available to consumers a special lock" to manufacturing, selling, offering for sale, or distributing locks only, since they describe ways beyond those named by Travel Sentry that would constitute "making a special lock available to consumers". Furthermore, Travel Sentry has not pointed to any evidence within the patents' written descriptions nor their prosecution histories demonstrating that Tropp intended to restrict "making available to consumers a special lock" to "manufacturing, selling, offering for sale, or distributing locks," "as a step in teaching a method of improving airline luggage screening. Accordingly, the term should not be limited to the few particular methods enumerated by Travel Sentry. In sum, since neither the claims nor the patents' written descriptions provide a reason for limiting "making available to consumers a special lock" in the way Travel Sentry advocates, the Court construes "making available to consumers a special lock" as "causing the special lock to be available to consumers".

2462

1. "Making said support member from vermiculite." Consistent with the claim language and its ordinary meaning, 18 the specification, 19 and the prosecution history, 20 the court construes "making said support member from vermiculite" to mean "the principal ingredient of the mat is vermiculite.”
meaning of "a mandrel that carries said blades". The dictionary defines "mandrel" as "3. A shaft on which a working tool is mounted" and defines carry as "6. To hold or be capable of holding . . . 7a. To support." American Heritage(R) Dictionary. Hence, the ordinary meaning of "a mandrel that carries said blades" is a shaft on which a blade is mounted, held, or supported.

The Court held a Markman hearing and subsequently issued a Memorandum opinion (Docket No. 138) in which the Court construed the disputed claim terms of the '981 Patent and the '306 Patent. At issued were the following claim terms of the '981 Patent and the '306 Patent: 1) "Frame"; 2) "Formed Integrally Within"; 3) "Integrally Formed Within"; 4) "Integrally Formed With"; 5) "Including"; 6) "Attached"; and 7) "Manifold". The Court construed the terms as follows:

"Frame": "the underlying structure of the cone crusher to which other constituent parts may be fitted, attached or integrated."

"Formed integrally within" and "Integrally formed within": "created or constructed within or as a part of the frame."

"Integrally formed with": "created or constructed within or in combination with the frame."

"Attached": "fastened or affixed."

"Including": "to take in or comprise as a part of a whole."

"Manifold": "a fitting or a passage that has a plurality of openings for making connections."

A. "Manipulator"

The manipulator limitation of the claim states, "a manipulator mounted inside the container for driving crop material into the disintegrator." Duratech argues this is a means-plus-function limitation. Means-plus-function limitations are provided for under 35 U.S.C. § 112, P 6:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

Section 112, P 6, allows an applicant to protect a structure that performs a specific function without specifically describing

However, in order to take advantage of this shortened form, the applicant is limited to the structure's description in the specification. Id.

In a means-plus-function analysis, the Court must first identify what function is to be performed. Cardiac Pacemakers, Inc. v. St. Jude Medical, Inc., 296 F.3d 1106, 1113 (Fed. Cir. 2002). The function can only include the limitations contained in the claim language. Id. After identifying the function, the Court must identify the "means" or structure that carries out the function. Id. The structure must perform the function, and the specification must clearly associate the two. Id.

Including the word "means" in a claim creates a presumption that the applicant intended § 112, P 6, to apply. Id. Inversely, excluding the word "means" creates a rebuttable presumption that § 112, P 6, does not apply. Phillips, 415 F.3d at 1311.

Bridgeview encourages the Court to adopt the plain meaning of manipulator. In support, it argues that a person of ordinary skill in the art would understand what "manipulator" means and that general purpose dictionaries provide a sufficient definition of manipulator. These arguments fail for two reasons.

First, none of the prior art disclosed in the ’104 patent (Markman hearing Exh. # 1), which is part of the prosecution history, uses "manipulator." The prior-art patents use many other terms to describe limitations similar to Bridgeview's manipulator, but "manipulator" appears to be a new way of expressing the limitation. By contrast, the term "disintegrator" used in the ’104 Patent is found in several of the prior-art patents in different forms such as "disintegrator," "disintegrating," or "disintegrate." Therefore, disintegrator provides a good example of a term ordinary people in the art would understand. Manipulator does not share this status.

Second, the dictionary definition cannot stand alone because the Phillips court warned against relying too much on a dictionary meaning of a term. 415 F.3d at 1320-21. Although the dictionary meaning is helpful, it cannot stand in the place of a specific specification that provides a clear construction of a claim. Id. Therefore, both of Bridgeview's arguments fail, and the Court cannot rely on the plain meaning of manipulator.

The manipulator limitation provides the function: "driving crop material into the disintegrator[.]" The structure associated with the function "manipulator." In the specification, the phrase "manipulator means" is used at least five times. The specification describes with particularity the engineering of the manipulator. The only embodiment discussed is the use of rollers with paddles protruding from the rollers. The specification does not provide any other examples of possible structures that would work as a manipulator. This language provides a clear indication that a "manipulator" is only the structure described in the specification.

Bridgeview notes the claims in the companion ’553 Patent uses language that is clearly intended to be a means plus function limitation: "means for supporting and manipulating the crop material for disintegration primarily by the disintegrator." (doc. # 80-2). Bridgeview argues this proves the manipulator limitation of the ’104 patent is not a means-plus-function limitation because the ’104 Patent was written after the ’553 patent. However, Duratech introduced into evidence at the Markman hearing the original applications for the ’104 Patent (Markman hearing Exh. # 5). These application documents reveal that Bridgeview tried to secure a broad protection for its manipulator limitation that did not include a function limitation: "a manipulator mounted inside the container substantially parallel to the disintegrator." The Patent and Trademark Office rejected this limitation twice. Bridgeview then added the function "for driving the crop material into the disintegrator." The Patent and Trademark Office approved this limitation. Although Bridgeview did not want to include a function limitation, the function was needed. This, combined with the specificity of the specification, rebuts the presumption that the manipulator limitation is not a means-plus-function limitation.

The Court construes the limitation "a manipulator mounted inside the container for driving the crop material into the disintegrator" to be a means-plus-function limitation as provided in 35 U.S.C. § 112, P 6. The function that is protected is "driving crop material into the disintegrator[.]" The Court construes the protected structure to be at least a pair of longitudinally extending crop material support rollers that are positioned above the disintegrator to define a disintegration opening between the rollers through which a portion of the disintegrator may rotate to engage the crop material supported by the rollers.

Bridgeview argues that even if the manipulator limitation is a means-plus-function limitation, it is entitled to protection of
equivalents as provided under 35 U.S.C. § 112, P 6. While this is true, see 35 U.S.C. § 112, P 6 ("and equivalents thereof."). the only purpose of a Markman hearing is to construe the claims of the patent. Whether Duratech's conveyor system is an equivalent entitled to protection is not before the Court.

A patentee's use of the word "means" in a claim limitation creates a presumption that 35 U.S.C. § 112 paragraph 6 applies. TriMed, Inc. v. Stryker Corp., 514 F.3d 1256, 1259 (Fed. Cir. 2008). Conversely, a claim term without the word "means" suggests that § 112, paragraph 6 does not apply. See Personalized Media Communns., L.L.C. v. ITC, 161 F.3d 696, 703-04 (Fed. Cir. 1998). This court has consistently held that "[m]eans-plus-function claiming applies only to purely functional limitations that do not provide the structure that performs the recited function." Phillips, 415 F.3d at 1311. Further, "[i]n considering whether a claim term recites sufficient structure to avoid application of section 112 P 6, we have not required the claim term to denote a specific structure. Instead, we have held that it is sufficient if the claim term is used in common parlance or by persons of skill in the pertinent art to designate structure, even if the term covers a broad class of structures and even if the term identifies the structures by their function." Lighting World, Inc. v. Birchwood Lighting, Inc., 382 F.3d 1354, 1359-60 (Fed. Cir. 2004).

The absence of "means" language in the disputed claim term "manipulator" entitles Bridgeview to a presumption that means-plus-function treatment does not apply. This presumption "is a strong one that is not readily overcome." Id. at 1358. Thus, this court looks to whether the term "manipulator" is one which does not recite "sufficiently definite structure." Id. The ordinary meaning of the term suggests that "manipulator" is a noun whose meaning connotes sufficient structure. "Manipulator" is not a generic structural term of the ilk of such placeholder terms as "mechanism," "device," or "element," whose meaning requires illumination from the specification. No doubt, the term "manipulator" does not conjure up any one specific structure. However, it does convey to one of skill in the art a certain genus of structures known as "manipulators."

Bridgeview presented evidence that practitioners within the mechanical arts field frequently use the term "manipulator" to define structure coupled with functions, pointing out several prior art device patents in which the term is used in claims without being coupled to the word "means." Tellingly, Duratech's own expert opined that "a manipulator performing nearly identical functions is shown in the prior art," implicitly evidencing his understanding of "manipulator" as a word whose meaning is not purely functional.

This court's precedent is clear that "the fact that a particular mechanism . . . is defined in functional terms is not sufficient to convert a claim element containing that term into a 'means for performing a specified function.'" Greenberg v. Ethicon Endo-Surgery, 91 F.3d 1580, 1582 (Fed. Cir. 1996). As this court noted in Greenberg, many devices take their names from the functions they perform, such as filters, brakes, locks, and clamps. Id. Similarly, simply because claim 1's "manipulator" takes its name from the verb "manipulate," this does not compel the application of § 112, paragraph 6.

This court also looked to dictionary definitions to discern whether a disputed term is recognized as a noun denoting structure. See Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996) ("Dictionary definitions make clear that the noun 'detent' denotes a type of device with a generally understood meaning in the mechanical arts, even though the definitions are expressed in functional terms."); Lighting World, 382 F.3d at 1361 ("Dictionary definitions in this case disclose that the term 'connector' has a reasonably well-understood meaning as a name for structure."). In the instant case, dictionaries readily identify that a "manipulator" falls into a specific category of structural devices. For example, Random House Unabridged Dictionary (1997) defines "manipulator" as a "mechanical device for the remote handling of objects or materials in conditions not permitting the immediate presence of workers." Further, Oxford English Dictionary (2008) defines the term generally as "a device used for or in the manipulation of something" and then provides auxiliary definitions for specific types of manipulators, including: "the transmitter of a dial telegraph," "device for massaging or pummelling the body of a bedridden person, as a substitute for exercise," "an instrument used to teach deaf people how to articulate sounds," and "a mechanical device for handling radioactive or hazardous material, operated by remote control from behind a protective shield." This court has clarified in Phillips that dictionaries often lack the specific context relevant to the legal and technical art of claim drafting and interpretation. See Phillips, 415 F.3d at 1321. With that limitation on dictionary usages in mind, this court notes that these particular definitions bolster the conclusion that "manipulator" is not a mere "nonce word or a verbal construct," Lighting World, 382 F.3d at 1360, but instead a noun connoting sufficient structure.
Duratech assigns great weight to many references in the specification in which the inventor describes "manipulation means," "means for manipulating," or a "support and manipulation mechanism." This, however, ignores the fact that the '104 patent uses the word "manipulator" numerous times in a manner that connotes structure. For example, "[a]ny number of manipulator rollers are possible, however, the disintegrator is located between and below two of the manipulator rollers," '104 patent, Col. 1, ll. 31-34; "Often, the result of this impeded rotation is that the teeth of the manipulator rollers tend to break the crop material bale apart . . ." Id., Col. 2, ll. 23-25; "the manipulator rollers 26 would continue to be rotatable in either direction, though clockwise would be their preferred direction of rotation," Id., Col. 6, ll. 22-24. These references in the specification further support a conclusion that this record does not contain enough evidence to rebut the strong presumption against means-plus-function treatment.

Duratech further argues that means-plus-function treatment is appropriate here since Bridgeview, during prosecution, added the functional language "for driving the crop material into the disintegrator” to claim 1’s "manipulator” in order to obtain allowance over the prior art. To the contrary, the '104 patent's prosecution history does not carry such a preclusive meaning. Bridgeview's arguments to the Patent Office in the amendment which added the functional language served only to distinguish the “disintegrator” and “discharge opening” elements of claim 1 from a prior art Canadian reference. Nowhere in the file history did Bridgeview argue that the addition of functional language to the manipulator claim element distinguished the '104 invention from the Canadian reference. This court does not see any reason to limit the meaning of "manipulator" based on an unrelated amendment.

Thus, this court finds nothing to rebut the strong presumption against the application of means-plus-function treatment to the "manipulator” claim term.

2467 In this case, Bridgeview seeks a construction of "manipulator" consistent with its ordinary meaning. The Court is of the view, however, that such an overly broad construction would not be helpful to a jury because it could encompass virtually any structure that would drive the crop material into the disintegrator. More importantly, such a construction would contradict any sensible reading of the specification. Boston Scientific Scimed, Inc. v. Cordis Corp., 554 F.3d 982, 987 (Fed. Cir. 2009) ("Courts may of course rely on dictionary definitions when construing claim terms, so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents.") (quoting Phillips v. AWH Corp., 415 F.3d 1303, 1322-23 (Fed. Cir. 2005)).

Viewing "manipulator" in light of the specification, it is clear the inventor sought to protect a more specific structure, namely, one with rollers. 1 Erbe Elektromedizin GmbH v. Int'l Trade Com'n, 566 F.3d 1028, No. 2008-1358, 2009 U.S. App. LEXIS 10634, 2009 WL 1377855, at *5 (Fed. Cir. May 19, 2009) ("We generally do not construe claim language to be inconsistent with the clear language of the specification; [u]sually, it is dispositive."). 2 The Federal Circuit recognized as much in its opinion, noting that "'[t]he manipulator has rotating rollers which turn the bale above a simultaneously rotating 'disintegrator.'" Duratech, 292 Fed. Appx. at 932. Accordingly, the Court construes "manipulator" to mean "a device that handles objects or materials with rollers." This definition is consistent with both the specification and the dictionary definitions set forth in the Federal Circuit opinion. Id. at 933-34. See Erbe, 2009 U.S. App. LEXIS 10634, 2009 WL 1377855, at *6 (construing "working" in a manner consistent with both the specification and general dictionary definitions).

--- Footnotes ---

1 See col. 3 ll. 1-13 ("the support and manipulation mechanism includes at least two manipulator rollers rotatably mounted inside the container . . . wherein at least one roller is located on each side of the flail roller . . . The cross-section of the manipulator rollers may be substantially square . . . The paddles are positioned . . . through the axis of the manipulator roller . . ."); col. 3 ll. 33-37 ("The support mechanism further includes a number of hoops mounted . . . substantially perpendicular to the . . . manipulator rollers."); col. 5 ll. 20-29 ("The manipulation means 24 comprises at least two rollers 26 rotatably mounted inside the container . . . Each roller 26 extends between the front wall 100 and the back wall 102 of the container 10. Each roller 26 is rotatable about its own longitudinal axis in either direction usually by a hydraulic motor 262, though electrical motors may also be used. A pair of rollers 26 . . . defines a disintegration opening 28 . . ."); col. 5 ll. 34-36 ("In addition to rotating the baled crop material, the rollers 26 define a support surface on which the crop material 12
is supported.); col. 6 ll. 22-23 ("In addition, the manipulator rollers 26 would continue to be rotatable in either
direction . . ."); col. 8 ll. 38-39 ("The crop material 12 is loaded into the container 10 onto the rollers 26 and the hoops 22.");
col. 8 ll. 41-42 ("In addition to supporting the crop material 12, the purpose of the rollers 26 is to rotate the crop material
12 . . ."); col. 8 ll. 53 ("As the rollers 26 rotate the baled crop material . . ."); col. 8 ll 66-67 ("In accordance with the present
invention, the manipulation means 24 which includes rollers 26 and walls 104 . . .").

2 Bridgeview correctly notes that Duratech's reliance on a Canadian court case involving a similar patent to the '104 is
misplaced. The analysis in that case, while interesting, is not controlling in this matter. However, in light of the
specification, the Court believes that "manipulator" in this case involves a structure with rollers.

GO BACK

B. Term 4: A manual actuator for adjusting the status of the electrical device (as used in claims 1 and 62).

Lutron contends that Term 4 means "A manual actuator, such as a button, knob, or touch screen element, for adjusting the
status of the electrical device." Control4 contends the term means "A manual actuator for adjusting the status of the
electrical device (which may include but is not limited to the on/off state, the intensity level, or both, of the electrical
device)." Lutron's definition focuses on defining a manual actuator, while Control4's definition focuses on defining status.
The distinction between this term and Term 3 is the use of the phrase "manual actuator" in place of "controllably conductive
device." Otherwise, they are the same.

The parties stipulated to the definition of a controllably conductive device. Thus, in Term 3, the Court focused on defining
the phrase "for adjusting the status of the electrical device." Because that phrase was defined in Term 3, focusing on the
definition of manual actuator in this claim is correct.

The claim does not define "manual actuator." The specification indicates the manual actuating device allows the user to
change the status of the electrical device, and an embodiment refers to a button when discussing the manual actuator. 18
While the embodiment provides this example, it would be inappropriate to import this limitation from the embodiment
because there is no evidence that Lutron intended to limit a manual actuator only to buttons. 19 Thus, other mechanisms,
such as a knob or touch screen sensor, fall within the meaning of "manual actuator." Providing such examples helps to
explain what constitutes a manual actuator.

--- Footnotes ---

18 '442 Patent, col. 23:62-63. The description of the drawings indicates that the "button" (meaning the actuator) is assigned
to a specific lighting control device. '442 Patent, col. 10:18-21. The detailed description of the embodiments speaks about
buttons in the context of how they are programmed to implement certain functions. '442 Patent, 16:64-67.

--- End Footnotes ---

Control4 argues, however, that a jury does not need any examples of what constitutes a manual actuator because the concept
is simple. Additionally, because Control4's device contains a touch screen, Control4 contends that including a touch screen
sensor as an example would be akin to granting Lutron summary judgment on this issue. Notably, Control4 does not refute
that a touch screen sensor is a manual actuator. It merely argues that it should not be included in the definition because its
device contains a touch screen. The Court is not persuaded that a "touch screen sensor" should be excluded from the
definition merely because Control4's device contains a touch screen. Because the use of examples does help explain what
constitutes a manual actuator, the Court concludes the meaning of the term is "A mechanism, such as a button, knob, or
touch screen sensor, for altering the condition of the electrical device."
GO BACK
D. Manual Application of Force

**Phrase:** to allow the [axial] removal of said [cylindrical] sleeve from said aperture of said body portion by the manual application of force

**Construction:** to allow the removal of the sleeve from the bit holder using a tool which may be hand-powered by a worker in field conditions to generate forces of approximately 5,000-20,000 pounds.

**Reasoning:** The parties disagree as to whether the removal forces are limited to those that are exactly between 5,000 and 20,000 pounds, or can include those that are "in the order of" 5,000 to 20,000 pounds. In this instance, the patentee has acted as his own lexicographer and has explicitly defined the term "Manual" to refer to "the use of a tool which may be hand-powered by a worker in field conditions to generate the forces in the order of 5,000 to 20,000 lbs. to remove the sleeve." Col. 3, Ins. 19-23. We must use this definition. This definition contradicts defendant's argument that the patents require removal forces to be exactly 5,000 and 20,000 pounds. Therefore, we reject defendant's proposed construction.

However, in order to inject further meaning into the disputed claim term, we must examine the phrase "in the order of." Although this phrase appears within the specific definition that the inventor gave to the term "Manual," the phrase is not itself redefined. Therefore, we will assign the ordinary and customary meaning to that phrase. Phillips, 415 F.3d at 1313; Merck & Co., 395 F.3d at 1370; Vitronics, 90 F.3d at 1582. As such, we find that "in the order of" shall mean approximately.

We cannot further assign exact values to what forces qualify as "approximately 5,000 and 20,000 pounds" because the factual record is insufficient on this issue. We will make that determination at a later time, on a fully developed factual record. Ortho-McNeil Pharm., Inc. v. Caraco Pharm. Laboratories, Ltd., 476 F.3d at 1321, 1324 (Fed. Cir. 2007). At that time, the court will give appropriate consideration to the principles discussed in Amhil Enters. v. Wawa, Inc., 81 F.3d 1554, 1562 (Fed. Cir. 1996).

At issue in this appeal is the proper construction of the manual valve element that is common to independent claims 1 and 15:

- a manual valve operatively associated with said cap, in fluid communication with said tube of filtering material and manually movable between a position defining means for allowing liquid flow through said tube and a position defining means not allowing liquid flow through said tube . . . .

The district court ultimately construed that limitation to require the following:

- a valve mechanism that controls the flow of water through the valve by moving to an open position allowing flow of water through the valve and moving to a closed position that restricts the flow of water from the bottle, but which encompasses neither valve 156 nor the valve of Figure 7 of the Magnusson '649 patent.

The district court's construction of the manual valve element is incorrect, because it impermissibly limits the literal scope of the claims to exclude bottles employing the valve depicted in Figure 7 of U.S. Patent No. 5,273,649 to Magnusson. There is no basis in the claim language or the prosecution history for so limiting the scope of the claims. The claim language reads on the Magnusson valve, and nothing in the prosecution history evinces a disclaimer of subject matter including that valve. Accordingly, it was improper for the district court to limit the scope of the manual valve element as it did. See, e.g., Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir. 1995).

Aladdin argues that the manual valve limitation is in means-plus-function form and that, under 35 U.S.C. § 112, P 6, its scope is limited to the particular structure disclosed in the specification and its equivalents. Even if Aladdin is correct in that
regard, the valve in its accused device is still within the literal scope of the manual valve limitation. The specification of the '759 patent recites valve structure that describes in detail a standard push-pull squeeze bottle valve. The valve described in Magnusson and depicted in Figure 7 of the Magnusson patent is clearly within the scope of the description of the standard push-pull valve in the '759 patent and is therefore within the literal scope of the manual valve limitation of the '759 patent, even if the scope of that limitation is restricted to the structure disclosed in the '759 patent. Aladdin has admitted that the valve in its accused device is identical to the valve of Magnusson Figure 7. Aladdin's valve is therefore within the literal scope of the manual valve limitation of the '759 patent. For that reason, the district court erred in basing its noninfringement ruling on the valve limitation of claims 1 and 15 of Innova's patent.

GO BACK

2471

2. "a manually operable charging member for moving the guide to the charged position against the urging of the coil spring"

Plaintiff argues that this term should be construed to mean "a manually operable charging member or mechanism that is used to create a charge or stored energy, the charging member or mechanism configured to move the guide to the charged position against the urging of the coil spring," MDTech's proposed construction is "a charging member operable by means of the hand for moving the guide to the charged position against the urging of the coil spring." The parties' primary disagreement about this term's construction is based on Plaintiff's inclusion of the word "mechanism." Indeed, both parties' proposed constructions add very little to the claim language, other than Plaintiff adding the word "mechanism" and MDTech making a point of excluding it.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

8 In its brief and at the Markman hearing, Plaintiff also objected to MDTech's use of the phrase "operable by means of the hand," arguing that the term implies that the device can be operated by only one hand, which Plaintiff states is a possibility, but not a limitation. At the Markman hearing, counsel for MDTech clarified that MDTech was not seeking to impose a one-handed limitation, and, therefore, this is no longer a point of contention. Because the Court believes that "manually" does not require a definition, it includes "manually" and not "by means of the hand" in its construction of this term.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - -

In regards to this dispute, the detailed description of the invention in the patent describes the safety cap as the element that is retracted in order to move the guide against the spring, thereby compressing the spring and putting the device in the charged position. The dispute in this case is whether the safety cap or other structure that is used to move the device into the charged position can be described as a "mechanism."

MDTech objects to the inclusion of the word "mechanism" because, according to MDTech, "member" and "mechanism" are not interchangeable terms, and including "mechanism" improperly broadens the scope of the claim beyond the easy-to-use invention these patents describe. MDTech points out that the word "mechanism" appears only twice in the specification and, in those instances, only to describe the more complicated prior art upon which the patent sought to improve. ("797 patent, col. 1, l. 62-67 (describing prior art as disclosing "a complicated biasing mechanism") and col. 3, l. 8-12 (explaining that known biopsy instruments "incorporate biasing mechanisms which are either complicated in construction or require undue force to operate"). In addition, MDTech argues that its position is supported by the dictionary definitions, which will be discussed below.

In support of its proposed construction, Plaintiff relies primarily on CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359 (Fed. Cir. 2002), in which the Federal Circuit held that the ordinary and customary meaning of the term "member" was not limited to a single component only but, instead, encompassed a multi-component structure. Plaintiff argues that, although both the Fig. 1 and Fig. 5 embodiments describe a "charging member" by reference to the safety cap, the absence of a multi-component "charging member" in the specification should not be used to narrow the ordinary and customary meaning of the term "member." In addition, counsel for Plaintiff argued at the Markman hearing that his argument was also supported by the fact that claim 5 of the '797 patent further defines the term "charging member" by including the following: "the charging member comprising a safety cap means for blocking inadvertent actuation of the release lever." ("797 patent, col. 12, l. 48-50.) Counsel argued that, under the doctrine of claim differentiation, this definition supports his argument that the "charging
As an initial matter, the defendant does not seek to limit the term member to a single component structure. At the hearing, the term "comprising" is contrasted with the term "consisting of" in general principles of claim construction. Elements may be added and still form a construct within the scope of the claim. Genentech, Inc. v. Chiron Corp., 112 F.3d 995, 501 (Fed. Cir. 1997). The term "comprising" is used in claim language which means that the named elements are essential, but other elements may be added and still form a construct within the scope of the claim. ID. at 1362-63. In that case, the accused infringing device contained a curved-bar with multiple components that served the same purpose of allowing the circular motion. ID. at 1364. In reversing the district court's construction of "member" as being limited only to a single-component structure, the Federal Circuit held that both the technical meaning and the ordinary and customary meaning of "member" encompassed a "beam-like structure that is a single unit in a larger whole." ID. at 1367.

As an initial matter, CCS Fitness involved a different patent and is, of course, not directly controlling in this case. In addition, the term "mechanism" does not appear anywhere in the Federal Circuit's opinion in CCS Fitness. Rather, the Court held that the term "member" encompassed a multi-component beam, lever, or structure. Significantly, the Court consistently referred to the beam, lever, or structure in the singular, i.e., a single structure that has multiple components. On the other hand, the term "mechanism" connotes a group of independent parts working together. Indeed, "mechanism" is defined as "a piece of machinery: a structure of working parts functioning together to produce an effect." Webster's Third New International Dictionary 1401 (1993); see also Mirriam-Webster Online Dictionary, www.m-w.com (defining "mechanism" as "a piece of machinery."). On the other hand, "member" is defined as "a constituent part of a whole, as . . . d(2): an essential part of a framed structure, a machine, or a device." Webster's Third New International Dictionary 1408 (1993); see also Mirriam-Webster Online Dictionary, www.m-w.com, (defining "member as "a part of a whole."). A mechanism, therefore, is not commonly understood to be simply a single part that has multiple components; a mechanism itself has multiple parts. Nor can "member" and "mechanism" be treated as synonymous, as Plaintiff seemingly attempts to do.

