The final disputed claim term is "reticle image" or "reticle pattern," which appears in claims 1-14, 17-19, and 22 either expressly or by reference. As used in the '908 Patent, the term "reticle image" or "reticle pattern" means one of a series of lines, dots or crosshairs, capable of serving as a reference for centering or otherwise adjusting an optical element in a telescope.

The parties' dispute over this term concerned Glatter's assertion that the reticle image was required to be "axially symmetric," (Def.'s Opp. Br. at 3.) It was initially unclear what Glatter meant by "axially symmetric," whether he meant symmetric about one axis n8 or two, and if it were two whether those reference axes had to be at right angles to one another. It appears that Glatter meant the last possibility, the sort of two-dimensional crosshair images that appear in Figures 6-8 and 12-15: two lines lying at right angles to one another, or a shape that is symmetric about each of those lines. (Markman Tr. at 35:10-14.) Such images, especially when they contain spaced gradations, function well as a reference tool for (1) determining the center of an optical element, (2) determining whether an optical element's angular orientation is perpendicular with the laser beam's path, and (3) measuring the difference made by a particular adjustment. However, there is an issue as to whether or not "reticle image," as used in the patent, is limited to such a specific image.
Looking first to the claims, claim 1(a) provides "a reticle image having one of a series of lines, dots, or crosshairs." '908 Patent at 6:31-32. Glatter's brief cites an online dictionary definition for "reticle" as "a network of fine lines, dots, cross hairs, or wires in the focal plane of the eyepiece of an optical instrument." (Def. Opp. Br. at 3)(citing http://www.hyperdictionary.com.) Glatter comments that in light of his definition of the word reticle, the phrase "reticle image having one of a series of lines, dots, or crosshairs" in claim 1 is redundant. (Id.) The Court agrees with Glatter's comment, which indicates that claim 1 contains the definition of "reticle image," as used in the patent. Therefore, the patent contains a clear definition of the term in claim 1, which contains no limitation of "axial symmetry."

Next, the term "axially symmetric" does not appear anywhere in the '908 Patent. However, figures 6-8 and 12-15 in the '908 Patent contain reticle images that happen to be "axially symmetric" by Glatter's definition. Additionally, the only references to specifically shaped reticle images are to images that happen to be axially symmetric. '908 Patent at 2:21-27, 3:13-6:27. Nonetheless, the figures and descriptions are limited to the preferred embodiment, and courts should "avoid the danger of reading limitations from the specification into the claim[s]." Phillips, 2005 U.S. App. LEXIS 13954, 2005 WL 1620331, at *15. There are examples of common geometric images, "composed of one of a series of lines, dots, or crosshairs" that are not "axially symmetric," according to Glatter's definition. n9 Therefore, the problem with imposing "axially symmetric" on the term "reticle image" is the danger that it unduly limits the scope of the patent by "confining the claims to [the preferred] embodiments." Id. There is nothing in the patent's specification that limits term "reticle image" to "axially symmetric" images.

n9 The most glaring example would be a triangular pattern or crosshair with three lines, equally spaced from one another in a two-dimensional plane, coming from a center point. Such an image would not be "axially symmetric" - having lines spaced at ninety degrees from one another, or shapes symmetric about such lines - but could serve the same function according to the patent. (The same would be true of any crosshair with an odd number of equally spaced lines stemming from its center.) Other examples of common patterns that are not "axially symmetric," or symmetric about any line, are those that only exhibit point symmetry - shapes wherein all of the components can be reflected through a center point and form the same image. These can include shapes that are not axially symmetric, like the letters "Z" and "S," and any geometric shape with a single diagonal line (that does not run along an axis of symmetry existing in the shape alone) passing through it, e.g., a rectangle with a diagonal passing from one corner to he opposite corner through its center.

Nonetheless, Glatter argues that a person of ordinary skill in the art would interpret the term "reticle image" to be limited to "axially symmetric" images. (Id. at 1-2.) It is clear that a person of ordinary skill in the art would be familiar with the term reticle. In fact, some definitions of the term reticle reference telescopes. The Oxford English Dictionary (2d ed. 1989), for example, defines "reticle" as "[a] set of parallel wires, threads, etc., with others intersecting them at right angles, or of lines similarly ruled upon a sheet of glass, placed in the object-glass of a telescope, in order to facilitate accurate observations." However, Webster's Third New Int'l Dictionary 1938 (1986), similar to Glatter's proffered dictionary definition, supra, defines "reticle" as "a system of lines, dots, cross hairs or wires in the focus of the eyepiece of an optical instrument (as a gunsight, microscope, telescope, or transit) used typically for estimating speed or distance, for measuring or counting, or as a centering or aiming device." The issue is whether one of ordinary skill in the art would understand the term reticle to be limited to "axially symmetric" patterns or images. The above dictionary definitions of "reticle" differ on the issue, because one presents examples that are "axially symmetric," as Glatter uses the term, while the other is silent as to that limitation. Thus, there is no clear indication that one of ordinary skill in the art would presume that limitation. Since there is no limitation in the claims, no limitation in the specification, and no mention of axial symmetry in the patent or the dictionary definition, this Court will not impose that limitation on the term "reticle."
III. Discussion

Kastner argues the Court erred at the stage of claim construction by defining the term "retract" narrowly. He also presents new evidence which, he contends, shows a genuine issue of material fact as to whether the studs in the Accused Products "retract," and he argues it was therefore error for the Court to grant summary judgment to Chet's Shoes. Because the parties have presented significant arguments and evidence, the Court grants reconsideration. The Court reaffirms its conclusions, however, on reconsideration.

A. Claim Construction of the Term "Retract"

Kastner accurately observes "the Court has limited the claims of the '283 patent to a stud that retracts until the tip of the stud is flush with the immediately surrounding surface of the sole or cleat." Doc. 65 at 3. Arguing this claim construction was error, Kastner points to the language of the '283 patent, which only requires the tip of the stud to be "substantially at the plane of said bottom surface of said sole," rather than flush with the immediately surrounding bottom surface. Doc. 45-4 at 6 ('283 Patent). He then asserts no prior art existed to require a narrower definition of "retract" than that contained in the patent itself. Kastner maintains he was the first to invent a stud capable of moving inward, so it was not necessary to limit the type of movement covered by his patents to true retraction (i.e., actually sliding or pulling up into the immediately surrounding rubber). See Doc. 60-1 at 3-5.

Despite Kastner's arguments, the Court declines to alter its conclusion as to the proper claim construction of "retract." As explained in the ruling on summary judgment, the narrower definition of "retract" is necessary to avoid prior art and invalidation on obviousness grounds. See Doc. 56 at 19-21. Common sense and a trip to the local outdoor outfitters will reveal that studded shoes with flexible rubber bottoms have long existed — a fact which Kastner admitted in his patent application. See Doc 24-2 at 18 (Response to Official Action at 4) (acknowledging various prior art, including Olsson's patent for studs embedded in a resilient sole). For many of these studded shoes, the resilient material of the sole allows the sole to deform when weight is distributed unevenly, when the terrain underfoot is uneven, or when the sole treads have irregular high-relief features. Due to the sole's deformation in these situations, one or more studs may end up vertically displaced (along with the surrounding area of sole) such that the stud tip is momentarily level with the rubber surface elsewhere on the sole. This kind of stud movement, due to asymmetrical pressure and flexing of the sole material, is nothing unusual, and is inherent in having a resilient sole. Cf. Doc. 24-9 (patent describing Olsson's method of fixing studs into a rubber or plastic sole, in which the sole itself remains free to flex or deform under pressure).

Kastner would have the Court interpret the term "retract" in his patents very broadly. In his view, a stud embedded in a flexible sole "retracts" if the sole can be deformed in any way such that the stud moves upward and its tip comes into line with the rubber surface somewhere — anywhere — on the sole. See, e.g., Doc. 60-1 at 4. This claim construction is too broad because, as noted above, it would encompass existing studded shoes with resilient soles and would place Kastner's patents in danger of invalidity for obviousness. See 35 U.S.C. § 103. For this reason, in ruling on summary judgment the Court construed the term "retract" in Kastner's patents more narrowly. See Doc. 56 at 20; Modine Mfg. Co. v. U.S. Int'l Trade Comm'n, 75 F.3d 1545, 1557 (Fed. Cir. 1996) (noting claims "should when reasonably possible be interpreted so as to preserve their validity"), overruled on other grounds,Festo Corp. v. Shoketsu Kinzoku Kogyo Kabushiki Co., 234 F.3d 558, 574 (Fed. Cir. 2000) (en banc). This was explained in the previous ruling and remains true.

Although Kastner now contends about the Court limiting his patents to studs that truly "retract," during the course of prosecuting his patent he explicitly acknowledged the narrower meaning of the term. In particular, he distinguished prior art by clarifying the term "retract" in his patent meant depressing the stud within the surrounding rubber of the sole: "While Olsson does disclose a metal stud the anchoring portion of which appears to be surrounded by a material that may be resilient, there is no disclosure whatsoever in Olsson that the stud is depressed within the body of the sole during wear of the shoe." Doc. 24-2 at 18 (Response to Official Action at 4) (emphasis added). This shows Kastner himself distinguishing true retraction, where the stud actually slides or presses up into the surrounding sole material, from mere sole deformation, where the stud moves upward along with a surrounding area of sole rubber. Thus, in ruling on summary judgment, this Court was simply reading the term "retract" in the way Kastner conceded it must be read. The Court required studs to actually slide or press up into the surrounding sole material, such that the tip of the stud becomes flush with the immediately
surrounding bottom surface of the sole — which is nothing more than a detailed way of saying the studs must pull up into a position completely "within the body of the sole."

Kastner further confirmed this interpretation of "retract" in the course of distinguishing other prior art in his patent application. The Tomuro patent describes a resilient sole with spikes that are completely retracted until the wearer places weight on the sole. See Doc. 24-11. In their retracted position, the spikes are wholly within the rubber sole, such that the spike tips are flush with the immediately surrounding bottom surface of the sole. See id. at 2 (illustrations). Noting the type of stud movement in the Tomuro shoes — from this fully withdrawn position to a protruding position — Kastner wrote, "Tomuro, it is submitted, performs in precisely the opposite way from . . . [my] invention." Paper 24-2 at 16 (Response to Official Action at 2). Kastner thus envisioned his own studs retracting to an end-point similar to Tomuro's starting point — where the stud tips would be flush with the immediately surrounding rubber surface. He cannot complain, then, when the Court construes "retract" in precisely this way and requires a retracted position similar to that of Tomuro's retracted spikes.

For the above reasons, as well as those contained in the March 30, 2010 ruling on summary judgment, the Court's claim construction of the word "retract" was correct, and is not altered on reconsideration.
a support bracket that supports the table top support surface adjacent and in line with to [sic] the conveyor surface and in a position for receiving a horizontal stack of folded from [sic] the conveyor,
said support bracket including a pivot mechanism positioned along the table top and having a pivot axis substantially transverse to the downstream direction so that said table pivots from a substantially horizontal position to a substantially vertical position to likewise move the stack from a horizontal to a vertical stack position,
at least one retractable backing surface substantially transverse to a plane defined by the table top that supports a bottom of the stack when the table is pivoted to a substantially vertical position,
and a cart movable to a position adjacent said tilted table for receiving from said table said vertical stack, wherein the retractable backing surface is retracted to allow the vertical stack located thereon to be received from said table.

Wallace defends its narrow interpretation in several ways, contending that claim 1's "retractable" language is narrowed by the specification, the patent's other claims, and the prosecution history of the '516 patent, to require retraction into the table top. Specifically, Wallace points out that (1) the patent's specification and commercial embodiment contain a sliding door which retracts into the table to transfer the paper stack to the wheeled cart, (2) three other independent claims of the patent, claims 21, 27 and 34, require a retractable backing surface which, in a retracted position, allows the paper forms to pass from the conveyor to the table top free of obstruction (suggesting retraction into the table), (3) Roll's original patent application included a specification that described a sliding door, and (4) Roll's original patent claims, which did not require a retractable backing at all, were rejected as unpatentable.

From these facts, which are undisputed, Wallace concludes that the retractable backing surface in claim 1 must be interpreted to require a backing that draws into the table, like the one contained in Roll's specification and commercial embodiment.

The Federal Circuit has made it clear that the words of a claim are to be given their ordinary meaning unless it appears that the inventor used them differently. Hoganas AB v. Dresser Industries, Inc., 9 F.3d 948, 951 (Fed. Cir. 1993). Webster's New World Dictionary (3rd ed. 1988) defines "retract" as "to draw back or in," or "to withdraw or disavow." The word "retract," then, is not ordinarily limited to mean "draw in." Wallace argues, however, that the term has been restricted to this definition by Roll's intent, as evidenced elsewhere in the '516 patent and its prosecution history.

When the meaning of a word contained in a patent claim is disputed, specification and prosecution history can provide relevant information about the scope and meaning of the claim. Read, 970 F.2d at 823. Wallace correctly notes that "though inventors may be their own lexicographers, they must use words in the same way in the claims and in the specification." Fonar Corp. v. Johnson & Johnson, 821 F.2d 627, 632 (Fed. Cir. 1987), cert. denied, 484 U.S. 1027, 98 L. Ed. 2d 764, 108 S. Ct. 751 (1988). But this tenet of patent interpretation must be considered alongside another important principle of claim construction: "that interpreting what is meant by a word in a claim 'is not to be confused with adding an extraneous limitation appearing in the specification, which is improper.'" Intervet America, Inc. v. Kee-Vet Laboratories, Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989) (quoting E.I. du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir.), cert. denied, 488 U.S. 986, 102 L. Ed. 2d 572, 109 S. Ct. 542 (1988))(emphasis in original). 3 Wallace has failed to heed the Intervet Court's warning -- it confuses precisely these ideas. Fonar provides a good illustration of the proper use of a specification in interpreting the language of a patent claim. In that case, the patent at issue described an imaging system which used nuclear magnetic resonance to detect cancerous cells. One claim limitation required a comparison of "the values obtained in [step] (b) against the standards obtained in [step] (a)." The plaintiff contended that, within the meaning of its
patent claims, the term "standard" was broad enough to signify a "baseline" of "images" stored in a doctor's memory. The Court disagreed, holding that because the specification used "standard" only to refer to numerical data, it contained no evidence supporting the plaintiff's "images' theory. Put another way, the specification implied a meaning other than the one urged by the plaintiff. Here, in contrast, Roll's specification supports its contention that "retractable backing surface" is one that can be withdrawn from the stack to transfer it. The device described by the specification, a sliding door, is one mechanism by which this transfer may be accomplished. The fact that the sliding door retracts into the table does not imply, however, that other forms of retractable backings are not contemplated by the inventor. See Specialty Composites v. Cabot Corp., 845 F.2d 981, 987 (Fed Cir. 1988) ("Where a specification does not require a limitation, that limitation should not be read from the specification into the claims." (emphasis in original)). In Specialty Composites, the defendant contended that the term "plasticizer," as it was used in plaintiff's patent, referred only to "external" plasticizers. Its evidence was the fact that the specification provided three examples of plasticizers, all external. The Court rejected this limited definition, noting that "what is patented is not restricted to the examples, but is defined by the words in the claims . . . . The emphasis is on the suitability of any plasticizer that will achieve the specified properties, not on the particular class of plasticizer." Id. at 987. Here, Wallace attempts to narrow claim 1 in exactly the way Specialty Composites forbids: Wallace contends that because the "retractable backing surface" described in Roll's specification also retracts into the table top, each claim of the patent requires a backing that retracts into the table. In fact, claim 1 requires only a retractable backing surface, transverse to the table top, which can be retracted "to allow the vertical stack thereon to be received from the table." The sliding door, like the external plasticizer, is merely one way of satisfying a requirement that could perhaps be performed in various ways.

Footnotes

3 The Federal Circuit has recently reconfirmed this principle in Electro Medical Systems, 34 F.3d 1048, 1054 (Fed. Cir. 1994) (patent claims are not to be interpreted by adding limitations appearing only in a specification -- although specifications may well indicate that certain embodiments are preferred, particular embodiments appearing in specification will not be read into claims when claim language is broader than such embodiments).

End Footnotes

Wallace's argument with respect to other, more limited claims of the patent is unpersuasive for the same reason. For example, independent claim 27 requires two backing surfaces, one at the "downstreammost" end of the tilting table, and:

a second backing surface positioned at an upstream most end of the table, the second backing surface extending substantially transversely to the table surface and being movable between an extended position and a retracted position, the second backing surface being constructed and arranged so that, in a retracted position, the folded [paper] web passes thereover from the conveyor free of obstruction by the second backing surface, the second backing surface being constructed and arranged to support the folded web in a vertical stack, with the second backing surface positioned at a bottom of the stack when the table is pivoted to a substantially vertical position; and a cart having a base and a vertical wall, the cart further including wheels so that it is portable, the base being located at a height from the ground that is approximately equal to the height from the ground of the second backing surface when the table is pivoted to a substantially vertical position so that the stacks supported thereby can be moved from the backing surface to the cart by positioning the cart base beneath the backing surface and moving the backing surface to a retracted position wherein the stack drops onto the cart base and supported thereby [sic].

U.S. Patent No. 5,273,516 at column 8, lines 50-68 and column 9, lines 1-7. Wallace contends that, in light of claim 27 and two other independent claims like it, 4 the "retractable backing surface" required by claim 1 must be interpreted as one that withdraws into the table top. Again, Wallace mistakes an improper construction for a proper one: The fact that claim 27 requires a backing surface which, in a "retracted" position, allows the paper forms to pass over the backing surface does not suggest that the word retracted, standing alone, implies such an arrangement. Rather, the claim includes an additional limitation -- that the backing may be drawn beneath the flow of moving paper forms. However, this limitation does not appear in, and is not required by, claim 1.

Footnotes

4 Claims 21 and 34 also require backing surfaces, in a retracted position, allow the paper to pass from the conveyor to the table free of obstruction.
Nor does the prosecution history of the '516 patent support Wallace's interpretation of claim 1. Although prosecution history may limit claims to exclude any interpretation disavowed during prosecution, Roll's original patent application did not include the word "retractable" at all. Therefore, there was no discussion during prosecution as to the meaning of the word, and no meanings were disclaimed by Roll Systems. Accordingly, the prosecution history of the '516 patent is not evidence that Roll intended to use the word in the limited sense urged by Wallace.

The specification, as originally submitted, does describe a sliding door. However, as set forth above, elements of a specification are not to be interpreted as claim requirements. Moreover, even if a sliding door was required by the original claims, to read this limitation into claim 1 would be to ignore what the Intervet Court calls "the impropriety of injecting into claims limitations from the prosecution history. Ambiguity, undue breadth, vagueness, and triviality are matters which go to claim validity . . . not to interpretation or construction." Id.

Furthermore, while it is true that Roll's claims were not deemed patentable until they were amended to require a retractable backing surface, this fact does not suggest that the backing surface required must withdraw into the tilting table. The original claims required no transfer mechanism at all. An examination of the prosecution history reveals that the patent office examiner amended claim 1 in the following way (examiner's omissions shown with a line through them, additions in italics):

at least one retractable backing surface substantially transverse to a plane defined by the table top that supports a bottom of the stack when the table is pivoted to a substantially vertical position,

and a cart movable to a position adjacent said tilted table for receiving from said

table said vertical stack [O>for support of said vertical stack on said cart.<O] wherein the retractable backing surface is retracted to allow the vertical stack located thereon to be received from said table.

Wallace's Exhibit B at 60. The unamended claim required no transfer mechanism whatsoever. The amendments merely limited the claim to describe a system which transfers the vertical stack by retracting the surface on which the stack rests. The examiner did not distinguish between retractable backings that retract into the table top and those which do not.

There is, therefore, a lack of evidence supporting Wallace's interpretation of claim 1. There are also several principles of construction which, when applied to the facts at hand, suggest that the term "retractable" must be broadly defined.

First, "narrow claim limitations cannot be read into broad [claims] whether to avoid invalidity or to escape infringement." Marsh-McBirney, Inc. v. Montedoro-Whitney Corp., 882 F.2d 498, 504 (Fed. Cir. 1989) 5 (quoting Uniroyal, Inc. v. Rudkin-Wiley Corp., 837 F.2d 1044, 1054 (Fed. Cir. 1988)). Here, claims 4, 5 and 6, each of which is dependent upon claim 1, recite "sliding door" requirements:

4. A system as set forth in claim 1 wherein said table has a sliding door at one end thereof.

5. A system as set forth in claim 4 wherein said sliding door is disposed at an end of said table adjacent said conveyor.

6. A system as set forth in claim 5 wherein said sliding door has a first position in which it is disposed under said table top support surface and a second position in which it extends over the table top support surface for holding an end of a stack of folded material disposed on the table.

5 The Court's opinion was vacated on other grounds in 1991. 498 U.S. 1061. Subsequently, however, the Federal Circuit reinstated the sections of the opinion relied upon here. Marsh-McBirney, Inc. v. Montedoro-Whitney Corp., 939 F.2d 969
These dependent claims describe the sliding door which Wallace contends is required by claim 1. Under Marsh-McBirney, however, Wallace proposes an impermissible inference: that these dependent claims require no more than the independent claim on which they rely. See also Specialty Composites, 845 F.2d at 987-88. (holding that the "plasticizer" required by the independent claims at issue did not refer solely to an external plasticizer: "Since the dependent claims 8 and 16 add an external plasticizer as a limitation, the broader independent claims 1 and 11 do not have this limitation.").

Further evidence that claim 1 does not require a backing surface which withdraws into the table is found in the use of the word "retract" in dependent claims 30 and 31 of Roll’s patent. Those claims require a "pivotable flap" which bridges the space between the conveyor belt and tiltable table to prevent forms from falling between the two as they are passed onto the table top. The claims describe a flap which is movable between two positions: an extended position (in which it bridges the gap) and a retracted position (in which it disengages from the tiltable table like a drawbridge and rises until it stands up at the end of the conveyor belt to prevent the folded forms from falling to the ground while the tiltable table transfers a stack to the cart (see the flap marked 50, figure 3). In this context, the word "retract" is used to mean "withdraw" or draw back, rather than "withdraw into."

In sum, no evidence supports Wallace's theory that claim 1’s "retractable backing surface" must withdraw into the table top. In the absence of proof that such a restricted meaning was intended, the ordinary meaning of "retract" -- to draw back or in, or to withdraw -- is assumed. Hoganas AB v. Dresser Industries, Inc., 9 F.3d 948 (Fed. Cir. 1993). Claim 1, therefore, requires a backing surface transverse to the table top which supports the stack of paper and withdraws, or draws back or in, to transfer the stack to the cart.

9. Retractable Filter Cover

The term "retractable filter cover" only appears in the claims of the '609 patent. The phrase was not present in the '130 application specification as filed, but was added by amendment during prosecution. The term first appears in claim five of the '609 patent, which reads in pertinent part:

A filter assembly for use with a regulator device, said filter assembly comprising:

   a housing . . . ;

   a retractable filter cover disposed within said passageway, said filter cover having a range of motion between (i) a closed position in which said filter cover blocks said gas inlet opening and prevents fluid flow therethrough and (ii) an open position in which said filter cover permits fluid flow through said gas inlet opening, said filter cover being biased toward said closed position, said filter cover intercepting a plane defined by an upstream end of said first attachment portion when in said closed position; and

   a filter disposed in said passageway downstream of said filter cover.

'609 patent claim 5 at 20:6-27 (emphasis added).

Because "retractable filter cover" was added by amendment, Aqua-Lung claims that the term merely is a new name for an element already identified within the specification, namely the "pressure responsive element." Aqua-Lung, therefore, offers the same construction for both terms: "A gas pressure-responsive valve closure element that covers the filter and has a rounded or tapered head to seal the gas inlet opening from inside in the absence of applied gas pressure, and which is displaced axially against the action of a spring to open the gas inlet opening in the presence of applied gas pressure." Two Forty's proposed construction is: "A portion of the device which can be moved from a first position where it prevents flow into the device, to a second position, where it allows flow into the device." Two Forty asserts that their proposed claim
construction is based on claim language and context, use of the term in the specification, and the meaning understood by those skilled in the art.

Since the term appears only in the claims, understanding the claim term in light of the specification relies less on specific usage of the term and more upon the overall context of its use. In other words, the construction depends upon how one skilled in the art would understand "retractable filter cover" based on the invention disclosed in the patent. As stated in the priority '130 application, the patents-in-suit disclose an invention solving a problem in the sport of scuba diving. That is, the invention prevents inadvertent entry of water and other contaminants into the regulator when not connected to a pressurized fluid. As described in the background of the invention, the dust cap or dust cover is the prior art method for preventing such contamination.

In light of the object of the invention and use of the term within the claims, one skilled in the art would understand that the "retractable filter cover" is the element that solves the problem of contamination by blocking fluid flow when it is in a closed position. Aqua-Lung argues that the filter cover must operate to cover the filter entirely, but that reading has no basis in the specification. In the disclosed embodiments, and claim five of the '609 patent, the filter is a downstream element from the retractable filter cover. As long as the "retractable filter cover" prevents fluid flow when it is in the closed position, it serves the intended function within the invention. In this manner, the "retractable filter cover" serves the same function as the prior art dust cover, which does not cover the filter in the sense argued by Aqua-Lung.

Additionally, Aqua-Lung's proposed construction imports structural limitations into the definition by requiring that the "retractable filter cover" possess a rounded or tapered head. As Aqua-Lung contends that "retractable filter cover" means the same thing as "pressure responsive element," it refers to the description of the latter in the specification. Specifically, Aqua-Lung argues that all ten of the embodiments of the "pressure responsive element" in the priority specification disclose a curved head. The specification, however, also states that while curved upper surfaces are preferred, "other surfaces shapes and arrangements may be used to plug or seal the opening 80." '609 patent at 9:24-29. Two Forty also notes that the patent specification expressly maintains that the invention should not be limited by the specific embodiments. Id. at 8:44-46. Because one skilled in the art at the time would read the specification as encompassing additional surface shapes, adding a rounded or tapered head to the definition of "retractable filter cover" is not warranted. Furthermore, because one skilled in the art would recognize the spring as a separate element of the patentee's device, reference to a spring within the construction of "retractable filter cover" is likewise unnecessary. For the foregoing reasons, the Court construes "retractable filter cover" to mean "an element of a device which can move from a first position where it prevents fluid flow into the device, to a second position, where it allows fluid flow into the device."

Retraction Mechanism

The parties also ask the Court to construe the term "retraction mechanism" in Claim 22 of the 011 Patent and Claims 25, 36, and 41 of the 077 Patent. With little argument, NMT asserts that "retraction mechanism" means "the needle holder and spring." In contrast, RTI proposes that "retraction mechanism" means "a mechanism comprising, at least, a needle holder and biasing element." The Court notes that the parties have asked the Court to interpret only the two words "retraction mechanism."

Again, the Court begins with the ordinary meaning of "retraction mechanism." "Mechanism" means "a piece of machinery," and "retract" means "to draw back in." MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY 719, 997 (10th ed. 2001). Machine is further defined as "a mechanically, electrically, or electronically operated device for performing a task." Id. at 695. Thus the Court begins with a heavy presumption that "retraction mechanism" means "a device which draws back in." The parties do not direct the Court to evidence from the specification which would limit "retraction mechanism" to a needle holder and biasing element, but rather take those limitations from claim language.

Claim 22 of the 011 Patent and Claim 36 of the 077 Patent limit "retraction mechanism." In relevant part, Claim 22 of the 011 Patent declares:

- 3968 -
needle holder and needle frictionally held by the wall of the syringe body with the needle extended from the nose portion, a biasing element applying a retraction force to the needle holder and a fluid path traversing the needle and needle holder.

Claim 36 of the 077 Patent, which is dependent on Claim 25 of the 077 Patent, declares that "the retraction mechanism comprises a needle holder held in an unretracted position by a removable ring member." Claims 25 and 41 of the 077 Patent use "retraction mechanism" without any definition. Thus, the "needle holder" and "biasing element" limitations come from definitions provided in Claim 22 of the 011 Patent and Claim 36 of the 077 Patent.

Claim 36 of the 077 Patent does not limit Claim 25 of the 077 Patent. Under the theory of claim differentiation, "there is a rebuttable presumption that different claims are of different scope." Sunrace Roots Enter. Co., LTD v. SRAM Corp., 336 F.3d 1298, 1303 (Fed. Cir. 2003). That presumption is "especially strong" where the limitation under consideration is the only meaningful difference between the independent and dependent claim and a party argues that the limitation in the dependent claim should be read into the independent claim. Id. Here, Claim 36 is dependent on Claim 25 via Claim 35. 3 The only meaningful difference between Claim 35 and 36 is Claim 36's limitation on the "retraction mechanism." Thus, there is an "especially strong" presumption that "retraction mechanism" as used in Claim 35 does not include Claim 36's limitations. Because Claim 35 does not change the definition of "retraction mechanism" from Claim 25, the Court must read those definitions consistently and find that Claim 36 also does not limit Claim 25.

Furthermore, if "retraction mechanism" as used in Claim 25 does not contain Claim 36's limitations, then "retraction mechanism" as a term should not contain Claim 36's limitations. The Court sees no reason to apply dependent Claim 36's limitations to wholly unrelated claims like Claim 22 of the 011 Patent and Claim 41 of the 077 Patent. Also, to apply Claim 36's limitations to other claims but not to Claim 25 would create competing definitions of "retraction mechanism" without reason. Therefore, reading all claims consistently, "retraction mechanism" in Claim 22 of the 011 Patent and in Claim 41 of the 077 Patent also do not contain Claim 36's limitations.

The Court also finds that NMT's proposed definition is inappropriate for Claims 25 and 41 of the 077 Patent. As noted above, Claims 25 and 41 do not restrict the term "retraction mechanism," and Claim 36's limitations should not be read into the other claims. Thus, any restrictions on "retraction mechanism" in Claims 25 and 41 of the 077 Patent must come from Claim 22 of the 011 Patent. 4 Furthermore, both parties's proposed definitions implicitly agree that Claim 22 of the 011 Patent must limit "retraction mechanism" as used in the remaining claims. The Court rejects NMT's proposed construction because there is no basis to limit the "retraction mechanism" to something that employs a spring. Claim 22 uses the term "biasing element" rather than spring. The parties have not asked the court to construe "biasing element," but it is presumably a broader term than "spring."

In conclusion, the Court defines "retraction mechanism" as a "device which draws back in comprising, at least, a needle holder and biasing element." As discussed above, the term "a device which draws back in" directly reflects the term's plain and ordinary meaning. Also, the language "comprising, at least, a needle holder and biasing element" reflects limitations from Claim 22 of the 077 Patent which the parties have agreed should exist in this term. The parties have agreed to those limitations by including them in their proposed constructions. The Court does not adopt NMT's construction because it finds no basis to limit the device to a spring. The Court expands RTI's construction with the phrase "a device designed to draw back in" to more accurately describe the "retraction mechanism's" purpose. Finally, as discussed supra, the Court does not read Claim 36's limitations into the other claims.
Return duct from said intercooler

Rice believes that this term need not be construed in that the ordinary and customary meaning of the term is clear. However, to the extent the Court finds construction necessary, Rice proposes that this term should be construed to read, "air duct through which air from the intercooler passes toward the high pressure compressor." While Rolls-Royce agrees the term need not be construed, Rolls-Royce asserts its construction, "conduit for conveying air back from the externally mounted intercooler (defined)." The specification notes that "air is compressed in a low-pressure compressor 24 which is driven coaxially by turbine 28. Said air is diffused and then ducted to intercoolers 38 and 40 where said air is cooled before being ducted back to be further compressed by high-pressure compressor 44 driven by turbine 46." See col. 16, lines 11-16 (emphasis added). The specification is more precise that the air is not just passing through, but is being ducted back or returned.

Therefore, the Court construes "return duct from said intercooler" as "conduit for conveying air back from the externally mounted intercooler (defined)."

A. The Pocrass '317 Patent

Claim 1 of the Pocrass '317 patent is set forth below. The parties dispute the meaning of the underlined language:

1. An RJ type modular connector for receiving a plug to form an electrical connection in data communication or telecommunication applications comprising:

   a housing formed by front, rear, top and bottom wall and having a plug receiving opening formed with the front wall thereof;

   at least one light emitting source integrally secured within said housing adjacent the plug receiving opening thereof to provide visual verification of the status of the electrical connection;

   a plurality of conductor wires, including conductor wires from said light emitting source, extending through one of said housing walls arranged in a predetermined spaced-apart array, adapted for insertion within a corresponding array of spaced holes in a printed circuit board.

1. Whether the claim is limited to "RJ type modular connectors"

The parties dispute whether the specification indicates that the invention is directed to RJ type modular connectors in particular or electrical connectors in general. While "RJ type modular connectors" are mentioned in the preamble, Maxconn asserts that the language does not function as a limitation, and that the claims themselves describe the particular connector of the invention. Conversely, Plaintiffs argue that the claim should be read as limited to RJ type modular connectors. 1

--------------- Footnotes ------------------

1 An RJ modular connector is a specific type of electrical connector which receives a plug containing several conductor wires to form an electrical connection with each wire.

--------------- End Footnotes  ---------------

- 3970 -
The determination of whether preamble recitations are structural limitations or mere statements of purpose or use "can be resolved only on review of the entirety of the patent to gain an understanding of what the inventors actually invented and intended to encompass by the claim." Corning Glass Works v. Sumitomo Electric U.S.A., 868 F.2d 1251, 1257 (Fed. Cir. 1989). Where a patentee uses the claim preamble to recite structural limitations of his claimed invention, the PTO and courts give effect to that usage. See id. On the other hand, where a patentee defines a structurally complete invention in the claim body and uses the preamble only to state a purpose or intended use for the invention, the preamble is not a claim limitation. See Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 620 (Fed. Cir. 1995); Kropa v. Robie, 38 C.C.P.A. 858, 187 F.2d 150, 152 (C.C.P.A. 1951). To determine whether the preamble provides a limitation to the invention claimed, the court should assess whether the claim preamble gives "life and meaning" to the claims. See Kropa, 187 F.2d at 152. The court may look to the patent specification to determine whether the claimed invention includes preamble recitations. See Bell Communications, 55 F.3d at 621; Vaupel Textilmaschinen KG v. Meccanica Euro Italia SPA, 944 F.2d 870, 880 (Fed. Cir. 1991); Corning Glass Works, 868 F.2d at 1257.

In the Pocrass '317 patent, the patentee uses the claim preamble to recite structural limitations of the claimed invention. The specification makes it clear that the invention of the '317 patent is limited to electrical connectors known as RJ type modular connectors. As background to the invention, the inventor repeatedly states that his invention relates to RJ connectors. Pocrass '317 patent, col. 1:12-25. The inventor also states that he has "invented an RJ connector with at least one LED integrated into the module," Pocrass '317 patent, col. 1:26-27, and that "it is the object of the present invention to provide an RJ connector including an LED formed integral therewith," Pocrass '317 patent, col. 1:45-47. In addition, in the prosecution history, the term RJ type connector was specifically relied upon in arguments to distinguish the claims over the prior art.

Accordingly, the claim should be construed such that "RJ type modular connectors" serves as a limitation to the claim. The Court adopts Plaintiffs' interpretation as follows: "a connector for receiving a plug to form an electrical connection of the type referred to as an RJ modular connector." At oral argument, Maxconn did not dispute this interpretation.

The Court finds that in the context of the '075 patent, "rib" means an elongated structural element, running radially along the flange that axially extends to a height sufficient to engage a second flange's annular rim. The Court must start with the language of the claim itself. See Pitney Bowes, 182 F.3d at 1305; Comark, 156 F.3d at 1186. Claim 31 reads, in pertinent part:

A flange . . . comprising:

an annulus having at least one annular rim, said annular rim extending axially from a first side of the annulus;

* * *

a plurality of ribs disposed on said first side of the annulus, said plurality of ribs having an axial height sufficient to engage a second flange's annular rim that axially extends from a first side of a second flange to facilitate registration of a reel assembly including the flange with a second reel assembly including the second flange and to retain the reel assembly in registration with the second reel assembly.

'075 Patent, col. 12, ll. 62-67 to col. 13, ll. 1-8. Starting with the plain meaning of the word, "rib" connotes an elongated piece that runs along the "length" of something else. Webster's Dictionary defines rib as "an elongated elevation running the length of an object." Webster's Third New Int'l Dictionary 1950 (Merriam-Webster, Inc. 1981). In the context of a flange with an annulus, the length would be the radius of the flange. Furthermore, the claim language itself requires that a rib axially extend to a height sufficient to engage a second flange's annular rim. This latter requirement is particularly pertinent to the purpose of the rib, "to facilitate registration of a reel assembly . . . with a second reel assembly . . . ." '075 Patent, col. 13, ll. 4-7. Based on this analysis, the claim language seems to support the following definition of rib: an elongated structural element, running radially along the flange that axially extends to a height sufficient to engage a second flange's annular rim.

The patent specification seems to support such a construction. In one segment discussing ribs, the patent teaches:
The first flange 14 also includes a plurality of ribs 54 that may extend axially above the annular rims 24 and 26. The plurality of ribs 54 are preferably disposed such that at least a portion of each of the plurality of ribs extends to the inner extreme of the outer annular rim 26. The plurality of ribs 54 may suitably comprise an axial extension of one or more of the radial support ridges 52. As will be discussed further below, the plurality of ribs 54 facilitates the stacking reels by holding the first flange 14 in registration with a flange of another reel, not shown, that is stacked on top of the reel 10.

The second segment discussing ribs in the preferred embodiment confirms this implication. The patent reads:

In the exemplary embodiment described herein, the plurality of ribs 54 are disposed such that they extend radially to, but inside of, the outer annular rim 26. The plurality of ribs 54 have a height that exceeds the height of the inner annular rim 24 and the outer annular rim 26.

Vandor argues that the specification merely suggests that the ribs may be extensions of the radial support ridges, but a "'rib' may be any axially extending structure, preferably one that extends to the inner extreme of the outer annular rim of the flange." Pl.'s Br. in Opp'n, at 16. But Vandor's construction ignores the language of the claims and the specification that imply that the geometry of a rib has a length in the radial direction of the flange. Vandor's construction makes extension in the radial direction a preference; however, the plain meaning of rib and the patent specification point toward a structure that necessarily extends in the radial direction as well as the axial direction. Furthermore, claim 31 is specific that the structure is a "rib;" the patentees did not use the broader term "protrusion" or even "any structure" in writing the claim. Therefore, the Court finds that the plain meaning of "rib," or an elongated structure, is the best starting point for construction of the claim.

In summary, the Court finds that the plain meaning of "rib" in the context of the '075 patent means an elongated structural element, running radially along the flange that axially extends to a height sufficient to engage a second flange's annular rim.
Because the specifications for the patents-in-suit are essentially the same, the Court will simply refer to the '689 patent. The numerical references are to the column (e.g., column 1) and lines (e.g., lines 32-33) where the referenced text appears.

FieldTurf accuses SCG of improperly reading the preferred embodiment of the specification into the claim. Indeed, the text cited by SCG explicitly refers to a "preferred" method of processing the ribbon. SCG responds by citing Watts v. XL Sys., Inc., 232 F.3d 877, 883 (Fed. Cir. 2000), for the proposition that "[w]here '[t]he specification only describes one method' of achieving an element of the claim, 'the specification actually limits the invention to structures that utilize [that method], even if a person of ordinary skill in the art would be aware of other methods for achieving the claim element." Doc. 59, pp. 49-50.

SCG's selective quotation misstates the holding of Watts. It is true that the Watts court noted that "[t]he specification only describes one method" for achieving a desired sealing connection through misaligned taper angles. Watts, 232 F.3d at 883. But that was not why the Watts Court found that the specification limited the invention to structures that utilize the method, as SCG contends. Rather, the Watts court pointed to other text of the specification as follows: "Moreover, the specification actually limits the invention to structures that utilize misaligned taper angles, stating that 'the present invention utilizes [the varying taper angle] feature.'" Watts, 232 F.3d at 883 (emphasis added, brackets in original). In other words, in addition to describing a single embodiment, the Watts patentee also stated that the embodiment was the invention. SCG points to no such text in the FieldTurf patents, and in fact, the patents state that the "ribbons can be manufactured" in a certain manner in a "preferred" embodiment. 7 '689 patent, 8:22-23.

This analysis is entirely consistent with the Court's earlier discussion of the issue of reading an embodiment from the specification into the claims. In Watts, it was clear from the specification that the preferred embodiment was intended to be strictly coextensive with the claims. Phillips, 415 F.3d at 1323. As explained in C.R. Bard and Wang, the Watts patentee also described the preferred embodiment as the invention as a whole. C.R. Bard, 388 F.3d at 864; Wang, 197 F.3d at 1383.

Accordingly, the Court generally agrees with FieldTurf's proposed claim construction of a ribbon. However, instead of using the word ribbon in the claim construction of ribbon, the Court will simply use the generic term structure as follows: "A synthetic structure representing a grass blade." The Court also notes that this is a generic definition of the term ribbon. As in claim 1 of the '689 patent, "a synthetic structure representing a grass blade" may be further defined within the claim as being "longitudinally intermittently slit in a predetermined pattern of slits" and other limitations stated within the particular claim.

In its reply, FieldTurf points to the doctrine of claim differentiation, by which courts generally avoid claim construction of an independent claim that would render a dependent claim superfluous. LG Elecs., Inc. v. Bizcom Elecs., Inc., 453 F.3d 1364, 1372 (Fed. Cir. 2006); Comark Commun's. v. Harris Corp., 156 F.3d 1182 (Fed. Cir. 1998). Although it is not entirely clear how this doctrine would apply to claims without a dependency relationship—i.e, claim 1 of the '689 patent and claim 1 of the '752 patent—as FieldTurf contends, the general point is well taken. Claim 1 of the '689 patent actually does provide specific structure (intermittent slits" that are "laterrally linked", etc.) while the '752 patent does not. Other related claims may always be considered during claim construction and it would make sense that one patent of a divisional would claim a specific ribbon structure while the other has the generic ribbon and is focused on the details of the infill layers.
Defendant's first argument concerns the term "ribbon stock," found in each of the 12 claims of the '919 patent. See claims 1-7 (describing a "metallic ribbon stock folding apparatus"), claims 8-11 ("method of folding metallic ribbon stock") and claim 12 (a "system for folding metallic ribbon stock"). Ken argues that ribbon stock constitutes a limitation on each patent claim. Ken Br. at 5. Should the court disagree, Ken nevertheless advances in the alternative that the term must be understood to construct the patent claims. It concludes: "The term 'ribbon stock' does not have an understandable meaning, and as such, all of the claims of the '919 patent must be held invalid for indefiniteness." Ken Br. at 5 (emphasis in original).

In its related motion for claim construction, SDS remarks that while the apparatus described in the '919 patent is novel, "there is no suggestion that ribbon stock per se is novel. On the contrary, the '919 patent makes clear that at least one form of ribbon stock (i.e., cutting blade) existed in the prior art, as did other devices for folding ribbon stock." SDS Markman Br. at 20. SDS relies on dictionary definitions of the terms "ribbon" and "stock"; descriptions of "steel rule stock," "stock," "metal ribbon" and "metal ribbon stock" in purported prior art patents; and the patent examiner's references to "ribbon" in the prosecution history. Plaintiff concludes: "The only reasonable and appropriate construction of 'ribbon stock' is to include within its scope a supply of continuous metallic material, such as flat cutting blade or even wire . . ." SDS Br. at 27.

--- Footnotes ---

1 "The dictionary definition of 'ribbon stock' would simply be a narrow strip or band of material as the raw material for something being made." SDS Br. at 23.

--- End Footnotes ---

Ken counters that the term "ribbon stock" is not defined by the '919 patent claims, and that the '919 specification nowhere uses that phrase. It concludes that the phrase is not defined by the intrinsic evidence. It also insists that SDS' proffered "ordinary meaning" of the phrase is unsupported: Ken claims that "ribbon stock" has no plain meaning within the diecutting and diemaking industry, 2 referring to testimony of SDS' President Simon Song, a glossary published by the International Association of Diecutting and Diemaking (I.A.D.D.), and its own reading of the purported prior art patents. Ken further objects that, according to the dictionary cited by SDS, "ribbon" is first defined as "[a] narrow strip or band of fine fabric, such as satin or velvet, finished at the edges and used for trimming or tying." Ken Br. at 13. 3 "Thus, SDS is apparently implying that the invention could also cover a unit that folds and cuts clothing, gift wrapping, etc. Such a result is absurd . . . [and] well beyond what the '919 patent was intended to cover." Id. Next, Ken cites the I.A.D.D. definition of "stock": "Paper or other material to be die cut or printed." Warshavsky Decl. Exh. N. "Thus, when someone in the diecutting and diemaking industry uses the term 'stock,' [she is] referring to the product which will eventually be made by the diecutter." Ken Br. at 14. Finally, defendant distinguishes plaintiff's proffered prior art patents as either irrelevant to the precise term "ribbon stock," or describing a field other than diecutting or diemaking. Id. at 15. Defendant concludes that a person with skill in the art could not determine the bounds of the claims using the words "ribbon stock" and that the claims must be invalidated as indefinite.

--- Footnotes ---

2 SDS seeks to define the relevant field more broadly as that of "metal forming art, in the context of diemaking." SDS Statement of Disputed Facts P 3.

3 Though SDS did rely upon the American Heritage Dictionary definition of the term "ribbon," it quoted a different dictionary definition as "most appropriate": "Anything resembling a ribbon, as a measuring tape." SDS Markman Br. at 23.

--- End Footnotes ---

In reply, SDS submits the declaration of Dr. Tricamo:

I am familiar with the level of knowledge of one of ordinary skill in the metal forming arts, including within the diemaking field, at least as early as June 1995 and to the present. (P 4).

The claims of the '919 patent use the words "metallic ribbon stock" and "ribbon stock" to describe the metal material
being worked upon by the apparatus and method stated in the claims. In my opinion, Claim 1 uses the words "ribbon stock" as a shorthand expression for "metallic ribbon stock," which identifies a material intended to be acted upon by the components of the claimed apparatus. (P 6).

When I reviewed the claims of the '919 patent, I had no trouble understanding what was referred to by the terms "metallic ribbon stock" and "ribbon stock" even without the benefit of the specification of the '919 patent, and I do not believe that one skilled in the art would have any trouble understanding them. . . . "Ribbon stock" is a common term used and understood not only by engineers and other technical individuals in the metal forming arts, but is also, in my opinion, one used and understood by non-technical people. In essence, "ribbon stock" defines a flat strip of metal having edges that are generally parallel, as exemplified by a ribbon. "Ribbon stock" can be of any length. The use of "metallic" ribbon stock makes it clear that the material must be metallic, as contrasted with, for example, decorative fabric ribbon. (P 7) (Emphasis added).

I understand that terms commonly used in the diemaking industry include "rule," "steel rule," "metal rule," "cutting rule" and "knife." In my opinion, the term "metallic ribbon stock" is consistent with the above terms. (P 15).

Finally, SDS argues that as a matter of law, the use of the phrase "ribbon stock" in the claims, though not in the specification, does not defeat definiteness. SDS Br. at 25.

Ken's argument lacks merit. Beginning with the specification, see Miles Laboratories, Inc., 997 F.2d at 875, and Exxon, 46 Fed. Cl. at 283, the court notes that the abstract describes the invention as a "unified folding system for processing in one work line all working processes needed in cutting and folding a cutting blade in a shape suitable to sheet material molding." The specification is replete with references to said "cutting blade," which is used to "press[] a folding or a cutting line on plate matters such as paper, canvas, leather, plastic, etc." See '919 Patent, col. 1, Ins. 21-23; Figure 2 (showing cutting blade 500 in preferred embodiment). It is clear from the specification that such "cutting blade," initially "wound in a roll shape," see col. 4, ln. 61, is fed through the claimed invention, which folds the blade "in [a] shape suitable to a molding of the sheet material," see col. 5, Ins. 25-27. In turn, a representative claim describes a "metallic ribbon stock folding apparatus" comprising a transferring unit, a rotary assembly, at least one retractable elongate member, "said rotary assembly configured for arcuate motion . . . to fold a portion of said ribbon stock by said elongate member." See Claim 1 (emphasis added).

The court finds from this review that the disputed "ribbon stock" described in the claims refers to the material from which the preferred-embodiment "cutting blade" is constructed. 4 According to the specification, the preferred embodiment uses a supply of metal rule, which it calls a "cutting blade" once it enters the machine, cuts and folds it to produce a die later used to cut predetermined shapes into sheet material such as cardboard. The specification, by its distinction between the terms "cutting blade," and "plate matters,"/"sheet material," refutes the defendant's argument that the claimed "ribbon stock" refers to cardboard or other sheet material which will eventually be stamped out in the diecutting process. And the claims themselves, referring to "metallic ribbon stock," refute Ken's assertion that the invention concerns fabric, clothing, or gift wrap.

4 Though not dispositive, defendant's repeated references to "steel rule" and "rule" provide some guidance to the court as well. See, e.g., Ken Br. at 13 n.3 ("The common term used in the industry for the material used to make cutting blades is 'steel rule' or 'rule.'"); Kengott Decl. P 28 ("From reading and reviewing the '919 patent, I understand the '919 patent to cover a device that processes steel rule such that the end product can be effectively used by a diecutter.").
whether the language is reasonably clear in its meaning.

Pennwalt Corp. v. Durand-Wayland, Inc., 1984 U.S. Dist. LEXIS 18354, 225 U.S.P.Q. 558, 565 (N.D. Ga. 1984), aff'd in part and vacated in part, 833 F.2d 931 (Fed. Cir. 1987) (addressing only infringement). See also Aqua-Aerobic Systems Inc. v. Richards of Rockford Inc., 1986 U.S. Dist. LEXIS 16031, 1 U.S.P.Q.2d (BNA) 1945, 1954 (N.D. Ill. 1986) (rejecting definiteness challenge based on patentee's failure to use the word "member") in both patent claims and specification: "While the patent may not be perfectly drafted, it is clear from an overall reading of the patent that the 'member' referred to in claim 8 is the casting.")], aff'd in part and vacated in part, 835 F.2d 871 (Fed. Cir. 1987). Finally, though expert testimony proffered by litigants tends to differ as to the understanding of a person with ordinary skill in the art, and despite this court's ruling that Dr. Tricamo may not testify as to the niche field of diecutting and diemaking, the court finds Dr. Tricamo's declaration to be useful guidance as to the background technology and terminology in the metal forming arts. See Exxon, 46 Fed. Cl. at 282, 284.

This court's determination is enforced by contrast to Morton Intern., Inc. v. Cardinal Chemical Co., in which the Federal Circuit approved a district court's determination of indefiniteness because the claimed chemical compounds could not be proved to exist even with the use of "sophisticated analytical instrumentation and . . . model systems." 5 F.3d 1464, 1469-70 (Fed. Cir. 1993). The level of imprecision here, even as alleged by defendant, does not rise to that level; plaintiff survives summary judgment of indefiniteness on the "ribbon stock" terminology.

3381

As set forth above, plaintiff does not specifically dispute, nor even address the propriety of, defendant's asserted definition of the word "having." Instead, plaintiff's arguments relating to claim construction appear to focus on the word "ridge" as that term appears in claim 4. More specifically, plaintiff contends that "the correct limitations to the term 'ridge' are: (1) that it extends outwardly opposite the rear surface of the tongue, (2) that it extends across the tongue, and (3) that it is generally parallel to and in a spaced relation to the tooth." Pl. Mem. in Opp. at 10.

Defendant does not dispute plaintiff's assertion that the ridge is subject to the above three limitations, and instead explains that, whatever the qualifying characteristics of the "ridge" of the latch mechanism, the ridge must be contained by, i.e., be a part of, the tongue structure itself. To the extent that defendant does not object and in light of the fact that his proposed construction of the characteristics of the "ridge" is supported by the language of claim 4, the court adopts plaintiff's proposed construction with respect to the qualifying attributes of that term. Thus, the "ridge" must (1) extend outwardly opposite the rear surface of the tongue, (2) extend across the tongue, and (3) be generally parallel to and in a spaced relation to the tooth. Contrary to plaintiff's apparent understanding of the issue, however, this construction of the ridge's features does not in any way change the court's conclusion that the ridge must be a part of the tongue structure. 1 In fact, and as defendant asserts, the "extending outwardly" and "across said tongue" language of claim 4, as it relates to the characteristics of the ridge, supports the conclusion that the ridge must be a part of the tongue structure.

1 The court notes that a construction of the word "ridge" also supports defendant's assertion that claim 4 of the '041 patent requires the lower ridge to be a part of the tongue structure. Although the remainder of claim 4 sets forth the attributes of the particular ridge which "extend[s] outwardly opposite [the] rear surface of the tongue across [the] tongue," it does not specifically define the term "ridge." According to Webster's, a "ridge" is "a small raised line on the surface of metal, cloth, or bone." Webster's Third New Int'l Dictionary 1953; accord Webster's Collegiate Dictionary (10th ed. 1999) (defining "ridge" as "a raised strip (as of plowed ground)"). Neither party has requested the court to interpret the actual meaning of the term "ridge." Even so, were the court to consider that term in light of its plain and ordinary meaning, it would likely conclude that the term "ridge" also compels the conclusion that the lower "ridge" structure must arise from, or otherwise be a part of, the tongue of the latch mechanism. Indeed, the definition of ridge appears to describe a raised portion of a foundational structure, i.e., the "tongue" in this case. Thus, to be considered a "ridge," it appears that a structure must be an elevated or raised portion of the tongue. The alternative meanings accorded the word "ridge" each support the conclusion that a "ridge" arises from, or erupts out of, a base surface such as the ground. See Webster's Third New Int'l Dictionary 1953 (further defining "ridge" as "an elevated body part projecting from a surface . . . a range of hills or mountains. . . a top or upper part . . . a raised line or strip (as of ground thrown up by a plow between furrows)"). Read in the context of claim 4, the
"ridge" language connotes a structure arising out of base surface, in this case, the tongue.

A. Disputed Term 1: "riding mower"

The Court construes the term "riding mower" in Claims 1 and 9 of the '325 patent to be a claim limitation that means:

A mower on which a person can ride.

Toro and Textron disagree over whether the term "riding mower" is a claim limitation at all. Textron argues that because the term appears in the preamble of both Claims 1 and 9 -- that is, it appears before the transition word "comprises" and the subsequent series of limitations -- it is not a claim limitation. Textron Opening Br. at 12-15. Toro counters that the term "riding mower" is a limitation because it defines the invention and was added during prosecution in response to an election requirement imposed by the U.S. Patent and Trademark Office ("PTO"). Toro Opening Br. at 16-19.

As a general rule, preamble language that merely states an invention's purpose or intended use is not limiting. See Bicon, Inc. v. Straumann Co., 441 F.3d 945, 952 (Fed. Cir. 2006). The general rule gives way, though, when the body of the claim does not describe a complete invention, id. at 952, or when the preamble language "is necessary to give life, meaning, and vitality to the claim." Catalina Mktg. Int'l, Inc. v. Coolsavings.com, Inc., 289 F.3d 801, 808 (Fed. Cir. 2002) (quotations omitted). In addition, under the Federal Circuit's opinion in Bass Pro Trademarks, L.L.C. v. Cabela's, Inc., the general rule also gives way when preamble language describes an essential feature of the invention and was added during prosecution to overcome rejection by the PTO. No. 2006-1276, 485 F.3d 1364, 2007 U.S. App. LEXIS 7990, 2007 WL 1029586 (Fed. Cir. Apr. 6, 2007).

Bass Pro involved a patent on a vest that incorporated a seat that could be folded down out of the vest. The original patent application claimed a "garment" with a foldable seat. The patent examiner rejected the application as unpatentable over the prior art, and the patentee responded by changing the phrase "a garment having a seat member" to "a combination vest and pivotable seat member." 2007 U.S. App. LEXIS 7990, at *8-9. Although the word "vest" occurred in the preamble of the issued claims, 2007 U.S. App. LEXIS 7990 at *7-8, the Federal Circuit held that "vest" was a claim limitation in light of the prosecution history, 2007 U.S. App. LEXIS 7990 at *10.

This case is controlled by Bass Pro. The term "riding mower" was added by Toro in response to the PTO's requirement that the application be split into a first application including claims directed to "a riding mower," and a second including claims directed to "an all wheel drive vehicle." JA 0058-59 (letter from PTO requiring election); JA 0065-74 (amendment by patentee of application that issued as '325 patent). This case differs from Bass Pro in that the claims were amended in this case in response to an election requirement, whereas in Bass Pro the claims were amended to overcome a rejection based on the prior art. But nothing in Bass Pro suggests that these two types of amendments -- amendments made in response to an election requirement, and amendments made to overcome prior art -- should be treated differently. Accordingly, the term "riding mower" is a limitation of Claims 1 and 9 of the '325 patent.

Having determined that the term "riding mower" is a claim limitation, the Court must next determine how to construe this limitation. Textron argues that, in light of the '325 patent's specification, "riding mower" should be construed (assuming that it must be construed at all) to mean "a vehicle that carries one or more cutting units." Textron Opening Br. at 15. Toro argues that the term need not be construed at all. Toro Opening Br. at 19. Alternatively, Toro argues that "riding mower" means "a motor driven device capable of mowing on which an operator rides." Id.

The Court rejects Textron's proposed construction because it is narrower than the claim language requires. The word "mower" is easily understood, and nothing in the intrinsic evidence suggests that it should be given the narrow meaning proposed by Textron. The Court agrees with Toro that the term "riding mower" should be given its ordinary meaning, and the Court's construction simply makes plain that ordinary meaning.
As to the claim construction issue, Bionx argues that the district court adopted too restrictive a construction of the term "rigid," which is used in each of the asserted claims. The district court construed the term to require that the claimed suture be sufficiently rigid to be pushed through meniscus tissue without a pre-cut channel for the suture to follow. Bionx disagrees and argues that the term "rigid" should be construed to apply to any shaft that is capable of being pushed through tissue, regardless of whether the tissue is pre-channeled. Thus, in Bionx's view, the term "rigid" is used to distinguish the claimed suture from ordinary flexible sutures that are wholly lacking in rigidity and cannot be pushed through any kind of tissue, whether pre-channeled or not.

Claims 1 and 19 of the '976 patent are representative. They provide as follows (emphasis added):

1. A single unit suture for body tissue repair comprising:
   a solid base member for seating against an exterior surface of said tissue;
   a single rigid shaft portion upstanding from and integrally connected to said base member adapted for insertion into said tissue; and barb means integrally connected to said portion to aid in insertion of said shaft portion into said tissue and to lock said shaft portion into said tissue.

19. A method for repairing a tear in a meniscus which comprises the steps of:
   providing a single unit suture having a solid base member, a single, rigid shaft portion upstanding from and integrally connected to said base member, and barb means located on and integrally connected to said shaft portion;
   preparing the medial surface of said meniscus for insertion of said suture; and inserting said suture into said meniscus, through said prepared surface and through said tear to join together opposing edges of said tear for repairing said tear and leaving said base member external to said meniscus.

The claim language itself offers no real guidance as to the proper construction of the term "rigid," so the district court turned to the specification and prosecution history of the patent. As the district court noted, the relevant portion of the written description states that "sutures, in accordance with the invention, . . . are formed of a material having sufficient rigidity to allow the sutures to be pushed through the tissue to be repaired." '976 patent, col. 2, l. 66, to col. 3, l. 1. Bionx, however, reads "tissue to be repaired" to refer not only to uncut tissue, but also to tissue that has been pre-channeled with a cutting device such as the needle used with Linvatec's BioStinger. Bionx reaches that conclusion based on the statement at the end of the written description that one embodiment of a suture insertion device may be equipped with a "blade end . . . for creating or initiating a channel in the tissue for the suture to pass through." Id., col. 4, ll. 7-9. In Bionx's view, that statement requires the "tissue to be repaired" language at column 3, line 1 to be construed to mean "either uncut or pre-cut tissue to be repaired."

The district court correctly observed that the brief reference to the possible use of a suture in a device that uses a blade to cut a channel in tissue does not bear on the definition of the term "rigid." The portion of the written description on which Bionx relies merely explains that a suture rigid enough to be pushed through uncut tissue may also be used in a pre-cut channel; it does not suggest that a suture would be "rigid" if it could be pushed through a pre-cut channel but could not be pushed through uncut tissue.

The written description makes clear that, to be "rigid" within the meaning of the claims of the '976 patent, a suture must be sturdy enough to be "pushed through the tissue to be repaired." The use of the term "pushed" implies that the "tissue to be repaired" is uncut, for in referring to tissue that is pre-channeled, the patent describes the suture as "passing through" the tissue rather than being "pushed" through it. Thus, the primary passage on which Bionx relies actually supports the district court's construction of the claim language.
The prosecution history of the '976 patent confirms that the district court's interpretation is correct. In attempting to
distinguish his claims over a prior art patent to Kronenthal, the inventor submitted an affidavit stating that the Kronenthal
device "is not a rigid type of suture as I have disclosed and claimed in my above noted patent application, but is a flexible
type of filament which cannot by itself be pushed into a body tissue without the use of a needle." Bionx argues that the
inventor's statement stands only for a limited proposition: that the "flexible" Kronenthal device is distinguishable from the
more rigid device of the Bionx invention. Linvatec, on the other hand, contends that the inventor was making the point that
a suture is not "rigid" if it is designed to be inserted with the use of a needle.

Both parties are incorrect. Linvatec reads the prosecution history too broadly. The inventor did not assert that a suture is
"non-rigid" simply because it is inserted using a needle. By the same token, Bionx's reading of the prosecution history is too
narrow. The significance of the inventor's statement is not the fact that he distinguished his device from the dissimilar
Kronenthal device, but the reason he gave for drawing that distinction. In stating that the "flexible" Kronenthal device,
unlike the "rigid" claimed suture, "cannot by itself be pushed into body tissue without the use of a needle," the inventor was
making clear that he was using the term "rigid" to refer to a suture that was rigid enough to be pushed into uncut tissue, i.e.,
"without the use of a needle." The district court's claim construction was therefore correct.

B.

Dunhall also argues that, even if it is proper to construe the term "substantially liquid tight" as including a "rigid" custom-
fitted appliance, the district court erred in determining that "rigid" means that the appliance must be "as firm as possible." In
support of this argument, Dunhall notes the following: (1) the use of the court's definition for the disputed term represents a
radical departure from the actual language of the allowed claims; (2) the requirement of a "rigid" tray contradicts the
preferred embodiment of a "resilient" tray, which strongly motivates against such a construction; and, (3) that the definition
by the court that "rigid" means that the device be as firm as possible, while still being sufficiently resilient to allow the
device to be removed and replaced around the teeth and gingival, likely renders the claims indefinite.

We do not find any of these arguments to be persuasive. First, we discern no contradiction between the district court's
definition and the preferred embodiment. The '196 patent discloses that the appliance must be resilient to allow the user to
remove and replace the splint around the tooth. The definition of "rigid" by the district court specifically notes "that the
device must be as firm as possible, while still being sufficiently resilient to allow the device to be removed and replaced
around the teeth and gingival." Thus, the district court's definition expressly encompasses the resiliency aspect of the
preferred embodiment.

Secondly, and most importantly, as we noted above, the prosecution history clearly reveals that in order to get its claims
allowed at the PTO, Dunhall asserted additional limitations to the claimed "mechanical barrier" or "splint" that were not
specifically set forth in the claim, i.e., that these were "rigid" appliances. These assertions cannot now be disavowed by

At oral argument, Dunhall contended that if this court deems it proper to include a rigidity aspect to the term "substantially
liquid tight," the only requirement of the term "rigid" should be that the appliance is structurally sound enough to perform
the functions of: (a) minimizing saliva from impacting the teeth/tooth enclosed within the splint, (b) restraining physically
the cleaning/brightening solution from evaporating or migrating away from the teeth, and (c) preventing the destruction of
the oxygenation properties of the peroxide, i.e., those functions identified in the definition of "substantially liquid tight" set
forth in the specification. However, as we noted above, in order to get its claims allowed, Dunhall distinguished the
"rigidity" of the claimed appliances over prior art appliances. In so doing, it clearly indicated to the PTO that the term
"rigid" required something more than being structurally sound enough to perform the foregoing functions (a) - (c); namely,
that the appliances had to be more rigid than the resiliently flexible trays of Greenberg and Riddell, and more rigid than
polyurethane foam or polyethylene foam fluoride tray liners.

It is our conclusion that the definition of the term "rigid" applied by the district court, i.e., that the device be as firm as
possible while still being sufficiently resilient to allow the device to be removed and replaced around the teeth and gingival,
does not change the scope of the claims as asserted by Dunhall to the PTO to secure allowance. Moreover, we do not find
this construction of the term "rigid" to be indefinite. The district court simply elaborated the terse claim language in order to understand and explain the scope of the claims. Thus, we conclude that the district court's definition of "rigid" was not in error.

GO BACK

3385

1. Claim Construction

48. In order to determine infringement, the Court must perform a two-step analysis. First, the Court must interpret the language of the claim to determine its scope and meaning. Second, the Court must compare the properly construed claim language to the accused device. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 976 (Fed. Cir. 1995), aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996); Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1454 (Fed. Cir. 1998).

49. Claim 1 of the '598 Patent in its entirety reads as follows:

1. Self-adjusting utility pliers for automatically gripping workpieces of different sizes, comprising:

first and second rigid elongated members each having a jaw end, a handle end and an intermediate neck portion;

slideable and pivotable fastening means connecting the members between their neck portions and permitting the jaw ends to move toward each other in a sliding action in response to an initial manual force being applied to close the handle ends toward each other to grasp a workpiece between the jaw ends;

biasing means coacting between the members and normally urging the jaw ends to slide away from each other to a fully opened disposition; and

the fastening means adapted to halt further sliding action of the members in response to the jaw ends contacting the workpiece and to then translate the manual force on the handle members into a pivoting gripping action of the jaw ends against the workpiece.

See Ex. P-1 ('598 Patent) at col. 5, 1.61 -- col. 6, 1.13. The words of the claim are to be interpreted according to their ordinary and customary meaning unless a special definition is stated in the specification or prosecution history. See Vitronics Corp. v. Conceptronic Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996).

50. The Turbopliers literally satisfy the preamble of claim 1, for the Turbopliers are unquestionably "self-adjusting utility pliers for automatically gripping workpieces of different sizes." See Ex. P-17; 2 Tr. at 54:19-24 (Cagan); 3 Tr. at 32:6-12 (Gierer).

51. The Turbopliers literally include a first rigid elongated member having a jaw end, a handle end and an intermediate neck portion as recited in claim 1. See 2 Tr. at 54:25 - 55:7 (Cagan) (confirming that the Turbopliers "do include a first rigid elongated member having a jaw end, an intermediate neck portion, and a handle end"); 3 Tr. at 32:13-25 (Gierer).

52. This first rigid elongated member in the Turbopliers is the member defining the upper jaw of the Turbopliers and is identified in the photograph below (Ex. P-43) by the label "first rigid elongated member." The jaw end, intermediate neck portion and handle end of this first rigid elongated member are also labeled in the photograph.

[SEE PHOTOGRAPH IN ORIGINAL]

53. The Turbopliers include a second rigid elongated member having a jaw end and an intermediate neck portion, where the neck portion of this second elongated member is connected to the intermediate neck portion of the first rigid elongated member in the Turbopliers. See 2 Tr. at 55:11 - 56:15 (Cagan); 3 Tr. at 33:6-13, 35:10-19 (Gierer). This second rigid elongated member, its jaw end and its intermediate neck portion are labeled in the photograph above.

54. The parties dispute whether the non-jaw end of the second rigid elongated member in the Turbopliers identified above
literally meets the language in claim 1 requiring the second rigid elongated member to have a "handle end." ACI contends that the language in the claim requires a rigid elongated member that has one end (the "jaw end") that grasps a workpiece and an opposite end (referred to as the "handle end") that receives a manual force to cause the jaw end to move in the manner recited in claim 1. See 3 Tr. at 33-34 (Gierer). Olympia contends that the language in the claim referring to a handle end requires a rigid elongated member having an end that is specially configured to be comfortable to hold in the human hand and to receive force from flesh contact during operation of the tool containing the member. See 2 Tr. at 62-63 (Cagan). The Court finds that ACI's construction of the disputed language is the legally correct construction.

55. First, the language of claim 1 supports the construction advanced by ACI. Specifically, the element recited in claim 1 is a "second rigid elongated member." The references to the "jaw end" and the "handle end" in the claim simply are labels used to identify the end of the member that is used to grip a workpiece (the "jaw end") and the end that receives force to cause movement of the jaw end (the "handle end"). In particular, the only purpose of the "handle ends" of the recited rigid elongated members as recited in claim 1 is to receive force to cause the jaws to move in a particular way. Ex. P-1 ('598 Patent), claim 1; 3 Tr. at 33:20 - 34:6 (Gierer). Olympia's expert, Dr. Cagan, confirmed this point. 2 Tr. at 56:16 - 57:3 (Cagan). Accordingly, the claim language supports the claim construction advanced by ACI.

56. Further, there is nothing in the language of claim 1 that suggests or indicates that the "handle end" of the rigid elongated members must have some specific construction or meet some specific comfort criteria. Accordingly, the claim language does not support the construction advanced by Olympia.

57. The specification of the '598 Patent and its prosecution history also support the literal construction of "handle end" advanced by ACI. As described in the '598 Patent specification, the purpose and function of the handle end of the first and second rigid elongated members is to receive a force causing the members to move together to effect the sliding and pivoting of the jaws with respect to one another in the manner described in claim 1. Ex. P-1 ('598 Patent), cols. 3-4.

58. The construction of "handle end" advanced by ACI is clear and definite and allows one to easily determine whether a structure is a "second rigid elongated member" as recited in claim 1. The construction of "handle end" advanced by Olympia relies on vague notions of comfort that Olympia's own witness could not quantify in any meaningful way.

59. For the reasons set forth above, the Court adopts the claim construction advanced by ACI and concludes that the language of claim 1 requiring a "second rigid elongated member[] having a jaw end, a handle end, and an intermediate neck portion" requires a rigid member having two ends: one end ("the jaw end") that grasps a workpiece and another end ("the handle end") that receives a force to cause the jaw end to move in the manner specified in the claim.

1. "[A] deep rigid heel seat to cup the calcaneus"

Plaintiffs' patent claims "an orthotic device … comprising a deep rigid heel seat to cup the calcaneus…" 052 Patent at 6:30-31. Plaintiffs acknowledge that defendants' inserts do not meet the standard definition of the term "rigid" (viz., inflexible). (Docket # 60, Ex. 36 at 8). They nonetheless insist that defendants' shoes infringe upon plaintiffs' patent. To this end, they advance two arguments: First, plaintiffs contend that the term "rigid" includes "semi-rigid" and that the latter term captures the accused products. Second, plaintiffs maintain that, no matter how "rigid" is defined, defendants' inserts so qualify once they are buttressed by other features of the accused shoes.

Defendants object to plaintiffs' revision of the meaning of the term "rigid" such that it would include "semi-rigid." Defendants are correct: While a patentee may act as her own lexicographer, her definitions will supplant those that ordinary practitioners in her field generally associate with a term's meaning only where she has "clearly set forth a different definition." 3M Innovative Props. Co. v. Avery Dennison Corp., 350 F.3d 1365, 1371 (Fed. Cir. 2003); see also Vitrionics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996) ("A patentee may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning, as long as the special definition of the term is clearly stated in the patent specification or file history."). Plaintiffs' specification does make use of the term "semi-rigid," 052 Patent at 4:68-5:4, 3 but it does so in the course of describing a preferred embodiment of the invention; nowhere does the patent explicitly and clearly provide an alternate definition of "rigid." Moreover, descriptions of preferred embodiments of an invention are less
probative of its scope than are descriptions that are not so designated, as the latter "describe an embodiment as being the invention itself, and not only one way of utilizing it." Autogiro Co. of Am. v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 398 (U.S. Ct. of Cl. 1967). Thus, the fact that the term "semi-rigid" appears only in a description of a preferred embodiment of the invention entails that this feature is not essential to the invention itself.

3 "In a preferred embodiment of the invention, an insert of the present invention is formed by molding semi-rigid material to the approximate shape as shown. This semi-rigid molding preferably has a varying rigidity, being more rigid and stiff at the heel cup and having somewhat less stiffness and rigidity towards the forefoot." '052 Patent at 4:68-5:4.

Indeed, the prosecution history of plaintiffs' patent supports a finding that the patent covers only rigid orthotic devices. As a condition of granting plaintiffs' patent, the Patent and Trademark Office required that plaintiffs add the term "rigid" to the description of their invention. (Docket # 45, Ex. 8). While the patent's specification includes a description of a semi-rigid embodiment of the invention, see '052 Patent at 4:68-5:4, the fact that the patent was granted only when it described the invention as rigid is dispositive here. As the court explained in Unique Concepts, Inc. v. Brown, 939 F.2d 1558 (Fed. Cir. 1991), where a claim insists upon a feature (here, the rigidity of the heel cup of the orthotic device), but the specification includes a description of an alternative lacking that feature, plaintiff cannot turn around and maintain that a defendant infringes upon his patent where defendant's product is like the alternative but lacks the element upon which the patent's claim insists. Id. at 1562. Otherwise, inventors could "escape examination of a more broadly-claimed invention by filing narrow claims and then, after grant, assert[] a broader scope of the claims based on a statement in the specification of an alternative never presented in the claims for examination." Id. In short, the term "rigid" in plaintiffs' claim should be construed as plain language requires - namely, as signifying a state of stiffness, or substantial inflexibility, that would not include "semi-rigid." Plaintiffs acknowledge that defendants' inserts do not meet that standard of rigidity.

4 See supra note 3.

Plaintiffs nonetheless argue that, when defendants' inserts are buttressed by the stiff shoe counter (i.e., the portion of the upper surrounding the back of the heel) of defendants' shoes, the resulting ensemble is rigid and, as a result, satisfies the rigidity requirement of plaintiffs' claimed invention. Plaintiffs' argument is unavailing. The patent specifically claims an "orthotic device … comprising a deep rigid heel seat…." U.S. Patent No. 5,174,052 (Issued Dec. 29, 1992) at 6:29-30. Thus, it is the heel seat itself that must be rigid, and not the heel seat in conjunction with some other part(s) of the shoe. 5 Because plaintiffs have not established that defendants' heel seat alone is rigid, plaintiffs have not succeeded in countering defendants' claim of non-infringement with respect to this patent limitation. Accordingly, the accused products cannot be said to infringe plaintiffs' patent.

5 It is worth noting that this conclusion does not turn on the result of a dispute between plaintiffs and defendants regarding the object of the patent. That dispute has defendants arguing that the patented invention is only a shoe insert, and plaintiffs countering that their invention covers shoes whose body and insert (or insole) together incorporate all of the invention's features. Even if plaintiffs are correct, however, a footwear product would infringe upon plaintiffs' patent only if, as the claim language states, the orthotic device contained in that footwear product "comprised a deep rigid heel seat." That is not the case here.
L. Rigid Member

The only dispute with respect to the construction of this term is the definition of the word "rigid." See RJCCPS at 5. ICU argues that "rigid" means "stiff," while Braun proposes that it be construed as "stiff or unyielding, not pliant or flexible." Id. In the Court's view, neither definition adds clarity to the scope of the term and therefore both are rejected. The term is unambiguous and therefore no construction is necessary.

1. "Rigid mooring arm"

SBM argues for the following construction of the term "rigid mooring arm" in Claim 1: "the non-flexible portion of the turntable that branches, extends, or projects out from the symmetrical portion (located at the bearings) of the turntable." APL seeks to limit this definition to "a separate, moveable, hinged arm." SBM argues that reading the limitations of "separate" and "hinged" into Claim 1 to modify the term "arm" is improper because the limitations are not supported by the intrinsic evidence.

The term "arm" is everywhere understood as the human upper limb. Its metaphorical use as applied to machinery and other inanimate objects is therefore well understood. For examples of the latter usage, WEBSTER’S NINTH NEW COLLEGIATE DICTIONARY (1991) defines "arm" as "2d. a slender part of a structure, machine, or an instrument projecting from a main part, axis, or fulcrum." WEBSTER'S NEW WORLD DICTIONARY OF THE AMERICAN LANGUAGE (1982) defines "arm" as "anything thought as armlike, esp. in being attached or connected to something larger." THE OXFORD DICTIONARY (2d ed. 1989) defines "arm" as "[a] narrower portion or part of anything projecting from the main body . . . of a machine or other object." WEBSTER'S II NEW RIVERSIDE UNIVERSITY DICTIONARY (1994) defines "arm" as "[s]omething branching out from a large mass." READER'S DIGEST ILLUSTRATED ENCYCLOPEDIC DICTIONARY defines "arm" as "[a] [ ] part projecting from a support in a machine." The term "arm" as used in Claim 1 requires no construction. 2 The argument here is whether, as APL contends, the intrinsic evidence of the '183 Patent requires that the "arm" of the turntable be "separate" and "hinged."

2 The term also is not uncommon to the offshore mooring industry. SBM has used the term "arm" in prior patents relevant to the offshore mooring industry to refer to a broad range of structures, all of which are or become narrower or slenderer than the structure to which they are attached as they extend or project outward. See, e.g., United States Patent No. 5,041,038 (Polder-vaart, Aug. 20, 1991), Figs. 3 and 4, at 3; United States Patent No. 4,568,295 (Poldervaart, Feb. 4, 1986), Fig. 7, at 37; United States Patent No. 4,534,740 (Poldervaart, Aug. 13, 1985), Figs. 3 and 4, at 18; United States Patent No. 4,527,501 (Poldervaart, July 9, 1985), Figs. 1 and 2, at 1. Other patentees employ the same understanding. See United States Patent No. 6,503,112 B1 (Chadwick, Jan. 7, 2003), Fig. 1, at 29; United States Patent No. 4,417,537 (Di Tella, Nov. 29, 1983), Figs. 1 and 2., at 13.
turntable is not supported in the claim or prosecution history. The rigid mooring arm is therefore not limited to a feature that is "separate" from the turntable.

APL argues further that the intrinsic evidence requires that the "rigid mooring arm" be "hinged." SBM responds that under the doctrine of "claim differentiation," there is a presumption that the limitations of dependent Claim 5, which provide, among other things, that the mooring arm have a "pivotal connection," cannot be read into independent Claim 1. Hence, SBM contends, Claim 1 does not require that the "rigid mooring arm" be hinged because such construction would be superfluous to Claim 5 and would therefore be presumptively unreasonable. SBM maintains, moreover, that there is no "clear and unmistakable" limitation of claim scope in the prosecution history that would overcome the presumption and support the reading of the "hinge" limitation into the "rigid mooring arm" phrase of Claim 1.

Claim 1 describes the rigid mooring arm as "having a relatively short length such that when in an essentially upright position from the buoyant body toward sea level, the mooring arm extends no further than just below or just above the sea level." Because the above-quoted "when" clause modifies the phrase "rigid mooring arm," APL argues that proper construction of the "when" language means that the rigid mooring arm must be moveable from the buoyant body to an upright position toward sea level. "When" refers to the variable positions of the rigid mooring arm 6 and 6', as shown in Figures 1 and 2 of the '183 Patent. Therefore, APL argues, the rigid arm must be hinged, so as to be moveable between an oblique position from the buoyant body, as represented by mooring arm 6, and the position "when in an essentially upright position from the buoyant body," as represented by mooring arm 6'.

The fact that the embodiment shown in Figures 1 and 2 of the '183 Patent depicts a buoy with a pivotal arm does not restrict the scope of the claim phrase "rigid mooring arm" necessarily to include a hinged arm. Indeed, the inventor described the embodiment shown in Figures 1-3 as the "most preferred at the time being," and added, "it will be immediately clear that a lot of amendments can be introduced without leaving the scope of protection." See Teleflex, 299 F.3d at 1327 ("[T]he number of embodiments disclosed in the specification is not determinative of the meaning of disputed claim terms."); CCS Fitness, 288 F.3d at 1366 (noting that an accused infringer cannot overcome the "heavy presumption" that a claim term takes on its ordinary meaning "simply by pointing to the preferred embodiment or other structures or steps disclosed in the specification or prosecution history.").

In determining the meaning of "when," in the phrase, "when in an essentially upright position from the buoyant body toward sea level," it is appropriate to consider the "broad range" of consistent dictionary definitions because the language has no specialized meaning. See Texas Digital, 308 F.3d at 1203. Both parties agree that included in the full range of meanings for the word "when" is this definition: "in the event that; IF." MERRIAM-WEBSTER ONLINE DICTIONARY, id. ex. G-34. See also THE OXFORD DICTIONARY (2d ed. 1989). Therefore, in the absence of any evidence of clear disavowal of claim scope, the claim phrase "said mooring arm having a relatively short length such that when in an essentially upright position from the buoyant body toward sea level, the mooring arm extends no further than to just below or just above sea level" covers both an arm that is movable by pivot or hinge to different angles with respect to the buoyant body and an arm that is not so pivoted or hinged. See Teleflex, 229 F.3d at 1327 ("[C]laim terms take on their ordinary and accustomed meanings unless the patentee demonstrated an intent to deviate from the ordinary and accustomed meaning of a claim term by redefining the term or by characterizing the invention in the intrinsic record using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope.").

Contrary to APL's contention, the prosecution history of the '183 Patent does not indicate a clear intent by SBM to disavow any construction of "arm" other than one that requires a hinge. APL, in support of its argument, relies on this single excerpt from the Remarks in support of the November 1997 Amendment:

By means of the hinging arm 6 and the anchor line 14 in the present invention, the anchor line 14 can always maintain an optimum alignment with a catenary anchor line 4 for optimum force transmission.

Amendment, Document No. 55 ex. B, at SBM 00279 (emphasis added). This sentence is found in that segment of the Remarks that distinguishes the German reference 27,52,266 (the "German patent"). In these Remarks, the applicant devotes at least two or three pages to a series of distinctions between the German Patent, which had been identified as prior art in the rejection of original claims 1-6. In the course of making several distinctions between the '183 Patent and the German Patent, the applicant refers no fewer than six times to "arm 6" of the '183 Patent but only once--in the sentence quoted above--is "arm 6" modified by the word, "hinging." After having reviewed the Remarks and this portion of the prosecution history, it
is evident that no "clear and unmistakable disavowing statements" are contained in the prosecution history that limit the scope of Claim 1's "arm" only to a "hinging arm." Instead, this segment of the prosecution history is amenable to several reasonable interpretations and to some extent is ambiguous.

Courts regularly decline to apply the doctrine of prosecution disclaimer where, as here, "the alleged disavowal of claim scope is ambiguous." Omega Engineering, 334 F.3d at 1324. See also Rexnord, 274 F.3d at 1347; Northern Telecom Ltd. v. Samsung Elecs. Co., 215 F.3d 1281, 1293-95 (Fed. Cir. 2000); Kothmann & Kothmann, Inc. v. Trinity Indus., Inc., 287 F. Supp. 2d 673, 687 (S.D. Tex. 2003) (Rosenthal, J.). Therefore, the doctrine of prosecution disclaimer does not operate in this case to limit the scope of Claim 1.

The doctrine of "claim differentiation" lends further support to SBM's proposed construction. There is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims. See Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998). To the extent that the absence of such difference in meaning and scope would make a claim superfluous, the doctrine of claim differentiation embodies the presumption that the difference between claims is significant. See Tandon Corp. v. U.S. Int'l Trade Com'n., 831 F.2d 1017, 1023 (Fed. Cir. 1987). Under the doctrine of claim differentiation, absent "clear and persuasive" indications to the contrary, Claim 1's "rigid mooring arm" is not limited to having a "pivotal connection," the limitation of the narrower dependent Claim 5. See Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1551 (Fed. Cir. 1996) ("Such a presumption [of claim differentiation] can be overcome, but the evidence must be clear and persuasive.").

Dependent Claim 5 reads: "Catenary anchor leg mooring buoy according to claim 4, wherein the mooring arm has a buoyant end and a second end, a pivotal connection connecting the buoyant end to the buoy, and a means for connecting a mooring hawser to the second end." This limitation of "a pivotal connection" is not found in Claim 1 or any prior dependent claims. Moreover, it is recited as "a pivotal connection"--not "the pivotal connection." As has been seen, the intrinsic evidence does not favor limiting the scope of Claim 1's "arm" only to an "arm having a pivotal connection" or a "hinging arm." The presumption of claim differentiation between independent Claim 1 and dependent Claim 5 has therefore not been rebutted with clear and persuasive evidence.

Accordingly, the Court finds that the term "rigid mooring arm" is a clear and descriptive term that requires no further definition to one of ordinary skill in the relevant art. Moreover, the Court concludes that the term as used in Claim 1 is not limited to being "separate" and "hinged."

II. Count II Noninfringement

In Count II of their Complaint, Plaintiffs allege infringement of claim 3 of the '251 patent, which was a continuation of the '715 patent and relates to a driver's side module incorporating the inflator of the '715 patent. Specifically, the claim relates to the structure for attaching an air bag to the driver's side inflator and for mounting the assembled module in a steering wheel. The Magistrate Judge recommends that the Court grant Defendants summary judgment as to claim 3 of the '251 patent. Plaintiffs have objected to the R&R and Defendants have responded. Specifically, Plaintiffs object to the Magistrate Judge's claim interpretation.

Plaintiffs allege only that Defendants have infringed claim 3 of the '251 patent. In moving for summary judgment, Defendants argued that the "rigid rim" element which appears throughout the following limitations of claim 3 precludes a finding of infringement:

- a pyrotechnic gas generator subassembly including means for generating a sufficient volume of gas for inflating a restraint bag, and an annular sealing surface on a peripheral portion of the gas generator;

- a separate inflatable bag subassembly including a folded inflatable bag, and a rigid rim connected to the mouth of the bag including a second annular sealing surface;

- means for assembling the two subassemblies into a unitary structure by connecting the rigid rim to the gas generator with
the annular sealing surface in opposition; and

adapter plate means for mounting the assembled unitary structure on an automobile steering wheel; and wherein

the annular sealing surfaces are recessed below the face of the gas generator through which gas is released so that the rigid portions of the inflatable bag subassembly do not extend substantially beyond the face of the gas generator; and

the rigid rim comprises an inwardly directed flange within the recessed region of the gas generator and including the annular sealing surface thereunder, and an outwardly extending flange-like portion for connection to the gas generator.

(emphasis added).

Further, as the R&R explains: The '251 patent specification teaches two embodiments of the claimed invention, illustrated by Figures 1 and 2. In Figure 1, the "rigid rim" is Z-shaped, with the upper portion consisting of an inwardly-directed flange that is connected to a bag attachment ring in the mouth of the bag by rivets or bolts, thereby clamping the edge of the air bag between the rigid rim and the bag attachment ring. The lower portion of the rigid rim consists of an outwardly-directed flange that is connected by a series of bolts to a mounting or adaptor plate for mounting the entire assembly on the steering wheel and to tabs welded on the side of the gas generator. When the rigid rim is attached to the generator the sealing surface of the inwardly-directed flange presses down against an annular sealing surface running around the circumference of the generator, thereby sealing the air bag to the generator.

In Figure 2, reproduced below, the mouth of the bag is sandwiched between the retaining ring in the mouth of the bag and the mounting plate that connects to the steering wheel. A series of bolts connects the bag and the retaining ring to the top of the mounting plate and also connects a flange on the gas generator to the bottom of the mounting plate. Thus, Figure 2 does not employ the Z-shaped rigid rim shown in Figure 1.

[SEE FIGURE 2 IN ORIGINAL].

Significantly, it is uncontested that the accused devices read on Figure 2. However, the parties dispute whether claim 3 reads on Figure 2. Defendants argue that the rigid rim element is completely lacking in Figure 2. Plaintiffs argue that the flat mounting plate in Figure 2 constitutes both the adapter plate and the rigid rim, including the flanges.

Defendants' argument for summary judgment is aptly summarized by the following statement:

Due to the obvious difficulty in finding the equivalent of its "rigid rim" anywhere in Figure 2, HBB is forced to contend that the mounting plate in the Figure 2 embodiment serves not only as the mounting plate, but also as the rigid rim, even though claim 3 expressly calls for the adapter mounting plate and the rigid rim as separate elements, and despite the fact that such an argument was explicitly rejected by the PTO in connection with application claim 5 . . . . Even more implausibly, HBB contends that arbitrary portions of the flat mounting plate somehow can be termed the "inwardly-directed flange" and "outwardly extending flange-like portion" of the Z-shaped rigid rim described in claim 3.

A. Claim Interpretation

The Magistrate Judge interpreted the rigid rim element of claim 3 to require that each "flange be a separately identifiable 'rib or rim' that is used to attach the overall object to a separate object." (R&R at 31). In contrast, Plaintiffs argue that where "the generator's connecting tabs are an extension of the annular sealing surface of the gas generator, . . . the inwardly-directed flange and the outwardly-directed flange-like portion of the rigid rim will be at the same level and the rigid rim will be a flat plate." (Pl.'s Obj. at 13). In support, Plaintiffs contend that "claim 3 does not include any directional orientation for the flanges other than that they are inwardly and outwardly directed. Therefore, imputing a vertical displacement into this claim language is improper." Id.

In rejecting Plaintiffs' proposed claim interpretation, the Magistrate Judge concluded that it "is clearly contrary to the plain and common meaning of the claim language." (R&R at 31). In support, the Magistrate Judge quoted Webster's New
Claim 5 read as follows:

Examiner explicitly rejected Lynch's attempt to read a claim on both the Figure 1 and 2 embodiments. Amended application claims relating to Figure 1, but rejected application claims relating to Figure 2. However, this argument begs the question, as the issue is whether a claim with the rigid rim language reads on Figure 2. The rejection of amended application claim 5 is significant to the interpretation of issued claim 3. Defendants argue that the bag be sandwiched between a bag retaining ring and the mounting plate, which was connected to a flange on the generator. The Examiner then rejected amended application claims 1, 2, 5, 9, and 10 did not require the "rigid rim" with the inward outward flange language, whereas amended application claims 5, 9, and 10 did not require the "rigid rim" with the inward outward flange language, but rather specified that the bag be sandwiched between a bag retaining ring and the mounting plate, which was connected to a flange on the generator. The Examiner then rejected amended application claims 1, 2, 5, 9, and 10 as obvious in light of the prior art, allowed claims 6 and 8, and objected to amended application claims 3 and 4, but indicated that they would be allowable if revised as directed. Thus, emphasize Defendants, the Examiner allowed application claims relating to Figure 1, but rejected application claims relating to Figure 2. However, this argument begs the question, as the issue is whether a claim with the rigid rim language reads on Figure 2.

The rejection of amended application claim 5 is significant to the interpretation of issued claim 3. Defendants argue that the Examiner explicitly rejected Lynch's attempt to read a claim on both the Figure 1 and 2 embodiments. Amended application claim 5 read as follows:
An inflatable bag restraint system as defined in Claim 2 [which depends on claim 1] wherein the rigid rim comprises a ring within the bag and a mounting plate outside the bag and connected to the ring and the annular sealing surface on the gas generator comprises a peripheral flange engaging the mounting plate.

In rejecting claim 5, the Examiner remarked that

The recitations of claim 5 are not in agreement with those of parent claim 1 (it is contended that claim 1 is not readable on applicant's species of Fig. 2, whereas the recitations of claim 5 attempt to describe this species). As for instance, claim 1 recites one sealing surface on the "gas generator" and one sealing surface on the "rim", the claim further including a "plate means", whereas claim 5 includes one sealing surface on the "gas generator" (on "a peripheral flange") which surface engages the mounting plate, and that the "rim" is "within the bag". It is therefore contended that claim 5 does not define an arrangement in which the rim and generator have sealing surfaces connected in opposition as claimed in claim 1. Claim 5 is therefore vague in maintaining claim continuity in defining the sealing surfaces.

Additionally, in rejecting application claims 1, 2, 5, 9, and 10 as unpatentable, the Examiner explained that, regarding claim 1, "a rigid rim connected to the mouth of the bag including a second annular sealing surface' is broadly readable on" the prior art. Thus, although claim 1 attempted to read on Figure 1, it still was not patentable because it lacked the flange language contained in the allowed claims. Indeed, the Examiner allowed amended application claim 3, which was identical to application claim 1 except that it included application claim 2 and the flange language as additional limitations. Thus, the rigid-rim-with-flanges language was instrumental in obtaining allowance.

In response, Lynch filed another amendment, modifying application claims 3 and 4 as directed, canceling claim 5, and rewriting it as claim 11, but still eliminating the "rigid rim" with flanges element and using the mounting plate in its stead, thus reading on Figure 2. The Examiner stated that application claims 3, 4, 6, and 8 were allowable if some amendments were made, but rejected application claims 1, 2, and 9-12 on the grounds that they would have been obvious in light of the prior art. Finally, Lynch cancelled all application claims other than 6, 8, 3, and 4, which became claims 1-4 of the '251 patent, respectively. Thus, the allowed claims included only those with the rigid-rim-with-flanges element.

--- Footnotes ---
1 The Examiner refused to enter Lynch's second amendment because it was filed after the "final rejection," however, he issued an Advisory Action indicating that claims 3, 4, 6, and 8 would be allowable. Eventually, Lynch filed a continuation application in favor of his original application and later a preliminary amendment that incorporated all of the previous amendments made to the earlier application, including the final amendment that the Examiner refused to consider. In addition, Lynch added application claim 12.
--- End Footnotes ---

This prosecution history presents the Court with the situation where the patentee limits the claims in order to obtain allowance over the prior art and then asserts a broad interpretation for litigation purposes that renders the claim invalid. Accordingly, the Court must reject Plaintiffs' proposed claim interpretation. As the Federal Circuit explained in Lemelson, a patentee "cannot acquiesce to a rejection and to an agreed alternative, and now years later shift his stance 180 degrees to argue for a second bite at the abandoned apple." 968 F.2d at 1208.

19. Ring

Synventive proposes

part of the valve pin assembly that couples the valve pin to the piston while facilitating side-to-side (radial) movement between the valve pin assembly and piston; the ring also enables decoupling of the valve pin assembly from the piston such that the valve pin assembly remains aligned with the piston and secured to the manifold when the ring is decoupled.

Husky proposes "circular band."

The patent and its specification provide no indication that the word is used in any manner inconsistent with the ordinary meaning of the word. There is no express definition of "ring" set out in the specification, nor is any alternative definition implied. See, e.g., Phillips, 415 F.3d at 1320-21 ("[T]he specification 'acts as a dictionary when it expressly defines terms used in the claims or when it defines terms by implication.'" (quoting Vitronics, 90 F.3d at 1582)). That the ring is an integral part of the innovative valve pin assembly that secures it to the piston does not alter its ordinary meaning. The term is construed as "circular band."

3393

4. "Ring." Consistent with the specification, 12 the court construes "ring" to mean "a stent."

A. Rigidity of Ring Means

The parties' motions are essentially mirror images of another, all disputing essentially the same issues. 2 The keystone of
this dispute is the term "ring means," which appears in each independent claim and impacts the other disputed terms. Sassy contends that "ring means" should be construed to mean "that a rigid or semi-rigid ring is mounted at the open end of the food receiving container". (Doc. 77 at 17). 3 Sassy also argues that a "rigid ring" should be construed to mean a ring which is stiff and not flexible, and that a "semi-rigid ring" should be construed to mean a ring which is substantially rigid, and thus substantially stiff and not flexible. (Doc. 77 at 17-18). Berry responds that the "ring means" is simply a ring, of no particular rigidity, except where (as in the dependent claims) that rigidity is specified as either rigid or semi-rigid. (Doc. 88 at 8). Berry also contends that "rigid" should be construed as "able to maintain shape without external force" and "semi-rigid" as "partially able to maintain shape without external force". (Doc. 88 at 8).

2 The Court notes that one of these issues has been resolved. Sassy originally sought construction of the term "elongate food receiving container of mesh material," but at the hearing it accepted Berry's construction.

3 More specifically, Sassy contends that what it describes as "element (ii)" of the '357 Patent claims should be construed in this way. (Doc. 77 at 17). However, Sassy points to a different phrase as "element (ii)" in each independent claim, ranging from the phrase "one end of said container having an aperture in which ring means is mounted" in claim 1 to "ring means serving to hold said aperture of said elongate container in an open position to simplify the placement of food in said container" in claim 17. Sassy acknowledges what it calls "minor differences" in the wording of each phrase it designates as element (ii) in the independent claims, but contends that each phrase defines identical subject matter. (Doc. 77 at 16). It is true that "two claims with different terminology can define the exact same subject matter." Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380 (2006). But Sassy offers no explanation as to why the Court should find that these claims -- or, more particularly, the differing phrases Sassy points to as element (ii) within these claims -- define identical subject matter. The fact that some of the phrases (such as the one in claim 17) include functions that the ring means is to perform, while others (such as the phrase in claim 1) do not, leads to a conclusion that the phrases are not defining identical subject matter.

Sassy offers two arguments in support of its favored construction of "ring means". First, Sassy argues that Berry's use of the word "means" gives rise to a presumption that Berry set forth a means-plus-function limitation as set forth in 35 U.S.C. § 112, P.6. (Doc. 77 at 18). That paragraph provides that

[a]n element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

35 U.S.C. § 112, P.6. Sassy correctly points out that claims 9, 13, and 17 associate the "ring means" with the function of holding the mesh bag open to make it easier to insert food. The specification recites (at Col. 5, lines 30-33) that one purpose of the ring means 36 "is to hold the aperture 34 of the elongate container in an open position to simplify the placement of food in the container" and (at Col. 5, lines 18-20) that the ring means 36 "may be of rigid or semi-rigid construction." Sassy therefore declares that the structure corresponding to the "ring means" is only a rigid or semi-rigid ring. (Doc. 17 at 18).

However, Sassy has misstated the requirements of the Section 112, paragraph 6 presumption. To invoke this presumption requires not merely the use of the word "means" in a claim element but its use in association with a function. See, e.g., Micro Chemical, Inc. v. Great Plains Chemical Co., Inc., 194 F.3d 1250, (Fed. Cir. 1999). Claim 1 and claim 5 do not associate the "ring means" with a function, and therefore the Section 112, paragraph 6 presumption is not invoked in regard to them. The fact that a patent asserts that an invention achieves several objectives does not require that each of the claims be construed as limited to structures that are capable of achieving all of the objectives. Phillips v. AWH Corp., 415 F.3d 1303, 1327 (Fed. Cir. 2005). Thus the "ring means" in claim 1 and claim 5 need not be able to hold the mesh bag open. As such, even assuming that the specification requires a rigid or semi-rigid ring structure to perform that function, 4 that structure would not be required of the "ring means" in claim 1 or claim 5.
4 As Berry points out, the pertinent portion of the specification says the ring means "may be of rigid or semi-rigid construction," not that it must fall into one of those two categories. (Doc. 88 at 11).

Sassy next argues that Berry expressly limited the scope of the "ring means" to a ring that is at least substantially rigid, by way of the following passage in the Detailed Description:

The central aperture 17 of the closure ring 16 is of a size to receive the elongate container 14 in which soft, readily dissolvable food has been placed. Around the aperture 17 is disposed the previously mentioned inner shoulder or internal shoulder 20, which is of a diameter to closely receive the ring means 36. However, the aperture 17 of the closure ring 16 is sufficiently smaller than the ring means or ring component 36 as to prevent the ring means passing through the aperture of the closure ring. In all instances the ring means 36 is sufficiently rigid or sturdy as to prevent it being pulled through the aperture 17 of the closure member 16, even if the caregiver fails to properly tighten the closure member upon the handle member.

(Col. 5, lines 47-59) (emphasis added).

Sassy contends that this "in all instances" language shows that Berry disavowed any invention in which the ring means was not at least substantially rigid. (Doc. 77 at 19). But such a disavowal requires a statement much more explicit than this one. See, e.g., SciMed Life Systems, Inc. v. Advanced Cardiovascular Systems, Inc. (Fed. Cir. 2001) (finding disavowal where specification defined particular structure for "all embodiments of the present invention contemplated and disclosed herein"). The phrase "in all instances" as used here is insufficiently broad and unequivocal to accomplish the complete disavowal that Sassy advocates, and instead refers to all instances of Berry's preferred embodiment.

As for the particular terms "ring means," "rigid," and "semi-rigid," the Court agrees with Berry's contention that "ring means" is nothing more than a ring, and that the remaining terms should simply be given their ordinary meanings. (Doc. 88 at 11-12). However, Berry offers no support for the "ordinary meanings" it proposes for those terms, and the Court finds that Sassy's proposed constructions are closer to the mark. In ordinary experience, "rigid" is taken to mean "stiff" or "not flexible". Similarly, "semi-rigid" is regarded to mean "partly rigid" or "somewhat flexible" (not "substantially rigid," as Sassy would have it).

A. Claim Construction

The disputed language of claim one of the '251 patent relates to the activator mechanism for opening the umbrella -- "a latch slidably received in said barrel for selectively disengaging said catch from said barrel to release said barrel from said tube; . . . said latch being ring-shaped and being slidably received in said channel of said barrel for slidably receiving said tube therein." 56 Windbrella suggests that the most appropriate claim construction of the term 'ring-shaped latch' is "a curved component for receiving the tube of the umbrella." 57 This construction would essentially read the words "ring-shaped" out of the claim and replace them with "curved." Taylor Made suggests that the claim requires "a latch which is continuously curved securing the latch to the umbrella against the tube." 58

56 '251 patent, col. 4, ll. 22-31 (emphasis added).

57 Pl. Mem. at 11.

Neither party asserts that the disputed claim language has a particular meaning to persons skilled in the art of designing umbrellas. The Tenth Edition of Merriam-Webster's Collegiate Dictionary was the contemporary edition available at the time the patent was filed, and it defines "ring" as follows:

1) a circular band for holding, connecting, hanging, pulling, packing, or sealing <<a key ring> <<a towel ring>
2) a circlet usually of precious metal worn on the finger
3 a) a circular line, figure, or object <<smoke ring> b) an encircling arrangement <<a ring of suburbs> c) a circular or spiral course -- often used in plural in the phrase run rings around. 59

The repetition of the word "circular" supports the initial inference that a ring-shaped object has an enclosed, continuously curved shape.

59 Webster's Collegiate Dictionary, Tenth Edition (Merriam-Webster Inc. 1996), available at www.m-w.com. While this dictionary lists dozens of definitions of "ring," these are the first three definitions of the noun form of the word, and the most relevant to the term "ring-shaped" in the '251 patent.

Windbrella submitted a dictionary definition of ring that says "a circular or curved band (as of metal, wood, fabric, or plastic) used for holding, connecting, hanging, or pulling." 60 This selection of a broad definition from an unabridged 1986 dictionary calls to mind the Federal Circuit's recent reminder that "general dictionaries, in particular, strive to collect all uses of particular words, from the common to the obscure." 61 Due to this and other factors, the Federal Circuit warned courts about the "risk of systematic overbreadth" if the utility of dictionary definitions for claim constructions is over-emphasized. 62

Even taking Windbrella's carefully-chosen definition at face value, it does not indicate that "ring-shaped" and "curved" are synonymous. The definition includes the word "band," which limits the subcategory of curved items that would qualify as a ring. For example, an object shaped like the letter "S" would not fall under the dictionary definition proffered by Windbrella -- although it is curved, it is not a "circular or curved band" and it clearly cannot function in the same way as a ring.

Turning to the contextual clues, there is a second claim term that assists in the interpretation of "ring-shaped latch." 63 The latch must "slidably receive said tube therein." 64 The word "therein" is significant, because if the inventor contemplated a pronged device, the tube would likely be received "between" the prongs rather than "in" the ring-shaped latch. So in addition to being "curved," the latch must be capable of encircling the umbrella's tube, as a ring encircles a finger so that the finger is received therein.

63 Cf. Mars, 377 F.3d at 1374 (construing claim term "ingredients" in light of the use of the term "mixture" in the same claim phrase).

64 '251 patent, col. 4, l. 31 (emphasis added).

There is additional guidance to be found in the specification of the '251 patent. The word "ring" is used to describe two other components of the patented umbrella. 65 The drawing of the preferred embodiment in Figure 2 of the '251 patent pictures both of these other "rings" as geometrically perfect circles -- see numbers twenty and thirty-one below.

65 See '251 patent, col. 2, ll. 36-38 ("ring 20 [which] includes a sleeve 21 provided or disposed or extended downward therefrom and is slidably engaged on the tube 10"); id., col. 2, ll. 45-46 (describing "ring 31" on the barrel of the umbrella). See also Phillips, 415 F.3d at 1314 (citing Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001)) ("Because claim terms are normally used consistently throughout the patent, the usage of a term in one claim can often illuminate the meaning of the same term in other claims.").
Nonetheless, the image of the "ring-shaped latch" itself -- number seven above -- shows that the inventor did not intend "ring-shaped" to mean "circular." The latch pictured in the patent specification is attached to a button -- number seventy in the figure above. Extending outward from this button at right angles are the two sides of the U-shaped latch. So viewed from the side, the latch would look like an upper-case "D," with the button on the left side of the piece. Because the latch pictured in Figure 2 of the patent is not in the shape of a geometric circle, the inventor and claim examiner must not have intended to define "ring-shaped" in a way that includes only perfectly circular objects. However, the latch in the preferred embodiment is still a curved, enclosed band that would encircle the tube as a ring encircles a finger.

66 "In the course of construing the disputed claim terms, a court should not ordinarily rely on the preferred embodiments alone as representing the entire scope of the claimed invention." CCS Fitness v. Brunswick Corp., 288 F.3d 1359, 1370 (Fed. Cir. 2002). Here, Figure 2 of the '251 patent is not used to limit the claim. It is only used to examine whether the inventor and claim examiner could have intended to define ring-shaped as circular, given that meaning of ring-shaped must be at least broad enough to include the preferred embodiment.

Finally, the prosecution history of the '251 patent also offers insight relevant to claim construction. While it does not clarify the exact meaning of "ring-shaped," the prosecution history does demonstrate that the "ring-shaped" and "slidably receiving said tube therein" language was added to the independent claim precisely in order to overcome a rejection based on the existence of prior art. This is of great importance given that "the purpose of consulting the prosecution history in construing a claim is to 'exclude any interpretation that was disclaimed during prosecution.'" 67 The prosecution history in this case counsels against reading any of the disputed terms out of the claim with broad definitions, absent convincing evidence that such meanings were intended by the inventor and accepted by the claim examiner.

67 Chimie, 402 F.3d at 1384 (quoting ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1580 (Fed. Cir. 1988)).

Taking all of the intrinsic evidence considered above into account, I now return to the '251 patent, which claims a latch, "said latch being ring-shaped and being slidably received in said channel of said barrel for slidably receiving said tube therein." 68 Because Windbrella has not been able to proffer evidence supporting its suggestion to replace the word "ring-shaped" with "curved" and disregard the word "therein," this suggestion fails as a matter of law. The language of the claim, the patent's specification, and the prosecution history require that the latch described by the '251 patent be construed as a curved band that encircles the tube.

68 '251 patent, col. 4, ll. 29-31 (emphasis added).
F. Ring Shaped Support

ICU argues that the term "ring shaped support" should be construed as "a circular-shaped structure that serves as a foundation, prop, brace or stay." Braun seeks a much narrower construction, limiting the term to "an annular cuff into which the flexible element fits." Braun cites as support for its limitation a portion of the preferred embodiment labeled the "annular cuff 28." Col. 7:29-38. However, in doing so Braun seeks to impermissibly import a limitation contained in the preferred embodiment onto the claim language. See Teleflex, Inc. v. Ficosa North America Corp., 299 F.3d 1313, 1328 (Fed. Cir. 2002) (cautioning against "limiting the claimed invention to preferred embodiments or specific examples in the specification" (citations omitted)). The term "ring shaped support" uses plain words and the phrase has an ordinary meaning based on the constituent terms' general usage. Braun's attempt to inject ambiguity where there is none is rejected.

ICU's interpretation, on the other hand, simply redefines the term "ring shaped support" using dictionary definitions that in no way clarifies the scope of the term. This Court finds little use in doing so and instead agrees with ICU's alternative interpretation that the term is unambiguous and construction is unnecessary. RJCCPS at 4.

B. Riser card

1. Parties' positions

The parties are in substantial agreement as to the meaning of the disputed term "riser card." Tulip has suggested a number meanings for the term, proposing in its final Markman brief the definition: "[a] printed circuit board that provides electrical connectors for expansion boards and plugs into a mating connector on the motherboard." 62 Dell contends that "the term requires a printed circuit board extending perpendicular to a motherboard, the printed circuit board including at least one expansion board connector mounted thereon, and wherein the printed circuit board is electrically connected to the motherboard." 63

--- Footnotes ---

62 D.I. 368 at 5. In the parties' joint submission of disputed terms, Tulip suggested "riser card" be defined as: "[a] printed circuit board that is mounted on the motherboard planar and provides electrical connections for expansion boards." D.I. 308 at 5. In its initial Markman brief, Tulip defines "riser card" as: "[a] printed circuit board that is mounted on the motherboard and that provides electrical connectors for expansion boards." D.I. 326 at 11.

63 D.I. 308 at 10.

--- End Footnotes ---

Both parties cite the definition of riser board contained in the specification of the '621 patent. The specification states, "the motherboard then comprises a connector for a plug-on or so-called riser card. This is a printed board with printed circuitry on which, in a row parallel above each other, a number of connectors are arranged." 64 Additionally, Dell notes that the claims also call for "a mating connector for [the] riser card." 65 The mating connector is claimed as having "an opening adapted to receive a riser card, said mating connector being oriented on the motherboard such that the opening extends in a direction perpendicularly upward from a horizontal surface of the motherboard." 66 From this, Dell argues the term "riser card" must include the requirement that the riser card extend perpendicularly from the motherboard.

--- Footnotes ---

64 '621 at 1:56-59.
2. Court's construction

The parties agree that the term "riser card" concerns a printed circuit board with connectors into which a plurality of expansion boards may be inserted. 67 At oral argument, Tulip agreed that the mating connector described in the claims at issue necessarily results in the riser card extending perpendicularly from the motherboard when the riser card is inserted into the mating connector. Likewise, Dell acknowledged at oral argument that the "electrical connectors," which Tulip described as "contact strips" (i.e., metal fingers on the edge of the riser card) that mate with the connector on the motherboard," 68 would satisfy Dell's proposed construction that the riser card be "electronically connected to the motherboard." Therefore, the court construes "riser card" to mean a printed circuit board extending perpendicularly from, and being electronically connected to, the motherboard and having a plurality of expansion connectors into which expansion boards may be inserted.

67 Although the proposed construction suggested by Dell in the joint submission on disputed claim terms includes a requirement that at least one expansion board be inserted into the riser card, neither party addressed that requirement in their Markman briefing or at oral argument with respect to the definition of riser card. Because that purported requirement is separately addressed, below, whether or not the riser card has at least one expansion board inserted is not considered in the court's construction of the term "riser card."

68 D.I. 368 at 5.
The parties first dispute whether the inventor's use of the term "road" in claim 5 was intended to encompass the cutting of grooves on the shoulder of a road. Defendant asserts that it was intended as such and plaintiff asserts that it was not. The patent does not particularly define the term road and the term's general definition is simply "an open way for the passage of vehicles, persons, and animals." Webster's Third New International Dictionary, 1963 (2002). However, considering the language of the entire patent, including the specification, the court concludes the term road should not be read to include a shoulder.

The primary purpose of the patent is to drain water from the road surface onto the shoulder by cutting grooves on or near the "edge" of the road. See "Background of the Invention," P1; "Summary of the Invention," Column 2, lines 2-4. The grooves secondarily serve as rumble strips to alert a driver to the edge of the road. See "Detailed Description of the Invention," P 8, lines 25-28. For purposes of both, the patent refers to the edge and surface of the road distinct from the shoulder. In addition, the figures representing the embodiment of the invention indicate that the grooves are cut into the road surface not the shoulder. See, e.g., Figs. 2 & 4:

Accordingly, the court construes the term "road" in claim 5 of the patent to mean that portion of the roadway designed or ordinarily used for travel which does not include the shoulder.

Plaintiff has submitted extrinsic evidence on this subject in the form of the deposition testimony of Inventor Whitney. While the court affords little weight to such after-the-fact testimony, it notes the inventor's recent statement of his former intentions is consistent with the court's construction.

With respect to this term, the parties dispute whether the patent expressly defines the term. The relevant portion of the specification appears in the description of the preferred embodiment and reads as follows:

The robotic beverage capture and transport assembly generally includes a pair of horizontally mounted rail/rack assemblies, a vertically oriented shuttle bar that rides along the horizontal rails in the X-direction, a carrier frame that moves in the Y- (vertical) direction along the shuttle bar, and a pick-up or transfer mechanism that is mounted to and moves with the carrier frame and operates in the Z-direction to remove a beverage container from a selected tray. '930 Patent, col. 11, ll.
This citation is, generally, the construction proposed by the defendants.

Crane asserts a broader construction, citing a number of references in the specification in support, as well as a few extrinsic sources. One of the citations in the specification alludes to the ability of a controller to contain robotic path files. See '930 Patent, col. 19, 1. 59 -- col. 20, 1. 4. A second reference in the specification discusses the use of "robotic principles to acquire a product to be vend..." '930 Patent, col. 2, 1. 56 -- col. 3, 1. 4. Despite these statements, the Summary of the Invention states that "[t]he invention uses an efficient, cost-effective, highly accurate, reliable and easily programmable robotic beverage capture assembly for capturing that beverage container selected by the customer. . . ." '930 Patent, col. 3, ll. 17-20. This passage of the portion of the specification appears to be referring to the robotic assembly more particularly described in the specification quoted by the defendants. In short, the court is persuaded that the robotic assembly of the invention is one that includes a pair of horizontally mounted rails, a vertically oriented shuttle bar that travels along the rails, and a carrier frame that moves vertically along the shuttle bar. Likewise, the robotic assembly must have a transfer mechanism to retrieve the selected product. Given the description of the robotic assembly in the specification, the court adopts a construction similar to what the defendants have proposed.

The court defines "robotic assembly" as a "machine consisting of a pair of horizontally mounted rail/rack assemblies, a vertically oriented shuttle bar that rides along the horizontal rails in a horizontal direction, a carrier frame that moves in the vertical direction along the shuttle bar, and a transfer mechanism that is mounted to and moves with the carrier frame and operates to retrieve a selected product."

**3403**

d. Rod and Crankshaft

Plaintiff asserts that the term "rod" in Claim 1 of the '662 Patent should be construed to mean "a rigid member for connecting and transferring mechanical force from one portion of a device to another portion of a device." Further, Plaintiff contends that "the term would include a connecting rod which is any rigid member for connecting and transferring mechanical force to other portions of a device, including a member that transmits power from one rotating portion of a machine to another in reciprocating motion." Defendant asserts that "rod" should be construed merely as "a one-piece member having a first end and a second end." Furthermore, Defendant argues that the first end of the rod should be construed to be pivotally connected to the crankshaft and the second end of the rod should be construed to be pivotally connected to the diaphragm.

First, the Court notes that it has already construed the term "operably connected" to mean that one component is connected to another component in such a manner that the components may interact with each other. Thus, the Court need not address Defendant's argument that a pivotal connection be read into the "operably connected" language in Claim 1 of the '662 Patent. Claim 1 states, generally, that one end of the rod is operably connected with the diaphragm, the second end of the rod is operably connected to the crankshaft, and the crankshaft is operably connected to the first motor. Consistent with the Court's previous discussion of the term "operably connected," the Court construes these terms to mean that these components are connected in such a manner that the components may interact with each other.

Second, the Court finds that Plaintiff is correct in asserting that the term "rod," as used in the '662 Patent, means "connecting rod." "Connecting rod" is commonly defined as "a rod that transmits motion from a reciprocating part of a machine (as a piston) to a rotating part or vice versa." Merriam Webster's Collegiate Dictionary 245 (10th ed. 1998). The McGraw-Hill Encyclopedia of Science and Technology defines a connecting rod as, among other things, "a link in several kinds of mechanisms . . . any straight link that transmits motion or power from one linkage to another within a mechanism." McGraw-Hill Encyclopedia of Science and Technology, vol. 4 at 625 (9th ed. 2002). As described in the specification of the '662 Patent, the term "rod" is used to describe the diaphragm's mechanical connection to the crankshaft. (See '662, c. 4, ll. 9-13 ("Diaphragm 19 is mechanically connected through rod 33 to a crankshaft 34, which is driven by a motor 35").) As noted by Plaintiff, the prosecution history also supports the definition of a rod as a connecting rod. Specifically, in the Response to the First Office Action for the '797 Patent, the applicant stated as follows:
Additionally, in the claimed invention, the crankshaft moves the diaphragm through a cycle that is sinusoidal with respect to time. Consequently, the sinusoidal pulses are generated at an oscillation frequency between about 5 and 25 Hz, which is generally below the human audible range. These sinusoidal pulses contain no undesirable high frequency components which would act on the walls of a bladder as a sounding board, creating undesirable noise. Also, the crankshaft is counterbalanced, which offsets the dynamic vibration forces of the reciprocating motion of the diaphragm and connecting rod. The benefits of offsetting these dynamic vibration forces include less noise, less vibration, and increased reliability.

See Response to First Office Action for ’797 Patent at 5. Thus, in the context of the ’662 Patent, a rod performs the function of transmitting power from the crankshaft to the motor within the mechanism.

Consistent with this definition, the specification, and the prosecution history, the Court construes the term "rod" to mean any straight link that transmits motion or power from one linkage to another within a mechanism.

3404

A. This Court Must Interpret "A First Rod Receiving Area and a Second Rod Receiving Area Formed in Said Hanger Member"

Bonneau asserts that the claim construction dispute relates to the last two clauses of Claim 5. The first clause which is in dispute ("Clause # 1") provides as follows:

- a first rod receiving area and a second rod receiving area formed in said hanger member below the upper edge thereof, said first and second rod receiving areas spaced apart from each other by the distance between said two rods, said first rod receiving area and said second rod receiving area configured to allow a first of said rods to extend through said first rod receiving area and the second of said rods to extend through said second rod receiving area so that said hanger member is supported by said two rods, said hanger member slidable along said two rods when said first rod extends through said first rod receiving area and said second rod extends through said second rod receiving area to secure a horizontal for said eyeglasses when said hanger member is supported on said two rods

(Col. 8, lns. 9-25 of the ’345 Patent.)

Overall, Bonneau asserts that the disputed elements - "a first rod receiving area and a second rod receiving area formed in said hanger" - only cover an enclosed elongated aperture or hole capable of being selectively usable with either a single-rod or a double-rod cantilevered support and not the Bonneau Slide Hook's opposed open-ended slots capable of being used with only a double-rod cantilevered support. Magnivision claims that although Figure 1 of the ’345 Patent demonstrates a rod receiving area which is one winged hole, the rod receiving areas are any areas on the hanger through which the duel rod cantilevered extends. It states that nothing in the claim indicates that the two rod receiving areas must be contiguous but only that the hanger should include a first and second rod receiving area. Magnivision asserts the following claim construction for Clause # 1:

The hanger includes a first and second rod receiving area. A rod receiving area is merely an area through which a rod extends. The first and second rod receiving areas are spaced apart from each other by the distance between the two rods. The first rod extends through the first rod receiving area and the second rod extends through the second rod receiving area. This (i) supports the hanger so that the hanger can slide along the rods, and (ii) maintains a horizontal orientation for the eyeglasses.

Bonneau asserts initially that the term "rod receiving area" is ambiguous because the term does not impart any clear, definite meaning to anyone skilled in the art of mechanical design. It supports this assertion with the declaration of Professor Siegel who states that "rod receiving area" has no common, settled, conventional meaning in the art of mechanical design. (Siegel Decl., PP 25-26.) Magnivision argues that this Court has already construed the term "rod receiving area" in its July 28, 1998 Order ("July Order") and therefore, this Court's previous construction is the law of the case. In addition, it submits the declaration of Professor Anders who states that the term is understandable to anyone with expertise in the field of point of purchase displays. (Anders Decl., PP 18-19.)
Contrary to Magnivision's assertions, this Court did not engage in any claim construction in its July Order. Rather, in the context of determining whether Claim 5 was invalid for indefiniteness, this Court found that the term "rod receiving area" was not indefinite. Presently, this Court is faced with the task of construing Claim 5 of which this term is a part. This does not mean, though, that this Court disregards its previous statements. In the July Order, this Court concluded that a rod receiving area is an area through which a rod extends. This Court arrived at this conclusion after making the following observation:

When Claim 5 of the '345 Patent is read in context, it is clear that Claim 5's reference to 'two rod receiving areas' on the eyeglass hanger member, in conjunction with the reference to a 'cantilever support' including 'two rods' on the eyeglass display member, describe an interface between two rods on the display and two rod receiving areas on the hanger.

(Order, p. 17.) In essence, this "interface" is now the focus of this claim construction issue. Specifically, the meaning of the words of Clause # 1 - "a first rod receiving area and a second rod receiving area formed in said hanger member" - are the subject of this dispute and require construction by this Court. While Magnivision urges this Court to end its construction of Claim 5 because the term "rod receiving area" is not ambiguous, it ignores the principle that this Court "must give meaning to all the words in [the] claims." Exxon Chemical Patents, Inc. v. Lubrizol Corp., 64 F.3d 1553, 1559 (Fed. Cir. 1995), cert. denied, 518 U.S. 1020, 135 L. Ed. 2d 1073, 116 S. Ct. 2554 (1996). In addition, the parties present conflicting testimony of their experts whether one of ordinary skill in the art would understand the terminology "rod receiving area."

As guided by the Federal Circuit, then, this Court must look to the patent specification. This Court is cognizant that patents are construed primarily by reference to the public patent record so that the public need not guess at unforeseen future claim interpretations that might be based upon unforeseen, litigation-induced, extrinsic testimony. Southwall Techs. v. Cardinal IG Co., 54 F.3d 1570, 1578 (Fed. Cir. 1995). "Claims are not interpreted in a vacuum, but are part of and are read in light of the specification." Fromson v. Anitec Printing Plates, Inc., 132 F.3d 1437, 1442 (Fed. Cir. 1997) (citation omitted).

The specification does not use the words "rod receiving area." However, it references areas through which rods extend:

The hanger is constructed with an aperture that receives a cantilevered bar projecting horizontally from a wall of the display, which bar may be of the single or double arm type . . . .

(Col.1, Ins. 48-55 of the '345 Patent.)

Now referring particularly to FIGS. 1, 2 and 3. Hanger 10, constructed in accordance with a first embodiment of the instant invention, includes main element 11 (FIG.3) which is a single sheet of relatively stiff resilient plastic material, typically a polythene. Element 11 consists of rectangular relatively wide main section or body 12 and relatively narrow extension 14. It is intended that front surface 29 of body 12 bear identifying indicia 28. Body 12 is provided with elongated aperture section 16 that is substantially longer than the width of extension 14, and is disposed in the vicinity of and extends parallel to edge 17. Centered between the ends of aperture section 16 and extending therefrom toward edge 17 is notch-like aperture section 18. Elongated section 16 is adapted to receive a cantilevered support comprising spaced parallel arms 19. 19, which project horizontally from wall 20, while notch section 18 is adapted to receive a cantilevered support consisting of single horizontal arm 21.

(Col. 2, Ins. 47-65 of the '345 Patent.)

The specification references an "aperture that receives a cantilevered bar." It states that the bar may be of the single or double arm type. It also states that the hanger is provided with "aperture section 16" which is formed to receive "a cantilevered support comprising spaced parallel arms." In the middle of "elongated" aperture section 16 is a "notch-like aperture section 18" which is formed to receive "a cantilevered support consisting of [a] single horizontal arm." When these words are viewed in conjunction with the Figures which are referenced, it is clear that the words of Claim 5 - "a first rod receiving area and a second rod receiving area formed in said hanger member" - mean that the area through which a rod extends is enclosed within the hanger so that the hanger can receive either a single arm or a double arm bar. Contrary to Magnivision's interpretation, the words of Claim 5, "formed in," do not equate with "includes." The hanger encloses and gives form to the rod receiving areas.

The prosecution history of the patent supports this conclusion as well. In the file history of the '345 Patent, Magnivision
states that "an opening means is formed in the hanger member below the upper edge thereof and receives the cantilever support …." (Cobrin Reply Decl., Exh. 1, p.7.) (Emphasis added.) Clearly, there can only be an "opening" in the hanger if the hanger fully surrounds such opening.

In addition, included in an analysis of the prosecution history is an examination of the prior art cited therein, which may help identify what the claims do not cover. Vitronics, 90 F.3d at 1583. During the prosecution of the '532 Patent, which is the '345 Patent parent, the Examiner repeatedly rejected the pending claims on the basis of, inter alia, lack of novelty and obviousness in view of what is disclosed in Patent No. 3,710,996 ("Smilow"). (Reilly Decl., Exh. 16, p. 132 and pp. 142-43 and Exh. 17, pp. 142 and 150.) The Smilow patent discloses a display hanger which has an open-ended slot by which the Smilow hanger is mounted on a support. (Reilly Decl., Exh. 21, p. 227.) In its response to the Examiner's rejection of the claims in the parent application, Magnivision stated that the Smilow reference does not teach an "aperture means." (Reilly Decl., Exh. 16, pp. 136 and 142.) During the prosecution of the patent, Magnivision emphasized that "with the Applicant's claimed invention, a plurality of eyeglasses can be conveniently and securely supported on either a single or double-arm-type cantilevered bar." (Reilly Decl., Exh. 16, p. 140.)

In Al-Site Corp. v. The Bonneau Co., 1994 U.S. App. LEXIS 6188, 33 U.S.P.Q.2D (BNA) 1136, 1139 (Fed. Cir. 1994), the Court looked to the prosecution history and parent application to support the district court's construction that the aperture means of the disputed claim was limited to an enclosed hole. The comments by the Federal Circuit are equally applicable here:

The fact that Al-Site expressly stated that the open-ended slot of Smilow et al. did not teach its claimed aperture means lends credence to the interpretation that 'aperture means' is limited to an enclosed hole and structural equivalents thereof. (citations omitted) (emphasis in original).

Magnivision claims that because the term "rod receiving area" was never discussed or used in the '532 Patent, the questions raised on the issue of patentability are different. It states that the '345 Patent was filed as a continuation of the '532 Patent to obtain broader protection. It argues that contrary to Bonneau's assertion that the claims are limited to exactly what was disclosed in the '532 Patent, the patent examiner did not limit or reject Claim 5 based on the earlier '532 Patent.

This Court does not look to the prosecution history, including the parent application, of the '345 Patent to address whether Claim 5 is limited by the disclosures in the '532 Patent. Rather, this Court looks to these references for aid in construing Clause # 1 of the '345 Patent. In addition, while this Court agrees in general with Magnivision that rejection of a portion of a claim in one patent does not limit the patentability of a similar portion of a new claim, this principle has no application here.

Magnivision also emphasizes that it is error to incorporate non-recited functional and/or structural limitations from the specification into the claims. Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1277 (Fed. Cir. 1995). "Although the specification may aid the court in interpreting the meaning of disputed language in the claims, particular embodiments and examples appearing in the specification will not generally be read into the claims." Constant v. Advanced Micro-Devices Inc., 848 F.2d 1560, 1571 (Fed. Cir. 1988). Based on previous hearings in this Court, Magnivision states that this is the "canon of importance" because it appears to believe that this Court is not cognizant of this principle.

In this instance, a reading of the specification provides evidence to indicate that the limitations found above must be imported into the claims to give meaning to the disputed terms. See id. In other words, the limitation that the rod receiving areas must be closed within the hanger is imported into Clause # 1 to give meaning to the disputed terms.

Bonneau further contends that permissible extrinsic evidence supports its construction. Specifically, it cites to statements by the inventor, Michael Nyman, wherein Nyman admitted that he contemplated a hanger that was usable with either a single-arm or a double-arm "U"-shaped cantilever and that all of the prototypes that he made of his claimed hanger card during the development of his invention included an enclosed opening. (Reilly Decl., Exh. 13, pp. 94-97.) This Court finds that reliance on this extrinsic evidence would be improper. Although this evidence does not vary or contradict the claim language, only if there were still some genuine ambiguity in the claims, after consideration of all available intrinsic evidence, should this Court resort to extrinsic evidence. Vitronics Corp., 90 F.3d at 1584. 3
Reference to dictionary definitions is permissible. "Judges are free to consult such resources at any time in order to better understand the underlying technology and may also rely on dictionary definitions when construing claim terms, so long as the dictionary definition does not contradict any definition found or ascertained by a reading of the patent documents." Vitronics Corp., 90 F.3d at 1584, n. 6. The Webster's Ninth New Collegiate Dictionary (1990) defines (i) "form" as "to give form or shape to" and "shape or mold into a certain state or after a particular model" and (ii) "in" as "a function word to indicate inclusion, location, or position within limits." Thus, even assuming that this Court accepted Magivision's proposition that the disputed language should be given its "ordinary" and "plain" meaning, this Court's construction as discussed above would still be proper. "A first rod receiving area and a second rod receiving area formed in said hanger member" would mean two areas through which a rod extends shaped within limits of the hanger member.

This Court finds that the rod receiving areas must be within, or enclosed by, the hanger card. Nothing in the specification or the prosecution history supports Magivision's broad construction that a first and second rod receiving area can be anywhere in the hanger. See Abtox, Inc. v. Exitron Corp., 122 F.3d 1019, 1024 (Fed. Cir. 1997)(adopting narrow interpretation because "nothing in the written description suggested" patentee's interpretation), op. amended, 131 F.3d 1009 (Fed. Cir. 1997); O.I. Corp. v. Tekmar Co., Inc., 115 F.3d 1576, 1581 (Fed. Cir. 1997) (affirming summary judgment of non-infringement - adopting narrow construction limited to the structures disclosed in the specification, in part because "[none] of the structures contemplated by the written description" encompassed a feature possessed by the accused device).

B. "Rod Receiving Areas" Is Not A Means-Plus-Function Element

Bonneau alternatively contends that "rod receiving areas" is a means-plus-function element under 35 U.S.C. § 112, P 6 and is therefore limited to the centrally-located elongated aperture disclosed in the specification. Magivision disputes this.

35 U.S.C. § 112, P 6 provides as follows:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

To invoke this statute, the alleged means-plus-function claim element must not recite a definite structure which performs the described function. Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531 (Fed. Cir. 1996).

Because of this latter requirement, this Court agrees with Magivision and finds that "rod receiving areas" is not a means-plus-function element. In other words, Clause # 1 recites a definite structure which performs a described function:

a first rod receiving area and a second rod receiving area formed in said hanger member below the upper edge thereof, said first and second rod receiving areas spaced apart from each other by the distance between said two rods, said first rod receiving area and said second rod receiving area configured to allow a first of said rods to extend through said first rod receiving area and the second of said rods to extend through said second rod receiving area so that said hanger member is supported by said two rods, said hanger member slideable along said two rods when said first rod extends through said first rod receiving area and said second rod extends through said second rod receiving area to secure a horizontal for said eyeglasses when said hanger member is supported on said two rods.

The bolded words describe the structure allowing the hanger and cantilevers to interact. "An element with such a detailed recitation of its structure, as opposed to its function, cannot meet the requirements of the statute." Id.
conception do not impose limitations, the claim drafter is free to claim broadly. See Ethicon v. United States Surgical, 93 F.3d 1572, 1582, 40 U.S.P.Q.2D (BNA) 1019, 1026 (Fed. Cir. 1996) (“[Because the inventor] did not consider the precise location of the lockout to be an element of his invention, he was free to draft . . . broadly . . . to exclude the lockout's exact location as a limitation.”).

The '345 applicant claimed the rod receiving areas in broad terms. Those claim terms receive their ordinary and customary meaning unless the applicant assigns them a narrower or special meaning. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). The language of claim 5, read alone, does not require enclosed receiving areas.

The district court concluded that the applicant had assigned the words "rod receiving area" a narrower meaning in the specification and prosecution history. When presented with relatively unrestricted claim language, however, a trial court must use care in checking the specification for a special meaning. Unless the applicant unambiguously narrowed the scope of broad claim terms in the rest of the patent, the construing court runs the risk of importing unintended limitations from the specification. See Transmatic, Inc. v. Gulton Indus. Inc., 53 F.3d 1270, 1277, 35 U.S.P.Q.2D (BNA) 1035, 1041 (Fed. Cir. 1995). Indeed this court has cautioned against limiting broad claim language to the preferred embodiments or specific examples in the specification. See Texas Instruments, Inc. v. United States Int'l Trade Comm'n, 805 F.2d 1558, 1563, 231 U.S.P.Q. (BNA) 833, 835 (Fed. Cir. 1986).

In this case, the district court's narrow reading of the specification to confine "rod receiving area" to holes "closed within the hanger," Magnivision I, 33 F. Supp. 2d at 1230, was reached by reference to the preferred embodiment in the patent's figures. In addition, the specification refers to the receiving rods in the preferred embodiment with the word "aperture." However, the claim language, the standard for measuring the scope of the invention, does not similarly limit the receiving areas. Moreover, the full context of the prosecution history shows that the applicant did not limit the meaning of "rod receiving areas." The prosecution history of the '345 patent carefully avoided limiting the receiving areas in claim 5 to holes. Rather the applicant used limiting terms only with reference to claims already limited by their language to an "opening" or "aperture." During prosecution, the applicant stated: "An opening means is formed in the hanger member . . . and receives the cantilever support." This statement referred to claims 1-3 of the '345 patent, which, unlike the asserted claim 5, recite "opening means." The trial court, however, relied on these portions of the prosecution history that do not relate to claim 5 of the '345 patent.

The district court also relied upon language related to the '532 patent in this court's 1994 decision in Al-Site Corp. v. The Bonneau Co., 22 F.3d 1107 (table), 33 U.S.P.Q.2D (BNA) 1136, 1994 WL 108966 (Fed. Cir. 1994). Magnivision I, 33 F. Supp. 2d at 1230. As noted, the claims of the '532 patent differ from those of the '345 patent by their use of the phrase "aperture means" or "aperture." The '532 specification (which is identical to the '345 specification) uses the term "aperture" to describe the structures shown in the figures, which are enclosed holes. See, e.g., '532 patent, col. 2, l. 62. In Al-Site, this court read the term "aperture" in the claims of the '532 patent to mean "an enclosed hole and structural equivalents thereof." Al-Site, 1994 WL 108966, at 4. Due to the different claim language, however, this court's analysis in Al-Site does not apply to the '345 patent.

In sum, claim 5 of the '345 patent does not require enclosure of the "rod receiving area." Thus, read without limitations imported from the specification, these areas may encompass slots. Because the Bonneau Slide Hook incorporates two slots, it literally infringes claim 5 of the '345 patent. Therefore, this court vacates the summary judgment granted in favor of Bonneau on this issue, and reverses the denial of summary judgment to Magnivision.
The term "roller" is used in various claims for the '274 Patent; the '698 Patent, the '917 Patent, and the '433 Patent. The parties dispute two aspects of this term: (1) whether the roller must revolve independent of the channel and (2) whether it must have a hole through it. 7 Innovative urges the court to construe the term roller as "an elongated body with a central portion between the sidewalls of the channel and the ends which extend outward of the sidewalls of the channel." Defendants argue for a much narrower definition and assert that the roller must revolve or rotate and have a hole therethrough.

7 Defendants do not dispute that the roller is an elongated body that extends between and beyond the sidewalls of the channel and that extends upward from the bottom wall of the channel for the distance spanning between the sidewalls of the channel. Defs' List Claim Terms, Mar. 9, 2007.

In support of its construction, Innovative points to the claim language from the '274 Patent indicating that the roller is integrally cast as part of the upper channel and is configured to be pivotally attached to the first end cap. Pl's Markman Br. Ex. A. col.15 ll. 13-38. Additionally, the specification to the '274 Patent states that the rollers are "rigidly attached to the upper channel...by welding" and "integraisly cast." Id. at col.2 ll. 34-41, 57-63; col. 5 ll. 55-60, 62-65. Since the roller is physically connected to the channel through a casting or welding process, the roller can only rotate or move relative to the end cap when it pivots as part of the channel.

Defendants unsuccessfully attempt to defeat the language of the patent specification with reference to extrinsic evidence. Defendants argue that roller derives from a Latin term for wheel and, by extension, the roller must revolve or rotate based on the ordinary dictionary meaning of the term. Construing roller to require a piece that revolves like a wheel would exclude the preferred embodiment described in the patent claim and specification that the rollers are integrally cast as part of the channel. The defendants' claim construction would offend the claim construction principle that it is improper to construe claims to exclude the preferred embodiments of the patent specification. Sandisk Corp. v. Memorex Prods., 415 F.3d 1278, 1285 (Fed. Cir. 2005), cert. denied, 546 U.S. 1076, 126 S. Ct. 829, 163 L. Ed. 2d 707 (2005) (citing Vitronics, 90 F.3d at 1583); Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1581 (Fed. Cir. 1996). The Phillips decision also supports Innovative's claim construction by emphasizing that a court should give extrinsic evidence, such as dictionary definitions, a less prominent role than the patent specification and prosecution history.

Defendants further argue, in support of their claim construction, that Innovative acted inequitably because Innovative did not assert that its rollers were non-rotatable until a November 2003 amendment to the '698 Patent that Innovative filed one year after defendants' allegedly infringing product appeared on the market. Defendants' inequitable conduct argument is erroneous because the prior art for the '274 Patent, filed on May 10, 1999, states that the rollers are rigid and attached by welding. Pl's Resp. Markman Br. Ex. K. at pp. 3, 10-13, 17.

Defendants also attempt to limit the patent by requiring that the roller have a "hole therethrough" by referencing the specification to the '274 Patent. Pl's Markman Br. Ex. A col. 8 ll. 30-34. Innovative argues that it is inappropriate to read the claim language so narrowly. Instead, the claims should be construed to permit any means of pivotal attachment to the end cap. According to the Federal Circuit in Phillips, a court should give claim specifications "the broadest reasonable construction in light of the specification as it would be interpreted by one of ordinary skill in the art." 415 F.3d at 1316-17. The court will follow this mandate.

The court will adopt Innovative's definition and find that "roller" means "an elongated body with a central portion between the sidewalls of the channel and ends which extend outward of the sidewalls of the channel."
Without a doubt "rolling" is the most hotly contested claim term. Tenneco has argued that rolling simply means bottom to top closing and top to bottom opening. SCJ argues that rolling requires that the elements "pinwheel"; that is, the bottoms of the elements rotate in one direction while the tops of the elements rotate in the opposite direction. The Court finds that the proper definition lies in the middle.

In its specification, the '143 Patent discloses "a rolling action zipper profile which closes most easily by pressing it together first at the bottom and then rolling it closed toward the top." U.S. Patent No. 5,007,143 at col. 1, lines 9-11 (emphasis added). Similarly, claims 1, 6 and 7 disclose "male and female [sometimes referred to as rib and groove] elements having complimentary cross sectional shapes such that they are closed by pressing the bottom of the elements together first and then rolling the elements to a closed position toward the top thereof." Id. at col. 6, lines 60-64; col. 7, lines 45-49; col. 8, lines 15-19 (emphasis added). SCJ cites this language to support its argument that "rolling" must mean something more than simply bottom to top closing or the use of the term "rolling" in the specification and the claims would be redundant. The Court agrees. Tenneco's construction of this language reads the term "rolling" out of the claim limitations, and we are unwilling to adopt such a construction. See Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 93 F.3d 1572, 1582-83 (Fed. Cir. 1996). Moreover, the plain language of the claims states that the "rolling" occurs after the bottoms of the elements are closed; the "rolling" occurs only in connection with closing (and opening) the tops of the elements. Although it is true that the '143 Patent's profile unquestionably closes from bottom to top (and opens from top to bottom), that order of movement is not part of the definition of "rolling." "Rolling" describes the nature of the motion, not the direction of the motion.

Words in a claim are given their ordinary and customary meaning unless the patentee chooses, and plainly states in the patent, a special definition. Vitronics, 90 F.3d at 1582. Fox Herrington, the patentee in this case, did not define rolling in the '143 Patent, which means we apply the word's ordinary and customary meaning. One scientific dictionary defines "rolling" to mean "motion of a body across a surface combined with rotational motion of the body so that the point on the body in contact with the surface is instantaneously at rest." McGraw-Hill Dictionary of Scientific and Technical Terms 1275 (1976). Merriam-Webster is in agreement, defining "rolling" to mean "rotating on or as if on an axis or moving along a surface by rotation." Webster's Third New International Dictionary of the English Language Unabridged 1969 (1993). The Court could find no dictionary that defines "rolling" to mean "bottom to top closing/top to bottom opening"; nor could the Court find a dictionary that used the term "pinwheeling" to define "rolling." Nor did the parties demonstrate that persons skilled in the art of plastic reclosable fasteners would give the term a particular meaning, a meaning other than the ordinary and customary meaning found in dictionaries. Accordingly, the Court will construe "rolling" consistent with the ordinary and customary meaning given that word, as set forth in the dictionary definitions. Thus, "rolling" as used in the patent requires something more than simply bottom to top closing and top to bottom opening. But the definition is not as strict and specific as SCJ suggests. SCJ even concedes that the elements disclosed in the '143 Patent's claims would not roll, as SCJ has defined the term, and we have no intention of adopting a definition that would exclude the disclosed preferred embodiment.

The specification describes how the tops of the elements are closed in the preferred embodiment as follows:

The shoulder 21a also has a non-uniform width and projects inwardly in FIG. 5 a greater distance than in FIG. 4 but is beneath the hook-shaped projection 17a of the groove element 17. This permits the groove elements 17 to be rolled outwardly under the action of the finger 23 so that the rib 16 can enter the groove 17 the spacing between the side walls 21 and 22 is less than in FIG. 5 and the finger 23 has a narrower cross-section which permits the tracks 18 and 19 to move toward each other this causing the rib 16 to be rolled into the groove 17 between the projections 17a and 17b.

[SEE FIGURE 4 IN ORIGINAL]

[SEE FIGURE 5 IN ORIGINAL]

The specification uses "rolled" consistent with the dictionary definitions discussed above, and this evidence, together with the claim language and the dictionary definitions, lead the Court to define "rolling" as used in the patent to mean a rotational motion. Thus the '143 Patent's profile is closed by first pressing the bottoms of the elements together and then rolling (a rotational motion which is achieved because of the shape of the elements and because of the materials from which the elements are made, i.e., flexible plastic) the tops of the elements together.

GO BACK
Another significant dispute between the parties is the meaning of the term "rotatable joint." The rotatable joint permits the user of the miter saw to change the orientation of the handle when the blade of the saw is operated on a tilt (to cut beveled edges, for example.) Rexon argues that the rotatable joint disclosed in the claim must be a separate component of the miter saw, while One World argues that the joint may be either a separate component or simply a space or place where the D-shaped handle and central portion join. The claim language reads, "said D-shaped portion [of the handle] being connected to said central region via a rotatable joint to permit rotation of said handle." (’976 Patent, Col. 2, ll. 59-62.)

The salient issue is whether the other claim terms, the specification or the prosecution history limit the rotatable joint of the claim only to joints that are a separate component of the miter saw. The claim language and the specification consistently use the phrase "rotatable joint." The term "rotatable" clearly modifies the term "joint," and thus it is the "joint" that must be capable of rotation. See Eastman Kodak Co. v. Goodyear Tire & Rubber Co., 114 F.3d 1547, 1553 (Fed. Cir. 1997), (the court must employ "normal rules of syntax"), overruled on other grounds by Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456 (Fed. Cir. 1998) (en banc); In re Hyatt, 708 F.2d 712, 714 (Fed. Cir. 1983) ("[a] claim must be read in accordance with the precepts of English grammar"). Rexon finds this syntax to be persuasive evidence that the inventor claimed a joint that is a separate component and not merely the space where the handle and the central region of the miter saw arm assembly meet.

The fact that the joint must be capable of rotation does not mean that it must be a separate component. A joint comprised of a space or place where two components meet could also be capable of rotation. Consider the traditional ball and socket joint. The ball and socket form a joint notwithstanding the absence of a separate "joint" component, yet the joint is capable of--and in fact is designed to permit-rotation. The references to the rotatable joint throughout the patent description are not, on their face, references to a separate structural element (as Rexon suggests) any more than they constitute references to a place where the handle and central portion join.

Both parties point to Webster's dictionary to support their proposed constructions of the term. Webster's defines a joint as "a part or space included between two articulations." Merriam-Webster's Collegiate Dictionary 630 (10th ed. 2000). Rexon emphasizes the part of the definition that reads "a part... between the two articulations." However, the definition clearly contemplates that a joint may be either a separate part (component) or simply a space. 4

4 One World notes that space is synonymous with place. See Merriam-Webster's Collegiate Dictionary 885 (10th ed. 2000). Furthermore, the same definition cited by Rexon also defines joint as "a place where two things or parts are joined." Id.

One World's proposed construction is consistent with the ordinary meaning of the term joint, as modified by the word rotatable. It is also consistent with the term as it is used in the specification and prosecution history, neither of which limit the joint to a separate component rather than simply a place where the handle and central region join. Construing the joint as a place where the D-shaped handle and central region of the arm assembly are joined is also consistent with other specification language teaching that the rotatable joint enables the handle to be rotated generally about the handle axis. Nothing in the specification indicates that this could only be accomplished if the joint is comprised of a separate component. 5

5 For these reasons I construe "rotatable joint" as a place where the D-shaped portion of the handle and central region are joined and are capable of rotation. 6

5 Rexon also argues that the word "via" implies that the joint is comprised of a separate component rather than simply a place where two parts of the saw join. Yet the two components may be joined by, or by means of, a place that is capable of rotation just as they may be joined by, or by means of, a separate component.

6 This conclusion is consistent with the claim construction analysis outlined in Phillips v. AWH Corp., 415 F.3d 1303 (Fed.
(Cir. 2005). Rather than starting with the dictionary definition and "whittling it down" based on the specification, id. at 1321, the claim terms must be construed in light of their ordinary meaning, with the dictionary serving as one tool "that can assist the court in determining the meaning of particular terminology to those of skill in the art of the invention," id. at 1308.

--- End Footnotes ---

3409

2. "Rotatable Output Member", "Rotating Member", and "Rotating Output Member"

and

3. "Cam Assembly"

Claim 1 recites, in part,

An electrically powered mover adapted to be activated by the output of the microcontroller in response to the sensed speed difference, the electrically powered mover including a rotatable output member and at least one cam assembly adapted to move the clutch plates into driving engagement.

Claims 15 and 23 recite similar limitations, such as "a rotating member" and "rotating output member." Claim 30 recites a "bi-directionally rotating output member." These claim terms are collectively referred to as a "rotatable output member."

BorgWarner:

"Rotatable output member" is a shaft, cam, sprocket, or gear that rotates. A "rotatable output member" that rotates in two directions is a "bi-directionally rotating output member." (Plaintiff's Markman Brief, at 39).

NVG:

A ball and ramp device, comprising two opposing members each have[ sic] a ramped surface, and at least one ball inserted in between the two ramped surfaces. (Markman Brief of NVG, at 44).

Claims 15, 23, and 30, also all contain similar claim limitations that include a "cam assembly" limitation.

BorgWarner:

"Cam assembly" is a cam and a cam follower. A cam is a moving piece of machinery shaped to cause an eccentric or alternating motion and a cam follower is a component designed to follow a surface of the cam. (Plaintiff's Markman Brief, at 41).

NVG:

A ball and ramp device, comprising two opposing members each have[ sic] a ramped surface, and at least one ball inserted in between the two ramped surfaces. (Markman Brief of NVG, at 44).

This dispute begins with the fact that the parties disagree as to whether "rotatable output member" and "cam assembly" can be interpreted together. According to NVG, the "rotatable output member" and "cam assembly" together form the "ball and ramp device." BorgWarner interprets the two items separately but, as noted above, indicates that a "rotatable output member" could be a "cam." The remainder of the dispute relates back to the previous issue over the term "electric operator" and the involvement of the dog clutch as opposed to the torque transferring clutch. The parties' arguments, in this regard, are much the same as those advanced regrading the previous interpretation issue.

BorgWarner submits that the claim language itself explains that the term "rotatable output member" is a drive output,
relying on several claims:

For example, claim 1 states that an electrically powered mover, which is an electric actuator and a drive, includes an output member that rotates. (Patent '330, col. 28, ls. 52-57). Likewise, claim 15 states that an electric operator, which is an electric actuator and a drive, includes a member that rotates to drive a cam assembly. (Patent '330, col. 30, ls. 51-54). In addition, claim 23 states that an electric operator, which is an electric actuator and a drive, includes an output member that rotates. Accordingly, these terms mean a drive output. (Patent '330, col. 31, ls. 37-40). Claim 30 states that an electric operator, which is an electric actuator and a drive, includes an output member that bi-directionally rotates. (Patent '330, col. 32, ls. 41-44.)

( Plaintiff's Markman Brief, at 40). Turning to the specification, BorgWarner returns to the "dog clutch" portion of the text upon which it relied in regard to its interpretation of the "electric operator" issue. It argues that the specification:

explicitly states that an output portion of an actuator (drive members 126, 134) rotates. (Patent '330, col. 7, lines 41-65). The specification also describes a rotatable drive shaft that is an output of an electric motor. (Patent '330, col. 6, line 66--col. 7, line 6). Cams and gears are also described as rotatable outputs. (Patent '330, col. 6, line 66 -- col. 7, line 6; col. 7, lines 26-41.) Further, the specification makes clear that a rotatable output member, such as a shaft, that rotates in both directions is a "bi-directionally rotating output member." (Patent '330, col. 7, lines 26-41.)

(Plaintiff's Markman Brief, at 40-41).

According to BorgWarner, "cam assembly" is a cam and a cam follower. Citing Webster's Ninth Collegiate Dictionary, BorgWarner notes that a cam is defined as "a rotating or sliding piece that imparts motion to a roller moving against its edge or to a pin free to move in a groove on its face or that receives motion from such a roller or pin." (Plaintiff's Markman brief, at 42; Ex. 17). It further explains that "[a] cam is a moving piece of machinery shaped to cause an eccentric or alternating motion and a cam follower is a component designed to follow a surface of the cam." (Plaintiff's Markman Brief, at 41). Claims 1 and 15 of the patent state that the "cam assembly" is driven by a rotating member to engage the clutch plates of the clutch assembly.

BorgWarner also relies on the specification to support its interpretation of "cam assembly." It points out that the specification:

describes a ball-ramp "cam" that is used to actuate a clutch. (Patent '330, col. 7, lines 55-58). The specification also describes a cylindrical cam and a cam follower that is used for engaging and disengaging a dog clutch. (Patent '330, col. 7, lines 26-34).

(Plaintiff's Markman Brief, at 42). Thus, again, we have the involvement of a clutch assembly other than the one transferring torque. As already noted, however, the "dog clutch" does not transfer torque.

NVG points out, however, that the claims require that the "rotatable output member" and the "cam assembly" be part of the "electrically powered mover" which transfers torque to the drives. And, as before, there is one description of such a mechanism, capable of transferring torque, in the specifications: a ball and ramp device. More specifically, the patent discloses:

The oblique side walls of the recesses 130A and 130B function as ramps or cams and cooperate with the balls 132 to drive the circular members 126 and 134 apart in response to relative rotation there between[sic].

(Patent '330, col. 7, l. 66-col. 8, l.2). We were unwilling to allow BorgWarner's exchange between the torque transferring clutch and the dog clutch in the previous claim dispute and, toward an end of internal consistency, we remain unwilling to do so here. Thus, the only possible interpretation of the 'rotatable output member" and "cam assembly must be: a ball and ramp device, comprising two opposing members each having a ramped surface, and at least one ball inserted in between the two ramped ramped surfaces.
The second and third claims of the '976 Patent relate to the miter saw user's rotation of the handle during operation of the saw. Claim 2 reads: "the miter saw of claim 1 wherein the handle is rotatably adjustable between at least 0 [degree] and 30 [degrees] from horizontal measured when the arm is lowered and the rotary spindle is horizontal." 8 ('976 Patent, Col. 5, ll. 3-6.) These claims address only the rotation of the handle within a certain range: they do not claim the ability to maintain, or fix, the handle at a particular position within that same range. Rexon argues that because claims 2 and 3 are dependent on claim 1 they must also incorporate claim 1's limitation of maintaining, or fixing, the position of the handle within that range. Although the limitation Rexon proposes--that claims 2 and 3 be construed to require that the handle is also "fixed" within the delineated range--would be consistent with claim 1, it is not required by claim 1. Claims 2 and 3 address the narrower issue of rotating the handle within a particular range. Construing those claims to include the further limitation of "fixing" the handle at any point within that range is beyond the scope of the claim language and is not expressly required by either the specification or the prosecution history. The specification states that the handle orientation can be varied and then fixed in a position; however, there is no indication in the specification that the handle must be capable of being fixed within any defined range of rotation. Nor do references in the prosecution history to the ability of the handle to be fixed when rotated compel a construction of claims 2 and 3 in which the handle must be fixed within the defined ranges of 0 [degree] to 30 [degrees] or 0 [degree] to 40 [degrees]. The prosecution history merely reveals that the orientation of the handle can be fixed at a position selected by the user. Therefore, the claims are construed as "the handle can be rotated at least 0 [degree] to 30 [degrees] [0 [degree] to 40 [degrees]], measured from horizontal. 9

Although the limitation Rexon proposes--that claims 2 and 3 be construed to require that the handle is also "fixed" within the delineated range--would be consistent with claim 1, it is not required by claim 1. Claims 2 and 3 address the narrower issue of rotating the handle within a particular range. Construing those claims to include the further limitation of "fixing" the handle at any point within that range is beyond the scope of the claim language and is not expressly required by either the specification or the prosecution history. The specification states that the handle orientation can be varied and then fixed in a position; however, there is no indication in the specification that the handle must be capable of being fixed within any defined range of rotation. Nor do references in the prosecution history to the ability of the handle to be fixed when rotated compel a construction of claims 2 and 3 in which the handle must be fixed within the defined ranges of 0 [degree] to 30 [degrees] or 0 [degree] to 40 [degrees]. The prosecution history merely reveals that the orientation of the handle can be fixed at a position selected by the user. Therefore, the claims are construed as "the handle can be rotated at least 0 [degree] to 30 [degrees] [0 [degree] to 40 [degrees]], measured from horizontal. 9

In this case, the parties dispute the meaning of "rotatably engaging," "proximate" and "commensurate." It is obvious from the patent that the term "rotatably engaging" describes the relationship between the first end of the nut and the second end of the tubular post, which are locked together in a way that allows the nut to rotate around the post, without allowing the post to move through the nut. At this stage of the proceedings, I construe "rotatably engaging" as used in plaintiff's claim 1 to mean "holding the tubular post fast in place, while allowing the tube to rotate."
fast in place, while allowing the tube to rotate." Plaintiff agrees with this definition. It is not clear whether defendant agrees or disagrees. Defendant does not argue that the court's initial construction was incorrect; it does not even acknowledge that I construed this term in the July 25 opinion and order. Also, in its reply brief, defendant identifies the terms "engage" and "engaging" as ones on which the parties agree. Nevertheless, in its opening claim construction brief, defendant offers a definition of "engaging" as meaning "to come into gear with; as, the teeth of one cogwheel engage those of another, or one part engages another part." This definition appears to conflict with the court's initial construction because it would require the two objects to come into physical contact with each other. Plaintiff offered no argument to support its definition, either in its brief or during the claim construction hearing, even though I asked defendant to clarify its position on this term. Thus, it appears that defendant has conceded that the court's initial construction is correct or it has waived any argument that the construction was incorrect because it failed to develop the point. Either way, I adhere to the initial construction of "rotatably engaging" to mean "holding the tubular post fast in place, while allowing the tube to rotate."

B. "a rotatable member rotatably mounted on said base, said elongate member being releasably secured to said rotatable member"

The parties stipulate that "rotatable member" means "a shaft that rotates for connection to the elongate member." The Court shall construe it as such. The Court also deems it necessary to construe the term "rotatably mounted" as that term is not one often found in common parlance. As "rotatably" is an adverb form of the word "rotate," the Court shall construe "rotatably mounted" to mean, "mounted in a way such that it is capable of being rotated."

2. "bottom guide roller rotatably mounted in the bottom guide" -- Amesbury argues that this phrase should be construed as meaning "a roller, mounted so as to permit rotation, in the portion of the bottom guide that is sized or configured to be received in and to slide in the jamb pocket, when installed." Caldwell has construed the phrase as requiring "the bottom guide roller to be mounted to the bottom guide and be located entirely within the bottom guide" and "external to the channel". This definition is both more limiting and more general than Amesbury's construction.