Based on the Court's reading of CCS Fitness, it concludes that the case does not support Plaintiff's proposed construction, and Plaintiff has not pointed to any other source that would support the interpretation of "member" as including the alternate meaning of "mechanism." Indeed, as MDTech argues, the specification actually counsels that, in defining "member," the Court should err on the side of simplicity rather than on the side of complexity. The only references to "mechanism" in the specification relate to prior art, are accompanied by the term "complicated," and are the very types of elements that Baran asserts he was attempting to remedy by making his invention more simple. Given that, and absent any other source to expand the meaning of "member" as it is used in claim 7, the Court cannot define "member" as including the alternate term "mechanism."

In addition, the argument Plaintiff raised at the Markman hearing based on the doctrine of claim differentiation does not convince the Court that it should add the words "or mechanism" to this claim language. According to Plaintiff, because claim 5 of the '797 patent further defines "charging member" as "comprising a safety cap means for blocking inadvertent actuation of the release lever," the term "charging member" in claim 7 cannot be limited to a single-component structure. Presumably, counsel for Plaintiff is contending that, because claim 5 employs the term "comprising," claim 5 describes a charging member that includes a safety cap but is not limited to just the safety cap. 9 According to Plaintiff, then, defining the term "member" in this case as only a single component renders the language in claim 5 further defining the "charging member" as comprising more than one element superfluous.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

9 "Comprising' is a term of art used in claim language which means that the named elements are essential, but other elements may be added and still form a construct within the scope of the claim." Genentech, Inc. v. Chiron Corp., 112 F.3d 495, 501 (Fed. Cir. 1997). The term "comprising" is contrasted with the term "consisting of" in general principles of claim construction. "Consisting of" generally is interpreted as including the subsequent elements listed, but no more and no less.

- - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - -

As an initial matter, the defendant does not seek to limit the term member to a single component structure. At the hearing,
counsel for MDTech said: "I'm not saying it has to be a single part. I mean, if it were two things welded together that moved in unison, I would consider that still a member." (Tr. at 89.) Rather, MDTech simply argues that Plaintiff's effort to expand "member" to include the far more complicated concept of a "mechanism" reaches too broadly, and effectively rewrites the claim.

Even if the Court were to resort to the doctrine of claim differentiation, moreover, its application would not compel the result Plaintiff espouses. Although claim differentiation can apply outside of the independent/dependent claim scenario, the Federal Circuit has "observe[d] that two considerations generally govern this claim construction tool when applied to two independent claims: (1) claim differentiation takes on relevance in the context of a claim construction that would render additional, or different, language in another independent claim superfluous; and (2) claim differentiation 'can not broaden claims beyond their correct scope.'" Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1381 (Fed. Cir. 2006) (citing Fantasy Sports Props v. Sportsline.com, 287 F.3d 1108, 1115-16 (Fed. Cir. 2002)). The Federal Circuit has characterized this doctrine more generally as "the presumption that each claim in a patent has a different scope." Id. at 1380 (quoting Versa Corp. v. Ag-Bag Int'l Ltd., 392 F.3d 1325, 1330 (Fed. Cir. 2004)). Further, the Court has described claim differentiation as a "narrow tool of claim construction." Id. at 1378.

In this case, the doctrine of claim differentiation simply does not compel the result Plaintiff espouses. Even if this Court construed "charging member" in claim 7 as including only a single component, it would not render the language in claim 5 superfluous. In that instance, such a construction would not limit the charging member in claim 7 to a component that includes a safety cap (the single component could be some other structure or part), even though claim 5 does require such a cap. As such, the language in claim 5 would not be superfluous. This Court, therefore, does not find that claim differentiation affects its analysis of this disputed language.

The Court notes, however, that, in finding that "member" does not encompass "mechanism," it only determines what "member" is not; it does not determine how it should be defined. For their part, the parties offer little guidance and, indeed, do not even attempt to define member. 10 Given that the parties do not seek to define "member," and that their sole dispute over this term is whether it could be defined to include "mechanism," the Court sees no need to further define this term. Accordingly, the Court construes "a manually operable charging member for moving the guide to the charged position against the urging of the coil spring" pursuant to Plaintiff's proposed construction, absent the term "mechanism," as follows: "a manually operable charging member that is used to create a charge or stored energy, the charging member configured to move the guide to the charged position against the urging of the coil spring."

--- Footnotes ---

10 As noted at the Markman hearing:

THE COURT: But, you don't even seek to define member, really, other than - what you seek to define is manually.

MS. THOMPSON (counsel for MDTech): No, I seek to define member only insofar as to exclude the expansion that Plaintiffs put on it.

(Tr. at 88.)

--- End Footnotes ---

2. "Manufactured To Have"

The district court construed the expression "manufactured to have" as used in claim 1 of the '831 patent to be "a manufacturing process utilizing woodworking techniques." Claim Construction Order, 2002 U.S. Dist. LEXIS 27501 at *16. The district court relied on statements in the '831 patent written description that "the advantages of the invention" were achieved through "cutting or milling and the like," 2002 U.S. Dist. LEXIS 27501 at *17. The district court found this statement in the written description, combined with its prior construction of the claim term "board" to be "construction
material made from wood cut from a log," to be tantamount to a redefinition of the scope of the claimed manufacturing process. 2002 U.S. Dist. LEXIS 27501 at *16.

Nystrom argues that for many of the same reasons the district court erred in construing the word "board," the district court's construction of the phrase "manufactured to have" is also in error. Further, he argues the district court's reliance on language in the written description mentioning "cutting or milling or the like" impermissibly reads a limitation from a preferred embodiment into the claim. TREX responds that the district court properly relied on the reference to "cutting or milling and the like" in restricting "manufactured to have" in all of the claims to solely woodworking techniques. TREX argues that the district court's construction makes sense because the '831 patent covers only wood materials.

In light of our construction of "board" as encompassing only materials made from wood cut from a log, we see no error in the district court's limitation of the phrase "manufactured to have" in claim 1 to woodworking techniques. The use of the phrase "manufactured to have" in reference to the top surface of the board is necessarily limited to manufacturing techniques related to wood. Thus, we affirm the district court's construction of "manufactured to have."

7. "MARKETING"

The term "marketing" appears in the 537 patent in independent claims 1, 9, 14 and 18 and claims 1 and 10 of the 728 patent. The 537 patent states the following in claim 1: "Marketing the special lock to the consumers in a manner that conveys to the consumers that the special lock will be subjected by the luggage screening entity to the special procedure. " With respect to "marketing" the language is identical in claims 9, 14, and 18 and substantially similar to the claim term "marketing" which also appears in the 728 patent.

Travel Sentry argues that neither the 537 nor the 728 patent specifications adequately describe what "marketing the special lock to consumers" means, rendering the term "marketing" indefinite and the claims, therefore, invalid under 35 U.S.C. § 112. 6 (Pl.'s Br. 15). Alternatively, Travel Sentry proposes that the Court construe the term 'marketing' as "offering for sale or selling" since, "at its core, marketing a product is about offering and selling that product." (Id. 17).

Contrarily, Tropp urges that "marketing" is a common term with a well-understood meaning, and that Travel Sentry's proposed construction limiting "marketing" to sales-related activities in unsupported by the patents' language. Tropp, consistent with this theme, advances a construction of "marketing" as "promoting the sales of the special locks by conveying to consumers that the special lock will be subjected by the luggage/baggage screening entity to a special screening procedure." 7

7 In support of this meaning, Tropp cites Webster's II New College Dictionary, "marketing" is defined as: 1) The act or process of buying and selling in a market. 2) The commercial functions involved in transferring goods from producer to consumer. 3) The act or business of promoting sales of a product, as by advertising or packaging. Webster's II New College Dictionary 686 (3d ed. 2005).
To reiterate, claim terms are to be given their ordinary and customary meaning unless it appears from the specification and prosecution history that they were used differently by the inventor. Phillips v. AWH Corp., 415 F.3d. 1303, 1312-13 (Fed. Cir. 2005). In some cases, the ordinary meaning of claim language may be readily apparent even to lay judges and claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood words. Id. However, if the ordinary meaning itself is disputed by the parties, and the meaning of the claim term as understood by persons of skill in the art is not readily apparent, then the Court must determine what claim scope is appropriate for that meaning in the context of the patents-in-suit. O2 Micro Intern. v. Beyond Innovation Tech., 521 F.3d 1351, 1361 (Fed. Cir. 2008). Here, both parties assert that their proffered definition of "marketing" is the understood and customary meaning of that term.

Against this harmonious backdrop, the claims, read in light of the specifications, support a broader reading of the term "marketing" than simply "offering for sale or selling"-- the definition espoused by Travel Sentry. Claim 1 in both patents states in relevant part that the invention comprises "[m]arketing the special lock to the consumers in a manner that conveys to the consumers that the special lock will be subjected by the luggage screening entity to the special procedure." This claim addresses promoting the availability of the special lock to allow for a consumer's understanding that an arrangement exists where the lock would be subject to a special procedure (i.e. one that avoids the clipping or other destruction of the lock and/or luggage by the luggage screener). Claim 3, which is dependent to claim 1, states that "a step of making available to consumers a special lock involving the special lock directly or indirectly to the consumers."

The specification to the 728 patent states that "[a]s a result of marketing the special lock to consumers or to airline travelers, the indicia conveys to luggage purchasers that the special lock is a lock that the luggage screening authority has agreed not to break". 728 patent, col. 4, 11. 24-28. The background of the invention and discussion of the prior art in both the 537 and 728 patents discuss inter alia, the plummeting of sales after TSA began clipping locks, 537 patent, col. 1, 11. 62-63; 728 patent, col. 2, 11. 9-10, and that the present invention would be valuable to prospective luggage purchasers or lock purchasers since the indicia would convey to luggage purchasers that the special lock is 'approved' by a luggage screening authority,"537 patent, col. 2, 11. 36-38, 728 patent, col. 60-66. Indeed, the focus of the patents is on the system or method or improving airline luggage inspection, not, simply, sale of the lock itself--a conclusion also supported by the patents' prosecution histories. Furthermore, Travel Sentry's own submissions in support of its proposed construction are consistent with a broader reading of "marketing", all of which evidences that the plain and ordinary meaning of "marketing" extends beyond the mere act of "offering for sale or selling." 8

8 In any event, even assuming that the Court should consider Travel Sentry's submitted definitions, they are unavailing since they are also consistent with a more expansive interpretation of "marketing" beyond "selling or offering for sale".

In short, the patent claims, read in light of the written descriptions, do not support limiting the ordinary meaning of "marketing" to "offering for sale or selling". See, e.g., Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1344-46, 1348 (Fed. Cir. 2001)(crediting the broader interpretation of a claim term's ordinary meaning when there was no indication in the intrinsic evidence that a more restrictive definition be adopted). Accordingly, the Court construes "marketing" within the context of the patents as "selling or promoting the sale" of the special lock to consumers in a manner that conveys to them that the lock is subject to a special screening procedure.

As might be expected in light of the foregoing, Travel Sentry's invalidity argument founded on the asserted indefiniteness of "marketing" is rejected. The definiteness requirement of § 112 ensures that the claims, as written, provide notice of the patent's scope so that the public can determine whether or not there is a danger of infringing the patent. See All Dental Prodx, Inc. v. Advantage Dental Prods., Inc., 309 F.3d 774, 779 (Fed. Cir. 2002). When a claim cannot be construed, it is indefinite and therefore invalid. Aero Prods. Int'l, Inc. v. Intex Recreation Corp., 466 F.3d 1000, 1016 (Fed. Cir. 2006). This includes instances where the claim language is so inherently standardless that it cannot be meaningfully applied. Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1354 (Fed Cir. 2005). An issued patent is presumed valid, 35 U.S.C. § 282, so the party attacking a claim term on validity grounds must overcome that presumption by clear and convincing evidence. Bancorp Servs., LLC v. Hartford Life Ins. Co., 359 F.3d 1367, 1371 (Fed. Cir. 2004). Even where a construction reached is one which reasonable persons can disagree, that claim is not indefinite. Id. If the claims read in light of the specification
reasonably apprise those skilled in the art of the scope of the invention, § 112 demands no more. Id. (citing Personalized Media Commc'ns, LLC v. Int'l Trade Comm'n, 161 F.3d 696, 705 (Fed. Cir. 1998).

Here, the claims and specifications sufficiently provide an appropriate understanding of "marketing". As demonstrated above, the claim term "marketing" is not so unamenable to construction that reasonable notice as to the scope of the claim is wanting. As a result, the Court concludes that Travel Sentry fails to meet its burden in proving by clear and convincing evidence that the term "marketing" is indefinite as to render the claim invalid under § 112.

GO BACK

2474

1. "Marking" and "Marked"

The claim language surrounding the use of the word "marking" supports the construction that "marking" and "marked" mean "placing an external visual symbol or identification code on the object (carrier or container)." The '415 patent requires "marking" a carrier with "an identification code," and the '670 patent requires "marking" a container and carrier with "a machine readable code." The plain claim language shows that "marking" and "marked" require an external (and visual) code because the dependent claims make clear that "marking" results in the placement of codes "on"—not "in" or "within"—the carrier and container. See Phillips, 415 F.3d at 1314 (context of disputed term, including use of other claim terms, is instructive in proper constructions).

For example, after the marking step, dependent claim 4 of the '415 patent recites "providing a sensor at each gate along the conveyor system for reading the identification code on a carrier . . . ." (Filing 64-3, Ex. C, '415 Patent, Claim 4 (emphasis added).) Likewise, dependent claim 2 of the '670 patent recites "inputting information into the computer database . . . including information as to . . . the code marked on the second container and the second carrier . . . ." (Filing 64-4, Ex. D, '670 Patent, Claim 2 (emphasis added).) Thus, "marking" plainly requires placing an external visual code "on" the carrier and container, as opposed to an internal (thus invisible) code in (or embedded within) the carrier and container.

Second, the court's construction is confirmed by the specifications of both patents, which state that after the carrier or container is "marked," the code appears "on" the object:

As carrier 26 moves along conveyor 24, it will pass within the zone of workstation 28 where a sensor 38 will detect the identification code on carrier 26.

(Filing 64-3, Ex. C, at 4:36-41; see also Filing 64-4, Ex. D, at 4:16-19 (same "on" language) (emphasis added).)

The specifications also confirm the court's construction because the patents' sole embodiment marks with a bar code, which is an external, visual code:

The inventor has found that a conventional bar code label applied to the specimen container is a simple and efficient method for fulfilling this function. . . . In the preferred embodiment of the invention, sensor 38 is a bar code reader while the identification code on the carrier 26 is a bar code.

(Filing 64-3, Ex. C, at 3:59-65, 4:36-41; Filing 64-4, Ex. D, at 3:41-43, 4:19-21 (same) (emphasis added).) While the fact that a patent describes a single embodiment does not mean the patent claims must be construed as being limited to that embodiment, the embodiment may inform the court regarding how a person of ordinary skill in the art would understand the claim terms, which is the issue upon which the court's focus should remain. Phillips, 415 F.3d at 1323.

The prosecution history also confirms that the patent examiner equated "marking" to "labelling" the carrier and containers, which implies that an external code is applied. (Filing 64-5, Ex. E, at SHD001435 (First Rejection) (examiner characterizing "marking" step as "labelling" both the specimen and container).) Likewise, the applicant argued that, unlike the claimed "marking" steps, in the prior art "[t]here is no teaching or suggestion to apply a label to a specimen container carried on the carrier, nor to automatically apply these labels to the separate units prior to placing the units on the conveyor system." (Id. at 1450 (First Amendment).)
The court's construction is further confirmed by the ordinary meaning of "mark." See Phillips, 415 F.3d at 1314 (claim construction can involve "little more than the application of the widely accepted meaning of commonly understood words," as supported by "general purpose dictionaries"). As a matter of common sense and experience, to "mark" something means to make a visible impression on the external surface of an object. This common understanding is confirmed by dictionary definitions of "mark" as a "visible impression on a surface" and "[a] visible trace or impression on something." (Ex. I-4, Webster's Desk Dictionary 278 (1993); Ex. I-2, The American Heritage Dictionary 417 (1989); see also Ex. I-3, Webster's II New College Dictionary (1995) (mark: "A visible trace or impression, as a spot, dent, or line . . . A visible sign or symbol, as a badge or brand . . . ").)

"Austempering" and "Marquenching"

The meanings of "austempering" and "marquenching," two metallurgical heat treating techniques, are jointly addressed to avoid repetition because the arguments with respect each term are similar and overlapping.

Claim 1 states:

A process for forming a rotary cutting blade, comprising the steps of

a) working a blank of boron steel to have a bevelled cutting edge; and

b) heat treating the formed blank to elevate the blank hardness to between 48 and 55 on the Rockwell Hardness Scale to thereby form a rotary cutting blade having Charpy Notch toughness of at least 15 ft. lb., wherein the heat treating step comprises austempering the formed blank.

(5:9-19.) (footnotes and emphasis added.)

Fisher-Barton relies upon the form of the definitions of "austempering" and "marquenching" in the American Society for Metals ("ASM") Metals Handbook ("Handbook I") (1964) and the ASM International Metal Handbook ("Handbook II") (1991) and the Turner Declaration. (Fisher-Barton Mem. Claim Construction ("Fisher-Barton Mem.") 4-5.) Fisher-Barton maintains that it may rely upon those definitions because the patent specifications use the terms consistently with the
Handbook I and II definitions. (Id. at 6.)

Turner avers that he owns a copy of the ASM International's Handbook II, which he has heard referred to as the "bible" of heat treating, he consults it regularly, and that when he drafted the patents he used the terms "austempering" and "marquenching" in a manner consistent with the Handbook II's definitions. (Turner Decl. PP 3-4.) Fisher-Barton proffers excerpts from the Handbook I and Handbook II which define the terms. (Turner Decl. P 4, Exs. A & B.) Handbook II defines the term "martempering" -- the patent uses the term "marquenching" -- but the two terms are used interchangeably in metallurgy. (Krauss Decl. P 8 n.1.)

Handbook II defines "austempering" as "the isothermal transformation of a ferrous alloy at a temperature below that of pearlite 4 formation and above that of martensite 5 formation." (Turner Decl., Ex. B at 3.) (footnotes added.) It further states that steel is austempered by being:

heated to a temperature within the austenizing range, usually 790 to 915 [degrees] C (1450 to 1675 [degrees] F); quenched in a bath maintained at a constant temperature, usually in the range of 260 to 400 [degrees] C (500 to 750 [degrees] F); allowed to transform isothermally to bainite 6 in this bath; and, cooled to room temperature.

(Id.) (footnote added).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
5 Martensite is a generic term for the microstructure formed by diffusion less phase transformation in which the parent and product phases have a specific crystallographic relationship. Id. at 462. "An important aspect of 'martempering' is that no transformation product other than martensite should form." Id. at 266.
6 Bainite is a transformation product that may form just above M[s]. See Id. at 267.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Handbook II defines "martempering" as:

an interrupted quench from the austenizing temperature of certain alloy, cast, tool and stainless steels. This purpose is to delay the cooling just above the martensitic transformation for a length of time to equalize the temperature throughout the piece. This will minimize the distortion, cracking, and residual stress. The term martempering is somewhat misleading and is better described as marquenching.

(Id. at 5.) The steps of "martempering" steel consist of:

quenching from the austenizing temperature into a hot fluid medium (hot oil, molten salt, molten metal or a fluidized particle bed) at a temperature usually above the martensite range (M[s] point); holding in the quenching medium until the temperature throughout the steel is substantially uniform; cooling (usually in the air) at a moderate rate to prevent large differences in temperature between the outside and the center of the section.

(Id.)

The Defendants, rely upon the patent specification, and assert that the terms "austempering" and "marquenching" have special meanings given to them by the patentee. (Defs.' Opening Br. 9-12.) The Defendants state that although the general processes of "austempering" and "marquenching" were known in the art several decades before the patents were filed, the inventions claimed in the patents-in-suit are the specific "austempering" and "marquenching" steps required by the claims to arrive at the boron steel blades with the claimed hardness and toughness characteristics. The Defendants indicate that Fisher-Barton's proffered definitions of the terms should be rejected because they fail to read the terms in light of the rest of the claim and the specification, completely disregard the express definitions ascribed those terms in the patents, and are
inconsistent with the process disclosed in the preferred embodiment. (Id. at 16.)

The Defendants rely upon the Declaration of George Krauss ("Krauss"), 7 a university emeritus professor of the Colorado School of Mines since 1997, who holds a Science Doctorate in Metallurgy and a Master of Science from Massachusetts Institute of Technology and has been involved exclusively in metallurgy and material science since 1955 when he received his Bachelor of Science from Lehigh University. (Krauss Decl. PP 1-2.) Krauss indicates that austempering of medium carbon boron steels has been well known for many years and that austempering in general is a method of transforming austenite to lower bainite - a particularly hard and tough steel microstructure in boron steels. (Id. at P 21.) He indicates that austempering, like marquenching begins with heating the work piece to the austenitizing temperature and cooling the steel to a temperature above the martensite (M[\text{s}]) range. (Id.) Krauss states that the quenching step differs from marquenching, because in the austempering the steel is held at the quench temperature for a particular duration long past the temperature equalization of the steel in order to allow the formation of lower bainite and not martensite. (Id.)

The Defendants maintain that this Court should construe the "austempering" as a heat treating process in which the blades are first heated to approximately 1560 [degrees] F.; the heated blades are then quenched into a liquid salt bath at approximately 500 [degrees] F. for about 20 minutes; the quenched blades are then withdrawn from the salt bath and allowed to air cool to room temperature. This alternative process eliminates the need for further tempering. The Defendants' definition is taken from the preferred embodiment.

The Defendants maintain that this Court should interpret "marquenching," as the process whereby the formed blades are first heated to approximately 1560 [degrees] F; the heated blades are then quenched into a liquid salt bath at approximately 5000 F. for about 20 seconds; the quenched blades are then withdrawn from the salt bath and allowed to air cool to room temperature; and, the cooled blades then proceed to a tempering station where they are tempered at 3000 F. as a stress relief. This definition is taken from the description of the preferred embodiment. (See 3:66-67 & 4:1-6.)

Krauss notes that claim 4 of the patent sets forth a process for achieving hardness in boron steel to "between 48 and 55 on the Rockwell Hardness scale" and a "Charpy Notch toughness of least 15 ft. lb., wherein the treating step comprises marquenching the formed blank." (Krauss Decl. P 10.) Krauss opines that a person skilled in the art would understand that because the process claimed seeks to arrive at a particular hardness and toughness in the boron steel, "marquenching" as used in claim 4 must refer to the process that includes particular times, temperatures and quenchants that are necessary to achieve those results from boron steel. (Id.) Krauss maintains that because marquenching is not defined in claim 4 a person of ordinary skill in the art would refer to the specification to determine what process is being claimed. (Id. at P 11.) Krauss also avers that a skilled heat treater reading the patent would not understand the term "marquenching" as used in claim 4 to have as broad a definition as advanced by Fisher-Barton. (Id. at P 14.) He states that Fisher-Barton's proposed definition does not provide for achieving the specific hardness and toughness for the boron steels expressly set forth in claim 4. (Id.) 8

8 Krauss also indicates that Fisher-Barton's "marquenching" definition is problematic because it does not include a tempering stage once the blades are cooled to room temperature and a person of ordinary skill in the art would realize that a blade that is quenched according the Fisher-Barton general definition, and then air cooled without a subsequent tempering step would be of low toughness such that it would not achieve the claimed Charpy Notch toughness of at least 15 ft. lbs. (Krauss Decl. P 16.) In its responsive claim construction memorandum, Fisher-Barton agrees to include in its definition of marquenching the step of an additional tempering after cooling. (Fisher-Barton Responsive Br. 9 n.2.) Therefore, the tempering issue raised by paragraphs 16 and 17 of the Krauss Declaration is moot.
Krauss avers that the M\([s]\) temperatures for the medium boron steels that are disclosed in the patent would be known to a skilled person, "for example by using the Andrews equation from his book, Steels: Heat Treatment and Processing Principles." (Id. P 15.) He states that the appropriate M\([s]\) temperatures are:

<table>
<thead>
<tr>
<th>Steel</th>
<th>M([s]) Temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td>10B36</td>
<td>687 [degrees] F.</td>
</tr>
<tr>
<td>10B37</td>
<td>673 [degrees] F.</td>
</tr>
<tr>
<td>10B38</td>
<td>671 [degrees] F.</td>

</tbody>
</table>

The Defendants' arguments regarding the meanings of "austempering" and "marquenching" have some initial appeal because they focus in part on intrinsic evidence, which is generally preferred over extrinsic evidence. However, Krauss's interpretation of the intrinsic evidence, upon which the Defendants rely, is extrinsic evidence. Krauss's construction of "marquenching" also centers on boron steel designations 10B36 through 10B42 but claim 4 provides for working a blank of boron steel blank but does not include designation of the boron steel type. (Compare claims 3, 7, 9 (5:21-24; 6:7-9; 6:26-28) ("wherein the blank is formed of a boron steel selected from the group consisting of 10B36, 10B37, 10B38, 10B39, 10B40, 10B41, and 10B42 steel.") Ultimately, careful consideration of the Defendants' position reveals that if accepted, the Court would be improperly importing the preferred embodiment into the claims. Furthermore, consideration of the terms in the context of the entire patent does not indicate that the patentee redefined the terms "austempering" and "marquenching." See Phillips, 415 F.3d at 1313. Therefore, the Court adopts Fisher-Barton's construction of the terms.

"Judges are free to consult dictionaries and technical treatises at any time in order to better understand the underlying technology and may also rely on dictionary definitions when construing claim terms, so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents." Phillips, 415 F.3d at 1322-23 (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1584 n.6 (Fed. Cir. 1996).) The Handbook II was the starting point for the Court in construing these metallurgical terms, which are familiar to a metallurgical lay person. But, the Court has carefully considered the intrinsic evidence -- the patent claims and the rest of the specification in its analysis.

Claim 1 uses the term "austempering" as a component of the heat treatment process claimed. Claim 4 uses "marquenching" as a component of the heat treatment process claimed. Neither claim defines the term. However, each term has a commonly accepted meaning known to one skilled in the art of metallurgy.

The proposed constructions of the terms urged by the Defendants is drawn from the preferred embodiment portion of the patent. 9 However, limitations from the specification are not to be read into the claims. See Golight, Inc. v. Wal-Mart Stores, Inc., 355 F.3d 1327, 1331 (Fed. Cir. 2004). This principle was reaffirmed in Phillips, 415 F.3d at 1323, where the court recognized that the distinction between using the specification to interpret the meaning of a claim and importing limitations from the specification into the claim can be a difficult one to apply in practice. Id. (citing Comark Commun. v. Harris Corp., 156 F.3d 1182, 1186-87 (Fed. Cir. 1998) ("there is sometimes a fine line between reading a claim in light of the specification, and reading a limitation into the claim from the specification.")) However, the line between construing terms and importing limitations can be discerned with reasonable certainty and predictability if the Court's focus remains on understanding how a person of ordinary skill in the art would understand the claim terms. Id. "Although the specification often describes very specific embodiments of the invention, [the court] repeatedly warned against confining the claims to
those embodiments," and had "expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment." Id.