The parties do not appear to dispute the meaning of the term "bottom guide roller", rather they argue over the placement requirements implicitly included in Claim 1. In this case, the ordinary meaning of the claim language as understood by a person of skill in the art is not readily apparent. Consequently, I consider the Claim terms, the specification, and the prosecution history as to each of the disputed proposed elements of the definition.

a) "Mounted in" or "Mounted to": Claim 1 specifically uses the preposition "in" and Caldwell has not pointed to anything in the specification that requires the bottom guide roller to be mounted to the bottom guide. The focus of the specification is on where the roller is to be mounted, not on what. For instance, in the Summary of the Invention the patentee describes how the bottom roller "mounted proximate to the second end of the channel." [264 Patent, col. 2, 11. 5-6, 14-15.] But, the use of "proximate" in the Summary does not impose the limitation suggested by Caldwell that the roller must be mounted to the bottom guide. It is possible that the bottom roller could be "in", even entirely within, the bottom guide, yet be mounted to the channel via some link rather than being mounted to the bottom guide itself.

In addition, Claim 1 was initially rejected as being anticipated by Fitzgibbon's "Sash balances and components thereof", U.S. Patent No. 4,089,085, which disclosed a block and tackle window balance device comprising "a bottom guide roller rotatably mounted to the bottom guide". To read "mounted in" as "mounted to" would not distinguish 264 Patent from Fitzgibbon's patent and would ignore the distinguishing feature of the invention, namely the location of the roller as discussed more thoroughly in the next sub-section.

b) "in the Bottom Guide" or "entirely within the bottom guide and external to the channel": The ordinary meaning of being mounted "in" an area could encompass the idea that the object may be both partially inside and outside the area. For example, a trash bag is "in" a trashcan even though a portion of it is hanging outside of the trashcan. Thus, the ordinary
meaning of the roller being mounted in the bottom guide could encompass the idea that the roller is "in" the bottom guide, yet not necessarily mounted directly to the bottom guide, with part of the roller sticking out of the bottom guide and/or part of it within the overlapping section of the channel. This interpretation makes sense when one compares Claims 1 and 23, which describes a window balance device comprising a bottom guide including "a bottom guide axle mounted within the bottom guide, the bottom guide axle located outside the window balance channel; and a bottom guide roller rotatably mounted on the bottom guide axle." [264 Patent, col. 8, ll. 40-44.] Nonetheless, Caldwell argues that "in the bottom guide" should be construed more narrowly as "entirely within the bottom guide and external to the channel" based on the specification and alleged disclaimers in the prosecution history.

13 In Amesbury's Post Markman Hearing Brief filed on January 6, 2006, counsel for Amesbury brought the unreported and non-precedential opinion of Cannon Rubber Ltd. v. First Years, Inc., 163 Fed. Appx. 870, 2005 U.S. App. LEXIS 28879, No. 05-1063, 2005 WL 3542910 (Fed. Cir. December 28, 2005) to this Court's attention. Under Fed. Cir. R. 47.6, this order is not citable as precedent. Consequently, I do not consider this case as precedent. Nonetheless, I incorporate the trashcan example and acknowledge that I have thought about the arguments considered in the case.

With respect to the prosecution history, Caldwell argues that the patentee disclaimed the idea of being mounted partially in and partially out of the bottom guide, and partially in the channel. I disagree.

Prosecution history "can inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution, making the claim scope narrower than it would otherwise be." Phillips, 415 F.3d at 1317. Here, as mentioned above, it appears that Claim 1 was initially rejected as being anticipated by Fitzgibbon's "Sash balances and components thereof", S. Patent No. 4,089,085, which disclosed a block and tackle window balance device comprising a bottom guide roller rotatably mounted to the bottom guide", by which the Patent Examiner meant that "the bottom guide roller 239 is rotatably mounted to bottom guide 215 in that roller 239 is rotatably mounted within fixed pulley unit 235, which is fixed to channel 205, which is fixed to bottom guide 215; thus, bottom guide roller 239 is rotatably mounted to' bottom guide 215." See Figures 2A and 2B of the Prior Art below. [Smalley Declaration, Exhibit J, at 000630, 000639.]

As Caldwell discusses in its Brief, dependent Claim 2 of the Patent, which claims "the device of claim 1 wherein the bottom guide roller is located external to the channel", was also initially rejected because the Fitzgibbon's patent showed that the "bottom guide roller 239 is located external to channel 205 in that a portion of roller 239, the portion that strikes mounting hook 245 when lower sash 104 is raised, is located outside of channel 205, see Figures 2A and 7A." [Smalley Declaration, Exhibit J, at 000631, 000640.] However, the Examiner accepted Claim 2 after the patentee amended Claim 1. As an aside, this comment also shows that the Examiner and the patentee had in their minds during the prosecution that at least the phrase "located external to the channel" includes the manifestation where only a portion of the object is external to the channel.

During a telephone interview, the Examiner also called attention to Fig. 4 in Biro, U.S. Patent No. 3,449,862 as anticipating the present invention. The patentee distinguished his invention from Biro, claiming that:

Biro is silent with respect to the location and mounting details of the bottom guide roller' (unnumbered) relative to the support slide; however as shown in FIG. 4, the roller appears to be mounted to the counterbalance housing above the lower support slide, not in the lower support slide. The lower support slide is held in place by rivets and appears to terminate below the axis of the roller. See also, for example, FIGS. 2A and 2B of Applicant's specification. Accordingly, Biro fails to disclose or suggest a bottom guide roller rotatably mounted in the bottom guide.' 14 [Smalley Declaration, Exhibit J, at 000656]

The patentee then amended "Claims 1, 12, 14, and 19 . . . to more clearly define the subject matter of Applicant's invention. Specifically, the claims are amended to clarify that the bottom guide roller is rotatably mounted in the bottom guide." [Smalley Declaration, Exhibit J, at 000656]

14 In the Biro Patent, the "support slide" is equivalent to the "bottom guide" in the 264 Patent, and the "counterbalance" is equivalent to the "U-shaped channel".
Given this prosecution history, it appears that the Examiner approved Claim 1 of the patent after the patentee explained that the subject matter of his invention was the relocation of the roller into the bottom guide, rather than mounting it in the channel above the bottom guide as in the prior art. From this response, it is not possible to conclude that the patentee explicitly disclaimed the ordinary meaning of "in" or limited his invention to configurations where the roller is entirely within the bottom guide roller and completely below the channel. Thus, this is not the case where the claim was narrowed in the way suggested by Caldwell in order for the patentee to obtain issuance over the prior art. Elekta Instrument S.A. v. O.U.R. Scientific Intern., Inc., 214 F.3d 1302, 1308 (Fed. Cir. 2000). Nonetheless, I turn to the specification to determine whether the written description shows an "express intent to impart a novel meaning" to the commonly understood word "in", and whether the written description "clearly redefine[s] [the] claim term so as to put a reasonable competitor or one reasonably skilled in the art on notice that the patentee intended to so redefine that claim term." Id. at 1307 quoting Process Control Corp. v. HydReclaim Corp., 190 F.3d 1350, 1357 (Fed. Cir. 1999).

As I understand Caldwell's argument, Claim 1 should be construed in the narrow sense suggested because of the repeated references in the patent supporting the idea that the invention allows the sash to travel a greater distance "because the bottom guide roller is located as in the bottom guide, instead of within the rigid U-shaped channel as in prior art balances." [264 Patent, col. 5, 11. 64-66.] In particular, Caldwell points to the repeated references in the specification to the instruction that the bottom guide roller is to be located "within the bottom guide." [264 Patent, Abstract, col. 1, 1. 51, col. 2, 1. 52, col. 5, 1. 42, col. 6, 1. 18.] The use of "within" is significant, according to Caldwell, because of the Federal Circuit's reasoning in TI Group, 375 F.3d at 1136, with respect to the claim term "[the pumping] means being located within the reservoir". In that pre-Phillips case, the Federal Circuit affirmed the district court's construction of the term "within" as meaning "inside", because "certainly, in ordinary and customary usage, what is not outside is on the inside." Id. The Federal Circuit drew this conclusion because the dictionary definition proposed by the alleged infringer ("on the inside") and the one adopted by the district court ("inside") "are not so different as the definition" proposed by the patentee ("within the limits of, not outside or beyond.").

Here, it is true that the patent specifically describes the roller as mounted within the bottom guide four times. [The 264 Patent, Abstract, col. 1, 1. 51, col. 2, 1. 52, col. 5, 1. 42, col. 6, 1. 18.] However, I do not think it is appropriate to simply adopt the conclusion in TI Group, where both parties were essentially proposing the same limitation and where the claim itself used the words "located within". Looking further, then, I note that the 264 Patent also states that the bottom guide serves as "a frame for housing the bottom guide roller", [264 Patent, col. 4, 11. 44-45], that it "is located in the bottom guide, instead of within the rigid U-shaped channel as in prior art balances" [264 Patent, col. 5, 11. 64-66], and that it "is located outside of the rigid U-shaped channel." [264 Patent, col. 4, 11. 46-48.] Thus, in my opinion, the issue is whether or not these expressions in the specification show that the patentee intended to assign a more narrow definition to the phrase "mounted in the bottom guide". As explained above in Section I, Phillips warned of "the danger of reading limitations from the specification into the claim." Id. at 1323. Specific embodiments of the invention described for teaching purposes should not be imported into the claim as a limitation. Id. The distinction between proper claim construction and improper limitation turns on "whether a person of skill in the art would understand the embodiments to define the outer limits of the claim term or merely to be exemplary in nature." Id. at 1323.

[SEE FIGURE 4A IN ORIGINAL]

Given these principles, I will not import the limitation of "external to the channel", despite the parts of the written description cited above. Although the roller in Figures 4A and 4B shown above is certainly not "within" the channel in the way the rollers in Figures 2A and 2B are, it would be perfectly consistent with the patent for the roller to be within the section of the bottom guide that is itself fastened to the overlapping section of the channel also shown in Figures 4A and 4B. In such a configuration, the roller would not be "external" to the channel. In addition, Claim 2 specifically provides that "the bottom guide roller is located external to the channel." [264 Patent, col. 6, 11. 57-58; see also Claims 14 and 19.] Given the possibility that a portion of the roller might actually be located inside the part of the bottom guide that overlaps with the channel, I will apply the doctrine of claim differentiation, which "is at its strongest where the limitation sought to be read into an independent claim already appears in a dependent claim," Seachange Int'l, Inc. v. C-Cor, Inc., 413 F.3d 1361, 1362-69 (Fed. Cir. 2005) quoting Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir. 2004), with respect to this aspect of Claims 1 and 2. Thus, I exclude the proposed addition of "external to the channel" from the definition.

With respect to the idea of limiting "in" in Claim 1 to "entirely within", I also disagree with Caldwell. The focus of this patent is the relocation of the roller from the channel above the bottom guide, as in the prior art, to the bottom guide. This relocation "provides an increased range of travel within a window frame", [264 Patent, col. 1, 11. 9-10], because it is the roller hitting the jamb mounting hook that limits the travel distance in these kinds of window balance assemblies. [264 Patent, Abstract, col. 1, 1. 51, col. 2, 1. 52, col. 5, 1. 42, col. 6, 1. 18.]

[SEE FIGURE 4B IN ORIGINAL]
Patent, col. 6, 11. 11-12.] Thus, by moving the roller down into the bottom guide instead of above it, the "sash can travel a greater distance before the bottom guide roller 239/350 hits the jamb mounting hook 245/345, resulting in a greater travel distance." [264 Patent, col. 6, 11. 20-22.] Compare Figures 7B and 8B below.

[SEE FIGURE 7B IN ORIGINAL]
[SEE FIGURE 8B IN ORIGINAL]

Relocating the roller "in" the bottom guide with either the portion that strikes the jamb mounting hook when the sash is raised extending partially outside the bottom guide, or even with a portion of the roller extending slightly above or below the bottom guide, would still allow one skilled in the art to make use of the invention and take advantage of the greater travel distance. In these configurations, one could not say that the roller would be "entirely within" the bottom guide.

Consequently, while the specification describes or depicts an embodiment where the roller is "within" or framed by the bottom guide and while there is nothing in the specification describing or depicting the roller as partially outside the bottom guide, I am not convinced that "a person of skill in the art would understand the embodiments to define the outer limits of the claim term" rather than merely being "exemplary in nature." Phillips, 415 F.3d at 1323. Thus, I adopt the common meaning of the term "mounted in", namely that mounting the roller in the bottom guide does not exclude the possibility that the roller may not be entirely within the piece of the apparatus called a bottom guide.

c) "so as to permit rotation": Caldwell does not contest the addition of this phrase in the definition.

d) "in the portion of the bottom guide that is sized or configured to be received in and to slide in the jamb pocket when installed": There is nothing in the Claims, the specification, or the prosecution history that limits the location of the roller within the bottom guide. Claims 13 and 18 do describe a window balance device comprising "a bottom guide adapted to be connected to an end of a window balance channel and adapted to slide in a jamb pocket when installed in a window frame; and a bottom guide roller rotatably mounted in the bottom guide." [264 Patent, col. 7, 11. 43-45; col. 8, 11. 1-2, 19-23; See also Claim 23, col. 8, 11. 36-38.] However, the specific references in these Claims, undermine Amesbury's attempt to include this additional limitation in Claim 1.

Construction -- A roller mounted in the bottom guide in a way that permits its rotation.

3415

a. "rotatably therewith"

The parties dispute whether the term "rotatably therewith" should be construed to encompass a cam that rotates independently of the cam shaft and a cam that rotates together with the cam shaft. Thus, Honda proposes that the term be construed to mean "supported by the cam shaft and turns on or with the cam shaft," while Coast argues that the term should mean "fixed to the cam shaft to rotate with the cam shaft."

The Court begins with the claim language. Coast argues that the term should be construed to mean that the valve operating cam is "fixed" to the cam shaft. This construction is based, in part, on the fact that the valve operating cam is "mounted" on the cam shaft. In general, "claim terms are presumed to be used consistently throughout the patent, such that the usage of a term in one claim can often illuminate the meaning of the same term in other claims." Research Plastics, Inc. v. Federal Packaging Corp., 421 F.3d 1290, 1296 (Fed. Cir. 2005) (citing Phillips, 415 F.3d at 1313-14). The term "mounted" is used in other several other elements of Claim 1, and the inventors use of the term in those claim elements does not suggest that the inventors intended the term to mean "fixed," in the sense that one component is immutably fixed to another component of the engine. Accordingly, the Court rejects Coast's proposed construction to the extent it includes this limitation.

"Claim language generally carries the ordinary meaning of the words in their normal usage in the field of the invention." Invitrogen Corp., 327 F.3d at 1367 (emphasis added). Neither party suggests that the term "therewith" has any particular meaning in the field of single, cylinder four-stroke engines. Rather, in support of its position that the term "therewith" can mean "with" or "on," Honda relies on dictionary definitions of the word, which include both "with that" and "thereupon, forthwith." (Declaration of Behrooz Shariati ("Shariati Decl."), Exs. H, I.). The latter definitions are noted to be "archaic" and also refer to a temporal, rather than spatial, relationship. Because the Court finds that the claim language does not clearly illuminate the meaning of this term, the Court looks to the specification for guidance.

The patent specification discloses two preferred embodiments. Honda argues that a person of ordinary skill in the art would understand "therewith" to encompass both embodiments. In the first preferred embodiment, "a single valve operating cam is
rotatably carried on the cam shaft." ("769 Patent at 3:63-66 (emphasis added.) In the second preferred embodiment, the "valve operating cam 36 and the cam shaft 35 may be formed integrally with each other and in this case, the cam shaft 35 is rotatably carried in the cylinder head 2." (Id. at 4:11-13.) Honda asserts that the first preferred embodiment discloses that the valve operating cam is mounted on the cam shaft in such a fashion as to permit "the cam to rotate or turn on the cam shaft, relative to the cam shaft," and in the second preferred embodiment the cam and the cam shaft are one moving piece, such that they rotate with one another. In general, a court should not interpret a term to exclude a preferred embodiment. See, e.g., Primos, Inc. v. Hunter's Specialties, Inc., 451 F.3d 841, 848 (Fed. Cir. 2006); Vitronics, 90 F.3d at 1583. In both of the preferred embodiments, the cam and the cam shaft are positioned so that they are able to move together, whether that is because the cam is "on" the cam shaft or because they have been formed into one piece. The specification, therefore, demonstrates that the claim term "therewith" can be construed broadly to permit the cam to turn on the cam shaft.

Coast argues that, although the specification discloses two embodiments, the inventor chose to claim the second preferred embodiment and, therefore, dedicated the first preferred embodiment to the public. In support of this argument, Coast relies on Johnson & Johnston Assocs. v. R.E. Serv. Co., 285 F.3d 1046 (Fed. Cir. 2002), in which the court applied the "discussion-dedication" rule to determine whether the district court erred in denying a motion for summary judgment based upon the doctrine of equivalents. Coast's argument, however, depends upon the conclusion that the term "therewith" must be limited to mean "with" rather than "on or with." For the reasons set forth above, the Court rejects this limiting construction and, therefore, concludes that the "discussion-dedication" rule would not operate to preclude Honda from claiming both preferred embodiments.

Accordingly, the Court construes the term "rotatably therewith" to mean: "supported by the cam shaft and turns on or with the cam shaft."
Only in the preferred embodiment is the more specific "rotational transformation" procedure described as a method to rotate the waveform. The remainder of the specification uses the words "rotate" and "shift" interchangeably. As the ITC noted, NWP's chief technology officer also used the words "rotate" and "shift" interchangeably in describing the operation of the patented device. Even Enercon's own expert admitted that he had heard the terms used interchangeably.

We have also considered Enercon's extrinsic evidence purportedly demonstrating what the term "rotate" means to one of skill in the art and find it to be unhelpful at best and misleading at worst. Submitted as part of Enercon's claim construction argument, the Mohan, Ooi and Thorburg references make no mention of the disputed claim term. Not only does the text of the references not purport to aid in determining the meaning of the term "rotating," but the argument accompanying the citation of these references in Enercon's brief apparently attempts to show that several of the limitations of claim 131 can be found in the prior art. Because the validity of the '039 patent was not appealed to this court, these references may not be considered for that purpose.

As we have stated above, the specification clearly uses the terms "rotate" and "shift" interchangeably. In addition, all parties agreed that the phrase "rotating the reference waveform" indicates a shift in phase of the desired waveform. Because we see no evidence to indicate that the term "rotate" was intended to refer to the specialized method of performing a phase shift known as a "rotational transformation," we hold that the term "rotating" is to be given its ordinary meaning. We therefore hold that the ITC was correct in interpreting the term "rotating" to mean merely a phase shift in the desired waveform.

The court first interprets the claims of the '014 patent. When construing claims, the court looks to the language of the claims, the specification, the prior art and the prosecution history. SRI Int'l v. Matsushita Elec. Corp., 775 F.2d 1107, 1118 (Fed. Cir. 1985). In interpreting the claims, the court first looks to the words of the claims. The words in a claim are "given their ordinary and accustomed meaning unless it appears that the inventors used them differently." Envirotech Corp. v. Al George, Inc., 730 F.2d 753, 759 (Fed. Cir. 1984) (quoting Universal Oil Prods. Co. v. Globe Oil & Ref. Co., 137 F.2d 3, 6 (7th Cir. 1943), aff'd, 322 U.S. 471, 88 L. Ed. 1399, 64 S. Ct. 1110 (1944)).

Claim 5 of the '014 patent reads as follows:

5. A method for finishing a surface of a workpiece, the method comprising:

(a) contacting the surface of the workpiece with a circumferential portion of at least one sanding member in the form of a body of revolution having a longitudinal axis;

(b) revolving the sanding member in a circle of revolution over the surface of the workpiece; and

(c) rotating each sanding member about its longitudinal axis in a preselected first direction during a first portion of each circle of revolution and rotating each sanding member in a second direction, opposite to the first direction, during a second portion of each circle of revolution.

In construing this claim, the court finds that the only portion of the claim which is the subject of any material dispute is subsection (c). The court finds that this claim language requires a finishing method whereby a sanding member must change direction twice when it is rotated through a circle of revolution, i.e., 360 degrees. Further, the court finds that the language of claim 6 merely requires the same method as claim five, with the exception that the method involve two or more sanding members.
This term is used in claims 44, 49, and 50 of the '988 Patent. Innovative argues that according to its ordinary and customary meaning this term should be construed to mean a plate which rotates. Defendants advance a more specific definition that rotating plate means "a generally square plate which has a rivet hole at the center, a recessed portion, and four mounting holes disposed at the corners" based on one of the patent specifications. See Pl's Markman Br. Ex. E. col. 5 ll. 52-60. Since defendants' construction unnecessarily and improperly imports features from the specification, the court will adopt Innovative's construction and find that "rotating plate" is "a plate which rotates."

3. Rotor Rotation Sensor

"Rotor rotation sensor" appears in Claims 1 and 38 of the '529 Patent. Plaintiffs assert that the term "rotor rotation sensor" should be construed as "a device that provides a signal, related to particulate matter being released, that the controller uses to determine when a desired amount of particulate matter has been released." Defendants, on the other hand, propose that "rotor rotation sensor" should be construed as "a device that detects the value or change in a physical quantity, here the rotation of a rotor."

The underlined portion of the following text shows the amendment made during the prosecution of the '529 Patent to include the rotor rotation sensor:

a rotor rotation sensor;

a controller adapted to automatically stop releasing the particulate matter when a desired amount of particulate matter has been released from the bin, the controller adapted to monitor a signal from the rotation sensor, determine, based upon said signal, when a desired amount of particulate matter has been released, and then to stop applying power to the drive motor;

(Declaration of Chad A. Hanson, P2, Ex. F (emphasis in original).) The signal of the rotor rotation sensor is based on the counted rotations of the rotor. As described in the claim language, the controller uses this signal to determine when a desired amount of particulate matter has been released and thus to stop the power that is sent to the drive motor and ultimately to stop the rotor from turning. Within this context, the Court construes the term "rotor rotation sensor" to mean a device that detects the rotation of the rotor and provides a signal that the controller uses to determine when a desired amount of particulate matter has been released.

III. The '026 Patent

Concerning the '026 patent, the parties dispute the correctness of the district court's construction of "rotational indexing means" as a means-plus-function claim limitation within the meaning of 35 U.S.C. § 112, paragraph 6. The district court reached this conclusion after noting that the claim language omitted a retainer sleeve structure needed to perform the indexing function. Summary Judgment Order, slip op. at 16. Robinson argues that "rotational indexing means" is not a means-plus-function limitation because the claim recites the structure that performs the recited function, thus overcoming the presumption arising from the use of the word "means." Cannondale responds that the district court's construction of "rotational indexing means" was proper because the district court correctly recognized that the bearing retainer structure was needed to perform the recited function and was omitted from the claim language.

Determining whether a claim limitation is a means-plus-function limitation subject to 35 U.S.C. § 112, paragraph 6, is a matter of claim construction we review de novo. Personalized Media Communications v. Int'l Trade Comm'n, 161 F.3d 696, 702 (Fed. Cir. 1998). Claim limitations that use the word "means" create a presumption that § 112, paragraph 6, applies. Id. at 703. However, the presumption of means-plus-function treatment is rebutted "where a claim recites a function, but then
In this case, the "rotational indexing means" is not a means-plus-function limitation. Rotational indexing refers to the function of having the bicycle's head tube suspension (and hence the front wheel of the bicycle) synchronously rotate with the front handlebars. Claim 1 of the '026 patent recites "a longitudinal bearing track" and "a plurality of rolling surface bearings in rolling reception in said bearing track" to accomplish this function. '026 patent, col. 5, ll. 44-47. This recitation of a bearing track and rolling surface bearings in rolling reception in the claim language provides sufficient structure to perform the function of rotational indexing and overcomes the presumption that "rotational indexing means" is a means-plus-function claim limitation. Because this inquiry focuses on the claim language, Cannondale's arguments regarding alleged admissions in the prosecution history that the bearing retainer was required are immaterial in evaluating whether the means-plus-function presumption is rebutted. Moreover, the alleged admissions in the prosecution history did not pertain to claim 1 of the '026 patent, but instead related to a claim in the parent application that recited all three structural elements, including the bearing retainer. There was no basis for granting summary judgment of non-infringement as a matter of law on the "longitudinal bearing track" limitation of element (c) or on element (d) of claim 1 of the '026 patent. At a minimum, there are disputes of material fact of infringement of these limitations.

Robinson argues that if "rotational indexing means" is not a means-plus-function claim limitation, we should find that Cannondale infringes elements (c) and (d) of claim 1 of the '026 patent as a matter of law. Robinson acknowledges that if we conclude that elements (c) and (d) were not infringed as a matter of law, the entire infringement issue should be remanded. Because it is not clear from the parties' arguments that no dispute of material fact of infringement remains under our construction of "rotational indexing means," we decline to enter judgment of infringement of elements (c) and (d) of claim 1 of the '026 patent as a matter of law. Instead, now that we have held that there is no basis for summary judgment of non-infringement as a matter of law for the "longitudinal bearing track" limitation of element (c) and for element (d), the district court may consider the parties' arguments regarding infringement of claim 1 of the '026 patent on remand.

Cannondale responds that the district court's finding of non-infringement should be affirmed on the alternate ground that it does not meet the "resilient compressive means" limitation of claim 1(e) of the '026 patent. Because the district court declined to construe "resilient compressive means" in the first instance in light of its conclusion that Cannondale did not infringe the "rotational indexing means" limitation, Summary Judgment Order, slip op. at 19 n.7, and because the issue has not been fully briefed by the parties, we decline to do so now. The district court may decide the issue in the first instance on remand.

Based on our construction that "rotational indexing means" is not a means-plus-function limitation, we vacate the district court's summary judgment of non-infringement and remand for further consideration of literal infringement and infringement under the doctrine of equivalents.

GO BACK

3421

2. Rotor

The term "rotor" appears in Claims 1 and 38 of the '529 Patent. Plaintiffs assert that "rotor" should be construed as "a component or assembly that rotates about an axis." Defendants contend that "rotor" should be construed as "a rotating assembly of vanes forming discrete pockets."

The ordinary meaning of the term "rotor" is "a part that revolves in a stationary part." Webster's Third New International Dictionary 1977 (1993); Merriam-Webster's Collegiate Dictionary 1019 (10th ed. 1998). Defendants have given the Court no reason to depart from a definition consistent with this ordinary meaning. In the independent claims of the '529 Patent, the rotor has a broad construction. Defendants propose that the meaning should be limited to that of the preferred embodiment of the rotor, or to the dependent claim language of Claim 2. But limitations in dependent claims are not to be read into the independent claims from which they depend. See Karlin Tech., Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 972 (Fed. Cir. 1999). It would be inappropriate for the Court to limit the construction of the term to a specific rotor type when the language of the independent Claims 1 and 38 is broad enough to cover many different types of rotors. Thus, the Court construes the term "rotor" in the context of the '529 Patent to mean a component that rotates about an axis.
p. "rough bark like texture" Claim 5

Figure 1 in the '514 Patent illustrates an example of a rough bark like texture. The Patent describes said texture as a surface with "numerous ridges and valleys of differing heights and depths." (‘514 Patent, col. 3, lns. 58-59) The Court finds that this definition adequately construes the phrase "rough bark like texture."

E. "roughened surface"

All parties contend that "roughened surface" should be construed to mean "a non-slip finish or surface." The term appears in dependent Claim 2 and independent Claim 19. The proposed construction is in keeping with the ordinary and customary meaning of the words of the term, and the claim language does not suggest any need for recourse to other sources of evidence. I therefore conclude that the term "roughened surface" should be construed as the parties propose.

II. "a rounded bottom in said gullets"

Claim 1 of the '783 Patent provides:

said sprocket teeth having adjoining root portions cooperatively configured to define a rounded bottom in said gullets . . . .

(disputed term emphasized).

The parties agree the "sprocket" in question is a nose sprocket that has several teeth as described by the '783 Patent. Between these teeth is a space called a "gullet." The parties also agree the disputed term "a rounded bottom in said gullets" refers to the bottom region that exists between adjacent sprocket teeth. The only apparent difference between the competing constructions of the parties is the meaning of the term "rounded" when used to characterize the shape of the bottom of the gullet.

At the outset, the Court notes both parties have offered competing definitions from common English language dictionaries, particularly for the word "rounded." As noted, however, the Court's task in claim construction must begin with intrinsic evidence. If construction is resolved on that basis, the Court may not look to extrinsic evidence such as dictionary definitions. See Vitronics, 90 F.3d at 1583. In other words, the Court should not consider extrinsic evidence unless it cannot resolve the matter with intrinsic evidence.

Defendants contend "a rounded bottom in said gullets" should be construed to mean "[t]he bottom region of the gullets between adjacent sprocket teeth has a radiused (semicircular) shape." Defendants note the '783 Patent refers to a sprocket design with a semicircular shape:

According to a preferred embodiment of the invention, the drive tang is closely received within semi-circular nose sprocket gullet formations whereby operational forces imposed upon the nose sprocket arrive substantially as compressive forces, as opposed to the substantially tensile forces found in conventional chain saw design.

The Court notes this text is part of the '783 Patent's specification and is not necessarily binding on the claim itself. See Phillips, 415 F.3d at 1315 (a patent claim is part of a "fully integrated written instrument, consisting principally of a specification that concludes with the claims.") (internal citations omitted). Moreover, this text merely describes the invention in its preferred embodiment. The Federal Circuit has frequently cautioned against impermissibly limiting a claim by importing specific features from a preferred embodiment into the claim. See Acumed, 483 F.3d at 805. See also Phillips, 415 F.3d at 1323 (even though "the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments."). Thus, this reference to a semi-circular shape in the preferred embodiment is not dispositive. In any event, the Federal Circuit also has warned that an illustrated embodiment, rather than limiting an invention, can indicate the patentee intends the illustration to be one embodiment but not necessarily the ideal embodiment of the invention. See Acumed, 483 F.3d at 807.

Defendants also contend Figure 1 of the '783 Patent's illustrations shows gullet formations on a nose sprocket that are semicircular at bottom and formed to match the radius of corresponding tang portions on a saw chain. In particular, Defendants rely on the following text from the specification:

In the illustrated embodiment, the symmetry results from a similar radius of curvature for gullets 70 and tang portions 42 yielding a semicircular shape for each. Gullet formations 70 thereby possess the same symmetric relationship to the axis 72 when the corresponding tang formation 42 rests within the gullet formation 70.

'783 Patent col.4 ll.30-36. This text constitutes a description of the illustrated embodiment of the '783 Patent. Thus, it too is not dispositive.

Moreover, the language of the specification demonstrates Defendants' interpretation is too narrow. The specification provides the gullet formations "closely receive the tang portions" of a saw chain, and "the tang portions 42 of center links 40 are substantially symmetric with respect to an axis 72 bisecting the center links 40 and the distance between rivets 44." '783 Patent col.4 ll.26-30. The specification then continues: "In the illustrated embodiment, the symmetry results from a similar radius of curvature for gullets 70 and tang portions 42 yielding a semicircular shape for each." '783 Patent col.4 ll.30-33. Although semicircular shape is one way that a gullet portion can be configured to be "closely received" with a saw-chain tang, it does not necessarily follow that Claim 1 of Plaintiffs' '783 Patent requires a semicircular or radiused shape in every case. Adopting Defendants' construction would impermissibly read into Claim 1 a limitation from the preferred or illustrated embodiment.

The final lines of the specification also demonstrate the overbreadth of Defendants' construction:

It will be appreciated that the present invention is not restricted to the particular embodiment or application that has been described and illustrated and that variations may be made therein without departing from the scope of the invention as found in the appended claims and equivalents thereof . . . . Furthermore, while the present invention has been shown and described with respect to a semi-circular drive tang portion, it will be understood that the present invention encompasses other drive tang and nose sprocket configurations wherein operational forces are desirably received substantially as compressive forces at the gullet formation of the nose sprocket.

'783 Patent col.5 ll.29-45.

Here the patentee stressed a semicircular gullet formation is not necessary to the invention. The heart of the invention is a drive tang and nose sprocket configuration in which operational forces are received as compressive forces in the gullet formation of the nose sprocket. Such a configuration could embrace a semicircular/radiused gullet formation or merely a "curved" gullet formation properly configured to receive the described operational forces substantially as compressive forces.

Thus, Plaintiffs contend "a rounded bottom in said gullets" should be construed to mean "[a] curved bottom region between adjacent sprocket teeth." The Court agrees. This more generic description of the gullet bottom accords with the text of Claim 1 and the specification as discussed above. Moreover, it does not read into Claim 1 the limitation of a specific geometric shape (i.e., radiused or semicircular) when the intrinsic evidence demonstrates that such limitation is not required or intended. Interpreting this term to require no more than a "curved" gullet bottom encompasses not only the semicircular preferred embodiment but also other embodiments, which the patentee appears to have intended. See '783 Patent col.5 ll.29-
45. See also Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004)("Even when the specification describes only a single embodiment, the claims of the patent will not be read restrictively unless the patentee has demonstrated a clear intention to limit the claim scope . . . .") (internal citations omitted).

Accordingly, the "a rounded bottom in said gullets" is construed to mean "[a] curved bottom region between adjacent sprocket teeth."

Next, the parties dispute the construction of "rounded dimple" found in claims 1, 15, 22, and 25 of the 183 Patent.

Claims 1, 15, 22, and 25 of the 183 Patent include, in pertinent part, a "rounded dimple".

The term "rounded dimple" is not explicitly defined in the specification. "Rounded" is defined as "convex, curving, or round in shape". Webster's Third International Dictionary 1979 (3d ed 1986). "Dimple" is generally defined as "a slight natural indentation … a depression or indentation…." Webster's Third International Dictionary 634 (3d ed 1986). The parties agree that the "dimple" in the 183 Patent is not an indentation as the term is commonly defined; instead, it is a protrusion or a bump. The drawings of the 183 Patent show support of such a definition as does the claim itself -- "a protrusion that is a rounded dimple".

The parties disagree on the construction of the term "rounded", which modifies the protrusion or bump. Plaintiff argues that the correct definition for "rounded dimple" is "a protrusion with a rounded surface". Defendant argues that the term should be defined as "a hemisphere-shaped bump".

The 183 Patent recites that the dimple has a curved surface to allow "guided pivoting" of the disc-shaped element relative to the housing and that the dimple has a curved surface to allow "universal pivoting" of the mounting disc. Figure 5 of the 183 Patent illustrates the dimple as half of a sphere.

While Figure 5 supports Defendant's proffered definition, such definition is more restrictive than the ordinary definition of rounded. The Patent does not demonstrate that such a restrictive definition is required. On the other hand, Plaintiff's proffered definition does not include a term or terms defining rounded but simply uses rounded. Therefore, Plaintiff's construction leaves the construction of the term to further interpretation.

The proper construction of the term "rounded dimple" is "a convex or curved shape protrusion" in light of the plain and ordinary definition of the term rounded, the agreed to definition for dimple as to this Patent, and the Patent drawings and description.

CooperVision contends that the term "contact lens having a rounded edge" means "a contact lens having a posterior surface in a general shape of an insert tool that includes a first posterior surface portion and a convexly curved second posterior surface portion that circumscribes the first posterior surface portion." (All italics added.) CIBA, on the other hand, proposes a construction of "an edge that is shaped like a portion of a circle in which every part of the surface or the circumference is equidistant from a center point." CooperVision's proposed construction refers exclusively to the posterior lens surface edge and the tool that shapes the back section of the mold used to create the lens. CIBA's proposed definition contains no reference to the mold tool and does not distinguish between anterior and posterior edge surfaces.

CooperVision's interpretation has initial appeal. When considered in overall context, the raison d'etre or core element of the edge design patents is a back surface mold insert tool with a convexly curved outer peripheral edge. The tool produces the back section of a mold which eventually forms a lens with a convexly curved outer peripheral edge on its back or posterior
surface. Common sense suggests that the rounded edge of the invention refers to the convexly curved outer peripheral edge of the posterior surface of the lens.

This proposed construction finds some support in certain language in the patents. Claim 4 states: "The method of claim 3 which further comprises demolding the contact lens member and hydrating the contact lens member to form a hydrogel contact lens having a rounded edge." '706 patent, col. 8, ll. 31-34 (italics added). Claim 3 refers the reader to claim 1, which provides that the contact lens product is produced with a back surface tool. The court must look at the claim language first, and ascribe the plain and ordinary meaning to the phrase. Hockerson-Halberstadt, 222 F.3d 951, 955 (Fed. Cir. 2000).

Second, the specification explains in some instances that "to form the rounded edge contact lens, the back surface tool having a convex curve along the outer radius thereof" is used to create a back surface mold, which is then assembled with another mold half to form a lens. '706 patent, col. 2, ll. 55-60. Elsewhere, the specification defines a lens with a rounded edge solely with reference to its back surface tool:

"[T]he convex curve of the tool, when used to form a back surface mold section, provides a contact lens having the desired rounded edge form . . . . "706 patent, col. 2, ll. 31-54.

To form the rounded edge surface of the final lens product, the surface of the [back surface] tool includes . . . a second surface portion defining a convex curved outer peripheral edge surface . . . . "706 patent, col. 3, ll. 40-45.

This language suggests that a contact lens with a rounded edge is a contact lens formed from a back surface tool with a convexly curved peripheral edge surface.

Despite its initial appeal, however, CooperVision's proposed construction does not fully survive further analysis. First, there is no evidence in the claim language itself supporting CooperVision's proposed limitation of a certain insert tool. The claim simply states that the contact lens is demolded and hydrated to form a hydrogel "contact lens having a rounded edge." '706 patent, col. 2, ll. 21-23; col. 8, ll. 31-34. This straightforward terminology of the invention and the understandable claim language give that meaning to this term. See Phillips, 415 F.3d at 1314 ("In some cases, the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood words"). "Contact lens with a rounded edge" means what it says, i.e., substantially smooth. '706 patent, col. 2, ll. 21-22, '706 patent, col. 5, ll. 30-32; '706 patent, col. 7, ll. 55-57. No claim language implies a departure from that meaning.

Similarly, the specification does not compel the court to deviate from the ordinary and customary meaning by importing added dimensions to the term. The specification consistently refers to an embodiment of the contact lens as having a "rounded edge." '706 patent, col. 3, ll. 51-52. However, nowhere does the patentee disclaim or disavow any other tool that can be used to form the rounded edge surface. Rather, when mentioning formation of a rounded edge lens, the specification states only that the tool is "preferably, a back surface tool," suggesting that the back surface tool, while preferred, is not the only tool that will create a rounded edge. '706 patent, col. 3, ll. 32-33. Simply put, when the specifications allude to "contact lens with a rounded edge," they do not reference the back surface tool in most instances.

Finally, and most importantly, even if a back surface tool is necessary to create a "contact lens with a rounded edge," it is improper to construe the claim term with such a tool when the tool is absent from the claim language. See Phillips, 415 F.3d at 1323 ("although the specification often describes very specific embodiments of the invention, [the Federal Circuit has] repeatedly warned against confining the claims to those embodiments . . . . In particular, [the Federal Circuit has] expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment").

Turning to the competing proposal, CIBA argues that the ordinary meaning of "round" is "having every part of the surface or circumference equidistant from the center." CIBA's Claim Construction Brief, p. 4. CIBA wholly relies on the definition in the Merriam-Webster's Collegiate Dictionary and The American Heritage Dictionary of the English Language. MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY (10th ed., 1999); THE AMERICAN HERITAGE DICTIONARY OF THE ENGLISH LANGUAGE (4th ed., 2000). Dictionaries may be helpful but are "less significant than the intrinsic record in determining the legally operative meaning of claim language." MBO Laboratories, Inc. v. Becton, Dickson & Co., 474 F.3d 1323, 1329 (Fed. Cir. 2007).
CIBA's proposal requires a "rounded edge" lens to be one in which the edge must have a circular, or approximately circular shape. The specification, however, contemplates that lenses covered by the invention can have different levels of peripheral edge roundness. See '706 patent, col. 7, ll. 34-47 (increasing the size of the angle at which the front and back surface molds meet, the "angle of interface," can increase the roundness of a lens edge). Accordingly, CIBA's proposed construction also is deficient.

Ultimately, the court partially adopts each side's construction. CooperVision correctly advocates that this claim term refers to the posterior surface edge of a contact lens, and that dictionary definitions do not trump the intrinsic record. CIBA correctly argues that this claim does not explicitly ascribe a specific tool that must be used to form the rounded edge surface.

Having considered all relevant factors, the court finds that:

"[C]ontact lens having a rounded edge" means: contact lens whose posterior surface has a substantially smooth, curved outer peripheral edge.

2) "runner filler"

Plaintiff proposes that "runner filler" be defined as "an element that volumetrically shapes the intake runner cavity to form an intake passageway." Defendant proposes the definition, "a component that is positioned within, and fully defines at least part of, the intake passageway." I conclude that a "runner filler" is a component that partially fills the intake runner, thereby forming at least a portion of the intake passageway.

Defendant's proposal would make a runner filler of any object placed within the intake runner. This is a broader construction of the term than the patent itself claims. The '502 patent's written description states: "The present invention solves some of the problems of redesigning engines to fit existing [original] [equipment] [manufacturer's] devices by forming an intake runner cavity that is relatively large and then filling at least some of the cavity space with a runner filler to form and position the intake passageway as desired." The '502 invention relies on the ability of the runner filler to fill portions of the intake runner cavity to form the intake passageway.

Although plaintiff's proposal comes closer to defining the term as claimed in the '502 patent, it states that the runner filler shapes the intake runner cavity, rather than the intake passageway. According to the '502 patent specification, the intake runner cavity does not change its shape. It is oversized and remains so without regard to the shape or size of the inserted runner filler. It is the intake passageway that is shaped by the runner filler, either partially (in the case of "open" runner fillers) or fully (in the case of "closed" runner fillers). Therefore, I will construe "runner filler" to be a component that partially fills the intake runner, thereby forming at least a portion of the intake passageway.

2. Rupturable

The defendant argues that the term "rupturable" in the '550 Patent should be construed to mean permanently deformable. The defendant argues that the process described in the '550 Patent involves an irreversible breaking of the membrane. The defendant also cites evidence that this construction accords with the ordinary meaning of the term "rupture" to those skilled in the art of injection molded plastics. (Belcher Decl. P 9.) The Court also notes that this construction is consistent with the ordinary lay meaning of the term.
1. Rupturable Web

SDP argues that the term "rupturable web" means "a thin sheet of material, such as is located on the end of a plunger for a syringe, that can be more readily broken or burst open in order to separate that portion from the rest of the plunger." Pls.' Br. in Supp. of Summ. J. on Defs.' Liability for Patent Infringement, at 17 ("Pls.' Br. in Supp. of Summ. J."). It is important, SDP argues, that the definition for rupturable web "include the notion that one portion of the web must be weaker in order to effectuate the tearing required." Pls.' Reply in Supp. of Summ. J., at 21 ("Pls.' Reply"). SDP uses dictionary definitions of web and rupture as well as expert averment to support its construction.

In contrast, NMT argues that the term "rupturable web" means "a thin portion of a boot which covers the open end of the plunger and tears to allow the needle to pass." Defs.' Br. in Opp'n, at 15. This definition, NMT argues, is the only definition clearly supported by the intrinsic evidence. Moreover, NMT avers that SDP's definition overreaches the bounds of the claim terms by incorporating the word "break," a term distinguished by SDP during patent prosecution. Id. at 16-17.

After reviewing the claim terms in light of the specification and the prosecution history, the Court finds that the term "rupturable web" means a material of a certain thickness that will tear or puncture when an out-of-plane force is applied against it. Starting with the claim language, the phrase "rupturable web" is used in two of the claims at issue. Specifically, claim 26 of the '952 patent reads:

A syringe comprising:

- a barrel having a first end and an opposite second end;
- a plunger having a forward end and movable within said barrel from said second end of the barrel towards said first end, the plunger having a hollow interior communicating with said forward end;
- a deformable base within said barrel intermediate said [sic] first and second end;
- a hollow needle having a pointed front, said needle extending through said first end of said barrel and a rear end received within and supported by said deformable base;
- energy storage means positioned in said barrel between said first end said deformable base and in engagement with said needle; and
- a rupturable web on said forward end of the plunger;

wherein a fluid can move from within said barrel through said needle as said plunger moves through said barrel to said deformable base, and when said rupturable web contacts said deformable base, continued movement of said plunger moves said deformable base toward said first end, said rear end of said needle thereby tearing said web wherein said rear end loses contact with said deformable base to allow said energy storage means to eject said needle into said interior of said plunger.

'952 Patent, col. 14, ll. 49-67, to col. 15, ll. 1-7 (emphasis added). Similarly, claim 38 of the '952 patent reads:

A syringe apparatus comprising:

- a barrel;
- a plunger movable within said barrel;
- a needle assembly attached to an end of said barrel and defining a passageway therethrough;
- a deformable base positioned within said barrel adjacent said [sic] needle assembly and defining a passage therethrough;

energy storage means within said passageway;
a hollow needle passing through said passageway;

an enlarged head on said needle engaged within said passage of deformable base; and

a rupturable web on an end of said plunger for moving a fluid within said barrel through the hollow of said needle when said plunger is moved through said barrel toward said needle assembly;

whereby when said plunger moves through said barrel toward said needle assembly, a fluid can be moved from said barrel through the hollow of said needle, and continued movement of said plunger moves said deformable base downwardly until such time as sufficient force is imparted to said rupturable web by said enlarged heard of said needle to tear said rupturable web, said deformable base then releasing said needle with said enlarged head due to force applied thereto by said energy storage means to project said needle with said enlarged head into the interior of said plunger.

Id. col. 16, ll. 16-45 (emphasis added). The purpose for the rupturable web in both of these claims is the same: it forms a seal on the end of the hollow syringe plunger during medication draw-up and injection, it moves the deformable base toward the outlet end of the syringe assembly and it tears when the enlarged needle head exerts enough force against it.

The '952 patent specification confirms that these functions are performed by the rupturable web. The patent teaches:

The plunger has a thin, rupturable web on an end thereof which is part of a boot covering the end of the plunger, the boot, including the web, being liquid impermeable for forcing liquid from the barrel upon movement of the plunger. Upon completion of an injection, the boot-covered plunger contacts the deformable base, and upon application of force at the plunger, moves such base downward. Continued application of force causes the flexible supports to flex and move over the needle assembly, permitting the deformable base to move the enlarged head of the needle downward until further movement of the enlarged head is blocked by the needle assembly. With the enlarged needle head blocked by the needle assembly, continued force at the plunger causes the deformable base to move around the enlarged needle head. As the deformable base moves around the needle assembly, the enlarged needle head begins to protrude from the deformable base and come into contact with the web on the boot of the plunger. Continued force causes the enlarged needle head to tear the web of the boot, positioning the enlarged needle head just inside the hollow portion of the plunger. The torn portion of the web creates a flap just inside the hollow plunger. As the plunger moves the deformable base still further, the enlarged needle head looses [sic] contact with the deformable base, which triggers a release of energy from the energy storage means in the passageway, projecting the needle with its enlarged needle head into the hollow portion of the plunger.

Id. col. 2, ll. 12-34 (emphasis added).

Similarly, in the alternative embodiment,

as the deformable base moves forward, the enlarged needle head begins to protrude from the deformable base and come into contact with a thin rupturable web on the boot of the plunger. Continued force causes the enlarged needle head to penetrate the web of the boot, positioning the enlarged needle head just inside a hollow portion of the plunger.

Id. col. 2, ll. 66-67, to col. 3, ll. 1-5 (emphasis added). Moreover, the detailed description of the rupturable web reads:

Plunger 7 has a hollow 41 therein and has a boot 43 covering an end thereof which is fluid impermeable for forced movement of a fluid in barrel 5 during ordinary injection. A portion of boot 43 is illustrated as having been torn by the needle head in FIG. 2, with boot web 79 laying over in the front of plunger 7.

Id. col. 5, ll. 39-44 (emphasis added). In addition,

To aid in the rupturing process of the web, tear groove 26 and tear groove 28, shown in figure 9B, are provided. The thickness of web 79 and the tear grooves are selected to withstand normal operating pressures within syringe 1, as shown in FIG. 1, but to allow relative ease in the puncturing of web 79 by enlarged needle head 13, shown in FIG. 6. The preferred material for boot 43 is an elastomer.

Id. col. 7, ll. 3-10 (emphasis added).
It is clear from these passages and the claims themselves that the rupturable web is a material of a certain thickness that will tear or puncture when an out-of-plane force is applied against it. SDP avers that the specification uses the terms "rupture" and "tear" interchangeably, therefore the definition for "rupture" should be used to define "rupturable web." SDP argues that the dictionary definition of the word rupture is break or burst, therefore, the rupturable web is a material that may be broken or burst when an out-of-plane force is exerted against it. However, the specification only uses the word "rupture" once to describe what happens to the "rupturable web" when the enlarged needle head comes in contact with it: "Plunger 107 has a hollow 141 therein and is terminated by a boot 143 having a rupturable web 179, the boot being fluid impermeable for movement of a fluid in the barrel during ordinary injection. Web 179 of boot 143 is illustrated as having been ruptured in FIG. 30." Id. col. 10, ll. 45-49. Although the word "rupture" may be used interchangeably with the word "tear" in the specification, this single reference to "rupturing" cannot overcome the repeated references to the "tearing" of the web in the claims and the remainder of the specification. In addition, although the dictionary definition of "rupture" may be helpful, the claims and the specification clearly connote that the rupturable web is torn or punctured rather than broken or burst.

Moreover, a definition for "rupturable web" that references "tear" instead of "break" or "burst" is more consistent with the prosecution history of the '952 patent. During prosecution of the patent's predecessor applications, the '007 continuation application filed January 4, 1993 and the '001 application filed December 16, 1994, the patent examiner rejected claims similar to the '952 patent's claim 30 and claim 26. Defs.' Exh. 7, File Wrapper, App. No. 08/000,007, Jan. 4, 1993, at 58, 66 ("App. No. '007"); id., File Wrapper, Continuation App. No. 08/359,001, Dec. 16, 1994, at 82 ("App. No. '001"). Those claims used the words "rupture" and "penetrate" to describe the action of the enlarged needle head pushing through the rupturable web, when those words meant "to break." See id.

Specifically, the claims at issue read in pertinent part:

13. (Amended) A process for retracting a needle at the completion of subcutaneous [sic] injection with a hypodermic syringe, comprising the steps of:

   forcing a plunger of said syringe downwardly to force a needle support deformable base downwardly and sever sacrificial supports;

   forcing an end portion of said needle to [penetrate] rupture a base portion of the [syringe and] plunger; and

   propelling said needle into the hollow of said plunger.

* * *

14. A syringe comprising:

* * *

   a rupturable boot on the forward end of the plunger;

   whereby a fluid is moved from within the barrel through the needle as the plunger moves through the barrel to the deformable base, and when the rupturable boot contacts the deformable base, continued movement of the plunger moves the deformable base toward the first end, the rear end of the needle thereby rupturing the boot and loosing [sic] contact with the deformable base to allow the energy storage means to eject the needle into the interior of the plunger.

The patent examiner rejected both claims citing 35 U.S.C. § 103, which forms the basis for obviousness rejections. Id. at 58. The examiner stated:

Claims 13 and 14 are rejected under 35 U.S.C. § 103 as being unpatentable over Batlle in view of Botich et al or WIPO 90/06146.
It is considered obvious and well within the skill of the art to provide the retractable needle syringe of Batlle with a hollow plunger of sufficient length to fully contain the retracted needle as taught by Botich et al or WIPO if so needed or desired.

Id. In response, SDP distinguished its claims explaining:

. . . Batlle teaches a disposable syringe utilizing as its closing device on the end of the piston (plunger) a discoid button 14 with its edge pressure-fitted into a ring-shaped groove 15 made around the mouth of the piston's cavity. During operation of the needle of Batlle, the button 14 is forced completely out of the groove 15 and forced back up into the piston.

The pertinent portion of Applicant's [sic] independent claim 13 claims "forcing an end portion of said needle to rupture a base portion of the plunger" (emphasis added). A pertinent part of the specification as amended herein states as follows:

As deformable base 11 moves forward, enlarged needle head 13 begins to protrude from base 11 and come into contact with web 79 of rupturable boot 43 on plunger 7. Continued force causes further translation of base 11 and enlarged needle head 13 to tear and penetrate web 79 of rupturable boot 43 . . . (page 12, lines 21 through 25) (emphasis added)[.]

By the above amendment, the specification has been amended to more particularly describe rupturing as used herein. As clearly illustrated in figure 2 and 19 through 23, a portion of the rupturable boot 43 is torn or ruptured in order for the needle to penetrate the rupturable boot 43. According to Webster's Dictionary, the verb rupture (or rupturing) means "to part by violence: break, burst". The meaning of rupture as used herein and supported by the specification and the drawings clearly illustrates that the rupturable boot 43 is torn to be parted for the needle to penetrate. This rupturing or tearing differs significantly from the closing device and the end of the piston in Battle [sic] wherein the discoid button 14 is merely dislodged from its pressure-fitted position within the ring-shaped groove 15. There is clearly no rupturing as taught by applicant in this process of Battle [sic]. As such, no combination of Battle [sic] with Botich et al or WIPO 90/06146 renders applicant's [sic] process obvious.

Id. at 60-62. In this passage, the inventors appear to argue that although the definition of rupture is to break or burst, their device uses a tearing action rather than a dislodging as taught by Batlle. But, even in light of the explanation here, the examiner again rejected the claims:

In view of applicant's [sic] cited definition of rupture which includes "to break", [sic] it is the Examiner's position that the dislodging in Battle is equivalent to a breaking and therefore readable on the claims. If the claims were amended to recite that the boot is "torn" or is caused to "tear" such language would render the claims allowable over the cited prior art[, Batlle in view of Botich et al or WIPO].

Id. at 66. Accordingly, the inventors amended the claims to read:

13. (Thrice Amended) A process for retracting a needle at the completion of subcontaneous [sic] injection with a hypodermic syringe, comprising the steps of:

forcing a plunger of said syringe downwardly to force a needle support deformable base downwardly and sever sacrificial supports;

forcing an end portion of said needle to [rupture] cause a base portion of the plunger to tear; and

propelling said needle into a hollow of said plunger such that said needle is contained entirely within said plunger.

14. (Amended) A syringe comprising:

* * *

a rupturable boot on the forward end of the plunger;

whereby a fluid is moved from within the barrel through the needle as the plunger moves through the barrel to the
deformable base, and when the rupturable boot contacts the deformable base, continued movement of the plunger moves the deformable base toward the first end, the rear end of the needle thereby [rupturing] causing the boot to tear and loosing [sic] contact with the deformable base to allow the energy storing means to eject the needle into the interior of the plunger.

Id. at 69-70. Further, the inventors stated, "In view of applicant's [sic] cited definition of "rupture", the examiner suggests to amend the claims to recite that the boot is "torn" or is caused to "tear" as such suggested language would render the claims allowable over the cited art. Such amendments have been submitted by this Amendment B." Id. at 71. The examiner allowed the claims so amended. Id. at 72.

But, the inventors did not stop there; they continued the '007 application and added additional claims in the '001 application. Defs.' Exh. 7, App. No. '001, at 75, 78-79. The new claims read:

15. (New) A process for retracting a needle at the completion of substaneous [sic] injection with a hypodermic syringe, comprising the steps of:

forcing a plunger of said syringe downwardly to force a needle support deformable base downwardly and sever sacrificial supports;

forcing an end portion of said needle to penetrate a base portion of said plunger; and

propelling said needle into a hollow of said plunger.

16. (New) The process according to claim 15 wherein said end portion of said needle penetrates said base portion of the plunger by rupturing.

Id. at 78-79.

Again, the patent examiner rejected the additional claims. He wrote: "Claims 15 and 16 are rejected under 35 U.S.C. § 102 (a or e) as being anticipated by Batlle. The broad recitation and meaning of 'penetrate' and 'rupture' is considered to be fully met by the breaking action disclosed by Batlle." Id. at 82. The inventors abandoned this application without amendment after it filed application Serial No. 08/481,093 (the "'093 application"), a continuation-in-part application of the '001 application; the '093 application later matured into the '952 patent. Id. at 85; Defs.' Exh. 9, File Wrapper, App. No. 08/481,093, Patent No. 5,613,952, June 7, 1995, at 4 ("'093 App."). The Court notes that all of the claims in the '952 patent state that the rupturable web or the end of the syringe plunger tears or is torn rather than ruptures or breaks. See '952 Patent, col. 13, ll. 15-18; id. col. 15, ll. 3-5; id. col. 15, ll. 29-30; id. col. 16, ll. 37-41.

It is clear to the Court that the patent examiner understood there to be a difference between the word "rupture," meaning "to break," and the word "tear." Where the Batlle patented device made obvious and anticipated a breaking action, according to the patent examiner Batlle did not make obvious or anticipate a tearing action. Moreover, in distinguishing their device from that in Batlle, the inventors describe the action as a tearing, and quoting from the patent specification, stated:

The pertinent portion of Applicant's [sic] independent claim 13 claims “forcing an end portion of said needle to rupture a base portion of the plunger” (emphasis added). A pertinent part of the specification as amended herein states as follows:

As deformable base 11 moves forward, enlarged needle head 13 begins to protrude from base 11 and come into contact with web 79 of rupturable boot 43 on plunger 7. Continued force causes further translation of base 11 and enlarged needle head 13 to tear and penetrate web 79 of rupturable boot 43 . . . (page 12, lines 21 through 25) (emphasis added)[.]

By the above amendment, the specification has been amended to more particularly describe rupturing as used herein. As clearly illustrated in figures 2 and 19 through 23, a portion of the rupturable boot 43 is torn or ruptured in order for the needle to penetrate the rupturable boot 43. According to Webster's Dictionary, the verb rupture (or rupturing) means "to part by violence: break, burst". The meaning of rupture as used herein and supported by the specification and the drawings clearly illustrates that the rupturable boot 43 is torn to be parted for the needle to penetrate. This rupturing or tearing differs significantly from the closing device and the end of the piston in Battle [sic] wherein the discoid button 14 is merely dislodged from its pressure-fitted position within the ring-shaped groove 15. There is clearly no rupturing as taught by
applicant in the process of Battle [sic]. As such, no combination of Battle [sic] with Botich et al or WIPO 90/06146 renders applicant's [sic] process obvious.

Defs.' Exh. 7, App. No. '007, at 61-62. In describing the changes to the specification, the inventors seem to equate rupture, with its "break; burst" definition, with tear. But, they also appear to distinguish Battle by stating that "a portion of the rupturable boot 43 is torn or ruptured in order for the needle to penetrate the rupturable boot 43." Id. at 61. This would be different from the Battle invention where the entire "boot" is dislodged. See id. at 62. Apparently, the patent examiner found this latter part of the inventors' reasoning persuasive because he allowed claims that referenced either "torn" or caused to "tear." Clearly, however, the patent examiner did not accept the inventors' definition of rupture that included "to break" because the examiner found "to break" equivalent to the dislodging taught by the Battle invention.

As a result of these findings, a definition for "rupturable web" that includes the phrase "to break" would be inconsistent with the patent examiner's rejection of a definition of rupture that included that phrase. In light of the claims, the specification and the prosecution history, the Court finds that the phrase "rupturable web" means a material of a certain thickness that will tear or puncture when an out-of-plane force is applied against it.

5. "Safety Edge"

The parties propose starkly different constructions of the term "safety edge." Jennmar proposes: "Edge positioned over one of the major surfaces and spaced from the perimeter." Excel proposes: "Smooth edge or end with no sharp edges accessible to touch." Jennmar argues that Excel's definition reads limitations into the claims that are not in the Patent. The Court agrees with Jennmar's proposed construction. The '933 Patent explains that the "safety edge" configurations, which involve ends that have been doubled over upon themselves, provide three benefits: (1) they "help to prevent injury from sharp edges"; (2) they "add additional strength to the outer periphery of the plates"; and (3) they "also aid in the stacking and destacking of the plates." Column 3. The proposed definition of Excel is both over-inclusive and under-inclusive. It expands the "sharp edge" condition by adding a reference to "accessible to touch" that is totally absent from the Patent. Moreover, Excel's proposed construction completely ignores the "peripheral strength" and "stackability" benefits that are expressly articulated in the Patent. Thus, the Court rejects Excel's effort to equate "safety edge" with "no sharp edges accessible to touch."

Claim 1 of the '674 Patent reads as follows:

A scooter, comprising: a scooter body; a pair of rear wheels rotatably supported at a rear portion of said scooter body; a transmission unit having an upper control portion positioned above said scooter body and a lower connecting portion extended underneath said scooter body; a steering means affixed to said control portion of said transmission unit for driving said connecting portion thereof to rotate in clockwise and anti-clockwise directions; a twister member having a driven portion connected to said connecting portion of said transmission unit; a pair of driving wheels spacedly and rotatably mounted to said twister member wherein said driving wheels are spaced apart from said driven portion of said twister member; and a safety driving equipment, comprising: a supporting arm frontwardly extended from said driven portion of said twister member; and a safety wheel which is rotatably mounted to a free end of said supporting arm to support a front portion of said scooter body and prevent said scooter from being flipped over.

Counsel in this case have agreed upon interpretations of most of the claim language or have agreed that the ordinary meaning is so clear that no interpretation is necessary. The disputed language is discussed below.

a safety wheel which is rotatably mounted to a free end of said supporting arm to support a front portion of said scooter body and prevent said scooter from being flipped over
The parties have asked the Court to construe the phrase, "a safety wheel which is rotatably mounted to a free end of said supporting arm to support a front portion of said scooter body and prevent said scooter from being flipped over." The parties were able to reach an agreement at the claim construction hearing that the words, "to support a front portion of said scooter body and prevent said scooter from being flipped over," mean exactly what they say--that the safety wheel functions to (1) support the front part of the scooter and (2) prevent the scooter from flipping over.

The parties' disagreement over construction is limited to the first seven words of the phrase, i.e., "a safety wheel which is rotatably mounted." Plaintiff, citing to the specification of the patent, contends that "a safety wheel which is rotatably mounted" is a wheel "which is 'capable of universal rolling.'" (Parties' Revised Joint Claim Charts 3 (citing, '674 Patent at col. 2, ln. 33-35.)) The parties agree that a wheel which is "capable of universal rolling" is a caster wheel. Defendants' view is that a caster wheel is only one of numerous possible embodiments of the invention and thus, should not be read as a limitation of the scope of claim 1. Defendants urge that "a safety wheel which is rotatably mounted" encompasses any wheel that can turn on its axis and can perform the safety functions that are delineated in the claim.

Defendants' argument, which focuses on the language of the claim itself, is more faithful to the principles of claim construction outlined in Phillips, and is more persuasive to this Court. As the Federal Circuit instructed district courts to do at the outset of their claim construction analyses, I have considered the words, "a safety wheel which is rotatably mounted," in the context of the entire patent.

Plaintiff asks the Court to construe the term "rotatably mounted," in this context, as, in effect, describing a wheel of the universal rolling or caster-type. In view of the plain meaning of the phrase and the way it and similar terms are used in claim 1 and in other claims in the patent, I reject plaintiff's proposed construction.

The Federal Circuit has advised that the context in which a term is used in a claim can be "highly instructive." Phillips, 415 F.3d at 1314 (citing examples of Federal Circuit cases in which "the use of a term within the claim provides a firm basis for construing the term"). The parties agree, as set forth in the Revised Joint Claim Charts, that "rotatably mounted," as used elsewhere in claim 1, refers to "wheels that are mounted . . . and serve to propel the vehicle." (Revised Joint Claim Charts 2 (construing "a pair of driving wheels spacedly and rotatably mounted . . .").) The parties also reached an agreement at the claim construction hearing that the phrase "rotatably supported," as used in claim 1, describes wheels that are able to rotate about their axles.

Further, the phrase "rotatably mounted" and similar phrases are used in other claims of the patent to describe wheel attachments that enable wheels to rotate, not specifically caster wheels. See, e.g., '674 Patent, claim 4 ("rotatably connecting") ("rotatably mounting"), claim 5 ("rotatably affixed"), claim 13 ("rotatably connecting"), ("rotatably mounting"), claim 14 ("rotatably supported"), ("rotatably mounted"). hi Phillips, the Court noted that "[h]ecause claim terms are normally used consistently throughout the patent, the usage of a term in one claim can often illuminate the meaning of the same term in other claims." 415 F.3d at 1314. I find that, consistent with its usage throughout the claims, the phrase "rotatably mounted," as it relates to the safety wheel, means mounted in a manner that allows for rotation.

Plaintiff shifted focus during the claim construction hearing to the term "safety wheel," as used in claim 1, urging the Court to construe the term to mean a wheel of the universal rolling or caster-type. Plaintiff relies primarily on the "Summary of the Present Invention," wherein the safety wheel is referred to as "capable of making universal rolling mounted lively at the end of the wheel arm." ('674 Patent, col. 2, ln. 33-35.)

The Federal Circuit has repeatedly cautioned courts not to import limitations from the specification into the claims. See Phillips, 415 F.3d at 1323; Teleflex, 299 F.3d at 1326 ("The claims must be read in view of the specification, but limitations from the specification are not to be read into the claims.") (citations omitted); Collegenet, Inc. v. Applyyourself, Inc., 418 F.3d 1225, 1231 (Fed. Cir. 2005) ("In examining the specification for proper context, . . . this court will not at any time import limitations from the specification into the claims." (citation omitted)). In order to avoid improperly limiting the claim terms, it is important to bear in mind that claim construction analysis must begin with the words of the claim. See Teleflex, 299 F.3d at 1324. The Federal Circuit, in Teleflex, held,

[claim terms take on their ordinary and accustomed meanings unless the patentee demonstrated an intent to deviate from the ordinary and accustomed meaning of a claim term by redefining the term or by characterizing the invention in the

- 4028 -
The Federal Circuit has noted that "[i]n some cases, the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood words." Phillips, 415 F.3d at 1314; see also, Acumed LLC v. Stryker Corp., 483 F.3d 800, 805 (Fed. Cir. 2007) (applying widely accepted meaning of the word 'curved'), petition for cert. filed, 76 U.S.L.W. 3094 (U.S. Sep. 4, 2007) (No. 07-304). The term "safety wheel," as it is used in the '674 patent, is not a term that has a particular meaning in a field of art. I find that the ordinary, lay meaning, of "safety wheel" is a free-rotating wheel that performs safety functions. There is nothing in the claim language to suggest that the safety wheel is limited to a wheel of the universal rolling or caster-type.

In addition to the claims, there are other indications in the specification that the caster wheel is only one example of an acceptable safety wheel. The term "safety wheel" appears in several places throughout the patent exactly as it appears in claim 1, i.e., without any reference to universal rotation. (See, e.g., '674 Patent col. 3, ln. 41; col. 4, Ins. 27, 55-56, 60.) The specification describes one of the features of the invention as "a safety wheel rotatably connected" to the supporting arm. (Id. at col. 3, ln. 41.) At column 4, line 30, the term "safety wheel" is described not as a universal wheel, but as a "free rotating wheel." When the specification does refer to the "universal rolling" feature, it is within the description of the preferred embodiments--"[a]ccording to the preferred embodiment, . . . [t]he safety wheel is capable of making universal rolling." (Id. at col. 3, Ins. 45-53.) At column 4, lines 25-44, again within the purview of the phrase, "according to the preferred embodiment . . . ." the specification provides further details about the qualities of a safety wheel of one particular type, i.e., the caster-type. In describing the second preferred embodiment, the specification describes the added benefits of a "universal" safety wheel. (Id. at col. 5, Ins. 11-15 ("Furthermore, the safety wheel is a universal wheel, so either because of automatic movement, under force or wobbling operation, the safety wheel will move along to any direction without encountering the obstacle caused by the angle of proceeding.").)

Turning to the prosecution history, I find that it, too, suggests that the safety wheel is not limited to one of the universal rolling or caster-type. Claim 1 was initially rejected on obviousness grounds because of prior art which teaches "wheel elements" on a scooter. (Office Action 2-5, citing U.S. Patent No. 4,323,258.) In connection with other claims, the PTO acknowledged that the cited prior art does not teach a "safety wheel adapted to rotate 360 degrees." (Office Action 6, 7.) In response to the Office Action, the inventors did not amend the "safety wheel" language or raise objections urging that the safety wheel of claim 1 has different rolling capabilities than the "wheel elements" of the prior art. (See Nov. 7, 2003 Response to the Office Action at 2, 7.) One would expect that if the inventors meant for the "safety wheel" in claim 1 to mean a wheel of a universal rolling or caster-type, they would have brought this to the PTO's attention because it would
have cured the obviousness problem.

Plaintiff argues that the Federal Circuit's decision in Verizon Services Corp. v. Vonage Holdings Corp., Nos. 2007-1240, 2007-1251, 2007-1274, 2007 U.S. App. LEXIS 22737, 2007 WL 2781869 (Fed. Cir. Sept. 26, 2007), a case decided just weeks before the claim construction hearing in this case, is dispositive of the questions before this Court. In Verizon, the court concluded that the district court had erred in its interpretation of the term "localized wireless gateway system." because it failed to require that the system is limited to one that can perform the functions described in the specification. See 2007 U.S. App. LEXIS 22727, [WL] at *10.-*11.

The Court, in Verizon, looked to the specification to guide its interpretation of the claim language. See 2007 U.S. App. LEXIS 22737, [WL] at * 10. The summary of the invention included a description of functions that were critical to the invention. See id. The Court read the claim term at issue to include the functional limitations outlined in the specification, even though those limitations were not included in the claim. See id. The Court explained that when "a patent thus describes the 'features' of the 'present invention' as a whole, this description limits the scope of the invention." Id. As discussed above, reading the patent as a whole, the ability of the wheel to roll universally is not a "feature of the present invention," but rather one preferred embodiment. While I agree with plaintiff that the reference to the "safety wheel, capable of making universal rolling" as "the invention herein" may be some evidence that the inventors intended to narrow the scope of claim 1, there is stronger conflicting evidence indicating that the ability of the safety wheel to roll universally is but one preferred embodiment. I do not read Verizon to 'mean that, when presented with magic words such as "present invention" or "the invention herein," district courts should disregard contrary indications in the language of the claims, as well as other language of the specifications. The Verizon court gave no indication that it was announcing such a new watershed rule.

The Court finds Honeywell Int'l. Inc. v. ITT Indus., 452 F.3d 1312 (Fed. Cir. 2006) and Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361 (Fed. Cir. 2007), two post-Phillips cases relied upon by the Court in Verizon, to be instructive. In Honeywell, the Federal Circuit affirmed the district court's ruling that the "fuel injection system component" described in the patent was limited to a "fuel filter." Id. at 1317-20. The written description of the invention referred to the fuel filter as "this invention" or "the present invention" at least four times. Id. at 1318. Furthermore, unlike the patent here, there was nothing in the specification to indicate that the fuel filter was merely a preferred embodiment of the invention. Id. The only fuel component disclosed and claimed in the patent was a fuel filter. Id. The specification's description of the prior art further supported the conclusion that the patentee limited the scope of the patent claims to a fuel filter. Id. In Andersen, the patentee challenged the district court's construction of the terms "composite composition" and "composite structural member." 474 F.3d at 1365. The Court affirmed the district court's finding that the term "composite composition" was limited to "a solid pellet or a solid linear extrudate, which may subsequently be remelted and extruded to make a structural member," Id. at 1366, and vacated the district court's conclusion that the term "composite structural member" was not similarly limited, Id. at 1371-73. In its opinion, the Federal Circuit reiterated its "warn[ing] against importing limitations from the specification into the claims absent a clear disclaimer of claim scope" and its "recogni[tion of] the difficulty faced by district courts in trying to walk that tightrope." Id. at 1373. The Federal Circuit observed that the patentee intended to narrow the claim scope, because it was clear from the specification that the steps of linear extrusion or pelletization are "required," "essential" and "critical" features of the "composite composition" and "composite structural member." Id. at 1367. Unlike the limitations at issue in Verizon, Honeywell and Andersen, the limitation urged by plaintiff here does not apply to the invention as a whole, but rather to one preferred embodiment. Furthermore, the patentee here has not made clear statements of intent to narrow the scope of claim 1. Absent such clear statements, I adopt the plain meaning of the claim language.

I conclude that "safety wheel" in claim 1 of the '674 patent is not limited to a wheel of the universal rolling or caster-type. Neither claim 1 nor any of the other claims contain language that would so limit the claim. Additionally, neither the specification nor the prosecution history includes an "expression of manifest exclusion or restriction demonstrating an intent to limit" the safety wheel to a universal rolling or caster-type. Teleflex, 299 F.3d at 1327. The term "safety wheel" is not redefined in the specification and there are no clear statements of scope limiting the term. The "capable of making universal rolling" language of the specification merely describes one preferred embodiment of the invention. I therefore construe the phrase "a safety wheel which is rotatably mounted to a free end of said supporting arm to support a front portion of said scooter body and prevent said scooter from being flipped over" as, a wheel, which is mounted to said supporting arm in a manner that allows the wheel to rotate, to support a front portion of said scooter body and prevent said scooter from being
18. Where subsequent uses of a claim term within a claim make reference to the first usage as an antecedent (through the use of introductory definite articles such as "said" or "the"), the claim term must be interpreted consistently across all such uses. See Process Control Corp. v. HydReclaim Corp., 190 F.3d 1350, 1356-57 (Fed. Cir. 1999).

The '322 Patent contains two independent claims that are the subject of this lawsuit: Claim 1 and Claim 14. The claims and the corresponding theories of liability will be addressed separately below.

A. Claim 1

1 Claim 1, in its entirety, reads as follows:

1. a box shaped fireplace having six walls comprising four substantially vertical walls, a top wall, and a bottom wall,

2. at least one of said four vertical walls having a glass access door and one of said remaining walls having a horizontal exhaust pipe connected thereto for insertion through said outside wall of the space to be heated,

3. a combustion chamber in said box shaped fireplace located within said six walls,

4. said bottom wall comprising an inner, and an outer bottom plenum below said combustion chamber,

5. the wall having said horizontal exhaust pipe connected thereto comprising an inner plenum, a middle plenum and an outer plenum,

6. said outer plenums being connected to form an air passage for interior space air being circulated around the outside of said fireplace combustion chamber to provide primary combustion air, and

7. Said horizontal exhaust pipe being connected to said inner plenum of said wall having said horizontal exhaust pipe connected thereto, said inner plenum being connected to said combustion chamber for receiving and exhausting exhaust gases from said combustion chamber.

(1) Claim Construction

The contentious element of Claim 1 provides: "said bottom wall comprising an inner, and an outer bottom plenum below said combustion chamber." FMI asserts that proper construction of this element requires that an infringing fireplace contain two plenums located below the bottom plate of the "combustion chamber." FMI further contends that its DVF fireplace has only one plenum below the bottom plate of the combustion chamber and, consequently, does not infringe the '322 patent. Hearth maintains that the DVF does in fact have two plenums below the combustion chamber. Hearth contends that the trapezoidal burner pan in the DVF forms the inner bottom plenum below the combustion chamber.

To resolve these issues, the Court must first determine the proper construction of this limitation in Claim 1. In determining the proper construction of a claim, the first source for guidance is the claim language itself. Vitrronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). "Although words in a claim are generally given their ordinary and customary
meaning, a patentee may choose to [her] own lexicographer and use terms in a manner other than their ordinary meaning, as long as the special definition of the term is clearly stated in the patent specification." Id. Other sources of guidance in claim construction include the specification, the prosecution history, and, if necessary, extrinsic evidence. Lockwood, 107 F.3d at 1572-73.

To determine what is meant by "below said combustion chamber" in the present case, it is necessary to first determine the proper construction of the term "combustion chamber." FMI argues that a combustion chamber, by definition, has four walls, a top, and a bottom. In contrast, Hearth maintains that a combustion chamber does not require six sides but is merely the area in which combustion occurs. The distinction is critical because it impacts the existence or non-existence of an inner bottom plenum in the DVF series.

Although Hearth is correct that the combustion chamber is generally the area in which combustion occurs, the ordinary and customary use of the word "chamber" connotes a space that is enclosed or compartmentalized. The claim language must also be analyzed in the context of the specification, or the textual description of the patented product or process. Vitronics, 90 F.3d at 1582. "The specification acts as a dictionary when it expressly defines terms used in the claims or when it defines terms by implication." Id. (quoting Markman, 52 F.3d 967, 979). Claims, however, must not be interpreted by adding limitations which appear only in the specification. Electro Medical Systems, S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994).

The specification of the '322 patent does not explicitly define the term "combustion chamber." In several instances, however, the specification implies that the combustion chamber is an enclosed or substantially enclosed space, meaning that it has a bottom of some sort. In its description of the preferred embodiment, the patentee described the bottom of the combustion chamber as follows: "Bottom plates 45 and 46 are shown spaced apart from each other in the manner in which they are connected to the sidewalls of the combustion chamber…." Gross Aff., Ex. 1 at Col. 4, lines 40-43. Similarly, the patentee refers to "sheet metal plates which are shaped to form the plenums and the combustion chamber." Id. at lines 30-32. Although the "particular embodiment appearing in a specification will not be read into the claims when the claim language is broader than such embodiments," 2 the specification in this case merely bolsters the Court's construction of the limitation in Claim 1, which is based on the ordinary meaning of the term "combustion chamber." This is consistent with a "common theme" of claim construction which advises that "words of the claim are generally given their ordinary and accustomed meaning, unless it appears from the specification … that they were used differently by the inventor." CHISUM ON PATENTS, 1997 Supplement, at 64 (citing In re Paulsen, 30 F.3d 1475, 1480 (Fed. Cir. 1994)). In the present case, the specification confirms rather than refutes the interpretation of a "combustion chamber" as an enclosed space wherein combustion occurs.

--- Footnotes ---

2 See Electro Medical, 34 F.3d at 1054.

--- End Footnotes ---

In addition to the claim language and the specification, the prosecution history of a patent may inform the court's construction of the claims. See e.g., Lockwood, 107 F.3d at 1573. In the present case, FMI asserts that Hearth's representations to the patent examiner during the prosecution of the patent are inconsistent with Hearth's recently proffered interpretation. According to the prosecution history, the patent examiner initially rejected Hearth's patent on the basis that it was obvious in light of the prior art. Hearth maintained that the unique inner and outer plenums below the combustion chamber distinguished the '322 patent from the prior art, specifically the Herron patent. The examiner accepted Hearth's distinction. FMI asserts that Hearth's current interpretation stands in contradistinction to its earlier representations to the Patent and Trademark Office ("PTO").

FMI's prosecution history argument, however, is unpersuasive. It was the Herron patentee, not Hearth, who clearly demarcated the bottom of the Herron combustion chamber as "bottom panel 14." Gross Aff., Ex. 6, column 2, lines 21, 42-52. FMI's argument would be more convincing if Hearth had attempted to manipulate or reinterpret the location of the bottom panel of the Herron combustion chamber in its subsequent patent application. Hearth, however, clarified to the patent examiner that the Herron patentee's own description of the bottom of the combustion chamber left room for only one plenum. There is nothing internally inconsistent in Hearth's representations to the PTO and its subsequent representations to
this Court. As a result, the prosecution history neither helps nor hinders FMI's interpretation of the limitation in Claim 1.

In light of the Court's finding that the "combustion chamber" is an enclosed space which necessarily includes a plate-like bottom of some sort, the meaning of the limitation "below said combustion chamber" is more clear. FMI further contends that the bottom of the combustion chamber must be "a thing separate from and below the burner and logs." In support of this contention, FMI offers extrinsic evidence in the form of prior art.

Where a genuine ambiguity remains in the claim language after consideration of all available intrinsic evidence, a court may resort to extrinsic evidence. Vitronics, 90 F.3d at 1584 ("No doubt there will be instances in which intrinsic evidence is insufficient to enable the court to determine the meaning of the asserted claims, and in those instances, extrinsic evidence, such as that relied on by the district court, may also properly be relied on to understand the technology and to construe the claims"). Extrinsic evidence, such as prior art, however, may not be used to contradict the claim language. Id.

A court may, in its discretion, rely on prior art proffered by one of the parties "whether or not cited in the specification." Id. Prior art often indicates how certain terminology is used and understood by those skilled in the art. Id. "As compared to expert testimony, which often only indicates what a particular expert believes a term means, prior art references may also be more indicative of what all those skilled in the art generally believe a term means." Id.

The prior art supports FMI's contention that the bottom plate of the combustion chamber must be separate from and below the burner and logs. FMI cites six examples of prior art in which the bottom plate of the combustion chamber is distinct from and located below the burner. Common sense dictates that, for combustion to occur in the combustion chamber, the burner or combustion mechanism must be located within the chamber. This requires that the burner and logs be distinct from the bottom of the combustion chamber.

As construed by this Court, therefore, the limitation requires: a combustion chamber with a plate-like bottom of some sort that forms the boundary between the combustion chamber and the inner plenum, where the bottom plate is a thing separate from and below the burner and logs; an inner bottom plenum below the combustion chamber, and an outer bottom plenum below the combustion chamber.

3434

B. THE 525 PATENT

The 525 Patent describes an improvement on a gas burner used to heat and dry grain. The improvement is a cone that diverts the flame and causes more efficient consumption of the fuel. The parties only dispute one term in the claims in this Patent. The disputed term states:

said diverter having a plurality of spaced openings therein for permitting of air moved by said blower to pass therethrough.

Joint Statement, Table Y, at 87. The language is clear and does not need construction. Sukup argues that the language should be construed to require triangular openings between the slots. Sukup argues that the openings in the drawings are triangular. This proposal would improperly import a limitation from the specifications into the claim. Furthermore, the openings in the detailed drawings are not triangular. They are closer to the shape of a trapezoid.

3435

5. said feed wheel

Lastly, Whirlpool argues that the term "said feed wheel" as used in claim 11 has no antecedent, and that therefore, claim 11 is invalid as indefinite. Maytag disagrees, claiming that one of ordinary skill in the art would interpret the term "feed section" as equivalent to the term "feed wheel." See, e.g., Omega Eng'g Inc. v. Raytek Corp., 334 F.3d 1314, 1320-21 (Fed.
Accordingly, the district court did not clearly err in finding that Canon made a strong showing of infringement.

Avoid infringement merely by adding elements if each element recited in the claims is found in the accused device.”)

Burroughs Corp., 713 F.2d 700, 703, 218 U.S.P.Q. (BNA) 965, 967-68 (Fed. Cir. 1983) (“It is fundamental that one cannot define the first chamber as being bounded by the grooved partition and the back wall. . . .”)

whether one skilled in the art would understand the bounds of the claim when read in light of the specification.”) (quoting Miles Lab., Inc. v. Shandon Inc., 997 F.2d 870, 875 (Fed. Cir. 1993)). Specifically, Maytag contends the term "feed section," "feed wheel" and "lift wheel" which prevent a finding that the terms are completely interchangeable. For example, the first two references cited by Maytag equate "feed section" with "lift wheel!" --not "feed wheel." See '688 patent, col. 1, l. 21; col. 1, ll.65-66. Secondly, the "feed section" is identified in the drawings as part 44, whereas the "lift wheel" or "feed wheel" is identified as part 66. See '688 patent, Figs. 1-2. In fact, in the description of the preferred embodiments describes the "feed wheel" as a part of the "feed section." See '688 patent, col. 5, ll. 15-16 ("feed section 44 further includes a plastic molded lift wheel 66 or feed wheel").

Nevertheless, the Manual of Patent Examining Procedure clarifies that "[t]here is no requirement that the words in the claim must match those used in the specification disclosure.” Manual of Patent Examining Procedure § 2173.05(e) (8th Ed. 2001). Furthermore:

[T]he failure to provide explicit antecedent basis for terms does not always render a claim indefinite. If the scope of a claim would be reasonably ascertainable by those skilled in the art, then the claim is not indefinite. Ex parte Porter, 25 USPQ2d 1144, 1145 (Bd. Pat. App. & Inter. 1992) ("controlled stream of fluid" provided reasonable antecedent basis for "the controlled fluid"). Inherent components of elements recited have antecedent basis in the recitation of the components themselves. For example, the limitation "the outer surface of said sphere" would not require an antecedent recitation that the sphere has an outer surface. Id. When read in context, "said feed wheel" as used in claim 11 clearly is meant to be an inherent component of the "feed section."

A district court is authorized to correct certain minor errors in a patent only if "(1) the correction is not subject to reasonable debate based on consideration of the claim language and the specification and (2) the prosecution history does not suggest a different interpretation of the claims." Novo Indus., L.P. v. Micro Molds Corp., 350 F.3d 1348, 1357 (Fed. Cir. 2003). The Court believes the substitution of "feed section" for "feed wheel" in claim 11 is not subject to reasonable debate. Lacking prosecution history to the contrary, the Court constructs the term "said feed wheel" to mean "said feed section."

Nu-Kote's second attack on the district court's likelihood-of-infringement finding turns on claim construction. Nu-Kote asserts that claim 1 cannot read on cartridges that contain more than one ink reservoir chamber, given the claim's precise definition of the first chamber: "said first chamber being defined by said partition [containing the groove] and said back wall . . . ." Nu-Kote argues that the claim does not read on a cartridge with more than one ink reservoir chamber because such a cartridge would not have an identifiable chamber bounded by both the partition and the back wall. Canon responds that the claimed "first chamber" distinguishes the portion of the cartridge containing the reservoir of liquid ink from that portion of the cartridge that contains the sponge-like material, which resides in the "second chamber."

We agree with Canon that the claimed "first chamber" may be subdivided into multiple ink chambers. The claim itself defines the first chamber as being bounded by the grooved partition and the back wall. It does not define the "first chamber" as being bounded by the grooved partition and the nearest opposite partition. Describing one embodiment of the invention, the specification states that "the ink chamber is separated into four chambers." Thus, multiple interconnected ink chambers between the grooved partition and the back wall can collectively comprise the "first chamber" of claim 1. Whether called a stiffening rib or a partition, the piece of plastic in Nu-Kote's cartridge is simply an additional component added inside the "first chamber" that does not prevent the cartridge from falling within the scope of the claim. See A.B. Dick Co. v. Burroughs Corp., 713 F.2d 700, 703, 218 U.S.P.Q. (BNA) 965, 967-68 (Fed. Cir. 1983) ("It is fundamental that one cannot avoid infringement merely by adding elements if each element recited in the claims is found in the accused device."). Accordingly, the district court did not clearly err in finding that Canon made a strong showing of infringement.

Claim 16, with the disputed term in bold states:

The article of footwear of claim 9, wherein said heel plate underlies at least a portion of an arch of the foot and substantially all of the heel.

Adidas argues that the dependent Claim 16 is invalid in violation of 35 U.S.C. § 112, P4. This section requires a dependent claim to "specify a further limitation of the subject matter claim." Because Claim 9, the independent claim, does not recite "heel plate," adidas asserts that Claim 16, as written, does not further limit Claim 9 and, therefore, is invalid. See Pfizer v. Ranbaxy Laboratories Ltd., 457 F.3d 1284, 1292 (Fed. Cir. 2005).

Nike argues that the use of "said" was an error that should be corrected in claim construction to mean "a." Construing a term in accordance with the principles of claim construction is different from correcting terms because of a typographical or clerical error. The court can correct such an error only if: (1) the correction is not subject to reasonable debate based on consideration of the claim language and the specification; and (2) the prosecution history does not suggest a different interpretation of the claims. Novo Industries, L.P. v. Micro Molds Corp., 350 F.3d 1348, 1357 (Fed. Cir. 2003).

Nike asserts that the specification and claims make ample references to "heel plate" so a substitution of "a" for "said" is not subject to reasonable debate. But the same argument could be made for substituting "claim 8" for "claim 9" in Claim 16, at Column 13, line 1. Then Claim 16 would impose a further limitation on the heel plate described in Claim 8. See Hoffer v. Microsoft Corp., 405 F.3d 1326, 1331 (Fed. Cir. 2005). If changing "9" to "8" makes as much sense as replacing "said" with "a," then Nike's proposed correction is "subject to reasonable debate." Claim 16 cannot be corrected in claim construction.

Next, appellant contends that the district court erred in granting summary judgment of non-infringement of claims 5 and 33-36 under the doctrine of equivalents. Foster alleges the district court made two separate errors in granting summary judgment. Appellant's first argument again centers on an issue of claim interpretation. Foster contends that the district court erred in interpreting the claim language "said linear hydraulic drive units transmitting downward forces from the transverse drive beams to the mounting frame members" as requiring all claimed parts of the drive units to participate in the transmission of forces. Second, Foster contends that there is a genuine issue of material fact, even under the district court's claim interpretation, as to whether all parts of the Hallco drive unit do in fact transmit downward forces.

Turning first to the claim interpretation issue, the district court held:

The linear hydraulic units . . . are defined to be comprised of piston head members, cylinder head members, piston rod end portions, and cylinder sidewall portions. If only a subset of those components were required to transmit downward forces, the limitation in the last paragraph would have expressly stated so. It did not. Accordingly, I conclude that all components of the hydraulic drive units, and not just a subset, must transmit downward forces.

In making this determination, the district court again unnecessarily limited the claim language. The claim language requires
that each linear hydraulic drive unit transmit downward forces. This language requires no more than that the drive unit, taken as a whole, transmit the downward force English syntax simply does not require that all the components, or even more than one of the specified components, contribute to the transmission of forces. As long as the downward forces flow from the drive units (or any portion of the drive units) downward, the claim language requires nothing more. Contrary to the opinion of the district court, the claims would need to have specified that all of the components of the hydraulic drive unit must participate in the transmittal of forces, if that was the meaning of the language. See In re Hyatt, 708 F.2d 712, 714, 218 U.S.P.Q. (BNA) 195, 197 (Fed. Cir. 1983) ("A claim must be read in accordance with the precepts of English grammar."). Merely specifying the drive unit, rather than any particular component or all of the components, does not limit the portion of the drive unit which may transmit or participate in the transmission of the downward forces. The district court thus read in an additional limitation not required by the language of the claim. Accordingly, this court vacates the district court's grant of summary judgment of non-infringement under the doctrine of equivalents of claims 5 and 33-36, and remands for a determination on the merits. Having decided this issue, this court need not reach the issue of whether there was a genuine issue of material fact under the district court's erroneous claim interpretation.

Amarr's proposed construction of this claim term is: "the lower joint member configured with the upper joint member establishes a clearance along the entire length of the adjacent panels of the door while the adjacent panels are moving at an angle to one another." Amarr's Opening Claims Construction Brief ("Amarr's Opening Brief") (Doc. 89) at 6.

Amarr identified three areas at issue in this term: first, the use of the word "clearance;" second, whether the clearance is across the entire length of the panel interface; and third, the construction of the phrase "angular articulation." Transcript of Markman Hearing ("Transcript") at 35.

Amarr stated at the Markman hearing that its first issue -- the replacement of the word "clearance" with the word "gap" -- was moot; Amarr agreed to the use of the word "clearance." Id.

With respect to the placement of the clearance -- whether the patent requires clearance across the entire length of the interface between the two panels -- Amarr was more insistent. Amarr's contention is that there must be clearance, a space of some dimension, between each panel of the sectional door; otherwise, Amarr contends, there will be binding, which is one of the evils the patent was intended to address. Wayne-Dalton argues that Amarr is attempting to read into the claim language a concept that is not only not found within the claim, it is also not found in the specifications or anywhere else in the patent -- Amarr's "no-touch" rule would be impossible to enforce as a practical matter, and it is not the scenario the patent was intended to create. Wayne-Dalton's Response to Amarr's Opening Claims Construction Brief ("Wayne-Dalton's Response Brief") at 7.

Contact between the panels of the sectional door, without more, is not an evil addressed by the patent, nor is it necessarily an evil at all. The claims at issue reference establishing a clearance and offsetting the center hinge such that "a portion of said clearance is maintained" in moving between the vertical (closed) and the horizontal (open) positions. See 872 Patent, col. 9, 11. 36-37; col. 12, 1. 2. The amount of the clearance that must be maintained is never identified; it is not clear that there is any specific minimal clearance. Further, the patent simply does not support an interpretation that any such specific minimal clearance must be maintained along the entire length of the adjacent panels. In its brief, Amarr conflates the notion of "gap" and "clearance," as those terms are used in connection with the notion of a "pinch resistant configuration," with the notion of "clearance," as that term is used in connection with the patent's object keeping adjacent door panels from rubbing and binding. 3 One example will suffice. Amarr declares: "the specification states that 'it is the object of the present invention to provide a sectional door wherein the panel interface maintain a minimal gap during movement . . . which eliminates rubbing and possible binding . . . .'" Amarr's Opening Brief at 8. When the language denoted by the ellipses is included, the patent actually says:

Accordingly, it is an object of the present invention to provide a sectional door wherein the panel interfaces maintain a
minimal gap during movement between a closed vertical position and an open horizontal position satisfying pinch resistant specifications. Another object of the present invention is to provide such a sectional door which eliminates rubbing and possible binding between interfaces of adjacent panels even during moving through the curved transition track section between the vertical track section and the horizontal track section.

872 Patent, col. 2, 11. 48-57. The minimal gap on which Amarr relies relates to "satisfying pinch resistant specifications," not to "rubbing and possible binding."

In fact, nowhere in the subject patent has this Court found language tending to indicate that any specific space, gap or clearance must be maintained along the entire length of the joint between panels, as Amarr suggests, in order to achieve the goals of the invention, which include avoiding rubbing and binding between adjacent panels. 4 Contact between the door panels is not listed as something to be avoided, except in conjunction with rubbing or binding, which is not a necessary adjunct to contact. See 872 Patent, col. 1, 11. 13-18 ("More specifically, the present invention relates to a door and method for locating the hinges between panels of such sectional doors to [sic] whereby the adjacent panels do not contact and bind when moving on tracks between the closed vertical position and the open horizontal position."). Amarr's proposed construction on this point does not help to "define the patented invention's scope." Orion IP, 406 F. Supp. 2d at 722. As such, it is not a proper construction and this Court will not adopt it.

Amarr offers the alternative language, "while the adjacent panels are moving at an angle to one another," to take the place of the patent's language, "during angular articulation." Amarr's Opening Brief at 9. Amarr offers no very persuasive explanation for why its language is better, clearer or more easily understood than the original claim language. Indeed, Wayne-Dalton contends that Amarr's construction is not merely unnecessary, it is wrong. Wayne-Dalton's Response Brief at 7. Amarr has not even attempted to overcome the "heavy presumption" in favor of the claim language carrying its ordinary and customary meaning, which to this Court seems reasonably clear. See CCS Fitness, 288 F.3d at 1366. No construction of this element of the claim term is required.

The language of the claim term at issue requires no construction. It will be accorded its ordinary and customary meaning.

2. Said Napkin Edges

This disputed term arises in the context of the flaps, or edges, that fold upwards to form the "occlusive volume" where fluids are pooled. Tyco claims the term "edge" refers only to the outermost edge of the napkin, whereas K-C believes it includes a
much broader area. Both claim 1 and claim 4 speak of the napkin edges folding upward at the embossed channels; in claim 4 the "upward folded edges are absorbent," and the "absorbent edges ... fold upwards to form said occlusive volume." (6:36-41.) Tyco argues that the term "edge" must be construed consistently throughout the claims, and that in other instances, the term "edge" means the outermost edge (which K-C concedes). Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1345 (Fed. Cir. 1998) ("whatever interpretation we assign should encompass both uses because the same word appearing in the same claim should be interpreted consistently.") Tyco also notes that if the inventors had wanted "edge" to mean flaps or sides of the pad, they could easily have used those terms -- as they did in the specification -- in place of "edge."

K-C, however, wants "edge" to mean not merely the outermost edge of the absorbent but to include the "portion between the embossed channels and the outermost edges of the absorbent, alternatively referred to in the patent as the 'sides of the pad.'" Throughout the specification and claims, it asserts, the inventors repeatedly refer to the these portions of the napkin as the only ones that fold upwards. Thus, when the claims speak of the napkin edges folding upwards, they are referring not just to the outermost edges -- which presumably are unable to "fold" at all -- but to the area K-C describes as the "sides of the pad" which "flip up" when squeezed by the upper thighs of the wearer. (5:24-26.)

Although K-C conceded that the claims were not a model of clarity, and while Tyco is generally correct that terms should be construed consistently throughout a patent, I conclude that K-C's reading of "edge" is truest to the practical understanding of the invention claimed. Epcon Gas Systems, Inc. v. Bauer Compressors, Inc., 279 F.3d 1022, 1031 (Fed. Cir. 2002) (noting that context can sometimes call for multiple definitions of the same term). First, within the claims themselves the "edges" in question are referred to as "upward folded" (6:36), and they are allowed to "turn upward" (6:34) or "fold upward" (6:14; 41) to form the occlusive volume described therein. At argument Tyco attempted to demonstrate how the outermost edge of the absorbent would be able to "fold" upwards because the edge, in Tyco's sense of the word, is not merely an end line but a three-dimensional planar cut. Even I accepted that an edge could fold, however, it is doubtful that such an edge could somehow form any kind of occlusive volume. That is, the edge must form some kind of wall and be possessed of some dimension of verticality if it is to form an occlusive volume, and once that occurs the "outermost edge" is no longer a line or even a planar cut.

More importantly, however, the claims themselves give a substantial clue about the nature of the "edges" in question. Claim 1 teaches, for instance, that the channels allow "said napkin edges to fold upward at said embossed channels." (6:14-15.) This phrase specifically teaches that the "edge," in that context, begins at the embossed channels. The edge is that part of the napkin that folds upward beginning at the embossed channel; it is, in other words, the side or flap of the napkin that is "hinged" to the rest of the napkin via the fold-line channels.

Thus, I conclude that while clearer drafting was no doubt feasible, K-C's reading of "edges" is the only construction that makes sense of the invention claimed.

* * *

2. "Said napkin edges" and other "edges" (as applicable) means "the portion between the embossed channels and the outermost edges of the absorbent, alternatively referred to in the patent as the 'sides of the pad.'"

GO BACK

3441

The next portion of Claim 1 for construction is as follows:

[S]aid operator signal requesting said engine control determine a zero torque parameter value for said engine output shaft that approximates a zero torque load on the connection between said engine and said transmission, and said engine control being operable to control said engine to achieve said zero torque parameter value.

Exhibit A, col.7 II.52-58 (emphasis added).

According to the Board, "[t]he significance of the zero torque parameter value is that when it is achieved, the transmission of the motor vehicle is free to be shifted to neutral without engagement of a clutch." Exhibit D, supra, at 3.

The parties do not dispute that the zero torque referred to in the [claim] is the engine's flywheel or net torque rather than
gross torque. Flywheel or net torque does not include torque necessary to overcome an engine's own internal friction or to drive the vehicle's accessories such as water pump, oil pump, air conditioning, lights, etc.

If actual zero torque at the flywheel is achieved, a driver may shift a manually operated transmission from an engaged gear into neutral without need to activate a clutch. . . . [T]he intended purpose of the invention . . . is to enable the driver of a manual transmission vehicle to shift an engaged gear into neutral without need to use the clutch. In the context of determining the zero torque parameter value and then achieving the determined value, . . . the determination is a prediction, something done before the condition has been caused to occur.

Id. at 5-6. These phrases mean that "the engine control actually determined a zero torque parameter value and also that the engine achieved the determined zero torque parameter value, assuming that there had been an operator signal to begin the process." Id. at 9. This claim does not require "that the condition of actual zero flywheel torque be achieved, but that the determined zero torque parameter value be reached." Id. at 23. That is, "a zero torque parameter value was first determined and then the engine was controlled and actually reached the 'determined' zero torque value." Id. The claim "specifically requires that the engine control be operable to achieve 'said' zero torque parameter value, which refers back to the determined zero torque parameter value, and not that the engine shall reach the condition of actual zero flywheel torque." Id. at 30. "Performance of the [claim] feature at issue requires the engine to meet the determined zero torque parameter value, not that the engine be made to provide zero flywheel torque. This difference cannot be ignored." Id. at 36. Moreover, the entire purpose of the invention is that no use of the clutch is required. Id. at 36-37. The Court construes this claim language in the same manner as the Board.
placing said parts in a pressurizable chamber,

applying a pressure in an amount below the capillary pressure imposed on molten binder in a direction away from the part voids and above the pressure necessary to physically collapse the part structure inwardly to said parts for a predetermined period of time while maintaining said parts above said liquid phase temperature, said applying step comprising the step of introducing a sufficient amount of gas to said chamber to create said pressure.

Statement of Facts # 163, Exh. E. 4

4 AVS notes that "in amendment practice, insertions to claims are underlined and deletions are placed in brackets. See 37 C.F.R. § 1.121(b)." ( # 163 P7) In this instance it appears that deletions were indicated by striking over.

In the Remarks by Ultra-Temp's attorney that accompanied this amendment, it was noted that

The present invention relates to a method for densifying previously sintered parts having internal voids and which are constructed from powdered metals, ceramics or the like. The method comprises the steps of placing the parts in a pressurizable chamber and heating the parts above their liquid base temperature.

****

Claim 1 in the instant application essentially incorporates the limitations of previous claim 5 except that the gas is not limited to an inert gas.

Supplemental Exhibits, Exh. L at AVS1558-9.

"Previous claim 5" that was rejected by the patent examiner read:

The method as defined in claim 1 wherein said pressure applying step comprises the steps of:

placing said parts in a pressurizable chamber; and

introducing a sufficient amount of an inert gas to said chamber to create said pressure.

Supplemental Exhibits, Exh. L at AVS1535 (emphasis added).

In other words, the act of placing said parts in a pressurizable chamber was viewed by the inventor as a limitation to the original claim 1.

As defined in the specification of the patent, "previously sintered parts mean parts that have been raised to liquid phase temperature regardless of whether the parts are cooled following sinter." (Plaintiff's Brief, # 169, Exh. C, col. 3, lines 22 - 26) In construing claim 1 of the '449 patent, the first question is the meaning of the term "said parts" in step 1 of the claim. AVS argues that "said parts" must refer back to "previously sintered parts" in the preamble to the claim or the claim would be rendered indefinite. In support of its position, the defendant cites to a treatise, Robert C. Farber, Landis On Mechanics Of Patent Claim Drafting, third edition, 50-53 (1990), wherein the author explains that "the word "said" is used by many practitioners rather than "the" to refer back to previously recited elements, sometimes to a previously recited anything." ( # 163, Exh. F) Section 706.03(d) of The Manual Of Patent Examination incorporates a similar view. ( # 163, Exh.G) Further, such a construction gives ordinary meaning to the phrase "said parts", harking back to the more complete antecedent description of "previously sintered parts".

- 4040 -
Although not dispositive of the issue, the defendant notes that in an earlier Report and Recommendation Magistrate Judge Bowler construed the term "said parts" in the claim 1 of the '449 patent to mean "previously sintered parts." ( # 163, Exh. H at 25)

Additional support for this interpretation has been proffered. A review of the specification of the '449 patent reveals that in the section "Summary Of The Present Invention", it is written that "in brief, the method of the present invention comprises placing previously sintered parts within a pressurizable chamber." ( # 163, Exh. A, col. 2, lines 36-38) Again in the "Detailed Description Of A Preferred Embodiment Of The Present Invention", the patent reads "in brief, in the method of the present invention the sinter parts are placed within a pressurizable chamber." ( # 163, Exh. A, col. 3, lines 35-37)

There is also case law which supports AVS' view. The Federal Circuit has had occasion to note that "when the claim drafter chooses to use both the preamble and the body to define the subject matter of the claimed invention, the invention so defined, and not some other, is the one the patent protects." Bell Communications Research, Inc. v. Vitalink Communications Corporation, 55 F.3d 615, 620 (Fed. Cir., 1995). Thereafter analyzing a patent claim, the Court wrote:

```
Claim 6 of the '080 patent recites a "method for transmitting a packet over a system comprising a plurality of networks… said packet including a source address and destination address," as its preamble indicates. It then recites, inter alia, the steps "assigning, by said source devices, one of said trees to broadcast said packet and associating with said packet an identifier indicative of said one of said trees." (Emphasis added). These two steps of the claimed method, by referring to "said packet," expressly incorporate by reference the preamble phrase "said packet including a source address and a destination address." As a result, only a method for transmitting packets that have both source and destination addresses can literally infringe Claim 6.

Vitalink, 55 F.3d at 621.
```

The analogy to the instant case is obvious: according to AVS, step one of claim 1 of the '449 patent requires the placement of previously sintered parts ("said parts") into a pressurizable chamber, that General Carbide undeniably does not perform that step and, therefore, that there can be no literal infringement.

According to Ultra-Temp, the '449 patent

is directed to a method for densifying previously sintered parts but, as defined in the patent specification, it does not matter if the parts were previously sintered a year before the densification or one second before the densification.

Plaintiff's Brief # 169 at 10.

The plaintiff points to the "Summary Of The Present Invention" in the patent specification where it provides:

```
The parts may be either vacuum or hydrogen sintered and, similarly, may be cooled following the sintering step.

****
```

For previously sintered parts the presure (sic) vessel can be heated first and then pressurized, pressurized first and then heated or simultaneously pressurized and heated. In the event that sintering is performed in the same vessel, pressure is applied immediately after sintering is completed.

Ultra-Temp cites to other parts of the '449 patent as, for example, Examples 2 and 3, "which represent a preferred embodiment of the invention, describing the preferred method in which the parts are maintained at a liquid phase temperature following the sintering operation and then pressurized." ( # 169 at 9 and Exh C, col. 4) The plaintiff argues that under controlling law, it is improper to construe the claim as the defendant would have it because under such an interpretation, preferred embodiments of the patent would not be covered. As the Federal Circuit has held:
Thus, second, it is always necessary to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning. The specification acts as a dictionary when it expressly defines terms by implication. As we have repeatedly stated, "claims must be read in view of the specifications, of which they are a part." The specification contains a written description of the invention which must be clear and complete enough to enable those of ordinary skill in the art to make and use it. Thus, the specification is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term.

Vitronics Corp. v. Conceptronic, 90 F.3d 1576, 1582 (Fed. Cir., 1996)(citations omitted).

Thereafter applying this reasoning to the patent being considered in Vitronics, the Court concluded:

"Indeed, if "solder reflow temperature" were defined to mean liquidus temperature, a preferred (and indeed only) embodiment in the specification would not fall within the scope of the patent claim. Such an interpretation is rarely, if ever, correct and would require highly persuasive evidentiary support, which is wholly absent in this case."

Vitronics, 90 F.3d at 1583 (citations omitted).

It is Ultra-Temp's position that a construction of claim 1 of the '449 patent that does not cover the method employed by General Carbide would be incorrect as a matter of law.

AVS does not dispute that there are other methods or embodiments disclosed in the '449 patent, indeed ones where a preform is initially placed in a furnace with a pressurizable chamber. ( # 162 at 9) However, so too is a method where previously sintered parts are placed in a pressurizable chamber disclosed. In other words, the defendant's proposed claim construction plainly reads on a preferred embodiment set forth in the patent specification. Because there is more than one preferred embodiment set forth in the '449 patent, AVS contends that this case can be distinguished factually from the Vitronics case.

6 Ultra-Temp does not disagree with this statement.

In addition, it is noted that in the Vitronics decision the Federal Circuit also wrote that in undertaking the claim construction analysis:

"Third, the court may consider the prosecution history of the patent, if in evidence. This history contains the complete record of all the proceedings before the Patent and Trademark Office, including any express representations made by the applicant regarding the scope of the claims. As such, the record before the Patent and Trademark Office is often of critical significance in determining the meaning of the claims. ("The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution.")."

Vitronics, 90 F.3d at 1582-3 (citations omitted).

In the present case, the patent history reveals that Ultra-Temp amended claim 1 of the '449 patent to overcome a rejection by the patent examiner by, inter alia, adding the self-described limitation which was previously in claim 5. Originally claim 1 was broader, providing no limitation as to the condition of the parts when they were loaded into the pressurizable chamber. In other words, presumably both preforms and previously sintered parts would be included. Given the breadth of the original claim 1, it likely covered the disclosed embodiments advocated by both the plaintiff and the defendant in support of their respective positions. While the scope of claim 1 was circumscribed by the amendment, the embodiments remained consistent in the specification from the initial application to the final patent. In these circumstances it is not surprising that with the scope of the sole independent claim having been narrowed, some of the embodiments may not longer fall within its purview. This is a critical distinction from the situation in the Vitronics case where there was no issue of claims being limited before the patent was issued; the problem in Vitronics was that the Court construed the claim in such a way that it
did not cover the sole embodiment of the invention listed in the patent. Vitronics, 90 F.3d at 1583.

The amendment to claim 1 of the '449 patent added the step of "placing said parts in a pressurizable chamber." Ultra-Temp has proffered no explanation whatsoever for the amendment despite bearing the burden of establishing the reason the change was required. See Warner-Jenkinson Co. v. Hilton Davis Chemical Co., 520 U.S. 17, 117 S. Ct. 1040, 1051, 137 L. Ed. 2d 146 (1997). In the absence of any contrary evidence, the only logical and reasonable explanation is that the amendment was made to overcome the patent examiner's rejection. The result of the amendment is that the scope of claim 1 of the '449 patent is limited to methods wherein previously sintered parts are placed in a pressurizable chamber. While different embodiments are disclosed in the specification, it is the claim that defines the patent holder's right to exclude. Environmental Instruments, Inc. v. Sutron Corporation, 877 F.2d 1561, 1564 (Fed. Cir., 1989) ("The disclosure of a patent is in the public domain save as the claims forbid. The claims alone delimit the right to exclude; only they may be infringed.") To read claim 1 more expansively would be to render the amendment meaningless, and to give back to Ultra-Temp something it gave up to get the patent during the prosecution.

As a matter of law, step one of claim 1 of the '449 patent as properly construed requires the placement of previously sintered parts in a pressurizable chamber. As a matter of fact, there is no dispute that General Carbide does not perform this step in its process. Ultra Temp's expert asserts that "it appears clear that General Carbide loads its preforms or 'green bodies' [neither of which are 'previously sintered parts' 7] into the furnace and then vacuum sinters the parts above liquidus." (Defendant's Memorandum # 162 at 7; Statement of Facts # 163, Exh. I at 9) Consequently, AVS cannot be held liable for contributory infringement or inducement to infringe the '449 patent since its customer does not literally infringe claim 1, and all other claims of the patent are dependent upon claim 1. See Wahpeton Canvas Co. v. Frontier, Inc., 870 F.2d 1546, 1552, n.9 (Fed. Cir., 1989).

--- End Footnotes ---

B. The '481 Patent

According to the '481 patent,

The present invention provides a method for densifying and removing porosity in previously sintered carbide or other liquid phase sintered part which overcomes all the disadvantages of the various proposed processes discussed above.

Statement of Facts # 163, Exh. B, "Summary Of The Present Invention". Claim 1 of the '481 patent reads as follows:

1. A method for densifying previously liquid phase sintered parts which may contain voids or porosity and constructed of cemented carbides, powdered metals, ceramics or the like comprising of the steps:

   heating said parts in a vacuum to a temperature such that they are substantially in the two phase field of hard phase plus liquid and that an equilibrium or nearly equilibrium amount of hard phase has dissolved in the liquid phase, and

   applying a pressure in an amount below that which overcomes the capillary forces imposed on the molten binder in a direction away from the part voids and above the pressure necessary to physically collapse the part structure inwardly to said parts for a predetermined period of time while maintaining said parts above said temperature.

Statement of Facts # 163, Exh. B, col. 12, lines 28-68.

The prior discussion regarding the general principles of construction to be applied to the meaning of "said parts" in the context of claim 1 of the '449 patent is fully applicable here. Put another way, claim 1 of the '481 patent requires heating previously liquid phase sintered parts in a vacuum. This construction is supported by at least one embodiment in specification of the '481 patent.
If the material has been previously hydrogen sintered, the parts should be treated under a vacuum to a temperature such that they are nearly in the WC+Liq region of their phase diagram before pressurization. This will help any hydrogen which may be trapped in the pores to dissolve in order to trap any gas in such pores.

Statement of Facts # 162, Exh. B, col. 6, lines 22-29; see also col. 8, lines 45-50. Ultra Temp's expert concedes that General Carbide does not heat previously liquid phase sintered parts in a vacuum, but rather, the previously sintered parts are immediately pressurized. 8

Other than noting that there are preferred embodiments in the specification of the ‘481 patent that would cover General Carbide's process ( # 169, Exh. E, col. 6, lines 45-50; col. 8, line 51 - col. 9, line 14), Ultra-Temp adopts its arguments advanced with respect to the ‘449 patent. The plaintiff does not address the defendant's specific position that claim 1 of the ‘481 patent requires heating previously liquid phase sintered parts in a vacuum before pressurization, not pressurizing immediately after the sintering step.

As a matter of law, properly construed claim 1 of the ‘481 patent mandates heating previously liquid phase sintered parts in a vacuum before pressurizing. As a matter of fact, there is no dispute that General Carbide does not heat previously liquid phase sintered parts in a vacuum. Consequently, AVS cannot be held liable for contributory infringement or inducement to infringe the ‘481 patent since its customer does not literally infringe claim 1 of the patent, and all other claims are dependent. Wahpeton, 870 F.2d at 1552, n.9.

Claim 14, Parts [10]-[13]

The eleventh through fourteenth disputed claim language sections are all consecutive parts of the same sentence. The Court addresses them all together. The language states:

said pins are each comprised of a threaded bolt passing through a hole in said storage structure and a pin member positioned around said bolt such that said pin member is tightly engaged with a portion of the inside surface of said storage structure; said pin member having a generally cylindrical body portion and an inwardly extending tapered nose portion; the diameter of said cylindrical body portion being only slightly less than the diameter of a respective one of said bores to provide a snug fit between said body portion and said respective one of said bores; and the diameter of said bolt being less than the diameter of said hole in said storage structure to help relieve said bolt from shear forces exerted between said storage structure and said cover member.

Joint Statement, Table X, at 80-83. The language is clear and does not need construction. The language describes how the pins or protuberances are attached to the storage structure, and the fact that they are only slightly smaller in diameter than the bores on the cover members to provide a snug fit. Sukup argues that the phrase must be interpreted under the means plus function method. The Court disagrees. The word "means" is not used so there is no presumption. The language also describes objects, pins. The means plus function analysis therefore does not apply.
HDI's motion for summary judgment of noninfringement was concentrated on claim 1, as representative of the '487 claims:

1. A method of causing an analytical measurement to be made in a reflectance-reading device at the end of a predetermined time period after an analyte reacts with a reagent in a porous, reflectance-reading matrix located in said device, which comprises:

   taking a first reflectance reading from a dry first surface of said porous matrix prior to application of a sample of body fluid suspected of containing said analyte to a second surface of said porous matrix from which said sample can travel to said first surface by capillary action and react with said reagent in said porous matrix if said analyte is present in said sample;

   applying said sample to said second surface of said porous matrix;

   taking an additional reflectance reading from said first surface after said sample is applied to said porous matrix;

   comparing said additional reflectance reading to said first reflectance reading;

   initiating said predetermined time period upon a predetermined drop in reflectance sufficient to indicate that said sample has reached said first surface; and

   taking a measurement reflectance reading at the end of said predetermined time period without having determined the time at which said sample was initially applied to said porous matrix.

The district court construed the claims as limited to a method wherein the initial measurement of the dry reflectance is taken on the same test strip just before the blood is applied, and not on a sample test strip whose reflectance is taken at the factory. The court held that although the HDI method functions in the same way as the claimed invention, the HDI device differs in that it "compare[s] the reflectance readings of the test strips, whether they are wet or dry, to a threshold reflectance reading which is programmed into the meter at the factory."

Lifescan states that there is no material difference between comparing two reflectance readings to each other, and comparing both readings to a third (threshold) reading that was previously taken at the factory. Thus Lifescan states that the district court erred in construing the claims, arguing that neither the '487 specification nor its prosecution history supports the district court's interpretation of the claims to exclude the possibility of infringement. Lifescan states that the reflectance reading taken at the factory constitutes "taking a first reflectance reading" as called for by claim 1, and that when this reading is compared with the additional reflectance reading taken by the HDI device after the blood sample has been applied, this literally constitutes "comparing said additional reflectance reading to said first reflectance reading," as the patent requires. Lifescan argues that direct comparison is not the only way of comparing values, and that HDI's method of comparing both reflectance readings to a factory-determined "standard" is the same as or equivalent to comparing them to the initial reading by the Lifescan meter. In both devices it is the amount of drop in reflectance that is measured, but in the HDI device both the initial "wet" reflectance after the plasma penetrates to the far side of the matrix, and the reflectance after the incubation period, are compared to the "standard" instead of directly to each other.

Lifescan argues that neither the specification nor the claims of the '487 patent requires that the reflectance readings be compared directly to each other, and that the district court erred in finding the claims to be so limited. Lifescan states that the district court improperly read into the claims the details of its preferred embodiment, although these details are not required by the specification, are not included in the claims, and are not required to preserve the validity of the claims. See E.I. DuPont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433, 7 U.S.P.Q.2D (BNA) 1129, 1131 (Fed. Cir.) (prohibiting reading limitations from the specification into the claims "wholly apart from any need to interpret what the patentee meant by particular words or phrases in the claim"), cert. denied, 488 U.S. 986, 102 L. Ed. 2d 572, 109 S. Ct. 542 (1988); Loctite Corp. v. Ultraseal Ltd., 781 F.2d 861, 867, 228 U.S.P.Q. (BNA) 90, 93 (Fed. Cir. 1985) ("Generally, particular limitations or embodiments appearing in the specification will not be read into the claims.").

Literal Infringement

Lifescan is correct that the claims do not include a limitation to how the reflectance readings are compared. Nor do the claims require that the reflectance readings be compared directly to each other instead of comparing each to a "standard"
reflectance. However, the claims state that the dry and wet reflectances are taken from the same strip. Claim 1 states: "taking a first reflectance reading from a dry first surface of said porous matrix."

The district court held that the claims can not be literally infringed when the dry reflectance reading is not taken from the same test strip that is used in the test, but is measured in advance at the factory. We conclude that the district court correctly interpreted the claims. Thus by programming its reflectance meter with a predetermined dry reflectance, HDI did not literally infringe the '478 patent. We affirm the summary judgment that the claims are not literally infringed.

3445
D. Said Scanning Head

The parties dispute whether the scanning head that samples the output signals must also produce or generate the characteristic signal samples that it uses for comparison. The relevant portion of claim 1 states: "a memory for storing characteristic signal samples produced by scanning said preselected segments of bills of different denominations with said scanning head." '196 Patent, Col. 32, ll.5-8. Glory argues that the characteristic signal samples must be produced and stored by the specific scanning head that is present in the device. Cummins argues that such a construction is improperly narrow, and that the scanning head need only have a memory for storing the signal samples.

The Court agrees with Glory's proposed construction. The use of "said scanning head" is a reference to a term of art in patent law in which the court must identify the antecedent basis for an element preceded by "said." See Gemstar-TV Guide Int'l, Inc. v. ITC, 383 F.3d 1352, 1379 (Fed. Cir. 2004). The "scanning head" is a specific, defined element in Claim 1; therefore, the plain language of the claim requires the characteristic signal samples to be produced and stored by that particular scanning head. Cummins could have drafted this claim differently so as to allow the scanning head to receive pre-programmed characteristic signal samples, but Cummins did not draft the claim in such a way. Courts may not redraft the plain language of a claim. Chef Am., Inc. v. Lamb-Weston, Inc., 358 F.3d 1371, 1374 (Fed. Cir. 2004). The language of the claim requires the patented device to produce and store the master characteristic patterns.

3446

3. "said side walls curving downwardly and inwardly towards said conveyor means such that said dump body defines a substantially semi-circular cross sectional configuration for guiding and evenly deflecting all of the materials within said body towards said conveyor means"

The next clause of claim 1 that the parties ask the court to construe is:

said side walls curving downwardly and inwardly towards said conveyor means such that said dump body defines a substantially semi-circular cross sectional configuration for guiding and evenly deflecting all of the materials within said body towards said conveyor means

'389 patent, col.7, ll.61-67. HECO contends that this clause should be construed as follows:

This claim element requires that the side walls are curved, and that they curve downwardly and inwardly toward the center of the dump body. The dump body cross-section, viewed from either end, is in the shape of a semi-circle (i.e., one half of a geometric shape having every point equidistant from a fixed center). The side walls cannot have flat or straight portions that are not inclined downwardly and inwardly so as to not approximate a part of a circle, or not form any curve that is not downward and inward. Thus, as one travels inward along each side wall, each point along the curved wall becomes closer to the conveyor means and is lower (closer to the ground) than the points that are farther away from the conveyor means.

"Deflecting" in its ordinary meaning, means the sidewalls turn the material from the vertical path caused by gravity.
This claim element requires that the side walls are curved, and that they curve downwardly and inwardly toward the conveyor of the dump body. The requirement that the "dump body defines a substantially semi-circular cross-sectional configuration" means that the dump body, viewed from either end, is approximately in the shape of a semi-circle.

"Substantially" is used to mean "approximately." Thus, the cross section of the dump body must be approximately in the shape of a semi-circle.

"Deflect," in its ordinary meaning, means to change course.

The court construes the clause in accordance with the proposal that Cives and Monroe offer. The plain and ordinary language of the claim requires that the side walls are curved, and that they curve downwardly and inwardly toward the conveyor of the dump body. "[S]ubstantially" means "approximately." See, e.g., Epcon Gas Sys., Inc. v. Bauer Compressors, Inc., 279 F.3d 1022, 1030 (Fed. Cir. 2002) (equating "substantially" with "to a considerable degree"); LNP Eng'g Plastics, Inc. v. Miller Waste Mills, Inc., 275 F.3d 1347, 1354 (Fed Cir. 2001) ("substantially" means "to a considerable degree" or "largely but not wholly that which is specified" (citing, in part, Webster's Ninth New Collegiate Dictionary 1176 (9th ed. 1983))); Ecolab, Inc. v. Envirochem, Inc., 264 F.3d 1358, 1369 (Fed. Cir. 2001) ("substantially uniform" means "largely, but not wholly in the same form"). Therefore, the requirement that the "dump body defines a substantially semi-circular cross-sectional configuration" must be construed as "the dump body, viewed from either end, is approximately in the shape of a semicircle."

The court rejects HECO's proposed construction, insofar as it states that the side walls "cannot have flat or straight portions that are not inclined downwardly and inwardly so as to not approximate a part of a circle, or not form any curve that is not downward and inward." The claims themselves do not contain any such restrictions. The only requirement is that the side walls, when viewed cross-sectionally, approximate a semicircle. Conceivably, such walls could approximate a semi-circle yet consist of one or more straight, non-curved portions.

Indeed, Figure 4 of the '389 Patent depicts a straight, non-curved portion at the top of the bin walls yet purports to be substantially semi-circular:

GET DRAWING SHEET 2 OF 4

'389 Patent, fig.4. Although HECO baldly asserts that such vertical portion is not part of the side wall, it offers the court no reason for such assertion. Again, the court declines to interpret the claim so restrictively as to exclude a preferred embodiment. See, e.g., MBO Labs, Inc., 474 F.3d at , 2007 WL 163068, at *8 (quoting On-Line Techs., Inc., 386 F.3d at 1138). 12

-- Footnotes --

12 HECO also argues that, under such construction, the patent is indefinite. Again, the court need not consider this argument at this time.

-- End Footnotes --

The court agrees that "deflect" should be construed as "to change course." HECO's construction, namely, that "[d]eflecting" means "the sidewalks turn the material from the vertical path caused by gravity" is only partially correct. As Cives and Monroe point out, conceivably material could bounce around the dump body and move in a horizontal direction yet be "deflected" toward the conveyor means.

Accordingly, the court adopts the construction proposed by Cives and Monroe, as set forth above. Because Cives and Monroe do not resist HECO's construction of a semicircle, however, the court shall also adopt such construction. A semicircle is "one half of a geometric shape having every point equidistant from a fixed center."
D. "Whereby a Substantially Tasteless Super-Purified Smoke Is Created; and "Treating Meat Having Freezing Point with Said Tasteless Super-Purified Smoke."

Finally, HISI and TPI dispute the meaning and use of "said tasteless" in relation to "substantially tasteless" in Claim 1. TPI argues that the simultaneous use of "substantially tasteless" and "said tasteless" is "an improper double inclusion of the element." (TPI Response 22.) TPI believes that a person of reasonable skill in the art would not be able to distinguish between "substantially tasteless" and "said tasteless." On this basis, TPI argues, Claim 1 should be ruled indefinite. HISI, on the other hand, that "substantially tasteless smoke" is not a limitation, but a label for what results at the end of the process, and that "said tasteless smoke" is merely an obvious shorthand reference for that product.

The Court agrees with HISI's analysis, and finds neither ambiguity nor indefiniteness in this portion of Claim 1. The use of "said" makes it clear that "said tasteless super-purified smoke" refers to the "substantially tasteless super-purified smoke" that is a result of the processes previously described in the Kowalski Patent.

The Commission held the claim invalid because the term "said zinc anode" lacked an antecedent basis, and because of the claim's imprecise statement of the role of the test parameters. EBC argues that these flaws do not render the claim "insolubly ambiguous," in the words of Marley Mouldings, Ltd. v Mikron Industries, 417 F.3d 1356, 1361 (Fed. Cir. 2005), which held that when a claim "is not insolubly ambiguous, it is not invalid for indefiniteness." See also Bancorp Servs., L.L.C. v Hartford Life Ins. Co., 359 F.3d 1367, 1371 (Fed. Cir. 2004) ("We have held that a claim is not indefinite merely because it poses a difficult issue of claim construction; if the claim is subject to construction, i.e., it is not insolubly ambiguous, it is not invalid for indefiniteness.").

EBC argues that a person of ordinary skill in this field would readily understand the claim despite imperfect drafting, for the specification makes clear that the test parameters included in the claim do not mean that every cell must be discharged for 161 minutes. EBC points out that the '709 patent is directed to a standard electrolytic alkaline cell, and that the specification clearly states that the purpose of the test is to identify zinc anode material used in the invention.

Claim definiteness is analyzed "not in a vacuum, but always in light of the teachings of the prior art and of the particular application disclosure as it would be interpreted by one possessing the ordinary level of skill in the pertinent art." In re Moore, 58 C.C.P.A. 1042, 439 F.2d 1232, 1235 (CCPA 1971). The definiteness inquiry "focuses on whether those skilled in the art would understand the scope of the claim when the claim is read in light of the rest of the specification." Union Pac. Res. Co. v. Chesapeake Energy Corp., 236 F.3d 684, 692 (Fed. Cir. 2001). Although neither the Commission nor the courts can rewrite claims to correct material errors, the issue here is not correction of error, but understanding of what the claim covers. When the meaning of the claim would reasonably be understood by persons of ordinary skill when read in light of the specification, the claim is not subject to invalidity upon departure from the protocol of "antecedent basis."

The requirement of antecedent basis is a rule of patent drafting, administered during patent examination. The Manual of Patent Examining Procedure states that "obviously, however, the failure to provide explicit antecedent basis for terms does not always render a claim indefinite." MPEP § 2173.05(e) (8th ed. Rev. 2, May, 2004). In Slimfold Manufacturing Co. v. Kinked Industries, Inc., 810 F.2d 1113, 1117 (Fed. Cir. 1987) the court held that "the missing antecedent clause, the absence of which was not observed by the examiner of the original patent or by Kinked in its reissue protest documents, did not fail to inform the public during the life of the [274] patent of the limits of the monopoly asserted." The Slimfold court held that addition of the missing antecedent basis during reissue was not a substantive change.

Whether this claim, despite lack of explicit antecedent basis for "said zinc anode," nonetheless has a reasonably ascertainable meaning must be decided in context. In prosecuting the '709 patent, the examiner made several objections to the claims, but the claims were not rejected or objected to on the ground of lack of antecedent basis. In Bose Corp. v. JBL,
Inc., 274 F.3d 1354, 1359 (Fed. Cir. 2001) the court held that despite the absence of explicit antecedent basis, "If the scope of a claim would be reasonably ascertainable by those skilled in the art, then the claim is not indefinite." Moreover, we noted in Slimfold that an antecedent basis can be present by implication. Slimfold, 810 F.2d at 1116. See Cross Medical Products v. Medtronic Sofamor Danek, 424 F.3d 1293, 1319 (Fed. Cir. 2005).

Neither the Commission nor the Intervenors argued that they did not understand the intended scope because of the absence of an antecedent. The Commission erred in holding that the need to construe a claim, or the proffer of alternative constructions, renders the claim indefinite. A claim that is amenable to construction is not invalid on the ground of indefiniteness. In Exxon Research & Engineering, 265 F.3d at 1375, the court stated that "if the meaning of the claim is discernible, even though the task may be formidable and the conclusion may be one over which reasonable persons will disagree, we have held the claim sufficiently clear to avoid invalidity on indefiniteness grounds." See also Novo Indus., L.P. v. Micro Molds Corp., 350 F.3d 1348, 1353 (Fed. Cir. 2003) (determining whether claim is "amenable to construction"); Honeywell Int'l, Inc. v. ITC, 341 F.3d 1332, 1338 (Fed. Cir. 2003) (a claim is not indefinite because it is hard to construe). Here, it is apparent that the claim can be construed. In that regard, we conclude that "anode gel" is by implication the antecedent basis for "said zinc anode." The Commission's holding of invalidity on the ground of indefiniteness is reversed.

D. Interpretation and Infringement Analysis of the Drive Element Contained in the '048 Patent.

The language of the drive element contained in the '048 patent reads: "a drive for rotating the plate cylinder and the blanket cylinder at the same speed." ( '048 patent, col. 13, lns. 1-2). The controversy surrounding this phrase revolves around the proper interpretation of the words "same speed." Some definition has already been given to these words as a result of this Court's January 9, 1996 opinion wherein we concluded that:

Considering the plain language of the claim in conjunction with the specifications, the Court finds that this element of Claim 1 requires the use of a conventional drive, as opposed to a harmonic drive, which rotates the cylinders such that the surface speed at the nip is the same.

Heidelberg Harris, 1996 WL 189398 at *12.

While Harris is content to leave the definition reiterated above in place, 7 Mitsubishi seeks an interpretation of the claim's "same speed" element which requires the described drive to rotate the plate cylinder and the blanket cylinder at precisely the same surface speed, a term which Mitsubishi defines as the measure of distance traveled per unit of time, as, for example, feet per minute.

7 Harris contends that the Court has already adequately defined the disputed element of the claims through the above holding in so much as a conventional drive operates to rotate the cylinders at the same surface speed while a harmonic drive rotates the cylinders different surface speeds. Thus, Harris contends that the term "conventional drive" is synonymous with the term "same speed" as it relates to the drive element of the patent.

In arguing that the speeds of the plate cylinder and blanket cylinder must be identical rather than substantially the same, Mitsubishi points to the prosecution history of the '048 patent, wherein Harris added the "same speed" limitation to allegedly overcome a prior art objection based on Harris' previous use of the phrase "substantially the same speed." 8 Pointing to the maxim that aspects of an invention specifically disclaimed during prosecution in order to obtain a patent over a prior art objection cannot be reclaimed when suing for infringement, Mitsubishi contends that Harris cannot now argue that the "same speed" language means substantially the same speed. Thus, Mitsubishi seeks the finding that a drive only rotates the cylinders at the same surface speed if the cylinders both move precisely the same distance per unit of time.

-4049-
8 Mitsubishi contends that the PTO initially rejected the '048 application as obvious in light of the Gaffney '461 patent on the grounds that the '461 patent had the same combination of elements (namely, a gapless blanket cylinder and gapped plate cylinder) that Harris claimed as its patentable invention. Mitsubishi asserts that, in response to this rejection, Harris distinguished its invention over the '461 patent on the grounds that the surface speeds of the plate cylinder and blanket cylinder differed from each other by as much as .0004 inches per revolution, thereby causing slippage, while the Harris invention drove the plate cylinder and blanket cylinder at "substantially the same speeds" with a resulting decrease in slippage. The PTO rejected Harris' attempt to use the phrase "substantially the same" in describing the speeds of the two cylinders as having no support in the specification, wherein Harris deleted the word "substantially" and relied instead on the phrase "same speed."

Applying the above interpretation to its invention, Mitsubishi asserts that, even though its presses admittedly use a conventional drive, they do not satisfy the '048 patent's "same speed" requirement. Specifically, Mitsubishi contends that, rather than driving the plate and blanket cylinder at the same surface speed as taught by '048 patent, the drive in its press is intentionally designed to rotate the plate cylinder and blanket cylinder at different surface speeds -- a difference that arises from Mitsubishi's intentional use of plate cylinders and blanket cylinders whose circumferences differ. 9 Thus, Mitsubishi contends that its presses do not have a "drive for rotating the plate cylinder and blanket cylinder at the same speed" and consequently, do not infringe the '048 patent.

9 Physics dictates that two cylinders differing in circumference which are geared together, as in a conventional drive, to make the same number of revolutions per unit of time, must rotate at different surface speeds. This is so because a point on the surface of the cylinder with the greater circumference must travel a greater linear distance per revolution than a point on the cylinder of lesser circumference, and therefore, must travel farther in the same amount of time which may only occur if the point on the cylinder of greater circumference travels faster than that on the smaller cylinder.

In fully defining the contours of the phrase "same speed," we look to the intrinsic evidence before us, including the patent's claims, specifications and prosecution history. Vitronics Corp., 90 F.3d at 1582. Review of the patent claims and specification reveals multiple reference to the phrase "same speed" or "same surface speed," but no clear definition of what was intended by this phrase. Some of this confusion arises from the fact that the phrase "same speed" seems to be used in connection with two aspects of the press. In the first instance, it is used to describe the drive element of the '048 patent. Thus, the specification provides "a drive assembly . . . is operable to rotate the blanket cylinders [] and plate cylinders [] at the same surface speed." ( '048 patent, col. 5, Ins. 22-25). In the second instance, the phrase is used to describe the absence of a speed differential attributable to the use of incompressible material in the manufacture of the printing blanket in its entirety. In this regard, the specification provides:

The present invention further provides that the printing blanket is at least partially formed of a compressible material which is compressed by the plate cylinder at a nip formed between the printing cylinder and the blanket cylinder. By compressing the compressible material at the nip, the outer surface of the printing blanket has a surface speed which is substantially the same at locations immediately before the nip, at the nip and immediately after the nip. This prevents slippage between the surfaces of the printing plate and printing blanket before, at, and after the nip to prevent smearing of the ink pattern.

( '048 patent, col. 3, Ins. 62-68; col. 4, Ins. 1-5).

As resort to the patent does not provide a ready definition for the phrase at issue, the Court looks to the '048 patent's prosecution history. It is undisputed that the "same speed" language was added to the claims to overcome a prior art objection by the PTO based on the Gaffney patent. "Positions taken in order to obtain an allowance of an applicant's claims are pertinent to an understanding and interpretation of the claims that are granted by the PTO." Advance Transformer Co. v. Levinson, 837 F.2d 1081, 1082 (Fed. Cir. 1988) (citing Loctite Corp. v. Ultraseal Ltd., 781 F.2d 861, 870-71 (Fed. Cir.}

- 4050 -
Thus, in construing the disputed phrase, the Court examines the manner in which the patent applicants used the "same speed" language to distinguish their invention over Gaffney.

The drive in the Gaffney patent is expressly stated to be a drive for "rotating the blanket cylinder and plate cylinder at different surface speeds." (461 patent, col. 4, lns. 59-62). The Gaffney patent refers to a drive which rotates the cylinders in this fashion as a "harmonic" or "differential" drive. (461 patent, col. 5, lns. 10-18). The purpose of the Gaffney harmonic drive is to cause an "area on the blanket cylinder which engages a given portion of the surface on a plate cylinder [to] change on each revolution of the blanket cylinder." (461 patent, col. 1, lns. 47-51). Thus, in order for a drive to rotate the cylinders at different surface speeds within the meaning of the Gaffney patent, the area of the blanket which a given point on the plate strikes must continuously move or migrate along the blanket's surface on each cylinder rotation. This is often referred to as "image migration."

In distinguishing the '048 patent over the Gaffney patent, the Harris inventors specifically pointed to the fact that '048 drive rotates the cylinders at the same surface speed. 10 In light of the Gaffney patent, this distinction only has meaning if the term "same speed" is read to mean that the '048 drive does not cause the image migration which arises from the speed differential present in the Gaffney patent. In other words, the critical attribute of the '048 drive's "same speed" limitation is that a given point on the plate will hit the same spot on the blanket during each revolution.

In light of the above, we find that the "same speed" element of the claim requires the use of a conventional, rather than harmonic drive which rotates the cylinders such that the surface speed at the nip is the same and which consequently does not produce any image migration.

III. Construction of "Same Speed" Limitation

The asserted claims of the '048 patent require "a drive for rotating the plate cylinder and the blanket cylinder at the same speed." (emphasis added). The magistrate judge noted that the patentees had used the phrase "same speed" in referring to two aspects of the claimed press, i.e., its drive assembly and its absence of slippage at the nip. Consequently, the magistrate judge resorted to the prosecution history to construe the "same speed" limitation, and ultimately concluded that:

The critical attribute of the '048 drive's "same speed" limitation is that a given point on the plate will hit the same spot on the blanket during each revolution.

In light of the above, we find that the "same speed" element of the claim requires the use of a conventional, rather than harmonic drive which rotates the cylinders such that the surface speed at the nip is the same and which consequently does not produce any image migration.

Because Mitsubishi did not contest that the drive in its accused presses was a conventional drive that did not exhibit any image migration, at trial the magistrate judge granted Heidelberg's motion for JMOL that the accused presses satisfied the
"drive" limitation.

Mitsubishi offers a plethora of arguments against the magistrate judge's claim construction of the "drive" limitation. Mitsubishi contends that the phrase "same speed" in the "drive" limitation must mean "same surface speed," and nothing more. In support, Mitsubishi notes that the written description expressly refers to a "drive assembly . . . operable to rotate the blanket cylinders . . . and plate cylinders . . . at the same surface speed." '048 patent, col. 5, ll. 22-25. (emphasis added). Mitsubishi emphasizes that the applicants relied on this very statement in the written description to support their addition of the "drive" limitation.

Mitsubishi also emphasizes that the entire purpose of the '048 patent was to avoid slippage at the nip. The written description notes:

Smearing of the ink pattern is also promoted by slippage between the surfaces at the nip where the ink pattern is transferred to the printing blanket. Thus, if the speed of the printing blanket surface is either greater or less than the speed of the surface transferring the ink pattern to the printing blanket the surfaces will slip relative to each other which smears the pattern.

Id., col. 2, ll. 19-25. Because running the blanket and plate cylinders at different surface speeds creates slippage, Mitsubishi contends that "same speed" must mean "same surface speed."

Finally, Mitsubishi notes that, during the prosecution of the '048 patent, the applicants distinguished the prior art Gaffney patent by arguing:

Gaffney et al. also discloses a harmonic drive which rotates the plate cylinder and the blanket cylinder at different surface speeds to create slippage. The slippage causes the image being transferred from the printing plate to the printing blanket to appear in a different location on the printing blanket for each revolution of the blanket cylinder.

(emphasis added). Because the Gaffney patent discloses a surface speed difference between the blanket and plate cylinders of 0.0001 - 0.0004 inches per revolution of the blanket cylinder, see Gaffney patent, col. 4, ll. 36-44, Mitsubishi argues that an accused device cannot infringe if the difference between the surface speeds of its blanket and plate cylinders exceeds 0.0004 inches per revolution of the blanket cylinder.

Heidelberg responds that the drive rotates the cylinders at the "same speed" in the sense that points or images on the printing plate are transferred to the same position on the blanket on each rotation (i.e., no image migration). Heidelberg contends that one of ordinary skill in the art in the offset printing industry would construe the "drive" limitation in this manner.

More particularly, Heidelberg alleges that one of ordinary skill in the art would recognize that a conventional drive avoiding image migration rotates the cylinders at the "same surface speed," even if the linear speeds of the cylinders are different. Citing the same excerpt from the prosecution history as Mitsubishi, Heidelberg further argues that the prosecution history supports its interpretation of "same speed" as relating to the absence of image migration.

We begin by noting the parties' agreement that the phrase "same speed" in the "drive" limitation refers to "same surface speed." The critical question is whether "same surface speed" also requires the absence of image migration, as Heidelberg argues and the magistrate judge held. We conclude that it does not. The plain language of the "drive" limitation says absolutely nothing about preventing image migration through use of a conventional drive. It refers only to "rotating the plate cylinder and the blanket cylinder at the same speed." Had the applicants intended the "drive" limitation to simply refer to a conventional drive, they could simply have so stated. See Hoganas AB v. Dresser Indus., Inc., 9 F.3d 948, 951, 28 U.S.P.Q.2D (BNA) 1936, 1939 (Fed. Cir. 1993).

The written description also fails to support Heidelberg's construction. It offers no special definition of "same surface speed" that would justify a departure from its plain meaning of same "linear speed," i.e., the distance a point on the surface of each cylinder travels per unit time. See Markman v. Westview Instruments, 52 F.3d 967, 980, 34 U.S.P.Q.2D (BNA) 1321, 1330 (Fed. Cir. 1995) ("Any special definition given to a word must be clearly defined in the specification."). We note that the written description does not even mention the terms "conventional drive" and "image migration."
Finally, Heidelberg's appeal to the prosecution history also fails. The clear import of the applicants' remarks is that they were distinguishing the Gaffney patent based on its disclosure of a surface speed variance between the plate and blanket cylinders. While the applicants emphasized that the Gaffney patent promoted a drive employing image migration, this image migration was itself a consequence of the fact that the blanket and plate cylinders were of the same diameter, but were intentionally rotated at different surface speeds. See Gaffney patent, col. 1, ll. 44-46; col. 2, ll. 52-54.

The magistrate judge's grant of JMOL that the accused Mitsubishi presses satisfied the "same speed" limitation improperly focused on the presses' avoidance of image migration arising from their use of a conventional drive. The magistrate judge erroneously deduced that such absence of image migration resulted from the "same speeds" of the printing and blanket cylinders, as required by the asserted claims. We note that Heidelberg does not even dispute that the blanket and plate cylinders in the accused presses run at a surface speed difference of 0.0177 inches per revolution of the blanket cylinder (i.e., over 40 times greater than that disclosed in the Gaffney patent). Because the accused presses do not satisfy the "same speed" limitation of the asserted claims of the '048 patent, we reverse the jury's finding that Mitsubishi literally infringes the '048 patent.

6. "Sample Gating Means"

The term "sample gating means" appears in Claim 1 of the '477 Patent. See id. col. 8 ll. 39-43 ("sample gating means for individually opening and closing any of said plurality of shafts to enable the flow of liquid, said sample gating means comprising a plurality of rigid elongate members positioned within the plurality of shafts."). Gore argues that the term "sample gating means" should be construed as a means-plus-function limitation pursuant to 35 U.S.C. § 112 ¶ 6 to the extent that the claims are themselves construed to cover any form of movement, i.e., both linear and rotational, between the "open" and "closed" positions. Specifically, Gore contends that, if the claims are so construed, Claim 1 does not recite sufficient structure to perform the function of enabling the flow of liquid. Millipore counters that the term "sample gating means" is not a means-plus-function limitation under 35 U.S.C. § 112 ¶ 6 because the claim itself does recite sufficient structure to perform the recited function.

6 Because I construe the "open" and "closed" clauses contained in Claims 1 and 5 of the '477 Patent to include both linear and rotational movement, see Section II.B.3. supra, I will assume that Gore contends that the term "sample gating means" should be construed as a means-plus-function limitation pursuant to 35 U.S.C. § 112 ¶ 6.

Section 112, paragraph 6, of title 35 provides that:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

As a general proposition, the "[u]se of the word 'means' in claim language creates a presumption that § 112 ¶ 6 applies." TriMed, Inc. v. Stryker Corp., 514 F.3d 1256, 1259 (Fed. Cir. 2008). This presumption is rebutted, however, "[i]f, in addition to the word 'means' and the functional language, the claim recites sufficient structure for performing the described functions in their entirety." Id.; see also Phillips, 415 F.3d at 1311 ("Means-plus-function claiming applies only to purely functional limitations that do not provide the structure that performs the recited function."). "Sufficient structure exists when the claim language specifies the exact structure that performs the functions in question without need to resort to other portions of the specification or extrinsic evidence for an adequate understanding of the structure." TriMed, 514 F.3d at 1259-60. "Claim construction of a means-plus-function limitation includes two steps. First, the court must determine the claimed function. Second, the court must identify the corresponding structure in the written description of the patent that performs

In this case, it is clear that the claimed function is "to enable the flow of liquid." See id. col. 8 l. 41. Contrary to Gore's contentions, I find that, regardless of whether I construe the claim to include any form of movement, i.e. either or both linear and rotational, the structure recited in Claim 1 is sufficient to perform the claimed function. Claim 1 provides that "the elongate members being displaceable between 'open' and 'closed' positions such that fluid can flow into the opening behind the cap and through said passage in each member when in said 'open' position, but not in said 'closed' position." Id. at col. 8 ll. 48-52. Under these circumstances, I find that the language in Claim 1 specifies the structure that enables the flow of liquid without need to resort to other portions of the specification or extrinsic evidence for an adequate understanding of the structure. Consequently, I conclude that the term "sample gating means" is not a means-plus-function limitation under 35 U.S.C. § 112 ¶ 6.
The parties dispute the meaning of the term "sample transfer path" which appears in claim 11 of the '890 patent. The claim reads as follows:

11. An electrode strip for use in an electrochemical sensor for measuring a compound in a sample, comprising an elongated electrode support defining a sample transfer path for directional flow of the sample from an application point along said electrode support…

Plaintiffs contend that the proper construction of the term is "the route along which a sample moves", whereas Defendant proposes that term means "an area of mesh layer not covered by screen printing ink in which the sample travels from the application point to the electrodes."

In support of their construction, Defendant cites the prosecution history. In a September 26, 1996 letter from the United States Patent and Trademark Office (PTO) entitled "Notice of Allowability", the patent examiner stated:

The following is an Examiner's Statement of Reasons for Allowance: The prior art of record fails to teach the key to the applicant's instant invention which is (1) a plurality of mesh layers interposed in an enclosed space between the cover layer and electrodes and (2) a sample transfer path where the electrodes are in the sample path. Applicant shows that the sample path is the area of the mesh layer that is not covered by the screen printing ink, as shown…

(Mehta Decl., Exh. C) (emphasis added).

Defendant argues that this statement indicates a mutual understanding between Plaintiffs and the examiner that the term "sample transfer path" meant "the area of the mesh layer that is not covered by the screen printing ink" and that the grant of the amendment was contingent on such an understanding. Defendant further contends that Plaintiffs failure to object to the examiner's statements amounts an adoption of these limitations. The Court does not agree. The meaning of Plaintiffs' failure to object is clearly ambiguous and does not constitute a "manifest exclusion or restriction" of the scope of the patent. Phillips at 1318.

Furthermore, it is not clear that the cited comments even apply to Claim 11. The '890 patent contains 21 claims in total. Several of the other claims of the '890 patent contain explicit "mesh layer" limitations, whereas Claim 11 does not. Although the examiner did not specify which claims were the subject of his comments, based upon his use of the term "mesh layer", it seems likely that the examiner was referring to one of the claims which explicitly included a "mesh layer" limitation. For example, Claim 1 asserts "… [a] covering layer having an aperture for receiving a sample into said enclosed space; and a plurality of mesh layers interposed in said enclosed space between said covering layer and said electrodes." ('890 Patent, Claim 1). Claim 3, which is dependent on Claim 1, adds "[t]he strip of claim 1 wherein said mesh layers define a path for directional flow of sample from said aperture through said enclosed space towards said working and reference electrodes, and said reference electrode is downstream from said working electrode in the direction of said flow." (890 Patent, Claim 3). By contrast, Claim 11 does not even use the term "mesh." Moreover, Claim 13, which is dependent on Claim 11, explicitly adds the following limitation: "a plurality of superimposed mesh layers disposed along said sample transfer path." The fact that a dependent claim explicitly adds a "mesh layer" limitation implies that Claim 11 contains no such restriction. See Tandon Corp. v. U.S. Intern. Trade Com'n, 831 F.2d 1017, 1023 (Fed. Cir. 1987). The Court finds that Defendant has not demonstrated that Plaintiffs conceded a "mesh layer" limitation in Claim 11 during the prosecution of the patent; the Court declines to read in such a restriction now. 2

2 Defendant also cites the preferred embodiment portion of the specification in support of their argument. Defendant points to language which states that "the periphery of the mesh… surrounds and defines a suitable sample transfer path" and that "the mesh layers preferably define a path for directional flow of the sample." Again, the Court is unpersuaded that these citations establish the presence of a mesh layer limitation in Claim 11. It is more likely that this language applies to the claims described above which include explicit mesh layer elements. Moreover, it is improper to read in a limitation from the preferred embodiment where, as here, there are no "words or expressions of manifest exclusion or restriction." Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 905 (Fed. Cir. 2004).
The Court next turns to Plaintiffs' proposed reading. Plaintiffs' construction employs the ordinary and customary meaning of the term "path" and is supported by the context of the words following the contested phrase. Immediately following the disputed term, Claim 11 states that the "sample transfer path" is for "directional flow of the sample from an application point along said electrode support." In other words, the path is the route upon which the sample travels as it moves from the application point to the electrodes. Accordingly, the Court construes "sample transfer path" as "route along which the sample moves."

3 The American Heritage Dictionary defines "path" as "the route or course along which something moves." (Plaintiffs Initial Markman Brief, Exh. 3, American Heritage Dictionary, 1991).

A. "SAMPLE WELL"

Roche contends that "sample well" means: "the reaction zone, i.e., a reservoir, or other structure or area, that receives a sample fluid." The crux of Roche's argument that the "sample well" is simply the reaction zone is because that is how "sample well" is referred to in the specification of the 609 patent. The patent states in the Background of the Invention section: "Biosensing instruments used for the detection of analyte levels in blood (such as glucose and cholesterol) often employ disposable sample strips that include a well or reaction zone for receiving a blood sample." Id. col. 1, ll. 13-16. Moreover, the patent teaches: "Sample strip 18 contains a well 20 (i.e., a reaction zone). . . ." Id. col. 4, ll. 31-32.

Although Apex Defendants take no position on this term, HDI contends that "sample well" means: "a well, i.e., an open-topped container or reservoir into which an analyte-containing fluid is emplaced." HDI finds support for the "sample well" to have an open top in Figure 3, and in the following passage from the specification: "[A] glucose determination is made by initially emplacing in well 20, a sample of blood." Id. col. 5, ll. 48-50. Figure 3 shows an example of a sample strip inserted into a meter. HDI also supports its construction for the term "sample well" with the testimony of its expert, Professor Anthony P.F. Turner ("Dr. Turner"), who opines about the difference between a "well," which requires only one opening, and "contemporary capillary-fill devices," which require a second aperture to allow air to escape. Turner Rep. P 36. Dr. Bruce K. Gale ("Dr. Gale"), also testified that he would not describe a "microfluidic channel" as a "well," apparently to distinguish one of the allegedly infringing devices. Gale Dep. at 148.

Similarly to HDI, Biosite contends that "sample well" means: "a chamber or other discrete space in a device defining a container or reservoir into which an analyte-containing fluid sample is emplaced." Biosite also wants to include other parameters in this definition: "In claim 1 of the 609 patent, the sample well is required to contain an analyte reactant, and further required to be the location in which reactions occur between the analyte-containing fluid sample and the analyte reactant." In other words, Biosite contends that the proper construction for "sample well" includes the specification that the "sample well" "must contain an analyte reactant and be the location where reactions occur." Biosite Br. at 35 n. 13. The Court finds that the later requirements are unnecessary given the recitation of these elements in claim 1 itself. In other words, "sample well" need not be further defined by what occurs there or what is contained there, because the remainder of claim 1 has elements that explicitly state what is required. Moreover, other claims also use the term and also clearly state the requirements of the "sample cell." See 609 Patent, claims 4 & 6.

The Court finds that the proper definition for "sample well" is "a container or reservoir for the sample," which best comports with the plain meaning of the term in the 609 patent. Beginning with the claims of the 609 patent the term "sample well" appears in four independent claims of the patent, claims 1, 4, 6, and 12. The plain meaning of the term in the context of those claims is a reservoir or container for a sample. There is no reason to interpret the term "sample well" to include limitations that appear otherwise in the claims. All of the independent claims particularly describe the contents of or the purpose for the "sample well" of that claim. For example, claim 4 states, that the sample strip "includes a sample well with
an analyte reactant therein" and that a current output occurs at a second electrode on the sample strip "when an analyte containing fluid is present in said sample well. . . ." 609 Patent, col. 9, ll. And, claim 6 requires that the sample strip include "excitation and sense electrodes and a sample well bridging thereacross [sic], said sample well including an analyte reactant. . . ." Id. col. 10, ll. 7-9. See also, col. 11, l. 23 to col. 12, l. 6 (claim 12). In other words, adding to the plain meaning of "well" what must also be included therein or what must happen therein is redundant.

The specification also supports a plain meaning definition for "sample well." The 609 patent teaches that the invention includes a meter that "is enabled to receive a sample strip that includes a sample well. . . ." 609 Patent, Abstract. Further, in the abstract the 609 patent teaches that the meter senses a current from the sample strip "when an analyte-containing fluid is present in the strip's sample well." Id. Both usages are repeated in the Summary of the Invention section of the patent. See id. col. 3, ll. 36-45. Neither one of these usages require that the sample well have an open top nor do they require that the sample be "emplaced" therein. Both merely require that the well exist and that the meter sense when fluid or a sample is present in the well.

Another section of the 609 patent that describes the "sample well" states: "Sample strip 18 contains a well 20 (i.e. reaction zone) that encompasses a pair of conductive electrodes 24 and 26. A layer (not shown) of enzymatic reactants overlays electrodes 24 and 26 in well 20 and provides a substrate on which an analyte-containing fluid sample may be emplaced." Id. col. 4, ll. 31-36. The 609 patent also teaches that "a glucose determination is made by initially emplacing in well 20, a sample of blood." Id. col. 5, ll. 48-50. A similar description is also found later in another section of the Detailed Description of the Invention. That description states, in relevant part:

If the leakage current (sensed by sense amplifier 50 and fed to microprocessor 59 via A/D converter 52) is found to be less than a threshold (key), microprocessor 59 indicates via display 12, that the user may apply a drop of blood to well 20. . . .

. . . . Time delay d enables the drop of blood to entirely wet the enzyme layer within well 20. If the voltage senses at time 70 is below a sample size threshold 72 (key), the test is aborted as the volume of blood is determined to be insufficient to assure complete hydration of enzymatic reactants within well 20.

'609 Patent, col. 6, ll. 41-68 to col. 7, l. 1. These descriptions also use the term "well" to mean a container or reservoir for the sample.

In the first description, the patent provides an example description of the well -- "a reaction zone" -- however, this is just an example, as indicated by the "i.e." before the term "a reaction zone." Id. col. 4, l. 32. Moreover, there is no indication in the claims or elsewhere in the patent that the construction of the term "sample well" should be narrowed to "reaction zone." The same section also uses the word "emplaced," which both HDI and Biosite contend limits the term "sample well," similarly to the requirement at column 5 where the process of measurement requires emplacing blood into the well. There is nothing in these descriptions, however, that limit the term "well" to require what is put inside the well. In other words, adding a phrase defining what is emplaced in the well to the definition of well unnecessary imports a requirement from the specification into the claim.

Moreover, a close reading of the specification teaches that the sample may be emplaced on a substrate in the well, id. col. 4, ll. 35-36, not that the sample is emplaced in the well. In other words, it is possible for the sample to be carried to the well, container, or reservoir, through a substrate or other means that wicks the fluid to the well. Furthermore, the patent clearly teaches that the emplacement is not mandatory by using "may" rather than "shall." Similarly, in the last passage quoted above, it is clear that the sample reaches some reactant layer within the well, however, there is no language that would limit the plain meaning of the term well either to have an open top or to have the sample emplaced therein.

For these reasons, there is nothing in these passages that convinces the Court that the inventors intended to limit the plain meaning of the term "sample well." The Court finds that the term "sample well" means: a container or reservoir for the sample.