9 The description of the preferred embodiment states, in pertinent part:

In one advantageous heat treating process, known as Marquenching, the formed blades are first heated to approximately 1560 [degrees] F. The heated blades are then quenched into a liquid salt bath at approximately 500 [degrees] F. for about 20 seconds. The quenched blades are then withdrawn from the salt bath and allowed to air cool to room temperature. The cooled blades then proceed to a tempering station 36 where they are tempered at 300 [degrees] degrees F. as a stress relief.

Alternatively, the formed and edged blade may be subjected to an austempering heat treating process in which the blades are first heated to approximately 1560 [degrees] F. The heated blades are then quenched into a liquid salt bath at approximately 500 [degrees] F. for about 20 minutes. The quenched blades are then withdrawn from the salt bath and allowed to air cool to room temperature. This alternative process eliminates the need for further tempering.

(3:66-67; 4:1-14.)

3. As used in claim 4 of the '114 patent "marquenching" means: Quenching from the austenizing temperature into a hot fluid medium (hot oil, molten salt, molten metal or a fluidized particle bed) at a temperature usually above the martensite range (M[s] range); holding in the quenching medium until the temperature throughout the steel is substantially uniform; cooling (usually in the air) at a moderate rate to prevent large differences in temperature between the outside and the center of the section. After the parts have been cooled to room temperature, they are tempered in the same manner as though they had been conventionally quenched.

11 Included among Wedgewood's summary judgment materials are the declaration of its proffered expert, Dr. Aldrich. (D.E.
27, Ex. A.) In his declaration, Aldrich expressly acknowledges that "the term mass region is not commonly used to describe structures within a golf club." (Id., Ex. A P 19.) Given this express recognition, the Court does not understand Wedgewood's passing footnote reference to the dictionary definitions of "mass" and "bulk" (see D.E. 26 at 7 n.6) to be the heart of its argument concerning the proper construction of the term "mass region." Moreover, as Nike points out, the related interrogatory-based proposed definition of Wedgewood (i.e., that the mass region is the "bulk area of a club head, located behind the striking surface") is materially defective and unworkable in that it is too vague and provides too little notice to the public regarding the scope of the patent claims. See D.E. 23 at 18. In any event, Wedgewood makes no serious attempt to advance or defend this vague definition, and the Court accordingly analyzes the term "mass region" in light of Wedgewood's more substantive arguments, which are based on the intrinsic record and which comprise the overwhelming majority of its presentation on this issue.

Nike argues that "mass region" should be construed to mean 'the portion of the golf club head that is behind the striking surface." (D.E. 23 at 18.) Plaintiff maintains that this construction is erroneous, since it relies on language in the specification that "identifies where the mass region is located--not what it is." (D.E. 26 at 8.) Furthermore, Plaintiff asserts, Nike's definition would vitiate the "lip" limitation, since, according to Wedgewood, the lip is adjacent to the striking surface, positioned between the striking surface and the top of the mass region. (Id.) Wedgewood proposes the following construction for the mass region: "the body of a wood-type club head extending above the median and below the top edge of said striking surface, delimited by a sole plate, a sole, a striking surface, a heel region, a toe region, a rear edge, a single and substantially continuous top side and a lip." (Id. at 7.) Nike objects, maintaining, among other things, that the phrases "single and substantially continuous topside" and "median" are "pulled . . . out of thin air." (D.E. 30 at 15.)

The disagreements between the parties as to the construction of mass region, therefore, include the following issues: whether (1) the mass region is simply "behind" the striking surface (without regard for the lip), (2) the topside of the mass region is necessarily "single and substantially continuous," and (3) the mass region is comprised of a region that is located above a "median" on the striking surface of the club.

i. Words of the Claims

Although the claims frequently refer to the "mass region," they do little to define it. Many parts of the club are described around the mass region—e.g., the club head's center of gravity is described as being "between the bottom edge of the striking surface and the rear edge of the top side of the mass region" (D.E. 20, Ex. A, Col. 8:23-27); the sole plate extends "from a bottom edge of the striking surface to a rear edge of said mass region" (id., Ex. A, Col. 6:59-60)—but the mass region itself remains undefined, at least in any single unified place. 12 Given the lack of any clearcut or comprehensive definition in the claims, the Court examines the specification and the prosecution history for further guidance.

12 As explained further below, the claims do provide meaningful guidance, at least on some issues. For example, the claims state that the "striking surface [of the club] extends above a top side of said mass region to form a lip extending between the striking surface and the top side of the mass region." D.E. 20, Ex. A, Col. 6:55-58 (emphasis added); accord id., Ex. C, Col. 6:57-58. This language makes clear that the top of the mass region under this patent cannot, at a minimum, extend beyond the top of the striking surface, at least in any contact area. The claims also state that "the height of said lip . . . is the vertical distance between the top edge of said striking surface and the top side of said mass region, [and] is between about 1/8 inch and about 1/2 inch." Id., Ex. A, Col. 7:3-6; accord id., Ex. C, Col. 7:11-13. This claims language indicates that if there is to be a lip, it must reach or span from an extended striking surface down to the mass region at any contact area.

ii. Specification

The specification contains many references to the mass region, and both parties rely heavily on them. At one point, as Nike notes, Plaintiff's specification states that "the mass region is provided behind the club head striking surface." (D.E. 20, Ex. A, Col. 4:66-67.) However, the specification goes on to explain that the mass region "is connected to the striking surface at
a lip extending between the two adjacent to the top edge of the striking surface. The top side of the mass region slopes downward linearly from the lip to the rear edge of the mass region." (Id., Ex. A, Col. 4:67-5:4.) Moreover, as explained above (see note 12, supra), the claims state that the "striking surface [of the club] extends above a top side of said mass region to form a lip extending between the striking surface and the top side of the mass region" (D.E. 20, Ex. A, Col. 6:55-58) (emphasis added), and further state that "the height of said lip . . . is the vertical distance between the top edge of said striking surface and the top side of said mass region, [and] is between about 1/8 inch and about 1/2 inch." (Id., Ex. A, Col. 7:3-6; accord id., Ex. C, Col. 6:57-58, Col. 7:11-13). This language also indicates that any lip must reach from an extended striking surface down to the mass region, and that the lip is not part of the mass region itself. All of this evidence indicates that Nike's assertion that the mass region is "behind" the striking surface, while true, is not sufficiently precise; more specificity is required, lest the placement of the lip be completely discounted and the lip limitation disregarded.

The specification also states that the mass region's lowest point is demarcated by its "sole plate" and "sole" (Id., Ex. A, Col. 2:61-62)), at its rear by its "rear edge" (Id., Ex. A, Col. 5:52-54) and on its top by a "top side"(Id., Ex. A, Col. 5:21-24). The pertinent drawings also indicate that the mass region is, generally, the body of a wood-type club head. (Id. at 2, 3).

There is nothing explicit in the specification, however, that mentions a "single and substantially continuous" topside or a "median" on the club face. Rather, these terms come from (as Plaintiff cites) the drawings of the club in the patent. The Court is reluctant to add the descriptive phrase "single and substantially continuous" to describe the topside simply based on the drawings. In its specification, Plaintiff saw fit to add the phrase "substantially flat" to describe the face on the striking surface of the golf club. (Id., Col. 3:35-36.) Wedgewood made sure to specifically define "substantially flat" as "lacks a bulge and roll sufficient to cause a gear effect." (Id., Col. 3:6-8.) In the paragraphs immediately preceding the discussion of the club's flat face, Plaintiff discussed the top side of the mass region with no explanatory phrases. Having recognized in the specification the significance of a portion of the club that is "substantially flat," it stands to reason that Wedgewood would have thought to include the phrase "substantially continuous" to describe the topside of the mass region if it indeed was necessary to do so. See Medinol Ltd. v. Boston Scientific Corp., 346 F. Supp. 2d 575, 598 (S.D.N.Y. 2004) (recognizing the validity of the canon of construction, expressio unius est exclusio alterius, in a discussion about the meaning of the term in patented items); accord, e.g., Świerkiewicz v. Sorema, N.A., 534 U.S. 506, 513, 152 L. Ed. 2d 1, 122 S. Ct. 992 (2002) (applying the expressio unius canon). The first meaningful representation or assertion that the top side of the mass region was "single and substantially continuous" appeared over six years after Plaintiff filed the patent, in its memorandum in opposition to Defendant's motion for summary judgment. The inclusion of this phrase appears to denote a conscious attempt to improperly reshape the scope of the patent. The Court respectfully refuses to adopt the "singular and substantially continuous" language. See also Intervet Am., Inc. v. Kee-Vet Labs., Inc., 887 F.2d at 1053 (limitations inferable from embodiments shown in patent drawings or specifications, but omitted from claims, are not to be read into claims).

Similarly, although the specification refers to the club head's vertical center of gravity as below the "median distance" between the top edge and bottom edge of the striking surface, it does not mention that a "median" point or region exists in or on the club. Conceivably, to a layman, the "median" could be interpreted to mean the club's midpoint, but that cannot be the case here. The "midpoint" is referred to specifically in both the specifications and the drawings. The "median," however, is not. As neither party has indicated where this point is or what its significance is, and since the patent does not provide any information to suggest that a "median" limitation exists within the four corners of the patent, the Court will not read one in.

iii. Prosecution History

As with the "sole" limitation, neither party points to any portion of the prosecution history to indicate that it would be helpful in construing the patentee's use of the disputed term. The Court's own analysis finds that the prosecution history does not provide anything more than what is in the final patent. Consequently, the prosecution history is of no help in construing the meaning of the "mass region."

Based on its analysis, the Court will construe the term "mass region" in the Wedgewood patent as "the body of a wood-type club head delimited by a sole plate, including the sole; a striking surface, though no higher than its top edge; a top side; a rear edge; a heel region; and a toe region." The Court further construes the term to recognize that a lip will reach or span from an extended striking surface down to a mass region. See D.E. 20, Ex. A, Col. 7:3-6 ("the height of said lip . . . is the vertical distance between the top edge of said striking surface and the top side of said mass region, [and] is between about 1/8 inch and about 1/2 inch."); accord id., Ex. C, Col. 7:11-13 (same); see also id., Ex. A, Col. 6:55-56 (the "striking surface [of the club] extends above a top side of said mass region to form a lip. . . .) Ex. C, Col. 6:57-58 (same).
2. "Master Cylinder Housing"

Formula proposes that this term be construed as meaning a cylinder housing with a first and second end that encloses the piston train assembly and that is connected to the reservoir housing. According to Formula, the reservoir housing and the master cylinder housing are two separate functional components. However, as was the case for several other disputed claim terms, Formula's interpretation impermissibly attempts to import limitations found in descriptions of preferred embodiments to limit the overall scope of the invention. See Phillips, 415 F.3d at 1323. Accordingly, we construe this claim as referring to the housing that contains the master cylinder, regardless of what other components may be included within or connected to that housing.

1."MASTER KEY"

The term "master key" appears in both the 537 and the 728 patents. Claim 1 of the 537 patent claims, in relevant part, a method of improving airline luggage screening comprising: "making available to consumers a special lock having a combination lock portion and a master key lock portion, the master key lock portion for receiving a master key that can open the master key lock portion of this special lock…" Claim 1 of the 728 patent claims, in relevant part, a method of improving carrier baggage inspection comprising: "making available to consumers a special lock, having a combination lock portion and having a master key lock portion, the master key lock portion for receiving a master key that can open the master key lock portion of this special lock…"

Tropp's construction of "master key" is a simple one. He suggests that "master key" is "a key that can open multiple locks," citing the American Heritage College Dictionary, which defines the term "master key" as "[a] key that opens each of a given set of locks." (Def.'s Ex. 5). Travel Sentry's proposed construction of the same term is a "single key or electronic sensor mechanism having the ability to open a dedicated key lock portion of multiple different locks."

In advancing this definition, Travel Sentry argues that there are "no material differences" between the two constructions, but for the inclusion of electronic sensor mechanisms. Tropp disagrees. Specifically, he objects to limiting "master key" to a "single key" since the written description allows for multiple master keys to be held by baggage screening officials, and because "the significant characteristic of a master key is that it can open each of a given set of locks - not whether there is a single key or multiple keys that have that capability." (Def.'s Reply Br. 7). Tropp also argues against Travel Sentry's use of "dedicated" and the insertion of "electronic sensor mechanism" in construing "master key" since the term "key" already embodies and contemplates electronic keys and the word "dedicated" is unsupported by the patents' claims.

The Court agrees with Tropp that "master key" does not require the word "single" to make the construction clear, and accordingly, the Court declines to read this limitation into the proposed construction of "master key". On the other hand, the ordinary meaning of "master key," does not make clear that its definition includes electronic or other sensor mechanisms, as the claim language, the surrounding claims, and the specifications suggest. In any event, and critically, the patents' written descriptions clearly teach that the definition of "master key," as it is used in the patents, extends beyond its centuries-laden description, i.e. a metal, jagged edge object, by contemplating electronic and other sensor mechanisms within the scope of the term. See Genzyme Corp. v. Transkaryotic Therapies Inc., 346 F.3d 1094, 1098 (Fed Cir. 2003)(a patentee can expand the scope of the term's generally understood meaning in the context of his claims). The specifications to the 728 and 537 patents state that "the terms 'master key' and 'master key lock portion' are broad terms intended to also include electronic or other sensor mechanisms for opening up the master key lock portion in [the special lock]" and that the "invention contemplates using in certain embodiments a special lock [] that makes use of an electronic sensor instead of a traditional physical key even though such a traditional physical key is typically understood by the term 'master key'. In such a case the locking mechanism inside [the] special lock [] would not be a traditional master key lock mechanism but rather would be a locking mechanism that is opened by an electronic sensor." 537 patent, col.5, 11.41-52; 728 patent, col. 6, 11. 66-67, col. 7,
11. 1-10 (emphasis added). In urging the Court to incorporate "electronic sensor mechanism" in its proposed construction, Travel Sentry similarly points to this same language, contrasting it with the term's plain meaning, which, as evidenced by a dictionary definition, has described "master key" as "a key designed to open several different locks". Merriam-Webster's Collegiate Dictionary 764 (11th ed. 2006).

While it is clear that the specifications expand the ordinary and plain meaning of "master key to include electronic and other sensor mechanisms, see Phillips, 415 F.3d at 1316 ("the specification may reveal a special definition given to a claim term by the patentee that differs from the meaning it would otherwise possess...in such cases, the inventor's lexicography governs."), limiting "master key" to "a single key or electronic sensor mechanism" appears overly restrictive since the patent clearly contemplates other kinds of mechanisms that may also qualify as a "master key", and, as the specifications to both patents teach-- "master key" is meant to be broadly construed.

Travel Sentry's argument that the key lock portion is "dedicated" is also unduly limiting in light of the specifications of the patents-in-suit. In describing the interaction of the master key with the master key lock portion of the special lock, the specifications state that when an electronic or other sensor mechanism is used to open up the master key lock portion of the special lock, that locking mechanism would not be a traditional master key lock mechanism but a locking mechanism opened by an electronic sensor. The language of the claims does not support a limitation that the locking mechanism or master key lock portion, electronic or otherwise, be "dedicated". When a patent's specification does not provide for the proffered restriction stated in the proposed construction, that limitation should not be then read into the claim terms. Teleflex, Inc. v. Ficosa North Am. Corp., 299 F.3d 1313, 1327(2002)(claim terms take their ordinary and accustomed meanings unless the patentee shows an intent to deviate from them, or by using words of manifest exclusion or restriction, clearly disavows a claim's scope). Indeed, under a fair reading of the specifications to both patents, it is contemplated that sensor mechanisms would not have a dedicated key lock portion. Instead, the patents' written descriptions focus on the interaction between the "master key" (in its traditional physical incarnation or otherwise) and the locking mechanism, which may include (but is not limited to) a dedicated key lock portion.

Therefore, in light of the patents' written descriptions, the Court construes the claim term "master key" in the 728 and 537 patents to be a key, including electronic or other sensor mechanisms, that can open the master key lock portion or locking mechanisms of the special locks described in the patent.

C. Claim Construction Analysis

The Court turns first to the question of claim construction. Plaintiffs contend that the Accused Posters infringe on Claims 1 and 5 of the 272 Patent. As previously noted, a plaintiff alleging patent infringement must prove that the accused product contains elements identical or equivalent to each and every claimed element of the patented invention. Warner-Jenkinson, 520 U.S. at 40. It is undisputed that the Accused Posters have many of the same attributes claimed in the 272 Patent: (1) they consist of a poster made of one material and a housing unit made of another material; (2) the speaker, along with an electric circuit, is concealed between the housing unit and the poster; and (3) a trigger, actuated through the housing unit, is attached to the electric circuit. The parties disagree, however, about whether the Accused Posters satisfy the final element of Claims 1 and 5.

Claim 1 includes:

An assembly . . . wherein a surface of said housing is prepared with a matching art which is substantially the same as that area of said poster art which appears on said portion of said poster that said housing covers when said housing is attached to said poster, such that said housing artistically blends in with the surrounding poster art that is not covered by said housing.

(Ex. J. to Third Am. Compl.). Likewise, Claim 5 of the 272 Patent refers to:

A method for making a talking poster, comprising the steps of . . . applying matching art to said housing which is substantially the same as that area of said poster art which appears on said portion of said poster that said housing covers when said housing is attached to said poster, such that said housing artistically blends in with the surrounding poster art that
is not covered by said housing.

(伊d.).

Plaintiffs construe this element to mean only that the color of the housing must complement the colors used in the poster so that the housing "artistically blends in with the surrounding poster art" and forms a "harmonious visual effect." Plaintiffs then submit the declaration of their expert witness, Ellen Shapiro, who opines that the housing on the Accused Posters "artistically blends in" with the color schemes of the Accused Posters, thereby satisfying this final element.

Defendants, however, maintain that this element is considerably more narrow. They argue that it is not enough that the color of the housing unit complements the color scheme of the poster. Rather, the housing unit must be "camouflaged" because the plain language of the claim requires that the housing unit be prepared with "matching art which is substantially the same as that area of said poster art which appears on said portion of said poster that said housing covers when said housing is attached to said poster." (伊d.) (emphasis added).

1. Language of Patent Claim

"The starting point for any claim construction must be the claims themselves." Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999) (citing Vitronics, 90 F.3d at 1582). In construing the language of a patent claim, all words defining the scope of the invention must be given effect. Bicon, Inc. v. Straumann Co., 441 F.3d 945, 950 (Fed. Cir. 2006) ("claims are interpreted with an eye toward giving effect to all terms in the claim"); Merck & Co., Inc. v. Teva Pharms. USA, Inc., 395 F.3d 1364, 1372 (Fed. Cir. 2005) ("A claim construction that gives meaning to all the terms of the claim is preferred over one that does not do so.").

Here, Claims 1 and 5 both require the surface of the housing unit to be prepared with a "matching art" which is "substantially the same as that area of said poster art which appears on said portion of said poster that said housing covers when said housing is attached to said poster, such that said housing artistically blends in with the surrounding poster art that is not covered by said housing."

Plaintiffs urge the Court to focus solely on the last phrase, which reads "such that said housing artistically blends in with the surrounding poster art that is not covered by said housing." They argue that because the colors of the housing units on the Accused Posters match certain colors used elsewhere in the posters, the housing units "artistically blend in," creating a harmonious visual effect, and therefore satisfy this element.

Plaintiffs' interpretation obviously ignores the remainder of the claim that requires that the artwork on the surface of the housing be "substantially the same as that area of said poster art which appears on said portion of said poster that said housing covers when said housing is attached to said poster." As Defendants correctly note, Plaintiffs' interpretation completely reads this key limitation out of the claims. Such a result cannot be condoned. See Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 93 F.3d 1572, 1582-83 (Fed. Cir. 1996) (refusing to read a limitation out of the claim).

When Claims 1 and 5 are read as a whole, and when all of the words defining the scope of the invention are given effect, these claims unambiguously require that the artwork on the surface of the housing be substantially the same as the artwork on that portion of the poster directly underneath the housing. The practical effect of this limitation is that the housing unit is camouflaged. Only under these circumstances can it be said that the housing is prepared with "matching art" such that it "artistically blends in with the surrounding poster art that is not covered by said housing."

2. Specification

The patent claims must also be read in view of the specification, that portion of the patent document which describes the invention "in such full, clear, concise, and exact terms as to enable any person skilled in the art . . . to make and use the same." 35 U.S.C. § 112; Markman, 517 U.S. at 384. The court examines the specification "to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning. The specification acts as a dictionary when it expressly defines terms used in the claims or when it defines terms by implication." Vitronics, 90 F.3d at 1582. In this case, nothing in the specification expressly defines the terms "matching art," "substantially the same," or "artistically blends in." Nor is there any indication that these terms are to be interpreted in a specialized, technical sense.
Plaintiffs note that the section entitled "Background and Summary of the Invention" describes the invention as "a talking poster that projects a recorded sound using a device that is attached to the poster with material that is painted to match the color scheme of the poster art." (Ex. J to Third Am. Compl.) (emphasis added). Admittedly, this introductory statement is broad enough to encompass Plaintiffs' interpretation of Claims 1 and 5. 4 Nevertheless, as discussed above, this interpretation is completely inconsistent with the claim language itself. As the Federal Circuit noted in Markman v, Westview Instruments, Inc., "[t]he written description part of the specification itself does not delimit the right to exclude. That is the function and purpose of the claims." 52 F.3d at 967, 980 (Fed. Cir. 1995). See also Environmental Instruments, Inc. v. Sutron Corp., 877 F.2d 1561, 1564 (Fed. Cir. 1989) ("[t]he claims alone delimit the right to exclude; only they may be infringed."). Because it is contrary to the claims themselves, this introductory statement may not be considered in determining the proper scope of the 272 Patent.

4 The Court notes that this same introductory statement also appeared in Plaintiffs' initial patent application. Even though the language of the claims was revised, this statement was not.

The specification also includes a "Preferred Embodiment" of the invention. It states that "[t]he invention uniquely provides the poster with the sound equipment without interfering with the artwork on the poster." (Ex. J to Third Am. Compl.) (emphasis added). Figure 4, a cutaway view of the preferred embodiment, indicates that the housing "may not be visible on the poster except on close inspection." Id. (emphasis added). An example for constructing a preferred embodiment describes how the housing

may be lithographed using a multi-color process printing technology to match the poster artwork. When finished, the material piece will artistically fit onto the poster, without any disruption in the poster artwork. In other words, the material piece will have the exact coloring and artwork on it, as would the space on the poster board where the piece resides, if the material piece was not present.

Id. (emphasis added).

Examples of the preferred embodiment are attached as Exhibit K to Plaintiffs' Third Amended Complaint. On one of those Talking Posters, depicting the group NSync, the housing unit is placed on the bottom right corner of the poster, over the top of Justin Timberlake's left foot. The housing unit is lithographed to match Timberlake's pants and shoe so that the poster artwork is not interrupted by the housing unit. In another Talking Poster, depicting entertainer Ricky Martin, the housing unit is camouflaged, being printed with the same purple-and-white checkered background that covers the rest of the poster. In this respect, the examples of the preferred embodiment are entirely consistent with the plain language of the claims.

In contrast to these examples, the Accused Posters do not have camouflaged housing units. Instead, each Accused Poster has a housing unit consisting of a solid color bar running the entire width of the bottom of the poster. Although the color of the housing unit generally complements the color scheme used in the poster, clearly the housing unit is not covered with artwork that is substantially the same as the poster artwork directly underneath it. See Ex. 1 toDefs.' Supp. Mem.

Plaintiffs correctly note that the Accused Posters "must be compared to the claims rather than to a preferred or commercial embodiment." Amgen Inc. v. Hoechst Marion Roussel, Inc... 314 F.3d 1313, 1347 (Fed. Cir. 2003). Plaintiffs accuse Defendants of importing claim limitations from the specification contained in the 272 Patent. As a general rule, the scope of the invention is not limited by the specification. See Phillips v. AWH Corp., 415 F.3d 1303, 1323 (Fed. Cir. 2005); JVW Enterprises, Inc. v. Interact Accessories, Inc., 424 F.3d 1324, 1335 (Fed. Cir. 2005) (holding that it is generally improper to limit claim language to the specific embodiment disclosed in the written description). The 272 Patent specifically states that "[t]he scope of the invention is not to be considered limited by the above disclosure, and modifications are possible without departing from the spirit of the invention . . ." (Ex. J to Third Am. Compl.).

Ordinarily, the patent claims will be broader than the preferred embodiment. Phillips, 415 F.3d at 1323. In such a case, the fact that the accused product differs from the preferred embodiment would not necessarily foreclose a finding of
infringement. In this case, however, the claim language and the preferred embodiment appear to be equal in scope. Properly construed, the claims are coextensive with the preferred embodiment as described in the 272 Patent. Both require that the housing be camouflaged.

3. Prosecution History

In addition to considering the plain language of the claims and the specifications, the Court may also consider the prosecution history of the 272 Patent. In this case, the prosecution history supports Defendants' interpretation of the claims. When Plaintiff Clark first submitted his patent application, the relevant portion of Claim 1 consisted of "a blister pack attached to said poster, wherein said blister pack . . . matches the artwork of the poster to which it is attached." (Ex. 5 to Kinsel Decl.). This claim, along with all others, was rejected as being "unpatentable over Hoshi (U.S. Patent No. 4,934,079)." (Ex. 5 to Kinsel Decl.). With respect to Claim 1, the examiner noted that "[t]he claimed blister pack matching the art work of the poster lacks criticality because the housing in Hoshi would still serve the same function as a housing for the electrical components." (Id.). Claim 8 of the original patent application, dealing with a method for making Talking Posters, included "printing a portion of the artwork on said poster on blister pack material." (Id.). The examiner rejected this claim as well, noting that although this claim was not met by Hoshi, it still lacked criticality for the same reasons given for rejecting Claim 1. (Id.).

In response to the rejection, Plaintiff Clark submitted amendments and remarks. Attempting to distinguish his invention from Hoshi's, he noted that Hoshi's poster and the display device containing the speakers were two separate pieces, whereas Plaintiff's invention consisted of one piece, allowing "artwork to be placed on the blister pack by lithograph color technology, for example, so that the electronic circuitry and sound emanating means under the housing is 'camouflaged' in the poster presentation." (Id.). He further noted that "the sound module housing can be printed with artwork so as to visually blend in with the actual artwork of the poster, and effectively hide the sound module so as not to disturb or interrupt the visual flow of the poster." (Id.). 5

5 The Court rejects Plaintiffs' attempt to now distance themselves from these statements. They argue that the use of the word "camouflaged" merely meant that the housing artwork could be used to render the functional components of the electronic circuitry and speakers less conspicuous by using housing that "artistically blends in" with the color scheme of the poster. As the Court has already held, this interpretation is clearly contrary to the plain language of the claims.

An interview was then held with patent examiner. The examiner's hand written note indicates that Clark agreed "to add limitation to the claim such that the blister pack is printed so that it blends in with the artwork at the area where the blister pack is attached to." (Id.). Accordingly, Clark amended his claims to include the language currently at issue, i.e., "wherein a surface of said housing is prepared with a matching art which is substantially the same as that area of said poster art which appears on said portion of said poster that said housing covers when said housing is attached to said poster, such that said housing artistically blends in with the surrounding poster art that is not covered by said housing." This amendment resulted in a narrowing of the scope of the invention. Whereas the original patent application required only that the blister pack "matches the artwork of the poster," the patent, as issued, requires the blister pack to be prepared with artwork that is "substantially the same" as the portion of the poster it covers.

4. Extrinsic Evidence

To summarize, an examination of the intrinsic evidence of record, i.e., the language of the claims, the specification, and the prosecution history, leads the Court to conclude that the claims at issue, as properly construed, unambiguously require the housing to be prepared with artwork that is substantially identical to the artwork on the area of the poster it covers so that the housing is, in effect, camouflaged and the visual flow of the poster art is not interrupted.

Because there are no remaining ambiguities, it would be improper for the Court to consult the extrinsic evidence submitted by the parties, including dictionary definitions and the declaration of Ellen Shapiro, submitted by Plaintiffs in support of their memorandum in opposition. Therefore, Defendants' motion to strike Shapiro's declaration is granted. 6
6 Even if the Court found that extrinsic evidence would be helpful in construing the claims, Shapiro's declaration is lacking in several respects. Shapiro is a graphic designer who concluded that because the housing units on the Accused Posters "artistically blend in" with the colors used in the posters and form a "harmonious visual effect," the Accused Posters infringe on Claims 1 and 5 of the 272 Patent. (Shapiro Decl. PP 12-13, 16). In the context of patent infringement cases, the Federal Circuit has held that "a court should discount any expert testimony 'that is clearly at odds with the claim construction mandated by the claims themselves, the written description, and the prosecution history, in other words, with the written record of the patent.' Key Pharms., 161 F.3d at 716." Phillips v. AWH Corp., 415 F.3d 1303, 1318 (Fed. Cir. 2005). Shapiro's declaration falls squarely within this category. Her interpretation of the claim language, like that of Plaintiffs, completely ignores the key limitation that requires that the housing unit be prepared with "matching art which is substantially the same as that area of said poster art which appears on said portion of said poster that said housing covers when said housing is attached to said poster."

2480

a. The Claim Term "Mate"

The court concurs with defendants that the proper construction of the claim term "mate" must include the following limitations: (1) a close confinement of the protrusion within the inset(s) of one or more blocks; (2) an ability to secure the blocks in place; and (3) an interlocking of the protrusion with the insets. This special limited meaning of "mate" is appropriate given the term's ordinary meaning as it appears in a general definition dictionary, the use to which "mate" is subjected throughout the specifications and the prosecution history.

--- Footnotes ---

6 The court also agrees with defendants' assertion that the meaning of the claim term "mate" includes the ability to restrict the movement of the block in a forwards and backwards direction. However, such a limitation is subsumed within the ability to secure the blocks in place. This limitation is not discrete enough to warrant addressing it separately. The court thus adopts this special limited meaning as part of the ability to secure the blocks in place.

--- End Footnotes ---

Dictionaries, which are a form of extrinsic evidence, hold a special place and may sometimes be considered along with the intrinsic evidence in construing claims. See Cybor Corp. v. FAS Tech., Inc., 138 F.3d 1448, 1459 (Fed. Cir. 1998); see also Vanguard Prod. Corp. v. Parker Hannifin Corp., 234 F.3d 1370, 1372 (Fed. Cir. 2000) ("a dictionary is often useful to aid the court in determining the correct meaning to be ascribed to a term as it was used"). According to Merriam-Webster's New Collegiate Dictionary 716 (10th ed. 1998), the term "mate" ordinarily means "to join or fit together." The patent applicant chose the term "mate" to describe the interrelationship of the protrusion and insets in separate blocks stacked upon each other. "Mate" necessarily implies two things joining together to create one.

It is true that dictionary definitions often may not represent the meaning of a claim term to one of ordinary skill in the art, and that the court should not manufacture such a technical meaning from an ordinary one. "Courts must exercise caution lest dictionary definitions, usually the least controversial source of extrinsic evidence, be converted into technical terms of art having legal, not linguistic, significance." Multiform Dessicants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1478 (Fed. Cir. 1998). It is also true that dictionary definitions, which are extrinsic evidence, must not be used to contradict the meaning of claim terms maintained throughout the specification. See Pitney Bowes v. Hewlett-Packard Co., 182 F.3d 1298, 1309 (Fed. Cir. 1999) (holding that Vitronics "warned courts not to rely on extrinsic evidence in claim construction to contradict the meaning of claims discernible from thoughtful examination of the claims, the written description, and the prosecution history -- the intrinsic evidence.")
Here, the dictionary definition of "mate" presents none of these problems. It is not inconsistent with the meaning of the term to one skilled in the art. Nor does it contradict the meaning of "mate" apparent from the specifications. Rather, the ordinary meaning of "mate" invites the special limited meanings put forth in the specifications.

i. Close Confinement

The specifications of the '363, '183, and '129 patents state that "the area of the inset adjacent the block bottom surface 8 should be approximately the same areas as, or only slightly larger than, protrusion 26 with which it will mate." ('183 Patent, col. 4, ln. 38-41.) The oversize of the inset with respect to the protrusion provides the block with setback capability of 1/8 to 3/4 inch. ('183 Patent, col. 4, ln. 52-57.) The court is satisfied that the qualitative description, i.e. "only slightly larger than" (emphasis added), and quantitative measure provided, 1/8 to 3/4 inch, are together sufficient to attach a connotation of close confinement to "mate." 7

7 The qualitative description emphasizes the relative closeness of confinement. The word "slightly" is sufficient on its own to impart the idea. Still, the specification adds "only" to intensify the meaning of "slightly." The quantitative measure, 1/8 to 3/4 inch, further reinforces the adoption of a special limited meaning. On a given block measuring almost 12 inches from front to back, 1/8 to 3/4 inch suggests relative close confinement. Even on a non-relative scale, 1/8 to 3/4 inch is small.

Plaintiff attempts to rebut defendants' argument that "mate" is limited to close confinement by offering the context from which this limitation is taken. However, the context fails to serve this end. The specification expressly says: "… the area of the insets adjacent the block top surface 10 is preferably larger than the protrusion 26 by a factor of 5% or more and preferably about 1% to 2% or more." ('183 patent, col. 4, lines 41-44.) This language only reinforces the conclusion that "mate" means close confinement. An inset that is larger than the protrusion it holds by a factor of 5 percent must be seen as closely confining that protrusion. 8

8 Plaintiff also argues that the prosecution history of the original patent application (U.S. Patent Application S.N. 07/957,598) prevents the court from attaching a special limited meaning to "mate." An examination of the prosecution history is particularly important where, as in the instant case, the claimed invention is in a crowded art. See Amhil Enter. Ltd. v. Wawa, Inc., 81 F.3d 1554, 1559-62 (Fed. Cir. 1996). Allegedly, claim 25 of that patent reads, "the block of claim 1 wherein the area of each inset adjacent said block bottom surface is larger than the area of said protrusion." This claim was allowed. Plaintiff argues, therefore, that "mate" can be no less broad than the above phrase, "larger than the area of said protrusion." This argument fails. The comparative phrase, "larger than the area of said protrusion" is too vague. "Larger than" could mean that the inset is larger than the protrusion it holds by a factor of 5% or 500%. The court is not prepared to grant the claim such a broad scope in an old and crowded art because doing so would probably invalidate the patent.

ii. Ability to Secure Blocks in Place

It is well established that:

the prosecution history of a patent contains: 'all express representations made by or on behalf of the applicant to the examiner to induce a patent grant. … Such representations include amendments to the claims and arguments made to convince the examiner that the claimed invention meets the statutory requirements of novelty, utility, and nonobviousness. Thus, the prosecution history (or file wrapper) limits the interpretation of claims so as to exclude any interpretation that may have been disclaimed or disavowed during prosecution in order to obtain claim allowance.'

When multiple patents derive from the same initial application, the prosecution history regarding a claim limitation in any patent that has issued applies with equal force to subsequently issued patents that contain the same claim limitation. See Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 980 (Fed. Cir. 1999)(citing Jonsson, 903 F.2d at 817-818).

During prosecution of the common parent application to the '363, '183, and '129 patents Anchor argued that its claimed block is distinguishable over prior art references because the claimed insets are for mating with a protrusion of a second similarly configured block and that the prior art "references require some form of additional engagement structure … to secure each of the blocks in place." (See Skaar Aff., Ex. 7 at 11 (emphasis added).) The distinction argued by Anchor compels the court's adoption of a special limited meaning for the term "mate." Here, the prosecution history is compelling. The specifications state that the protrusion functions in concert with sidewall insets 22A and 22B to secure the blocks in place when positioned in a series or together by aligning the protrusions 26 within the given insets. ('183 Patent, col. 5, ins. 1-4 (emphasis added).) The claim term "mate" thus requires the ability to secure the blocks in place.

9 Plaintiff argues that the prosecution history is not controlling because the invention was distinguished from the prior art, not for its ability to secure the blocks in place, but rather because of the fact that the prior art had pins. That is, the prior art was distinguished for physical differences, not for different functions. Plaintiff is correct that, while the differences in the way the patented invention and accused device function certainly are relevant to a doctrine of equivalents analysis, these considerations are not legally relevant to whether a device falls within the literal language of the asserted claim, which is the question before the court. Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1278 (Fed. Cir. 1995).

iii. Interlocking of Protrusion with the Insets

The specifications attach "interlocking" to the meaning of "mate" because they use the words interchangeably. The specifications state, "the use of the dogbone shaped protrusion 26 allows for retention of these blocks in an interlocking fashion with the blocks of lower courses to form a wall of high structural integrity." ('183 Patent, col. 6, ins. 21-24 (emphasis added).) The court finds that this substitution of the term "interlocking" for what would be "mating" has two effects.

First, it raises a presumption that the patent applicant intended to create a special limited meaning for the claim term "mate." The claim itself uses the term "mate" to describe the function of the protrusion with respect to the insets. This excerpted part of each specification describes the very same function. Yet, here the patent prosecutor uses a different word, "interlocking." This variation in diction between two phrases designed to impart the same idea invites the meaning of "interlocking" into the claim term "mate."

Second, this interchange strengthens the connection of the other special limited meanings discussed supra with the term "mate." The term "interlocking" is highly suggestive of "close confinement" and the "ability to secure in place."

10 "Interlocking" is probably more suggestive of these connotations than "mate" itself, the term for which it is substituted synonymously. The adjective "interlocking" has its root in the verb "interlock," which is derived from "lock." According to Merriam-Webster Collegiate Dictionary 684 (10th ed. 1998), the term "lock" means "to make or become rigidly fixed or immovable." The court is satisfied that the interchange of "interlocking" with "mate" supports the adoption of the other special limited meanings of "mate."
The court chooses not to accord the extrinsic evidence marshaled by the plaintiff any weight in its analysis of the claim term "mate." Rockwood's technical literature is offered to provide the view of one skilled in the art. The court acknowledges that such evidence may properly serve this purpose. However, the court will not examine a brochure for the accused device in order to construe the claims of Anchor's patents when the meaning of the claims is clear from the intrinsic evidence. The expert testimony of Mr. Strawbridge is rejected for the same reason. It is the claim language of the patent that the public may rely upon for notice. See London v. Carson Pirie Scott & Co., 946 F.2d 1534, 1538 (Fed. Cir. 1991) ("if the public comes to believe (or fear) that the language of patent claims can never be relied on … then claims will cease to serve their intended purpose … competitors will never know whether their actions infringe a granted patent.")

The claims of the '363 patent family require that the protrusion be "configured to mate with an inset of one or more adjacent blocks." See, e.g., '183 patent, col. 16, ll. 20-33 (emphasis added). The district court construed "mate" to require the following three limitations: "(1) a close confinement of the protrusion within the inset(s) of one or more blocks; (2) an ability to secure the blocks in place in a forwards and backwards direction; and (3) an interlocking of the protrusion with the insets." Anchor, 252 F. Supp. 2d. at 844-45. Anchor does not dispute the district court's third limitation that "mate" is interchangeable with "interlock" in the patent specification. However, we hold that the first and second limitations of the district court's construction of "mate" are erroneous.

The ordinary meaning of "mate," as the district court found, is "to join or fit together." Id. at 845 (citing Merriam-Webster's New Collegiate Dictionary 716). Contrary to the district court's narrow construction, the written description does not define "mate" as requiring "a close confinement of the protrusion within the inset(s) of one or more blocks." Id. at 844. In describing one preferred design, the written description only states that the area of the inset "should be"--not must be--"approximately the same area as, or only slightly larger than, protrusion 26 with which it will mate." '363 patent, col. 4, ll. 37-40. The written description makes quite clear that the open-ended examples of "mating" are merely illustrative; that is, they do not exhaustively delineate the scope of the term "mate" whose ordinary meaning is clear from the claims. Id. at col. 4, ll. 35-38 ("The area of the insets adjacent the block to surface 10 is preferably larger than the protrusion 26 by a factor of 5% or more and preferably about 1% to 2% or more." (emphases added)). Moreover, the general rule, of course, is that claims of a patent are not limited to the preferred embodiment, unless by their own language. See, e.g., Va. Panel, 133 F.3d at 866. That the term "mate" is used in a nonlimiting way in the written description with respect to preferred degrees of confinement is simply not "a special and particular definition created by the patent applicant," Renishaw, 158 F.3d at 1249, and is thus an insufficient reason to limit the scope of "mate" to require close confinement.

Furthermore, the prosecution history does not attribute a special meaning to the term "mate" as requiring an ability to secure the blocks in place in a forwards and backwards direction. Anchor, 252 F. Supp. 2d at 844-46. During prosecution of the common parent application of the '363 patent family, the applicant distinguished features of its invention over prior art by admitting that the insets "(1) extend into side surfaces of the blocks and (2) are for mating with a protrusion from a second, similarly configured block." The applicant also argued during prosecution that the prior art "references require some form of additional engagement structure (i.e., pins in Forsberg, and mortar in Italy 709,599) to secure each of the blocks in place" (emphasis in original). As these statements show, the patentee did not clearly and unmistakably relinquish any claim to a block in which the "mating" does not include the district court's functional limitation of restricting the movement of the block in a forwards and backwards direction. Omega, 2003 WL 21517751, at *9 ("For prosecution disclaimer to attach, our precedent requires that the alleged disavowing actions or statements made during prosecution be both clear and unmistakable."). Rather, the applicant's statements distinguish the prior art primarily in structural terms by emphasizing that the invention of the '363 patent family does not require an additional engagement structure such as pins or mortar to secure the blocks in place. We therefore do not consider the applicant's remarks to be a clear and unmistakable disavowal of claim scope as required to depart from the ordinary meaning of the term provided by the specification and therefore hold that the proper construction of "mate" is to join or fit together.
IV. "mated for engagement"

Claim 1 of the ’783 Patent provides:

said center link tang portions configured to nest between the sprocket teeth and further configured with a bottom tang portion mated for engagement with the rounded bottoms in said gullets.

(disputed term emphasized).

Defendants contend "bottom tang portion mated for engagement with the rounded bottoms in said gullets" should be construed to mean "[t]he tang portion contacts the rounded bottom of the gullets over the entire radiused portion when the chain is entrained on the nose sprocket." As noted, the Court has found a radiused shape is not required by Claim 1 of the ’783 Patent.

Defendants’ proposed construction is not permissible because it is more limited than the specification. The specification provides the nose sprocket "receives the drive tang portion of the saw chain substantially along the entire semi-circular gullet formation." ’783 Patent col.5 ll.8-10. The word "substantially" demonstrates the patentee did not intend to limit the invention by requiring that the gullet formation contact the entire rounded bottom portion of the tang as Defendants contend.

Plaintiffs contend "bottom tang portion mated for engagement with the rounded bottoms in said gullets" should be construed to mean "[t]he tang portion is adapted to transmit operational forces to the bottom of the gullet." Here, however, Plaintiffs’ definition is not specific enough. As noted, the specification provides the nose sprocket "receives the drive tang portion of the saw chain substantially along the entire semi-circular gullet formation." ’783 Patent col.5 ll.8-10. This receiving means the drive tang contacts the gullet formation in a substantial manner. Plaintiffs’ proposed definition is too broad, however, because it might encompass some manner of adaptation that results in the transmission of operational forces to the bottom of the gullet in some way other than by substantial contact between the gullet bottom and the tang portion.

On this record, the Court construes the term "bottom tang portion mated for engagement with the rounded bottoms in said gullets" to mean that "the tang portion is adapted to contact the gullet formation substantially along the rounded bottom region of the gullet to transmit operational forces to the bottom of the gullet."

This construction is faithful to the text and construction of Claim 1 and is not subject to the over- or under-inclusiveness of the parties’ respective definitions.

A

The first issue we must decide is the meaning of "material for finishing." Since that phrase appears in the preamble of claim 4, we must first ask whether "material for finishing" is a claim limitation at all. Whether a statement of intent in a preamble should limit a claim is an inquiry we undertake on a case-by-case basis. As we have previously stated:

No litmus test can be given with respect to when the introductory words of a claim, the preamble, constitute a statement of purpose for a device or are, in themselves, additional structural limitations of a claim. To say that a preamble is a limitation if it gives 'meaning to the claim' may merely state the problem rather than lead one to the answer. The effect preamble language should be given can be resolved only on review of the entirety of the patent to gain an understanding of what the inventors actually invented and intended to encompass by the claim.

Here, the '514 specification makes clear that the disclosed invention is a material and method for applying "a replaceable finish of uniform thickness onto a floor." '514 patent, col. 1, lines 67-68 (emphasis added). Furthermore, during prosecution of the '514 patent and its parents, the applicant amended what subsequently became the preamble of claim 4 several times to avoid prior art. Specifically, the applicant added the term "refinishing," which was later changed to "finishing," and argued to the examiner that "finishing" a bowling lane is patentably distinct from replacing the top of a bowling lane with a thick laminate material. Thus, based on the entirety of the '514 patent and its prosecution history, we conclude that the district court correctly read "material for finishing" as a claim limitation.

Having determined that "material for finishing" is a claim limitation, we must now decide what that limitation means. We begin, as we must, with the language of the claim itself. Terms in the claim are to be given their ordinary and accustomed meaning, within the context of the claim, unless a different meaning is clearly set forth in the written description or the prosecution history. See Johnson Worldwide Assoc., Inc. v. Zebco Corp., 175 F.3d 985, 989, 50 U.S.P.Q.2D (BNA) 1607, 1610 (Fed. Cir. 1999); Renishaw, 158 F.3d at 1249, 48 U.S.P.Q.2D (BNA) at 1121.

The text of claim 4 leaves little ambiguity as to the meaning of "material"—namely, at least one elongated sheet of a uniform flexible film of clear plastic having a thickness between about one and about twenty-five mils. What remains in dispute is the precise meaning of the phrase "for finishing." In the context of claim 4, "finishing" clearly refers to providing a clear, uniform layer on the top surface of a floor. Significantly, there is no indication in claim 4 as to what level of durability, if any, the "finish" layer must have. Thus, claim 4 implies a broad meaning for the term "finishing," which is consistent with the dictionary definition of "finish." See, e.g., Webster's Ninth New Collegiate Dictionary 464 (1984) (defining "finish" as "the final treatment or coating of a surface," but not identifying any specific properties).

The district court construed "material for finishing" to mean "a material that makes more durable the underlying surface of the floor." We have held that, absent a clear indication in the specification to the contrary, it is improper for a court to add a narrowing characteristic to an otherwise general term that stands unmodified in a claim. See Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 621-22, 34 U.S.P.Q.2D (BNA) 1816, 1821 (Fed. Cir. 1995). Thus, we now look to the specification of the '514 patent to determine whether the applicant gave a meaning to "finishing" that would require an element of durability to be read into claim 4. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1577 (Fed. Cir. 1996) ("It is always necessary to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning.").

The specification of the '514 patent contains numerous instances of the words "finish" and "finishing." Most refer to the material of the invention itself; e.g., "the flexible sheet finishing material of the present invention." '514 patent, col. 3, lines 56-57 (emphasis added). However, the applicant also used "finish" or "finishing" to refer to various other materials. For instance, the applicant noted that wooden playing floors "are finished with clear varnish or urethane applied in liquid form." Id., col. 1, lines 22-23 (emphasis added). Also, the applicant explained that, to facilitate sliding movement on bowling lanes, "a very light oil finish" could be applied to the surface. Id., col. 3, line 43 (emphasis added). Finally, the applicant described the use of his invention on "floors of wood, terrazzo, marble, or other smooth finish material." Id., col. 4, line 40-41 (emphasis added). In sum, the applicant's use of the words "finish" and "finishing" are consistent with the ordinary meaning of those terms--namely, a general reference to the top coat, layer or surface on a floor, whether it be varnish, oil, marble, or terrazzo.

3M argues that the '514 specification touts improved durability from the outset and that "material for finishing" must therefore be construed to mean a material that enhances durability. We disagree. Although the specification describes the invention as providing both durability and wear resistance, this does not necessarily mean that durability must be read into claim 4 as a limitation.

The '514 specification recites several objects of the disclosed invention. Some of these pertain to improved durability, but others contain no reference to durability whatsoever. See '514 patent, col. 1, line 62 - col. 2, line 12. The specification alternates between touting the improved durability of the invention and other characteristics that do not involve durability (e.g., simplicity of application, uniformity of thickness, etc.). Thus, there is nothing in the specification that requires "durable" to be read into claim 4 as a modifier of "finishing." See Renishaw, 158 F.3d at 1249, 48 U.S.P.Q.2D (BNA) at 1121 ("Where a specification does not require a limitation, that limitation should not be read from the specification into the claims." (citations omitted)).
In addition to considering the language of the claim and the specification, we may also look to the prosecution history of the patent, where relevant, to determine the proper meaning of claim limitations. See Vitronics, 90 F.3d at 1582-83, 39 U.S.P.Q.2D (BNA) at 1577. 3M argues that the prosecution history of the '514 patent and its parent applications sheds light on the meaning of "material for finishing."

During prosecution of the '428 application (one of the parents of the '514 patent), the applicant was forced to overcome U.S. Patent No. 4,221,620, issued to Milne. The Milne patent discloses the use of 1/8-inch thick flexible panels to "refinish" a bowling lane. The applicant sought to distinguish his invention from that of Milne on the basis that the present invention utilizes a finish film, rather than a 1/8-inch thick panel. To that end, the applicant explained to the examiner, in an Amendment After Final Rejection, dated July 6, 1988, that his invention "essentially duplicates the characteristics of a conventional liquid varnish." 3M asserts that this argument was made in an attempt to distinguish the claimed invention from the prior art on the basis of enhanced durability. According to 3M, the prosecution history requires that "durability" be read into the claim as a limitation. We disagree.

In making this statement, the applicant was clearly not referring to durability as a distinguishing characteristic. Indeed, the 1/8-inch thick panels taught by Milne are themselves quite durable and, thus, durability would not have been a distinguishing characteristic of the claimed invention. Instead, in equating his invention with varnish, the applicant was apparently referring to varnish's characteristic of providing a protective coating without transforming the physical and aesthetic properties of the underlying floor. See Amendment After Final Rejection at 6 ("Being only a finish film, [the claimed invention] does not change the physical characteristics of the wood floor . . . . By contrast, the one-eighth inch thick floor covering materials described by MILNE can modify the physical characteristics, such as resilience and hardness, of a wood bowling lane."). It was this characteristic--preserving the physical attributes of the underlying floor--that successfully distinguished the applicant's invention from that of Milne.

Having reviewed the language of claim 4, the specification of the '514 patent, and the relevant prosecution history, we conclude that the district court erred in reading "material for finishing" to require an element of durability. We recognize, as did the district court, that some degree of protection will be afforded by any type of floor covering, whether it be varnish, plastic, or marble. Middleton's claimed product provides some degree of protection, which varies depending on the thickness of the sheet (1 - 25 mils). Likewise, 3M's FloorMinders provides some degree of protection to the underlying floor. However, to the extent that the court drew a distinction between FloorMinders and the claimed invention on the basis of "durability," we must disagree. Durability is simply not a limitation of claim 4.

A.

With respect to the "material for finishing the top surface of the floor" limitation, Suitco contends that the Board should have been bound by this court's earlier construction of "material for finishing." In the alternative, Suitco contends that the Board's adopted construction is unreasonable. This court need not address Suitco's first argument because even under the broadest-construction rubric, the PTO's construction is unreasonable.

The express language of the claims requires a "material for finishing the top surface of the floor." '514 patent col.7 ll.67-68 (emphases added). A material cannot be finishing any surface unless it is the final layer on that surface. Otherwise, the material would not be "finishing" the surface in any meaningful sense of the word.

The PTO's proffered construction ignores this reality by allowing the finishing material to fall anywhere above the surface being finished regardless of whether it actually "finishes" the surface. Indeed, according to the PTO, the finishing surface need only be "structurally suitable for placement on the top surface of the floor"--i.e., several layers can be placed on top of the "finishing" layer. If the PTO's construction were accepted, a prior art reference with carpet on top of wood, on top of tile, on top of concrete, on top of a thin adhesive plastic sheet anticipates the claims in question because an adhesive plastic sheet falls at some point in the chain of layers. This construction does not reasonably reflect the plain language and disclosure of the '514 patent.
Although the PTO emphasizes that it was required to give all "claims their broadest reasonable construction" particularly with respect to claim 4's use of the open-ended term "comprising," see Genentech, Inc. v. Chiron Corp., 112 F.3d 495, 501 (Fed. Cir. 1997) ("the open-ended term comprising . . . means that the named elements are essential, but other elements may be added"), this court has instructed that any such construction be "consistent with the specification, . . . and that claim language should be read in light of the specification as it would be interpreted by one of ordinary skill in the art." In re Bond, 910 F.2d 831, 833 (Fed. Cir. 1990) (quoting In re Sneed, 710 F.2d 1544, 1548 (Fed. Cir. 1983)) (emphasis added).

The PTO's construction here, though certainly broad, is unreasonably broad. The broadest-construction rubric coupled with the term "comprising" does not give the PTO an unfettered license to interpret claims to embrace anything remotely related to the claimed invention. Rather, claims should always be read in light of the specification and teachings in the underlying patent. See Schriber-Schroth Co. v. Cleveland Trust Co., 311 U.S. 211, 217, 61 S. Ct. 235, 85 L. Ed. 132, 1941 Dec. Comm'r Pat. 802 (1940) ("The claims of a patent are always to be read or interpreted in light of its specifications."). In that vein, the express language of the claim and the specification require the finishing material to be the top and final layer on the surface being finished. See, e.g., '514 patent, col.1 ll.15-20 ("The present invention is directed generally to a material and method for quickly and easily producing a transparent wear resistant finish on a smooth flat surface subject to wear and more particularly to a material and method for finishing a floor . . . ."). The PTO's proffered construction therefore fails.

When read in the appropriate context of the claim language and specification, the broadest reasonable construction is clear: the phrase "material for finishing the top surface of the floor" refers to a clear, uniform layer on the top surface of a floor that is the final treatment or coating of a surface. It is not any intermediate, temporary, or transitional layer. Because the PTO based its rejection on its unreasonable construction, this court remands with instructions to conduct a new invalidity analysis using the appropriate construction.