3455

III. Construction of "Sandwich Panel"
The Defendants' next objection is to the construction of the term "sandwich panel" as set forth in the SM's Report. Defendants' Obj., pp. 19-25. The Defendants argue that the meaning of the term "sandwich panel" does not include the understanding that such a structure can be formed as one piece, but only formed from the unification of different components. Defendants' Obj., pp. 21-23. The Defendants argue that the SM's report on this issue violates the precedent of Phillips by using a "whittling down" approach through requiring the Defendants to prove the pultrusion process was not included as a method forming the "sandwich panel" as one piece rather than assembly of separate components. Defendants' Obj., p. 23. The Defendants would construe the '118 patent's term "sandwich panel" to be a panel formed by the attaching of facesheets to a "pre-existing core." Defendants' Obj., p. 25.

While the SM's discussion of "sandwich panel" in the '378 patent, as it is understood in the ordinary meaning of the term within the relevant art (see SM's report, page 84-88), may not ordinarily include the idea of pultruding a "sandwich panel" as one piece, the language of the specification clearly contemplates the idea of this process in the formation of both patents. See '378 patent, col. 10, lines 11-14, 67, col. 11, lines 1-3; '118 patent col. 11, lines 53-56, col. 12, lines 48-52. The Defendants interpret the claim language of both patents contrary to the findings of the SM, and now of this Court, and argue that because such patents are overbroadly interpreted the Defendants are forced to whittle down such constructions of this Court and are burdened to prove the proper construction of the patents. This is an incorrect interpretation as the specification language for the '118 and '378 patents clearly contemplate the inclusion of the idea of forming "sandwich panels" as a "unitary structural component" and being "fabricated as a single component such as by pultruding a single sandwich panel" and the Defendants have failed to prove its proposed construction from the language of the claim, specification, prosecution history and other evidence. '378 patent, col. 10, lines 11-14, 67, col. 11, lines 1-3; '118 patent col. 11, lines 53-56, col. 12, lines 48-52. Moreover, the language of both patents refer to "pultrusion or other suitable forming methods" as the manner to form the unitary structural component thereby leaving open the possibility of using other formation processes that fabricate the invention as one piece rather than through the assembly of distinct pieces. '118 patent col. 11, lines 55-56, '378 patent col. 12, lines 13-14. Thus, the SM correctly concludes that the formation of the "sandwich panel" is not restricted to formation using either "distinct" or "indistinct" pieces. SM's Report p. 97. The Court also agrees with the SM that the patents-in-suit do not concern product-by-process claims, but are apparatus claims. See SM's Report, pp. 76, 93, 96, 150-153. Most importantly, the language explaining the alternative avenues of forming the "sandwich panel" contemplates that that term in the patents is different from what the Defendants would construe such term as being based upon the understanding of the ordinary meaning of a "sandwich panel" in the relevant art at the time of the patent. See SM's Report, pp. 84-88. The guidance of the specification provides the most weight and the basis for the SM's conclusion. It is clear that the specification language contemplates the assembly of distinct parts to create a "sandwich panel" or the formation of a "sandwich panel" as one modular piece which can be fabricated as a single component such as by pultruding a single sandwich panel..." '378 patent col. 11, lines 1-2; '118 patent col. 12, lines 48-52. The Defendants' argument for ignoring the specification language to this effect and arguing for construing the claim based upon ordinary meaning within the industry without reference to the specification language is contrary to Phillips and contrary to their previous reliance on Phillips in their objections by arguing that the SM violated its holding when he proceeded to ignore the patents' specification language and concentrated on the plain meaning thereby placing the burden upon the Defendants. The Court finds that the specification language is dispositive on this matter. See Phillips at 1315. The Defendants' choice to focus upon either the specification language or the plain meaning of the word when it suits their proposed construction is unavailing. The Defendants' objection is denied.

ix. Sandwiched between

Plaintiffs interpret the phrase "sandwiched between" to mean "placed snugly in between the arms of the u-shaped bridge." Defendant, referring to a figure in the specification of the '811 Patent, insists that the bridge of the first frame need not be completely enclosed by the bridge. Rather, the arms of the U-shaped structure must simply extend over (and under) part of the bridge. Plaintiffs do not disagree that the U-shaped structure may extend over only part of the bridge, but disagrees to the extent Defendant is claiming that the U-shaped structure must extend over only part of the bridge.

The court agrees with Plaintiffs. Although the drawing Defendant cites does indicate that the U-shaped structure extends over only part of the bridge, the court finds no reason to limit the claim language to the specific embodiment discussed by
Defendant. As such, the court construes "sandwiched between" to mean that the U-shaped structure "extends at least partially 'over' (and 'under') the bridge."

A. The "sandwiched" claims

Claim 11 of the '496 patent is representative of the "sandwiched" claims at issue in this case:

An exterior finishing system for a building comprising an underlying structural support element . . . said support element including gypsum board comprising a set gypsum core sandwiched between two sheets of porous glass fiber mat, the gypsum core including one or more additives which are effective in improving the water-resistant properties of the board. . . .

(Emphasis added.)

The jury found that USG infringed Claim 11 of the '496 patent, which uses the term "sandwiched," but the district court granted USG a new trial on the issue of whether this claim was infringed. The district court held that Claim 11 does not claim a board where the gypsum core may penetrate through and onto the outside of the mat.

The district court found that the word "sandwiched" had not been given a special definition in the patents and that it did not have a special meaning in the gypsum board manufacturing context. The court therefore gave the word its ordinary meaning - viz, to insert or place between - and instructed the jury that "sandwich means between two things and not through and outside one of the two things." After the jury returned a verdict of infringement in favor of Georgia-Pacific with respect to the claims of the '989 patent, the district court ruled on USG's JMOL motion that the construction of "sandwiched" did not constrain it from finding that the claims could cover a board with gypsum core between two porous glass mats with gypsum bleeding through the outer surface of one porous mat. The court ruled that because these claims specifically required only one side to be gypsum free, by implication the other side need not be gypsum free.

Georgia-Pacific argues that it is clear from the patent that it contemplates that gypsum might come through the glass mat on one side. There would be no reason to specify that one surface is to be gypsum-free if "sandwiched" means that the gypsum could not go through either surface. Georgia-Pacific contends that "sandwiched" cannot mean that the gypsum must stay between both of the glass mats.

We agree with Georgia-Pacific.

There would be no need to specify a gypsum free surface if the "sandwiched" term meant that the gypsum could not go through one of the glass mats. Further, other dependent claims, such as claim 8 of the '496 patent, specifically claim one of the fiberglass mats has an outer surface with "portions thereof coated with set gypsum."

As we have discussed, the district court interpreted the "sandwiched" claim limitations in the patents as not precluding the gypsum core from flowing through one of the glass mats. In the case of Claim 11, however, the district court interpreted "sandwiched" differently - i.e., that the gypsum core must remain between the mats.

Unless the patent otherwise provides, a claim term cannot be given a different meaning in the various claims of the same patent. See Southwall Tech., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579, 34 U.S.P.Q.2D (BNA) 1673, 1679 (Fed. Cir. 1995) (holding that claim term found in different claims must be interpreted consistently); see also Fonar Corp. v. Johnson & Johnson, 821 F.2d 627, 632, 3 U.S.P.Q.2D (BNA) 1109, 1113 (Fed. Cir. 1987.) (holding that a term used in one claim had the same meaning in another claim). Interpretation of a disputed claim term requires reference to the other claims. See Southwall, 54 F.3d at 1579, 34 U.S.P.Q.2D (BNA) at 1679. We are convinced that the district court's interpretation of "sandwiched" as not precluding the flow through of the gypsum core on one of the fiberglass mats should have been applied to that term in claim 11 absent any indication that a different meaning was contemplated. The evidence demonstrates that USG infringed claim 11 of the '496 patent when it is so interpreted. We therefore reverse the district court's grant of a new trial and reinstate the jury's finding of infringement with respect to claim 11 of the '496 patent.
The parties agree that the term "scalloped" means that there are portions of material that have been cut out of the fabric or plastic. The primary dispute between Plaintiffs and Cook is whether the phrase must be limited such that the "scalloping" occurs only "between," i.e. in the space that separates, each wire apice, as depicted in figures 6-7 of the patents-in-suit, or whether the fabric may also contain scalloping underneath the wire apices.

The specification states that "[i]t is preferred" that the edge of the material is "scooped out or scalloped between each projecting crest." ('458 Patent, col. 2, ll. 56-58 (emphasis added).) If the Court looked only to the claim language, Cook's argument might have some force. However, because the specification makes clear that the scallops "between" the projecting crests are preferred but not required, the Court declines to construe this phrase to limit it to a preferred embodiment. See, e.g., Primos, Inc., 451 F.3d at 848 (court should not import limitations from preferred embodiments into claims).

Plaintiffs and Gore also disagree about whether the wires always extend beyond the edge of the material. For the reasons set forth above in Section B.5, the Court concludes that they do not.

Accordingly, the Court construes the term "edge which is scalloped between projecting apices of the wire member/structure" to mean: "The edge of the material may be scooped out or removed between or underneath each projecting crest of the wire."

The parties disagree as to whether "scan," "scanner," and "scan a surface of the workpiece" need be construed, given the magistrate judge's proposed construction of the phrase "scanning the surface of the workpiece" as found in the '525 patent claims. (See D.I. 575, 619 Dec. 27, 2002 Joint Claim Construction Submission For U.S. Patent No. 6,292,259.) Because the Court has not previously ruled on the objection made to the magistrate judge's proposed construction (D.I. 531), those terms are interpreted herein. The Court's decision regarding those terms is also informed by a de novo review of the phrase "scanning the surface of the workpiece" as found in the '525 patent claims and serves as the Court's ruling on the objection to the magistrate judge's proposed construction of that phrase.

23 The magistrate judge construed "scanning the surface of the workpiece" as used in the '525 patent to mean that "the entire surface of the workpiece is inspected through relative motion of the incident beam of P-polarized light and/or the
workpiece being inspected. The phrase is broad enough to encompass rotation and translation of the workpiece during scanning." ADE Corp., 220 F. Supp. 2d at 312-13.

24 Hereinafter the parties' December 27, 2002 Joint Claim Construction Submission For U.S. Patent No. 6,292,259 B1 will be cited to as JCCS. The JCCS is a document setting forth each party's proposed construction for each term in dispute and, importantly, a compilation of each party's evidence from the intrinsic record in support of their proposed constructions. The record citations and quotations are arranged term by term, thus providing easier access for the Court, in a single document, to the parties' positions and the record support for those positions. The parties' submission of the JCCS in this case has proven helpful and is appreciated by the Court.

1. ADE's Position

ADE argues that "scanner" should be construed to mean "components that together allow the entire workpiece to be scanned; where 'scanned' means 'inspected through relative motion of the incident beam of P-polarized light and/or the workpiece being inspected.'" (D.I. 595 at 28; D.I. 613 at 3-4 (quoting D.I. 318 at 52); JCCS at 2.) ADE also proposes that the phrase "scan a surface of the workpiece" should be construed consistently with the magistrate judge's previous construction of the phrase "scanning the surface of the workpiece." (Id.) ADE does not set forth a proposed construction of the word "scan," detached from the entire phrase "scan a surface of the workpiece." (See D.I. 595; D.I. 613; JCCS.)

In support of its proposed construction of the word "scanner," ADE points to the magistrate judge's proposed construction of the '525 patent and to the '259 and '525 intrinsic record. (JCCS at 2-3.) ADE then argues that the magistrate judge properly construed the phrase "scanning the surface of the workpiece" in relation to the '525 patent and that the magistrate judge's construction of "scanning" is equally applicable to the "permutations" of that word, "scan" and "scanner," as used in the '259 patent. (D.I. 595 at 28.) ADE supports its argument by asserting that "nothing in the intrinsic record compels an interpretation for either of these related set of terms that is clearly inconsistent with their plain and ordinary meanings." (Id.) Moreover, asserts ADE, the magistrate judge already rejected KLA's attempts to narrow the scope of the word "scanning." (D.I. 613 at 4-6.) The magistrate judge's reasoning, argues ADE, applies with equal force to the words "scan" and "scanner" and the phrase "scan a surface of the workpiece" as found in the claims of the '259 patent. (Id.) To conclude its argument, ADE quotes definitions of "scan" and "scanner" as found in several dictionaries. (Id. at 7-8.)

2. KLA's Position

KLA, in contrast, proposes that the Court construe the words "scanner" and "scan" as opposed to the phrase "scan a surface of the workpiece." (D.I. 594 at 11-12; D.I. 615 at 13-14; JCCS at 2.) KLA suggests that "scanner" be construed to "include a 'beam deflector' such as an acousto-optical deflector" and "scan" should be construed to mean "deflect the beam along a relatively narrow scan path." (Id.) In support, KLA directs the Court to numerous intrinsic citations, including the prosecution history of the '701 patent. (Id.) KLA asserts that the "scanner" taught in the '259 specification includes "a component or components for deflecting the incident beam[,] ... [and a scan is performed] by imparting a relatively narrow scan path." (D.I. 594 at 12.) KLA then points to figures of the '259 patent and argues that those figures indicate that the "scanner" is closely associated with the incident beam of p-polarized light. (Id. at 12-13.)

KLA also asserts that the description of the '259 invention in the specification of the patent makes it clear that the "scan" performed by the "scanner" is "along a relatively narrow scan path." (Id. at 14.) Moreover, asserts KLA, the magistrate judge's construction of "scanning" in relation to the '525 patent does not impart a plain and ordinary meaning to the words "scan" and "scanner" in the '259 patent, as ADE suggests. (D.I. 615 at 13 (citing D.I. 594 at 14-17).) This, argues KLA, is clear from the '259 specification and prosecution history of the '701 patent, 25 which clarify that the inventors "clearly and unequivocally distinguished their invention from the prior art cited by the examiner on the grounds that their invention employed 'narrow angle scans.'" (Id.)
3. Analysis

The parties advance essentially the same arguments that they did before the magistrate judge when contesting the claim language of the '525 patent. See ADE Corp., 220 F. Supp. 2d at 312-13. The magistrate judge, in sifting those arguments and reviewing the record, observed that "scanning" is a broad term. Id. at 312. The magistrate judge then turned to a review of the '525 written description and drawings, stating:

The '525 disclosure teaches several ways to perform a surface scan of a workpiece. During some of these scans, the workpiece is translated and rotated along its material path as it is inspected ….

Claim 1 of the '525 patent does not limit "scanning" to any particular type of scan; instead, the claim plainly states that one step in the disclosed inspection method is to scan the surface of the workpiece at the inspection station. In contrast, KLA would have this court read a non-existent limitation into the phrase 'scanning the surface of the workpiece' from dependent claim 21 ….

… Some movement must exist between the light beam and the surface to inspect the entire surface "scanned" and effectuate the inventors' invention. Claim 1 of the '525 patent ensnares all such movement whereas dependent claim 21 specifies that the movement is translation and rotation. Any other construction is simply illogical and inconsistent with the invention taught in the '525 patent.

Id. at 312-13 (citations omitted).

The '259 patent teaches the same invention as does the '525 patent but it claims the invention differently, and both the '259 and '525 patents descend from the application that led to the '701 patent. Accordingly, the inventors' statements with regard to the words "scan" and "scanner" during the prosecution of the '701 patent, and the use of similar language in the '525 and '259 patent claims, are of significance.

In the '701, 525, and '259 patent specifications, the word "scanner" refers to a component or combination of components for deflecting the incident beam along a "scan" path to "scan a surface of the workpiece" being inspected. During prosecution of the '701 patent, the inventors distinguished their invention from the prior art in an attempt to traverse an earlier rejection by the examiner under Section 103(a). (D.I. 627 at '701 Patent Prosecution File History, Applicants' Response to Office Action mailed Mar. 4, 1996 at 1-4.) The inventors argued that their invention uses an "acousto-optical deflector" to provide "a narrow subscan" and "teaches a single scan over each area of the wafer" to maximize "high spatial resolution, complete coverage of the workpiece surface, and high throughput …." (Id.)

The examiner was not persuaded by these arguments and again rejected the applicants' claims under Section 103(a), stating that "the rejected claims call for scanning systems with a main scan and a smaller subscan; this is taught by Yoshii et al." (Id. at '701 Patent Prosecution File History, Final Office Action mailed Oct. 23, 1996 at 3-4, PP 4-5.) The examiner then restated that the prior art does not teach adjusting the speed of the scanning system and does not teach the use of a plurality of collectors to collect both forwardly and backwardly scattered light. (Id. at 3-5, PP 4, 6.) Subsequently, the applicants amended their application consistent with the examiner's remarks to include, in claim 1, a light channel detector and a dark channel collector, and in claim 22 a "means for varying the speed of rotating the workpiece … during a scan" to maintain a constant scan speed. (Id. at '701 Patent Prosecution File History, Amendment After Final dated Jan. 20, 1997 at 1-2.) The applicants' did not readdress the examiner's remark that their invention employs a main scan and a smaller subscan. (Id.)

Having defined "scanner" in the specification of the '701, '525, and '259 patents and having evidenced a clear disavowal of
claim scope through argument in attempt to traverse the prior art during prosecution of the '701 patent, the applicants have limited the possible construction of "scan," and "scanner," and the permutation "scanning," as found in the claims of the '525 patent. See Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 979-80 (holding that arguments made during prosecution of an earlier patent application are accorded the same weight as amendments and, therefore, applicant's arguments to distinguish prior art relinquished a proposed construction of the claim). Accordingly, the Court construes (1) "scan" to mean deflecting the beam of P-polarized light along a relatively narrow scan path, (2) "scanner" to mean a component or combination of components employing a deflector such as an acousto-optical deflector for directing the beam of P-polarized light along a relatively narrow scan path, and (3) "scan a surface of the workpiece" to mean the surface of the workpiece is inspected by deflecting the beam of P-polarized light along a relatively narrow scan path. The phrase is broad enough to encompass relative motion of the workpiece during a scan.

The magistrate judge had construed the phrase "scanning the surface of the workpiece," as used in the '525 patent, to mean that "the entire surface of the workpiece is inspected through relative motion of the incident beam of P-polarized light and/or the workpiece being inspected. The phrase is broad enough to encompass rotation and translation of the workpiece during scanning." ADE Corp., 220 F. Supp. 2d at 312-13.

Pursuant to the Court's de novo review of this phrase, the magistrate judge's construction of "scanning the surface of the workpiece," is modified to be consistent with the foregoing analysis of "scan," "scanner," and "scan a surface of the workpiece." As used in the '525 patent, "scanning the surface of the workpiece" means the entire surface of the workpiece is inspected along a relatively narrow scan path through relative motion of the incident beam of P-polarized light and/or the workpiece being inspected. As the magistrate concluded, the phrase is broad enough to encompass rotation and translation of the workpiece during scanning.

B. "Scanning Head"

"Scanning head" is found in claims 1 and 3 of the '486 patent and claims 1, 3, 4, 7, 8, 9, 11, 12, 13, and 14 in the '677 patent. Hysitron asserts that "scanning head" means "an assembly configured to cause the probe and sample to move relative to one another in three dimensions, including a back-and-forth scan in two dimensions." Joint Claim Construction Statement at 1. Hysitron's claim construction incorporates all actuator configurations known at the time of the invention. Hysitron's Markman Brief [Docket No. 145] at 28. MTS asserts that "scanning head" means "an actuator with a probe mounted thereon which moves in the x, y, and z directions to engage the surface of a sample during scanning, or a sample holder which incorporates an actuator which moves the sample in the x, y, and z directions during scanning." Joint Claim Construction Statement at 7. MTS's claim construction requires a scanning head to be a unitary device able to scan in the x, y, and z directions. MTS's Markman Brief [Docket No. 148] at 14.

MTS argues that the claims and specification make clear that "scanning head" is a single unit because the claim language consistently refers to "scanning head" in the singular. In the disputed claims, "scanning head" is preceded by the singular articles "a" and "the." '486 patent, col. 15:27; '677 patent, cols. 15:23, 15:41, 15:56, 16:5, 16:8, 16:19, 16:21, 16:23, 16:26. "A" and "the" also precede "scanning head" throughout the specification. See '486 patent, cols. 12:23-28, 14:42-50. Additionally, MTS emphasizes that the "patentee's remarks about the heart of the invention underscore this reading: 'the key to operation of patentee's invention is that a scanned probe microscope apparatus incorporates a probe in a scanning head arranged for operative engagement of a surface of a sample or measuring a surface topography thereof.'" MTS's Markman Br. at 17 (quoting '486 patent, col. 14:47-51). MCTS contends that these references demonstrate unambiguously that a "scanning head" is a unitary device.

The Court disagrees that the use of "a" and "the" remove ambiguity from the definition. If, as Hysitron contends, a "scanning head" is an assembly of parts the assembly is a collective noun making appropriate the use of the singular article. Additionally, the language MTS cites from the specification implies multiple parts to a scanning head. If an SPM "incorporates a probe in a scanning head arranged for operative engagement," it necessarily requires multiple parts to be "arranged." While the arrangement could exist between a probe and a unitary scanning head, the arrangement also could exist between a probe and multiple elements of a scanning head. For these reasons, the patentee's use of "a" and "the" is not dispositive of the issue.
MTS also argues that none of the figures in the specification show or suggest that a "scanning head" could be composed of multiple components. Because each of the figures contains a box, or single device, labeled "scanning head," MTS asserts a "scanning head" is a unitary device. This interpretation ignores the limiting language in the specification that: "[a] scanning head (a piezo actuated head in the illustrated embodiment). . . . " '486 patent, col. 12:24-25 (emphasis added). This qualifying language clearly implies that the patent anticipates other types of scanning heads and that the figures in the specification were not intended to represent the only type of scanning head that could be employed. Moreover, a patentee "is not required to describe in the specification every conceivable and possible future embodiment of his invention." Rexnord Corp., 274 F.3d at 1344. The figures in the specification do not limit the term "scanning head" in the patent to a unitary device.

Hysitron argues that the independent claims that define "scanning head" are in Jepson form. Jepson form is used when a claim covers an improvement to the known art and requires:

(1) A preamble comprising a general description of all the elements or steps of the claimed combination which are conventional or known,

(2) a phrase such as "wherein the improvement comprises," and

(3) those elements, steps and/or relationships which constitute that portion of the claimed combination which the applicant considers as the new or improved portion.

37 C.F.R. § 1.75(e); see also Dow Chem. Co. v. Sumitomo Chem. Co., 257 F.3d 1364, 1368 (Fed. Cir. 2001). The parties agree that the claims are in Jepson form, but disagree whether elements recited in the preamble encompass all known embodiments of prior art or merely well-known embodiments.

In support of its argument that elements recited in the preamble encompass all known embodiments of the prior art, Hysitron cites Zoran Corp. v. Mediatek, Inc., No. 04-04609, 2005 U.S. Dist. LEXIS 34454, at *32-35 (N.D. Cal. Sept. 9, 2005). Zoran involved patents dealing with an improved CD-ROM drive. Id. at *4. The defendants advanced a claim construction based on the contention that only one type of circuitry was known in the art. Id. at *32. The court rejected the argument for multiple reasons but central to its analysis was the plaintiffs' presentation of evidence that other types of circuitry were known by one skilled in the art at the time of the patent's filing. Id. at *33. While not binding on this Court, Zoran is persuasive support for Hysitron's construction.

MTS counters that Jepson format limits the scope of an invention to "well known" embodiments of the prior art and, in support, cites Dow Chemical. There, the court stated that "the claimed process is written in Jepson format, and describes certain conditions as an improvement over a well known process." 257 F.3d at 1381. MTS's position is that limiting the scope to well known embodiments is the logical corollary to the requirement that claims be construed according to their "ordinary and accustomed meaning as understood by one of ordinary skill in the art." See id. at 1373. MTS submits the testimony of an expert, Dr. Dawn Bonnell who opines that the standard and well known configuration of a scanning head at the time of the patent application consisted of a unitary device. Pearson Aff. [Docket No. 150], Ex. 7 (Bonnell Decl.) P 11. Dr. Bonnell also admits that at the time of the patent application devices existed that had separate x-y and z controls but states that they were not commonly used. Id. PP 24, 25. One such device is disclosed in the declaration of Hysitron's expert, Dr. Richard J. Colton. Graham Decl. Ex. 3 (Colton Decl.) P 21 (citing D. Sarid, D. Iams, V. Weissenberger & L.S. Bell, "Compact scanning-force microscope using laser diode," Optical Letters 13(12) at 1057-59 (1988)).

The Court finds that when the Jepson form is used, the scope of an invention includes all known embodiments of the art. Thirty-seven C.F.R. § 1.75(e)(1) requires that an independent claim contain a preamble that sets forth a general description of "all the elements or steps of the claimed combination which are conventional or known." The regulation establishes clear that prior art is not confined only to those elements that are "conventional" or well-known but rather extends to "all" elements. This interpretation best effectuates the purpose of the Jepson form, which is to provide a clear and consistent vehicle for an improvement on prior art. For this reason, the Jepson form of the patents supports Hysitron's definition of "scanning head." 4
Even under the "well-known" standard suggested by MTS, Hysitron's interpretation could hold force. There has been little analysis of what constitutes "well-known" among people of ordinary skill in the art. Dr. Bonnell's opinion that the existence of a few "one-off" devices that used a multiple actuator scanning head did not rise to the level of well-known is merely that—one opinion. And that opinion is contradicted by the opinion of Dr. Colton. When, exactly, scientific knowledge and use has adequately entered the Zeitgeist of the scientific community to rise to the level of "well-known" is not a question this Court can answer.

Finally, the prosecution history supports Hysitron's claim construction. The Patent and Trademark Office ("PTO") rejected the initial application, serial number 327,979 (the '979 application"), for this patent. The Examiner initially found uncertainty as to whether the "3-D piezo actuator" in the '979 application was the same device as the "scanning head." Graham Decl., Ex. 11 ('979 application) at 15. The patentee changed the specification to the current form to address that "other types of scanning heads are contemplated while still remaining within the scope of the present invention." Id. This amendment clearly indicates the patentee intended that multiple types of scanning heads be included within the scope of the patent. Therefore, based on the intrinsic evidence and the prosecution history, the Court construes "scanning head" to mean "an assembly configured to cause the probe and sample to move relative to one another in three dimensions, including a back-and-forth scan in two dimensions."

D. "scattered from the surface of the workpiece" 27

27 The phrase "scattered from the surface of the workpiece" is used in claims 1, 21, 25, 29, and 30 of the '259 patent.

1. ADE's Position

ADE argues that "this simply-worded term requires no further interpretation. The phrase simply means what it says: 'light scattered from the surface of the workpiece.'" (D.I. 613 at 17.) ADE goes on to assert that KLA's proposed construction is in error for importing awkward limitations into the phrase "concerning (1) the placement of the workpiece; (2) the relative timing of when light is collected vis-a-vis when the workpiece is present; and (3) the placement of collectors as set forth in the preferred embodiment." (Id.)

2. KLA's Position

KLA argues that the phrase "scattered from the surface of the workpiece" should be construed to mean that "the workpiece is present in the inspection system, with light scattered therefrom while the collectors are configured in the manner recited." (D.I. 594 at 17.) KLA asserts that when the specification is read in its entirety, the workpiece must be present in the inspection system during a scan and there is no basis "for collecting light while the workpiece is not in the inspection station." (Id. at 18.)

3. Analysis

The Court agrees with ADE. The phrase does not naturally carry such limitations nor are such limitations mandated by the intrinsic record. The Court, therefore, will not read limitations into the construction of this claim language. See Tate Access Floors, Inc. v. Maxcess Techs, 222 F.3d 958, 966 ("It is improper to read limitation [explicit or implicit] from the written description into a claim."). The Court construes "scattered" to mean diffused or dispersed and the phrase "scattered from the surface of the workpiece" to mean diffused or dispersed from the surface of the workpiece. MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY 1042 (10th ed. 2002).
III.

During trial, the district court defined "score line"—the corresponding structure of the means-plus-function limitation in claim 1 of the '904 patent. The district court defined the term largely in response to Enpath's cross-examination of Pressure Products' witnesses. Enpath's cross examination strategy revealed a dispute over the trial court's definition of the term "score line" in its Markman order. While recognizing the potential for surprise and prejudice in a late adjustment to the meaning of claim terms, this court also acknowledges that the trial court is in the best position to prevent gamesmanship and unfair advantage during trial. Moreover, this court understands that a trial judge may learn more about the technology during the trial that necessitates some clarification of claim terms before the jury deliberates. Indeed, before the district court defined "score line," it acknowledged that it was in a better position than the magistrate judge at the Markman hearing to understand the operation of the sheath due to extensive expert testimony from both parties.

Enpath posits that the trial judge's late adjustment prejudiced its defense and compromised its ability to respond. While somewhat sympathetic to those concerns in general, this court is not prepared to substitute its judgment for that of the district judge, who understood the entire context far beyond the limitations of the written record on review in this proceeding. Moreover, the district court made the adjustment early enough in the trial to give Enpath an opportunity to consider the new construction and adjust its arguments to account for the change. Thus, this court does not consider the trial court's supplemental definition of a claim term during trial to present a fundamental procedural flaw that jeopardizes the jury's verdict. As this court has recognized, "District courts may engage in a rolling claim construction, in which the court revisits and alters its interpretation of the claim terms as its understanding of the technology evolves." Pfizer, Inc. v. Teva Pharms., USA, Inc., 429 F.3d 1364, 1377 (Fed. Cir. 2005); see also Utah Med. Prods., Inc. v. Graphic Controls Corp., 350 F.3d 1376, 1381-82 (Fed. Cir. 2003) (holding that the district court did not err in amending its claim construction during oral arguments for pretrial motions nearly two years after the original construction). Moreover, "w when the parties raise an actual dispute regarding the proper scope of these claims, the court, not the jury, must resolve that dispute." O2 Micro Int'l Ltd. v. Beyond Innovation Tech. Co., 521 F.3d 1351, 1360 (Fed. Cir. 2008).

Although originally agreeing with the district court's decision to supplement its definition of "score line," Enpath now contends that the district court erred by relying on O2 Micro for its decision. According to Enpath, "the district court was in no way faced with the jury interpreting the 'means for permitting removal' or 'score line' limitations because the magistrate judge had already construed those terms." Enpath cites to a non-binding district court decision distinguishing O2 Micro, as well as Broadcom Corp. v. Qualcomm Inc., 543 F.3d 683, 694 (Fed. Cir. 2008). In both cases, the district court declined to supplement the definition of claim terms that had already been construed in earlier claim construction orders.

In this case, the magistrate judge defined "score line" as "one or more line(s) defined in the hemostatic valve and introducer sheath" in the context of dependent claims 4 through 8 of the '904 patent. The words "score line" do not appear in independent claim 1 of the Lee patents. Instead, that independent claim includes a means-plus-function limitation "means for permitting removal" (i.e., "score lines defined in the hemostatic valve and introducer sheath, and equivalents thereof")). The magistrate judge then determined that the structure in the specification that corresponded to this functional limitation was a score line. The magistrate judge did not define "score line" in the context of the structure corresponding to independent claim 1 of the Lee patents. Without a definition of "score line" in the Markman order for that corresponding structure, the trial judge observed that the trial proceedings invited the jury to define this term on its own in a manner this court has questioned in O2 Micro, 521 F.3d at 1360, and Markman v. Westview Instruments, Inc., 52 F.3d 967, 976 (Fed. Cir. 1995) (en banc), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996) (holding that claim construction is a matter of law for the court). Therefore, the trial court undertook to supplement the Markman order by clarifying the meaning of "score line."
The trial court erroneously used structures from the prior art references listed in the patent to provide a definition for "score line." In the context of the corresponding structure to independent claim 1 of the Lee patents, the trial court erred in expanding the definition of "score line" to include structures not disclosed in the specifications of the Lee patents. Section 112 requires that the corresponding structure must be "described in the specification." The Lee patents give a laundry list of prior art references. See '904 patent col.1 ll.41-61; '355 patent col.1 ll.45-63. The trial court included the structures disclosed within that list of prior art references as corresponding structures for claim 1 by including them in its definition of "score line." In doing so, the trial court impermissibly expanded the corresponding structure of claim 1 to include structures not described in the specification.

Trial courts cannot look to the prior art, identified by nothing more than its title and citation in a patent, to provide corresponding structure for a means-plus-function limitation. In this case, these references provide alternatives to scoring. Although many of the disclosed alternatives may well be determined to be structural equivalents permitted by section 112, paragraph 6--a question of fact for the jury--these alternative methods of splitting or peeling cannot be treated as the disclosed structures for the removal means. Simply mentioning prior art references in a patent does not suffice as a specification description to give the patentee outright claim to all of the structures disclosed in those references.

In Atmel Corp. v. Info. Storage Devices, Inc., 198 F.3d 1374, 1381 (Fed. Cir. 1999), this court refused to utilize the concept of incorporation by reference to include a structure in the prior art as a corresponding structure for a means-plus-function claim element. In Atmel, this court held that the title of a prior art reference could provide the structure for a mean-plus-function element because "Atmel's expert, Callahan, testified that this title alone was sufficient to indicate to one skilled in the art the precise structure of the means recited in the specification." Id. at 1382. His testimony was essentially unrebutted. Id. If, on the other hand, the title did not disclose the prior art structure, the structures in the prior art reference could not be a corresponding structure to the means-plus-function claim element. Id. (holding that "the district court properly held that the Dickson article [prior art cited in the patent] may not take the place of structure that does not appear in the specification").

The magistrate judge construed "score line" consistent with the specification as "one or more lines defined in the hemostatic valve and introducer sheath." The magistrate judge, citing a dictionary, explained that "'score' has been defined to mean 'any scratch, line or groove' that is formed by the scoring process." The trial court went on to supplement the magistrate's construction and defined "score lines," the structure for permitting removal, as "linear perforation; slit; slot; tab; line; severing; weakening; or tear that can be partial or complete."

Pressure Products argues that the trial court correctly construed the term "score lines" according to the doctrine of claim differentiation. Claim 1 claims "means for permitting removal of said hemostatic valve and introducer sheath." Claims 4 through 8 of the '904 patent claim "a score line defined in said hemostatic valve and introduce sheath" as the means for permitting removal. As such, Pressure Products argues that the means-plus-function element of claim 1 must encompass structures other than score lines, namely, those structures disclosed in the prior art references mentioned in the patent. This argument fails, however, because a means-plus-function claim element already includes structures other than the corresponding structure explicitly described in the specification, namely, equivalents of the corresponding structure. See 35 U.S.C. § 112, P 6. Therefore, as the means-plus-function claim element of claim 1 includes the equivalents of score lines, the magistrate judge's claim construction does not violate the doctrine of claim differentiation.

The specification does not expressly describe use of a cut or a slit or a tear for removal. The specification explains, "[t]he score line comprises a pair of lines defined in the hemostatic valve and introducer sheath. The pair of score lines are diametrically opposed from each other on the hemostatic valve and introducer sheath." '904 patent col.3 ll.14-18. The patent further explains, "score lines 34 and 36 are shown as having a V-shaped cross section but have such a shape and depth as to permit the entire length of introducer sheath 10 to be manually separated." Id. col.6 ll.7-10. The specification recognizes a difference between score lines and slots. Id. col.6 ll.28-32 ("However, it is entirely possible that score lines 34 and 36 will be continued through flanges 38 and 40 to provide deep scores instead of open slots 44 and 46." (emphasis added)).

The trial court erroneously used structures from the prior art references listed in the patent to provide a definition for score
lines encompassing structures not disclosed expressly in the patent specification. As such, this court detects error in the trial
court's definition. Score lines are "one or more lines defined in the hemostatic valve and introducer sheath" as supported by
the specification. This court remands for further proceedings in light of the proper construction of the term "score lines."
Those further proceedings will allow appropriate measures to also ascertain the structural equivalents of the express structure
in the specification corresponding to the claimed function.

3463

D. "Scraping Edges" as used in Claims 730:6 and 416:1, 5, 6, 8, 10, 16, and 22

Alden's asserted construction is "the edges formed at the tip of a bit by the longitudinal scraping surfaces and relief surfaces,
which edges dig into and engage the damaged screw upon rotation in the extracting direction so that there is a unitary
rotation of the bit and screw in the extraction direction." Alden Br. at 6. Eazypower agrees with the first phrase ending in
"relief surfaces," but would omit the remainder of Alden's construction.

1. Claim Language

a. Claim 730:6

This claim reads exactly the same as claim 416:6, set forth above, except that claim 730:6 refers to "a pair of longitudinal
recesses," as opposed to "a plurality of longitudinal recesses." DX A, col 4, lns 37-54. The relevant language is "having a
scraping edge" and "the scraping edges engaging the end surface of the fastener at the margin of the cross slot." DX A, col
4, lns 49, 52-54. This claim language supports including in the claim construction a reference to "engaging" the fastener, but
no more.

b. Claim 416:1

The full text of this claim is set forth above. The relevant language is "scraping edge." DX B, col 3, lns 57, 50, 61-62. This
claim does not describe the function of the scraping edges.

c. Claim 416:5

The full text of this claim is set forth above. The relevant language is "scraping edge," but the claim also describes
"engaging the head [of the damaged fastener] with the tip end with the scraping edges engaging the end surface of the
fastener" and "rotating the bit in a counter-clockwise direction." The language of the claim supports Alden's construction.

d. Claim 416:6

The full text of this claim is set forth above. It reads the same in all material respects as claim 730:6.

e. Claim 416:8

The full text of this claim is set forth above. The relevant language is "scraping edge," but the claim also states that it is a
"tool for removing damaged screws." DX B, col 4; lns 58, 65-66; col 5, lns 2-3. This claim language provides some support
to Alden's construction in that it makes clear that the tool is to be used to remove a damaged screw, but does not specify the
function of the scraping edges explicitly.

f. Claim 416:10

This claim states, in full:

A tool for removing damaged screws comprising: a bit having an axis of rotation extending between a tip end and rear
end, the rear end being formed with a cross-section adapted for installation in and rotation by a chuck of a reversible drill,
the tip end having a plurality of longitudinal recesses uniformly disposed about the tip end, each recess bordered by a
scraping surface facing in the counter-clockwise direction of rotation, the scraping surface being formed with a distal
scraping edge, each of the scraping edges being disposed at a scraping edge acute angle relative to the axis of the bit, and a
support portion behind each scraping edge, the support portions each defined by a relief surface leading away form the
scraping edge to a rearward edge bordering one of the longitudinal recesses, the rearward edge being disposed at an angle
relative to the axis of the bit more acute than the scraping edge acute angle.

DX B, col 5, lns 8-23. There are no material differences between this claim and claim 416:8.

g. Claim 416:16

The full text of the claim is:

A tool for removing damaged screws comprising:

a. a bit having an axis of rotation extending between a tip end and a rear end,

b. the rear end being formed with a cross-section adapted for installation in and rotation by a chuck of a reversible drill,

c. the tip end having a plurality of longitudinal recesses uniformly disposed about the tip end, each recess bordered by a
scraping surface facing in the counter-clockwise direction of rotation,

d. the scraping surface being formed with an associated scraping edge at the tip end of the bit,

e. the associated scraping edge when viewed perpendicular to the axis being disposed at a first acute angle relative to the
axis,

f. a support portion being located behind the associated scraping edge in the direction of rotation, the support portion
being defined by a relief surface loading away from the associated scraping edge to a rearward edge,

g. the rearward edge when viewed perpendicular to the axis being disposed at a second acute angle relative to the axis, the
second acute angle being more acute than the first acute angle.

DX B, col 5, lns 36-57; col 6, lns 1-2. There are no material differences between this claim and claim 416:8.

h. Claim 416:22

This claim is nearly identical to claim 416:16. The differences are not material to the term "scraping edge."

2. Specification

The Abstract to the '416 patent states that the scraping edge "dig[s] into the metal of a deformed screw at points removed
from the axis to get a good purchase on the screw." DX B (cover page). Identical language is found in the Abstract to the
'730 patent. DX A (cover page).

The Detailed Description of Embodiments in the '730 patent states that the edges perform a "digging function," "engage and
effectively scrape . . and rotate the screw out of its hole," and are structured to assure "a firm purchase of the fastener by the
Similar language is found in the '416 patent. See, e.g., DX B col 2, lns 45-50.

3. Construction

Alden argues that the function-related language is necessary to distinguish the cutting edges used in the Richards patent.
Eazypower points the Court to Schwing GMBH v. Putzmeister, which held: "Where a claim uses clear structural language,
it is generally improper to interpret it as having functional requirements." 305 F.3d 1318, 1324 (Fed. Cir. 2002). See also
Toro Co. v. White Consol. Indus., 266 F.3d 1367, 1371 (Fed. Cir. 2001) ("An invention claimed in purely structural terms
generally resists functional limitation.").

In Schwing, the Federal Circuit noted, in reaching its decision, that nothing in the claim language or the specification
required the structural component at issue to serve any particular function. 305 F.3d at 1323. Here, several claims explicitly state that the scraping edges engage the head of the damaged fastener. The Abstract section of the specification says the same, notes digging, and implies rotation, as does the Detailed Description of Embodiments. Therefore, the Court accepts Alden's proposed construction in part, and construes "scraping edges" to mean "the edges formed at the tip of a bit by the longitudinal scraping surfaces and relief surfaces, which edges dig into and engage the damaged fastener upon rotation." This construction is consistent with the claim language and alleviates Alden's concern that the scraping edges could be confused with cutting edges.

**3464**

1. "Screen Plate" is an Assembly of a Screening Medium and a Backing Plate

The Court shall first construe "screen plate," which is found in independent claim 10, and dependent claims 11, 13-17, 32-36, 39. 6 J&L proposes that the term "screen plate" (as well as "screen cylinder," which it asserts is synonymous within the patent) should be construed to mean "an assembly of a screening medium and a backing plate." J&L's Mem. in Supp. of Mot. for Claim Construction (Dkt. No. 45-2) ("J&L's Construction Mem.") at 21. AFT proposes that "screen plate" should be construed to mean "a perforated plate utilized on many designs of pulp screening equipment that impedes pulp flow and is instrumental in causing a separation between suspended particles on the basis of their size, shape, and/or flexibility." Opp'n Construction Mot. at 11. AFT, moreover, seeks to construe "screen plate" as synonymous with "screening plate" and "screen cylinder" as synonymous with "screening cylinder." Tr. (Dkt. No. 106) at 49. As to this term, the Court adopts J&L's construction, which is consistent with the claim terms and specification of the '940 patent and has not been disavowed; additionally, the Court rejects AFT's contention that "screen plate" and "screening plate" are synonymous terms and adopts J&L's construction which equates "screening plate" with "screening medium," see Tr. (Dkt. No. 106) at 21.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

6 A claim in dependent form incorporates by reference all limitations of the claim to which it refers but must recite a further limitation of the subject matter claimed. 35 U.S.C. § 112.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

a. A "Screen Plate" is an Assembly

The claims and specification leave no uncertainty that the term "screen plate" describes an assembly comprising a "screening medium" and a "backing plate." Any construction that does not include this essential feature is contrary to the intrinsic evidence and must be rejected.

Claim 10 describes "[a] screen plate . . . comprising: a screening medium . . . and a structural backing plate . . . ." '940 patent, col. 14, Lns. 13-19 (emphasis in original). The specification also requires a construction of "screen plate" that defines this term by reference to its assemblage character: "Screen plate 10 may be formed as a flat screen plate or a screen cylinder as illustrated and is comprised of two different layers, namely a screening layer/plate 12 and a backing layer plate 14." Id., Col. 7, Lns. 61-64. Each preferred embodiment of the present invention similarly notes the "screen plate" as comprising a screening medium and a backing plate. Finally, the specification explicitly identifies "the present invention" as "formed of two separate layers. The first layer comprises a screening plate . . . and the second layer comprises a backing plate." Id., Col. 2, Lns. 22-25.

The consistent description of "the present invention" as a screen plate comprising two layers, a screening layer and a backing plate makes clear that a "screen plate" must have these two layers. See, e.g., SciMed Life Systems, Inc. v. Advanced Cardiovascular Systems, Inc., 242 F.3d 1337, 1343 (Fed. Cir. 2001) (construing term to include feature characterized as "the present invention"); Honeywell Int'l, Inc. v. ITT Indus., Inc., 452 F.3d 1312, 1318 (Fed. Cir. 2006) (construing claim term to include a fuel filter because of multiple mentions in the written description of a fuel filter as "the present invention"). AFT's proposed construction leaves out this essential feature, focusing instead upon factors such as the type of equipment in which "screen plates" are used and the role they play in that equipment. AFT's construction does not comport with the intrinsic evidence. Thus, a "screen plate" is an assembly of a screening medium and a backing plate.
b. "Screen Plate" and "Screening Plate" are not Synonymous

The Court rejects AFT's assertion that the terms "screen plate" and "screening plate" are synonymous. Tr. (Dkt. No. 106) at 49. AFT's position is inconsistent with the language of the claims themselves and is contrary to the specification. The claims and specification require construing "screening plate" and "screening medium" as equivalents, and as a component part of a "screen plate."

The claim terms indicate that a "screen plate" (used in claim 10 and its dependent claims) is not equivalent to a "screening plate" (used in claim 18 and its dependent claims). Claim 10 describes a "screen plate . . . comprising: a screening medium . . . and a structural backing plate . . . ." '940 patent, Col. 14, Lns. 13-19 (emphasis in original). Claim 18 describes "a method of manufacturing a screen . . . said screen being formed of a screening plate and a backing plate . . . ." Id., Col. 15, Lns.13-15. To construe the terms consistently, the "screen plate" referred to in claim 10 must be equivalent to the "screen" that is the object of the method of manufacture described in claim 18. Claim 10's "screen plate" cannot be synonymous with claim 18's "screening plate," as this would mean that claim 18 describes a method of manufacturing a screen comprising a screening medium, a structural backing plate, and a backing plate. To avoid that construction, the Court finds that "screening plate" is not equivalent to "screen plate" but is equivalent to "screening medium."

The correctness of this construction is confirmed by reference to the specification and extrinsic evidence. Contrary to AFT's assertion that "screen plate" and "screening plate" are synonymous, the specification notes repeatedly that "according to the present invention, there is provided a method of manufacturing a screening plate for use in a screen plate . . . the screen plate being formed of a screening plate and a backing plate." See, e.g., id., Col. 6, Lns. 12-14, 24-26 (emphasis added). A "screening plate" is clearly a component part that, along with a backing plate, comprise a "screen plate." The term "screening plate" serves the same role and should be construed to describe the same object denoted by the term "screening medium" in the apparatus claims and described in the specification's preferred embodiments. See, e.g., id., Col. 5, Lns. 42-50; 58-65.

Plaintiff's own description of the '940 patent confirms this construction. In his Declaration, Robert Gooding, AFT's Vice President, states that the patent "is directed to screen plates and screen cylinders." Gooding Decl. (Dkt. No. 33-2) ¶ 8. AFT asserts that screen cylinders are a particular (cylindrically curved) type of the broader category of screen plates. See AFT's Mem. In Opp'n to J&L's Post-Claim Construction Hearing Brief (Dkt. No. 113) ("AFT's Post-Hearing Brief") at 18. Gooding states that the patent includes a screen cylinder, a type of screen plate, "formed of at least two pieces: a screening plate . . . and a backing plate." Gooding Decl. (Dkt. No. 33-2) ¶ 16. This description dovetails with claim 1, which claims a "screen cylinder comprising: a generally cylindrical screening medium . . . [and] backing plate." (Emphasis added). Gooding, in describing depictions of the '940 patent, refers to "screening medium" and "screening plate" as denoted by the same reference number (12). Id. ¶ 17. Finally, AFT's Opposition to J&L's Construction Motion acknowledges that "the recited claims provide additional structure for a 'screen plate.'" Dkt. No. 60 at 11. Based on the foregoing, the inescapable construction of "screen plate" as well as "screen cylinder" as used in the '940 patent is an assembly comprising a "screening medium," also referred to as a "screening plate" and a backing plate.

Lucks admits that the term "screen printing" has a well-known meaning in the art -- printing by silk screening. Lucks correctly points out, however, that the specification of the '394 patent sets forth a different meaning for "screen printing," and that the claim must be construed in accordance with the meaning set forth in the specification. See Vitronics Corp., 90 F.3d at 1582 ("Although words in a claim are generally given their ordinary and customary meaning, a patentee may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning, as long as the special definition of the term is clearly stated in the patent specification or file history."). We conclude that the district court was correct in construing the claim not to be limited to conventional screen printing, but as including other conventional processes for printing on foodstuffs.

However, Kopykake argues that the prosecution history shows that Lucks disclaimed ink jet printing from coverage by the claims. Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576, 34 U.S.P.Q.2D (BNA) 1673, 1676 (Fed. Cir. 1995) ("The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed

- 4071 -
during prosecution.") (citations omitted). During prosecution of the '394 patent, the applicants distinguished several prior art references cited by the examiner by emphasizing that the references do not disclose "screen printing" pictorial images on foodstuffs. The prosecution history, however, was not concerned with the question of whether "screen printing" as used in claim 1 included ink jet methods of printing. For example, a prior art Swiss patent to Aschinger was distinguished because it involved the application of an image with a foil transfer process. From this, we conclude only that "screen printing" does not encompass a foil transfer process.

The applicants distinguished U.S. Patent No. 3,503,345 to Abrams because it allegedly did "not even disclose what his 'decorating means' are; much less disclosing [sic] that his decorating means are used for 'screen printing' . . . as claimed by applicants." (internal citations omitted). With regard to other cited references, U.S. Patent No. 919,736 to Loesch and U.S. Patent No. 2,895,832 to Bersey, the applicant argued that "neither . . . makes any disclosure of 'screen printing' . . . at all." From these statements we cannot conclude that the applicants disclaimed any particular claim construction.

Finally, the applicants' statements in the prosecution history distinguished the Abrams patent, U.S. Patent 3,537,406 to Ort, and U.S. Patent 3,198,109 to Dwyer by asserting that none of them "discloses or suggests the successive method steps of first screen printing a very thin, flexible free standing edible image and then using screen printing to print onto it an edible pictorial image." This statement, however, neither defined "screen printing" nor excluded a particular printing process from the definition of screen printing. As we said in York Products, Inc. v. Central Tractor Farm & Family Center, 99 F.3d 1568, 1575, 40 U.S.P.Q.2D (BNA) 1619, 1624 (Fed. Cir. 1996), "unless altering claim language to escape an examiner rejection, a patent applicant only limits claims during prosecution by clearly disavowing claim coverage."

Thus we conclude that "screen printing" includes, in the words of the specification, "any other conventional printing process and any other conventional means and methods" for applying pictorial images to foodstuffs. The question here is what were the "conventional printing processes" that were claimed as part of the invention. To discern the ordinary and customary meaning of "conventional" we may look to dictionary definitions of the word. Dictionaries, although a form of extrinsic evidence, may always be relied on by the court to determine the meaning of the claim terms "so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents." Vitronics, 90 F.3d at 1584 n.6; see also Interactive Gift Express v. Compuserve, Inc., 231 F.3d 859, 866 n.1, 56 U.S.P.Q.2D (BNA) 1647, 1653 n.1 (Fed. Cir. 2000). Dictionary definitions of "conventional" include "according with, sanctioned by, conforming to, or based on convention, custom, or traditional usages or attitudes; established and sanctioned by general agreement and usage; lacking spontaneity, originality or individuality." Webster's Third New International Dictionary 498 (1968).

We must next determine which processes were conventional at the time of the invention. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 968, 34 U.S.P.Q.2D (BNA) 1321, 1335 (Fed. Cir. 1995) (en banc) ("The focus in construing disputed terms in claim language is not the subjective intent of the parties to the patent contract when they used a particular term. Rather the focus is on the objective test of what one of ordinary skill in the art at the time of the invention would have understood the term to mean."); aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996); Eastman Kodak Co. v. Goodyear Tire & Rubber Co., 114 F.3d 1547, 1555, 42 U.S.P.Q.2D (BNA) 1737, 1742 (Fed. Cir. 1998) ("As a general rule, the construing court interprets words in a claim as one of skill in the art at the time of invention would understand them.") (abrogated on other grounds in Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456, 46 U.S.P.Q.2D (BNA) 1169, 1174 (Fed. Cir. 1998) (en banc)). While Lucks may be able to prove an earlier invention date than the date of its patent application, since it did not, we consider the meaning of the claim as of the date the invention was constructively reduced to practice -- the date the patent application was filed. Mahurkar v. C.R. Bard, Inc., 79 F.3d 1572, 1576-77, 38 U.S.P.Q.2D (BNA) 1288, 1290 (Fed. Cir. 1996). As we explained in Schering Corp. v. Amgen Inc., 222 F.3d 1347, 1352-54, 55 U.S.P.Q.2D (BNA) 1650, 1653-55 (Fed. Cir. 2000), when a claim term understood to have a narrow meaning when the application is filed later acquires a broader definition, the literal scope of the term is limited to what it was understood to mean at the time of filing.

Lucks, citing Hoechst Celanese Corp. v. BP Chemicals Ltd., 78 F.3d 1575, 1580-81, 38 U.S.P.Q.2D (BNA) 1126, 1130 (Fed. Cir.), cert. denied, 519 U.S. 911, 136 L. Ed. 2d 198, 117 S. Ct. 275 (1996), claims that screen printing itself was not a conventional process for printing on foodstuffs in 1986 and argues that a claim construction limiting "conventional printing processes" to processes for applying images to foodstuffs therefore is erroneous because it allegedly excludes the preferred embodiment of conventional screen printing. Lucks, however, cites no evidence to support its premise that screen printing was not conventional for printing on foodstuffs in 1986. Moreover, the patent specification states that "screen printing as used herein encompasses . . . conventional screen printing," ('394 patent, col. 1, l. 68 - col. 2, l. 1) thus clearly showing that conventional screen printing is covered.
The claims and the specification of the patent itself do not indicate what other printing processes one of ordinary skill in the art considered to be conventional for applying images to foodstuffs in October 1986. Although Lucks presented evidence that hundreds of thousands of ink jet printers were sold in 1985 and 1986, the evidence does not show that a single ink jet printer was used to print images on food at that time.

Lucks argues that the examiner's citation of U.S. Patent No. 4,548,825 (the "'825 patent"), which issued on October 22, 1985 and describes the use of ink jet printing to print letters on uncoated pharmaceutical tablets, demonstrates that the examiner understood step (d) of claim 1 to encompass ink jet printing. We disagree. The '825 patent was cited by the examiner as "art of interest." There is no discussion of the '825 patent in the prosecution history, and nothing in the record reveals why the examiner believed the '825 patent to be "of interest."

The '825 patent on its face does not indicate that ink jet printing was a conventional printing process for applying pictorial images to very thin, flat, flexible, edible, free standing base shapes in October 1986. The '825 patent states that "ink-jet systems are well known in the field of paper printing," '825 patent, col. 1, ll. 65-66, but the use of ink-jet printing for applying letters to tablets was considered novel and non-obvious. See 35 U.S.C. §§ 102, 103. Lucks presented no evidence that the invention described in the '825 patent was ever actually reduced to practice, commercially introduced, or became a commonly-used, well-known, or generally accepted method for printing images onto foodstuffs prior to October 1986. 1

--- Footnotes ---

1 Lucks also cites U.S. Patent No. 4,168,662 (the "'662 patent"), entitled "Videojet Ink for Printing of Food Products," which issued on September 25, 1979. The '662 patent claims an ink for use in ink jet printing on citrus fruits and other foodstuffs. As with the '825 patent, the '662 patent does not on its face show that ink jet printing was a commonly used printing process for printing on food in October 1986.

--- End Footnotes ---

Because the appellant has not shown that, from the point of view of one of ordinary skill in the art, ink jet printing was a conventional method of printing images on foodstuffs at the time the application for the '394 patent was filed, "screen printing" may not be construed to cover ink jet printing.

--- 3466 ---

Window screens, which allow air to move while barring insects, are not new inventions. And since there have been window screens, manufacturers have had a continuing interest in making them less visible. Andersen, a window screen manufacturer, assembled a team to design reduced visibility insect screens. During their search for the right material, the team members scoured the internet and came upon the TWP, Inc., website. TWP manufactures a variety of screen/mesh products, some of which it actually advertises as window screens.

Relevant to this case, TWP's website displayed a fine, highly transparent stainless steel mesh (referred to as "TWP"), offered for use as electromagnetic shielding. Members of the Andersen team obtained some of this material, and after painting it black, found it appeared nearly invisible when used as window screening. The idea of putting this fine screen mesh into a fenestration unit - a window or door frame - is the essence of the patent in suit.

Andersen attempted to patent its reduced visibility insect screen, but the Patent Examiner initially denied its application. The Examiner considered Andersen's claims obvious in light of the pre-existing TWP material, in combination with a Japanese patent disclosing darkening to make screening less visible. Andersen, thereafter, amended its application to include the limitation "in a fenestration unit that permits ventilation therethrough." With this modification, the U.S. Patent and Trademark Office issued Andersen U.S. Patent No. 6,880,612 ("'612 patent").

Andersen now seeks to prevent Pella and Gore from producing and marketing Pella's Vivid View insect screen, claiming it infringes the '612 patent. In particular, Andersen contends defendants' reduced visibility screen infringes independent claims 22 and 76, and dependant claims 12, 23-29, 55, 59, and 65. Exemplary independent Claim 76 recites:
An insect screening material in a frame removably attached to a fenestration unit that permits ventilation therethrough, having a reduced visibility, comprising a plurality of screen elements having a diameter of 0.007 inch or less, the screen elements having a tensile strength greater than 5500 psi, wherein the screening has a transmittance of light of at least .75 and a reflectance of light of .04 or less. 1

(Def's Ex. 1 at 34.) The Court has construed the term "insect screening" in accord with Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996), to mean "a mesh of thin linear elements permitting ventilation while excluding insects." (Claim Construction Order 3, July 7, 2006).

1 Independant claim 22 is nearly identical to claim 76, without the limitation "in a frame removably attached to" a fenestration unit.

The term "screening medium" appears in claims 1, 2-8, 10, 11, 13-16, 27-32, 36-37, and 39. J&L proposes that the term be construed in a non-industry specific manner as "a filtering medium for liquid-solid separation." Alternatively, if the Court finds that the '940 patent is limited to the pulp and paper industry, J&L proposes the construction: "a screening element made of a perforated metal plate." J&L Construction Mem. at 22. AFT proposes an industry-specific construction for "screening medium," where that industry is paper and pulp: "a barrier with openings or perforations for passing stock therethrough, which removes oversized, troublesome and unwanted particles from good fiber." Opp'n Construction Mot. at 12-14. The Court largely adopts AFT's construction.

The claims and the specification do not limit the terms of the patent in an industry-specific manner. AFT, however, unambiguously limited the patent's scope during its prosecution of the reissue. The claim terms do not limit the '940 patent to the paper and pulp industry. For example, while independent claim 10 asserts "[a] screen plate for screening pulp," '940 patent, Col. 14, Ln. 13 (emphasis added), no such limitation appears in independent claim 1. See also claim 18 (applying the limitation "for use in screening for pulp"). The fact that the limitation, "for screening pulp" appears in many claims but is absent in others, leads the Court to conclude that the claims themselves do not limit the invention to use in the paper and pulp industry. This conclusion is bolstered by the specification, which begins: "The present invention relates to screen plates, e.g. screen cylinders and flat screen plates, for use, for example, in the pulp and paper industry . . . ." '940 patent, Col. 1, Lns. 11-13 (emphasis added). As with the claims, the preferred embodiments described in the specification at times explicitly note that the embodiment is for use in screening pulp, see, e.g., id., Col., Lns. 35-37; id., Col. 4, Lns. 63-64; id., Col. 5, Lns. 58-60, and at other times express no such limitation, see, e.g., id., Col. 5, Lns. 42-48; id., Col. 6, Lns. 41-53. Giving the claims "their broadest reasonable construction" in light of the specification, see Phillips, 415 F.3d at 1316, the '940 patent does not appear limited to use in the paper and pulp industry.

As noted, however, prosecution disclaimer attaches where a patent applicant makes statements that unequivocally disavow the scope of the claims during the prosecution history providing competitors with notice of a narrowed scope of subject matter covered by the invention. Schwing, 305 F.3d at 1324-25. AFT made unmistakable statements during its prosecution of the '940 patent, specifically in response to the Patent Examiner's rejection of the patent as anticipated by the Gillespie. See O'Brien Decl., Ex. B, Parts 25, 29 (Dkt. No. 60-5). The Patent Examiner rejected the application despite his finding that "applicant's claimed invention is merely intended for use in a pulp process." O'Brien Decl., Ex. B, Part 25 (Dkt. No. 60-5). AFT's response to the rejection highlighted that finding, unmistakably denying that the scope of the claimed invention extended beyond pulp and paper. O'Brien Decl., Ex. B, Part 29 (Dkt. No. 60-5) at 20-24. AFT, for example, argued to the Examiner that "[c]learly, the invention recited in claim 1 [which does not explicitly note for use for screening pulp] is a screen cylinder used in the treatment of pulp." Id. at 21. In fact, AFT's entire argument distinguishing the claimed invention
as not anticipated by Gillespie emphasizes the former's limited application in the pulp treatment art and insists that the
Gillespie is neither directed toward, nor appropriate for, pulp fiber sorting. Id. The prosecution history, thus, evidences a
clear and unequivocal disavowal of coverage beyond the pulp treatment industry.

J&L's proposed construction of "screening medium" as "a filtering medium for liquid solid separation" is rejected. The
problem with this construction is that once the industry-specific context is embraced, "screening" takes on a specific
meaning, namely the separation of solid from solid, and is distinguished from "filtering," which involves liquid-solid
separation. J&L's own experts' testimony, a valuable source of extrinsic evidence, confirms this. See, e.g., Hutton Decl., Ex.
AFT never explicitly distinguished the '940 patent as not being a filter, nor distinguished the Gillespie as a filter, rather
than a screen. Nevertheless, while the Court is to construe the claim terms in the broadest way reasonable in the context of the
specification, the scope of that construction is always constrained by the meaning such terms would be given by one of
ordinary skill in the art. Phillips, 415 F.3d at 1316 (citing In re Am. Acad. of Sci. Tech. Ctr., 367 F.3d 1359, 1364 (Fed. Cir.
2004)). Here, the scope is constrained by the ordinary meaning the term "screening medium" is given in the pulp industry,
which, as noted by experts, is distinct from what is meant by "filtering." J&L's construction is, therefore, rejected.

In arguing to the Patent Examiner, AFT asserted that the claim terms have particular meanings in the pulp treatment art and
articulated those meanings by way of definitions supplied by the Handbook of Pulp and Paper Technology. O'Brien Decl.,
Ex. B, Part 29 (Dkt. No. 60-5). Using the Handbook, AFT adopted the following definitions:

SCREEN: Separation device utilizing some type of perforated barrier for removing unwanted material from stock[*] stream.

SCREENING: Process step involving passage of stock[*] through some form of perforated barrier to remove oversize, troubleshooting and unwanted particles from good fiber.

SCREEN PLATE: Perforated metal plate utilized on many designs of pulp screening equipment that impedes pulp flow and is instrumental in causing separation between suspended particles on the basis of their size, shape, and/or flexibility.

STOCK: A mixture of pulp and water with or without non-fibrous additives.

Id. at 21-22. AFT then "submit[ted] that this meaning of the term 'screen plate' in claim 1 is consistent with this meaning in
the art." Id. at 22. Curiously, in view of that statement, claim 1, in fact, does not contain the term "screen plate." Rather,
claim 1 refers to a screen cylinder, which, as noted, is a cylindrically shaped screen plate. The "screen cylinder" in claim 1,
as with all mentioned screen cylinders and screen plates in the '940 patent, is described as an assembly of a "screening
medium"— which the Court finds is synonymous with "screening plate"— and a "backing plate." The Court is thus left with
two options as to what AFT is referring to when it argues that the term "screen plate" in claim 1 is consistent with the
definition it argued to the Examiner: 1) "screen plate" in this argument may refer to the "screen cylinder" claimed in claim
one; or 2) "screen plate" in this argument may refer to the "screening medium" that is one of the two components of the
assembly that comprises the "screen cylinder."

The first option cannot be correct. A screen cylinder is a type of screen plate. '940 patent, Col. 1, Lns. 12-13. However, if the
screen cylinder referred to in claim 1 is construed as a "perforated metal plate . . . that impedes pulp flow and is instrumental
in causing separation between suspended particles on the basis of their size, shape, and/or flexibility" then that claim
actually results in an assembly of three elements, rather than the two that are clearly required by the claims and the
specification. That is, if the screen cylinder in claim 1 is defined as a "perforated metal plate . . . that impedes pulp flow and
is instrumental in causing separation between suspended particles on the basis of their size, shape, and/or flexibility," which
is itself comprised of a "barrier with openings or perforations for passing stock therethrough which removes oversized . . .
particles from good fiber" 7 and a backing plate, then this claim describes a three-part assembly that is unlike the two-part
assembly consistently and repeatedly described in the specification. See, e.g., '940 patent, Col. 2, Lns. 22-23 ("the present
invention provides a screen of two separate layers"). The resulting incongruence between claim 1, so construed, and the
specification would render claim 1 invalid under 35 U.S.C. § 112. See 35 U.S.C. § 112 (requiring a specification that "shall
contain a written description of the invention"). The same difficulty emerges if these constructions are applied to
independent claim 10.
7 AFT's construction of "screening medium." Opp'n Construction Mot. at 14.

If, however, the definition of "screen plate" argued by AFT to the Patent Examiner and submitted to the Examiner as being consistent with its (non)use in claim 1 are applied to the term "screening medium," a more coherent result obtains. This option assumes that, in this instance, AFT mistakenly refers to "screen plate" when in fact it means "screening plate," which is equivalent to screening medium. While applying this assumption results in a coherent claim construction, it does not evidence a clear intent to deviate from the ordinary meaning of screening medium nor rest upon "words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope." Teleflex, 299 F.3d at 1324. Relying upon such unclear prosecution history to define the term "screening medium" as metal perforated plate to that term, as J&L proposes, is inappropriate. See id.; Omega Eng'g, 334 F.3d at 1324.

A third option for construction of "screening medium" is available by reference to extrinsic material, namely the Handbook of Pulp and Paper Technology used by AFT during prosecution of the patent. It defines "screening" as a "process step involving passage of stock[*] through some form of perforated barrier to remove oversize, troublesome and unwanted particles from good fiber." Thus, "screening medium" is properly construed as the medium employed in this "process step," which is identified in the definition as a "perforated barrier." Unlike AFT's proposed construction, the Handbook does not provide for "openings" as well as "perforations" and the Court sees no reason to adopt this additional characteristic. Similarly, the definition does not limit the medium to metal, nor do the claim terms and specification, see, e.g., '940 patent, claim 21 (allowing for a ceramic screening medium); id., Col. 11, Lns. 63-65. Hence, J&L's construction, which requires the medium be metal is contrary to the description. Accordingly, a "screening medium" is a perforated barrier through which stock is passed to remove oversized, troublesome, and unwanted particles from good fiber.

A. "Blunt-nosed screw" and "screw"

The parties' primary claim construction dispute concerns the meaning of the terms "screw" and "blunt-nosed screw" as used in both the '248 and '588 patent. The parties agree that the term "screw" as used in these patents means a "blunt-nosed screw."

Claim 1 of the '248 patent is representative of the manner in which the disputed terms are used in the asserted patents. It reads, with the disputed terms in italics:

1. An apparatus for controlling movement of ice and/or snow along a predetermined area of a sloping surface, said surface including a plurality of spaced, longitudinal raised portions, said raised portions extending from an elevated portion of said surface to a lower portion thereof and each being laterally separated by a base portion, wherein said raised portions are positioned a greater distance above a reference plane than said base portions, said apparatus comprising:

   clamp means for detachably engaging one of said raised portions, said clamp means including a body having a longitudinal cavity for receiving said one raised portion and means for frictionally engaging an external surface of said one raised portion, said means for frictionally engaging comprising at least one blunt-nosed screw threadably interconnected to said body, said screw being extendable into said cavity to deform said external surface of said one raised portion, wherein a first of said clamp means is positionable on a first of said raised portions and a second of said clamp means is positionable on a second of said raised portions; and

   a cross-member interconnectable with said clamp means, wherein a first said cross-member extends between and is interconnected with said first and second clamp means above at least one of said base portions.

The parties agree that the ordinary and customary meaning of "blunt-nosed screw" to one skilled in the art at the time of the invention is a device with a blunted forward end, a shaft or cylinder with a continuous, spirally grooved thread and a tool.
member connection, such as a slot to accept a driving device. The parties also agree that a unitary structure having these elements is a "blunt-nosed screw." They do not agree, however, whether a "blunt-nosed screw" is limited to a unitary structure or whether, as CFE asserts and Contek disputes, it may also be comprised of several parts.

Neither party points to any intrinsic evidence that defines or addresses, directly or indirectly, whether the ordinary and customary meaning of a "blunt-nosed screw" to one skilled in the art of metal roofing encompasses a multi-piece device. Both parties instead rely on extrinsic evidence to support their arguments.

Webster's Third New International Dictionary provides several definitions of "screw" that are potentially relevant here. The first, relied upon in part by Contek, defines a "screw" as "a simple machine of the inclined plane type consisting of a spirally grooved solid cylinder and a correspondingly grooved hollow cylinder of equal dimensions in which the applied force acts in a spiral path along the grooves while the resisting force acts along the axis of the cylinder." Webster's Third New Int'l Dictionary of the English Language Unabridged 2040 (1993); see Merriam Webster's Collegiate Dictionary 1049 (10th ed. 1995) (reciting a similar definition relied upon by Contek). Other, related definitions describe a "screw" as "a cylinder with a helical cut groove on the outer surface . . . used variously (as to fasten, apply pressure, transmit motion, or make adjustments)," and "a cylindrical fastener that is usu. pointed, that has a head with a slot or recess, that is helically or spirally threaded, and that is designed for insertion into material by rotating." Webster's Third New Int'l Dictionary at 2040. While these definitions can be read as suggesting that a "screw" is a unitary structure consisting of a spirally grooved solid cylinder, none definitively addresses this issue.

Webster's Third New International Dictionary offers an alternate definition that more closely addresses this question. This definition states that the term "screw" includes "any of several devices consisting wholly or partly of a screw." Id. (emphasis added). Under this definition, therefore, the ordinary meaning of the term "screw" includes devices that encompass both a spirally grooved solid cylinder and shaft or additional features or components.

The only evidence in the record regarding the ordinary and customary meaning of the term "screw" in the field of metal roofing is found in the declaration of Robert M. Haddock, the inventor of the '248 and '588 patents. Mr. Haddock testifies there that he has 30 years of experience in the steel and metal construction trades, including more than 15 years in the field of metal roof design and fabrication. Pls.' Markman Br., Ex. 1 [hereinafter "Haddock Decl."] P 2. Based on this experience, Mr. Haddock declares that it is well-known in the field of metal roofing that fasteners such as screws come in many different shapes, sizes and configurations, including "threaded shaft-type fasteners that are comprised of multiple components, but are designed to function as a single unit." Id. P 8. Mr. Haddock states that such threaded shaft-type, multi-component fasteners are known as "screws" and gives several examples of such devices that are common in the metal building trade. Id.

Mr. Haddock's testimony is unrebuted. Contek contends it nonetheless should be disregarded based on Federal Circuit authority holding that inventor testimony regarding the meaning of patent claims is not entitled to special deference, see Markman, 52 F.3d at 983, and that inventor testimony is entitled to little or no consideration when it is "a self-service, after the fact attempt to state what should have been part of his or her patent application." Bell & Howell Document Mgmt. Prods. Co. v. Altek Sys., 132 F.3d 701, 706 (Fed. Cir. 1997). The testimony by Mr. Haddock relied on here does not fall within this authority because it describes the state of knowledge in the field of metal roofing at the time of the invention, rather than Mr. Haddock's intent and meaning in using the term "screw" in the asserted patents. In its most recent and comprehensive statement of evidence that district courts may properly rely upon in claim construction, the Federal Circuit specifically authorized consideration of extrinsic evidence, "including expert and inventor testimony," for the purpose of "establish[ing] that a particular term in the patent or prior art has a particular meaning in the pertinent field." Phillips, 415 F.3d at 1317, 1318. That is precisely the purpose of the inventor testimony cited here and thus it may be considered.

Contek also argues "screw" as used in the asserted patents must be construed to be a unitary structure because this construction is most consistent with the most common English usage of the term. This may be true, but the dictionary definition recited above as well as Mr. Haddock's testimony indicates that "screw" as used in the metal roofing field can also encompass multi-part fasteners that include a spirally grooved cylinder or shaft.

"[U]nless compelled otherwise, a court must give a claim term the full range of its ordinary meaning as understood by persons skilled in the relevant art." Riverwood Int'l, 324 F.3d at 1357; Rexnord, 274 F.3d at 1342. Before adopting the broadest definition of a term based on a dictionary definition or other extrinsic evidence, however, I must scrutinize the
Having reviewed the language of the claims, the specification of the asserted patents and relevant prosecutorial history, I find no indication that the term "screw" must be limited to the narrower definition of a unitary structure. The intrinsic record suggests that "blunt-nosed screw" simply means a fastener with spirally grooved shaft and rounded end that frictionally engages the roof seam. Nothing in this record indicates a concern with whether this fastener is made up of one or multiple parts. Based on this and the extrinsic evidence cited above, I hold that the term "blunt-nosed screw" and "screw" as used in the asserted patents is not limited to a unitary structure.

My reasoning and result here is similar to that of the Federal Circuit in Free Motion Fitness, Inc. v. Cybex International, Inc., 423 F.3d 1343 (Fed. Cir. 2005), an infringement action concerning a patent for an exercise apparatus comprising a resistance assembly, two adjustable extension arms that pivot on an axis substantially parallel to the axis of rotation of a pulley at the end of each arm, and a cable linking the resistance assembly to the arms. Id. at 1345. One of the issues on appeal was the proper construction of the term "adjacent" as used in claims describing the location of the resistance assembly of the exercise machine relative to the pivot point on each of its extension arms. Id. at 1345, 1349. The court observed that the intrinsic evidence did not define the term and that it had no specialized meaning in the relevant art. Id. at 1348. It next identified two definitions of "adjacent" in Webster's Third New International Dictionary that might apply, the first being "not distant" and the second being "relatively near and having nothing of the same kind intervening." n4 Id. at 1349. The court then returned to the intrinsic record and determined that nothing in it suggested a concern with intervening pivot points or excluding any intervening pivot points. Id. Accordingly, the court adopted the broader definition of "not distant" in construing the term "adjacent." Similarly, I find no concern in the asserted patents for a unitary as opposed to a multi-part screw and therefore also adopt the broader of the possible dictionary definitions of "screw" in finding that the term is not limited to a unitary structure. n5

--- Footnotes ---
n4 The choice between these definitions was material because the accused device had intervening pivot points. See id. at 1346, 1348-49.

n5 I am also guided by the Federal Circuit's decision in Riverwood International Corp. v. R.A. Jones & Co., 324 F.3d 1346 (Fed. Cir. 2003), in which the court considered whether the term "flight bars" was limited to a unitary structure or could include a plurality of pieces. The court found that the term, which was not defined in either the intrinsic or external evidence, was not limited to a unitary structure because "[n]othing in the claim language, specification, or prosecution history suggests that flight bars must be of unitary structure. The district court, consistent with our guidance that a claim term is to be given 'the full range of its ordinary meaning as understood by an artisan of ordinary skill' instructed the jury not to limit the term to the unitary structure found in the specification. We agree with that conclusion." Id. at 1358 (quoting Rexnord, 274 F.3d at 342).

--- End Footnotes ---

I caution the parties that this decision goes only to the construction of the disputed term "blunt-nosed screw" and in no way finds or suggests that Contek's accused device constitutes a multi-part "blunt-nosed screw" that infringes on CFE's patents. The question of infringement is for the finder of fact, which may well find that one or more of Contek's combinations of a spirally grooved cylinder and blunt-ended ball bearing, "circle-lok" and/or "sure grip pad" does not constitute a "blunt-nosed screw" because it has other functionality or perhaps for other reasons.

3469

A. Whether the TFN Helical Blade Is a Screw

Synthes contends that the TFN product does not practice claim 1, and other dependent claims, of the '663 patent because the Helical Blade inserted into the femoral head is not a "first screw for insertion." Synthes contends that the TFN does not practice claim 1 of the '406 patent, and other dependent claims, for the same reason. At the Markman hearing, Synthes
argued that the patent term "screw" should be confined only to those devices that are inserted into the object medium by a
torsional, or twisting, force. This definition would not apply to the Helical Blade, which is driven, or hammered, into place
in the femoral head. The court rejected that argument, however, concluding that it is the physical structure, rather than the
method of insertion, of a device that determines whether it is a "screw" claimed by the patents in suit. The patent phrase
"first screw" was interpreted to mean "a generally cylindrically-shaped simple machine of the inclined plane type, at least a
portion of which is threaded."

The Helical Blade of the TFN serves the function of engagement and support of the femoral head, which is also served by
the "first screw for insertion" in the asserted patents. It extends through the oblique opening in the proximal portion of the
intramedullary rod and up into the femoral head. (TX 1-4, 12). Rather than traditional screw threads that wind a nearly
horizontal spiral up the shaft of the screw, the Helical Blade possesses four threads, each of which is uniquely structured and
has a more vertical (steeper) pitch.

The top thread of the Helical Blade starts with no height at the tip of the device and gradually increases in height as it moves
from the tip to the distal end of the shaft. The taper of the top thread reduces the potential for cut-out because there is no
sharp edge directed toward the top of the femoral head. (TX 12, 91; Tr. 1205:7-17, 1604:3-6, 1477:10-1478:4). The two side
threads provide a horizontal, paddle-like surface to carry loading and resist cut-out. These two threads increase in thickness
as they approach the shaft of the device to aid in transferring loads to the shaft of the Helical Blade. (TX 12, 91; Tr. 1478:5-
24, 1604:6-17). The bottom thread of the Helical Blade has a uniform thickness and height along its length. It provides
additional surface area for engagement of bone in the head of the femur and contributes to the overall bending strength and
rotational stability of the Helical Blade. (TX 12-13, 91; Tr. 1478:25-1479:17, 1604:18-22). Unlike a traditional lag screw,
the zero-height top thread and the two side threads form a flat plane to receive loading, such that there are no sharp edges
against the loading force. This characteristic helps to prevent the device from cutting out of the femoral head in patients

Although Synthes has submitted credible evidence that the TFN Helical Blade constitutes an improvement over the
traditional lag screw included in the inventions sold under the patents in suit, the issue before the court is whether the TFN
Helical Blade qualifies categorically as a "screw" as claimed by the patents in suit. The physical structure of devices
actually sold under the patents does not limit the meaning of the claim language. See Uniroyal, Inc. v. Rudkin-Wiley Corp.,
837 F.2d 1044, 1057-58 (Fed. Cir. 1988) ("Adding features to an accused device will not result in noninfringement if all the
limitations in the claims, or equivalents thereof, are present in the accused device"). After careful consideration of all of the
evidence admitted at trial, the court concludes that the TFN Helical Blade is "a generally cylindrically-shaped simple
machine of the inclined plane type, at least a portion of which is threaded."

Synthes's primary argument directed at the claim language is that the Helical Blade is not a "simple machine of the inclined
plane type" because the pitch of the threads is such that it requires less force to drive the Helical Blade into the femoral head
than it would to rotate or twist it into the femoral head. Because a simple machine is a device used to make work easier by
providing a mechanical advantage, Synthes contends that the threads, or blades, are not configured so as to allow the Helical
Blade to function as a simple machine of the inclined plane type. (Tr. 1440:209).

Dr. Eric Gozna testified on behalf of Synthes that an inclined plane makes work easier by allowing an object to be moved a
given vertical distance using less force than would otherwise be necessary. (TX 85; Tr. 1440:10-1441:25). A screw is a
simple machine of the inclined plane type because the thread of a screw is an inclined plane wrapped around a cylindrical
shaft. (TX 85; Tr. 1442:17-1443:9). The pitch of a screw is the distance between the tips of the screw thread. The greater the
pitch, the steeper the inclined plane, and the less efficiently the device will work as a simple machine of the inclined plane
type. (TX 85; Tr. 1443:5-23). As a screw is inserted into a material (in this case, bone), the object material "rides up" the
inclined plane, e.g., the screw thread. The shape of the inclined plane (screw thread) is capable of converting a torsional (or
"horizontal") input force into an axial (or "vertical") force advancing the screw into the material. (TX 85; Tr. 1441:1-22). As
the thread pitch is increased (i.e., as the inclined plane gets steeper), the mechanical advantage of applying a torsional force
diminishes, until it requires less force to advance the screw using a vertical ("driving") force than using a horizontal
("twisting") force. (TX 85; Tr. 1444:23-1446:7).

Synthes's foregoing description of the manner in which a screw functions as a simple machine of the inclined plane type is
 accurate. The court cannot accept, however, the argument or testimony that a screw ceases to be a "simple machine of the
inclined plane type" when the screw threads obtain a steepness at which it is easier to drive the screw than to twist the
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

screw. Using the description offered by Synthes and accepted by the court, an inclined plane does not cease to be an inclined plane because its steepness results in a failure to achieve some predetermined level of efficiency. Offering a distinction between the respective forces required in driving and twisting a screw is a sophisticated way of making the argument that was rejected in the Markman hearing: that a "screw" is twisted into place and a "nail" is driven into place. The mechanical advantage provided by an inclined plane is measured by comparing the force parallel to the inclined plane with the purely vertical force required to overcome gravity. (See TX 85, Demo. 3-4) (emphasis added). Mechanical advantage is not measured, as Synthes contends, only by comparing a purely horizontal, or in the case of a screw, torsional, force to a purely vertical force.

The patent's definition of the term "screw" imposes no limitations on the manner or ease with which the screw must be inserted. (Markman Order at 14; Tr. 2984:7-2985:2, 2995:16-2996:19). Two of Synthes's experts conceded that they were unaware of any scientific literature, reference, or treatise to support their opinions that the fundamental point of distinction between a nail and a screw is whether the pitch of the threads makes it easier to hammer or twist into the object material. (Tr. 1231:3-14, 1510:25-1512:1). More importantly, the patents in suit appear to make no attempt to distinguish a "nail" from a "screw." 11 See, e.g., Phillips v. AWH Corp., 415 F.3d 1303, 1320 (Fed. Cir. 2005) (rejecting the "presumption" in favor of dictionary definitions announced in Texas Digital Systems, Inc. v. Telegenix, Inc., 308 F.3d 1193 (Fed. Cir. 2002), as giving inadequate weight to the role of the specification in interpreting claim language). 12 If the term "screw" were meant specifically to disclaim similar prior art that employed a nail for insertion into the femoral head, Synthesis proffered distinction would be more persuasive. The evidence introduced at trial pertaining to "spiral nails" and "drive screws" shows, if anything, that the terms "screw" and "nail" may overlap, that they are not mutually exclusive. (See TX 42-43; Tr. 2996:20-2997:8, 3124:8-14). The question before the court is only whether the Helical Blade qualifies as a screw as defined in the '406 and '663 patents.

The Helical Blade qualifies as a "screw" as defined by the court and claimed by the patents in suit. An examination of the device clearly shows that it is "generally cylindrically shaped." (TX 12). The helical threads ease the insertion of the Helical Blade into the head of the femur and provide a mechanical advantage in retaining engagement of the femoral head when bone fragments are squeezed together. (Tr. 1239:25-1240:13, 1418:25-1419:5, 1498:13, 1498:25-1499:13). Thus, the TFN Helical Blade qualifies as "a generally cylindrically-shaped simple machine of the inclined plane type, at least a portion of which is threaded."

3470

a. Definition of Screw Holes

DePuy argues that the "plurality of screw holes" limitation of the 36 Patent can only mean "those holes that are capable of fixing or locking the head of a corresponding screw into the bone plate". Therefore, a plurality of such screw holes must mean more than one of these screws.

In the actual claims of the 36 Patent, the screw holes are defined as being "conical and transverse said plate between said
upper and lower surfaces such that the narrow end of the cone is towards the lower surface and said holes adapted to receive screws having conical heads of a predetermined cone angle, such that the plate will not slide down the heads of the screws." (Claim 2). Claim 9 describes a plurality of bone screws for attaching the plate of Claim 7 to the bone, and screw holes capable of receiving such screws. Finally, Claim 13 adds a bone plate assembly according to # 9 wherein said screws are of a length that permits engagement of the screw with only one side of the bone cortex. The Court can find no distinct meaning of the "plurality of screw holes" limitation from the language of the claims alone.

Since the claims themselves do not give a complete answer to the term "plurality of screw holes", the Court must now look to the written specifications of the 36 Patent. Synthes uses the terms "screw holes" in different ways throughout the specification. For example, it uses that term to describe prior art screw holes (Pl. Mem. in Opp., Ex. A, 36 Patent 3:40) 1. When discussing the proposed reduced contact plate, Synthes uses "screw holes" to define both locking screw holes and self-compressing screw holes. See (Pl. Mem. in Opp., Ex. C, Burstein Dep. Tr. 124:12-20) (Def. expert stated that he did not know of and could not imagine a compressing screw hole that is also a locking screw hole.) The varied use of the term throughout the specification suggests a broad definition of screw hole consistent with a meaning that encompasses all types of openings through which screws can be passed to attach the plate to the bone. See Johnson v. Worldwide Assoc., Inc. v. Zebo Corp., 175 F.3d 985, 991 (Fed. Cir. 1999) (Varied use of a disputed term in the written description demonstrates the breadth of the term rather than providing a limited definition).

The Defendant argues that it is only through the use of locking screw holes that the Synthes can accomplish its goal of reducing contact between the plate and bone. Synthes does in fact describe a locking screw hole as one manner by which contact can be reduced because it allows the use of short screws that only reach the front cortex of the bone. (Pl. Mem., Ex. A, 3:5-35). However, this is not the only embodiment of the invention that Synthes claims will achieve reduced contact. Alternative methods include the use of a long screw with a spherical or conical insert, and the use of self-compressing screw holes. (Pl. Mem, Ex. A, 3:59-4:15).

The prosecution history of the patent also favors a broad definition of the plurality of screw holes limitation. Synthes points out that during prosecution of the 36 Patent, the examiners rejected several claims related to the plurality of screw holes limitation as being anticipated by earlier patents. Pl. Mem., Ex. D, page 2. (Treace and Kummer patents disclose plurality of screw holes). The Kummer patent discloses a plurality of 'conventional metallic bone' screws that secure the bone plate to the bone. Pl. Mem., Ex. E, 3:10-15. This Court agrees with Synthes's position that examiner did not view the "plurality of bone screws" as referring only to locking screw holes, an interpretation that DePuy encourages.

The Court concludes that a "plurality of screw holes" as disclosed in the 36 Patent is entitled to a broad interpretation, a meaning that encompasses all types of openings through which screws can be passed to attach a plate to the bone. In Claim 2, the screw holes are further defined as to be locking and conical. In Claim 4, at least one screw hole has the additional limitation of being self-compressing. Therefore, the Court can not accept a definition of screws holes that refers only to locking screws.

Sunon asserts that the use of the word "means" creates a presumption that section 112, ¶6 applies, and that the function of the "scroll plate means" is "to surround the impeller means." (R. 96-1, Defs.' Claim Constr. Br. at 12.) The word "surrounding," however, does not specify a function. Rather, the word "surrounding" refers to a structural relationship between the fan housing, the fan blades, and the hub. Further, the term "scroll plate means" recites structure, i.e., the scroll...
plate (the fan housing). Cole, 102 F.3d at 531; Pirelli Cable, 988 F. Supp. at 434. Because there is no corresponding function for the "means," section 112, P6 does not apply to the "scroll plate means" term. Rodime, 174 F.3d at 1302; Sage Prods., 126 F.3d at 1427; York Prods., 99 F.3d at 1574.

3472

Defendants also seek to add an air tight limitation, which the Court agrees has support. In Claim 10, the invention adds the step of "drawing out at least a portion of the ambient atmosphere from said area involved in fire after it has been sealed." If the seal had no air tight characteristics, this step could not be completed; whatever air that was drawn out would simply be replaced by air outside of the seal. However, given the irregular surfaces of the walls of a mine, the Court can comfortably conclude that one of ordinary skill in the art would not understand the seal to be perfectly air tight. The Court construes "seal" to mean "a fire proof barrier that is substantially air tight."

3473

D. "To Seal" and "A Seal"

1. The claim terms and proposed constructions

Claims 1 and 16 recite in relevant parts:

1. . . . wherein said shield's forward side abuts the frame's rearward side and said shield's rearward side contacts the face of the wearer of the frame to seal with the wearer's face. . . .

'688 patent at 10:6-9 (emphasis added).

16. . . . wherein the shield structure is resilient and extends rearwardly to form a seal with the wearer's face.

Id. at 11:7-9 (emphasis added).

Preventive proposes the verb "to seal" should be construed as "to fit snugly or mold with another surface so as to hinder the passage of liquids and solids," and the noun "seal" should be "a means of hindering the passage of liquids and solids." Panoptx contends that the terms should instead mean "to create a tight and impenetrable barrier or closure preventing entry," and "a tight and impenetrable barrier or closure preventing entry," respectively. Again, Preventive seeks a construction with "hinder" as the operative term connoting less than a perfect seal, whereas Panoptx offers the absolute terminology of "impenetrable barrier."

2. Plain meaning of the claim

The ordinary meaning of the verb "to seal" is to: make tight, secure against leakage, close, or close hermetically. Even though this word admits of less of a range in the degree of closure, a range is nonetheless discernable. It is undisputable that "to close," and "to close hermetically" carry different connotations. Thus, it is reasonable to question whether the claim term should be restricted to the more stringent interpretation offered by Panoptx, or whether it carries a broader, less absolute meaning.

The ordinary meaning of the noun "a seal" is: a device that prevents leakage, or an airtight or watertight closure. Again, a range of meaning is present. The shield material itself is air permeable, although there is no indication that it need be watertight. Whether either or both of these conditions apply to the interface between the shield and the face, where "the seal" in question is formed, is not apparent from the language of the claims.

The rest of each claim limitation provides the context for what is making the seal. Again, it is the shield's rearward side, where it contacts the face of the wearer, that is forming the seal. Note that it is this same contact between the rearward side of the shield and the face that is said to "prevent the passage of liquids and solids." See supra Part C. The terms "seal" and
"prevent" do not appear within the same claim, however, and thus are entitled to the presumption of a difference in meaning and scope. Power Mosfet Technologies, L.L.C. v. Siemens AG, 378 F.3d 1396, 1409-10 (Fed. Cir. 2004). Nonetheless, because the claim language itself does not resolve the ambiguity regarding the degree to which the shield seals to, or forms a seal with, the face, the specification is again consulted for the context of the invention.

3. Specification

The key question is whether by the term "seal" the patentee was claiming an eye shield system that is "leakproof" at the point of contact between shield and face as the invention. In the specification the phrase "seal or fit snugly" appears numerous times. '688 patent at 1:22, 2:12, 20, 41. A duo of terms given in the alternative normally implies that each word or phrase carries a distinct meaning. See Innova/Pure Water, Inc. v. Safari Water Filtration Systems, Inc., 381 F.3d 1111, 1119 (Fed. Cir. 2004). Within this pair, "seal" would carry a more stringent meaning than "fit snugly." However, any distinction between these two is blurred by the passage in the specification teaching that the shield "must fit snugly to both the face and the frame of the eyeglasses or goggles, thus creating a seal." '688 patent at 2:50-52 (emphasis added). A "snug fit" does not necessarily connote a leakproof seal, but an object that "fits snugly" does at least amount to a "close contact with another surface" that can be described as a seal. Other uses in the specification of the term "seal," as either a noun or a verb, also fail to specify the degree to which a leakproof fit is required.

The discussion above for the term "prevents" is also relevant to this construction. The specification interrelates the two terms, for example, "a seal preventing entry," '688 patent at 3:16, and nowhere does it indicate they carry distinguishable connotations. "Where neither the plain meaning nor the patent itself commands a difference in scope between two terms, they may be construed identically." Power Mosfet, 378 F.3d at 1410 (citation omitted).

Again, viewing the invention as a whole, the eye shield system is not intended to be restricted to perfect systems. "Seal" generally implies a tight, secure contact that does not permit leakage. In the context of this invention, however, nothing in specification explains that the terms "to seal" has any different meaning than "to prevent" as these terms relate to the interface between the shield and face. As with the teaching relating to the term "prevents," the allowance of a mechanism for wearing the glasses that does not ensure a positive, secure fit against the face also would lead one of skill in the art to understand that the "seal" at the interface need not be absolute. Nowhere is it explained that "a seal" does anything more than "prevent" the passage of liquids to the degree construed above. Furthermore, although the condition of a "leakproof seal" may be established periodically, or even nearly continuously, the language of the claims and the specification does not establish that an "absolute seal" must be created and maintained by the shield system.

4. Conclusion

The term "to seal," as used in claim 1 means "to make contact with another surface so as to substantially stop the passage of solids and liquids." See Playtex Products, 400 F.3d at 907. The related term "a seal," as used in claim 16 is "a means for substantially stopping the passage of liquids." See id. The rearward edge contacts the face to seal, or form a seal, that largely stops, although not to the degree of absolutely stopping, the passage of liquids and solids at the point of contact. The specification does not require the term to carry only the most restrictive meaning that the contact between the shield and face "not allow" the passage of liquids or solids.

3. Seal

The ordinary meaning of "seal" is a device that joins two parts so as to prevent leakage. Figure 2 of the '562 Patent specification is consistent with this meaning of a seal. It displays a seal extending from the side wall to the piston. The prosecution history does not contain a definition contrary to the ordinary meaning. Accordingly, the Court construes "seal" as a device that joins two parts so as to prevent leakage.
Finally, Moore has asked this court to construe the term "seal" in Claims 1 and 2. Central States asserts that the limitation in claim 1 must be read: "when activated the strips of adhesive will tightly or completely close or secure its respective edge from one end to the other." Relying on a dictionary definition of the term "seal," Moore argues that the seal need only satisfy the form's users and postal authorities.

The Court has no reason to doubt the definition for seal used by Central States. Nonetheless, the wide spectrum of definitions of seal warrants an examination of intrinsic evidence. Examination of the term "seal" within the claims gives no indication of the type of seal claimed. However, the specifications indicate that the seal desired is such that it will be adequate to "satisfy users and postal authorities." This statement indicates that a tight, continuous seal is not necessary to satisfy the meaning of the term "seal" in the claims. Nothing further is mentioned in the prosecution history concerning the meaning of the term. Therefore, the term "seal," as used in Claims 1 and 2, means attached together to satisfy users and postal authorities.

II. Claim Construction

Claims 15 and 33 of the '134 patent present two issues of claim construction. Claim 15, an apparatus claim, recites in pertinent part: "means operable upon completion of a filling cycle for moving said plate toward said filling machine for causing an internal wall of the container to engage about and seal off said aperture to exclude entry of foreign matter until the aperture is closed by a cap." '134 patent, col. 13, ll. 34-39 (emphasis added). Claim 33, a method claim, recites in pertinent part: "moving an internal wall of the bag into overlying relationship relative to the inner end of the spout to seal off the spout and exclude entry of foreign matter . . . ." Id. at col. 16, ll. 18-20 (emphasis added).

A. Physical Contact

The district court correctly held that the claims require a "bag-to-spout seal" during the time after filling and before capping. The claim language requires a sealing mechanism or method that creates a seal in which the bag contacts the spout. For example, claim 15 specifically states that the plate is moved toward the filling means, i.e., the spout, for causing an internal wall of the container to engage about and seal off the aperture, i.e., the spout. The recitation of "engage about and seal off said aperture" requires contact. Claim 33 requires the same, albeit in different terminology, reciting "moving an internal wall of the bag into overlying relationship relative to the inner end of the spout to seal off the spout and exclude entry of foreign matter . . . ." Therefore, we conclude that the district court was correct in construing claims 15 and 33 to require physical contact between the inner wall of the flexible bag and the bottom of the spout when the filler is in the uppermost position. In the context of this case, this requires some physical contact between the inner wall of the flexible bag and the bottom of the spout.

B. Substantial Seal

The second issue of claim construction is that of the "airtight seal" requirement. The district court held that the patent required the seal to be "airtight," i.e., allowing only negligible amounts of air to enter the bag, and not a "substantial" seal as urged by Scholle. In this respect the district court erred. We find that the claims only require a "substantial" seal resulting in - 4084 -
In construing a claim, "the court should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). We begin with an analysis of the claim language itself. Id. "The general rule is, of course, that terms in the claim are to be given their ordinary and accustomed meaning." Johnson Worldwide Assocs., Inc. v. Zebeo Corp., 175 F.3d 985, 989, 50 U.S.P.Q.2D (BNA) 1607, 1610 (Fed. Cir. 1999). "It is always necessary to review the specification to determine whether the inventor used any terms in a manner inconsistent with their ordinary meaning." Vitronics, 90 F.3d at 1582; 39 U.S.P.Q.2D (BNA) at 1577. Finally, the court may consider the last piece of intrinsic evidence -- the prosecution history. Id. If however, a claim limitation is still not clear after examining the intrinsic evidence, we may look to extrinsic evidence to help resolve the lack of clarity. Interactive Gift Express, Inc. v. CompuServe, Inc., 231 F.3d 859, 866, 56 U.S.P.Q.2D (BNA) 1647, 1653 (Fed. Cir. 2000). Dictionaries, although a form of extrinsic evidence, may always be relied on by the court to determine the meaning of the claim terms "so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents." Vitronics, 90 F.3d at 1584 n.6, 39 U.S.P.Q.2D (BNA) at 1578 n.3; see also Interactive Gift Express, 231 F.3d at 866 n.1; 56 U.S.P.Q.2D (BNA) at 1653 n.1.

Packaging Systems argues that "the plain language of both claims requires that the machine create an airtight seal." We disagree. An airtight seal is only one of many possible seals. Resort to the dictionary does not provide a clear and unambiguous definition as to the type of seal that is required either. The dictionary has a number of definitions of seal, only one of which requires "a tight and perfect closure (as in the passage of air and water)." Webster's Third New International Dictionary 2046 (1968). Whatever the dictionary definition of seal is, here the definition of seal in the specification makes clear that only a "substantial" seal is required.

The specification of the '134 patent states: "Desirably, substantially all of any such atmosphere should be removed and excluded from the head space of the bag prior to recapping both to minimize the overall volume of the bag and, more importantly, to prevent oxidation and/or contamination of the product in the bag." '134 patent, col. 9, ll. 1-6 (emphasis added). Packaging Systems argues the above quoted phrase is directed toward the quantity of the air that is removed from the bag after the filling process, not the ability of the device to exclude air from the head space. This argument is unpersuasive. The term "substantially" as used in this passage from the specification, modifies both "removed" and "excluded," and thus the specification must be read to require only substantial exclusion or sealing of the spout.

"Substantial seal" should be defined by the industry standard for the quantity of air allowed into the head space of a bag in the flexible bag industry.

II. The requirement for a "sealed" lamp cavity or socket enclosure

A. Literal Infringement

1. Interpretation

All of the claims of both Plaintiff's patents, with the exception of claims 5 and 20 of the '709 reissue patent, require the "lamp cavity" to be sealed. See, e.g., the '709 reissue patent, col. 7, line 11 et seq.; '397 patent, col. 5, line 47 et seq. Claim 7 of the '709 reissue patent is representative in pertinent part: "A lighting system comprising ... a lamp assembly having a socket enclosure and a lens, said socket enclosure with said lens defining a lamp cavity separately sealed from said housing; ..." '709 reissue patent, col. 7, lines 9; 12-14. Claim 21 of the '709 reissue patent is representative in pertinent part of claims 25 of the '709 reissue patent and claims 2 through 7 of the '397 patent: "A lighting system comprising ... a lighting assembly having a socket enclosure and a lens, said socket enclosure with said lens defining a lamp cavity, said lamp cavity being sealed against moisture; ..." Id., col. 8, lines 66-68 - col. 9, lines 1-2.

Defendant contends that the requirement in each of the claims of the '709 reissue patent and the '397 patent for a lamp assembly having a "sealed" lamp cavity or socket enclosure means that the socket enclosure and the lens of the lamp assembly must be in sealed engagement. According to Defendant, all of the claims state that the socket enclosure with the
lamp lens defines the "lamp cavity." It is this assembly of the socket enclosure and lamp lens that must be in sealing engagement in order to have a sealed lamp cavity. 7

7 All of the claims of both Plaintiff's patents, with the exception of claims 5 and 20 of the '709 reissue patent, require the "lamp cavity" to be sealed. Claims 5 and 20 do not recite that the lamp assembly includes a lens. Therefore, on their face, these claims only require the socket enclosure to be sealed, separately from the housing. Defendant argues that as there is no discussion in the patents as to how the socket enclosure could be separately sealed from the housing without being sealed by a lens, the omission of the word "lens" in these claims is a technicality without any practical significance.

Plaintiff appears to misconstrue Defendant's interpretation of the claims in question as requiring that the lamp cavity or socket enclosure be sealed "separate and apart from the housing." See Pl. Opp., p.10. Plaintiff then argues that some of the claims 8 do not include any such limitation that the lamp cavity be "separately sealed from the housing." Rather, these claims only require that the lamp cavity be "sealed against moisture." The Court believes that Plaintiff avoids interpreting the "sealed" lamp cavity and ignores the issue raised by Defendant of what constitutes the lamp cavity or socket enclosure and hence what exactly has to be "sealed. The issue of whether or not the lamp cavity is "separately sealed" from the housing is a different question not challenged by Defendant in this instant motion.

8 Plaintiff asserts that claims 21 and 25 of the '709 reissue patent and claims 2-5 of the '397 patent do not require that the lamp cavity be separately sealed from the housing. As Defendant points out, claims 2-7 of the '397 patent do not require separate sealing.

The Court finds that the requirement in all of the claims of both patents that the lamp assembly have a "sealed" lamp cavity or socket enclosure means that the socket enclosure and the lens that together form the lamp assembly must themselves be in sealed engagement. This interpretation is consistent with the language of the claims as well as the basic principle of Plaintiff's invention that the individual components of the lighting fixture be sealed to allow the fixture to remain open to enable use of air and water for cooling. 9

9 For example, Plaintiff cites as one of the problems its invention was meant to address: "Field repairs can trap humidity in the lamp, which eventually condenses inside the lamp and has the potential to short out and/or corrode the electrical system. " '709 reissue patent, col. 1, lines 52-55. Interpreting the claim to require separate sealing of the lamp assembly is consistent with addressing this problem so that the lamp assembly could be serviced and sealed in an controlled environment.
in the opening at its distal end. Claim 33 includes a limitation requiring such a seal: "said second lumen being sealed at a distal end thereof to prevent fluid communication between [chamber 1] and said second lumen." Utah Medical argues that this limitation should be interpreted to require only a seal sufficient to prevent fluid communication between the second lumen and the first chamber that would interfere with the pressure measurement function of the first chamber. The unambiguous language of this limitation, however, is not limited to the definition urged by Utah Medical. The district court correctly concluded that this limitation requires an element that "completely seals off the area between the chamber holding the amniotic fluid and the second lumen." Utah Medical, 79 F. Supp. 2d at 1306.

3479

First, we look to the reissue patent. Plaintiff alleges that defendant infringed claim 32 of this patent, which defines the invention as:

A pre-packaged, pre-soaked cleaning system for use to clean the cylinder of printing machines comprising in combination:

(1) a pre-soaked fabric roll saturated to equilibrium with cleaning solvent disposed around a core, said fabric roll having a sealed sleeve which can be opened or removed from said fabric roll for use of said fabric roll, disposed there around, and said system including

(2) means for locating said fabric roll adjacent to and operatively associated with a cylinder to be cleaned.

Defendant argues that its product does not meet two elements in this claim: "a pre-soaked fabric roll" and a "sealed sleeve." Defendant construes "a pre-soaked fabric roll" to be a single fabric roll, and "sealed sleeve" to mean a heat-sealed sleeve. Plaintiff contends that "a pre-soaked fabric roll" in the context of this claim means one or more fabric rolls, and that "sealed sleeve" is not limited to heat-sealed sleeves.

The question of whether claim 32 applies to a cleaning system that has more than one fabric roll is not simply answered by the singular article "a," modifying "pre-soaked fabric roll." As defendant recognizes, "a" can mean "one or more" when in a claim with the transitional phrase "comprising." See Scanner Technologies Corp. v. Icos Vision Systems Corp., N.V., 365 F.3d 1299, 1304 (Fed. Cir. 2004); KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000). Unless the patentee "evinces a clear intent" to limit the article "a" to a singular interpretation, it is properly construed as one or more. KCJ Corp., 223 F.3d at 1356. To determine if there is clear intent to limit "a" to one, the court looks to claim language and context, and to the patent specification and prosecution. Id.; Scanner Technologies, 365 F.3d at 1304-05; see Phillips, 2005 U.S. App. LEXIS 13954, 2005 WL 1620331 at *9 ("It is therefore entirely appropriate for a court, when conducting claim construction, to rely heavily on the written description for guidance as to the meaning of the claim.").

Defendant contends that the claim's repeated reference to "said fabric roll" indicates that the patentee contemplated only one roll. In Abtox, the Federal Circuit addressed the significance of the word "said," while analyzing whether the phrase "a metallic gas-confining chamber" limited the claim to relevant devices with a single chamber. The court found that the claim's repeated reference to "said chamber," instead of "a chamber," reinforced "the singular nature of the chamber." Abtox, 122 F.3d at 1024. Similar to the patent in Abtox, claim 32 of the reissue patent repeatedly employs the term "said fabric roll" to refer back to the antecedent, "a pre-soaked fabric roll." But the court found that the claim's repeated reference to "said fabric roll," instead of "a fabric roll," reinforced "the singular nature of the fabric roll." Abtox, 122 F.3d at 1024.

Plaintiff cites the Manual of Patent Examining Procedure (MPEP) to support the contention that "said" does not per se connote "single," but rather is an accepted term used to refer back to a previously cited object. While we agree that "said" does not per se connote single, plaintiff's citation to MPEP § 2173.05(e) only strengthens defendant's contention that the use of "said" in claim 32 evidences a limitation to a single fabric roll. Section 2173.05(e) discusses the confusion that can arise when a claim lacks a proper antecedent basis for a term. For example, a claim is unclear if it mentions "the lever," without first identifying an element of the claim to which this could refer, or references "said aluminum lever," even though the only prior reference to a similar element was the less specific, "a lever." Id. The section also explains, "if two different levers are recited earlier in the claim, the recitation of 'said lever' in the same or subsequent claim would be unclear where it is uncertain which of the two levers was intended." Id. Therefore, the use of "said fabric roll" implies that the prior reference to "a fabric roll" should be read as a single roll, not one or more rolls, in order to avoid confusion. As the Abtox court found,
use of the word "said" evidences an intention that the modified term be singular. 122 F.3d at 1024.

The Federal Circuit faced the same issue in Insituform Technologies, Inc. v. Cat Contracting, Inc., 99 F.3d 1098, 1105 (Fed. Cir. 1996), as well. In that case the patent concerned a method of repairing underground pipes in which a vacuum drew heat-setting resin through a tube inserted in the pipe. The court considered whether the claim's reference to "a [vacuum] cup" and "the cup" limited the claim to a repair method that involved only one vacuum cup. Id. at 1105. It found that the claim's repeated reference to "the cup," as well as to a singular region of vacuum application, was inconsistent with a construction of the claim that covered methods involving more than one vacuum cup. Id. In Scanner Technologies, in which the court construed "an illumination apparatus" to mean one or more apparatuses, the Federal Circuit distinguished the outcome in Insituform Technologies, by emphasizing the claim's reference to "the cup." 365 F.3d at 1304. Like with "the cup," "said fabric roll" emphasizes the singularity of the term.

The Scanner Technologies opinion highlighted other reasons why the Insituform court properly limited the claim to a single cup, including that "neither the specification nor the drawings disclose[d] the use of more than one cup." Scanner Technologies, 365 F.3d at 1304. Similar circumstances compel us to construe "a pre-soaked fabric roll" to mean a single fabric roll. Not only does the specification not disclose a system involving more than one fabric roll, it indicates only one roll was intended. The patent specification states that the sleeve is "disposed around and in intimate contact with the fabric roll," which would not be fully possible with more than one roll in the sleeve. While plaintiff is correct that courts do not import limitations from the specification into a claim, see Comark Commun., Inc. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998), the Federal Circuit regularly turns to the specification for context when weighing whether the patentee evinced an intent to limit the meaning of the article "a." See Scanner Technologies, 365 F.3d at 1305; KCI Corp., 223 F.3d at 1357; Abtox, 122 F.3d at 1024; Insituform, 99 F.3d at 1106. As with the patent specifications in Abtox and Insituform, the reissue patent specification repeatedly modifies the relevant claim term, in this case fabric roll, with "the." Furthermore, Figures 1,2 and 3 of the reissue patent all depict a single roll, just as the figure in Abtox depicted a single chamber and the figures in Insituform depicted a single vacuum cup. Abtox, 122 F.3d at 1024; Insituform, 99 F.3d at 1106. Thus, we construe the term "a pre-soaked fabric roll" in claim 32 of the reissue patent to mean a single pre-soaked fabric roll. Given that defendant never sold single pre-soaked fabric rolls, but only rolls in sets of three or in quantities between six and nine, it has not infringed the reissue patent.

Even if "a pre-soaked fabric roll" is properly construed to mean one or more fabric rolls, summary judgment for non-infringement of this claim would still be appropriate because the term "sealed sleeve" in claim 32 is properly limited to heat-sealed sleeves and it is an undisputed fact that defendant never sold pre-soaked fabric rolls in heat-sealed sleeves. As discussed above, there is a heavy presumption that a term means what it says, and thus, when a court construes a claim, it should give the disputed term the full range of its ordinary meaning, as understood by persons skilled in the relevant art. Of course, even a heavy presumption can be overcome. Though the plain meaning of the term "sealed" is much broader than "heat-sealed," intrinsic evidence reveals that the patentee disavowed the broader meaning of the term.

All references in the reissue patent specification to a sealed sleeve are to a "heat-sealed" or a "heat-shrunken and heat-sealed" sleeve, as are all references in the 28 claims that appeared in the original '157 patent. Given that limitations from the patent specification or other claims are not imported to apply to terms in separate claims, this alone would not justify construing "sealed sleeve" in claim 32 to mean "heat-sealed sleeve." However, a review of the prosecution history for the reissue patent makes clear that in this context a person skilled in the art would understand this term to carry the narrower meaning.

In Gasparrini and Cano's application for the reissue patent, they sought, among other things, to replace the terms "heat-sealed" and "heat-sealable," which modified "sleeve" in the specification and abstract, to "sealed" and "sealable." The patent examiner rejected the changes requested in the reissue application. He explained that "the changes sought to be made to the disclosure constitute new matter, because they add to the invention originally disclosed, as opposed to merely broadening the scope of the claims." (Reissue Patent Prosecution, PTO Official Action 12/5/1995 at 4). To illustrate his point, he used the requested change from "heat-sealed" to "sealed":

The amendments to the specification in the reissue application now indicate that the invention encompasses other means of sealing the sleeve, when in the original disclosure, the sleeve was described as being a heat sealed or a heat-shrunken and heat sealed sleeve, whenever the method of sealing was referred to. The applicant has not shown where in the original disclosure, other than a heat-sealed or a heat-shrunken and heat sealed sleeve was contemplated, and if so, what those other
kinds of sealing and/or sleeve might be.

Id. In their response to the PTO's rejection of the substitution of terms, the patentees contended that the revisions do not introduce new matter, "but merely explain in more detailed language subject matter which is already disclosed therein." (Reissue Patent Prosecution, Amendment 3/6/1996 at 9). They argued that since the '157 patent specification included more specific aspects of the patented method, such as using a vacuum to draw the heat-sealable plastic sleeve into intimate contact with the fabric roll, the specification "clearly teaches that broadly the sleeve could be a sleeve which need not be plastic and/or which is not heat sealable by actually requiring application of heat from an external source." Id. at 10.

Once again the patent examiner rejected the proposed changes. He soundly dismissed the patentees' contention that the more specific aspect of the method involving the use of a vacuum with the heat-sealable plastic sleeve taught that the sleeve did not need to be plastic nor heat-sealable. He writes, "It is inconceivable that the applicants can find such a teaching in the above quoted language of the original specification, which by its own terms refers to the sleeve as a heat sealable plastic sleeve. Why would one of ordinary skill in the art upon being informed that a sleeve was a heat sealable plastic sleeve, infer that what was really intended was that the sleeve need not be plastic and/or need not be heat sealable?" (Reissue Patent Prosecution, PTO Official Action 5/16/1996 at 5).

After this final rejection by the PTO, the patentees withdrew their proposed amendments substituting "heat-sealed" and "heat-sealable" for the broad term "sealed." In their Amendment After Final Rejection, filed September 18, 1997, the patentees still sought various changes concerning issues unrelated to the heat-sealed sleeve, as well as the approval of new claims 44, 45, 46, and 57 (which when accepted was renumbered as claim 32). Arguing for the acceptance of these changes, the patentees stated, "Moreover, with the cancellation of the material submitted in the Preliminary Amendment of April 10, 1995, also renders moot the objection to the Specification on grounds of new matter, under 35 U.S.C., Section 132, with the cancellation of such Amendment." In other words, the patentees argue that the patent examiner's objection on the grounds of new matter concerning the term "sealed sleeve" is no longer valid because their revised amendments do not seek to broaden the term "heat-sealed sleeve" to "sealed sleeve." Under such circumstances, the term "sealed sleeve" in the proposed claims can only be read as the more limited term, "heat-sealed sleeve." A broader reading would be wholly incongruous with the patent prosecution, the patent examiner's blunt rejection of the contention that the patent specification supports the broader term, and the patentees' own acknowledgment that their revised amendments no longer sought to broaden this terminology.

Plaintiff argues that, to the contrary, the patent examiner has established that the specification supports the claim term "sealed sleeve." Plaintiff contends that despite the patent examiner's initial objections to the claims on the basis of new matter, he ultimately concluded that the broader term was supported in the specification, as evidenced by the withdrawal of his objection and the approval of four claims that contained the term "sealed sleeve" in the reissue patent. Plaintiff quotes the examiner's Official Action dated June 20, 1997, as evidence that he did not intend for this term to be narrowly defined: "In view of the latest amendments to the specification and the applicant's arguments, the previous rejections and objections on grounds of New Matter are hereby withdrawn or have been rendered moot." However, the examiner opened that same Official Action by stating it was intended to respond to the current requested changes, and that "it would appear that the only remaining substantial changes to the original specification (the patent specification) are those having to do with the thickness of the fabric roll and with the specific types of organic compound solvent which may be employed in carrying out the practice of the invention." Thus, the examiner was not addressing the term "sealed sleeve." This official action provides no indication that the examiner re-evaluated his prior objections concerning the term "sealed sleeve," nor his opinion that it is inconceivable that the specification teaches that the sleeve need not be plastic and/or need not be heat-sealable. As he points out, his objections were merely rendered moot because the patentees made such significant changes in the amendments they were seeking, including dropping all requests that the terms "heat-sealed" and "heat-sealable" in the '157 patent be replaced by "sealed" or "sealable" in the reissue patent. Based on this patent history, "sealed sleeve" in claim 32 must be construed to mean "heat-sealed sleeve."

d. Sealing Means

The term "sealing means" is used in the '884 Patent in independent Claims 1 and 10, dependent Claims 2 and 9, which depend from Claim 1, and dependent 11, which depends from Claim 10. See '884 Patent at 7:9, 7:34, 7:36, 7:56, 8:16, 8:21-
24. Plaintiffs contend that the term invokes the means-plus-function provision of 35 U.S.C. § 112, P 6:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

"Whether certain claim language invokes 35 U.S.C. § 112, P 6 is an exercise in claim construction and . . . a question of law." Personalized Media Comm'n, LLC v. Int'l Trade Comm'n, 161 F.3d 696, 702 (Fed. Cir. 1998). "Use of the term 'means' in a claim limitation creates a presumption that section 112, paragraph 6 has been invoked." Kemco Sales, Inc. v. Control Papers Co., Inc., 208 F.3d 1352, 1361 (Fed. Cir. 2000). However, "[t]his presumption may be overcome in two ways. First, a claim element that uses the word 'means' but recites no function corresponding to the means does not invoke § 112, P 6. Second, even if the claim element specifies a function, if it also recites sufficient structure or material for performing that function, § 112, P 6 does not apply." Allen Eng'g Corp. v. Bartell Indus., 299 F.3d 1336, 1347 (Fed. Cir. 2002) (quotations marks and citations omitted). In determining whether a term in a claim limitation recites sufficient structure, the court inquires into whether the "term, as the name for structure, has a reasonably well understood meaning in the art." Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996).

Here, Claim 10 recites a "sealing means," invoking the means plus function presumption. '884 Patent at 8:16. Plaintiffs contend that the function of the "sealing means" in Claim 10 is "sealing." Pls.' Mem. in Opp'n to Mot. for Summ. J. at 29. At oral argument, Defendants argued that Claim 10 does not state a function. Claim 10 recites in relevant part a "coupler presenting a plurality of mating surfaces for sealingly mating to the manifold, the plurality of mating surfaces being substantially continuous and free of sealing means." '884 Patent at 8:13-8:16. The Court finds that Claim 10 adequately recites a function--the function of a "sealing means" is "sealing."

Plaintiffs contend that "sealing means" does not recite sufficient structure for sealing. Defendants argue, however, that the term "sealing means" invokes sufficient structure and detail to rebut the presumption that 35 U.S.C. § 112, P 6 applies. Defendants rely on Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531 (Fed. Cir. 1996), where the Federal Circuit held that the term "perforation means" in the patent claim at issue did not trigger 35 U.S.C. § 112, P 6 because the claim "describes the structure supporting the tearing function (i.e., perforations). The claim describes not only the structure that supports the tearing function, but also its location (extending from the leg band to the waist band) and extent (extending through the outer impermeable layer)." Defendants also cite Envirco Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 1365 (Fed. Cir. 2000), where the Federal Circuit held that the term "baffle means" recited sufficient structure to rebut the presumption that § 112, P 6 applied. Cole and Envirco Corp. are distinguishable from the instant case, however, because the term "seal" does not recite as much structure as the terms "perforation" and "baffle" did in Cole and Envirco Corp. respectively. Therefore, the Court finds that "sealing means" invokes the means-plus-function provision of 35 U.S.C. § 112, P 6.

"After a court establishes that a means-plus-function limitation is at issue, it must then construe the function recited in that claim and determine what structures have been disclosed that correspond to the means for performing that function." Kemco Sales, 208 F.3d 1352, 1361 (Fed. Cir. 2000). Consistent with the construction of "fluid seals," the Court construes "sealing" as "operating as a tight or complete closure, as against the passage of a fluid." The parties agree that the corresponding structure disclosed in the '884 Patent's specification is an o-ring. Pls.' Mem. in Opp'n to Mot. for Summ. J. at 29; Defs.' Reply Mem. at 8.

Located in Sealing Relation With

Claim 12 describes a "separate annular end piece located in sealing relation with the first end cap. . ." Plaintiffs offer the construction of the above term as "located tightly or securely against." Defendants argue the appropriate construction should be "forming a fluid-tight seal against the inside surface of." Plaintiffs contend the contested term merely describes the closeness of the fit between the annular end piece with another object. According to Plaintiffs, the specifications clearly discuss the option of permanently affixing the end piece with an adhesive or merely holding the end cap by means of friction or interaction of locking members. It does not require the members fit be fluid tight as Defendants construe nor does the specification limit the fit to the inside surface.
Defendants contend Plaintiffs' interpretation reads out "sealing". The sealing out of fluids and preventing the passage of contaminants and debris is a critical feature of the filter. Also, the specification provides the separate annular end piece fits against the inside surface of the cap. Therefore, the intrinsic evidence supports Defendants' proposed construction that the placement is limited to the inside surface of the end cap.

Court's Construction

The Court holds that the patent specification states specifically "fluid-tight" when it wanted to indicate such a limitation. Claim 12 places no such limitation and the Court will not read one into the patent. As Plaintiffs point out, the specification at Col. 10 ln 20-30 describes the sealing relation contemplated.

The end piece 160 can be permanently fixed to the end cap, such as with an adhesive, or can merely be located against the end cap and held in place by friction fit, or by the interaction with the locking member 76.

This description supports Plaintiff's contention that a sealing relation refers to the manner in which the component is joined to another object.

Therefore, the Court holds "located in sealing relation with" to mean "located tightly or securely against."

3482
d. "sealing trough"

The term "sealing trough" appears in claim 7 of the '712 Patent. Donaldson asserts that the term should be construed as a "depression or recess which cooperates with corresponding raised structure to inhibit migration of water or debris from one side of the structure to the other." Baldwin initially contended that the term should be construed as "a recess in the outer surface of the second end cap that forms a seal with the housing to prevent the passage of water and other contaminants." In its post-Markman brief, Baldwin proposed the following construction:

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
9 At the Markman hearing, Donaldson agreed to Baldwin's proposed construction provided the word "prevent" was replaced with "inhibit."

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Nothing in the claim language or the patent specification indicates that the purpose of the "sealing trough" is to prevent the passage of water or contaminants. Instead, the specification describes the purpose of the "secondary seal" as to inhibit movement of debris and water. For example, the specification reads: "The secondary seal 80 is generally provided to inhibit movement of debris or water into region 81, between element 21 and base 63, rather than to necessarily prevent flow of air therebetween." '712 Patent, col. 7, ll. 9-14. The specification also provides that the "secondary seal 80 will inhibit the likelihood of debris or moisture moving from pan 71 into surface 69, or region 77." Id., col. 8, ll. 27-29. Therefore, the Court determines that the purpose of the "sealing trough" is to inhibit the passage of water and other contaminants.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
10 The "sealing trough" of the second end cap and a housing sealing bead form the "secondary seal."

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -
Baldwin also asks that the "sealing trough" be required to maintain a pressure differential of up to about 2 inches (and typically only up to about 2-4 inches) of H\(_2\)O. The Court notes that the specification indicates that the "secondary seal" will "generally be sufficient if it can maintain at pressure differential thereacross of up to about 2 inches (and typically only up to about 2-4 inches) of H\(_2\)O." Id., col. 7, ll. 16-19. That portion of the specification, however, appears to offer a comparison between the outer primary seal that "prevents" the flow of unfiltered air from reaching the clean air path to the engine, and the secondary seal that is "generally provided to inhibit movement of debris or water into region 81." The Court declines to import the specification's general description of effectiveness of the secondary seal into the claim language.

Consistent with the claim language and the specification, the Court construes "sealing trough" as "a recess in the outer surface of the second end cap that forms a seal with a housing to inhibit the passage of water and other contaminants."

Sealingly Bonded

Claim 12 also describes "a first flat annular end cap sealingly bonded to the first end of the filtration media..." Plaintiffs suggest the following construction, "located tightly or securely against by bonding." Defendants argue for the following construction "bonded so as to form a fluid tight seal." The parties argue on the same basis as the previous term; Plaintiffs against a limitation that it be fluid tight; Defendants for such a limitation.

Court's Construction

Again, for the foregoing reasons, the Court finds no such fluid tight limitation is placed on the described claim and holds that "sealingly bonded" means "held together tightly or securely by bonding."

8. "Seam"

The term "seam" is found in both the method and product claims of the patents-in-suit. For example, in Claim 1 of the 779 Patent, a method claim, step (a) of the seam manufacturing process requires "placing the first garment component in an adjacent relationship to the second garment component so as to define a seam." 779 Patent at 6:30-32 (emphasis added). In Claim 20 of the 779 Patent, a product claim, the "smooth seam" is defined as comprising "a bonding element," "a first garment component," "a second garment component," "a first set stitch," "a second stitch" and "the bonding element of the seam having been subjected to a sufficient amount of heat. . . ." 779 Patent at 8:7-43 (emphasis added). The 615 Patent similarly uses the term in Claims 1 and 19, method and product claims, respectively. 615 Patent at 6:28-36, 8:1-33.

Taltech asks the Court to construe "seam" to mean "two or more plies of fabric material joined together by sewing along a line." Taltech relies on the opinion of Taltech's expert, Mr. Nienke, and on specialized dictionary definitions of "seam." Esquel asks the Court to construe "seam" to mean "the place where at least two pieces of fabric are joined by stitches, the width of the seam being defined by the distance between two stitches." Esquel relies on the claims, on the specifications, and on the opinion of Esquel's expert, Mr. Haddock. The parties' differences on the construction of "seam" centers on the minimum number of rows of stitches required. Esquel asserts that at least two rows of stitches are required for a seam, whereas Taltech asserts that no particular number of rows of stitches is required.

The Court finds Esquel's proposed construction more persuasive. The claims define a seam as bounded by two stitches that create two "sides" of a seam: "a first set stitch running along a first side of the seam . . . a second stitch running along a second side of the seam. . . ." 779 Patent at 8:25, 8:31;615 Patent at 8:17, 8:23 (emphasis added); see also 615 Patent at 6:44, 6:56. The different sides of the seams are bounded by two different stitches. The specifications also define the "seam width" as the distance (labeled 46 in Fig. 3c) between two stitches (labeled 38 and 40 in Fig. 3c) and note the importance of having the bonding element flow over the entire surface of the seam width for maximum prevention of pucker. Fig. 3c; 779
Patent at 4:53-59; 615 Patent at 4:54-60. This definition of "seam width" indicates that more than one row of stitches must define the seam. See Phillips, 415 F.3d at 1321 ("[T]he specification acts as a dictionary when it expressly defines terms used in the claims or when it defines terms by implication." (internal quotation marks omitted)). The Court does not rely on extrinsic evidence to interpret "seam" because the intrinsic evidence is sufficient to enable the Court to construe the term. See Pitney Bowes, 182 F.3d at 1308-09.

Accordingly, the Court adopts Esquel's proposed construction, with modification, and construes the term "seam" to mean "the place where at least two pieces of fabric are joined by at least two rows of stitches."

The court adopts Crown's proposed construction.

Claim 13 of the '826 patent recites a "can end comprising: a peripheral cover hook, said peripheral cover hook comprising a seaming panel adapted to be formed into a portion of said double seam during said seaming operation." 27 Therefore, the seaming panel is part of the peripheral cover hook. Describing a preferred embodiment of the claimed invention in figure 4, the common specification identifies "a peripheral cover hook 23." 28 That figure illustrates radii r[1] and r[2] which are described as "seaming panel/chuck wall radius" and "seaming panel radius," respectively. 29

"Seaming panel" is recited in each of the above-referenced claims and the parties' proposed constructions are the same for each claim. Claim 13 of the '826 patent recites "a peripheral cover hook, said cover hook comprising a seaming panel adapted to be formed into a portion of said double seam during said seaming operation" and "a wall extending inwardly and downwardly from said cover hook." 30 Claim 32 of the '875 patent recites "a circumferentially extending peripheral cover hook, said peripheral cover hook comprising a seaming panel to be formed into a portion of said double seam during a seaming operation" and "a circumferentially extending wall comprising first and second portion[s] . . . said first wall portion extending from said seaming panel to a first location on said wall and comprising a radiused portion extending from said seaming panel." 31 Claim 50 of the '875 patent recites "a circumferentially extending peripheral cover hook, said peripheral cover hook comprising a seaming panel to be formed into a portion of said double seam during said seaming operation" and "a circumferentially extending wall comprising first and second portion[s] . . . said first wall portion extending from said seaming panel to a first location on said wall and comprising a radiused portion extending from said seaming panel."
cover hook comprising a seaming panel to be formed into a portion of said double seam during a seaming operation" and "a circumferentially extending wall extending from said seaming panel to said reinforcing bead." 32

At the Markman hearing, Rexam argued that the seaming panel is not the innermost part of the peripheral cover hook, as proposed by Crown, but that the seaming panel is "a section of the cover hook that is separated from a chuck wall because . . . the innermost portion of the cover hook joins the chuck wall." 33 According to Rexam, "there is a section of cover hook that . . . extends from the chuck wall to the seaming panel that is not the seaming panel." 34 The court finds that argument unavailing.

First, Rexam's position is contradicted by the language of claims 32 and 50 of the '875 patent reciting a can end wall extending "from said seaming panel." This unambiguously demonstrates that there is not a part of the peripheral cover hook located between the can end wall and the seaming panel as Rexam argues. Crown's proposed construction is consistent with the language of the relevant claims of the '875 patent. Claim 13 of the '826 patent recites that the can end wall extends "from said cover hook" but because the seaming panel is a part of the cover hook, Crown's proposed construction is not inconsistent with that claim language. This is particularly true since the parties have proposed the same construction for "seaming panel" for both the '826 patent and the '875 patent. Further support for Crown's construction is found in the common specification's identification of radius r[1] as the "seaming panel/chuck wall radius," 35 rather than the "seaming panel/peripheral cover hook radius." Also, the common specification indicates the seaming panel does not necessarily have a constant radius (as required by Rexam's proposed construction) by its identification of r[2] as the "seaming panel radius" and r[1] as the "seaming panel/chuck wall radius."

Consequently, the court adopts Crown's proposed construction: "curved innermost portion of the peripheral cover hook."
"seat" should also be construed to mean "to rest on." (P Mem. 14). Limited contends that the term "seat" necessarily requires "some level of engagement or fit -- in this case between the holder and the cover," rather than also meaning to rest. (D Mem. 9).

The Federal Circuit has stated that "it is axiomatic that a claim construction that excludes a preferred embodiment . . . is rarely, if ever correct and would require highly persuasive evidentiary support." Anchor Wall Systems, Inc. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1308 (Fed. Cir. 2003)(quoting Vitronics, 90 F.3d at 1583). In the '969 Patent, the embodiment shown in Figures 1B and 1C clearly show the holder's protruding feet merely resting on the cover, as opposed to Figure 5B, in which the protruding feet are fit into the cover. Limited argues that "virtually all of the Figures show the candle tin seated on the cover such that there is some engagement . . . ." (D Mem. 9). However, virtually all is not the same as all of the embodiment figures. Accordingly, Limited's argument further supports U.S. Can's construction of the term "seat."

In addition, "the presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim." Phillips, 415 F.3d at 1315. In the '969 Patent, Claim 2, which is a dependant claim, states that "the closed end of the cover has a recess formed therein for seating the protrusions . . . ." ( '969 Patent Col 5, Ln. 57-58). The reference to a recess in which the protrusions can be seated is not present in independent Claims 1 and 5 and, therefore, the requirement that the term "seat" necessarily involves engagement between the holder and the cover should not be read into Claims 1 and 5. Accordingly, we agree with U.S. Can and find that the term "seat" in Claims 1 and 5 means to either rest on or fit into the cover.

The Court is further asked to construe the word "seat." Within the context of these patents the plain meaning of the word seat is the structure intended to be sat in or on. In addition, as explained above, the "seat" is intended to be thought of and used in conjunction with but not as a part of the base. To construe otherwise would run afoil of the prior art and the rejection by the patent examiner of the one piece, stand alone base/seat.

1. Claim Construction

As a preliminary matter, we first determine whether the district court properly construed the term "to seat" to mean "to either rest on or fit into the cover," thus not requiring any engagement between the candle holder and the cover. Claim Construction Opinion, 2006 U.S. Dist. LEXIS 21010, 2006 WL 1049581, at *2. We review claim construction de novo. Phillips v. AWH Corp., 415 F.3d 1303, 1328 (Fed. Cir. 2005) (en banc).

Limited argues that the district court's construction is inconsistent with the text, context, and history of claims 1 and 5. Limited asserts that every figure in the '969 patent shows an engagement between the candle holder and the cover. In response, BASC states that the ordinary and customary meaning of "to seat" is "to rest on." BASC contends that there was no clear disavowal in the '969 patent or its prosecution history of the embodiment shown in figure 1C, which shows the feet merely resting upon the cover. BASC also argues that the principle of claim differentiation dictates the construction given by the district court because claim 2, which is dependent on claim 1, expressly requires engagement with the cover.

We agree with BASC that the district court did not err in construing the term "to seat" as not requiring an engagement between the feet and the cover. The relevant portions of claims 1 and 5 are identical: "protrusions formed on the closed end of the holder and extending therefrom, the protrusions resting upon the closed end of the cover to seat the holder on the cover." '969 patent col.5 ll.54-56; id. col.6 ll.27-30. This language makes clear that the protrusions, or feet, are what cause the candle holder to be "seated" on the cover. Thus, Limited's argument that every figure in the '969 patent shows an engagement between the candle holder and the cover misses the point because even if engagement were required, the claim language dictates that the engagement would be between the feet and the cover. Similarly, Limited's argument regarding the prosecution history of the '969 patent is unpersuasive. The language regarding the protrusions was added to claims 1 and 5
to overcome a rejection based on prior art that depicted a candle holder that could lock together with its cover when the cover was used as a base. Nothing in the language added concerning the protrusions indicates that BASC intended the feet to lock into the cover; rather, the language indicates an intent to distinguish BASC’s claimed invention from the prior art by the presence of feet on the bottom of the candle holder.

Furthermore, "claims must be read in view of the specification, of which they are a part." Phillips, 415 F.3d at 1315 (internal quotation marks and citation omitted). Figure 1C clearly depicts the feet merely resting atop the cover, in contrast to figure 5B, which depicts the feet locking into recesses in the cover. In addition, claim 2 specifically requires some engagement between the feet and a recess in the cover. See '969 patent col.5 l.57-col.6 l.2 ("The candle tin of claim 1 in which the closed end of the cover has a recess formed therein for seating the protrusions, there being a gap formed between the cover and holder when the holder is seated on the cover."). Thus, because the specification illustrates feet both resting on the cover and locking into recesses in the cover, and also in light of the prosecution history, we conclude that the correct construction of the term "to seat" does not require an engagement between the feet and the cover.

a. Claim 15

In claim 15 of the '405 patent, the patentee claimed:

   c) a seat assembly mounted to said carriage unit, said seat assembly comprising:

      
      ...

      ii) a swivel tube fixed to the bottom of said seat bracket proximate to said front edge of said bracket;

      iii) a swivel mounting bracket fixed to the top of said carriage unit and mounted to said carriage unit proximate to the front of said carriage unit;

      ...

      wherein said swivel tube coaxially fits within said swivel mounting bracket and further wherein said swivel tube is free to rotate axially within said swivel mounting bracket.

   [SEE FIG. 3B IN ORIGINAL]

'405 Patent, at 11:30-12:15. Because claim 15 defines "seat assembly" expressly, it is unnecessary to turn to the patent specification to interpret its meaning. In claim 15, "seat assembly" includes a "swivel mounting bracket," which plaintiff construes as including both swivel housing 254 and bracket 242. Because the claim provides further that "said swivel tube [266] is free to rotate axially within said swivel mounting bracket," it is logical that the "swivel mounting bracket" is made up of both swivel housing 254 and bracket 242. Accordingly, in claim 15, "seat assembly" includes a "swivel mounting bracket," which, in turn, includes swivel housing 254 and bracket 242. (At the claims construction hearing, defendants appeared to concede that swivel housing 254 and bracket 242 are part of the seat assembly as to claim 15.)

   [SEE FIG. 3A IN ORIGINAL]

b. Claims 5, 9 and 10.

Plaintiff contends that "the most complete definition of 'seat assembly,' to which [plaintiff] is entitled for all claims construction, is set forth in Claim 15." Plt.'s Br., dkt. # 17, at 12. In other words, plaintiff argues that "seat assembly" in claim 5, 9 and 10 means the same as it does in claim 15. In support of its contention, plaintiff cites In re Baker Hughes, Inc., 215 F.3d 1297, 1301 (Fed. Cir. 2000). In that case, however, the court did not discuss how a defined term of art in one claim controls an undefined use of that same term in other claims. In fact, it is unclear how Baker Hughes relates to plaintiff's contention. In any event, at the claims construction hearing, plaintiff conceded that a patentee cannot use limitations in one
claim to limit another claim. This was a wise concession. It is settled law that the "scope of each individual claim must be examined on its own merits, apart from that of other claims, even in same patent." Lemelson v. TRW, Inc., 760 F.2d 1254, 1267 (Fed. Cir. 1985); see also Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1326 (Fed. Cir. 2003) ("when a patent claim does not contain a certain limitation and another claim does, that limitation cannot be read into the former claim in determining either validity or infringement") (internal quotation omitted).

It is well established that "the language of the claim defines the scope of the protected invention." Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 619 (Fed. Cir. 1995) (citing Yale Lock Mfg. Co. v. Greenleaf, 117 U.S. 554, 559, 29 L. Ed. 952, 6 S. Ct. 846, 1886 Dec. Comm'r Pat. 169 (1886) and Autogiro Co. of Am. v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 396 (Ct. Cl. 1967) ("Courts can neither broaden nor narrow the claims to give the patentee something different than what he set forth [in the claim]."). Accordingly, "resort must be had in the first instance to the words of the claim," words to which we ascribe their ordinary meaning unless it appears the inventor used them otherwise." Vitalink, 55 F.3d at 619 (quoting Envirotech Corp. v. Al George, Inc., 730 F.2d 753, 759 (Fed. Cir. 1984)). Second, it is equally "fundamental that claims are to be construed in the light of the specifications and both are to be read with a view to ascertaining the invention." United States v. Adams, 383 U.S. 39, 49, 15 L. Ed. 2d 572, 86 S. Ct. 708, 174 Ct. Cl. 1293 (1966); see also Markman, 52 F.3d at 979 ("Claims must be read in view of the specification, of which they are a part. . . . For claim construction purposes, the [specification's] description may act as a sort of dictionary, which explains the invention and may define terms used in the claims.").

Plaintiff contends that "the limitations of the specification cannot be used to limit the express terms of the claim." Plt.'s Br., dkt. # 17, at 13 (citing Intervet America, Inc. v. Kee-Vet Laboratories, Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989)). This is true. However, claims 5, 9 and 10 do not define "seat assembly" expressly. Instead, these claims merely refer generally to the "seat assembly." Thus, the specification is "necessary to give life, meaning, and vitality" to the term in these three claims. Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1306 (Fed. Cir. 1999) (quoting Kropa v. Robie, 38 C.C.P.A. 858, 187 F.2d 150, 152, 1951 Dec. Comm'r Pat. 177 (C.C.P.A. 1951)); see also Intervet, 887 F.2d at 1053 ("this court has consistently adhered to the proposition that courts cannot alter what the patentee has chosen to claim as his invention, that limitations appearing in the specification will not be read into claims, and that interpreting what is meant by a word in a claim 'is not to be confused with adding an extraneous limitation appearing in the specification, which is improper'") (emphasis in original; internal citation omitted). In other words, persons reading "seat assembly" in claims 5, 9 and 10 can understand the term only in the context of the specification. Therefore, I will turn to the specification to determine what the patentee meant by the term "seat assembly" in these claims.

Defendants assert that swivel housing 254 and bracket 242 are not part of the "seat assembly" because (1) Figure 3A and 3B, which are described as views of the "carriage unit," each show swivel housing 254 and bracket 242; and (2) the carriage unit section of the specification provides that:

A control box 236 is fixedly mounted to the top of arm 204. . . . Bracket 242 provides the base for a swivel housing 254. Housing 254 is a piece of steel tube welded to bracket 242. As shown in FIG. 4A, housing 254 extends upwardly through cover 246. A hole is provided in bracket 242 to permit wires from control circuit 252 to pass through to the seat assembly 106.

[SEE FIG. 3A IN ORIGINAL]

[SEE FIG. 3B IN ORIGINAL]

[SEE FIG. 4A IN ORIGINAL]

In response to defendants' argument, plaintiff argues that swivel housing 254 is also found in the "seat assembly" section of the specification, as follows:

The seat assembly 106 is mounted to the carriage unit 104 by using the swivel housing 254. . . . A swivel tube 266 is welded to the underside of bracket 262. Tube 266 fits coaxially into housing 254 to permit rotation of seat assembly 106.
 Plaintiff's argument is unpersuasive for several reasons. First, the reference to swivel housing 254 in the seat assembly section of the preferred embodiment appears to be nothing more than an aside to demonstrate how the seat assembly couples with the carriage unit. In contrast, the specification for the carriage section of the preferred embodiment describes swivel housing 254 and bracket 242 in detail rather than merely referring to the way the seat assembly and carriage unit mate. Second, although the carriage section refers to both swivel housing 254 and bracket 242, the seat assembly section never mentions bracket 242. Therefore, it is unclear how bracket 242 fits into plaintiff's argument. Third, the carriage section provides that "[a] hole is provided in bracket 242 to permit wires from control circuit 252 to pass through to the seat assembly 106." Because the wires pass through bracket 242 to seat assembly 106, bracket 242 could not be part of the seat assembly. Fourth, the seat assembly section provides that "tube 266 fits coaxially into housing 254 to permit rotation of seat assembly 106." However, swivel housing 254 and bracket 242 do not rotate, indicating that these two components are not part of the rotatable seat assembly. Finally, swivel housing 254 and bracket 242 are parts of Figure 3A, described in the specification as the "front view of the carriage unit," and Figure 3B, described in the specification as the "cross-sectional view of the carriage unit."

The correct claim construction is the one that "stays true to the claim language and most naturally aligns with the patent's description of the invention." Renishaw PLC v. Marposs Societa per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998). Moreover, the carriage unit section, seat assembly section, and Figures 3A and 3B describe the preferred embodiment. Thus, adopting plaintiff's construction of "seat assembly" for claims 5, 9 and 10 would necessarily exclude the preferred embodiment; such a construction "is rarely, if ever, correct." Vitronics, 90 F.3d at 1583; see also Hoechst Celanese Corp. v. BP Chemicals, Ltd., 78 F.3d 1575, 1581 (Fed. Cir. 1996) (unlikely that inventor would define invention in way that excludes preferred embodiment or that those skilled in the art would read it that way); Gentry Gallery, Inc. v. Berkline Corp., 134 F.3d 1473, 1477 (Fed. Cir. 1998) (same). Accordingly, "seat assembly" as used in claims 5, 9 and 10 exclude swivel housing 254 and bracket 242.

J. Seated Within the Cavity

ICU's Construction  RyMed's Construction
Situated, positioned or Sitting in a seat [the annular
located within the cavity cuff] of housing walls forming
the cavity

The claim term "seated within the cavity" appears in claim 1 of the '866 Patent. RyMed contends that construction of this term is not necessary. (D.I. 116, at 34.) ICU apparently concurs, but has submitted a proposed construction to the Court because RyMed allegedly claims that this element is not present in the accused device. (D.I. 118, at 29.) ICU contends that "in this way RyMed will be forced to provide some hint about why construction of this term matters." (Id.) ICU contends their construction is consistent with the plain meaning of "seated," and is supported by the Common Specification. (Id. at 30.) In response, RyMed contends that ICU's construction is unsupported by intrinsic or extrinsic evidence, and that RyMed's construction is actually supported by the Common Specification. (D.I. 165, at 35.)

In the Court's view, it is not entirely clear that this term needs to be construed, as both parties seem to indicate that construction is only necessary because of the other party. (See D.I. 118, at 29-30 and D.I. 165, at 36.) To the extent that construction is necessary, the Court is persuaded that ICU's construction is more appropriate because it does not limit the claim language to a preferred embodiment in the Common Specification. Admittedly, none of ICU's citations to the Common Specification directly support the construction of "seated" as "situated, positioned, or located." However, RyMed's construction principally relies on a sentence in the Detailed Description of the Preferred Embodiments in the Common Specification which reads, "the spike 24, with contiguous inner conduit 18, is affixed to the housing 12 through the association of the external portion of annular cuff 28 and the internal portion of annular ring 14." '866 Patent, col. 8: 13-17. Broader claim language should generally not be limited to a preferred embodiment in the patent specification. See Phillips, 415 F.3d at 1323 ("although the specification often describes the very embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments")(citations omitted). Thus, the Court concludes, if a construction
is necessary, the term "seated within the cavity" means "situated, positioned or located within the cavity."

"First and second seating discrete surfaces" is defined as two seats that are distinct from other areas within the cockpit area, with each seat accommodating a paddler or occupant.

Finally, the addition of the word "discrete" in the '912 patent actually does not act in the same way that the additional "contoured" requirement functions in claim 13 of the '177 patent. There is not really a separate limitation included because of the word "discrete," rather the word makes explicit the limitation that the court construed is implicit in the other four claims in the very terms "seating surfaces" as a result of the prosecution history. The word "discrete" as a modifier is consistent with this court's construction of "seating surfaces" as a seat structurally distinct from the deck surface.

"Seating Surfaces" ( '177 Patent):
Aft, middle and forward locations in the cockpit area that are contoured to provide comfortable seating areas and on which passengers are intended to sit, with the footwells associated with the aft seating surface straddling transversely the middle seating surface, and the footwell portions of the footwell associated with the middle seating surface straddling transversely the forward seating surface.

"Seating Surfaces" ( '063 Patent):
Locations in the cockpit area on which passengers are intended to sit, and separated longitudinally by a spacing surface, with any seat that is located behind another seat having footwells straddling transversely the forward seating surface.

B.

Next we turn to the construction of "seating surfaces" in all three patents. The term appears in all five claims at issue in this suit. In claim 13 of the '177 patent, a separate element of the claim asserts that the claimed seating surfaces must be contoured. In claim 1 of the '912 patent the phrasing is also modified to read "seating discrete surfaces" instead of simply "seating surfaces."

The trial court construed "seating surfaces" in the '177 patent and the '063 patent as areas or locations "on which passengers are intended to sit." Old Town, 2001 U.S. Dist. LEXIS 19680, slip op. at 10. Glenwa argues that this definition is overly broad in view of the prosecution history. We agree. Niemier avoided an anticipation rejection under French Pat. No. 2,686,055 ("Philippe") by distinguishing the seating surfaces on the invention as discrete seats unlike the bench-style seating deck of Philippe on which passengers can sit anywhere. Clarifications by inventors that are made to avoid prior art prohibit contrary interpretations, whether by argument or narrowing amendment. Alpex Computer Corp. v. Nintendo Co., 102 F.3d 1214, 1220, 40 USPQ2d 1667, 1671 (Fed. Cir. 1996). The references to "seating surfaces" in all three patents must be construed as clearly delineated areas on which passengers are intended to sit. The delineation must be through shape, material, or other differentiation from the surrounding deck such that the "seating surfaces" are clearly different from the other surfaces on the top deck of the craft. In traversing the rejection of the claims, for example, the patentee argued that a "hatch surface" is described as "separating each of the seating surfaces," implying that a "hatch surface" is distinct from a
4. "Second Free End"

Plaintiff argues that the term "second free end" in claim 3 of the '685 patent means "[t]he latter of two relatively unrestricted extremities." (Doc. # 51, at 33). Plaintiff relies on dictionary definitions to support its proposed construction. (Doc. # 51, at 33-34). Plaintiff admits that "the patentee's description of one embodiment states that 'the second free end 51 engages the housing 11 and intermediate connector 39[']" (Doc. # 55, at 37) (emphasis in original). However, plaintiff contends that the other embodiment that defendant relies on states "the second free end 148 engages the housing 111 under plateau 117." (Doc. # 55, at 37; # 51-2, '685 patent, col. 9, lines 50-51). As such, plaintiff asserts that "[t]he mere fact that the specification discloses an embodiment in which the second free end of a spring engages a housing and an intermediate connector does not mean that the second free end of the spring must engage a housing and intermediate connector in every possible embodiment of the invention." (Doc. # 55, at 37-38) (emphasis in original).

Defendant proposes that the Court construe "second free end" as "a second free end engageable with the housing and intermidiator connector." (Doc. # 51, at 33). Defendant relies on the two embodiments mentioned above. Defendant contends that the Court should adopt its proposed construction "to clarify the term and the scope of claim 1." (Doc. # 51, at 35). Finally, defendant asserts that, because "[t]he '685 patent only discloses a 'second free end' that 'engages the housing and the intermediate connector[,]" . . . it is therefore proper to include this limitation in claim 3." (Doc. # 51, at 35) (internal citation omitted) (emphasis added).

The claim language, specification, and prosecution history do not make clear the definition of "second free end." Accordingly, the Court will consult a dictionary to determine the ordinary and customary meaning of "second free end." The word "second" is defined as "being one of two parts," "free" is defined as "not joined to or in contact with something else, and "end" is defined as "the extremity of anything longer than it is wide or broad . . . " RANDOM HOUSE COLLEGE DICTIONARY (1980). The extrinsic evidence supports plaintiff's proposed construction. Therefore, the Court finds that "second free end" in the '685 patent means "the latter of two relatively unrestricted extremities."

C. "Second Opening"

Comaper's proposed construction of "second opening" is "a passage in the case that is exposed to the drive bay region." (Pl.'s Constr. Mem. at 7; Pl.'s Reply Mem. at 9.) Again, Plaintiff points to the intrinsic record for support. Comaper submits that the specification does not ascribe a special meaning to the term "second opening", and makes it clear that it may take on different embodiments as long as it is internal to the computer enclosure. (Pl.'s Constr. Mem. at 8.)

Antec wishes the Court to interpret "second opening" as "a separate opening in the case located so as to pull or exhaust air from the central area of the drive bay region." (Defs.' Constr. Mem. at 11.) In its response, Antec submits that Comaper's construction is overbroad because it covers intention in the prior art. (Defs.' Reply Mem. at 13.) Antec reasons that its definition is more appropriate because the specifications instruct that the openings are separate. Id. at 12.

The Court interprets the term "second opening" to mean "a separate opening in the case that is exposed to the drive bay region." This term is construed consistent with the specifications. As stated above, claims must be read in view of the specification, of which they are a part. Markman, 52 F.3d at 979. The specifications make it clear that the second opening "may be located on the sides or top providing they cooperate adequately with the air movement means." '955 Patent col. 3, In. 50-52. In other words, the second opening may take on different embodiments, as long as it is internal to the computer enclosure.
Finally, Antec challenges the district court's construction of the term "second opening." The court determined that the term meant "a separate opening that is exposed to the drive bay region." Claim Construction Order, 2006 U.S. Dist. LEXIS 67363, 2006 WL 2709382, at *6. Antec contends that "second opening" must mean "a separate opening in the case located so as to pull or exhaust air from the central area of the drive bay region." See 2006 U.S. Dist. LEXIS 67363, [WL] at *5. But this construction confuses the term "second opening" with the configuration limitation present in the claims, which requires that the air from the drive bay region be exhausted through either the first or second opening. See '955 patent col.5 ll.47-54. Antec further argues that the second opening must be more than the back side of the first opening. The district court's construction is in fact faithful to this requirement because the district court's construction requires that the second opening be a "separate opening" from the first.

Thus, the district court's construction faithfully tracks the ordinary and customary meaning of the term in light of the intrinsic evidence. **We discern no error in the district court's construction of "second opening."**

**B. "Second Predetermined Pressure"**

Elements (e)-(f) of Claim 12 disclose a two-step pressurization method designed to "conform the liner substantially precisely to the interior wall surface contours of the pipe." (D.I. 17. Ex. 2, col. 11, lns. 33-35) Specifically, the '196 patent teaches

pressurizing the interior of said liner to a first predetermined pressure above atmospheric pressure by means of said heated fluid and (3) reheating said liner to a predetermined temperature by heat transfer from said heated fluid to said liner, whereby, the liner returns substantially to its remembered cylindrical cross-section; and

(f) then increasing the pressure in said liner to a **second predetermined pressure above said first predetermined pressure**. . . .

(D.I. 17. Ex. 2, col. 11, lns. 23-33) (emphasis added). Both parties agree that the claim calls for a two stage pressurization process. The first stage of pressurizing the interior of the liner must return the liner to its remembered cylindrical cross-section. The second stage of pressurization must "be above said first predetermined pressure to conform the liner substantially precisely to the interior wall surface contours of the pipe." (D.I. 17, Ex. 2, col. 11, lns. 33-35) In the preferred embodiment, the pressure rises to about seven bars during the first pressurization stage and to about fifteen bars during the second pressurization stage. (D.I. 17, Ex. 2, col. 3, lns. 31-32, 40) The claims and the specification reveal that both the first and second pressures must be "predetermined." Although the patent does not specifically define "predetermined," the court shall construe it, according to its ordinary meaning, as "determined beforehand." Webster's Third New International Dictionary 1786 (unabridged ed. 1993). That is, the exact pressurization of the liner must be known before the pressurization process begins. Based on the plain meaning of the claim language, the second predetermined pressurization stage begins after the liner has returned "substantially to its remembered cylindrical cross-section." The court notes, however, that there is no limitation on how long the first predetermined pressure must be maintained after the rerounding of the liner and before the commencement of the second pressurization stage.

**The court, therefore, shall construe the term "second predetermined pressure" to mean a pressure, determined before the second pressurization stage begins, which is above the first predetermined pressure and which conforms the liner substantially precisely to the interior of the host pipe.**
2. "a second screw receiving opening in said head having its axis within the femoral neck, and a third screw receiving opening in said head having an axis generally transverse to the axis of the femoral neck and crossing the axis of the second opening."

a. The Parties' Proposed Construction

Smith & Nephew's proposed constructions is as follows:

The "second screw receiving opening in said head having its axis within the femoral neck" and the "third screw receiving opening in said head having an axis generally transverse to the axis of the femoral neck and crossing the axis of the second opening" means that the head of the intramedullary nail includes two passageways capable of receiving a screw, the "second" passageway being aligned along the femoral neck when the nail is inserted into the medullary canal of a femur and the "third" passageway extending across the "second" passageway. The second and third passageways cross one another within the axial opening of the nail at an angle such that the same nail can position a screw along a femoral neck or in a direction transverse to a femoral neck of a left or a right femur.

(Pl.'s Opening Markman Br. 16; D.E. # 57.) In other words, Smith & Nephew assert that:

The plain language of claim 1 clearly requires that each of the second and third screw receiving openings be formed in the head of the nail (the screw receiving openings are "in said head"), that one of those openings align with the "axis of the femoral neck," and that those openings extend across one another in the head of the nail (the third screw receiving opening "cross[es] the axis of the second opening."). As discussed below, in the context of the entire '959 Patent, it is clear that the screw receiving openings must cross in the axial opening of the nail's head.

(Id. at 17.) Specifically, Smith & Nephew asserts that the patent specification's disclosure of certain angle ranges for positioning the screws along the passageways throughout the femoral neck demonstrate that the passageways could not extend to angles significantly outside the disclosed range, nor could the passageways cross each other anywhere but in the axial bore of the nail's head. (Id.) As such, Plaintiff contends that within the context of the Patent's written description and drawings, the "second" and "third screw receiving openings" must cross one another within the axial opening of the nail at an angle such that the same nail can position a screw along a femoral neck or in a direction transverse to a femoral neck of a left or right femur. (Id. at 18.) They state that reading the claims in any other fashion would be too broad, and thus, violate the tenet that claims should not be construed to cover more than what the patentee considers the invention. (Pl.'s Resp. to Def.'s Opening Markman Br. 12; D.E. # 12.)

Zimmer on the other hand asserts that the claim term "a second screw receiving opening in said head having its axis within the femoral neck" is very straightforward, and merely means "the nail includes a second opening for a screw in the head of the nail that has an axis which in use can align with the femoral neck." (Def.'s Opening Markman Br. 15; D.E. # 56.) They go on to state that "a third screw receiving opening in said head having an axis generally transverse to the axis of the femoral neck and crossing the axis of the second opening" also is straight forward and means "the nail includes a third opening for a screw in the head of the nail that has an axis that is angled with respect to the axis of the femoral neck, and crosses with the axis of the second screw opening." (Id. at 16.)

Defendant asserts that interpreting this to mean that the screw receiving opening must occur such that the same nail can be used in the left or right femur is contrary to the claim language, which merely describes "just 'an axis' of the third screw receiving opening that crosses with 'an axis' of the second screw receiving opening." (Id.) Specifically they state: "The claim limitation does not require that passageways of the openings for the second and third screws necessarily extend across one another; nor does the limitation require that the openings be in a configuration such that the nail can be positioned within a left or right femur." (Id.) Zimmer also states that Smith & Nephew has misrepresented the recited term "screw receiving opening" as a "passageway." (Def.'s Resp. to Pl.'s Opening Markman Br. 16; D.E. # 59.) They point to the language of the patent to demonstrate that the term "passageway" is never used, and thus, should not be interchangeable with the term "screw receiving opening." (Id.)
Finally, Zimmer contends that a required screw receiving opening configuration is not affirmatively stated in the patent until Claim 9, which depends from Claim 1. (Id.) Thus, according to Zimmer construing the claims as Smith & Nephew does would violate the doctrine of claim differentiation, which requires that an independent claim should not be construed as requiring a limitation added by a dependent claim. (Def.'s Opening Markman Br. 16-17; D.E. # 56.) Although dependent Claim 9 does recite a nailing configuration that requires the receiving openings in the head to have their axes in a common plain, which are symmetrical about a plane normal to said common plain, which in term enables usage in both the left and right femur, Zimmer states nothing of such a configuration can be found in Claim 1. (Id.) Zimmer asserts that Smith & Nephew's construction again violates the tenet that limitations found within the specifications generally should not be read into the claims. (Def.'s Resp. to Pl.'s Opening Markman Br. 16; D.E. # 59.)

b. Claim Construction Analysis

As the previous construction analysis set forth, nothing from the claims, specifications, or prosecution history indicate that the configuration of screw receiving openings should be limited to a configuration that enables the nail to be insertable into both the left and right femur. 61 To the extent that the specifications discloses an embodiment of a nail with a specific screw receiving opening configuration, it would be improper to import these additional limitations into the broader scope of claim 1. 62 Additionally under the doctrine of claim differentiation, it is not until dependent claim 9, which does disclose a specific screw receiving opening configuration that a limitation such as the one suggested by Plaintiff is revealed. 63 As such the Court construes this portion of claim 1 to mean:

The nail includes a second opening for a screw in the head of the nail that has an axis, which in use can align with the femoral neck. The nail includes a third opening for a screw in the head of the nail that has an axis that is angled with respect to the axis of the femoral neck, and crosses with the axis of the second screw opening.

3500

A. "second transmission"

Claim 1 of the '490 patent contains the term "second transmission": "said mobile repair unit comprising: . . . a second transmission coupled to said engine; a variable speed hoist coupled to said second transmission." The claim describes the first transmission being coupled to the wheels and the second transmission being coupled to the hoist. Key contends that no construction of this term is necessary. The defendants' proposed construction of "second transmission" is "a second compact, enclosed unit of gears or the like for the purpose of transference of force between machines or mechanisms, often with changes of torque and speed, that is separate and independent from a first such assembly."

The defendants argue that the second transmission must be "separate and independent" from the first transmission. Forbes and Petron point to portions of the specification and the prosecution history that describe multiple transmissions, e.g., "[a]pplicant's claimed engine and multiple transmissions do not appear to be disclosed" by the prior art references, (Dkt. No. 91, Ex. 4, at 12), and Figure 1, which depicts the first transmission 32 and the second transmission 34 as two separate and
independent components. Key responds that nothing in the patent requires the transmissions to be "separate and independent." Key points out that the applicant did not argue to the PTO that the transmissions had to be separate and independent; he distinguished his invention from the prior art based on multiple transmissions. The plaintiff further contends that the figures and specification passages cited by Forbes and Petron describe preferred embodiments that should not restrict the breadth of the claims.

The Federal Circuit has addressed the issue of whether recited claim elements must be separate and distinct. In Linear Technology Corp. v. International Trade Commission, the court construed the terms "second circuit" and "third circuit." 566 F.3d 1049, 1054-55 (Fed. Cir. 2009). Linear Technologies rejected the argument that the two circuits must be "entirely separate and distinct." Id. at 1055. "Rather, the 'second' and 'third' circuits must only perform their stated functions" and "can contain overlapping components." Id. at 1055-56. Although the '490 patent's preferred embodiment discloses separate and independent transmissions, nothing in the patent disclaims two transmissions that share overlapping components. And, even though the specification in Linear Technology disclosed the circuits as having overlapping components, the rule announced by the Federal Circuit was that the patentee was entitled to the full scope of the claim term, absent a clear disavowal or a contrary definition. Id. at 1055 (citing Home Diagnostics, Inc. v. LifeScan, Inc., 381 F.3d 1352, 1358 (Fed. Cir. 2004)). Based on Linear Technology and a reading of the '490 patent as a whole, the court will not impose a "separate and independent" limitation. Therefore, "second transmission" is construed to mean "a second compact, enclosed unit of gears or the like for the purpose of transference of force between machines or mechanisms, often with changes of torque and speed."

"Second Wall" in Claim 1

Claim 1 includes this element (emphasis added to identify the terms disputed by the parties):

a second wall disposed outwardly of said first upstanding annular wall and defining therebetween a guide chamber.

That language must be read in light of the specification's representation (1) of the first wall as serving as both the outer wall of the pump chamber and the inner wall of the guide chamber and (2) of the second wall as the outer wall of the guide chamber and inner wall of the soil container. W. Mem. 13-14 asserts that because the specification uses the term "wall" in an array of ways, this Court should construe "second wall" broadly as "a structure for holding back pressure that may be of any shape, size, orientation or formed of any number of individual parts" (id. at 14). 8 But such wishful thinking runs contrary to the words of the claim because to form a guide chamber "therebetween," the outwardly disposed second wall must be "upstanding" 9 and must surround the annular first wall.

8 W. Mem. 13 alternatively contends that a "'wall' is a structure that serves to hold back pressure" and that because that "meaning…is plain upon a simple reading of the claim…no further inquiry into the specification is necessary." But in the present context the term "wall" has no definitive content without reference to the specification.

9 That does not however mean that the second wall must be a straight vertical wall as viewed from the side. As the ensuing discussion highlights, it must simply be "upstanding" to the extent that its radially outward placement from the first wall forms a guide chamber "therebetween." As used in this opinion, "radially outward" connotes a structure on the same horizontal plane--that is, sharing space along a vertical axis--but farther away from the center of the pump chamber.

W. R. Mem. 11 (footnotes omitted) attempts to avoid such a construction:

The inventor has testified that the '433 invention could readily be implemented using a non-annular guide chamber. One of the inventor's first prototypes…[used] a "hole" directly from the pump chamber to the soil container chamber. In the inventor's mind, the guide chamber of the '433 invention is merely a "conduit," "pipe" or "path."
Not only is that testimony unacceptable as extrinsic evidence, but it is also impermissible revisionist history that directly contravenes the words of the claim. Whirlpool drafted that claim language, and it is Whirlpool's fault if it did not properly reflect what was supposedly in the "inventor's mind."

As for the shape of that second wall, 10 the specification embodies only an annular wall that encircles the first concededly annular wall. W. Mem. 15 nonetheless argues that the omission of the term "annular" in the claim language as to the second wall, while that term is expressly used as to the first wall, marks "a clear intent" to avoid that limitation. It is also true that construing the second wall in claim 1 as necessarily annular makes that claim nearly identical to claim 2 (W. Mem. 15). 11 Because that argument has some logical force (though any nonannular alternative would surely seem to be a less likely candidate 12), this Court holds that the second wall does not have to be "annular." Instead it may be square, or in the shape of a pentagon, or in any other shape that fulfills the in-all-events requirements that it must be upstanding and must completely surround the first upstanding annular wall.

10 "Shape" as used in this opinion refers to how the second wall appears from an overhead view.

11 Claim 2 states in relevant part: "said second wall comprises an annular wall disposed substantially circumjacent said first annular wall."

12 Given fluid dynamics and the forces of friction, it is obvious that the optimum shape for an upstanding wall that surrounds an upstanding annular wall to guide fluid therebetween is also annular.

In still another effort to reshape the English language, W. Mem. 14 would like to define "outwardly" as "away from a center point in any direction." To the contrary, M. Mem. 15 is right in saying that the term "outwardly" must mean, by definition, radially outward and sharing at least some position along a vertical axis." Hence the second wall is positioned circumjacent to the first annular wall. Buttressing that normal meaning of the claim language, the specification describes how centrifugal force is central to the design by forcing water over the first wall and into the guide chamber 13--and to position the second wall in any direction other than radially outward would negate that effect. Moreover, the specification says "outwardly and upwardly" to describe the flow of wash liquid in the soil collection chamber (col. 2, l. 38)--a usage that torpedoed Whirlpool's current suggestion that "up" is the same as "out."

13 Except where otherwise indicated, this opinion's column and line references are to the patent whose claims are being construed. Here col. 6, l. 40 says that "the "wash liquid [in the pump chamber] contains a heavy concentration of entrained soil particles…which tend to be forced outwardly by centrifugal force."

It is useful to sum up the end result of the analysis of ordinary English language usage--and not of Whirlpool's attempted convolutions--to this point. As used in claim 1, a "guide chamber" is a space formed between the second upstanding wall and the first annular upstanding wall that it surrounds, with that second wall being located radially outward from that first wall. 14

14 Both parties agree that "guide chamber," as the term implies, is a compartmented space (see W. Mem. 14, M. Mem. 15).

To round out the analysis (perhaps a bad pun), this opinion should eliminate any potential misunderstanding of two other
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

terms--"annular" and "subjacent" 15--that are relevant to the claim element under consideration and that this opinion has already used, but without formal definition. W. Mem. 19-20 suggests that "annular" means "at least part of a circle, but not necessarily a full circle," and that "circumjacent" means "lying adjacent to at least a portion of an object, generally in a curved manner, but again, not restricted to a full 360 [degrees] surrounding." Again those purported definitions are seriously warped--not only are they contrary to the terms' dictionary meanings, but nothing in the '433 Patent suggests any usage different from those dictionary meanings.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

15 Maytag and Whirlpool directly dispute the meaning of those terms in the context of claims 2 and 4 in the '433 Patent. Because this opinion addresses those terms at this point, no later discussion as to those other claim elements is needed.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

"Annular" means, in the words of the first listed definition in Webster's Third New International Dictionary (unabridged 1986)("Webster's") "of or relating to a ring: forming a ring: shaped like a ring." 16 To escape that really tautological usage, W. Mem. 19 points to a reference in the '599 Patent to the "annular flow" of water and to soil "flow that follows an approximately 270 [degrees] path within the soil container." But an "annular flow" merely describes the circular (ringlike) orientation of the liquid's flow. Although a patentee may choose to use the same word in different ways in different patents (part of the conventional wisdom that a patentee may be his or her own lexicographer), it is worth noting that the '100 Patent used the term "substantially annular" to describe a structure that was greater than 270 [degrees] in circumference but was not completely enclosed ( '100 Patent, col. 6, l. 25)--something that surely renders it more likely that the closely related '433 Patent employs "annular" to mean a full 360 [degrees] ring. 17

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

16 That is scarcely surprising, given the word's derivation from the Latin "annulus"--a ring.

17 And of course the specifications in both the '433 Patent and the '100 Patent use the term "annular" to describe a complete ring.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

As for "circumjacent," Whirlpool offers nothing persuasive to suggest that the term is understood in the art as indicating a location in relation to only "at least a portion" of another object (W. R. Mem. 17). 18 Hence the term is given its ordinary Webster's listed meaning of "lying adjacent on all sides: surrounding" (emphasis added). 19

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

18 W. R. Mem. 17 n.22 cites a single patent "relating to a dishwasher construction" that uses "circumjacent" in a context where a structure does not completely surround another structure. Despite the already-referred-to notion that any patentee (in this instance, someone else) may serve as his or her own lexicographer, potentially giving a myriad of meanings to the same term in different patents, Whirlpool's own patent plainly uses the term in its ordinary sense to describe a structure that completely surrounds another.

19 Once again a language buff hardly requires schooling in classical Latin to couple "circum" with "jacent" (the latter as in "adjacent").

Secondary display
The Court construes "secondary display" to mean "a second display in a multi-display system."

MASS proposes that "secondary display" means "the subsidiary, subsequent flat panel electronic display that is not physically interchangeable with the primary display, and that supplements the display area of the primary display by increasing the total overall display area." MASS attempts to limit the secondary display by stating it is "not physically interchangeable" with the primary display. However, the claim language contradicts such a limitation.

In claim 15, the secondary display is described as a "flat panel display." '170 patent, Col. 6:19–29. Dependent claim 18 requires the primary display to be a "flat panel display." See id., Col. 6:38–39. The intrinsic evidence does not suggest that the primary flat panel display of claim 18 cannot be interchangeable with the secondary flat panel display of claim 15. Thus, MASS’s limitation is improper.

As with “primary display,” “secondary display” is not given a special meaning. In the claim language, the inventor uses the term “secondary” and “second” interchangeably. See id., Col. 6:54–55 (referring to the system of claim 20, dependent claim 21 states “in said secondary position” when it previously refers to that position as the “second position”). Also, MASS’s extrinsic evidence defines “secondary” as “of second rank” or “of, relating to, or being the second order or stage in a series.” See MASS’s Response Brief, Ex. 4. Dell’s proposed construction encapsulates the plain and ordinary meaning of “secondary,” as shown by the claim language and MASS’s extrinsic evidence. Accordingly, the Court construes “secondary” as “a second display in a multi-display system.”

3. "Central circulation section"

A further stage in the above-described internal structure is the disputed "central circulation section." (Doc. 68, Ex. 2, cl. 1g). The dispute, in this regard, is not its location; it is centrally located beneath the horizontal rack structure and between juxtaposed pallets. Rather, the parties dispute whether the "central circulation section" has a functional attribute, i.e., a high-pressure state in operation. Thermal contends that the central circulation section is a high pressure plenum. (Doc. 69 at 7). Dade counters that this is not necessarily so. (Doc. 67 at 8-9). In regard to this dispute, the 158 Patent's prosecution history dictates what the foregoing analysis clearly implies, to wit, that the central circulation section is a high pressure plenum.

In the course of the 158 Patent's prosecution, the Patent Applicant filed with the U.S. Patent Office a document containing the following statement:

Applicant elects Group I for examination which is represented by drawing figures 1-4, which group is distinguished by the inclusion of a central high pressure plenum 25, 11 and covered by claims 1 (generic), 2, 3, 4, 5, 6, 17, 18, 19, 20, 21, 22, 23, 24, 27, 28 and 29.

11 This numeric reference as well as the reference to drawing figures 1-4 refer to figures 1-4 ultimately contained in the 158 Patent.

Applicant makes this election with traverse as Applicant has noted that the central high pressure plenum is contained in all embodiments and any additional items are merely minor improvements or modifications and thus, all claims should be kept in the same application for examination.

(Doc. 68, Ex. 3, at 69-70).

Thermal claims that the foregoing statement is a prosecution disclaimer, which prevents Dade from recapturing through claim construction a meaning foreclosed by unambiguous representations the Applicant made in prosecuting the patent application. See Omega Eng’g., Inc. v. Raytek Corp, 334 F.3d 1314, 1324 (Fed. Cir. 2003). The Court agrees. Although
Dade argues that the statement refers to fewer than all possible embodiments of the invention, (see Doc 67 at 8-9), that argument is incorrect. The statement unambiguously refers to all embodiments and was made to pursue all claims -- not simply those claims enumerated in the statement, but all claims from 1 through 29. (Doc. 68, Ex. 3, at 69-70). Specifically, the statement was made in response to a U.S. Patent Office action requiring the Applicant to elect from Claims 1 through 29, or restrict all those claims to, one patentable species of invention. (Id. at 64-65, 69). The Applicant's response, in part, restricted all embodiments of Claims 1 through 29 to embodiments containing a central high pressure plenum. 12 (Id. at 69-70). Accordingly, Dade is estopped from claiming that the central circulation section is not a high pressure plenum.

--- Footnotes ---

12 The U.S. Patent Office thereafter issued the 158 Patent on Claims 1 through 28, which include claims not specifically enumerated (elected) in the Applicant's above-quoted statement. Only Claim 29 was denied, and it was denied as being anticipated by the prior art. (Id. at 72-74).

--- End Footnotes ---

Even if this patent history disclaimer had not occurred, the context of Claim 1 reveals that the central circulation is a high pressure plenum. As previously discussed, Claim 1's horizontal rack structure, top horizontal baffle, and pressurizer(s) are centrally suspended above a "central circulation section," and located between the pressurizer(s) and the "central circulation section" is a "pressurization conveyance," which Dade describes as a duct. From these limitations, the pressurizer(s) can conceivably operate in only two ways, either to drive fluid (gas) into the central circulation section or to draw it out. In an area beneath a pressurizer, the latter operation would create a vacuum that would extend through the "pressurization conveyance" into the central circulation section, and thereby improperly render the "pressurization conveyance" a "vacuum conveyance." 13 In its immediate context, the term "pressurization conveyance" carries with it the unambiguous connotation that it conveys fluid (gas) at high pressure from a pressurizer into a central circulation section. In this way, the central circulation section becomes a high pressure plenum relative, for instance, to the area above the pressurizer(s). Accordingly, the term "central circulation section" means a central high-pressure plenum.

--- Footnotes ---

13 The Court readily accepts Dade's characterization of the "pressurization conveyance" as a duct because such structures fulfill a containment function that the Court recognizes as essential to conveying gases. Ducts convey gas at low or high pressure relative to their exterior. If it were not sealed in some manner, the conveyance would serve no operative function in regard to the Claim's other recited limitations. To interpret the conveyance as conveying gas at low pressure (vacuum), would read the word "pressurization" out of the relevant limitation.

**3504**

G. "upper section including an interface for receiving and retaining a firearm accessory"

The court will construe "upper section including an interface for receiving and retaining a firearm accessory" as "part or portion of the accessory clamp that includes an interface for receiving and retaining a firearm accessory and which is higher in physical position than the lower section of the accessory clamp."

Claim 1 describes "an accessory clamp having an upper section and a lower section, said upper section including an interface for receiving and retaining a firearm accessory." Defendant argues that the claim's use of the term "section" (as opposed to the word "portion") implies that the upper and lower parts of the clamp must be physically separable. For "upper section including an interface," Defendant therefore proposes "a physically separable component of the accessory clamp that cooperates with the lower section of the accessory clamp to retain a firearm accessory, that resides above the lower section when the mount is in the latched position."

Severability is not implicit in the word "section," either as a matter of common English usage or as a matter of internal

The central issue of this appeal is the meaning of the term "secured" as it is used in the '300 and '471 patents. Claim 93 of the '300 patent, for example, claims:

A shoe comprising:

an upper having a heel region;

a rear sole secured below the heel region of the upper; and

a flexible plate having upper and lower surfaces and positioned between at least a portion of the heel region of the upper. . .

't300 patent, col. 20 ll.29-43 (emphasis added).

The '471 patent also uses the term "secured." For example, claim 1 states:

A shoe comprising:

an upper, and

a rear sole secured below a portion of the upper, the rear sole comprising:

a member having a top wall with a lower surface . . . the member having a bottom wall . . . the forward regions of the top and bottom walls being connected at a close end by a curved wall. . .

't471 patent, col. 13 ll.6-50 (emphasis added).

Akeva argues that the ordinary meaning of the claim should be given to the term and that the ordinary meaning would encompass permanent, removable, and rotatable soles to athletic shoes. adidas argues that the specifications of the '300 and '471 patents disavow rear soles that are not detachable or rotatable.

This court construes claims in accordance with the principles set forth in Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005) (en banc). Claim language governs claim interpretation. Id. at 1312. Claim terms, however, are construed in light of the specification. Id. at 1315. The ordinary meaning of a term may be narrowed when interpreted in light of the specification. Id. at 1316.

A. The '471 Patent

The '471 patent is directed to athletic soles with interchangeable soles which "provide extended and more versatile life and better performance in terms of cushioning and spring." Col. 1 ll.13-17. The '471 patent states that "an athletic shoe can be changed dramatically if it is simply given interchangeable rear soles." Id. at col. 2 ll.54-55. In particular, the specification describes shoes with "interchangeable/detachable rear soles" to address problems with uneven wear patterns. Id. at ll.14-15, 26-27. While Akeva argues that the invention of the '471 patent is the flexible membrane, the language of the '471
specification specifically states that the invention of the '471 patent is an athletic shoe with a detachable heel: "However, in a radical departure from conventional shoes, the shoe of the present invention incorporates a heel structure, including a detachable rear sole, that significantly alleviates heel wear problems associated with conventional soles and provides enhanced cushioning and/or spring." Id. at col. 4 ll.56-61 (emphasis added).

Akeva argues that the catch-all phrase at the end of the '471 patent specification, which states "[t]hus, it is intended that the present invention cover all possible combinations of the features shown in the different embodiments, as well as modifications and variations of this invention, provided they come within the scope of the claims and their equivalents," precludes a claim construction which comprises only detachable heels. Col. 13 ll.1-5. No embodiments, however, of the '471 patent include permanently attached heels. Of course, the absence of an embodiment does not necessarily exclude that embodiment from the scope of the invention. Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004). But here, the specification when read as a whole clearly demonstrates that the scope of the invention is athletic shoes with detachable heels which may include an optional flexible plate. See '471 patent, col. 4 ll.62-col. 5 ll.4 ("An embodiment of the heel structure . . . includes . . . a rear sole detachable secured to the rear sole support. . . . In addition, the heel structure may include a flexible plate for providing spring to the heel of the user and reducing wear caused by midsole compression."). Akeva cites Golight, Inc. v. Wal-Mart Stores, Inc., 355 F.3d 1327, 1331 (Fed. Cir. 2004), in which the court found no disclaimer where the specification states the invention "includes" some feature where it is only one of several features described as significant or important. However, this case is distinguishable because the detachable sole of the '471 patent is not one of several features, it is the primary feature of the invention.

Indeed, when the '471 patent uses the term "secured," it uses it to describe a rear sole which is "detachably secured." Col. 3 ll.14-17. Finding that the term "secured" applies only to shoes with detachable heels does not take the term outside its ordinary meaning. Rather, the term is interpreted as it is used in accordance with the specification; "secured" does allow for removability. As this court has stated in Phillips, "[t]he construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction." 415 F.3d at 1316. In other words, an inventor cannot get more than he or she invents. On Demand Mach. Corp. v. Ingram Indus. Inc., 442 F.3d 1331, 1344 (Fed. Cir. 2006) (citing Phillips, 415 F.3d at 1316 and Autogiro Co. of Am. v. United States, 384 F.2d 391, 397-98, 181 Ct. Cl. 55(1967)) ("[w]hile each term standing alone can be construed as having varying degrees of breadth, each term must be construed to implement the invention described in the specification"). The district court construed this term as used in the '471 patent to mean "a rear sole detachably secured below a portion of the upper." Claim Construction Decision 2005 U.S. Dist. LEXIS 11213 at 35, [slip op] at 28. As such, this court will not disturb the district court's claim construction that the '471 patent covers shoes with detachable heels.

B. The '300 Patent

The '300 patent specification also discloses athletic shoes with extended life by improving the rear sole such that the rear sole is rotatable, detachable, or both. The '300 patent notes that the soles of prior art athletic shoes tend to wear out faster than the shoe itself. Col. 1 ll.2-42. Further, athletic shoe performance cushioning also tends to wear out faster than the shoe itself. Id. at ll. 44-46. In order to solve this problem, the '300 patent specification discloses shoes that can be rotated into different positions to allow for more even wear to the sole of the athletic shoe. Col. 6 ll.56-59. Or, in a preferred embodiment, the rear sole can be detached, allowing the athletic shoe owner to change the sole depending on the cushioning and other features desired for a particular activity. Col. 4 ll.42-46.

The district court construed the term "secured" in the '300 patent to mean "selectively or permanently fastened, but not permanently-fixed into position." Claim Construction Decision 2005 U.S. Dist. LEXIS 11213 at 32, [slip op] at 25. Akeva argues on appeal that the invention of the '300 patent is a flexible plate that can be used in shoes with rotatable, detachable, or permanently fixed heels. To support its argument for this claim interpretation here, Akeva points to language in the '300 patent specification which states "[t]he flexible region also need not be used only in conjunction with a detachable rear sole, but can be used with permanently attached rear soles as well." Col. 10 ll.12-16. Akeva also argues that a related patent, U.S. Patent 5,560,126 (the '126 patent), claims a "detachably secured" rear sole and a rear sole that allows for "selective rotation" and that this supports its claim that such soles are not the claimed invention of the '300 patent. Thus, Akeva argues, the asserted claims of the '300 patent cover permanently-fixed soles that will or will not rotate and which contains a flexible plate.

In SciMed Life Systems Inc. v. Advanced Cardiovascular Systems Inc., 242 F.3d 1337, 1341 (Fed. Cir. 2001), this court
stated "[w]here the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent, even though the language of the claims, read without reference to the specification, might be considered broad enough to encompass the feature in question." In SciMed, the language of the specification contained a "broad and unequivocal" disclaimer of dual lumens in catheters. 242 F.3d at 1344. The language of the '300 patent specification is less equivocal than that in SciMed. Here, the '300 patent states contains the "all embodiments" language discussed in SciMed: "[i]n all embodiments, the invention includes mechanical means for selectively locking the rear sole relative to the rear sole support and upper of the shoe." Col 7 ll.17-20. The "all embodiments" language of the '300 patent specification however, appears at first blush to conflict with the "permanently attached rear soles" language, creating a less equivocal disclaimer than that of SciMed. Col. 7 ll.17-20; col. 10 ll.12-16.

Nevertheless, the "permanently attached" language, when read in the context of the specification, supports a finding that the '300 patent specification disclaims permanently attached rear soles that do not at least rotate. Phillips, 415 F.3d at 1316. The "permanently attached" language in the specification contemplates shoes with heels that are permanently fixed (cannot be interchanged) but are rotatable. For example, the '300 patent specification states that "the rear sole may not be removable but only rotatably positionable." Col. 7 ll.42-43, see also col 6:58-63, col. 7 ll.35-44; Fig. 3 of the '300 patent. In addition, the '300 patent specification discusses as a problem of prior art shoes with heels the shoe owner is "stuck" with. Col. 2 ll.2-3. In order to solve this problem and other problems, the '300 patent contemplates athletic shoes with rear soles that can be rotated or replaced. Col. 6 ll.33-45.

As the district court noted: "Akeva has cited no statement in the '300 Patent's specification, and this court has found none, that would contemplate a rear sole that is permanently locked into position." Claim Construction Decision 2005 U.S. Dist. LEXIS 11213 at 31, [slip op] at 25. Accordingly, one skilled in the art reading the specification of the '300 patent specification would understand the term "secured" as used in the '300 patent to mean shoes with rear soles that are secured to the shoe, but not permanently fixed.

Further, while this court has considered prosecution of earlier patents in the construction of claim terms used in later issued patents, see Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1349-50 (Fed. Cir. 2004), in those cases, the patents had the same specification. Here, the '126 patent on which Akeva relies has a different disclosure than the '300 patent. Accordingly, this court construes the term "secured" in accordance with the district court.

B. "SECURED" TAKES ON ITS ORDINARY AND ACCUSTOMED MEANING

Eazypower and VA differ as to what is the meaning of the word "secured" used in claims 1 and 7 of the '929 patent. Eazypower proffers that the word "secured" takes on the meaning "to be made fast or firm, as by attaching," whereas VA states "secured" means "a tight and non-rotating attachment." (Pl.'s Mem. in Supp. of its Proposed Claim Const. at 1), (Def.'s Mem. in Supp. of its Proposed Claim Const. at 2). Claims 1 and 7 first use the word "secured" as follows:

...said flexible extension shaft including a plurality of concentric coil springs in tightly wound adjacent relation extending between and secured to generally cylindrical body portions at said first and second ends of said shaft to accommodate universal deflection of said shaft relative to said access of chuck...

(The '929 patent, col. 5, lines 3-9, col. 6, lines 37-44) (emphasis added). Claims 1 and 7 then use the word "secured" as follows:

...a flexible sleeve disposed about said concentric coil springs, said flexible sleeve having cylindrical fittings secured thereto at opposite ends thereof so as to define a shoulder internally of each of said fittings...

(Id. at col. 5, lines 9-13, col. 6, lines 44-47) (emphasis added).

VA argues that "secured" must take on the meaning "a tight and non-rotating attachment," because the invention will not work if the cylindrical bodies 20a and 22a are allowed to rotate with respect to the concentric coils, 30, 32, 34. (Def.'s Mem.
in Supp. of its Proposed Claim Const. at 4-5). It claims that if the cylindrical body portions 20a or 22a could spin freely, then "rotary motion of the screwdriver could not be transferred to the tool held at the opposite end, and the tool would not rotate." (Id. at 4).

VA argues that because "secured" must mean "a tight and non-rotating attachment" as it is used in reference to the securing of the concentric coils, 30, 32, 34 to the cylindrical body portions 20a or 22a, it must take on that same meaning when used in reference to the flexible sleeve 36 having cylindrical fittings 38 and 40 secured thereto at opposite ends 42 and 44 thereof. (Id. at 5). VA argues this because when an inventor uses words in the patent they must take on the same meaning when used multiple times throughout the claim and specification, citing Fonar Corp. v Johnson & Johnson, 821 F.2d 627, 632 (Fed. Cir. 1987). (Id.).

In support of VA's proffered definition of the word "secured," VA also offers extrinsic evidence in the form of expert testimony and the prosecution history of the European counterpart to the '929 patent. (Def.'s Mem. in Supp. of its Proposed Claim Const. at 6-8). It also submits dictionary definitions of the word "secured" to mean "to make fast: tie down," and of the word "fast" to mean "firmly, fixed, immovable or moved only with the greatest difficulty." (Id. at 6) (quoting Webster's Third New International Dictionary (1993)).

Eazypower disputes VA's proffered meaning of the word "secured" and offers its own: "to be made fast or firm, as by attaching." (Pl.'s Mem. in Supp. of its Proposed Claim Const. at 1). It states that because the patentee never acted as his own lexicographer, since he set forth no explicit definition of the word "secured," he intended for it to have its ordinary and accustomed meaning. (Id. at 11-12). Therefore, it alleges that the word "secured" is used simply "to explain that the cylindrical bodies are functionally 'secured' to the concentric coil springs and that the cylindrical fittings are functionally 'secured' to the flexible sleeve." (Id. at 9-10).

Eazypower states that the phrase "tight and non-rotating," and the words "tight," and "non-rotating" are not used in the patent itself nor in the prosecution history. (Id. at 12). Therefore, it argues, because such limitations cannot be read into the claim, the use of extrinsic evidence is prohibited. (Id. at 12).

Furthermore, Eazypower argues that many articles are "secured" without being constrained against relative motion. (Pl.'s Reply Mem. in Supp. of its Proposed Claim Const. at 5). As an example, it states that an automobile tire is "secured" to a vehicle, yet it can rotate relative to the automobile. (Id.).

Eazypower rejects VA's assertion that the tool will not work unless "secured" is construed to take VA's proffered definition because such a determination is based on VA's own personal speculation. (Id. at 3). It argues that even if VA's proposed workings of the invention are correct, that it is still consistent with its definition of the word "secured" because "the cylindrical bodies 20a, 22a are also made fast or firm against relative motion since they are attached to the concentric coil springs 30, 32, 34 such that they are constrained against axial motion along the shaft. Therefore, because the cylindrical bodies 20a, 22a are held firm in at least one direction of relative motion, the common and ordinary meaning of secured is consistent with this embodiment of the invention." (Id at 7).

In support of Eazypower's proffered meaning of the word "secured": "to be made fast or firm, as by attaching," it offers dictionary evidence. Such evidence provides that the word "secured" is defined as "to be made firm or fast, as by attaching," The Random House Dictionary of the English Language, Unabridged Edition (1966), "to make firm, fast, tight, etc.," Webster's New World College Dictionary (XXXX), "to take (a person) into custody: hold fast," Merriam-Webster's Ninth New Collegiate Dictionary (XXX), (Pl.'s Mem. in Supp. of its Proposed Claim Const. at 10).

VA has not overcome the presumption that "secured" takes on its ordinary meaning. Thus, the Court construes the word "secured" to take on its accustomed and ordinary meaning: "to be made fast or firm, as by attaching." The Random House Dictionary of the English Language, Unabridged Edition (1966).

VA has failed to show any of the exceptions to the rule that a word used in a patent claim takes on its accustomed and ordinary meaning. First, it has offered no evidence that the patentee of the '929 patent set forth an explicit definition of the word "secured."

Second, VA has shown no evidence that the word "secured" describes a particular embodiment that is important to the
invention. VA alleges that the invention will not work without the word "secured" taking on its proposed definition, however, it has done so through the use of an expert which is extrinsic evidence. There is nothing on the face of the patent itself or through other intrinsic evidence that suggests that the securing of the concentric coils, 30, 32, 34 to the cylindrical body portions 20a or 22a must mean "a tight and non-rotating attachment." The patentee does not use the word "tight" or "non-rotating" anywhere in the patent. He does not make reference to any requirement that the concentric coils, 30, 32, 34 must be non-rotating to body portions 20a or 22a; VA is inferring this to be the case. The "preferred embodiment itself does not limit claim terms," and "mere inferences drawn from the description of an embodiment of the invention cannot serve to limit claim terms." Johnson, 175 F.3d at 992.

Even if it is true that the tool requires concentric coils 30, 32, 34 to be tight and non-rotating to body portions 20a and 22a, that does not mean that the ordinary meaning of the word secured is not used. In this situation, the concentric coils, 30, 32, 34 are still "attached" to the body portions 20a and 22a regardless of whether there is any rotation allowed. They are "attached" and "made fast or firm" because there is no axial motion along the shaft. Thus, the ordinary and accustomed meaning of the word "secured" is maintained.

Third, VA failed to show that the word "secured" deprived the claim of clarity so that there was no means by which the scope of the claim could ascertained. Based on the claims description, that "said flexible extension shaft including a plurality of concentric coil springs … secured to generally cylindrical body portions at said first and second ends of said shaft…" as well as by looking at Figures 2 and 3 of the '929, it is understandable that the plurality of concentric coils are "attached" to the cylindrical body portions. (The '929 patent, col. 5, lines 3-9, col. 6, lines 37 - 44, Fig. 2, Fig. 3) (emphasis added). Thus, "secured" takes on its accustomed and ordinary meaning.

Fourth, there is no allegation that Eazypower is attempting to broaden the meaning of the word "secured" to cover more than that disclosed in the specification. "To be made fast or firm, as by attaching," is the ordinary meaning of the word "secured." The Random House Dictionary of the English Language Unabridged Edition (1966). On the other hand, VA is changing the meaning of the word "secured" to be that of "tight and non-rotating."

In construing the word "secured," extrinsic evidence need not be considered by the Court because the intrinsic evidence was capable of making its meaning clear. Therefore, because VA was not able to overcome the presumption that the word takes on its accustomed and ordinary meaning, the Court construes the word "secured" to mean "to be made fast or firm, as by attaching." Id.

1. Secured

In its brief, Fiala argues that the term "secured" should be interpreted broadly to mean "held fast." 7 In support of its position, Plaintiff relies on Webster's dictionary, as well as the patent prosecution history. Pl.'s Brief at 23-24. See also CCS Fitness, 288 F.3d at 1366 (explaining that although dictionary definitions do not form a part of the integrated patent document, they are relevant in helping to establish a term's ordinary meaning). Interestingly, Card USA also predicates its argument on the prosecution history. However, Card USA uses the same evidence to propose a narrower construction of the term "secured". According to Card USA, "secured" ought to be construed as meaning more than just holding fast, but actually providing a security aspect. 8 Def.'s Brief at 15-19.

7 Fiala advanced the same argument during the Markman hearing. See Tr. at 14-15.

8 During the hearing, Card USA articulated this argument more precisely. Defendant urged this Court to construe the term "secured" as a synonym for "retaining"; using the meaning for retaining that Defendant believes Fiala set forth in the specifications and during the prosecution process. Tr. at 47. According to Card USA, "retaining", does not relate only to a mechanism for attaching the card, such as a rivet, but actually includes "everything that the rivet [would do] in terms of [showing evidence of tampering] and/or [obscuring the PIN].
The Court's analysis begins, as it must, with the language of Claim 12. Teleflex, 299 F.3d at 1324-25. Words in a claim are generally given their ordinary and customary meaning, unless the patentee has chosen to be his/her own lexicographer and explicitly defined the terms in the specifications. Vitronics, 90 F.3d at 1582; Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578 (Fed. Cir. 1996) ("A technical term used in a patent document is interpreted as having the meaning that it would be given by persons experienced in the field of the invention . . . ").

Because Mr. Fiala did not define the term "secured", the Court must ascertain whether the this word must be given its ordinary meaning or discern a specific meaning for the term. Although Fiala correctly notes that one of the ordinary meanings of the word secure is to "hold fast", the same source that Fiala urges the Court to rely on includes an alternative meaning which supports Card USA's position. Pl.'s Brief at 13. Specifically, the version of Webster's Dictionary Fiala introduced during the hearing also defines the word "secured" as relieving exposure from danger or making safe. See Webster's Ninth New Collegiate Dictionary at 1062 (1990). This definition is in line with Card USA's argument that the means for securing were intended to protect the customer from purchasing a card that had been tampered with. Def.'s Brief at 15. Given the inconclusive nature of this source, the Court turns its attention to the other sources of intrinsic evidence in search of guidance. CCS Fitness, 288 F.3d at 1366 (explaining that a court may restrict a claim terms ordinary meaning when the intrinsic evidence shows that the "the patentee distinguished the term from prior art on the basis of the particular embodiment").

The Court first considers the specifications, which are the written description of the invention, as well as the instructions on how to practice the '909 patent and the drawings depicting the preferred embodiments. Vitronics, 90 F.3d at 1582. Here, the specifications indicate that Fiala conceived of the invention as incorporating a security aspect. For instance, in the brief summary of the invention, Fiala identifies the security aspect as one of the objectives of the '909 patent. 11 Similarly, the Detailed Description of the Invention, repeatedly describes embodiments of the '909 patent in which the retaining means incorporate tamper evident mechanisms that allow consumers to detect when the PIN number has been surreptitiously viewed. See, e.g., U.S. Patent, Column 6: 14-40 (explaining that preferably the rivets "comprises tamper evident means for indicating that a surreptitious attempt has been made to view the PIN number"); U.S. Patent Column 7:7-22 (noting that the preferred means for the embodiment include tamper evident means); Column 8:45-52 (describing a retaining mechanism that protects customers from buying cards that have been tampered with); Column 9:48-52 (explaining that the embodiment includes a tamper evident mechanism); Column 10:26-32 (describing the particular embodiment as "also providing tamper-evident means"); Column 12: 46-58 (explaining that the sixth embodiment, which uses glue, instead of rivets also "provides clear evidence of tampering with the package").
attempted to view the PIN number on the card." U.S. Patent; Column 3:7-12.

Fiala acknowledges including a security element in its description of the invention. Rather, in its Corrected Response Brief Fiala urges the Court to consider the retaining means (i.e., rivets, glue, etc.) as merely articulating possible embodiments of the invention. 12 Pl.'s Corrected Resp. at 2-4. To this end, Fiala relies on CCS Fitness v. Brunswick Corp, 288 F.3d at 1366.

In this case, the Court of Appeals for the Federal Circuit considered the appropriate role the specifications and the prosecution history should play in claim construction. Id. at 1367-68. Although as Fiala correctly points out, the Federal Circuit found that the infringer cannot narrow a term's ordinary meaning by simply pointing to the preferred embodiment, Fiala overlooks the fact that the Federal Circuit explicitly noted that a "claim will not carry its ordinary meaning if the intrinsic evidence shows that the patentee distinguished that term from prior art on the basis of a particular embodiment . . . or described a particular embodiment as important to the invention." Id. at 1366. See also Scimed., 242 F.3d at 1343-44 (holding that "where the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent, even though the claims, read without reference to the specification, might be considered broad enough to encompass the feature in question"); O. I. Corp. v. Tekmar Co., 115 F.3d 1576, 1581 (Fed. Cir. 1997) (refusing to give the word "passage" its ordinary meaning and using the specifications to narrowly construe the term).

In this case, the specifications make evident that Fiala identified the safety aspect as an important element of the invention. The fact that every embodiment incorporates a safety aspect cannot be dismissed as a mere coincidence. The safety aspect of the retaining means is essential to the invention. The prosecution history lends further support to this interpretation.

The record shows that the PTO Examiner originally rejected Claim 12 "under 35 U.S.C. 102(b) as being anticipated by [two prior patents, the] McIntire et al. and Hill et al. [inventions]." 13 Pl.'s Ex. B at 142. In response to this communication from the PTO, Fiala submitted two subsequent amendments to Claim 12. The first amendment altered other language in the Claim, but left intact the term "retaining means." Id. at 147. The examiner once again rejected Claim 12 forcing Fiala to submit a subsequent amendment. Id. at 150-52. It was in this second amendment filed in January of 1999 that Fiala amended the language of Claim 12 to include the term secure. Id. at 155.

The Hill and McIntire patents showed a carrier panel holding an information card with a magnetic stripe, in which the information card sat atop of and wholly within the perimeter of the carrier panel so that the magnetic stripe could be encoded with data, such as happens with well-known credit card mailing carriers and the like. In the Hill and the McIntire references, the card and its magnetic stripe, sitting atop the carrier panel, were displaced an infinitesimal distance above the carrier panel in a direction substantially perpendicular to the plane of the card. Pl.'s Brief at 15. See U.S. Patent 5,494,544 (Feb. 27, 1996); U.S. Patent 5,281,799 (Jan. 25, 1994).
a package including a first panel, said first panel having an outer perimeter; and retaining means securing said first card to said first panel . . . .

to read

a package including a first panel, said first panel having an outer perimeter; said first card being secured to said first panel . . . .

Pl.'s Ex. B at 172; 186-87(emphasis added).

Fiala asserts that the amendment was intended to broaden the scope of the patent, such that Claim 12 would not be limited to the particular modes of securing the card to the package disclosed in the specification of the patent (e.g., rivets, glue), but would instead cover all available methods for holding the card to the panel. 14 Pl.'s Brief at 23; Tr. at 13-15; 65-67. Fiala, however, fails to provide any cites to the record that would support its characterization of the amendment. In fact, the remarks following the amended Claim undermine Fiala's contention. The prosecution history indicates that Fiala characterized the amendment to the Examiner as helping to distinguish the invention from the prior art. Specifically, Fiala noted that: "Claim 12 . . . [had] been amended to recite that the first card is secured to the first panel rather than having retaining means securing the first card to the first panel. . . . Thus distinguishing Claim 12 from the prior art with greater clarity and particularity. . . ." Id. at 167-68.

14 As Plaintiff correctly noted during the hearing, "in the world of patent law, . . . the word "means" in a claim . . . coupled with some language like retaining, it's a signal that that particular limitation or element in the claim is to be interpreted in accordance with[P 6] of [§ ] 112 of the Patent Act. That is the section of the Patent Act that says an element in a claim for a combination that recites means for carrying out a given function . . . ." Tr. at 14. See also Ethicon, Inc. v. United States Surgical Corp., 135 F.3d 1456, 1463 (Fed. Cir. 1998) (explaining that means language indicates that the inventor is announcing the means for achieving a certain function).

According to Fiala, Plaintiff changed the "means" language to "signal to the public that secured to is broader than the retaining means [language]." Tr. at 14:25-15:2. Fiala argues that the purpose of the amendment was to indicate that Claim 12 did not require the card to be attached only by the retaining means listed in the specifications (e.g., rivets, glue and stickers), but had a broader general meaning that encompassed other means outside the ones listed in the embodiment. While the Court recognizes that it is possible that Fiala may have strategically eliminated the phrase "retaining means" to overcome this limitation, the Court does not believe that this change compels Fiala's proposed construction of the term "secured". The intrinsic evidence suggests that Fiala purposefully chose the term secure to convey that a security element was part of the invention.

These remarks confirm Card USA's position. The only possible manner in which this textual change could distinguish the '909 patent from the prior art is by adding a safety component, as the other Hill and McIntire patents already covered a method for holding a card to a package. In other words, the amendment was used to distinguish the '909 patent from the two existing patents by showing that the Fiala patent offered more than a means for attaching the card to the package; it secured the card such that it would protect customers from purchasing tampered products. Tr. at 48; Def.'s Brief at 15, 18-19.

For this reason, the Court adopts Card USA's proposed construction of the term "secured." The Court holds that one skilled in the art reading the language of Claim 12, the specifications, and the prosecution history, would conclude that the term "secured" encompasses more than a mechanism for holding together, but actually includes a security element. The Court construes the term as meaning "to make safe."

Sandt argues that the district court erred in construing the term "secured across" to refer to the placement or positioning of
the plate, rather than to the position of the fasteners used to secure the plate to the housing. According to Sandt, because the Resco cover is secured to the telephone housing by welds at the peripheries of the cover and the housing, it is not "secured across" the housing front face as required by the claim. A plate welded to the periphery, Sandt argues, extends across the housing face, but it is not secured across the housing face.

The district court correctly construed the term "secured across" in claim 1. There is nothing in the specification which indicates that the term "secured across" requires a specific securing structure between the first and the second plate. Indeed, the specification states that the upper housing is "removed along with a double-face plate which may be bolted or welded to it . . . ." '057 patent, col. 3, ll. 60-63. The patent's teaching that the cover could be mounted to the housing by bolting or welding supports a broad interpretation of the term "secured across." The Resco cover is fastened to the housing, and is therefore secured across the face of the housing within the meaning of claim 1. Thus, it contains this limitation of claim 1.

Aspex posits that the phrase "a rear side with a first magnetic member secured thereto" means "a first magnetic member is connected directly or indirectly to a portion of the corresponding extension facing inward toward the wearer when the primary spectacle frame is worn, in a manner such that the connection is not likely to fail or give way." Ps. Br. 11. Aspex also posits that "magnetic member" means "either a permanent magnet or a ferromagnetic member, but at least either the first or second magnetic members must be a permanent magnet." Ps. Br. 10. E'Lite argues that the entire limitation should be construed to mean "with a first magnet horizontally secured to the rearwardly facing side of the extension," D. Br. 6, 14, and that the phrase "magnetic member" need not be construed, D. Resp. Br. 3.

Aspex argues that its proposed construction is consistent with the ordinary meaning of the words "rear" and "secure" and with the specification, including FIG. 3, which shows "first magnetic members" secured in housings called "projections" that are connected to portions of the extensions that would face inward toward the wearer's head when the primary spectacle frame is worn. Aspex also contends that its construction of "magnetic member" is consistent with the ordinary meaning of the phrase and is supported by the Sadler patent, to which the '545 patent refers as prior art.

E'Lite does not dispute that "magnetic member" means at least "magnet," and it concedes "that it has two pairs of magnetic members in its frames." D. Resp. Br. 3. E'Lite thus argues that the term need not be construed. 9 E'Lite also defers to Aspex's construction of "secured" with the exception of "or indirectly," contending that this addition is nonsensical, vague, and indefinite. E'Lite maintains that horizontal orientation of the magnetic members is implied from the intrinsic evidence. It also posits that "thereto" is a confusing term in this limitation and should be construed as "to the rearwardly facing side of the extension." D. Br. 6. By eliminating "thereto" from its proposed construction, Aspex implicitly agrees with E'Lite that "thereto" should be eliminated when construing claim 18.

9 Because the court holds for the reasons described below that "magnetic member" need not be construed, it need not address E'Lite's additional argument challenging Aspex's proposed construction of this phrase.

The court holds that the term "magnetic member" need not be construed. Because the parties agree that the term at least includes "magnet," and E'Lite concedes that magnets are present in its accused products, the court need not now construe this limitation. See, e.g., Pall Corp. v. Hemasure Inc., 181 F.3d 1305, 1308 (Fed. Cir. 1999) ("Although the construction of the claim is independent of the device charged with infringement, it is convenient for the court to concentrate on those aspects of the claim whose relation to the accused device is in dispute." (emphasis added)); see also Scripps Clinic & Research Found. v. Genentech, Inc., 927 F.2d 1565, 1580 (Fed. Cir. 1991) ("In 'claim construction' the words of the claims are construed independent of the accused product . . . . Of course the particular accused product (or process) is kept in mind, for it is efficient to focus on the construction of only the disputed elements or limitations of the claims.").
The parties disagree concerning the term "rear side." E'Lite contends that "rear side" means "rearwardly facing' from the viewpoint of the wearer." D. Br. 6. Aspex maintains that "rear side" means "facing inward toward the wearer when the primary spectacle frame is worn." The court adopts Aspex's construction as the clearer of the two. See U.S. Surgical Corp. v. Ethicon, Inc., 103 F.3d 1554, 1568 (Fed. Cir. 1997) ("Claim construction is a matter of resolution of disputed meanings and technical scope, to clarify and when necessary explain what the patentee covered by the claims[,]" (emphasis added)); Hyperion Solutions Corp. v. Outlooksoft Corp., 422 F.Supp.2d 760, 772-73 (E.D. Tex. 2006) (modifying the parties' proposed constructions to provide greater clarity); Precor Inc. v. Fitness Quest, Inc., 2006 U.S. Dist. LEXIS 63244, 2006 WL 2469123, at *7 (W.D. Wash. Aug. 23, 2006) (adopter clearer of two proposed constructions in light of fact that court's construction would ultimately be used by jury).

The parties agree that "secured" means "connected in a manner such that the connection is not likely to fail or give way." D. Resp. Br. 4; Ps. Br. 11. They only dispute whether "or indirectly" should be added after "connected." Aspx provides no basis for construing "secured" with the addition of "directly or indirectly." The court concludes that this addition does not provide any greater clarity to the claim. Thus the court construes "secured" as "connected in such manner that the connection is not likely to fail or give way."

The principal remaining dispute is whether horizontal orientation of the magnetic members is implied in this limitation. The court holds that the '545 patent's specification, its references to magnetic orientation in claims other than claim 18, and its prosecution history support the construction that claim 18 is limited to magnetic members with horizontal orientation.

As a threshold matter, the court explains its meaning of magnetic members having horizontal orientation. When magnets with flat surfaces are engaged, the juncture of the magnetic members' surfaces forms a plane. When the magnetic members are oriented horizontally, this plane, if extended, intersects perpendicularly with the plane of the lens spectacles, which form a vertical plane when the eyeglasses are worn. When magnets are engaged so that they are oriented horizontally, the action of becoming engaged (the movement of engagement) occurs along an axis that is perpendicular to the plane of the magnetic members' orientation. Horizontally oriented magnets therefore engage vertically. For a fuller explanation for the basis of this terminology, see infra § IV(F), where the court construes the phrase "vertically engage."

The '545 patent's description of the preferred embodiment contains the only general statement in the specification regarding the particular orientation of the invention's magnetic members. This statement specifies the magnetic members as possessing horizontal orientation. "As shown in FIGS. 3-7, the engaging surfaces between magnetic members 14 in primary spectacle frame 10 and the magnetic members 22 in the auxiliary spectacle frame from 20 lie in a plane that is substantially horizontal when the eyeglass device is worn." D. App. 7 (italics omitted except where court emphasis added). The '545 patent discloses only one preferred embodiment. All of the figures that illustrate this preferred embodiment perfectly fit this general description of magnetic members that possess horizontal orientation. When magnetic member 22 engages magnetic member 14, the magnetic members are clearly horizontally oriented.

Only three of the '545 patent's claims (claims 4, 6, and 23) specify the particular orientation of the invention's magnetic members. Each claim describes the magnetic members as possessing horizontal orientation. Claim 4 states: "a first magnet having a horizontal surface . . . including two side magnets, each secured to one of the auxiliary side portions for respectively engaging the horizontal surface for coupling a corresponding horizontal surface of one of the first magnets so as to secure the auxiliary spectacle frame to the primary spectacle frame." D. App. 8 (italics omitted except where court emphasis added). Claim 6 states, in relevant part: "including two first magnetic members respectively having a horizontal surface . . . including two auxiliary side portions, wherein the auxiliary spectacle frame further includes two second magnetic members each secured to one of the auxiliary side portions and having a horizontal surface of one of the first magnetic members so as to secure the auxiliary spectacle frame to the primary spectacle frame." Id. (italics omitted except where court emphasis added). Claim 23 reads, in pertinent part: "said arms and said pair of magnetic members adapted to extend across respective side portions of a primary spectacle frame so that said pair of magnetic members can vertically engage corresponding magnetic members on a primary spectacle frame." Id. at 10 (italics omitted except where court emphasis added).
In interpreting claim 23, Aspex confuses orientation with engagement. Claim 23 refers to the magnetic members as "vertically engaging," meaning that, when engaged, they are oriented horizontally (with the flat surfaces of the magnets forming a horizontal plane). Conversely, claims 4 and 6 refer to the "horizontal surface" of the magnets. This requires that the magnets engage vertically. Thus every reference to the specific orientation of the magnetic members in the claims of the '545 patent specifies the magnetic members as possessing horizontal orientation.

The '545 patent's prosecution history also supports construing the disputed limitation of claim 18 so that it restricts the orientation of the magnetic members to a horizontal plane, meaning that the magnetic members engage vertically. In the process of obtaining what eventually became the reissue '545 patent, the patentee filed an information disclosure statement ("IDS") in October 1998 in which he attempted to distinguish his reissue patent from the prior art. The patentee began the IDS by stating that the principal difference between his reissue patent and the ten patents discussed in the IDS is the positioning of the magnets with respect to the lenses. The patentee pointed out to the patent examiner that eight of the ten similar patents "describe magnetic coupling at the plane of the lenses." D. App. 12. The patentee thus apparently sought to differentiate the proposed patent on the ground that, when engaged, the magnets do not form a plane parallel with the lenses, but instead form a plane perpendicular to the lenses. The patentee then briefly described the principal differences between the ten similar patents and the proposed reissue patent. The last sentence for seven of these excerpts highlights that the prior art employs magnets that possess vertical orientation.

10 These sentences include the phrase "with magnetic coupling seeming to occur on the plane of the lenses," "magnetic coupling again seems to occur on the plane of the lenses," or "again, magnetic coupling seems to occur on the plane of the lenses." D. App. 12-13.

One patent that the applicant attempted to distinguish was U.S. Patent No. 5,642,177 ("Nishioka"), on which the patent examiner later relied to reject some of the proposed claims. Nishioka requires the magnets to engage horizontally so that, when engaged, their surfaces form a vertical plane. The IDS reflects the patentee's attempt to limit the application to an eyeglasses device that employs magnetic members that engage vertically to form a horizontal plane when engaged.

After the patent examiner rejected some of the proposed claims on the basis of Nishioka, the patentee submitted a response. In distinguishing Nishioka from claims 12 and 24, the patentee stated:

"[i]n the Nishioka Patent, the magnets 3 in the auxiliary frame 1 engage vertically with the magnets 7 in the primary frame. The engagement surfaces are parallel to the plane of the lenses. In Claims 12 and 34[,] the amendment should have removed any possibility of ambiguity. The engagement is on a horizontal position, as opposed to the vertical plane defined by the lenses in the primary frame."

D. App. 44. On this basis, the patentee contended that its claims could not have been anticipated by Nishioka. Similarly, the patentee submitted another response to the patent examiner with the same statement. The patentee later returned an amendment and interview summary to the Patent and Trademark Office in which it responded to rejection. It stated, in relevant part:

"The Nishioka patent, as previously argued in the November 27, 2000 Amendment, shows magnetic engagement along a vertical plane, which is not being recited in Claim 12. Further, a clarifying amendment to claim 12 has been made to more clearly distinguish the horizontal attraction between the first and second magnets."

Id. at 130. The patentee repeated this objection almost verbatim in a later submission.

11 The patentee misapplied the phrase "engage vertically" in the first sentence of this quoted paragraph, because the
Nishioka magnets clearly engage horizontally and form a vertical plane when engaged. The patentee acknowledged that, when engaged, the Nishioka magnets form a plane "parallel to the plane of the lenses." D. App. 44. This statement contradicts the previous sentence concerning vertical engagement. The patentee is clearly attempting to juxtapose the positioning of the Nishioka magnets with his own.

The notice of allowability that the patent examiner issued also supports construing claim 18 as limiting the position of the magnetic members to a horizontal orientation. The examiner concluded:

Nishioka fails to disclose the limitations "the primary spectacle frame including two side portion extensions extended therefrom for pivotally coupling a leg thereto and a first magnet having a horizontal surface and secured to said side portion extension of the primary spectacle frame" and "the auxiliary spectacle frame including two auxiliary side portions, the auxiliary spectacle frame including two second magnets, each secured to one of the auxiliary side portions for respectively engaging the horizontal surface of one of the first magnets so as to secure the auxiliary spectacle frame to the primary spectacle frame" in combination with claimed subject matter as claimed in claim 12 . . . . Therefore claims 1-3, 12, 28, 36-41, 67-89 are allowable over the prior art of record.

Id. at 148-49 (emphasis added). Although the examiner specifically pointed to proposed claim 12 in this statement, the difference in orientation of the magnetic members in the patentee's reissue application and Nishioka served as a basis to approve more claims than claim 12.

The starting point for construing a claim is the words of the claim, but claim terms are not to be read in isolation. See, e.g., Phillips, 415 F.3d at 1314. Rather, the terms of each claim must comport with the language of the entire patent, including its specification and the patent's prosecution history. Id. The court concludes that an ordinary person of skill in the art, having read the terms of claim 18 in the context of the specification, the other claims that refer to magnetic orientation, and the patent's prosecution history, would understand the phrase "magnetic members" to be limited to horizontal orientation.

Aspex first opposes this construction on the ground that it contradicts the court's opinion in Aspex Eyewear, Inc. v. E'Lite Optik, Inc., 2001 U.S. Dist. LEXIS 2088, 2001 WL 204775, at *1 (N.D. Tex. Feb. 27, 2001) (Fitzwater, J.). E'Lite urged the court to construe the claims of the '545 patent's predecessor to contain the limitation that they did not cover a back-mounted design, but claimed solely a top-mounted design (referring to direction in which magnetic members came together). Id. 2001 U.S. Dist. LEXIS 2088, [WL] at *3. This is essentially the same construction argument that E'Lite now makes concerning horizontal and vertical engagements of the magnetic members. In Aspex the court rejected E'Lite's claim construction as being limited to a top-mounted design (i.e., magnetic members that engaged vertically and possessed horizontal orientation). Id. 2001 U.S. Dist. LEXIS 2088, [WL] at *4.

Aspex's reliance on Aspex is misplaced. First, in Aspex the court construed U.S. Patent No. 5,568,207 ("the '207 patent"), the predecessor patent of the '545 patent. The '207 patent does not contain any of the specific language concerning the orientation of the invention's magnetic members that is included in the '545 patent. Moreover, the '207 patent and the '545 patent have unique prosecution histories. As is evident from Aspex, the two statements on which E'Lite relied to support its construction were extrinsic evidence of negligible value. See id. 2001 U.S. Dist. LEXIS 2088, [WL] at *4. By contrast, there is stronger intrinsic evidence from the specification and prosecution history of the '545 patent that indicates that the claims are restricted to vertical magnetic engagement (and thus possess horizontal orientation).

In arguing against the court's construction, Aspex invokes the doctrine of claim differentiation. Under this doctrine, when a patent claim specifically limits one of its terms and another claim employs the same term but without the limiting language, it is presumed that the limitation of the narrower claim is not present in the claim that does not contain the explicit limitation. See Phillips, 415 F.3d at 1314-15. This presumption may be rebutted, however, by intrinsic evidence. Inpro II Licensing v. T-Mobile USA, Inc., 450 F.3d 1350, 1354 (Fed. Cir. 2006). Because some of the '545 patent claims specifically limit the orientation of the magnetic members and the language of claim 18 does not likewise limit the magnetic members' orientation, Aspex contends that the court should not import this orientation restriction from the other claims into claim 18.
The proper starting place for analyzing this argument is the presumption that each claim of the '545 patent has an independent scope. Because the language of claim 18 cannot itself support a construction limiting the orientation of the magnetic members, the court begins by presuming that the claim does not contain this limitation.

In Inpro the Federal Circuit affirmed the district court's construction of the claim term "host interface" to mean a particular kind of interface—a "parallel bus interface"—despite claim language that did not support this restriction. Inpro, 450 F.3d at 1352-53. Some of the patent's claims referred to a "parallel bus interface," while other claims, including the one the court construed, used the more general term "host interface." Id. at 1353. The court specifically rejected Inpro's claim differentiation argument and construed "host interface" to be limited to a "parallel bus interface." Id. at 1354, 1357. The court noted that "the only host interface described in the specification is a direct parallel bus interface." Id. at 1354. The specification also contained a statement emphasizing the importance of the parallel bus interface in solving the problems of the prior art. Id. The court considered specific statements in the description and the summary of the invention to support its conclusion that host interface meant a parallel bus interface. Id. at 1355-56 ("Claims are construed in light of the specification of which they are a part"). Additionally, the court found that the prosecution history of the patent supported a construction limiting the general terms "host interfaces" to mean "parallel bus interface." Id. at 1356.

The reasoning and result of Inpro support a construction of claim 18 that requires magnetic members with horizontal orientation. As in Inpro, in each instance in which the '545 patent specifies the particular orientation of the magnetic members, it describes them as having horizontal orientation. Although some claims restrict the orientation of the magnets, others do not. The '545 patent's description of the preferred embodiment and its accompanying figures specifically limit the orientation of the magnetic members to be horizontal. The prosecution history strongly suggests that the patentee intended to distinguish its invention from the prior art based on the horizontal orientation of the magnetic members. Although the Inpro court had additional support for its limiting construction from statements in the summary of the invention that are not present in the '545 patent, the Federal Circuit did not suggest that this statement was the decisive factor.

Aspex cites C.R. Bard Inc. v. United States Surgical Corp., 388 F.3d 858 (Fed. Cir. 2004), to support the contention that it is improper to import restrictions into the claims that are contained in the preferred embodiment. While preferred embodiments are not dispositive of claim constructions, Bard indicates that they provide a useful interpretive guide. Id. at 865. "Under our precedent, a patentee's choice of embodiments can shed light on the intended scope of the claim, but a patent claim term is not limited merely because the embodiments in the specification all contain a particular feature." Id. (citing Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 907-08 (Fed. Cir. 2004). "On the other hand, a construction that excludes a preferred embodiment is rarely if ever correct." Id. (quoting Vtronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996) (internal quotation marks omitted)).

Aspex urges a construction of claim 18 that would permit horizontal as well as vertical orientation for the magnetic members. This construction clearly excludes the '545 patent's preferred embodiment, which specifically describes the magnetic members as "substantially horizontal when the eyeglass device is worn." D. App. 7. Based on the description of the preferred embodiment alone, Bard suggests that Aspex's proposed construction is likely incorrect. Moreover, the Inpro court undoubtedly relied on statements in the description of the preferred embodiment as well as other intrinsic evidence to support its limiting construction of the claim at issue. Inpro, 450 F.3d at 1355.

Bard cuts against Aspex's construction of claim 18. In Bard the Federal Circuit affirmed a construction limiting the invention's texture to having "pleats," even though the claim language itself did not specify the invention's texture. Bard, 388 F.3d at 860. The court held that the patent's specification and prosecution history provided independent bases to uphold the district court's narrowing construction. Id. at 866, 869. The court began its analysis by concluding: "A long line of cases indicate that the intrinsic record is the primary source for determining claim meaning." Id. at 861. The court noted that the statements in the specification concerning the texture of the invention consistently describe it as having pleats. Id. at 860. In two places the specification described the patent in global terms, and, in each instance, the specification defined the invention as having pleats. Id. at 863-64.

Regarding the prosecution history, the court noted, "[p]leating is implicated in each of [Bard's] responses to the examiner's rejections." Id. at 867. Aspex focuses on the next statement: "limiting claim 20 to requiring pleating based solely upon [Bard's] amendments and arguments made during the initial examination would likely be improper." Id. Nevertheless, the court concluded that the statements made in the initial examination alone "suggest a close connection between pleating and claim 20." Id. 867. Therefore, in combination with other intrinsic evidence, these statements during the initial examination
could serve as a proper basis for the narrower construction of claim 20. The court recognizes that Bard had more evidence supporting the limiting construction than that which supports the limiting construction of the '545 patent. But the Bard court held that the specification and prosecution history provided independent bases for upholding its narrow construction. Conversely, the limiting construction in this case, as in Inpro, is based on the intrinsic evidence as a whole. Bard's discussion of the role of the prosecution history and other intrinsic evidence in interpreting claims counsels in favor of limiting the orientation of claim 18's magnetic members.

Aspex challenges the court's reading of the prosecution history. First, it questions the interpretation of the patentee's statements in the IDS distinguishing the prior art from his proposed invention. Aspex contends that the meaning of "seems to occur on the plane of the lenses" is that the prior art consists of front-mounted eyewear. It argues that the patentee did not intend to distinguish the invention from back-mounted eyewear, even if the magnetic members of such eyewear, when engaged, form a plane parallel to that of the lenses. Aspex's interpretation of the IDS is unpersuasive, because the limitation "on the plane of the lenses" encompasses both front- and back-mounted magnets, provided that when the magnets are engaged, they form a vertical plane. If the patentee had intended to distinguish the proposed patent from the prior art based on front- and back-sided magnetic mounting, he would have said so. Because at least eight times in the IDS the patentee used the phrase "on the plane of the lenses," the court presumes that he meant what he said.

Aspex points out that some of the patentee's statements to the patent examiner attempting to distinguish Nishioka referred to proposed claims 12 and 34, neither of which became claim 18 of the '545 patent. Moreover, although the reason for allowance mentions the magnetic coupling on a horizontal surface as a principal basis for approving the '545 patent, it appears to limit this basis to proposed claim 12. These arguments, however, do not undercut the conclusion that the prosecution history supports a narrower construction of claim 18.

First, the patentee's initial statements in the IDS distinguishing the proposed patent from the prior art were not limited to any particular claim. The patentee made global statements about his patent. He specifically distinguished the patent from Nishioka based on the orientation of the magnetic members, without referring to any particular claim. In the patentee's responses to the patent examiner's rejections of claims 12 and 34, he distinguished the proposed patent from Nishioka based on the orientation of the magnetic members. Although the distinctive feature of these communications with the patent examiner appears to be limited to claims 12 and 34, these statements have a broader application in light of the IDS. Similarly, although the patent examiner's reasons for allowance identify horizontal orientation of the magnetic members as a principal basis for approving the patent, the reasons appear to limit this difference to proposed claim 12.

Aspex points out that in a later sentence in the same paragraph that reflects that there are other differences between the '545 patent and Nishioka. See D. App. 149 ("Nishioka also fails to disclose the limitations as claimed in claims 36, 67-78, 81, 86-89."). But the last sentence of the paragraph, which lists more claims than claims 36, 67-78, 81, 86-89, suggests that the horizontal surface distinction served as the basis to approve more claims than simply claim 12. Id. ("Therefore claims 1-3, 12, 28, 36-41, 67-89 are allowed over the prior art of record.").

But even assuming that this is an incorrect reading of these latter statements of the prosecution history, the clear, global statements in the IDS and the evidence in the '545 patent itself provide sufficient support for the court's construction of claim 18 as being limited to horizontally oriented magnetic members.

For the foregoing reasons, the court construes "a rear side with a first magnetic member secured thereto" to mean "a first magnetic member with horizontal orientation is connected in a manner such that the connection is not likely to fail or give way to the side of the extension facing inward toward the wearer when the primary spectacle frame is worn." 12

--- Footnotes ---

12 Although the court is persuaded by E'Lite's arguments concerning the magnetic members' orientation, it is not adopting E'Lite's proposed construction, i.e., "with a first magnet horizontally secured to the rearwardly facing side of the extensions." D. Br. 6, 14. Requiring that the magnetic members be "horizontally secured" to the primary frame's extensions does not address how these magnetic members engage the magnetic members of the auxiliary frame arms. In other words, under E'Lite's proposed construction, the magnetic members could be "horizontally secured" to the primary frame while engaging horizontally with the magnetic members of the auxiliary frame's arms. When engaged, the magnetic members would form a vertical plane. Therefore, the court adopts a construction that eliminates the ambiguity that remains in E'Lite's
Mead Johnson contends that this claim limitation, "said bottom surface having a filter secured thereto" requires the filter be secured directly to the bottom surface without any filter housing or other similar intervening support structure in a manner that eliminates the need for a filter housing. Mead Johnson further claims that securing the filter to the bottom surface obviates the need for the ball and housing of the conventional filter means. Mead Johnson bases its reasoning on the patent specifications. The specifications clearly state that the closure "eliminates the need for the housing associated with filter means 30." The specifications further state under the "Best Mode" that "the closure of this invention may be fabricated by molding the actual cap and then fusing the heat staked material of the filter to the bottom surface of this closure thereby obviating the need for the ball and the housing of the conventional filter means."

Abbott contends that Mead Johnson reads limitations into the claim which do not exist. Abbott asserts the claim requires that the filter must somehow be fastened or attached to the bottom surface of the closure, but that the filter need not be directly attached to the bottom surface without any intervening support structure. Abbott's argument is based on a plain language reading of the term "secure."

I reject Mead Johnson's interpretation of the claim. Mead Johnson urges this Court to read into the claim, limitations found only in the specifications.

First, Mead Johnson asks this Court to interpret all of the claims of the patent to require the filter be secured directly to the bottom surface without an intervening structure. Neither the claims nor the specifications place this limitation. Claim two of the '545 Patent, which is not claimed to be infringed, does specify how the filter is to be secured to the bottom surface. It reads: "said filter is heat staked material which is fused to said bottom surface." However, the limitation in claim two is a dependent claim 2 and is not contained in any other claim. Therefore, it cannot be read or implied into any other claim. C & F Packing Co., Inc. v. IBP, Inc., 916 F. Supp. 735, 742-43 (N.D. Ill. 1995), citing, D.M.I., Inc., v. Deere & Co., 755 F.2d 1570 (Fed. Cir. 1985). The "Best Mode" of the specifications also indicates a method to secure the filter. It reads: "this invention may be fabricated by molding the actual cap and then fusing the heat staked material of the filter to the bottom surface of this closure thereby obviating the need for the ball and the housing of the conventional filter means." However, the specifications clearly state that the invention "may" be constructed this way, but that "the invention is not limited to this precise form of apparatus or method." Furthermore, it is clear that the "Best Mode" embodiment of the invention does not restrict the claim. SRI, 775 F.2d at 1122.

2 There are two types of claims in a patent: independent and dependent claims. An independent claim stands on its own and does not refer to any other claim in the patent, thus it must be read separately from the other claims when determining its scope. A dependent claim includes a reference to at least one other claim in the patent and incorporates all of the elements of the claim to which it refers. C & F Packing Co., Inc. v. IBP, Inc., 916 F. Supp. 735, 742-43 (N.D. Ill. 1995), citing, D.M.I., Inc., v. Deere & Co., 755 F.2d 1570 (Fed. Cir. 1985). The additional limitations of a dependent claim must not be read or implied into an independent claim if said independent claim does not contain the same limitation. C & F Packing Co., 916 F. Supp. at 743 (N.D. Ill. 1995), D.M.I., 755 F.2d 1570.

Next, Mead Johnson asks this Court to find that the claims preclude the use of a filter housing unit. Again, neither the claims nor the specifications place this limitation. To the extent the specifications describe the claimed invention as eliminating or obviating the need for a filter housing, they clearly state the invention closure "eliminates the need for the housing associated with filter means 30" with the possible exception of aesthetic purposes. Filter means 30 is an "external filter" as
described in the specifications. Thus, assuming the specification language can be read to limit the claims, the ‘545 Patent would be read to eliminate the external filter, not an internal filter secured to the inside of the closure as in the patented and accused products.

Finally, the specifications describe the "Best Mode" of the invention as eliminating the need for the filter housing. However, since the invention is not limited to the precise form described in the specifications and the claims themselves do not limit the invention in this way, the ‘545 Patent cannot be read to eliminate the filter housing.

The claim limitation "said bottom surface having a filter secured thereto" turns on the meaning of the word "secure." The words of a claim are generally given their ordinary and accustomed meaning, unless it appears from the specification or the prosecution history that they were used differently by the inventor. Carroll Touch, 15 F.3d at 1577. According to Webster's dictionary, the word "secure" means "well-fastened," "to make tight or firm: fasten," "not likely to fail or give way: stable." Webster's II New Riverside University Dictionary pp. 1055. The Oxford English Dictionary defines "secure" as "firmly fastened." The Oxford English Dictionary, 2nd Edition, XIV, pp. 853. The word "fasten" means "to attach firmly to: join," to close, as by fixing firmly in place," "to cling fast," Webster's at pp. 466. "to attach together," Oxford, V, pp. 750. I read this claim to mean that the filter must be firmly attached to the bottom surface in some way, but does not require direct contact between the filter and the bottom surface, nor does it require the elimination of the filter housing.

3511

A. Intrinsic Record of the ‘653 Patent

1. Claim language

The claims themselves can "provide substantial guidance as to the meaning of particular claim terms." Phillips, 415 F.3d at 1314. Indeed, the Federal Circuit has noted that the context in which a term is used in the asserted claim can be highly instructive. Id. Further, other "claims of the patent in question, both asserted and unasserted, can also be valuable sources of enlightenment as to the meaning of a claim term." Id. Because claim terms are normally used consistently throughout the patent, the usage of a term in one claim can often illuminate the meaning of the same term in other claims. Id.

The parties dispute the meaning of the claim term "secured to." According to Plaintiff, the term "secured to" in independent claim 10 is consistent with both a unitary and two-piece product. (See R. 51, Pl.'s Reply at 7-8.) For Defendant, the term's presence in claim 10 precludes a construction permitting a unitary product. (R. 47, Def.'s Mem. at 14.) Based on its reading of the relevant term, both in independent claim 10 and in other claims in the ‘653 Patent, the Court finds that its usage suggests that Defendant's proposed construction is proper.

Aside from its presence in limitation (c) and comparable usage in independent claims 1 and 21, 10 the term "secure" or "secured" is used four times throughout the ‘653 patent claims. See ‘653 Patent col. 18, ll. 2, 13; col. 19, ll. 4, 15. In each of those instances, the term is used to refer to the physical attachment of two separate pieces. For example, claims 7 and 20 use the term to note the physical attachment of two pieces: claim 7 describes "a seat cushion having an attachment means secured to the lower portion of the foundation"; in claim 20, a "pillow has an attachment means to secure it near the top of the generally wedge shaped foundation." Id. at col. 18, l. 2; col. 19, l. 4. Thus, when used in other portions of the claims, the term "secure" or "secured" indicates a relationship whereby one piece is physically attached to another piece of the product. Because "[a] claim term should be construed consistently with its appearance in other places in the same claim or in other claims of the same patent," Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001), the Court finds that an examination of the claim language points in favor of Defendant's proposed construction of the term "secured to." 11

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

10 Limitation (b) in independent claim 1 provides for "a softer top cushion having an upper and lower portion secured to the face." '653 Patent col. 17, l. 35. Limitation (b) in independent claim 21 provides for a "a top cushion having an upper and lower portion secured to the face of said generally wedge shaped foundation." Id. at col. 20, l. 21.11 The Court notes that the parties did not provide any discussion regarding the meaning of the preposition "to" in the term "secured to."

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -

- 4124 -
Plaintiff provides one discernible claim-language based argument in support of his proposed construction. In his briefs, he contends that independent claim 10 includes a unitary product wherein a "top cushion is integral and continuous with the generally wedge shaped foundation" because "limitations in a dependent claim 'are implicitly permitted . . . by extension' in the independent claims from which they depend." (R. 45, Pl.'s Mem. at 6-8.) The Court finds this argument unpersuasive as it is unclear whether dependent claim 11 is a limitation or an extension of independent claim 10. 12

12 Plaintiff also invokes the doctrine of claim differentiation in support of his position. (R. 51, Pl.'s Reply at 7-9.) Under this doctrine, "the presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim." Enzo Biochem, Inc. v. Appliera Corp., No. 2009-1281, 2010 WL 1135563, at *14 (Fed. Cir. Mar. 26, 2010). This argument fails because it is unclear whether dependent claim 11 is indeed a limitation on independent claim 10.

2. Specification

The specification contains a "written description of the invention which must be clear and complete enough to enable those of ordinary skill in the art to make and use it." Vitronics, 90 F.3d at 1582. Thus, the Federal Circuit has noted that the specification is always highly relevant to the claim construction analysis. Id. Indeed, it is usually dispositive and is considered the single best guide to the meaning of a disputed term. Id.

Portions of the '653 Patent specification also support Defendant's proposed construction of the term "secured to," In the specification, the term "secure" or "secured" is used at various points. See '653 Patent col. 6, l. 50; col. 8, ll. 34, 36-39, 58; col. 10, ll. 60, 63, 67; col. 12, l. 27. Consistent with its usage in the claims, the use of the term in the specification indicates a relationship between two or more pieces. (See id.) Specifically, it suggests the physical attachment of two pieces. For example, the specification describes: a seat cushion designed to prevent the user from sliding down which must be "secured" directly or indirectly to the foundation "so that the user won't slide down and move the seat cushion while he or she slides down"; a head pillow attached to straps which are "secured to the support foundation"; and a piece of upholstery "secured around the support foundation and . . . around the main cushion." Id. at col 8, ll. 32-39; col. 10, ll. 59-61; col. 12, ll. 26-28.

Further, other portions of the specification also shed some light upon the meaning of the term "secured to." In describing the convex lumbar support in an embodiment depicted by figure 1A, the specification notes that it "can be integral and continuous with the foundation, or can be secured to the top of the lower portion of the foundation." Id. at col. 6, ll. 48-51 (emphasis added). The use of the term "or," which the Federal Circuit has noted indicates the presentation of alternatives unless given a different meaning, Kustom Signals, Inc. v. Applied Concepts, Inc., 264 F.3d 1326, 1330 (Fed. Cir. 2001), strongly suggests that the term "secured to" in independent claim 10 cannot also mean "integral and continuous." As a result, this portion of the intrinsic record indicates that limitation (c) is satisfied not by a unitary "integral and continuous" product, but by a product whose separate pieces are attached, or "secured to," one another. Thus, the term's use in the specification—along with its usage in the claim language—leads the Court to adopt the following construction of the term "secured to": "attached using attachment means, such as an adhesive or mechanical type fasteners that might be used with material that is selected for the top cushion and foundation."
"the top 4" of material on the face of the foundation or the cushioning material on 'the face of the foundation.'" (R. 45, Pl.'s Mem. at 4.)

While the parties contest the meaning of the terms "top cushion" and "secured to," they fail to properly address the construction of another term they ask the Court to construe: "the face of the generally wedge shaped foundation." (See R. 45, Pl.'s Mem. at 14-15; R. 47, Def.'s Mem.) Based on its reading of the claims and specification, the Court construes "the face of the generally wedge shaped foundation" as meaning the "top surface of the wedge shaped foundation."

3. Prosecution history

The prosecution history consists of the complete record of the proceedings before the USPTO and includes the prior art cited during the examination of the patent. Phillips, 415 F.3d at 1317. Like the specification, the prosecution history provides evidence of how the USPTO and the inventor understood the patent. Id. The prosecution history can often inform the meaning of the claim language by "demonstrating how the inventor understood the invention in the course of prosecution, making the claim scope narrower than it would otherwise be." Id. When considering the prosecution history, a court may also look to reexamination proceedings for guidance. See C.R. Bard, Inc. v. U.S. Surgical Corp., 388 F.3d 858, 861 (Fed. Cir. 2004).

The prosecution history of the '653 patent supports the conclusion that limitation (c) is not satisfied by a unitary product with a top cushion that is integral and continuous with the foundation. In response to Plaintiff's election of species for prosecution on the merits, the Office Action rejected what would become claim 10 on obviousness grounds. 13 (R. 47, Def.'s Mem., Ex. B-1 at 79-80.) While noting that the prior art did not show an "overlying cushion member," the Office found that to have included such a member for support "would have been an obvious modification to one with ordinary skill in the art." (Id. at 80.) Thus, in its comparison of the '653 application to the prior art, it is evident that the USPTO considered the proposed invention as consisting of a foundation with an "overlying cushion member." In his subsequent communications with the Office, Plaintiff did nothing to suggest that the cushion could have been alternatively "overlying" and "integral and continuous." The Court finds that the USPTO's apparent understanding of the '653 application is inconsistent with a reading of independent claim 10 which would claim a unitary product.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

13 The communication from the Office indicates that claim 11 was unpatentable over the prior art. (R. 47, Def.'s Mem., Ex. B-1 at 79-80.) Claim 11 became independent claim 10 once claim 4 was cancelled.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Similarly, the reexamination proceedings also suggest that the USPTO understood the '653 patent as a two-piece product. In the proceedings, the USPTO made clear that the prior art failed to anticipate or render obvious the claims in the '653 patent because, among other things, the prior art failed to teach a "top cushion secured to the face of the foundation." (R. 47, Def.'s Mem., Ex. G at 4.) While standing alone this statement is unhelpful, its meaning is clarified when understood in its context. Specifically, the USPTO found that the "top cushion" limitation allowed the '653 patent to overcome two references that only teach: (1) "a pillow with a cover"; and (2) "a single pillow structure." (Id. at 5-6.) Thus, in the reexamination proceedings, the USPTO compared the '653 patent to unitary "pillow" structures and found that it overcame prior art because it contained "a top cushion secured to the face of the foundation." (Id. at 4.) Based on its reading of the reexamination statement, the Court finds that the USPTO understood the '653 Patent as claiming a two-piece product.

Plaintiff argues that an interpretation of limitation (c) which would exclude disclosed embodiments describing a unitary product would run afoul of claim construction principles. (R. 51, Pl.'s Reply at 13.) Indeed, the Federal Circuit has noted that courts should avoid interpreting "claim terms in a way that excludes embodiments disclosed in the specification." Oatey Co. v. IPS Corp., 514 F.3d 1271, 1276 (Fed. Cir. 2008). Interpretations of claim terms which exclude disclosed embodiments are acceptable, however, "where those disclosed embodiments are clearly disclaimed in the specification or prosecution history." Id. at 1277.

In this case, the Court's interpretation of limitation (c) would exclude the embodiment disclosed in figure 1E, which describes a unitary product wherein the top cushion is integral and continuous with the generally wedge shaped foundation.

- 4126 -
The Court's interpretation of the relevant claim terms is acceptable, however, because the excluded disclosed embodiments were subject to a restriction requirement by the USPTO, and thus not claimed by Plaintiff. In his response to the initial Examiner Action setting forth the restriction requirement, Plaintiff unambiguously elected the species shown in figures 1A-C--and not figure 1E--for prosecution on the merits. (R. 47, Def.'s Mem., Ex. B-1 at 74.) Because these disclosed embodiments were not elected by Plaintiff in proceeding with his application, the Court finds that its interpretation of limitation (c) does not impermissibly exclude disclosed embodiments. 14

--- Footnotes ---

14 Plaintiff argues that the embodiment in figure 1E was not subject to a restriction requirement because independent claims 10 and 21 were generic. (R. 45, Pl.'s Mem. at 10.) While the presence of a generic claim would have rendered the election of any disclosed species unnecessary, there is nothing in the record indicating that the USPTO believed that independent claims 10 and 21 were generic. The record does indicate that Plaintiff believed independent claims 10 and 21 were generic, but it does not indicate that the USPTO believed that they were. (R. 47, Def.'s Mem. at 74.) In fact, the record indicates that the examiner believed that no claim was generic. (Id. at 72.) Plaintiff points to no portion of the record suggesting that the USPTO found that the independent claims 10 and 21 were generic.

--- End Footnotes ---

Accordingly, the Court finds that the prosecution history in this case supports the aforementioned constructions of the terms in limitation (c).

B. Extrinsic evidence

While extrinsic evidence can shed useful light on the relevant art, it is less significant than the intrinsic record in determining the legally operative meaning of claim language. Phillips, 415 F.3d at 1317. Where the intrinsic record suffices to resolve any ambiguity in the disputed claim term, it is improper to rely on extrinsic evidence. Vitronics Corp., 90 F.3d at 1583. Here, Plaintiff uses extrinsic evidence in the form of unrelated patents to support his proposed construction of the term "secured to." (See R. 45, Pl.'s Mem. at 12-14; R. 51, Pl.'s Reply at 5-6.) Because the intrinsic evidence in this case resolves any ambiguity surrounding the disputed claim terms, the Court finds an examination of extrinsic evidence unnecessary.

The primary issue is whether claim 12 will be interpreted to require "tamper evident means" of securing the card to its packaging. Neither party's interpretation is facially inconsistent with the ordinary meaning of "secured." Fiala's construction focuses on the term's use in describing the attachment of one item to another. SVS's interpretation incorporates this definition, but would also add an element of safety (as in "secured" against/from fraud, theft, etc.). When read against the full phrase "secured to," however, SVS's interpretation is an impermissible narrowing of the ordinary meaning of the claim language. SVS has argued that the "ordinary meaning of 'secured' is incomplete in light of the intrinsic evidence that the invention requires that the card be secured to the package in a manner that would reveal evidence of tampering." (Def. Slide 79.) The court will, therefore, determine whether the specification or prosecution history dictates a deviation from the ordinary meaning of "secured to."
Unlike "in combination" or "package," the phrase "secured to" was specifically added to claim 12 in the process of gaining acceptance by the patent examiner. (See Def. Brief Ex. H.) The previous phrase used by the applicants was "retaining means securing." 1 (Id.) SVS argues that "retaining means securing" described any possible method of attaching the card to a panel, whereas the new phrase "secured to" narrowed that definition by adding a requirement that the method of attachment reveal evidence of tampering by third parties. SVS argues that this more specific definition distinguished the claimed invention from those in previous patents. (Def. Brief at 11.)

1 The previous version of claim 12 read "a package including a first panel and retaining means securing said first card to said first panel..." The amended version reads "a package including a first panel, said first panel having an outer perimeter; said first card being secured to said first panel..." U.S. Patent No. 5,918,909, Column 22:43-45.

The prosecution history, however, does not establish that SVS's proposed construction was offered to, or relied upon by, the patent examiner. Unlike the amendments to claim 12 referring to the data-encoded strip as "displaced externally remote from a portion of said outer perimeter of said first panel," the "secured to" language was not explicitly invoked by the applicants in distinguishing the '909 patent. The remarks attached to the (re)application mention only that, unlike those in claim 12 of the '909 patent, the magnetic strips claimed in the Hill and McIntire patents are contained wholly within the outer perimeter of the first panel. Notably, the applicants did not state that the Hill and McIntire inventions have "retaining means securing" the card to the panel, rather than cards "secured to" the panel. 2 (See Pl. Brief Ex. B. FH 186.) The prosecution history, therefore, indicates that the amended language at issue here was not a direct response to the examiner's earlier rejection of claim 12. If anything, the revision supports Fiala's contention that "secured to" should be given a broader interpretation, because it appears that the intention was to avoid a means-plus-function reading of the claim. (See Pl. Brief at 26-27.)

2 The applicants' description of claim 12 reads: "In contrast, as now claimed in claims 1, 12, and 24, at least a portion of the data-encoded strip of the retained card of the present invention is required to be exposed and displaced externally remote from a portion of the outer perimeter of the first panel of the package when the first card is secured to the first panel (citations omitted). Additionally, claims 12 and 24 have been amended to recite that the first card is secured to the first panel rather than having retaining means securing the first card to the first panel." (Pl. Brief Ex. B at GH 186.) Although it is grammatically plausible that the "secured to" amendment is meant to refer "in contrast" back to the description of the Hill and McIntire inventions, the applicants mentioned nothing about the Hill or McIntire patents with which to contrast this language. Therefore, it is more likely that this amendment was offered to the examiner as a linguistic change not directly related to traversing the Hill and McIntire inventions.

Therefore, it is desirable to provide means for detecting when the PIN number P has been surreptitiously viewed. . .

The rivet 26 thus preferably comprises tamper evident means 38 for indicating that a surreptituous attempt has been made to view the PIN number P...

Id. at Column 6:29-32 (emphasis added).
The second preferred embodiment may also comprise tamper evident means as heretofore described.

Id. at Column 7:10-11 (emphasis added).

The rivet 3.36 is preferably constructed integral, one-piece with the pane 3.47, as, for example, by being heatedly and deformably formed in the PVC pane 3.47, and preferably includes tamper evident means …

Id. at Column 8:45-48 (emphasis added). The specification shows that the preferred embodiments of the '909 invention preferably included tamper evident means of securing the card to the panel. It does not require that the card must be secured to the panel using tamper evident means.

In claim 16, the patentees specifically assert ownership of:

The combination as recited in claim 12 in which said first card has a personal identification number thereon and said first card is secured to said first panel so that said personal identification number is obscured from view, and in which said package comprises tamper evident means for indicating that an attempt has been made to view said personal identification number.

Claim 16 is dependent on claim 12. Normally, a limitation contained in a dependent claim will not be read into an independent claim, because such a reading would render the dependent claim superfluous. See United States v. Telectronics, Inc., 857 F.2d 778, 783-84 (Fed. Cir. 1988.) The doctrine of claim differentiation does not apply directly to this case, however, because the "tamper evident means" limitation is not the only meaningful difference between claim 12 and claim 16. See Wenger Manufacturing, Inc. v. Coating Machinery Systems, Inc., 239 F.3d 1225, 1233 (Fed. Cir. 2001). Even so, given that neither the plain language, specifications, nor prosecution history supports a reading that the "secured to" phrase requires a tamper-evident-means limitation, the fact that this precise limitation is contained in a narrower claim is further evidence that it is not a part of claim 12.

Having considered the claim language, specification, and prosecution history, the court construes "secured to" to mean "held fast." This meaning is consistent with the ordinary and customary meaning of the word. The evidence before the court also indicates that a person of ordinary skill in the art would have so defined "secured to" at the time the patent was prosecuted.

C. Secured To

Webster's defines secure as "(1) (a) to relieve from exposure to danger: act to make safe against adverse contingencies … (b) to put beyond hazard of losing or of not receiving: guarantee … (2) (a) to take (a person) into custody: hold fast: pinion (b) to make fast: seal … (3) (a) to get secure usually lasting possession or control of … (b) bring about, effect (4) to release (naval personnel) from work or duty …." WEBSTER'S at 1062. Blank proposes that "secured to" should be construed to mean "attaching two or more separate items together." (Def.'s Markman Memo. at 12.) Fiala would interpret "secured to" to mean "held in any manner whatsoever." (Pl.'s Markman Brief at 24).

The claim language itself offers minimal assistance in construing the term. Either interpretation is plausible. However, because the claim language cannot be read to require two separate pieces, it would be inappropriate to read Blank's proposed limitation into the claim language. See Cordis Corp. v. Medtronic Ave, Inc., 339 F.3d 1352, 1356-57 (Fed. Cir. 2003).

The specification presents some support for Blank's position. Several times while discussing preferred embodiments, the specification indicates that the manufacturer "secure[s] the first card C to the package." U.S. Patent No. 5,918,909, Column 19:9-10, 20: 46-48. This usage necessarily indicates that the parts were distinct at one time. Other language from the preferred embodiments further supports this interpretation. See id. at Column 19:18-19 ("Once the first card C is secured to
the package … "). The claim, language, however, is broader than any of the preferred embodiments. In such circumstances, claim limitations should not be read from the preferred embodiments into the claim language itself. See Envirco Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 1366 (Fed. Cir. 2000). "Being secured" does not necessarily indicate that two separate things were joined. Although language from the preferred embodiments indicates the presence of two separate things joined together, that indication is not sufficient to establish that Fiala claimed only card package combinations where the card and package originally were separate.

The prosecution history adds little to the discussion. The claim originally read "retaining means securing said first card to said first panel," rather than "said first card being secured to said first panel." Pros. Hist. at FH155. Fiala's attorney described this revision as slight. Id. at FH153. Although the patent examiner previously had disallowed claim 12, this revision was not a response to that rejection. See id. at FH142 (stating reasons claim 12 was rejected); FH147 (detailing Fiala's changes to claim language in order to attain allowance of claim 12). If anything, the revision supports Fiala's contention that "secured to" should be given a broader interpretation, because it appears that the intention was to avoid a means plus function reading of the claim.

Having considered the claim language, specification, and prosecution history, the court construes "secured to" to mean "held fast." This meaning is consistent with the ordinary and customary meaning of the word. The evidence before the court also indicates that a person of ordinary skill in the art would have so defined "secured to" at the time the patent was prosecuted.

"Secured to Said Golf Bag"

The parties dispute the meaning of this phrase, although the nature of disagreement was not originally clear from their submissions. However, counsel clarified their respective positions during oral argument. (See, Oral Argument Transcript at pp. 34-39, 68-72). In that regard, plaintiff's counsel contends that the term "secured to said golf bag" means that the strap may be secured to the bag indirectly, via a securing means, such as a strap or loop. Plaintiff distinguishes this from the terminology used in Claim 14, referring to attachment points on the "sidewall" of the golf bag, which according to plaintiff, means to be secured directly to the sidewall of the golf bag. Defendant's counsel, on the other hand, does not appear concerned with the golf bag/sidewall distinction. (Oral Argument Transcript at 68-72) Rather, he emphasizes that "attached to said golf bag" means that the attachment point must actually be the point where a strap or section of strap attaches to the bag's outer surface, by some securing means:

[W]e look for a point on the golf bag . . . where the strap ends are secured to the golf bag. I am saying we find those locations . . . attached to the wall of the bag. We don't find it in the middle of the strap and say, oh-ho, if you follow th strap far enough, it's attached to the golf bag. The points of attachment mean points of attachment; it does not mean attachment in the larger sense.

(Oral Argument Transcript at pp. 70-71) Consequently, the parties' expressed concerns regarding the term "attached to said golf bag" do not really appear to be in conflict. In any event, the Court finds that the term "secured to said golf bag" means that a strap end is attached to the outer surface of the golf bag by a securing means. The point at which the strap is "secured to said golf bag" is the point at which a particular section of strap ends at the securing means.

(5) "secured to said rear side" (claims 12 and 16):

Plaintiffs contend that the phrase "secured to said rear side" in claims 12 and 16 "means that each first magnetic member is connected to the rear side of the corresponding extension in a manner such that the connection is not likely to fail or give away. The first magnetic member may also be secured to other portions of the primary spectacle frame (e.g., the lens rims) in addition to the extension." JS, Exh. B at 11.
Conversely, Defendant argues that the phrase in question "should be interpreted to require that each of the two first magnetic members of the primary frame are secured or attached to the back side of the extension, but not attached to the lens rim." Def. Opposition at 8:12-14; see also JS, Exh. D at 4.

Defendant contends that the prosecution history of the '545 Patent mandates their construction of the phrase in question. See Def. Opposition at 8:17. Specifically, Defendant states that "[i]n the original reissue application, proposed claims 12, 16, 20, 34 and 35 included limitations where projections or first magnetic members were attached to the side portions of the primary frame." Id. at 8:17-20. Defendant goes on to say that "the Examiner rejected these claims, indicating: Regarding claims 12, 16, 18, 20, 34, 35, the subject matter of securing the magnetic members to the side portions of the primary spectacle frame and of the auxiliary frame is not supported in the original specification. Therefore, it is new matter." Id. at 8:20-9:2 citing the prosecution history of the '545 Patent, Koo Decl., Exh. E at 167-169.

Defendant's characterization of the prosecution history of the '545 Patent is incomplete. Subsequent to the Examiner's rejection cited by Defendant, an interview with the Examiner was conducted on April 4, 2001, wherein the Examiner expressly withdrew his rejection. See Koo Decl., Exh. E, 476-77. Additionally, the Court notes that one of the preferred embodiments of the invention shown in Figure 3 illustrates magnetic members 14 secured to the extensions and to the edges of the lens rims. See Koo Decl., Exh. B at 11.

Based on the above, the Court construes the phrase "secured to said rear side" in claims 12 and 16 of the '545 Patent to mean that each first magnetic member is connected to the rear side of the corresponding extension or to other portions of the primary spectacle frame in a manner such that the connection is not likely to fail or give away. See Webster's, Nicodema Decl., Exh. 5 at 150 (defining "secure" as "not likely to fail or give away").

First, the district court construed the meaning of the claim language "fixed opposite end portions which are secured to the mounting frame members." With respect to this issue, the court held:

Although I agree with Foster that the cylinder does not have to "touch" the mounting frame member, I believe that the indirect connection relied on by Foster is too circuitous for the cylinder to be considered secured to the undercarriage channel member. The two are connected to portions of the conveyor frame that are at right angles to each other. All parts of the conveyor are welded or bolted to another part. Foster's argument would have them all "secured to" each other. I disagree. The trial judge apparently interpreted the claim language with an eye to the accused device, a practice this court eschews. See SRI Int'l. v. Matsushita Elec. Corp., 775 F.2d 1107, 1118, 227 U.S.P.Q. (BNA) 577, 583 (Fed. Cir 1985) The district court concluded that the two components need not be in direct contact and that the connection may be indirect, but then looked to the accused device to declare the meaning of indirect.

As the district court correctly noted, the claim does not require "secured" to mean a direct connection. Rather, the term "secured" means "to make tight or firm: FASTEN." Webster's II New Riverside University Dictionary 1055 (2d ed. 1988). Neither the specification nor the prosecution history discloses a more specialized or different meaning. Thus, the claim envisions and includes an installation which connects the opposite end portions of the drive units to the end portions of the conveyor frame, and which connects the end portions of the conveyor frame to the channel members. Although the connection is indirect, the claim requires no more than a secure fastening of the fixed opposite end portions to the mounting frame members. The district court unnecessarily restricted the meaning of this claim language.
Callicrate urges that the phrase "securely fastening said ligature material" means "securely fastening the ligature material." On the other hand, NAIC proposes the following construction: "being crimped in a manner sufficient to hold two bands together so as to retain the loop in a tensive condition." The claim language, however, provides only that the grommet securely fasten the ligature material.

Specification

Even though the claim language does not require that the loop be held in a tensed condition, NAIC argues that "the specification and the entire background from which the invention claimed springs" demonstrate that such a limitation is proper. The specification states:

The grommet 32 must be capable of being properly crimped in a manner sufficient to hold two bands together so as to form a loop 20 of ligature material. The grommet 32 must retain the loop 20 in a tensive condition during the atrophy process which may take several weeks. Further the grommet 32 is designed so as to securely fasten the ligature material without significantly damaging the material. 62

The specification in this case explains that to be securely fastened, the grommet must retain the loop in a "tensive condition." This is crucial for the proper function of the endless loop, which must remain in place for several weeks during the atrophy process. Indeed, Callicrate identified a problem in the prior art with bands that are difficult to attach such that they are sufficiently tight. Callicrate's endless loop invention with an attached deformable grommet claims to solve this problem by allowing the ligature band to be "tightly attached to an animal body part." Thus, the Court concludes that the phrase "securely fastening said ligature material" means that the loop must be secured so as to retain the endless loop in a tensive condition.

3. "securing"

The parties agree that the claim language covers various means of "securing" and that the object to be secured is "at least a portion of the distal end portion of the catheter." 8 '198 patent, col. 11, 11. 32-33. They also agree that "securing" should be given its ordinary meaning. Spire proposes that "securing" be construed as "fastening the distal end portion to the patient." Arrow opposes the use of the word "fastening," but offers no alternative definition.

I agree that "securing" should be construed as it is commonly understood, which in this context, is to "hold fast," "to make fast," or "tie down." See Webster's Third New International Dictionary (1986). To hold or make "fast" and "tie down" suggests that the objects are fixed firmly in place. Consequently, I find that "securing" means "firmly fixing the distal end portion to the patient."

Spire proposes the term "fastening," a close, but not perfect synonym of "securing." Although "fastening" accurately captures this concept of fixing one object firmly to another, it can also imply that the two objects are attached to each other. "Securing" does not carry this same connotation. Cf. Int'l Rectifier Corp. v. IXYS Corp., 361 F.3d 1363, 1374 (Fed. Cir.)
2004) (["The district court's adoption of . . . a synonym of the claim term, disregards entirely the distinction between the two terms set forth in the usage note. Had the inventor meant [the synonym], he could have used that word. However, we must consider the word that the inventor actually chose and use the definitions of that term that are consistent with the written description.").

The specification devotes only two sentences to describing how the distal end is to be "secured," but it is clear from this brief explanation that "firmly fixing" is more accurate than "fastening." The first sentence states that the distal end is "secured by sutures or any other suitable means." '198 Patent at col. 5, 11. 44-46. The second indicates that the tubes can be "secured" by placing a stabilizing cuff in a dilated portion of the subcutaneous tunnel. Id. at col. 5, 11. 52-54. Sutures firmly fix the tubes in place by holding them tightly to the patient's skin. This appears also to fit the definition of "fasten." But the same cannot necessarily be said of the stabilizer cuff, which is held in place, not by any attachment mechanism, but by pressure from the walls of the subcutaneous tunnel. This is "securing" as "firmly fixing" but it does not import the concept of "fastening." At the risk of tautology, I will provide a construction of "securing" as "firmly fixing" that I believe comprehends both circumstances.

According to Smith & Nephew, in the 330 patent, "securing" means "holding" tissue. See Ex. Y, col. 1, 1. 12 ("a device . . . for holding and manipulating . . . tissue"); col. 1, 1. 20 ("Conventional medical clamps have serious disadvantages when used for securing and manipulating" tissue); col. 1, 1. 66 (none of the prior art disclose "apparatus suitable for holding and manipulating cartilage during arthroscopic surgery"); col. 3, 1. 7-8 (during surgery, once the anchor member is deposited, the cartilage can be "secured with the use of tension on the suture").

In contrast, according to Smith & Nephew, in the 691 patent, "anchoring" tissue means "to permanently reattach" tissue. Ex. A, col. 1, 1. 47-51 ("the present invention provides a relatively compact and easy to use apparatus for manipulating cartilage and other fibrous tissue, and for anchoring the tissue to other tissue or to bone"). Therefore, according to Smith & Nephew, claim 7 in the 330 patent describes a device for holding the tissue while the surgeon cuts and removes it, while the relevant claims in the 691 patent are directed to a device for anchoring tissue to tissue so a tear can heal.

"Differences among claims can . . . be a useful guide in understanding the meaning of particular claim terms." Phillips, 415 F.3d at 1314. Claim 7 is the only claim in the 330 patent directed solely to "securing" tissue, while all of the other claims in the 330 patent describe a device for use in "anchoring and manipulating" tissue. In addition, all of the claims except claim 7 limit the claimed invention to one that includes a retainer to keep the anchor member in place. The retainer is described in the specification as a means of "holding tissue permanently in place." Ex. Y, Abstract, col. 3, 1. 22-34, col. 8, 1. 32-38. Therefore, "anchoring and manipulating" contemplates a claimed invention that permanently holds the tissue. "Securing," on the other hand, must mean something different from "anchoring and manipulating," as those terms are used in the 330 patent. Differentiating claim 7 from the other claims in the 330 patent, and referring to the specification referenced by Smith & Nephew, I find that "securing" in claim 7 means temporarily holding.

As for the 691 patent, claims 15 and 18 describe a method for "manipulating" tissue. Absent a definition for manipulating in the specification, the term carries its ordinary and customary meaning. Manipulating is generally understood to mean handling. Accordingly, claims 15 and 18 describe a method for handling tissue, while claim 7 describes a device for holding tissue.

A device that is capable of holding tissue can also handle tissue. Indeed, the 330 specification recognizes that a device that can secure tissue can also manipulate tissue. See Ex. Y, col. 1, 1. 12 ("a device . . . for holding and manipulating . . . tissue"); col. 1, 1. 20 ("Conventional medical clamps have serious disadvantages when used for securing and manipulating" tissue); col. 1, 1. 66 (none of the prior art disclose "apparatus suitable for holding and manipulating cartilage during arthroscopic surgery"). Similarly, the 691 patent specification confirms that a device that secures tissue is implied in a device that manipulates tissue. See Ex. A, col. 1, 1. 15 ("an apparatus and method for manipulating . . . tissue"); col. 1, 1. 20 ("Conventional medical clamps have serious disadvantages when used for manipulating" tissue); col. 1, 1. 56 (none of the prior art disclose "apparatus suitable for manipulating fibrous tissue during arthroscopic surgery").

Although claim 7 of the 330 patent and claims 15 and 18 of the 691 patent use different terminology, the claims are so alike
as to render the 691 claims obvious in view of the 330 claim. As a result, I find that Smith & Nephew has not demonstrated that Biomet's claim of double patenting with respect to claims 15 and 18 lacks substantial merit.

In this case, plaintiffs contends that the term "securing mechanism" as stated in a number of claims in the patent, means a "conventional mechanical locking device." Defendants, on the other hand, argue that "securing mechanism" means "latching mechanism." If defendants' view is accepted, the patent extends only to a clothes hanging device as described above that uses any kind of a latch to lock the arms of the device in place. By contrast, plaintiffs' interpretation would broaden the scope of the patent to cover similar clothes hanging devices that use any mechanical system to lock the arms in place. For the reasons stated below, the court agrees with plaintiffs that "securing mechanism," as used in the claims of the " '888 patent," means "conventional mechanical locking device."

In support of their argument, plaintiffs point to claims 13, 14, and 21. Claims 13 and 14 state, in part:

A hanger, comprising:

a hanger body having an attached hanging structure; a plurality of arms attached to the body; and at least one securing mechanism for securing the plurality of arms in a first position relative to the hanger body;

Pls.' Ex. 1, col. 8, lines 24-28, 39-43 (emphasis added). Claim 21 contains the same language as the quoted portions of claims 13 and 14, supra, and further states:

wherein the plurality of arms are each movable from the first position to a second position, such that the arms are fixably stopped in the second position, wherein each of the plurality of arms includes a plurality of hang locations for fixedly holding conventional hangers, wherein each securing mechanism comprises a latch, and wherein the plurality of arms include a plurality of hang locations, the plurality of hang locations comprising holes in the plurality of arms.

Pls.' Ex. 1, col. 9, lines 50-59 (emphasis added). Defendants, in turn, rely on a number of claims that refer to a "latch." For example, claims 28 and 29 notes that "wherein each latch has a latched position and an unlatched position, [and] wherein each latch is biased on the latched position." Pls.' Ex. 1, col. 11, lines 8-10, 26-28; see also Pls.' Ex. 1, claims 2, 5, 21-27, 57-59.

"In construing the claims, a court "first . . . looks to the words of the claims themselves, both asserted and nonasserted, to define the scope of the patented invention." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). Within the claims, there is support for both parties' positions. Defendants' asserted claims demonstrate that the claims contemplate that the securing mechanism will contain some kind of latch system. The multiple references to latches, however, does not conclusively answer the question before the court of what the term "securing mechanism" means.

"The 'varied use of a disputed term in the written description demonstrates the breadth of the term rather than providing a limited definition.'" Northern Telecom Ltd. v. Samsung Elec. Co., Ltd., 215 F.3d 1281, 1291 (Fed. Cir. 2000) (quoting Johnson Worldwide Assoc. Inc. v. Zebco, Corp., 175 F.3d 985, 991 (Fed. Cir. 1999)). Therefore, the various references within the claims to "latches" that describe the term "securing mechanism" do not limit the scope of the term. In addition, the mere use of the term "securing mechanism," rather than simply "latching mechanism" or "latch system," suggests that the claims encompass systems "for securing the plurality of arms in a first position relative to the hanger body," Pls.' Ex. 1, col. 8, lines 28-29, 43-44, that do not include latches. This reading supports plaintiffs' position that "securing mechanism" encompasses all types of conventional mechanical locking devices, not merely those that use latches.

Footnotes

2 Plaintiffs point out that the language in claim 21 relied upon by both parties, "wherein each securing mechanism comprises a latch," would reduce that language to a redundancy, reading "each latching mechanism comprises a latch." The fact that defendants' reading renders a portion of claim 21 superfluous further supports the court's conclusion.
The Federal Circuit directs that the second step in claim construction analysis is to look at the specification, and read the claims in view of the specification. See Vitronics, 90 F.3d at 1582 ("As we have repeatedly stated, 'claims must be read in view of the specification, of which they are a part.'" (quoting Markman, 52 F.3d 967, 979 (Fed. Cir. 1995), aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996)). The court in Vitronics describes the specification as "the single best guide to the meaning of a disputed term." Vitronics, 90 F.3d at 1582.

The specification contains two references to the means of holding the arms of the device in a locked position that strongly support plaintiff's position. First, in the "Summary of the Invention," the patent describes "an embodiment of the present invention [which] comprises a device, method, and system for clothing organization that includes . . . a securing or latching system to hold the arms in place." Pls.' Ex. 1, col. 2 lines 53-54 (emphasis added). Second, the "Detailed Description" provides that "in an embodiment of the present invention, as shown in FIG. 1, two securing mechanisms 3, 4, such as latches, are incorporated near the top of the body 1a." 3 Pls.' Ex. 1, col. 4 lines 37-39 (emphasis added). The latter passage in particular demonstrates that the term "securing mechanism," at least as used in the specification, encompasses systems that rely on latching mechanisms and those that use some alternative means of holding the arms of the device in a fixed position. Because the specification is the "single best guide," for determining the meaning of the disputed claim term, see Vitronics, 90 F.3d at 1582, the court concludes that the term "securing mechanism" has the same meaning in the claims section of the '888 patent as it has in the specification section. Accordingly, the court finds that defendants' contention that "securing mechanism" merely means "latching mechanism" is not supported by the '888 patent.

Having shown that defendants' definition of "securing mechanism" is not supported by the '888 patent, the court must determine the proper construction of the term. Plaintiffs contend that "securing mechanism" means "conventional mechanical locking device." The court concludes that this definition is accurate because, one, it recognizes that a securing mechanism need not be limited to a latching system, and, two, it does not unduly expand the scope of the patent.

The court reaches this conclusion by first examining "the context of this patent is all about." Design by U.S. Company v. Best Foods, Inc., 2000 U.S. Dist. LEXIS 10669, No.CIV.A. 98-736, 2000 WL 1056454 (E.D. Pa. Aug. 1, 2000). The Federal Circuit has endorsed this approach, stating that "a claim construction is persuasive, not because it follows a certain rule, but because it defines terms in the context of the whole patent." Renishaw PLC v. Marposs Societa' Per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998). In this case, the context of the patent concerns protecting the concept of a clothes hanging device that, through movable arms that contain holes through which conventional hangars can fit, decreases the amount of space taken up by the clothes when the arms are locked in a certain position. The means by which the arms are locked is of minimal importance, and requires nothing more than rudimentary engineering. Had the plaintiffs attempted to patent the latching system which is contained on the product they market to the public based on the '888 patent, such an attempt would have been summarily rejected, because the latch system found on the product is so basic and obvious. This is clear to the average person, let alone someone "skilled in the art." Therefore, in order to provide adequate protection for the primary concept articulated in the '888 patent, it is necessary to construe the claims as to features of the invention of secondary importance, such as the securing mechanisms, in a manner broad enough to prevent a patent holder's competitors from evading the reach of the patent laws by altering a single relatively unimportant component of the invention. This conclusion is also supported by plaintiffs' expert, Dr. Thomas Haas, 4 who testified that, in his opinion, "a securing mechanism is a conventional mechanical locking device." Hr'g Tr. (10/13/00) at 61.

4 Dr. Haas is a professor of chemical engineering at Virginia Commonwealth University, see Hr'g Tr. (10/13/00) at 51, and is a past president of the Society of Plastic Engineers, see id. at 54. At the hearing, Dr. Haas was qualified as an expert in the fields of mechanical design and polymer engineering. See Hr'g Tr. (10/13/00) at 59. Defendants objected to the proffer of
this opinion because Dr. Haas's testimony is extrinsic evidence. They argue that the court may not consider such extrinsic evidence because, in their view, the claims clearly establish that the term "securing mechanism" means "latching mechanism." It follows from the court's rejection of that view, however, that the claims are ambiguous. Consideration of extrinsic evidence is thus appropriate. See Victronics, 90 F.3d at 1583 ("In those cases where the public record unambiguously describes the scope of the patented invention, reliance on any extrinsic evidence is improper.").

Finally, defendants' means-plus-function argument under 35 U.S.C. § 112(b) is equally unavailing. Section 112(b) provides that an element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material or acts described in the specification and equivalents thereof.

35 U.S.C. § 112(b). The claims asserted by defendants do not contain the "means for" language that is generally used by claims drafters to trigger application of § 112(b). The absence of the "means for" language creates a presumption that § 112(b) does not apply. See Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1584 (Fed. Cir. 1996). In this case, defendants has pointed to nothing in the claim language of the '888 patent which overcomes the presumption created by the absence of the "means for" language.

For the reasons stated above, the court finds that, the term "securing mechanism" as used in the '888 patent means "conventional mechanical locking device."

Plaintiff asserts in its rebuttal statement that the claim requires securing the protective barrier "to said structure," not the ground, and that Defendants' proposal improperly narrows the claim by importing limitations from embodiments disclosed in the specification. In rebuttal, Defendants argue that construing this claim term within the context of the entire patent, the protective barrier is required to protect the entire structure and "does not require physical attachment to the structure." Defendants contend that "numerous of the embodiment[s] illustrated in [Patent '852] show connecting the single protective barrier device to the ground around the perimeter of the structure so as to achieve the securement of the barrier device to the structure." At the hearing, Plaintiff argued that the claim language itself says nothing about securing the barrier to the ground. Defendants' countered by referencing illustrated figures 1, 2, 4, and 8, which show the device anchored to the ground or at or above a structure's cave. While conceding that the protective barrier can also be secured to the structure, Defendants argue that such securing must be at or above the eave.

The Court finds Defendants' argument to be counter-intuitive and inconsistent with the claim's plain language. The claim language clearly and plainly states "securing said protective barrier to said structure" and says nothing about securing the
barrier to the ground, as urged by Defendants. Defendants' reliance upon specific figures in the specification is misplaced. As has been stated consistently throughout this Report and Recommendation, the Federal Circuit clearly prohibits courts from improperly importing limitations from the specification into a claim. Varco, 436 F.3d at 1373. More specifically, courts are not to confine claims to embodiments described in a specification. Phillips, 415 F.3d at 1323. Here, Defendants primarily rely on specific figures and their corresponding written descriptions. Because this Court is not permitted to narrowly confine the instant claim term to these specific embodiments, this Court rejects Defendants' proposal.

Moreover, as noted by Plaintiff in its rebuttal statement, claim 10 of Patent '085 includes the claim term "securing said textile material to said structure." Since Patent '852 is a continuation-in-part of Patent '085, the common claim term "securing" in both patents should be construed consistently. See NTP, Inc. v. Research In Motion, Ltd., 418 F.3d 1282, 1293 (Fed. Cir. 2005) (holding that because the patents at issue "all derive from the same parent application and share many common terms, we must interpret the claims consistently across all asserted patents"). This Court construes "securing said textile material to said structure" in claim 10 of Patent '085 to mean "securing or connecting the textile material to the structure." Similarly, the instant claim language means "securing or connecting the protective barrier device to the structure."

The parties agree that protective barrier device means "one or more panels of a flexible textile material." The parties also agree that the protective barrier device can be secured to the structure, except that Defendants argue that the device can also be secured to the ground in a manner that holds the device onto the structure and, if it is secured to the structure, such securing must be at or above the cave. Although the specification reveals an embodiment in which part of the protective device is indeed anchored to the ground and secured at or above the cave, there is no evidence to support a construction narrowing the claim to only these two methods of securement. Instead, the Court reads the instant claim language in view of the specification, which specifically incorporates prior art and predecessor patents, to mean that the device is in some manner secured or connected to some portion of the structure itself. The Court finds Plaintiff's proffered construction to be consistent with this reading and hereby adopts it as the proper construction of this claim term.

GO BACK

3522

G. "Securing"

Mitek argues that "securing by advancing" should be construed as "to make fast by impacting." Mitek asserts that the patents warn against securing the graft by rotating a screw-in type implant because the graft could become wrapped around the implant. Mitek cites to the Background of the Invention portion of the patent. (Doc. 140, Exh. 1, 1:60-62). Mitek also cites to the language in the patents which includes the implant is "driven into the femur" and later "the implant easily can be impact driven into the repair site," and a "mallet is used to drive the implant into the femur." (Doc. 140, Exh. 1, 3:5-6, 7-8, 6:11-12). Mitek argues that the patents do not propose any other method of securing the graft other than impaction.

Arthrex argues that the transverse implant can be advanced by impaction into the bone, however the claim is not limited to this suggested manner of advancing. Arthrex asserts that there is nothing in the claim language or the specification to limit how the "advancing" is to occur.

In the System for Loading Tendons into the Knee, the patent provides that "[a] threaded portion of the implant screws into the bone as the implant is advanced with rotation into the repair site. The technique is disadvantageous, however, because the graft can become wrapped around the implant as it is rotated. An improved bone implant is the subject of the U.S. Pat. No. 5,895,425." (Doc. 140, Exh. 1, 1:58-64). In the Summary of the Invention, the patent provides that the "implant is placed over the wire and driven into the femur. The implant preferably is formed with back-biting threads. Accordingly, the implant easily can be impact driven into the repair site, and yet can be removed if necessary by rotation." (Doc. 140, Exh. 1, 3:5-9). In the Detailed Description of the Preferred Embodiments, the patent provides for the implant being "driven by impaction into bone, and then, if necessary can be subsequently removed by screw rotation as discussed below." (Doc. 140, Exh. 1 4:59-61). Later in the Detailed Description of the Preferred Embodiments, the patent provides that "a mallet is used to drive the implant into the femur." (Doc. 140, Exh. 1, 6:11-12).

The specific claim language does leave open the method of "advancing an implant transversely into the opening." (Doc. 140, Exh. 1, 6:55-56). However, considering the specification as a whole and in conjunction with the claim language, the
terms "securing the graft by advancing an implant transversely" should be construed as by impaction and not by securing the graft by rotating a screw-in type implant. In the System for Loading Tendons Into the Knee, the language disavows the use of the screw-in type implant as possibly causing the graft to become wrapped around the implant when rotated. (Doc. 140, Exh. 1, 1:62-63). Relying on the language of the claim and the language in the specification, the Court determines that a "person of ordinary skill in the art" would construe the "ordinary and customary meaning" of the terms "securing the graft into the opening by advancing an implant transversely into the opening and under the graft," to mean to secure the graft by impacting and not by rotating a screw-in type implant.
can affect dead band within the invention at issue and points to several instances within the specification where the term "select starting position" specifically refers to the start position of the piston. However, the use of the terms "select start position," "start position," or "starting position" within the specification is not restricted to discussions of the piston; rather, these terms are used numerous times throughout the specification in connection with various components of the brake system. As a result, it is difficult to extrapolate the constant association of this term with a specific component that Formula urges. Instead, this type of use demonstrates that the term is not independently definable but instead relies upon other associated language to convey its full meaning. It also indicates that the inventor knew how to use, and the PTO knew how to approve or disapprove of, different terms to specifically call to mind when specific scenarios were being described. In other words, to know the object whose start position has been selected, we must look at the language surrounding this term.

The term "select starting position" is used twice in claim 21. The first appearance occurs in the context of a description of the positioning of the seal as it moves from its initial position, selected by the rider according to his or her preference, toward the opening of the timing port. The second instance, by contrast, appears in a discussion of the lever and the effect on the piston when the lever pivots. The latter use pertains to the starting position of the piston; the former, to that of the leading edge of the seal. Thus, we cannot agree with the construction advanced by Formula that "select starting position" always pertains to the starting position of the piston. Rather, the component at issue will differ and must be determined through the context in which it is used. Consequently, we construe this term to mean the position of a particular component, as chosen by the rider.

5) "selectable"

Plaintiff proposes that "selectable" be defined as "a design choice." Defendant proposes the definition, "capable of being altered." I conclude that selectable means capable of being altered.

Claims 15 and 22 both use the term selectable. Claim 15 requires the "position of said intake passageway [to be] selectable based upon at least one of the position and the configuration of said runner filler," while claim 22 requires the "position of the inlet [to be] selectable." Plaintiff emphasizes the invention of the '502 patent, which is a cylinder head that can be used in a variety of engine configurations. The '502 patent teaches altering the size or position of the intake passageway by changing the size or shape of the runner filler. Therefore, plaintiff argues, "selectable" means the ability to make different design choices.

Defendant does not deny that the '502 patent teaches changing the runner filler to alter the shape or size of the intake passageway. However, defendant contends that plaintiff's proposed construction is so broad as to render the term "selectable" meaningless. After all, equipment designers necessarily make "design choices" at some point in the production of any cylinder head. Defendant contends that an intake passageway and inlet are not "selectable" within the meaning of claims 15 and 22 unless those components can be altered without undermining the functioning of the cylinder head.

The patent does not define selectable. The ordinary meaning of the term is "capable of being chosen." Webster's New World Dictionary 3, 1299 (4th ed. 2001). Like plaintiff's original proposal, this definition is inadequate to give any meaning to the term as it is used in claims 15 and 22. All designs are "chosen," but not all designs infringe the '502 patent. I conclude that "selectable" as used in claims 15 and 22 refers to intake passageway positions and inlets that can be altered without disturbing the function of the cylinder head.

B. Claim Construction

The parties dispute the construction of Claim 27's phrase "selected and combined such that the storage tank is able to withstand an environment of at least 2000 degrees F. for a period of time of at least two hours." Specifically, they disagree as to the significance and construction of the terms "selected and combined." U-Fuel argues that these terms distinguish
Claim 27 from prior art in that they necessarily entail an intent to build a tank that is "fire-resistant." Defendants dispute plaintiff's construction, asserting that there is no such intent limitation attached to these terms.

The "first step" of an invalidity analysis based on anticipation in view of prior art is determining the claim's meaning and scope. See Lemelson v. Gen. Mills, Inc., 968 F.2d 1202, 1206 ("It is elementary in patent law that, in determining whether a patent is valid and, if valid, infringed, the first step is to determine the meaning and scope of each claim in suit."). "A claim must be construed before determining its validity just as it is first construed before deciding infringement." Markman v. Westview Instruments, Inc., 52 F.3d 967, 996 n. 7 (Fed. Cir. 1995), aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). "Only when a claim is properly understood can a determination be made whether ... the prior art anticipates and/ or renders obvious the claimed invention." Amazon.com, 239 F.3d at 1351.

In construing the meaning and scope of a claim, the Court can consider two types of evidence: intrinsic and extrinsic. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). There are three sources of intrinsic evidence: (a) the words of the claims themselves; (b) the specification, which is the written description of the claims including a description of the preferred embodiment of the protected invention; and (c) the prosecution (or file) history of the patent, if it is in evidence. Id. "Extrinsic evidence is that evidence which is external to the patent and file history," such as expert testimony and prior art. Id. at 1584. It is only to be considered if the analysis of intrinsic evidence alone will not resolve any ambiguity in a disputed claim term. Id. at 1583.

In considering intrinsic evidence, the Court must look first to the claim language itself to define the scope of the protected invention. Bell Atlantic Network Servs., Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1267 (Fed. Cir. 2001). Claim terms are to be given their plain and ordinary meaning unless it is apparent from the patent specification that the inventor intended a different meaning. Nat'l Recovery Techs., Inc. v. Magnetic Separation Sys., Inc., 166 F.3d 1190, 1195 (Fed. Cir. 1999).

U-Fuel contends that the language "selected and combined" instructs one skilled in the art to select and combine materials with the intent of manufacturing a non-insulated AST that can withstand a 2000 degree Fahrenheit environment for two hours. U-Fuel argues that the words "selected and combined" necessarily incorporates an "intent" limitation -- a limitation that U-Fuel notes is neither in the UL 142 standard nor the F921 specifications -- thereby distinguishing its claim from prior art. Defendants dispute this construction and assert that there is no intent element in Claim 27 that makes this process claim new.

To support its interpretation that the terms "selected and combined" embody an "intent-to-achieve-fire-resistance" limitation, U-Fuel cites two cases, Nat'l Recovery Techs., Inc. v. Magnetic Separation Sys., Inc., 166 F.3d 1190 (Fed. Cir. 1999), and Optical Coating Laboratory, Inc. v. Applied Vision, Ltd., 1996 U.S. Dist. LEXIS 1476, 1996 WL 53631, No. C-92-4689 MHP (N.D. Cal. January 19, 1996). The Court concludes that these decisions are inapposite to the construction of plaintiff's method claim at issue in this case, Claim 27.

Although Nat'l Recovery and Optical Coating both involved the disputed construction of the term "select" in method claims, that is where the similarity to the present case ends. Those cases never addressed the issue of whether the plain and ordinary meaning of the term "select" to one of ordinary skill in the art includes the intent of achieving an objective for the purpose of distinguishing a claim from prior art. In other words, the courts in these cases were not faced with the question of whether an intent limitation is attached to the term "select" to prevent prior art anticipation, nor did they in fact conclude that this term incorporates such an intent element.

The dispute in Nat'l Recovery centered around whether the term "select" merely stated a preference for certain radiation signals that did not pass through plastic containers or required "perfect isolation" between those signals that passed and those that did not pass. That case did not address the question presented in this case -- whether the term "select" incorporated an intent limitation. In Optical Coating, the crux of the controversy was whether two distinct processes of applying protective films to optical lenses was incorporated in the term "select," not whether this term included an intent limitation.

Moreover, an argument of claim construction similar to that made by U-Fuel was rejected in In re Cruciferous Sprout Patent Litigation, 168 F. Supp. 2d 534 (D. Md. 2001), aff'd, 301 F.3d 1343, 2002 WL 1917373, No. 02-1031, (Fed. Cir. 2002). Plaintiffs in that case discovered that certain cruciferous sprouts, such as broccoli and cauliflower, contained higher levels of
cancer-prevention properties than other cruciferous seeds, such as cabbage or radish. Id. at 538. Plaintiffs patented a method of preparing food products by "identifying" those seeds which produce cruciferous sprouts high in cancer-prevention properties, germinating said seeds, and harvesting them for consumption. Id. at 536. Defendants argued that the claim described nothing more than germinating sprouts from certain cruciferous seeds and harvesting those sprouts as a food product, a process known long before the application of the plaintiff's patent. Id. at 537. The court agreed with the defendants and rejected plaintiff's argument that the claim language "identifying seeds which produce cruciferous sprouts … containing [the desired anti-cancer properties]" introduced a new 'selection' step that was not part of the prior art." Id. at 540. It held that this "selection" step merely entailed "choosing to do one thing over another [-] choosing to grow broccoli or cauliflower sprouts instead of [other sprouts]"-- and concluded that "any process could be prefaced by a similar 'selection' step" and that being the first to "perform a particular process cannot be enough to make the process 'new'." Id.

In construing a claim, the "claim terms are to be given their ordinary meaning unless it is apparent that the inventor intended to use them differently." Nat'l Recovery, 166 F.3d at 1195. In this case, there is nothing in the '144 patent's specification or prosecution history which tracks the "selected and combined" language of Claim 27 and which provides any indication that these terms necessarily entail an intent-to-achieve-fire-resistance limitation. Furthermore, in giving the term "selected and combined" its ordinary meaning to one of ordinary skill in the art, there is no such intent limitation. Thus, U-Fuel's argument that there is an intent element inherent in the term "selected and combined" must be rejected. The Court concludes that in construing the claim at issue on the present state of the record, there is no intent limitation on the term "selected and combined;" U-Fuel's method claim, as construed by the Court, describes nothing more than building a non-insulated AST that has fire-resistant properties for the use of storing combustible and flammable materials such as gasoline.

The Court notes that for purposes of plaintiff's motion, its construction of Claim 27, in particular the terms "selected and combined," is a tentative one. The Court is not required to interpret Claim 27 "conclusively and finally" when deciding a motion for preliminary injunction. Sofámov Danek Group, Inc. v. DePuy-Motech, Inc., 74 F.3d 1216, 1221 (Fed. Cir. 1996) (stating that a trial court is "not obligated … to conclusively interpret claims at an early stage in a case" and "may exercise its discretion to interpret the claims at a time when the parties have presented a full picture of the claimed invention and prior art"). Furthermore, findings and conclusions as to claim construction at the preliminary injunction stage are not binding at trial. See Int'l Communication Materials, Inc. v. Ricoh Co., 108 F.3d 316, 318-19 (Fed. Cir. 1997) (holding that a district court did not abuse its discretion in denying a preliminary injunction based on a "tentative claim construction," given that there were "substantial open issues and questions that must be litigated before a finding of infringement can be made, including claim construction …"); Illinois Tool Works, Inc. v. Grip-Pak, Inc., 906 F.2d 679, 681 (Fed. Cir. 1990) (affirming a district court's denial of a preliminary injunction "after a hearing in which neither party was required to prove his case in full and in light of findings and conclusions not binding at trial") (emphasis in original).

Maytag and Whirlpool dispute the construction of the element 5 language emphasized here:

said shelf spaced laterally inward from said one side wall and forming a front-to-rear gap therebetween in one position of said shelf for supporting selected articles to be washed

W. Mem. 20 contends those three phrases must be read together to "properly interpret this limitation." According to Whirlpool, "the 'front-to-rear gap' must be sufficiently large to receive the 'selected articles' and the 'laterally inward' spacing must also be sufficiently large so as to provide the appropriate sized gap" (W. Mem. 21). Whirlpool emphasizes that the specification describes the gap as "allowing large articles such as cookie sheets and pizza pans to be placed between the pivotal shelf 80 and the side wall 72" ( '419 Patent col. 5, ll. 54-56).

Maytag's position (M. Mem. 26) is that the gap need not be either a long single gap or a quite wide single gap (or both) and that Whirlpool's arguments on that score lead to importing "several limitations that appear nowhere in the claims and are nowhere suggested by the specification." In particular, M. R. Mem. 14 (emphasis in original) charges Whirlpool with overreaching by claiming "that because the specification references certain large items in the gap, the gap must extend all the way from the front of the rack" and "that for 'front-to-rear' to mean orientation rather than longitudinal extent would
create a 'superfluous' claim requirement." Maytag is right.

In that respect Whirlpool has glossed over (or, more accurately, has omitted entirely) the fact that the claim specifies the gap's orientation by its reference to "a front-to-rear gap therebetween." That emphasized word is not a reference back to designate the distance between the front and rear walls--terms that are regularly used throughout the patent claims, and that specifically appear in element 2 of the claim now under consideration (claim 3). Instead "therebetween" plainly refers to the space between the higher side wall and the pivotal shelf in one position of the shelf--and that being so, "front-to-rear" simply characterizes that gap in longitudinal rather than lateral terms, without in any way specifying or indicating the longitudinal dimension.

If Maytag's patent counsel, whose total work product in drafting the claims has demonstrated the typical patent lawyer's fondness for detail in drafting (and of course the typical prolific use of the adverbial form), had wished to limit the claim as Whirlpool urges, it would have been the easiest thing in the world to say "a front-to-rear gap between the front and back walls of said basic rack" (note the comparable usage in element 2) rather than the very different meaning of "a front-to-rear gap therebetween." And similarly, if Maytag's counsel had wished to limit the claim (as Whirlpool also urges) by restricting the use of the gap to such large articles as those referred to in the specification by way of illustration, it would likewise have been the easiest thing in the world to say something along the lines of the gap's "supporting particularly large articles to be washed" 27 rather than simply referring to "selected articles." Nothing supports Whirlpool's attempted redrafting of element 5 to convert it from indicating a user's choice (of "selected articles," perhaps--but not necessarily--selected from among "large articles") into a limitation that is restricted to extraordinarily large articles or the like.

--- Footnotes ---

27 Note that element 3 already refers to the function of the one substantially higher side wall as providing support for the racking and washing of "large articles."

--- End Footnotes ---

In much the same way, in turning from the length of the gap to its width, W. Mem. 22-23 offers up the unpersuasive contention that the pivotal shelf must be "spaced laterally inward" sufficiently to make the gap wide enough to accommodate cookie sheets and pizza pans. But again nothing in the claim language calls for such a restrictive construction. While W. Mem. 23 would have this Court measuring the width of cookie sheets and pizza pans to determine exactly how far "laterally inward" the shelf is placed, doing that would obviously import limitations from the specification into the claim language. Standing alone, the claim language is plain enough: It merely requires the shelf to be laterally inward so as to form the previously described front-to-rear gap. In other words, the spacing between the shelf and the side wall does not have to meet some particular measure, but must merely be located "laterally inward." 28

--- Footnotes ---

28 W. Mem. 23-24 contends that the term "selected articles" must have a meaning related to the cookie sheet and pizza pan cited in the specification and cannot "mean any possible article." But while the specification may be a useful aid in claim construction, limitations in the specification are not to be imported in the claim. Instead the term "selected articles" in element 5 merely means, as the normal meaning of those words connotes, some articles that can fit into a front-to-rear gap created by placing the shelf laterally inward from the side wall.

--- End Footnotes ---

3. "selected color variations"

This claim term appears in all of the asserted claims in both the '726 and '068 patents. Travis proposes the following construction: "colors of a natural fire, including shades of orange." Hearth contends that this term is indefinite and not capable of construction. Based on the intrinsic evidence, the Court construes "selected color variations" to mean "the portion
of the color spectrum that simulates a natural wood-burning fire."

Claims 1 and 13 of the '726 patent and claims 1 and 15 of the '068 patent all read, in part: "material that glows at selected color variations in the simulated coal members to simulate a burning and glowing coal ember bed in the base of a fire when the fuel gas is ignited . . . " (The '726 patent, 11:48-51. 12:42-45; the '068 patent, 11:53-57, 12:67-13:3 (emphasis added)). Claim 20 of the '726 patent and claim 23 of the '068 patent contain similar language: "material that glows at selected color variations when the fuel gas is ignited . . . " (The '726 patent, 13:52-53; the '068 patent, 14:9-11 (emphasis added)).

Hearth argues that this term is indefinite because the term is not found in any dictionaries. However, each of these individual words have ordinary and plain meaning defined in dictionaries. The combination is not so unusual as to render the term incomprehensible.

The surrounding claim language makes clear that selected color variations refers to the various colors that simulate a burning a glowing coal ember bed in the base of a fire. While it is true that fires emit a wide range of colors, the term itself is not so ambiguous that one skilled in the art cannot understand that the term refers to a range and combination of colors that mimic a natural fire.

The specification provides further support. It states "the ceramic-based ember members glow an orange-ish color very similar to the color of burning embers in a natural wood-burning fire," (the '726 patent, 6:21-24; the '068 patent, 6:25-28); "distribute the fuel gas at selected rates and volumes over the burner assembly's upper surface 17 and around the simulated logs 16 to provide a flame having a generally orange coloration that flickers and 'dances' around the simulated logs similar to the flames of a natural wood-burning fire," (the '726 patent, 3:57-61; the '068 patent, 3:61-65). This language makes clear that the "selected color variations" are the range of colors that simulate a natural wood burning fire.

Based on this specification language, Travis seeks to include in the construction a reference to "shades of orange." The Court is not persuaded that such language is appropriate. First, the specification's use of the term "orange-ish" is not persuasive because it is not a word found in the dictionary. Second, when asked at oral argument if Travis would accept a construction that referred to the precise meaning of orange -- "wavelengths of approximately 590 to 630 nanometers" (The American Heritage Dictionary, 4th ed. 2000) -- Travis responded that it was not seeking such a construction. Third, the colors of a natural wood-burning fire include shades of orange but also include other colors. Therefore, the Court sees no reason why the construction should specify shades of orange when it does not refer to other specific colors.

Lastly, the Court finds that this term is not so ambiguous that it is not capable of construction. As shown above, the surrounding claim language as well as the specification provide sufficient context to give meaning to this claim term.
are preferably selected from the group consisting of waste rubber buffings and ground tires."

The language of Claims 2 and 6 reads, "said rubber particles with said rubber particles having an outer surface designed and dimensioned to look like natural mulch selected from the group consisting of natural polymers and synthetic high polymers." Claim 1(a) also contains the language "with the rubber selected from the group consisting of natural polymers and synthetic high polymers." Claim 1(a) also contains the language "with said rubber particles having an outer surface designed and dimensioned to look like natural mulch selected from the group consisting of pea gravel, wood chips, and tree bark . . ." The language of Claims 2 and 6 reads, "said rubber particles are preferably selected from the group consisting of waste rubber buffings and ground tires." (Pl. Exh. 1) (emphasis added).
Like the patent in Abbott Labs., "the claims do not clearly embrace more than one member of the Markush group." Abbott Labs., 334 F.3d at 1281. Therefore, the plain meaning of the claims asserted in 1, 2, 6 and 8 "limits them to a single [alternative] selected from the recited Markush group." Id.

３５３０

1. At Selected Higher and Lower Pressure Magnitudes

This phrase is found in Claims 3 and 24 of the '802 Patent and Claims 9, 44, and 53 of the '193 Patent.

Phrase: At selected higher and lower pressure magnitudes

Construction: at a higher pressure magnitude and a lower pressure magnitude that have been chosen prior to operation of the computer circuitry that is used to determine whether the patient is inhaling or exhaling.

Reasoning: The dispute between the parties focuses on when, and how, the two pressures must be selected. Plaintiffs contend that they can be selected in any manner and at any time prior to their being applied. In fact, at the hearing, plaintiffs contended that the lower pressure could fluctuate breath by breath while the device is in operation. Defendant contends that the pressures must be selected manually prior to operation.

In construing the term "selected" it is of primary importance to understand the overall context of the patents themselves. These patents disclose bi-level treatment devices. The claims disclose a treatment method that senses the occurrence of the exhalation or inhalation phase of the breathing cycle, even in the presence of system leakage, based on the spontaneous breathing of the patient, so that the system knows when to apply a higher pressure magnitude (i.e., during inhalation), or a lower pressure magnitude (i.e., during exhalation).

With that said, in arriving at the proper construction of the term "selected", we must look at the entirety of the claims. By way of example, the word "select" appears in Claim 3 of the '802 Patent twice. It is the first occurrence of the term that we are being asked to construe. The first time, "select" is used it appears in the past tense as part of the first step of the claim (i.e., ". . . for delivery to the airway of such a patient at selected higher and lower pressure magnitudes . . ."). The second time, "select" appears it is used in the present tense as part of the final "utilizing" step of the claim (i.e., "utilizing said instantaneous flow rate and said reference indicia to select one of said higher and said lower pressure magnitudes"). When the claim is read in its entirety, it is clear that the "selected" higher and lower pressure magnitudes of the first step are pre-selected, before the computer circuitry does its detecting, processing, and utilizing, so that once the circuitry has completed these tasks, it can pick which of the two pressures to apply. Apart from the structure of the claim itself, this is supported by the fact that in the final "utilizing" step, the higher and lower pressures are referred back to as "said", or previously mentioned/referenced, pressures (i.e., "utilizing said instantaneous flow rate and said reference indicia to select one of said higher and said lower pressure magnitudes").

This reading of the claim language is consistent with the remaining intrinsic evidence. The specifications, figures, and prosecution history all presuppose that the two pressures are chosen before the device starts detecting, processing, and utilizing. See e.g., Prosecution History, '802 Patent, Amendment and Remarks (June 11, 1990) at 19-20; '802 Patent, Fig. 4; cl. 2, Ins. 59-63; cl. 3, Ins. 24-28; cl. 6, Ins. 43-46, 55-59, 61-66; cl. 8, Ins. 53-55; cl. 11-12, Ins. 62-22; cl. 13, Ins. 24-32, 40-42. There is no indication in the patents that the lower pressure magnitude can somehow be changed breath by breath, as was asserted at the hearing. While a person of ordinary skill in the art might be able to modify the invention so as to "select" the pressures via computer screen, rather than dial, there is nothing to suggest that the "selected" step is nearly as broad as plaintiffs contend.

３５３１

13. Selected minimum distance
FieldTurf's Proposed Construction: "Space determined not to exceed a specific amount of space"

SCG's Proposed Construction: "Space determined not to exceed a specific amount of space that is predictable and reproducible and not densely packed together"

The Court's Claim Construction: "Space determined not to exceed a specific amount of space"

The "selected minimum distance" language appears in claim 10 of the '689 patent, which reads as follows: "A synthetic grass assembly according to claim 1, wherein the synthetic' ribbons are disposed in rows spaced apart a selected minimum distance." The only dispute is whether the distance must be "predictable and reproducible and not densely packed together." SCG pulls this language from the following excerpt from the "Background of the Art" portion of the specification:

Therefore the combined structure of upstanding ribbons and loose particulate infill must be balanced or optimized to provide a desirable playing surface. When the ribbons are densely packed together, the cleats cannot release properly, but when the ribbons are spaced too far apart, adequate traction and stability is not available. Due to the high cost of artificial grass installations, and risk of injury to highly skilled an highly paid athletes, a predictable and reproducible artificial grass performance is required.

'689 patent, 4:27-35.

The portion of the specification that refers to a "selected minimum distance" reads as follows:

The synthetic ribbons are preferably disposed in rows spaced apart a selected minimum distance "W". Depending on the firmness desired and the degree of freedom required for cleats to rotate for various sports, the spacing "W" can vary between 2.25 inches and 0.625 inches. A closer spacing provides firmer support for the infill 3 whereas a wider spacing permits easier rotation of embedded cleats.

'689 patent, 12:6-12.

The Court agrees with FieldTurf that SCG is attempting to improperly import statements from the specification into the claims. First, the "predictable and reproducible" language has little or no relation to the "selected minimum distance" claim limitation. Whatever the purpose of the "selected minimum distance," that purpose is met so long as the ribbons are spaced apart more than that minimum. Second, it is clear from the specification that "not densely" depends on the end use of the turf. Adding this to the claim construction would not serve to help the jury but would instead cause confusion. Third, even if "not densely" were appropriate claim language it is also clear from the specification that it is not a correct limitation for selected minimum distance. There are some applications where firmness will be desired and thus the "selected minimum distance" will be densely packed together.

Accordingly, the Court construes "selected minimum distance" as a "space determined not to exceed a specific amount of space."

4. selected ones of the supports (claim 5)

Fargo more than one of the supports

Iris there must be more supports than pins so as to facilitate the ability to choose one combination of pin placements instead of some other combination of pin placements

Iris contends that the phrase "selected ones of the supports" requires that there be more supports than pins. Otherwise, according to Iris, the word "selected" has no meaning. The flaw in Iris's argument is that Iris ignores that the discussion of "selected" occurs in the context of identifying different ribbon types. The manufacturer therefore "selects" not only amongst supports on each spool, but amongst different configurations of pins on different spools. Reading the claim language, there
is no reason why one of the configurations could not be to fill all of the supports with pins. This interpretation is consistent with the word "ones," meaning, obviously, more than one.

Iris's reliance on Hewlett-Packard Co. v. Mustek Sys., Inc., 340 F.3d 1314 (Fed. Cir. 2003), is misplaced. The issue in that case was whether the end user of an optical scanning device selected a scan speed where there was no mechanism for selecting a speed, but merely a mechanism for selecting a resolution, which was related to scan speed but did not have a one-to-one correlation. That issue bears little resemblance to the issue here, which is whether the word "selected" necessarily means that some of the possible selections be left unselected. Here, where more than one of the supports can be selected at one time, there is no reason why all of them cannot be selected.

Iris argues that in the single disclosed embodiment of the patent, four of the apertures must be left open in order to facilitate identifying the "home position." As a general rule, however, limitations are not to be imported from the specification into the claims. Phillips, 415 F.3d at 1323. As Fargo points out, claim 2 language referring to a "selected plurality of combinations" explicitly requires that the assembly has more supports than pins, whereas claim 5 contains no such explicit language. Under the doctrine of claim differentiation, courts presume that each claim in a patent has a different scope. Versa Corp. v. Ag-Bag Int'l Ltd., 392 F.3d 1325, 1330 (Fed. Cir. 2004). Although this doctrine is at its strongest when a party seeks to read a limitation into an independent claim that already appears in one of its dependent claims (which is not the case here), Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir. 2004), it is nevertheless instructive that the patentee specifically chose to require that there be more supports than pins in one claim and not in another. The Court therefore adopts Fargo's proposed construction.

3533

IV.

The district court found that "selected orientation" in claims 1-3 of the '911 patent meant "the specific orientation set forth in the '911 patent, which is horizontal." Magnivision I, 33 F. Supp. 2d at 1234. In this instance again, the claim language is quite broad, suggesting any orientation selected for a particular purpose. The phrase "selected orientation," therefore, requires consultation of the specification and prosecution history to determine whether the applicant confined the invention to a particular purpose and thus a particular orientation. After all, the applicant would not have specified a "selected" orientation if it meant to claim every orientation.

Indeed, the prosecution history reveals the reason for inclusion of the term "selected." During prosecution of the '532 patent, the applicant had to overcome prior art of Smilow, U.S. Patent No. 3,710,996. In so doing the inventor clarified the meaning of the claim phrase "selected orientation." Smilow had claimed a hanger that displayed belts vertically. The applicant asserted that his horizontal display was "more desirable" than Smilow's vertical display invention, stating: "The fact that the eyeglasses are hung . . . in a horizontal manner forms part of the essence of the present invention." See Magnivision I, 33 F. Supp. 2d at 1218, 1236. Statements in the '345 prosecution history also emphasize a horizontal orientation as essential to the invention: "If the hanging card is hung from a central point . . . the card may shift . . . whereby the eyeglasses would not be oriented in a horizontal position, contrary to the aforementioned essential aspect of the present invention." And, "if the [prior art] system of Govang is used, the hanging card could easily tip . . . contrary to the objects of the present invention."

These statements to overcome prior art during prosecution inform the meaning of the claims. See Zenith Lab., Inc. v. Bristol-Myers Squibb Co., 19 F.3d 1418, 1424, 30 U.S.P.Q.2D (BNA) 1285, 1290 (Fed. Cir. 1994). Because a competitor may reasonably rely on prosecution history to explain the meaning of claim terms, see Mark I Marketing Corp. v. R. R. Donnelley & Sons Co., 66 F.3d 285, 291, 36 U.S.P.Q.2D (BNA) 1095, 1100 (Fed. Cir. 1995), this court agrees with the district court that the applicant in this case limited itself to a horizontal orientation. To distinguish the Smilow prior art, the inventor explained that his "selected orientation" limitation meant a horizontal orientation. Thus, the inventor selected that meaning for his claim.

In reaching this meaning, this court has considered that the claims of the '911 patent describe a different combination than those of the '532 and '345 patents. As with the "receiving area" limitation above, the inventor prosecuted many different claims at the same time. Thus, this court must take care to avoid attributing statements about one set of claims to a different claimed combination. The claims of the '911 patent do not mention "horizontal" as do those of the '532 and '345 patents.
However, unlike the "receiving area" limitation above, the inventor during prosecution of these patents did not distinguish between "selected orientation" and "horizontal." To the contrary, Smilow's prior art was a threat to each of the '911, '532, and '345 inventions. To overcome Smilow, the applicant invoked a horizontal display feature for each of his claimed inventions. These unequivocal statements to obtain the patents limited each of the inventions. Therefore, this court concludes that the district court properly interpreted "selected orientation" to mean horizontal.

Defendant contends that "selected shape" means those shapes shown in the drawings found in the patent specification, and provided by Mr. Shelton. See Playtex Products, Inc. v. Procter & Gamble Co., 400 F.3d 901, 909 (Fed. Cir. 2005) (finding that, in some circumstances, patent illustrations can support the construction of a claim term). It is correct that the term "selected" may have a specific meaning. See Innova/Pure Water, Inc. v. Safari Water Filtration Sys., 381 F.3d 1111, 1119 (Fed. Cir. 2004) ("While not an absolute rule, all claim terms are presumed to have meaning in a claim."). But the Court is not persuaded that "selected" refers to those shapes provided in the drawings in the specification. Defendant correctly notes that "the specification is the single best guide to the meaning of a disputed term." Phillips v. AWH Coro., 415 F.3d 1303, 1321 (Fed. Cir. 2005). Here, the specification provides that the drawings are only "representations"; it does not provide that they are the selected shapes, nor are the claims limited to the shapes provided in the drawings. Therefore, the Court concludes that Plaintiff's construction, i.e., "selected shape" is any shape selected by a person skilled in the art who is practicing the patent. The '184 patent states that the drawings "are representative of fishing bait shapes." '184 patent at col. 11.

Defendant contends that "selected shape" means those shapes shown in the drawings found in the patent specification, and provided by Mr. Shelton. See Playtex Products, Inc. v. Procter & Gamble Co., 400 F.3d 901, 909 (Fed. Cir. 2005) (finding that, in some circumstances, patent illustrations can support the construction of a claim term). It is correct that the term "selected" may have a specific meaning. See Innova/Pure Water, Inc. v. Safari Water Filtration Sys., 381 F.3d 1111, 1119 (Fed. Cir. 2004) ("While not an absolute rule, all claim terms are presumed to have meaning in a claim."). But the Court is not persuaded that "selected" refers to those shapes provided in the drawings in the specification. Defendant correctly notes that "the specification is the single best guide to the meaning of a disputed term." Phillips v. AWH Coro., 415 F.3d 1303, 1321 (Fed. Cir. 2005). Here, the specification provides that the drawings are only "representations"; it does not provide that they are the selected shapes, nor are the claims limited to the shapes provided in the drawings. Therefore, the Court concludes that Plaintiff's construction, i.e., "selected shape" is any shape selected by a person skilled in the art who is practicing the patent, is the proper construction.

Mr. Shelton claims that two contributions he made, in addition to the "selected shapes," concerned incorporating food particles into fishing lures and the characteristics of buoyancy, tear resistance, set-to-catch ratio, elongation and softness. These contributions to the inventions do not constitute the conception necessary to establish co-inventorship. Mr. Shelton contributed only "well-known principles." He acknowledges that the idea of adding scents to fishing lures was "very common knowledge to anybody in the fishing industry." Graber Dec., Ex. A at 133:25-34:1. Further, it is not disputed that Mr. Chen could have learned about the desirability of buoyancy, tear resistance, high set-to-catch ration, elongation and softness "by just talking to someone in the fishing industry." Graber Supp. Dec., Ex. 1 at 70:12-25. As noted above, an inventor does not lose his right to a patent merely by using the service, ideas and aid of others in the process of perfecting his invention. Shatterproof Glass Corp., 758 F.2d at 624.

Defendant also fails to provide corroborating evidence for Mr. Shelton's testimony that he assisted in the conception of other claims of AEI fishing lure patents. The only evidence Defendant presents to corroborate its co-inventorship claim is the declaration of Ms. Wahoup. She states only that, at various times, including during 2002, she "witnessed conversations between Mike Shelton and John Chen," including "communications from Mr. Shelton describing and explaining essential characteristics of soft fishing lures of the types utilized by Z-Man." Creason Dec., Ex. L. She does not identify the claims to which Mr. Shelton allegedly contributed. Defendant argues that, at this point in the litigation, it is not required to present all of the factual evidence of corroborating that it will present at trial. While this may be true, Defendant is required to present enough evidence to show that there is a material dispute of fact concerning whether it can show by clear and convincing corroborated evidence that Mr. Shelton is a co-inventor of AEI fishing lure patents. It does not.
The Court's Claim Construction: "a selected width narrower than the ribbon"

FieldTurf argues that selected width need not be construed, but if it is, that "each of the grass blades having a preselected width" is appropriate. In its brief, SCG does not appear to quarrel with the preselected aspect of FieldTurf's construction, but rather it seeks to make clear that the selected width must be narrower than the "ribbon." FieldTurf objects to SCG's definition on several bases, including that it improperly attempts to invoke process steps and that there is no basis for bringing "narrower" into the claim. The Court agrees with FieldTurf on the former objection. Even if the concept of "narrower" is to be included, it should be included in a structural definition, such as a "width narrower than the ribbon." Whether to include the "narrower" concept in the claim definition is a more difficult issue. On the one hand, the claim states "selected width." On the other hand, the selected width is necessarily no greater than a ribbon width, since the strands are "split" portions of the ribbon that sit above the infill. Thus, from the claim language itself it is clear that the "selected width" of the "strands" would have to be narrower than the ribbon. This construction is not imported from the specification, but inherent in the claimed structure. This construction is also supported by the specification, which explains that the "ribbons are longitudinally split . . . along the slits into several individual free-standing strands of a thinner width resembling grass blades." '689 patent, 5:28-31 (emphasis added). That "selected" is used instead of "thinner" cannot change the fact that a strand split from a slit ribbon is necessarily thinner than that ribbon. Although it is clear from the claim language, because the matter is obviously in dispute the Court finds it appropriate to explain that the selected width must be thinner than the ribbon. Finally, neither "determined" or "preselected" appear to impart any more meaning than "selected." Accordingly, the Court construes a selected width as "a selected width narrower than the ribbon."

III.

The claim language itself suggests a broader reading of claim 14. In the selecting step, the relevant language reads:

14. A method for automatically regulating the release of the drill string of a drilling rig drill, comprising the steps of:

selecting any one of said first signal, said second signal, and both said first and said second signals to control the release of said drill string;

'142 patent, col. 28, ll. 34-35 (emphasis added).

The preamble recites that the method steps are to be performed automatically by the drilling rig. This language suggests that the selecting step is not limited to manual operation of valve selectors and/or manual calibration of regulators as construed by the district court. See Catalina Mktg. Int'l v. Coolsavings.com, Inc., 289 F.3d 801, 808 (Fed. Cir. 2002) (quoting Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999)) ("In general, a preamble limits the invention if it recites essential structure or steps, or if it is 'necessary to give life, meaning, and vitality' to the claim."); Innova/Pure Water, 381 F.3d at 1118 ("Language in a preamble limits a claim where it breathes life and meaning into the claim but not where it merely recites a purpose or intended use of the invention.") (internal citations omitted). Hence, the language of claim 14 (particularly the preamble) does not support the district court's construction of this step.

In addition, the specification does not limit the selecting step to the manual operation of valve selectors or the manual calibration of regulators. Rather, the specification discloses an initial setup procedure in which an operator, using valve
selectors 232-235, manually chooses the regulators 200-203 that will control the drilling operation once underway. See '142 patent, col. 7, l. 49-col. 8, l. 6; col. 23, ll. 6-12. The specification also discloses a manual calibration process, a subset of the initial setup procedure, for those regulators 200-203 selected using valve selectors 232-235. See '142 patent, col. 8, l. 51-col. 10, l. 3; col. 23, ll. 12-23. To clarify this setup procedure, the specification explicitly states that this initial setup occurs "before the [selected] regulator will automatically regulate" the release of the drill string. '142 patent, col. 8, ll. 57-61 (emphasis added). The district court relied on this portion of the specification to support its requirement of manual operation. To the contrary, this portion of the specification sets forth an initial setup or calibration step that precedes the claimed selecting step. In effect, the district court erred by reading the initial setup or calibration step into the claimed selecting step.

Notably, the specification also describes a conflict resolution process automatically performed by the drilling rig after the initial setup or calibration; i.e., once the drilling rig is up and running. See '142 patent, col. 24, ll. 4-26. Because the valves 236-239 are connected in series, see '142 patent, Figure 2, the valve 236-239 with the largest signal generally provides the signal conveyed to the air motor 204, which ultimately controls the brake 32. With two or more parameters in use (i.e., when the drill rig operator "selects" two or more parameters, such as bit weight and drilling pressure), conflicts will occur between the controlling parameters (e.g., a first parameter may suggest the drill string should be released whereas a second parameter may suggest the drill string should be held steady).

This conflict resolution process led to the 35 U.S.C. § 112, P1 rejection during prosecution, because the Examiner did not understand the drilling system's method for resolving conflicts between the "primary" and "secondary" controls. The Examiner questioned the conflict resolution method:

It is the examiner's view that at the least, applicant has failed to provide a logical explanation with respect to how such conflicts can be resolved. Because it is well known in the art that among other things, the relationship between rate of penetration and the drilling parameters one can not simply isolate one parameter from the others. Specifically the operational procedures illustrated in [the specification] fail to teach how and when the secondary control overrides the primary control. Examiner also could not understand why among the four control parameters, the rpm and the torque regulators can be switched off, since as best understood, all these four parameters need to be taken into consideration and should be properly balanced.

In response, the applicant explained to the Examiner that an operator, as part of the initial setup procedure, can adjust the level for override of the primary control, thus ensuring that only undesirable conditions will trigger intervention. With this initial adjustment in place, the drilling system then automatically selects between the primary and secondary controls during operation. Thus, the prosecution history confirms that selecting in claim 14 does not encompass the initial setup or calibration of the drilling system, but rather the conflict resolution process between primary and secondary controls during operation.

Finally, one potential reading of dependent claim 15 implicitly suggests "selecting" in the context of the initial setup or calibration of the automatic driller differs from "selecting" in the context of claim 14. See '142 patent, col. 2, ll. 20-24 ("relay selectors which permit an operator to select which one of or which combination of the regulators are to control the drilling operation."). Specifically, claim 15 provides two signals, a signal representing drill string torque and a signal representing drill string RMP, in addition to the two signals required by claim 14. Compare '142 patent, col. 28, ll. 34-38, with col. 28, ll. 39-57. Because claim 15 adds signals to the control process and the addition/subtraction process is described in the specification as occurring during the initial setup/calibration of the automatic driller, "selecting" in claim 14 must refer to the conflict resolution process that occurs between controlling parameters. Otherwise, the provision of additional signals in claim 15 would be subsumed within the "selecting" step already recited in the claims.

In sum, claim 14 does not suggest that the selecting step requires a two-part manual process as interpreted by the district court. Moreover, the specification and prosecution history confirm that the two-part manual process relied upon by the district court is distinct from the claimed selecting step. Thus, the district court's interpretation of the selecting step was unduly narrow.
B. Claims 40 and 67

Here, I must construe the following elements of the following claims: 19

Claim 40--the "means . . . for selecting a set of parameters to be compounded."