2485

Finally, Digital Angel argues that the term "material having characteristics equivalent to glass" viewed in the context of the claim as a whole and the specification, means "the material must be capable of preventing leakage of an amount of fluid that would be sufficient to cause failure of the claimed device for a period of at least two months." 7 Pl.'s Markman Br. at 26. Digital Angel further argues that the term inherently includes five additional criteria directed toward the reliable functioning of the transponder: the material must (1) be inert in tissue, (2) be not toxic, (3) be sufficiently impermeable to water and water vapor to protect the electronic circuitry, (4) have sufficient mechanical properties to protect the device during syringe implantation, and (5) be able to encapsulate the components of the claimed device without damaging them. Id. at 26-27. Digital Angel contends glass is merely a preferred material, and nothing in the prosecution history shows a "clear and unmistakable surrender" of non-glass encapsulating materials. In contrast, Defendants define "material having characteristics equivalent to glass" as "glass." Joint Claim Constr. Statement, App. A at 4, 12, 16. Defendants again rely on prosecution history and judicial estoppel arguments to support their contention that the encapsulating material of the '129 patent can be made only of glass. Defendants also assert an indefiniteness argument.

7 In the Joint Claim Construction Statement, Digital Angel avers that "material having characteristics equivalent to glass" means "having characteristics of low water vapor permeability which prevent leakage into the transponder." App. A at 4, 12, 16.

Judicial estoppel is a discretionary, equitable doctrine "that prevents a litigant from perverting the judicial process by, after urging and prevailing on a particular position in one litigation, urging a contrary position in a subsequent proceeding -- or at a later phase of the same proceeding -- against one who relied on the earlier position." Sandisk, 415 F.3d at 1290; see also Amtrust, Inc. v. Larson, 388 F.3d 594, 600 (8th Cir. 2004). The Supreme Court has identified three non-exclusive factors for courts to consider when determining whether to apply judicial estoppel:

(1) the party's later position must be clearly inconsistent with the earlier position, (2) the party must have succeeded in persuading a court to adopt the earlier position in the earlier proceeding, and (3) the courts consider whether the party
seeking to assert an inconsistent position would derive an unfair advantage or impose an unfair detriment on the opposing party if not estopped.

The exhibits submitted by Defendants concerning the prior Infopet litigation do not support that Digital Angel's position in this litigation is "clearly inconsistent" with its position in the Infopet litigation. Defendants' Exs. 7-8, 10-11. Digital Angel's previous briefs describe in considerable detail the history of the development of the transponder, including its initial encapsulation in plastic/polypropylene, failure due to leakage, and later encapsulation in glass. Fairly construed, Digital Angel's previous statements indicate an intent to disclaim the particular plastic/polypropylene previously used as an encapsulant due to its inability to prevent leakage, but not an intent to disclaim all plastic/polypropylene for all time. The claim language at issue, "materials having characteristics equivalent to glass," is not overwritten by any statements made in the previous litigation. While "plastic" may ultimately not be a "material having characteristics equivalent to glass," Digital Angel has not specifically disclaimed plastic, and as such, statements made in the prior litigation regarding plastic/polypropylene v. glass transponders do not work a judicial estoppel. 8

8 Whether "plastic" is a "material having characteristics equivalent to glass" is an issue likely to be determined under the doctrine of equivalents on summary judgment.

The specification establishes the characteristics of glass that material must have to be equivalent: "Glass encapsulation is preferred because glass is non-porous, corrosion-resistant, and amenable to sterilization, as compared to other possible encapsulation materials, such as plastic." '129 patent, col. 7:11-14. While the preferred embodiment described in the specification appears to be made of glass, the specification reveals that glass is a preferred but not required encapsulating material: "The transponder may be encapsulated in glass or a similarly durable material . . . ." Id. at col. 4:13-15. Also, as previously stated, the specification expressly states that the invention is not limited to the preferred embodiment. Id. at col. 13:1-7. Finally, and most importantly, the claims consistently recite "material having characteristics equivalent to glass," which is significantly different from reciting "glass." The Court is wary of incorporating limitations from the preferred embodiment into the claims, and mindful of the directive that effect must be given to all words in a claim. See Exxon Chemical Patents, Inc. v. Lubrizol Corp., 64 F.3d 1553, 1557 (Fed. Cir. 1995). In view of the claim language and the specification, and for the reasons stated above, the term "material having characteristics equivalent to glass" means "material that is non-porous, corrosion-resistant, and amenable to sterilization."

II. Material Object

As with the term point of sale location, the district court made several findings with regard to the construction of the term "material object." We address these findings below, agreeing with some and disagreeing with others.

1.

The district court held that a material object is "a tangible medium or device in which information can be embodied, fixed, or stored, other than temporarily, and from which the information embodied therein can be perceived, reproduced, used or otherwise communicated, either directly or with the aid of another machine or device." Interactive Gift Express, 47 U.S.P.Q.2D (BNA) at 1810. Although IGE admits in its brief to this court that a material object is a tangible medium, counsel for IGE argued to this court at the oral hearing that a material object is defined as the information itself and need not be a tangible medium. The appellees respond that the district court's construction is supported by the specification.

Although the appellees do not argue that IGE has waived this argument, we note that it is being presented for the first time
on appeal. However, given that the proper resolution is beyond any doubt, we exercise our discretion and consider it for the purpose of elucidating our further comments on the proper construction of the term "material object." L.E.A. Dynatech v. Allina, 49 F.3d 1527, 1531, 33 U.S.P.Q.2D (BNA) 1839, 1843 (allowing an appellate court to consider an issue not presented below if "the proper resolution is beyond any doubt").

A material object cannot be the information itself, as IGE now argues. Examining first the claim language, claim 1, for example, requires that the information be reproduced in a material object. See Freeny patent, col. 28, ll. 22-23 (preamble to claim 1) and 44-45 (step four of claim 1). If the information itself is the material object, as IGE argues, then claim 1 would require the information to be reproduced in itself. Such a construction is illogical and does not accord with the plain import of the claim language. See White v. Dunbar, 119 U.S. 47, 52, 30 L. Ed. 303, 7 S. Ct. 72 (1886) ("It is unjust to the public, as well as an evasion of the law, to construe [a claim] in a manner different from the plain import of its terms. This has been so often expressed in the opinions of this court that it is unnecessary to pursue the subject further."); Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 93 F.3d 1572, 1579, 40 U.S.P.Q.2D (BNA) 1019, 1024 (Fed. Cir. 1996) (rejecting a proffered construction because "the plain meaning of the claim [would] not bear [such] a reading"); cf. Conopco, Inc. v. May Dep't Stores Co., 46 F.3d 1556, 1562, 32 U.S.P.Q.2D (BNA) 1225, 1228 (Fed. Cir. 1994) (noting that "a finding that the accused process literally infringed did not . . . eviscerate the plain meaning of the [relevant] term").

Despite the plain language of the claims, we turn to the specification to discern whether IGE attributed a different meaning to the term material object. See Vitronics, 90 F.3d at 1582, 39 U.S.P.Q.2D (BNA) at 1577 ("It is always necessary to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning."). Examining the specification, it is clear that even the broadest definition of material object in the specification requires that a material object be a "medium or device in which information can be embodied or fixed." Freeny patent, col. 4, ll. 36-38. Thus, IGE's argument that the reproduced information itself constitutes the material object is not only illogical, but unsupported in the specification as well.

2.

The district court further held that a material object must be: (a) separate and distinct from the IMM, (b) removed from the IMM after purchase, and (c) intended for use away from the point of sale location. See Interactive Gift Express, 47 U.S.P.Q.2D (BNA) at 1810. IGE argues that neither the claims nor the specification requires that a material object be separate and distinct from the IMM or intended for use at a location other than the point of sale location, and that these limitations were improperly read into the claims from the specification. The appellees respond that the district court's construction is supported by the specification. We agree with the district court on these three limitations, with one variation regarding point (c) above. On that point, we find that the material object could be intended for use at the point of sale location as long as it is on a device separate from the IMM.

Beginning with the claim language, we note that the preamble of claim 1, for example, describes a method in which IMMs are located at point of sale locations and in which information is reproduced in material objects utilizing the IMMs. See Freeny patent, col. 28, ll. 22-24. This language could be read to suggest that the material objects, which receive the reproduced information, are not part of the IMM and are intended to be purchased and removed from both the IMM and the point of sale location, but that reading is not clear from the claim itself. The claim later describes reproducing the information in a material object, but again there is no clear indication that the material object is or is not a separate and distinct item that is to be removed from the IMM after purchase and used on another device. See id. at col. 28, ll. 42-45. Thus, we look to the specification for further guidance.

The Freeny patent envisions and discloses only material objects that are separate from the IMM and that can be purchased by the consumer and taken away from the IMM. See, e.g., Freeny patent, col. 13, ll. 25-48 (retail store embodiment), cols. 26-27 (vending machine embodiment). The emphasis of the specification on distribution and sale consistently reveals that the material objects are intended to be separate from the IMM, removed from the IMM, and used apart from the IMM. See, e.g., Freeny patent, col. 4, ll. 13-18 ("The system of the present invention solves the problems associated with manufacturing, inventory, configuration distribution and collection . . . and permits sale of material objects embodying information in a more efficient, economical and profitable manner."). These three conditions, namely, that a material object be separate and distinct from the IMM, removed from the IMM after purchase, and used apart from the IMM, are fundamental to the meaning of a material object as clearly and consistently specified in the patent description. See, e.g., Freeny patent, col. 4, ll. 36-59; col. 5, ll. 47-50; col. 13, ll. 36-44; col. 26, ll. 28-34.
IGE contends that "material object" should be construed so broadly as to include a hard disk that is internal to a personal computer. Although the specification describes numerous material objects, a hard disk, internal or otherwise, is never mentioned as a possibility. In fact, where a hard disk is discussed, it is in relation to the implementation of particular aspects of the IMM or the ICM and not as an example of a material object. See id. at col. 22, ll. 6-34. Any construction of the expression "material object" which encompasses a hard disk is not only not envisioned anywhere in the specification but is also inconsistent with the definition of a point of sale location asserted by IGE before the district court. Specifically, a consumer would not go to a point of sale location to purchase an internal hard disk embodying predetermined or preselected information. See id. at col. 5, ll. 47-50.

3.

The district court also held that a material object "must be offered for sale independently from the information that may be reproduced onto the material object." Interactive Gift Express, 47 U.S.P.Q.2D (BNA) at 1810. The district court applied this same limitation to a point of sale location. For the reasons discussed earlier with respect to a point of sale location, we again disagree with the district court's reading of this condition into the claims.

4.

Accordingly, we construe a material object to be a tangible medium or device in which information can be embodied, fixed, or stored, other than temporarily, and from which the information embodied therein can be perceived, reproduced, used or otherwise communicated, either directly or with the aid of another machine or device. A material object must be offered for sale, and be purchasable, at point of sale locations where at least one IMM is located. Further, a material object must be separate and distinct from the IMM, removed from the IMM after purchase, and intended for use on a device separate from the IMM either at the point of sale location or elsewhere. "Material object" does not encompass the hard disk component of a home personal computer. Finally, a material object need not be offered for sale independently from the information that may be reproduced onto the material object, that is, as a blank.

2487

4. "layer having material release means for release of an at least one treating material in a directional manner" 2 (claim 1)

Both parties agree that this limitation is a means-plus-function limitation. Plaintiff argues that the recited function is "to release a drug preferentially toward the damaged tissue when the layer is placed adjacent to damaged tissue" and that the corresponding structure(s) in the specification is/are "various structures performing the claimed function, including chemical bonds and linkages such as a hydrophobic layer and a hydrophobic drug."

The defendant argues that the recited function is "the release of an at least one treating material in a directional manner from the first major surface when said first major surface of the layer has been placed facing the damaged tissue" and that the recited structure(s) in the specification is/are "the previously described layer (which as manufactured, has pores smaller than an at least one treating material such that the layer is impermeable to that treating material), wherein that treating material is initially affixed to the first major surface."

The court will first address the recited function. The parties disagree about the meaning of "directional." The specification supports construing "directional" to mean toward the damaged tissue. In the Background of the Invention, the patentee states that "the invention can be modified such that a treating material, when affixed to a major surface of the minimally-porous sheet, can be directed preferentially to the site of the injury." 1:24-27. Further, at col. 9, the patent states that "healing
macromolecules can be contained at the site of the injury, and medicine can be applied directly and preferentially to an injured wall to promote healing." 9:20-23. Additionally, the patent supports "administering antibiotics in a directional manner . . . at the site that they are needed most." 9:36-37; see generally 9:33-44.

Defining "directional" to mean "toward the damaged tissue" renders the term synonymous with "unidirectional," a term used in claims 8 and 15 when the sole direction is toward the damaged tissue. The prosecution history, however, supports this view. The patentee overcame the Scott reference by telling the examiner that the invention disclosed in the '760 patent was "directional" delivery, whereas Scott disclosed 'multidirectional' delivery. See 9/15/96 amendment at 5. In doing this, the patentee thus disclaimed "multidirectional" delivery in the application process.

Turning to the question of structure, the plaintiff argues that the corresponding structure includes chemical bonds or linkages. In support, the plaintiff correctly notes that the specification supports this argument. See e.g., 15:6-20, 22:4-17, and 14:58-15:5. For example, chemical bonds are clearly linked to the recited function in the specification at col. 15, ll. 6-20:

This device can be manufactured with several different medicines, each with their own particular release bond. Remarkably, one can implant the device of this invention such that one medicine is released by enzymes from Neutrophils (the first inflammatory cells to arrive), a second medicine released by enzymes from fibroblasts (cells that arrive later), and a third medicine which can be released only by osteoblasts (cells arriving even later). Although I have disclosed the implementation of multiple medicines in my application for the Malleable Fracture Stabilization Device with Micropores, the surprising specificity of medicine release provided by the chemical bond is entirely new and unexpected. The above-described feature of specific drug release is impossible using the prior art, and it represents a major advance in fracture treatment.

15:6-20

Elsewhere, the description states:

The rate of healing can be further accelerated by the attachment of a treating material, either mechanically or by chemical bond, to the inner surface of the device. The method of medicine release by chemical bond is also a method of highly significant improvement over the prior art. Prior art references all rely on the efflux of treating materials from micropores to deliver medicine. The ability to release medicine according to a rate constant, rather than relying on random efflux of molecules from various sized micropores, provide a surprising consistency to drug delivery not before seen in the art. Moreover, the chemical coupling of medicine and device provides for unprecedented specificity of release. The unexpected ability to be able to link medicine release with the specific enzymatic activity of healing cells is a highly significant improvement over the prior art.

22:4-17

Accordingly, the court construes the recited function as "releasing a treating material toward the damaged tissue." Because the patentee used a means-plus-function limitation, the patentee is limited to the structure clearly linked or associated with the claimed function. The court identifies the corresponding structure in the specification that is clearly linked to the claimed function to be chemical bonds and linkages. The court rejects the defendant's proposed structure because, inter alia, it recites limitations found elsewhere in the claim.

a. Mating Surfaces

The first term to be interpreted is "mating surface." The phrase appears in independent Claims 1, 7, and 8, and dependent Claim 5 (which depends from Claim 1) of the '644 Patent, and the phrase appears in independent Claims 1, 10, and 14 of the '884 Patent.

Claims 1 and 5 of the '644 Patent provide representative uses of "mating surface" in the '644 Patent. Claim 1 of the '644
The Court adopts Defendants' first proposed definition of "mating surface" as "those surfaces of the cartridge which fit with or mount to the manifold." Defendants' second proposed definition and Plaintiffs' proposed definition of "mating surface" include only mating surfaces of the two-stage cylindrical recess. Both definitions fail to include the "substantially planar mating surface" in Claim 5 of the '644 Patent. Although Plaintiffs have not asserted Claim 5, courts "look to the words of the claims themselves, both asserted and nonasserted, to define the scope of the patented invention." Vitronics, 90 F.3d at 1582. Defendants' first proposed definition of "mating surface" encompasses the "substantially planar mating surface" in Claim 5 of the '644 Patent, as well as the mating surfaces presented by the first and second cylindrical stages of the two-stage recess. Additionally, Defendants' first proposed definition of "mating surface" is more useful than Plaintiffs' proposed definition because Defendants' definition defines the word "mate" as "to fit with or mount to." This definition of "mate" is consistent with the use of the term in the '644 Patent, and it is consistent with the plain and ordinary meaning of the term. See Anchor Wall Sys. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1309 (Fed. Cir. 2003) (noting that ordinary meaning of word "mate" is "to join or fit together"). Plaintiffs' proposed definition is circular because it fails to define "mate."
first and second meanders defining a plurality of enclosed spaces.

('120 patent, col. 7, Ins. 13-26)

The court construed disputed terms of the '120 patent as follows:

"Meander." A periodic or repeating pattern of structural elements oriented about a center line. "First meanders" and "second meanders" identify and differentiate two different patterns.

(D.I. 256)

A. "Meander" or "Meander Pattern," "First Meander" or "First Meander Pattern," "Second Meander" or "Second Meander Pattern"

The meander terms appear in claims: 13, 16, 27, and 28 of the '120 Patent; and 1, 2-15, and 17 of the '982 Patent. 63 Medinol contends that "meander" or "meander pattern" should be defined as "a periodic or repeating pattern about a center line," and that first and second meanders "identify and differentiate two different patterns." 64 Guidant (1) defines "first meander" as "[a] periodic sinusoidal pattern that is uniformly distributed about a center line and extends circumferentially [equivalent to vertically in Medinol's patent figures] around a stent" 65 and (2) finds "second meander" to be indefinite. 66 The parties agree that there is no customary meaning for these terms and that Medinol, in using them, has acted as its own lexicographer. 67 Accordingly, the Court looks to the patent specification and file history for guidance.

--- Footnotes ---

63 See '120 Patent, col. 7, ll. 16-17, 19, 21-25, 41-42, col. 8, ll. 45-51; '982 Patent, col. 6, ll. 32-33, 35-36, 37, 40-43, 45-48.

64 Pl. Mem. at 13. In the Claim Chart, Medinol words this slightly differently, equating "meander" with "[a] periodic or repeating pattern of structural elements oriented about a center line" and first and second meanders that "identify and differentiate two different patterns." Claim Chart at 4.

65 Guidant's Memorandum of Law on Claim Construction (filed under seal) ("Def. Mem.") at 12.

66 See id. at 14; see also 35 U.S.C. § 112, ¶ 2. Guidant adds that "to the extent that this term can be construed . . . it should be construed as a periodic pattern that is uniformly distributed about a center line from one longitudinal end of the cell to the other." See Claim Chart at 4.

67 See Pl. Mem. at 13 ("For these terms, the patentees acted as their own lexicographer and clearly set forth a different definition than the plain meaning.") (quotation marks and citation omitted); Def. Mem. at 13 ("It cannot be disputed that the term 'meander' has no ordinary meaning in stent design."); see also Tr. at 43 (statement of Dorothy Auth, counsel for Medinol).

--- End Footnotes ---

The specification for the '303 Patent provides that "the term 'meander pattern' is taken herein to describe a periodic pattern about [a] center line and 'orthogonal meander patterns' are patterns whose center lines are orthogonal to each other." 68 The summary of the invention explains:

The stent of the present invention is formed of a tube . . . which has first and second meander patterns having axes extending in first and second directions wherein the second meander patterns are intertwined with the first meander patterns. The first and second directions can be orthogonal to each other. 69

In the description of the preferred embodiments, it is further explained that "the present invention encompasses all stents
manufactured with a pattern formed of two meander patterns, orthogonal or otherwise." 70 Accordingly, while the first and second meanders can be orthogonal to one another, the patentee also contemplates that the meander patterns could be "otherwise" oriented. The inclusion in the patent specification of a non-orthogonal arrangement of the first and second meander patterns forecloses Guidant's suggestion that circumferential and longitudinal directions be assigned to the meanders. 71

Moreover, to so limit the meanders would render some of the claims redundant, violating the canon of "claim differentiation." Karlin Tech. Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 972 (Fed. Cir. 1999). This principle is not a "rigid rule" and is "ultimately based on the common sense notion that different words or phrases used in separate claims are presumed to indicate that the claims have different meanings and scope [and] normally means that the limitations stated in dependent claims are not to be read into the independent claim from which they depend." Id.

For example, claim 1 of the '982 Patent describes:

1. An expandable stent for supporting a vessel, wherein in the expanded and deployed state, the stent consists of:

(a) first meander patterns having loops, the first meander patterns being longitudinally spaced from each other and having axes extending in a first direction; and

(b) second meander patterns having loops, the second meander patterns having axes extending in a second direction, different than the first direction . . .

[(c)-(e) omitted]

'982 Patent, col. 6, ll. 29-36. Claim 3 asserts a "stent according to claim 2 and wherein said first direction extends in a circumferential direction." Id. col. 6, ll. 51-52. Claim 4 discloses a "stent according to claim 3, wherein the second direction extends in a longitudinal direction." Id. col. 6, ll. 53-54. To ascribe circumferential and longitudinal directions to the first and second meanders would render the words "circumferential" and "longitudinal" in claims 3 and 4 irrelevant.

However, the written description of the patent clearly provides that the first meander is sinusoidal about a center line. The written description states that "meander pattern 11 is a vertical sinusoid having a vertical center line 9." 72 Accordingly, the term "first meander" is construed as follows: a periodic sinusoidal pattern about a center line. 73 The phrase "second meander" is not indefinite. Rather, it is defined as a periodic pattern about a center line oriented in a direction different from the axis of the first meanders. 74

Guidant would also include the phrase "uniformly distributed" in the definition of a first meander, arguing that the ordinary meaning of "center line" is a "real or imaginary line that is equidistant from the surface or sides of something." Webster's Ninth New Collegiate Dictionary (1991), cited in Guidant's Markman Hearing Slide Presentation at 12. Thus, the phrase "about a center line" requires that the meander pattern be uniformly distributed about the line. But the meaning of "uniformly distributed" is adequately captured by the words "center line." To use both "uniformly distributed" and "center line" would be needlessly redundant.
III

The district court held that the "battery means" and "lamp means" limitations of claim 1 are "means" limitations that are subject to 35 U.S.C. § 112, para. 6 (1994). That was error. Paragraph six states:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

Here, the limitations in issue recite structure - battery and lamp - and not functions. A battery and a lamp are not functions, and the addition of the word "means" does not convert the structure to a means or a step for performing a specific function. Consequently, the limitations fail the test of § 112, para. 6, and must be construed as ordinary limitations. The district court thus erred in thinking the limitations to be governed by § 112, para. 6.

That error, however, is harmless. The "battery means" and "lamp means" limitations, when construed in light of the specification, refer to a light bulb powered by a battery (‘229 patent, col. 1, lines 20-24, 61-62). As the district court properly found, the accused products use a chemiluminescent light instead. A chemiluminescent light does not require a battery to operate. The chemiluminescent light in the accused products results from a chemical reaction between chemical materials (chemiluminescent glow sticks and glow buttons) that generates light for a limited time. No electrical current is generated. On the other hand, the patent claims a lamp that is powered by an electrical current generated by the battery. Thus, the battery means and lamp means limitations are not met, and the accused products do not infringe the patent literally.

Neither is there infringement under the doctrine of equivalents. To prove infringement under the doctrine of equivalents, the patentee must show that the accused devices perform (1) substantially the same function, (2) in substantially the same way, and (3) to achieve substantially the same result, as the claimed invention. London v. Carson Pirie Scott & Co., 946 F.2d 1534, 1538, 20 U.S.P.Q.2D (BNA) 1456, 1458 (Fed. Cir. 1991).

Here, the claimed invention and the accused products generate the light in very different ways with different results. Generating light through chemiluminescence generally makes the saucer lighter because the battery is not needed. Also, no mechanical connections between the lamp and the battery are necessary, making it a sturdier construction. However, once the chemical reaction starts, chemiluminescence cannot be stopped. In a battery-operated lamp, on the other hand, a simple switch may be employed to turn off the lamp light (see ‘229 patent, col. 2, lines 6-11). Accordingly, the district court did not err in holding noninfringement under the doctrine of equivalents with respect to the battery means and lamp means limitations.

2) Product Coating Zones

We next turn to CMS's contention that the district court erred in concluding that the claimed "means defining a plurality of separate product coating zones" includes fully perforate reels. CMS raises this issue as another ground for affirming the district court's judgment of noninfringement. CMS argues that § 112, P 6 applies to the "product coating zones" limitation.
because there is no structure recited for performing the claimed function of "defining." CMS also argues that the only embodiment disclosed in the specification has a reel with alternating perforate and imperforate sections, and that the claimed "product coating zones" are limited to imperforate sections. Wenger responds that § 112, P 6 does not apply to the "product coating zones" limitation because there is no function that corresponds to the word "means." Wenger alternatively argues that there is sufficiently definite structure recited for performing the function of "defining." Wenger also asserts that the specification discloses fully perforate reels, and that the "product coating zones" limitation should not be limited to the preferred embodiment.

We conclude that the district court did not err in construing the "product coating zones" limitation. The court concluded that the "product coating zones" limitation was not subject to § 112, P 6 because there is no function recited that corresponds to the word "means." The court further concluded that, even if there was a corresponding function, the claim recited sufficiently definite structure to fall outside of § 112, P 6. Wenger I at 8-9.

Claim 1 reads in relevant part as follows:

1. An apparatus for coating and drying a food product comprising:

   . . .

   means defining a plurality of separate product coating zones longitudinally spaced along said reel, each of said zones including at least one spray nozzle directed toward said sidewall for pressurized spraying of a coating on the food product during passage of said food product from said inlet to said outlet.

'683 patent, col. 7, l. 24-25; col. 7, l. 45 to col. 8, l. 2 (emphasis added). Because the "product coating zones" limitation uses the word "means," there is a presumption that § 112, P 6 applies. Personalized Media, 161 F.3d at 703, 48 U.S.P.Q.2D (BNA) at 1886. However, it is unclear whether there is any function recited that corresponds to the word "means." See York Prods., Inc. v. Cent. Tractor Farm & Family, 99 F.3d 1568, 1574, 40 U.S.P.Q.2D (BNA) 1619, 1624 (Fed. Cir. 1996) ("Without an identified function, the term 'means' in this claim cannot invoke 35 U.S.C. § 112, P 6.").

CMS asserts that the function of "defining" is the function that corresponds to the word "means." Even assuming that is correct, we agree with Wenger that § 112, P 6 does not apply because the claim recites sufficiently definite structure for performing the function of "defining." See Rodime, 174 F.3d at 1302, 50 U.S.P.Q.2D (BNA) at 1434 ("Even if the claim element specifies a function, if it also recites sufficient structure or material for performing that function, § 112, P 6 does not apply."). The claim specifically recites structure including spray nozzles that are directed toward the sidewall of the reel, which "define" (i.e., establish the boundaries of) the separate product coating zones that are longitudinally spaced along the reel. We therefore conclude that the district court did not err in concluding that the "product coating zones" limitation was not subject to § 112, P 6.