Claim 67--"means for . . . selecting a set to be compounded based on the particular base solution and amount required by a set to minimize the quantity of containers of base solution required."

Footnotes
19 See supra note 12.

The issue is the meaning of the function "selecting." See 35 U.S.C. § 112, P 6 (claim element expressed in means-plus-function terms). Baxa contends that "selecting" is synonymous with "sorting" appearing in claims 1, 19, 87, and 93, i.e., sorting a set of parameters to be compounded such as to minimize the quantity of containers of base solutions. Clintec counters that "selecting" means [merely] to pick or choose a set of parameters (i.e. formula) out of a sequence of formulas entered into the system by preference, such as for an emergency. 21 (Pl.’s 12(M) Statement P 37.)

Footnotes
20 The parties agree that Clintec has expressed these elements in the means-plus-function terms, subject to § 112, P 6.
21 The record does not support Clintec's argument that Baxa should not be allowed to offer its definition of "selecting" because it refused to do so throughout discovery.

"It is well-settled that, in interpreting an asserted claim, the court should look first to the intrinsic evidence of record, i.e. the patent itself, including the claims, the specification and, if in evidence, the prosecution history." Vitronics, 90 F.3d at 1582 (citing Markman, 52 F.3d at 979).

1. Patent/Claims

The terms of the claims are given "their ordinary and accustomed meaning, unless it appears that the inventor used them differently." Jonsson v. Stanley Works, 903 F.2d 812, 820 (Fed. Cir. 1990) (quoting Envirotech Corp. V. Al George, Inc., 730 F.2d 753, 759 (Fed. Cir. 1984)). To sort is to choose, allot, classify. See WEBSTER'S THIRD NEW INT'L DICTIONARY at 2175 (1981). To select is to choose. Id. at 2058. Thus, the two words are synonyms.

Additionally, the terms of a claim must be interpreted in light of the other claims. Jonsson, 903 F.2d at 819. Claim 67 includes the "means for . . . selecting a set to be compounded based on the particular base solution and amount required by a set to minimize the quantity of containers of base solution required." Claims 1, 19, 87, and 93 all include a step or a means of sorting a set of parameters to be compounded, in accordance with the particular base solutions and their amounts to be included in each set of parameters, such as to minimize the quantity of containers of base solutions. Since the context in which the term "sorting" appears in claims 1, 19, 87, and 93 is identical to that in which "selecting" appears in claim 67, the two terms have identical meanings.

2. Specification

The specification can act as a dictionary when it defines terms by implication. Markman, 52 F.3d at 979. The specification provides that

in accordance with the present invention a system and a method are provided for compounding a plurality of selected
mixtures from one or more base solutions. The system includes a storage device for storing sets of parameters for a group of mixtures which are to be compounded from the base solutions. A compounding is electrically connected to the storage device, and in combination with the storage device, compounds a selected mixture on receiving a set of parameters which define the base solutions to be used and the amounts thereof.

( '010 patent, col. 3, lines 3-13) (emphasis added). The above is the first paragraph of the Summary of the Invention. Nowhere else in the specification do the words "select," "selecting," or "selected" appear. Given the importance and the prominence of the sorting feature to the Clintec's invention, it is unlikely that the first paragraph of the Summary of the Invention would refer merely to "picking or choosing a set of parameters" out of sequence in which they were entered into the computer, (Pl.'s 12(M) Statement P 37), without sorting. A more logical interpretation is that the mixtures (or sets of parameters) are "selected" for compounding (or transmitted to the compounder) in the order in which the host computer has previously sorted them to minimize the quantity of containers of base solutions out of which the mixtures will be compounded.

3. Prosecution History 22

22 Neither party explores the prosecution history of claim 67 in any detail and I do not find it necessary to do so. Vitronics, 90 F.3d at 1582 ("The court may also consider the prosecution history of the patent, if in evidence.") (emphasis added).

"The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution. . . . Claims may not be construed one way in order to obtain their allowance and in a different way against accused infringers." Southwall Techs., 54 F.3d at 1576.

Claim 40 (numbered 37 in the patent applications 23) originally read as follows:

A system for compounding a plurality of selected mixtures comprising:

means for storing sets of parameters for a plurality of mixtures to be compounded from a group of base solutions;

means for compounding a selected mixture corresponding to a selected set of parameters; and

means for coupling said storing means to said compounding means.

(Ex. D at 2-3. 24) The Patent Office Examiner ("Examiner") rejected claim 37(40) for two reasons. First, she said that the claim was indefinite, 35 U.S.C. § 112, P 2:

In claim 37, line 3, again it is unclear what the "sets of parameters" are and how they are inputted into the system. It is also unclear what the "base solutions" are. In lines 5-6, how is the "selected set of parameters" selected

Axelson et al discloses an apparatus for compounding substances which includes a programmable controller for receiving the ratio, and or volume parameters to be used in the compounding apparatus. Axelson et al also teach a control means for selecting which of the substances is to be compounded. These substances have been presorted and placed in a container to facilitate ease when compounding the final mixture. Instead of presorting the substances as disclosed in Axelson et al. it would be obvious to one of ordinary skill in the art to use a programmable sorting routine, as in the instant invention, within the programmable controller of Axelson et al.

(Ex. A P 18) (emphasis added).
23 In discussing prosecution history, I will refer to claim 40 as claim 37(40) and amended claim 37(40).

24 The exhibits cited in the following subsection are attached to Baxa's Statement of Undisputed Facts filed as a response to Clintec's partial summary judgment motion and in support of its own cross-summary judgment motion viz-a-viz claim 40.

25 The statute states, in relevant part, that

[a] patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains.

Clintec responded to the Examiner's two objections. In an Amendment letter dated May 12, 1986, Clintec first amended claim 37(40) to address the vagueness concern:

(Amended) A system for compounding a plurality of selected mixtures to produce individual doses of mixture comprising:

means for receiving sets of parameters for a plurality of mixtures to be compounded from a group of base solutions, one set for each dose:

means for storing said sets and for selecting a set of parameters to be compounded [of parameters for a plurality of mixtures to be compounded from a group of base solutions];

means for compounding a selected mixture corresponding to a selected set of parameters to produce individual doses; and

means for coupling said storing means to said compounding means.

(Ex. D at 2-3) (new text underlined and old text bracketed in the original).

Second, Clintec did not dispute that Axelson was prior art. Rather, implicitly acknowledging that it was prior art, Clintec stated that

all of the claims have been rejected under 35 U.S.C. § 103 as being unpatentable over Axelson, Jr. et al. in view of Hawes, Jr. et al. The scope and content of the Axelson, Jr. et al. reference includes the teaching that a plurality of commodities such as various types of feed grains can be blended together to produce a final product which consists of a selected percentage of each of the commodities used to make the blend. The percentage of commodity used to make the blend is controlled by a computer which selectively opens various gates a desired amount to allow a selected amount of each commodity to flow through a chute into a grain bin.

(Id. at 6.) 26

26 Axelson includes "means for selecting the containers whose commodities are to be blended together" and "means for selecting the relative percentages of the commodities to be blended." (Ex. B, col. 1, lines 58-62.)
Clintec next distinguished the amended claim 37(40) from Axelson in the following manner:

the claimed invention, as claimed in Claims 1, 19, 37[, which issued as claim 40], 67, 87, and 93, requires that a plurality
of sets of parameters of mixtures be provided and that these parameters are sorted in accordance with the particular base
solutions used to make each mixture and the amount of each base solution included in each set of parameters in order
to minimize the number of containers of base solution required to make a plurality of individual doses[.]

(Emphasis added). This was the only fashion in which claim 37(40) was distinguished from Axelson. Clintec also stated
that other groups of claims were different from Axelson because they required time intervals, or queuing, or printing labels,
or other features not found in Axelson. (Id. at 6-7.) Clintec concluded that since "none of the differences discussed above are
either taught or even suggested by the Axelson, Jr. et al. reference, even given the claims their broadest interpretation
suggested by the Examiner," the '010 patent claims "contain allowable subject matter over the Axelson . . . reference." (Id. at
7.)

The Examiner allowed the '010 patent after Clintec amended claim 37(40) and distinguished it, among others, from
Axelson. The Notice of Allowability was "responsive to the Amendment filed May 12, 1986." (Ex. E.) The record shows
that the May 12, 1986 Amendment was the only occurrence between the rejection and the allowability. The distinction
drawn between Axelson and claims 1, 19, 37(40), 67, 87, and 93 in the Amendment is consistent with the repeated
description of the invention in the specification as sorting mixtures to be compounded so as to minimize the number of
source solution containers. (See '010 patent, col. 2, lines 64-68; col. 3, lines 44-51; col. 8, lines 45-49; col. 8, lines 64-68.)

The prosecution history is part of the "public record of the patentee's claim . . . on which the public is entitled to rely . . . [in
order to] ascertain the scope of the patentee's claimed invention and [to] design around" it. Vitronics, 90 F.3d at 1583. In this
case, based on the prosecution history, a reasonable competitor would be entitled to conclude the following: (1) the
Examiner rejected claim 37(40) as unpatentable over prior art because the Axelson patent taught use of a computer to select
which substances to compound; 27 (2) Clintec acknowledged that Axelson was prior art; 28 (3) Clintec distinguished
Axelson from the amended claim 37(40) on the basis that the latter required sorting to minimize the number of containers of
base solutions; (4) the Examiner allowed the amended claim 37(40) based on Clintec's amendment and explanation; and (5)
the term "selecting" in claim 37(40), therefore, means the same as the term "sorting" in claims 1, 19, 87, and 93.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

27 Clintec points out that the Examiner also found other differences between Clintec's various claims and Axelson. This is
correct. However, this fact is irrelevant.

28 Clintec argues that Axelson is not prior art because it pertains to grains, not pharmaceuticals. Clintec cannot make this
argument now. First, he did not make it in response to the Examiner's rejection. Second, in a Preliminary Amendment, dated
February 14, 1985, Clintec cited numerous references to the Examiner in its Preliminary Amendment and Information
Disclosure Statement ("IDS"), (Ex. C), that did not involve pharmaceutical compounding. In the IDS, Clintec said that
"each of the above-identified systems is believed to be pertinent to the pending application in that each discloses a form of
multicomponent mixing system." See Eckhian v. Home Depot, Inc., 104 F.3d 1299, 1304 (Fed. Cir. 1997) ("holding that
statements made in an IDS can be the basis for a court to interpret the scope of the claims").

Clintec's Arguments

Clintec maintains that "selecting" is not the same as "sorting," but "means to pick or choose a set of parameters (i.e.
formula) out of a sequence of formulas entered into the system by preference, such as for an emergency." (Pl.'s 12(M)
Statement P 37.) Relying on their dictionary definitions, Clintec argues that "sorting" and "selecting" have different
meanings. However, as discussed above, the words are synonymous. The portion of the specification which describes the
kind of "selecting" to which Clintec refers, (Pl.'s 12(M) Statement P 37); ('010 patent, col. 4, lines 18-21; col. 10, lines 31-
58), does not use the word "selecting." Indeed, the context of the only place in the specification in which "selecting" does
appear suggests the meaning attributed to it by Baxa, i.e., sorting to minimize the number of source solution containers. See
Relying on Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017 (Fed. Cir. 1987), Clintec says that different words in claims are presumed to have different meanings. Although Tandon does make this statement, id. at 1023, it immediately follows with another: "practice has long recognized that claims may be multiplied . . . to define the metes and bounds of the invention in a variety of different ways. (cites omitted) Thus two claims which read differently can cover the same subject matter." Id.

Clintec also relies on the doctrine of claim differentiation. Under this doctrine, "interpretation of a claim should be avoided if it would make the claim read like another one." Autogiro Co. of Am. v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 404 (Fed. Cir. 1967). Clintec points out that claim 62, which depends upon claim 40, includes "means for sorting authorized parameter sets." Thus, the plaintiff says that claim 40 cannot likewise include a "sorting" limitation. However, "although the doctrine of claim differentiation may at times be controlling," it is trumped if

the "definition [at issue] . . . is otherwise clear from the claim language [the specification], and [the] prosecution

O.I. Corp. v. Tekmar Co. Inc., 115 F.3d 1576, 1582 (Fed. Cir. 1997); see also Autogiro Co. of Am., 384 F.2d at 404 ("Claim differentiation is a guide, not a rigid rule. If a claim will bear only one interpretation, similarity will have to be tolerated."). Such is the case here.

Clintec attempts to invoke the testimony of its expert, Mr. Uhen. However, in cases such as this one, "where the public record unambiguously describes the scope of the patented invention, reliance on any extrinsic evidence[, such as expert testimony,] is improper" because the public is entitled to rely on the public record. Vitronics, 90 F.3d at 1583.

Clintec insists that what Baxa is doing is improperly injecting into claim 40 a "sorting" element appearing in the prosecution history. Clintec says that Kay Hannafan, the attorney prosecuting the patent application, simply made a mistake when she stated that claim 37(40) required sorting. Clintec relies on Intervet Am., Inc. v. Kee-Vet Laboratories, Inc., 887 F.2d 1050 (Fed. Cir. 1989), this court's opinion in Viskase Corp. v. American Nat'l Can Co., 947 F. Supp. 1200 (N.D. Ill. 1996), and International Rectifier Corp. v. SGS-Thomson Microelecs. Inc., 38 U.S.P.Q.2d (BNA) 1083 (C.D. Cal. 1994).

In Intervet the prosecution history was as follows: responding to the second Patent Office action, the attorney prosecuting the patent application, simply made a mistake when she stated that claim 37(40) required sorting. Clintec relies on Intervet Am., Inc. v. Kee-Vet Laboratories, Inc., 887 F.2d 1050 (Fed. Cir. 1989), this court's opinion in Viskase Corp. v. American Nat'l Can Co., 947 F. Supp. 1200 (N.D. Ill. 1996), and International Rectifier Corp. v. SGS-Thomson Microelecs. Inc., 38 U.S.P.Q.2d (BNA) 1083 (C.D. Cal. 1994).

In Intervet the prosecution history was as follows: responding to the second Patent Office action, the attorney prosecuting the patent application, simply made a mistake when she stated that claim 37(40) required sorting. Clintec says that Kay Hannafan, the attorney prosecuting the patent application, simply made a mistake when she stated that claim 37(40) required sorting. Clintec relies on Intervet Am., Inc. v. Kee-Vet Laboratories, Inc., 887 F.2d 1050 (Fed. Cir. 1989), this court's opinion in Viskase Corp. v. American Nat'l Can Co., 947 F. Supp. 1200 (N.D. Ill. 1996), and International Rectifier Corp. v. SGS-Thomson Microelecs. Inc., 38 U.S.P.Q.2d (BNA) 1083 (C.D. Cal. 1994).

The court held that

when it comes to the question of which should control, an erroneous remark by an attorney in the course of prosecution of an application or the claims of the patent as finally worded and issued by the Patent and Trademark Office as an official grant, we think the law allows for no choice. The claims themselves control.

Id. at 1054.

The court acknowledged that

there are . . . situations in which what an attorney says or does during prosecution may be held against a patentee . . . . For example, when a patentee attempts to expand the literal meaning of a claim . . . and the prosecution history shows that the expanded scope would be inclusive of subject matter the attorney had represented to the examiner was not intended to be included in order to get the claim allowed, the patentee may be estopped to contend otherwise.

Id. (emphasis in the original). The court concluded that the instant case was different because "the patentee was granted broad claims in spite of the statement by the attorney that he was amending them, though he never did so." Id. (emphasis
The court pointed out that "the examiner was not misled or deceived[ because] the erroneous remark was not the end of the prosecution." Id. There were two telephone interviews between the attorney and the examiner, the examiner made two "examiner's amendments," and the absence of the "single vaccination" limitation in all but three claims "may very well have been discussed." Id.

The present case is different. In Intervet three claims were expressly limited to one vaccination, while the others were not. The Intervet court did not have to interpret an existing term. The Intervet court itself acknowledged the difference between "interpreting what is meant by a word in a claim[, which is proper via reliance on the prosecution history,] . . . and [adding] an extraneous limitation appearing in the [prosecution history], which is improper." Id. at 1053 (emphasis in the original); Vitravonics, 90 F.3d at 1582 (in interpreting claim, "the court may also consider the prosecution history of the patent, if in evidence"). In addition, unlike the Intervet attorney, Ms. Hannafan amended claim 37(40) in response to the Examiner's vagueness, not patentability, concern. Then, in response to the Examiner's patentability objection, she explained how the amended claim 37(40) differed from the prior art, thereby defining "selecting." Unlike in Intervet there is no evidence of further contact between the Examiner and Ms. Hannafan, during which the Examiner could have acquired a different understanding than that conveyed by the May 12, 1986 Amendment. Unlike Intervet, the only logical conclusion is that the Examiner allowed claim 37(40) because of Ms. Hannafan's explanation, not in spite of it. See Intervet, 887 F.2d at 1054.

Clintec insists that the Examiner knew that "selecting" and "sorting" had different meanings, see id. ("The examiner was fully aware of what claims he was allowing."). and that Ms. Hannafan's error would be obvious to anyone perusing the prosecution history, see Southwall Techs., 54 F.3d at 1578 (competitors "must be able to rely on the patent documents[, including prosecution history, . . . in ascertaining the scope of a patentee's right to exclude")., because (1) neither the original nor the amended claim 37(40) contained the term "sorting;" (2) prior to the May 12, 1986 Amendment, the Examiner demonstrated that she knew the difference between "selecting" and "sorting;" (3) Clintec amended the original claim 37(40) to add a "selecting," not a "sorting," function, and (4) the Examiner did not require Clintec to further amend claim 37(40) to include a "sorting" limitation. However, these statements are unresponsive to Baxa's argument, i.e., that in the one and only response by Clintec to the rejection of its patent, Clintec (through Ms. Hannafan) effectively defined "selecting" as "sorting," thereby shaping the Examiner's and the public's understanding of the meaning of that word. 29

29 Clintec relies on the fact that, prior to the May 12, 1986 Amendment, regarding claim 37(40), the Examiner asked "how is the selected set of parameters' selected," while with respect to claim 87, she asked "how is the sorting accomplished?" (Ex. A at PP 12, 13.) However, the unamended claim 37(40) recited "means for compounding a selected mixture corresponding to a selected set of parameters," while the unamended claim 87 recited "sorting the sets of parameters in accordance with the types of base solutions included in each said set." (Ex. D at 2-3, 4) (emphasis added). The Examiner rejected the above claims, among others, for vagueness. Obviously, in seeking clarification of vague terms, she would have posed the question using the words whose meaning was unclear. One cannot surmise from this that the Examiner knew that "selecting" and "sorting" meant different functions.

In Viskase v. American Nat'l Can Co., also relied upon by Clintec, the issue was the meaning of the term "about" as used in the phrase "a density below about 0.91 g/cm<3>," The plaintiff argued that it meant a number between 0.905 and 0.914. The defendant argued that it meant 0.910. 947 F. Supp. at 1202. One of the defendant's reasons was that in a letter sent to the Patent Office after the plaintiff's patent had been allowed, the plaintiff's attorney stated that the patent "does not have a density below about 0.910 g/cm<3>," Id. (emphasis added). Following Intervet, this court disregarded the attorney's statement because "in no other place in the prosecution history did Viskase use a third decimal point," id., the attorney used the word "about," suggesting numbers "slightly above and slightly below," id. at 1201, "the Examiner certainly knew that the claims themselves included broader language than the limitation of 0.910," 30 and "the Examiner "did not require an amendment." Id. at 1202.

30 This statement was based on the court's earlier observation that the Examiner said that the plaintiff "clearly . . . intended to claim below 0.91," and that the plaintiff's claims included "density of from about 0.86 to about 0.91." Viskase, 947 F.3d.
The present case is different. By limiting "about 0.91" to "0.910," the defendant was advocating a construction contrary to the term's "ordinary dictionary definition" and to its understanding by "persons skilled in the art." Id. The Examiner in the present case did not indicate that she differentiated between "sorting" and "selecting." See supra. The term "sorting" appears more than once in the prosecution history because Clintec's Ms. Hannafan used it to distinguish claims 1, 19, 37(40), 67, 87, and 93 from Axelson. See supra. In addition, the specification abounds with the term "sorting," in contrast to "selecting." See supra. Finally, it is not surprising that the Examiner in this case did not require a further amendment of claim 37(40) since she had been provided with the definition of "selecting" by the May 12, 1986 Amendment.

In the third case relied on by Clintec, International Rectifier, the attorney "plainly wrongly" distinguished prior art. The court concluded that the Patent Office must have "found other grounds on which to distinguish [prior art] and did not rely on the erroneous statement made by counsel." 38 U.S.P.Q. at 1091. Clintec cites this case in support of its contention that the Examiner must have distinguished claim 37(40) from Axelson on grounds other than those represented by Ms. Hannafan. However, Ms. Hannafan's explanation that "selecting" in claim 37(40) required sorting to minimize the number of source solution containers would not have appeared "plainly wrong," see id., to the Examiner who herself rejected claim 37(40) as unpatentable over Axelson.

I conclude, therefore, that the meaning of "selecting" in claims 40 and 67 is identical to that of "sorting" in claims 1, 19, 87, and 93. Since there is no genuine issue of material fact that Baxa's compounders employ the identical or equivalent structure for "sorting" as that disclosed in the '010 patent, see supra, there can be no literal infringement of claims 40 and 67. Carroll Touch, 15 F.3d at 1578 (literal infringement of means-plus-function element requires that accused device (1) perform identical function and (2) do so with identical or equivalent structure). Accordingly, Baxa's summary judgment motion on literal infringement and cross-summary judgment motion viz-a-viz claim 40 are granted. Clintec's summary judgment viz-a-viz claim 40 is denied.

C. Selectively Adjusted

The parties agree on what the term excludes but have not reached agreement on what the term includes.

Brike contends that the term "selectively adjusted to any horizontal or vertical position within a range of movement as permitted by the pair of arm segments" means a hand crank position adjustable within a restricted plane, and excluding a device in which the hand crank position is adjustable only on an axis linearly coincident with the axis of two telescoping sections. Brike contends that the movement can occur in two axes at once but since the up/down and forward/rearward movements are independent, the movement is not limited to occurring in two axes.

Invacare contends that the term "selectively adjusted to any horizontal or vertical position within a range of movement as permitted by the pair of arm segments" means a hand crank position that is adjustable along at least two axes anywhere within a restricted plane, excluding a device in which the hand crank position is adjustable only linearly, coincident with the axis of two telescoping sections. According to Invacare, it is impossible to move the hand crank up and down independently of forward and rearward and both vertically and horizontally simultaneously unless adjustability is permitted along at least two axes.

The specification states:

Whereas in the prior vehicles different rider size and riding style was difficult to adjust for or the adjustments were always limited in someway [sic] the present invention offers the rider almost unlimited adjustability. The handcranks are mounted to a structure that includes a combination of telescoping sections, linkage arms and pivot points that form an approximate triangular shape. This shape allows the cranks to be moved about both up and down independently of the forward and rearward adjustment, forward and rearward independently of the up and down adjustment or both vertically and
horizontally simultaneously for differing arm lengths and/or rider height and then be locked rigidly into place once the desired position is located. In previous hand powered vehicles the adjustment of the location of the cranks for rider use was limited to telescoping the frame in and out or telescoping the cranks in and out of a fixed inner and outer cylinder arrangement that limited the crank arm adjustment to linear movement only.

The parties are close in their constructions and appear to agree on the movement allowed by the adjustment, namely that the movement can be horizontally only or vertically only or both together, as stated in the specification. They cannot agree over the use of axes but I do not think the term is necessary. The construction can borrow language from the specification to make the meaning clearer.

I construe the term "selectively adjusted to any horizontal or vertical position within a range of movement as permitted by the pair of arm segments" to mean a hand crank position adjustable anywhere within a restricted plane and allowing movement either up and down independently, or forward and rearward independently, or both up/down and forward/rearward simultaneously, and excluding a device in which the hand crank position is adjustable only on an axis linearly coincident with the axis of two telescoping sections.

The word "respective" in the context of the claim means "in the order given." The order given in the claim is to energize and deenergize in response to increase capacity signals and decrease capacity signals. "Respective" links the energizing steps to the increase capacity signals and links the deenergizing steps to the decrease capacity signals. The Court adopts Dr. Rhyne's testimony that a person of ordinary skill in the art would give this interpretation to the word "respective."

In the specification, where "respective" is used many times, it also means "in the order given." See, e.g., Column 4, line 66 through Column 5, line 4. The prosecution history further supports this interpretation. See JX-776, Response, Bates Nos. 144-45, example showing that a compressor was energized only in response to an increase capacity signal and that a compressor was deenergized only in response to a decrease capacity signal.

The language in claim 1 is exemplary and states that the last step comprises "selectively energizing and deenergizing compressors in response to respective increase capacity signals and the decrease capacity signals." To understand why "compressors" and "signals" are plural, the Court examined other portions of the claims, the specification, and the prosecution history. The next to last element in each of claims 1, 3, and 24 indicates that a single increase capacity signal is generated when more compressor capacity is needed and that a single decrease capacity signal is generated when lesser compressor capacity is needed. The use of the plural "signals" in the last element of claims 1, 3, and 24 reflects a history of operation, i.e., a result of controller operation over a time interval. The Court accepts and adopts Dr. Rhyne's testimony that a person of ordinary skill at the relevant time would have so understood and interpreted the use of plural "signals" and "compressors" in the claims. Because there is no indication from other portions of claims 1, 3, and 24 whether the use of the plural in "compressors" is also a result of the same time interval or history of operation, the Court looked to the specification and discovered that the specification and disclosure indicate that a single compressor is turned on in response to an increase capacity signal and a single compressor is turned off in response to a decrease capacity signal. See, e.g., Column 4, line 66 to Column 5, line 4 states that "one of the multiple compressors" is energized in response to an increase capacity signal. The prosecution history at pp. 28-29, JX-776, Response, Bates Nos. 144-45, reflects that only one compressor is turned on in response to an increase capacity signal and one compressor is turned off in response to a decrease capacity signal. On page 30 of the same Response, JX-776, Bates No. 146, the applicant argued,
It is the independent control of each compressor of the present invention without regard to the energized or deenergized state of the other compressors in the system which makes the number of combinations of compressors available greater than the number of available compressors.

Thus the last element of claims 1, 3, and 24 of the '776 patent recites a step or means for energizing a single compressor in response to an increase capacity signal and deenergizing a single compressor in response to a decrease capacity signal.

Furthermore, this last element of claims 1, 3, and 24 of the '776 patent is construed to be a step or means for energizing or deenergizing a single compressor at a time and in such a manner that compressors are turned on and off in sequence until the appropriate compressor combination to meet the load demand is eventually achieved. Thus this last element of claims 1, 3, and 24 is not so broad as to cover the situation where a specific capacity signal is generated, the controller analyzes the signal, and in response turns on the specific combination of compressors that matches the load demand without cycling through a sequence of compressors.

The claim further needs interpretation in light of the collective limitations of the words and phrases, "selectively," "in respective response," and "to provide a greater combination of compressors." In combination with other limitations of "respectively" and "to provide a combination of compressors . . .," "selectively" means energizing or deenergizing compressors according to some particular logic or criteria. Thus the claim element takes on the construction indicated supra. Support is found in the specification, Column 7, line 45-51, DX-119:

As described above, it will be evidence that controller circuit 10 will "cut-in" or "cut-out" the next compressor or compressor stage as above described until the combination of stages has an operating capacity closest to matching the system load, i.e., causing the system suction pressure to return to the previously established . . . range as hereinabove described and shown in FIG. 4 [emphasis added].

Similarly, the prosecution history also supports this construction. On page 30, Response, JX-776, Bates Nos. 146), the applicant was commenting upon the example provided on the prior pages which compared the operation of "the invention" to the prior art (in which the example clearly cycled through compressors until the correct capacity match was made) and explained:

Successive reiterations of the FIFO strategy enables [sic] the present invention to more efficiently match the system load with the expanded set of compressor combinations available than previous systems, such as in Golber, having only a limited number of combinations available [emphasis added].

The Court accepts and adopts Dr. Rhyne's testimony that a person of ordinary skill in the art at the time would have understood and interpreted the use of "selectively" and "respective" in the claims in the '776 patent as limited with respect to choosing the optimal combination without the cycling through individual compressors until the proper combination for the needed capacity was achieved.

As discussed above, the Court finds that the specification at Column 7, line 58 through Column 8, line 10 does not disclose a binary sequence as an alternate logic to the FIFO sequence of operation for controlling compressors. 24 Instead, based upon the prosecution history, the Court interprets the claims as limited to the structure or an act for achieving a FIFO sequence. While the example of the invention given by the applicant was specifically directed at application claims 7, 8, and 10, among others, and did not explicitly limit the sequence to FIFO, the example is clearly a FIFO sequence. See, e.g., the statement at page 29 of the Response, JX-776, Bates No. 145:
By contrast, the second system [in accordance with the present invention] faced with the same five horsepower requirement will energize Compressor Number 3, being the compressor deenergized for the longest period of time, in addition to maintaining Compressor Number 2 in an energized state. This will establish a capacity of six horsepower which, being greater than that required, will initiate a cut-out signal for the compressor which is energized for the longest period of time, i.e., Compressor No. 2. This leaves a total capacity of four horsepower. In the final stage of matching the system capacity to the instantaneous load, the second system will then initial a cut-in signal and increase the capacity of the system by energizing the compressor which has been deenergized the longest period of time (i.e., Compressor Number 1) [emphasis added].

On the following page, the applicant states that "successive reiterations of the FIFO strategy" enabled the present invention to match more efficiently the system load.

24 The '602 patent makes clear that both the binary and the FIFO sequences cycle through a set sequence of turning compressors on and off until they arrive at the optimal combination to satisfy the load demand.

On page 2 of a Supplemental Response (JX-776, Bates No. 162) mailed to the PTO on November 10, 1982, moreover, the applicant asserted that the arrangement claimed by applicant provides an operation that has several subtle advantages over the art which may not be readily apparent, and therefore, the claimed structural and functional operations do not really do justice to the many advantages of applicant's system, except by comparison with operation in accordance with the prior art [emphasis added].

The only comparison of the operation of the present invention against the prior art in the prosecution history is found at pages 28-29, Response (JX-776, Bates No. 144-45). Moreover also on page 2 of the Supplemental Response, the applicant states,

Expressed in shorthand terms, an applicant's claims are directed to a cooling system using a FIFO control strategy applied in tandem to a plurality of commonly piped compressors to enable independent compressor control.

Furthermore, the Court observes that the FIFO sequence is mentioned five more times in the following page and a half. In addition, Dr. Rhyne, whose expertise is greater than one of ordinary skill in the art in 1979, testified that in five readings of the prosecution history, he never construed the "shorthand terms" comment as limited to certain claims.

The statements in the Supplemental Response are not limited to any particular claims, as evidenced by the last quoted statement, which is not restricted to any particular claims. Moreover, the applicant stated in the first paragraph about the description of "THE INVENTION" (JX-776, Bates No. 208),

The claimed invention concerns a novel control system for controlling the capacity of a preselected number of commonly piped compressors, as typically employed in a cooling system. Expressed in shorthand terms, applicant's claims are directed to a FIFO control strategy applied in tandem to a plurality of commonly piped compressors to enable independent compressor control.

In sum, the Court concludes from these arguments and statements made during the prosecution history that all the claims of the '776 patent, regardless of the application of 35 U.S.C. § 112 par. 6, are limited to the structure and acts for achieving a FIFO sequence of operation.

The Court concludes that the last element in each of claims 1, 3, and 24 of the '776 patent invokes application of § 112 par. 6 and satisfies the three requirements indicated supra.

Specifically Claim 1 of the '776 patent is a method claim that recites a series of "steps." The preamble ends with the phrase "steps of," indicating that each of the following elements is a step. (DX-109). Thus the element "selectively energizing" is a
step. Moreover the step of "selectively energizing and deenergizing" has a specified function, following the step and linked to the step, "to provide a combination of energized unequal capacity compressors that exceeds in number the preselected number of compressors in the system . . . ." Finally, the step does not recite structure, material or acts for achieving the designated function.

The last elements in claims 3 and 24 are also subject to § 112 par. 6. These claim elements are expressed as "means for," signaling an intention to invoke § 112 par. 6 and raising the presumption that it applies. The elements in claims 3 and 24 have the specified function "to provide . . . ." following the recited "means" and linked to that means. There is no recitation of structure, material or acts in those respective elements for achieving the specified function. Dr. Rhyne, testifying that § 122 par. 6 applied, maintained that "selection" or "selection means" had no commonly understood meaning in the art at the time to define a particular structure.

Since claims 1, 3, and 24 are subject to § 112 par. 6, they are limited to the corresponding structure or acts disclosed in the specification for performing the recited function, and their equivalents. As noted supra, the only disclosure for such a means or step to achieve the recited function is a capacity controller circuit that implements a FIFO logic or sequence. Thus the last elements of claims 1, 3, and 24 are limited to a FIFO sequence of operation and structure.

The decision in Altech Controls Corp. v. The Larkin Group, Inc., No. 1:88-CV-499-MHS at *6, 56-61 (N.D. Ga. September 18, 1990), holding that some claims were directed specifically to the FIFO control strategy and others to more combinations, is not binding on this Court. Moreover because E.I.L. was not a party, the doctrine of res judicata does not apply. Substantial questions have been raised about the order, adopted from the plaintiffs' proposed findings of fact and conclusions of law after a settlement was communicated to the court. Furthermore, it was issued prior to Vitronics, which clarified the need to focus on intrinsic evidence, and recent Federal Circuit cases dealing with § 112 par. 6, including Greenberg, York Products, Cole, and Fonar.

C. Infringement

Because laches bars any claim with respect to the RC-48 controller, 2 the only issue we must address is infringement of the RC-1000 controller. After holding a Markman hearing to construe the '776 patent's claims, the district court granted summary judgment that the RC-1000 controller did not infringe claims 1, 2, 3, 7, and 24 of the '776 patent literally. 3 The court thereafter issued a second order that granted summary judgment that prosecution history estoppel barred an assertion of infringement of the '776 patent by the RC-1000 under the doctrine of equivalents. The district court concluded that the patent claims were limited to FIFO selection. There is little dispute that the RC-1000 does not utilize FIFO selection as described by the '776 patent, and instead uses a single signal to both de-energize some compressors and at the same time energize others to obtain the desired capacity. In contrast, FIFO selection uses a decrease signal only to de-energize compressors, and it uses an increase signal only to energize compressors. The district court therefore held that the RC-1000 did not infringe the '776 patent.

2 Laches is a defense to a continuing tort up until the time of suit and can only bar recovery until that time. Aukerman, 960 F.2d at 1031, 22 U.S.P.Q.2D (BNA) at 1327. In this case, E.I.L. stopped manufacturing the RC-48 controller before suit was filed. Therefore, laches bars recovery for all acts of potential infringement by the RC-48 controller.

3 Claims 1, 3 and 24 are independent claims. Claims 2 and 7 are dependent claims.
selectively energizing and deenergizing compressors in response to the respective increase capacity signals and the
decrease capacity signals to provide a combination of energized unequal capacity compressors that exceeds in number the
preselected number of compressors in the system so that the capacity of the system matches the common pressure load.

The '776 patent, col. 9, ll. 19-26. Altech argued that, while other claims in the '776 patent were directed to a FIFO invention,
claim 1, as well as claims 2, 3, 7, and 24, were broad enough to encompass the RC-1000 selection process. However, both
the language of the claims and the prosecution history indicate that the claims are limited to a FIFO system. During
prosecution of the patent Altech made express representations that the claims were limited to a FIFO system. In addition,
Altech repeatedly referred to its invention as utilizing FIFO selection, without any reference to specific claims.

Furthermore, application claim 7, which issued as claim 1 of the '776 patent, was originally written broadly enough to
encompass the technology of the RC-1000 controller. However, the claim was rejected over the prior art. Altech amended
the claim to include the words "selectively energizing" and "respective." The word "respective" effectively limits the claims
by aligning an "increase" signal with an increase capacity response, and a "decrease" signal with a decrease capacity
response. This interpretation is reinforced by the term "selectively energizing." The amended claims do not allow for a
construction where each signal generates a response that turns on the specific combination of compressors that matches the
load of demand, the selection process of the RC-1000. Given that the amendments narrowed the claims and were for
reasons related to patentability, Altech is barred from asserting infringement of claim 1 and dependent claim 2 under the
doctrine of equivalents. See Festo Corp. v. Shoketsu Kinzoku Kogyo Kabushiki Co., Ltd., 234 F.3d 558, 574-75, 56
U.S.P.Q.2d (BNA) 1865, 1872 (Fed. Cir. 2000) (en banc). Similarly, because the parallel language of claims 3, 7, and 24
was likewise amended, Altech is barred from asserting infringement of those claims under the doctrine of equivalents.

4 For example, in FIFO selection, if a system has three compressors of 4, 2 and 1 horsepower and is running the first two
compressors, the system will be running at six horsepower. If the pressure indicates that the system requires only five
horsepower, a de-energize signal will cause the controller that has been running the longest to turn off. In our example, that
would be the 4 horsepower compressor. The system will be running at only 2 horsepower and an energize signal will
indicate that more power is needed. In response, the 1 horsepower compressor will turn on, because that has been off the
longest. Now the system is running at 3 horsepower. Another energize signal will indicate that more power is needed, and
the 4 horsepower compressor will turn on, for a total of seven. Now, the de-energize signal will cause the 2 horsepower
compressor to turn off, because that compressor has been on the longest and finally, the system will be running at the
necessary five horsepower. In contrast, the RC-1000 controllers do not utilize FIFO selection. Instead, in our example where
the system is running the 4 and 2 horsepower compressors, but needs only five horsepower, the RC-1000 controller will
respond to the de-energize signal by turning off the 2 compressor and turning on the 1 compressor, for a total of five
horsepower. The RC-1000 responds to de-energize and energize signals without regard for which compressors have been on
or off for the longest period of time.

III. ANALYSIS

The parties have resolved all matters of claim construction, save for one. Claim 23 of the '995 Patent specifies in pertinent
part:

A roll bending die for being used with a roll bending machine for producing rib reinforced rolled material, the roll
bending die comprising . . . a pair of clamp members selectively engaging an end face of each of said opposing ends of said
body member, each of said clamp members being adapted for engaging the roll tube of the roll bending machine such that
said clamp members are for securing said body member to the roll tube of the roll bending machine.

'995 Patent.
Plaintiffs request that the Court construe this portion of Claim 23 as follows:

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Plaintiffs' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;[a] pair of clamp members&quot;</td>
<td>&quot;two clamps&quot;</td>
</tr>
<tr>
<td>&quot;selectively engaging an end face of each of the opposing ends of said body member&quot;</td>
<td>&quot;able to engage an end face of each of the opposing ends of said body member&quot;</td>
</tr>
<tr>
<td>&quot;each of said clamp members being adapted for engaging the roll tube of the roll bending machine&quot;</td>
<td>&quot;the clamps are designed to be able to engage the roll tube of the roll bending machine&quot;</td>
</tr>
<tr>
<td>&quot;such that said clamp members are for securing said body member to the roll tube of the roll bending machine&quot;</td>
<td>&quot;the clamps are for securing the body member to the roll tube of the roll bending machine&quot;</td>
</tr>
</tbody>
</table>

Defendant, on the other hand, requests that the Court construe Claim 23 in the following manner:

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Defendant's Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;[a] pair of clamp members&quot;</td>
<td>&quot;two clamps&quot;</td>
</tr>
<tr>
<td>&quot;selectively engaging an end face of each of the opposing ends of said body member&quot;</td>
<td>&quot;the clamps can be secured and removed to interlock with the end faces of the body member&quot;</td>
</tr>
<tr>
<td>&quot;each of said clamp members being adapted for engaging the roll tube of the roll bending machine&quot;</td>
<td>&quot;each clamp can be interlocked to the roll tube of the roll bending machine&quot;</td>
</tr>
<tr>
<td>&quot;such that said clamp members are for securing said body member to the roll tube of the roll bending machine&quot;</td>
<td>&quot;each clamp member functions to rigidly hold the body member both radially and laterally with respect to the roll tube&quot;</td>
</tr>
</tbody>
</table>

1. Claim language.

In any claim construction analysis, "[t]he appropriate starting point . . . is always with the language of the asserted claim itself." Phonometrics, Inc. v. Northern Telecom Inc., 133 F.3d 1459, 1464 (Fed. Cir. 1998) (citation omitted).

As the Supreme Court stated in White v. Dunbar, 119 U.S. 47, 52, 30 L. Ed. 303, 7 S. Ct. 72, 1886 Dec. Comm'r Pat. 494 (1886): "The claim is a statutory requirement, prescribed for the very purpose of making the patentee define precisely what his invention is; and it is unjust to the public, as well as an invasion of the law to construe it in a manner different from the plain import of its terms."

Kimberly-Clark Corp. v. Johnson & Johnson, 745 F.2d 1437, 1458 (Fed. Cir. 1984). The words used in a patent claim are examined from the perspective of a person of ordinary skill in the art. Tegal Corp. v. Tokyo Electron America, Inc., 257 F.3d 1331, 1342 (Fed. Cir. 2001).

The parties are in agreement that the first clause of the claim, ",[a] pair of clamp members," references "two clamps." As to the second clause of the claim, "selectively engaging an end face of each of the opposing ends of said body member," the
parties' interpretations diverge significantly.

In determining the ordinary and customary meaning of the phrase "selectively engaging," the parties have both referenced dictionary definitions for the individual terms. Dictionaries, while technically extrinsic evidence, are permissible sources of information for use during claim construction. See Vanguard Prods. Corp. v. Parker Hannifin Corp., 234 F.3d 1370, 1372 (Fed. Cir. 2000) ("A dictionary is not prohibited extrinsic evidence, and is an available resource of claim construction"). Indeed, the Federal Circuit has stressed that dictionaries "are particularly useful resources to assist the court in determining the ordinary and customary meanings of claim terms." Texas Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1202 (Fed. Cir. 2002); see also Vitronics Corp., 90 F.3d at 1584 n.6 ("Judges are free to consult [dictionaries] at any time in order to better understand the underlying technology and may also rely on dictionary definitions when construing claim terms, so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents.").

Having read the dictionary definitions proffered by the parties, the Court finds little, if any, support for Buckaroos' proposed reading of the term "selectively" within the context of the phrase "selectively engagable." Buckaroos cites Webster's Ninth New Collegiate Dictionary ("Webster's") for its assertion that "the term 'selectively' means that the clamp members are removable at the choice of the operator, as opposed to permanently attached." Pl.'s Br. at 23. While Webster's does not directly define the term "selectively," it does define related terms:

select . . . to take by preference from a number or group: pick out: CHOOSE . . . to make a choice . . .

selection . . . 1: the act or process of selecting: the state of being selected 2: one that is selected: CHOICE; . . .

selective . . . 1: of, relating to, or characterized by selection: selecting or tending to select . . . selectively

Buckaroos' App. at 11-3. The word "removable" neither appears in nor can be fairly inferred from the Webster's definitions. Indeed, the Webster's definition more fairly accords with Plaintiffs' contention that the term "selectively," merely implies "that the user of the invention may, or may not, choose to 'engage' the clamps with the dies, as demonstrated by the definition of 'selection'" in Merriam-Webster's Collegiate Dictionary, which defines "selection" as meaning "one that is selected: choice." 3 Pls.' Reply at 7 (quoting Merriam-Webster's Collegiate Dictionary (10th ed. 2002)). Likewise, Oxford English Dictionary defines the term "selectively" as "[i]n a selective manner; by selection," and further defines the term "selection" as "[a] particular choice; choice of a particular individual or individuals." Oxford English Dictionary (2d ed. 1989).

3 Buckaroos counters that "the proposition that a user 'may or may not' engage the clamps at the user's choice logically means that the clamps are removable at the user's choice." The Court disagrees and fails to see how imposing a requirement that the clamps be removable "logically" follows from the use of the term "selectively."

Buckaroos argues that reading the term "selectively" as Plaintiffs propose ignores the context of the term and the fact that it is used in conjunction with the term "engaging." Buckaroos argues that the term "engaging" should be interpreted with reference to Webster's definition of the root term "engage": "to come together and interlock (as of machinery parts)." Id. Webster's also, however, defines "engage" as "to cause (mechanical parts) to mesh," and "to bring together or interlock (weapons)." In the context of "engaging and disengaging machinery," Oxford English Dictionary defines "engaging" as: "that in which one part is alternately united to, or separated from another part, as occasion may require." Oxford English Dictionary (2d ed. 2002).

Even reading "selectively" and "engaging" together, as recited in Claim 23, Buckaroos' request for a construction that employs a requirement that the clamps be removable reads a limitation into the claim that is unsupported by any intrinsic evidence in the case. This is not to say, however, that Plaintiff's proposed construction, "able to engage an end face," is wholly adequate. In fact, after careful consideration of the parties' arguments and the language of the Claim itself, the Court finds that adopting Plaintiff's construction would fail to adequately give meaning to the word "selectively." Accordingly,
after careful consideration of all the evidence in the case, the Court concludes that the term "selectively" requires that the clamps be able to engage the end face, "at the operator's discretion." This construction gives due weight to the "choice" aspect of the term, rather than rendering it superfluous. As to whether the claim should be read to require a construction that "engaging" be synonymous with "interlock," the question is a closer one. The "engaging" requirement of the second disputed clause is also relevant to the third disputed clause of Claim 23, that "each of said clamp members being adapted for engaging the roll tube of the roll bending machine." Accordingly, the Court looks to other intrinsic evidence in the case, namely the patent specification, to aid in determining the construction of the second and third clauses, as well as to evaluate the fourth clause of Claim 23, for which Buckaroos requests that the Court impose additional limitations on the Claim language. 4

4 While the prosecution history is often a useful source of intrinsic evidence, it provides no guidance in the present case. In regards to Claim 23, the Examiner merely stated that "New claim [23] has been added to vary the scope of the claims and clarify the present invention. All limitations are supported by the original disclosure including the specification, drawings and original claims. . . . Therefore, no new matter has been added. The new claim is believed to be allowable." Clerk's No. 99-4 at 34.

2. The specification.

"The importance of the specification in claim construction derives from its statutory role." Phillips, 415 F.3d at 1316. The patent statutes require that a specification "shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same. . . ." 35 U.S.C. § 112; see Lizardtech, Inc. v. Earth Resource Mapping, Inc., 433 F.3d 1373, 1374 (Fed. Cir. 2006) (per curiam) (stating that the specification statute contains two separate requirements, a written description and an enablement requirement); Capon v. Eshhar, 418 F.3d 1349, 1360 (Fed. Cir. 2005) ("[A]lthough the legal criteria of enablement and written description are related and are often met by the same disclosure, they serve discrete legal requirements."). "In light of the statutory directive . . . the specification necessarily informs the proper construction of the claims." Phillips, 415 F.3d at 1316 (citing Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998) ("Ultimately, the interpretation to be given a term can only be determined and confirmed with a full understanding of what the inventors actually invented and intended to envelop with the claim. The construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction."). Accordingly, where a patentee reveals in the specification a "special definition given to a claim term . . . that differs from the meaning it would otherwise possess . . . the inventor's lexicography governs." Id. (citing CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002)). Likewise, if the specification reveals "an intentional disclaimer, or disavowal, of claim scope by the inventor . . . the inventor has dictated the correct claim scope, and the inventor's intention, as expressed in the specification, is regarded as dispositive." Id. (citing SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1343-44 (Fed. Cir. 2001)). If neither a unique lexicography nor a disavowal of claim scope appear in the specification, the "ordinary meaning, to one skilled in the art, of the claim language controls." Digital Biometrics, Inc. v. Identiix, Inc., 149 F.3d 1335, 1344 (Fed. Cir. 1998).

Buckaroos contends that its interpretation that Claim 23 requires "interlocking" is supported by the specification in this case. Specifically, Buckaroos points to the "Description of the Preferred Embodiment," which provides:

A pair of clamp members 22 5 selectively engage an end face 23 of each of the opposing ends 15 of the body member 11. Each of the clamp members 22 is designed for engaging the roll tube 56 of the roll bending machine 50 whereby the clamp members 22 are for securing the body member 11 to the roll tube 56 of the roll bending machine 50.

Each of the clamp members 22 comprises a pair of clamp portions 24. One of the clamp portions 24 is selectively coupled to the other of the clamp portions 24 whereby each of the clamp portions 24 is designed for being positioned around the roll tube 56 of the roll bending machine 50 when the clamp portions 24 are coupled to together [sic]. Each of the clamp portions 24 comprises an arcuate interior face 25 20 whereby the arcuate interior face 25 20 of each of the clamp portions
24 is designed for frictionally engaging the roll tube 56 for inhibiting rotation of the clamp portions 24 with respect to the roll tube 56 when the clamp portions 24 are coupled together around the roll tube 56.

Each of the clamp members 22 comprises a lip portion 29. The lip portion 29 outwardly extends from an engagement face 30 the associated one the clamp members 22. The lip portion 29 of each of the clamp members 22 selectively extends into one of the alignment grooves 28 of the body member 11 when the engagement face 30 of each of the clamp member 22 abuts against the end face 23 of the association one of the opposing ends 15 of the body member 11 for maintaining alignment of the body member 11 with respect to the roll tube 56.

'995 Patent, col. 4, lines 10-53. 6 A plain reading of the specification as articulated in the preferred embodiment indicates that the clamp members are designed to have a protuberance that will extend into prefabricated alignment grooves on the body member, that is, the lip of the clamp member is designed to engage the body member in order to keep the body member in proper alignment with the roll tube. The engagement between the lip and the body member, as described in the embodiment, clearly implies something more than "some contact between the clamps and the dies," as suggested in Plaintiffs' Reply. Pls.' Reply at 6.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

5 The numbers interspersed throughout the Description of the Preferred Embodiment reference the drawings including in the '995 Patent.

6 The language from the preferred embodiment is essentially duplicated in Claims 11-13 of the '995 Patent. Claims 11-13, however, are dependent claims of Claim 1. The doctrine of claim differentiation "create[s] a presumption that each claim in a patent has a different scope." Comark Comm., Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998). The doctrine would not support reading a limitation from Claims 11-13 into Claim 23, because "when a patent claim 'does not contain a certain limitation and another claim does, that limitation cannot be read into the former claim . . . ." Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1326 (Fed. Cir. 2003) (quoting SRI Int'l v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1122 (Fed. Cir. 1985)). Furthermore, the Court notes that Buckaroos has referenced only the description in the "Preferred Embodiment," and has not referenced Claims 11-13 in support of its proposed claim construction.

- - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - -

Plaintiffs contend that because the specification only teaches a preferred embodiment, it does not act to limit the claims. Pls.' Reply at 100. Plaintiffs cite Rexnord Corp. v. Laitram Corp., 274 F.3d 1313 (Fed. Cir. 2001) in support of this proposition. In Rexnord, the Federal Circuit stated: "Our case law is clear that an applicant is not required to describe in the specification every conceivable and possible future embodiment of his invention." 274 F.3d at 1344. The Court agrees that as a general rule, the Federal Circuit has found it improper to import limitations from an embodiment, even a preferred embodiment, into a claim. Phillips, 415 F.3d at 1323 ("[A]lthough the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments. . . . In particular, we have expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment.") Id. (citations omitted); Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1327 (Fed. Cir. 2002) ("We hold that claim terms take on their ordinary and accustomed meanings unless the patentee demonstrated an intent to deviate from the ordinary and accustomed meaning of a claim term by redefining the term or by characterizing the invention in the intrinsic record using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope.").

In the present case, the Court can find no words of manifest exclusion or restriction in the language Buckaroos quotes from the Preferred Embodiment portion of the patent. The applicability of the Federal Circuit's general rule on importing limitations from the specification, however, is made somewhat more difficult by the fact that the only descriptions sufficient to satisfy the enablement requirement of the specification statute appears in the "Description of the Preferred Embodiment." 7 See 35 U.S.C. § 112 (stating that a patent "shall" contain a description of the invention and how to make it sufficient "to enable any person skilled in the art . . . to make and use the same"). The Court's concern in this regard is highlighted by a statement the Federal Circuit made in Lizardtech: "Claims are not necessarily limited to preferred embodiments, but, if there are no other embodiments, and no other disclosure, then they may be so limited. One does not receive entitlement to a period of exclusivity for what one has not disclosed to the public . . . merely calling an embodiment 'preferred,' when there
are no others, does not entitle one to claims broader than the disclosure." Lizardtech, 433 F.3d at 1375. The quoted Lizardtech decision was a per curiam denial of a petition for rehearing en banc. In the underlying case, however, the three judge panel actually construed the disputed claim as not being limited by the specification. While on the one hand, this may give rise to a conclusion that the Lizardtech quotation is dicta; on the other, it may be consistent with the Federal Circuit's statement that when a preferred embodiment is the only written description sufficient to enable the patent, that a court "may," but is not required to, limit the claims of the patent to the written description in the preferred embodiment, despite the general rule to the contrary.

7 The '995 Patent specification contains a brief "Background of the Invention," a broad and nonspecific "Summary of the Invention," and a "Brief Description of the Drawings." '995 Patent, cols. 1-2. Other than these items, the '995 Patent comprises nothing more than the drawings, the "Description of the Preferred Embodiment," and the Claims themselves.

In this case, the Court finds it appropriate to abide by the typical rule of the Federal Circuit that claims should not be limited by embodiments. While certainly Plaintiffs' stated embodiment foresees a lip portion of the clamps that "interlock" with precut grooves in the body member, this is not the only reasonably conceivable method of "engaging" the body member. Indeed, the Court finds that the term "engaging" has a readily apparent meaning that requires more than mere touching, though not necessarily interlocking. See Oxford English Dictionary (2d ed. 2002) (defining "engaging" as encompassing mechanical situations where "one part is alternately united to, or separated from another part, as occasion may require"). Where, as here, Plaintiffs have not disclaimed or intentionally disavowed the use of clamps that do not interlock, per se, the Court declines to read such a limitation into the patent claim. Given the Court's determination that the term "engaging" does not necessarily require interlocking and that the term "selectively" cannot be read to require that the clamps be removable, the Court adopts Plaintiffs' proposed construction, with one modification, of the second and third phrases of the disputed portion of Claim 23.

With regard to the fourth phrase of the disputed portion of Claim 23, "such that said clamp members are for securing said body member to the roll tube of the roll bending machine," the Court also declines to import Buckaroos' requested limitations into the Claim language. Specifically, Buckaroos' request to read the Claim as requiring that "each clamp member functions to rigidly hold the body member both radially and laterally with respect to the roll tube" is simply not supported by the ordinary meaning of the claim terms or by any other limitation apparent from the intrinsic evidence in the case. Indeed, the Claim language itself is clear and the Court does not believe it requires further construction.

IV. CONCLUSION

For the reasons stated herein, the final paragraph of Claim 23 shall be read as follows: "two clamps, which are able, at the operator's discretion, to engage an end face of each of the opposing ends of said body member, each of the clamps is designed to engage the roll tube of the roll bending machine, such that the clamp members function to secure the body member to the roll tube of the roll bending machine."
a locking reinforcement support member having a mating means for selectively engaging said connector body at said open-end body cavity . . .

Claim 6 calls for

a locking reinforcement support member slidably fit within said open end of said body cavity defined in said multiple contact connector, said open end of the body cavity having a configuration to selectively receive said locking support member while preserving the integrity of said connector body after attachment of said angulate contact elements to said second external article . . .

Under Claim 1, the reinforcement support member has a mating means for "selectively engaging" the connector body. Under Claim 6, the body cavity is configured to "selectively receive" the reinforcement support member while preserving the integrity of the connector body. Claim 1 itself defines the element "connector body" as "having a body interior and having a front mating surface and an open-end body cavity." Maxconn '017 patent, col. 5, ll 1-13. The claim does not define "connector body" as including the contact elements, a separate element of the Claim. Maxconn '017 patent, col. 5, ll. 4-13.

Regarding Claim 6, it is the open end of the "body cavity" which selectively receives the reinforcement support member. Claim 6 describes the "body cavity" as just one part of the multiple contact connector: the "contact elements" are described as lying within the interior of the connector, Maxconn '017 patent, col. 6:7-9, while the connector itself is described as having various parts, including "a front mating surface, opposed lateral surfaces, a cover surface, a base surface and an open-end body cavity" Maxconn '017 patent, col. 6:9-11. The plain language of the itself indicates that the term "body cavity" does not include the contact elements.

The term "selectively" is used only in reference to the connector body or body cavity. It is not used in reference to the contact elements. Accordingly, Maxconn's interpretation involving the mechanism by which the support member mates with particular contact elements cannot be correct. 4 There is no need to consult the specification, prosecution history, or extrinsic evidence for further enlightenment, except to say that Amphenol's interpretation is entirely consistent with the arguments made by the applicant in the course of the prosecution of the patent.

4 In addition, later portions of both Claims 1 and 6 contain extensive descriptions of how the teeth of the member interlock with the wires of the connector, further supporting the Court's conclusion that the term "selectively" does not operate to define how the teeth meet with the wires. The extensive descriptions would render the term "selectively" superfluous.

b. Construction

The term "selectively" serves to emphasize that, as the Court concluded in part (B)(1)(e), above, the support member can be removed from the connector body so as to allow access to the interior of the connector, facilitating inspection or repair of the contacts without destroying the integrity of the connector in general or the contact elements in particular.
occlusive devices, such as embolic coils that comprises three distinct components: a pusher, a coupling, and an implant

"pusher"

"any device or structure intended to push another device or structure"

"selectively operable coupling"

"a connecting device that connects the implant to the pusher and that can be selectively operated by the user"

"coupling"

"a connecting device that connects the implant to the pusher and that can be selectively operated by the user"

"said coupling operable by fluid pressure so that when a sufficient amount of fluid pressure is applied to the coupling, the fluid pressure a user causes the occlusive implant to separate from the pusher"

"delivering fluid pressure through the pusher such that the implant detaches from the pusher by the fluid pressure"

Plain and ordinary meaning applies, no specific construction by the Court

(The Markman Order at 22-29, Docket Item No. 177.)

3544

A. Claim 35

In their Joint Statement the parties identified six disputed terms within Claim 35. By the time of oral argument the sole term in dispute was "selectively operating" within the context of the phrases "selectively operating the sputter cathode device to deposit a layer of the selected material on the substrate" and "selectively operating the ion source device in sequence with the sputter cathode device . . . ."

Avidly adversarial, the parties make this determination harder than it needs to be by consistently exaggerating the position of the other side and obscuring the actual point of disagreement. As this court sees it, the crux of the debate is whether "selectively operating" refers to how a device is operated to control conditions or whether a device operates at all at any given moment in the process.

AVL contends that "selectively" modifies "operating" such that the term requires that both the sputter cathode device and the ion source device be capable of either operating or not operating. Joint Statement at 4, 5. In addition, AVL urges that since the patentees did not specifically define the term, it should be given its accustomed meaning. To support that proposed reading AVL looks to Webster's Dictionary to define "select" as "to pick or choose," and to the patent specification and prosecution history which discloses how to achieve the desired reaction by "selectively opening the shutters." '095 Patent at col. 13, line 62. At oral argument, AVL suggested that the term requires turning the stations on and off; its putative expert Albert Smith goes farther, implying that it requires shutters or baffles to prevent poisoning. See Declaration of Albert Smith, P 16.

OCLI contends that it would be more accurate to interpret "selectively operating" to mean that the device "is operated
selectively through allowing for selection of process conditions" necessary to create the desired reaction. Joint Statement at 5, 6. OCLI emphasizes a number of places in the patent to support their reading. For example, it enumerates the many instances in which a reaction is governed by the thickness of a coating or the power applied to the sputter sources to argue that those decisions require selective operation. OCLI opp. at 12, n.13. In other words, what one picks and chooses is not mere functionality but the myriad process conditions which dictate the end result. During oral argument, OCLI elaborated on this claim by referring to the invention's parameters--citing a list of process conditions in column twelve of the patent--which they contend are all controlled by selectively operating the sputter cathode and ion source devices. In fact, OCLI proposes that selective operation encompasses almost the entire array of operating conditions necessary to achieve the desired reaction, including the regulation of pressure, power flow, oxygen flow, and target material in addition to sequentially turning the devices on and off as contemplated by AVL. Selective operation according to OCLI is expansive enough to embrace continuous operation as well. OCLI opp. at 12, n.13.

OCLI further relies on its putative experts to support its proposed reading of "selectively operating." Charles K. Carniglia, for example, attests that to one with ordinary skill in the art, the '095 patent "teaches selection of 'materials,' 'thickness of materials,' 'power,' 'pressure,' 'gas flow rates' and other process conditions for selective operation of the claimed magnetron-enhanced sputter device(s) and ion source(s)." Declaration of Charles K. Carniglia, P 30. Finally, OCLI insists that selective operation does not necessitate shutters, baffles, or the ability to turn a device on and off.

First, with respect to separation of the sputter device and ion source device through the use of sputters or baffles, OCLI is correct that nothing in the patent requires these although the various embodiments make use of them. However, AVL is also right that physical separation is envisioned and incorporated into the '095 patent. See '095 Patent at col. 3, line 36. It appears that all the embodiments contemplate that "the sputter device and the ion source device are enclosed in distinct partial pressure regimes or chamber regions between which the substrate is alternated by the continuously rotating drum." '095 Patent at col. 8, lines 4-7. Furthermore, the '095 patent discloses one of the "essential differences" between it and the prior art is that the '095 "technique employs distinct separate non-contiguous zones for deposition and reaction." '095 patent at col. 18, lines 1-2.

Second, while the meaning of "selectively operating" as used in the patent is far from clear and both parties interpretations seem reasonable, this court's reading of the term tends toward that proposed by AVL in which the term refers to the choice of whether or when to operate or activate either a given sputter cathode device or the ion source device during a particular pass of the carrier. 5

Footnotes

5 It should be noted that the court does not concur with other readings of the phrase proffered by AVL. For example, AVL also understands selectively operating to mean a device must be turned on or off, or functionally removed from the system. Joint Statement at 6. This court reads the term to mean only that the device's ability to operate can be controlled or activated.

End Footnotes

The interpretation proposed by OCLI is so expansive that it imports a great many functions into otherwise simple claim language. Without a doubt the invention requires both the selection of the process conditions and the selective operation of sputter cathode devices and the ion source device to achieve the conditioned result. However, the patent language appears to make a fine distinction between "selected" materials and conditions and "selective" operation. The patent documents use "selected" and "selectively" throughout and though they do not appear to be terms of art, they are used in different contexts within the patent specification and claims and seem to have slightly different meanings.

The meaning of "selectively operating" suggested by OCLI is better understood as the selection of "materials" and "reactions" rather than the selection of the sequence in which the devices should operate. Admittedly both types of selection occur and are correlated, but contrary to OCLI's contention, they appear as distinct processes within the context of the '095 patent and are not both embodied in the term "selective operation." For example, one selects metal 1 and metal 2 for the sputter cathodes and selects a particular sequence for depositing and oxidizing them, then one selectively operates the sputter and ion source devices to conform to the desired sequence. This distinction is best exemplified in the patent language in the summary of the rotary system operation:
With the sputter cathodes and ion source cathodes established at stable operating conditions, that is, at stable selected power, gas flow and pressure and with the drum operating at the specified rotational speed to provide selected deposition and oxidation rates, the desired deposition and oxidation sequence is effected by selectively opening the shutters.

'095 Patent at col. 13, lines 56-62 (emphasis added). As this language demonstrates, the process conditions are already selected; the sputter cathode and ion source devices are then selectively activated in a given sequence to produce the contemplated result. Nor is this reading a limitation from the specification on the claims, as this distinction between selected conditions and selective operation appears not only in the specification, but in claim 35 itself as well as in claim 46. This use of "selectively" is also consistent with a number of other dependent claims, in particular claims 22, 23 and 40.

OCLI posited at oral argument that selective operation must mean to tailor the process conditions because those of ordinary skill in the art refer to activating the sputter cathode and ion source devices in sequence as "sequencing." OCLI cites an article on the ARx10 by AVL expert J. Michael Walls in support of this interpretation. Declaration of Larry R. Laycock, Exh. I at 388. However, the Walls article does not appear to use "sequencing" as a term of art; rather it discusses how the process is controlled by "activating each of the magnetrons in sequence." Id. This sequential activation is distinguished from the control of the other parameters of the ARX10 machine. Walls' description is also consistent with this court's construction of "selectively operating" in the context of the '095 patent in which selection of the process conditions or parameters occurs apart from the selective activation of the sputter cathode and ion source devices. In the '095 patent "selectively operating" therefore means selective activation or operation of the device regardless of the method used to achieve activation.

4. Claim 17:

Claim 17 is dependent upon claim 1 and claims:

The system of claim 1 wherein the stem mounting means is selectively positionable in a plurality of orientations with respect to the base mounting means so that the second axis can be selectively oriented in a plurality of positions with respect to the first axis and with respect to the base portion.

313 patent, col. 6, 11. 43-48.

Zimmer asserts that this term, "selectively positionable" should be construed as "capable of being oriented and made fast in more than one location with respect to the base mounting means, where the location is chosen prior to the stem extension's insertion into the bone." Zimmer asserts that the term "mounting" in claim 17 requires that the stem extension and base portion be fastened or attached together such that they are not free to move relative to one another. 04/06/05 Zimmer Mem. at 17. Zimmer points to the specification and abstract, which state: "The stem extension can be attached in a selected orientation with respect to the base portion, thus enabling the main body of the stem to be positioned in any one of a plurality of orientations with respect to the base portion." 313 patent, Abstract. The specification goes on to state that the conical shape of the Morse taper "enables the stem extension 1 to be attached in any selected radial orientations." 313 patent, Abstract, col. 3 11. 50-52. And in the prosecution application, the applicant stated, "this feature is different from a system in which only a single orientation is provided." 313 patent Prosecution History, June 14, 1993, Amendment at 3. Finally, Zimmer rests its argument on Dr. Crowninshield's declaration, in which he stated, "it is clear that orientation requires that the stem mounting means be positioned or placed in a location with respect to the base mounting means, and that it then remains there." Crowninshield Decl. P 88.

In contrast, Howmedica asserts that claim 17 does not require that the stem be oriented and subsequently fixed without movement, but only that the stem mounting means be positionable. 05/06/05 Howmedica Mem. at 21. Howmedica then construes each term, "selectively" and "positionable," separately. Howmedica proposes that "selectively" should be construed as "the orientation of the components is selected prior to the components being secured in the bone." Howmedica argues that the ordinary meaning of the term "positionable" should be adopted as consistent with the embodiments described in the 313 patent. Id. As such, Howmedica alleges that "positionable" should be construed as "capable of orienting the stem in a plurality of radial orientations." Thus, according to Howmedica, "selectively positionable" requires only "that the stem
be capable of being positioned or arranged in any desired orientation." Id. at 22.

Howmedica's construction of this claim term is correct and, as such, adopted by this Court. As discussed in relation to claims 1 and 3, this Court is not of the view that mounting requires fixing or fastening without movement relative to each other. Rather, in this context, selectively positionable refers to being put in position for use. Here, we are dealing with a component that must be positioned or arranged in any variety of orientations prior to insertion into the bone. Thus, for the same reasons employed in the analysis above, this Court adopts Homedica's proposed construction of "selectively positionable, which requires "that the stem be capable of being positioned or arranged in any desired orientation."
disclosed in the disclosure of the 628 Patent. Synthes states clearly that the claim should be read in light of that specification. In other words, Synthes specifically defined a term within one of its claims by adopting a definition found in the 628 Patent's specification. Since a patentee may not proffer an interpretation for the purposes of litigation that would alter the public record, the Court construes self-compressing hole in the manner encouraged by DePuy. See Southwall Techs., 54 F.3d at 1578.

On the other hand, it is not clear that Claim 4 must include "one and only one" self compressing hole. Since the claim is unclear, the Court looks to the specification of the 36 Patent. That specification contemplates the use of one or more self compressing screw holes of the type described in Patent No. 31,628. (36 Patent, 4:13-15). This same specification helps to define the term "self compressing screw hole" and can also be used to determine the number of holes claimed. Reading this specification, the Court concludes that Claim 4 is not limited to just one self compressing screw hole.

Lockwood argues that the district court misconstrued all four elements of the '115 patent claims cited by the district court. First, Lockwood contends that, properly construed, the term "self-contained" means an "apparatus or collection of components which includes the materials necessary for the apparatus to function on its own" and that the language "easily transported" includes a collection of components of comparable size and weight to those disclosed.

American argues that Lockwood's interpretation of these terms is flatly inconsistent with his interpretation before the Patent and Trademark Office (PTO). We agree. The limitation "self-contained apparatus dimensioned to be easily transported" was added after the PTO rejected Lockwood's claims as obvious in light of a business transaction computer system disclosed in U.S. Patent 3,705,384. In response to the rejection, Lockwood distinguished the prior art system, which was composed of multiple cabinets that filled a room, stating, "applicant's device, on the other hand, is a free-standing self contained unit which can be moved from location to location." During the prosecution of the patent, Lockwood thus differentiated his device from the prior art because of its compact physical dimensions, not because of its ability to "function on its own." In fact, the interpretation of the words "self-contained" that Lockwood now advances is insufficient to distinguish his invention from the prior art because the prior art patent also discloses a system that can function independently. Lockwood cannot now argue for an interpretation inconsistent with this earlier representation. "Claims may not be construed one way in order to obtain their allowance and in a different way against accused infringers." Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576, 34 U.S.P.Q.2D (BNA) 1673, 1677 (Fed. Cir.), cert. denied, 133 L. Ed. 2d 424, 116 S. Ct. 515 (1995); see Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1562, 19 U.S.P.Q.2D (BNA) 1500, 1504 (Fed. Cir. 1991).

II.

The primary issue of claim interpretation is the meaning of "self-erecting." Discharging its duty to give meaning to the claims, the district court instructed the jury that the term "self-erecting" required "that the device form a curved or arched structure which stands off the patient." Augustine Medical argues that "self-erecting" requires only that the blanket form an "environment" about the patient in which warm air can circulate. Under its proposed claim interpretation, Augustine Medical argues that the accused blankets literally "self-erect" because they create an environment of circulating warm air about a patient.
This court finds no support for Augustine Medical's claim construction. The patents themselves define what the claims mean by "self-erecting." As noted above, the '188 patent describes its structure as "a self-supporting structure having a generally rounded or elliptical cross-sectional shape which contacts the patient only at the tubes which are immediately adjacent the keystone tube." Col. 4, ll. 12-16. The other patents all explain that a blanket which "self-erects" "erects itself into a Quonset hut-like structure" when inflated. The '102 patent, col. 3, ll. 31-35; the '320 patent, col. 3, ll. 11-12, 20-22; the '371 patent, col. 4, ll. 10, 17-19. Thus, the district court correctly construed the term "self-erecting" to require that the accused blankets "form a curved or arched structure which stands off the patient." Following this interpretation, the jury found that the accused blankets did not literally infringe. The jury did, however, find infringement under the doctrine of equivalents.

3550

D. Term 5: "a self-expanding structure exhibiting a spring-like behavioural component for moving the member between a compressed orientation . . . and an expanded orientation"

The Court construes the term "a self-expanding structure exhibiting a spring-like behavioural component for moving the member between a compressed orientation . . . and an expanded orientation" in claim 1 of the '281 patent to be a means-plus-function limitation subject to 35 U.S.C. § 112, P 6. The claimed function and the structure that corresponds to this function are as follows:

The claimed function is moving the member from a compressed orientation to an expanded orientation. The structure that performs this function must be either: (1) a flexible, elastically deformable frame carried around the periphery of the member; or (2) a frameless membrane made of a thin piece of a superelastic material.

The disputed language is not written in means-plus-function format, and the University denies that it is a means-plus-function limitation. Am. JCCS Sched. B. at 14; Univ. Opening Br. at 27-31. Because the claim does not use the term "means," the Court must presume as an initial matter that the University is correct and that § 112, P 6 does not apply. See Apex Inc. v. Raritan Computer, Inc., 325 F.3d 1364, 1371-72 (Fed. Cir. 2003). For the Court to construe the disputed language as a means-plus-function limitation, AGA must show, by a preponderance of the evidence, that the claim does not recite sufficiently definite structure for performing the claimed function. See id. at 1372. AGA has made this showing.

To begin with, the patent claims a "structure" that has certain properties. The word "structure" is entirely generic. According to the University, however, "structure" as used in claim 1 of the '281 patent is made definite by the surrounding words that modify "structure." Univ Opening Br. at 30-31. Specifically, the University calls the Court's attention to the word "self-expanding" and the phrase "exhibiting a spring-like behavioral component." Id. at 31.

The University has not, however, made any attempt to establish that "a self-expanding structure exhibiting a spring-like behavioural component" is something with an understood meaning in the art. Instead, the University has told the Court what this disputed language does not do -- it "does not call out a specific separate spring or tension spring . . . ." Univ. Opening Br. at 30. This is true, but unhelpful. The question before the Court is not what the term does not mean. Rather, the question is whether the disputed language, "as the name for the structure, has a reasonably well understood meaning in the art . . . ." Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996); see also Apex Inc., 325 F.3d at 1372 (quoting Greenberg). The Court finds that it does not.

To call a generic structure "self-expanding" is to describe what it does, not what it is. The word "self-expanding" thus does not make the claimed "structure" less generic. Similarly, to describe the structure as "exhibiting a spring-like behavioural component" is to describe -- oddly and awkwardly, but plainly enough -- how the structure behaves, not what it is.

The word "component" is no more particular than the word "structure." And to call a component "behavioural" is bizarre, since "components" are generally physical things, and "behavioural" typically modifies abstract nouns (as in "behavioral psychology"). The phrase "behavioural component" thus cannot be interpreted to cover any structure with a meaning in the art (particularly since the University has offered neither evidence nor argument that "behavioural component" denotes any identifiable structure). Rather, the phrase "exhibiting a spring-like behavioural component" can be interpreted only one way: to mean something like "behaving like a spring." A "self-expanding structure that behaves like a spring" is thus a generic
structure with spring-like properties, not a specific structure with a well-understood meaning.

Having determined that the disputed language is a means-plus-function limitation, the Court must next determine what function is claimed, and what particular structures are disclosed in the written description and linked to that function. See Asyst Techs., Inc. v. Empak, Inc., 268 F.3d 1364, 1369 (Fed. Cir. 2001). It is obvious from the patent's written description that the claimed device expands by virtue of its spring-like properties but must be compressed by some external force. The Court therefore finds that the claimed function is moving the device "from" a compressed orientation to an expanded orientation, rather than moving the device "between" the two orientations. AGA agrees with this characterization of the claimed function. AGA Opening Br. at 28-29 & 28 n. 11. And although the University proposed, in the amended JCCS, that the Court construe the claimed function to be "moving the structure between" the two orientations, Am. JCCS Sched. B at 14, the Court does not believe that the University actually objects to characterizing the function as involving movement only from a compressed orientation to an expanded one.

Having identified the claimed function, the Court must next "identify the corresponding structure set forth in the written description that performs the particular function set forth in the claim." Asyst Techs., 268 F.3d at 1369. The "corresponding structure" must be clearly linked or associated, in the specification or prosecution history, with the claimed function. B. Braun Med., Inc. v. Abbott Labs., 124 F.3d 1419, 1424 (Fed. Cir.1997).

The Court agrees with the University that the written description discloses two structures that can fulfill the claimed function of moving the member from a compressed orientation to an expanded orientation. There is no dispute that the written description discloses a device featuring a peripheral frame. Univ. Opening Br. at 33-34; AGA Opening Br. at 33-34. The only question is whether the written description also adequately discloses a frameless structure capable of moving the member from a compressed to an expanded orientation. The Court finds that it does.

In describing a preferred embodiment of the claimed invention, the patent describes a closure device with two disks, each featuring a membrane. '281 patent col. 4:58-61. The patent notes that the membrane "may be formed of a thin piece of superelastic material, such as a thin sheet of [nickel-titanium] alloy or a superelastic polymeric composite." Id. col. 5:3-6. The patent then describes a membrane with an attached peripheral frame that "in its natural, non-deformed state . . . serves to hold the membrane . . . taut." Id. col. 5:9-10. And the patent explains that the frame can "be deformed sufficiently for insertion into and passage through a small-diameter catheter yet automatically elastically return to its initial shape upon exiting the catheter." Id. col. 7:9-11. Crucially, after describing a membrane-plus-frame combination, the patent says: "[I]f the membranes are themselves formed of a superelastic material, they will tend to return to their original shape without a frame, so the frame may be omitted if so desired." Id. col. 5:32-35 (emphasis added).

In short, the peripheral frame is linked to the function of moving the disk (or, more generally, member) from a compressed to an expanded orientation. The patent unambiguously says that the frame may be omitted if the membranes are made of superelastic materials. And such superelastic membranes are described as "tend[ing] to return to their original shape" -- that is, tending to return to an expanded orientation from a compressed orientation. This suffices to link a frameless, superelastic membrane to the claimed function.

13 Further, if the specification left any doubt that a frameless, superelastic membrane could move itself from a compressed to an expanded orientation, that doubt would be dispelled by the prosecution history of the '291 patent. During prosecution of that patent, the patentee responded to a rejection by the PTO by saying: "The omission of a frame is clearly contemplated in the specification of this application as originally filed." JA 414. The PTO subsequently allowed claims of the '291 patent that do not include the limitation of a peripheral frame. Cf. '291 patent claim 1 (no frame mentioned), with claim 7 ("The closure device of claim 1 wherein each of the first and second disks has a periphery, each disk further comprising an elastically deformable frame . . . ”).

3551
B. "self-tensioning membrane digitizer" (claims 6, 10, and 20)

PolyVision's proposed construction

Smart's proposed construction

No construction required. Alt.: An apparatus having a membrane that
digital form (or digitizer) where the
tension on the membrane to keep it

This phrase is the preamble. PolyVision contends that no construction is required because the phrase is self-explanatory and because it would be improper to construe the preamble as a limitation in these circumstances. Whether the preamble should be considered a limitation on the claim language depends on its nature. A preamble can be considered a claim limitation when it is "necessary to give life, meaning and vitality" to the claim." Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999). In other words, if the preamble recites structure that is important to the invention or necessary to give the claim meaning, it will be regarded as limiting. See Bicon, Inc. v. Straumann Co., 441 F.3d 945, 952 (Fed. Cir. 2006). On the other hand, the preamble is not limiting where the "patentee defines a structurally complete invention in the claim body and uses the preamble only to state a purpose or intended use for the invention." Rowe v. Dror, 112 F.3d 473, 478 (Fed. Cir. 1997). In the latter circumstance, "the preamble is of no significance to claim construction because it cannot be said to constitute or explain a claim limitation." Pitney Bowes, Inc., 182 F.3d at 1305. Smart contends that construction is required because the self-tensioning aspect is the primary focus of the invention and that term was coined by the inventors, thus, there is no accepted meaning.

In this case the claim language discloses all of the structure necessary for the invention. The preamble does not provide further structure but is merely descriptive of the purpose of the invention -- a digitizer that has a self-tensioning membrane. While it may arguably be desirable to further define "self-tensioning," as noted above, the pretensioning aspect of the invention in the claim language provides sufficient context to the meaning of "self-tensioning." Thus no construction is necessary.

3552

Semipermeable Membrane

Claim 1 requires the gas sample chamber include "a sheet of a semipermeable membrane covering each of said plurality of filtering apertures, said semipermeable membrane permitting gases to diffuse through it under ambient pressure into and out of the space within said tube and preventing airborne particles larger than a predetermined size from entering said space." '332 Patent, col. 6, ll. 15-21. The district court interpreted this limitation to be "limited to [a] semipermeable membrane[] which deflects particles larger than 0.1 micron" and which "is properly described as a thin, soft pliable membrane with a thickness on the order of 25 to 50 microns thick." Finding and Recommendation, slip op. at 19, 21. Thus, the court found two numerical limitations on the semipermeable membrane: 1) the "predetermined size" of the particles prevented from entering the tube had to be 0.1 micron; and 2) the thickness of the membrane had to be "on the order of 25 to 50 microns."

We turn first to the "predetermined size" limitation. Edwards asserts the court improperly limited the claim term "predetermined size" to "particles larger than 0.1 micron," arguing that such a construction violates fundamental principles of claim construction and the doctrine of claim differentiation. Specifically, Edwards contends that the term "predetermined size," on its face, is broader than any one numerical limitation and that the specification and prosecution history provide no basis for a specific numerical limitation. Further, Edwards argues that because dependent claim 4 recites "said predetermined size is 0.1 micron," '332 Patent, col. 6, ll. 29-30, "0.1 micron" cannot be synonymous with the "predetermined size" language of claim 1 under the doctrine of claim differentiation. Edwards also asserts that the original application, the substitute specification, and the prosecution history do not support the court's narrowing of the claim limitation.

In response, Digital Control points out that the application as filed contained no mention of the phrase "predetermined size" and argues that the phrase "predetermined size" in the substitute specification must find support in the original disclosure if
the claim is to be valid. Digital Control contends that the only way this occurs is if the phrase is read to mean 0.1 micron, because that is all the original application supports. Digital Control also contends that in the prosecution history of the ’332 patent 0.1 micron was relied on to distinguish the semipermeable membrane from that of the prior art. Therefore, semipermeable membrane should be limited to a membrane that screens out particles greater than 0.1 micron.

When interpreting the phrase "predetermined size" of the particles screened out by the semipermeable membrane, we first look to the ordinary meaning of the words. The phrase "predetermined size" is clearly broader on its face than any one numerical limitation, whether it be 0.1 micron or any other.

We next turn to the specification -- or in this case, the specifications -- to determine whether "predetermined size" should be given another meaning. Here, the substitute specification was substituted for the original prior to examination. The phrase "predetermined size" does not appear in the original specification, and references to 0.1 micron as a numerical limitation do occur in the original specification. However, in explaining what has been "described" in the application, the detailed description does not mention a numerical limitation for the size of particles the semipermeable membrane must prevent from entering the chamber. Rather, the application simply states "dust and smoke particles are kept out of the sample chamber by a sheet of semi-permeable membrane that spans apertures that extend through the tubular wall of the sample chamber." This description demonstrates that the purpose of the membrane is to keep dust and smoke particles out of the chamber. Thus, it teaches one of ordinary skill in the art that the membrane need only be of a porosity that keeps out dust and smoke particles. As such, the application as filed does not support limiting the invention to only screening out particles greater than 0.1 micron. Accordingly, the original specification would not limit "predetermined size" to 0.1 micron. 2

2 This is further supported by the fact that the examiner did not issue a new matter rejection in response to the filing of the substitute specification. As such, the examiner did not view the addition of the broad phrase "predetermined size" in the specification to be outside the scope of the original specification. See TurboCare Div. of Demag Delaval Turbomachinery Corp. v. GE, 264 F.3d 1111, 1118 (Fed. Cir. 2001) ("The fundamental inquiry is whether the material added by amendment was inherently contained in the original application.") (citations omitted). This lack of a new matter rejection "carries an especially weighty presumption of correctness." Brooktree Corp. v. Advanced Micro Devices, Inc., 977 F.2d 1555, 1574-75 (Fed. Cir. 1992).

We now turn to whether the substitute specification sheds any light on the construction of the claim term "predetermined size." We conclude that the substitute specification supports a construction of the claim term that does not place a numerical limitation on the particle size. For example, the specification states

"A second objective of the diffusion type gas sample chamber is to restrict access of unwanted contaminants, by size, so that they will not cause error in the measurement of the concentration of a particular gas, while at the same time permitting molecules of particular gas [sic] to freely enter and leave the sample chamber by diffusion only, through one or more filtering apertures."

"’332 patent, col. 3, ll. 28-34. The substitute specification also contains the statement from the original specification: "dust and smoke particles are kept out of the sample chamber by a sheet of semi-permeable membrane that spans apertures that extend through the tubular wall of the sample chamber." This demonstrates that the substitute specification supports a construction of "semipermeable membrane" that does not place a numerical limitation on the particle size, even though the preferred embodiment of the invention suggests that the predetermined size be 0.1 micron. See Electro Med. Sys. v. Cooper Life Scis., Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994) (stating "claims are not to be interpreted by adding limitations appearing only in the specification" and "particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments").

Next, we look to the prosecution history of the ’332 patent to determine whether "any interpretation . . . may have been disclaimed or disavowed during prosecution in order to obtain claim allowance." Intellectual Prop. Dev., Inc. v. UA-Columbia Cablevision of Westchester, Inc., 336 F.3d 1308, 1316 (Fed. Cir. 2003); see also Inverness Med. Switz. GmbH v. Princeton Biomedical Tech Corp, 309 F.3d 1365, 1372 (statements made during prosecution were not a "clear and
unambiguous" disclaimer of a claim scope). We hold that there was no such disclaimer or disavowal.

Two prior art references referred to in the prosecution history are relevant to this issue: Miyazaki and Fujimura. The Miyazaki reference discloses an infrared gas analyzer that comprises a sample cell and a reference cell, both of which have the form of a spiraled cylindrical tube to achieve a long optical path. Gas is forced into the sample cell through a gas inlet and exits through a gas outlet. The Fujimura reference is an air pollution detector unit which is designed to allow a car's air conditioning system to automatically switch between inside and outside air in response to a build-up of pollutants in the car. The device is characterized by a tube with two open ends in which air is forced by the movement of the vehicle into one end of the tube and exits through the other end of the tube. The concentration of pollutants in the air is measured by beaming light from an element in the side of the tube across the diameter of the tube and back again to the detectors located on each side of the light-emitting element. The intake end of the tube is covered by a dust filter which excludes relatively large airborne particles -- it being necessary to pass smaller dust particles through so that their concentration in the air can be measured.

In the First Office Action on the Merits, the examiner rejected claim 1 over Miyazaki in view of Fujimura, explaining that Miyazaki does not use a filter for the aperture, but Fujimura teaches a filter and it would have been obvious to use Fujimura's filter in Miyazaki's device in order to keep dust out of the sampling tube. In response, the applicant stated

Neither Miyazaki nor Fujimura teach or suggest "a sheet of semipermeable membrane" as recited in Claim 1. The dust filter 2 of Fujimura is for presenting [sic] the entry of particles much larger than 0.1 micron; otherwise it would screen out the very particles that, by scattering the light, are essential for the operation of the instrument.

While the applicant did refer to 0.1 micron as the size of particles entering the chamber, he simply explained how the "membranes" would not work the same. The filter in Fujimura needed larger particles to enter the chamber such that pollution levels could be measured. In the claimed invention, however, particles of the size of those Fujimura was designed to let in were to be kept out, as they could affect the device's readings. Thus, the applicant argued that the proposed Miyazaki-Fujimura combination would not work as the claimed invention was intended, because it would let in particles that were too large. Nothing in the inventor's statement suggests a "clear and unambiguous disclaimer" of all membranes that do not screen out particles down to 0.1 micron in size.

Finally, Edwards argues that the doctrine of claim differentiation suggests that the term "predetermined size" cannot be synonymous with the limitation "0.1 micron" in claim 4. The doctrine of claim differentiation presumes that separate claims do not have the same scope. Karlin Tech. Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971-72 (Fed. Cir. 1999). The doctrine is particularly applicable in situations in which a claim limitation stated in general terms is asserted to be limited to a numerical range in the specification and the same numerical range appears in a dependent claim. Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1551 (Fed. Cir. 1996). In our analysis of the original and substitute specifications, it is apparent that "predetermined size" in claim 1 does not mean the same thing as 0.1 micron in claim 4.

Accordingly, the claim language itself, the specifications, the prosecution history, and the doctrine of claim differentiation all support a construction of the term semipermeable membrane in which "predetermined size" is not limited to 0.1 micron; rather, the limitation simply requires that the particles kept out of the chamber by the semipermeable membrane are of a predetermined size such as the size of dust and smoke particles.

As explained above, the district court also construed "semipermeable membrane" to contain an implicit thickness limitation: that it be a thin, soft pliable membrane with a thickness on the order of 25 to 50 microns.

Edwards argues that the court erred by importing the numerical range directly from the prior art discussion in the '332 patent's written disclosure because these were merely general descriptive words in the background section of the patent. Edwards further asserts that there is nothing in the remaining portion of the specification or the prosecution history which suggests such a limitation was intended by the applicant.

Digital Control counters that both the specification and the prosecution history support the district court's imposition of a thickness limitation. Specifically, Digital Control relies on the applicant's statement during the prosecution of the '332 patent that "Burough et al. [a prior art reference] make no use whatsoever of any semipermeable membrane." The theory is that because the applicant explained in the specification that the membrane is to be of the order 25-50 microns and then further
identified the thickness as a point of difference between his invention and Burough et al., the applicant intended to limit the thickness of his membrane to 25-50 microns and took the position that Burough et al.'s "several hundreds of microns thick" media was not a membrane.

Again, we start with the plain meaning of the claim terms. There is no suggestion in the specifications or the prosecution history that "semipermeable membrane" has anything other than its ordinary meaning. The term "semipermeable" means "partially permeable" or "allowing passage of certain, esp. small molecules or ions but barring others." The American Heritage College Dictionary 1240 (1997). "Membrane" is defined as "a thin soft pliable sheet or layer esp. of animal or vegetable origin," Webster's Third New International Dictionary 1408 (1986).

The substitute specification 3 explains that the semipermeable membrane must be "quite thin." '332 Patent, col. 2, ll. 63-64. The only mention of a suggested thickness of the semipermeable membrane occurs in the patent's discussion of the prior art. There the specification is comparing the claimed invention to the Burough et al. reference. Burough et al. discloses a device for measuring gas that includes a porous tube surrounding an enclosed column of air through which infrared radiation is beamed to measure its absorption by gas in the chamber. The specification explains that the porous material in Burough et al. is "several hundreds of microns thick," and contrasts that to the relatively thin semipermeable membrane of the claimed invention, which the specification says "is on the order of 25 to 50 microns thick." '332 Patent, col. 2, ll. 27-28.

Numerical ranges in the specification cannot, without more, be imported into the claims as limitations. See Modine Mfg. Co., 75 F.3d at 1551 ("Ordinarily a claim element that is claimed in general descriptive words, when a numerical range appears in the specification and in other claims, is not limited to the numbers in the specification or the other claims.") Here, there is nothing "more" suggesting a particular thickness range. In fact, there is no other mention of a numerical thickness limitation contained in the patent. Rather, the specification only suggests that the semipermeable membrane be "quite thin." Of course, because the applicant has distinguished his semipermeable membrane from the several hundreds of microns thick porous material of Borough et al., the claim limitation cannot be construed to cover a semipermeable "membrane" that is several hundreds of microns thick. The specification does not show that Edwards disavowed claim scope and limited the thickness of the membrane to a numerical range including "on the order of 25 to 50 microns." From the plain meaning of the term in view of the specification the semipermeable membrane is "thin" and has a thickness less than several hundred microns.

Nothing in the prosecution history changes this interpretation. In responding to a rejection directed at the 0.1 micron limitation in view of Burough et al., the applicant argued "Burough et al. make no use whatsoever of any semipermeable membrane." At most, the applicant is asserting that the semipermeable material used in Burough et al. is not a "membrane." Even interpreting the statement in this light does nothing to suggest that the applicant intended to disclaim membranes that had a thickness other than "on the order of 25 to 50 microns." Rather, the applicant is simply disclaiming calling something several hundreds of microns thick a "membrane."

Thus, we construe "semipermeable membrane" to be a "thin" or "quite thin" layer but with a thickness of less than several hundred microns and allowing the passage of airborne particles through it while preventing airborne particles larger than a predetermined size, including the size of dust and smoke particles.
shaft of the washer due to an impact [i.e., contact] from the clothes." (Chart at 6.) Whirlpool proposes instead that the term be construed to mean "sensing a torque occurring at a drive shaft of the washer due to a collision from the clothes." (Id.) For reasons already discussed, the Court will adopt Whirlpool's proposed construction. The term "sensing a torque occurring at a drive shaft of the washer due to an impact from the clothes" is therefore construed to mean "sensing a torque occurring at a drive shaft of the washer due to a collision from the clothes."

GO BACK

3554

(2) "sensing a torque occurring at a drive shaft of said washer due to the twist of clothes, to sense the distribution of impact applied to an agitator of the washer by said clothes"

The parties also dispute the term "sensing a torque occurring at a drive shaft of said washer due to the twist of clothes, to sense the distribution of impact applied to an agitator of the washer by said clothes," which appears in Claim 1. LG proposes that the term be construed to mean "sensing torque occurring at a drive shaft of the washer due to the bundling [i.e., uneven distribution] of clothes, to sense the distribution of impact [i.e., contact] applied to an agitator of the washer by the clothes." (Chart at 5.) Whirlpool proposes instead that the term be construed to mean "sensing a torque occurring at a drive shaft of the washer due to clothes that are entwined together, to sense the distribution of collisions between the clothes and the agitator of the washer." (Id.)

Comparing the parties' proposed constructions, the main issue is whether the term "impact" should be construed to mean "contact" or "collision[]." Figure 3 is an illustration of a washer to which the invention was applied. (474 Patent, col. 3, ll. 21-23.) The written description of Figure 3 states that "[i]n accordance with the present invention, the clothes twist determining apparatus comprises a clothes twist sensing unit 10 for sensing a torque occurring at the drive shaft 6 due to the distribution of impact applied to the agitator 8 and generating a clothes twist signal according to the sensed torque." (Id., col. 3, ll. 42-47.) The use of the word "applied" favors Whirlpool's argument that the term "impact" means "collision" rather than "contact." The written description also states that "[b]y the normal and reverse rotations of the agitator 8, the clothes 1 are agitated normally and reversely. The clothes 1 being agitated strike against the agitator 8, so that the agitator is subjected to an impact." (Id., col. 5, ll. 18-21.) The use of the word "strike" in describing how the "impact" is applied to the agitator further supports Whirlpool's proposed construction.

The claimed invention seeks to distinguish twisted and untwisted clothes based on the "distribution of impact applied to the agitator . . . ." (Id., col. 3, ll. 42-47.) LG, however, fails to explain how determining the distribution of "contact" -- for example, differences in the amount of surface area in contact with the agitator -- would affect the torque occurring at the drive shaft.

The Court will therefore construe the term "sensing a torque occurring at a drive shaft of said washer due to the twist of clothes, to sense the distribution of impact applied to an agitator of the washer by said clothes" to mean "sensing a torque occurring at a drive shaft of the washer due to clothes that are entwined together, to sense the distribution of collisions between the clothes and the agitator of the washer."

3555

8. Sensing

The meaning of the term "sensing" is in dispute. It appears in the following context: "sensing an amount of concentrated detergent being released from said tumbling fabric." (370 patent, claims 8, 15.)

Whirlpool argues for the following construction: "This claim step means that the washer detects the level or amount of detergent solution in the washer, and perceives a particular level or amount of detergent solution as an indication that the fabric is (or is not) fully saturated with detergent solution. Sensing may occur regardless of whether there is pooling of detergent solution in the wash chamber."
LG argues for the following construction: "Sensing an amount of concentrated detergent solution that is released from the tumbling fabric (i.e., not sensing the level of a pool of detergent solution in the wash chamber as the fabric tumbles)."

The dispute is not about the meaning of the term "sensing," but rather what is being sensed. According to LG, the word "sensing" must be understood in its context in the claim, which discusses "sensing an amount of concentrated solution being released from said tumbling fabric." (emphasis added) In LG's device, the detergent solution is located in a pool that reaches above the lower portion of the spin drum containing the clothes. Thus, the fabric never "releases" solution, making it impossible to "sense" the "amount of...solution being released." This system, LG argues, contrasts with Whirlpool's disclosed systems which keep the water level below the wash chamber and enable the machine to "sense" the amount of solution that drips down (i.e., is "released") from the clothes into the pool.

Whirlpool argues that LG is attempting to read a negative limitation into the claim based upon how a Whirlpool machine may work, when no such limitation arises from the claim itself. See RF Delaware, Inc. v. Pacific Keystone Techs., Inc., 326 F.3d 1255, 1263 (Fed. Cir. 2002) (a basic claim construction canon is that one may not read an unstated limitation into a claim).

The Court disagrees with Whirlpool because regardless of the specification, prosecution history, or how Whirlpool's machines may operate, the claim language supports only LG's construction. The claim does not, as Whirlpool would now have it, describe sensing an amount of solution in the wash chamber. Rather, it requires sensing the amount of solution released from the fabric. It defies both the ordinary meaning of "release" and common sense to suggest that clothes sitting in a pool of solution can at the same time "release" an amount of solution that can then be "sensed." The only logical view of the claim is that it requires a method whereby the clothes are elevated above the pool of solution, the level of which can be measured (i.e., "sensed") to determine how much solution drips down from (i.e., is "released" from) the clothes. Whirlpool's proposed construction would impermissibly read the phrase "released from said tumbling fabric" out of the claim. See Apple Computer, Inc. v. Articulate Sys., Inc., 234 F.3d 14, 25 (Fed. Cir. 2000) (rejecting interpretation of language in a claim so broadly as to read the limitation out of the claim).

Accordingly, the Court adopts LG's proposed construction of the phrase "sensing an amount of concentrated detergent being released from said tumbling fabric."

10. sensing system

The term "sensing system" appears in claims 25 - 53 of the '213 patent and in claims 10 - 12 of the '283 patent. The plaintiff proposes a construction of "a system for transmitting an output signal in response to the causing of contact on the work platform." The defendant counters with "system that senses location and identification information for a block." The specification fails to support the defendant's requirement that the sensing system sense both object location information and identification information. Additionally, the specification fails to support the plaintiff's proposed requirement that the sensing system transmit an output signal. Therefore, the court concludes this term means "a system that senses the location and/or identification information of objects."

11. sensors

The term "sensors" appears in claims 1 - 24 of the '874 patent and in claims 1 - 20 of the '786 patent. The plaintiff proposes a construction of "one or more elements that cooperate to transmit an output signal in response to the placement of an object on the work platform." The defendant counters with "system that senses location and identification information for a block." In accordance with the above construction for "sensing system," the court concludes the term "sensors" means "one or more devices for sensing the location and/or identification information of objects."
a. "sensing the weight of an occupying item of a seat of the vehicle"

Plaintiff states that the court need not construe the claim because the ordinary meaning is sufficient, whereas Defendant maintains that the court should construe the claim to mean "measuring the weight of an item occupying a vehicle seat. Weight is the calculation of the force gravity exerts on the item." (Chart at 26.) Plaintiff and Defendant both raise arguments similar to previous claims regarding the interpretation of "weight," "measuring," and "sensing."

Plaintiff cites the specification for the proposition:

The system can also include a weight sensing system coupled to a seat in the vehicle for sensing the weight of an occupying item in the seat. The weight sensing system is coupled to the processor whereby the processor controls deployment or actuation of the occupant restraint or protection device based on the state of the vehicle and the weight of the occupying item of the seat sensed by the weight sensing system.

'080 Patent col. 7 l.14-21. As with claims regarding similar language from other patents, Plaintiff argues that the precise, numerical value of weight is never calculated and to adopt Defendant's proposed construction would be to limit Plaintiff's claim. (Pl.'s Br. At 45-46.) Plaintiff further argues that "sensing" is not the same as "measuring."

In response, Defendant argues that not only does the ordinary meaning of the claim support Defendant's proposed construction, so does the patent specification, stating, for example: "By combining the outputs of the accelerometers and the strain gages and appropriately processing the same, the mass and weight of the object occupying the seat can be determined." '080 Patent col. 24:50-53.

The court finds that the language is substantially similar to that of Claim 18 of the '516 Patent and will construe this claim in a similar manner for the reasons stated above. Therefore, the court will construe "sensing the weight of an occupying item of a seat of the vehicle" as "sensing or measuring the weight of an item occupying a seat of the vehicle." See '516 Patent Claim 18.

IV. Interpretation of the Term "Sensor"

The parties dispute the meaning of the term "the sensor" in claim 107 of the 855 Patent and claims 12, 20, and 47 of the 480 Patent. Hunter Douglas argues that these claims are indefinite under 35 U.S.C. § 112, P 2 because they refer to a non-existent element called "the sensor" in preceding claims from which they depend.

Under 35 U.S.C. § 282, a patent is presumed valid. See 35 U.S.C. § 282. The defendant has the burden of proving facts by clear and convincing evidence establishing that the patent is invalid. See North Am. Vaccine, Inc. v. American Cyanamid Co., 7 F.3d 1571, 1579 (1993). Indefiniteness is a question of law. See id. The determination of whether a claim is invalid as indefinite "depends on whether those skilled in the art would understand the scope of the claim when the claim is read in light of the specification." Id. While claims may be rendered indefinite for lack of antecedent basis, such claims may nevertheless remain definite when read in light of the specifications. See Slimfold Mfg. Co. v. Kinkead Indus., Inc., 810 F.2d 1113, 1116-17 (Fed. Cir. 1987); Messerschmidt v. United States, 29 Fed. Cl. 1, 42 (1993).

The language of the disputed claims refers to "the electronic circuit [that includes] a switch electrically connected to the sensor for receiving the control signal." Neither the disputed claims nor the claims from which they depend refer to or define a sensor element. The independent claims, however, do refer to a "control signal generator for generating a control signal." Hunter Douglas argues that it is unclear whether the term "the sensor" refers to "the sensor for receiving the control signal" from the control signal generator of the independent claims or whether "the sensor" is part of the control signal generator itself. Hunter Douglas argues further that the specifications do not resolve the ambiguity because they refer to two sets of sensors, one that generates signals and one that receives those signals.

Contrary to Hunter Douglas' argument, the specifications of the patents at issue do resolve the ambiguity. The specifications refer to "[a] control signal generator, preferably a daylight sensor 28 . . . [that is] electrically connected to electronic
components within the actuator 10 to send a control signal to the components." 480 Patent, col. 9, lines 30-38; 855 Patent, col. 8, lines 22-30. The specifications also refer to "another control signal generator, preferably a signal sensor 29 . . . [that is] electrically connected to the electronic components within the actuator 10 [and] that can generate an electrical control signal to activate the actuator 10." 480 Patent, col. 9, lines 43-58; 855 Patent, col. 8, lines 34-49. Thus, it appears that the term "the sensor" in the disputed claims refers to the control signal generator in the independent claims.

Hunter Douglas is correct that the specifications refer to a second set of sensors, namely the "first and second stages 144, 146 of a type 4538 activity sensor." 480 Patent, col. 13, lines 39-40; 855 Patent, col. 12, lines 26-27. But the specifications also make clear that these devices receive the signals produced by the signal sensor 29 through the means of an electrically connected "switch." Thus, it appears clear that the "switch" in the disputed claims is the device that "receives" the control signal generated by "the sensor."

Because the specifications resolve the ambiguity of the claim language, the Court is inclined to find that the claims are not invalid as indefinite. Furthermore, the Court is also inclined to find that one of ordinary skill in the art would understand the term "sensor" to mean a "device designed to respond to a physical stimulus (as heat or cold, light, a particular motion) and transmit a resulting impulse for interpretation or measurement or for operating a control." Webster's Third New International Dictionary (unabridged edition) (1986), p. 2068.

v. Claims 7 and 8

Claim 7 requires "sensor means for providing an output signal when said article feeder element is in a predetermined position." Magistrate Judge Valdez previously concluded that the term recited sufficient structure to avoid mean-plus-function treatment and left the term to its ordinary meaning of "a sensor." (R. 191 at 21-23.) The parties did not object to that decision and it was adopted by Judge Manning. Nevertheless, Special Master Harmon disagreed with the prior decision to not construe the term, found that there was insufficient structure to rebut the presumption, and recommended that this Court construe the limitation to include only those sensor structures provided in the specification. (R. 471 at 27-29.) Goss objects to this new construction. Claim 8 depends upon claim 7, so the construction of this clause is applicable to claim 8.

As discussed above, whether there is sufficient structure to avoid means-plus-function treatment depends on what structure is included in the claim language. See Enviro Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 1365 (Fed. Cir. 2000) ("baffle means" recited sufficient structure in the term "baffle" to rebut the § 112, ¶6 presumption); Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531-32 (Fed. Cir. 1996) (limitation of "perforation means for tearing" was not a means-plus-function claim because the word "perforation" constituted sufficient structure); but see Biomedino, 490 F.3d at 950 (concluding that "control means" did not rebut § 112, ¶6 presumption because it could not be implied that "control" meant "controller"). Moreover, a structural term used in the claim language is sufficient even if the claim term used to designate structure covers a broad class of structures by their function. Lighting World, 382 F.3d at 1359-60.

Here, "sensor" provides sufficient structure for performing the recited function. While it may cover a broad class of structure, as was Special Master Harmon's concern, it is still a definite structure. See Lighting World, 382 F.3d at 1359-60. Thus, the Court sustains Goss's objection and rejects Special Master Harmon's recommendation that the Court give "sensor means" means-plus-function treatment.

2. "two or more sensors"

KLA maintains that "two or more sensors" as used in the '325 patent means two or more PMT type detectors. D.I. 338 at 14-18. ADE argues that the phrase should mean two or more groups of sensors. D.I. 316 at 20-25.

This court holds that "two or more sensors" as used in claims 26 and 43 of the '325 patent means two or more PMT type
detectors. Referring to Figure 4, reproduced below, of the '325 patent, the written description provides that:

"Each collector channel 10a-b and 11a-b includes a lens system 113 that collects scattered light. A series of mirrors 114a-c reflect the light so that it is imaged onto a photomultiplier tube (PMT) 115." The PMT 115 converts the light impinging thereon into an electrical signal having a voltage level that is proportional to the light intensity."

'325 at 6:39-49.

This construction is also supported by statements made by the inventors during patent prosecution. Originally, claims 36 and 43 (numbered claims 39 and 45 during prosecution) contained the phrase "a two-dimensional array of sensors." D.I. 338 at 16. The examiner rejected these claims seeking clarification of the meaning of "a two-dimensional array of sensors." Id. The applicants amended the claims replacing the phrase "a two-dimensional array of sensors" with the phrase "two or more sensors" and clarified that these sensors referred to Figures 1, 2, and 10 of the '325 patent. Id. Figures 1, 2, and 10 depict PMT type detectors (See Figure 4 and '325 7:39-45 describing collector channels 10a-b and 11a-b). '325 at 6:39-45. Clear support for KLA's claim construction is found in the intrinsic record of the '325 patent. Accordingly, this court holds that "two or more sensors" as used in the '325 patent means two or more PMT type detectors.

Independent claim 1 of the '857 patent is the only independent claim. It provides:

1. A method of trimming the width of venetian blinds of the type having a head rail, a plurality of slats and a bottom rail, each of said head rail, said slats and said bottom rail having first and second opposed ends, said method comprising the steps of:

   placing a first end of said head rail of said venetian blind through a corresponding head rail opening in a support body and placing a first end of said bottom rail and a first end of said slats through respective openings in said support body, whereby respective first ends of said head rails said bottom rail and said slats extend through said openings;

   moving said first ends of said head rails said bottom rail and said blind slats through said openings in said support body and into respective aligned further openings in a cutting means, said cutting means including a first cutter for cutting said head rail and a separate second cutter for cutting at least said slats; and,

   moving said first and second cutters to cut at least said head rail, and said slats.

'857 patent, col. 12, l. 66, to col. 13, l. 18 (emphasis added). One of the embodiments illustrated in the specification uses a die plate that slides diagonally to cut the head rail and a blade mounting frame that moves horizontally to cut the slats. See '857 patent, figures 1-7.

On July 16, 2001, Springs filed suit charging Novo with infringing claims 1, 2, 8, and 10 of the '857 patent through the manufacture and sale of cut-down machines that employ the claimed methods. In Novo's accused device, a single plate with multiple blades cuts the head rail, bottom rail, and slats. The plate has a series of openings for the rails and slats, and it has blades that correspond to the openings. When the plate is moved, the blades cut the rails and slats. Novo moved for summary judgment, arguing that its device did not employ "separate" cutters within the meaning of the asserted claims. The district court granted Novo's motion. The court construed the term "separate" to mean capable of independent movement. The court rejected Springs's contention that "separate" means simply different cutting surfaces. Springs's construction, according to the district court, would render the term "separate" superfluous in the phrase "separate second cutter" in light of the presence of the word "second." Instead, the court looked to dictionary definitions of the term "separate," including "detached, disconnected or disjoined," to conclude that the cutters must "have the potential for independent movement." The court further held that the specification and prosecution history of the '857 patent confirmed that the inventor intended to limit the claimed invention to detached and independently moveable cutters.
In light of that claim construction, the district court held that there was no genuine issue of material fact as to whether Novo's machines infringed, because Novo's device did not have two cutters that were moveable independently of one another. Instead, the blades in the Novo machine were all attached to the same plate, and when that plate moved so did all the blades.

II

Springs argues that the district court erred in its claim construction and therefore erred in granting summary judgment to Novo. According to Springs, the term "separate" does not require the cutters to be independently movable, but only requires that the machine have distinct cutting edges. Thus, in Springs's view, the term "separate" distinguishes the claimed cutting means from a single, unbroken cutting edge that cuts the head rail and then the slats.

While the claim language and specification may only allow, rather than dictate, the court's construction of the term "separate," the prosecution history of the '857 patent confirms that the district court's interpretation is correct. In the first official action, the examiner rejected all of the original claims on several grounds, including that they were either anticipated by or obvious in light of U.S. Patent No. 5,816,126 to Pluber. The Pluber patent claims a device in which three blades are mounted on one sliding support plate, which is moved by a lever. The head rail, slats, and the bottom rail are cut by these three blades simultaneously as part of a single motion. The examiner explained that

Pluber discloses the same invention [as applicant], a method of trimming the width of Venetian blinds, as claimed including the steps of: placing a selected end of the head rail, bottom rail and the blind slats through corresponding . . . slat openings in a support body . . . ; placing the selected ends of the head rail, bottom rail and the blind slats through aligned corresponding openings in a cutting means . . . ; moving the cutting means to cut the head rail, bottom rail, and blind slats.

The applicant submitted an amendment modifying the claims, distinguishing Pluber from the claimed invention, and arguing that Pluber was not prior art because it postdated the grandparent application. The applicant's accompanying remarks noted that extra effort is required to cut the head rail because of its steel construction. The applicant stated: "It is for this reason that the Applicant provides two entirely separate movement means, one for cutting the head rail and the other for cutting the bottom rail and the blind slats." In amending claim 1, the applicant replaced the language "a cutting means" with "a cutting means, said cutting means including a first cutter for cutting said head rail and a separate second cutter for cutting at least said slats." The applicant also modified the specification to include the language "with the cutting stroke of the bottom rail and the blind slats being performed independently of the cutting stroke of the headrail cutting means."

In distinguishing the '857 claims from the Pluber patent, the applicant stated: Pluber discloses a somewhat simplistic form of guillotine cutter. All of the blades are mounted on a single plate . . . operated by a single arm 55. The single plate 22 carries three blades, one for cutting the head rail, one for cutting the blind slats and one for cutting the bottom rail. Pluber does not provide two separate cutters for cutting (1) the blind slats and bottom rail, and (2) the head rail. Operation of Pluber would require a very considerable manual effort. He shows only one movement arm. This has to move all three cutting blades. . . . The present invention has been devised to avoid this problem by providing one cutter for the head rail and a separate cutter for the bottom rail and slats.

In the second official action, the examiner continued to reject claim 1 and the other claims as anticipated by the Pluber patent or obvious in light of it. The examiner rejected the applicant's contention that Pluber lacked two separate cutters, noting that "each of the cutters . . . are separably mounted to the plate 22 and separately cut a portion of the blinds. Therefore, the phrase 'a first cutter . . . and a separate second cutter' does not distinguish the instant application from the Pluber reference even though the cutters . . . are all mounted to the single plate 22."

In response to that office action, the applicant argued that Pluber was not a prior art reference. In addition, the applicant adhered to his argument distinguishing his invention from Pluber:

Applicant maintains the arguments set forth in the prior Amendment concerning distinguishing of Pluber from the claims previously presented, on the merits. However, in light of the Examiner's concession that Claim 1 finds full support in the application filed September 11, 1995, it is not believed necessary to go any further than to point out that fact and request a Notice of Allowance.
The examiner issued a notice of allowance without further comment.

It is well established that "the prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution." Pall Corp. v. PTI Techs. Inc., 259 F.3d 1383, 1392, 59 USPQ2d 1763, 1769 (Fed. Cir. 2001); Southwall Tech., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576, 34 USPQ2d 1673, 1676 (Fed. Cir. 1995); see also Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1304, 41 USPQ2d 1364, 1368 (Fed. Cir. 1997) ("By distinguishing the claimed invention over prior art, an applicant is indicating what the claims do not cover, he is by implication surrendering such protection."). The disclaimer, however, must be effected with "reasonable clarity and deliberateness." N. Telecom Ltd. v. Samsung Elecs. Co., 215 F.3d 1281, 1294, 55 USPQ2d 1065, 1075 (Fed. Cir. 2000).

Springs concedes that the applicant amended the claims to include the word "separate" in an effort to distinguish the invention from Pluber. We agree with the district court that, in distinguishing Pluber, the applicant disclaimed a single plate with multiple blades or cutting edges on that single plate. The applicant specifically noted that the claimed method provided "separate movement means," thus restricting "separate" cutters to those cutters capable of independent movement.

The district court correctly stated that Novo's single plate with attached blades is "similar to the blade configuration of the preferred embodiment in Pluber." Given that the Pluber reference and Novo's device are nearly identical with respect to the arrangement of their cutting edges, it is clear that the applicant disclaimed coverage of Novo's device.

Springs contends that the examiner did not agree that the amended claims distinguished over Pluber and that the claims therefore should not be limited based on the applicant's argument that they did. Springs argues that the examiner allowed the claims based on an entirely distinct rationale: that Pluber was not prior art. In fact, it is not clear from the record why the examiner allowed the claims. While the examiner expressed doubt in the second office action that the amended language of the claims was sufficient to distinguish over Pluber, it is not clear that the examiner adhered to that position at the time of allowance. The notice of allowance offers no explanation of the examiner's reasoning.

In any event, the examiner's remarks do not negate the effect of the applicant's disclaimer. In Desper Products, Inc. v. QSound Labs, Inc., 157 F.3d 1325, 1336, 48 USPQ2d 1088, 1096 (Fed. Cir. 1998), when the applicant amended the claims and made accompanying remarks to overcome a rejection based on another patent, we stated that the fact that "the prosecution shifted to a different focus does not blunt the impact of those remarks made to overcome the prior rejection." See also Laitram Corp. v. Morehouse Indus., Inc., 143 F.3d 1456, 1462, 46 USPQ2d 1609, 1614 (Fed. Cir. 1998) ("Regardless of the examiner's motives, arguments made during prosecution shed light on what the applicant meant by its various terms. . . . The fact that an examiner placed no reliance on an applicant's statement distinguishing prior art does not mean that the statement is inconsequential for purposes of claim construction."). Because an examiner has the duty to police claim language by giving it the broadest reasonable interpretation, see In re Hyatt, 211 F.3d 1367, 1372, 54 USPQ2d 1664, 1667 (Fed. Cir. 2000), it is not surprising that an examiner would not be satisfied with the applicant's insistence that particular claim language distinguishes a prior art reference, but that a court would later hold the patentee to the distinction he pressed during prosecution.

The public notice function of a patent and its prosecution history requires that a patentee be held to what he declares during the prosecution of his patent. A patentee may not state during prosecution that the claims do not cover a particular device and then change position and later sue a party who makes that same device for infringement. "The prosecution history constitutes a public record of the patentee's representations concerning the scope and the meaning of the claims, and competitors are entitled to rely on those representations when ascertaining the degree of lawful conduct. . . . Were we to accept [the patentee's] position, we would undercut the public's reliance on a statement that was in the public record and upon which reasonable competitors formed their business strategies." Hockerson-Halberstadt, Inc. v. Avia Group Int'l, Inc., 222 F.3d 951, 957, 55 USPQ2d 1487, 1491 (Fed. Cir. 2000). See also Vitrronics Corp. v. Conceptron, Inc., 90 F.3d 1576, 1583, 39 USPQ2d 1573, 1577 (Fed. Cir. 1996) ("the claims, specification, and file history . . . constitute the public record of the patentee's claim, a record on which the public is entitled to rely"). In this case, a reasonable competitor, reviewing the amendments and statements made by the applicant to distinguish the claimed invention from Pluber, would conclude that the claimed invention did not cover a device like Pluber's. If the applicant mistakenly disclaimed coverage of the claimed invention, then the applicant should have amended the file to reflect the error, as the applicant is the party in the best position to do so. The applicant, however, never retracted any of his statements distinguishing Pluber nor did he acquiesce in the examiner's comments regarding the overlapping scope of Pluber. Springs therefore must be held to the restrictive
We are also unpersuaded by Springs's argument that the statements made during prosecution should be disregarded because the distinguishing features "were not and are not reflected in the claims" and thus the statements simply constituted an error by the prosecuting attorney that should not be binding on the applicant. Here, as in Hockerson-Halberstadt, there is no indication that the detailed distinction of Pluber was simply an inadvertent misstatement by the prosecuting attorney for which the applicant should be given a mulligan. The statements distinguishing Pluber were detailed, consistent, and repeated. A reasonable competitor would have believed that the applicant's disclaiming statements were not a mere mistake. This case is thus distinguishable from Biotec Biologische Naturverpackungen GmbH & Co. KG v. Biocorp, Inc., 249 F.3d 1341, 1348, 58 USPQ2d 1737, 1741-42 (Fed. Cir. 2001), in which the court held that "a person of reasonable intelligence would not be misled into relying on [an] erroneous statement" made during prosecution because the statement was contrary to the plain language of the claims and specification as well as other statements in the same document. As in Desper Products, we are interpreting claim language, not importing limitations into the claim. There is nothing in the prosecuting attorney's remarks that is at odds with anything in the specification or the claims.

Lastly, Springs contends that the district court's claim construction had the effect of excluding one of the embodiments in the '857 patent, illustrated in Figures 8 through 10, and thus cannot be correct. The district court, however, concluded that the embodiment was consistent with its construction requiring capacity for independent movement. The court stated that the use of the word "synchronism" in the specification to describe this embodiment "implies a capacity for independent movement since that term is generally applied only to independently movable members that are compelled to move coincidentally." The court thus determined that the embodiment in Figures 8 through 10 discloses "independently movable cutters, though they are configured to move sequentially in response to a single manual control."

We reject Springs's argument that Figures 8 through 10 require a claim construction different from that employed by the district court. First, we have adopted claim constructions excluding an embodiment when the prosecution history requires the claim construction because of disclaimer. See Rheox, Inc. v. Entact, Inc., 276 F.3d 1319, 1327, 61 USPQ2d 1368, 1373-74 (Fed. Cir. 2002). Second, we agree with the district court that the construction of the term "separate" to mean independently moveable does not exclude the embodiment in Figures 8 through 10. The lost motion linkage in that embodiment causes the two cutters to move sequentially: the head rail is first cut and then after the arm rotates further the slats are cut, thus providing a mechanical advantage. One could move the handle some distance to cause the die plate to move and cut the head rail, stop pushing the handle, and thus not move the blade and not cut the slats. In each of the remaining embodiments the cutters are unconnected and independently moveable.

Because the patentee explicitly stated during prosecution that his claims differed from a single plate with multiple cutting edges, we construe the disputed claims to exclude the disclaimed single plate device. Based on that construction, we uphold the district court's grant of summary judgment of noninfringement and denial of summary judgment of infringement.

3562

C. Claim Construction of "separate from but adjacent to"

Claims 3, 4, 7, and 8 of the '511 Patent refer to "said second visual display being separate from but adjacent to said first visual display." Plaintiff argues that this term means that the visual displays need only be near, or not far from, each other but need not be shown on two separate monitors, and that the images themselves must be distinct and not integrated. Defendants argue that the term requires that the visual displays are shown on separate monitors or displays that are physically separate from but adjacent to each other.

Both a person of ordinary skill in the art and a lay person would understand that there are two visual displays, which must be detached but near each other. However, nothing in the language of the claim suggests that the images cannot be "integrated," or that they must be shown on separate monitors. Furthermore, neither the specification nor the prosecution history provides any guidance on this term. Aside from the language of the claim itself, the intrinsic evidence is not particularly helpful for claim construction. Thus, the Court finds it appropriate to consult the dictionary to define the term "separate from but adjacent to." Merriam-Webster dictionary defines "separate" as "set or kept apart; detached; existing by itself" and "adjacent" as "not distant; nearby." Accordingly, the Court FINDS that the term "separate from but adjacent to" as
defined in the '511 Patent means that the two visual displays must be near, or not far from, each other.

3563

E. "separate switch(es)"

Minerva proposes the following definition for the terms "separate switch" and "separate switches": "two or more controls for making, breaking, or changing connections in an electric circuit." The defendants assert that "separate switch" should be construed as "a plurality of independent, mechanically actuated device(s) for making, breaking, or changing connections in an electric circuit." The term "separate switches" appears in several claims in the following manner: "separate switches for separately operating said microphone for capturing sounds and said camera for capturing said still or continuing images." (E.g., '783 Patent, Claim 28). The terms "switch" or "separate switch" appear nowhere in the specification. The parties dispute whether "separate switches" must be "mechanically actuated."

According to the defendants, the plain and ordinary meaning of "switch" is "a manual or mechanically actuated device for making, breaking or changing connections in an electrical circuit." McGraw-Hill Dictionary of Scientific and Technical Terms 1968 (5th ed. 1994). In addition, the Federal Circuit has previously construed the term "a plurality of discrete switches" to mean "two or more distinct and separate manual or mechanically actuated devices for making, breaking, or changing the connections in an electric circuit." NCR Corp. v. Palm, Inc., 120 F. App'x 328, 331-32 (Fed. Cir. 2005). Finally, the defendants argue that the specification discloses only mechanically actuated push buttons, and the term should not be construed more broadly than what the patentee disclosed.

Minerva responds that the plain and ordinary meaning of "switch" does not require a mechanical limitation. The plaintiff cites a dictionary definition of "switch," which states, "a device for turning on or off or directing an electric current, or making or breaking a circuit." The Random House College Dictionary (revised ed. 1988). Minerva also reiterates that it is improper to limit a claim to the disclosed embodiment. Liebel-Flarsheim, 358 F.3d at 906.

"[T]he context in which a term is used in the asserted claim can be highly instructive." Phillips, 415 F.3d at 1314. In the patents at issue, the separate switches are used to operate the device's microphone and camera. It is implied that the human user is who operates the separate switches. Thus, the switches in this context are not circuit elements but mechanical devices, such as the disclosed push buttons, for humans to operate. Therefore, "the court construes the term "separate switches" to mean "a plurality of distinct, mechanically actuated device(s) for making, breaking, or changing connections in an electric circuit.""

GO BACK

A. Claim 1: "separated apart and disconnected from each other"

The first dispute concerns a phrase in paragraph three of claim one of the '180 patent, which states that "the diffuser plate" is comprised of, inter alia:

- a plurality of curvilinear walls extending from said second side to define air chambers therebetween which are open to corresponding said air inlet apertures, each said curvilinear wall extending from a corresponding curved wall toward, but terminating prior to reaching said shaft aperture, and wherein said curvilinear walls are separated apart and disconnected from each other.

'180 patent, Cl.6, L.54-60 (emphasis added). See Exhibit 1: '180 patent. The phrase in dispute is "separated apart and disconnected from each other."

Johnson argues that "separated apart and disconnected from each other" means "not joined to one another by virtue of a corner or other structural feature that extends from the second side of the main body portion." Johnson supports this definition with two arguments. First, Johnson argues that the prosecution history reveals that Ametek acted as its own

- 4188 -
lexicographer and clearly set forth this explicit definition for the disputed claim language. Specifically, Johnson argues that its proposed definition is "the exact one given by" Ametek "and their counsel during the prosecution of the '180 patent." Second, Johnson argues that Ametek disavowed the ordinary scope of the disputed claim language "by amending the claim and expressly distinguishing it from the Havens patent . . ."

Ametek responds, first, that Johnson's proposed definition is an attempt to "improperly read an extraneous limitation into the claim with reference to the accused product in a veiled attempt to avoid infringement." Second, Ametek responds that Johnson's definition has "no basis in the claim . . . specification or drawing."

Instead, Ametek argues that the court should give "separated apart and disconnected from each other" its dictionary definition which is, according to Ametek, "set at a distance in place or position and individually divided."

For the reasons set forth below, the court concludes Ametek used the disputed phrase, "separated apart and disconnected from each other", in the prosecution history and claims 8 of the '180 patent to mean "not joined to one another at their ends by any structural feature."

--- Footnotes ---

8 The specification does not use the disputed phrase. Accordingly, the court will not use the specification to define the disputed phrase.

--- End Footnotes ---

A. Prosecution History

1. Acting As One's Own Lexicographer

Johnson first argues that the prosecution history reveals that Ametek acted as its own lexicographer by defining the disputed claim language to mean "not joined to one another by virtue of a corner or other structural feature that extends from the second side of the main body portion." Ametek responds that it did not act as its own lexicographer. The court agrees with Ametek.

A patent applicant can act as its own lexicographer by giving a claim term "a meaning 'inconsistent with its ordinary meaning'". Merck & Co. v. Teva Pharm., USA, Inc., 395 F.3d 1364, 1378 (Fed.Cir. 2005). However an applicant seeking to give a claim term a meaning other than its ordinary meaning must do so "with reasonable clarity, deliberateness, and precision . . . so as to give one of ordinary skill in the art notice of the change." In re Paulsen, 30 F.3d 1475, 1480 (Fed.Cir. 1994)(concluding the "patent does not clearly redefine the term 'computer' such that one of ordinary skill in the art would deem it to be different from its common meaning"). See also Merck & Co., Inc. v. Teva Pharm., USA, Inc., 395 F.3d 1364, 1370 (Fed. Cir. 2005)(noting "the Federal Circuit has repeatedly emphasized that the statement in the specification must have sufficient clarity to put one reasonably skilled in the art on notice that the inventor intended to redefine the claim term").

For example, in Merck & Co., Inc. v. Teva Pharm., USA, Inc., 395 F.3d 1364 (Fed.Cir. 2005), the Federal Circuit concluded that a district court had erred when it concluded that a patentee had acted as its own lexicographer. Specifically, the Federal Circuit reasoned that the "passage" that the district court had relied on was "ambiguous" and "amenable to a second (and more reasonable) interpretation". Id. at 1370-71. As such, the patentee's statement did not amount to the patentee "clearly setting out its own definition with 'reasonable clarity, deliberateness, and precision.'" Id. at 1371.

Johnson argues that Ametek acted as its own lexicographer when it wrote to the USPTO and distinguished the Havens patent from the '180 patent. Specifically, Ametek requested an amendment to the '180 patent,

which sets forth that the curvilinear walls [in the '180 patent] are separated apart and disconnected from each other. In other words, the curvilinear walls are not joined to one another by virtue of a corner or other structural feature that extends from the second side of the main body portion.
(emphasis added). Ametek argues that in the second sentence of this excerpt, Ametek was simply describing the differences between the prior art and the '180 patent. Ametek argues that it was not providing a new definition for the phrase "separated apart and disconnected from each other."

The court concludes that at the very least the excerpt is ambiguous. To act as one's own lexicographer, the patent applicant must provide a new definition of the disputed phrase with deliberateness, precision, and clarity. The prosecution history of the '180 patent lacks such a deliberate, precise or clear attempt by Ametek to invoke its power to act as its own lexicographer. Accordingly, the court concludes that Ametek did not act as its own lexicographer with respect to the phrase "separated apart and disconnected from each other."

2. Disavowal of Claim Scope

Johnson next argues that during the prosecution of the '180 patent, Ametek disavowed the full scope of meaning that the disputed claim language would otherwise have. Ametek argues that it did not disavow any claim scope. The court concludes that Ametek partially disavowed the scope that the disputed phrase would otherwise have.

A patent's prosecution history "may demonstrate that the patentee intended to deviate from a term's ordinary and accustomed meaning" by showing that "the applicant characterized the invention using words or expressions of manifest exclusion or restriction" before the USPTO. Teleflex, Inc. v. Ficosa N. Amer. Corp., 299 F.3d 1313, 1326 (Fed.Cir. 2002). Examination of a prosecution history will "limit[] the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution." Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed.Cir. 1995). In other words, "claims may not be construed one way in order to obtain their allowance and in a different way against accused infringers." Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed.Cir. 1995).

The prosecution history of the '180 patent reveals that Ametek added the phrase "separated apart and disconnected from each other" to claim one of the '180 patent in an apparent attempt to distinguish the '180 patent from the Havens patent. Ametek described the Havens patent to the USPTO examiner as having "adjacent vanes [which] are connected to one another near the center of air guide 25 at the corners 41. As such, the air flowing between the adjacent vanes is sharply re-directed by the corners 41"(emphasis added). See Exhibit 2: Havens patent. In other words, Ametek pointed out to the USPTO that in the Havens patent the ends of the curvilinear walls were "connected to one another" so that when the air flowed between the curvilinear walls inward the air stopped at the connected ends of the curvilinear walls. Therefore, the air in Havens never reached the opening that ran axially through the center of the diffuser plate.

After pointing out the problems with the Havens patent, Ametek requested an amendment that would clarify the differences between the '180 patent application and the Havens patent. Specifically, Ametek proposed an amendment to proposed claim six (issued claim one) that

sets forth that the curvilinear walls [in the '180 patent] are separated apart and disconnected from each other. In other words, the curvilinear walls are not joined to one another by virtue of a corner or other structural feature that extends from the second side of the main body portion. This feature is clearly not taught or suggested by the Havens reference nor does any of the prior art made of record provide such a feature with all the other claimed elements

(emphasis added).

Ametek emphasized to the examiner that one distinguishing feature of the '180 patent application was that because the curvilinear walls were "separated apart and disconnected from each other" air could flow between the curvilinear walls radially inward, and then into the air chamber running axially through the diffuser. The examiner accepted the amendment, added the phrase in dispute to claim one, and issued the '180 patent.

The court concludes that Ametek's statements to the USPTO constituted a partial disavowal of claim scope. Ametek used the phrase "separated apart and disconnected from each other" in writing to the examiner to emphasize that in contrast to the Havens patent, the '180 patent had no structural feature blocking the air from flowing inward between the curvilinear walls and into the axial chamber.

The court has not fully adopted the definition of the phrase that Johnson urges. Johnson argues that the meaning of the
disputed phrase is "not joined to one another by virtue of a corner or other structural feature that extends from the second side of the main body portion" (emphasis added). Johnson derives this definition from the sentence in the prosecution history in which Ametek states: "In other words, the curvilinear walls are not joined to one another by virtue of a corner or other structural feature that extends from the second side of the main body portion."

The court, however, concludes that reading the full prosecution history reveals that Ametek focused during the prosecution on the fact that the '180 patent's curvilinear walls are not joined at their ends at all; the prosecution history does not focus on the '180 patent's curvilinear walls not being joined by specific "structural feature[s] that extend[] from the second side of the main body portion." Rather, the court concludes Ametek used the words "structural feature[s] that extend[] from the second side of the main body portion" in writing to the examiner to specifically describe the Havens patent. Ametek's statements to the examiner did not limit the '180 patent's scope to a diffuser plate with curvilinear walls that are not joined by a particular kind of structural feature. The statements limited the '180 patent's scope to a diffuser plate with curvilinear walls that are not joined at all. Therefore, the court construes the disputed claim language to mean "not joined to one another at their ends by any structural feature."

B. Claim Language

The court's construction of the disputed phrase is consistent with how Ametek used the phrase in the claim itself. Desper Prods. v. Qsound Lab., 157 F.3d 1325, 1334 (Fed.Cir. 1998). The Federal Circuit has held that "while certain claim terms may be at the center of the claim construction debate, the context of the surrounding words of the claim also must be considered in determining the ordinary and customary meaning of those terms." ACTV, Inc. v. Walt Disney Co., 346 F.3d 1082, 1088 (Fed.Cir. 2003). Here, the context of the words surrounding the disputed phrase shows that the disputed phrase means "not joined to one another at their ends by any structural feature."

The relevant paragraph of claim one of the '180 patent states that "the diffuser plate" is comprised of, inter alia:

a plurality of curvilinear walls extending from said second side to define air chambers therebetween which are open to corresponding said air inlet apertures, each said curvilinear wall extending from a corresponding curved wall toward, but terminating prior to reaching said shaft aperture, and wherein said curvilinear walls are separated apart and disconnected from each other.

Overall, this claim language describes that the curvilinear walls extend from the second side of the diffuser plate and create "air chambers," or "boundaries of space or cavities of air," 9 between the curvilinear walls. Each curvilinear wall "ends before arriving at" 10 the "shaft aperture", or opening, that runs through the center of the diffuser. Construing the disputed claim language "separated apart and disconnected from each other" to mean "not joined to one another at their ends by any structural feature" fits within the context of the claim because it describes a feature of the vanes that allows the air to flow freely into the axial chamber.

9 The parties have agreed to this definition of "air chambers" in their joint claim construction statement.

10 The parties have agreed that "terminating prior to reaching" means "ending before arriving at" in their joint claim construction statement.

C. Drawings

11

11 Because the court has concluded that it can determine the meaning of the disputed terms through examination of the intrinsic evidence, the court need not turn to extrinsic evidence. See Phillips Petroleum Co. v. Huntsman Polymers Corp.,
157 F.3d 866, 870 (Fed.Cir. 1998) (noting if "intrinsic evidence unambiguously delineates the scope of the patent, resort to extrinsic evidence . . . is unnecessary").

The drawings confirm that Ametek's use of the disputed terms was consistent with the meaning that the court has given the terms. In the drawings, the vanes are "not joined to one another at their ends by any structural feature" thereby allowing air to flow between the vanes and directly into the central axial chamber. See Exhibit 1: '180 patent.

For purposes of the current Rule 56 motions, the parties contest the interpretation of only one element of one claim in the '513 Patent. That disputed element of Claim 20 reads:

. . . said ramp members being separated by a distance of substantially about 3.5 inches from inside to inside whereby said base member can accommodate the movement thereover of a snowplow blade straddling the ramps and disposed at an angle not in excess of 50 [degrees] measured perpendicularly to the longitudinal axis of the base member before any part of the plow blade may impact an associated reflector mounted on the base member.

NightLine argues that the measurement of "substantially about 3.5 inches" refers to the distance between the ramps at their distal ends, where they begin to rise above the road surface. Stimsonite, on the other hand, maintains that the measurement refers to a point considerably higher up the ramps, at or near the reflector entrance.

As an examination of the claim language demonstrates and as the parties' disagreement further confirms (though the fact of such disagreement does not necessarily betoken ambiguity), the claim element at issue is ambiguous: Where is the "inside to inside" measurement to be taken? Because the inside edges of the ramp members of the '513 Patent (and therefore the Stimsonite 101 and 101LP markers) are shown as parallel ('513 Patent Fig. 2, Ex. 2 to this opinion), they measure 3.54 inches apart at every point. But the inside edges of NightLine's accused markers measure roughly 3.75 inches at the reflector entrance and stay parallel for a short distance down the ramps, then taper out to a little more than 4 inches at the distal ends of the ramps (S. 12(M) P94, N. 12(M) PP29-30, 35, Ex. 3 to this opinion). This Court must determine, then, at what point along the ramps Stimsonite's '513 Patent claims the approximate 3.5 inch distance as an essential element. Keeping in mind the canons of claim construction set out by the Federal Circuit, this Court turns to the written description and the prosecution history for help.

Stimsonite's written description is an appropriate resource for use in clarifying the ambiguous claim reference. That written description discusses the 3.5 inch measurement several times. Each of those times the measurement is mentioned in comparison to a 4.9 inch measurement drawn from the prior art as embodied in the Stimsonite 96 and 96LP. Although the references are somewhat lengthy, their virtually dispositive influence on the interpretation of Claim 20 suggests it is appropriate to recite two critical references here: 12

1. At '513 Patent col. 3 lines 42-48:

It is another feature of the present invention that the distance between the inside edges of the inclined ramps is reduced to lower the chance of plowblade contact with the reflector during snowplowing. Preferably, this distance is reduced from
about 4.9 inches in the prior Model 96 and 96LP versions, to approximately 3.54 inches, allowing for increased plow blade angle.

2. At '513 Patent col. 4 lines 63-68:

The base member has two inclined upper ramp surfaces, the inside edges of which are laterally spaced apart a distance of about 3.54 inches (compared with the 4.9 inch spacing of the prior "96" and "96LP" markers) to reduce the probability of plowblade contact with the retroreflector carried by the base member.

Thank you for your patience. I hope this is helpful. Let me know if you need anything else.
Upon reviewing that distinction, the PTO allowed Claim 20 as originally drafted (id. P19). Once again, Stimsonite placed reliance on the more narrow 3.5 inch distance between the ramps in order to gain a new extended monopoly.

Having distinguished the prior art in order to meet patentability requirements, Stimsonite cannot now broaden its patent claim by arguing that Claim 20 referred to the distance between the ramps at the reflector entrance, or even slightly forward of the reflector entrance. Because Model 96LP (embodying the prior art) itself measures only about 3.75 inches at the reflector entrance, any construction of Claim 20 to refer to the distance between the ramps at the reflector entrance would torpedo it as an advance over that prior art. Stimsonite seeks to urge that one skilled in the art would know that the distance between the ramps at the reflector entrance--not at the distal ends--affects the blade angle that the marker can accommodate, so that such a person would read Claim 20 to refer to the distance at the reflector entrance. But that is an unsupported ipse dixit assertion--to the contrary, S. Mem. 8 argues that its own 96 and 96LP models (which Lowe used as the basis for his 3.75 inch ramp spacing at the reflector entrance) do not come within the new patent because that narrow reflector entrance measurement does not extend far enough along the ramps to affect the blade angle. That undercuts any contention that it is the distance between the ramps at the reflector entrance that allows for greater blade angles.

--- Footnotes ---
15 There is no dispute between the parties that 3.75 inches is "substantially about 3.5 inches," which is the magic (and purportedly differentiating) language in Claim 20.

--- End Footnotes ---
Hence when Claim 20 states "said ramp members being separated by a distance of substantially about 3.5 inches from inside to inside," which the specifications contrast to the former 4.9 inch dimension, it must refer either to the distal end of the ramps or, at most, to roughly the last inch of the ramps nearer to the distal end before they go below the road surface. Because the intrinsic evidence unambiguously compels that conclusion, this Court need not turn to extrinsic evidence to construe the claim.

3566
E. "separated by a wall" and "interchamber orifice"

Claim 1(a) describes "first and second vacuum chambers separated by a wall." Claim 1(d) then requires "an interchamber orifice located in said wall and aligned with said first and second spaces so that ions may travel through." Similarly, the preamble in claim 14 describes "first and second spaces . . . separated by an interchamber orifice so that an ion may travel through said first space, said interchamber orifice and said second space . . ." Thus, while claim 14 does not identify the wall discussed in claim 1, it does identify the interchamber orifice separating the first and second spaces.

Micromass's proposes a construction of "separated by a wall" and "interchamber orifice" that would require the wall and interchamber orifice to join or link the two vacuum chambers and spaces. In support of this construction, Micromass points to Figures 1 and 12 and notes that in both there is only a solitary wall and interchamber orifice dividing the two vacuum chambers and spaces. Micromass also notes that the description of Figure 1, which states, in part, "the vacuum chamber 30 is connected by an interchamber orifice 34 to a second vacuum chamber 38 pumped by a vacuum pump 39." Noting the specification's use of the term "connected" to describe the interchamber orifice, Micromass maintains that wall and interchamber orifice must "join or link together" the two structures.

AB/Sciex contends that "separated by a wall" should be construed to mean only that "there is at least a wall between the first and second vacuum chambers" and that "interchamber orifice" should be construed to mean "an orifice in a wall that is between the first and second vacuum chambers." It criticizes Micromass's proposed construction because by requiring that the wall and interchamber orifice to join or link the two vacuum chambers or spaces, Micromass would be creating a requirement that no other structure, such as the multiple walls between vacuum chambers in the Quattro Ultima, be between the "first vacuum chamber" and the "second vacuum chamber."

AB/Sciex's proposed construction is well-founded. Claim 1 requires only that the first and second vacuum chambers be
separated by a wall with an interchamber orifice. Because the claim uses the term "comprising," other structures may be present between the two vacuum chambers at well. See Genentech, Inc. v. Chiron Corp., 112 F.3d 495, 501 (Fed. Cir. 1997) ("Comprising is a term of art used in claim language which means that the named elements are essential, but other elements may be added and still form a construct within the scope of the claim."). Similarly, claim 14 requires only that an interchamber orifice separate the first and second spaces and it does not preclude other structures separating those spaces. Micromass's proposed construction ignores this ordinary reading of the claims and relies on the embodiments shown in the specification. The court will not import limitations existing only in the patent specification into the claims themselves. See Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998) ("limitations from the specification are not to be read into the claims"). Thus, the court will adopt AB/Sciex's proposed construction of "interchamber orifice" and "separated by a wall."

2. Surface indicia have substantially uniform widths defining width of information tracks

The discrete surface indicia on the disc-shaped member is also limited by the language in claim 1 to discrete surface indicia that have "substantially uniform widths defining the width of" the substantially parallel "information tracks." (Col. 5, lines 33-4, 43-5) As construed by this court's prior memorandum order, this claim language allows for minor variations in the width of the discrete surface indicia and, by definition, the widths of the information tracks. (D.I. 558 at 11)

Further claim construction, however, is required to resolve the parties' dispute concerning this claim limitation. The language in claim 1 describes the term "information track" as the sequential arrangement of discrete surface indicia. (Col. 5, lines 33-34) The claim language further describes the "information tracks" as being "substantially parallel" and "separated by intertrack portions" of the planar surface. (Col. 5, lines 34, 39) (emphasis added). The claim language describes "planar surface" as being defined by the "intertrack portions" and "interval portions." (Col. 5, lines 41-2)

As stated above, the information tracks on the disc-shaped member are separated by intertrack portions. Accordingly, an information track as described in claim 1 does not include any intertrack portion. Additionally, since only the discrete surface indicia are described as representing the stored information (col. 5, lines 44-5), the term "intertrack portion" cannot represent any stored information.

This construction is supported by the written description, which discloses a transmissive disc. In the description of the transmissive disc, the information tracks share the same boundaries (edges) as the surface indicia since light must be shined through the surface indicia. The stored information in a transmissive disc is only represented by the physical features and no information is represented by the intertrack portions.

2. Separated

The fifth clause of claim 1 recites that the cavity of the catalytic burner comprises an upper part and opening at the lower end of the burner, the cavity "being separated from the upper surface (10) of the burner (3, 30) by a wall." Plaintiffs propose that the clause should be construed by its plain and ordinary meaning, i.e., that "the cavity is separated from the upper surface by a wall." Defendants, on the other hand, propose an added limitation that "the cavity is completely separated from the burner's upper surface by a wall." In addition, Defendants propose the limitation that "[t]his term may not be construed to encompass a cavity that is only partially separated from the burner's upper surface by a partial wall."

Defendants base their construction on the fact that, consistent with the doctrine of claim differentiation, claim 1 literally requires "a wall," while claim 13 only requires a structure which "shuts off, at least in part, the upper part of the cavity." Claim 13 (an unasserted claim) recites, among other things, that "a central zone shuts off, at least in part, the upper part of the cavity." See '061 patent, claim 13 (emphasis added). According to Defendants, the Applicants knew how to claim a "partial" wall, which, in part, shuts off the upper part of the cavity, as recited in claim 13. Thus, because different words and
phrases are used in claims 1 and 13, Defendants urge, there is presumed to be a difference between "wall," as used in claim 1, and the "shuts off, at least in part" language of claim 13, supporting a construction that the wall completely separates the cavity from the burner's upper surface.

Indeed, claim 1 requires that the cavity communicates with the atmosphere by the presence of at least one open channel (8, 33) being situated in the upper part (3b, 30b) of the burner (3, 30). See '061 patent, 5:48-51. Claim 2 adds the limitation that the invention is characterized in that "said channel (8) is substantially axial." Id., 5:52-53. Claim 13, as cited by Defendants, requires the open channel communicating between the cavity and the atmosphere to extend radially. Id., 6:38-43. However, selected terms in two claims may appear different but have the same scope. This does not violate the doctrine of claim differentiation because it is the claims as a whole that are presumed to differ in scope, not merely selected terms of the respective claims. See Tandon Corp. v. U.S. Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed. Cir. 1987) (citations omitted). In other words, though claims 1 and 13 may vary in scope, the term "wall" can have the same meaning.

As Defendants acknowledge, Fig. 2 of the specification shows that the annular groove 9 extends axially over a greater distance than the thickness of the wall separating the cavity 6 from the upper surface 10 of the burner. '061 patent, 3:25-28. As illustrated in Fig. 2, the open passage 8 of the invention passes through the wall that separates cavity 6 from upper surface 10. Thus, Defendants' assertion that the wall must completely separate the upper surface from the cavity is contrary to the plain language of the patent.

Defendants' argument that the prosecution history shows a complete separation is also not persuasive. Defendants claim that claim 1, as originally filed with the USPTO, did not contain any language which in any way referred to any structure which separated the cavity and the upper surface of the burner. Doc. No. 58, Ex. 3, at PB0333. Defendants argue that in order to make the claims "conform" with the specification and the application, originally filed claim 1 was cancelled and "new claim 12" was added, which added that "the upper surface was shut off from the cavity, at least in part." Id. at PB0270. In response to a rejection, the Applicants submitted "amended claim 12," which required "a wall" separating the upper surface of the burner from the cavity," which Defendants assert is the same as claim 1 in the '061 patent. Defendants claim the progression of this limitation in claim 1 of the '061 patent shows the Applicants have surrendered any coverage of a partial wall. Defs.' Br., at 19-20.

The Court disagrees with Defendants' reliance on the prosecution history. In the response to the office action dated May 3, 2002, the Applicants distinguished the present invention on the basis of the presence of at least one open channel located in the upper part of the burner. Doc. No. 58, Ex. 3, at PB0238-39. Nowhere in the response did the Applicants submit that the prior art was distinguished by the presence of a full or partial wall. This does not amount to an express or unequivocal disclaimer as Defendants suggest. Middleton, Inc. v. Minn. Mining & Mfg. Co., 311 F.3d 1384, 1388 (Fed. Cir. 2002). Because the Court concludes that the prosecution history does not change the plain meaning of the term, the Court finds that no construction is necessary. As plainly set forth in the claim, the Court construes the term separated to mean that the cavity is separated from the upper surface by a wall and will add no further limitation.

Limitation (a) in claim 24 reads:

(a) Separating a layer of skin and subcutaneous soft tissue connected to surrounding skin and soft tissue from underlying support tissue to form a pocket

The parties agree that "separating" is interpreted as "spacing apart." The parties disagree whether "a layer of skin" means "a single thickness." In construing open-ended claims, "a" has been found to mean "one or more." KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000). Therefore, "a layer of skin" is not limited to "a single layer of skin." This court finds this limitation means "spacing apart the skin and loose connective tissue located just beneath the skin connected to surrounding skin and soft tissue from the support tissue lying beneath to create a pocket."
2. SiGen contends that the district court erred as a matter of law in construing the disputed claim term "a separation" found in independent claim 1. The court construed "separation" based upon its ordinary meaning to be a "gap or intervening space." SiGen argues that this interpretation ignores intrinsic and extrinsic evidence that "a separation" requires "splitting into two parts." SiGen believes that "separate" necessarily means that the thin film and the stiffener are "split into two pieces" because the stiffener has been dissolved and no "self-supporting" membrane exists if still attached to the stiffener. Therefore, according to SiGen's logic, "a separation" must mean complete splitting or cleaving of the thin film and the substrate.

We agree with the district court that the proper interpretation of "a separation" is "an intervening space or gap" between the thin film and the majority of the substrate. The specification of the '564 patent describes "a separation" created during the thermal treatment "by a crystalline rearrangement effect in the wafer and a pressure effect in the microbubbles." The separation results from the thermally induced "crystalline rearrangement" and "coalescence of the bubbles." The specification does not require the "coalescence of the bubbles" to form a perfect cleavage between the top of the film and the bottom substrate. "Splitting or cleaving" the whole layer uniformly is a limitation not found in the '564 patent.

SiGen says that figure 4 depicts a complete cleavage. Drawings aid in the interpretation of claims, but a simple depiction of a single embodiment does not create such a limitation when the words of the specification and claims are broader and more descriptive. See Autogiro Co. of Am. v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 398 (Ct. Cl. 1967) ("In those instances where a visual representation can flesh out words, drawings may be used in the same manner and with the same limitations as the specification.") (citations omitted).

2. Language in Dispute: "An integral septum."

Does "septum" mean (1) a dividing wall or (2) a flat divider?

Answer: "Septum" means a dividing wall.

a). Claim Language

The issue is whether the septum is limited to being flat. The Court holds the septum extending along the tube and dividing the tube into first and second lumens is not limited to a flat divider. The claim language provides that there must be a septum which is integral with the tube which divides the interior of the tube into the "first lumen" and the "second lumen." The claim language does not specify the type of septum, only that it must be integral. Therefore, the Court will not read another adjective into the claim language but will instead construe "septum" in accordance with its ordinary usage and accustomed meaning. The ordinary meaning of "septum" is divider.

b). Written Description

The specification supports the construction that a "septum" is a divider:

The tube 11 is circular in cross section... And has an internal divider 12 defining a return lumen 13 and an inlet lumen 14 within the interior of the hollow tube. ('968 patent col. 3, lines 17-20).

This language does not specify what type of divider must divide the tube into two lumens. Furthermore, the specification does not limit the "septum" of claim 19 to a planar septum, it merely discloses one preferred embodiment.

That Dr. Mahurkar intended for claim 19 to cover catheters with a non-planar septum is made particularly clear by comparing claim 19 to the other independent claims of the '968 patent: claims 1, 12, and 25. Claims 1 and 25, unlike claim...
19, both explicitly recite a "planar septum," and claim 12 recites a "planar axial divider." The patentee's use of the limiting adjective "planar" in some claims, but not others, must be given meaning. See Karlin, 177 F.3d at 972 ("different words or phrases used in separate claims are presumed to indicate that the claims have different meanings and scope").

c). Dictionary Definition

The dictionary defines "septum" as "a dividing wall or membrane." (Webster's Collegiate Dictionary 1068 (10th ed. 1996)). The dictionary definition supports Dr. Mahurkar's construction of "septum" as a divider that separates the interior of the tube into two lumens. Additionally, a medical dictionary definition of "septum" also supports the Plaintiffs' proposed construction. In Stedman's Medical Dictionary, "septum" is defined as "A thin wall dividing two cavities or masses of softer tissue." (Stedman's Medical Dictionary 1599 (26th ed.1995)). For example, the septum of the nasal passage divides the nose into two cavities. (Id).

d). Prior Litigation

Arrow contends Judge Easterbrook's decision in In re Mahurkar judicially estops Plaintiffs from asserting claim 19 is not limited to a planar septum. This Court disagrees. In In re Mahurkar, Judge Easterbrook wrote, "the essential question concerning infringement came down to a disagreement about the meaning of language in the '968 patent concerning the septum." In re Mahurkar, 831 F. Supp. at 1358. However, Judge Easterbrook was never required to construe the meaning of septum in claim 19 because he found IMPRA infringed without having to do so. IMPRA argued its catheter did not infringe claims 1 and 19 because the septum in its device was not continuous through the tip. Id. at 1358. Judge Easterbrook noted that, "[a] 'septum' is something dividing two lumens; because at the tip IMPRA's device has only one lumen, it has no septum there." Id. However, Judge Easterbrook determined that Dr. Mahurkar's invention also had its septum "moved out of the way at the tip." Id. Thus, "the invention claimed and described in the patent has exactly the deflection that IMPRA's device does…IMPRA's device literally infringes." Id. Therefore, this Court's holding that the septum in claim 19 should be construed as a divider which is not limited to being flat is not inconsistent with Judge Easterbrook's decision in In re Mahurkar, because Judge Easterbrook never decided this issue.

Arrow argues Dr. Mahurkar limited all his claims to a flat septum in In re Mahurkar, in order to claim priority from a design application. This is simply not what happened. The priority issue turned on whether the claims of the '968 patent, including those requiring a planar septum, were supported by the drawings presented in the design application. Judge Easterbrook's decision was based on his finding that the drawings in the design application satisfied the written description requirement of § 112. Id. at 1362. Judge Easterbrook found the claims of the '968 patent were supported by the drawings in the design application. Id. He did not limit the patent to only that which was shown in the drawings.

Similarly, Arrow quotes a portion of the In re Mahurkar opinion relating to an inequitable conduct defense:

But only a dunderhead looking at figures 6 and 7 of the original design application would have supposed that the septum is discontinuous, or curved in places not depicted…The design drawings alone therefore imply a unitary, planar, full-length septum. In re Mahurkar, 831 F. Supp. at 1381-82. (Emphasis in original).

When Judge Easterbrook rejected the inequitable conduct defense, he was not limiting claim 19 to a flat septum as shown in the drawings. This passage does not discuss whether all the claims of the patent, including claim 19 are limited to a flat septum, only that the drawings in the embodiment illustrate a flat septum. Claim 19 is certainly not limited to the drawings in the specification. See Karlin Technology Inc., 177 F.3d at 972.

Arrow also cites passages from Judge Easterbrook's opinion and a Federal Circuit opinion that describe Dr. Mahurkar's commercial embodiment and his preferred design. These passages were introductory to describe Dr. Mahurkar's advance over other catheters, and do not concern the specific claim presented in claim 19.

Finally, Arrow argues that a planar septum was crucial to the court's finding that the '968 patent was valid over the prior art regarding the Blake balloon catheter. Judge Easterbrook did hold that the '968 patent was valid over Blake's prior art, but not because of a planar septum. The reason Judge Easterbrook held the '968 patent was valid over the prior art was because he found Blake's catheter to be an "utterly different beast" from Dr. Mahurkar's. Id. at 1376. He also stated that in Blake, the "lumens are not of equal size, are not D-shaped, there is no axial separation to improve flow (Blake was uninterested in
A. Support by the Written Description

The jury found claims 15 and 16 "not supported by the description contained in the specification." M3 Systems explains that the issue was the meaning of the claim terms "sequential energizing" and "energizing means." The district court had permitted the jury to resolve this disputed issue of claim construction. On this appeal we give de novo review to the issues relevant to the construction and interpretation of the claims. See Cybor, 138 F.3d at 1454-56, 46 U.S.P.Q.2D (BNA) at 1172-75.

M3 Systems states that "sequential" should be construed, and was construed by the jury, to permit no overlap of needle movement during the energizing step. M3 states that since the patent shows that the second needle can start to move before the first needle has completed its movement, the written description does not support the claims. M3 states, as it did at trial, that since the specification does not describe how to obtain elimination of all overlap of needle movement, the claims are not supported by the written description and are invalid.

Bard agrees that the specification shows a slight overlap in the movement of the needles, whereby the second needle starts to move just before the first needle has completed its movement and the first spring latches. Thus, Bard contends, correct interpretation of the claims allows for this slight overlap in needle movement. Bard states that it is incorrect to construe the claims contrary to the specification, and then to hold the claims invalid because they are contrary to the specification. Bard is of course correct; the claims are construed in accordance with the rest of the specification of which they are a part, and not contrary to it. See Slimfold Mfg., 810 F.2d at 1116, 1 U.S.P.Q.2D (BNA) at 1566; SRI Int'l v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1125, 227 U.S.P.Q. (BNA) 577, 585 (Fed. Cir. 1985) (in banc).

The specification illustrates the sequential energizing of the needles as having some overlap in movement of the needles. The term "sequential" in the claims is in accordance with this description in the specification; no usage or exemplification of the sequential movement requires eliminating all overlap. It is incorrect to construe the claims as barring all overlap, as urged by M3 Systems. On the correct claim construction, no reasonable jury could have found that the claims are not supported by the description in the specification. It is thus apparent that the jury either adopted M3's erroneous claim construction, or incorrectly applied the law governing claim construction to the undisputed facts of the structure described in the specification.

On the correct claim construction the written description is in accordance with and in support of the claims. The judgment of invalidity on this ground is reversed.
"a series of gussets disposed along each of said edges, said gussets along each of said edges being fitted together"

i. "a series of"

It does not appear that the parties dispute the construction of the claim phrase, "a series of." Perouse construed "series" in its opening brief to mean that the "gussets" "come one after another in spatial succession." (Perouse Opening Br. 29.) However, Gore did not construe this term either in its briefs or during the Markman hearing. Therefore, the Court will assume that this term is not in dispute. If the term should require construction, the Court adopts Perouse's proposed construction.

ii. "gussets"

The parties dispute the construction of "gussets." Perouse's proposed construction is "housing part portions through which something passes." Gore's proposed construction is "several sequential, cylindrical structures that protrude from opposing edges of the housing part."

The parties agree that: the ordinary meaning of "gussets" is not applicable in the context of this invention. Therefore, "gussets" is a term coined for use in the '787 patent and has no ordinary meaning to a person of skill in the art. In this circumstance, the construction is determined by the disclosure in the specification. My Mail, Ltd. v. Am. Online, Inc., 476 F.3d 1372, 1376 (Fed. Cir. 2007) ("Both parties agree that the term NSP is a coined term, without a meaning apart from the patent. . . . We therefore look to the specification to determine what the NSP must do. . . ."); J.T. Eaton & Co., Inc. v. Atl. Paste & Glue Co., 106 F.3d 1563, 1570 (Fed. Cir. 1997) ("In this case, the dispositive claim limitation is a term unknown to those of ordinary skill in the art at the time the patent application was filed. It thus fell to the applicants, as a duty, to provide a precise definition. . . ."); Honeywell Int'l Inc. v. Universal Avionics Sys. Corp., 488 F.3d 982, 991 (Fed. Cir. 2007) ("Without a customary meaning of a term within the art, the specification usually supplies the best context for deciphering claim meaning."); Irdeto Access, Inc. v. Echostar Satellite Corp., 383 F.3d 1295, 1300 (Fed. Cir. 2004) ("[If a disputed term has "no previous meaning of a term within the prior art[], its meaning, then, must be found [elsewhere] in the patent. . . . absent such an accepted meaning, we construe a claim term only as broadly as provided for by the patent itself. The duty thus falls on the patent applicant to provide a precise definition for the disputed term.").

21 Gore's expert cites the following dictionary definitions for "gusset": "I: A usu. diamond-shaped or triangular insert in a seam (as of a sleeve, pocketbook, or shoe upper) to provide expansion or reinforcement 2: A plate or bracket for strengthening an angle in framework (as in a building or bridge). (Matsumura Decl. Ex. E at 543.)

The intrinsic evidence provides very little guidance regarding the structure of the gussets. The second embodiment is described as having "a series of projecting, cylindrical gussets" that "interpenetrate" when the housing part is in its closed state. (787 patent col.3 11.62–66.) In this embodiment, a "cord . . . passes through all the gussets, holding the housing part together. (787 patent col.3 1.67–col.4 1.1.) Figure 8, which represents this embodiment "diagrammatically," depicts the "gussets" as cylindrical structures lining the edges of the slitted housing part. (787 patent Fig. 8.)

Gore asserts that its construction is supported by the reference in the specification to the second embodiment's "projecting, cylindrical gussets" and by Figure 8. (787 patent col.3 11.62–63, Fig. 8.) In fact, the patentee's choice of language refutes Gore's construction. If "gussets" were inherently projecting (or "protrud[ing]"), cylindrical structures, it would be unnecessary to specify that the gussets of the second embodiment had these qualities. See, e.g., Acumed LLC v. Stryker Corp., 483 F.3d 800, 807 (Fed. Cir. 2007) (stating that where specification describes "a plurality of transverse holes, each of which is . . . perpendicular to the . . . nail axis. . . . [t]his implies that a 'transverse' hole need not be 'perpendicular.'"); Phillips, 415 F.3d at 1314 ("The claim in this case refers to 'steel baffles,' which strongly implies that the term 'baffles' does not inherently mean objects made of steel."). Also, the depiction of the gussets in Figure 8 is a representation of the second
embodiment. Therefore, the specific features of this representation are not to be imported as a limitation on the claims. See Phillips, 415 F.3d at 1323.

In fact, the only limitation imposed by the specification is that the gussets must have a structure such that a cord can be passed through them. Given this lack of detail regarding this term, it would be clear to a person of ordinary skill that "gussets" is used to refer to any structure through which a cord can pass.

Therefore, the Court construes "a series of gussets" to mean "a series of structures through which a cord can pass."

Claims 1, 3, and 4, which Karlin alleges are infringed by the Ray TFC implant, read as follows (emphasis on the disputed limitation added):

1. A fusion implant comprising a cylindrical member having an outside diameter larger than the space between the two adjacent vertebrae to be fused and a series of threads on the exterior of the cylindrical member for engaging said vertebrae to maintain said implant in place, a plurality of openings in the cylindrical surface of said member, said outside diameter of said cylindrical member being substantially uniform over the entire length of the implant.

3. The implant of claim 1 in which said implant has a hollow portion for receiving autogenous bone for promoting bone ingrowth.

4. The implant of claim 3 in which said implant has a removable cap for covering said hollow portion.

The district court interpreted the "series of threads" limitation in claim 1 to require threads that are "highly specialized in that they are periodically interrupted, such that the tail ends of each of the tabs so formed are blunted and twisted so as to resist accidental unscrewing." The court held that, given this construction, there was no genuine issue of material fact and SDI was entitled to a summary judgment that the Ray TFC spinal implant did not infringe the asserted claims of the '247 patent, either literally or under the doctrine of equivalents. The court did not rule on SDI's motion for a summary judgment of invalidity. Karlin appeals the grant of summary judgment of noninfringement in favor of SDI.

DISCUSSION

Our review of a grant of summary judgment of patent infringement or noninfringement is plenary. See Cole v. Kimberly-Clark Corp., 102 F.3d 524, 528, 41 U.S.P.Q.2d (BNA) 1001, 1004 (Fed. Cir. 1996). We first determine whether "the pleadings, depositions, answers to interrogatories, and admissions on file, together with the affidavits, if any, show that there is no genuine issue as to any material fact and that the moving party is entitled to a judgment as a matter of law." Unidynamics Corp. v. Automatic Prod. Int'l, Ltd., 157 F.3d 1311, 1316, 48 U.S.P.Q.2d (BNA) 1099, 1102 (Fed. Cir. 1998) (quoting Fed. R. Civ. P. 56(c)). "In determining whether there is a genuine issue of material fact, the evidence must be viewed in the light most favorable to the party opposing the motion, with doubts resolved in favor of the opponent." Chiuminatta Concrete Concepts, Inc. v. Cardinal Indus., Inc., 145 F.3d 1303, 1307, 46 U.S.P.Q.2d (BNA) 1752, 1755 (Fed. Cir. 1998).

An infringement analysis entails two steps. The first step is determining the meaning and scope of the patent claims asserted to be infringed. The second step is comparing the properly construed claims to the device accused of infringing." Markman v. Westview Instruments, Inc., 52 F.3d 967, 976, 34 U.S.P.Q.2d (BNA) 1321, 1326 (Fed. Cir. 1995) (en banc) (internal citation omitted), aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). In this case, the claim construction issue centers on the phrase "series of threads" contained in claim 1. We first discuss the proper construction of that phrase and then compare the properly construed claims to the accused Ray TFC spinal implant. Because we conclude that the Ray TFC implant literally infringes the asserted claims, we do not consider whether the device infringes under the doctrine of equivalents.

I. Claim Construction
Claim construction is a question of law, which we review de novo. See Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456, 46 U.S.P.Q.2d (BNA) 1169, 1174 (Fed. Cir. 1998) (en banc). When construing a claim, a court should first look to the intrinsic evidence, i.e., the patent itself, its claims, written description, and, if in evidence, the prosecution history. See Vitronics Corp. v. Conceptronics, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2d (BNA) 1573, 1576 (Fed. Cir. 1996). The court may receive extrinsic evidence to educate itself about the invention and the relevant technology, but the court may not use extrinsic evidence to arrive at a claim construction that is clearly at odds with the construction mandated by the intrinsic evidence. See Key Pharm. v. Hercon Lab. Corp., 161 F.3d 709, 716, 48 U.S.P.Q.2d (BNA) 1911, 1917 (Fed. Cir. 1998).

The district court here construed "series of threads" to be limited to "highly specialized . . . periodically interrupted [threads], such that the tail ends of each of the tabs so formed are blunted and twisted so as to resist accidental unscrewing." This was error. As we discuss below, this limitation is properly construed as referring to continuous threading with a plurality of turns, as found on an ordinary screw or bolt.

A. The Claim Language

Claim construction begins with the words of the claim. See Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 619-20, 34 U.S.P.Q.2d (BNA) 1816, 1819 (Fed. Cir. 1995). Where "series of threads" has no specialized meaning to persons of skill in the art (as the parties here agree), the ordinary meaning of those words to those skilled in the art controls, unless the evidence indicates that the inventor used them differently. See Quantum Corp. v. Rodime, PLC, 65 F.3d 1577, 1580, 36 U.S.P.Q.2d (BNA) 1162, 1165 (Fed. Cir. 1995).

The relevant definition of "series" is "a number of things or events of the same class coming one after the other in spatial or temporal succession." WEBSTER'S NINTH NEW COLLEGIATE DICTIONARY 1160 (1986). That is what the threads on screws do. "Thread" is defined as a "continuous helical rib, as on a screw or pipe." MCGRAW-HILL DICTIONARY OF SCIENTIFIC AND TECHNICAL TERMS 2024-25 (5th ed. 1994) (emphasis added). At the same time, it is common to speak of each turn as "a thread," as when referring to the number of threads per inch. See A. PARRISH, MECHANICAL ENGINEER'S REFERENCE BOOK § 4-2 to 4-63 (11th ed. 1973). We therefore conclude that the ordinary meaning of "series of threads" to one of skill in the art, or even according to common knowledge, is continuous threading with a plurality of turns, as found on an ordinary screw or bolt.

B. Claim Differentiation

The doctrine of claim differentiation also supports a construction of "series of threads" that is not limited to the preferred embodiment's highly specialized interrupted threads. This doctrine, which is ultimately based on the common sense notion that different words or phrases used in separate claims are presumed to indicate that the claims have different meanings and scope, see Comark Communications Inc. v. Harris Corp., 156 F.3d 1182, 1187, 48 U.S.P.Q.2d (BNA) 1001, 1005 (Fed. Cir. 1998), normally means that limitations stated in dependent claims are not to be read into the independent claim from which they depend, see Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1277, 35 U.S.P.Q.2d (BNA) 1035, 1041 (Fed. Cir. 1995). Here, claims 8 and 9, which were included in the original application as dependent on claim 1, recite additional structure related to the threads:

8. The implant of claim 1 in which said threads are locking threads.

9. The implant of claim 1 in which said threads are interrupted.

While the canon of claim differentiation is not a rigid rule, see Comark, 156 F.3d at 1187, 48 U.S.P.Q.2d (BNA) at 1005, we conclude that, in this case, that doctrine supports the broad construction of "series of threads" that is based on the ordinary meaning of that phrase.

C. The Written Description

We conclude that the '247 patent's written description does not specifically define "series of threads." SDI argues the contrary, based on language discussing the "present invention" as having highly specialized threads. Karlin argues that this language describes the inventor's preferred embodiment, and that "series of threads" should not be construed as limited to the preferred embodiment. An example of the disputed language in the written description follows:

BRIEF DESCRIPTION OF THE DRAWINGS

- 4202 -
FIG. 4 is a perspective view of a cylindrical implant and vertebra structure.

FIG. 4A is a perspective view of one preferred embodiment of the implant.

FIG. 4B is a cross sectional view of the implant of FIG. 4A.

DETAILED DESCRIPTION OF THE DRAWINGS

Referring to FIG. 4, a cylindrical embodiment of the present invention is shown.

A series of external threads 53 are formed on the circumference of the cylindrical implant 50. The threads 53 are locking threads having a series of interjections, the ends of which are blunted and twisted so as to resist unscrewing.

Although Figure 4 is expressly stated to show the "present invention," and Figures 4A and 4B refer to "one preferred embodiment," the same spinal implant is shown in each of the figures. The remainder of the written description has similarly mixed references to "present invention" and "preferred embodiment." We therefore conclude that the written description uses the terms "present invention" and "preferred embodiment" interchangeably. Given this, it is clear that only the preferred embodiment is described as having highly specialized threads. The general rule, of course, is that the claims of a patent are not limited to the preferred embodiment, unless by their own language. See, e.g., Virginia Panel Corp. v. Mac Panel Co., 133 F.3d 860, 866, 45 U.S.P.Q.2D (BNA) 1225, 1229 (Fed. Cir. 1997) ("It is well settled that device claims are not limited to devices which operate precisely as the embodiments described in detail in the patent."). There is nothing in this case that warrants departing from the general rule. Thus, the written description does not narrow the ordinary meaning of "series of threads."

D. The Prosecution History

All of the claims in the original application for the '247 patent were initially rejected by the Patent Office examiner as being obvious in view of U.S. Patent No. 4,501,269 to Bagby (Bagby), in further view of U.S. Patent No. 4,328,593 to Sutter (Sutter). Bagby discloses a nonthreaded, hollow, cylindrical bone fusion implant with holes through the cylindrical surface, and taught that the implant was to be hammered into an undersized drilled hole in the bones to be fused. Sutter discloses a surgical implant with a plurality of interrupted and locking threads. The examiner stated that it would have been obvious that a fusion implant as taught by Bagby could be constructed with threads on the outside of the cylindrical member as taught by Sutter.

In traversing the rejection of claim 1, the applicant argued that the force fit of the Bagby device was required for the unthreaded device to work, and that there was no suggestion in Bagby "that a thread on the exterior of [the Bagby device] would be sufficient to retain the device in a cervical spine." With respect to the rejection of claims 8 and 9, which were worded identically to the issued claims, the applicant stated that those claims "recite the particular threaded structure that is employed on the present implant. The use of threads [is] not obvious for the Bagby device, and accordingly, these claims drawn dependent on claim 1 are also nonobvious and allowable."

Karlin argues that the unqualified use of "thread" in the portion of the response directed to claim 1, when viewed in context with the description of claims 8 and 9 as reciting the "particular threaded structure [of the] present implant," shows that "series of threads" in claim 1 is not highly specialized. SDI argues that, because the examiner rejected all of the claims,
including claim 1, on the basis of Sutter's disclosure of the use of a plurality of interrupted and locking threads, the examiner apparently considered that claim 1's "series of threads" limitation referred to a specialized thread design. The district court concluded that the prosecution history did not favor either side.

It is clear that the scope of "series of threads" in claim 1 was not limited by this office action response. In addition, the differences in the responses concerning claim 1 and claims 8 and 9 indicate that the applicant considered the claims to have a different scope. We are therefore persuaded that the prosecution history further supports the broad ordinary meaning of "series of threads" in claim 1.

E. Conclusion

The foregoing discussion shows that, when viewed as a whole, the claim language, the written description, and the prosecution history support a construction of the phrase "series of threads" as meaning continuous threading with a plurality of turns, as found on an ordinary screw or bolt. We next discuss the second step of the infringement analysis.

3576

4. "Said support mat and central reduced diameter portion serve as the sole support means for the substrate. 30 Consistent with the claim language and its ordinary meaning, 31 the specification, 32 and the prosecution history, 33 the court construes "said support mat and central reduced diameter portion serve as the sole support means for the substrate" to mean "the central reduced diameter portion and the mat are the only structures that hold the substrate in place in the cylindrical body."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

30 "An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof." 35 U.S.C. § 112, P 6. Use of the term "means" in a claim limitation creates a presumption that § 112, P 6 has been invoked, but that presumption may be rebutted if the properly construed claim itself recites sufficiently definite structure to perform the claimed function. TI Group Auto. Sys. (N. Am.), Inc. v. VDO N. Am., L.L.C., 375 F.3d 1126, 1135 (Fed. Cir. 2004); Personalized Media Communns., L.L.C. v. ITC, 161 F.3d 696, 703-04 (Fed. Cir. 1998).

Claim 1 of the '476 patent uses the term "means". However, the limitation in which "means" is used also recites sufficiently definite structure, namely the central reduced diameter of the tube and the support mat, to perform the claimed function. As a result, the limitation is not governed by 35 U.S.C. § 112, P 6.

31 D.I. 151, ex. E at 1122 (defining "sole" as "being the only one" and "functioning independently and without assistance or interference"), 1186 (defining "support" as "to hold up or serve as a foundation or prop for").

32 '476 patent, col. 2, ll. 35-48; col. 3, ll. 7-12, 60-63; figs. 1, 3, 9, 10.

3577

I. Focusing lens servo

The servo mechanism means includes a focusing lens servo. See '981 patent, claim 3. The parties dispute the meaning of the phrase "focusing lens servo to modulate the position of a focusing lens." The court construes the word "servo" in accordance
with its ordinary meaning to mean "the motor part of the servomechanism controlled by the feedback circuit that produces the final mechanical output." The court defines the term "modulate" to mean "regulate." The court is persuaded that the terms "focusing" and "lens" require no construction.

GO BACK

3578

3. Wherein a Shape of Said Predetermined Pressure Profile . . .

This phrase is found in Claims 21 and 43 of the '575 Patent.

Phrase: Wherein a shape of said predetermined pressure profile is set independently of any monitored respiratory characteristics of such a patient

Construction: Wherein the magnitude and duration of the predetermined pressure profile are set without reference to or consideration of any monitored breathing characteristics of such a patient.

Reasoning: The dispute between the parties is whether the shape of the Predetermined Pressure Profile is synonymous with its magnitude and duration, or is a wholly different characteristic. After close review of the intrinsic record, we find that the shape of the profile is made up of its duration and magnitude.

The predetermined pressure profile is used in the less complex, and more cost effective version, of the invention. The predetermined pressure profile is applied to reduce the constant pressure of CPAP or the reduced EPAP pressure of bi-level therapy once the device detects the expiratory breathing phase. According to the teachings of the patent, the predetermined pressure profile has two parts: a magnitude, that represents the drop in pressure from the higher pressure value; and a duration that is ideally based on an average expiration period of the patient. These pre-set or pre-programmed magnitude and duration values approximate the values that would be generated by the proportional version of the invention. '575 Patent, cl. 20, lns. 44-65. Read in context of the language of the patent, the predetermined pressure profile is programmed into the computer with a magnitude value and a duration value so that the device can reduce the pressure during expiration independently of the patient's breath (other than sensing when exhalation begins). '575 Patent, cl. 20, lns. 66-67 and cl. 21, lns. 1-8.

The term shape appears in the '575 Patent four times, apart from being included in Claims 21 and 43. The first three times it appears, it does not refer to the shape of the predetermined pressure profile. '575 Patent, cl. 16, lns. 21, 55; cl. 18, lns. 43-44. The last time the word appears, it does refer to the predetermined pressure profile. '575 Patent, cl. 20, ln. 25. In describing a preferred embodiment of the invention, the patent states that the defined pressure profile has a shape that generally corresponds to a patient's normal flow. Because, in the proportional version of the invention, the patient's normal flow is used to determine the magnitude and duration of the pressure, this reference to the term "shape" indicates that the shape of a profile is comprised of its magnitude and its duration. This reading is further supported by the overall context of the patent, wherein pressure profiles, sometimes called waveforms, are consistently comprised of magnitudes and durations. '575 Patent, cl. 20, lns. 54-58.

This construction is also supported by the prosecution history. The limitation that the shape be set independently of any patient monitored characteristic was added to these claims to differentiate them from prior art. The prior art generated an expiratory model waveform based on the inspiratory waveform, which was set by monitoring patient flow. Prosecution History, '575 Patent, Response to Office Action (Nov. 24, 1999) at 13. At the time, plaintiff distinguished the prior art by explaining that the shape of its predetermined profile is not based on any monitored respiratory characteristics. Id. In the context of these inventions, the pressure profiles are defined by how large a drop in pressure there will be, and for how long. In that context, the argument that the profile is independent of the respiration of the patient, indicates that these factors, i.e., magnitude and duration, will be set without reference to the patient.

Our construction is also in accord with the dictionary definition of the applicable term. In discussing this issue in the office action response, plaintiffs used the terms waveform profile, waveform, model waveform, and shape of the expiratory waveform model interchangeably. The dictionary definition of a waveform is a graphic representation of the shape of a wave that indicates its characteristics (as frequency and amplitude), called also waveshape. Merriam-Webster's Medical
We do not accept plaintiffs' argument that the "shape" of the profile is separate and apart from the characteristics that define the profile. According to plaintiffs, the pressure profile's shape is "a bathtub." There is no support in the patent for such a construction. The only time that the patent describes how the waveform or profile might look it speaks to the pressure dropping off quickly at the start of expiration and then rising slowly toward the baseline pressure, which actually describes more of an off-center U, or rounded checkmark, shape, rather than a "bathtub" shape. '575 Patent, cl. 20, lns. 61-65. Regardless, in so describing this form, the patent labels it the "contour", not the shape, of the profile. Id.

Based on the patent language and the prosecution history, and buttressed by the dictionary definition of the relevant term, the shape of the pressure profile is its magnitude and duration. And, according to the plain language of the patent, these values must be set independently of any respiratory characteristic of the patient.

Finally, there is no support for plaintiff's argument that the magnitude and duration are not set in Claim 21 because Claim 22 recites the act of setting the magnitude or duration. Claim 22 claims an apparatus "comprising the means for setting" these values. A claim for the means for doing an act does not mean that Claim 21 does not claim the act itself.

Claim construction is a question of law, Markman v. Westview Instruments, Inc., 517 U.S. 370, 388, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996), which should begin by analyzing the words of the claim. Int'l Rectifier Corp. v. IXYS Corp., 361 F.3d 1363, 1369 (Fed. Cir. 2004). "Absent an express intent to impart a novel meaning to a claim term, the words take on the
ordinary and customary meanings attributed to them by those of ordinary skill in the art." Id. at 1370; Texas Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1202 (Fed. Cir. 2002) ("The terms used in the claims bear a 'heavy presumption' that they mean what they say and have the ordinary meaning that would be attributed to those words by persons skilled in the relevant art.") (internal citations omitted). Courts may consult dictionaries, encyclopedias and treatises to determine the ordinary and customary meanings of claim terms, Texas Digital, 308 F.3d at 1202; Intellectual Property Devel., Inc. v. UAColumbia Cablevision of Westchester, Inc., 336 F.3d 1308, 1314 (Fed. Cir. 2003), in addition to other "intrinsic evidence," namely, the claims themselves, the written description, 1 known as specifications, and prosecution history. 2 Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1346-1347 (Fed. Cir. 2004). The intrinsic record must be consulted "in every case to determine which of the possible dictionary meanings is consistent with the use of the claim term in the context of the claims and the written description[,] and to determine if the presumption of ordinary and customary meaning is rebutted," IXYS Corp., 361 F.3d at 1370, and whether the claim term encompasses more than one consistent dictionary definition. See Texas Digital, 308 F.3d at 1203 ("By examining relevant dictionaries . . . to ascertain possible meanings that would have been attributed to the words of the claims . . . the full breadth of the limitations intended by the inventor will be more accurately determined and the improper importation of unintended limitations from the written description into the claims will be more easily avoided."). While the specification cannot be used to limit the scope of a claim, it can "define a term already in a claim limitation, for a claim must be read in view of the specification of which it is part." Mueller Sports Med., Inc. v. Core Prods. Int'l, Inc., No. 02-445, 2003 U.S. Dist. LEXIS 24617, 2003 WL 23200261, at *1 (W.D. Wis. Mar. 3, 2003) (quoting Renishaw, PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1248 (Fed. Cir. 1998)); see also IXYS Corp., 361 F.3d at 1371 (noting that the court looked to "the written description for context and guidance as to the meanings attributed by those of ordinary skill in the art").

--- Footnotes ---

1 Specifications are written descriptions which describe the invention "in such clear, concise, and exact terms as to enable any person skilled in the art . . . to make and use the same." 35 U.S.C. § 112 (2000).

2 The Federal Circuit has agreed to re-examine the use of dictionaries in claim construction. See Phillips v. AWH Corp., 376 F.3d 1382, 2004 WL 1627271 (Fed. Cir. 2004). Because an independent review of the specification and patent claim language here supports the instant claim construction, as is described fully below, and because the dictionary definition wholly supports the construction as well, the outcome of Phillips v. AWH Corp. should have no effect here.

--- End Footnotes ---

An inventor can rebut the presumption that an ordinary and customary meaning for a claim term is appropriate by showing that he "has chosen to be his own lexicographer by clearly setting forth an explicit definition of the term" in the specification, Prima Tek II, LLC v. Polyplast, S.A.R.L., 318 F.3d 1143, 1148 (Fed. Cir. 2002); see also Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996) ("Usually [the specification] is dispositive; it is the single best guide to the meaning of a disputed term."). or by clearly limiting the scope of a claim with "words of manifest exclusion or restriction." IXYS Corp., 361 F.3d at 1370. The language must make clear "that the invention does not include a particular feature, [and] the feature is deemed to be outside the reach of the claims of the patent . . . ." Microsoft Corp., 357 F.3d at 1347.

The prosecution history, if in evidence, should then be examined to determine whether the doctrine of prosecution disclaimer has narrowed the ordinary meaning of the claim. Liquid Dynamics Corp. v. Vaughan Co., Inc., 355 F.3d 1361, 1368 (Fed. Cir. 2004). Here, the parties have not introduced prosecution history. (See Pl.'s Br. at 5 ("[N]o portion of the prosecution history is relevant to interpretation of the disputed terms.").) Finally, if the intrinsic evidence does not clarify ambiguities, extrinsic evidence "may also be considered, if needed to assist in determining the meaning or scope of technical terms in the claims." Vitronics Corp., 90 F.3d at 1583 (emphasis in original) (internal citations omitted).

I. SET 3

--- Footnotes ---

3 The parties do not dispute the definition of "reference" as used in the claims. (See Pl.'s Response Br. at 4.) Both the Oxford English Dictionary and the Webster's Third New International Dictionary, cited by defendant and plaintiff.
respectively, define "reference" as some basis for calibration or standardization. That construction comports with the
ordinary meaning that would be attributed to the term. Nothing in the written specification indicates an intent to ascribe
a different definition for the term either. Given the purpose of the patent and the ordinary meaning associated with the term
"reference," it will be defined as a "basis for comparative measurement or standardization." Although plaintiff defines the
term "reference" as a "means used or usable as a standard for calibrating data," that definition is less consistent with the
function of the reference set of colors as used in the patent than the formulation found in the Oxford English Dictionary. The
reference set of colors is not the standard for calibrating data; the absolute set of colors is the standard. The reference set
provides a basis for calibration or standardization as against the absolute set. Therefore, to the extent that the ordinary and
customey usage of the term "reference" denotes the standard for measurement, the claims make clear that the meaning of
"reference" deviates somewhat from that usage. The parties are in agreement however, in principle, that "reference" here
means a "basis for comparative measurement or standardization" as against the absolute set of colors, and for calculating a
compensation factor for the article to be color matched.

The parties dispute whether "set of colors" should be interpreted to require a "group of two or more colors, not a single
color" as plaintiff contends (Pl.'s Br. at 7), or any number of colors, including a single color, as the defendant argues. (Def.'s
Br. at 11.) The Webster's Third New International Dictionary defines a set as a "group of articles of uniform design."
Webster's Third Int'l Dictionary 2078, def. 39a (1993). The Oxford English Dictionary defines a set as a "number of things
grouped together according to a system of classification or conceived as forming a whole." Oxford English Dictionary 53,
def. 10a (Vol. XV 1989). Neither dictionary definition makes clear whether a set requires more than one article or thing.
Neither party seems to contest linguistically the definition for "set" established in either dictionary as the ordinary and
customey definition of the term. The disagreement centers, instead, in how each definition is interpreted. 4

4 Plaintiff also argues that using the plural form of "colours" in the disputed language indicates defendant's intent that a set
should be defined to require more than one color. Plaintiff asserts that defendant could have used a parenthetical plural, "of
colour(s)," to indicate that the set could include a single color. Because the defendant used parenthetical plurals, "colour(s),"
in other parts of the claims, plaintiff argues that defendant knew how to and did indicate when a single color was
permissible in drafting the claim. (Pl.'s Br. at 6.)

It is evident, however, that the patent language is not consistent or clear in indicating the plural or singular forms of the
terms. Claim 1, for instance, sets forth that the method is designed to color match "a first article with one or more articles."
('694 Patent, col. 6, l. 20) (emphasis added.) In the very next line, however, the claim speaks of "placing a strip displaying a
reference set of colours adjacent the associated articles." (Id. (emphasis added.) Although the inventor clearly expresses in
the first line that the scope of the patent includes color matching one or more associated articles, the second line reads only
in the plural, without the qualifying "one or more" language. (See also claim 3 (shifting from possible singular to plural in
the same line with language that the method enables "comparison of the colour(s) of the associated articles . . . with the
enhanced colours of the associated articles").) Of course, this example is not direct evidence that the inventors were simply
sloppy in their drafting of "reference set of colours" since they at least expressed once that a single associated article was
covered by the patent, but the example shows that the inventors' intent to require more than one color is not unequivocally
clear from their failure to use the parenthetical plural in "reference set of colours."

The Webster's Third New International Dictionary defines a "set" as a "group of things," and the term "group" is defined as
"two or more figures (as in sculptures or paintings) forming a distinctive unit complete in itself or forming part of a larger
of group -- expressly requires two or more constituent elements. Another definition of "group" that is not specific to
compositions of sculptures or artwork supports an understanding of "set" to require more than one constituent article as
well. A "group" is also an "assemblage of objects regarded as a unit because of their comparative segregation from others
<<a [approximately] of buildings>>." Id. at 1004, def. 2b. An "assemblage," in turn, is a "collection of . . . particular things:
aggregation," id. at 131, def. 1a, and a "collection" is defined as a "number of objects that has been collected . . . according
to some unifying principle or orderly arrangement." Id. at 444, def. 2. To "collect" is to "bring together into a . . . group . . . :
Regarding Claim Interpretation ("Def.'s Suppl.") at 1.) The parties' agreement is consistent with the general rule that a term consistently in the phrase "reference set of colors" and "absolute set of colors." (Pl.'s Suppl. at 1; Def.'s Supplemental Mem. of the disputed claim language") (internal citations omitted). Here, the parties agree that "set of colors" should be interpreted 1313 (Fed. Cir. 2004) (noting also that "the patent itself . . . is the most significant source of the legally operative meaning patent and in their technological and temporal context. See Smithkline Beecham Corp. v. Apotex, Corp., 365 F.3d 1306, purpose of the patented method do not bear out such a definition of "set." Claims must be read in light of the purpose of the or that the inventors intended the special mathematical understanding of "set" to control, the claims themselves and the relationship" or to "cause (as two or more things or ideas) to mix together: mingle, blend." Id. at 452, def. 2. Although hardly an unequivocal requirement that a set contain two or more things, the implication -- and common understanding -- of "grouping" requires more than one thing. 5 See also Paymaster Techs., Inc. v. United States, 54 Fed. Cl. 579, 585 (2002) (agreeing "with defendant's proffered definition of 'set' as that which connotes 'more than one thing of the same kind,'" pointing to definition in Webster's Ninth New Collegiate Dictionary 1077 (9th ed. 1985) and American Heritage Dictionary 1122 (2d ed. 1982), both of which define a set as "more than one thing of the same kind").

--- Footnotes ---

5 The Federal Circuit recently used a similar methodology -- defining the terms within a definition -- to construe a disputed claim. See Novartis Pharmaceuticals Corp. v. Eon Labs Mfg., Inc., 363 F.3d 1306, 1308-1310 (Fed. Cir. 2004) (looking at dictionary definition of "hydrosol" and then the terms used to define it -- "sol," "solution" and "medicinal" -- to construe claim).

--- End Footnotes ---

Defendant argues that the common understanding of a "set" includes sets which contain a single element and that the canons of claim construction prohibit unnecessarily narrow interpretations of the term. (Def.'s Br. at 2, 9.) Defendant offers the term "singleton" -- defined as "the only one of its kind or class; a set having only one member" -- as evidence that its interpretation, permitting a set with a single element, is the customary one. (Id. at 9 (quoting Oxford English Dictionary Vol XV, p. 524 (2d ed. 1989)).) That same argument was proffered and rejected by a court construing the phrase "set of lace eyelets." Mueller Sports, 2003 U.S. Dist. LEXIS 24617, 2003 WL 23200261, at *2-3. In Mueller Sports, the plaintiff sued for infringement of its patent for an adjustable ankle brace that included a set of lace eyelets on an eyelet strip which tied two ends of the brace together. Id. The central question in that case was whether a "set of lace eyelets" could "include a single eyelet . . . or whether a [person skilled in the field of the invention] would read 'set' as requiring two or more eyelets." 2003 U.S. Dist. LEXIS 24617, [WL] at *2. After examining the dictionary definition of set, the court rejected the plaintiff's contention that a set ordinarily denoted a group of one or more elements and noted that "[a]lthough in the field of mathematics it is possible to have a set of one or even zero ('null set') there is no - 15 - indication that a person skilled in the field of designing ankle braces is a mathematician or would understand the ordinary meaning of the word 'set' to be mathematical in nature." 2003 U.S. Dist. LEXIS 24617, [WL] at *3. Accordingly, the court defined "set" by what it considered a "common-sense definition": a group with two or more elements.

Id.

Similarly, here, there is no indication that an ordinary person skilled in the field of color-matching would import a special mathematical concept of set to define a reference set of colors. Although the patented computerized color-matching system arguably may require one versed in more rigorously analytic processes than one skilled in the field of designing ankle braces, defendant here points to no claim language that would indicate that the mathematical interpretation was the intended one. Instead, defendant invokes the common, everyday, "accepted usage" of the term "set" (Def.'s Response Br. at 1), which defendant contends may contain one or more elements. As described in Mueller and as defined in the dictionaries, however, the ordinary understanding of "set" requires two or more constituent elements.

Even if defendant were correct in stating that the ordinary definition of set encompasses sets containing only one element, or that the inventors intended the special mathematical understanding of "set" to control, the claims themselves and the purpose of the patented method do not bear out such a definition of "set." Claims must be read in light of the purpose of the patent and in their technological and temporal context. See Smithkline Beecham Corp. v. Apotex, Corp., 365 F.3d 1306, 1313 (Fed. Cir. 2004) (noting also that "the patent itself . . . is the most significant source of the legally operative meaning of the disputed claim language") (internal citations omitted). Here, the parties agree that "set of colors" should be interpreted consistently in the phrase "reference set of colors" and "absolute set of colors." (Pl.'s Suppl. at 1; Def.'s Supplemental Mem. Regarding Claim Interpretation ("Def.'s Suppl.") at 1.) The parties' agreement is consistent with the general rule that a term
will be interpreted uniformly throughout claims, and that "modifiers will not be added" to change the meaning of an unmodified term. Johnson Worldwide Assoc., Inc. v. Zeboco, Corp., 175 F.3d 985, 989 (Fed. Cir. 1999).

As is recited in Claim 1 of the '694 Patent, the end goal of the color-matching system is to generate a "colour map and/or enhanced photograph identifying the colour(s) of the associated articles relative to an absolute set of colours" so that an objective color-match can be made. ('694 Patent, col. 6, ll. 30-32; see Def.'s Suppl. at 6-7.) Assuming that an accurate compensation factor may be calculated by comparing the values for a reference set of colors and an absolute set of colors comprised of a single color, 6 that compensation factor would not do much to effect a preferred object of the patent: "to provide a method which can incorporate compensation factors to relate all colours against set standards." (See also Def.'s Br. at 5 ("[T]he significance of 'a reference set of colours' is that color data of the displayed light can be captured, analyzed, and used in identifying the colors of the article being color-matched relative to some 'absolute' or known set of colors (i.e., certain color data stored in computer memory).") If the patent meant for the absolute set of colors only to be a means to calculate a compensation factor, the language in the claim disclosing a method of generating a "colour map identifying colors of the associated articles relative to an absolute set of colors" would lose all meaning. ('694 Patent, col. 2, ll. 15-16; Pl.'s Suppl. at 3 ("Logically, if the absolute set included only one color, then the colors of the associated articles could be identified only as that one color. There would be no other colors to choose from for the color match.").) The matching colors are identified in the patent claim by printing the enhanced picture/color map "to enable comparison of the colour(s) of the associated articles as photographed with the enhanced colours of the associated articles against the absolute reference set." (Id. at col. 6, ll. 45-48 (emphasis added).) Comparing an article's colors against that of an absolute reference set with a single color would result in a binary match or no-match result, 7 effectively eviscerating the purpose of the patent. Because an absolute set of colors containing only a single color would render the color-matching system ineffective (or useless), the ordinary definition of set encompassing more than one element is the proper one.

--- Footnotes ---

6 Defendant states in its Supplemental Brief that a compensation factor may be calculated by comparing the value measured in a reference set of colors of one color against the value stored in the absolute set of colors. (See Def.'s Suppl. at 6.) Defendant illustrates that a compensation factor of one would follow from a reference set of colors "represented by a single value which is ... measured to be 76, and ... the stored 'absolute set of colours' (what the value for the light reflected from the reference strip would be expected to be under some defined conditions) is 77 ... ". (Id.) An article, like a tooth, which is photographed and the colors analyzed as 65, 59 and 62, could be calibrated by adding one, to "produce a color map with adjusted colors corresponding to values of 66, 60, and 63." (Id.)

7 Defendant's illustration in its Supplemental Brief described in note 5 supra shows why an absolute set of colors with a single color would not effect the purpose of the patented method. Despite being able to generate a color coded map having applied the compensation factor to the article's colors, creating a "map" showing that the values 66, 60 and 63 corresponded to the colors on the article, one could not compare those values effectively for the colors "against the absolute reference set" as claimed in Claim 3 if the absolute set contained only one color. The values of 66, 60 and 63 would have no meaning independent of some absolute set of values that corresponded to some known colors.

--- End Footnotes ---

The specification does not define set of colors with "reasonable clarity, deliberateness, and precision" as to render inappropriate the ordinary meaning or to show an intent that the inventors intended to act as their own lexicographers. Prima Tek, 318 F.3d at 1150. The specification is consistent with a definition of set that requires two or more colors. The patent discloses that a reference strip "may comprise samples of the reference porcelain shades" of teeth -- the plural "shades" and "samples" indicating that the reference set of colors may contain more than one color. (694 Patent, col. 3-4, ll. 68, 1.) In addition, the specification describes how the "coded map has been produced relative to a fixed set of standards[,]" or absolute set of colors, from which a dentist may "accurately match the colour of the cap or prosthetic tooth to the patient's teeth ...." (Id. at col. 5, ll. 53-56.) Although the specification does not require two or more colors in a set, it certainly does not state with clarity that a single color may comprise a set as well.

Accordingly, set will be defined by its ordinary dictionary definition as a group of two or more articles grouped together according to a system of classification.
II. COLOR

Plaintiff defines color as "the quality or attribute in virtue of which objects present different appearances to the eye, when considered with regard only to the kind of light reflected from their surfaces." Oxford's English Dictionary Vol. III, p. 499, def. 1 (2d ed. 1989); Pl.'s Response Br. at 3. Plaintiff claims that "color" should be defined with respect to the "appearance of an object to the eye" given the purpose of the patent to color-match articles and the specification, which describes shades, "not light or wavelengths." (Pl.'s Response at 3 (noting also that "[t]here is no suggestion that the dental technician mixes 'light' or lights of 'certain wavelengths' as [defendant's] argument would imply").) Defendant defines color as "a particular hue or tint, being one of the constituents into which white or 'colourless' light can be decomposed, the series of which constitutes the spectrum; also any mixture of these." Oxford's English Dictionary Vol. III, p. 499, def. 2a; Def.'s Br. at 9. 8

Because the color-matching system measures the color of an article by instrumentation, and not by human perception of the article, the defendant argues that the term "color" should be defined by its physical characteristics and not as a quality presented to the human eye. (Def.'s Br. at 5.) Defendant asserts that if "the quality [or appearance] of the reference strip were being measured, it would always be the same. It could be stored in the computer without any need to measure it under the same illumination as the article being color-matched." (Def.'s Reply at 4.)

8 In the Webster's Third New International Dictionary, the first definition of color relies on the physical "phenomena of light" that allow differentiation of objects; the second defines color based on the perception of one viewing an object; and the third combines aspects of the first and second definitions by defining color as "the characteristic of light by means of which two areas of identical size and shape that are juxtaposed, structure free, and steadily and uniformly illuminated may be distinguished by a human observer and which is commonly identified for spectral colors by complementary wavelength, luminance, and purity -- used in this sense as the psychophysical basis for measuring color which in turn makes it possible to define the limits for each color definition . . . ." Id. at 447, def. 1c.

In choosing among the dictionary definitions, "the intrinsic record must always be consulted to identify which of the different possible dictionary meanings of the claim terms in issue is most consistent with the use of the words by the inventor. If more than one dictionary definition is consistent with the use of the words in the intrinsic record, the claim terms may be construed to encompass all such consistent meanings." Texas Digital Systems, 308 F.3d at 1203. The purpose of the patented method is to mitigate the color mismatches which occur "in many industries, including automobile repair; paint and dye manufacture; printing; and fabric dyeing. Tooth colour matching is a major problem . . . ." (694 Patent, col. 1, ll. 9-14.) The goal of color-matching therefore is to present a uniform perception of color to observers of, for example, an automobile repair job, paint, printing, fabrics and repaired teeth. It is "the quality or attribute in virtue of which objects present different appearances to the eye, when considered with regard only to the kind of light reflected from their surfaces" that the method seeks to homogenize by calibrating for different light conditions and matching colors accordingly.

However, it is also evident that the patented method requires a computer to "analyze[c] colour data[,]" and "compare[] the reference set of colours against the absolute reference set of colours to determine the compensation factor." The computer cannot analyze the quality or attribute of an object as presented to a human eye or compare the qualities or attributes of an object; rather, it must analyze the physical characteristics of the reference set of colors and compare them to the absolute set of colors. In addition, a compensation factor could not be applied to the colors of an article as provided in the patent if color simply defined a quality or attribute as perceived by the eye. Instead, the compensation factor applies to the physical measurements taken from the object. (See Def.'s Reply at 2-3 ("[T]he claimed invention concerns measuring and analyzing physical characteristics of light by instrumentation. The significance of a 'reference set of colours' is that color data of the displayed light can be captured, analyzed, and compared with some 'absolute' or known color data stored in computer memory. The color data of the displayed light is representative of the spectral nature of that light -- that is, its colors.").)

The specification describes a "colour reference strip" with "samples of different porcelain shades . . . on the front thereof." (694 Patent, col. 4, ll. 47-49.) Plaintiff argues that the description of "shades" requires a construction of color that is focused on the quality of the object, and that no portion of the specification describes color in terms of the wavelengths of light or its physical characteristics. (Pl.'s Response at 3-4.) To the contrary, the specification does describe how a computer "compares the colour reference strip as photographed with an absolute reference strip to bring the two into conformity. This correction
factor is applied to the photograph data to create a corrected photograph . . . ." ('694 Patent, col. 5, ll. 30-34.) As mentioned above, if color were defined to relate simply to the perceived quality of an object, the computer would have nothing to compare, and could not apply a compensation factor to correct a color. Only if color is described also as a physical characteristic do the specification and patented claims have utility. The inventor did not patent a subjective color-matching system, but a "computerised colour matching" one. (Id. at col. 1, l. 7.)

In any case, the specification does not clearly -- and with unequivocal language -- disavow a construction of color encompassing defendant's proposed definition of color. The language does not make clear "that the invention does not include a particular feature, [and] the feature is deemed to be outside the reach of the claims of the patent . . . ." Microsoft Corp., 357 F.3d at 1347. Accordingly, color will be defined as a "particular hue or tint being one of the constituents into which white or 'colourless' light can be decomposed, the series of which constitutes the spectrum; also any mixture of these" as well as "the quality or attribute in virtue of which objects present different appearances to the eye."

CONCLUSION AND ORDER

Based on the ordinary and customary definition of the terms reference, set, and color, and consistent with the purpose of the patented claims and the specification, the Court construes the disputed claim language "reference set of colors" as a "group of two or more hues or tints, the quality or attribute in virtue of which objects present different appearances to the eye, that serves as a basis for comparative measurement or standardization." With the claim construction process completed, it is hereby

ORDERED that the parties confer and file a joint report proposing a schedule for the remainder of the case by September 3, 2004.

Vitronics, 90 F.3d at 1584 n.6. Plaintiff notes that a "set" is defined as "a collection of articles designed for use together: a set of china; a chess set." Random House Unabridged Dictionary 1752 (2d ed. 1993). Plaintiff contends that because "a chess set" is "a single object," a set does not require "any specific number of objects within the 'collection'" and therefore may contain only one item. Plt.'s Markman Br., dkt. # 13, at 8-9. The dictionary definition does not help plaintiff's cause. It makes clear that a set is a "collection of articles." A "collection" by definition involves more than one item. A collection is "[a] group of objects or works to be seen, studied or kept together," The American Heritage Dictionary of the English Language 362 (4th ed. 2000), or "a group of things or people." The New Oxford American Dictionary 335 (2001). Collection traces its origin to the Latin verb colligere, to "gather together." Id. One does not gather together a single item. Although in the field of mathematics it is possible to have a set of one or even zero (a "null set"), there is no indication that a person skilled in the field of designing ankle braces is a mathematician or would understand the ordinary meaning of the word "set" to be mathematical in nature. Moreover, although a chess set can be described as a single item, it is composed of multiple chess pieces and a board designed for use together. Just as a single pawn does not make a chess set, a single eyelet does not make a set of lace eyelets.

This common-sense definition is not "contradicted by any definition found in or ascertained by a reading of the patent documents.
Moreover, other courts have indicated that the term "set" requires two or more objects. In Karsten Mfg. Corp. v. Cleveland Golf Co., 242 F.3d 1376, 1379-80 (Fed. Cir. 2001), the Court of Appeals for the Federal Circuit affirmed the district court's holding that a "correlated set" of golf clubs "comprises two or more clubs which contain the same design characteristics [and are sold together as a set]." In an effort to distinguish Karsten, plaintiff argued at the Markman hearing that the "two or more clubs" limitation in that case hinged on the word "correlated," rather than the word "set." Not so. The term "correlated" was read by the court to impose the limitation that each club in the set contain the same design structure. See id. (noting that "term 'correlated set' . . . precluded infringement if the set of iron-type clubs is not completely correlated, that is, if any club does not have the claimed structure."). The "two or more clubs" limitation resulted from the claim term "set." Similarly, in Paymaster Technologies, Inc. v. United States, 54 Fed. Cl. 579 (2002), the Court of Federal Claims construed the claim term "form set" in the context of money order forms. The court concluded that the "definition of 'set' . . . connotes 'more than one thing of the same kind.'" Id. at 585. In that case, the court ultimately held that the term "form set" could include sets containing only one form, but only because the intrinsic evidence displaced the ordinary meaning of the term set. The patent applicant had acted as a lexicographer, both in the claim itself and in the specification, by defining a "form set" to include "at least one negotiable instrument sheet." Id. at 583 (emphasis added). Because the intrinsic evidence "clearly redefined the claim term," the ordinary meaning of "set" did not determine the term's meaning. Id. at 584-85. By contrast, plaintiff in this case does not argue that the patent applicant endowed the term "set" with any special meaning. Therefore, the ordinary meaning of the term controls, that is, that set connotes a group containing more than one item.

Plaintiff's best argument relies on the doctrine of claim differentiation. "Under the doctrine of claim differentiation, 'each claim in a patent is presumptively different in scope.'" Ecolab, Inc. v. Paracilpe Inc., 285 F.3d 1362, 1375 (Fed. Cir. 2002) (citation omitted). Plaintiff points out that claim 1 recites an eyelet strip "having a set of lace eyelets" and that claim 10 recites an eyelet strip "having a plurality of lace eyelets." The parties agree that "plurality" means "two or more." Thus, plaintiff argues, "the patentee's use of 'set' in claim 1, and 'plurality' in claim 10, was intended to convey different meanings: 'set' referred to 'one or more' lace eyelets, while 'plurality' referred to 'more than one' (or 'two or more') lace eyelets." Plt.'s Markman Br., dkt. # 13, at 9. However, the doctrine of "claim differentiation only creates a presumption that each claim in a patent has a different scope; it 'is not a hard and fast rule of construction.'" Kraft Foods, Inc. v. International Trading Co., 203 F.3d 1362, 1368 (Fed. Cir. 2000) (citation omitted). This is because "'claim differentiation can not broaden claims beyond their correct scope.'" Id. (citing Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1480 (Fed. Cir. 1998)). Although this formulation borders on the tautological (what could expand a claim beyond its correct scope?), the idea underlying this formulation makes sense. When the intrinsic evidence provides no support for construing two very similar words as having very different meanings, the doctrine of claim differentiation drops out of the equation, as it does in this case. The written description and the drawings indicate uniformly that the invention's eyelet carrier strips each carry multiple eyelets. The summary of the invention (not the description of the preferred embodiment) describes "a carrier strip that carries lace eyelets." There is no support in the intrinsic evidence for construing the phrase "set of lace eyelets" as including a single eyelet. Moreover, the idea that "claims are presumed to differ in scope does not mean that every limitation must be distinguished from its counterpart in another claim, but only that at least one limitation must differ." Id. Claims 1 and 10 differ in a number of respects in addition to the use of the word "set" in the former and "plurality" in the latter. Plaintiff does not argue that the only difference between the two claims lies in the supposed distinction between "set" and "plurality." Accordingly, I am not persuaded by plaintiff's claim differentiation argument. I conclude that the phrase "eyelet strip having a set of lace eyelets" means an "eyelet strip" having two or more eyelets.
the claim language by arguing that set screw is "a machine screw designed to be screwed through a metal part (as a collar) and to jam tightly upon another part (as a shaft) so as to prevent relative movement." Once again, defendants seek to improperly limit the definition to the specification by arguing that set screw is "a screw that is threaded into an object to interfere with the rotation of another object." See Pl's Markman Br. Ex. E. col. 5 ll. 42-44. For the reasons described above, the court will adopt Innovative's definition and find that "set screw" means "a machine screw designed to be screwed through a metal part (as a collar) and to jam tightly upon another part (as a shaft) so as to prevent relative movement."

2. "Set Stitch"

The term "set stitch" is found in both the method and product claims of the patents-in-suit. For example, in Claim 1 of the 779 Patent, a method claim, step (c) of the seam manufacturing process requires "sewing the first and second garment components and the bonding element together by a first set stitch running along the seam." 779 Patent at 6:37-39 (emphasis added). In Claim 20 of the 779 Patent, a product claim, the seam is defined as comprising "a first set stitch running along a first side of the seam and traversing through the bonding element . . . the first garment component . . . and . . . the second garment component. . . ." 779 Patent at 8:25-30 (emphasis added). The 615 Patent similarly uses the term in Claims 1 and 19, method and product claims, respectively. 615 Patent at 6:44-47, 8:17-22.

Taltech asks the Court to construe "set stitch" to mean "a stitch that sets' or firmly joins at least the bonding element and two layers of garment material to define their relationship in the garment seam but does not pass through the outer layer of garment material in the finished seam." Taltech relies on the claims, on the specifications, on the prosecution history of the patents-in-suit, and on the opinion of Taltech's expert, Mr. Nienke. Esquel asks the Court to construe "set stitch" to mean "a stitch used to hold two or more components together and is not visible in the final product." Esquel relies on the specifications, on the prosecution history of the 615 Patent, on a dictionary definition of "set," and on the opinion of Esquel's expert, Mr. Larry Haddock.

The parties agree that the "set stitch" "sets or joins." The parties disagree on whether the bonding element needs to be included in what is set or joined. Taltech also refers to "two layers of garment material," whereas Esquel refers to "two or more components" as being set by the stitch. Lastly, Taltech and Esquel use different language to convey that a set stitch does not pass through the outer layer of garment material and thus is not visible in the final product.

The first issue is whether the bonding element needs to be included in what is set or joined by a "set stitch." Every term found in a claim is presumed to have meaning and purpose. See RF Delaware, Inc. v. Pac. Keystone Techs., Inc., 326 F.3d 1255, 1264 (Fed. Cir. 2003). Taltech argues that the term "set" distinguishes a stitch that joins at least a bonding element and two layers of garment material from a stitch that merely joins two layers of garment material. Claims 1 and 20 of the 779 Patent and Claims 1 and 19 of the 615 Patent describe the "first set stitch" as traversing through the bonding element and the first and second garment components. 779 Patent at 6:37-39, 8:25-30; 615 Patent at 6:44-47, 8:17-22. In contrast, the "second stitch," in which the word "set" is notably missing, is described in Claims 1 and 19 of the 615 Patent as traversing through the first and second garment components and not the bonding element. 615 Patent at 6:56-60, 8:23-26; see ACTV, 346 F.3d at 1088 (considering the context of surrounding words of the claim). This distinction between "first set stitch" and "second stitch" lends support to Taltech's proposed construction. However, in Claims 1 and 20 of the 779 Patent, the "second stitch" traverses through the bonding element in addition to the first and second garment components. 779 Patent at 6:47-49, 8:31-37. As a result, the claims do not consistently use "set" to distinguish a stitch that joins a bonding element to other components from one that does not.

Taltech argues that the specifications show that a set stitch joins a bonding element to other components. 779 Patent at 4:4-9, 5:31-38; 615 Patent at 4:5-10, 5:32-39. While this may be true, the Court refuses to import a limitation from the specifications into the claims. See Teleflex, 299 F.3d at 1328.

The expert testimony relied upon by Taltech does not require a set stitch to join a bonding element to other components. Although Mr. Nienke recites Taltech's proposed construction (Nienke Decl., docket no. 96, P 22), he discusses how the term is used in the industry to describe a stitch where a seam is being constructed just using fabrics (i.e., not including a bonding element). See Nienke Decl. P 23.
Taltech argues that the prosecution history of the 779 Patent supports its proposed construction. See 779 Prosecution History, March 11, 1996, Amendment Filed Under 37 C.F.R. § 1.115, docket no. 85, Ex. D (part 2) at 13. Except for showing that the term "set" was added to the "first stitch" claim language, this evidence does not explain why the word "set" was added, other than "to clarify" and "to improve readability." Id. These proclaimed reasons are not particularly useful in assisting the Court's construction of "set stitch." What is clear is that nothing in the prosecution history of the 779 Patent indicates an intent to require the presence of a bonding element in the materials fixed by a "set stitch."

For all these reasons, the Court does not require that a bonding element be included in what is set or joined by a "set stitch." Next the Court must address Taltech's reference to "two layers of garment material" versus Esquel's reference to "two or more components." At the Markman hearing, Taltech emphasized that stitch 48 in Figure 4a is a set stitch and that it joins a bonding element to two layers of garment material (i.e., a folded over portion of a single garment component, the second garment component) and does not join a bonding element to two garment components. 779 Patent at 4:7-9 (describing first set stitch 38 in Figure 3a as "set sleeve stitch") and 5:34-42 (describing stitch 48 in Figure 4a as "needle set sleeve"). Although this is an accurate description of stitch 48 in Figure 4a, the Court hesitates to introduce a new term, "layers of garment material," into the definition of set stitch, when "garment component" is one of the disputed terms that the Court has been asked to construe. On a related note, at the Markman hearing, Esquel pointed out that although it advocates a construction in which a bonding element is not required to be joined by a set stitch, it does not urge the adoption of a construction that precludes the joining of a bonding element to a garment component by a set stitch. The Court modifies the first part of Taltech's proposed construction to read: "A stitch that sets or joins at least a garment component and a bonding element together, or at least two garment components together, to define their relationship in the garment seam. . . ."

Regarding the second part of the parties' proposed constructions of "set stitch," the prosecution history of the 615 Patent supports Taltech's construction that a "set stitch" "does not pass through the outer layer of garment material in the finished seam." 615 Prosecution History, March 11, 1996, Preliminary Amendment Filed Under 37 C.F.R. § 1.115, docket no. 85, Ex. E at 10. The Preliminary Amendment discusses how the "Benstock stitches" are deficient because they "fail[] to show a first set stitch' . . . and a second stitch' as claimed" in that they "protrude through the top fabric ply." Id. Esquel's proposed construction states that a set stitch "is not visible in the final product." Esquel's proposed construction does not appear to conflict with Taltech's proposed construction, but merely states it a different way. Taltech's proposed construction is more aligned with the wording in the prosecution history of the 615 Patent and will be adopted; however, for the same reason outlined above, the Court will use the construed term "garment component" in place of "layer of garment material."

Accordingly, the Court adopts Taltech's proposed construction, with modification, and construes the term "set stitch" to mean "a stitch that sets' or joins at least a garment component and a bonding element together, or at least two garment components together, to define their relationship in the garment seam, but does not pass through the outer garment component in the finished seam."

H. Settling modulation

The third limitation of the claim requires "settling modulation of servomechanism means dependent upon the optical disk standard data which corresponds with the processed optical signal." The plaintiffs contend that this term means "establishing the operational parameters of an electromechanical device." The defendants contend that the term means "permanently resolving and setting the regulation of an automatic feedback control system for mechanical motion."

Reading the patent as a whole, the court is persuaded that the patentee used the term "settling" to connote the meaning of "establish." The court is not persuaded, however, that the patentee used the term "modulation" in the narrow, and special, manner urged by the plaintiffs. It appears from the specification that after the type of disk has been identified, the regulation of the servomechanism is "settled" depending on the type of disk in the drive. The ordinary meaning of the term "modulate" suggests a "regulation" of the servomechanism, and the court is bound to give that term some effect. Finally, the term "servomechanism" as used in this claim limitation, refers to a device for mechanical motion controlled by some type of feedback system. Sybil P. Parker, McGraw-Hill Dictionary of Scientific and Technical Terms 1801 (5th Ed. 1994). The court therefore construes the phrase "settling modulation of servomechanism means dependent upon the optical disk standard data which corresponds with the processed optical signal" to mean "establishing the regulation of an automatic feedback control system for mechanical motion."
system for mechanical motion dependent upon the recognized arrangement of depressions for an optical storage medium which corresponds to the processed optical signal."

One of the patents' stated goals is to overcome deficiencies of the prior art and to alleviate its associated problems, for example, "ruptured containers," "explosive or overflow effervescence," "damage to containers," and "product leakage." '930 Patent, col. 1, ll. 12-17; col. 2, ll. 12-45. To convey to one of ordinary skill in the art the claimed solutions to the above problems, the patentee chose to use descriptive terms like "severe," "sharp," "accurately," "jarring," "smoothly," and "rapidly."

The defendants' primary complaint is that one of ordinary skill in the art would never know whether a particular vending machine infringed the patents-in-suit because, according to the defendants, the vending machine may infringe under certain circumstances, but may not infringe under others. According to the argument, one cannot measure the severity of an impact by reference to the amount of resulting effervescence because the amount of effervescence depends in part on variables such as geography and atmospheric pressure. Although this concern is not without some force, the court is persuaded that the claims are nonetheless amenable to construction, given the language in the specification and the nature of the art. In short, one of skill in the art would understand the boundaries of the claim.

The claims of the patents-in-suit need not be measurable by an entirely objective standard. Intertrust Techs. Corp. v. Microsoft Corp., 275 F. Supp. 2d 1031, 1046 (N.D. Cal. 2003); but cf. Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1350 (Fed. Cir. 2005) ("The scope of claim language cannot depend solely on the unrestrained, subjective opinion of a particular individual purportedly practicing the invention.") and Application of Musgrave, 431 F.2d 882, 893, 57 C.C.P.A. 1352 (1970) (noting that "[a] step requiring the exercise of subjective judgment without restriction might be objectionable as rendering a claim indefinite."). To one of ordinary skill in the art, a construction may allow for both a subjective and objective determination of claim scope. See Datamize, 417 F.3d at 1350; Orthokinetics, Inc. v. Safety Travel Chairs, Inc., 806 F.2d 1565, 1576 (Fed. Cir. 1986). Furthermore, even assuming that the patents did suggest an entirely objective test for measuring any of the above solutions to the prior art, under the defendants' argument, the results of such tests would likely vary based on relative geographical locations and meteorological conditions. This would require a boundless amount of objective criteria and data in support of the claims. See Orthokinetics, 806 F.2d at 1576; Datamize, 417 F.3d at 1350. 3

--- Footnotes ---

3 In Datamize, the court distinguished Orthokinetics, stating as follows:

The fact that the claims were intended to cover the use of the invention with various types of automobiles made no difference; we concluded that the phrase "so dimensioned" is as accurate as the subject matter permits since automobiles are of various sizes. Thus, in Orthokinetics we recognized that an objective definition encompassed by the claim term "so dimensioned" could be applied to innumerable specific automobiles. Although the patentee's choice of terminology relies in part on the subjective opinion of one of ordinary skill in the art, the court finds that the specification and prosecution history provide enough context and support to allow the term to be construed. Id. (internal citation omitted).

--- End Footnotes ---

In light of the language of the specification and the objects of the invention, the court defines "severe impact forces" as "impact forces such as jarring, rolling, dropping, or tipping having a magnitude sufficient to cause immediate effervescence and overflowing of carbonated beverages upon opening, or damage to a container/product such that the container or product is no longer suitable for consumption or sale."
3585

Limitation (f) of claim 24 reads:

(f) Severing edges of the expanded layer from surrounding soft tissue to form a differentially expanded tissue flap; and

The parties agree that the flap is separated from the surrounding soft tissue during this step. The main dispute is whether this step limits the creation of a flap to one separated at all but one edge. The court disagrees with defendants that this claim requires all but one edge of the flap to be severed, as there is no such limitation in the claim language. Particularly, after considering the principles of claim differentiation, it is notable that claim 25 requires "retaining one edge of the tissue flap connected to surrounding tissue." In light of this language, to maintain all claims as relevant, it is assumed that claim 24 is broader than claim 25 and can apply to situations where more than one edge remains connected to the surround tissue.

The court finds this limitation to mean "separating dividing lines of the expanded layer from the soft tissue along the outer points of the expanded tissue layer to render it capable of being used to cover an area greater than its original area."

3586

3. Element 1

With regard to element 1, Defendants argue that the term "shaft" typically represents a cylindrical, rectangular structure that extends from the ground surface downwardly. Thus, Defendants argue that Plaintiff is wrong when he interprets "shaft" to encompass any hole in the ground, no matter the size or shape. A horizontal trench is not a shaft. Defendants refer the Court to Figure 1 of the patent which shows the conduit as a single pipe, placed vertically in a shaft. To this, Plaintiff responds that Figure 1 depicts only the "preferred embodiment", but that the language contained in the claim does not limit the patent to the preferred embodiment.

Defendants further argue that this element provides that the shaft is excavated to a point within the contaminated area. Defendants argue that digging a hole to a point requires a specific geometry - which is a cylindrical hole in the ground.

Finally, Defendants argue element 1 limits the claim to a single shaft, not multiple shafts. Plaintiff responds that the claim language does not define the word shaft in any particular way. Relying on the definition in Webster's Third New International Unabridged Dictionary, shaft is simply an opening that extends from the ground surface downwardly to a location below the surface. No particular geometry is required. Nor does the language in element 1 limit the number of shafts in any way.

The dictionary definition of "shaft" is ". . . 4: any of various long hollow structures: as a (1): a vertical or inclined opening of uniform and limited cross section made for . . . ventilating underground workings (2) a passage resembling a mine shaft in structure or function (as in a cave or a pyramid). . . ." WEBSTER'S THIRD NEW INTERNATIONAL UNABRIDGED DICTIONARY ((c) 1961, 1993) at 2804. The dictionary definition thus suggests that the ordinary meaning of "shaft" is generally a long hollow structure. The claim adds the limitation to the term "shaft" as requiring this structure to extend from the ground surface to a point within the contaminated area. Thus, combining the ordinary meaning and the claim limitation, the Court concludes that the term "shaft" means a vertical or inclined hollow opening, of uniform and limited cross section, from the ground surface to a point in the contaminated area. Finally, the claim language does refer to a single shaft, not multiple shafts. The claim is thus limited to a single shaft.

4. prior to adding a fluid to the liner, has a shape corresponding to, and is a close fit within, the interior of the reservoir

(a) no definition necessary
(b) the liner has a shape as the interior of the reservoir before fluid is added to the liner so that the liner fits within the reservoir with little space between the exterior of the liner and the interior of the reservoir. ITW maintains that the exterior of the liner is formed to have the same geometrical shape and size as the interior walls and base of the reservoir before fluid is added to the liner so that the exterior of the empty liner is in contact with the interior side walls and base of the reservoir when the liner is inserted into the reservoir.

The crux of the dispute over this term is whether the liner must be in contact with and have the same "geometrical shape" as the reservoir. ITW maintains that the patent specification makes clear that such requirements exist, pointing to examples in the specification wherein the liner is described as being an "accurate" or "exact" fit inside the reservoir. Even assuming the terms in the specification dictate that the liner be in contact with the reservoir or have the same geometrical shape, the terms of the claim only direct that the liner be a "close fit." The Court is to avoid using elements of the specification to limit claim terms, see Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1325 (Fed. Cir. 2003), and it declines to do so in this case because any such construction would contradict the ordinary meanings of the terms. The Court again disagrees with the position of 3M that a definition is unnecessary but adopts its definition.

III. Shape Memory Alloy

Medtronic defines an SMA as "an alloy capable of undergoing a reversible transformation from an austenitic state to a martensitic state with a change of temperature and capable of displaying stress-induced martensite." (Medtronic's Proposed Order.) While BSC defines it as an alloy capable of transforming from austenite to thermal-induced martensite by being cooled, and if subsequently deformed, capable of regaining ("remembering") its original shape by being heated, the heat causing the thermal-induced martensite to transform back to austenite; the alloy is also capable of transforming from austenite to stress-induced martensite by being subjected to a deforming stress (without cooling), and transforming back from stress-induced martensite to austenite upon release of the stress.

(BSC's Proposed Order.) The Court adopts Medtronic's definition of SMA. BSC, again, adds the limiting language of "without cooling" to the formation of stress-induced martensite. What BSC omits in its more detailed discussion of SMA is that in order for thermal-induced martensite to form, the temperature of the alloy must be below its Ms - temperature. Any martensite formed above Ms resulted from the application of stress. Accordingly, the Court concludes that SMA is defined as an alloy capable of undergoing a reversible transformation from an austenitic state to a martensitic state either by cooling the alloy below its Ms temperature at zero stress or by applying sufficient stress to the austenite above its Ms temperature at zero stress.

2. "Shape memory alloy element" and "Memory alloy element"

The primary dispute between the parties is whether these terms must be construed to require that the "shape memory alloy element" be placed in a deformed shape, i.e. its martensitic state, solely by the application of stress. For the reasons set forth above, the Court rejects Gore's arguments on this point.

Accordingly, the Court construes the term "shape memory alloy element" to mean: "a device or device component made of an alloy that can be caused to revert, or to attempt to revert, from its unstable deformed shape to its stable, original state."
Claim 27 of the '433 Patent contains one disputed term. Claim 27, with the disputed term underlined, reads:

A tension member according to claim 25 wherein said engagement surface is shaped by an outer contour of said plurality of cords.

Schindler proposes construing the highlighted term as "an outermost layer or surface of the tension member wherein the entire outermost layer or surface comes into contact with a corresponding surface of the sheave and wherein the outermost layer or surface has a shape which is the same as the shape of a portion of each of the cords." The first portion of the phrase, "engagement surface," has already been defined in regard to Claim 25. The Court, therefore, must only construe the "is shaped by an outer contour of said plurality of cords" language.

Schindler asserts that the term "is shaped by an outer contour of said plurality of cords" should mean "has a shape which is the same as the shape of a portion of each of the cords." Otis asserts that the term does not require construction. The Court agrees with Otis. See O2 Micro, 521 F.3d at 1362.

The Court need not define the term "is shaped by an outer contour of said plurality of cords."

Claim 7 discloses:

A medical appliance comprising an inflatable bag shaped for active engagement solely with the human foot and substantially only in the region between the ball and heel of the foot, and cyclically operable automatic means for delivering pressure within said bag in accordance with the following criteria:

(a) a pressure rise to a predetermined maximum of 220 mm Hg or less within less than two seconds:

(b) holding said maximum for a period of up to five seconds before dropping the pressure;

(c) repeating pressure delivery pursuant to criteria (a) and (b) at a periodic interval which is in the range of 20 to 60 seconds.

The Board concluded that Dreiser and Rastgeldi establish the level of ordinary skill in the art 2 and that claims 7-14 of the 101 patent are obvious over Dreiser in view of Rastgeldi and Gaskell/Parrott. The Board found that it "would have been obvious to modify the inflation means taught by . . . Dreiser with the inflation criteria and holding period taught by Rastgeldi." Ex parte Novamedix, No. 97-2776 (PTO Bd. Patent App. & Interference Dec. 4, 1998) (Def.'s Ex. 1) at 2413. That finding assumed that the novelty of the 101 patent was only the "inventors' departure from normal ambulatory conditions involving the application of forces to the foot for a holding period of time which is not present in normal ambulation." (Def.'s Ex. 1 at 2400). It did not contemplate the different, and more narrow, construction that this Court has given to the term "active engagement" in the phrase. A medical appliance comprising an inflatable bag shaped for active engagement solely with the foot and substantially only in the region between the ball and heel of the foot. That term is now construed to "preclude[] additional inflatable bags activated in time-coincidence with the bag(s) directed to the plantar arch." Cl. Constr. Mem. at 5 (Jan. 12, 2001). The novelty of the patent thus involves, not only variable holding periods longer than those present in normal ambulation, but also the absence of any other pump involvements. "The fact of no other pump involvements means that foot-pump driven venous-return flow can be substantially unimpeded in its direct delivery."
c. "Shaped Substantially As Right Triangles"

The definition of this claim element appears to be undisputed. Defendant proffers the following construction: "shaped as a triangle in which one of the interior angles is substantially ninety degrees." (Def.'s Mot. for Summ. J. Ex. H (Webster's Third New International Dictionary 1956 (4th ed. 1976))). Plaintiff does not appear to dispute this construction. The use of the term "substantially" suggests that the objects in question are "approximately" right triangles. See Anchor Wall Sys. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1311-12 (Fed. Cir. 2003) (noting that "words of approximation, such as generally' and substantially,' are descriptive terms commonly used in patent claims to avoid a strict numerical boundary to the specified parameter" (internal quotations omitted; citations omitted)). Therefore, the court concludes that the claim language "shaped substantially as a right triangle" should be construed as follows: "shaped as a triangle in which one of the interior angles is approximately ninety degrees."

C. A Surface Shaped to Contact Said Skin Region (Claim 14)

Defendant seeks to add a parenthetical explaining that "shaped" means "not flat." This is contrary to the patent. The language of the claim, far from being "boundless" (Def.'s Preliminary Br. 18, Docket # 29), would exclude shapes that are, for example, sufficiently concave such that they contact the skin only at the outer edge. The specification specifically states that the contact surface "can be either convex or substantially flat." 568 Patent col.2 ll.23-24.

Principles of claim differentiation also counsel against such a construction. See, e.g., Comark Commc'ns, Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998). Claim 15 is dependant on claim 14 and adds only the limitation that the "surface is convex." Plaintiff's suggested construction excluding a flat surface from claim 14 would render claim 15 superfluous, as "convex or substantially flat" are the only shapes contemplated in this patent. This claim language needs no further construction.

5. "Shaped to Fit Substantially Water-Tight Within"

The term "shaped to fit substantially water-tight within" appears twice in Claim 5 of the '477 Patent. See '477 Patent col. 9 ll. 12-13 ("said body shaped to fit substantially water-tight within said port"); id. col. 9 ll. 15-17 ("elongate members . . . shaped to fit substantially water-tight within said one or more shafts"). Millipore initially sought to have this term construed
as "object A is shaped to fit substantially water-tight within object B if object A, alone or in combination with additional parts, when disposed within object B, causes a water-tight seal." (emphasis added).

Nothing in Claim 5 of the '477 Patent suggests that parts other than the elongate members and the body are required to be shaped to cause a water-tight seal. Millipore's addition of other parts is unsupported by intrinsic evidence. Consequently, I construe the term "shaped to fit substantially water-tight within the body," as Millipore now concedes, to mean that "the elongate member, when disposed within the body, causes a water-tight seal."

3595

1. Construction

I have construed "insertable into and through the tissue" above, and that construction applies to this claim as well. However, I have not yet construed the portion of the claim calling for an anchor member "shaped to normally assume a substantially straight configuration." Smith & Nephew asserts that "shaped to normally assume a substantially straight configuration" means that the "anchor member -- which can be either rigid or deformable -- is sufficiently straight to be inserted into a needle, and cannot include an angle of 135 [degrees] or less." Smith & Nephew's Reply at 14.

Biomet argues that the only references in the specification to a "normal" shape are in the context of describing the change in shape a resilient, deformable anchor makes from its bent position to its extended position. Biomet highlights the following from the specification: "The anchor member is located within the tip of the hollow needle in either a deformed U shape, or in its normal, substantially straight shape," Ex. A, col. 2, 1. 19-21 (emphasis added); "FIG. 6 is an enlarged perspective view of the anchor member and suture, showing the normal and deformed configuration of the anchor member," id., col. 3, 1. 49-51 (emphasis added); "Once expelled between the cartilage 18 and bone 38, the anchor member resiliently resumes its normal shape, as shown in FIG. 5," id., col. 4, 1. 42-45 (emphasis added); "As the anchor member 10 is pushed from the needle tip 26, it resumes its normal elongated shape," id., col. 6, 1. 43-45 (emphasis added); "Once the anchor member 10 has generally resumed its normal elongate shape behind the cartilage 18, the needle 14 and the tube 16 may be withdrawn from the joint, allowing the cartilage 18 to partially collapse around the anchor member 10 and suture 12 as shown in FIG. 5," id., col. 6, 1. 50-55 (emphasis added).

In addition, according to Biomet, the only drawings in the 691 patent are of deformable anchors. Therefore, the claim limitation that call for an anchor member that normally assumes a straight configuration must be limited to deformable anchors, as opposed to rigid anchors.

Smith & Nephew replies that the 691 patent expressly states that the anchor member "may be formed of a substantially rigid material." Id., col. 7, 1. 45-47. Furthermore, claim 14, which is dependent on claim 13, adds a limitation requiring the anchor member to be formed of resilient material. According to Smith & Nephew, since claim 14 expressly requires that the anchor be resilient, claim 13 cannot be construed to also require that the anchor member be made of resilient material. See Phillips v. AWH Corp., 415 F.3d 1303, 1315 (Fed. Cir. 2005) (en banc) ("the presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim").

In addition, Smith & Nephew provides prosecution history of the 691 patent. The phrase "shaped to normally assume a substantially straight configuration" was added to the claim in an amendment filed on June 19, 1992. The amendment contained an explanation that "the normally substantially straight configuration of the applicant's anchor member permits insertion of the member into a tubular delivery member, such as needle 54 (Fig. 8) . . . " Appendix "A" to Smith & Nephew's Corrected Reply Brief ("Appendix A"), Ex. V at 14 of 44. The applicant also distinguished a prior art reference which was not substantially straight, but had feet arranged at a 135 [degrees] angle. Id.

Biomet contends that Smith & Nephew cannot adequately distinguish claim 14 from claim 13. Claim 14 in its entirety reads, "The apparatus of claim 13 further characterized in that the anchor member is formed of resilient material that is absorbable by the tissue." Ex. A, col. 13, 1. 41-43 (emphasis added). Biomet argues that Smith & Nephew is attempting to replace the word "that" with the word "and." In fact, according to Biomet, claim 14 confirms that claim 13 describes a deformable, resilient anchor. According to Biomet, "resilient" means deformable because the two words are almost always used together in the specification, and convertible from one shape to another. Claim 14 simply adds the limitation that this resilient anchor
be absorbable by tissue.

I am not persuaded by Biomet's arguments. Much of the specification cited by Biomet also supports Smith & Nephew's argument, and demonstrates that the anchor member can be either rigid or deformable. See Ex. A, col. 2, l. 19-21 (anchor member may be in the needle either in its deformed shape or its straight shape) (emphasis added); Ex. A, col. 3, l. 49-51 (Figure 6 showing both an anchor member that is deformed and an anchor member that is straight). The other portions of the specification simply calls for an anchor member that, if deformed, will resume a straight shape.

In addition, I read claim 14 as adding two additional elements to claim 13—not only that the anchor member be made of resilient material, but also that the resilient material be absorbable by tissue. It is clear that the specification considers these to be separate characteristics. Ex. A, col. 11, l. 19-23 ("The anchor members may be formed of non-absorbable material (e.g. stainless steel of suitable resilience) that remains in the bone indefinitely). In addition, relying on Phillips, which permits me to consider unasserted claim terms used consistently throughout the patent in construing a meaning for a term in dispute, I consider claim 10. See Phillips, 415 F.3d at 1314. Claim 10 contains the disputed phrase "shaped to normally assume a substantially straight configuration," but also calls for an anchor member that is "formed of resilient material and deformable into the deformed position within the needle tip[,]" Ex. A, col. 12, l. 62-63. It is clear that claim 10 requires a resilient anchor member, while claim 13 makes no mention of the material from which the anchor member must be formed. Claim 10 would not need to add the limitation for a resilient and deformable anchor if that limitation were equivalent to "shaped to normally assume a substantially straight configuration."

Additionally, given that the specification expressly states that the anchor member may be formed of rigid material, and that the prosecution history supports Smith & Nephew's interpretation, I find that "shaped to normally assume a substantially straight configuration" means the anchor member must be sufficiently straight to be inserted into a needle.

"Shaped Throughout the Length Thereof"

Claim 1 discloses:

- a separator finger depending from said back between said side walls and inserted between said tracks, said separator finger being shaped throughout the length thereof for first holding the top of the male and female elements open while the slider first presses the bottom of the elements together and then permitting the slider to press the top of the elements together while the slider moves in a closing direction, said slider having shoulders projecting inwardly from said depending side walls and shaped throughout the length thereof for cooperation with said depending separator finger in creating the rolling action in opening and closing said reclosable interlocking male and female profile elements. U.S. Patent No. 5,007,143, col. 7, lines 4-17 (emphasis added).

SCJ argues that the phrase "shaped throughout the length thereof" means that the separator finger must be very wide on one end and then taper down to a thinner shape moving horizontally toward the opposite end of the zipper profile. Tenneco argues that the separator finger does not have to be any particular shape; rather, all the patent requires is that the separator finger is shaped such that it accomplishes its intended purpose. The Court agrees with Tenneco. Nothing in the patent specifies any particular shape for the separator finger. Instead, the patent equates the shape of the separator finger with the function that structure plays in the operation of the device. The claims do the same with respect to the slider. Thus the separator finger must be shaped to "first hold[] the top of the male and female elements open while the slider first presses the bottom of the elements together and then permit[s] the slider to press the top of the elements together while the slider moves in a closing direction." See U.S. Patent No. 5,007,143 at col. 7, lines 7-12, 60-65; col. 8, lines 47-51. The slider must be shaped "for cooperation with said depending separator finger in creating the rolling action . . . ." See id. at col. 7, lines 14-17; col. 7, line 67 - col. 8, line 2; col. 8, lines 53-56. If a separator finger shaped other than as SCJ described and if a slider shaped other than that disclosed in the figures of the '143 Patent can serve these specified functions, such shapes would fall within the scope of the '143 Patent's claims.
B. Effect of Prior Litigation

As stated above, SunTiger prevailed in a prior patent infringement suit against Scientific Research Funding Group (SRFG) on the same patents now in question. Both SunTiger and Sunglass Products have stipulated that the claim construction in the prior suit will control here:

The patents-in-suit have already been construed by the U.S. District Court for the Eastern District of Virginia [and that] construction . . . is binding on the parties in this case. To the extent that the terms in the asserted claims were not construed in the said prior litigation, the parties are asking the Court to make a claim construction based on the arguments submitted in the summary judgment motions.

Stipulation at 1-2. "In a patent litigation action, where the parties do not dispute any relevant facts regarding the accused product but disagree over possible claim interpretations, the question of literal infringement collapses into claim construction and is amenable to summary judgment." Rheox, Inc. v. Entact, Inc., 276 F.3d 1319, 1324 (Fed. Cir. 2002).

The relevant terms and their stipulated construction are as follows:

<table>
<thead>
<tr>
<th>Term</th>
<th>Stipulated Construction</th>

Plaintiff SunTiger contends that this Court cannot apply the stipulated construction in a way that would contradict the finding of the Eastern District of Virginia that YE-82 infringed SunTiger's patents. Pl.'s Mot. at 1 ("[T]he YE-82 lens material must literally infringe whatever claim construction the Court adopts in this case."). In essence, SunTiger argues the following: (1) the parties have stipulated to the prior construction, (2) the decision in the prior suit does not bind this Court, but (3) any ruling that this Court issues must not be inconsistent with the fact that YE-82 was found to infringe its patents.

I disagree with this assessment. My decision is not foreordained by the result in SunTiger, Inc. v. Scientific Research Funding Group. SunTiger attempts to elevate the prior claim construction to the level of a decision. Despite the parties' agreement that the prior claim construction would be binding, that prior court's decision applying its own construction is only persuasive. Although the parties have agreed to be bound to the use of the prior construction, they have not agreed that this Court's application of that construction must be consistent with prior decisions involving a different defendant and different lenses. Indeed, were consistency with prior results necessary, that would be tantamount to an improper form of collateral estoppel against a current party, i.e., Sunglass Products, which was not a party (nor a party in privity) to SunTiger v. Scientific Research Funding Group. Cf. MCA Records, Inc. v. Charly Records, Ltd., 865 F.Supp. 649, 654 (C.D. Cal. 1994) ("[D]ue process requires that the party to be estopped must have had an identity or community of interest with, and adequate representation by, the losing party in the first action as well as that the circumstances must have been such that the party to be estopped should reasonably have expected to be bound by the prior adjudication.").

I. CLAIM CONSTRUCTION.

Claim 54 of the 009 patent reads, in relevant part, as follows:

54. A cutting blade assembly . . . , said . . . assembly comprising:

a) a cutting blade having:

i) a front portion, said front portion including a sharp, forward cutting edge;

ii) a rear, trailing portion including a rear edge;

iii) a pair of side edges interconnecting said front portion and said rear trailing portion;

iv) at least one of said side edges being at least partially tapered; and

b) a blade holder [.]

Oasis contends that its replacement blade, the rear portion of which terminates in a triangular point, cannot infringe claim 54, which requires that rear trailing portion include a "rear edge." 1 According to Oasis' very brief memorandum, Oasis relies exclusively on what it believes will be the conclusion of the Court: that the rear point of the accused blade is not, either literally or by equivalents, a "rear edge" as properly construed.

--- Footnotes ---

1 Although Oasis did not mention the doctrine of equivalents until its Reply, Oasis has sufficiently set out its noninfringement contentions that the Court will consider, if necessary, noninfringement under the doctrine of equivalents as well.

--- End Footnotes ---

In its two paragraph claim construction argument, Oasis only cites to Webster's dictionary, urging a construction of "edge" as "a line or line segment that is the intersection of two plane faces (as of a pyramid), or of two planes." Oasis contends that this is the ordinary English meaning for the term. B&L counters that the term must be looked at through the eyes of one of
The claim element "rear, trailing portion including a rear edge" means the non-cutting face on the rear of the blade and a portion of the blade adjacent to this face. The rear edge can be, but is not required to be, generally parallel to the forward cutting edge of the front portion of the blade. The rear trailing portion can be generally trapezoidal or have other shapes.

The Court rejects both parties' proposals. While the meaning of "edge" in the claim is not as simple as Oasis suggests, it is not particularly esoteric. Looking to the intrinsic evidence and relying on common understanding and usage, the Court finds that the proper construction lies somewhere between the facile and the abstruse.

Part of the parties' difficulty in properly construing "rear edge" is caused by the fact that the limitation "edge" can itself have different meanings depending upon the context in which it is used. While in some instances, "edge" may describe the actual physical margin of intersection between two surfaces (e.g., "she cut herself on the sharp edge of the blade"), "edge" can also simply define the surface boundary created by that margin of intersection (e.g., "the quarter rolled off the edge of the table"). In the context of the relevant claim (Claim 54), "edge" is used in both senses.

Claim 54 specifies that the blade has three types of "edge": "cutting edge," "side edge," and "rear edge." While each type of "edge" must be interpreted individually, the nuances are clear from the context in which each type is used.

The "cutting edge" in claim 54 is described in both physical and relational boundary terms. It is a structure "included" in the "front portion" of the blade and is described physically as "sharp". It is also, however, described relationally: with respect to the rest of the blade it is "forward." Thus, not only is the "cutting edge" a physical structure, but it is a relational boundary that, by defining what will be considered the forward part of the blade, establishes the orientation for all of the other parts.

Likewise, the "rear edge" of the blade has dual meaning. In claim 54, the "rear edge" is physical, and is described as being "included" in the "rear portion" of the blade. In the 009 patent specification, it is also described in relational terms. The specification explains that in the preferred embodiment, the rear edge is "generally parallel to the forward cutting edge." Col. 11, Ins. 26-28. This statement would be meaningless unless the drafter meant to describe the two dimensional relationship between the front and rear surface borders. It must be noted that, in the relational, "border" sense, neither the specification nor claim 54 appear to place any shape limitations on the "rear edge." See col. 11, Ins. 49-51. Thus, the surface border defined by the rear margin may be any shape (e.g., linear, curved, triangular, scalloped, jagged) so long as at least some part of the surface border defined by the rear margin is at the rearmost point of the blade. 2

2 Note as well that while the specification leaves the "rear edge" open to not being parallel to the forward edge at all, the fact that all edges are defined in reference to the forward border supports a construction in which the forward cutting edge must by definition be perpendicular to what is considered to be the forward direction.

In contrast to the "cutting edge" or the "rear edge," the "side edges" of the blade are only ever described in relational terms. Both in the specification and the claims, the description of the "side edges" only makes sense if "edge" is interpreted as the border created by the margin of intersection, and not the margin itself. In claim 54, the "side edges" are described to be "at least partially tapered." In the context of the claims, the written description, the drawings and the prosecution history, it is clear that "tapered" only has meaning in describing the surface border of the blade as one looks from the forward portion to the rear portion of the blade. The drafter clearly meant to describe the shape of the blade's surface, not the shape of the margin of intersection. Another example of this kind of use is col. 11, Ins. 36-39, in which a preferred embodiment is described as having "rounded" side edges. The figure to which this passage refers (Fig. 7) confirms that the drafter meant "border," not "margin of intersection" (See Fig. 7, showing that rounded side edges are ones in which the side borders of the blade surface lack sharp corners).

While it might be argued that the drafter could have better described the invention by using separate words for either "border" or "margin of intersection," the Court finds that the differing meanings for "edge" in claim 54 can nonetheless be properly interpreted from context of the intrinsic evidence.
Thus, having considered the Motions, the papers filed in support of and in opposition to the Motions, the other pleadings and papers on file, as well as the evidence presented and the arguments of counsel at hearing, the Court arrives at this preliminary construction:

1. **INCLUDING A SHARP, FORWARD CUTTING EDGE** means "having a sharp margin of intersection between the top and bottom surfaces of the blade, in which the surface border defined by that margin also defines the forward most point of the blade."

2. **A PAIR OF SIDE EDGES INTERCONNECTING SAID FRONT PORTION AND SAID REAR TRAILING PORTION** means "the two surface borders, on each side of the blade, that are defined by the margin of intersection between the top and bottom surfaces of the blade and are adjacent to and/or continuous with the front and rear trailing portions of the blade."

3. **INCLUDING A REAR EDGE** means "having a margin of intersection between the top and bottom surfaces of the blade in which at least some part of the surface border defined by that margin is at the rearmost point of the blade. There is no limitation on the shape of the surface border defined by the margin of intersection."

3599

b. "sharp impact forces"

The court also agrees with Crane regarding the construction of "sharp impact forces." The phrase "sharp impact force" connotes an abrupt or sudden impact force sufficient to cause the undesirable result of an overflowing beverage or a damaged product. See '930 Patent, col. 3, ll. 12-17; col. 24, ll. 46-56. The court therefore defines "sharp impact forces" as "abrupt and sudden impact forces such as jarring, rolling, dropping, or tipping sufficient to cause immediate effervescence and overflowing of carbonated beverages upon opening, or damage to a container/product such that the container or product is no longer suitable for consumption or sale."

1. **Sheath**

The district court framed the dispute surrounding the "sheath" limitation as "whether the sheath described has a particular size range," ultimately concluding that it did not. Summary Judgment Decision, 345 F. Supp. 2d 466. It thus construed the term to mean "any tubular member of any size that can be used for accessing the vascular system through the skin and through which other devices and elements can be passed." Id. Grayzel asserts that the district court erroneously relied on a dictionary definition to trump both the intrinsic and extrinsic record in rendering its construction. He contends that the correct construction for the "sheath" limitation, based upon the intrinsic record, is "a SDH sheath for use in the SDH technique." For support, he relies on the "Summary and Objects of the Invention" section, which he argues describes the introducing catheter and sheath as an assembly used in the SDH technique at least sixteen times. He also relies on the prosecution history, in particular a statement Grayzel made in response to an office action disclosing that "basically, the present invention sets forth an introducing catheter and/or sheath having a beveled end."

We disagree with Grayzel. The '960 patent uses the term "sheath" in the ordinary sense of the word. First, as the district court noted, claim 13 recites that the "sheath" is "of a size for use in the vascular system for assisting in the insertion of other devices in blood vessels through the wall of the blood vessel." Second, as St. Jude points out, the specification expressly defines the term "sheath" as "[a] thin-walled outer tubular member" through which an operational catheter is inserted into the blood vessel. '960 patent, col. 1, ll. 58-59, 67-68. While that definition is disclosed in the "Background of the Invention" section of the specification in the context of describing the prior art, Grayzel does not depart from it when describing his invention. For example, the specification states in the context of describing figures 12, 13, and 14: "Once the sheath is in place, with entry to the lumen of the blood vessel properly dilated and the opening is secured, the introducing catheter 506 and the guide wire 514 can be removed leaving the sheath in place to allow for entry of the various devices that
will then be placed into the blood vessel." '960 patent, col. 10, ll. 17-22. Third, logically, it is unlikely that Grayzel would have defined the term "sheath" distinct from the prior art because his invention did not radically depart from the modified Seldinger technique. Rather his invention involved an improvement over the prior art wherein he simply terminated the tip of the prior art sheath at an angle to facilitate entry through the puncture site.

Given that the term "SDH sheath" does not appear anywhere in the '960 patent or its prosecution history, we suspect that Grayzel likely coined the term for purposes of this appeal. Indeed, the statements in the specification and prosecution history relied upon by Grayzel do not actually support his proffered construction. Instead, we read those statements to be consistent with an ordinary definition for the term as accorded by the district court. Additionally, we note that before the district court Grayzel argued only in favor of limiting the definition of "sheath" to a particular size range, numerical limits which the district court correctly found are not present in the intrinsic record. Grayzel did not advocate below that the term "sheath" means "SDH sheath." Accordingly, we agree with the district court's construction of the term "sheath" to mean "any tubular member of any size that can be used for accessing the vascular system through the skin and through which other devices and elements can be passed."

HEN contends that the term "sheathing" does not require any construction as anyone would understand the plain and ordinary meaning of this word. (HEN CC Br. at 25.) Minco proposes to construe "sheathing" to mean "the sheathing is attached to the outside of the conductive tube; it is not physically attached to the inside of the tube, and it is capable of being slide [sic] over, telescoped onto, the conductive tube." (Minco CC Br. at 34.) We agree with HEN that the term "sheathing" does not require any construction and we reject Minco's proposed construction because it would add limitations that have no basis in the claim, the specification, or the prosecution history.

First, the portion of Minco's proposed construction that states that the sheathing is attached to the outside of the conductive tube is unnecessary as it is apparent to us that this would be understood to be required by a person of ordinary skill in the art. See Phillips, 415 F.3d at 1314 (stating that the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges). Second, with respect to the proposed construction that the sheathing is not physically attached to the inside of the tube, Minco's argument in support of this proposed construction is merely that the claim does not specify that the sheath is attached to the tube's interior, and that it would go against common sense for a sheath to be attached to the inside of the tube. We find that this is an insufficient basis to import a limitation into the claim that the sheath cannot be attached to the inside of the tube.

Finally, Minco argues that the specification and the prosecution history illustrate that the patent applicants understood the sheath to be a separate pre-formed unit, that is later "telescoped," "joined to," or "bonded to" the outside of the conductive tube. According to Minco, the specification states that one of the principal advantages of the invention is the ability to "preassemble the probe on a production line basis." (Minco Ex. A, col. 3, l. 21.) Then the specification describes the sheathing as being "telescoped" over the major length of the tube. Minco asserts that "telescoped" commonly means to slide or pass one within another like the cylindrical sections of a hand telescope. Minco also points to the portion of the specification that states "tube 1 performs the dual function of providing support for elements there within [sic] which may be preassembled as a unit and then joined to the sheath 2 and support 16 in an economical manner." (Minco Ex. A, col. 3, ll. 23-28.) Therefore, Minco concludes based on specification that the sheathing must be a separate pre-formed unit, so that it can be later "telescoped," "joined to," or "bonded to" the outside of the conductive tube. Minco also contends that the figure contained in the specification supports its argument that the sheathing is a separate unit, capable of being slid over the tube.

We find that these arguments by Minco are meritless. Minco essentially asks us to construe a word, "telescoped," contained in the specification and then import this limitation from the specification into the claim. Additionally, the specification does not fully support Minco's proposed construction as it also states "[t]he sheath . . . is bonded [to the tube] in any convenient manner." It seems impossible that the sheathing could be bonded to the tube, as described in the specification, but also a separate unit capable of being slid over the tube, as Minco proposes in its construction. Contrary to Minco's proposed
construction, the claim only requires that the sheathing be attached to the exterior of the tube. See Minco Ex. A., col. 4, ll. 50-53.

Turning to Minco's prosecution history argument, it claims that HEN distinguished the prior art disclosed in Norburn (U.S. Patent No. 3,353,808) ("Norburn") and made other statements to the PTO thereby narrowing the construction of sheathing so that it does not include a molded-on refractory coating and that it must be a separate and distinct entity from the rest of the probe, capable of being slid on or telescoped over the tube. HEN made the following representation to the PTO concerning Norburn:

The Norburn patent has been cited as teaching the use of a sheath forming a shoulder, to which hollow support means abuts when receiving the probe. It is again submitted that the Examiner's reliance upon the Norburn patent for this teaching is misplaced. The Norburn patent discloses a refractory coated oxygen lance which includes a generally central section of tubing (14) which is press-fitted onto a portion of a surrounding tubing called the "rear section" (11) formed of relatively thick, black iron pipe. The two tubes are press-fitted together by heating both tubes and then installing a portion of tube 14 into the end of tube 11. Because the tubes are of differing outer diameters, a shoulder is formed. Thereafter, a heat-resistant refractory coating (15) is applied over the entire length of tubing (14) and over a portion of tube (11). Preferably, the coating is molded onto the tubes. Thus, the protective coating (15) cannot be said to be a "sheath" in the same manner as applicant's sheath. In addition, the coating does not initially contain a shoulder which abuts against a hollow support tube in the manner of applicants' claimed invention. Instead, to the extent the coating includes a shoulder, the shoulder is formed only when the coating is applied to conform to the fitted-together tubes. . . . Thus, none of the references cited by the Examiner teaches the applicants' claimed concept of employing such an abutting shoulder arrangement.

(Minco App. 4J at HEN000144-145) (emphasis omitted). Minco only points to a portion of this quote in its argument. However, after examining HEN's entire statement regarding Norburn, we conclude that HEN distinguished the sheathing in its claim from the Norburn sheathing based on the formation of a shoulder, and not based on whether the sheathing was molded or not molded onto the probe's electrically conductive tube. Minco's other references to the prosecution history are similarly unavailing. Consequently, we find that HEN has not made a clear disavowal of claim coverage regarding whether the sheathing can or cannot be molded onto the conductive tube, or whether it must be a separate unit that is capable of being slid on and off the probe.

1. "Sheet" and "Sheet-like"

The parties contend that the proper construction of claim terms "members of conductive sheet material" (claim 1) and "electrically conductive sheet-like members" (claim 6) is critical to this appeal. We agree. The pertinent portion of the district court's "claim meanings" reads as follows (emphasis added):

"Sheet" or "sheet-like" mean conductive material that can be shaped to furnish electrical contact between the resistor and the outside contact in the steering column and can be shaped into contacts with a long dimension along the axis of the key. The use of the sheet in the claims merely shows the advantages of that method and is not a part of the claim.

The district court erred when it instructed the jury that the use of the term "sheet" is "not a part of the claim." The claimed "members of conductive sheet material" (claim 1) and "electrically conductive sheet-like members" (claim 6) are clearly limitations of the claims. Although the claims themselves do not define the terms "sheet" and "sheet-like," the specification variously refers to "sheet metal," "flat sheet metal," "conductive sheet metal," and "electronically conductive sheet metal." In addition, the applicants added the references to "sheet" and "sheet-like" to the independent claims in their response to the first examiner's action. This is apparent from the following example, which is the result of our comparison between originally filed claim 1 and issued claim 1 (text that is present in the issued claim but absent from the original claim is underlined and text that is absent from the issued claim but present in the original claim is bracketed):

A packaged electronic component includes an insulating body, [completely enclosing] an electronic chip disposed within the insulating body and having a pair of terminals, and two members of conductive sheet material which connect to opposite terminals, the two members extending laterally from said terminals to the outside of the insulating body and forming a pair
of runner-like leads that terminate said laterally extending members [which are electrically connected to the terminals of the chip and which extend outwardly from said body, said leads being particularly adapted for making and breaking sliding electrical contact with stationary contacts in an electronic circuit].

As may be seen, the added limitations more particularly define how the terminals of the electronic chip are electrically connected to the runner-like leads. In their amended claim, the applicants made it clear that conductive sheet material connects to the terminals of the electronic chip and forms the runner-like leads. Similar limitations were added in the other independent claim that eventually issued as independent claim 6. Importantly, the applicants also specifically relied on these new limitations in the remarks portion of their first amendment. They distinguished the teachings of U.S. Patent No. 3,808,506, which describes wire leads electrically connecting circuit elements to button contact pads, by arguing that in their claimed invention the electrical connection between the electronic chip and the runner-like leads is provided by members of conductive sheet material, as opposed to wire leads, extending laterally from the terminals of the electronic chip to the outside of the insulating body.

A review of the '482 patent and its prosecution history reveals that the terms "sheet" and "sheet-like" do not have any special meanings in the art and that the '482 inventors used these terms in their ordinary, everyday sense, i.e., to describe something flat with a fairly broad surface relative to its thickness. The claims thus include within their literal scope only devices with conductive material that comprises a fairly broad surface relative to its thickness.

A. "Sheet"

Claim 1 of the '418 patent describes "an implantable sheet for implantation in a body . . . ." Plaintiffs propose that "sheet" means "a relatively thin structure, such as a layer or covering." Gore contends that the term refers to "a piece of material having a length, width and thickness."

Plaintiffs rely upon the dictionary definition of "sheet." See Pl. Claim Constr. Mem., Ex. H, Random House Dictionary of the English Language Second Edition, at 1762 (1987). While a court may rely on a dictionary to construe ordinary and customary claim terms, it may only do so when it considers the definition in the context of intrinsic evidence and only then to the extent that the "definition does not contradict any definition found in or ascertained by a reading of the patent documents." Phillips, 415 F.3d at 1318-19, 1322-23. Gore claims that Plaintiffs' proposed construction is contrary to the preferred embodiments of the expander identified within the '418 patent's Abstract, Summary of the Invention and Detailed Description. However, Gore fails to specify how the phrase "a relatively thin structure, such as a layer or covering" necessarily precludes expandable structures. Considering the proposed definitions in the context of the intrinsic evidence presented, the Court concludes that Plaintiffs' proposed construction comports with the specification and language of the claim. In contrast, Gore's proposed construction of "sheet" is overbroad and would include nearly every conceivable tangible object, regardless of the object's thickness. Accordingly, the Court determines that the term "sheet" means "a relatively thin structure, such as a layer or covering."

The parties argue extensively over what constitutes a "sheet of flexible material." Ludlow contends that a sheet consists of a single layer of material, while ConMed posits that a "sheet," as used in the '511 patent, can consist of one or more layers. The distinction is important because, whereas the '511 patent contemplates the conductive paint, conductive adhesive and patient adhesive all applied directly to one side of the flexible backer, the 210 has a small layer of polyester between the flexible backer and the conductive paint and conductive adhesive. If, as ConMed contends, a "sheet of flexible material" includes both the flexible backer and the smaller, polyester layer affixed thereto, then the 210 is substantially similar to the '511 patent such that, provided all the other elements of the claim are present in the 210, it infringes upon the '511 patent's monopoly. If, on the other hand, a "sheet of flexible material" cannot be so defined, then the 210 does not contain all the elements of the '511 patent, and therefore, does not infringe upon it.
The '511 patent itself does not explicitly define the term "sheet." The use of the term within the patent suggests that it refers to a thin, continuous, flat layer of material. Nowhere within the claims or the specification of the '511 patent does the term "sheet" refer to multiple layers of different materials or elements or multiple layers of dimensionally different materials. For example, that portion of the specification discussing Figures 17 and 18 provides, in part, as follows:

Reference number 212 identifies a substrate such as a paper tape substrate and the reference number 214 identifies a pressure sensitive patient adhesive adhered to and entirely covering one surface of the substrate 212. The substrate 212 is … a relatively narrow strip having an indefinite length. Adhered centrally to the exposed surface of the patient adhesive and extending longitudinally the entire length of the substrate 212 is a thin carrier sheet 216 of flexible and dimensionally stable material such as polyethylene terephthalate. The width of the sheet 216 is less than the width of the substrate 212 so as to leave to each side of the sheet 216 a margin 218 comprising the more aggressive patient adhesive. Applied longitudinally and centrally to the lower face of the sheet 216 is a stripe 220 of a conductive paint. The stripe 220 is narrower than the sheet 216 so that margins 222 remain on the sheet 216 for receiving a layer 224 of conductive adhesive which fully covers the conductive stripe 220 and also shields the side edges of such stripes.

(See Griem Aff. Ex. C, Col. 13 at line 64.) The specification references item 216 as a "thin carrier sheet of a flexible and dimensionally stable material such as polyethylene terephthalate." (See Powers Aff., Ex. A at col. 14.) Item 216 is a single layer element (plastic) that attaches to the substrate. (Id.) This portion of the application never refers to the substrate together with the flexible material (i.e. multiple layers) as a sheet as ConMed now argues. Rather, the specification refers solely to the flexible material 216 (which is dimensionally different than the underlying substrate) as the sheet. As another example, the specification states that "in a tenth embodiment … each of the electrodes comprises a substrate having the jigsaw puzzle shape and coated on one face by a patient adhesive to which is mounted a relatively narrow sheet of dimensionally stable plastic material." (Id. at col. 2.) Again, this does not contemplate multiple layers or different materials. Similarly, when discussing the fifth embodiment, the specification states that "a medical electrode is formed from a conductor comprising a suitably formed plastic sheet having a thin layer of electrically conductive, paintable material adhered to one face thereof ...." (See id. at col. 2.) 10

10 See also id. ("In an eighth embodiment, a substrate is covered on one face thereof … to which is centrally adhered a sheet of dimensionally stable nonconductive materials, such as plastic …."); id. at col XXX ("Conductive adhesives available in sheet form can be applied directly to the surface of the substrate 132 over the conductive layer 134 or the conductive adhesive could be applied by spraying, silk screen, casting, or other processes.")

This use of the term "sheet" throughout the specification and the claims accords with the ordinary dictionary definition, which provides that a "sheet" is

2. a broad, relatively thin, surface, layer, or covering. 3. a relatively thin, usually rectangular form, piece, plate, or slab …. 4. material, as metal or glass, in the form of broad relatively thin pieces.

The Random House Dict. of the English Language at 1313 (Random House 1979); see also Oxford English Dict., at http://dictionary.oed.com (Oxford Univ. Press 2002) ("A broad expanse or stretch of something lying out flat … forming a relatively thin covering or layer."); Webster's II New Riverside Univ. Dict. at 1073 (Riverside Publ. 1994) ("a broad, thin, usually rectangular piece of material, as paper, metal, glass or wood."); The Am. Heritage Dict. of the English Language, at http://www.bartleby.com (4th ed. 2000) ("A broad, flat, continuous surface or expanse.").

Nothing in the patent itself or the ordinary use of the term defines the term "sheet" to include multiple layers or a piece of material with a dimensionally different (i.e. smaller) type of material affixed to it. Of course, the materials comprising the sheet may be composites made up of different elements. For example, sheets of plywood, paper or plastic may be composites of different elements. A sheet of plywood is made up of thin layers of wood that are glued together. A sheet of plastic is comprised of the various elements that make up the plastic. This, however, should be distinguished from multiple layers of different materials and multiple layers of dimensionally different materials. Thus, a sheet of plywood with a smaller piece of plywood attached to it is no longer referred to as a sheet of plywood. Similarly, a sheet of plywood with a
smaller piece of plastic adhered thereto is not ordinarily referred to as a sheet. 11 To summarize, the term "sheet" may include material made up of different elements and may even include multiple layers of material that are dimensionally the same. When various layers are pressed together, however, to retain the characteristics of a "sheet," the material must have a continuous, flat surface (e.g. a bed sheet, a sheet of wood, a sheet of paper, or a sheet of ice). By placing a dimensionally different (e.g. a smaller) material on top of a sheet of flexible material, it loses its sheet-like characteristics because it loses its continuous, flat shape. Thus, as used in the '511 patent's claims, the term "sheet of flexible material" does not include dimensionally different materials affixed to the flexible backer.

11 ConMed's reference to the use of the term "sheet" in prior art in the field of invention is unavailing and may work against its argument. ConMed cites to patent no. 3,989,035 ("the '035 patent") which has a "disposable pre-gelled medical electrode … wherein said carrier sheet is formed of a multiply sheet of polypropylene." (ConMed Mem. of Law at 8 (emphasis added).) According to ConMed, "this reference for a disposable medical electrode expressly identifies a single 'sheet' as having multiple layers." (Id.) This argument is unpersuasive because, in the '035 patent, the patentee expressly defined the term sheet to be "multi-ply." The term "ply" means "one thickness or layer." Random House Dict. at 1108. The prefix "multi" means "many." Id. at 939. Thus, the '035 patentee ensured that his use of the term "sheet" included multiple layers. The converse of this is that the term "sheet" does not ordinarily encompass multiple layers. Cartmell made no effort to define the term sheet to include multiple layers.

As ConMed points out, there is a rule of patent construction that "an indefinite article 'a' or 'an' in patent parlance carries the meaning of 'one or more' in open-ended claims containing the transitional phrase 'comprising.'" KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000). Applying this rule of claim construction, ConMed's patent can be interpreted as follows: one or more sheets of flexible material and one or more conductive paints adhered to one face of said sheet … wherein said electrode further comprises one or more layers of adhesive means on said one face of said sheet. (See Powers Aff., Ex. A, col. 16.) The problem with applying this rule here is that the claim requires, among other things, that "a conductive paint [be] adhered to one face of said sheet" and that a "layer of adhesive means [be applied] on said one face of said sheet." (Id. (emphasis added).) This part of the claim does not contemplate the plural form of sheet, but, rather, refers only to the singular form. Thus, the parts of the claim limiting application of the adhesive and conductive paint to "one face of said sheet" suggest only one sheet. Even if the claim contemplates multiple layers of flexible material as comprising the sheet, the claim still requires that both the conductive paint and the patient adhesive be applied to "one face of said sheet." (Id.)

Confortex contends that a "sheet" exists only if there is a continuous expanse of material. The "Shangri-La", therefore, does not include a "sheet" because the front and back fabric panels of its product are actually composite strips. In effect, neither a "first" nor a "second" "sheet of relatively translucent material" exists on the "Shangri-La."

Hunter Douglas, however, asserts that the method used to produce the "Shangri-La" product is irrelevant here because the claims at issue are product claims. Instead, the important consideration is that in its final state, the front and rear fabric panels of the "Shangri-La" are in fact "sheets" rather than composite strips much like woven thread is a sheet of fabric rather than composite threads. Hunter Douglas cites to Exxon Chemical Patents, Inc. v. Lubrizol Corp., 64 F.3d 1553 (Fed. Cir. 1995) for the proposition that "a product claim is infringed by any product containing every claim limitation, regardless of how the product is made." Id. at 1557 n.4. (citing Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1535 (Fed. Cir. 1991)). This principle of patent law, however, ultimately sheds no light on the present action. 6

6 In Exxon, plaintiff claimed defendant infringed on its patent for a lubricating oil composition. Plaintiff proffered an interpretation of the claim at issue which would allow a finder of fact to find infringement if defendant used all of the ingredients of plaintiff's composition regardless of the relative proportion of each ingredient. 64 F.3d at 1557. Defendant, on
the other hand, argued that infringement could be found only if the ingredients of plaintiff's composition were found in defendant's final product. Id. at 1558. The court, however, found no "temporal limitation to the term 'composition'" either in the specification or the patent's prosecution history. Id. Accordingly, the court held that defendant could be found to infringe if defendant's product "at some time contained each of the claimed recipe ingredients in the amounts specifically claimed." Id.

Similarly, here, there is no temporal limitation on the term "sheet". As a result, given the teaching of Exxon, whether one has a "first" and "second" "sheet" in the final stage of the product or at some other point in the manufacturing process is irrelevant. The critical inquiry is whether first and second "sheets" are present. Thus, we are left with the same problem - are Comfortex's "composite strips" or "composite facings" the same as Hunter Douglas's first and second "sheets"?

More important is the fact that neither the specifications nor the prosecution history clearly set forth the definition of "sheet" as it is used in the '999 patent. The specifications use terms such as "first and second parallel sheer fabric sides", col. 2, l. 55, "first sheer fabric sheet [and] a second sheer fabric sheet", col. 3, ll. 40-41, see also col.3, ll. 55-56, "first sheer fabric", col. 4, l. 23, and "second sheer fabric", col. 4, ll. 25-26. The prosecution history is similarly varied. See Comfortex Book Exs., Ex. 6, p.2, l. 24 ("first and second parallel sheer fabric sides"); id. at p.6 ll. 18-19 ("a first sheer fabric sheet"); id. at p.8, line 21 ("sheer fabrics"); id. at p. 30, l.14 ("first and second sheer fabrics"); id. at p.41, ll. 24 ("first wide sheet material"); id. at claim 50, p. 60, l.21 ("first sheet of material"); id. at claim 76 ("a first sheet of material, a second sheet of material"); id. at claim 237 ("first sheet of relatively translucent material"). Indeed, during the final stages of the application process, Colson requested that a reference to "sides" be changed to "sheets of differing texture, weave and openness." Id. at Ex. 6H, 2/9/1994 Supplemental Amendment. The PTO rejected the amendment on March 15, 1994 because such a change would "necessitate consideration of new matter." One possible inference from the rejected amendment is that both Colson and the PTO recognized a difference between "sides" and "sheets". This is, however, far from conclusive pronouncement.

In the final analysis, the Court is left with two reasonable interpretations of a malleable term. If only the law permitted declarations of a tie much difficulty could be avoided. However, "when a claim term can reasonably be given two meanings and neither the specification nor the file history provide a clear basis for selecting one, the court will adopt the narrower one, which tends to show noninfringement, on the ground that the patentee is ultimately responsible for the drafting of the claim language," Chisum, supra at 18:03[1] (1997 Supp.) (citing Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 93 F.3d 1572, 1581 (Fed. Cir. 1996) (limiting interpretation to narrower of two alternatives); Athletic Alternatives, Inc. v. Prince Manufacturing, Inc., 73 F.3d 1573, 1581 (Fed. Cir. 1996) (holding notice function requires that a claim be interpreted only as broadly as its unambiguous scope). Here, the narrower construction of the term "sheet" favors Comfortex. As a result, Comfortex's "composite strip" or "composite facing" escapes the reach of Hunter Douglas's "sheet.

3606

Although the Weber patent contains 27 Claims, only Claim 1 is relevant to this litigation. The other 26 Claims contain all of the limitations described in Claim 1, the exact language of which is as follows:

A machine for accumulating folded sheets into brochures and like products, comprising:

(a) a sheet transporting device arranged to advance sheets having folded backs in a predetermined direction along a predetermined path and including:

1. at least two elongated parallel carriers and
2. discrete conveyor means for each of said carriers,
3. each of said conveyor means having means for advancing sheets along the respective carrier; and

(b) means for feeding sheets to said carriers so that the backs of the sheets straddle the respective carriers, comprising
1. a first feeding unit having means for depositing first sheets onto successive carriers in a first portion of said path and

2. at least one additional feeding unit having means for depositing second sheets over successive first sheets in a second portion of said path downstream of the first portion so that the backs of the second sheets straddle the backs of the respective first sheets and form therewith accumulations of first and second sheets wherein the backs of the second sheets are accessible.

(emphasis added)

In memoranda filed in this Court and in oral argument, the parties agree that whether the Meier '755 patent anticipates the Weber patent depends upon the meaning of "sheets" and upon the meaning of "discrete conveyor means for each of said carriers." Because plaintiffs must show that every element of the Weber patent is anticipated by the asserted anticipating reference in order to obtain the declaratory judgment they seek, if either the first or the second point of dispute is found against the plaintiffs, then the plaintiffs' invalidity contention cannot prevail. For this reason, only the "sheets" issue is discussed here, as it is dispositive of this motion.

A.

Whether the term "sheets" is a claim limitation which must be met to prove anticipation is itself a point of contention between the parties. Plaintiffs maintain that the form of paper used is irrelevant. "The sheets (are not) part of the machine. It's a machine that's working on sheets." Hearing Transcript at 30. Plaintiffs argue that even if "sheets" did specifically 'call for discrete or separate sheets, it would not be limited as a matter of law because the limitation does nothing to 'define the invention', i.e., patentably distinguish it from the prior art." Plaintiffs' Memorandum in Response to Defendant's Post-Hearing Memorandum and Proposed Findings of Fact at 7. Defendant disagrees, noting that the term "sheets" is set forth in the preamble of Weber Claim 1 and is repeated eight times in the body of the claim, and contending that the term "sheets" is "necessary to give meaning to the claim and properly define properly the invention," and is thus an affirmative limitation of the claim. Gerber Garment Technology v. Lectra Sys., Inc., 916 F.2d 683, 688 (Fed. Cir. 1990).

The importance of a term, be it a word used in the claim preamble or in the claim itself, depends upon the "entirety of the patent to gain an understanding of what the inventors actually invented and intended to encompass by the claim." Corning Glass Works v. Sumitomo Elec. U.S.A., Inc., 868 F.2d 1251, 1257 (Fed. Cir. 1989); see also In re Stencel, 828 F.2d 751, 754 (Fed. Cir. 1987). In certain circumstances, terms used in a claim preamble and repeated throughout the body of the claim (such as "sheets" in the Weber patent) become claim limitations, and these claim limitations must be taken into account in construing the patent. For example, the term "cutting blade" was interpreted to be a claim limitation because, inter alia, it "is referenced repeatedly in the body of the claim. It is integral to the claim itself." Gerber Garment, 916 F.2d at 689.

The focus on "sheets" may appear to be inappropriate; as plaintiffs observe, the Weber patent concerns a binding machine, and not the paper on which it operates. Nevertheless, even a brief inquiry toward an understanding of the bindery industry reveals that the role of "sheets" is crucial. Because paper tends to tear or flutter when moved too quickly, the speed of the binding process has always lagged behind that of the printing press, which prints on rolls of paper. Consequently, inventions in bindery appropriately address the problem of how best to handle sheets of paper.

Meier improved the art of bindery by designing a machine with a rotary drum and capable of handling interconnected folded sections in web form. Prior art devices operated only on separate individual sheets. Placing "individual sheets in the correct position upon one another . . . required a corresponding great expenditure in machinery and control equipment," however. Meier '755, col. 1, ll. 22-26. By taking a continuous web of paper from the printing press and folding it in zig-zag or fan fashion (rather than cutting it), Meier was able to increase productivity without requiring greater expenditures in machinery and control equipment.

Indeed, the Meier '755 patent is exclusive as to the use of sheets in web form:

Since the individual sheets, which in each case form a zig-zag folded web, are interconnected with one another, the mutual position of the sheets of a web is always defined. Meier '755, col. 2, ll. 4-7 (emphasis added).
Now in order to implement these and still further objects of the invention . . . the method for the formation of multi-sheet printed products, especially newspapers and magazines, is manifested by the features that at least two zigzag shaped, folded webs, each of which is formed by sheets interconnected with one another at fold locations or fold lines extending transverse to the web lengthwise direction, are deposited in aligned condition upon one another, and these webs are supported at spaced locations at the fold locations, preferably at each second fold location. Meier '755, col. 1, ll. 47-59 (emphasis added).

The language plainly indicates that in order to implement the "object" of the invention, "in each case" and "at least" "two Zigzag shaped, folded webs" must be used. Although it was and continues to be industry practice to bind paper together in separate sheet form, the very point of Meier's invention was to avoid the problem of individual, separate sheets by using paper in folded web form. See also Weber, cols. 1, 2 (addressing the problem of sheets).

To refute this argument, plaintiffs point out that the Meier '755 patent states that "it is already known in this technology to withdraw individually printed sheets from stacks and to place them upon one another." Meier '755, Col. 1, ll. 20-22. From this, plaintiffs argue that only "for the sake of simplicity and cost alone" did Meier '755 choose to feed sheets interconnected in web form.

The Federal Circuit has observed that "the problem confronted by the inventor must be considered in determining whether it would have been obvious to combine references in order to solve that problem." Diversitech Corp. v. Century Steps, Inc., 850 F.2d 675, 679 (Fed. Cir. 1988). The problem confronted by Meier was the problem of sheets. It is illogical for plaintiffs to assert that it is "obvious" that individual sheets could have been used in the Meier '755 and it was only for the "sake of simplicity and cost alone" that sheets in web form were utilized, when, as the plaintiffs' own expert witness has observed, "It is the feeding sections interconnected in a web which Meier considered to be an improvement in the art." Al Jeske Decl. P 20. Moreover, plaintiffs' assertion contravenes the language of the Meier '755 patent itself, which states that only paper in folded web form is able to "implement the object . . . of the invention."

For these reasons, the Court finds that "sheets" is a claim limitation in the Weber patent.

If even a single element or limitation required by the claim is missing from the disclosure of the reference, there can be no anticipation. See Connell v. Sears, Roebuck & Co., 722 F.2d 1542, 1548 (Fed. Cir. 1983). In order to discern whether "sheets" is missing from the disclosure of Meier '755, it is necessary as an initial matter to define "sheets" as used in the Weber patent.

The meaning of "sheets" is a question of proper claim interpretation. Words in a claim are to be given their ordinary and everyday meaning unless the specification indicates otherwise with respect to a particular term. See Jonsson v. Stanley Works, 903 F.2d 812, 820-21 (Fed. Cir. 1990). The dictionary defines a "sheet" as a "piece of paper of a size suitable for printing esp. of books or other matter of which the page is a subdivision of a larger area -- often distinguished from reel or web." Webster's Third New International Dictionary (1971) (emphasis in original). There is no indication in the Weber patent that any meaning other than the ordinary meaning of sheets was intended.

Plaintiffs argue that "Weber Claim 1 is not, in law or fact, limited to coverage of a machine for individually handling separate sheets," because defendant's use of "sheets" in Claim 1 does not specifically exclude any mention of individual or discrete sheets and because defendant never suggested that "it was critical for his machine to operate on separate sheets." Plaintiffs' Memorandum in Response to Defendant's Post-Hearing Memorandum and Proposed Findings of Fact at 2, 8. Plaintiffs' arguments are unpersuasive.

Defendant did not need to state either that "sheets" means only sheets in individual form or that it is critical for the Weber device to operate on single sheets for the simple reasons that, first, "sheets" and "web" are not synonymous in common usage, and in fact, their meanings are distinct from each other; and second, the usual industry practice was and is to bind paper in individual sheet form. Hence, it was unnecessary for defendant to state that it was "critical for the machine to operate on separate sheets" because it was already presumed -- which is precisely why the Meier '755 patent makes clear it was departing from this practice by referring repeatedly and exclusively to "webs." Plaintiffs challenge Webster's Third by noting that "webs comprise 'sheets', nevertheless, and folded 'sheets' at that, as Meier '755 points out"; but the fact that many sheets connected together make a web does not mean that a "sheet" is a "web." Plaintiffs' Memorandum of Law Including Proposed Findings of Fact and Conclusions of Law in Support of its Motion for Summary Judgment at 24.
Independent claim 1 reads (emphasis added):

1. A static-dissipating, synthetic, surface-covering sheet material which comprises:

   a) an electrically nonconducting, synthetic sheet laminate material having a hard thermoset resin top surface suitable for use as a surface covering; and

   b) an electrically conductive layer of a polymeric, film-forming, particulate binder material secured to the bottom surface of the synthetic sheet material, the polymeric material containing uniformly dispersed therein a static-reducing amount of electrically conductive particulate material wherein the particulate material comprises from about 2 to 40% by weight of the polymeric binder material, whereby static charges, accumulating on the top surface of the synthetic sheet material, are dissipated through the electrically conductive layer.

On Nevamar's motion for summary judgment and Charleswater's motion for partial summary judgment on claim construction, the district court held that Nevamar's products do not infringe the '040 patent as a matter of law and granted summary judgment of noninfringement in favor of Nevamar.

In its infringement analysis, the district court held that the accused Nevamar products did not infringe claim 1 either literally or under the doctrine of equivalents. Specifically, the district court held that none of the accused Nevamar products met the "secured to the bottom surface of the synthetic sheet" limitation, the "containing uniformly dispersed therein . . . conductive particulate material" limitation, or the "polymeric, film-forming, particulate binder material" limitation. The district court also held as a matter of law that the "electrically conductive" limitation does not read on the accused products that contain a melamine polymer resin, but found a genuine issue of material fact as to whether that limitation reads on the accused products that contain a phenolic polymer resin.

DISCUSSION

*   *   *

1. The "secured to the bottom surface of the synthetic sheet material" limitation

The accused Nevamar static-dissipating products have a multilayer construction. The layer that Charleswater alleges to be electrically conductive in the Nevamar products is an interior layer which is attached to the underside of the nonconductive "surface" layer.

The district court construed the "synthetic sheet material" in subpart (b) of the claim to refer to the static-dissipating product as a whole. Based on this construction, the court interpreted the "secured to the bottom surface of the synthetic sheet material" limitation to read only on a static-dissipating product where the electrically conductive layer is at the bottom of the finished material. The district court then held that this limitation does not read on the accused Nevamar products because their alleged conductive layers are not on the bottom of the products. This analysis is incorrect.

In this case, the phrase "the synthetic sheet material" in subpart (b) of the claim refers to previously described synthetic sheet material. The first description of the term, found in subpart (a), reads "an electrically nonconducting, synthetic sheet laminate material." Thus, the conductive layer described in subpart (b) of the claim must be secured to the bottom surface of the nonconductive layer described in subpart (a) of the claim, not the bottom surface of the complete static-dissipating material.

The district court properly noted that the use of the word "comprising" in the claim preamble makes this an "open" claim, i.e., the claim is infringed if the accused material embodies all of the claim limitations even if the article contains additional elements not described in the claim. In this case, so long as the accused static-dissipating material has an electrically nonconducting layer that embodies all of the limitations described in subpart (a) and an electrically conductive layer that embodies all of the limitations described in subpart (b), the material literally infringes the claim even if it has additional...
layers below the conductive layer.

3608

B.

Claim 1 of the Weber patent discloses a "sheet transporting device arranged to advance sheets having folded backs in a predetermined direction along a predetermined path and including at least two elongated parallel carriers and discrete conveyor means for each of said carriers, each of said conveyors having means for advancing sheets along the respective carrier. …" Ferag contends that the "sheet transporting device" should be construed as having six elements: a shaft, a hub, carriers, plate-like guides, chain conveyors, and pushers. These are the elements numbered 1 to 6 in figure 1 of the patent. Ferag states that this construction finds support in the Weber patent specification, which in the "description of the preferred embodiments" refers to "sheet transporting device" as follows: "The guides 4, chain conveyors and pushers (not specifically shown) are identical with or analogous to the parts 4, 5 and 6 of the sheet transporting device 1-6 in the machine of FIG. 1." See Weber patent, col. 7, ll. 13-15 (emphasis added). To buttress this interpretation, Ferag refers to the prosecution history of the Weber patent, in which the attorney prosecuting the Weber patent application before the U.S. Patent and Trademark Office referred to the sheet transporting device "as the device 1-6 of Fig. 1." Pl.'s Ex. 2 at 77.

In construing the specific language of a claim, "words … will be given their ordinary … meaning, unless it appears that the inventor used them differently." Envirotech Corp. v. Al George, Inc., 730 F.2d 753, 759 (Fed. Cir. 1984). "Claims are not to be interpreted by adding limitations appearing only in the specification. . . . Although the specification may well indicate that certain embodiments are preferred, particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments." Electro Medical Systems, S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994).

Ferag's proposed interpretation of "sheet transporting device" fails to overcome the clear language in the claim as to the meaning of the term. The language in the specification and the reference in the prosecution history describing the sheet transporting device as including elements "1-6" simply describe two embodiments of the claimed invention, i.e., that shown in figure 1, and that shown in figures 2 to 4. These references do not control the meaning of "sheet transporting device," which is defined in the claim: it covers a drum and "includes at least two elongated parallel carriers, each carrier having discrete conveyor means." Ferag's proposed interpretation would violate the rule that particular embodiments appearing in a specification should not be read into the claims when the claim language is broader than such embodiments, and it would also violate the rule of claim construction prohibiting "double inclusion." Ex parte Kristensen, 10 U.S.P.Q.2D (BNA) 1701, 1703 (Bd. Pat. Appeals 1989). If "sheet transporting device" is interpreted as proposed by Ferag, that is, as including elements 1 to 6 described in the specification -- shaft, hub, carriers guides, endless chain conveyors, and pushers -- then the subsequent language in claim 1 defining the elements of the sheet transporting device as including carriers, conveyors, and advancing means would be "doubly included" and superfluous.

As interpreted, the "sheet transporting device" element of claim 1 literally reads onto Ferag's IPEX machine because Ferag's IPEX machine has a drum and "at least two elongated parallel carriers, each carrier having discrete conveyor means."

3609

II

SRAM argues that the district court erred in its construction of the term "shift actuator" in claim 16 of the reexamined '291 patent, and that the appropriate construction of the term is "a mechanism that controls the changing of gears." SRAM contends that the district court did not give enough weight to the ordinary meaning of the term, that it disregarded the claim differentiation doctrine, that it improperly read limitations from the specification into the claim, and that it ignored the distinction between the apparatus and method claims of the patent.
We next look to the specification to determine whether SunRace has satisfied its burden of showing that SRAM meant to
from that course of events that both SRAM and the examiner regarded claim 24 as adding something--the cam means--to
If, as SunRace contends, the shift actuators in claim 16, and thus in claim 27, were already limited to those containing a
cam, there would have been no difference between claim 24 and claim 27. Yet the patent examiner deemed both claim 24
and claim 27 to be patentable. Had SRAM understood the term "shift actuator" to be limited to devices containing a cam,
one would assume that SRAM would have requested that claim 24 be cancelled (as it did in the case of claims 27 and 28
once claim 16 was amended). Instead, SRAM continued to prosecute claim 24, and the examiner found it patentable, even
after claim 16 was amended to include the structural mounting limitation of the shift actuator on the handlebar. We infer
from that course of events that both SRAM and the examiner regarded claim 24 as adding something--the cam means--to
the limitations found in claim 16 as amended in reexamination.

B

We next look to the specification to determine whether SunRace has satisfied its burden of showing that SRAM meant to
define the term "shift actuator" more restrictively than is suggested by its ordinary meaning and by the doctrine of claim
differentiation. A "claim term will not receive its ordinary meaning if the patentee acted as his own lexicographer and clearly set forth a definition of the disputed claim term" in the specification. CCS Fitness, 288 F.3d at 1366. See also Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1249 (Fed. Cir. 1998) ("The patentee's lexicography must, of course, appear 'with reasonable clarity, deliberateness, and precision' before it can affect the claim."). We have recently held that "claim terms take on their ordinary and accustomed meanings unless the patentee demonstrated an intent to deviate from the ordinary and accustomed meaning of a claim term by redefining the term or by characterizing the invention in the intrinsic record using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope." Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1327 (Fed. Cir. 2002).

We believe the district court erred in relying on various statements in the written description to conclude that the term shift actuator should be limited to a device containing the cam structure of the preferred embodiment. The district court focused on the following statements in the written description: (1) One of the objects of the invention is "to provide a bicycle derailleur shifting system having a handgrip shift actuator embodying a generally helical cam which defines the derailleur mechanism movements," '291 patent, col. 3, ll. 32-36; (2) "Another important part of the invention is . . . the programming of the cam operating face of the handgrip shift actuators of the invention to accurately achieve such shifting limits for each available derailleur system," id., col. 6, ll. 20-26; (3) "Each handgrip shift actuator contains a generally cylindrical cam member having a generally helical operating face configured with a plurality of spaced detents or valleys with a cam peak or lobe between each pair of adjacent detents," id., col. 4, ll. 49-53; and (4) "A rotary cam member 74 having a generally helical operating face is the heart of the rear handgrip shift actuator," id., col. 9, ll. 64-66. The district court determined that those statements, in connection with the absence of any disclosure of a shift actuator other than one using a cam mechanism, had the effect of limiting the definition of shift actuator to a device that includes a cam.

The quoted statements do not sufficiently evidence an intention to depart from the ordinary meaning of "shift actuator." The first two statements simply detail some of the goals of the invention that are achieved by some of the apparatus claims. Those are not the only goals of the invention, however. Some of the recited goals relate to compensating for lost motion and providing automatic overshift capabilities and do not specifically address the use of cams. The third and fourth statements are more problematic for SRAM, but they still do not define the term shift actuator, nor do they constitute expressions of clear exclusion. While SunRace would characterize the statement that every handgrip shift actuator contains a cam member as definitional, we believe it is more properly characterized as descriptive of the preferred embodiments and the structure recited in the apparatus claims. We note that original claim 16, unlike claim 1, was not limited to handgrip shift actuators, but simply recited a shift actuator as the structural element. It seems that the applicant contemplated a broad class of shift actuators containing a subcategory of handgrip shift actuators, which in turn contained a subcategory of handgrip shift actuators employing a cam mechanism. Accordingly, the statements from the written description do not narrow the ordinary definition of the term "shift actuator."

The district court regarded this case as analogous to ATD Corp. v. Lydall, Inc., 159 F.3d 534 (Fed. Cir. 1998), and SciMed Life Systems, Inc. v. Advanced Cardiovascular Systems, Inc., 242 F.3d 1337 (Fed. Cir. 2001), in which claim language was limited based on a feature that was described as essential to the invention. It is true that this court has narrowly construed claim terms in light of the preferred embodiment when the patent has described the preferred embodiment as the invention itself. See, e.g., Wang Labs., Inc. v. Am. Online, Inc., 197 F.3d 1377 (Fed. Cir. 1999). The written description of the '291 patent, however, does not state that the cam is the actual invention itself. Instead, it recites that, in the context of the preferred embodiments of the shifting system apparatus, the cam is the heart of the handgrip shift actuator. Moreover, this is not a case in which a feature was described in the written description as critical but was never explicitly listed in the claim language, suggesting that the relevant structure in the claims should be narrowly construed as having that feature. Rather, in this case, the cam feature was explicitly included as an element in numerous claims, but not in the claim in suit. Because many of the claims of the '291 patent are explicitly directed to a shift actuator with a cam, we need not construe the term "shift actuator" to be limited to one consisting of a cam in order to give effect to the language in the specification extolling the significance of the cam.

We recognize that the written description does not explicitly address the claimed methods. In fact, the written description focuses exclusively on the gear shifting systems themselves. The complete absence of any discussion of the claimed method weakens SRAM's argument that the statements in the written description regarding the cam appear only in the context of the description of the apparatuses. Yet nothing in the written description indicates that the invention is exclusively directed toward cams or suggests that systems not employing cams are outside the scope of the invention. Thus, while it is clear that the patentee was primarily focused on an embodiment of his invention using a cam, nothing in the patent limits the claims to
that embodiment.

Other cases in which we have found that the specification limited the scope of the claims have elements that are absent here. For example, the SciMed patent distinguished prior art on the basis that it did not have the relevant features. 242 F.3d at 1343-44. In O.I. Corp. v. Tekmar Co., 115 F.3d 1576 (Fed. Cir. 1997), the court narrowed a term to a particular structural element when all the disclosed embodiments contained that element. As in SciMed, the written description expressly distinguished the prior art on the ground that the prior art did not incorporate that element. O.I. Corp., 115 F.3d at 1581-82. As noted, there is no such language of exclusion in the specification of the '291 patent.

Our case law makes clear that while "an accused infringer may overcome the 'heavy presumption' [of ordinary meaning] and narrow a claim term's ordinary meaning[,] he cannot do so simply by pointing to the preferred embodiment or other structures or steps disclosed in the specification or prosecution history." CCS Fitness, 288 F.3d at 1366. "An applicant is not required to describe in the specification every conceivable and possible future embodiment of his invention." Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1344 (Fed. Cir. 2001). "Whether an invention is fairly claimed more broadly than the 'preferred embodiment' in the specification is a question specific to the content of the specification, the context in which the embodiment is described, the prosecution history, and if appropriate the prior art." Teleflex, 299 F.3d at 1327 (quoting Wang Labs., 197 F.3d at 1383). In this case, those considerations lead us to conclude that the term "shift actuator" is not limited to a device with a cam.

C

We next examine the prosecution history to assess whether it confirms that the term "shift actuator" should be construed in a manner consistent with its ordinary meaning. "Although [it] is correct that the prosecution history is always relevant to claim construction, it is also true that the prosecution history may not be used to infer the intentional narrowing of a claim absent the applicant's clear disavowal of claim coverage." Amgen, 314 F.3d at 1327. To be given effect, such a disclaimer must be "clear and unmistakable." Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 2003 U.S. App. LEXIS 13570, Nos. 01-1546, 02-1478, slip. op. at 17 (Fed. Cir. July 7, 2003).

The district court cited several instances in which it regarded SRAM or the examiner as having characterized claim 16 as encompassing a cam structure. The instances relied upon by the district court, however, are not clear statements of disclaimer. First, the court alluded to SRAM's request for reexamination, which describes the '291 patent as "involving an actuator comprising a cylindric cam member 74 rotary on the outside of the handlebar and axially slidable relative to the handlebar" and refers to "actuator 66," which contains a cam structure. The cited statement, however, was not specific to method claim 16 and in fact appears from its context to relate to the apparatus claims. A later paragraph in the request for reexamination addresses the method of operation of the gear-shifting system; that paragraph does not refer to a cam in the discussion of the claimed method.

Second, the court pointed to the examiner's June 20, 1997, office action. The examiner stated that claims 5 through 26 were allowable over the prior art because "these claims comprise what the examiner considers to be 'fine tuning' features wherein specific embodiments are 'configured' so as to provide a more absolute control of the derailleur gear shifting system for a bicycle existing thentofore." The district court considered that statement to be "plainly inconsistent with SRAM's view that claim 16 embraces broadly a method of shifting gears unconstrained by any structural limitations requiring the use of a cam." We disagree. That statement is merely the examiner's general reason for allowance of 21 of the claims in the patent, including both apparatus claims and method claims. Various aspects of the 21 claims, including taking up cumulative motion and providing for overshifting, would likely allow for more control of the shifting system and would not necessarily be limited to a cam mechanism. The examiner's remarks thus do not indicate that the examiner believed the term "shift actuator" was limited to a device having a cam mechanism. To the contrary, as we have noted, the fact that the examiner confirmed dependent claim 24, which added the cam means to independent claim 16, supports the contrary conclusion.

Third, the court relied on SRAM's statements addressing the patentability of claims 27 and 28. As previously explained, prior to the reexamination amendment of claim 16 SRAM submitted an amendment in which it sought to add two claims dependent on claim 16--claims 27 and 28--that specified the structural mounting limitations now found in amended claim 16. According to the court, "in asserting the patentability of these claims, SRAM directed the examiner to portions of the patent specification describing the cam structure."
SRAM pointed to the discussion of the cam means of the preferred embodiment, however, not to define the term shift actuator nor to distinguish the shift actuators in the claims from prior art shift actuators that lacked cams. Rather, SRAM did so to show that the written description requirement was satisfied and that no new matter was being introduced with the amendment that added claims 27 and 28. SRAM stated that "for disclosure of these limitations, the Examiner is referred to the description of the 'Inboard Handgrip Shift Actuators' starting in line 15 of column 30 of the '291 patent, particularly including the following statements." The discussion of the preferred embodiment incorporates the limitations that SRAM sought to include through the addition of claims 27 and 28, such as having the shift actuator mounted inboard on the fixed handgrip of a handlebar and rotatably mounted to take up cumulative lost motion in the derailleur mechanism. However, the disclosure of these features in an embodiment employing a cam does not limit those claims to a cam. It appears that the features may also be present in actuators lacking a cam mechanism.

We agree with the district court that SRAM's statements addressing the Huret reference and responding to Shimano's arguments against patentability do not provide the requisite disclaimer. In fact, other portions of the prosecution history confirm that SRAM did not argue for the patentability of claim 16 based on the absence of a cam means from the prior art, even though it made that argument for several apparatus claims. For example, SRAM's submission to the PTO in response to Shimano's request for reexamination never mentions a cam, but explains that the method of claim 16 was not previously disclosed because the prior art references only "mention[] slack take-up in or during the first climb or first downshift." In the May 17, 1999, amendment and response to the PTO, SRAM argued that other prior art references did not "show[] a shift actuator mounted inboard of a fixed handgrip on the handlebar." Moreover, SRAM concurred with Shimano's statement in its request for reexamination that the shift actuator of original claim 16 "does not require a handlebar mounted or twist-shifter." If SRAM was not even arguing to limit the shift actuator to a handlebar mounted shifter or twist-grip shifter, it was not putting the public on notice that the shift actuators were limited to those employing a cam mechanism to effect the twist shift.

SunRace points to extrinsic evidence to support the district court's construction, including the deposition testimony of the inventor in previous litigation with Shimano involving the '291 patent. In this case, however, the intrinsic evidence resolves any ambiguity about the appropriate construction of "shift actuator," and therefore consideration of extrinsic evidence is inappropriate. Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1344 (Fed. Cir. 1998).

In sum, while we commend the district court for its thorough analysis of the difficult claim construction issue presented by this case, we conclude that the court's claim construction was unduly restrictive. Although this is a close case, we conclude that the ordinary meaning of the term "shift actuator" controls because neither the specification nor the prosecution history clearly defines the shift actuator as including a cam or disclaims a shift actuator that does not include a cam. Because the intrinsic evidence does not clearly narrow the term "shift actuator" to a device containing a cam, the district court erred by construing the term in that manner. Accordingly, we reverse the district court's claim construction of the term "shift actuator" in claim 16 and remand the case to the district court for further proceedings consistent with this opinion.

3610

Short distance

Claim 24 of patent 851 states:

"said at least one protrusion permanently fixed to said first end cap and projecting axially inward from said first end cap a short distance toward second end cap."

Parker proposes the construction of short distance as "a small distance relative to the overall length of the filter element." Baldwin contends the term is indefinite as the claim lacks a point of reference and lacks any specification of the length of a short distance. Furthermore, Baldwin contends the specifications and prosecution history gives no indicator of the length of the distance. Baldwin points to the case of Halliburton Energy Services, Inc., v. M-I LLC, 514 F.3d 1244, 1256 (Fed. Cir. 2008) for the proposition that vague, undefined terms are indefinite.
Parker contends a point of reference is provided in the claim itself in that the protrusion must be shorter than the full distance between the first and second end caps since the plain language of the claim states the protrusion "project axially inward from said first end cap a short distance toward said second end cap." Also, since the protrusion must engage the head of a locking member as illustrated in Figures 6 & 7 of the 851 patent, a person of ordinary skill in the art is informed as to the short distance.

Court's Construction

The Court agrees with Parker that the term is not indefinite as it must be smaller than the distance between the first and second end caps and engage the locking member. Therefore, the Court adopts Parker's construction.

1. Language of The Claim

"A claim in a patent provides the metes and bounds of the right which the patent confers on the patentee to exclude others from making, using, or selling the protected invention." Corning Glass Works v. Sumitomo Elect., 868 F.2d 1251, 1257 (Fed. Cir. 1989). The claim is described "by a series of limiting words or phrases (limitations)." Id. at 1258. The words used in the claim must be given their common meanings unless the inventor used them differently. Envirotech Corp. v. Al George, Inc., 730 F.2d 753, 759 (Fed. Cir. 1984). The "ordinary" meaning is the meaning the claim would have had to one of ordinary skill in the art. McGill v. John Zink Co., 736 F.2d 666 (Fed. Cir. 1984).

Applying these principles to the instant case, the court concludes that as Tenneco submits, the term "shoulder", as used in Claim 1 of the '659 patent, is consistent with the relevant, common dictionary meaning of the word "shoulder", that is, any "projection for keeping something in place, or preventing movement past the projection." See Funk and Wagnall, Standard College Dictionary, (1963). Claim 1 provides that the male "shoulder structures" are "outwardly extending" from the opposite ends of the latch. The female "shoulder structures" are "inwardly extending" from the opposite ends of the latch and are "adapted to mate with said male rib..." when the male rib "snap[s] into position beneath" the female shoulder structure. The shoulder structure of the male rib is designed to "deflect" with the female shoulder structure as the male rib enters the female recess. During closure of the container, the shoulders must deflect and snap into position. This action latches the container lid against its base. Both the male and female shoulder structures "keep [the lid and base] in place", that is, closed, and, "prevent movement." Accordingly, the meaning of the term "shoulder" in the '659 patent is consistent with the above stated common dictionary definition of "shoulder."

2. The Specification

Inline argues, however, that "the specification suggests that the term 'shoulder structure' is limited to that which is shown in [Exhibit 3, Figures 3 and 3A]." Specifically, Inline argues that the only place throughout the specification where the term "shoulder structure" is defined in any way, is in connection with the specification drawings. Accordingly, "the only way to interpret the term "shoulder structure" is in view of what is shown in the drawings, that is, "[a structure] with definite breaks or sharp edges serving as boundaries of a linear or planar surface."

Tenneco responds that "the specification provides additional information, illuminating the fact that a 'shoulder' is merely a projection from the opposite ends of the-latch, for keeping something in place or preventing movement past the projection."

The court concludes that the term shoulder structure, as used in both the specification and claim 1, means a "projection for keeping something in place", but "requiring definite breaks or sharp edges." Patent claims must be construed in light of the other parts of the patent document, (including diagrams or figures), which collectively are referred to as the "specification." Markman v. Westview Instruments, Inc., 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384, 1387-88 (1996); see also Al-Site Corp. v. Bonneau Co., 22 F.3d 1107 (Fed. Cir. 1994). "The specification contains a written description of the invention that must enable one of ordinary skill in the art to make and use the invention. For claim construction purposes, the description may act as a sort of dictionary, which explains the invention and may define terms used in the claims." Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995) (internal citations omitted). "The caveat is that any special definition given to a word must be clearly defined in the specification." Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384,
The specification in the instant case provides, inter alia,

As may be seen in FIGS.3 and 3A the substantially rectangular male rib 20 has at its opposite ends outwardly extending shoulder structure 20a. Also as shown in FIG.3A the opposite ends of the female recess 21 have inwardly extending shoulder structure 21a adapted to mate with the outwardly extending shoulder structure 20a on the male rib 20 when the container 10 is in closed condition. . . When the lid 11 of the container moves from the open position shown in FIG.3A to the closed condition of FIG.3 the latching structure including the rib 20 moves from the position in FIG.3A to the closed or latched position shown in FIG.3. During this movement the cam surfaces 20c on the male rib 20 engage the inclined cam surfaces 21d on the female recess 21 causing the cam surfaces 21d to move outwardly and permit the shoulders 20a on the male rib 20 to move beneath the shoulders 21a on the female recess 21 thus bringing the surfaces 20a and 21a into engagement. Likewise, the mating surfaces 20d and 21d move into engagement and similarly the surfaces 20c and 21c move into engagement. This is clearly illustrated in FIG.3.

See United States Patent No. 5,046,659 to Warburton, at Col.3 (Sept. 10, 1991) (emphasis added). The specification uses identical terms as those used in claim 1, such as "outwardly extending shoulder structure", and "inwardly extending shoulder structure." Further, Exhibit 3, Figures 3 and 3A show that the shoulder structure on the male rib (marked as 20a) projects outward from the ends and that the shoulder structure in the female recess projects inward from the ends to prevent movement past each other when the '659 patent latch is in the locked position. Accordingly, the specification term "shoulder structure" may be read to mean a "projection for keeping something in place, or preventing movement past the projection." Moreover, the shoulder structure cam surfaces depicted in Exhibit 3, Figure 3A at 20c, increase in diameter until the point of the shoulder structure at 20a. There is, accordingly, an increase in diameter or projection at the opposite ends of the latch element, consistent with the common meaning of "shoulder" as described in claim 1.

However, the specification drawings, or figures, explain by illustration that the claimed subject matter is something less than generally a "projection for keeping something in place or preventing movement past the projection." The shoulder structure, as illustrated, is explained as requiring sharp edges that serve as boundaries of a linear or planar surface, i.e., the latch element. Since words defined in the specification must be given the same meaning as used in the claim, the court concludes that the term shoulder structure, as used in both the specification and claim 1, means a "projection for keeping something in place", but "requiring definite breaks or sharp edges."

3. The Prosecution History

Inline further argues that under the doctrine of file history estoppel, Tenneco cannot recapture what is shown in the prior art and disclaimed by Mobil during the reexamination proceedings. Specifically, Inline asserts that Mobil, during the reexamination proceedings, distinguished its '659 invention from Arnolds, by arguing that the scope of the term "shoulder structure" in the '659 patent does not include a latching structure that passes smoothly from one surface to another surface. Since Inline asserts that its "LineLock" latch utilizes the smooth surface transition as found in the Arnolds' invention, the "LineLock" latch is outside the legally permissible scope of the '659 patent claims.

Tenneco responds that the prosecution history of the '659 patent removes any doubt that a "shoulder" is a projection located at the end surfaces of the latch elements for keeping something in place or preventing movement past the projection, and that Inline's "LineLock" latch includes "shoulders".

For the reasons that hereinafter follow, the court concludes that the file history of the '659 patent demonstrates that a "shoulder" is a projection for keeping something in place or preventing movement past a projection, located at the ends of the male rib and female recess, that does not offer a smooth transition when the male rib is pressed into the female recess during latching.

The undisputed public record of the proceedings in the Patent and Trademark Office is of primary significance in understanding the claims. Markman v. Westview Instruments, Inc., 52 F.3d 967, 980-981 (Fed. Cir. 1995). File history limits the permitted construction of claim terminology so as to exclude any interpretation that was disclaimed during prosecution.
On December 12, 1993, the PTO issued a Notice of Intent to Issue Reexamination Certificate (“PTO Reexamination Certificate”) which is not the same as “shoulders” described in the ‘659 patent.

Because there was no projection out of the surface of the ends to hold something in place. Rather, Arnolds merely had flat, uninterrupted ends. He accepted Mobil’s position that the flat, uninterrupted ends of the Arnolds' latch could not be considered “shoulders” located at the ends. See Exhibit 3, Figure 4. Accordingly, the smooth surface (17) on the ends of the protuberance (10) did not extend or project out from the end surfaces. See Exhibit 3, Figure 4. In order to be considered “outwardly extending shoulder structures”, the projections would have to extend outward from the ends. Arnolds did not further, Mobil argued that, unlike the ‘659 patent, the protuberances (10) of Arnolds' latch have flat surfaces (17) which pass over smoothly into the flat ends (24) of the female protuberance (9), and do not have any projections extending out of the surface of the plane to hold the cooperating part in place. See Exhibit 3, Figure 4. Accordingly, the smooth surface (17) on the ends of the protuberance (10) do not fall within the meaning of the terms "outwardly extending shoulder structure" as used in the ‘659 patent or within the ordinary definition of the term "shoulder" 6.

On November 9, 1993, Mobil submitted arguments in response to the August 16, 1993 office action, distinguishing the ‘659 patent over Arnolds on the basis of the meaning of the term "shoulder structure". 5 Specifically, Mobil pointed out that the projections in Arnolds were located at the "corners" formed by the top and the sides of the latch and did not extend or project out from the end surfaces. See Exhibit 3, Figure 4. In order to be considered "outwardly extending shoulder structures", the projections would have to extend outward from the ends. Arnolds did not further. Mobil argued that, unlike the ‘659 patent, the protuberances (10) of Arnolds latch have flat surfaces (17) which pass over smoothly into the flat ends (24) of the female protuberance (9), and do not have any projections extending out of the surface of the plane to hold the cooperating part in place. See Exhibit 3, Figure 4. Accordingly, the smooth surface (17) on the ends of the protuberance (10) do not fall within the meaning of the terms "outwardly extending shoulder structure" as used in the ‘659 patent or within the ordinary definition of the term "shoulder" 6.

Under the doctrine of equivalents, a product that does not literally infringe a claim may nevertheless act as an infringing product if it performs substantially the same function in substantially the same way to obtain the same result. Graver Tank & Mfg. Co. v. Linde Air Products Co., 339 U.S. 605, 608, 94 L. Ed. 1097, 70 S. Ct. 854 (1950). However, the doctrine of file history estoppel limits the range of equivalents available to the patentee by preventing the recapture of subject matter surrendered during the prosecution of the patent. Southwall Technologies, Inc. v. Cardinal IG Company, 54 F.3d 1570 (Fed. Cir. 1995).

The relevant, undisputed file history reveals that, in the initial action in reexamination, dated August 16, 1993, the examiner stated that the invention of the ‘659 patent was unpatentable in view of U.S. Patent No. 3,565,146 to Arnolds. The examiner concluded utilized outwardly extending shoulder structures.

On November 9, 1993, Mobil submitted arguments in response to the August 16, 1993 office action, distinguishing the ‘659 patent over Arnolds on the basis of the meaning of the term "shoulder structure". 5 Specifically, Mobil pointed out that the projections in Arnolds were located at the "corners" formed by the top and the sides of the latch and did not extend or project out from the end surfaces. See Exhibit 3, Figure 4. In order to be considered "outwardly extending shoulder structures", the projections would have to extend outward from the ends. Arnolds did not further. Mobil argued that, unlike the ‘659 patent, the protuberances (10) of Arnolds' latch have flat surfaces (17) which pass over smoothly into the flat ends (24) of the female protuberance (9), and do not have any projections extending out of the surface of the plane to hold the cooperating part in place. See Exhibit 3, Figure 4. Accordingly, the smooth surface (17) on the ends of the protuberance (10) do not fall within the meaning of the terms "outwardly extending shoulder structure" as used in the ‘659 patent or within the ordinary definition of the term "shoulder" 6.

--- Footnotes ---

6 Specifically, "it is submitted that [the] definition of shoulder is not applicable to the transition of the Arnolds surface 16 to the 17 or the transition of the surface 27 to the surface 19. In Webster's Third New International Dictionary. . .the definition of a shoulder with respect to a roadway is "either edge of a roadway; specifically: the part of a roadway outside of the traveled way on which the vehicles may be parked in an emergency." It is recognized that with a shoulder on a road or highway the shoulder is something in addition to the hard surface road on which the automobile rides. In the Warburton patent [‘659] the shoulder on the ends of the ribs and recess is something in addition on the ends of these items. It is not a corner of either the rib or recess. [Washburn, Mobil's representative] has made additional research into definitions of the term "shoulder". In McGraw-Hill Dictionary of Scientific and Technical Terms-Third Edition, the engineering definition for "shoulder" is "a projection made on a piece of shaped wood, metal, or stone, where its width or thickness is suddenly changed." The design engineering definition for the word "shoulder" is "the portion of a shaft, stepped object, or a flanged object that shows an increase in diameter." None of these definitions correspond with a corner such as the transition from surface 24 to the surface 19 in Arnolds.

--- End Footnotes ---
Notice"), holding that,

the reference to Arnolds shows a container with a series of protuberances and recesses namely, [each male and female latch action]. The ends of the protuberances (17) and the recesses (24) are straight and cannot be considered to be shoulder structures. . . Moreover, the female shoulder structure [of Arnolds] as thus interpreted would neither deflect with respect to the male shoulder structure or have the male shoulder structure "snap into position beneath" it.

See Notice of Intent To Issue Reexamination Certificate (December 12, 1993).

The file history therefore indicates that the term "shoulder structure" generally refers to a projection located at the ends of the latch elements for keeping something in place or preventing movement past the projection. However, by the doctrine of file history estoppel, the scope of the term "shoulder" is limited to a protuberance located at the ends of the male rib and female recess, that does not offer a smooth transition when the male rib is pressed into the female recess during latching, but instead deflects in the latching process, causing the male shoulder to snap into position beneath the female shoulder structure.

II

Extrinsic Evidence

The court concludes that use of the extrinsic evidence is unnecessary in this case. "The court may, in its discretion, receive extrinsic evidence in order to 'aid the court in coming to a correct conclusion' as to the 'true meaning of the language employed' in the patent." Markman v. Westview Instruments, Inc., 52 F.3d 967 (Fed. Cir. 1995)(internal citations omitted). "[It] may be used only to help the court come to the proper understanding of the claims; it may not be used to vary or contradict the claim language." Vitronics Corp v. Conceptronic, Inc., 90 F.3d 1576, 1584 (Fed. Cir. 1996). "Reliance on such evidence is unnecessary, and indeed improper, when the disputed terms can be understood from a careful reading of the public record [that is, the claims, specification, and file history]." Id. at 1584.

In this case, the court is satisfied that the definition of the term "shoulder structure" as used in the '659 patent can be understood from a careful reading of the public record. Accordingly, the extrinsic evidence is unnecessary.

CONCLUSION

For the foregoing reasons, the court concludes that the term "shoulders" or "shoulder" as used in the '659 patent means an enlargement or projection for keeping something in place or preventing movement past a projection, located at the ends of the male rib and female recess, consisting of definite breaks or sharp edges, that does not offer a smooth transition when the male rib is pressed into the female recess during latching.

B. Shoulder Guard

Plaintiff urges a broad construction of "shoulder guard": "a component that protects the shoulder." (Pl.'s Br., at 13.) Plaintiff maintains that the term is made up of two commonly understood words, and arrives at this construction by noting that one dictionary definition of the verb "guard" is "protect." (Id. (citing WEBSTER'S ENCYCLOPEDIC UNABRIDGED DICTIONARY 847 (1996)).) Plaintiff further contends that no limitation of this broad definition is appropriate because the intrinsic evidence does not limit the scope of the term; according to Plaintiff, nothing in the specification of the '226 Patent provides any other definition or an intentional disavowal of the term's scope, and the prosecution history does not refer to the term at all. (Id.)

TAG urges a significantly narrower construction: "a U or J shaped plastic or sufficiently rigid, but flexible, material that maintains a U or J shape and that rests on the shoulder of the wearer." (Def.'s Br., at 21.) TAG is forthright in acknowledging that this construction relies on the description of the preferred embodiment in the '226 Patent. (Id. at 18.) Indeed, the claim itself does not mention from what material the shoulder guards are made, nor their shape; the guards are merely "flexible"--a term the court addresses below--and "extend[] . . . over the shoulder of a wearer . . . ." (226 Patent, col. 4, ll. 6-7.) Plaintiff thus argues that TAG is improperly attempting to limit the scope of a claim term to the preferred
embodiment. TAG acknowledges that the scope of a patent cannot be limited to a preferred embodiment, but maintains that where only one embodiment is disclosed in the specification, the claims can--and should--be limited in accordance with that embodiment. (Def's Br. at 12, 18.) As noted in Phillips, however, the Federal Circuit has consistently rejected that proposition. See Phillips, 415 F.3d at 1323. Indeed, the Federal Circuit has explicitly rejected an argument strikingly similar to the one TAG advances here: in Teleflex, where the alleged infringer asserted that "where only one embodiment is disclosed in the specification, claim terms are limited to the embodiment disclosed," the court found "no such rule" in its precedent. 299 F.3d at 1326.