CMS further argues that, even if § 112, P 6 does not apply, the claimed "product coating zones" do not include fully perforated reels, and should be limited to imperforate reel sections. According to CMS, the only embodiment disclosed in the specification is a reel with imperforate sections separated by perforate sections, with spray nozzles for coating the food product located in each of the imperforate sections. Based on this embodiment, CMS argues that the claimed "product coating zones" requires a reel with "spaced apart" imperforate sections wherein product coating takes place. We disagree. Although claims must be read in light of the specification of which they are a part, it is improper to read limitations from the written description into a claim. Tate Access Floors, Inc. v. Maxcess Techs., Inc., 222 F.3d 958, 966, 55 U.S.P.Q.2D (BNA) 1513, 1518 (Fed. Cir. 2000). While claim 1 expressly recites that the reel has "a plurality of perforations," it does not require that the reel have imperforate sections, nor does it limit the claimed "product coating zones" to such reel sections. See '683 patent, col. 7, l. 24 to col. 8, l. 2 (emphasis added). Likewise, the specification states that the claimed apparatus includes "an axially rotatable reel provided with a perforate sidewall"; it does not state that the reel must have imperforate sections, or that the "product coating zones" must be limited to such sections. Id. at col. 1, ll. 61-63 (emphasis added). Moreover, as the district court correctly noted, the references in the specification to imperforate sections and spraying zones that correspond to those sections are not limiting, as they merely describe the preferred embodiment. See Tate Access, 222 F.3d at 966, 55 U.S.P.Q.2D (BNA) at 1518 ("Although the specification may well indicate that certain embodiments are preferred, particular embodiments appearing in the specification will not be read into the claims when the claim language is broader than such embodiments."). We therefore agree with Wenger that the district court did not err in concluding that the "product
coating zones" limitation may be satisfied by fully perforate reels as well as reels with alternating perforate and imperforate sections.

VI. "Means defining an air collecting space"

The first issue raised by the parties, one that cuts to the core of what the '996 patent was intended to disclose, involves the claim language "means defining an air collecting space." All three Defendants assert that this language defines what is referred to as a "means-plus-function" element, and thus should trigger the claim interpretation rules of 35 U.S.C. § 112, P 6. Brita, on the other hand, argues that this claim language is not "means plus function" language and should not be construed as such. Since the resolution of this dispute will color much of our construction for this claim term, the Court must first resolve whether Section 112, P 6 should be applied.

Section 112, P 6 provides that:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

35 U.S.C. § 112, P 6. This statutory provision thus allows a patent applicant to express a claim element as a means for performing a function without reciting any structure, material or acts in the claim's means-plus-function limitation. Valmont Industries, Inc. v. Reinke Mfg. Co., Inc., 983 F.2d 1039, 1042 (Fed. Cir. 1993). Section 112, P 6 then limits the broad language of a means-plus-function element to equivalents of the structures, materials or acts disclosed for that element in the specification. Id.; see also Fonar Corp. v. General Elec. Co., 107 F.3d 1543, 1551 (Fed. Cir.), cert. denied, 139 L. Ed. 2d 192, 118 S. Ct. 266 (1997). In addition to structural equivalence, the means described in the specification must also perform the exact function recited in the claim that corresponds to the means. Valmont, 983 F.2d at 1042; Micro Chemical, Inc. v. Great Plains Chemical Co., Inc., 103 F.3d 1538, 1547 (Fed. Cir.), cert. denied 138 L. Ed. 2d 1018, 117 S. Ct. 2516 (1997).

The import of having claim language construed as a means-plus-function element has been summarized as follows:

Section 112 thus permits means-plus-function language in a combination claim, but with a "string attached." The "attached string" limits the applicant to the structure, material, or acts in the specification or their equivalents. Indeed the section operates more like the reverse doctrine of equivalents because it restricts the coverage of literal claim language.

Valmont, 983 F.2d at 1042 (citing Johnston v. IV AC Corp., 885 F.2d 1574, 1580 (Fed. Cir. 1989)). Seeking a broad construction of the '996 patent, Brita argues against application of Section 112, P 6 and its limitation of the claim language to only those structures disclosed in the specification. The Defendants, of course, want the embodiments disclosed in the specification to strictly define the bounds of the patent claims.

The Federal Circuit has repeatedly opined that use of the word "means" in a claim element "triggers a presumption that the inventor used this term advisedly to invoke the statutory mandates for means-plus-function clauses." York Prods. Inc. v. Central Tractor Farm & Family Center, 99 F.3d 1568, 1574 (Fed. Cir. 1996); see also Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1427 (Fed. Cir. 1997). Because the '996 patent does employ the word "means", Brita faces an uphill battle to avoid mean-plus-function treatment. This hill, however, is not insurmountable. The presumption for means-plus-function treatment can be rebutted where a claim, though using the word "means," specifies no corresponding function for the "means" to perform. See, e.g., York Prods., 99 F.3d at 1574 (construing "means" without reference to Section 112, P 6).

Alternatively, and more relevant to this case, a claim which recites "means," but then goes on to elaborate sufficient structure, material or acts within the claim itself (without referring to the specification) to perform the recited function, does not warrant means-plus-function analysis. See, e.g., Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531-32 (Fed. Cir. 1996). Thus, though certainly indicative of a means-plus-function element, "mere incantation" of the word "means" is not dispositive that an element deserves such treatment. York Prods., 99 F.3d at 1574.

Brita asserts that the "means" language in the '996 patent is like those cases in which means-plus-function treatment has
been found inappropriate. Rather than expressing a means "for performing a specified function without recital of structure" as required by the statute, Brita contends that the claim describes a physical structure defining "the air collecting space." The claim element goes on to specify that this space must be "located in at least a portion of the filter bottom" and "extend[] upwardly at least partially towards the side wall and to the opening in said sleeve." Since the structure which defines the "air collecting space" can be discerned from this subsequent claim language itself, Brita argues that it should not be treated as a means-plus-function element.

The Defendants note, however, that the inclusion of some structure in a "means" claim does not preclude the applicability of Section 112, P 6. See Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1536 (Fed. Cir. 1991). The phrases cited by Brita as purported examples of structural language are, according to the Defendants, merely "the place[] where the function occurs" - limitations which do not serve to remove an otherwise covered claim from means-plus-function treatment. See O. I. Corp. v. Tekmar Co., Inc., 115 F.3d 1576, 1581 (Fed. Cir. 1997) (court determined that the word "passage" should not be interpreted under § 112 P 6 but remainder of clause "means for passing the analyte slug through the passage" should receive means-plus-function treatment). Thus, the Defendants argue that the claim language following the clause "means defining an air collecting space" should not preclude this clause from being interpreted as a means-plus-function element.

The use of the words "means defining an air collecting space" does send mixed signals as to its proper construction. On the one hand, the drafter did not employ the prototypical language -- "means for [performing a function]" -- which normally epitomizes such claims; indeed, Brita acknowledges that an element claiming "means for collecting air" would be a means-plus-function element. The claim language also goes on to describe some spatial limitations on this "means" claim, though it is debatable whether these limitations are structural or merely provide location and direction information. On the other hand, however, the Court must start with the presumption that the use of the word "means" should trigger application of Section 112, P 6. Furthermore, the language "means defining" was added to the claim to satisfy an objection of the patent examiner, further indication that this term should be given means-plus-function treatment.

Though a close call, the Court believes that "means defining an air collecting space" should be construed as a mean-plus-function element. In our opinion, Brita has not overcome the presumption which use of the term "means" imposes upon it. The language used is admittedly not prototypical, but it does adequately describe a means for performing the specified function of collecting air as contemplated by Section 112, P 6. The limitations which follow the "means" language in the claim recite no more than limited structure, such that reference to the specification is needed in order to sufficiently define the "means defining an air collecting space" limitation. At bottom, the patentee's use of the loaded term "means," without clearly intending that it not define a way of performing a specified function, compels our conclusion. Thus, the Court will construe the clause "means defining an air collecting space" as a mean-plus-function element under Section 112, P 6.

Having concluded that Section 112, P 6 applies, we must next consider how the claim language must be construed in light of this statutory section. As a means-plus-function element, the claim language "means defining an air collecting space" is restricted to (1) the identical function described in the specification, and (2) the specific corresponding structure described in the specification that performs the function. See Valmont, 983 F.2d at 1042. The parties dispute the scope of both the function and structure disclosed in the specification. Thus, the Court must delve into the specification to determine the proper construction of this clause.

The parties first dispute what function this mean-plus-function language actually claims. The Defendants contend that the specification makes clear that the "means defining an air collecting space" must perform the function of fixing the limits of a space that gathers or directs air bubbles from the different areas of the filter bottom and then exhausts them through the chimney section and out the sleeve opening. Brita argues that the function of this claim is much more mundane -- that the function is not to collect air but simply to define a space. According to Brita, the "air collecting space" is just a space, and thus there is no requirement that the space gather and exhaust air from the filter bottom. It follows from Brita's assertion that, if this claim merely defines a space, the presence of air or gas bubbles is unnecessary to the function of the patent.

The Court agrees with the Defendants that this means-plus-function element claims the function of gathering and exhausting air bubbles entrained at the filter bottom. Defining a space is not a function; defining a space which collects air and then exhausts it out a chimney is a function. Indeed, the specification makes clear that the whole purpose of this claimed invention is to collect and vent air bubbles that would otherwise impede the flow of water from the filter bottom. For Brita to argue that the function of this means-plus-function element is to merely define a space defies common sense. Furthermore, the Court believes that the term "air collecting space" connotes more than merely a defined path for receiving
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

air bubbles (as Brita would have us find). Instead, we find this claim language to require the presence of air bubbles, such
that these bubbles are gathered by the "air collecting space" and removed via the chimney-portion of this space. Brita's
assertion that this is merely a passive space, which just may so happen receive air bubbles and let them escape, is without
merit.

The Court must also look to the specification to determine the corresponding structure for this mean-plus-function claim. As
for the structural elements disclosed, the Defendants contend that the "air collecting space" must have not only a vertical
component, but also a horizontal section extending along the filter bottom. Signature would seem to further argue that this
horizontal component must also match the cross-shaped, half-tube air channel system specifically described in the
specification. To the contrary, Brita argues that the specification discloses embodiments both with and without a horizontal
component, and that therefore this component should not be read into the claim language. Thus, the Court must decide
whether the "air collecting space" necessarily includes a horizontal portion along the filter bottom.

There is no dispute that the preferred embodiment of the claimed invention does include a horizontal component. Brita
points out, however, that references to a preferred embodiment are generally not to be construed as claim limitations.
Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988), cert. denied, 490 U.S. 1068, 104 L. Ed. 2d
634, 109 S. Ct. 2069 (1989); see also Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1303 (Fed. Cir. 1997). The Court agrees
with this general proposition. Nevertheless, because we are dealing with a mean-plus-function element, the "air collecting
space" is limited to the corresponding structure disclosed in the specification and its structural equivalents. Valmont Indus.,
983 F.2d at 1042. Thus, although our construction may not be limited by the preferred embodiment of the invention, we are
bound to those structures the specification discloses for accomplishing the function of this claim.

Brita argues that there is an embodiment in the specification which does not contain a horizontal component. Specifically,
Brita refers to the first embodiment discussed in the specification which describes "the filter bottom has an air collecting
space which is extended upwardly at least partially towards the side wall." Spec., col. 2, lines 4-6. Comparing this
embodiment to others disclosed in the specification, Brita argues that this language dictates that the air collecting space may
be comprised of only a vertical chimney portion without an accompanying horizontal section along the filter bottom. Thus,
according to Brita, the "corresponding structure" includes embodiments both with and without horizontal sections.

A more thorough reading of the specification reveals, however, that Brita's purported example of a vertical-only
embodiment actually does include a horizontal section. In describing this same embodiment in the same paragraph that Brita
cites, the specification states that "it is sufficient for only an e.g. tubular part of the region of the filter bottom to be extended
radially outwardly to the size [sic] and then towards the filter cover." Spec., col. 2, lines 16-19. Though not entirely clear,
the Court reads this sentence to require the air collecting space to extend (1) in a horizontal direction to the side wall, and
then (2) vertically towards the filter cover. The use of the words "and then towards" between these directions indicates that
some kind of discontinuity or change in direction is implied, and thus it is incongruous for Brita to assert that this
embodiment extends only in a vertical direction. Therefore, contrary to Brita's contentions, the Court finds that all of the
embodiments in the specification disclose "air collecting spaces" with both horizontal and vertical components.

In summary, the Court finds that the claim term "means defining an air collecting space" is a means-plus-function element
and thus must be construed under Section 112, P 6. The function disclosed for this element is a space which gathers and then
removes air bubbles from the filter bottom. The corresponding structure for this element requires a space with both a
vertical and horizontal component, though these components are not restricted by the precise structures disclosed by the
preferred embodiment.

1. "means defining an air collecting space"

The first claim construction issue concerns the "means defining an air collecting space" limitation. The district court
determined that this claim language was in means plus function form and should be governed by 35 U.S.C. § 112, P 6. We
disagree.

The use of the term "means" in a functional claim limitation raises the presumption that the limitation is governed by 35
The claim language itself structurally defines the air collecting space as a component of the insert—"an insert having approximately cylindrical sidewalls, a filter cover and a filter bottom, . . . with means defining an air collecting space." The claim further recites that the air collecting space is "located in at least a portion of the filter bottom" and "extends at least partially towards the side wall and to the opening in said sleeve." In other words, the air collecting space is a void that is formed as part of the insert, and is located at the bottom of the insert (the filter bottom), and extends upwardly along the side walls of the insert and to the opening of the sleeve in which the insert sits. Because this structural recitation sufficiently performs the function of "defining an air collecting space," 35 U.S.C. § 112 treatment is not proper.

Having determined that this limitation is not governed by 35 U.S.C. § 112, P 6, we must construe it in the usual fashion. As discussed above, the claim language describes the air collecting space as a void which is structurally defined as part of the insert, formed at the bottom of the insert and extending upwardly along the side walls and to the opening in the sleeve. This understanding of the claim language is also supported by the written description and figures included in the specification. Throughout the written description, the patentee describes the air collecting space as half-tubes and tunnels formed in the bottom and the side walls of the insert. See '996 patent, col. 2, ll. 27-30, ll. 42-48; col. 3, ll. 23-25; col. 4, ll. 52-65. This is also the arrangement shown in the figures of the '996 patent. See id. at Figure 1. Thus, while not limited to the specific embodiments disclosed in the patent, the claim requires the "air collecting space" to be formed by a void in the insert located at the filter bottom and extending upwardly along the side walls and to the opening in the sleeve.

Brita, on the other hand, contends that the air collecting space is all air space between the insert and sleeve, including any "ambient" air. Brita's contention is squarely contradicted by the claim language which explicitly defines the structural parameters of the air collecting space. Brita's proffered claim construction would entirely divorce the air collecting space from the structure of the insert, such that any slight gap between the sleeve and the insert would be "air collecting space." This is inconsistent with the claim language and must be rejected.

4. Means defining fluid flow passages in said manifold

The parties dispute whether "means defining fluid flow passages in said manifold" as used in claim 1 of the '935 patent is a means-plus-function limitation. The claim's use of the word "means" raises the presumption that the limitation is means-plus-function, but plaintiff contends that the claim language provides sufficient structure to overcome the presumption, placing the limitation outside the scope of § 112 P6. I disagree.

In plaintiff's view, the fluid flow passages are a structure and there cannot be a more specific structure to perform the function of defining fluid flow passages that communicate with hydraulic cylinders. However, a fluid flow passage is not a self-defining term. It is necessary to have some other structure or structures to create fluid flow passages that communicate with the hydraulic cylinder means as claimed in claim 1. Therefore, the term is properly constructed as a means-plus-function limitation.

In construing the term, it is helpful to read it in context: a manifold including means defining fluid flow passages in said manifold communicating with said hydraulic cylinder means. '935 pat., col. 6, ins. 56-58. According to the claim language the term's function is defining fluid flow passages that communicate with the hydraulic cylinder means. Defendant includes an additional function in its proposed construction. I understand defendant to contend that the function should include communicating with the solenoid valve means and being operative to selectively direct fluid to said lift hydraulic cylinder means and angle hydraulic cylinder means. Defendant is mistaken in its reading of the claim language. Although the language is somewhat muddled, it is clear that the solenoid valve means is a part of the manifold, separate from the means defining fluid flow passages. A plain reading of the claim language establishes that although a solenoid valve means is
located within the structures establishing the fluid flow passages, it is the solenoid valve means that selectively directs fluid and not the fluid flow passages.

With the claimed function defined, the next step is determining the corresponding structures. Defendant contends that the corresponding structures are all the valving, ports, flow channels and ancillary mechanisms in the manifold, as identified in Figures 3A, 3B and 4 through 7. Defendant's proposed construction includes too much. The specification states that "Figs. 3A and 3B show the actual structural relationships within the valve manifold, i.e., valves, ports and flow channels." Id., col. 5, lns. 34-36. According to the claim language, the manifold includes both a means defining fluid flow passages and a solenoid valve means. Id., col. 6, lns. 56-61. Thus, despite defendant's contention to the contrary, not everything pictured in Figures 3A or 3B is associated with the means defining fluid flow passages.

Nonetheless, many of the structures identified in Figures 3A, 3B and 4 through 7 are the only structures linked to defining fluid flow passages that communicate with hydraulic fluid cylinders. When there is only one embodiment of a structure linked or associated with a claimed function, the claimed function is limited to that embodiment of the structure and its equivalents. E.g., Cross Medical Products, Inc. v. Medtronic Sofamor Danek, Inc., 424 F.3d 1293, 1304 (Fed. Cir. 2005) ("because there is only one embodiment described in the specification . . . there is no basis on which to extend the limitation to cover alternative, non-disclosed structures not shown to be structurally equivalent").

Figure 3A, provided below, is an illustration of the entire manifold, which includes the structures for executing the claimed function.

[SEE FIGURE IN ORIGINAL]

Figure 6, provided below, illustrates the flow path to the right angle hydraulic cylinder 76.

[SEE FIGURE IN ORIGINAL]

The structures that define fluid flow passages that communicate with both the lift 72 and angled 74 and 76 hydraulic cylinders are those shown in Figures 3A, 3B and 4 through 7 and listed in column 5, lines 38 through 68 and column 6, lines 1 through 11 and their equivalents. For example, hydraulic conduits 167 and 169, ports 200, 202 and 204, passages 88, 94 and 100 and valves 80, 82 and 84 are clearly associated with performance of the claimed function. E.g., '935 pat., col. 5, lns. 38-60. They all play a necessary role in defining the fluid passages used to communicate with the hydraulic cylinders. E.g., id., col 5, lns. 53-60, 61-64 and 65-col. 6, ln. 1 ("fluid flows from reservoir . . . through passage . . . to pressurize cylinder 72"); "fluid returns through passage"; and "the flow path is again to the four way valve through passage . . . to pressurize cylinder 76").

Plaintiff contends that channels are the only structure necessary for performing the claimed function and that to require more would be reading limitations from the specification into the claim. Plaintiff would be correct but for the fact that the general rule against reading limitations from the specification into claims does not apply to means-plus-function limitations. A patentee's decision to use a means-plus-function limitation carries a price: "use of that convenience is limitation of the claim to the means specified in the written description and equivalents thereof." Texas Digital Systems, Inc. v. Telegenix, Inc., 308 F.3d 1193, 1208 (Fed. Cir. 2002)(quoting O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1583 (Fed. Cir. 1997)). Defining fluid flow passages that communicate with hydraulic cylinders requires more than channels according to the specification. Without conduits, ports and valves, there would be a connection but no communication. Those structures are necessary for the communication aspect of the claimed function, which means that plaintiff's proposed construction is incorrect.

I conclude that "means defining fluid flow passages in said manifold" is a means plus function limitation. Its function is to define fluid flow passages that communicate with the hydraulic cylinder means. The structures clearly linked to performing that function are provided in Figures 3A, 3B and 4 through 7, which includes hydraulic conduits, ports, passages and valves.

Claim 1 of the '419 Patent
At the outset, the litigants dispute the logical way to divide claim 1 for analytical purposes. Though the precise manner of division is not necessarily essential to effective claim construction as such, convenience of organization and discussion is well served by looking at the issues in terms of these five numbered elements:

A dishwasher having an enclosure defining a washing chamber and a dish racking system mounted therein, the combination comprising:

1. a lower rack having a bottom support means including a plurality of spaced-apart generally longitudinal and lateral wire members and

2. means extending generally perpendicular to said bottom support means for defining front, rear and a first and a second side wall, said first side wall extending substantially higher than said front, rear and second side walls to define a protective barrier between a side panel of said washing chamber and various oversize articles placed adjacent said first side wall for washing;

3. rack mounting means associated with opposed side panels of said washing chamber; and an upper rack supported above said lower rack by said rack mounting means,

4. said upper rack having bottom support means including a plurality of spaced-apart generally longitudinal and lateral wire members formed to provide at least one upwardly stepped portion adjacent said first side wall of said lower rack,

5. said upper rack wire members projecting upwardly and generally perpendicular to said bottom support means for at least partially defining front, rear and side walls.

Of these, elements 2, 3 and 4 are in dispute. 12

--- Footnotes ---

12 Both sides concur that element 1 is not to be construed in means-plus-function form (see M. Mem. 10 and W. Mem.2).

--- End Footnotes ---

Element 2 Is Not Governed by Section 112 P6

Element 2 is presumptively in means-plus-function form because it employs the word "means." But because lots of structure and little or no function is recited, the element does not come within the scope of Section 112 P6. While the first side wall (a structure) is said to act as a "protective barrier" for oversized articles (its stated function), 13 the other walls are expressed in purely structural terms. Specifically, the "front, rear and a first and a second side wall" are perpendicular to the bottom support, with the "first side wall extending substantially higher" than the other walls. 14

--- Footnotes ---

13 W. Mem. 3 wrongly claims that all four walls function to form a protective barrier. As the claim language makes plain, only the higher side wall is said to perform that role.

14 Indeed, it could reasonably be argued, as M. Mem. 11 does, that structure only is recited by this claim element.

--- End Footnotes ---

W. Mem.3 attempts to transform the structure into function by stating that "the claimed function is 'defining front, rear and a first and a second side wall'" and that "defining something is not structure--it is a function." That odd notion is not only unsupported by any authority but also runs contrary to common sense, for "definition" and "structure" are practically synonyms. Regardless, complex language involving complex technology is not at issue. Claim 1 talks about four walls, one higher than the others, 15 and the element conveys to any casual reader the structure and orientation of those walls. Hence
element 2 is not in means-plus-function format.

15 In fact, as W. Mem. 4 states (including the numbers given to the four walls in the '419 Patent's illustrations), "both parties agree that the corresponding structure to this limitation is the front wall 68, back wall 70 and side walls 72 and 74."

The court first examines the claim on an element-by-element basis to determine which, if any, elements are drafted in "means-plus-function" language. Having carefully considered all of the papers submitted, including the extensive prosecution history of the '043 patent, the court first concludes that claim 4(a), detailing the "means for containing the bulk substance to be analyzed," is not subject to § 112 P 6's limitations. Claim 4(a) details sufficient definite structure so as to provide one knowledgeable in the prior art of nuclear bulk-substance analysis notice of the scope and meaning of the claim. Quite simply, the "means for containing" the bulk substance consist of an "elongated passageway," which is "at least partly surrounded by a [unspecified] neutron-reflecting substance," adapted, in an unspecified way, "to contain" the substance as it "flows through the apparatus." This structural disclosure is sufficient to support a finding that, despite the drafter's use of the word "means," this claim is not so indefinite as to require interpretation under § 112 P 6. See Cole, 102 F.3d at 531; Greenberg, 91 F.3d at 1584. Accordingly, the recited "means for containing" is limited in element (a) by structural details that clearly remove it from the purely functional form urged by defendants. Id.

The court then examines the plain claims language. In its relevant part, claim 4 contemplates an apparatus which analyzes "the composition of a bulk substance flowing through the measurement volume …" comprising "(a) means for containing the bulk substance … said means comprising an elongated passageway adapted to contain said bulk substance as it flows through said apparatus …" Simply defining the terms "passageway," "contains," and "flows" supports plaintiff's contention that these terms disclose a definite structure. In patent law, the patent drafter may act as his own lexicographer. Multiform Desiccants, Inc., 133 F.3d 1473 at 1477. "This rule of construction recognizes that the inventor may have imparted a special meaning to a term in order to convey a character or property or nuance relevant to the particular invention." Id. "Such special meaning, however, must be sufficiently clear in the specification that any departure from common usage would be so understood by a person of experience in the field of invention." Id. As the patent drafter did not ascribe a technical definition to any of these terms in either the claims or specification -- and as neither party argues that any technical definition was intended -- the court attributes to them their ordinary meaning. A "passageway" is "a way that allows passage to or from a place or between two points." Webster's Third New Int'l Dict., at 1650 (1981). "Contain" is defined as, "… to have within; hold; … enclose …" (id., at 491), and "flows" is defined as, "to move with a continual change of place among the constituent particles or parts; run; stream; … designates the characteristic movement of a fluid, gentle or rapid, copious or meager, showing unbroken continuity …" (Id., at 875.) Taken together, one schooled in the prior art may read claim 4(a) and envision a tunnel-like passageway designed to hold a bulk substance, through which the bulk substance being analyzed enters the apparatus, moves or is moved, and exits the apparatus.

Moreover, both the prosecution history and the doctrine of claim differentiation support the court's construction. The prosecution history is particularly helpful. The Federal Circuit "has repeatedly stated that application of prosecution history estoppel does not necessarily limit a patentee to the literal language of the amended element -- even when an amendment has been made to overcome the prior art." Litton Sys., Inc. v. Honeywell, Inc., 140 F.3d 1449, 1998 WL 156754, *8 (Fed. Cir. 1998) citing LaBounty Mfg., Inc. v. United States Int'l Trade Comm'n, 867 F.2d 1572, 1575-76 (Fed. Cir. 1989). Rather, "the relevant inquiry is whether a competitor would reasonably believe that the applicant had surrendered the relevant subject matter" after reviewing the prosecution history of the disputed claim. Cybor Corp. v. FAS Tech., Inc., 138 F.3d 1448, 1998 WL 134028, *7 (Fed. Cir. 1998), citing Instiuniform Techs., Inc., v. Cat Contracting Inc., 99 F.3d 1098, 1107-08 (Fed. Cir. 1996). In analyzing this history, the court must bear in mind that "positions taken before the PTO may bar an
inconsistent position on claim construction under § 112 P 6." Id. (citations omitted).

The '043 patent application was a continuation of an earlier application (Ser. No. 866,488), and was pending for almost ten years prior to issue. During this time, the patent application was significantly redrafted on several occasions. In his several appeals briefs, the patentee continuously distinguished his device from those in the prior art -- identified by the PTO as Tittle (patent no. 3,053,388, issued September 11, 1962); Chope (patent no. 3,082,323, issued March 19, 1963); and Christell (patent no. 4,028,267, issued June 7, 1977). In his appeals to the Board of Patent Appeals and Interferences (following several rejections by the PTO), plaintiff argues repeatedly the prior art "did not even recognize the existence of the problem of attempting to obtain uniformity of response in analytical measurement ..." (11/18/80 Marshall App. Br., at 28.) Marshall argued he "solved this problem in a highly novel manner with his improved measurement volume 'geometry' and 'plural-source' configuration." (Id.) Following initial rejections by the Board for § 103 obviousness, the applicant (now MDH Industries) modified the application and added "new claim 39" 1 (present claim 4) "specifically directed toward the various novel features of the apparatus of the invention." The heart of the novelty as described by the applicant lay in the use of an "elongated passageway ... symmetrical in cross-section" at least partly surrounded by a "neutron-reflecting substance adapted to increase the neutron flux along the sides of the passageway," in conjunction with a plurality of neutron sources and gamma-ray detectors. (5/4/83 App. Br., at 7-8; 1/25/84 App. Br., at 25.)