TAG relies primarily on Toro Co. v. White Consolidated Industries, Inc., 199 F.3d 1295 (Fed. Cir. 1999). In Toro and similar cases TAG cites, the Federal Circuit approved importing limitations from a disclosed embodiment not because only one such embodiment was disclosed, but because it was clear from the specification and/or the prosecution history that the patentee intended the invention to be thus limited. The Toro court considered whether a claim that recited a cover "including" a restriction ring should be construed to require attachment of the ring to the cover. 199 F.3d at 1300. The only embodiment disclosed in the specification showed the ring permanently attached to the cover. Id. The court adopted this limitation because the specification contained "clear statements of scope": the embodiment listed several advantages of permanent attachment, and the specification described the "unitary structure" between the cover and the ring as "important to the invention." Id. at 1301, 1302. Moreover, the Federal Circuit has since explicitly distinguished Toro as applying only where the proposed limitation was clearly designated in the specification as "important to the invention." See, e.g., Altiris, Inc. v. Symantec Corp., 318 F.3d 1363, 1373 (Fed. Cir. 2003) ("Toro is not dispositive here because . . . there is no such statement of importance present in the specification").

The patent in General American Transp. Corp. v. Cryo-Trans, Inc., 93 F.3d 766, 767 (Fed. Cir. 1996), also cited by TAG, concerned a "cryogenic" railcar for transporting frozen foods. The invention utilized carbon dioxide "snow" in an overhead compartment; chilled gas flowed down into the car through a series of holes in the ceiling of the railcar. The claims recited holes "adjacent each of [the railcar's] side walls and end walls." Id. at 768. The holes in the allegedly infringing railcar were located along the side walls, but not the end walls, and the endmost hole along each side wall was three feet from the nearest end wall. Id. at 768-69. The district court, following a bench trial, nonetheless found infringement by construing "adjacent" broadly enough so that the endmost holes in the infringing railcar were "adjacent" to the end walls. Id. at 769. The Federal Circuit disagreed, holding that the invention was limited to railcars with holes along both the side walls and the end walls. Id. at 769-70. In doing so, the court noted the claim language itself, which required openings adjacent to "each of" the side walls and the end walls, and the specification, which disclosed only one embodiment--a railcar with holes along both the side and end walls. Id. at 770 (emphasis in original). The court did not limit the claims simply because only one embodiment was disclosed, however, nor did the court simply use the embodiment to narrow an otherwise broad claim term. Rather, the claim language itself incorporated the limitation, through the use of the term "each of"; and the embodiment was consistent with that limitation in that no other embodiment was possible in light of the restrictive claim language.

Similarly, in Honeywell International, Inc. v. ITT Industries, Inc., 452 F.3d 1312, 1318 (Fed. Cir. 2006), the Federal Circuit in a post-Phillips decision affirmed the district court's construction of the term "fuel injection system component" as limited to a "fuel filter." Again, the mere fact that only one embodiment was disclosed was not dispositive; rather, the specification repeatedly used language describing a fuel filter as "this invention," and the prior art problem discussed by the patentees in the specification related to leaking fuel filters. Id. Thus, the patentees used particular limiting language that led the court to conclude that a fuel filter was "not merely discussed as a preferred embodiment," but that the patentees had explicitly limited the scope of the claims to a fuel filter. Id.

This court finds no support in Defendant's cited cases for the proposition that the existence of a single embodiment in itself necessarily limits the scope of claim terms; rather, there must be some other indication that the invention was intended to be limited to a particular embodiment. See Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 907-08 (Fed. Cir. 2004) (distinguishing cases including Toro and General American Transportation because "there were specific reasons dictating a narrow claim construction beyond the mere fact that the specification disclosed only a single embodiment or a particular structure"); to wit, "the specification, claim, or prosecution history made clear that the invention was limited to a particular structure"); see also Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1351-52 (Fed. Cir. 2004) (district court improperly construed claim feature based on references to certain limitations in the specification that were "nothing more than disclosures of a preferred embodiment," where "nowhere did the specification indicate that [those limitations were] necessary" to the claimed function). This approach is consistent with the Federal Circuit's discussion of this issue in Phillips,
which directed courts to consider the purpose behind the disclosed embodiment. There, the court explained that a patent's written specification is aimed at teaching those skilled in the art to make and use the invention; to that end, the preferred embodiment merely serves as an example of how to practice the invention in a particular case. Phillips, 415 F.3d at 1323. In light of that goal, a court should avoid importing limitations from an embodiment into the claims, unless it is clear that the patentee intended for the claims and the embodiments "to be strictly coextensive." Id. In other words, an embodiment limits a claim only where a person of ordinary skill in the art would understand the embodiment not to be "merely exemplary in nature," but would view an embodiment as intended to "define the outer limits of the claim . . . ." Id.; see also Ormco Corp. v. Align Tech., Inc., 463 F.3d 1299, 1306-07 (Fed. Cir. 2006) (citing Phillips in rejecting alleged infringer's argument that the scope of a claim term should be limited in accordance with disclosed embodiments, absent any indication that the term was otherwise explicitly defined in the specification). This concept, in turn, is consistent with the broader role of the specification in general: as noted, it is improper for the specification to impose limitations on the claims absent "a clear disclosure that the patentee intended the claims to be limited," MBO Laboratories, 474 F.3d at 1334, through "words or expressions of manifest exclusion or restriction." Teleflex, 299 F.3d at 1327.

Here, there is no indication in the specification that the patentees intended the term "shoulder guard" to be limited only to the shoulder guard described in the preferred embodiment, that is, one that is "made of plastic or any other material that is sufficiently rigid to maintain a 'U' or 'J' shape but that is flexible enough for comfort." ('226 Patent, col. 2, ll. 36-38.) Nowhere is the particular material used for the shoulder guards, or its ability to form and maintain a particular shape, characterized as "important to the invention." Cf. Toro, 199 F.3d at 1301; see Altiris, 318 F.3d at 1373. Nor does the specification contain any language suggesting that the patentees intended for the preferred embodiment to be "strictly coextensive" with the claim, or for that embodiment to "define the outer limits of the claim." Phillips, 415 F.3d at 1323. Indeed, the specification hints at the opposite: in summarizing the invention, the patentees stated that the shoulder guards "are of lightweight material, such as the material used for other portions of the chest protector," ('226 Patent, col. 1, ll. 30-32 (emphasis added)), whereas in the preferred embodiment, the shoulder guards are "preferably made of plastic" or other sufficiently rigid, yet flexible material. (Id. col. 2, ll. 34-35 (emphasis added).) This language suggests that the "plastic" or similar material referred to in the preferred embodiment is indeed provided merely as an example of the shoulder guards' construction.

12 Not only does the preferred embodiment section of the specification contain no language suggesting that it is intended to define the invention, but it concludes with the following:

The invention has been described in an illustrative manner and it is to be understood that terminology which has been used is intended to be in the nature of description rather than that of limitation. . . . It is therefore understood that within the scope of the appended claim, the invention may be practiced otherwise than as specifically described.

('226 Patent, col. 3, ll.6-15.)

TAG further argues that the claim should be limited to the preferred embodiment here because only one embodiment of the '226 invention is possible in order to accomplish what TAG asserts as the "goal of the invention": "to keep the chest protector in the correct location to protect the wearer." (Def.'s Sur-reply, at 4-5.) Citing to the patentees' description of the background and summary of the invention, TAG contends that the sole purpose of the '226 chest protector is "to properly position the protector to protect the wearer's shoulders even when the straps are not properly adjusted." (Id. at 7 (citing '226 Patent, col. 1, ll. 20-22, 39-41.) U-or J-shaped shoulder guards, according to TAG, are the key to serving this purpose and are thus so necessary to the invention that no other embodiment is conceivable. (Id.) This argument, however, ignores the other purpose explicitly identified by the patentees: the need to protect the top of the shoulder. Existing chest protectors, the patentees explained, left the top of the shoulder exposed even when "properly fitted." (226 Patent, col. 1, ll.15-17 (emphasis added.).) Indeed, the patentees identify this exposure as the primary problem with existing chest protectors; the fact that the existing protectors might sag and expose an even larger portion of the shoulder and chest area, if the straps are not properly adjusted, is an "addition[al]" problem. (Id. col. 1, ll. 20-24.) Thus, even if TAG is correct that a U- or J-shaped shoulder guard is necessary to accomplish the goal of proper positioning of the chest protector, the other, and more important, goal of protecting the shoulder--which existing chest protectors did not accomplish even when properly positioned--does not appear
to require shoulder guards that have the ability to "maintain" any particular shape. Because other embodiments of the invention--chest protectors whose shoulder guards do not necessarily "maintain a 'U' or 'J' shape"--are therefore conceivable to serve that purpose, TAG's assertion that only one embodiment of the '226 Patent is possible is incorrect. Moreover, where a patent specification "sets forth multiple objectives," claim terms are not required to be construed "as limited to structures that are capable of achieving all the objectives." Phillips, 415 F.3d at 1326-27 (quoting Liebel-Flarsheim, 358 F.3d at 908).

In sum, TAG has identified nothing in the specification that warrants a departure from the general rule, repeatedly articulated by the Federal Circuit, that claim terms are not to be limited in accordance with the preferred embodiment. TAG's proposed limitations of the claim term "shoulder guard" to plastic or similar construction and the ability to maintain a "U" or "J" shape, are based on language that does not appear "throughout the entire '226 patent specification," as TAG incorrectly asserts, (Def.'s Sur-reply, at 7), but is disclosed only once, and only in the preferred embodiment. There is simply no indication in the preferred embodiment, or elsewhere in the specification, that the patentees intended their invention to be limited to the chest protector described in the preferred embodiment; nor, in the court's view, would the specification suggest to a person of ordinary skill in the art that a chest protector with a plastic U- or J-shaped shoulder guard is the only possible embodiment of the claimed invention. The court thus declines to adopt Defendant's proposed narrow construction of "shoulder guard," which relies entirely on the description found in the preferred embodiment.

The court thus turns to Plaintiff's proposed construction of the term--"a component that protects the shoulder." Plaintiff is correct that "shoulder" and "guard" are both words with commonly understood meanings, for which general purpose dictionary definitions are helpful. See Phillips, 415 F.3d at 1314; see also Ormco, 463 F.3d at 1306-07 & nn.5 & 6 (Fed. Cir. 2006) (noting the Phillips court's approval of the use of general purpose dictionaries for determining the ordinary meaning of commonly understood words, and looking to such a dictionary in arriving at the meaning of the claim term "geometry"). Used as a verb, a common definition of "guard" indeed is "protect"; and the court further notes that as a noun, a relevant definition includes "a device, appliance, or attachment that prevents injury, loss, etc." WEBSTER'S UNABRIDGED DICTIONARY 847. An interpretation of "shoulder guard" as a device, or "component," that "protects the shoulder" is thus consistent with the meaning of commonly understood words. The court is nevertheless not persuaded that the combination of the two words into the claim term "shoulder guard" creates a term whose meaning to a person of ordinary skill in the art is so "readily apparent" that the court can construe the term merely by applying "the widely accepted meaning of commonly understood words" without any further examination of the intrinsic evidence. Cf. Phillips, 415 F.3d at 1314. Instead, in accordance with the methodology articulated in Phillips, the court looks to the claims, the specification, and the prosecution history, if any, as well as to relevant extrinsic evidence, for any indication that the term "shoulder guard" has a particular meaning in the art, or that the patentees intended a particular meaning inconsistent with Plaintiff's proposed construction. See id. at 1316.

As noted, no explicit definition of "shoulder guard" appears in the claim. Other portions of the claim limit the shoulder guard to one that is "flexible," that "extend[s] from the [] shoulder portion of the main pad over the shoulder of a wearer," and that has "a front portion adjacent to the main pad, a top portion, and a back portion." (226 Patent, col. 4, ll. 6-10.) Other than in the preferred embodiment, which, as discussed above, does not limit the claims, the specification states, in summarizing the invention, that the shoulder guards "are of lightweight material, such as the material used for the other portions of the chest protector," and further that "each shoulder guard should extend just slightly outward of the wearer's shoulder, such that the shoulder is protected but the guard does not interfere with the wearer's throwing motion." (Id. col. 1, ll. 30-38.) This language does suggest that the patentees' conception of the term is somewhat limited with respect to the general type of material from which shoulder guards should be made, and with respect to how wide the shoulder guards should be. In the court's view, however, the language does not amount to a "special definition" of the term, nor an "intentional disclaimer, or disavowal, or claim scope" that establishes that the patentees clearly intended to thus limit their claim. See Phillips, 415 F.3d at 1316; see also MBO Laboratories, 474 F.3d at 1334. In any event, these potential limitations--"lightweight material" and "extend[ing] just slightly outward of the wearer's shoulder"--are not inconsistent with Plaintiff's proposed construction, and TAG has not argued for such limitations here.

Plaintiff likewise is correct that the prosecution history does not reveal any limitation of the term "shoulder guard." In their argument distinguishing their invention from the Siemens hockey goalie equipment, the patentees explained that Siemens had a "rigid frame," whereas their invention was "flexible enough for comfort." (Amendment, Ex. 11 to Def.'s Br.) In their sole reference to shoulder guards, the patentees noted only that the shoulder guards "may be made of a different material" from the main pad, but should also be "flexible enough for comfort." (Id.) There is, therefore, no indication that the patentees limited the scope of the term "shoulder guard" in the course of prosecution, beyond explaining that it should
be "flexible"; and the patentees added that term to the claim itself. 13

13 In its effort to limit the scope of the term "shoulder guard" to a plastic U- or J-shaped component, TAG also points to the fact that the shoulder guards on Serewicz's prototype chest protector were made of plastic. (Def.'s Sur-reply, at 2-3.) TAG cites no authority holding that an inventor's prototype necessarily limits the scope of a claim term, however, and the court is aware of none.

The court thus finds nothing in the intrinsic evidence of the '226 Patent that would support TAG's proposed construction, nor any narrower construction than that advanced by Plaintiff. Furthermore, the extrinsic evidence appears to favor Plaintiff's position rather than TAG's. As noted above, Plaintiff's construction is consistent with the commonly understood meaning of the words "shoulder" and "guard." Significantly, Swangard, TAG's president, believed that Mizuno's Tsunami chest protector was covered by the '226 Patent, and Mizuno apparently agreed, as it obtained a sublicense from TAG and paid royalties. But there is no evidence that the shoulder guards on the Tsunami are made from plastic U- or J-shaped pieces, and TAG does not so assert; indeed, the shoulder guards appear to be made from the same material as the main pad. The fact that Swangard and Mizuno both believed that the Tsunami was covered by the '226 Patent suggests that persons of ordinary skill in the art would view a chest protector that lacked plastic U- or J-shaped shoulder guards as nonetheless within the scope of the claim. 14

14 Although TAG maintains that any reference to licensed products such as the Tsunami is irrelevant to claim construction, TAG cites only the well-recognized rule that a court may not tailor its claim construction to accommodate allegedly infringing products. See Wilson Sporting Goods Co. v. Hillerich & Bradsby Co., 442 F.3d 1322, 1331 (Fed. Cir. 2006). Plaintiff's reference to licensed products, as evidence of how persons skilled in the art understood the '226 Patent, thus does not implicate this rule and indeed serves as competent extrinsic evidence of how others understood the invention. See Phillips, 415 F.3d at 1318.

Finally, citing the chest protectors disclosed by the older '851 and '861 patents, TAG contends that Plaintiff's proposed construction--"a component that protects the shoulder"--is impermissibly broad because it "would read the asserted claim directly on the prior art." (Def.'s Br., at 20.) As explained above, however, the court is not required at this stage to ascertain the scope of prior art and construe the present claims in light of that art. Indeed, TAG's argument is more properly directed to issues of validity such as obviousness and anticipation; it is premature here. See Rhine v. Casio, Inc., 183 F.3d 1342, 1346 (Fed. Cir. 1999) (labeling "premature" defendant's effort to "raise[] the specter of invalidity during the claim construction phase"); BorgWarner, Inc. v. New Venture Gear, Inc., 237 F. Supp. 2d 919, 949 (N.D. Ill. 2002) (citing Rhine and rejecting defendant's argument that the claim must be interpreted so as to avoid invalidity). Moreover, Plaintiff's proposed construction, when read in light of the rest of the claim, is not as broad as TAG insists: as noted, the "component that protects the shoulder" must also be "flexible," it must "extend[] from the[] shoulder portion of the main pad over the shoulder of a wearer," and it must have "a front portion adjacent to the main pad, a top portion, and a back portion." ('226 Patent, col. 4, ll. 6-10.) Thus, even if TAG is correct that the '851 and '861 patents also disclose a "component that protects the shoulder"--and the court expresses no opinion on that issue at this time--that fact alone would not necessarily result in the claim of the '226 Patent reading directly on the prior art, rendering the patent invalid.

The court thus accepts Plaintiff's proposed construction of "shoulder guard": "a component that protects the shoulder."
Claims in the '249, '715, and '631 Patents contain the terms "cone" or "cone region," "nose" or "nose region," "flank" or "flank region," and "shoulder region." The parties dispute whether these regions extend around the circumference of the drill bit face or are limited to the blades of the drill bit face. The parties further dispute the construction of these regions with respect to each other.

Whether the Regions Extend Around the Circumference of the Drill Bit Face

Baker Hughes contends "cone," or "cone region," means "the area or region extending around the entire circumference on the drill bit face and which is located radially closest to the centerline or longitudinal axis of the drill bit body (and which is shaped more or less like an inverted cone)." Baker Hughes proposes similar constructions for the other claim terms and contends these regions extend around the entire circumference of the bit face.

ReedHycalog contends "cone," or "cone region," means the "region, defined by the blades of the bit, radially between the nose and the center longitudinal axis of the bit." ReedHycalog proposes similar constructions for the other claim terms and claims these regions are limited to the drill bit blades.

The specifications of the '249, '715, and '631 Patents support a construction that limits the "cone," "nose," "flank," and "shoulder" regions to the blades. The '249 and '715 Patents refer to the "cone," "nose," "flank," and "shoulder" regions as being regions within the bit profile. '249 Patent col. 5:66-col. 6:1; '715 Patent col. 9:34-39. As the blades define the bit profile, and each of these regions are located in the bit profile, the blades likewise define the "cone," "nose," "flank," and "shoulder" regions.

Second, figures in the '249, '715, and '631 Patents confirm that these regions are limited to the area defined by the drill bit blades. Fig. 10 of the '249 and '715 Patents, displayed in Appendix C and annotated, shows the "cone," "nose," "flank," and "shoulder" regions along the bit profile. Fig. 13 of the '715 Patent, a quarter-sectional side view of the three-region embodiment of the claimed drill bit, similarly shows the disputed regions along the bit profile. '715 Patent Fig. 13. Figs. 14A and 14B of the '631 Patent, reproduced in Appendix C and annotated, show the "cone," "nose," "flank," and "shoulder" regions on the blades of the drill bit. While Fig. 14C of the '631 Patent, annotated and shown in Appendix C, tends to support Baker Hughes's contention that the "cone region" extends circumferentially around the drill bit, the above intrinsic evidence more clearly shows that this region, in addition to the "nose," "flank," and "shoulder" regions, is limited to the drill bit blades. Thus, the Court construes these terms to only extend on the blades of the drill bit.

Radial Location of Each Region With Regard to Other Regions

Baker Hughes and ReedHycalog additionally dispute the definition of each region on the drill bit in relation to the other regions. In short, Baker Hughes defines "cone" as "... located radially closest to the centerline or longitudinal axis of the drill bit body..." and subsequently defines "nose" as the area or region radially between the cone and the "flank," which includes the leading most point on the drill bit body. Similarly, Baker Hughes defines "flank" as the area or region radially between the "nose" and the "shoulder" or "gage," and "shoulder region" as the area or region radially between the "flank" and the "gage," although in a given drill bit, the "flank" and "shoulder" regions may be the same part of the bit.

ReedHycalog's constructions are similar, except that ReedHycalog starts with the "nose," which it construes as "extending radially and proximately about the leading-most point." ReedHycalog defines "cone" as the region radially between the "nose" and the longitudinal axis of the drill bit body, "flank" as the area or region radially between the "nose" and the "shoulder region," and the "shoulder region" as radially proximate the "gage."

* * *

Shoulder Region

The '631 Patent claims a "shoulder region." Baker Hughes contends this region is the region "radially more distant from the centerline or longitudinal axis of the drill bit body than the flank region, but which is radially less distant from that centerline than the gage region." Further, Baker Hughes states "[i]n a given drill bit, the flank and shoulder regions may be the same." ReedHycalog contends the "shoulder region" is "radially proximate the gage."

As discussed above, the "shoulder region" may incorporate the "flank region." In this configuration, the "shoulder region" is radially between the "nose" and "gage" regions. If the "shoulder region" does not incorporate the "flank region," the
"shoulder region" is radially between the "flank" and "gage" regions. '249 Patent Fig. 10, col. 5:59--col. 6:2; '715 Patent, Figs. 10, 13, col. 9:35-39, col. 12:55-63; '631 Patent, Figs. 14A, 15A, 15C, 16, 17, col. 19:60-65. Therefore, the construction of "shoulder region" must comport with both embodiments.

The Court agrees with Baker Hughes but modifies its construction. "Shoulder region" means "region defined by the blades of the bit, located radially between the nose and gage regions if the shoulder region is incorporated with the flank region, and located radially between the flank and gage regions if the flank region exists separately, labeled 316 in Fig. 16 of the '631 Patent." 9

1. "shredding" and "shredded Claims 4 and 5

With regard to these terms, Green Edge simply states that the Court should give the terms their plain and ordinary meaning. According to the patent, the rubber particles are "cut . . . to resemble tree bark . . ., wood chips, pea gravel . . ., and a variety of other natural mulches, as the rubber particles can be textured in a variety of ways." ('514 Patent, col. 3, Ins. 50-54) According to the Merriam-Webster Online Dictionary, "shredded" or "shredding" means, "to cut or tear into shreds." Merriam-Webster Online Dictionary (visited May 15, 2007) <http://www.m-w.com/dictionary/shred>. Therefore, the Court finds that the terms "shredded" or "shredding" are defined in the '514 Patent as, "to cut or tear into pieces to resemble tree bark, wood chips, pea gravel and other natural mulches."

--- End Footnotes ---

3615

1. "A Shredder" and "A Shredding Mechanism"

Fellowes and Michelin propose that "a shredder," element 1(a), is "a well known device used for shredding documents, CDs, floppy disks, or other information-carrying media." Intek construes "a shredder" to mean "a well known device used for shredding items, such as documents, CDs, floppy disks and other articles." Fellowes and Michelin both define "a shredder mechanism," element 1(d), as "a device that shreds documents, CDs, floppy disks, or other information-carrying media." Intek construes the term "shredding mechanism" to mean "a device that shreds items, such as documents, CDs, floppy disks and other articles."

--- Footnotes ---

3 This order's references to "elements" such as "1(a)" is based upon the "elements" used to refer to particular claim terms that the parties have adopted in their claim charts and briefs.

--- End Footnotes ---

The only identifiable issue with respect to elements 1(a) and 1(d) is the difference, if any, between "other information carrying media" and "other articles." Fellowes contends that the term "other articles" is overly broad and that "information-carrying media" is consistent with the specifications and the purpose of shredders, that is, to destroy confidential information. Fellowes' Resp. to Intek's Br. 11 [Doc. No. 88]. None of the claims in the '559 Patent specify, however, that the "shredder" or "shredder mechanism" shreds solely "information carrying media." Indeed, Claim 1 refers to "articles" being shredded. See '559 Patent, col. 6, lines 39-45 ("[The] shredder mechanism enabling articles to be shredded to be fed into the cutter elements and the motor being operable to drive the cutter elements so that the cutter elements shred the articles fed..."

--- End Footnotes ---

- 4250 -
therein [and] a throat opening provided on the housing for enabling articles to be fed into the shredder mechanism.

(emphasis added). The specifications refer to "shredders" as "well known devices used for shredding items, such as documents, CDs, floppy disks, etc." Id. at col. 1, lines 11-12. The Court agrees with Intek that the specifications do not limit the "shredder" or "shredder mechanism" to any particular media, and finds it unnecessary to address the parties' arguments over the significance of "etc." in this phrase. See id. at col. 2, lines 49-52 ("[T]he shredder 10 may have any suitable construction or configuration"); id. at col. 2, lines 58-61 (the cutter elements generally "shred articles fed therein"); id. at col. 2, lines 66-67 ("Generally, any suitable shredder mechanism 16 known in the art or developed hereafter may be used."). The Court FINDS that a "shredder," element 1(a), is "a well known device used for shredding items, such as documents, CDs, floppy disks and other articles" and a "shredder mechanism," element 1(d), is "a device that shreds items, such as documents, CDs, floppy disks and other articles."

3616

b. "Shrink fit"

Claim 25 names a "shrink-fit" as a "means for releasably connecting" as used in claim 2. No claim recites a "heat-fit." As seen in the specification language previously quoted, "shrink-fitting" may alone, or in combination with another means, secure the backing and screening plates. The backing plate may be "heat-shrunk" onto the screening plate. Neither "a heat-shrink," "a heat-fit," nor "a shrink-fit," that is, the noun form of heat-shrinking, heat-fitting, or shrink-fitting is mentioned in the specification. J&L asserts that the terms heat-shrinking and shrink-fitting are equivalent for purposes of the patent, and that neither, even when conjugated as a noun, actually describe a structure; rather, these terms describe processes and are thus invalid under 35 U.S.C. 112 ¶ 4. 13 J&L's Construction Mem. at 6, 9-13. AFT asserts the two terms are distinct, with shrink fitting being broader, and that both are valid. Opp'n Construction Mot. at 21-23.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

13 35 U.S.C. § 112, ¶ 4 provides, "a claim in dependent form shall contain a reference to a claim previously set forth and then specify a further limitation of the subject matter claimed." Were a "shrink-fit" not a structure, claim 25 would not further limit the claimed subject matter. See infra see. III.C.3.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

(I) "Shrink-fit" and "Heat fit" are Equivalent

Shrink-fitting and heat-fitting or heat-shrinking are used equivalently in the specification. AFT asserts that heat-fitting describes a thermal process and shrink fitting need not occur through such process, but may rather result from press-fitting or interference fitting. Opp'n Construction Mot. at 22. This position is belied by the specification as well as by compelling extrinsic evidence.

AFT asserts first that J&L's objection to a shrink-fit is an invalidity argument, rather than a claim construction issue. This is incorrect. The construction of the structures covered by the limitation, "means for releasably connecting" is an issue of claim construction. Chiuminatta, 145 F.3d at 1308. That fact is not changed because the result of the construction eventually given to one disputed structure may affect later invalidity analysis. AFT next argues that "a shrink-fit includes structure." Opp'n to Construction Mot. at 21. AFT supports this argument on the fact that claim 25 recites "a shrink-fit," that is, a noun; on the prosecution history; on separate definitions for "shrink" and "fit" pulled from a general use dictionary; and expert testimony. Id. at 21-23. In making these arguments, AFT, citing the specification and expert testimony, further asserts that "a shrink-fit" does not require heating or cooling and is, therefore, not equivalent to a "heat-fit" or "heat-shrink." Id.

Beginning first with the issue of whether shrink-fitting is a thermal process, the specification indicates that it is. See, e.g., 940 patent, Col. 3, Lns. 24-31. So too does extrinsic evidence in the form of a technical dictionary definition supplied by J&L. See Cross Decl., Exs. B, C (Dkt. No. 45-7) (citing the McGraw Hill Dictionary of Scientific and Technical Terms defining "shrink fit" as: "A tight interference fit between mating parts made by shrinking-on, that is, by heating the outer member to expand . . . for easy assembly, then cooling so that the outer member contracts" and distinguishing "interference fit" from "press fit"). AFT correctly notes that the specification uses the both "shrink-fit" and "heat-shrink." Æpp'n to
Construction Mot. at 23. The specification's use of "heat-shrink," however, is descriptive of the process of shrink-fitting. See 940 patent, Col. 3, Lns. 24-31; Col. 9, Lns. 6-23. Moreover, to the extent that AFT's statement that "the '940 patent refers to a 'heat-shrink'" suggests that the patent refers to heat-shrink as anything other than a verb, it is untrue. Opp'n to Construction Mot. at 23. Finally, insofar as AFT bases its argument on the testimony of its expert, Dr. Gary Scott, Ph.D., see Opp'n to Construction Mot. at 22-23; O'Brien Decl., Ex. O (Dkt. No. 20) (associating one version of "shrink fit" with the sort of fit described in J&L's dictionary as a "press fit"), the Court finds that other extrinsic evidence such as the technical dictionary definition supplied by J&L is more compelling, particularly in light of Dr. Scott's admission that he is not an expert in mechanical devices or shrink-fitting, see Cross Reply Decl., Ex. E (Dkt. No. 84-6) at 67-69, and the fact that Dr. Scott's report was "generated at the time of and for the purpose of litigation." Phillips, 415 F.3d at 1318. Therefore, the Court construes "shrink fit" as: A tight interference fit between mating parts made by heating the outer part to expand it or cooling the inner part to contract it so that the outer part fits into the inner part.

(ii) "Shrink fit" Describes a Process not a Structure

Claims 2, 15, and 32 employ the phrase "means for releasably connecting" but do not specify a corresponding structure. The parties dispute whether a shrink-fit is a structure covered under the limitation, or, for that matter, a structure at all. AFT argues that "a shrink-fit includes structure" and supports this argument by reference to dictionary definitions of "fit" and "shrink" to arrive at its construction: "an assembly of parts where one part is made smaller relative to the other part." Opp'n to Construction Mot. at 21-22. AFT also cites to the prosecution history, in which the Examiner found that "a shrink-fit" is a structure. These arguments are unavailing.

First, to the extent that AFT's construction relies upon the definition of "fit" as the "degree of closeness," it fails to recite a structure. AFT's proposed construction recites a process, one in which "one part is made smaller relative to another part." Further, insofar AFT seeks to define "a shrink-fit" by combining individual definitions from a general use dictionary of "fit" and "shrink," the Court views the resulting construction with some suspicion. See Network Commerce, Inc. v. Microsoft Corp., 422 F.3d 1353, 1359-60 (finding that while the term "download component" is nowhere defined as a singular term, a construction resting upon separate dictionary definitions for "download" and "component" was untenable, particularly in light of the resulting breadth of that construction). That suspicion is heightened where, as here, the hyphenated term at issue is defined in a single definition available in a technical dictionary, and that definition better comports with the specification. Finally, the Court does not find that the prosecution history clearly evidences that "a shrink-fit" is a structure, and certainly does not evidence that AFT's construction is correct. Accordingly, the Court construes "shrink-fit" to mean: A tight interference fit between mating inner and outer parts made by heating the outer member to expand it or cooling the inner part to contract it so that the outer part can fit into the inner part. Additionally, because the above construction does not describe a structure, "shrink-fit" is not a "means for releasably connecting."

15 35 U.S.C. § 112, ¶ 6 provides that "[a]n element in a claim for a combination may be expressed as a . . . step for performing a specified function without the recital of . . . acts in support thereof, and such claim shall be construed to cover the corresponding . . . acts described in the specification and equivalents thereof." While such "step-plus-function" claims are allowable, the claim must take the form of a "step-plus-function" claim, rather than, as here, a "means-plus-function" claim. See, e.g., O.I. Corp. v. Tekmar Co., Inc., 115 F.3d 1576, 1582-83 (Fed. Cir. 1997).
The parties also dispute the term "shrinkable shielding." LG proposes construing the term to mean "flexible device to shield clothes from entering a gap." (Chart at 20.) Whirlpool proposes instead that the term be construed to mean "a shielding structure that is capable of being reduced in size by a vibration stroke of the vibrating disc." (Id.)

Claim 1 describes a "shrinkable shielding means disposed in the gap to prevent clothes from becoming jammed in the gap during a clothes washing operation." ('886 Patent, col. 4, ll. 10-12.) Claims 4 through 8 describe the different limitations applicable to the shrinkable shielding means. Those limitations include being "made of rubber or sponge," "a tube type shielder," "a spring type shielder," or "a flexible thin film annularly placed in said gap . . ." (Id., col. 4, ll. 21-37.) The background section of the patent states that "[t]he present invention relates . . . to an improved structure in [low frequency vibration type] washing machines for prevention of jamming of clothes in a gap between a low frequency vibrating disc and the inner bottom of a washing tub." (Id., col. 1, ll. 9-14.) Given these limitations, and the use of the proposed invention in washing machines with vibrating discs, the Court agrees with LG that the term "shrinkable" means "flexible." Moreover, insofar as the patent itself refers to the invention as relating to "an improved structure," the Court will construe the term "shielding" as "structure" for shielding clothes from entering a gap. (Id., col. 1, l. 11.)

In arguing that "shrinkable" should be construed to mean "capable of being reduced in size by a vibration stroke of the vibrating disc," Whirlpool refers to the written description for Figure 2, which states that "the shrinkable shielder 4 should be designed such that it can be elastically shrunk and extended in the vibration stroke h[1]-h[2] of the vibrating disc 2." (Id., col. 2, ll. 52-55.) As the Court has already explained, however, the written description concerns only one of the preferred embodiments described in the patent. Nothing in the descriptions of the other preferred embodiments refers to a similar vibrating stroke. (See id., col. 3, ll. 5-25.)

For these reasons, the Court construes the term "shrinkable shielding" to mean "flexible structure to shield clothes from entering a gap."

GO BACK

3618

A. "Locking Shutter"

The first term from claim 1 that is in dispute is "locking shutter." The term appears in the second element of claim 1 which reads, "a slidable locking shutter movable between open and closed positions . . ." See '715 patent, Col. 16, ll. 59-60 (emphasis added). It also appears in the third element of claim 1, which reads, "whereby the locking shutter allows placement and removal of the archwire when in the open position and prevents the displacement of the archwire from the bracket member when in the closed position." Id. at Col. 17, ll. 5-8 (emphasis added).

Plaintiff proposes that the term "locking shutter" be construed as the "portion of [the] bracket that is capable of shutting, closing, making secure, or preventing displacement." Pl.'s Ex. 3 at 4. Defendants' proposed construction reads as follows:

Locking: fastening, fixing, engaging;

Shutter: A sliding cover that moves between open and closed positions that has a bar that is set into the occlusal-gingival opening and which is capable of locking into place; portion of the bracket that is capable of locking, as defined above.

Id. at 7.

Claim Construction of "Locking Shutter"

The term "locking shutter" is described in the Summary of the Invention at Col. 2, ll. 27-31 as the portion of the bracket which "in the closed position . . . prevents the archwire from being displaced." A similar description of the "locking shutter" is provided at Col. 4, ll. 55-61, where the "locking shutter" is said to be "movable" between an "open position for receiving an archwire and closed position for locking an archwire to the bracket." The "locking shutter" is depicted in various embodiments throughout the '715 patent. In the embodiment shown in Figs. 2 and 3, it is depicted as item 24 (in open and
closed positions, respectively). In other embodiments, the locking shutter is depicted as a "closure member" or "shutter" (item 132) (Col. 12, ll. 26-28) in Figs. 28-29, and "closure member" or "shutter" (item 162) (Col. 14, ll. 46-50) in Figs. 35-39. In all such depictions, the "locking shutter" is shown as a portion of the bracket that is either open to permit placement of the archwire in the slot, or closed to prevent the archwire from becoming displaced.

One aspect of the claimed invention that is important for providing proper treatment is the locking shutter's ability to secure the archwire within the archwire slot, preventing it from becoming displaced, but still permitting it to move to correct the alignment of the teeth, as described in the specification. See Col. 5, ll. 49-52 ("When the locking shutter 24 is in the closed position the shutter prevents the archwire from being displaced from the archwire slot 40 while allowing limited labiolingual movement depending on archwire size."); see also Col. 7, ll. 4-15 (providing that use of a "relatively small archwire . . . allows for some labial movement of the archwire . . . while maintaining the archwire in the archwire slot."). OrthoArm's proposed construction captures this aspect of the invention.

By contrast, Defendants' proposal is inconsistent with the claims and the specification. Defendants' terms "fastening" and "fixing" imply that the locking shutter prevents all movement of the archwire and the shutter. However, the claims and the specification reveal that the locking shutter need only "close" the archwire slot and prevent displacement of the archwire from the bracket when in closed position, not fix the shutter or the archwire in one place. See Col. 17, ll. 2-8.

Moreover, as noted above, the invention's functionality requires some movement by the archwire when restrained by the locking shutter, and there is no requirement that the shutter itself be locked into place and immovable. In fact, the specification describes the locking shutter as having a "dual flexibility," which "allows easy movement of the locking shutter between open and closed position and which reacts on the archwire to maintain the archwire in the archwire slot." Col. 6, ll. 52-56; see also Col. 10, ll. 52-67 (discussing movement of the locking shutter within the recess). Thus, Defendants' contention that the concepts of "fastening" and "fixing" are at the very core of Dr. Voudouris' claimed invention,” (Defendants' Opening Brief on Claim Construction, "Defendants' Memo," filed February 12, 2007, at 16) is not supported by the intrinsic evidence.

Defendants' emphasis on the concept of "locking" as "the very heart of the invention for which Dr. Voudouris sought a patent," (Defendants' Memo, at 12, 14), is misplaced. It is not supported by the intrinsic evidence and nothing in the file history supports Defendants' position. Moreover, it is incorrect to emphasize one part of a patent as the "heart" of the patent; all claimed aspects must be taken into account. See Fuji Photo Film Co., Ltd. v. Int'l Trade Comm'n, 474 F.3d 1281, 1297 (Fed. Cir. 2007) ("[T]here is no legally recognizable or protected 'essential element,' 'gist,' or 'heart' of the invention in a combination patent."). The Supreme Court long ago rejected the contention Defendants now advance--that courts should focus on the purported "gist" or "heart" of the invention and ignore other aspects of a claim. See Aro Mfg. Co. v. Convertible Top Replacement Co., 365 U.S. 336, 344-45, 81 S. Ct. 599, 5 L. Ed. 2d 592, 1961 Dec. Comm'r Pat. 635 (1961).

Defendants attempt to support their proposal by improperly limiting the disputed term to functional embodiments disclosed in the specification. Defendants' Memo at 15. While claim 1 includes a means-plus-function limitation, the phrase "locking shutter" is not part of that limitation. It is therefore incorrect to limit the construction of that phrase to the structures disclosed in the specification. See Interactive Gift Express, Inc. v. Compuserve Inc., 231 F.3d 859, 865 (Fed. Cir. 2000); Northern Telecom Ltd. v. Samsung Electronics Co., 215 F.3d 1281 (Fed. Cir. 2000); Rhine v. Casio, 183 F.3d 1342, 1346 (Fed. Cir. 1999).

Finally, the Court notes that the extrinsic evidence supports OrthoArm's position. The dictionary definitions of the terms "lock" and "shutter" support construction of the term "locking shutter" as the portion of the bracket that is capable of shutting, closing, making secure, or preventing displacement. To "lock" is "to shut or make secure by or as if by locking." See Pl.'s Ex. 4 at 739, The American Heritage Dictionary: Second College Edition; see also Pl.'s Ex. 5 at 786, The Random House College Dictionary: Revised Edition. A "shutter" is a thing that "shuts," or "closes." See Pl.'s Ex. 5. at 1220, Random House College Dictionary.

Plaintiff's expert witness, Dr. Jerrold, and the inventor, Dr. Voudouris, have submitted Declarations which confirm that Plaintiff's proposed construction is consistent with the understanding of the term in the relevant art. They agree that, based on their review of the patent, the specification, and the file history, the term "locking shutter" is understood in the art of design and use of orthodontic brackets as a device that shuts, closes, makes secure, or prevents displacement of the archwire.
from the slot. See Voudouris Decl. at P 11; Jerrold Decl. at PP 10-12. Dr. Jerrold also notes that the locking shutter is designed to allow some movement of the archwire in the slot and not to fasten or fix the archwire in one position. Jerrold Decl. at P 10. Defendants have submitted no evidence to refute the testimony in these Declarations, and it is appropriate to consider these Declarations to confirm the constructions proposed by OrthoArm.

Accordingly, the Court construes the term "locking shutter" as the "portion of bracket that is capable of shutting, closing, making secure, or preventing displacement of the archwire."

3619

10. The '219 patent, claim 16: "shutter means"

Claim 16 of the '219 patent describes a "shutter means operably associated with said lens." The parties dispute whether this phrase is in means-plus-function form. St. Clair contends that a shutter is a structure. St. Clair further contends that the disputed phrase does not recite a function corresponding to this structure, rebutting the presumption that Section 112, P 6 applies to the disputed term. Canon contends that "shutter means" does not recite a definite structure and is a means-plus-function term.

After reviewing the claim language in light of the parties' respective positions, the Court concludes that the disputed phrase is not in means-plus-function form. A shutter is reasonably understood as a structure and "shutter means operably associated with said lens" describes such a structure and does not recite a function. Therefore, the presumption that "shutter means" is in means-plus-function form is rebutted and Section 112, P 6 does not apply. Accordingly, the Court concludes that the term "shutter" should be construed consistently with its ordinary meaning as "a shutter" such that further construction by the Court is not required.

3620

6. "side-by-side"

Claim one recites "a plurality of cords arranged side-by-side." Schindler asserts that "side-by-side" should be construed as "each one immediately next to and directly touching an adjacent one." Schindler bases this interpretation on the fact that the specification instructs that "it is desirable to minimize the spacing . . . between the cords." Otis responds that "side-by-side" should simply mean "arranged linearly along the width dimension." Otis' definition, then, does not require that the cords be in contact with each other.

The Court will adopt Otis' construction. Schindler's proposed construction misconstrues the above-quoted portion of the patent specification. Although according to the specification spacing between cords should be "minimize[d]" if possible, it does not follow that the invention requires there to be no spacing at all. In fact, all of the embodiments depicted in the patent contain some spacing. See Verizon Servs. Corp. v. Vonage Holdings Corp., 503 F.3d 1295,1305 (Fed. Cir. 2007) (construing terms in a manner that does not exclude examples in the specification); Oatey Co. v. IPS Corp., 514 F.3d 1271, 1277 (Fed. Cir. 2008) (same). Furthermore, the specification explicitly recognizes that completely eliminating separation between the cords may not be possible. Schindler's proposed construction would, therefore, potentially lead to Otis' claim covering an invention that is impossible to achieve. See Cross Atl. Capital Partners, Inc. v. Facebook, Inc., 2008 U.S. Dist. LEXIS 15862, at *24 (E.D. Pa. Feb. 29, 2008) (rejecting a proposed term construction that would make it impossible for the invention to function properly). Otis' definition more accurately reflects the claim language, and properly encompasses for the examples contained in the patent.

The Court will construe "side-by-side" to mean "arranged linearly along the width dimension."

3621
The defendants concede "side-by-side" means "one beside the other." Defendants' Objections at 4, 6. However, the defendants argue that the R&R ignored the dispute as to whether there can be "side-by-side" ribs that have an additional rib in between them. Id. at 4. The defendants contend that the magistrate judge erred by not construing the term and request that the court construct "side-by-side" to mean that nothing can be in between the generally V-shaped ribs. Id. at 4, 6. The R&R states that both parties agree "side-by-side" means "one beside the other." R&R at 18. Therefore, the magistrate judge determined that there is nothing about the term requiring interpretation as a matter of law. Id.

Claim 6, at issue here, states that: "The molded bucket according to claim 5 wherein said ribs are arranged in a diagonal orientation forming side-by-side generally V-shaped ribs." The defendants assert essentially that the magistrate judge should have construed the term "side-by-side" in Claim 6 to mean that the ribs must abut with nothing in between. But, as noted above, there is no dispute as to the ordinary meaning of the phrase "side-by-side" and the court does not fail to discharge its duty under Markman when a term does not require construction or does not depart from its ordinary meaning. Biotec, 249 F.3d at 1349. Thus, the court agrees with the magistrate judge's conclusion not to construe the term as asserted by the defendants.

This is particularly true because to impose the construction that "side-by-side" ribs cannot have intervening radial ribs would be imposing a limitation on the claims not supported in the specification. The Federal Circuit has held:

A fundamental rule of claim construction is that terms in a patent document are construed with the meaning with which they are presented in the patent document. Thus claims must be construed so as to be consistent with the specification, of which they are a part…[I]t is axiomatic that claims, not the specification embodiments, define the scope of protection.

Playtex Prods., Inc. v. Procter & Gamble Co., 400 F.3d 901, 906 (Fed. Cir. 2005)(internal citations omitted). The claims and the specification support additional embodiments of side-by-side generally V-shaped ribs next to radial ribs. 1 '493 patent Cols. 7:12-19, 5:1-5; KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000)("[A]lthough the specifications may well indicate that certain embodiments are preferred, particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments.").

Construing "side-by-side" to mean that nothing can come between generally V-shaped ribs would be construing the terms in reference to an accused device, which is a question of fact not within the scope of a Markman hearing. Miken Composites, L.L.C. v. Wilson Sporting Goods Co., 515 F.3d 1331, 1336 (Fed. Cir. 2008) (stating that the issue of infringement, whether literal or by the doctrine of equivalents, is a question of fact). Therefore, the court concludes that "side-by-side" means "one beside the other" and requires no further construction.

C. Side Grate Tables

The term "side grate tables" is recited two times in Claim 1. The Court has already construed terms "table" and "grate." The term "side" is what remains. Plaintiff proposes "grate tables positioned at opposing ends of a middle member." Defendant proposes "a side grate table is not located in the middle of the portable modular kitchen." (Def. Claim Constr. Brief at 13-14.)

Figures 1 and 2 of the '270 patent describe the possible positioning of the side grate tables 214 and 216. The parties do not
refer the Court to, nor has the Court found any, information in the specification that more fully describes the location of the side grate tables. Defendant objects to Plaintiff’s use of the phrase "opposing ends" because this imposes more of a limitation on the patent than is required by the term "side." The Court agrees. The two side tables, for example, could be placed at any of the four sides of the middle member resulting in an "L" shape.

Notwithstanding the Court's construction of "table" and "grate," the Court construes the term "side grate tables" as:

A "side grate table" is not located in the middle of the portable modular field kitchen.

1. "Side Impact Crash Sensor"

Defendants would have the court construe the words "side impact crash sensor" to mean "a crash sensor for use in detecting an impact to the side of a vehicle or an impact having a significant component of lateral force." (Defs.' Markman Br. at 13.) On the other hand, Plaintiff contends that the ordinary meaning of the language is self-evident and no construction is required. (See Joint Mem. at 1.) The court agrees that no construction of this phrase is required. The ordinary meaning of "side impact" already includes Defendants' proposed construction. Ordinarily understood, a side impact sensor senses not only the actual "striking" of the vehicle at one of its sides, but also the "[side] force or impetus transmitted by a collision." See Webster's New College Dictionary 353 (2d ed. 1995). The court fails to see how the claim limitation language would be clarified by adopting Defendants' proposed construction. The ordinary meaning of "side impact sensor," as understood by a person having ordinary skill in the relevant art, includes a sensor capable of sensing both the actual striking of a vehicle at its side and the side force transmitted by the striking of the vehicle at a position other than its side.

4. Language in Dispute: "Same Side" and "Opposite Side."

Does "same side of said cylindrical tube" refer to (1) the position on the cylindrical tube relative to the axial divider (i.e., the holes are on the portions of the tube on the same side of the axial divider) or (2) to the position on the cylindrical tube relative to the circumference of the cylindrical tube (i.e., the holes are aligned on the portions of the tube along the length of the tube)?

Answer: "Same side of said cylindrical tube" refers to the position on the cylindrical tube relative to the axial divider.

Does "opposite side of said cylindrical tube" refer to (1) the position on the cylindrical tube relative to the axial divider (i.e., the holes are on the portions of the tube on different sides of the axial divider) or (2) the position on the cylindrical tube relative to the circumference of the cylindrical tube (i.e., the holes are aligned on the portions of the tube along the length of the tube)?

Answer: "Opposite side of said cylindrical tube" refers to the position on the cylindrical tube relative to the axial divider.

a). Claim Language

These claim limitations concern additional side holes exposing the two lumens of the catheter to the blood stream. The dispute involves the meaning of the phrases "opposite side" and "same side." The Court holds "opposite side" to mean on the other side of the axial divider of the cylindrical tube without reference to any particular point and "same side" to mean on the same side of the axial divider of the tube without reference to any particular point.

The Court's construction is based largely upon the common usage and meaning of the terms "opposite" and "same" as they relate to the term "side." For example, during a tennis match, one player is on one side of the court and his opponent is on the opposite side of the net which divides the court in half. The opponent need not be directly opposite the player to be on
the opposite side, he must just be on the other side of the net. Similarly, in a doubles tennis match teammates are considered to play on the same side when they are on the same side of the court as divided by the net. They need not be in the same service box, but just on the same side of the court.

b). Written Description

The illustrations in figs. 1 and 2 of the '968 patent illustrate one embodiment of the claimed side holes. Opening 19, the primary inlet opening for the second lumen, is "said second opening." Multiple holes 21 constitute "at least one side hole circumferentially disposed on the opposite side" of the tube as opening 19, and multiple holes 22 make up "at least one side hole circumferentially disposed on the same side" of the tube as opening 19.

The specification supports Dr. Mahurkar's construction of this claim:

The return holes 21 and the inlet holes 22 are further disposed circumferentially on opposite sides of the divider 12. Thus, there is axial as well as circumferential separation of the inlets and outlets for fluid circulation. ('968 patent, col. 4, lines 10-14).

Holes 21 and 22 are not lined up 180 degrees from each other. In fact holes 22 are much further away from the tip than holes 21. Thus they are on opposite sides of the divider, but not directly across from one another. In this specification there is not a requirement for the outlet hole to be 180 degrees (halfway) from the second opening to be "opposite." There must be holes on the opposite sides of the divider and also some on the same side.

c). Dictionary Definition

The construction of the words "opposite side" and "same side" is simple. The ordinary and accustomed meaning of the words provide their construction. The parties agree the cylindrical tube is divided in half by the axial divider. Therefore, the "opposite side" is simply the opposite side of the divider, and "same side" means the same side of the divider. This does not mean the holes must be exactly 180 degrees apart to be on "opposite sides" nor does it mean the holes must be axially aligned to be on the "same side." Webster's Dictionary defines "side" as "a place, space, or direction with respect to a center or to a line of division (as of an aisle, river, or street)." (Webster's Collegiate Dictionary 1089 (10th ed. 1996)).

Common usage of the words here, leads the Court to construct "opposite side" as on the opposite side of the tube as determined by a center line, which in this case is the axial divider. Similarly, "same side" is on the same side of the tube as determined again by the axial divider.

3625

B. "Side Rail Positioning Mechanism"

The claim term "side rail positioning mechanism," as used in Claims 1, 10, and 18 of the '855 Patent, is the most hotly contested and heatedly debated issue by the parties, who argue for widely divergent interpretations of this claim limitation. The term "side rail positioning mechanism" is nowhere explicitly defined in the '855 Patent, but it is used throughout the patent as part of the primary independent claims. In Claim 1, a "side rail positioning mechanism" is claimed as part of the overall apparatus, "each of said at least one positioning mechanism being coupled to a respective one of said at least one side rail, each of said at least one positioning mechanism being operable to position said respective one of said at least one side rail in an uppermost position [above the bed surface] . . . and in a lowermost position [substantially at or below the bed surface]." '855 Patent, Col. 7, Claim 1. In Claims 10 and 18, "side rail positioning mechanism" is given a more specific structure, to include: (a) a handle component mounted to at least one side rail; (b) "a vertical lock spindle rotatably attached to said respective one of said at least one side rail and having a plurality of lock pins spaced vertically thereon, said lock spindle being operable to rotate between a lock position and a release position;" and ©) "a locking component slidably receiving said vertical lock spindle, said locking component being fixed to said frame." '855 Patent, Col. 9, Claim 10; Col. 10, Claim 18.

Pedicraft submits that the claim limitation "side rail positioning mechanism" does have an ordinary meaning to one skilled
in the art of hospital beds and cribs, when read in the context of the claims in the '855 Patent. Pedicraft urges this Court to adopt an ordinary and known meaning of "side rail positioning mechanism" that "covers any number of constrained kinematic chains arranged to lock and unlock a side rail and various up and down positions with respect to the bed surface and the patient." Dkt. 65, pg. 6. It urges the Court to reject Stryker's proposed construction, which limits the term "side rail positioning mechanism" to the combination described in Claims 10 and 18 of the '855 Patent, namely a combination of a handle component mounted to a side rail, a vertical lock spindle rotatably attached to the side rail and having several vertically spaced lock pins along its length, and a locking component which slidably receives the vertical lock spindle. See id. Pedicraft claims that Stryker's proposed narrow claim construction does not comport with the ordinary meaning that should be given to the term "side rail positioning mechanism," as shown through both intrinsic and extrinsic evidence.

Pedicraft asserts that the meaning of "side rail positioning mechanism" to one of ordinary skill in the art is reflected in the testimony of Mr. Lockwood, who has education and experience in the design and development of hospital beds and equipment. See Dkt. 62, pp. 20-22. Mr. Lockwood testified that one skilled in the art would understand the term based on the person's understanding of the word "mechanism," along with a working knowledge of the functioning and design of hospital beds and cribs. See id. at pp. 28-30. According to Pedicraft's interpretation of the term "side rail positioning mechanism" as reflected by Mr. Lockwood's testimony, an ordinarily skilled person would understand the term as signifying a "mechanical linkage that is arranged to provide controlled motion transfer." See id.; Dkt. 65, pp. 7-8. Admittedly, this construction of the term was discussed through a "highly technical" definition of "mechanism" as a "constrained kinematic chain." Dkt. 65, pp. 7-8. Such a "constrained kinematic chain" would purportedly be arranged on a crib so as to move the side rail to lock and unlock the rail in up and down positions, and Pedicraft contends that this structure and function is made clear through the language in Claim 1 of the '855 Patent. Dkt. 62, pp. 28-30.

As "corroboration" for this technical definition of "mechanism," Pedicraft points to Mr. Lockwood's discussion of a 1969 college mechanical engineering textbook, which allegedly indicates how the term is defined by mechanical engineers -- and would continue to be defined to the present day. Dkt. 62, pp. 32-34. Furthermore, Pedicraft claims that Stryker's own expert who testified at the Markman hearing, Dr. Joseph F. Dyro, a biomedical engineer who specializes in clinical engineering, also corroborated this definition of "mechanism" as a "constrained kinematic chain." According to Pedicraft, Dr. Dyro formed his opinion on the construction of this term without any consultation with colleagues or literature in the art, and he subsequently conformed with Mr. Lockwood's understanding of the meaning of "side rail positioning mechanism" by concluding that it would be a mechanical structure for moving the side rails up and down. Dkt. 63, pp. 32-24. In short, "other than semantical differences in their expressions," Pedicraft argues that both Dr. Dyro and Mr. Lockwood have the same understanding of the proper construction of the term "side rail positioning mechanism" from the perspective of one skilled in the art. Dkt. 65, pp. 8-9.

Pedicraft also disputes Stryker's attempt to use a general dictionary definition to construe the term "side rail positioning mechanism" as "a piece of machinery: a structure of working parts functioning together to produce an effect," which Stryker then argues is vague and must be limited by using the specific disclosures throughout the '855 Patent. Dkt. 65, pp. 9-10. Pedicraft argues that general dictionary definitions cannot control over how a claim would be interpreted by one specifically skilled in the art of hospital beds and cribs, and as such the claim term must be viewed in the entire context of the patent and the "world of hospital beds and cribs." In this world, Pedicraft contends, skilled individuals would understand a "side rail positioning mechanism" to mean a "constrained kinematic chain" used to position the side rails between the uppermost and lowermost positions on the crib.

Although Stryker contends that 35 U.S.C. §112, P6 applies to the term "side rail positioning mechanism" because it is a "means-plus-function" claim, Pedicraft disputes this argument because the term "means" is nowhere used in the claim, and therefore Section 112, P6 is presumed not to apply to this case. Pedicraft asserts that Stryker has not overcome this presumption of inapplicability of the "means-plus-function" section because "side rail positioning mechanism" does invoke sufficient structure to one skilled in the art when viewed in context of the entire '855 Patent and one's knowledge of hospital beds and cribs. Dkt. 65, pp. 11-12. Allegedly, the term "mechanism" would be understood by those skilled in the art (as demonstrated by the experts during the Markman hearing), and as such one would understand the meaning behind a mechanical structure used to position the side rails of hospital beds or cribs. Id. Pedicraft points to Stryker's own expert as demonstrating that those skilled in the art of hospital bed design and structure understand "side rail positioning mechanism" to mean a constrained mechanical linkage used to raise and lower side rails, without the need for dictionaries, treatises or other resources. Id. at pp. 12-13.
Stryker has therefore purportedly failed to overcome the presumption against application of Section 112, P6. Instead, Pedicraft contends that "side rail positioning mechanism," as used in Claim 1, states sufficient structural, operational and positional limitations to describe the "metes and bounds" of the claim limitation and thus take it out of the ambit of the "means-plus-function" section. It argues extensively that the disputed claim limitation "inherently has structure in the form of a mechanical linkage for motion transfer . . . a side rail lock . . . coupled to the side rail . . . operable to position the side rail between an uppermost position and a lowermost position." Id. at 13. In short, in view of the "inherent structure" contained in the term "side rail positioning mechanism," Pedicraft urges the Court not to analyze the term in light of Section 112, P6. Instead, the claim limitation should be interpreted in light of the meaning accorded to it by those of ordinary skill in the art (including both experts presented at the Markman hearing) -- i.e., "a constrained kinematic chain, or in other words, a mechanical linkage coupled to the side rail and arranged to provide a controlled or predictable movement up and down of the side rail." Id. at 14.

Lastly, Pedicraft argues against the construction of "side rail positioning mechanism" as limited to the terms of the '855 Patent specifications, or in other words, the specific limitations evidenced in Claims 10 and 18. None of the descriptions in the patent claims that specify the purported limitations of a "side rail positioning mechanism" are presented in a "definition format" that would be readily understood by one skilled in the art, and according to Pedicraft, "[m]ost of the references to side rail positioning mechanism and the specific embodiment disclosing the specification are made in the context of the detail description section and with reference to the specific embodiment in the figures." Dkt. 65, pg. 15. As such, these descriptions and the single embodiment should not be read as limitations to the term "side rail positioning mechanism," as one skilled in the art would not perceive such limitations upon interpreting the term in Claim 1 of the '855 Patent.

Stryker vehemently disputes what it considers Pedicraft's "strained" interpretation of the term "side rail positioning mechanism." Instead, Stryker contends that the claim limitation should be interpreted to include the combination of "(1) a handle mounted to a side rail, (2) a vertical lock spindle which is rotatably attached to the same side rail and has several lock pins spaced vertically along its length, and (3) a specially designed locking component for receiving the lock spindle." Dkt. 66, pg. 7. According to Stryker, this interpretation of "side rail positioning mechanism" is supported by the '855 Patent's abstract, summary of the invention, and detailed description of the invention (shown in Figure 3). Id. at pp. 7-8. In other words, the term "side rail positioning mechanism" is defined in accordance with Stryker's construction consistently throughout the '855 Patent.

In fact, Stryker argues that its interpretation of "side rail positioning mechanism" is not simply the preferred embodiment expressed in the patent, it is the only embodiment described in the '855 Patent. Moreover, the patent repeatedly refers to the positioning mechanism "of the present invention," including in the written description or summary of the invention where the mechanism to position the side rails is described as comprised of a handle, vertical lock spindle, and a locking component. '855 Patent, Col. 2, lines 50-65. Accordingly, because the phrase "of the present invention" is affirmatively used and followed by a description of "side rail positioning mechanism" that is consistently in concert with Stryker's specific construction, Stryker urges the Court to define the claim term using the three consistently required elements. Stryker highlights the testimony of Dr. Dyro at the Markman hearing, during which the expert testified that use of the phrase "present invention" in the '855 Patent is a signal regarding the meaning of the unfamiliar terminology "side rail positioning mechanism." Dkt. 63, pp. 23-24. In addition, it is evident that Pedicraft considered the "side rail positioning mechanism" to be an essential part of the invention, including the claim term in the title of the '855 Patent. Stryker also urges this Court to carefully consider the specification of the invention in this case, as it is important to look to the specification as either an express definition of a claim or a definition by implication. Furthermore, other intrinsic evidence is allegedly consistent with Stryker's construction, including the prosecution history of the patent, wherein the Patent Office only allowed the '855 Patent to issue based on the specific attributes of the "side rail positioning mechanism." Dkt. 66, pp. 11-12. In fact, nowhere in the prosecution history did Pedicraft object to the Patent Officer's issuance of the patent with the claim "side rail positioning mechanism" including the required components named in the specification.

Contrary to Pedicraft's analysis, Stryker also asserts that 35 U.S.C. §112, P6 is applicable to the claim term "side rail positioning mechanism." In effect, it argues that "side rail positioning mechanism" recites a means for performing a specified function, without reciting specific structure, material or acts in the limitation. The Court must therefore look to the specification and its equivalent of the '855 Patent (i.e., the "side rail positioning mechanism" as specifically defined by Stryker and Claims 10 and 18 of the patent) for the proper construction of this "means-plus-function" element. Although the claim element "side rail positioning mechanism" does not specifically include the "means" phrasing that would
presumptively trigger Section 112, P6, Stryker points out that the claim language nonetheless fails to provide sufficient structure to remove the limitation from the "means-plus-function" analysis. This analysis, Stryker contends, is supported by Dr. Dyro, who testified that the term "side rail positioning mechanism" in Claim 1 of the '855 Patent is specifically described in terms of a function for positioning the side rail, without any described structure to perform the function. Dkt. 66, pp. 16-17. Dr. Dyro further testified that the term "mechanism" itself does not help in construing the claim limitation, as "mechanism" does not connote some identifiable structure. Id. In short, Stryker argues that the claim element "positioning mechanism being operable to position the side rail" in fact should be construed as if it were worded "means for positioning the side rail." Dkt. 66. Pg. 17.

Under Section 112, P6, Stryker asserts that the '855 Patent describes the claimed function of a "side rail positioning mechanism" as positioning the side rails between an uppermost and lowermost position, but the claim itself (i.e., Claim 1) does not disclose sufficient structure to correspond with this function. Accordingly, the only structure disclosed in the patent for accomplishing the function of positioning side rails include the combination of (1) a handle component mounted to a side rail; (2) a rotatable lock spindle with several vertically spaced lock pins operable to rotate between lock and release positions; and (3) a locking component attached to the frame of the bed which slidably receives the lock spindle. See '855 Patent, Abstract; Col. 2, Summary of the Invention; Detailed Description of the Invention, Col. 5, lines 20-40; Figures 3, 7 and 8; Claim 10, Col. 9; Claim 18, Col. 10. All of the claims in the patent -- including Claim 1 -- therefore recite a "side rail positioning mechanism" that includes this combination of elements, as reflected in the patent's abstract, specification, figures, and later, Claims 10 and 18. As such, since nothing within the intrinsic evidence ever reflects a more expansive definition of "side rail positioning mechanism" that would not be limited to these required elements, Stryker argues that the Court should construe this claim as limited to the only disclosed structure in the '855 Patent. It claims this is required because Pedicraft cannot broaden Claim 1 by differentiating the patent's other claims, given the fact that functional language is used and the patent's specifications consistently describe a "side rail positioning mechanism" through the use of its required elements.

Stryker also points to the evidence presented at the Markman hearing as reflecting the clear fact that prior to the issuance of the '855 Patent, the term "side rail positioning mechanism" had no clear meaning to a person of ordinary skill in the art of hospital bed and crib design and manufacture. Instead, it is the patent itself which defines the claim term, solely by reference to the specific limitations described above. Stryker highlights Mr. Lockwood's testimony as reflecting his understanding that a "side rail positioning mechanism" as used in the '855 Patent would be understood to include a handle component, a vertical lock spindle, and a locking component. Dkt. 62, pp. 93-95. Additionally, there is no dictionary or treatise which includes a specific definition of "side rail positioning mechanism," nor is there any evidence that the phrase was ever used prior to its use by Pedicraft's counsel during patent prosecution. Dkt. 66, pg. 22. Both experts at the Markman hearing apparently agreed that prior to the '855 Patent, the term "side rail positioning mechanism" had never been used in any patent or publication. See Dkt. 62, pp. 99-100; Dkt. 63, pp. 16-17.

Stryker's own expert, Dr. Dyro, testified that the word "mechanism" does not connote a specific structure, but instead brings to mind an understanding of some "assemblage of parts that, when working together, perform some function." Dkt. 63, pg. 17. He also testified that he has never seen the definition of "mechanism" as a "constrained kinematic chain" in any document, textbook or dictionary, prior to hearing this definition presented by Pedicraft. Id. at 17-19. Moreover, although pieces of prior art presented during the '855 Patent prosecution do contain potential "mechanisms" for moving bed railings, Dr. Dyro did not acknowledge that the prior art at any time expressly used the term "side rail positioning mechanism." Id. at 17, 40-41, 49-52. Dr. Dyro therefore testified that one must look to the disclosures of the '855 Patent itself to determine the meaning of this newly-used claim term.

Lastly, Stryker urges this Court to adopt its construction of "side rail positioning mechanism," as reflected in the '855 Patent itself and in the intrinsic evidence, over the strained and contradictory construction presented by Pedicraft and its expert, Mr. Lockwood. This testimony, along with a 1969 college textbook, cannot be used to contradict the meaning of the previously undefined term that is reflected in the language of the patent, its prosecution history, and in the testimony of the experts. See Dkt. 66, pp. 26-27. Such documents and prosecution history purportedly establish the meaning of this vague term without the need for reference to extrinsic evidence, such that one skilled in the art would understand a "side rail positioning mechanism" as requiring the three components highlighted above in the context of the '855 Patent. Stryker claims any evidence to the contrary is entitled to little or no weight by this Court, such that the intrinsic evidence provides the required public notice of what is included within the claims of the '855 Patent.
The Court agrees that Pedicraft's attempts to define "side rail positioning mechanism" through the use of strained and convoluted phrases such as a "constrained kinematic chain" do not properly give clear notice to the public as to what would be covered under the terms of the '855 Patent. Instead, the description of "side rail positioning mechanism" to include (1) a handle component mounted to a side rail; (2) a rotatable lock spindle with several vertically spaced lock pins operable to rotate between lock and release positions; and (3) a locking component attached to the frame of the bed which slidably receives the lock spindle, is the only embodiment that is reflected throughout the '855 Patent, its prosecution history, and any additional intrinsic evidence. See '855 Patent, Abstract; Col. 2, Summary of the Invention; Detailed Description of the Invention, Col. 5, lines 20-40; Figures 3, 7 and 8; Claim 10, Col. 9; Claim 18, Col. 10. This claim term was previously undefined, and even when looking at the extrinsic evidence, it becomes clear that both experts believe the term would be understood by one of ordinary skill in the art of crib design and manufacture as it is reflected throughout the '855 Patent. The Court therefore believes Stryker's construction of the claim term "side rail positioning mechanism" is the correct one.

Additionally, the '855 Patent consistently defines the "positioning mechanism" of the present invention as including a handle, vertical lock spindle, and locking component. The Court agrees that the use of the phrase "of the present invention" is particularly indicative of the appropriate construction, because that language indicates the limitations of the structure Pedicraft intended to patent. See, e.g., SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1343 (Fed. Cir. 2001) (discussing use of phrase "present invention" to describe a particular structure); Bell Atlantic Network Servs., Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1277 (Fed. Cir. 2001) (same). Stryker's expert affirmed this legal proposition by stating that "of the present invention" would be taken as a signal as to the meaning of the heretofore undefined term "side rail positioning mechanism." Dkt. 63, pg. 23 ("[W]hen a specification refers to the term 'the present invention,' it's talking about the present invention and not some possible embodiment or some possible configuration. It is, this is the invention."). Moreover, Pedicraft indicates in the title of the '855 Patent that the "side rail positioning mechanism" effectively is a vital component of the invention, if not the heart of the invention itself. Therefore, it is proper to refer to the specification and descriptions of this feature, consistent throughout the '855 Patent, as the implied definition of the term "side rail positioning mechanism." See Vitronics, 90 F.3d at 1582; Bell Atlantic, 262 F.3d at 1268; SciMed, 242 F.3d at 1344.

The Court also finds that the prosecution history, a recognized piece of the puzzle in construing a disputed claim term, supports the interpretation of "side rail positioning mechanism" put forth by Stryker. See Zenith Lab, Inc. v. Bristol-Myers Squibb Co., 19 F.3d 1418, 1425 (Fed. Cir. 1994). In the Notice of Allowance, Stryker correctly points out that the Patent Examiner described the features of the positioning mechanism to be patented, which included a rotatable lock spindle and a locking component to slidably receive the lock spindle. Notice of Allowance, June 25, 2001, pg. 2. It is also noteworthy that there are no notes or commentary from Pedicraft in the prosecution history clarifying the scope of its invention, providing further intrinsic support for Stryker's proffered construction. See, e.g., Southwall Tech., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1578 (Fed. Cir. 1995) (holding that patentee cannot later contradict an indisputable public record regarding the allowance of the patent claims).

The claim term "side rail positioning mechanism" should also be construed with reference to the patent specification because it is a "means-plus-function" element as defined under 35 U.S.C. § 112, P6. While it is true that this element does not include the requisite "means for" language that would result in the presumptive application of Section 112, P6, the fact remains that "side rail positioning mechanism" connotes a function -- i.e., positioning side rails of the crib - without connoting sufficient structure for performing that function. As such, Stryker has overcome the presumption that Section 112, P6 does not apply to this term such that it must be construed with reference to the specification in the '855 Patent. See Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1213 (Fed. Cir. 1998); Watts v. XL Systems, Inc., 232 F.3d 877, 880-81 (Fed. Cir. 2000) (discussing application of Section 112, P6 when the claim term, a name for a structure, does not connote a reasonably well-understood meaning to one skilled in the art).

As discussed above, both Dr. Dyro and Mr. Lockwood appeared to agree at the Markman hearing that the term "side rail positioning mechanism" did not have a reasonably well-understood meaning prior to the issuance of the '855 Patent. Moreover, the word "mechanism" itself is vague and could connote a wide variety of structures, all to be used to perform some specified function -- here, positioning the side rails of the crib. See, e.g., Rodime PLC v. Seagate Tech., Inc., 174 F.3d 1294, 1303-04 (Fed. Cir. 1999); Dkt. 63, pg. 17. The Court does not find Pedicraft's proffered "constrained kinematic chain" definition the least bit helpful in defining this vague term by narrowing its structure to a concrete "mechanism." Rather, to allow Pedicraft to widen the scope of its claim terms through such broad and ambiguous definitions would defeat the purpose of giving the public adequate notice of the limitations of the patented invention. See Markman, 517 U.S. at 390;
Vitronics, 90 F.3d at 1583; Mas-Hamilton, 156 F.3d at 1214 (stating that claims cannot be construed too broadly to cover every conceivable structure that would serve as a means for performing a certain function). Because the term "mechanism" as used in the claim limitation "side rail positioning mechanism" does not connote a sufficiently known structure for performing the function, the Court finds that Section 112, P6 is applicable, and as such the claim term should be defined through referral to the specification and description of the invention in the '855 Patent. See also Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531 (Fed. Cir. 1996); Mas-Hamilton, 156 F.3d at 1213-15 (discussing application of Section 112, P6 to claim term even without traditional "means for" language); Raytheon Co. v. Roper Corp., 724 F.2d 951, 957 (Fed. Cir. 1983).

The Court agrees with Stryker that the Federal Circuit opinion in CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359 (Fed. Cir. 2002), is inapposite to this case. In CCS Fitness, the traditional "means for" language was not used, and therefore it was presumed that Section 112, P6 did not apply. However, unlike this case, the Defendant in CCS Fitness did not present sufficient evidence to overcome the presumption, and in any event, the claims in the CCS Fitness patent provided sufficient structural description to take the disputed term outside of the requirements of Section 112, P6. See id. at 1364, 1369. Here, the Court finds that "side rail positioning mechanism" is a functional term, and there is not sufficient structure disclosed in Claim 1 of the '855 Patent. Nor does the term "side rail positioning mechanism" possess an ordinary meaning to one skilled in the art. Thus, the "means-plus-function" requirements apply.

In applying Section 112, P6, it therefore becomes clear that Stryker's identified construction comports with the disclosures in the '855 Patent. Because Claim 1 itself does not disclose a specific structure, the specification provides the required construction of the disputed claim term "side rail positioning mechanism." See Kemco Sales, Inc. v. Control Papers Co., 208 F.3d 1352, 1361 (Fed. Cir. 2000). Here, that means the only structure disclosed in the entire '855 Patent must be construed as the meaning of "side rail positioning mechanism": a device that includes a handle component mounted to a side rail, a rotatable lock spindle with several vertically spaced lock pins operable to rotate between lock and release positions, and a locking component attached to the frame of the bed which slidably receives the lock spindle. Stryker's construction of this term is therefore the correct one under Section 112, P6.

Pedicraft also cannot invoke the doctrine of claim differentiation to separate the "side rail positioning mechanism" disclosed in Claims 10 and 18 from the undisclosed structure in Claim 1. It argues that by virtue of the detailed description of a "side rail positioning mechanism" in independent Claims 10 and 18, the term should have an excessively broad scope in Claim 1 because it is not defined specifically as in the independent claims. Stryker's assertion is correct, however, that the only description of "side rail positioning mechanism" throughout the '855 Patent claims and specification includes the three required components. As such, claim differentiation "cannot broaden claims beyond their correct scope, determined in light of the specification and the prosecution history and any relevant extrinsic evidence." Wang Lab, Inc. v. America Online, Inc., 197 F.3d 1377, 1384 (Fed. Cir. 1999). Here, due to the functional language of Claim 1 and the only structural disclosure in the specification and remaining claims of the '855 Patent, the term "side rail positioning mechanism" should properly be construed as requiring a handle, vertical lock spindle, and locking component. See also Laitram, 939 F.2d at 1358.

Lastly, the Court agrees with Stryker's contention that the term "side rail positioning mechanism" does not have an ordinary meaning to one skilled in the art of hospital beds and cribs, considering the fact that the term was not coined until the '855 Patent. Accordingly, the Court must look first to the intrinsic evidence in this case (i.e., the patent itself and the prosecution history), and then, if needed, to the extrinsic evidence (i.e., the expert testimony and exhibits provided at the Markman hearing). In this case, as discussed above, the '855 Patent and prosecution history give clear indication that a "side rail positioning mechanism," in conjunction with Pedicraft's product, must embody a handle component, vertical lock spindle, and a locking component. This embodiment was further supported by Dr. Dyro and Mr. Lockwood, who acknowledged that under the '855 Patent, a "side rail positioning mechanism" would include the required three elements. Dkt. 62, pp. 93-95.

Pedicraft has presented no evidence to demonstrate to the Court that prior to the '855 Patent, "side rail positioning mechanism" had any recognized meaning to one skilled in the art. In fact, there is no evidence to show that the term has ever been used in a dictionary or treatise, nor has it previously been used in any of the patents disclosed as prior art during
prosecution of the '855 Patent. See, e.g., Texas Digital, 308 F.3d at 1202; Optical Disc Corp. v. Del Mar Avionics, 208 F.3d 1324, 1334-35 (Fed. Cir. 2000); Dkt. 62, pg. 99. Pedicraft's own expert even acknowledged his unfamiliarity with the term prior to this litigation, and it is patently evident that the term had never been used prior to the prosecution of the '855 Patent. Dkt. 62, pp. 80-81, 110. Stryker's expert, Dr. Dyro, also testified that the term "mechanism" does not signal a clear structural meaning, and that he had never seen the term "side rail positioning mechanism" prior to review of the '855 Patent. Dkt. 63, pp. 17-18.

The Court must accordingly look to the intrinsic evidence in this case to determine the meaning of the heretofore unused term. As explained above, the intrinsic patent documents (including the specification and file history) signal a clear meaning of "side rail positioning mechanism" without the need for reference to Mr. Lockwood's strained and unsupported (save for a 1969 textbook) definition of "mechanism." See Vitronics, 90 F.3d at 1584-85; Southwall, 54 F.3d at 1578; Texas Digital, 308 F.3d at 1204; Middleton, Inc. v. Minnesota Mining and Mfg. Co., 311 F.3d 1384, 1387 (Fed. Cir. 2002). The Court will therefore adopt Stryker's construction of the term based on the intrinsic documents that would give the public proper notice of what constitutes a "side rail positioning mechanism."

Accordingly, the Court construes the term "side rail positioning mechanism," as used in Claim 1 and throughout the '855 Patent, to include the combination of (1) a handle mounted to a side rail; (2) a vertical lock spindle which is rotatably attached to the same side rail and has several lock pins spaced vertically along its length; and (3) a specially designed locking component for receiving the lock spindle.

1. "Side wall"

The second patent at issue in this case is United States Patent No. 5,961,231 (the '231 patent), entitled "Keyboard Positioning System" and issued on October 5, 1999. The '231 patent also describes "a device for mounting a keyboard to a base and for positioning the keyboard in a backward tilted position." The device claimed in claim 1 is comprised in part of (c) a support tray comprising:

- a support surface and
- a keyboard stop member comprising a stop wall, said support surface comprising a front position, a rear portion, a first sidewall, and a second sidewall, such that said stop wall extends from said first side wall to said second side wall and wherein said stop wall is disposed in said rear portion of said support surface.

'231 patent claim 1(c), col. 9, 11. 47-54.

Plaintiffs contend "side wall" should be given its ordinary and accustomed meaning: "a wall forming the side of something." Merriam-Webster Unabridged Dictionary (2002) (online version). As such, plaintiffs contend the term is broad enough to include side walls of the support tray support surface that extend either upwardly or downwardly from the sides of the support surface. Defendants maintain that a side wall is ordinarily understood to be "a vertical structure or member forming an enclosure or defining a space." McGraw-Hill Dictionary of Scientific and Technical Terms, Fifth Edition (1994). Defendants argue that a downwardly extending side wall would not serve to enclose the space of the keyboard support surface.

Although the parties argue matters of prosecution history and extrinsic evidence in support of their respective positions, this dispute is properly resolved with reference to the patent language and specification. Each "side wall" is part of a support surface, a surface of a support tray, designed to support a keyboard. The keyboard rests on the top of the support surface. Whether the side wall is deemed to partly "form the enclosure of the support surface," or "define the space of the support surface," or "form the side of the support surface," it is clearly the top, and not the bottom, of the support surface that is relevant. A side wall must be a wall in relation to the top of the support surface. It follows, applying even plaintiffs' proposed definition, that a side wall must project upward from the side of the support tray to form the side of the support surface. A structure or surface which projected only downward from the support surface could be considered part of the
edge of the support tray, but would not form the side or define the space of the "support surface" for purposes of this claim.

This construction is consistent with the plain and ordinary meaning of side wall, consistent with the claim language and specification disclosures, and consistent with plaintiffs' own initial proposal, recognizing that "wall" includes a structure having a slightly upward projection or enclosing part. See Markman Charts, docket # 88, p. 3. Accordingly, the Court holds:

"Side wall" shall be construed to mean a structure projecting or extending upward, i.e., above the plane of the support surface, from either side of the support tray.

3627

8. "side wall" is a substantially vertical component of a beam. 2 The side wall of the beams in the '237 device is continuous (and rigid) although not necessarily constructed of one piece. At the same time, the side wall is not of "piecemeal construction" as would permit alteration of the cross-sectional configuration of the axle; rather it permits insertion of an orifice in the side walls which orifice substantially surrounds the axle. (See ARV000616);

9. . . . "whereby said axle cross-sectional configuration is prevented from assuming a cross-sectional configuration substantially different from an unaltered configuration when said torsional forces are imposed upon said axle" is inherent in the process rather than a claim limitation. See Texas Instruments Inc. v. United States ITC, 988 F.2d 1165, 1172 (1993) (A "whereby" clause that merely states the result of the limitations in the claim adds nothing to the patentability or substance of the claim).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

1 A "means plus function" limitation, under 35 U.S.C. § 112 P6, must "be construed to cover the corresponding structure, material, or described in the specification and equivalents thereof."

2 A beam is "a structural member (as an iron girder) usually supported at the two ends that is laid horizontally to bear a load and brace a frame" (Webster's Third Int'l Dictionary 190 (1981 ed.). The beam in the '237 device is rigid, not flexible.

3628

1. Claim 1 -- "side walls"

Bradford proposes that "side walls" means "structural elements partially defining the body that join a top and a bottom." Defendants contend that "side walls" means "opposing vertical constructions resembling an upright continuous surface, and each serving to enclose, divide, or protect the opposing areas of the body and that join a top and a bottom." The basic dispute over this term is whether "side walls" requires a continuous surface.

In contending that it does not, at oral argument, Bradford pointed to Figures 4 and 5 of the '119 Patent. Figures 4 and 5 show one of the preferred embodiments of the invention in which folding legs are utilized to collapse the top of the container onto the bottom of the container. The embodiment in Figures 4 and 5 is essentially a frame-like structure 1 which does not create an enclosure around the dunnage structures. In contrast, the embodiment in Figures 1, 2, and 3 demonstrates a container that is more box-like than the container in Figures 4 and 5. In this embodiment, the sides of the container are continuous surfaces. The sides are hinged where they connect to the bottom and fold over one another to collapse the container.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

1 Noting that the term "frame" is a term which also requires construction, the Court clarifies that here it uses the term "frame-like" in a descriptive rather than definitional sense.
In arguing for their definition, Defendants note this distinction. They argue that the specification of the ‘119 Patent always uses the term "side walls" when referring to embodiments with continuous surfaces and that it uses "side" but not "wall" when it refers to embodiments, such as the frame-like structure in Figures 4 and 5, that do not include substantially continuous surfaces. Defendants also observe that dependent claims 18 and 19 of the ‘119 Patent use the term "sides" but not "side walls". Thus, they argue, there clearly is a distinction between "side walls" and "sides" which in turn requires "side walls" to have substantially continuous surfaces. Finally, Defendants point out that during the prosecution of the corresponding patent application before the European Patent Office, Bradford argued that "side walls" did not include the frame structure disclosed in Janus (U.S. Patent 5,211,290).

The Court concludes that Defendants' proposed construction of "side walls" is correct. As they correctly observe, the specification consistently uses "side walls" in reference to embodiments with substantially continuous surfaces and "sides" in reference to embodiments without substantially continuous surfaces. See Phillips, 415 F.3d at 1315 (stating that the specification is usually dispositive and that "it is the single best guide to the meaning of a disputed term.") (quoting Vitronics Corp. v. Conception Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). Additionally, dependent claims 18, 19, 21, and 22 use the term "sides". Dependent claims 25 through 30 revert to use of the term "side walls". Clearly, then, there is a distinction between "side walls" and "sides" which should be maintained. Power Mosfet Techs., L.L.C. v. Siemens AG, 378 F.3d 1396, 1409 (Fed. Cir. 2004) (stating that although not an inflexible rule, "interpretations that render some portion of the claim language superfluous are disfavored.").

Moreover, the Court observes that in Claim 1, the "side walls" are "coupled to the bottom[.]") '119 Patent, col. 17 ll. 28-29. By contrast, according to the specification, the embodiment shown in Figures 4 and 5 has "sides". The "sides" are not "coupled to" anything. Instead, the "sides" form a part of the top member. Then, folding or collapsible legs are "hingedly coupled" to top and bottom members. Id. col. 12, ll. 15-24. Thus, according to Figures 4 and 5, the "coupling" occurs between the top and bottom members and the folding legs, and not between a "side wall" and a "bottom." To conclude that "side walls" includes the "sides" disclosed in Figures 4 and 5, the Court would also have to ignore that in Claim 1, the sides walls are only "coupled to" a single component, the "bottom", and not to a top member and a bottom member, as shown in Figures 4 and 5, which would be coupling to two elements. These figures further demonstrate that "side walls" and "sides" are different concepts which require different definitions.

Arguably, an interpretation of "side walls" which requires substantially continuous surfaces results in a construction which excludes the preferred embodiment disclosed in Figures 4 and 5 because they do not show "side walls". Dow Chem. Co. v. Sumitomo Chem. Co., Ltd., 257 F.3d 1364, 1378 (Fed. Cir. 2001) ("[A] claim construction that excludes a preferred embodiment is rarely, if ever, correct.") (quoting Vitronics, 90 F.3d at 1583). This contradiction, however, can be reconciled if Figures 4 and 5 are understood as a preferred embodiment of independent claim 17, and not as a preferred embodiment of independent claim 1.

As indicated, independent claim 1 in pertinent part claims a "returnable and reusable container for holding product therein during shipment . . . comprising . . . a body having a bottom and at least two side walls coupled to the bottom[,]" '119 Patent col. 17 ll. 24-29. In contrast, independent claim 17 discloses a collapsible container body but there is no limitation concerning either "sides" or "side walls". The "sides" limitation is introduced in dependent claim 18. "Side walls" resurfaces in dependent claim 25. Thus, independent claim 17 is broad enough to encompass both containers with "sides" and containers with "side walls". See Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir. 2004) ("[T]he presence of a dependent claim that adds a particular limitation raises a presumption that the limitation is not found in the independent claim."). Therefore, requiring "side walls" to have a substantially continuous surface does not improperly exclude a preferred embodiment.

Accordingly, the Court holds that "side walls" means "opposing vertical constructions resembling an upright continuous surface, and each serving to enclose, divide, or protect the opposing areas of the body and that join a top to a bottom."
B. Side View

The dispute over the term "side view" in claim 1 raises two issues: first, whether the side view image created by the second camera must be crescent shaped; and second, what range of angles generates a side view image. As to the first issue, Scanner asserts that a side view image is not limited to only a crescent shape; ICOS contends that a side view image must be a crescent shape. As to the second issue, Scanner asserts that with no crescent shape limitation, a side view image is not limited to one taken at a low angle; ICOS contends that a side view image must be taken from an angle between 14 and 25 degrees. I first address whether the term "side view" is limited such that a side view image must be crescent shaped.

The plain language of the patents and the doctrine of claim differentiation show that while the preferred embodiment may include a crescent shaped side view image, a side view image is not limited to only crescent shapes. In analyzing the language of the patents, the Court first looks to the claim language; here, the language of claim 1, the independent claim, does not expressly include such a limitation. (See, e.g., Col. 18, ll. 46-47).

Next, the Court looks to the language of the specification for aid in construing the claims. Kraft Foods, 203 F.3d at 1368. See also Ethicon Endo-Surgery, 93 F.3d at 1578. Here, in the specification, side view is described as producing a crescent shape. (See e.g., Col. 4, l. 16 & Col. 12, l. 41). Nowhere in the specification, however, are side view images limited only to crescent shapes. The specification, instead, demonstrates that the preferred embodiment includes a crescent shaped side image. But "there is no basis for reading a limitation from the preferred embodiment into the language of the claim." TurboCare Div. of Demag Delaval Turbomachinery Corp. v. Gen. Elec. Co., 264 F.3d 1111, 1123 (Fed. Cir. 2001) (citing Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988)) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations.").

ICOS argues that the limitation written in the specification may be read into the claim, and ICOS relies on the recent Federal Circuit decision in Kraft Foods for that proposition. Kraft Foods, 203 F.3d at 1368 (adopting written description of rigidity of back panel where claim lacks language of rigidity). While the Federal Circuit decision in Kraft Foods does support this argument, the same court held otherwise in another recent decision. See Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1343, 2001 U.S. App. LEXIS 24810, 60 U.S.P.Q.2D (BNA) 1851 (Fed. Cir. 2001) (reversing the district court's decision because the district court "relied solely on the preferred embodiment in the written description and its drawings (which admittedly reads on the narrower meaning of the key word) and . . . the prosecution history").

The two Federal Circuit cases, however, are not contradictory because the facts differ. After careful analysis it is apparent that Rexnord is applicable here. Specifically, the language of the written description in Kraft Foods -- that "any of the back panels would be constructed of a relatively stiff material[,]" Kraft Foods, 203 F.3d at 1367 (emphasis in original, internal quotation omitted) -- indicates that there is only one embodiment, i.e., one with relatively stiff material. Here, the language of the specification does not limit the side view image to only crescent shapes. Instead, the mere fact that the specification refers to the side view image as crescent shaped suggests that the preferred embodiment is one that creates a crescent shaped image. Accordingly, the plain language of the patents does not limit a side view image to a crescent shaped image.

Under the doctrine of claim differentiation, independent claim 1 and dependent claim 2 must be read to have different limitations. Because claim 2 expressly defines the second image as a crescent shape, and because claims 1 and 2 are presumptively different in scope, the doctrine would suggest that a crescent shape limitation cannot be read into claim 1. Wenger Mfg., Inc. v. Coating Mach. Sys., Inc., 239 F.3d 1225, 1233 (Fed. Cir. 2001). See also 35 U.S.C. § 112. The only different limitation added by claim 2 is that the second image is a crescent shape; the requirement of a crescent shape therefore cannot be found in claim 1.

Although "claim differentiation only creates a presumption that each claim in a patent has a different scope[,] . . . at least one limitation must differ." Kraft Foods, 203 F.3d at 1368 (citation omitted). Here, if a crescent shape limitation were read into claim 1, claim 2 would be superfluous. Moreover, the doctrine applies here because "claim differentiation . . . is clearly applicable when there is a dispute over whether a limitation found in a dependent claim should be read into an independent claim, and that limitation is the only meaningful difference between the two claims." Wenger Mfg., 239 F.3d at 1233.

Hence, I conclude that the term "side view" in claim 1 is not limited to a view that produces only crescent shapes.

I turn next to the issue of the position of the second camera such that the camera produces a side view image. As an initial
note, it is uncontested that a side view image cannot be one taken from a 90 degree angle or a top angle view, and it must differ from one taken by the first camera. (See Scanner Br. at 14-15; ICOS Post-Hr. Br. at 19).

Scanner asserts that there are no limits to the viewing angle other than those that are uncontested. ICOS argues that to produce a side view image, the viewing angle must be a low angle, specifically between 14 and 25 degrees. ICOS's argument to limit the viewing range is based on the presumption that the side view image is crescent shaped. Specifically, ICOS argues that it is this range of angles that will produce the crescent shaped image. Because the Court has concluded that there is no crescent shape limitation, and because the patents contain no language limiting the viewing angle to 14 to 25 degrees, ICOS's argument to limit the viewing angle to 14 to 25 degrees is rejected.

ICOS's argument that the viewing angle must be a low angle fails under the doctrine of claim differentiation. Because claim 7 is dependent on claim 1, and because claim 7 expressly states that the second image is obtained at a low angle, a low angle limitation cannot be read into the term "side view." See 35 U.S.C. § 112. If a "low angle" limitation were read into claim 1, then claim 7 would have no limitations separate from claim 1. Wenger Mfg., 239 F.3d at 1233.

In sum, as to the term "side view": the side view image is not limited to crescent shaped; the viewing angle may not be a 90 degree angle, a top view angle, or identical to the angle created by the first camera; and the viewing angle is not limited to a "low angle."

GO BACK

 Turning first to the issue of literal infringement, we find that Brand Management's charge of literal infringement falls with the proper interpretation of the claim term "sides." 1 Camden asserts that the inventors' statement during prosecution that the patent was directed only at the embodiments depicted in Figures 1-12 divested any claim to the embodiments in Figures 13 through 15 of the issued patent. Figure 1, illustrative of Figures 1-12, and Figure 13, representative of Figures 13-15, are reproduced below.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

1 Because we resolve the issue of literal infringement based on our interpretation of the term "sides," we do not address the district court's holding that "construction device" is a structural limitation of the claim. We affirm the district court's judgment, not its decision. Eastman Kodak Co. v. Goodyear Tire & Rubber Co., 1997 U.S. App. LEXIS 11831, Nos. 95-1511, 95-1533, 95-1512, 95-1532, 1997 WL 261364, at *8, 42 U.S.P.Q.2D (BNA) 1737 (Fed. Cir. May 20, 1997) (noting that "this court need not agree with the trial court's reasoning in order to affirm its judgment").

[SEE FIGURES IN ORIGINAL].

Figure 1. Figure 1 of the '642 Patent.

Figure 2. Figure 13 of the '642 Patent.

Camden argues that in limiting the invention to the embodiments in Figures 1-12, and in specifically excluding Figures 13-15 from the scope of the claim, the inventors cannot now claim a concrete block whose internal sides meet the claim limitations, but whose external sides do not. For its part, Brand Management does not argue that claim 1 reads on the embodiments seen in Figures 13-15. Rather, it takes the position that those embodiments fail to meet the "four-way recess" limitation of the claim. 2 Brand Management notes that, read in light of the prior art the inventors were attempting to overcome, the statement in the prosecution history upon which Camden relies should not be read to define the claim term "sides," but instead should be interpreted as clarifying the point that the claim is directed only at four-way recesses, and not the two-way recesses shown in Figures 13-15. We disagree.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
2 Brand Management uses the term "four-way recess" to refer to the "pair of recesses extending at right angles to one another" which appears in the third clause of claim 1.

On November 3, 1986, the inventors filed a Patent and Trademark Office (PTO) form 1449, Statement of Prior Disclosure. Addressing the prior art recorded on the form, the inventors stated that "although these publications may be of general interest, they do not appear to be anticipatory in any manner of the embodiment of Figures 1 to 12 to which the claims are now directed." We find that a person skilled in the art could reasonably interpret the inventors' statement as limiting the scope of the claim to external zig-zagged walls.

We have, on a number of occasions, expressed our inclination to interpret narrowly claims that are otherwise ambiguous. In Athletic Alternatives Inc. v. Prince Mfg., Inc., 73 F.3d 1573, 37 U.S.P.Q.2D (BNA) 1365 (Fed. Cir. 1996), we stated:

Were we to allow AAI successfully to assert the broader of the two senses of "between" against Prince, we would undermine the fair notice function of the requirement that the patentee distinctly claim the subject matter disclosed in the patent from which he can exclude others temporarily. Where there is an equal choice between a broader and a narrower meaning of a claim, and there is an enabling disclosure that indicates that the applicant is at least entitled to a claim having the narrower meaning, we consider the notice function of the claim to be best served by adopting the narrower meaning. Id. at 1581, 37 U.S.P.Q.2D (BNA) at 1372.

The term "sides" is ambiguous to the extent that it could be interpreted to refer to either internal sides or both internal and external sides. Therefore, we rely upon the specification and the prosecution history to provide the meaning the inventors ascribed to the term. See Markman, 52 F.3d at 979-80, 34 U.S.P.Q.2D (BNA) at 1329-30 ("To ascertain the meaning of claims, we consider three sources: the claims, the specification, and the prosecution history." (quoting Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1561, 19 U.S.P.Q.2D (BNA) 1500, 1503 (Fed. Cir. 1991))).

The statement in the prosecution history that the claims are directed only at Figures 1-12 could convey to one of ordinary skill in the art that the patentee considers his invention to cover only devices with zig-zagged outer sides. This reading is supported by the fact that Figures 13-15 differ from Figures 1-12 in two major respects: (1) Figures 13-15 contain two-way as opposed to four-way recesses and, importantly, (2) Figures 13-15 do not contain zig-zagged outer sides. It is also supported by the fact that former claim 11, which was deleted after the first rejection, was directed at a construction member that "comprised a concrete block." Although the claims were also amended such that the broadest claim, which originally did not limit the invention to devices with four-way recesses, now contains a four-way recess limitation, it is not clear that one of ordinary skill would interpret the statement in the prosecution history as speaking only to the recess limitation. Faced with two competing interpretations that are equally tenable, we choose to reinforce the notice requirement by construing claim 1 narrowly. Thus, we hold "sides" to mean both internal and external sides. The Camden molds do not literally infringe because they do not contain zig-zagged outer sides.

Turning to the patent infringement issue, Brand and Pro Shop allege that Menard infringed claims 1-4 of the '642 patent. Those claims are directed to a construction device for connecting lumber building elements, such as 2x4's and 4x4's, to a base in the construction of a deck. The claimed device includes a plurality of wall portions disposed in a zig-zag pattern for receiving a vertical post as well as a number of horizontal supports. Claim 1 is the only independent claim; claims 2 through 4 depend from it. Claim 1 provides as follows:

1. A construction device for anchoring or connecting construction elements to a base comprising:

   a body member having upper and lower ends and defining sides,

   said lower end serving as a support of the member on a base,
and recess means in the upper end of said body member forming an anchor seat for a construction element,

said recess means comprising a pair of recesses extending at right angles to each other and fully from respective sides of said body member to the other whereby one or more construction elements can be laid therein in edge relation,

said recess means also including a rectangular socket disposed in a central portion of said body member and arranged to receive the bottom end of an upright construction element in support engagement,

said defining sides comprising a plurality of connected wall portions

leading in a zig zag pattern forming said full width recesses and said rectangular central socket.

(Emphasis added.)

The district court held that the accused concrete pier blocks do not infringe claim 1 either literally or under the doctrine of equivalents. The dispute in the district court centered on the meaning of the term "sides" in the last clause of claim 1. The court interpreted the term "sides" to mean both the external and internal sides. Brand Management, Inc. v. Menard, Inc., No. 94-623, slip op. at 24 (D. Minn. Apr. 7, 1997). According to the district court, "both the internal and external surface of the 'sides' [of the accused device] must necessarily zig-zag" for a finding of infringement. Id. It is undisputed that the concrete pier blocks sold by Menard do not contain zig-zagged external sides.

Brand and Pro Shop argue that the district court misconstrued the claims of the '642 patent and thus erred in granting summary judgment of noninfringement. We disagree. The district court properly construed the claims of the '642 patent to preclude literal infringement and did not err in determining that there could be no infringement under the doctrine of equivalents.

V.

A patent infringement analysis involves two steps: first, the claim meaning and scope is determined, and second, the properly construed claim is compared with the accused device to determine whether each claim limitation is present, either literally or by an equivalent. See Carroll Touch, Inc. v. Electro Mechanical Sys., 15 F.3d 1573, 1576, 27 U.S.P.Q.2D (BNA) 1836, 1839 (Fed. Cir. 1993). Claim construction is a question of law properly decided on summary judgment. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 979, 34 U.S.P.Q.2D (BNA) 1321, 1329 (Fed. Cir. 1995) (in banc), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 27 U.S.P.Q.2D (BNA) 1461, 134 L. Ed. 2d 577 (1996). The second step of the inquiry, comparing the properly construed claim with the accused product, is a question of fact. See CVI/Beta Ventures, Inc., v. Tura LP, 112 F.3d 1146, 1152, 42 U.S.P.Q.2D (BNA) 1577, 1581 (Fed. Cir. 1997). In the absence of a factual dispute, the issue may be decided on summary judgment. Here, there are no disputed facts. We focus on the zig-zagged sides limitation because if that limitation cannot be found in the concrete blocks sold by Menard, either literally or by equivalence, there can be no infringement as a matter of law. See Pennwalt Corp. v. Durand-Wayland Inc., 833 F.2d 931, 935, 4 U.S.P.Q.2D (BNA) 1737, 1739 (Fed. Cir. 1987) (in banc).

Turning to the issue of literal infringement, we construed claim 1 of the '642 patent in Brand Management, Inc. v. Sutherland Lumber Southwest, Inc., 116 F.3d 1497, 1997 WL 351268 at *2-3 (Fed. Cir. 1997) (unpublished table decision).

We held "sides" to mean both external and internal sides. 3

Id. at *3. In so doing, we looked to the claims, the specification and the prosecution history. See id.; see also Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). We noted that, during prosecution, the inventors stated that the claims are only directed to the embodiments depicted in Figures 1-12 of the specification and that they disclaimed the concrete pier blocks depicted in Figures 13-15. See Sutherland Lumber, 1997 WL 351268 at *2. Figure 1, representative of Figures 1-12, and Figure 13, representative of Figures 13-15, are reproduced below.
Although our discussion of claim construction differs from the district court's, the district court properly construed "sides" to mean both internal and external surfaces.

Brand and Pro Shop concede that, under our claim construction in Sutherland, as a matter of law Menard's sale of the concrete pier blocks cannot infringe the '642 patent.

In Sutherland, we noted that the concrete pier blocks depicted in Figures 13-15 differ from the connecting elements depicted in Figures 1-12 in two respects: (1) Figures 13-15 do not include zig-zagged outer sides; and (2) Figures 13-15 contain two-way as opposed to four-way recesses. On the other hand, we also stated that "it is not clear that one of ordinary skill would interpret the statement in the prosecution history as speaking only to the recess limitation." Relying on Athletic Alternatives, Inc. v. Prince Manufacturing, Inc., 73 F.3d 1573, 1581, 37 U.S.P.Q.2D (BNA) 1365, 1372 (Fed. Cir. 1996), we stated: "Faced with two competing interpretations that are equally tenable, we choose to reinforce the notice requirement by construing claim 1 narrowly." Sutherland Lumber, 1997 WL 351268 at *3.

Therefore, we adopt the narrower meaning of the term "sides" and interpret claim 1 to require both internal and external zig-zagged sides. In order for there to be literal infringement, each and every limitation set forth in a patent claim must be found in the accused product. See CVI/Beta Ventures, 112 F.3d at 1161, 42 U.S.P.Q.2D (BNA) at 1588. Because the concrete pier blocks sold by Menard did not contain zig-zagged external sides, Menard did not literally infringe claims 1-4 of the '642 patent.

The district court construed the "sidewall" limitation to mean "a structure projecting or extending upward, i.e., above the plane of the support surface, from either side of the support tray."

Flex-Rest argues that "sidewall" does not include a directional limitation and can therefore be met by a projection extending downwards. Flex-Rest characterizes the sidewall term as "minor," "inconsequential," and "unimportant," and asserts that there is no basis in the intrinsic evidence for importing a directional limitation. Steelcase counters that the specification and prosecution history make clear that "sidewall" is part of the "support surface" and can only serve its function if it extends upward from the "support surface."

In determining the meaning of the disputed claim limitation, we look principally to the intrinsic evidence of record, examining the claim language itself, the written description, and the prosecution history, if in evidence. See Phillips, 415 F.3d at 1312-17. Here, the language of claim 1 recites a support surface "comprising a front position, a rear position, a first sidewall, and a second sidewall, such that the said stop walls extend from said first side wall to said second side wall." The claim language makes clear that in order for a "sidewall" structure to support the keyboard, it must extend upwardly; if "sidewalls" extend downwardly, they would not interact with or play any role in supporting the keyboard. Indeed, downwardly extending "sidewalls" would be entirely superfluous. Such a requirement does not improperly read a limitation from the specification into the claim. Rather, the written description and the drawings make clear that when the claim refers to "sidewalls" of a support surface, the claim language refers to upward-extending walls. Phillips, 415 F.3d at 1316 ("The construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction." (citation omitted)). The prosecution history is consistent with this interpretation and provides no further guidance. Flex-Rest's attempt to avoid the sidewall
limitation by characterizing it as "inconsequential" disregards the basic patent law doctrine that every limitation of a claim is material. See Warner-Jenkinson Co. v. Hilton Davis Chem. Co., 520 U.S. 17, 29, 117 S. Ct. 1040, 137 L. Ed. 2d 146 (1997) ("Each element contained in a patent claim is deemed material to defining the scope of the patented invention . . . ."). We therefore agree with the district court's construction that "sidewalls" must extend upwardly.

Because there is no dispute that the accused devices do not meet the "sidewall" limitation under this construction, summary judgment of non-infringement of the '231 patent was appropriate.

2. Sidewalls Comprising First and Second Parts

The parties also dispute whether the accused blocks possess two-part sidewalls. Claim 1 of the '168 Patent, like the other claims asserted with respect to this element, directs that the block must have "first and second sidewall surfaces, each of said sidewall comprising a first and second part." CP submits that this limitation requires two distinct sidewall elements, separated by some clear demarcation, as seen in the figures contained in the specifications. Anchor offers no construction of two part sidewall, stating that there is no disagreement as to the meaning of this element, only as to infringement.

The logical, plain meaning of "first and second part" is that the item described must have two components: a first and a second. The figure drawings in Anchor's Patents, which identify numerically two separate block surfaces making up the sidewall first and second parts, affirm this common sense and undisputed interpretation. See, e.g., '015, Figs. 1-6. 1 Accordingly, "sidewall comprising a first and second part" is a sidewall with two distinct sidewall surfaces.

--- Footnotes ---

1 All of the Patents at issue share the same figure references.

--- End Footnotes ---

Sidewardly Arranged Area of Tissue (Claim 35)

Coagulating an Area of the Tissue Sidewardly of the Extended Longitudinal Axis (Claim 35)

The next disputed claim terms set forth above all deal with the term "sidewardly." As such, the parties propose the following definition for all four phrases found in Claims 1 and 35.

Erbe's Proposed Definition: Positioned such that the longitudinal axis of the flexible tube is not substantially perpendicular to the surface area of the tissue to be coagulated.

Canady's Proposed Definition: The longitudinal axis of the tube being parallel to and spaced a distance from the tissue to be coagulated.

(Docket No. 42, p. 13, 17-19). After a review of the plain claim language, I find that one of ordinary skill in the art would construe the term "sidewardly" simply to mean to the side of. This is supported by the figures of the specification. See, Docket No. 42, Ex. 1, Figs. 4, 15 and 20. Consequently, I will construe the term "sidewardly" to mean to the side of.

No particular or special meaning is claimed to have been given to any of the words or terms. They are given the ordinary and common meaning by which they would be understood by a person skilled in the art. Intellicall, Inc. v. Phonometrics,
Inc., 952 F.2d 1384, 1387 (Fed. Cir. 1992). There are basically two phrases in Claims 1 and 17 as to which the proper construction is disputed. The first reads as follows:

"a projecting portion extended from the rear pad surface, and a recessed portion extended from the pad surface by a second distance that is significantly less than the first distance." (Emphasis supplied.)

Defendant urges that the Court conclude that a difference of less than one-quarter inch is not "significantly less" within the meaning of this claim. It notes that the specification gives an example of 1/4 inch, and that Claim 3 requires a difference of "more than about 0.64 centimeters (0.25 inch)." Rather than support Defendant's point of view, these references imply a different construction. Under the doctrine of claim differentiation, Claim 3 is necessarily narrower than Claim 1, not identical to it. Moreover, patent claims are not limited to the preferred embodiment. Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865-66 (Fed. Cir. 1988), cert. denied, 490 U.S. 1068, 104 L. Ed. 2d 634, 109 S. Ct. 2069 (1989); SRI Intl. v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1121-22 (Fed. Cir. 1985).

3636

B. "Similar Radii"

The parties seek construction of the phrase "wherein the groove about the lid has an inner surface, and the rim of the main body has an outer surface, that each define semi-circular arcs of similar radii." Their proposed constructions are:

- Plaintiff: The semi-circular arcs defined by the upper, inner surface of the groove about the lid and the upper, outer surface of the rim of the main body correspond such that the first and second lips produce a nominal radial interference as the lid and main body are engaged.

- Defendant: The inner surface of the groove and the rim of the main body are curved at respective radii so that the inner surface and the rim remain in close contact with each other throughout their extent of curvature when assembled.

1. The parties' disputes

As plaintiff puts it, "there is no common ground shared between the parties' proposed definitions" for this term. Dkt. # 31, at 21. This may explain why, from the court's perspective, neither construction is satisfactory. Plaintiff's construction would require only that the "semi-circular arcs" be capable of "correspond[ing]" in a way that allows the first and second lips to produce nominal radial interference as the lid and main body are engaged. This proposal is problematic because the claim already requires that the first and second lips produce nominal radial interference as they are engaged, suggesting that "similar radii" is devoid of independent meaning.

On the other hand, defendant's construction suggests that "similar" should mean "identical"; how else could the respective surfaces remain in contact throughout the extent of curvature? To the extent defendant uses the phrase "close contact" to suggest that there can be some variation, the word is unclear and unhelpful in explaining how "close" to identical the radii must be to comply with defendant's construction. Such a construction is bound to create another round of arguments about the meaning of the claim terms at the summary judgment stage.

Plaintiff points out that its construction would not render the claim term entirely redundant because it adds that the semi-circular arcs must help create the nominal radial interference disclosed in claim 1, a requirement supported by the specification. The specification describes the semi-circular arcs as playing a part in "provid[ing] the slight snap fit of the lid onto the cup body," explaining that the semi-circular arcs form part of the "inner contour of the groove 36 and outer contour of the cup body rim 38" that serve to create the snap fit. '784 pat., col. 3, ins. 40-45.

However, plaintiff's point does not explain why the patent applicants described the radii of the arcs as similar. The claim language does not say "capable of creating nominal radial interference"; it says "of similar radii." Plaintiff's construction suggests that radii that are not "similar" in any sense of the term could still be infringing so long as they nonetheless assist in creating a nominal radial interference. Plaintiff cannot eviscerate specific limiting terms in the claim language by focusing on the larger purpose of the patent; if the patent applicants chose "similar radii," plaintiff is stuck with that limitation, even if
it turns out that similar radii were not necessary to create the snap fit that is the focus of the patent.

The next question is, how different can the radii of the arcs be and still be considered "similar"? As I explained above, defendant's proposed construction requiring the arcs to remain in "close contact" is unhelpful. More helpful is the description of "similar" radii that defendant uses in its brief: "nearly continuous contact over the extent of the semi-circular arcs" when the cup and lid are assembled. Dkt. # 29, at 25. This description involves two important points: the arcs contact each other when assembled in "nearly" all places and the contact is made over the entire semi-circular arc (as opposed to all on one side).

I am persuaded that this description captures the requirement that the radii be "similar" and will construe the term accordingly. The ordinary meaning of "similar" and the specification support a reading of "similar" that requires "nearly continuous contact over the extent of the" arcs. First, as plaintiff points out, common dictionary definitions of "similar" include having a likeness or resemblance and being alike in substance or essentials. The only way that two radii of semi-circular arcs could be "similar" is for the size of each radius to be "alike." (What other feature of a radius could be similar or different?) Moreover, the only apparent rationale for having the size of one of the radii approximate the other is that provided by defendant's expert: when the arc of one radius is slightly smaller than the other, the smaller arc will fit "snugly" with the larger arc throughout the extent of their curvatures. Dkt. # 22, P 17. (Although plaintiff may argue that the ability to create nominal radial interference is the proper "rationale" for similar radii, this "rationale" does not explain why the sizes of the radii should be similar, as I explained above.)

That said, defendants must accept the possibility that some spaces may exist between the semi-circular arcs of "similar radii," which is the position they argued in the original lawsuit. First Years, 07-cv-558-bbc, dkt. # 59, at 108-09, 114. However, the phrase "nearly continuous" encompasses that notion. It also emphasizes the important point that any gaps are not created by major size differences between the radii, but rather by either minor size differences (such that the smaller arc would not fit snugly on both ends, for example) or by acceptable imperfections in the "semi-circular" arc.

2. The court's construction

Because I conclude that defendant's view better describes "similar radii," I will adopt its proposed construction, with modifications: "The inner surface of the groove and the rim of the main body are curved at respective radii so that the inner surface and the rim remain in nearly continuous contact over the extent of the semi-circular arcs when the lid and body are assembled."

5. The Proper Claim Construction of the Phrase "The Improvement Comprising a Simplified Set of Instruments, Including:" as Used in Claim 1 of the '885 Patent.

The claiming format of Claim 1 of the '203 patent is not in dispute and illustrates the typical three parts of a claim.

1. A method for making triplanar bone resections for total knee replacement, including the steps of:

   resecting the proximal tibia such that it is perpendicular to an imaginary axis extending through the ankle joint, knee joint, and hip joint;

   * * *; and
resecting the distal femur in reference to said slot while the knee is in flexion.

Plaintiff submits the following for the proper construction of the phase "the improvement comprising a simplified set of instruments, including:." The phrase is in the transition part of the claim and is merely a short-hand collective reference to two limitations that follow in the body of the claim. Therefore, the phrase places no limitation on scope of the '885 patent. The guide member and L-shaped guide rod are the two limitations which appear in the body of claim 1. Plaintiff makes the alternative argument that the phrase "the improvement comprising a simplified set of instruments," is in the Jepson format and is located in the preamble. 4 Similarly, plaintiff asserts that the phrase places no limitation on scope of the '885 patent.

Defendants submit that the phrase "simplified set of instruments" is located in the body of the claim and acts as a limitation on the invention. Defendants also argue that this phrase requires that a single guide member must be used for all of the triplanar bone resections.

The parties' briefs pose two questions in analyzing this issue: 1) is the phrase, "simplified set of instruments" part of the transition phrase or part of the body of the claim; and 2) during the prosecution of the '203 method patent did plaintiff use the guide member's structure to distinguish his invention over the prior art?

However, even if the court accepted either one of plaintiff's arguments, what controls in the present case is whether plaintiff used that phrase in the prosecution history to patentably distinguish his invention over the prior art. If any interpretation was disclaimed during the prosecution, that prosecution history excludes that interpretation from the claim construction. Vitronics, 90 F.3d at 1583.

The Prosecution History Concerning "Simplified Set of Instruments."

Defendants argue that in plaintiff's Amendment to overcome the examiner's 35 U.S.C. § 103 rejection, plaintiff unequivocally stated that the set of instruments referred to a single guide member which establishes the appropriate points of resection in the tibia and femur. Defendants further assert that the phrase "a simplified set of instruments," was a principle feature of the invention in distinguishing plaintiff's patent over the prior art. Defendants support their argument by quoting the plaintiff's Amendment:

In contrast to this [the prior art of the Richards reference] * * * The technique of Richards requires the use of two wholly independent cutting guides. One [a guide member] for use on the distal femur and the proximal tibia and another for use on the distal femoral condyles. As reflected in claim 3 5, all resections made in accordance with the method of Applicant's invention may be made in reference to a single guide member which is appropriately positioned for each cut by one of two guide rods. (Emphasis added).

5 Claim 3 of the '203 patent that the plaintiff refers to adds two additional slots to the guide member to make the distal femoral condyles resections.

In the Amendment, plaintiff describes the intangible method of inserting the L-shaped guide rod into the medullary canal. However, plaintiff gave notice to the examiner and the public that a principle distinction between his invention and the prior art was his invention's ability to employ a single guide member to make all the necessary resections. Plaintiff distinguished
the method of performing his invention by disavowing techniques, such as Richards, which require the use of two wholly independent cutting guides. The examiner accepted this limitation from the phrase "simplified set of instruments" to distinguish plaintiff's invention from the cited art.

The Specification's Use of "Simplified Set of Instruments."

In the specification, the patent contrasts the prior art knee replacement systems, which required numerous components, and the present invention which includes a single guide member for use in making the proper bone resections. ('885 patent, Col. 1 Line 65 to Col. 2 Line 7.) The specification goes on to state that, "The guide member eliminates the necessity for a different type of guide component for each triplanar resection." ('885, Col. 8, Lines 30-35.)

Additional Arguments Made by Plaintiff.

Plaintiff argues an infringement principle: if a written claim uses the transition phase of "including:" or "comprising:" then the named elements are an essential component but other elements may be added and still form a construct within the literal scope of the claim." Genentech Inc. v. Chiron Corp., 112 F.3d 495, 500 (Fed. Cir. 1997). Plaintiff concludes that even if a single guide member is construed as a limitation on the scope of the '885 claims, the law requires that the claims can not be limited solely to a single guide member because of this infringement principle. Plaintiff is incorrect. First, because this litigation is at the stage of claim construction and not at an infringement analysis, that principle does not apply. Second, the application of that principle to the instant case would be incorrect under the doctrine of file wrapper estoppel.

What controls how many guide members may be used in employing plaintiff's invention is the prosecution history doctrine. During the prosecution of the '203 patent, plaintiff disavowed any interpretation that more than one guide member must be used to make all the cuts. Plaintiff distinguished his invention by stating, "As reflected in claim 3, all resections made in accordance with the method of Applicant's invention may be made in reference to a single guide member." The plaintiff's modifying language of "may be" is precatory language. Accordingly, the court finds that at least one of the guide members used in performing this surgery must be capable of making all the resections.

CONCLUSION ON THE MEANING OF "THE IMPROVEMENT COMPRISING A SIMPLIFIED SET OF INSTRUMENTS, INCLUDING:"

The court finds that plaintiff disavowed structures in which a single guide member may not make all the resections in the knee replacement. The court construes the phrase of "the improvement comprising a simplified set of instruments, including" to possess the following meaning: "A set of instruments used in resecting the bones that form a patient's knee. The set of instruments comprises: at least one guide member capable of making all the necessary tibia and femur bone resections; and at least one L-shaped guide rod that cooperates with the guide member."
The parties agreed that the issue of whether the Print '91 machine literally infringes claim 4 of the Weber patent turned on how "simultaneously stapling" was defined. The legal framework under 35 U.S.C. § 112 requires that (1) the claim at issue be interpreted to determine its proper scope and meaning; and (2) it be determined whether the accused device is within the scope of the properly interpreted claim. Moreover, 35 U.S.C. § 112 further directs that the claim language be construed to "cover the corresponding structure."

Accordingly, I decided that "simultaneously stapling" means "exactly same," because that is how defendant used it to mean: the inventor is his own lexicographer. Defendant argued for a looser construction of "simultaneously stapling." But its own Weber patent states that "Weber shows two staple applicators simultaneously applying staples to two different accumulations at the exact same instant in time." I therefore concluded that defendant was bound by its own usage: "simultaneously stapling" means "exactly same or coincident." Memorandum at 20.

It is undisputed that 1/10 of a second separates the timing of the two competing machines; that is, 1/10 of a second prevents the stapling on the Print '91 machine from being "simultaneous." Defendant noted this difference, but complained it was insubstantial. Nevertheless, whether or not a difference is "insubstantial" matters little under Section 112: literal equivalence means exactly that. I also went further -- and this elaboration forms the basis of defendant's request to reconsider -- and explained that although only 1/10 of a second separates the timing of the two machines,

in the binding industry, even 1/10 of a second may be significant. . . . the 1/10 of a second difference may be a significant advance in the art. Defendant does not explain why or why not 1/10 of a second is unimportant. Because the patentee has the burden of proof in an infringement action, defendant's failure to explain why the difference is negligible leads to the conclusion that the Print '91 device does not" infringe the Weber patent.

Memorandum at 20-21.

Defendant argues that this paragraph is erroneous as a matter of law because on summary judgment motion, the burden of proof is on the moving party, the plaintiffs. The paragraph recited above mentions that "patentee [defendant] has the burden of proof in an infringement action . . . ." Defendant therefore argues that "it is clear that it was Ferag's burden to show that no fact material to this issue is in dispute." As a matter of law, then, "this Court must find that the issue remains in dispute." Defendant's Request at 3.

Defendant is correct in noting that the reference to burden of proof in my Memorandum was not sufficiently precise. In Celotex Corp.v. Catrett, the Supreme Court ruled that:

the plain language of Rule 56(c) mandates the entry of summary judgment . . . against a party who fails to make a showing sufficient to establish the existence of an element essential to that party's case, and on which that party will bear the burden of proof at trial.

477 U.S. 317, 322, 91 L. Ed. 2d 265, 106 S. Ct. 2548 (1986). That the Memorandum states that the "patentee has the burden of proof in an infringement action . . . ." Defendant therefore argues that "it is clear that it was Ferag's burden to show that no fact material to this issue is in dispute." As a matter of law, then, "this Court must find that the issue remains in dispute." Defendant's Request at 3.

Defendant is correct in noting that the reference to burden of proof in my Memorandum was not sufficiently precise. In Celotex Corp.v. Catrett, the Supreme Court ruled that:

the plain language of Rule 56(c) mandates the entry of summary judgment . . . against a party who fails to make a showing sufficient to establish the existence of an element essential to that party's case, and on which that party will bear the burden of proof at trial.

Defendant did not say, in support of its motion, "why or why not" the 1/10 of a second difference was important. This failure to "establish the existence of an element essential" to defendant's case coupled with defendant's burden of proof on this issue at trial mandate the entry of summary judgment on the authority of Celotex.

Defendant's request for reconsideration of this court's decision as to literal infringement cannot be honored. Defendant has conceded that "in the event this Court adopts Ferag's position and determines that 'simultaneous stapling' means two stapling operations that occur exactly coincidentally, claim 4 would not be literally infringed." Defendant's Post-Hearing Memorandum in Opposition to Plaintiffs' Summary Judgment Motion at 40. I determined as a matter of law that "simultaneous stapling" did, in fact, mean "exactly coincidentally." I therefore concluded, as defendant had conceded, that claim 4 "would not be literally infringed."
### III. Simultaneously

</table>
The word "simultaneously" appears once in the '336 patent. Claim 33 states that the inner tubular secures both flapper valves "simultaneously." As explained above, the '336 patent teaches that both flapper valves are held open by the inner tubular during auto-fill mode, and both flapper valves are able to close during back pressure mode after the inner tubular is released.

Weatherford argues that claim 33 requires the flapper valves to open and close at the exact same instant. It points out that, during prosecution, the patentee distinguished prior art by stating that the flapper valves operate "simultaneously," and that they are converted from auto-fill mode to back pressure mode "simultaneously." '336 patent Pet. to Make Special 12/13/2001 at 10 (Doc. No. 113-5). In addition, Weatherford notes that the specification states that once the inner tubular is released, the inner tubular blocks off downward angled jets and uncovers upward angled jets "at the same time." 10:59-64. It argues that because the patentee relied on these statements to distinguish prior art, the Court must construe the claims at issue to require the flapper valves to open or close at the exact same instant. 8 See Phillips, 415 F.3d at 1323 (explaining the doctrine of prosecution disclaimer).

8 At the hearing, Weatherford presented the Court with diagrams of other devices which Weatherford claimed were distinguished during prosecution by arguing that the flapper valves close at the exact same instant. Weatherford included at least one of these diagrams as exhibit T to its claim construction brief, but it never cited or explained the exhibit in its brief. Regardless, Weatherford has not cited any statement to support its claim that, during prosecution, Davis-Lynch argued that the flapper valves close at the exact same instant.

Davis-Lynch argues that Weatherford's proposal would exclude every disclosed embodiment in the '336 patent because Weatherford's proposal describes a situation that is not physically possible. It points out that, when the inner tubular drops, the higher flapper valve will close slightly more quickly than the lower flapper valve because it will be released sooner. Similarly, when wellbore fluid or cement is pumped down the tubular string, the higher flapper valve will open more quickly because the wellbore fluid or cement will reach it first. Furthermore, the mere fact that the patentee used the word "simultaneously" during prosecution does not support Weatherford's proposal because that is precisely the term to be construed.

Weatherford responds that, although its proposal may render the claims impossible or nonsensical, the Court may not redraft the claims at issue. See Process Control Corp. v. HydReclaim Corp., 190 F.3d 1350, 1357 (Fed. Cir. 1999) ("a nonsensical result does not require the court to redraft the claims" of a patent, where the "claims are susceptible to only one reasonable interpretation"). For example, in Chef America, Inc. v. Lamb-Weston, Inc., the patent at issue claimed a method for producing flaky, crispy dough products in a microwave. 358 F.3d 1371, 1372 (Fed. Cir. 2004). One claim step required "heating the resulting batter-coated dough to a temperature in the range of about 400[degrees]F to 800[degrees]F." The plaintiff argued that this step should be construed to require that the oven be heated to 400[degrees]F to 800[degrees]F because, if interpreted literally, the claim would require the dough to be burned to a crisp. Id. The Federal Circuit construed the claim literally to require that the dough be heated to 400[degrees]F to 800[degrees]F, even though this led to a nonsensical result, because the claim was susceptible to only one reasonable interpretation. Id. at 1374.

The Court agrees with Davis-Lynch, and finds the cases cited by Weatherford to be distinguishable. Whereas the cases cited by Weatherford construed the claims at issue literally, Weatherford is attempting to import limitations not literally present in the claims. See Chef America, Inc., 358 F.3d at 1374; Process Control Corp., 190 F.3d at 1357. Furthermore, unlike the plaintiff in Chef America, Davis-Lynch has not proposed a construction that is inconsistent with the unambiguous language of the claim at issue. See Chef America, Inc., 358 F.3d at 1374. The word "simultaneously" may mean at the exact same instant, or it may mean, as Davis-Lynch correctly contends, at approximately the same time. For example, while the House and Senate may be "simultaneously" working on a bill, the two legislative bodies need not always work on their respective bills at the exact same moments. Because a person having ordinary skill in the art would understand that the inner tubular is affected by gravity and fluid pressure, that person would not expect the inner tubular to be in two places at once, or expect the flapper valves to open or close at the exact same instant. Thus, the Court rejects Weatherford's proposed construction.

The Court also rejects Davis-Lynch's proposed construction because it would be confusing for a jury.
construe the term "simultaneously" as "at the same time or almost the same time," e.g., the inner tubular holds both flapper valves open at the same time during auto-fill mode, and the flapper valves close at almost the same time during conversion and back pressure mode. This construction best captures the plain and ordinary meaning of the term "simultaneously."

The disputes regarding the related terms above simply revolve around whether or not Weatherford's construction of "simultaneously" should be imported into other claim terms. See E.I. du Pont de Nemours & Co., 849 F.2d at 1433; In re Paulsen, 30 F.3d at 1480. Having rejected Weatherford's construction, the Court will not construe these terms. See O2 Micro Int'l Ltd., 521 F.3d at 1362; Fenner Inv. Ltd., 2008 U.S. Dist. LEXIS 65686, 2008 WL 3981838 at *3.

B. Said Weight Member Consisting Essentially of 7 a Single Back Bar Mass (Claim 1)

The parties agree that the term "consisting essentially of" as used in the subject phrase means that the back bar mass does not have any elements that would substantially affect the characteristics of the claimed invention in addition to those elements set forth in the claim.

The Defendants seek to read into the foregoing language the additional limitations that the back bar mass have planar surfaces with uniform width. However, the Court does not find it appropriate to read these limitations into the words "back bar mass." Indeed, Claims 14, 15, and 16 (which depend from Claim 1) add limitations including planar sides and, to a degree, uniform width. It may be, as Defendants contend, that these dependent claims add more limitations than just a requirement for planar surfaces and uniform width. Nevertheless, in context, the dependent claims are written consistent with the conclusion that independent Claim 1 lacks limitations of planar surfaces and uniform width. The Court, therefore, construes the subject language to mean what it says or, more precisely, not to mean what it does not say. The term "back bar mass" in Claim 1 is not limited to masses having planar surfaces and uniform width.

The Court, therefore, construes the subject language to mean what it says or, more precisely, not to mean what it does not say. The term "back bar mass" in Claim 1 is not limited to masses having planar surfaces and uniform width.

8 Claim 14 refers to the bar as "generally rectangular in shape."

12 This term is found in independent claim 1 of the '073 Patent. The parties ask the Court to construe this term and the following terms in the same manner: (1) "to define a continuous flow passage through said first graft body inlet end, said first graft body outlet end, said second graft body inlet end, and said second graft body outlet end," found in independent claim 1 of the '736 Patent; (2) "to define a continuous flow passage between said inlet end and said outlet end of said first graft body and said inlet end and said outlet end of said second graft body," found in claims 20 and 22 of the '736 Patent; and (3) "to define a continuous flow passage through said first flow passage and said second flow passage," found in claim 21 of the '736 Patent.
Cook argues that this phrase must be construed to require only one flow lumen, i.e. that the phrase cannot encompass a bifurcated or "y-shaped" graft. It appears that Gore also suggests that the disputed phrase cannot encompass a bifurcated device, because its proposed construction focuses on the creation of a single flow lumen. (See Gore Br. at 17.)

The Court starts with the claim language. With respect to the '073 Patent, the claim language could be read to encompass a bifurcated device, if one assumes that branches or legs of a bifurcated device are the "second portion" of the primary graft body. This argument, however, is less convincing with respect to the claims of the '736 Patent, because those claims refer to a first graft body having an "inlet end" and an "outlet end," rather than outlet ends. Because the claim language is ambiguous, the Court looks to the specification. The specification discloses "trouser" or "bifurcated" grafts, which can be used when the device is to be placed in or near a bifurcated vessel. Thus, the specification provides support for Plaintiffs' assertion that the term "single flow lumen" need not be restricted to a lumen within a tubular graft.

Defendants find support for their argument in the prosecution history of the '073 Patent, and the inventors' efforts to distinguish over U.S. Patent 5,316,023 (Palmaz). Defendants cite to an Examiner Interview, which the inventors summarized and noted that the Examiner determined that "the claims could be amended to clearly distinguish over Palmaz based upon the fact that this application discloses forming a single lumen to carry substantially all blood flow in a vessel, whereas, what Palmaz '023 discloses is two adjacent lumens inside a stent or a stent graft, inside a vessel, and that the two adjacent lumens in the vessel split the flow of blood in the vessel between them." (See Edwards Ex. 28, '073 Response dated 11/28/01 at 53-54 (emphasis added).) The Court finds that this reference supports Plaintiffs' argument. The inventors' statement focuses on the fact that their device forms a single lumen in a vessel. They contrasted their invention to the invention taught by Palmaz, which formed two lumens inside a vessel. (See also id. at 52 ("Palmaz does not disclose connecting flow lumens of two graft bodies to define a single flow lumen which transfers substantially all flow between the engaged lumens.").) There is nothing in these statements that suggests the inventors intended to limit their invention to a device that could be used only in non-bifurcated vessels.

Accordingly, the Court construes the term "to define a single flow lumen which transfers substantially all flow between said primary graft flow lumen and said secondary graft flow lumen" to mean: "When the primary graft body is connected to the secondary graft body a single, rather than a bilateral, lumen is formed and substantially all fluid flows from the primary graft body to the secondary graft body through that single flow lumen."

3642

The Court will define "single joint of boneless meat" as "one of the portions into which an animal carcass is divided." United States Patent No. 4,545,177 (the '177 Patent), which was issued on October 8, 1985, includes the following language in its Description of the Preferred Embodiments section, "part of the carcass of an animal e.g. a joint of meat." (Pl.'s Markman Binder at 48). The Oxford English Dictionary Online defines "joint" as "one of the portions into which a carcass is divided by the butcher, consisting of one or more bones (e.g. that of the leg or shoulder) with the meat thereon; esp. as cooked and served at table." Oxford English Dictionary Online, http://www.oed.com/ (definition from the 2d ed. 1989) (last visited Sept. 4, 2008). While the plaintiff and defendants agree that a joint of meat includes both boned and boneless products, the defendant wishes to define "a single joint of boneless meat" as "a product produced from the whole or intact muscles of a single cut from a single animal, rather than from multiple chunks from the same or different animals" based on the expert declaration of Dr. Edward William Mills (Dr. Mills). The plaintiff, however, contends that the defendant's definition would exclude from it various boneless products because "all boneless meats, by virtue of their description . . . are manufactured either by removing muscle tissue . . . from the bone or vice versa . . . and then reforming the muscles with pressure . . . into a single, solid piece of meat marketed as a boneless product." (Doc. 95 at 3). For example, as Logan sets forth in his declaration,

A boneless turkey breast product (or any other fowl) is generally made by the removal of the uncooked breast meat (a breast includes a left and right lobe of breast-meat) of one or more whole turkeys. Multiple lobes of turkey breast meat are then either netted/bound or placed in a mold with or without a binder and then cooked. The lobes of breast-meat are thus held together to form a unitary piece of boneless meat that is generally marketed as a 3-4 pound boneless, turkey breast which generally consisting of 2-3 lobes of breast-meat. This type of product was shown and described during the prosecution of the '374 Patent.
(Logan Decl., Doc. 95 Ex A at P 9). Viewing the extrinsic evidence in the context of the intrinsic evidence, the Court defines a "single joint of boneless meat" as "one of the portions into which an animal carcass is divided."

3643

J. Claim 12: "single layer web"

Finally, the parties dispute the meaning of "single layer web." Pliant defines single layer web as a "single sheet of plastic film," and more specifically, one that is comprised of one or more discrete polymer layers. Atlantis argues that "single layer" refers to the layers of polymers within the film itself, rather than the resulting web, or sheet, of plastic film. At issue is not the meaning of "single layer" so much as a determination of what the word "single" modifies.

The inventor did not attempt to define "single layer web;" in fact, in an earlier version of the patent application the Examiner found that claim to lack support in the specification. However, in the final version, the word "layer" appears three times in the specification. In the first two instances, it appears in discussions of a prior art reference that teaches a double-layer plastic film used to stretch-wrap goods. Pliant suggests that the term "layer," as used in the prior art reference, refer to the sheets (or web) of plastic film, not the polymer layers comprising the film. 6 I cannot agree with Pliant without construing the meaning of the claims of the '706 patent, which is not before me. The third reference to "layer" in the '393 patent appears in a description of the benefits of a pulley adjusting mechanism, which allows the operator to control the speed of the invention's rollers. The specification concludes: "in other words, the amount of air that is trapped in the layer of the wrapped film may be controlled." ('393 Patent, Col. 7, ll. 42-44.) Here, "layer" clearly refers to the sheet of film without addressing the polymer layer or layers that comprise the film.

6 The '393 Patent states:

Finally, U.S. Pat. NO. 4,499,706 teaches a double layer thermal plastic film which is used in pass through stretch wrapping of goods. The double layer improves the tear resistance and puncture resistance of the film.

('393 Patent, Col. 1., ll. 58-61.)

Atlantis complains that Pliant is relying on a term that was removed after it was subject to challenge by the Patent Examiner. Nonetheless, the term was subsequently added to the claim and approved by the patent examiner. The patent prosecution offers no other insight into the meaning of the term. Atlantis suggests relying on the term's plain meaning, which it construes as a web of film comprised of a single polymer layer. However, I find no support in the claims, specification or prosecution history for Atlantis's proposed construction, which would require that the sheet of film consist of only one discrete polymer layer. Therefore, I construe the term "single layer web" to mean "a single sheet of film consisting of one or more polymer layers."

3644

A. Defendants' S-Machines Do Not Infringe Claims 7-8 and 10-11.

Claims 7-8 and 10-11 of the '067 patent are dependent upon Claim 1. Accordingly, if there is no infringement of Claim 1, there can be no infringement of Claims 7-8 and 10-11. Independent Claim 1 of the '067 patent is an apparatus claim that includes the limitation "a single output receptacle."

Notwithstanding the plain language of Claim 1, Cummins asserts that Claim 1 is broad enough to include a device with more than one output pocket. Cummins' position was raised during Markman briefing. The Court found that Cummin's position was incorrect then and it is incorrect now.

As detailed in this Court's Markman ruling, the plain language of Claim 1, and relevant prosecution history, mandates that any device with more than one output pocket would not infringe Claim 1. It is undisputed that the S-Machines manufactured and sold by Defendants include more than one output receptacle. Accordingly, Claims 7-8 and 10-11 that depend on Claim 1 are not infringed and a finding of summary judgment of non-infringement is proper. 1
1 Infringement under DOE is equally inappropriate for at least two reasons: (1) prosecution history estoppel and (2) such a result would ignore the single output pocket limitation of the claims. See K-2 Corp. v. Salomon S.A., 191 F.3d 1356, 1367 (Fed. Cir. 1999).

We also disagree with the district court's construction of claim 1 in one other respect. We reject the district court's conclusion that the "single package" limitation of claim 1 of the '611 patent merely requires that devices be "capable of" being provided to the patient in a single package. Here, the claims are written to require that the devices actually be in a single "package." In similar contexts, our cases have rejected claim constructions that would merely require that infringing devices be capable of being modified to conform to a specified claim limitation. 7 With these constructions of claim 1's limitations, we turn to the question of whether the Truax devices rendered claim 1 obvious.

The first clause of claim one refers to a caliper body in which the hub-side and wheel-side elements and connecting bridges "constitute a single part." Brembo contends the term "a single part" means "one piece." Alcon argues that the term denotes "a single monolithic or assembled piece." The Court agrees with Brembo.

The first step in construing a claim is to determine the ordinary and customary meaning understood by those skilled in the relevant technology. Alcon provides no definition for the word "single," from which the Court infers that Alcon does not dispute Brembo's proposed definition. Indeed, the dictionary defines the adjective "single" as "consisting of only one in number." Webster's Third New Int'l Dictionary at 2123 (3rd unabr. ed. 1993).

The parties do, however, dispute the definition of the term "part." Because this term has several alternative meanings, the Court must determine which meaning is most "consistent with the use of the word[] in the intrinsic record." Texas Digital, 308 F.3d at 1203. The most relevant dictionary definition for "part" is "piece." Webster's Third New Int'l Dictionary at 1641. This is consistent with the usage of the term in the context of the claim language, which makes it clear that the patentee was referring to the hub-side and wheel-side elongate elements and the connecting bridges as a single piece. It is also consistent with the usage of the term in the specification. See, e.g., '766 patent, col. 2, lines 14-26 (describing the caliper body as being
"formed as a single piece of aluminum" and being "completed by three connecting bridges … formed integrally with the
elongate elements ….").

Alcon argues that the definition of "part" that is most consistent with the use of the word in the claim language is "a
monolithic or assembled piece." The Court is not quite sure why Alcon makes this argument or Brembo opposes it.
Ordinarily an alleged infringer seeks a narrower construction of the claims. One could argue that defining "a single part" as
"one monolithic or assembled piece" is a broader definition that the "one piece" proposed by Brembo. Nonetheless, Alcon
has made the argument, so the Court will address it. Nothing in the ordinary meaning of the term, the context, or the
specification precludes the "single piece" from being either a monolithic piece or an assembled piece. But it is equally true
that nothing in those sources necessarily limits the term to those two alternatives (though the Court is not entirely clear what
the other possibilities might be). The Court therefore rejects Alcon's argument.

In sum "a single part," as used in the claim, means "one piece."

Beginning with the language of the Claim itself, the Hall patent in Claim 1 states that it is:

A hydraulically efficient underground pipe of single piece construction for use in buried storm drains, said pipe consisting
essentially of a cylindrical metal wall having an 18-12 gauge thickness and defining a pipe diameter within the range of 24-
120 inches, a rigid lock seam extending helically about and along the length of said wall and a plurality of outwardly
projecting walled- structural supporting ribs extending helically about and along the length of said wall and being integrally
formed therewith, said ribs defining a corresponding plurality of open channels formed interiorly thereof, the width and
depth of said open channels being within the range of 0.5 to 1.5 inches and the spacing between said ribs being within the
range of 6 to 12 inches to render the pipe substantially rigid and possess sufficient structural strength to withstand the
stresses of being buried underground, means to increase the hydraulic efficiency of fluid flowing through the pipe consisting
of substantial portions of said wall extending between said open channels being of constant radius, and said lock seam being
disposed in said portions of constant radius to provide a substantially uninterrupted smooth flow.

Though it is not disputed by Defendant that its pipe conforms to much of the above claim. Defendant asserts that its pipe
is neither a pipe of "single piece construction" nor is it comprised of "open channels." Defendant contends that its pipe
channels are not open as they are filled with inserts, and that its pipe is not made of a single piece as it includes several
pieces, namely the pipe wall and the multiple inserts.

Plaintiff contends, however, that "single piece construction" refers to the single piece of outer pipe wall which is formed
with very specific dimensioned ribs and lockseams that eliminate the need for any additional reinforcing elements. Plaintiff
contends that Defendant's pipe is in fact of "single piece construction"because due to its rib spacing it does not need the
inserts to be sufficiently strong. Similarly, Plaintiff contends that "open channels" means channels that need no further
reinforcement, regardless of whether the channel is actually open or filled with an insert. According to this definition,
Plaintiff contends that though Defendant's pipe ribs are filled with inserts they are functionally hollow or open as the inserts
are not needed for support.

There is nothing to indicate that the patentee chose to be his own lexicographer in using the terms "open channel" and
"single piece construction" as no special definition of these terms is stated in the patent or its prosecution history. As such
the Court will first consider the ordinary and customary meaning of the terms. In doing so the Court cannot find that the
term "open channel" as is limited as Plaintiff suggests. It is difficult to fathom how Plaintiff can argue that the term "open channel" does not exclude channels which are closed by metal inserts. Likewise it is difficult to conceive how "single piece construction" can include pipe made of multiple pieces. Considering the ordinary meaning of the words, single piece construction is something made of one piece, not something which necessitates only one piece.

In reviewing the patent prosecution history it appears that by "single piece construction" Plaintiff meant a pipe without inserts, not a pipe that does not require inserts to be sufficiently strong. Throughout the prosecution of the patent, applicant referred to the benefits of a pipe without inserts. For instance, in addressing the Nyssen pipe and its reinforcing inserts applicant stated "...they are very susceptible to corrosion at the points where the metal liners or inserts abut the pipe walls." Stetina Declaration, Ex. C, pg. 7. In referring to the Hall patent applicant stated that "applicant's single piece construction eliminates the need for additional metal to metal junctures, such as those found in … Nyssen … which are highly prone corrosion." Id. at 15. In addition to the corrosion problems caused by the inserts, applicant argued that its pipe of "single piece construction" was less expensive to manufacture due to its lower material costs. "Because of its single piece construction, applicant's pipe employs less material … It is therefore far more economical to manufacture that those taught by Lombardi and Nyssen ..." Id. at 15. If single piece construction were to include pipe using inserts not necessary for reinforcement this statement would not be accurate.

In addition the Court notes that though Plaintiff argues that Defendant's inserts have no functional purpose, even assuming that the inserts add no strength to the pipe, Plaintiff stated during the prosecution of the patent that such inserts improve hydraulic efficiency. See Stetina Declaration, Ex. C. pg.16 ("[Nyssen] teaches away from applicant's concept of particularly configured open ribs to obtain both strength and hydraulic efficiency by closing the channels defined by the rib with additional reinforcing elements he provides a totally different solution to the hydraulic and structural problems ...") (emphasis added).

It becomes clearer that "single piece construction" means a single piece of pipe wall without inserts when looking at the development of the term "single piece construction." Initially in the patent prosecution process, Plaintiff described its pipe as a pipe of "unitary construction." However the Examiner found that the term unitary did not "preclude that the pipe cannot have additional elements such as the reenforcements ..." See Stetina Declaration. Ex. D, pg. 4. This was discussed in an office interview regarding the claims. In the applicant's summary of the interview it states:

The examiner expressed concern over the meaning of the word 'unitary' which is used in the claims to describe the pipe, and stated that the Nyssen pipe was of unitary construction. Mr. Lyon stated that the word 'unitary' was used to describe the pipe as being of single piece construction as opposed to dual or multi piece construction, such as the pipes taught by the Nyssen and Lombardi patents. Mr. Lyon acknowledged that the word 'unitary' in the claims should be changed to 'of single piece construction' to avoid any ambiguity. Stetina Declaration. Ex. E, pg. 7.

Because of the above arguments made by the applicant distinguishing Nyssen's dual or multi piece construction from the applicant's single piece construction, and the arguments made regarding hydraulic efficiency, corrosion, and manufacturing costs, "single piece construction" cannot mean pipe which does not require inserts, but instead means pipe which in fact does not have inserts. This is the definition that was presented to the examiners during the patent prosecution and the term cannot now be argued to mean something else.

Even if "single piece construction" were to include pipe made from a single pipe wall and additional unnecessary structural elements, the term "open channels" refers to channels which are not closed by inserts, not channels which do not require inserts as Plaintiff asserts. "[Nyssen] teaches away from applicant's concept of particularly configured open ribs to obtain both strength and hydraulic efficiency by closing the channels defined by the rib with additional reinforcing elements." See Stetina Declaration, Ex. C, pg. 16. Applicant further stated "due to its closed ribs, [Nyssen pipe] would not be suitable for use with an interior liner ..." Id. At 18. The interior liner refers to material, often concrete, which coats the inside of the pipe in an effort to make the pipe more resistant to abrasion. Because of Nyssen's closed ribs there is no means of anchoring the liner as referenced above. The Hall patent states that "it is a further object of the present invention to provide metal ribbed pipe which includes means integral therewith for anchoring a smooth liner of inert material to the interior of the pipe wall." Hall Patent, Summary of Invention. It also states that "the channels formed in the pipe wall interiorly of the supporting ribs are opened along the interior surface of the pipe to define an anchor throughout the length of the pipe for securing thereto a smooth interior lining of a suitable corrosion resistant protective material." Id. Again, this evidences that "open channels" refers to channels which are in fact open. Open channels cannot encompass channels closed with inserts, even if they are
unnecessary, because like the Nyssen pipe, there would be no means of anchoring an interior liner.

Because Defendant's pipe is made from a single pipe wall with multiple inserts closing its ribs it is neither of "single piece construction" nor is it comprised of "open channels." Because Defendant's product does not contain each structural element of the Hall patent there is no genuine issue of material fact as to infringement.

The Court will briefly address the arguments asserted by Plaintiff. First Plaintiff asserts that Defendant cannot escape infringement by merely adding an additional feature when it has adopted the basic features of the patent. AmStar Corp. v. Envirotech Corp., 730 F.2d 1476, 1482 (Fed.Cir. 1984). What Plaintiff overlooks is that the basic feature of the Hall patent is a pipe with open helical ribs and without reinforcing inserts. A pipe with inserts does not have the purported benefits of Plaintiff's pipe without inserts, namely corrosion resistance, reduced material costs, and means to anchor an interior liner.

Plaintiff also argues that by using the phrase "consisting essentially of" the examiners left open the inclusion of unlisted materials to the pipe that do not materially affect the basic and novel properties of the invention, such as Defendant's inserts. Assuming the truth of this argument, it still does not advance Plaintiff's position. The inclusion of inserts does materially affect the basic properties of the Hall patent, as according to the prosecution history it becomes an uneconomical, hydraulically efficient underground pipe susceptible to corrosion unable to anchor an interior liner. This is in direct contradiction to applicant's description of its pipe, that is an economical hydraulically efficient pipe which is readily susceptible of being rendered corrosion resistant.

The last argument that Plaintiff asserts is that the terms "single piece construction" and "open channel" should be understood not in absolutes, but in relation to their associated performance or functional characteristics. See Pall Corp. V. Micron Separations, Inc., 66 F.3d 1211 (Fed.Cir. 1995). Or in other words, that the terms should be understood to reference their function in making up a pipe that can withstand burial forces and stand alone without the need for supporting inserts. The problem with this argument is that it ignores that the "single piece construction" of the Hall patent and its "open channels" have several functions or performance characteristics. One such function is to withstand burial forces, other functions are to serve as an anchor for an interior liner, to resist corrosion, and to be economical. The latter three functions are eliminated when a pipe is made of multiple pieces and its channels are closed with metal inserts.

For the above stated reasons, Defendant's Motion for Summary Judgment [# 23-1] is GRANTED.

3. Wherein Each of the Components of the Health Tracker is Part of a Single, Unified Portable Unit

The defendants propose that the court construe the phrase "wherein each of the components of the health tracker is part of a single unified portable unit" to mean "the data logger, time base, data storage unit and data transmission device are all included within a single, unified portable unit." The defendants contend that they have construed the phrase in accordance with its plain and ordinary meaning because "for the components of the health tracker to be 'part of' a single unit, they must be physically included within the unit." (D.I. 40, at 20.) The defendants further contend that during prosecution the patent applicants excluded from claim 22 devices using a component that is not physically included within the unit, such as an external modem. (Id.) According to the defendants, the applicants added the claim limitation at issue "as a key distinguishing feature over the prior art." (Id. at 21.)

PHT proposes that the court construe the phrase to mean "wherein the health tracker's components are combined into a unit which is capable of being carried by a patient." PHT asserts that, as with the "capable of connecting directly" limitation, the defendants' construction seeks to exclude the preferred embodiment of the invention, or an external modem combined with a telecommunications driver. (D.I. 39, at 13.) PHT further asserts a health tracker combined with an external modem is a single, unified, portable unit that is capable of being carried by a patient. (Id.)

The parties do not disagree that the data logger, time base, data storage unit, and data transmission device are the components of the health tracker. Thus, the court need not construe the phrase "wherein each of the components of the health tracker." The parties' dispute concerns whether the phrase "part of a single, unified portable unit" means that the components must be "included" within a single, unified portable unit or that the components can be "combined" into a
single, unified portable unit. As previously stated, the defendants’ maintain that a construction in which all of the components are "physically included" within the unit is compelled, relying on the "part of a single unit" language of the phrase. (D.I. 40, at 20.) The court disagrees, based on the plain and ordinary meaning of the term "unified." The plain and ordinary meaning of the term "unified" is "made into a coherent group or whole." Webster's Third New International Dictionary 2499 (1993). The meaning of "unified" is broad, in that a component not physically included within the unit can be combined with components that are physically included within the unit to form "a coherent group or whole." The '985 patent specification also supports a broad construction. For example, in the preferred embodiment of the invention "the monitor connects directly to a modem (when used without a data logger), or can be connected to a serial data port on the subjective data logger which, in turn, connects to a modem. In the preferred embodiment an external modem is used. . . ." (Col. 5, 11. 4-9.)

The defendants also contend that the prosecution history compels the court to construe the phrase so that the data transmission device "is included within the portable unit." (D.I. 40, at 21.) The defendants maintain that the applicants disclaimed a data transmission device that is not within the portable unit when they described the handheld unit as being "a single, unified handheld unit that includes an on-board communication device, such as a modem." (Id. at 20.) The court is not persuaded. As previously discussed, the court will not find a disclaimer unless the applicants have "used words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope." Texas Digital, 308 F.3d at 1204. The court cannot agree that the word "includes," in the statement that the defendants cite, represents a clear disavowal of the applicants' preferred embodiment.

Lastly, the plain and ordinary meaning of "portable" is "capable of being carried." Webster's Third New International Dictionary 1768. The court, therefore, will construe the phrase "wherein each of the components of the health tracker is part of a single, unified portable unit" as "wherein each of the components of the health tracker is a part of a coherent group or whole that is capable of being carried."

3649

b. "single unit"

Next, Defendant proposes that the term "single unit" may consist not only of spokes and cross-bars, but also additional structures. Defendant claims that the use of the word "includes" in subsection (b) of Claim 1 allows for an non-exhaustive list, which contains, but is not limited to, the enumerated spokes and cross-bars. (Defs.' Br. at 17-18.) Plaintiff appears not to disagree. 6 Defendant's proposed construction is supported by the claim language, and the court will therefore adopt it.

6 Although Plaintiff initially proposed a different construction in the Joint Claim Chart, Plaintiff appears to have abandoned that argument, and fails to mention this claim in its briefs.

3650

2. "Single Unitary Part"

Claim 1 provides, in part, as follows:

An elongated impact protection component in the form of a single unitary part having a top, a base, a peripheral side wall having a rear portion configured to mate with the structural support so as to seat said component in an installed position adjoining the structural support;

Similarly, claim 10 states:
Each of said components being a single unitary part having a peripheral side with a rear portion configured to mate with the structural support upon movement of the component transversely into its installed position;

In ruling on Plaintiffs' motion for preliminary injunction, the court concluded that the phrase, "single unitary part" should be construed in accordance with its ordinary meaning based on the dictionary definitions of these terms. In particular, the word "part" is defined as a "division or segment of a whole." The word "unitary" is defined as "of or pertaining to a unit or units; having the character of a unit; whole." "Single" is defined as "unaccompanied by another or others." Based on these definitions, the court construed the phrase to mean "a division or segment of an apparatus for protecting an elongated structural support from impact that is comprised of a unit or units having the character of a whole." (See Prelim. Inj. Order at p. 12). Sentry maintains that this construction is appropriate and should be used to compare its device to the accused product.

Eagle argues that the proper construction of this phrase should be that "the impact protection component is a single part, which is complete by itself without additional pieces." Eagle bases its construction on the examiner's initial rejection of the '781 patent based on U.S. Patent No. 3,831,941 (the "Pease" patent). The Pease patent discloses a "protective shock absorbing device for goal posts." Its specification states:

Since the inner tube 11 and the outer shell 12 are preferably secured together, they are not separable, . . . but remain together and will be removed from and placed on the post as a single unit so that they maintain their relative positions when the inner tube is deflated and when the inner tube in [sic] inflated.

(Pease patent, col. 2 at lines 67-68 - col. 3 at lines 1-5). After the examiner's rejection, the applicant filed an amendment, stating that the applicant and the examiner had "agreed that the rejection [for obviousness] based on the prior art . . . Pease could be overcome by use of 'unitary' claim language." (See December 4, 2000 Amendment at p. 6). Based on this amendment, the applicant added the term "unitary" to "distinguish[] the present invention from the multi-component impact protection assembly disclosed by Pease." Id. (emphasis added). According to Eagle, this amendment establishes that the applicant added single unitary part to distinguish its claims from Pease and therefore any construction of this phrase that would cover Pease, such as the court's construction, is necessarily improper.

The court finds that the term single unitary part must be construed to reflect the fact that the impact protection component is comprised of one piece. The Pease specification language indicates that the apparatus is comprised of two parts, an inner tube and an outer shell, that are not separable but remain together as a single unit. Based on this description of multiple components, the examiner rejected the claim and in response, the applicant filed an amendment modifying its device to a single unitary part. The court's earlier construction, "comprised of a unit or units having the character of a whole," does not account for this amendment. 6 Because a claim term will not carry its ordinary meaning "if the intrinsic evidence shows that the patentee distinguished that term from prior art on the basis of a particular embodiment, expressly disclaimed subject matter, or described a particular embodiment as important to the invention," the earlier construction must be rejected. CCS Fitness, Inc., 288 F.3d at 1366-67. Thus, the court concludes that the phrase single unitary part must be construed to mean that the impact protection component is a single part, which is complete by itself without additional pieces.

6 The court notes that it is considering Eagle's arguments as they relate to a rejection based on Pease for the first time, as Eagle did not raise them in opposing Sentry's Motion for a Preliminary Injunction.

As to infringement, the court finds it a close question. One could argue that the accused device, including the openings with molded inserts is not analogous to the device in Pease consisting of an inner tube and an outer shell; therefore, the accused device is not a multi-component device within the teachings of Pease. On close reading, the court does not find Pease is so limited. Eagle's device has three parts, including the cushion itself and two molded inserts that are fitted into the openings to seal the unit. Like Pease, it is comprised of multiple components that are "secured together [and] are not separable." Conversely, Sentry's device is one piece that expressly disclaimed the use of multiple components to overcome a rejection. Because the accused device does not meet this element, it does not literally infringe claims 1 and 10.
1. Claim Construction

Courts look to the prosecution history as intrinsic evidence of the meaning of claim terms. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). The prosecution history modifies the scope of a claim term if "the patentee distinguished that term from prior art on the basis of a particular embodiment, expressly disclaimed subject matter, or described a particular embodiment as important to the invention." CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366-67 (Fed. Cir. 2002). The district court in this case determined that Sentry "expressly disclaimed the use of multiple components to overcome a rejection."

The district court's analysis of the prosecution history disclaimer is sound. Pease has an impact protection component made of multiple parts: a soft inner tube and a protective outer shell, as shown below in Figures 2 and 3. Both of these parts are involved in impact protection; together, they form the impact protection component. By amending their claims to include the limitation "single unitary part" and arguing that this amendment "distinguishes the present invention from the multi-component impact protection assembly disclosed by Pease[,]" the patentees gave up coverage of multipart impact protection components. For this reason, we affirm the district court's interpretation of this term as meaning "that the impact protection component is a single part, which is complete by itself without additional pieces."

This construction is correct even if, as Sentry asserts, the disclaimed Pease impact protection component can be separable. Pease discloses both separable and inseparable embodiments. For example, in the preferred embodiment, the shell and tube are "glued together." In another embodiment, they are connected by "snap fasteners" and thus are separable. By distinguishing their invention from Pease, the patentees disclaimed coverage of both separable and inseparable impact protection components, so long as the components include multiple parts. The district court's construction accounts for this disclaimer.

Sentry's quarrel seems to be with the way the court applied its construction. The court held that Eagle's device did not infringe because, "like Pease, it is comprised of multiple components that are 'secured together [and] not separable.'" As mentioned supra, we have elected to dispose of this appeal without considering infringement issues. But, to the extent that this statement by the district court represents a corollary to the court's claim construction, the statement nonetheless reiterates the key point: that impact protection components consisting of "multiple" parts are not covered. Properly, the court's overriding concern was that "the term single unitary part must be construed to reflect the fact that the impact protection component is comprised of [only] one piece."

1. "Sinusoidal"

I previously held that "first meander" means "a periodic sinusoidal pattern about a center line." 75 In including the term "sinusoidal," I relied on the written description of the patents-in-suit, which "clearly provides that the first meander is sinusoidal about a center line." 76 After the close of expert discovery, the parties disputed the meaning of "sinusoidal." 77

76 Id. Specifically, "the written description states that 'meander pattern 11 is a vertical sinusoid having a vertical center line 9.'" Id. (quoting '303 Patent, col. 2, ll. 63-64 (referencing Figs. 1-4). All patents-in-suit share this written description. See '120 Patent, col. 3, ll. 1-3; '381 Patent, col. 3, ll. 3-4; '982 Patent, col. 3, ll. 7-8.