1 Claim 39(a) was substantially identical to current claim 4(a) ("means for containing the bulk substance … said passageway including a neutron-reflecting substance adapted to increase the neutron flux along the sides of said passageway"), but as initially drafted included an additional recitation claiming "… which passageway is configured to exclude the bulk substance from regions of reduced measurement sensitivity and to direct it toward a region of maximum measurement sensitivity;"

In its March 25, 1986 decision the Board opined that claim 39 was not obvious in view of Tittle or Chope or the combined teachings of these two references. Ex parte J. Howard Marshall, Bd. Pat. App. Int., App. No. 596-18, at 2 (Mar. 25, 1986). However, the Board did reject independent claim 39 and its dependant claims under § 112 P 1 for containing inadequate disclosure to support certain included recitations pertaining to the functional configuration of the passageway. Once the applicant removed the offending language from 39(a), 2 the claim was approved and the patent issued in its present form. See PTO Feb. 24, 1987 Notice of Allowability.

2 Specifically, the applicant deleted the following parenthetical language and inserted the underlined language:

(a) means for containing the bulk substance to be analyzed, said means comprising an elongated passageway adapted to contain said bulk substance as it flows through said apparatus, said passageway [including] being at least partly surrounded by a neutron reflecting substance; [adapted to increase the neutron flux along the sides of said passageway, which passageway is configured to exclude the bulk substance from regions of reduced measurement sensitivity and to direct it toward a region of maximum measurement sensitivity.]

(See Applicant's 4/25/86 Amendments and Remarks, at 2, 4.)

Thus, the prosecution history supports a construction of element (a) as claiming an analytical apparatus with a symmetrical passageway designed to contain the bulk substance, at least partly surrounded by a neutron-reflecting substance. Defendants' argument that plaintiff disavowed the use of a conveyor belt to move the bulk material through the passageway so as to distinguish this claim against the prior art is unavailing, viewed in light of the entirety of the prosecution history concerning independent claim # 4. A fair and contextual reading of the applicant's appeals briefs indicates he attempted to distinguish his claims from Christell's "open conveyor belt" on the grounds that his proposed passageway was symmetrical, enclosed and partly surrounded by a neutron-reflecting substance. The means by which the bulk substances moves, or is moved,
through the apparatus is not contemplated or discussed by the applicant, nor does it appear as an element of claim 4.

Defendants' assertion that applicant surrendered all claims to the use of any type of conveyor belt is simply not supported by a fair reading of the record. Rather, the prosecution history supports plaintiff's contention that applicant was simply attempting to distinguish his apparatus from those conveyor belt-devices described in Tittle, Chope and Christell. In his final appeals brief to the Board of Patent Appeals applicant argued,

"While Applicant agrees with the Examiner and with the Board that the use of one or a plurality of sources, or one or a plurality of gamma ray detectors, is in and of itself obvious, the use of a plurality of sources and/or a plurality of detectors in conjunction with the apparatus of the invention … is clearly non-obvious. The invention as defined in the claims, when considered as a whole, is neither suggested or disclosed by either Tittle or Chope et al and would certainly not be obvious to one skilled in the art having those patents before him. Quite to the contrary, the only suggestion of such an arrangement could come only from the disclosure of the application itself."

(1/25/84 App. Br., at 27-28.) This argument was ultimately accepted by the Board. "Independent claim 27 … and independent claim 39 … each provide for the passageway 'including a neutron-reflecting substance.' Clearly, such is not shown or suggested by either Tittle or Chope or by the combined teachings of these references." Ex parte J. Howard Marshall, Bd. Pat. App. Int., App. No. 596-18, at 2 (Mar. 25, 1986). In so holding, the Board makes clear that the point of novelty of applicant's device was its use of a neutron-reflecting passageway in conjunction with the specified arrangement of sources and detectors. It therefore follows that a competitor reading the entire prosecution history could not reasonably conclude it may avoid infringing Marshall's patent by simply placing all of the Marshall apparatus's essential elements -- an elongated container, at least partly surrounded by a neutron-reflecting substance -- on a conveyor belt. Such a conclusion is simply not warranted by the prosecution history.

Finally, the doctrine of claim differentiation also supports the court's construction of claim 4(a). This venerable patent law doctrine dictates that language in one claim should not be interpreted so as to make another claim superfluous. See, e.g., Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1277 (Fed. Cir. 1995). If the court were to construe element 4(a) as a means-plus-function claim as suggested by defendant -- and thereby interpret this claim as covering only the structure disclosed in the patent specification (or its equivalents) -- then the court would be hard-pressed to differentiate this claim from claim 1(a), not at issue in this suit. In drafting claim 4(a), the patentee wished to extend his patent protection to all nuclear bulk analysis devices employing elongated, symmetrical neutron-reflecting container-passageways, and did not intend to be limited only to those which are "substantially square in cross-section" as claimed in claim 1(a) and as disclosed in the specification.

The court therefore holds, without resorting to extrinsic evidence, that the plain language, specification and prosecution history of claim 4(a) adequately discloses the scope of the claim. Claim 4(a) encompasses an apparatus in which the "means for containing" the bulk substance to be analyzed includes a symmetrical "elongated passageway adapted to contain" the substance as it moves, or is moved, through the apparatus, said passageway "being at least partly surrounded by a neutron-reflecting substance."

6. Chad's claims can cover a system whose clinching pin goes down and up before it has finished bending all the leads to be bent on a particular component.

(a) The terminology in dispute.

The parties agree that, while the language is slightly different in different claims, interpretation of claim 1 will be dispositive of the dispute as to all claims. The pertinent part of claim 1 reads as follows:

means for driving said clinching element through a programmably determined path of travel substantially within a plane adjacent said lower surface in response to control signals to contact and bend one or more leads of said component adjacent said lower surface of said board,
ATS argues that the path of the clinch pin cannot go up and down because its path would then not be "substantially within a plane adjacent [the] lower surface" of the circuit board. Chad agrees that the pin has to stay in the same plane while it bends a lead, but Chad contends that the claim language does not exclude operations where the pin goes down and back up between leads. The claim language itself does not answer the question. Chad urges, correctly, that it can be read to mean that the path is in one plane only while the pin bends one lead. ATS urges that the language "one or more" means the pin bends all the leads on a component while it is in the plane adjacent the lower surface—whether there is only one lead or more than one.

(b) Reference to the specification supports Chad's view. 5

--- Footnotes ---

5 Chad devotes a good deal of its arguments both in its pre-hearing brief and in its post-hearing brief challenging ATS's patent expert for taking inconsistent positions regarding the claim interpretation at different stages of the dispute. ATS devotes an equal amount of argument, with accompanying declarations, attempting to reconcile the expert's positions. The Court agrees with Chad that the attempted reconciliation is strained and not credible; however, the Court also agrees with ATS that it doesn't matter. The expert was an expert on law, not one skilled in the art of circuit board manufacture. Accordingly, his opinions are accepted merely as extensions of litigation counsel's arguments, not as evidence of how one skilled in the art would interpret the claims in issue. If it were probative evidence, the earlier admissions would indeed be indicative that those skilled in the art would favor Chad's interpretation of the claims.

--- End Footnotes ---

The specification refers to the invention as being able to adapt the system to the clinching requirements for "any type of inserted component." (See, patent at col. 14, 1. 14-16.) The adaptability is attributed to being able to program the path the clinching pin takes to handle different components (which is consistent with the general theme of the entire system—not just the clincher—that it can adapt to different sizes and types of components). (See, patent at col. 13, 1. 43-47.)

The programming operation itself shows that it was intended that a clinch path was contemplated to constitute the route of travel during the bending of a single lead, not all the leads on a component. As described in the specification, omitting the references to drawings and unnecessary verbiage, the procedure reads in substance as follows:

In a typical manual teaching sequence, an identifying number for the component to be clinched is entered into the controller via the keyboard. Then the operator … moves the clinch element to the appropriate start position required to initiate the desired clinch path. The start position … is then stored in the memory of the controller.

…. 

If, during the next move, it is desired to clinch a lead of the component, the operator activates the "clinch up" control…. The appropriate movement controls … are then activated to execute the desired clinch path. If the leads are not to be clinched during this sequence of moves, the "clinch up" switch is not activated.

In the next step of the … sequence, the final position of the clinch head and clinch element (up or down) are stored in the controller memory.

The preceding two steps are then repeated to perform all desired clinching movements for the particular component. The entire sequence is then repeated for each of the components on the board requiring clinching.

(See, patent at col. 19, 1. 6-32.)

While the interpretation of the specification urged by ATS is far from frivolous, it appears to the Court that the reference to a starting position and a final position for the bending of a single lead, repeated to perform all desired movements for each particular component, is indicative that it was contemplated that the precise meaning of a clinching path was contemplated.
as the route taken for bending a single lead, not all the leads on a component.

Even assuming the claims read in the light of the specification still were ambiguous, the ambiguity would be resolved in this case in favor of Chad by resort to extrinsic evidence of how those skilled in the art would interpret the patent language. The Court's interpretation of the disputed language is consistent with the declaration of the inventor that:

The definition of the clinch as disclosed in the patent is the act of running into and bending the lead, not moving the pin up to the board and dropping away from the board. ... The actual clinching takes place when the pin runs into a lead and bends it over. Everything before and after that is not clinching, it's just movement of the system in preparation for the clinching action.

(declaration of Gregory Holcomb filed February 8, 1996, p. 20-21.)

Although the inventor's declaration is entitled to no special deference, it does constitute evidence of what those skilled in the art would understand from reading the claims in issue. In this case, it, taken together with the testimony at the Markman hearing and all the other evidence and information presented, is persuasive that this Court's interpretation of the claims is correct. 6

ATS objects to the testimony of Holcomb as expert testimony from a witness who was not timely identified as an expert witness pursuant to local and federal rules. The Court agrees that Holcomb's testimony as to what terms as "clinching" would mean in the context of his invention constitutes expert testimony. Treated as a motion in limine to exclude the testimony at trial, ATS's objection may be well-founded; however, it is not an issue for the Markman hearing. This Court is required to make its own determination of the issues of law, including claim interpretation, and the Court instructed the parties to call all witnesses who would be useful for that purpose. Accordingly, for purposes of the Markman hearing only, ATS's objection is overruled.

Chad also argues generally that this Court should not consider the prior art cited by the examiner to limit the interpretation of the claims herein because they are means-plus-function claims, citing Intel Corp. v. I.T.C., 946 F.2d 821 (Fed. Cir. 1991). The Court agrees with ATS, however, that nothing in Intel prohibits this Court from considering the prosecution history, including the prior art cited therein. In fact, as noted above, this Court has an affirmative duty to do so. 7

It is elementary that a patentee cannot obtain, in an infringement suit, protection of subject matter that was relinquished in order to obtain allowance of other subject matter during prosecution of the patent application. Mannesmann Demag Corp. v. Engineered Metal Prods. Co., 793 F.2d 1279, 1285, 230 U.S.P.Q. 45, 48 (Fed. Cir. 1986). The standard for determining whether particular subject matter was relinquished is an objective one to be determined as a matter of law and is based on
the reasonable reading, by a person of skill in the field of the invention, of the entire prosecution history. Modine
1609 (Fed. Cir. 1996).

ATS refers to the fact that claims in Chad's patent application were rejected as unpatentable when they did not include the
limitation that the path of travel of the clinching pin was "substantially within a plane" adjacent the lower surface of the
circuit board. After that limitation was put in, the patent examiner allowed the claims. However, a review of all the papers
filed fails to show, objectively, that either the examiner or Chad construed the amendment of the claims as relinquishing
Chad's right to assert infringement over systems whose pins go up and down between clinching paths. The Court agrees
with Chad that the issue before the examiner was whether the claims were patentable over the Foley reference and others
without the "substantially within a plane" language. Without that language, Chad's claims could have covered a clinching
device that moved in an arc, rather than a plane, while performing the bending. Since Foley showed a prior art device that
moved in an arc, it was not surprising that the examiner rejected Chad's attempt to cover that subject matter.

Nor is ATS's argument persuasive that Chad limited the scope of its claims by arguing that the Chad pin did not have to go
up and down like Foley's device. This was simply an advantage of Chad's system, not a prohibition against using its ability
to go up and down when there was an obstacle in the way or other reason to do so. The flexibility of the Chad system--in
permitting an operator to choose when to have the pin extend or retract--was obviously a difference between it and the prior
art device, and it would be ironic to construe that as a restriction against asserting coverage of that very flexibility.

In short, there is nothing in the prosecution history presented in the papers filed that tends to lead to any interpretation of the
claims different from that which results from merely reading the claims and specification of the patent, as discussed above.
The claims are not interpreted as limited so as to preclude asserting infringement against systems whose clinching pins go
up and down between each bending step for each lead in the same component.

7. The claims cover a system programmed so that the pin never moves sideways while it is up unless it is touching the lead.

ATS argues that if horizontal movement of the clinch pin occurs only while the pin is actually in contact with a component
lead, the claims are not infringed. It bases its argument on Holcomb's submission to the examiner of an argument along with
a new claim 42. In the argument, Holcomb's counsel argued that the new claim distinguished over prior art because the prior
art apparatus "relies on actuating the clinch head after it has positioned relative to the lead." From this, ATS argues that
Holcomb was disclaiming any coverage of devices that operate by having the clinch pin come up along side the lead exactly
positioned to touch it, presumably by sliding along vertically beside it, before starting sideways.

Given that Holcomb's invention was expressed as one where the leads appear to point straight down and the pin points
straight up, it is not implausible that Holcomb was willing to disclaim an embodiment that would require such perfect
precision to function. There is simply no evidence that such a subject ever came up in discussions with the examiner,
however, and it is clear that what the examiner insisted on was a limitation that the bending part of the pin movement be in a
plane. The addition of that limitation is clearly what resulted in the allowance of the claims. 8

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

8 To the extent that ATS is arguing that the claims cannot cover devices that operate without having the clinch pin go further
horizontally after it has finished bending the lead, there is nothing in Holcomb's arguments to the examiner to support that
interpretation, and it would be inconsistent with being able to bend leads only partially flat.

- - - - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In short, ATS's argument on this point is strained and is not persuasive that Chad's claims should be limited to prevent
coverage of a system programmed so that the clinch pin never moves sideways while it is up unless it is touching the lead.

GO BACK

2499

2. Claim 1(a)(i) -- "means for filtering"
The parties initially disputed the proper construction of "means for filtering" in limitation (a)(i) of claim 1. However, Defendants now withdraw their "proffered claim construction for the 'filter means' and accept[] RTI's claim construction for the limitation as 'any filter that performs the recited function of filtering cooking oil from the fryer station." (Defs. Ltr. Resp. Br., at 10.) Therefore, the Court adopts this interpretation.

A. Means for Retaining. . . .

Phrase: means for retaining said [cylindrical] sleeve member relative to said body portion

Construction: an area of interference fit between the bit holder and the sleeve

Reasoning: The central dispute regarding this claim term is whether means-plus-function analysis applies. Defendant asserts that it does, while plaintiffs contend that it does not. Regardless, both parties agree that the "means for retaining" is "an area of interference fit." Because this agreed upon structure appears in the claims themselves, it would be improper to apply means plus function analysis to this claim. Phillips, 415 F.3d at 1311 ("Means-plus-function claiming applies only to purely functional limitations that do not provide the structure that performs the recited function").

While the dependent claims reflect the inventor's preferred embodiment that the area of interference fit be in the form of band, or bands, of interference fit, the independent claim is not so limited. Claim 1 speaks broadly to a "means for retaining . . . . comprising an area of interference fit." In the dependent claims, this "area" is more narrowly defined to include "one band of interference fit", "at least two discrete bands of interference fit", and one or more bands found on cylindrical or conical sleeves. These dependent claims reflect the inventor's stated preferred embodiment that the areas of interference be created by "one or more bands of interference." Col. 2, Ins. 57-60. However, the disputed claim term need not be so limited.

The only claim element at issue is the "means for retaining" element of claim 1 of the '908 patent, which recites:

means for retaining said test pins in parallel alignment in said apparatus with said test pins extending through respective said through-bores in said mask plate, said means comprising an elastic plate formed of elastic material and mounted at a position spaced from said mask plate and extending parallel thereto, said test pins extending through said elastic plate in a manner such that said elastic material elastically contacts and grasps said test pins, whereby said test pins are maintained in said alignment due to the elasticity of said material.

The district court held, and neither party disputes, that this element should not be interpreted under 35 U.S.C. § 112, P 6. The district court's holding in that regard was based on the disclosure of: (1) the claimed structure to perform the function of alignment, (2) the structure's claimed location in the apparatus, and (3) the claimed physical properties of the elastic plate. We agree with the district court that the claim recites definite structure for performing the claimed function and that
therefore it should not be interpreted under section 112, P 6. See Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531, 41 U.S.P.Q.2D (BNA) 1001, 1006 (Fed. Cir. 1996) ("the alleged means-plus-function claim element must not recite a definite structure which performs the described function").

The district court construed the "means for retaining" element to cover:

elastic plates having the capability, when positioned parallel to and spaced from the mask plate, of maintaining the pins in proper parallel alignment. The literal terms of claim 1, therefore, do not cover elastic plates that are incapable of maintaining, in conjunction with a through-bored mask plate, the pins in proper alignment within the apparatus.

The district court further stated:

As a practical matter, to have the capability of maintaining test pins in proper alignment, when positioned parallel to and spaced from a mask plate, an elastic plate must possess either one of two characteristics. First, any elastic plate, regardless of its thickness or degree of flexibility, that is firmly affixed to the structure of the adaptor would be capable of working in conjunction with the mask plate to maintain the pins in parallel alignment. Second, an elastic plate that is not firmly affixed to the apparatus, but that is sufficiently rigid so that it can stand vertically without collapsing, would be equally capable of serving this function.

On appeal, Testerion argues that the district court improperly added a new limitation to claim 1. Specifically, it contends that the court improperly construed the claim to required that "the elastic plate be stiff or rigid enough that it independently (i.e., not in conjunction with the mask plate) maintains the test pins in parallel alignment." Testerion asserts that this interpretation impermissibly reads a limitation from the specification into the claim, and effectively eliminates the claim language "with said test pins extending through respective said through-bores in said mask plate." We do not believe that the district court impermissibly read a limitation into the claim. While claim 1 does not explicitly recite that the elastic plate independently maintains parallel alignment of the test pins, this limitation is inherent in the claim language that the pins are maintained in parallel alignment due to the elasticity of the plate. In addition, as indicated below, it is reinforced by the discussion of the term "elastic plate" in the specification and prosecution history.

Claim 1 of the '908 patent recites a means for retaining test pins in parallel alignment with the test pins extending through through-bores in a mask plate. The means for retaining the pins in parallel alignment is recited as an elastic plate formed of elastic material and mounted spaced from the mask plate. The claim further recites that the test pins are maintained in parallel alignment "due to the elasticity of the material." Thus, the "means for retaining" element recites an elastic plate, spaced from the mask plate, that maintains the pins in parallel alignment due to the elasticity of the elastic plate. This claim language indicates that the elastic plate independently maintains the pins in parallel alignment.

This interpretation of the claim is reinforced by the specification, which discloses that: "Elastic plate 4 is designed to be sufficiently stable while exhibiting the required resilience so that it may be mounted on the apparatus in the manner of a stable plate." '908 patent, col. 3, lines 27-30. Thus, the specification indicates that the elastic plate is stable or rigid. The specification further discloses that, in one embodiment, "elastic insert 4 may be in the form of a plate or sheet loosely placed in the space between top and bottom guide plates . . . ." Id. at col. 4, lines 36-38. This language draws a distinction between an elastic plate and an elastic sheet, which reinforces the interpretation that the elastic plate is stable, or rigid, as opposed to an elastic sheet, which is flexible.

The prosecution history also supports the interpretation that the elastic plate must be sufficiently rigid to maintain the test pins in parallel alignment. To distinguish the claimed invention from a prior art reference (the Eddy reference), the applicants argued that:

It is submitted that the "resilient binding material" 4 of Eddy cannot be compared with the elastic supporting and retaining plate 4 of the present invention, since the functions of the two elements are different. Thus, resilient binding material 4 of Eddy does not operate to retain the test pins in parallel alignment in the apparatus as is the case in the present invention. This function rather is achieved by rigid carrier 3 of Eddy. Material 4 of Eddy simply connects the two test probes and allows relative axial displacement therebetween.

* * *
The Examiner's reference to element 4 of Eddy as an "elastic support plate" is inaccurate for the above reasons.

(Emphasis in original). Thus, the applicants indicated that it was inaccurate to refer to material that simply connects the test probes and allows axial displacement between the test pins as an elastic plate because such material does not retain the test pins in parallel alignment like the elastic plate of the claimed invention. The applicants further distinguished their invention from a device that relies on a rigid carrier (or guide plate) to maintain the parallel alignment of the test pins.

Based upon the foregoing, we conclude that the "means for retaining" element of claim 1 of the '908 patent is properly construed to cover elastic devices that are sufficiently rigid to independently maintain test pins in parallel alignment, and that the element does not cover flexible elastic devices that rely on guide plates to maintain the parallel alignment of the test pins.

Thus, the district court's construction of claim 1 was both too broad and too narrow. To the extent that the court construed the claim to cover an elastic plate that maintains the pins in parallel alignment due to the interaction between the elastic plate and the mask plate, the construction was too broad. As discussed above, the proper claim construction requires the elastic plate to independently maintain the test pins in parallel alignment. On the other hand, to the extent that the court limited the claim to elastic plates that "can stand vertically without collapsing," the construction was too narrow. Although this may be one way to determine whether an elastic plate is sufficiently rigid to maintain the pins in parallel alignment, we are not prepared to say that it is only the way to make that determination. In other words, the district court went too far by imposing the limitation that the elastic plate be able to stand vertically without collapsing.

\[\text{Footnotes}\]

1 We note Testerion's argument that the district court improperly applied a prosecution history estoppel analysis in construing claim 1. Testerion is correct that there is a difference between prosecution history estoppel and interpreting the claim language based on the prosecution history. See Biodex Corp. v. Loredan Biomedical, Inc., 946 F.2d 850, 852, 20 U.S.P.Q.2d (BNA) 1252, 1262 (Fed. Cir. 1991) ("There is a clear line of distinction between using the contents of the prosecution history to reach an understanding about disputed claim language, and the doctrine of prosecution history estoppel . . ." (citation omitted)). As seen above, however, prosecution history is properly used in this case to interpret how the patentee defined the claim term "elastic plate," and the court did not improperly apply a prosecution history estoppel analysis.

We also note Testerion's argument that the district court erred by not reading claim 1 in light of Figure 3 of the patent. This argument is directed at the district court's construction that the elastic plate be sufficiently stable that it can stand vertically without collapsing. Because we have already determined that the district court erred on this point, we do not address this argument.

\[\text{End Footnotes}\]
Mitek's Motion for Reconsideration of Claim Construction argues that the court committed errors in its construction of the terms "drill means" and "means for securing". Mitek does not request modifications of the court's definition of "thread means". Mitek argues that the question of whether or not a drill means includes a screw, a pin, a nail or a trocar tip is a question for the jury and not a question of law for the court. This court disagrees. Mitek argued and presented evidence at length to support its contention that a drill means includes a trocar tip, a pin, a nail or a screw and requested that this court construe the term "drill means" to include these devices. Only when this court disagreed with Mitek's definition did it argue that this was an issue for the jury. The conclusion that a drill means does not include objects that do not have cutting edges and flutes is fully supported by the intrinsic evidence. Further, the Federal Circuit has affirmed claim construction rulings that define functions or structures that are excluded from the coverage of a claim. See, e.g. The Gentry Gallery, Inc., v. The Berkline Corp., 134 F.3d 1473, 1477 (Fed. Cir. 1998) (term "console" construed to exclude tray unit) and General American Transp. Corp. v. Cryo-Trans, Inc. 93 F.3d 766, 770 (Fed. Cir. 1996) (opening "adjacent" to a side was construed to exclude opening adjacent to an "end wall").

Mitek further argues that the court committed error in defining "means for securing" to exclude a freely sliding suture. As stated above, this court may properly define functions or structures that are excluded from the coverage of a claim. Mitek also argues that the court may not use the prior art to limit the range of structures that may be equivalent to the structure disclosed in a specification for performing an identified function. Once again, this court disagrees. It is well established that the prior art relied upon by the applicant "gives clues as to what the claims do not cover." Autogiro Co. of America v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 399 (Ct Cl. 1967). The holding that the structure of the means for securing cannot include an eyelet is fully supported by the intrinsic evidence. Therefore, Mitek's Motion to Reconsider Claim Construction is denied.

2503

Means for securing

Mitek argues that the district court erred by limiting the claim to the preferred embodiment with regard to the "means for securing" term. The district court defined a "means for securing a suture to said anchor to extend therefrom after said anchor is seated in the bone mass' as a structure having a suture permanently attached to a retention disk positioned internally within the anchor." Mitek Surgical Products, Inc. v. Arthrex, Inc., No. 1:96 CV 00087K, slip op. at 8 (D. Utah May 10, 1998). Mitek admits that the specification only discloses the structure of a means for securing that contains a retention disk attached to the means. However, Mitek's argument regarding the construction of "means for securing" revolves around differences between "attach" and "secure" and the fact that those two functions are used interchangeably in the specifications.

Mitek misses the focus of means-plus-function claim construction. There was no error in the district court's construction of "means for securing" because section 112 P 6 expressly restricts coverage of a means-plus-function claim to the structure disclosed in the specification and the equivalents of that structure. The internal retention disk is the only means for securing structure disclosed in the specification. Mitek argues that alternative embodiments of means for securing are disclosed in the prior art. These embodiments are irrelevant when attempting to outwardly expand claim scope as here. Structure in the prior art may be used to limit, but not broaden the scope of means-plus-function structures. See Biodex Corp. v. Loredan Biomedical, Inc., 946 F.2d 850, 863, 20 U.S.P.Q.2D (BNA) 1252, 1262 (Fed. Cir. 1991) (stating that prosecution history may be used to limit scope of means-plus-function claims).

An equivalent of a means-plus-function claim "results from an insubstantial change which, from the perspective of one of ordinary skill in the art, adds nothing of significance to the claimed invention." Valmont Indus., Inc. v. Reinke Mfg Co., Inc., 983 F.2d 1039, 1043, 25 U.S.P.Q.2D (BNA) 1451, 1455 (Fed. Cir. 1993). In this case, there is no question but that a person of ordinary skill in the art would conclude that there are substantial differences between the internal retention disk structure disclosed in the patent and the eyelets used in the accused device. The internal disk itself stands out as the primary example of a substantial difference in structure between the scope of Mitek's means-plus-function claim and Arthrex's suture anchors, and by itself is substantial enough to render Mitek's patent inapplicable in this case. We reject Mitek's characterization of the construction as erroneously reading limitations from the written description into the claim. We agree
with the district court's interpretation of the several disputed claim terms and determination of noninfringement.

IV.

Unlike claim 1, however, claim 32 does not explicitly limit the height of the ridge members forming the load locks in the sidewalls. Instead, claim 32 describes the load lock in terms of depth:

32. A protective liner for a cargo bed of a vehicle, said protective liner allowing a structure positioned in the trunk cargo bed to be supported and affixed in position in the vehicle cargo bed, including:

a liner floor portion having elevated portions formed thereupon to conform to wheel wells protruding from the cargo bed floor;

upwardly extending liner sidewall portions extending upwardly from opposite sides of the liner floor portion an upwardly extending liner frontwall portion extending upwardly from a front end of the liner floor portion; and

means formed on the upwardly extending liner sidewall portions including a plurality of spaced apart, vertically extending ridge members protruding from the liner sidewall portions and forming load locks in gaps separating adjacent ones of the ridge members, said load locks having a depth sufficient to anchor a structure positioned and supported in the cargo bed.

(Emphasis added). Despite the differences between claim 1 and claim 32, the district court interpreted claim 32 to require "the ridge member . . . [to] extend from near the bottom of the sidewall to near the top of the sidewall."

While the last paragraph of claim 32 begins with the word "means," what follows is a detailed recitation of structure. The clause begins with a description of "means formed on the . . . sidewall portions including . . . ridge members." This language describes generally, indeed expressly includes, ridge members that serve as anchors for load locks. The clause then refers to "forming load locks," followed by still more structural language about gaps between ridge members and the depth of the load locks ("load locks having a depth sufficient to anchor a structure positioned and supported in the cargo bed").

The claim language, however, does not link the term "means" to a function. In language again suggestive of structure, the claim notes that the "means" "protrude from the liner sidewall portions and form[] load locks." This language vaguely hints at the function of anchoring a load in the cargo bed. Nowhere does the claim language following "means" state that function. Instead, the claim recites structure. Without an identified function, the term "means" in this claim cannot invoke 35 U.S.C. § 112, P 6. Without a "means" sufficiently connected to a recited function, the presumption in use of the word "means" does not operate. In any case, the express structural limits of the claim language limit its scope. Thus, this court construes this claim without reference to section 112, P 6.
The parties agree that this claim term refers to the measurement of displacement, rotation, and tilts along the relevant axes, the measured displacements found along either the X or the Y axes, the measured rotation found about the Z axis, and the measured tilts registered about the X and Y substrate axis. ASML believes that the court need not investigate further, construing the claim as simply a "step of a method claim." To the extent that ASML argues that no limitations appear in the claim text, the court agrees.

But to the extent that ASML asserts that the court need not investigate further, the court cannot agree. The Federal Circuit has long noted that "claim language [must be] limited based on a feature that was described as essential to the invention." See Sunrace Roots Enter. Co., Ltd. v. SRAM Corp., 336 F.3d 1298, 1305 (Fed. Cir. 1305). Where specification language identifies an essential claim feature, and where the embodiments uniformly disclose that feature, the feature proves a required limitation of all the relevant claims. See, e.g., ATD Corp. v. Lydall, Inc., 159 F.3d 534, 542 (Fed. Cir. 1998); Gentry Gallery, Inc. v. The Berkline Corp., 134 F.3d 1473, 1478-80 (Fed. Cir. 1998). In this instance, specification language identifies an essential claim feature, and the embodiments uniformly disclose that feature; thus, the court must apply the attendant limitation. A seminal aspect of the '832 invention is the enhanced accuracy with which substrate and mask position can be determined by interferometer use. See '832 Patent at 3:35-40. "Integrated" with the interferometers is a block of mirrors, a block unequivocally described in the specifications as "an essential condition and an important aspect of the present invention." Id. at 4:39-50; 14:18-21. This mirror block is consistently depicted in the embodiments as the art's method of measurement, see, e.g., id. at figs. 7-9 & 25-26, and this mirror block is uniformly described as part of the structure serving as substrate support. Id. In such a context, Federal Circuit doctrine directs the court to apply a limitation to an otherwise unlimited claim term. See Sunrace Roots, 336 F.3d at 1305. For this reason, the court construes "measuring . . . of the substrate" to mean "determining and quantifying, by means of interferometers with an integrated mirror block, movement along either the X or Y axis or both, rotation around the Z axis, and tilts about the X and Y axes of the substrate."
mechanical reference would anticipate the claimed inventions. We therefore reject

The critical element of claim 9 is the phrase "plate being orthogonal to the direction of motion and skew to said axis of said sensor."

RVSI argues that the "measurement center line" or "axis" of the sensor is the line that bisects the angle between the projected and received beam of light. View, on the other hand, argues that the "measurement center line" is the line between the center of the sensor and the target point.

The task of claim construction is made difficult in this case because the term "measurement center line" appears nowhere in RVSI's written description, and neither party suggests that the term has a well-established meaning in the art. The prosecution history, however, provides some guidance as to what the patentee and the examiner understood the term to mean.

When RVSI filed the application that eventually issued as the '308 patent, the method claims recited the step of "aligning a sensor at an angle relative to said linear motion." Those claims were rejected as anticipated by U.S. Patent No. 4,682,894 to Schmidt et al. The examiner characterized Schmidt as disclosing a device in which "the center line of the sensor is aligned at an angle of zero degrees with the direction of linear motion" of the flat plate (the testing surface), and the side of the sensor facing the flat plate "is aligned at an angle of 90 degrees with the direction of linear motion of the flat plate." That is, the face of the sensor in Schmidt is parallel to the face of the test plate and perpendicular to the linear motion of the plate. Because the claims in RVSI's application referred to an "angle relative to [the] linear motion" of the flat plate, and did not exclude an angle of zero degrees, the examiner regarded Schmidt as an anticipating reference.

In response to the rejection, RVSI canceled all pending claims and added the claim that eventually became claim 1 of the '308 patent. That claim contained the critical language reciting a sensor "with a measurement center line located" at a "non-zero" angle relative to the linear motion of the flat testing plate. RVSI asserted that with the amended language, claim 1 and its dependent claims "define clearly the improvement over the prior art," including both Schmidt and U.S. Patent No. 4,375,921 to Morander. With a similar explanation, RVSI subsequently added apparatus claim 9, which contained the critical language reciting a testing plate "skew to" the axis of the sensor.

In light of the language of the claims and the prosecution history, RVSI's proposed claim construction cannot stand. If the "measurement center line" or "axis" of a sensor is the bisector of the angle between the projected and received light, as RVSI contends, then a sensor such as the one in View's device, which has two detectors, must have two measurement center lines or axes, however, is inconsistent with the language of the '308 patent, which uses those terms in the singular throughout. Moreover, it would be contrary to common understanding to use the terms "center line" or "axis" to refer to a line that does not pass through any central point in the sensor or form an axis of symmetry for the device. Finally, if the terms "measurement center line" and "axis" referred to the bisector of the angle of projection and reception, as RVSI argues, devices such as View's sensors would satisfy the limitations of the claim but not be capable of performing multiple simultaneous calibration, which the patent asserts as one of the principal advantages of the claimed invention. Based on the way the terms "measurement center line" and "axis" are used in the patent, we are therefore persuaded that those terms cannot be construed as RVSI proposes.

In addition, the prosecution history is inconsistent with RVSI's proposed claim construction. After amending the language of the claims, RVSI explained that none of the cited references, including Morander, anticipated the novel features of RVSI's invention. Yet Morander discloses a sensor in which the bisector of the angle of projection and reception forms a non-zero angle with the line of motion of the flat plate, and RVSI has not pointed to any other limitation of its claimed invention that is not found in Morander. Thus, if the critical claim language is construed as RVSI proposes, it appears that, contrary to RVSI's representation to the examiner, the Morander reference would anticipate the claimed inventions. We therefore reject RVSI's construction of the claims of the '308 patent and uphold the district court's ruling on the issue of literal infringement.

We also agree with the district court that View's process does not infringe the '308 patent under the doctrine of equivalents. The advantages that RVSI touted for its off-angle improvement over the "face-on" sensor systems disclosed in Schmidt and Morander include the capacity to calibrate multiple sensors at the same time and register them to one another. That capacity is not shared by View's device, in which the path of the laser between the projector and the plate is perpendicular to the testing plate and parallel to the path traveled by the plate. Accordingly, so far as the record reflects, View's device is no more
equivalent to the claimed invention than are the devices disclosed in Schmidt and Morander. The district court thus properly
granted summary judgment of non-infringement with respect to both literal infringement and infringement by equivalents of
the '308 patent.

Plaintiff contends that no additional construction is needed for this claim, whereas Defendant argues that this claim requires
a means-plus-function limitation pursuant to 35 U.S.C. § 112 P 6. (Chart at 9.) Plaintiff states that if the court finds a means-
plus-function to be required, then it agrees with Defendant's construction. (Id.)

"[T]he court must see to it that disputes concerning the scope of the patent claims are fully resolved" so that such questions
are not left open for a jury. Every Penny Counts, Inc. v. Am. Express Co., 563 F.3d 1378, 1383 (Fed. Cir. 2009) (citing O2
Micro Intl' Ltd. v. Beyond Innovation Tech. Co., 521 F.3d 1351, 1361-62 (Fed. Cir. 2008)). When a claim does not use the
word "means," there is a rebuttable presumption that § 112, P 6 does not apply." TIP Sys., LLC v. Phillips &
Brooks/Gladwin, Inc., 529 F.3d 1364, 1374 (Fed. Cir. 2008) (citing CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359,
1369 (Fed. Cir. 2002)). "In deciding whether the presumption has been rebutted, the focus is on whether the claim recites
sufficiently definite structure." Id. (citing CCS Fitness, 288 F.3d at 1369). "This court has consistently held that '[m]eans-
plus-function claiming applies only to purely functional limitations that do not provide the structure that performs the
recited function." Welker Bearing Co. v. PHD, Inc., 550 F.3d 1090, 1095-96 (Fed. Cir. 2008) (quoting Phillips v. AWH
Corp., 415 F.3d 1303, 1311 (Fed. Cir. 2005)). "Further, a patentee's use of the word 'means' in claim limitation creates a
Corp., 514 F.3d 1256, 1259 (Fed. Cir. 2008)). However, the "generic terms 'mechanism,' 'means,' 'element,' and 'device,'
typically do not connote sufficiently definite structure," unless they are modified such that they have a specifically
"understood meaning in the art." Mass. Inst. of Tech. and Elec. for Imaging, Inc. v. Abacus Software, 462 F.3d 1344, 1354
(Fed. Cir. 2006) (finding that "colorant selection mechanism" did not have a sufficiently defined meaning in the art to avoid
means-plus-function construction). Finally, dictionary definitions to find synonyms are an appropriate method to aid in
resolving. Id.

Plaintiff does not use the word "means" in its claim and also argues that the '029 Patent explicitly states that means-plus-
fraction limitations should not apply, unless stated. See '029 Patent col. 48 l.6-14. In response, Defendant argues that
nonetheless Plaintiff's claim fails to give sufficient structure such that it can avoid a means-plus-function limitation.

This claim is properly construed in the means-plus-function format. "System" is of the same sort of generic term as
"means," "mechanism," and "device," defined as "a regularly interacting or interdependent group of items forming a unified
addition, the modifier "measurement" offers no further indication regarding what comprises the "system." See Mass. Inst. of
Tech., 462 F.3d at 1354 (finding that "colorant selection mechanism did not have a sufficiently defined meaning in the art
to avoid means-plus-function construction). Indeed, Plaintiff resorts to the specification in order to prevent its claim from
being construed in means-plus-function format. Defendant's argument is more persuasive, as the language of this claim does
not express a sufficiently definite structure. See TIP Sys., LLC, 529 F.3d at 1374 (citing CCS Fitness, Inc., 288 F.3d at
1369). Furthermore, this language is parallel to that of Claim 10 of the '029 Patent, which the parties agree is requires a
means-plus-function limitation, except that "measurement system" takes the place of "constraining means."

As for Plaintiff's argument that it did not intend means-plus-function construction for any claims not written in that format,
claim construction is a question of law for the court to decide. See Markman, 52 F.3d 967, 979. Finally, any citation of
Plaintiff to Watts v. XL Sys., Inc., 232 F.3d 877 (Fed. Cir. 2000), is distinguishable from this phrase because in Watts, even
if the court also looked to the specification, the claim itself had sufficient structure described. Id. at 879, 881 (finding that "a
second end formed with tapered external threads dimensioned such that one such joint may be sealingly connected directly
with another such joint" had sufficient structure to avoid means-plus-function construction).
The court does further bolster its argument by looking to the specification; however, only to confirm that sufficient and correct structure was provided by the claim. Id. Any more elaborate discussion of the use of the specification for purposes of construction in this case refer to construction, not determination regarding whether paragraph 6 of § 112 applies. Id.

Therefore, the court finds that this claim is properly construed in the means-plus-function format. Because the parties agree as to the construction of the claim if the court construes it in means-plus-function format, the court will construe "a measurement system for measuring the pressure in said at least one chamber" as follows:

Function:

measuring the pressure in the chamber or chambers.

Corresponding Structure:

a sensor or transducer.
be known. Hence, the claims recite a "step of measuring the temperature," which is how the temperature is ascertained or determined. The limitation's recitation of an act thus precludes application of § 112, P 6.

Aside from its step-plus-function argument, Defendant has presented no reason why these claim phrases should not carry their plain and ordinary meanings. The Court construes "measuring the temperature of the fluid, wherein the heating step is responsive to the step of measuring the temperature" as "determining the temperature of the cleaning fluid, wherein the heating step reacts or is responsive to such temperature determination."

For the reasons set forth below, the Court construes the claim term "meat" as "a single joint of boneless meat, not pressed meat."

The Court agrees with the defendant's contention that the doctrine of prosecution disclaimer applies in this case. "Arguments and amendments made during the prosecution of a patent application and other aspects of the prosecution history, as well as the specification and other claims, must be examined to determine the meaning of terms in the claims." Southwall Techs., Inc. v. Cardinal ID Co., 54 F.3d 1570, 1576 (Fed. Cir.), cert. denied, 516 U.S. 987, 116 S. Ct. 515, 133 L. Ed. 2d 424 (1995) (citing E.I. du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1438 (Fed. Cir.), cert. denied, 488 U.S. 986, 109 S. Ct. 542, 102 L. Ed. 2d 572 (1988)). "The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution." Id. at 1576 (citing ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1580 (Fed. Cir. 1988); Senmed, Inc. v. Richard-Allan Med. Indus., Inc., 888 F.2d 815, 818 (Fed. Cir. 1989)). "Claims may not be construed one way in order to obtain their allowance and in a different way against accused infringers." Id. (citing Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1562 (Fed. Cir. 1991)). This doctrine "promotes the public notice function of the intrinsic evidence and protects the public's reliance on definitive statements made during prosecution." Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1324 (Fed. Cir. 2003) (citing Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1347 (Fed. Cir. 1998)).

Courts will not apply the doctrine of prosecution disclaimer where the alleged disavowal of claim scope is ambiguous. Id. at 1324. "Prosecution disclaimer does not apply, for example, if the applicant simply describes features of the prior art and does not distinguish the claimed invention based on those features." Computer Docking Station Corp. v. Dell, Inc., 519 F.3d 1366, 1375 (Fed. Cir. 2008) (citing Eolas Techs., Inc. v. Microsoft Corp., 399 F.3d 1325, 1337 (Fed. Cir. 2005)). If, however, "the patentee has unequivocally disavowed a certain meaning to obtain his patent, the doctrine of prosecution disclaimer attaches and narrows the ordinary meaning of the claim congruent with the scope of the surrender." Omega, 334 F.3d at 1324. "A patentee could do so, for example, by clearly characterizing the invention in a way to try to overcome rejections based on prior art." Computer Docking Station, 519 F.3d at 1374. The patentee's statements must be both "clear and unmistakable." Omega, 334 F.3d at 1326.

The USPTO issued an Office Action on August 25, 1989, (the Office Action) rejecting Logan's patent application. Specifically, it rejected Claims 3-6 pursuant to 35 U.S.C. § 103 as being "unpatentable over Hoenselaar, Mart or Chesley in view of Doecken or Ferrarini." (Def.'s Markman Binder, Tab 4 at 2). The USPTO went on to state, "[i]t would be obvious to remove all bones from the spiral cut ham in any of the primary references since it is old to prepare a sliced ham from which the bones have been removed, as evidenced by either secondary reference. The 'support member' recited in the claims is not part of the final product." (Id.).

In his response, Logan makes various statements relevant to the issue of whether the doctrine of prosecution disclaimer should apply. Of specific importance is the following:

The present invention is directed toward a single joint of meat, not a pressed meat product. The present invention's commercial appeal is due substantially to the presentation of the meat as a single meat product having continuous spiral slices arranged around a longitudinal axis of unsliced meat in the absence of a bone. . . . [t]he use of pressed ham meat would not enjoy similar success as pressed ham is perceived as having a much lesser commercial appeal . . . [a]pplicant
respectfully submits that the Ferrarini reference is directed toward an entirely different product and does not teach the present invention: a single boneless meat product having a continuous spiral slice therethrough.

(Def.'s Markman Binder, Tab 5 at 6). Also in regard to the Ferrarini reference, Logan states that an attempt to spirally slice a ham following Ferrarini would cause the ham to disintegrate because of its pressed nature and lack of support. (Id. at 7). Logan further states that "the use of pressed meat in a boneless meat product significantly decreases [the product's] commercial appeal and value." (Id.).

The USPTO reviewed Logan's response and decided once more to reject claims 3-6 pursuant to 35 U.S.C. § 103. The USPTO found these claims "unpatentable over Hoenselaar, Mart, or Chesley in view of Doepkin. " (Def.'s Markman Binder, Tab 6 at 3). Although the USPTO said that Logan's arguments in response to the Office Action were unpersuasive, the USPTO did not reject the claims in view of Ferrarini as it had in August of 1989 when the Office Action was first issued.

The Court, therefore, finds that Logan clearly and unmistakably disavowed a certain meaning in an attempt to obtain his patent. Logan clearly characterized the product and process set forth in his patent application to overcome the USPTO's rejection of claims 3-6 in view of Ferrarini. He identifies his invention as "a single joint of meat, not a pressed meat product" in order to distinguish it from the product described in Ferrarini. He bolsters this with statements about Ferrarini's lack of structural support and lower commercial appeal and value. Although the USPTO chose not to change its decision to reject claims 3-6, it did accept Logan's arguments about Ferrarini and, as such, did not issue its rejection in view of Ferrarini as it had previously. The Court's decision to apply the doctrine of prosecution disclaimer in this case protects the public's reliance on Logan's clear and unmistakable statements.

Because the Court has determined that Logan's remarks constitute a clear and unmistakable disclaimer of the claim scope, the Court must now decide exactly what Logan disclaimed during the prosecution history. Specifically, the Court must define "a single joint of meat, not pressed meat." The Court will give this term its ordinary and customary meaning, which is the meaning it would have had to a person of ordinary skill in the art at question at the time of the invention. The Court has not only considered the intrinsic evidence, such as the '374 Patent, it has also reviewed patents for other inventions, expert and inventor declarations, and the Oxford English Dictionary.

8. Second Mechanical Connection

"Second mechanical connection" is the next term for construction. The term appears in claims 1, 13, 14, 26, 27, 39, 40, 41, 49 and 50 of the '410 patent; in claims 1, 10, 21, 22 and 28 of the '579 patent; and, in claims 1, 16, 21, 22, 33, and 34 of the RE '439 patent.

The Plaintiffs contend that "second mechanical connection" should be defined as "structures that lock the panels to each other in the direction parallel to the principal plane and at right angles to the joint edges." (Pls.' Open. Br. 30-32.) Pergo maintains that "second mechanical connection" means "the arrangement of the locking element projecting from the strip and the locking groove such that when the locking element is inserted into the locking groove the two panels are locked in the horizontal direction parallel to the principal plane of the panels and at right angles to the joint edges such that a play exists allowing the joined panels to slide movably (i.e., be displaced) along the joined edges and disassembled by being rotated about the joint edge." (Unilin's Open. Br. 18-21.)

In considering the parties' proposed definitions of "second mechanical connection," the Court notes that the Plaintiffs' proposed definition does not include "play" which is inherent in all the claims of the patents-in-suit. The specification explains that in the second mechanical connection a "play exists between the locking groove and a locking surface on the locking element that is facing the joint edges and is operative in said second mechanical connection" and "that the first and the second mechanical connection both allow mutual displacement of the panels in the direction of the joint edges." (579 patent, 4:19:23; 4:24-26.) As described in the specification, "the second mechanical connection is so conceived as to allow the locking element to leave the locking groove if the groove panel is turned about its joint edge angularly away from the strip." (579 patent, 4:27-30.)
The first portion of the Pergo's proposed definition is consistent with the specification. However, the latter portion of Pergo's definition is subsumed by the Court's definition of play and, therefore, is surplusage. See infra at 64. Thus, the Court defines "second mechanical connection" as "the arrangement of the locking element projecting from the strip and the locking groove such that when the locking element is inserted into the locking groove the two panels are locked in the horizontal direction parallel to the principal plane of the panels and at right angles to the joint edges such that a play exists."

2. "Mechanical Distortion"

In its original Claim Construction Ruling, the Court found that a person of ordinary skill in the art would understand the phrase "mechanical distortion" in Claim 21 to mean "by physical processes directed at the cannula." Although Plaintiffs concede that the Court's construction of "physical processes" is consistent with their proposed definition of "changing the diameter with the assistance of tools, fixtures, devices or machinery," they maintain that the Court improperly imported a limitation from the specification by requiring that these physical processes be directed at the cannula. (Pls.' Mem. at 5.) Instead, they ask the Court to include physical processes directed at the cannula and/or the plug. Id. at 6.

The primary focus of the original briefs was on what constituted a mechanical process and whether biological and chemical processes had to be expressly excluded. Defendant also argued that it was clear from the Specification that the "mechanical distortion" was a distortion of the cannula, which provides that the "cannula may be infinitesimally distorted externally to cause it to 'shrink' in the area of the plug and therefore hold the plug in position," (col. 4, ll. 13-16), and refers to "minute distortions of the cannula" (col. 4, ll. 64-67).

Plaintiffs, however, cite to the Summary of Invention, which states that "holding the biocompatible end plug in place inside the cannula . . . may be accomplished by modifying the diameter of the plug by mechanical distortion means" (col. 4, ll. 52-57) (emphasis added). Indeed, Claim 21 itself refers to modifying the diameter of the plug by mechanical distortion (col. 6, ll. 64-65).

The Court concedes that its earlier construction improperly read a limitation from the Specification into the claim, in contravention of the holding of Phillips v. AWH Corp., 415 F.3d 1303, 1323 (Fed. Cir. 2005)(en banc). Accordingly, upon reconsideration, the Court adopts the construction now proposed by Plaintiffs of "mechanical distortion," that is "by physical processes directed at the cannula and/or the plug."

V. "mechanically embossing" and "a mechanically embossed portion"

The parties contest the meaning of "mechanically embossing" as used in claim 1 of the '903 patent and "a mechanically embossed portion as used in claims 1, 9, and 11 of the '008 patent.

Mannington argues that "mechanically embossing" as used in claim 1 of the '903 patent "means a technique using an etched or engraved roll, etched or engraved plate, or a similar tool that is capable of imparting a sharp, detailed texture to the vinyl surface (relative to chemical embossing)." D.I. 326 at 17. To support this proposed construction, Mannington contrasts the phrase "any embossing technique known to the those skilled in the art can be used" as contained in the '903 specification ('903 at 6:23-24) with the phrase "the texture created by the chemical embossing technique does not have a well-defined sharpness of real, natural products" and the phrase "mechanical embossing, on the other hand, is capable of reproducing … subtle [sic, subtle], sharp, and shallow textures" to support its positive inference that the use of "mechanically embossing" in claim 1 of the '903 patent would be understood by those skilled in the art to mean sharp and detailed imprinting. Id. at 18.

Mannington also asserts that this construction is supported by the prosecution history. Id. at 19. Mannington further argues that "a mechanically embossed portion" as used in claims 1, 9, and 11 of the '008 patent "means that created by mechanical embossing." Id. at 17. Moreover, asserts Mannington, as used in this phrase "portion" has an ordinary and accustomed meaning referring to "[the] 'portion' of the cushioned sheet vinyl flooring that has been mechanically embossed, i.e., has

- 3008 -
sharp, detailed textures (relative to chemical embossing) imparted by the use of an etched or engraved roll, etched or engraved plate, or similar tool." Id. at 21.

Armstrong confines its argument to "a mechanically embossed portion" as found in claims 1, 9, and 11 of the '008 patent. As to this process limitation, Armstrong reiterates its argument that the court should not construe this language and, in the alternative, Armstrong argues that the phrase as used therein means that the mechanical embossed "portion" is limited to the raised areas. D.I. 324 at 20. Furthermore, argues Armstrong, "these portions are … distinct, [referring to] a mechanically embossed portion and a [separate] chemically embossed portion." Id.

Domco asserts the same meaning for "mechanically embossing" in claim 1 of the '903 patent and "a mechanically embossed portion" as used in claims 1, 9, and 11 of the '008 patent. As properly construed, Domco argues that "these claim terms … mean the portion of the wear layer surface where mechanical embossing imparts any indent mark." D.I. 142 at 20. Furthermore, Domco alleges, that "an indent [mechanical indentation] can have any desired shape or form and the specification explicitly states that 'any surface texture can be embossed onto the wear layer' and 'any embossing technique known to those skilled in the art can be used.'" Id. (quoting '008 3:62-63; 6:22-24). Moreover, Domco argues the prosecution history does not contravene this interpretation. Id.

Domco correctly notes that the inventors disclose in the '903 and '008 patents that mechanical embossing is accomplished by techniques commonly known in the art when the patent was filed. '903 at 6:10-13; '008 at 6:22-24 ("For purposes of the present invention, any embossing technique known to those skilled in the art can be used …."). In contravention of this express language, Mannington is attempting, now, for the purpose of the present litigation, to limit mechanical embossing to the mechanical embossing of sharp, detailed texture as opposed to the more subtle rounded texture produced by chemical embossing. D.I. 326 at 18.

Although some mechanical embossing instruments are probably designed specifically for imprinting sharp and detailed textures, the '903 and '008 patents teach that mechanical embossing can be accomplished by "any embossing technique known to those skilled in the art." '903 at 6:10-13; '008 at 6:22-24. It is a highly speculative proposition to assume that those skilled in the art of vinyl surface coverings only knew of and practiced sharp and detailed mechanical embossing techniques and neglected entirely the countless variations of product textures that could be manufactured with less sharply detailed mechanical embossing instruments. This court, therefore, will not read a sharp and detailed texture limitation into the claims of the '903 and '008 patent were none is expressly present. Having concluded this query, the question remains as to what "portion" of the surface covering may be mechanically embossed consistent with the invention taught and patented by the inventors.