77 Medinol had argued at claim construction that the definition of first meander should not include the term "sinusoidal" at all. See, e.g., 9/2/04 Markman Hearing Transcript ("Markman Tr."), at 44-45 (statement of Dorothy Auth, counsel for
Medinol) (“Guidant would like to see meanders [] required to be uniformly distributed. They would like to see first meanders, they must be sinusoids . . . [but] there is just no disclaimer for that in our specification or in our file history.”).

As an initial matter, "sinusoidal" in the context of the patents-in-suit must mean something different than the plain meaning of the term, which according to the relevant dictionary is "of, relating to, shaped like, or varying according to a sine curve or sine wave." 78 This conclusion is mandated because the first meanders pictured in Figure 2 of the patents-in-suit (identified explicitly as a "vertical sinusoid") are not sine waves at all, but are squared off at the top of each repeating pattern. 79 Thus, the plain meaning of "sinusoidal" would impermissibly exclude a preferred embodiment from the claim construction. 80 Accordingly, both parties agree that sinusoidal must have a different meaning. 81

79 See '120 Patent, Fig. 2; id. col. 3, ll. 1-2.

80 See, e.g., Anchor Wall Sys., Inc. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1308 (Fed. Cir. 2003) (claim construction excluding a preferred embodiment is "rarely, if ever, correct").

81 See 6/14/05 Alan Snyder Deposition Transcript ("Snyder Dep. Tr.") at 96, Ex. 44 to 10/28/05 Declaration of Fabian Gonell ("10/28/05 Gonell Decl.") (Medinol's expert stating that "conformance with a mathematical sine wave is not what's meant by sinusoidal."); see also Markman Tr. at 107-08 (statement of J. Michael Jakes, counsel for Guidant) (stating that "sinusoidal" as used by the patents-in-suit is not strictly a mathematical sine wave, because the edges of Figure 2 are squared off; "I think [sinusoidal] means it goes up and down in a regular pattern on both sides."). I note that the Snyder transcript has been designated "highly confidential," but the portions of that transcript quoted in this Opinion do not reveal any sensitive information.

Medinol contends that "a person of ordinary skill in the art would understand 'sinusoidal,' in the context of the Patents-in-Suit, to refer [to] alternating turns." 82 Guidant argues for a narrower meaning, hewing as closely as possible to the dictionary definition quoted above and contending that "sinusoidal" in the context of the patents-in-suit means a pattern exhibiting "(1) constant amplitude, (2) equal distances from one curve [of the meander pattern] to the next, and (3) a single repeating pattern of one up-or-down curve." 83 To arrive at this definition, Guidant determined "which characteristics of a sine wave are consistent with the disclosure in Medinol's patents," and then constructed its three-part test. 84 Not surprisingly, the accused products fall within Medinol's proposed definition for sinusoidal.

82 Pl. Infringement 56.1 P61. Accord Pl. Mem. at 7 (in the stent art, sinusoidal is "well understood to mean a ring with alternating turns."). Medinol contends that Guidant's counsel conceded that Medinol's definition is correct during the Markman hearing, when he stated that "sinusoidal" is "not strictly a mathematical sinusoidal wave," and that such a wave "goes up and down in a regular pattern on both sides." Id. at 7-8 (quotation omitted). This statement, however, is fully consistent with Guidant's current position, and for that matter with the dictionary definition of sinusoidal, which merely requires that a sinusoidal wave "relate to" a sine wave.

83 Def. Reply at 3. In a pre-motion letter to the Court, Guidant also argued that because the Penta and Vision stents "double back on themselves," they cannot be sinusoidal. See 6/14/05 Letter from J. Michael Jakes to the Court at 3 (citing Medtronic v. Advanced Cardiovascular Sys. Inc., 182 F. Supp. 2d 810, 822-23 (D. Minn. 2000), where the Court: (1) adopted parties' agreed construction of "generally sinusoidal in shape" to mean "[a] further description of the zig-zag shape. The shape does not come to sharp angles, but is more the shape of the mathematical sine wave"; and (2) found that Multi-Link stents did not literally infringe because the ring patterns doubled back on themselves). However, Guidant did not pursue this argument in its motion. See Def. Reply at 3 n.3.

84 Def. Reply at 2.

The intrinsic evidence regarding the meaning of sinusoidal is sparse, as the word "sinusoid" is used only once in the patents-in-suit, in the written description of Figure 2. Indeed, Medinol's expert derived his definition of sinusoidal from a review of the Figures included in the patents-in-suit. 85 Accordingly, the text of the claims, specification and written description is inconclusive.

- 4290 -
85 See Snyder Dep. Tr. at 74-75:

Q. What is the basis for your opinion that sinusoidal means alternating loops facing in opposite directions?
A. . . . I start with the Court's definition that the first meander is a periodic sinusoidal pattern about a center line, and I start out by saying periodic means the pattern . . . must repeat, and sinusoidal is, from the dictionary, means of or relating to or shaped like of varying [sic] according to a sine curve or sine wave. Then from the examples in the patent we learn that . . . sinusoidal here can't mean a mathematical sine wave, you can't take the mathematical, it has to be a sine, a pure sine function, because the examples in the patent which are square waves . . . but what's common in all cases is a series of alternating loops with no intervening material, basically a pattern that wiggles back and forth . . . from periodic, I get the additional requirement that as the pattern wiggles back and forth, whatever wiggles, you have whatever alternating loops you have going down, whatever the shapes of those loops are needs to repeat with regularity.

The only item of prosecution history bearing on the proper construction of "sinusoidal" is a representation made by Medinol that:

The text [of the related '303 Patent] defines a "meander pattern" as a periodic pattern . . . According to the American Heritage Dictionary of the English Language (1975), the term "meander" means "circuitous windings or sinuosities (of a stream or path) or a circuitous journey or excursion; a ramble' . . . . Thus, when the specification mentions . . . that the term "meander pattern" is a periodic pattern, it means that a meander pattern is a periodic pattern about a center line. 86

86 Preliminary Amendment filed with the PTO by Medinol on May 31, 1995 ("Medinol PTO Statement") at 4, Ex. 7 to Shaffer Decl.

Guidant asserts that this statement is a concession by Medinol that a first meander must be shaped like a sinusoid, which in turn should be defined as a pattern exhibiting characteristics of a sine wave consistent with the disclosures of the patents-in-suit. But Guidant places far more weight on this statement than it can bear. In fact, this statement supports Medinol's position, because it indicates the patentee's understanding that "sinuosity" in this context means something more expansive than simply a pattern resembling a sine wave. In particular, this definition of meander reveals that Medinol took it to mean "circuitous windings or sinuosities," indicating that the definition is not limited to sinuosities. 87 The statement further explains that a meander can "ramble" which is far from a mathematical sinusoidal structure. 88

87 Id. at 4 (emphasis added).

88 See id.

More generally, while Guidant's definition is elegant and better grounded in the dictionary definition of "sinusoidal," 89 it does not account for the fact that Medinol's patents are not limited, by the prosecution history or any other intrinsic evidence, to rings exhibiting the particular characteristics of sine waves selected by Guidant. 90 Moreover, Guidant's proposed definition for "sinusoidal" would render superfluous the terms "periodic pattern" and "about a center line" in the Court's construction of first meanders. Any ring structure meeting Guidant's three criteria would necessarily be a periodic pattern about a center line. At the same time, Guidant is incorrect when it argues that Medinol's definition of sinusoidal fails to take account of the difference between the construction of "first meander" and "second meander." 91 It is entirely possible for there to be a "periodic pattern about a center line" that does not also have "alternating turns." 92 For example, the second meanders disclosed in Figure 5 of the Lau Patent, 93 exhibit a repeating pattern, but also include straight elements (the straight connectors of Lau), and therefore those second meanders do not consist of alternating turns.

89 I do note, however, that Guidant's definition, relying as it does on first meander patterns being "curved," runs the risk of excluding the preferred embodiment depicted in Figure 2 of the patents-in-suit, given that "curved" means "to have or take a turn, change, or deviation from a straight line or plane surface without sharp breaks or angularity." Merriam-Webster Dictionary.

90 See, e.g., Irdeto Access, Inc. v. Echostar Satellite Corp., 383 F.3d 1295, 1302 (Fed. Cir. 2004) (citing Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 905-07 (Fed. Cir. 2004)) (claim terms not restricted to scope of preferred embodiments unless the patent's written description expressly or by clear implication restricts the scope of the invention to the preferred
Guidant attempts to demonstrate the all-encompassing nature of Medinol's proposed definition by presenting a seemingly random, squiggly pattern that is, according to Medinol's expert, technically a periodic sinusoidal pattern about a center line. See Def. Mem. at 12 (citing Snyder Dep. Ex. 7). But Medinol is correct that claim terms must be considered in context of the claim as a whole, See Pl. Reply at 8 (citing Phillips, 415 F.3d at 1314). Similarly, even if Guidant's hypothetical pattern qualified as a first meander, every asserted meander claim contains additional limitations, which means that a broad definition of first meander, by itself, would not mean that the patentee had violated its duty to inform the public as to the scope of its invention.

Def. Mem. at 11.

The exclusion of the word "sinusoidal" from the definition of second meanders means only that second meanders can, but need not, be sinusoidal. See Pl. Reply at 8 n.5 ("thus, 'periodic' requires that the meander have a repeating pattern and 'sinusoidal' requires that the repeating pattern be of alternating turns").

I note, however, that Medinol's contention that Guidant's definition of sinusoidal would exclude a preferred embodiment of the patents-in-suit is meritless. Medinol relies on an alleged small deviation in the distance between loops in Figure 2 of the '120 Patent to argue that the patents-in-suit do not display "equal distances from one curve to the next," as required by Guidant's proposed definition of sinusoidal. 94 This reliance is misplaced. There is no indication in the specification of the patents-in-suit that the alleged variations in Figure 2 result from any intent that the loops of the design be spaced unevenly. 95 Indeed, Figure 5A of the patents-in-suit, illustrating a close-up diagram of the same first meander pattern, clearly discloses that the distances between each loop in the pattern are meant to be equal. 96

See Pl. Mem. at 9; Pl. Reply at 4-5 (citation omitted).

95 "'Patent drawings do not define the precise proportions of the elements and may not be relied on to show particular sizes if the specification is completely silent on the issue.'" Nystrom v. TREX Co., 424 F.3d 1136, 1149 (Fed. Cir. 2005) (quoting Hockerson-Halberstadt, Inc. v. Avia Group Int'l, Ltd., 222 F.3d 951, 956 (Fed. Cir. 2000)).

96 See '120 Patent, Fig. 5. The patents-in-suit specifically state that Figures 1-5 are meant to depict the same stent. See, e.g., id. col. 2, ll. 28-39.

Given the intrinsic evidence, there is no real need to examine the extrinsic evidence cited by the parties. 97 Nonetheless, I note that Medinol's extrinsic evidence in support of its definition misses the mark. Medinol points to usage of the terms "sinusoidal" or "sinusoid-like" by Guidant in relation to other products, as well as in third-party patents, that Medinol asserts is consistent with Medinol's definition of the term. Because this evidence post-dates 1994, the relevant date for purposes of determining the meaning of sinusoidal, it is irrelevant for the purpose of claim construction. 98

See, e.g., Storage Tech. Corp. v. Cisco Sys., Inc., 329 F.3d 823, 832 (Fed. Cir. 2003) (extrinsic evidence need not be considered when intrinsic evidence is sufficient to construe a claim term).

See, e.g., Pl. Infringement 56.1 P58 (discussing a patent with an application filing date of September 3, 1999); id. P59 (discussing patents with filing dates of 1998 and 2000); id. P60 (discussing a patent with filing date of July 31, 2002).

In sum, Medinol's proposed definition is more consistent with the prosecution history and my previous Opinion.

Accordingly, "sinusoidal" is defined as a "series of alternating turns with no intervening material."
4. Sinusoidal shape

Habasit contends that "sinusoidal shape" means "having a regular amplitude and frequency." (D.I. 55 at 25.) The disputed phrase, it argues, must be considered in the context of the claim. Habasit contends that all of the intrinsic evidence of the '941 patent supports its construction. For example, Habasit points out that the specification states, the "corrugated portion forms a series of ridges and valleys in a sinusoidal manner," not a sinusoidal wave. (941 patent, col. 3, l. 49-51.) Additionally, Habasit contends that Figures 2, 5, and 9 depict a sinusoidal shape that is not strictly limited to a sine curve or a sinusoid. Finally, Habasit contends that Rexnord's proposed construction reads the preferred embodiment out of the claims at issue.

Habasit also contends that Webster's dictionary supports its construction. That is, an object has a sinusoidal "shape" if it is shaped "like or similar to" a sine wave. (D.I. 55 at 25.) Habasit argues that Rexnord avoids this problem by reading "shape" out of the phrase "sinusoidal shape."

Habasit cites the Court to Medtronic, Inc. v. Advanced Cardiovascular Sys., 182 F. Supp. 2d 810 (D. Minn. 2000), which it argues supports, rather than undermines, its construction. The court in Medtronic, Habasit contends, construed "generally sinusoidal" as "a further description of the zig-zag shape" that "does not come to sharp angles." (D.I. 62 at 23.) Habasit argues that Figures 1-8 from the Medtronic patent, which the court found to be "generally sinusoidal," did not possess the strict shape of a sine wave. Finally, Habasit contends that the '941 patent has the two mathematical characteristics necessary, according to the Medtronic court, for constituting a sine wave: (1) it has only one defined value at each point along the horizontal X-axis (it cannot "double back" on itself) and (2) it can have its mathematical derivative take'h at every point along its curve. (D.I. 62 at 24, citing Medtronic, 182 F. Supp.2d at 823.)

Rexnord contends that "sinusoidal shape" means "a shape defined by a curve having a magnitude that varies as the sine of an independent variable such that \( y = \sin x \)." (D.I. 57 at 3.) It argues that, since the term has neither an explicit definition in the text of the '941 patent nor a special meaning to one skilled in the art of conveyor belts, the Court should apply the common, mathematical definition. (Id. at 13.) Rexnord contends that Habasit instead proposes a construction far beyond how sinusoidal is defined by persons skilled in the art.

With regard to Medtronic, Rexnord contends that Habasit's E construction lacks both of the aforementioned requirements for sine wave. It argues that the patent's preferred embodiment both doubles back on itself and has vertical lines that do not have a derivative. Furthermore, Rexnord contends that Habasit's construction lacks other common characteristics of sine waves, such as having no straight sections and no sections of constant radius curvature.

After reviewing the claim language, specification, and prosecution history of the *941 patent in light of the parties' respective positions, the Court agrees with Habasit's proposed interpretation. The Court concludes that Rexnord's narrow interpretation of sinusoidal shape does not comport with the intrinsic evidence. First, the claim itself provides that "the corrugated portion has a sinusoidal shape." Furthermore, the specification states, the "corrugated portion forms a series of ridges and valleys in a sinusoidal manner." Nowhere in the specification does the patent claim to use an exact sine wave. Second, the figures of the patent's preferred embodiment clearly indicate that sinusoidal manner did not mean a sine wave in the strict sense. The claim construction propounded by Rexford excludes the preferred embodiment and "is rarely, if ever, correct and would require highly persuasive evidentiary support." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576 1996

In addition, the Court finds Rexford's arguments regarding Medtronic unpersuasive. Rexnord's proposed construction of sinusoidal shape far exceeds Medtronic's two requirements for a "sine wave." Rexnord's proposed construction would render Figures 1-8 of the Medtronic patent, which the Medtronic court considered "generally sinusoidal," to be non-sinusoidal. Moreover, the rings that the Medtronic court found non-sinusoidal deviated much more from a strict sine wave than the *941 patent embodiment. Thus, the Court finds that Medtronic's holding therefore does not deal with the type of shape at issue in the instant case. In sum, the Court concludes that "sinusoidal shape" means "having a regular amplitude and frequency."

The final relevant clause in this claim construction is found in limitation part '(d),' which provides for "siphoning treated
water from the drainage space under gravity into the treated water outlet conduit.” Contech argues that the specification of the '527 patent describes that “when a siphon effect is induced, in accordance with the invention, by purging air from the drainage space, a negative pressure develops inside the drainage space. This results in suctioning of water through the bed into the drainage space, and thence into the conduit.” (Pl.'s Opp. Mem. at 17-18 (quoting the '527 patent, col. 7, In. 64 - col. 8, In. 2.)) Contech further asserts that the definition of "siphoning" in the '527 patent does not exclude water that travels over an intermediate elevation as a result of the siphon effect. (Id. at 19.) BaySaver and AccuBid, however, assert that the '527 patent does not define "siphoning" according to its meaning as understood by a person of ordinary skill in the art since, according to the patent, the treated storm water is not induced to flow upwards over an intermediate elevation before it drains. (Def.'s Reply Mem. at 4.) "Instead of a conventional siphon," the defendants argue, "the patent requires a valve" that fully opens once the basket has filled with water, thereby displacing air and creating a suctioning flow of water through the outlet conduit. (Id. at 6.)

As Judge Mosman noted in the Oregon litigation when attempting to define "siphoning," “technical sources . . . appear to show that a person of ordinary skill in the art of hydraulics would understand the ordinary meaning of 'siphoning' to contemplate, among other limitations, a conduit that rises above the hydraulic grade line.” Stormwater Management, Inc. v. CDS Techs., Inc. (Case No. CV 04-414) (citing HYDRAULICS FOR PUBLIC HEALTH ENGINEERS 279 (1967). Stated differently, "siphoning" is technically defined as inducing water to flow upwards over an intermediate elevation before it ultimately drains. Because Judge Mosman properly found that “artisans attach special meaning to the term 'siphoning,'” the court relied on technical, rather than general usage dictionaries. Id.; see also Vanderlande Indus. Nederland BV v. ITC, 366 F.3d 1311, 1321 (Fed. Cir. 2004) (finding that a general-usage dictionary can be useful to aid a claim construction when an artisan would understand a claim term to have the same meaning in the art as that term has in common, but that technical dictionaries should be used when an artisan "would attach a special meaning to a claim term"). Judge Mosman recognized, however, that a technical definition of "siphoning" that requires a conduit that rises above an intermediate elevation would "exclude the patent's sole disclosed embodiment." Id. As the Federal Circuit stated in Vitronics Corp., 90 F.3d at 1583, it "is rarely, if ever, correct" to define a claim term in a manner that would exclude the preferred embodiment described in the specification.

Because the '527 patent specification and preferred embodiment do not teach of an induced hydraulic flow over an intermediate elevation, and would thus be excluded by such a definition, it would be improper to adopt this construction of the term "siphoning." Instead, the court recognizes that "a patentee is free to be his or her own lexicographer," assigning whatever meaning he or she likes to the terms in the claims. Hormone Research Found., Inc., 904 F.2d at 1563. The intrinsic evidence in this case, which includes the claim language and the specification, makes it clear that the patentee is defining "siphoning" to describe a process by which water is emptied from a drainage space by traveling through a tube or pipe running from the liquid in the drainage space to a lower level outside the vessel so that atmospheric pressure forces the liquid through the tube. This adopted language is wholly consistent with the definition offered by Contech's predecessor in the Oregon litigation. (See Def.'s Mem. at Ex. L, Stormwater Mem. at 10.) Furthermore, this definition is confirmed by the claim language, which describes the "siphoning process" as draining water into the water outlet conduit under the force of "gravity."

Whether this "siphoning effect" requires a siphon valve that allows the drainage space to fill with water before opening does not need to be determined by the court in construing this claim for the purposes of this litigation. The essential finding here is that the '527 patent does not define "siphoning" to include the ordinary meaning of the term as understood by a person of skill in the art. Quite simply, the '527 patent does not teach a true siphon. To define "siphoning" in the '527 patent to include the hydraulic process by which water is induced to flow against gravity and over an intermediate elevation would grant the '527 patent an overbroad scope that exceeds the clear intent of the patent's claim language and specification. It is of note, however, that the intrinsic evidence does appear to indicate that a valve may be required to create the "siphoning effect" stated in the patent since no other possible method for inducing the effect is offered. First, the specification consistently describes the siphoning effect only in the context of some kind of siphon valve. For example, the specification states that:

[I]n certain preferred embodiments, the apparatus includes an outlet siphon priming valve that allows a siphoning effect to occur . . . the outlet valve is optionally a water level actuated siphon priming valve that is able to at least partially cover the opening of the outlet and thereby restrict flow of treated storm water through the duct . . . When the storm water runoff rate is above a threshold level, so that the basket becomes completely submerged and the inner drainage space fills with treated water, then the outlet siphon priming valve opens completely and a continuous fluid communication is established between the inner drainage space and the outlet conduit [under this siphon effect].

- 4294 -
The terms "sit-on-top kayak" appears in the "preamble" to each of the claims at issue, and plaintiff argues the phrase should be construed as a limitation. A patent claim typically has three parts: 1) the preamble; 2) the transition; and 3) the body. (Def.'s Mem. at Ex. B.) Accordingly, a claim preamble recites claim limitations only if "the claim cannot be read independently of the preamble and is essential to point out the invention." Marston v. J.C. Penney Co., 353 F.2d 976, 986 (4th Cir. 1965), cert. denied, 385 U.S. 974, 17 L. Ed. 2d 437, 87 S. Ct. 515 (1966) (citing Kropa).

This court concludes that the preamble provides essential meaning to the claims that follow, and that the patents intended to, and must, include "sit-on-top kayak" as a structural limitation. The preamble includes repeated references to "sit-on-top kayak," such as: "Conventional kayaks comprise a hollow shell. . . . [A] new type of kayak is referred to. . . as a sit-on-top kayak [where] the user. . . sits in an open cockpit on the top of the kayak hull. The sit-on-top kayak is somewhat similar to a surfboard in overall shape, but normally has a generally V-shaped hull portion and a deeper draft to allow better tracking." The need . . . exists for a sit-on-top kayak design that provides three seating surfaces and footwells associated therewith, but does not result in a boat that is inconveniently long." Background of the Invention, Col. 1 of Patent 177. The use of the term "sit-on-top kayak" goes beyond merely describing certain advantages of the invention, and "breathes life into the claims that follow. Accordingly, the term sit-on-top kayak amounts to a limitation and, therefore, must be construed by the court.

Plaintiff proposes construing "sit-on-top kayak" as a "human-propelled, water displacement vessel used as a conveyance for carrying people and cargo on flat water surfaces for long periods of time, and has a keel, hull, prow, and chines [ridges on the hull to stabilize and channel water]." Defendant argues that the extrinsic evidence, including plaintiff's catalogues and Internet website, suggests a much broader scope for "sit-on-top kayak" vessels (including surfing), with portrayals of several sit-on-top kayaks that have no keel and/or a flat-bottomed hull.

Since the preamble uses plain language to describe a sit-on-top kayak as "somewhat similar to a surfboard in overall shape," but normally having "a generally V-shaped hull portion and a deeper draft to allow better tracking," this court relies upon the terms' ordinary meaning, as well as the insights provided by the patents' specifications, in construing "sit-on-top kayak" as a small decked watercraft propelled by a human or by humans using a double-ended paddle or paddles, narrow in shape.
with a generally V-shaped hull portion and a deeper draft than a surfboard to allow better tracking, on top of which the passenger or passengers sit horizontally aligned.

The trial court correctly discerned that the preamble "sit-on-top kayak" should be understood to limit all of the claims to a category of watercrafts and "in general, a preamble limits the invention if it recites essential structure or steps, or if it is 'necessary to give life, meaning, and vitality' to the claim." Catalina Marketing Int'l, Inc. v. Coolsavings.com, Inc., 289 F.3d 801, 808, 62 USPQ2d 1781, 1784 (Fed. Cir. 2002) (quoting Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1305, 51 USPQ2d 1161, 1165 (Fed. Cir. 1999)). However, the trial court's explanation of what this limitation is, namely that a sit-on-top kayak has "a generally V-shaped hull portion and a deeper draft than a surfboard to allow better tracking," is not consistent with the plain meaning of the term as used in the patents. Old Town, 2001 U.S. Dist. LEXIS 19680, slip op. at 8 (quoting the '177 patent, col. 1, ll. 25-28).

There are two flaws in the trial court's reliance on this statement. First, the plain meaning of "hull" does not include a particular shape (V) because otherwise the phrase "V-shaped hull portion" would be redundant. Second, the contextual meaning of "hull" also cannot include a limitation on its shape because the qualifier "normally" precludes the term from always requiring a V-shape. In the claims, "hull" appears to be a generally descriptive term and as such the appellant is correct that it should be given its full meaning and no modifiers should be added. See York Prods., Inc. v. Central Tractor Farm & Family Cent., 99 F.3d 1568, 1572, 40 USPQ2d 1619, 1622 (Fed. Cir. 1999) ("Without an express intent to impart a novel meaning to claim terms, an inventor's claim terms take on their ordinary meaning.").

Moreover, the interpretation of "sit-on-top kayak" in the preamble as having a particular hull shape and of "hull" in the claims to be "generally V-shaped to create a deeper draft than a surfboard to obtain better tracking" is directly contradicted by statements in the written description of the '912 patent describing particular embodiments. One such example is for the description of the fourth embodiment:

The bottom portion 418 of the kayak hull 412 may be any size, shape, and/or configuration as appropriate to provide a stable and efficient platform for movement of the kayak 410 through the water.

'912 patent, at col. 9, ll. 17-20 (emphasis added). As the appellant asserts, this is incompatible with the idea that the terms "sit-on-top kayak" and "hull" in the '912 patent require a particular shape. Our broader interpretation of "sit-on-top kayak" and "hull" is not solely for the '912 patent. The terms should be construed similarly in the '177 patent and the '063 patent because they use the same claim terms and, in fact, the preamble and the first line of the claims (referring to a "hull") are identical in all three patents. Also, all three arise from the same original patent application. The terms must be construed in the same way in all three patents. See Jonsson v. Stanley Works, 903 F.2d 812, 818, 14 USPQ2d 1863, 1869 (Fed. Cir. 1990) (holding that when two patents use the same claim terms the prosecution histories of both are relevant).

We, therefore, adopt the district court's construction of "sit-on-top kayak" and its function as a limitation of the claims with the exception of the clause "with a generally V-shaped hull portion and a deeper draft than a surfboard to allow better tracking." That we reject. Old Town, 2001 U.S. Dist. LEXIS 19680, slip op. at 9. The proper definition includes crafts with both displacement and planing hulls.
Green Edge again requests that the Court give this phrase its plain and ordinary meaning. However, the specification that Green Edge relies upon provides for “round rubber particles [that] have a length ranging between about 1/16 inches and about eight (8) inches and a width ranging between about 1/16 inches and about two (2) inches.” (‘514 Patent, col. 4, lns. 7-10) The patent continues to state that “[a] variety of sizes can be used, however, dependent upon the specific natural mulch it is desired to imitate.” (‘514 Patent, col. 4, lns. 10-11) The term “size” is defined as “physical magnitude, extent, or bulk; relative or proportionate dimensions.” Merriam-Webster Online Dictionary (visited May 15, 2007) <http://www.m-w.com/dictionary/size>. Therefore, the Court interprets “size between about a quarter inch and about four inches” to mean rubber particles ranging in “proportionate dimensions reasonably close to a quarter of an inch to reasonably close to four inches.”

4. "Lip portion sized larger than the first opening" and "the peripheral lip portion projecting beyond the first opening thereof"

A "lip portion sized larger than the first opening" means a portion of the suction cup sized to project beyond the first opening of the housing; and "the peripheral lip portion projecting beyond the first opening thereof" means the peripheral lip portion of the suction cup extending beyond the first opening of the housing.

For both terms, Palmetto contends that "sized larger" and "projecting beyond" should be limited to mean that the outer lip of the suction cup is obviously larger to a "non-expert observer."

There is no intrinsic evidence to support Palmetto's proposed limitation on these two terms. The specification teaches that the purpose of sizing the outer lip larger than the opening is so that the suction cup can properly come into contact with the surface to which it attaches. 420 Patent, col. 6, lines 60-65 (“the lip portion . . . of the elastically resilient material [is] structured to . . . keep[] the peripheral lip from being drawn into the concavity”). There is no basis for limiting how much larger the suction cup lip must be, just that it is sized in such a way that it does not get drawn into the housing. Palmetto attempts a common sense argument that "as a matter of simple physics" the lip portion of the suction cup must be obviously larger than the housing to perform its job. Palmetto's Resp. at 8. Nothing in the intrinsic evidence supports this limitation of an "obvious" size differential; indeed, common sense just as easily suggests that a person practicing the invention could fashion the lip portion behind another structure or so finely calibrate the cooperating or integrated elements such that sizing is not at all obvious to the observer. The court rejects Palmetto's proposed limitation and adopts NPI's construction, which tracks the claim language.

D. Term 5: An antenna, sized to fit within an area defined by a faceplate for an outwardly facing opening of said wallbox (as used in claims 1 and 23).

Lutron contends that Term 5 means "An antenna that is small enough and designed to fit within an area defined by the outer edges of a faceplate designed for use with an electrical wallbox." Control4's original claim construction stated the term means "An antenna, able to fit entirely behind the faceplate for an outwardly facing opening of said wallbox." During this lawsuit, Control4 redesigned its antenna. After doing so, it modified its claim construction to require that the antenna must be incapable of extending beyond the faceplate. Thus, Control4 contends now it means "An antenna designed so that it cannot extend outside the area defined by the outer edges of the faceplate."

As the term itself states, the control device's antenna is "sized" to fit within an area defined by a faceplate for an outwardly
facing opening of said wallbox. Control4 designed its antenna to fit behind the faceplate, but it is capable of being uncoiled to extend beyond the faceplate if needed for better reception.

Originally, Control4's antenna was not a "whip" antenna. Although Control4 contends its original antenna did not infringe Lutron's patent, Control4 states it redesigned its antenna after this lawsuit was commenced to move its antenna even further away from Lutron's patent. In redesigning its antenna, Control4 looked to prior art and incorporated an antenna similar to the one used in the Heath Zenith patent.

The Heath Zenith patent is different from Lutron's because it provides only one-way communication, with no status feedback. Nevertheless, Lutron does refer to this prior art in the background section of its '103 patent. Specifically, Lutron discusses how an antenna that dangles outside the wall is aesthetically displeasing and may be hazardous if it dangles inside of the wall. 52 Control4 argues that by criticizing this antenna configuration, Lutron relinquished the right to claim infringement on any antenna that is capable of dangling below the faceplate. Lutron claims it only criticized antennas that actually dangle, not those that are capable of dangling after modification. Additionally, it argues its reference "was useful to highlight the benefits of" its antenna invention, but Heath Zenith's patent did not need to be distinguished on the basis of an antenna configuration. Consequently, it did not limit the scope of its patent when it criticized Heath Zenith's configuration.

--- Footnotes ---

Notably, the Heath Zenith configuration also had a wire whip antenna that could be unwound to extend beyond the faceplate. 53 By referring to the Heath Zenith patent, Control4 contends that Lutron necessarily included the patent's entire antenna configuration, not just the extended configuration.

--- Footnotes ---

53 Decl. of Kevin W. Bates, Instructions for the Installation of a Heath Zenith Reflex Switch, at Ex. 7, at 12 (docket no. 123).

This disputed issue revolves around disclaimer and notice. Whatever Lutron disclaimed in its patent cannot be reclaimed now due to notice issues. The case law supports the proposition that when the specification of a patent criticizes a prior art, the art that is criticized is excluded from the patent. "Specification" has been used broadly in other cases to include the "Background of the Invention" section. 54

--- Footnotes ---

Here, in the background section, Lutron criticizes the Heath Zenith patent because it allows an antenna to dangle below the faceplate. Consequently, antennas that dangle below the faceplate are not included within the scope of Lutron's patent. Lutron, however, only criticized one aspect of Heath Zenith's patent. It did not criticize its antenna configuration when coiled. Cases cited by Control4 to support its position do not appear to address the particular issue of whether a narrower, disclaimed configuration sweeps within it the broader configuration of a prior art.

In contrast, prosecution disclaimer cases show that disclaimers apply only when "the patentee clearly and unambiguously disclaimed or disavowed the proposed interpretation during the patent's prosecution to obtain claim allowance." 55 In this case, the prosecution history is silent regarding whether Lutron's disclaimer was necessary to obtain claim allowance. Because the Heath Zenith patent is distinguishable on other grounds, it is unlikely that claim allowance was solely
dependent on the disclaimer. Moreover, even if it were a factor, Lutron did not clearly and unambiguously disclaim the entire Heath Zenith configuration. Indeed, nothing in the patent indicates the antenna must be incapable of being modified to extend beyond the faceplate. The Court therefore concludes the term means "An antenna developed so it fits within the outer edges of a faceplate that covers the opening of an electrical wallbox."

D. Back Bar Mass Being Sized to Provide a Significant Mass at its Point of Location to Enhance the Energy Transfer of a Golf Ball Being Struck During the Execution of a Golf Stroke (Claim 1)

The Defendants contend that the subject language should be interpreted to require that the mass be located at the center of percussion. Tr. at 345. This argument is then tied to the argument that "center of gravity" and "center of percussion" are at the same place. The end result would be that the claim would be internally inconsistent. That is, the claim would expressly call for the mass being "offset . . . from . . . the club's center of gravity" yet also require that the mass be placed at the center of percussion, which, per the Defendants' argument, is the same place as the center of gravity. The Defendants' position would render the claims incomprehensible.

--- Footnotes ---

10 Transcript references herein refer to the claim construction hearing held on March 26-27 and April 2 of this year.

--- End Footnotes ---

The Court does not find a locational limitation in the subject phrase that would require the mass to be at the center of gravity.

3661

sized to receive a finger of the user

Again, Plaintiff argues that this term is unambiguous and is readily comprehensible to a finder of fact. Defendants propose the term be defined as: "[O]f a size such that the entire finger of the user is capable of making contact. The entire finger is understood to include the distal, middle, and proximal phalanx."

Defendants cite the prosecution history of the patent in which the patentee claimed that the invention "accommodates the entire finger of the user, allowing for greater leverage and easier opening of the binder." (Plf. Ex. A at 57.) The patentee distinguished the Trussell patent which, according to the patentee, "does not disclose a finger plate that is sized to receive a finger of the user." (Id.)

As discussed above, the patent specifications teach that the release lever includes a thumb or finger plate. ("729 patent at col. 3, ll. 36-37.) The claim itself provides that the finger plate is sized to receive a finger of the user to actuate the release levers. (Id. at col. 5, ll. 2-4.) The only place in which the advantage of this design is discussed is in the prosecution history cited above. The Court agrees that the patent teaches that an advantage to the "729 patent design is a reduction in the size of the ring binder. (See id. at col. 2, ll. 4-7.) On the other hand, the prosecution history emphasizes the leverage advantage in the extended size of the finger plate. However, to define the instant term as proposed by Defendants adds too much detail
and complexity, which are not taught in the specifications or the claim language of the patent.

For the foregoing reasons, the Court construes "sized to receive a finger of the user" as follows:

**Of such a size to allow greater leverage for easier opening of the binder when applying the finger of the user.**

**3662**

Nylon 66 Membranes

A representative product claim of the Pall patent is:

34. A hydrophilic skinless alcohol-insoluble polyamide resin membrane sheet of alcohol-insoluble hydrophobic polyamide resin selected from the group consisting of polyhexamethylene adipamide, polyhexamethylene sebacate, and poly--caprolactam, and capable when completely immersed in water of being wetted through within no more than one second, and reverting when heated to a temperature just below the softening temperature of the membrane to a hydrophobic material which is no longer wetted by water.

Nylon 66 is polyhexamethylene adipamide, named in claim 34. It was not disputed that all of the limitations of claim 34 were met by MSI's nylon 66 membranes, except for the term "skinless," the meaning of which received extensive attention at trial. MSI argued that the plain meaning of "skinless" eliminated the MSI products from infringement, because a photomicrograph showed a "skin" on the MSI membranes. Pall's position was that "skinless" as used in the specification and claims should be understood as a performance characteristic, for a skin is a nonporous layer that impedes filtration.

Claim interpretation is a question of law. Markman v. Westview Instruments, Inc., 52 F.3d 967, 34 U.S.P.Q.2D (BNA) 1321 (Fed. Cir. 1995) (en banc). We review the construction of the claims without deference to that of the district court. Id. at 979, 34 U.S.P.Q.2D (BNA) at 1329 ("Because claim construction is a matter of law, the construction given the claims is reviewed de novo on appeal.") In construing the claims we look to the language of the claims, the specification, and the prosecution history. Id. Extrinsic evidence may also be considered, if needed to assist in determining the meaning or scope of technical terms in the claims. Id. at 980, 34 U.S.P.Q.2D (BNA) at 1330.

At trial both sides presented support for their conflicting positions concerning the term "skinless." Pall presented data showing "bubble point," "flow time," and "KL curve" measurements of the membranes in suit. These measurements were described in the Pall patent specification as tests for determining the presence or absence of a skin on a membrane. The bubble point test measures the pressure applied to a membrane whose pores are filled with water in order to force the water through the pores; the larger the bubble point value, the smaller the pores in the membrane. Flow time is the time required for a certain amount of water to pass through a given area of membrane; the smaller the pores the longer the flow time. The KL curve depicts the flow of water through a membrane at constant pressure; skinless membranes characteristically show an initially level KL curve followed by a sharp rise in the curve as flow commences, whereas KL curves for skinned membranes show a gradual upward-sloping curve. These are generally accepted tests of whether a membrane is skinned or skinless, for a non-porous skin impedes the passage of water through the membrane, and is detected by all three tests. The district court defined "skinless" as a performance characteristic in accordance with the parameters of these tests. We too conclude, based on the specification and the data in evidence, that "skinless" is properly construed as a performance characteristic, and that a surface that does not impede flow is "skinless" as that term is used in the art of filtration membranes.

The district court then applied the construed claims to MSI's membranes. The court found that the MSI membranes had bubble points, flow times, and KL curves characteristic of skinless membranes. The court also observed that MSI's product literature described its membranes as of uniform pore size or having precise porosity, which the court found were necessary characteristics of skinless membranes. The court thus found, on the totality of the evidence, that the MSI membranes did not have a barrier layer that blocked fluid flow, and that the MSI membranes were skinless as the Pall patent used that term. We discern no clear error in this finding.

Literal infringement is found when every limitation of a claim is met in the accused structure. Applying its interpretation of
the term "skinless," which we have confirmed, the district court found that the MSI nylon 66 membranes literally infringed the Pall patent. The judgment of infringement by MSI's nylon 66 membranes is affirmed.

1. "Skull Facial Features"

Hoodlums defines "skull facial features" as "[t]he bones of the face including but not limited to the skull facial features shown in Figures 5 through 9 of the '972 patent." (Doc. 37, Ex. B at 2.) Redtail defines "skull facial features" as the "[p]rominent and distinctive characteristics of the bones underlying the face." (Id.)

The term "skull facial feature" is found in each of the four claims of the '972 patent. In claim 1, the patent language declares that animal skull facial features "include a nose feature and a mouth feature and in which there is an area for receiving a welding helmet lens in the area that would otherwise contain eye facial features." (Doc. 44, Ex. B at 8) (emphasis added). In claims 2, 3, and 4, respectively, the patent language notes that animal skull facial features "include mammalian facial features," "include human facial features," and "include non-human facial features." (Id.) (emphasis added).

The word "include" means the same thing as the word "comprise" or "comprising." Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1344-45 (Fed. Cir. 2003). And when a claim uses an open transition phrase, such as "comprising," the claim's scope may cover additional, unlisted elements. AFG Indus., Inc. v. Cardinal IG Co., 239 F.3d 1239, 1245 (Fed. Cir. 2001). "The claim term 'including' is synonymous with 'comprising,' thereby permitting the inclusion of unnamed components." Hewlett-Packard Co. v. Repeat-O-Type Stencil Mfg. Corp., 123 F.3d 1445, 1451 (Fed. Cir. 1997). In contrast, when a claim uses a closed transition phrase, such as "consisting of," the claim's scope does not include any elements, steps, or traits that were not listed in the claim. AFG Indus., 239 F.3d at 1245.

In the specification, the patent points to Figures 5, 8, and 9, as showing "one embodiment having a human skull shape 34." (Doc. 44, Ex. B at 7.) The language in the specification highlights the "jaw portion" of the skull found in this embodiment. (Id.) When a specification describes a preferred embodiment, the court should construe the patent claims to include that embodiment. See On-Line Techs., Inc. v. Bodenseewerk Perkin-Elmer GmbH, 386 F.3d 1133, 1138 (Fed. Cir. 2004) ("[A] claim interpretation that excludes a preferred embodiment from the scope of the claim is rarely, if ever, correct."). Beyond the embodiments already illustrated in the patent, the specification notes "that modifications and variations may readily occur to those skilled in the art . . ." (Doc. 44, Ex. B at 8.)

Taken together, the term "skull facial features" is inclusive, with references to a nose feature, a mouth feature, and a jaw portion. The specification's reference to the jaw portion indicates any definition should not include a requirement that the characteristics be prominent or distinctive. Under Federal Circuit law, any construction must also allow for the claim to "cover additional, unlisted elements." Finally, the court finds "bones of the face" to be an ordinary and customary meaning of skull, and "pertaining to the face" to be an ordinary and customary meaning of facial. See New Webster's Dictionary and Thesaurus, 144, 356 (1991). "Feature" is defined in the dictionary as "any part of the face," and as "a part of the face." Id. at 147; Shorter Oxford English Dictionary, 935 (5th ed. 2002).

Looking to the claims, the specification, Federal Circuit law, and the dictionary, the court defines "skull facial features," as "pertaining to the bones of the face, including, but not limited to, a mouth feature and a nose feature, as shown in Figures 5 through 9 of the '972 patent."

2. sleeve (claims 1, 17)

Fargo — a substantially cylindrical object that is dimensioned to fit into or attach to the roll core of the print ribbon supply roll
Iris cites a technical dictionary definition of the term "sleeve." Reading the claims and the specification, however, it is clear that Iris's definition is too constricting. The specification states that "the sleeve is preferably substantially cylindrical and includes a tapered end, wherein the sleeve is dimensioned to fit into the roll core of the print ribbon supply roll." (Fink Aff., Ex. B.) Claim 11 includes almost identical language. (Id.) The Court therefore adopts Fargo's definition of this term.

C. Sleeve

Federal's proposed interpretation of the term "sleeve" is that a sleeve is:

"A part, such as a grommet or rubber collar, that fits over the non-pointed end of the spike such that (a) both the spike and the sleeve fit into the hole so that (b) the sleeve is capable of reducing the forces between the spike and the frame. This design reduces potential damage to, or distortion of, the frame as the spike pierces a tire and is removed from the frame during deployment."

Plaintiff PMG does not appear to contest this construction but, rather, argues that Federal has failed to develop evidence that "the sleeve in the Roadspike TM device is used to resist distortion to the shaft, or of any other part of the device (whether a 'frame' or not)." Mem. of Law in Supp. of PMG's Renewed Mot. for Summ. J. at 37. Federal points out that this is an issue pertaining to infringement, the application of the claim language to the Roadspike TM, which is a question of fact. This Court agrees. Therefore, this Court has reviewed the term "sleeve" under the Markman standards and finds that Federal's interpretation is supported by the evidence presented. Therefore, this Court interprets the term "sleeve" as being a part, such as a grommet or rubber collar, that fits over the non-pointed end of the spike such that (a) both the spike and the sleeve fit into the hole so that (b) the sleeve is capable of reducing the forces between the spike and the frame. This design reduces potential damage to, or distortion of, the frame as the spike pierces a tire and is removed from the frame during deployment.

(c) "Sleeve"

Cordis argues that the term "sleeve" should be construed to cover an impervious liner, i.e., one without holes or openings, suitable for isolating the wall of a body vessel from materials that otherwise could come into contact with it. Cordis cites to Alloc, Inc. v. U.S. Int'l Trade Comm'n, 342 F.3d 1361 (Fed. Cir.). The patent claims in Alloc did not mention a "play" or space between the components of the claimed locking joint, and "play" was not part of the dictionary definition of any claim term. Nonetheless, the Federal Circuit construed the claims as requiring "play" because the specification described "the invention" -- not merely a preferred embodiment, but rather, the invention itself -- as a locking joint with "play." Id. at 1368. Moreover, the specification did "not show or suggest any systems without play." Id. at 1370. Under these circumstances, the Federal Circuit construed the claims as requiring "play," even though "play" was not mentioned in the claims. As the Federal Circuit explained (id. at 1370-71):

[The] Court looks to whether the specification refers to a limitation only as a part of less than all possible embodiments or whether the specification read as a whole suggests that the very character of the invention requires the limitation be a part of every embodiment. . . [W]here the specification makes clear at various points that the claimed invention is narrower than the claim language might imply, it is entirely permissible and proper to limit the claims.

See also SciMed Life Ins., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1345 (Fed. Cir. 2001) (discussed with
Throughout the '1,653 Patent specification, Dr. Rockey's invention -- not merely a preferred embodiment, but the invention itself -- is described as a sleeve that isolates a body vessel from material normally flowing into it. This theme starts on the first page of the Patent, when the Patent Abstract summarizes the '1,653 invention as "comprising a sleeve unit . . . to isolate material flowing into the vessel from direct contact with the interior surface of the vessel." (emphasis added). The section of the '1,653 specification entitled "Summary of the Invention" goes on to describe Dr. Rockey's "invention" (again, not merely a preferred embodiment, but the invention itself) in the same fashion: "The invention provides a method and means for isolating the internal walls of hollow viscera or other body vessels from contact with materials, both fluids and solids, occurring naturally, ingested or otherwise introduced into a body vessel." (Summary of the Invention, 1:54-58) (emphasis added). The "Summary of the Invention" further states that the "tissue isolating function of the disclosed sleeve," in addition to control of the mechanism of digestion, has numerous other applications . . ." (Summary of the Invention, 2:33-36). These include using the "sleeve . . . to chemically and/or physically protect tissue which has been ulcerated, herniated, fissured, or the like from natural body fluids," id. at 2:37-40, which can be done by "isolating the effect of normal blood pressure from the vessel by containing it within the sleeve." Id. at 2:42-44. The Summary of the Invention also provides (id. at 1:58-64): "Isolation of a body vessel according to the invention, is achieved by positioning and anchoring a sleeve, impervious to materials sought to be isolated within the vessel . . ." (emphasis added).

Every embodiment described in the Patent is capable of serving this "isolating" function. For example, the "sleeve unit" of the embodiment in Fig. 1, for use in the digestive system, is described as being "implanted in a body vessel in order to isolate the walls of such vessel from fluids normally flowing into it." (Description of the Preferred Embodiment, 4:1-3) (emphasis added). Figure 4 illustrates "a manner of use of the sleeve unit 10 to isolate the internal surface area or lumen, designated 31, of a human stomach 32 and its secretions from food substances passing through it." (Id. at 4:3-7) (emphasis added). The specification further states as to Figure 4 that the sleeve reduces the digestive efficiency of the stomach "by isolating the walls 31 of the stomach 32 from ingested food passing through it . . . ." (Id. at 5:6-8).

The other embodiments of the '1,653 Patent are described in similar terms. For example, an embodiment of the sleeve shown in Figure 8 and intended for use in the aorta, is described as having "a construction essentially the same as the earlier described in sleeve 10." (Ex. 3 at 5:31-32). According to the specification, this permits "blood flowing through the sleeve to be effectively isolated from the vessel." (Id. at 5:55-56) (emphasis added). The remaining embodiment, shown in Figure 9, is described as suitable for use in a body vessel requiring "isolation or like treatment." (Id. at 5:59-61) (emphasis added). The sleeve of this third embodiment has inner and outer walls that are capable of isolating the vessel wall because they are "imperforate" (id. at 6:10-11), and these imperforate walls are "joined in a fluidtight manner . . . ." (Id. at 6:12).

Each of the figures of the '1,653 Patent, and the only sleeves described in the Patent, show a sleeve that can isolate the vessel wall from materials with which it would otherwise come into contact. Indeed, the Patent does not disclose or suggest any embodiment of the sleeve that could not perform this "isolating" function. The term "sleeve" means the type of sleeve that Dr. Rockey described as his invention, i.e., a part that can perform this tissue-isolating function.

AGR's experts take the position that the term "sleeve" should be defined as "a tubular part (such as a hollow axle or bushing) designed to fit over another part." (Webster's Ninth). This definition, however, does not comport with Dr. Rockey's description of his "medical sleeve" in the '1,653 Patent. The definition of "sleeve" that the inventor adopted, implicitly or explicitly, is the one that should be given effect. As the Federal Circuit has held:

[A] claim term may be clearly redefined [in the specification] without an explicit statement of redefinition. Indeed, we have specifically held that the written description of the preferred embodiments 'can provide guidance as to the meaning of the claims, thereby dictating the manner in which the claims are to be construed, even if the guidance is not provided in explicit definitional format.'

Bell Atlantic, 262 F.3d at 1268 (quoting SciMed Life Sys., 242 F.3d at 1344). "In other words, the specification may define claim terms 'by implication' such that the meaning may be 'found in or ascertained by a reading of the patent documents.'" Id. (quoting Vitronics, 90 F.3d at 1584 n.6). See also Invitrogen Corp. v. Biocrest Mfg., L.P., 327 F.3d 1364, 1367 (Fed. Cir. 2003) ("The applicant may also act as his own lexicographer and use the specification to implicitly or explicitly supply new meanings for terms.") (emphasis added); Moba, B.V. v. Diamond Automation, Inc., 325 F.3d 1306, 1313 (Fed. Cir. 2003) (same); Altiris, Inc. v. Symantec Corp., 318 F.3d 1363, 1374-75 (Fed. Cir. 2003) (basing construction of the term
"automation code" on the use of that term in the specification where dictionary definitions did not provide meaningful guidance on the usage of that term in the patent).

In Bell Atlantic, 262 F.3d 1258, for example, the Federal Circuit held that the patentee implicitly defined the term "mode" so that it had a narrower definition than the ordinary dictionary definition. Although the word "mode" had an ordinary meaning, the Federal Circuit did not end its analysis there. Instead, it went on to examine the specification:

It may be true that the ordinary meaning of the word 'mode' supports a broader meaning than the construction ascertained by the district court. However, we must look at the intrinsic evidence to determine whether the patentee has given the term an unconventional meaning.

Id. at 1269. In construing the claims, the Federal Circuit relied extensively on the patentee's repeated references to the purpose of the invention, including those in the summary of the invention. Id. at 1269-73. Based on the implicit definitions in the specification, the court construed the term "mode" to be limited to the embodiments actually disclosed in the specification and not to the broader ordinary meaning (id. at 1273):

We acknowledge that it is generally impermissible to limit claim terms by a preferred embodiment or inferences drawn from the description of a preferred embodiment. However, that is not the case here. We note that '[t]he usage 'preferred' does not of itself broaden the claims beyond their support in the specification.' Moreover, unlike Johnson Worldwide, this case does not involve the '[v]aried use of a disputed term.' Instead, the patentees defined the term 'mode' by implication, through the term's consistent use throughout the '786 patent specification. Given this definition, the three modes described in the Detailed Description of the Preferred Embodiments describe the three possible modes of the invention, and the claims are not entitled to any broader scope.

The '1,653 specification as a whole is replete with descriptions of Dr. Rockey's "sleeve" as capable of isolating the vessel wall from contact with materials. That definition is one that Dr. Rockey implicitly or explicitly adopted, and it governs. See Bingo Brain, Inc. v. Cal. Concepts, Inc., 2002 U.S. Dist. LEXIS 1209, 2002 WL 99272, at *3-5 (N.D. Ill. 2002), aff'd 53 Fed. Appx. 75 (Fed. Cir. 2002) (court relies on implicit definition in specification to limit claim term "bingo cards" to physical bingo cards and not to include virtual bingo cards); Wang Lab, Inc. v. America Online, Inc., 197 F.3d 1295 (Fed. Cir. 1999) (claim term interpreted more narrowly than its ordinary meaning and limited in accordance with the specification, which described a particular feature as part of the invention); Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295 (Fed. Cir. 1999) (claim term interpreted in accordance with specification and drawings, which showed a particular structure, did not illustrate or describe any other structure, and described the advantages of the featured structure as important to the invention); Chiron Corp. v. Genentech, Inc., 266 F.Supp.2d 1172, 1198 (E.D. Cal. 2002) (inventor acted as his own lexicographer of "immunoassay" based on the purposes of the patent)

Nevertheless, and contrary to the position adopted by Cordis, Dr. Rockey did not require that the sleeve be completely "impervious." Although he makes several references to the "sleeve" as an "impervious" liner, he does not describe it in such a way in the Abstract section of the Patent specification. As previously mentioned, he does specify in the Abstract that the sleeve unit must isolate material flowing into the vessel from direct contact with the interior surface of the vessel. Although an impervious material would accomplish the "isolating" function, it is conceivable that a device that is not completely impervious could nonetheless isolate some materials from the vessel. Moreover, the term "impervious" is not used to describe all of the preferred embodiments. The critical aspect of Dr. Rockey's invention is the "tissue isolating function," as it is described as the only feasible design in the disclosure. As far as the "shape" of the "sleeve," Dr. Rockey provides that it may be cylindrical, tubular, or "it may take other configurations, such as a frustrum or a sphere truncated adjacent opposite poles, or a tubular elbow of constant and varying diameter." (Description of the Preferred Embodiment, 3:39-44).

AGR relies on the section of the Patent specification that provides that "the sleeve can include a weave or mesh outer layer (not shown) which will lie against and adhere to the wall to the blood vessel." (Description of the Preferred Embodiment, 6:17-21). In this sentence, Dr. Rockey refers to the "outer layer" of the sleeve, which may be made of weave or mesh. Dr. Rockey also writes, however, that "[t]he inner wall 61 may be formed of Teflon so that cells will not readily adhere to this area." (Id.). Accordingly, the sleeve's inner layer performs the isolating function in this embodiment.

AGR does not deny that the specification of the '1,653 Patent describes Dr. Rockey's invention as a sleeve that can isolate the wall of a body vessel from material that otherwise would come into contact with it. Nor does it deny that every
The embodiment in the Patent is capable of performing that isolating function. And AGR cannot point to any different use of the term "sleeve" in the '1,653 Patent. The term "sleeve" accordingly should be given the meaning it has in the specification of Dr. Rockey's Patent.

Because the specification of the '1,653 Patent describes Dr. Rockey's "invention" -- not just a preferred embodiment, but the invention itself, as a sleeve that can isolate the wall of a body vessel from material that otherwise would come into contact with it, the Court will adopt the meaning attributed by Dr. Rockey to his invention. Thus, a "sleeve" refers to a cylinder, tube, frustum or sphere insertable into a body vessel and capable of isolating material normally flowing into the vessel from direct contact with the interior surface of the vessel.

A. "a sleeve"

Recovery asserts that the term "sleeve," based on its generally understood definition, connotes several important limitations. Recovery first argues that a "sleeve" must have two open ends, and that something with only one open end is not a "sleeve" as that term is commonly understood. Specifically, Recovery asserts that the ordinary definition of a sleeve is a tangible object - like a shirt sleeve (the first example given in Webster's Collegiate Dictionary) - that fits over something else. Recovery also notes that the McGraw-Hill Dictionary of Scientific and Technical Terms defines a "sleeve" as a "cylindrical part," with a "cylindrical surface" in turn defined as a shape with no closed ends. Thus, Recovery argues that the ordinary usage of the word "sleeve" refers only to objects with two open ends.

Brita, being the plaintiff in this action, understandably seeks a broader construction of the term "sleeve." Although acknowledging that sleeves may have two open ends, Brita asserts that an object with only one open end can also constitute a sleeve. As examples of sleeves having one closed end, Brita alludes to phonograph or book sleeves, Webster's also defines a "sleeve" as "a tube or tubelike part fitting over or around another part." Taking this a step further, Brita notes that certain forms of tubes - for example, tube socks or test tubes - can also be closed on one end. Thus, Brita contends that the ordinary usage of the word "sleeve" is not limited to objects having two open ends.

Recovery disputes whether the examples cited by Brita are, in fact, ordinary usages of the term "sleeve." For example, Recovery notes that phonograph records are on their way to obsolescence, arguing that usage of the term "sleeve" in this context is no longer ordinary. Similarly, Recovery points out that the term "sleeve" is never used to refer to test tubes or tube socks, and that therefore these purported analogs are also unavailing. Though conceding that the word "sleeve" may be used for objects with a closed end, Recovery contends that these are extraordinary usages of the word which should not color our construction in this case.

As evidenced by the competing definitions cited by Recovery and Brita, it is debatable whether the plain meaning of the word "sleeve" dictates an object with two open ends. The term "sleeve" would seem to primarily apply to objects that have two open ends, but Brita has cited some relatively common examples where it is used to apply to something with only one open end. In such a case, where two competing definitions are arguably plausible for a claim element, the patent's specification should be used to determine how the inventor intended the disputed term to be used. Vitronics, 90 F.3d at 1582. In addition, the Court may also look to the patent's file history for guidance as to the intended meaning of this term.

In this case, the specification clearly contemplates a "sleeve" to be something that is open at both ends; in fact, Brita concedes that there is nothing in the patent showing a close-ended sleeve. Though Brita attempts to argue that the patent's requirement that the sleeve "open downwardly" does not necessarily imply it be open on both ends, the Court is unpersuaded by this distinction. As disclosed in the patent, the sleeve has water flowing in one end and out the other. Furthermore, there are references in the prosecution history - notably to the Zika reference - in which the patentee indicated that his usage of the term "sleeve" implied an object open at both ends. Thus, as used in the '996 patent, the term "sleeve" is something which is open at both ends.

The parties also fight over whether a "sleeve" can be two separate parts or must be a singular structure. This question is an easy one, and thus only a brief analysis is necessary. It is apparently Brita's position that a combination of parts can constitute a "sleeve." This Court, however, finds no support for this position either from the plain meaning of the word or
the patent specification. A "sleeve" is a singular object - that is how Webster's conceives of the term, and that is how the '996 patent uses the term. Brita's position is therefore nothing more than a figment of its imagination, having no basis in the evidence before this Court.

Though the Court finds there to be competing definitions for the term "sleeve," the specification and the prosecution history make clear the inventor intended it to refer to an object with two open ends. Furthermore, the term "sleeve" refers only to singular structures, as no evidence has been presented demonstrating that a sleeve can be a multi-part object. The Court will therefore adopt Recovery's proposed definition of "a sleeve": "a single continuous structure with two open ends that fits over something else."

2. "sleeve . . . having an opening formed therein"

Brita also takes issue with the district court's holding that the term "sleeve" requires a single continuous structure. In particular, Brita asserts that "sleeve" can encompass a structure in which the sleeve is made up of two parts that are not connected to one another. We see no error in the district court's claim construction.

As commonly understood, a sleeve is a continuous structure that fits over and around another structure. This understanding is reflected in various dictionary definitions of the term. See, e.g., Oxford English Dictionary, Vol. XV, 684 (1989 2d ed.) (defining sleeve, inter alia, as "[a] close fitting protective case or cover"). While this structure may be made up of several pieces, these pieces must be affixed to one another to form a single continuous sleeve.

Brita's proffered construction differs from this ordinary understanding of the term "sleeve." Our case law recognizes two situations in which a claim term may be given a meaning other than its ordinary meaning--where the patentee has explicitly defined the claim term differently and where the term chosen deprives the claim of clarity so that the scope of the claim cannot be ascertained. See Johnson Worldwide Assoc., Inc. v. Zebco Corp., 175 F.3d 985, 990, 50 U.S.P.Q.2D (BNA) 1607, 1610 (Fed. Cir. 1999). In this case, the patentees have not defined sleeve differently from its ordinary meaning. To the contrary, throughout the patent, the sleeve is shown as a single continuous structure. See '996 patent, col. 6, ll. 3-7; Figure 4. Furthermore, the term "sleeve" does not render the scope of the claim ambiguous. Thus, the ordinary meaning of "sleeve" controls.

2. Sleeve

As with the cavity element, both parties rest on the arguments in their summary judgment papers. According to Centricut, the 425 patent claims a sleeve, which necessarily separates the emissive insert from the holder at all possible points of contact. 10 Esab counters that: (1) the claimed sleeve need not enclose the emissive insert on all sides to separate it from the holder; and (2) Centricut impermissibly incorporates a "complete encirclement" limitation into the claims from language elsewhere in the specification describing one of the preferred embodiments.

10 Centricut contrasts the sleeve claimed in the 425 patent, which it likens to a top hat, with the analogous feature in the accused electrodes, which it characterizes as a washer and likens to the brim of a top hat. (In the 425 patent, the "brim" of the top hat is called the "annular flange," 425 patent, col. 3, l. 52, and the "stovepipe" portion of the hat is called the "peripheral wall," 425 patent, col. 3, l. 49.)
The electrodes disclosed in claims 1 and 2 have

\[
\text{a sleeve surrounding said emissive insert so as to separate said emissive insert from contact with said holder, said sleeve having a radial thickness of at least about 0.01 inches at said front end} \ldots \text{whereby said sleeve acts to resist movement of the arc attachment point from said insert to said holder.}
\]

425 patent, col. 7, ll. 32-33, 44-46. The electrode disclosed in claim 8 has

\[
\text{a sleeve positioned in said cavity coaxially about said emissive insert, said sleeve having a radial thickness of at least about 0.01 inches at said front end} \ldots \text{whereby said sleeve acts to resist movement of the arc attachment point from said insert to said holder.}
\]

425 patent, col. 8, ll. 47-50, ll. 59-61.

--- Footnotes ---

11 "Encircled" may not be the most apt term to describe a three-dimensional object that is surrounded on all sides, to the extent a circle (as opposed to a sphere) is a two-dimensional geometric figure. Nevertheless, when the court refers to the emissive insert as being "encircled," the intent is to refer to all three dimensions.

--- End Footnotes ---

Nowhere do claims 1, 2, or 8 limit the patented invention to a sleeve that fully surrounds the emissive insert. Rather, the sleeve surrounds the emissive insert (or is positioned about it) by virtue of separating the emissive insert from the holder, for the purpose of resisting movement of the arc from the emissive insert to the holder. Because the arc attachment point is necessarily on the front end of the emissive insert (or, in the case of electrode failure, on the front end of the holder), and because the only dimensions in claims 1, 2, or 8 that pertain to the sleeve specify its radial thickness at the front end, it necessarily follows that the emissive insert is surrounded, within the meaning of the 425 patent, when the sleeve (or other analogous element) has a radial thickness of at least about 0.01 inches and as much depth as is necessary to allow the sleeve to resist the movement of the arc attachment point from the emissive insert to the holder. In other words, the term "sleeve," as used in the 425 patent, includes both long sleeves that run the full length of the emissive insert and short sleeves that run only part of the length of the emissive insert.

The trial court construed "slidably enclosing" in claim 1 of the '311 patent:

1. A guard slidably enclosing a sliding assembly comprising a needle and a winged needle hub . . . .

'311 patent, col. 15, ll. 46-47 (emphasis added). The trial court concluded that this term in claim 1 "requires that the guard substantially contain the needle-assembly at all times." Claim Construction Order, slip op. at 9. Because the Platypus is a "stand-alone guard" without a needle, the trial court granted summary judgment of non-infringement to the defendants on multiple claims. 1 Id., slip op. at 15-19.

--- Footnotes ---

1 The trial court granted a summary judgment of non-infringement on claims 1, 4-9, 12, 19, 20, 22-23 of the '311 patent, and on claims 1, 6, and 7 of the '072 patent.

--- End Footnotes ---

The language and context of the claims support the trial court's construction of "slidably enclosing a sliding assembly."
Again, the trial court read the claim to require that the guard substantially contain the needle-assembly at all times. Claim Construction Order, slip op. at 9. In the first place, claim 1 expressly recites the presence of a needle as part of the sliding assembly. Thus, the claimed "assembly" would not be complete without a needle. The claim also uses the term "enclosing." In the context of an invention "for locking a needle in a shielded position as the needle is removed from a patient," that language suggests constant shielding or covering of the sharp. '311 patent, col. 2, ll. 8-9. The specification reinforces that suggestion:

[T]he guard is folded about its hinge position and locked . . . into a generally cylindrical, folded configuration. Alternatively, the guard may be molded . . . to enclose a sliding hub/needle assembly that has been positioned between the two pieces.

'311 patent, col. 2, ll. 53-58. By emphasizing that the guard is locked in a protective configuration, or molded to enclose the needle assembly, the specification conveys the concept of a permanent cover for the needle. Indeed, the figures in the specification show a completely enclosed, and thus guarded, needle. Figures 15-19 also show the needle hub as permanently housed in the guard. '311 patent, figures 15-19. The trial court also methodically considered and rejected each of DSU's arguments that the term means only generally surrounding the needle and hub. Claim Construction Order, slip. op. 8-15. This court concurs in the district court's analysis.

II

A.1 The issue before us can best be explained by reference to the following diagrams. Figure A is a simplified version of Figure 1 of the '302 patent, which the patent describes as a preferred embodiment. Figure B is a drawing included in Foremost's opening brief, and not challenged by Cold Chain, of the latter's insulated cooler ("the Kool Temp GTS") that Foremost contends infringes the '302 patent.

The district court construed this limitation to require that the cover block be inserted into the coolant cavity in order to "slidably engage" it. See Foremost in Packaging Sys., Inc. v. Cold Chain Techs., Inc., No. SACV 05-24-JVS(MLGx), slip op. at 8-9 (C.D. Cal. June 15, 2006).

II

A.1 The issue before us can best be explained by reference to the following diagrams. Figure A is a simplified version of Figure 1 of the '302 patent, which the patent describes as a preferred embodiment. Figure B is a drawing included in Foremost's opening brief, and not challenged by Cold Chain, of the latter's insulated cooler ("the Kool Temp GTS") that Foremost contends infringes the '302 patent.

[SEE FIGURE A IN ORIGINAL]

Fig. A--Simplified Version of Figure 1 of '302 Patent Fig.

[SEE FIGURE B IN ORIGINAL]

B--Drawing of KoolTemp GTS

The square insulated block in the cover of Figure A contains four horizontal extensions consisting of rectangular blocks. When the cover is placed on the container, these four blocks descend into the four coolant cavities. The question is whether
Claims 9 and 13 require that they so extend.

We agree with the district court that the claims so require. The claims state that when the insulated block "slidably engage[s]" the coolant cavity, the result is that "the coolant and the insulated block together substantially fill [] the coolant cavity." Focusing primarily on the patent words "slidably engage the coolant cavity," Foremost contends that even though the insulated block does not extend down into the coolant cavities, this limitation of the claim is satisfied as long as the insulated block "slidably engages" the coolant cavity.

If the insulated block does not extend down into the coolant cavities, the coolant and the insulated block cannot "together" substantially fill the cavity. In that situation the only way the coolant cavity would be substantially filled would be if the coolant itself performs that function. The insulated block would have no role in that process. The claims, however, require that the two elements of the container perform that filling function "together," not that one of them do so separately.

Our interpretation of these claims rests upon their language. It does not import into the language, as Foremost contends, the preferred embodiment shown in Figure 1 of the patent.

E. Slidably engages (claim 14)/ slidably engaging (claim 21)

Both claims 14 and 21 refer to slidably engages or engaging in describing the connection between the L-shaped connector at the free end of the screen and the movable glass insert. Defendants argue the claims are limited to coupling these parts together in the manner depicted in Figures 8 and 9 of the '998 patent, i.e., sliding them together lengthwise in continuous contact as shown by the directional arrow in Figure 8. Thus, Defendants' argument is that slidably engages/engaging should be defined as "smoothly moving a piece lengthwise in continuous contact with and along the surface of another piece until the pieces interlock." They recognize the specification describes several alternate ways of coupling the free end of the screen to the window insert, but they argue that none of these alternates are described as being "slidably" engaged. Rather, they argue, the specification offers alternatives to slideable engagement, such as using a spline, clamps or adhesives to couple the screen insert to the window insert. Because none of these alternatives are defined as "slidably" engaging the screen insert to the window insert, Defendants argue none of these alternatives is included in the claim language at issue.

Plaintiff, however, contends that Figures 8 and 9 demonstrate how the screen module can be removed and replaced, not how the connecting member on the screen came to be engaged with the retaining feature on the window insert. Plaintiff contends these figures do not require that the screen insert be coupled to the window with a horizontal movement. As to Figures 11A-F, Plaintiff asserts the six different alternative connectors do not suggest any advantage to sliding in a particular direction and there is no mention of any requirement that the engagement be smooth and continuous. The last use of the term "slidably engage" is in the description of Figure 12, which is an alternate door that incorporates a screen module attached to the door as an accessory or add-on. In describing how the free end of the screen can be attached to the sash or window insert, the specification states "[attachment can be effected by any of the previously discussed methods, including using a spline, adhesive, providing attachment clips which slidably engage a portion of the sash of the insert." (‘998 Patent, Col. 7, ll. 6-13.) This reference to "slidably engage" does not require only lengthwise or horizontal sliding.

The Court has reviewed the specification and prosecution history, including the reexamination proceedings, and does not find that the language in claim 14 of "slidably engages" or in claim 21 of "slidably engaging" is limited to "lengthwise" or "horizontal" sliding. The Court recognizes the directional arrow in Figure 8 demonstrates a lengthwise or horizontal sliding movement. And, although the alternatives in the description of Figure 8 could be construed to be excluded from the meaning of "slidably" engaging, the later use of the phrase "slidably engage" in the specification to describe Figure 12 and in reference to using attachment clips does not restrict the word slidably to lengthwise or horizontal sliding.

The Court consulted the Webster's Third New International Dictionary (1981) for the definition of slidably, which is an adverb defined as "capable of sliding or being slid." The Court will adopt Plaintiff's construction of the term "slidably engages" (claim 14) and "slidably engaging" (claim 21), which is "to engage by sliding," because it adds clarity to the unusual term "slidably," and it is consistent with the claim language, specification and prosecution history, which do not restrict sliding to any specific direction.
Both claims 14 and 21 refer to slidably engages or engaging in describing the connection between the L-shaped connector at the free end of the screen and the movable glass insert. Defendants' proposed construction is:

[T]he "elongated engagement feature" slides into and thereby engages the "elongated connection region" by sliding in the direction of their respective elongations, i.e., lengthwise from one end to the other. In embodiments where the roll of screen is disposed horizontally adjacent the door header, the direction of the sliding is from side-to-side.

Plaintiff's proposed construction is: to engage by sliding. Defendants contend the Court should reject Plaintiff's proposed construction for "slidably engage" for at least four reasons: (1) Plaintiff's arguments based upon the prosecution history of the reexamination proceeding is refuted by Examiner Johnson in the '039 Continuation Application; (2) it is inconsistent with the teachings in the specification of the '998 Patent; (3) it relies heavily on extrinsic expert testimony that should be discounted by the Court; and (4) it is inconsistent with the doctrine of claim differentiation.

The Court does not find the prosecution history of the '998 Patent, including the reexamination, to be instructive regarding the construction that should be given to the term slidably engages or engaging in claims 14 and 21. The focus during the reexamination proceeding was on whether U.S. Patent No. 3,244,222 to Johnson ("the Johnson Patent") taught the edge frame extended into the fabric track between facing weather stripping, not on how the free end of the screen was coupled to the window insert.

As to the specification, Defendants argue the claims are limited to coupling the free end of the screen to the window sash or insert in the manner depicted in Figures 8 and 9 of the '998 patent, i.e., sliding them together lengthwise in continuous contact until engaged as shown by the directional arrow in Figure 8 and as stated in Column 6 explaining Figures 8 and 11. They recognize the specification describes several alternate ways of coupling the free end of the screen to the window insert, but they argue that none of these alternates are described as being "slidably" engaged. Rather, they argue, the specification offers alternatives to slidable engagement, such as using a spline, clamps or adhesives to couple the screen insert to the window insert. Because none of these alternatives are defined as "slidably" engaging the screen insert to the window insert, Defendants argue none of these alternatives is included in the claim language at issue.

Plaintiff, however, contends that Figures 8 and 9 demonstrate how the screen module can be removed and replaced, not how the connecting member on the screen came to be engaged with the retaining feature on the window insert. Plaintiff contends these figures do not require that the screen insert be coupled to the window with a horizontal movement. As to Figures 11A-F, Plaintiff asserts the six different alternative connectors do not suggest any advantage to sliding in a particular direction. The last use of the term "slidably engage" in the written description is in the description of Figure 12, which is an alternate door that incorporates a screen module attached to the door as an accessory or add-on. In describing how the free end of the screen can be attached to the sash or window insert, the specification states "[a]ttachment can be effected by any of the previously discussed methods, including using a spline, adhesive, providing attachment clips which slidably engage a portion of the sash of the insert." (‘998 Patent, Col. 7, ll. 6-13.) This reference to "slidably engage" does not require only lengthwise or lateral sliding.

The Court has reviewed the specification and prosecution history, including the reexamination proceedings, and does not find that the language in claim 14 of "slidably engages" or in claim 21 of "slidably engaging" is limited to "lengthwise" or "lateral" sliding. The Court recognizes the directional arrow in Figure 8 demonstrates a lengthwise or lateral sliding movement. And, although the alternatives in the description of Figure 8 could be construed to be excluded from the meaning of "slidably" engaging, the later use of the phrase "slidably engage" in the specification to describe Figure 12 and in reference to using attachment clips does not restrict the word slidably to lengthwise or lateral sliding.

The Court has not relied on Plaintiff's expert's testimony, but the Court consulted the Webster's Third New International Dictionary (1981) for the definition of slidably, which is an adverb defined as "capable of sliding or being slid."
Defendants argue that under the doctrine of claim differentiation, Plaintiff has always intended that "slidably engages" should be limited to what is illustrated in Figure 8 of the '998 Patent. They assert that throughout the prosecution history Plaintiff started with a broad term in the independent claims, such as "coupled" or "removably coupled," to describe the connection between the free end of the screen and the window insert, and then included the narrowing limitation of "slidably engages" in the dependent claims to describe this connection.

Claim differentiation in its most specific sense, "refers to the presumption that an independent claim should not be construed as requiring a limitation added by a dependent claim." Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380 (Fed.Cir. 2006) (citing Nazomi Commc'ns, Inc. v. Arm Holdings, PLC., 403 F.3d 1364, 1370 (Fed.Cir. 2005) ("[C]laim differentiation 'normally means that limitations stated in dependent claims are not to be read into the independent claim from which they depend.'"). In a more general sense, the Federal Circuit has characterized claim differentiation as the "'presumption that each claim in a patent has a different scope.'" Id. (quoting Versa Corp. v. Ag-Bag Int'l Ltd., 392 F.3d 1325, 1330 (Fed.Cir. 2004)).

In this case, both of the independent claims at issue refer to "slidably" engages or engaging and there is no relevant limitation to that claim language added by a dependent claim. Thus, claim differentiation does not assist the Court in its most specific sense in construing the claims in the '998 Patent. Even if claim differentiation applies in this case in the more general sense, the Court does not find that the two independent claims at issue have a different scope regarding "slidably" engages or engaging. Neither of the claims require the sliding to be in any particular direction. Moreover, as discussed above, the Court does not find that the specification or prosecution history restricts the term "slidably" to any specific direction in either claim 14 or 21.

For the reasons set forth above, the Court rejects Defendants' strained and narrow construction of the phrase slidably engages or engaging. The Court will adopt Plaintiff's construction of the term "slidably engages" (claim 14) and "slidably engaging" (claim 21), which is "to engage by sliding," because it adds clarity to the unusual term "slidably," and it is consistent with the claim language, specification and prosecution history, which do not restrict sliding to any specific direction.

5. nib slidably located in said passageway

The term "nib slidably located in said passageway" appears in claim 1 and claim 12. Chip-Mender argues that this term means "slideable nib located in said channel." Sherwin-Williams argues that it means "a rod-shaped structure that moves longitudinally and not rotationally, which may or may not operate in conjunction with a valve and which may or may not be a unitary part."

Chip-Mender asserts that the term should be construed using the ordinary meaning of the words. Chip-Mender contends that its proposed construction is consistent with the claims, the specification, and the prosecution history of the '299 patent.

Sherwin-Williams claims that Chip-Mender is attempting to narrow the scope of the claims by excluding any passageway that operates in conjunction with, or as, a valve. Sherwin-Williams contends that the claims do not exclude a valve in the passageway, and furthermore, that the specification shows that the nib located in the passageway operates as a "flow-restricting valve."

Sherwin-Williams also argues that figure 2 from the '299 patent is "essentially a copy" of figure 8 from U.S. Patent No. 4,812,071 ("the '071 patent" or "Batra"--a patent for a "Correction Fluid Pen," cited by Russo in the '299 patent as prior art). He notes that the '071 patent explains that the pressing of the applicator against the page to be corrected "helps constrict any additional flow of fluid through orifice 133 to avoid the discharge of too much fluid." Citing Kumar, 351 F.3d at 1368, Sherwin-Williams contends that the '071 patent is intrinsic evidence. Sherwin-Williams suggests that since '071 patent specification applies to the functioning of a "valve," and since it is similar to the description of the functioning of the invention disclosed in the '299 patent, a person skilled in the art would not read the claim language to exclude a valve structure in the passageway of the '299 patent.
Sherwin-Williams also argues that "slidably located" excludes spherical nibs. Sherwin-Williams asserts that Chip-Mender's '663 patent—the continuation-in-part patent—removed the term "slidably" to broaden the claim language, added new disclosure describing a nib that may be "cylindrical, conical, spherical, or any suitable shape." Sherwin-Williams argues that the effect of this broadening only after describing a spherical nib proves that "slidably located" in the '299 patent excludes such spherical nibs.

The court finds that "nib slidably located in said passageway" means "slidable nib located in said channel." "Slidably located" in the passageway means that the nib is located or positioned in the passageway or channel, and that it moves, or "slides," within the passageway. The court finds no indication in the claims, the specification, or the prosecution history that any meaning other than the ordinary meaning should apply.

Although Sherwin-Williams previously argued that a nib is "a small projecting point," it now attempts to add limitations ("rod-shaped structure that moves longitudinally and not rotationally" and "which may or may not operate in conjunction with a valve," and "which may or may not be a unitary part"). As discussed above, the usage of "nib" and "passageway" in the claims and specification shows that those terms require no construction beyond their ordinary dictionary definitions. The specification indicates that the nib operates as "a regulator of the flow rate of paint composition." '299 patent, col. 2, ll. 10-12. However, apart from Russo's mention of the '071 patent as prior art (one of three "fluid pen devices using nibs"), there is no other support in the claims, the specification, or the prosecution history for the addition of limitations regarding the nib operating "in conjunction with a valve," or possibly being a "unitary part."

Finally, with regard to the '071 patent reference, the court is not persuaded by Sherwin-Williams' argument. As noted above, Kumar found a prior art reference cited during the prosecution history of the patent at issue to be controlling, on the grounds that the applicant and the examiner considered the reference to be highly pertinent, and that the reference was discussed extensively and distinguished during the prosecution of the patent. See 351 F.3d at 1368. As with the Hori, Suzuki, and Bishop references, there is no indication in the prosecution history that Russo discussed the Batra reference extensively during the prosecution of the '299 patent or that Russo embraced that reference as applying specifically to the claims at issue.

MBO contends that the term "slidably receiving," which is part of the claim limitation "providing a body slidably receiving the needle," should be interpreted according to its plain meaning, i.e., a body which fits around and slides along the needle. MBO calls my attention to the following language of the specification: "The safety and guard assembly 80 in FIGS. 3 and 4 carrying needle 40 . . . includes a needle shielding or guide body 82 having an opening shown as a bore extending from port means in its front surface or distal end 84 to proximal end 86 within which needle 40 is slidably received." 885 patent, col. 5, ll. 31-37. MBO recites several dictionary definitions of the terms "slide" and "receive," and concludes that nothing in these definitions mandates withdrawal or retraction of the needle into the body. According to MBO, the "slidably receiving" claim limitation encompasses any movement of the body sliding over the needle in any direction.

MBO further insists that nowhere in the specification of the 885 patent is the needle retraction emphasized or referred to as the critical feature of the invention. MBO maintains that the specification never disclaims or disavows forward motion of the body to cover the tip of the needle. MBO emphasizes that its use of the terms "retraction" and "rearwardly," in describing the preferred embodiment for the invention, is not enough to read the "retraction" limitation into all the claims, especially into the reissue claims 27, 28, 32, and 33. MBO contends that its statements during prosecution of the 699 patent did not limit the scope of its claims to retraction.

Becton explains that, the claim language, the specification, and MBO's statements to the patent examiner during the prosecution of the 699 patent support the proposition that the term "slidably receiving" should be interpreted to mean the retraction of the needle into the body. Tr. 1:72:17 -- 1:76:18. Specifically, Becton argues that MBO's original patent application, relied on for the benefit of priority, as well as the specification of the 885 patent, clearly indicated that the following three elements are crucial to the invention: (1) immediate blocking of the needle tip (2) by an imperforate flange adjacent to the front surface of the body (3) on retraction of the needle into the body. Accordingly, Becton insists that claims
The disputed term is part of the following clause: "providing a body slidably receiving the needle and having a front surface through which the needle extends for use and is retracted into the body after use." It is clear from the context, that the term "slidably receiving," connotes a stationary body through which a movable needle extended for use and retracted after use.

That interpretation is confirmed by the specification. The preferred embodiment set forth in the specification contemplates the retraction of the needle into the body. The specification explains, in relevant part:

As similarly taught in [the 655 patent,] safe needle withdrawal from the donor's . . . blood vessel is effected by holding the needly shielding body 82 stationary adjacent the needle skin entry point and with wings 88 relaxed to remove lugs 102 outwardly from behind lug 104. Thereupon, as shown in FIG. 6A, the base section 44 (or the tubing 48 thereat) is pulled in a proximal direction while needle guide body 82 is stationary thereby causing needle 40 to slide rearwardly in the proximal direction through the guideway thereof in body 82.

885 patent, col. 6, ll. 46-55. While generally the preferred embodiment does not limit a claim, in this case, it is clear that MBO "intended for the claims and the embodiments in the specification to be strictly coextensive." Phillips, 415 F.3d 1303, 2005 WL 1620331, at * 16.

This case is similar to Alloc, Inc. v. ITC, 342 F.3d 1361 (Fed. Cir. 2003). In Alloc, after the patentee's claims were allowed, it added new claims that were substantially identical to the allowed claims, except without a particular limitation (the term "play"), to the final application. 342 F.3d at 1372 (explaining that the applicant never "retracted or modified the representations that secured allowance of the original claims"). In construing the claims narrowly to include the "play limitation," the court considered the specification and the prosecution history of the entire line of patent applications. Alloc, 342 F.3d at 1368 (noting that the court must "immerse[] itself in the specification, the prior art, and other evidence, such as the understanding of skilled artisans at the time of invention, to discern the context and normal usage of the words in the patent claim").

The Alloc court read into all the claims the limitations contained in the descriptions of the invention found in the section titled "Technical Problems and Objects of the Invention," which is substantially equivalent to the "Summary of the Invention" section of the 885 patent. Id. at 1369 (concluding that the specification taught that the invention as a whole, not merely a preferred embodiment, provided for "play" in the positioning of floor panels); see also 37 C.F.R. § 1.73 (mandating that the summary of the invention, "be commensurate with the invention as claimed"). The Alloc court further emphasized that "all the figures and embodiments disclosed in the asserted patents impl[ied the existence of the play limitation] or expressly disclosed [the limitation]." 342 F.3d at 1370. The court also noted that the applicants criticized prior art that did not contain the limitation, represented to the PTO that the limitation is important to the invention, and sought to distinguish the invention from the prior art based on the existence of the limitation. Alloc, 342 F.3d at 1371. In light of all the factors set forth above, the court incorporated the "play" limitation into all the claims of the patent. Id. at 1371-72 (explaining that "because the applicant invoked play to overcome the prior art, [it] cannot now contend that the [patent-in-suit] claims [the invention] without play").

In this case, the language of the specification and MBO's assertions throughout the prosecution history make clear that MBO intended that the preferred embodiment be coextensive with the claims. Phillips, 415 F.3d 1303, 2005 WL 1620331, at * 16. The abstract of the invention, the drawings of the 885 patent, and the written description portion of the specification are all directed to retraction. 885 patent, abstract; col. 3, ll. 4-5; col. 6, ll. 46-67; col. 8, ll. 13-16. In addition, as explained more fully above, during the prosecution of the 699 patent, MBO repeatedly represented that its device encompassed a needle that retracted into the guard. MBO contended that its invention would significantly decrease or eliminate the possibility of accidental needlestick injury by retracting the needle into the guard simultaneously with the needle's withdrawal from the patient. MBO also sought to distinguish its invention from Bayless and Smith by pointing out, inter alia, that both Bayless and Smith disclosed stationary needles and movable safety means, whereas its invention disclosed a movable needle. Becton Exh. 13 p.4; Exh. 19, p. 5. See Tr. 1:72:17 -- 1:76:18. MBO, thus, effectively disclaimed any device that has a stationary needle with a guard extending forward over the needle. Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1304 (Fed. Cir. 1997) (explaining that statements made by the applicant "to induce a patent grant" limit the interpretation of the disputed claims "so as to exclude any interpretation that may have been disclaimed or disavowed during prosecution in
order to obtain claim allowance” [internal citations omitted]; emphasizing that, by “distinguishing the claimed invention over the prior art, an applicant is indicating what the claims do not cover, [and, accordingly] he is by implication surrendering such protection”). It would be improper therefore to construe the disputed claim language to encompass what MBO had "expressly disclaimed" during the prosecution of the 699 patent. SciMedLife Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1341-43 (Fed. Cir. 2001) (emphasizing that, where the applicants "discussed the disadvantages of certain prior art structures," the court should not read the claims "so broadly as to encompass the distinguished prior art").

I conclude that, in light of the language of the claim, the specification, and MBO's assertions during the prosecution of the 669 patent, the term "slidably receiving" (as well as the terms "relative movement" and "relatively moved" found in other claims) should be construed to refer to a stationary body into which the movable needle retracts. See, e.g., Alloc, 342 F.3d at 1368-72.

The phrase "slideably supported on the truck trailer" means "the bows are adapted for smooth and continuous movement along a surface on the truck trailer, which supports the bows."

Sliding Interface

The parties dispute whether "sliding interface" as used in Claims 1 and 23 of the 551 Patent is limited to things "axially aligned" and "laterally contacting." Claims 1 and 23 do not define "sliding interface," but the dictionary defines "slide" as "to move smoothly along a surface" and "interface" as "a surface forming a common boundary of two bodies, spaces, or phases." MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY 609, 1101 (10th ed. 2001). Thus, RTI's proposed definition, "a common boundary between two surfaces that can move along in smooth, continuous contact," appears to match the plain and ordinary meaning of "sliding interface." However, NMT argues that RTI's proposed definition is too expansive and that based on intrinsic evidence "sliding interface" properly means "the axially aligned, frictional contact area between laterally contacting surfaces of the needle holding member and the release element." To overcome "sliding interface's" ordinary and plain meaning, NMT must direct the court to "words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope." Teleflex, Inc. v. Ficosa North America Corp., 299 F.3d 1313, 1327 (Fed. Cir. 2002).

NMT argues that the specification explicitly "defines" the term "sliding interface" as having "laterally facing" surfaces. NMT cites the Summary of the Invention stating "the needle holding member … has … a head portion with laterally facing surface which frictionally engages a cooperating surface on the coupled retainer member which defines the sliding interface." Defs' Markman Brief on U.S. Patent No. 5,385,551, p.10-11 (citing 551 Patent, col. 4, Ins. 56-61). NMT claims that the patentee manifestly limited "sliding interface" to something with a "laterally facing surface" by using the word "defines" in the specification.

The Court disagrees with NMT's reading of the 551 Patent specification because NMT's quoted language describes only a preferred embodiment. NMT's ellipses omit the word "preferably" from the quoted sentence. The Summary of the Invention actually declares "the needle holding member is preferably cylindrically T-shaped, having a stem portion serving as a guide for the biasing spring, and a head portion with laterally facing surface which frictionally engages a cooperating surface on the coupled retainer member which defines the sliding interface." 551 Patent, col. 4, Ins. 56-61 (emphasis added). The language following the word "having" in the previously cited sentence describes the preferred "cylindrically T-shaped" embodiment. Thus, NMT improperly asks this Court to limit the 551 Patent to a preferred embodiment. Teleflex, Inc., 299 F.3d at 1327.

NMT also argues that language from dependent Claims 5 and 8 require the "sliding interface" to have "laterally contacting surfaces." Claims 5 and 8 are both dependent on disputed Claim 1 of the 551 Patent. Claim 5 claims in relevant part "the
medical device of claim 4 [dependent on Claim 1] characterized in that the needle holding member has a head portion … having a laterally facing surface which frictionally engages the coupled retainer member and defines said sliding interface."

551 Patent, Col. 16, Ins. 5-10. Claim 8 claims in relevant part "the medical device of claim 7 [dependent on Claim 1] characterized in that … said needle holder is smaller than said internal opening such that a portion of said retainer member extends laterally inwardly, below said stop member, to the sliding interface where it is coupled to the needle member to expose a generally transverse surface." Because these two dependent claims describe a "laterally facing surface." NMT argues that the patentee limited the "sliding interface" in all claims to something with a laterally facing surface."

The Court rejects NMT's attempt to import limitations from dependent claims into independent claims. The doctrine of claim differentiation creates a presumption that different claims have different scopes. Sunrace Roots Enter. Co., LTD v. SRAM Corp., 336 F.3d 1298, 1303 (Fed. Cir. 2003); Kraft Foods, Inc. v. Inter Trading Co., 203 F.3d 1362, 1368 (Fed. Cir. 2000). Although the presumption applies to all claims, it is particularly strong where the limitation under consideration is the only meaningful difference between the independent and dependent claim and a party argues that the limitation in the dependent claim should be read into the independent claim. See Sunrace Roots Enter. Co., LTD, 336 F.3d at 1303. Although the "laterally facing surface" limitation is not the only difference between Claim 1 and Claims 5 and 8, claim differentiation does create a presumption that the patentee chose to not include the "laterally facing surface" limitation in Claim 1 (and Claim 23) for a reason. Against this presumption, NMT points only to one preferred embodiment. As discussed supra, that preferred embodiment does not express a manifest intent to limit claim scope. Thus, the Court will not limit "sliding interface" to only things with "laterally facing surface[s]."

The Court further finds no need to import NMT's "axially aligned" limitation into the term "sliding interface." Compared with the somewhat ambiguous term "axially aligned," 8 disputed Claims 1 and 23 plainly describe the direction in which the "sliding interface" is oriented. For instance, Claim 1's description of "a sliding interface oriented in the direction of retraction" unambiguously tells the reader that the interface will slide in the "direction of retraction." Furthermore, the term "axial" already exists in Claim 23. Claim 23 declares that "the needle holder is selectively released by gradual reduction of the sliding interface caused by sliding axial movement of the retainer member ." 551 Patent, col. 18, Ins. 42-45. Thus, any limitation on the direction the "sliding interface" moves is included in the term "sliding axial movement." The Court interprets "sliding axial movement" infra, and finds that incorporating an "axial" limitation into "sliding interface" in Claim 23 would be redundant. Simply stated, because disputed Claims 1 and 23 describe the direction in which the "sliding interface" moves, incorporating the term "axially aligned" into "sliding interface" would be redundant and unnecessarily confusing. See United States Surgical Corp. v. Ethicon, Inc., 103 F.3d 1554, 1568 (Fed. Cir. 1997) ("Claim construction is a matter of resolution of disputed meanings and technical scope, to clarify and when necessary to explain what the patentee covered by the claims, for use in determination of infringement. It is not an obligatory exercise in redundancy.").

8 The Court describes "axially aligned" as ambiguous because NMT never informs the Court exactly what it intends that term to mean. The Court can envision different circumstances where "axially aligned" would either mean "oriented exactly parallel with an axis" or "oriented generally in the direction of an axis." Thus, adopting NMT's proposed definition would place unclear limitations on the claim scope. Furthermore, a proposed claim construction that is unclear to the Court after briefing cannot be a construction that would assist the jury in determining claim infringement.9 551 Patent, col. 15, Ins. 40-42.

In sum, the Court adopts RTI's proposed construction and finds that "sliding interface" means "a common boundary between two surfaces that can move along in smooth, continuous contact." RTI's definition parallels the term's plain and ordinary meaning. Moreover, NMT's proposed definition incorporates limitations that the claims and specification do not required and which would be unnecessarily confusing and redundant.
Initially, the Special Master notes that consistent with the parties' briefing and the Preliminary Markman, the term "slight misalignment" is shorthand for the wherein clause of Claim 3:

wherein at least one of said first and second lens arrays is rotated about an axis perpendicular to said liquid crystal panel in order to provide a slight misalignment between said lenslets and said liquid crystal panel.

In the Preliminary Markman, the Court construed "slight misalignment" as:

a misalignment of typically 2-16 degrees between an axis of the lens array and an axis of the pixel arrangement causing moire effects.

(D.I. 500 at 37). The dispute between the parties regarding the Court's construction centers on to the scope of "typically 2-16 degrees."

1. Hard Limits Should Not Be Part of the Construction of "Slight Misalignment"

The Special Master concludes that hard limits should not be part of the construction of "slight misalignment."

A claim element claimed in general descriptive words, like "slight," is not ordinarily limited to the specific numerical range described in the specification. Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1551 (Fed. Cir. 1996) (citing Specialty Composites v. Cabot Corp., 845 F.2d 981, 987 (Fed. Cir. 1988)) ("Particular embodiments appearing in the specification will not generally be read into the claims. What is patented is not restricted to the examples, but is defined by the words in the claims."). To include the hard limit of not less than 2 degrees and not more than 16 degrees would, in the Special Master's view, impermissibly read the preferred embodiment of the invention into the construction of "slight misalignment". Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004) ("Even when the specification describes only a single embodiment, the claims of the patent will not be read restrictively unless the patentee has demonstrated a clear intention to limit the claim scope using words or expressions of manifest exclusion or restriction."). See also, Brassica Protection Products LLC v. Sunrise Farms (In re Cruciferous Sprout Litig.), 301 F.3d 1343, 1348 (Fed. Cir. 2002) (declining to construe a claim term with specific numerical limits when, among other reasons, the patent included no indication that the claim term should be so limited); Conoco, Inc. v. Energy & Envtl. Int'l, L.C., 460 F.3d 1349, 1358 (Fed. Cir. 2006) (declining to limit the term to a specific numerical limit when the language was only in the preferred embodiment and not used to limit the claim); Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1249 (Fed. Cir. 1998) ("when a claim term is expressed in general descriptive words, a court will not ordinarily limit the term to a numerical range that may appear in the written description in other claims."). It follows, a fortiori, that reading the phrase "a few degrees" into the construction is likewise improper because this language incorporates into the claim a limitation related to the preferred embodiment taught in the specification ("[t]his rotation of the lens array by a few degrees (Typically 2 to 16 degrees) from the horizontal axis…."). '371 Patent, Col. 5, ll. 23-25 (emphasis added).

The Special Master recognizes that in some cases the preferred embodiment may describe the invention itself such that the claims are not entitled to a scope broader than that embodiment. Modine 75 F.3d at 1551. In the Special Master's view, this is not the case in the patent at issue because there is nothing in the specification or drawings that demonstrates the inventors' intent to restrict the rotation to specifically 2 to 16 degrees. In point of fact, the description of the rotation as "[t]ypically 2 to 16 degrees," and the illustration as approximately 2 to 16 degrees ("[theta] [approximately equal to] 2[degrees] TO 16[degrees]") in Figure 12, demonstrates that the rotation is broader than the range of not less than 2 and not more than 16 degrees. The use of the word "typically" and the symbol for "approximately," in the Special Master's view, confirms that the inventors contemplated a range outside of not less than 2 and not more than 16 degrees. Furthermore, the Customer Defendants have pointed to nothing in the prosecution history suggesting that the inventors intended to limit the invention to strictly 2 to 16 degrees of rotation. Accordingly, the Special Master declines to adopt the Customer Defendants' proposed construction that the rotation must be limited to not less than 2 and not more than 16 degrees, or other words to that effect.

The terms "small" and "about," advanced by the Customer Defendants at the Hearing, are, in the Special Master's view, no less problematic. 8 (4/27/2009 Tr. at 86:13-17). The Special Master agrees with Honeywell that the term "small" simply replaces one relative term for another. Additionally, the term "about" is synonymous with the term "approximately" in that they both mean "close to." 9 See, e.g., American Heritage Dictionary. Thus, the use of the term "about" in the construction would effectively impermissibly read in the preferred embodiment of [theta] [approximately equal to] (approximately)
2[degrees] TO 16[degrees].

--- Footnotes ---

8 The Customer Defendants' specific proposal is "a small misalignment of about 2-16 degrees between an axis of the lens array and an axis of the pixel arrangement causing moire effects due to the structure of the display." (4/27/2009 Tr. at 86:13-17).

9 The Special Master expects the same conclusion is applicable by replacing the term "typically" with "approximately" or "about.

--- End Footnotes ---

Similarly, the Special Master agrees with the Customer Defendants that the use of the term "typically," with the hard limit of between 2 to 16 degrees, creates uncertainty regarding atypical scenarios. Further, the Special Master is mindful that the term "typically" is a term of frequency and not measurement and therefore does complement the term "misalignment." Furthermore, "typically 2-6 degrees" provides no numerical limit on the construction of "slight misalignment," thus, in the Special Master's view, rendering it superfluous. Accordingly, because "typically 2-16 degrees" does not bind the construction and is potentially confusing, the Special Master concludes it should not be part of the construction.

2. "Slight Misalignment" Should be Construed Functionally

The Special Master concludes that "slight misalignment" should be read functionally.

The Special Master considers the Federal Circuit's opinion in Innovad as being particularly instructive. Innovad, Inc. v. Microsoft Corp., 260 F.3d 1326 (Fed. Cir. 2001). In Innovad, the relevant claim related to a telephone dialer system that included "a case having at least one surface for substantially enclosing a small volume." Id. at 1329. The lower court construed "small volume" as smaller than the prior art dialer unit which had a 4.4 cubic inch volume. Id. at 1330. The Federal Circuit rejected the lower court's construction and focused instead on the fact that the specification equated the dialer's size with its function: "[t]he dialer unit has no keypad, it is much smaller than existing repertory dialers and thus more portable and suitable for specialty advertising purposes." Id. at 1332-1333. Because the specification did not provide a specialized meaning for the term "small volume," the Federal Circuit construed the term functionally -- that is with respect to the dialer's function of being "comfortably portable," concluding that "'small volume' does not limit the dialer to a particular size as long as it performs its function." Id.

Interpreting "slight misalignment" in terms of the function of the rotation is, in the Special Master's view, consistent with both the claim language and the specification. Claim 3 recites a relationship between the rotation and the slight misalignment ("rotated … in order to provide a slight misalignment"). '371 Patent Col. 5 ll. 39-42. The specification explains a similar relationship between rotation and moire effect, that is the rotation of the lens array with respect to the LCD panel results in the elimination of residual moire. '371 Patent, Col. 5, ll. 24-25. Thus, the claim language read in the context of the specification per Phillips v. AWH Corp., 415 F.3d 1303, 1315 (Fed. Cir. 2005), links "slight misalignment" in the claim to the elimination of residual moire in the specification.

The Special Master rejects the Customer Defendants' argument that the claim must specifically recite a functional limitation related to eliminating the residual moire effect, whether as a means-plus-function or otherwise, in order to interpret the claim functionally. In the Special Master's view, such a requirement is contrary to Innovad, in which no such functional limitations were recited in the relevant claims. Innovad, 260 F.3d at 1332-33.

In reaching these conclusions, the Special Master also rejects the Customer Defendants' reliance on Sinorgchem Co. v. United States Int'l Trade Comm'n, 511 F.3d 1132 (Fed. Cir. 2007), for the dual proposition that "slight misalignment" should (i) not be construed functionally; and (ii) should be construed by using a numerically precise range. In Sinorgchem, the Federal Circuit construed "controlled amount" using a numerical limitation, specifically, processes that use "up to about 4% H[2]O." Id. at 1140. This construction was based on a special definition of "controlled amount" found in the specification, indicating the patentee was its own lexicographer. Id. at 1136. It is clear that the Federal Circuit was also influenced by the fact that the phrase "controlled amount" was set off by quotation marks in the specification indicating that what followed
was a definition. Id. Concluding that because the definition of "controlled amount" only encompassed processes using at most 4% water, the Federal Circuit ruled that the Sinorgchem's process, which always used more than 10% water, did not literally infringe. Id. at 1140-1141.

Unlike Sinorgchem, the term "slight misalignment" appears nowhere in the specification of the '371 patent. The Customer Defendants are, therefore, unable to point to a special definition for "slight misalignment" in the specification. Instead, the Customer Defendants argue that the rotation is defined as a "few degrees (typically 2 to 6 degrees)." (D.I. 618 at 2). While the Special Master agrees that there is an obvious relationship between the rotation of the lens array and the slight misalignment as described in the specification and claimed, that relationship, in the Special Master's view, does not amount to a special definition demonstrating that the inventors were acting as their own lexicographer in defining "slight misalignment." Therefore, in the Special Master's view, Sinorgchem is inapposite.

The only alternative to reading "slight misalignment" functionally is to accept the Customer Defendants' argument advanced at the Hearing, to construe the term structurally. The Special Master concludes that a structural construction would have the same problems as incorporating a hard limit. Indeed, a structural construction would necessarily require interpreting "slight" as a numerical range rather than as a function of eliminating residual moire. And as discussed at section 1 supra, incorporation of a numerical range into the construction is generally disfavored and would improperly include the preferred embodiment.

3. The Reference Axis is Relative to the Edges of the LCD Panel

The Special Master concludes that the '371 patent is not limited to only vertical luminance tailoring, and therefore, the rotation of the lens arrays should likewise not be limited to measurements from only the horizontal axis. (D.I. 500 at 36).

In the Preliminary Markman, the Court cited language from the specification, which was illustrative that the lens arrays are not limited to the vertical viewing angle. (D.I. 500 at 13). Accordingly, the Court concluded that the lens arrays may be oriented either vertically or horizontally, depending on the preferred viewing angle. Although Figure 12 depicts a rotation as measured from the horizontal axis of the LCD panel, in the Special Master's view, Figure 12 is only an example demonstrating the general concept of rotation to eliminate moire. Astra Aktiebolag v. Andrx Pharms., Inc. (In re Omeprazole Patent Litig.), 483 F.3d 1364, 1372 (Fed. Cir. 2007) ("Absent some clear intent to the contrary, this court does not import examples from the specification into the claims.") Given the lens arrays may be vertically or horizontally oriented, the Special Master concludes the rotation of a lens array can be measured from either the horizontal and/or vertical axes of the LCD panel, that is from the edges of the LCD panel.

The patent does not, however, teach rotating the lens arrays with respect to a diagonal axis of the LCD panel. Indeed, Honeywell's own expert has never seen a diagonal axis of an LCD panel that caused moire. (Deposition of Ian Lewin, March 5, 2008 51:16 - 52:21 and 55:4-8 (attached as Exhibit 18 to D.I. 1017 in C.A. 04-1338)). The presentation by Honeywell at the hearing showing a diagonal axis of the LCD panel was, in the Special Master's view, merely theoretical and not taught by the patent. Without support in the intrinsic record and only speculation from Honeywell, the Special Master declines to adopt Honeywell's view that the rotation can be measured from not only the horizontal and vertical axes of the display but a diagonal axis as well.

4. Rotation is Just Enough to Eliminate Residual Moire

As discussed above, the Special Master concludes it is inappropriate to incorporate the hard limit of not less than 2 degrees and not more than 16 degrees or even incorporate a few degrees into the construction of "slight misalignment" because doing so would read into the claim the preferred embodiment. Accordingly, "slight misalignment" should be construed in conjunction with its moire eliminating function. In the context of what the '371 patent teaches, however, it is clear to the Special Master that "slight misalignment" cannot be the result of any rotation, particularly a rotation beyond what is absolutely necessary to eliminate residual moire. Phillips, 415 F.3d at 1315 (holding that the specification is a critical source for understanding the claims because it must describe the manner and process of making and using the invention).

The Special Master concludes that this interpretation of the '371 Patent is supported by its specification which teaches that what is important is that the rotation results in a small change in the effective spatial frequency difference between the rotated lens array and the LCD panel. '371 Patent, Col. 5, ll. 23-28. Therefore, in the Special Master's view, the patent contemplates a small or just enough change in the effective spatial frequency difference to eliminate any residual moire.
Thus, the Special Master agrees with Honeywell that the rotation could extend outside of the 2-16 degree range where necessary to create that small change. The patent does not, however, teach rotating the lens array beyond what is needed to eliminate residual moire. Such an interpretation risks reading out of the claim the term "slight."

Also, during the Hearing, both parties agreed that once the lens array is rotated with respect to the LCD to eliminate residual moire, moire will not be reintroduced if rotation of the lens array was continued (that is an "overrotation"). (4/27/2009 Tr. at 32:11-33:1; 75:1-3). Consequently, the invention did not contemplate an "overrotation" of the lens array because an "overrotation" would not be necessary or anticipated given no possibility of moire being reintroduced. Accordingly, in the Special Master's view, the patent teaches rotating the lens array just enough, and not more, with respect to the LCD panel, to eliminate residual moire. 10

--- Footnotes ---

10 Because 2 to 16 degrees is the preferred embodiment of the invention, "just enough" rotation necessarily includes the range of the preferred embodiment, that is 2 to 16 degrees. Indeed, all of the parties agree, including the Customer Defendants, that a rotation of between 2 to 16 degrees is a slight misalignment. 4/27/2009 Tr. at 19:15-18 (KOPSIDAS: "I think you have to give them 2 to 16 in that case").

--- End Footnotes ---

CONCLUSION

Having stated the above, the Special Master concludes that "slight misalignment" means a misalignment resulting from a rotation of the lenslets of the lens array relative to an edge of the LCD panel by just enough number of degrees to eliminate residual moire.

On reviewing the supplemental claim construction record, the Court agrees with the Special Master that the Court's tentative claim construction does not give adequate meaning to the word "slight." Specifically, the Court acknowledges that because the term "typically" is only a word of frequency, it does not genuinely bind the construction. In this regard, during the supplemental claim construction hearing, the following exchange took place between the Special Master and counsel for Honeywell:

SPECIAL MASTER POPPITI: If moire is eliminated at 14 degrees, and if it is not reintroduced, if a product is rotated to 44 degrees and the moire could have been eliminated between 2 and 16, is that 44-degree product, is that a design-around?

MR. WOODS: I think the answer to your question, your Honor, would depend upon the facts of why it was, in this case, "over-rotated."

I hesitated because over-rotation is a term which has been used in different fashions over the course of the history of the case. But in that scenario, if someone has the patent in hand and thinks that they can design around by eliminating moire and it happens to work out at 15, but then just happens to rotate more, I would argue, we would argue, it is not a design-around.

(D.I. 665, Exh. H at 48:15-49:4 (emphasis added).) Thus, according to Honeywell, rotations of just about any angle would, under the Court's tentative claim construction, fall within the scope of the claims so long as they accomplished the objective of reducing moire. The problem with this theory is that, although it is appropriate to understand the claim limitation in light of its moire-reducing purpose, the claims specifically require that the misalignment be only "slight." The word "slight" limits the claim mainly in a structural way, indicating that misalignments within the scope of the claims are of limited magnitude. Certainly, the word "slight" does not contemplate superfluous excess rotations. In addition, to the extent Honeywell contends that an over-rotation may infringe depending "upon the facts of why it was . . . 'over-rotated,'" 2 the Court will not look into the question of "why" a particular rotation was included in an accused product. See Amazon.com, Inc. v. Barnesandnoble.com, Inc., 239 F.3d 1343, 1353 (Fed. Cir. 2001) (refusing to "inject subjective notions into the
infringement analysis" and explaining that "[w]e are not prepared to assign a meaning to a patent claim that depends on the state of mind of the accused infringer").

2 In this regard, the Court further notes that Honeywell argues "[f]or any degree of rotation, including those beyond 2 to 16 degrees, the question will be why that amount of rotation was implemented, and whether it is misaligned to be 'slight' as limited by this Court's construction (i.e., misaligned to reduce moire)." (D.I. 675 at 6 (emphasis in original.).)

Helpful here is the Federal Circuit decision Innovad, Inc. v. Microsoft Corp., 260 F.3d 1326, 1332-33 (Fed. Cir. 2001), a case that both Honeywell and the Special Master find particularly instructive. In Innovad, the Federal Circuit construed the term "small volume," which described the size of a case that enclosed a claimed telephone dialer system, to mean "comfortably portable" because the specification related "small volume" to a portability function. Id. Though the Federal Circuit explained that "the term 'small volume' does not limit the dialer to a particular size as long as it performs its function," the portability function did, as a practical matter, restrict the dialer from being too large. Id. In this regard, the Federal Circuit concluded that a "keypad" could not be part of the claimed telephone dialer because it would inhibit portability. Id. Here too, a functional understanding of the claim term is appropriate. Indeed, as in Innovad, the specification relates the rotation to a function, explaining that the "rotation of the lens array by a few degrees (Typically 2 to 16 degrees) from the horizontal axis causes a small change in the effective spatial frequency difference of the two arrays and thereby eliminates the residual moire." '371 patent at 5:21-28. Likewise, the claim itself explicitly states that the lens arrays are rotated "in order to provide a slight misalignment between said lenslets and said liquid crystal panel." Id. at 6:38-42.

However, it is not enough to, as Honeywell requests, simply state that a "slight misalignment" is one that reduces moire because, unlike Innovad, where a construction of "comfortably portable" limited the term "small volume," this alone would place no genuine limit on the magnitude of the misalignment. Here, such a limitation must be present because the patentee claimed not merely a "misalignment" but a "slight misalignment." In the Court's view, the Special Master's proposal to limit the magnitude of the rotation to only what is necessary to eliminate moire vindicates the functional teaching of the specification, yet at the same time gives proper meaning to the claim term "slight," which clarifies and constrains the functional teachings of the specification.

3 The Special Master stated that because 2 to 16 degrees is the preferred embodiment of the invention, his proposed construction "necessarily includes the [2 to 16 degree] range of the preferred embodiment." (D.I. 656 at 17 n.10.) Honeywell contends that the Court should reject the Special Master's construction because it includes nothing to indicate that his proposed construction "necessarily" includes the 2 to 16 degree range. However, during the supplemental claim construction hearing, Honeywell explained that the preferred 2 to 16 degree embodiment had a very specific geometric requirement, including 172 pixels per inch on the LCD and 142 lenslets per inch on the lens array. (See D.I. 665, Exh. H at 40:25-41:3.) In this respect, the "typical" 2 to 16 degree rotation described in the specification appears to correspond only to an embodiment with certain LCD and lens array spatial frequencies. The Court sees no reason to require that the term "slight misalignment" be understood to encompass a rotation of 2 to 16 degrees even when the LCD and lens array spatial frequencies are chosen such that rotations within the "typical" 2 to 16 degree range are not particularly effective at reducing moire. Indeed, as the Special Master observed, the term "typically" is merely a term of frequency that does not genuinely indicate a universal limitation on the size of moire-eliminating rotations. Thus, under the Court's construction, it would in fact be possible for a trier of fact to conclude that a rotation within the 2 to 16 degree range does not infringe if it is, for instance, far beyond what is necessary to eliminate moire.

To the extent Honeywell objects to the Special Master's construction as referring to the "elimination" of moire, the Court notes that the parties acknowledge that moire cannot be completely "eliminated" within the strictest sense of the term "eliminate." Put another way, the parties acknowledge that, within the context of the patent, the "elimination" of moire does not refer to the total elimination of any and all moire effects. Rather, in the context of the patent, those of skill in the art understand that the word "eliminate" is used in a looser sense to refer to the reduction of moire to visually acceptable levels.
(D.I. 665, Exh. H at 32:12-17.) In these circumstances, the Court concludes that the use of the word "eliminate" in the Special Master's proposed construction is not problematic. However, the Court will not adopt the Special Master's Proposed Construction to the extent it refers to the elimination of "residual" moire. The Court agrees with Honeywell that this limitation improperly implies that the pitch selection method of reducing moire, which is set forth in Claim 1, is a requirement of Claim 3.

As to the reference axis for the measurement of the rotation, the Court will also not adopt the Special Master's proposal that rotations be measured relative to an edge of the liquid crystal panel. In recommending this aspect of his proposed construction, the Special Master noted that the specification does not explicitly mention diagonal axes of the LCD panel and that Honeywell's expert had never observed diagonal axes of an LCD panel giving rise to moire. However, in its Memorandum Opinion on claim construction, this Court chose not to, as the Manufacturer Defendants requested, limit the claims to luminance tailoring along a particular axis. Rather, the Court explained that although the specification discussed the tailoring of luminance along a particular axis, this was merely an example that was used to illustrate a broader concept. Accordingly, to the extent some diagonal axis of the LCD panel genuinely leads to moire effects, the Court concludes that the patent teaches methods of reducing those effects. Furthermore, although Honeywell's expert may have never observed a diagonal axis causing moire effects, this is not, in the Court's view, an adequate basis to limit the claims. Furthermore, this aspect of the Special Master's claim construction appears to encompass a factual finding that is best reserved for proceedings other than claim construction.

However, during the supplemental claim construction hearing, the Customer Defendants proposed that the Court's claim construction be modified to reflect that the axes causing moire are those associated with the structure of the LCD panel. (See D.I. 665, Exh. H at 84-88.) The claims themselves explain that rotation is carried out to provide a "slight misalignment between said lenslets and said liquid crystal panel." ('371 patent at 6:40-42 (emphasis added).) Likewise, the specification explains that the "spatial frequency" of the display panel refers to the number of "dots or pixels per inch" and that the rotation brings about a small difference in the spatial frequency of lens array relative to the spatial frequency of the LCD panel. (See '371 patent at 4:20-25, 5:16-27.) Thus, the claim and specification confirm that moire arises from the liquid crystal panel itself and its attendant structural features, such as its spatial frequency. (See also id. at 4:59-5:5 (explaining that the lens arrays and panel spatial frequencies should be chosen to avoid integral multiples of one another); id. at Fig. 12 (depicting rotation relative to the pixel structure of the LCD); id. at 4:17-25 (explaining that moire arises from "interference between the lens array and the display panel" (emphasis added)).) Accordingly, the Court agrees with the Customer Defendants that it is appropriate to clarify that the moire arises from the structure of the LCD panel.

In light of the above, the Court will construe the term "slight misalignment" to mean "a slight misalignment resulting from a rotation of the lenslets of the lens array, relative to an axis of the LCD panel causing moire, by just enough, and not more, number of degrees to eliminate moire effects due to the structure of the display." The parties will no doubt take differing and nuanced views as to whether the levels of precision offered by the various aspects of this claim construction are adequate. However, the Federal Circuit has explained that "[a]fter the court has defined the claim with whatever specificity and precision is warranted by the language of the claim and the evidence bearing on the proper construction, the task of determining whether the construed claim reads on the accused product is for the finder of fact." PPG Indus. v. Guardian Indus. Corp., 156 F.3d 1351, 1355 (Fed. Cir. 1998). Likewise, the Federal Circuit has explained that "a sound claim construction need not always purge every shred of ambiguity. The resolution of some line-drawing problems . . . is properly left to the trier of fact." Acumed LLC v. Stryker Corp., 483 F.3d 800, 806 (Fed. Cir. 2007). In the Court's view, in remaining true to the intrinsic record, the current claim construction leaves some appropriate "line-drawing problems" to the trier of fact. Specifically, the claim construction leaves for the trier of fact at least the issues of (1) whether a particular rotation "eliminates" moire, (2) whether a particular rotation is larger than necessary to eliminate moire and is thus not a "slight" misalignment, and (3) whether a particular reference axis is both causing moire and associated with the structure of the display. Thus, although the Court has narrowed its original claim construction, the question of infringement remains.

6. "Slightly Larger in Diameter Than Said Male End"

- 4321 -
"... a second enlarged interior diameter being larger than said first enlarged interior diameter and terminating said PVC pipe at said female end, said second enlarged interior diameter being (a) slightly larger in diameter than said male end of said similar adjacent PVC pipe to receive said male end therethrough ..."

b. Parties' Contentions

CertainTeed's proposed construction of "slightly larger in diameter than said male end" is "the second enlarged interior diameter is approximately 21-25% larger than the exterior diameter of the male end." CertainTeed contends that the claim gives no direction as to what "slightly" means. Thus, the Court must look to the specification for some standard for measuring that degree. The specification states that the "first cylinder section 109 [i.e. the second enlarged diameter section] is wider in diameter than second end 107 [i.e. the male end] by approximately 1/2 inch to allow for ease of insertion of second end 107 into first cylinder section 109." Pl's Markman Brief at 13 (citing Specification of '480 patent, col.3, lines 34-37). CertainTeed interprets the specification to state that if the male end is two inches in exterior diameter, then the interior diameter of the female end with a 1/2 inch oversize is 2.5 inches, or 25% larger. And even assuming that the pipe referenced in the specification means a pipe with a two inch interior diameter and an exterior diameter of 2.375 inches, the interior diameter of the female end would have to be 2.875 inches, or approximately 21% larger.

Modern Products' proposed construction of "slightly larger in diameter than said male end" is "the second enlarged interior diameter is slightly larger than the exterior diameter of the male end." Modern Products argues for a simple and straightforward construction. The term "slightly" is not quantitatively defined in the claim, and CertainTeed cannot argue that "slightly" is ordinarily defined in quantitative terms, much less that it specifically means "approximately 21-25%." See THE AMERICAN HERITAGE DICTIONARY OF THE ENGLISH LANGUAGE (4th ed. 2000). CertainTeed's proposed construction seeks to graft a limitation into the claim that has no basis in the claim language, the specification, or the prosecution history. On the other hand, Modern Products' proposed construction is consistent with the plain and ordinary meaning of the terms and the specification.

c. Court's Construction

The Court concludes that "slightly larger in diameter than said male end" means "the second enlarged interior diameter is slightly larger than the exterior diameter of the male end." Limitations from the specification may not be read into the claim. Liquid Dynamics Corp. v. Vaughan Co., 355 F.3d 1361, 1368 (Fed. Cir. 2004) (citing Comark Communications v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998)). In this case, the limitation that CertainTeed attempts to read into the claim is tenuous at best. Further, words of approximation, such as "slightly," are descriptive terms commonly used in patent claims to avoid a strict numerical boundary to the specified parameter. Anchor Wall Sys. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1311 (Fed. Cir. 2003). As such, the Court will construe this term using its plain and ordinary meaning.

3681

B. Claim Limitation 7(f): "a slit through a planar section of said thin membrane"

Claim limitation 7(f) claims a "a slit through a planar section of said thin membrane, said slit functioning to provide an opening through said thin membrane when an external negative pressure exists and remain closed when internal and external pressures are equal." The court construed the phrase "a slit through a planar section of said thin membrane" to mean "a slit through the section of the thin membrane that has a flat, two-dimensional quality." Jury Instructions (doc. # 232), at 19.

3682

2. The Properly Construed Meaning of "Sloping Upwardly and Inwardly":

Cleveland argues that when the sole of the club heads of the claimed correlated set lay horizontal, the "lower portion of said back surface," labeled 60, "adjacent said indented trailing edge," labeled 54, slopes "upwardly" and "inwardly" creating an
acute angle, of which the legs are defined by the sole and the adjacent surface said trailing edge which slopes upwardly and inwardly, surfaces 52 and 60 respectively. The hypotenuse is defined by the club face hitting surface, labeled 45.

Again, Karsten points to extrinsic evidence in an effort to argue that the "upwardly and inwardly" sloping surface, labeled 60, need only be within the adjacent area relative to the indented trailing edge. Relying on SRI International v. Matsushita Electric Corp. of America, 775 F.2d 1107 (Fed. Cir. 1985) (en banc), Karsten argues "that the scope of the claims is not limited to the specific structures illustrated in the patent drawings, nor to the specific structures described in the written description." (Response, p. 15.)

This Court is mindful of the Federal Circuit's cautionary statement that "claims are interpreted in light of the specification does not mean that everything expressed in the specification must be read into all of the claims," SRI Int. v. Matsushita Elec. Corp of America, 775 F.2d at 1114. Rather, Karsten has sufficiently described the role of the patent's specifications in Karsten's brief. (See Response, p. 5.) Paraphrased, a patent's written description and drawings function as a dictionary when they expressly define terms used in the claims or when they define terms by implication. Thus, a patent's written description and drawings are always highly relevant to the claim construction analysis. (Response, p. 5.) "The patent itself is the single best guide to the meaning of a disputed claim term." (Id.)

It is undisputed that the '813 patent provides the best evidence of the meaning of limitations found within the claims. Once the adjacent surface is defined, it must slope "upwardly and inwardly" relative to the trailing edge and the hitting face of the club. Rather than rely on the language of the patent itself, Karsten has attempted to expand the scope of its patent by illustrating various possible configurations that might result from the claim language. Karsten's attempts to rely on extrinsic evidence are premature. As noted above, the Karsten patent requires that the surface adjacent said indented trailing edge slope upward and inward. While this Court finds that the '813 patent specifications help define the term adjacent by labeling the surface as 60 in Figures 5 and 11, even if a broader relative proximity is allowed than that depicted as surface labeled 60, the surface must slope upward and inward.

The Adjacent Back Surface

Karsten states that the district court erroneously identified the "back surface" as used in claim 1, and that this error led the court to misconstrue the meaning of "sloping upwardly and inwardly," resulting in an erroneous construction of these terms that excluded the Cleveland clubs. Karsten argues that "the lower portion of said back surface adjacent said indented trailing edge" is the encircled area 60, indicated by dashed line 59 in Figure 4 of the '813 patent:

[SEE FIGURE 4 IN ORIGINAL]

The district court construed the "back surface adjacent said indented trailing edge" as excluding the surfaces of the cavity. This construction is in accordance with the description in the specification that the "back surface" that is adjacent to the indented trailing edge circumscribes but does not include the cavity surfaces. The court was correct in rejecting Karsten's proposed construction, which departs from this description.

The district court also required that "the surface adjacent said indented trailing edge [must] slope upward and inward" relative to the trailing edge and the face of the club. Karsten states that it was incorrect to interpret "sloping inwardly" as relative to the trailing edge and the club face, instead of relative to the ground when the sole of the club is placed horizontally on the ground. However, the specification describes the lower back surface area as sloping inwardly and upwardly from the trailing edge as shown in Figures 5, 7, and 9, which illustrate these parameters relative to the trailing edge and the hitting face, not the ground. The district court's claim construction correctly reflected the description in the specification, and is confirmed.
1. "Slot"

This term is an element of claim 1 of the '053 patent, wherein its states "a holder slidably arranged in the housing and comprising a slot defined therein." ('053 patent, col. 8, lines 36-37.)

Both Security Door and Rutherford propose dictionary definitions. Rutherford urges the Court to adopt the construction of "narrow opening." Security Door suggests "narrow or elongated opening, and not a circular hole." Neither Vanguard nor Harco offered a proposed definition.

While the proposed definitions appear to be similar at first glance, the plaintiff contends that a slot is distinct from a hole. Careful examination of the claims and specifications yields no indication that the inventor intended to give the term "slot" any special meaning. In support of its proposed construction, Security Door points out that throughout the specification, the inventor referred to a specific type of structure when using the term "slot" and referred to a very different configuration when employing the term "hole." Security Door asserts that "the notion that a slot is the same thing as a hole contravenes the common and universally recognized meanings of these terms." (Security Door's Am. Reply Claim Const. Br. p.15.)

The Court therefore concludes that the ordinary and customary meaning of the claim term "slot" to a person of ordinary skill in the art at the time of the invention would be "narrow opening." This definition is consistent with all dictionaries consulted, the specifications, and the preferred embodiment.

The court also construed "slot," as used in claims 1, 46, and 52. Claim Construction Order, slip op. at 19-24. The relevant portion of claim 46 is:

46. A guard for slidably enclosing a sliding assembly . . . said guard comprising . . .

   a hollow member proportioned for receiving said needle and winged needle hub, said hollow member defining at least one longitudinal slot proportioned to receive a wing of said needle hub projecting outwardly through the slot when the needle hub resides within the hollow member in sliding relation thereto, and means, associated with the hollow member, for engaging said wing projecting through said slot when the needle and hub are in a slidingly retracted position in which the needle is enclosed by the hollow member for locking said needle hub and needle in said retracted position.

'311 patent, col. 20, II. 20-39 (emphases added). Claim 52 is:

52. The guard of claim 46 in which said slot extends in a longitudinal direction through one end of said hollow member, to provide sliding access to said wing.

'311 patent, col. 20, II. 63-65 (emphasis added). The trial court held that the term did not require "a defined width." Claim Construction Order, slip op. at 19. Later the district court, at the request of defendants, clarified that "'[s]lot' shall mean 'an opening in the guard capable of receiving a wing that projects through the opening and having both an upper edge and a lower edge that are defined by the sidewall of the guard.'" DSU Med. Corp. v. JMS Co., JMS Co., JMS N. Am. Corp., & ITL Corp. PTY, Nos. C-00-1826-DLJ, C-99-2690-DLJ (N.D. Cal. Apr. 30, 2001) (Construction Clarification Order I). In claim 46, because "proportioned to receive" modifies "slot," the trial court explained that "slot" "shall mean 'sized relative to the wing so that the wing extends through the slot when the hub is within the hollow member and so said slot can accommodate the wing's movement as it translates the length of the slot."' Id.; see also DSU Med. Corp. v. JMS Co., JMS N. Am. Corp., & ITL Corp. PTY, Nos. C-00-1826-DLJ, C-99-2690-DLJ, slip op. at 29 (N.D. Cal. Jan 16, 2002)
The trial court identified the crux of the dispute over "slot" as "whether . . . the slots for the wings should have defined widths closely approximating the wings' thickness." Construction Clarification Order I, slip op. at 19. If "slot" limits the size of the opening to accommodate the "minor" thickness of the '311 patent's wings, the Platypus would not infringe because its jaws accommodate any thickness. Claim Construction Order, slip op. at 19. On the other hand, if "slot" contains no thickness limitation, the Platypus would infringe because it opens to receive a wing of any size. Id., at 19.

The claim language recites only "slot." Thus, the claim itself does not incorporate any thickness limitation. Moreover, the specification provided no size limitation on the opening. In a tribute to its complete analysis, the trial court went beyond those primary sources to also consult the prosecution history. Phillips, 415 F.3d at 1317 (a court "should also consider the patent's prosecution history, if it is in evidence"). The record before the Patent Office shows that the patentees amended the claims of Application Serial Number 252,564, which is the application from which the '311 patent (and '072 patent) derived, to avoid U.S. Patent No. 4,840,619 (Hughes Patent).

In amending the claims to avoid the Hughes Patent, however, the applicant did not limit the size of the slot, as argued by JMS and ITL. The amendments concerned only the orientation of the needle wings that moved back and forth through the slot. To distinguish the Hughes Patent, the patentee did not have to, and did not actually, limit the width of the slot. Thus, the trial court correctly construed "slot" as not requiring a defined width, as long as it was capable of receiving a wing. Construction Clarification Order I, slip op. at 14.

2. Construction of "slot"

The question in claim construction of "slot" is easily defined: is a slot limited to an opening in the retaining portion that is less than the full length of it? Medtronic contends that the "plain and commonly used meaning" is a partial vertical opening. (Defs.' Br. 20.) In support, Medtronic points to three examples in prior art patents which, it claims, show partial vertical openings. Whether or not this is accurate, this does not establish that one of ordinary skill in the art would understand a slot to be limited to a partial vertical opening.

Medtronic next argues that the specification is consistent with this meaning. It points to the fact that in the preferred embodiment, the slots in the retaining portion do not extend the full length. As established, this Court rejects the argument that the claims are limited by the preferred embodiment. Medtronic has not pointed to anything in the specification which constitutes a clear redefinition by implication.

Medtronic next argues that its construction is supported by the prosecution history of the '665 patent. As discussed above, Medtronic points to an explanation given by the examiner as to the rejection of certain claims. Medtronic refers to the office action of April 29, 2003, in which the examiner stated:

Claims 44 and 47 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to enable one skilled in the art . . . to make and/or use the invention. The specification contains no disclosure or illustration of a locking collar with a slot extending the entire length of the collar and thus forming an incomplete circle as recited. Therefore, such an embodiment is not enabled by the disclosure.

(Gleason Dec. Ex. 10 at 4.) In its initial brief, Medtronic points to this but does not articulate any argument about what it means.

In its responsive brief, Medtronic attempts to fill in the gaps in its argument, as it were, explaining that the cited prosecution history shows that the applicant acquiesced to the examiner's interpretation of the word "slot." This is an argument with quite a few serious problems. First, it asks this Court to divine the examiner's interpretation of the word "slot," but the quoted statement from the examiner is very ambiguous. Was the problem encountered by the examiner that the specification disclosed no locking collar, or no slot, or neither? Thus, even if there was some legal basis for this Court to consider the examiner's interpretation of "slot," it is unclear what it was. Certainly the language cited above does not leave the reader
with a clear impression that the examiner understood slots to be only partial vertical openings. In fact, the examiner's reference to "a slot extending the entire length of the collar" suggests that, in his view, a slot could extend for the full length of the collar. The only clear statement that can be made here is that construction based on the examiner's interpretation of "slot" is entirely speculative.

Moreover, even if this Court agreed with Medtronic's view of the examiner's interpretation of "slot," the applicant's subsequent non-response to the examiner's interpretation does not meet the Federal Circuit requirement for importing a claim limitation from the prosecution history: a clear and unambiguous disclaimer. Nor does this appear to be the kind of binding acquiescence discussed above in TorPharm. There is no legal basis to find a claim limitation in this piece of prosecution history.

Medtronic tries to find support for its position in Lemelson v. General Mills, Inc., 968 F.2d 1202, 1207 (Fed. Cir. 1992), relying on that Court's use of the word "acquiesce." Lemelson is noteworthy because, in that case, the applicant "cancelled the [] claim in face of the Examiner's rejection, and submitted for allowance the claim with the additional clauses, as suggested by the Examiner." Id. Thus, in Lemelson, the applicant did not merely acquiesce and remain silent in response to the examiner's interpretation; he actively adopted the claim language suggested by the examiner. Id. Although the Lemelson Court did not apply the current "clear and unambiguous disclaimer" standard, the applicant's conduct in that case seems likely to have satisfied it.

Medtronic concedes that the evidence offered by Fastenetix "[a]t best . . . shows that there is no commonly accepted meaning of the word 'slot' outside of the context in which it is used. Sometimes it is used to refer to a complete break, and sometimes it refers to a partial opening." (Defs.' Resp. Br. 13.) Medtronic thus has conceded that the ordinary meaning of "slot" does not limit it to a partial vertical opening, and has failed to persuade this Court that the specification or prosecution history present clear evidence that might justify importing such a limitation into the language of the claims. This Court determines that a "slot" is not limited to a partial vertical opening.

The parties dispute the meaning of the word "slot" as it appears in the claim. The '308 patent claims "a base having an interior support surface and a bottom exterior surface with a slot therein, said base attached to said frame with said raised surface fitting substantially within the slot."

Truth argues that "slot" should be defined as single uninterrupted channel or groove that is bounded by the exterior surface of the bottom of the base that may engage a raised surface in a manner that internalizes it. Ashland argues that the "slot" need not be continuously bounded.

A "slot" is generally defined as "a long and narrow opening or groove[;] slit." Webster's Third International Dictionary 2146 (3d ed. 1986). This definition does not state that a "slot" is continuously bounded.

Nothing in the claim language itself requires the "slot" to be a single, uninterrupted channel. The '308 patent teaches the prevention of air and water infiltration through "a raised wall of rectangular cross-section extending along a sill of a frame that fits substantially within the slot when the operator is secured to the frame. The wall prevents the unobstructed flow of air and water along the bottom of the base and the sill." '308 Patent, Col. 6, ll. 4-8. The specification does not state that the "slot" must be continuously bounded. Rather, the specification states that a raised wall must be able to fit substantially within the "slot". A raised wall or window sill could substantially fit within a "slot" that was not continuously bounded. Furthermore, as Truth now concedes, the fact that a "base" may be composed of more than one piece is further evidence that a "slot" need not be continuously bounded. Finally, the specification of the '308 patent teaches that "still other aspects, objects and advantages can be obtained from a study of the specification, the drawings and the appended claims." '308 Patent, Col. 7, ll. 32-34. This language indicates that Truth's definition of "slot" would impose a limitation on the term that is not warranted by the '308 patent's specifications or claims or by the ordinary meaning of "slot".

Therefore, based on the foregoing, a "slot" is construed as "a groove or opening in the bottom exterior surface of a window operator's bottom support that accommodates a raised surface of a window frame."
2. Claims 2 and 3 ("slot for receiving the camming member of the clamp / pair of slots")

Claims 2 and 3 of the '544 Patent use the claim term "slot for receiving the camming member of the clamp / pair of slots" as "an ultrasonic instrument according to claim 1, wherein the actuation member includes a slot for receiving the camming member of the clamp," '544 Patent, Claim 2 (emphasis added), and "an ultrasonic instrument according to claim 2, wherein the clamp includes a pair of camming members and the actuation member includes a pair of slots, each one of the pair of slots being positioned to receive one of the pair of camming members," '544 Patent, Claim 3 (emphasis added). Plaintiff's proposed construction of the term is: "Opening or groove that imparts motion to the camming member," while defendant's proposal is: "Narrow opening or groove that receives and controls the motion of the camming member."

The Court incorporates its discussion infra of similar claim terms in the '050 and '286 Patents construes the term as: "Opening or groove (or a pair of openings or grooves) that imparts motion to and guides the motion of the camming member." See Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1334 (Fed. Cir. 2003) (the Court will "presume, unless otherwise compelled, that the same claim term in the same patent or related patents carries the same construed meaning.") Additionally, with respect to this claim term, the claim language itself contradicts defendant's proposed use of the word "control," because the claims explicitly use the word "receive," where "control" could have been included if the patentees had so desired. Similarly, and as discussed above, it would be inappropriate to import defendant's notion of "control" where there is no basis for it in either the claim language or specification and the words "impart" and "guide" more accurately reflect the interaction between the slots and the camming member.

Turning to the plain language of the claims, the Court concludes, and the parties agree, that it is appropriate to consult dictionary definitions to construe the meaning of the claim limitation in dispute. The language to be construed is "a housing having [or including] a slot therein for receiving the pedal shaft [therein]." The ordinary meaning of the term "slot" as used in the Asserted Claims is "a narrow opening or groove" or "a narrow passage, enclosure, or space." See Webster's Third New Int'l Dictionary 2146 (1993). The ordinary meaning of the term "therein", as used in the Asserted Claims, is "in or into that place, or, in or into that thing." Id. at 2372. Therefore, the plain language of the Asserted Claims requires that the device have a "narrow opening or groove" or a "narrow passage, enclosure, or space" (a slot), and that this slot be located in the housing of the device.

4 Winner concedes that the Accused Product has a housing, and the meaning of the term was not disputed by the parties. Therefore, the Court need not construe the meaning of the term "housing." See Vivid Techs., Inc. v. American Sci. & Eng'g, Inc., 200 F.3d 795, 803 (Fed. Cir. 1999) ("only those terms need be construed that are in controversy").

Nothing in the file history or the specification discloses a different meaning to be given to the language of the claims at issue. Although the specification illustrates a preferred embodiment of the claimed invention that is similar to the commercial Lawman Product, with an inverted U-shaped housing and a slot between two legs of the housing, this description should not be read to narrow the definition of the language used in the relevant patent claims. See Interactive Gift Express, 256 F.3d at 1331-32. When considering whether the specification discloses any special or alternative meaning to be given to the claim terms, the Court cannot import into the claims limitations or features found in the specification, but not in the claims themselves. Id.

This prohibition exists because the claims, not the particular detailed examples or preferred embodiments disclosed in the specification, define the scope of the invention. Kraft Foods, Inc. v. Int'l Trading Co., 203 F.3d 1362, 1366 (Fed. Cir. 2000); American Permahedge, Inc. v. Barcana, Inc., 105 F.3d 1441, 1444 (Fed. Cir. 1997). Therefore, when the claim language is
broader than the particular embodiments appearing in the specification, those more narrow embodiments will not limit the
claims. See Electro Med. Sys., S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994); see also Al-Site
Corp. v. VSI Int'l, Inc., 174 F.3d 1308, 1323 (Fed. Cir. 1999); SRI Int'l v. Matsushita Elec. Corp. of America, 775 F.2d 1107,
1121 (Fed. Cir. 1985) (en banc). Nothing in the language of the claims requires the device to have a U-shaped housing, and
the Court will not read that requirement into the language based on the preferred embodiment discussed in the specification.

Because the Court concludes, and the parties agree, that neither the specification nor the file history discloses any special or
alternative meaning to be given to the terms used in the Asserted Claims, the Court will accord the terms their ordinary
meaning. Therefore, the Court construes claims 1, 7, 14 and 19 of the 696 Patent to require that the device contain a narrow
opening, groove, passage, enclosure or space, and that this narrow opening, groove, passage, enclosure or space be located
in the housing of the device. Because the meaning of this language is plain, and no ambiguity remains, the Court will not
rely on any extrinsic evidence to further define these terms. 5

5 The main extrinsic evidence introduced was the testimony of Winner's expert, Mr. Marotto. Mr. Marotto testified that the
accused product had a "narrow path" for the pedal shaft. Hr'g Tr. II, at 11-12 (Marotto). Although Mr. Marotto also testified
that a "slot" requires structural members on opposing sides, no objective evidence in the form of literature or technical
dictionaries were introduced that supports such a narrow definition of the term. For that reason, and because the meaning of
the term is clear after reviewing the intrinsic evidence, the Court will afford the term "slot" the full scope of its common and
ordinary meaning. See Rexnord Corp., 274 F.3d 1336, 1342. In addition, the Court finds that Mr. Marotto's testimony is of
limited value. Although he had many years of experience with door locks, he had none with automotive locks such as those
at issue here. The only similarity between the products at issue and those with which he worked is the key cylinder, which is
not at issue here. Hr'g Tr. I, at 177 & II, at 10 (Marotto).

3. "The slots being disposed substantially parallel to the longitudinal axis of the tubular member."

Consistent with the claim language and its ordinary meaning 22 and this court's previous construction, 23 this court
construes this limitation to mean that "a 'slot' is a long and narrow opening or groove, an opening whose length is
substantially greater than its width. The claim requires slots in the tubular members that run largely or approximately
parallel to the longitudinal axis."

22 Cordis Corp., 339 F.3d at 1360 ("substantially' as used in this context, denotes approximation.")

23 In 97-550-SLR the court construed "plurality of slots" in such a way as to include the "substantially parallel" limitation.
(97-550-SLR, D.I. 1127) The court includes this previous construction to make it clear what the limitation as a whole is
construed to mean.
clamp member." '050 Patent, Claim 12 (emphasis added). Plaintiff proposes construing the term as: "Openings or grooves that impart motion to the camming members" and defendant proposes: "Narrow openings or grooves that engage and control the motion of the camming members."

The Court construes the disputed term as "openings or grooves that impart motion to and guide the motion of the camming members." It is clear from a review of the claim language, the other intrinsic evidence, and the parties' discussions in the briefing, that the ordinary meaning of "slots" is "openings or grooves." See Pl. Claim Construction Br. at 30; Def. Claim Construction Br. at 28-29. There is no basis for importing defendant's limitation of the "slots" as being "narrow." The issue of the use of the word "control" is the same as that discussed above with respect to the term "camming members" and, for the same reasons, the Court concludes that use of that word is improper. Defendant also proposes using the word "engage" to describe the relationship between the "camming members" and the "slots," but this qualification similarly appears to be without basis in either the claim language or specifications, particularly where the use of the words "impart" and "guide" more accurately describes the interaction between camming members and slots.

GO BACK

3692

4. Construction of Retainer Includes Slots

The final disputed phrase is "retainer includes slots" in the fourth claim of the '776 patent. Based on the plain meaning of the term "include", A.J. urges this construction: "the slots are a component part of a larger whole, which is the retainer." (Def. Br. at 20.) Lisle, meanwhile, urges the following construction based on the plain meaning of the term "slots": "the retainer includes slits." (Pl. Br. at 14). The fuller passage surrounding the disputed phrase is: "The tool of claim 1 wherein the retainer includes slots for receipt of the tabs." (Pl. Ex. A at Col. 4, lines 34-35).

Retainer has been constructed above, so the only remaining terms in dispute are "includes" and "slots". "Include" will be given its plain and ordinary meaning, which is "being part of a whole." (Def. Br. at 20). "Slots" in the context of the '776 patent refer to opening with which to receive the tabs of the C-shaped wrench disc. They are described thusly in claim 1: "at least two slots for cooperatively engaging the tabs of the wrench disc." (Pl. Ex. A at col. 4, lines 22-24). In claim 1, the tools describe the tube as having slots at the same end as the retainer. In claim 4, the retainer, rather than the tube itself, would contain the slots.

The Court finds that the phrase "retainer includes slots" does not need further construction in light of the language that immediately follows. Lest there be any dispute, the fuller phrase, "the retainer includes slots therein for receipt of the tabs", is constructed to mean: "the retainer contains slots for receipt of the tabs on the c-shaped wrench disc."

GO BACK

3693

3. "Slotted head"

Claim 6 of the '053 patent recites, "[t]he electric strike of claim 1, wherein the means for selecting further comprises a slotted head projecting through an aperture defined in the housing and accessible from outside the housing to be operable therefrom." (Col. 9, lines 4-7.) This term also appears in several other claims of the '053 patent.

Rutherford suggests that this term be defined as "a head containing one or more slots." Security Door proposes the construction, "a head that is manipulated by a single blade, standard screwdriver." Harco and Vanguard offer no suggested definition.

The term "slotted head" is not defined in the specification or described in the claims. Furthermore, nothing within the patent or the testimony adduced at the evidentiary hearing would suggest the limitation advanced by Security Door. As Rutherford aptly observes, "a slotted head could be manipulated by any number of implements or tools." (Rutherford's Rebuttal Claim Const. Br. pp. 14-15) The term "slotted head" is neither a term of art nor a concept intrinsic to the '053 patent. It will therefore be given its ordinary and customary meaning, namely "a head containing one or more slots."
Claim 1(a)(I) - "a slotted plate"

Plaintiff proposes that claim 1(a)(I) means, "a plate attached to a case that includes a slot." (Pl. Mem. Claim Chart at 7.) Defendant proposes the following: "A flat piece of metal with a slot that is stably fastened to a container." (Def. Brief Addendum B.) The court agrees with defendant that plaintiff's interpretation indicates that the slot is in the "case" rather than in the "plate" as stated in the claim. The court recommends the following construction of claim 1(a)(I): "a plate with a slot that is stably attached to a case."

The starting point from which to evaluate Excel's inoperability defense is the parties' claim construction briefs. The parties disagree as to the proper construction of two portions of Claims 1 and 6 of the '681 patent. The relevant language refers to the upper head bushing. The relevant language in Claim 1 refers to the function of the bushing, and describes that it will "slow the rotation of said head during said no-load operational mode." (Joint Claim Construction Statement, [Dkt. # 62] Ex. A, at 1). The relevant language in Claim 6 also refers to the bushing, which it describes as an "anti-spin apparatus." (Id. at 4). The parties proffered constructions are as follows:

<table>
<thead>
<tr>
<th>Metso's Construction</th>
<th>Excel's Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>slow the rotation of said head during said no-load</td>
<td>slow the rotation of said head during said</td>
</tr>
<tr>
<td>operational mode means adequately</td>
<td>no-load operational mode means adequately</td>
</tr>
<tr>
<td>slow the rotation of the head when no material is</td>
<td>slow the rotation of the head when no material is</td>
</tr>
<tr>
<td>being crushed.</td>
<td>being crushed.</td>
</tr>
<tr>
<td>&quot;anti-spin apparatus&quot; means device that slows the</td>
<td>&quot;anti-spin apparatus&quot; means device that</td>
</tr>
<tr>
<td>rotation of the head</td>
<td>adequately slows the rotation of the head.</td>
</tr>
</tbody>
</table>

Thus, Metso contends that the claim language should be construed to mean exactly what it says it means (i.e., giving the words their ordinary plain meaning), and Excel advocates that the modifier "adequately" should be read into the claims.

In construing the language of a patent's claims, a court's "claim construction analysis must begin and remain centered on the claim language itself, for that is the language the patentee has chosen to particularly point out and distinctly claim the subject matter which the patentee regards as his invention." Innova/Pure Water, Inc. v. Safari Water Filtration Systems, Inc., 381 F.3d 1111, 1116 (Fed. Cir. 2004) (quoting Interactive Gift Express, Inc. v. Compuserve, Inc., 256 F.3d 1323, 1331 (Fed. Cir. 2001)) (quoting 35 U.S.C. § 112 P 2). The court must "accord a claim the meaning it would have to a person of ordinary skill in the art at the time of the invention." Innova/Pure Water, 381 F.3d at 1116.  

Metso argues that one of ordinary skill in the art would understand "slow the rotation of said head during said no-load operational mode" to mean slowing the rotation of the head when no material is being crushed. Excel argues that "slow" has no generally understood meaning, but Excel points to no particular evidence to support this contention. The court finds that the term "slow" should be given its plain ordinary meaning, which in the context of a conical crusher would be "to reduce the rate at which the head is rotating."

Metso does not offer argument as to what one of ordinary skill in the art would understand "anti-spin apparatus" to mean. Excel argues that there is no consensus among those of ordinary skill in the art as to what "anti-spin apparatus" means. As support, Excel offers the testimony of two of its own employees, both of whom have worked in the crusher industry for many years. One of the Excel employees, Mr. Christopher Wade, testified that he understood an anti-spin device to be a mechanism that brings the head to a complete stop, not something that merely reduces the rate at which the head rotates.
(Excel Claim Construction Br. [Dkt. # 80] at 9). Mr. Wade testified that he had no knowledge as to whether his understanding of an anti-spin device was consistent with the widely held understanding of what anti-spin means in the business. (Id.) The other employee, Mr. Kurt O'Bryan, testified that an anti-spin device is not one that stops the spinning of the head completely, but rather is a device that would "significantly reduce 80-90 percent of the spin." (Id. at 10). Mr. O'Bryan stated that this definition of anti-spin was his own definition; his testimony gives no indication as to whether anyone else would agree with this definition. (Id.).

Excel argues that Mr. Wade's and Mr. O'Bryan's testimony shows that there is not a generally understood meaning of the term "anti-spin apparatus" among those of ordinary skill in the art. Excel further argues that the court should thus construe the term, based on language in the patent's specifications, to mean a "device that adequately slows the rotation of the head." Excel's argument is that the specifications make it clear that the whole point of the anti-spin apparatus was to prevent the violent ejection of rocks when they are poured into a crusher that is running "no load". Excel, therefore, argues that the modifier "adequately" should thus be inserted into the claim construction in order to clarify the amount of spin reduction claimed. 5

4 There is no reason for the court to recite the language of the specifications, because, for the purposes of this analysis, the court is drawing all inferences in favor of Excel, the non-moving party, and thus will assume that Excel's conception of the '681 patent's specifications is correct.

5 Excel does not explain what amount of slowing is necessary to be considered "adequate." Under Mr. Wade's conception, only a full stop is adequate. Under Mr. O'Bryan's conception, only an 80-90 percent reduction would be adequate. Under a more reasonable conception, only the amount of reduction necessary to either eliminate or at least reduce the occurrence of rocks being violently ejected is adequate. Were the latter definition of adequate accepted, one would then have to determine how forceful of an ejection is necessary to be considered "violent" and how much do such occurrences have to be reduced by in order to be sufficient to say that the amount of slowing was "adequate." This inquiry demonstrates two things. First, "adequate" means different things to different people and in different circumstances. Second, adding the modifier "adequately" would only create confusion; it would not offer clarity.

Excel correctly states that courts "must always read the claims in view of the full specification." SanDisk Corp. v. Memorex Products, Inc., 415 F.3d 1278, 1285 (Fed. Cir. 2005). This is to prevent the court from adopting a claim construction that "enlarge[s] what is patented beyond what the inventor has described as the invention." Netword, LLC v. Centraal Corp., 242 F.3d 1347, 1352 (Fed. Cir. 2001). However, a finding by this court that "anti-spin apparatus" means "device that slows the rotation of the head" (as opposed to "adequately slows the rotation of the head") does not enlarge the '681 patent beyond that described in the specifications. This is true even if the court adopts Excel's view that the specifications disclose claims directed solely at addressing the problem of rocks being violently flung upon introduction to a crusher operating "no load." This is because a reduction in the rate at which the head rotates when operating "no load" -- even if that rate reduction is not what Excel would consider "adequate" -- does address the problem of rocks being violently flung from the crusher. To the extent that Excel would argue that a less than "adequate" reduction of rotation does not solve the problem of rocks being violently ejected, this court rejects the notion that for an invention to warrant patent protection it must entirely and optimally resolve the problems it is designed to address.

It is important to recognize that the SanDisk court, in directing that claims be construed in light of the specifications, was addressing the issue of whether a construction that excluded preferred embodiments of the invention could be a correct construction. SanDisk, 415 F.3d at 1285. This court's refusal to incorporate the term "adequately" into the proffered constructions of the disputed claim terms does not exclude any of the preferred embodiments of the '681 claim. Nor is the court's construction of the disputed claim terms inconsistent with Excel's conception of the specifications. See On Demand Machine Corp. v. Ingram Industries, Inc., 442 F.3d 1331, 1339-41 (rejecting construction of the term "customer" to include non-retail customers, when the specifications clearly showed that the invention was geared only to retail customers). For even if the specifications do clearly show that the purpose of the upper head bushing is to prevent the violent expulsion of rocks, to the extent that the bushing does reduce the rate of rotation during "no load" operation, it does clearly address the problem that Excel maintains the specifications evidence it was designed to address.
It is also important to recognize that a basic rule of claim construction is that terms will ordinarily be given their full meaning, and modifiers should not be added to limit the scope of broad terms. Virginia Panel Corp. v. MAC Panel Co., 133 F.3d 860, 865-66 (Fed. Cir.1997) (unmodified term "reciprocating" not limited to linear reciprocation); Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 621-22 (Fed. Cir. 1995) (unmodified term "associating" not limited to explicit association); Specialty Composites v. Cabot Corp., 845 F.2d 981, 987, 6 U.S.P.Q.2d 1601, 1606 (Fed. Cir. 1988) (unmodified term "plasticizer" given full range of ordinary and accustomed meaning). For example, in Acumed LLC v. Stryker Corp., 483 F.3d 800 (Fed. Cir. 2007) the court, in construing the term "sharp," refused to incorporate a numerical angular limit required for "sharpness" into the term construction. Id. at 806. The Acumed court explained that "a sound claim construction need not always purge every shred of ambiguity." Id.

As the court has already pointed out, inserting the modifier "adequately" would only increase the ambiguity of the disputed terms. Ultimately, there is no basis for adding the modifier "adequately" to the definitions of the disputed terms. Metso's proffered definitions are consistent with the ordinary meaning of the terms, and are consistent with the purposes of the invention set out in the specifications, even when the court adopts Excel's conception of the specifications. Additionally, the court's refusal to incorporate the term "adequately" into the definitions does not create a claim construction that excludes any preferred embodiment of the '681 patent.

Because the court has not adopted Excel's proffered definition of the disputed terms found in Claims 1 and 6 of the '681 patent, the court is, therefore, obliged to grant Metso summary judgment on Excel's "inoperability" defense. The entirety of that defense hinged on the court inserting the modifier "adequately" into the definitions. As the court declined to do so, there is no basis for the inoperability defense.

However, even if the court had construed the disputed terms in Claims 1 and 6 in the manner sought by Excel, the court would nonetheless be obliged to grant summary judgment to Metso on Excel's "inoperability" defense. To prove its inoperability defense, Excel would have to establish at trial that "each disclosed embodiment in the patents was impossible." EMI Group North America, Inc. v. Cypress Semiconductor Corp., 268 F.3d 1342, 1349 (Fed. Cir. 2001). Simply put, Excel has not proffered any evidence capable of proving (especially clearly and convincingly) that it is impossible for the upper head bushing to "adequately" reduce the rate of rotation of the head of a conical crusher during "no load" operation.

Excel's evidence as to the inoperability of the bushing consists of the testimony of one of Metso's engineers, Mr. Walter Marks, who testified that the upper head bushing "would seem to leave a lot to be desired." (Joint Ex. 65, Marks Dep., 158: 7-13). Mr. Marks said: "Compared to the eccentric speed, the crusher operational speed when it's spinning, it's still moving very fast." (Id.). The only other piece of evidence Excel points to is the fact that Metso eventually added additional anti-spin devices to its MP800 crusher line. (Excel Br. Opp. Mot. S.J. [Dkt. # 299] at 6-8).

The above evidence, drawing all inferences in favor of Excel, would only allow Excel to, at best, prove clearly and convincingly that the upper head bushing is incapable of adequately slowing head rotation during "no load" operation in the MP800, and perhaps in Metso's other commercial embodiments of the '681 patent. However, such a finding would not warrant a finding that Claims 1 and 6 of the '681 patent are inoperable, or that it is impossible for a crusher built according to the '681 patent to utilize an upper head bushing that adequately slows head rotation.

The degree to which the bushing is effective as an anti-spin device undoubtedly depends to some degree on the size and power of the machine in which it is utilized. The fact that the particular commercial embodiments of the '681 patent built by Metso are such that the bushing does not adequately slow head rotation does not mean that the patent itself is inoperable. Patents are held inoperable when the challenged claim is shown to be demonstrably impossible. For example, in EMI Group, the claims recited a "vapor-induced explosion mechanism" which utilized vapor pressure in order to cause a fuse to blow. 268 F.3d at 1349. At trial, an expert testified that, through exhaustive studies, he had determined that "a fuse simply cannot explode due to vapor pressure." Id. The court of appeals thus upheld the trial court's finding that the patent was inoperable. Similarly, in Process Control, the court of appeals found a patent inoperable because a claim in the patent embodied a method that was scientifically unsound because it violated the principle of the conservation of mass. 190 F.3d at 1359. These cases stand in stark contrast to the facts presented in the case before the court.

Excel has not produced any evidence to justify that a reasonable jury could find, by clear and convincing evidence, that the anti-spin apparatus disclosed in the '681 patent is incapable of adequately slowing head rotation during "no load" operation.
Therefore, the court is obliged to find that, even if the disputed terms regarding upper head bushing were construed in the manner advanced by Excel, Excel could still not succeed on its inoperability defense. The court, therefore, awards summary judgment to Metso as to Excel's inoperability defense.

B. Slurry

80. The term "slurry" appears numerous times in the patent claims. During trial, MCI's witnesses testified that this term should be interpreted as being restricted to a "homogeneous slurry." The Court finds no support for such a limitation in the specification, the file history, or the claims of the patent. The patent disclosure calls for mixing feed additives in a liquid carrier to "dilute, disperse and suspend" them. See Col. 1, lines 54-60; Col. 3, lines 44-47. This would seem to disclose to a person of skill in the art that a mixture of additives and carrier is required, not necessarily a uniform or homogeneous mixture.

15. Small Play

The next term for construction is "small play" as used in claims 2 and 11 of the '579 patent. The Plaintiffs contend it would be error to include any specific dimensional requirement in small play. Pergo maintains that small play means an intentional space of at least 0.2 millimeters allowing for free movement, displacement or sliding of joined panels relative to each other along joined edges. (Unilin's Open. Br. 37-38.)

Claim 2 of the '579 patent claims:

The mechanical locking system as claimed in claim 1, wherein when the first and second edges are joined together with the locking device, the first and second panels can be arranged such that a small play exists between the first and second edges.

('579 patent, 11:5-9.) (Emphasis added).

In advocating the inclusion of the minimum space of 0.2 millimeters in the definition of "small play," Pergo relies upon the specification which states:

In order to permit taking up previously laid, joined floor panels in a simple way, a preferred embodiment of the invention is characterised [sic] in that when the groove panel is pressed against the strip panel in the second direction and is turned angularly [sic] away from the strip, the maximum distance between the axis of rotation of the groove panel and the locking surface of the locking groove closest to the joint edges is such that the locking element can leave the locking groove without contacting the locking surface of the locking groove. Such a disassembly can be achieved even if the aforementioned play between the locking groove and the locking surface is not greater than 0.2 mm.

('579 patent, 5:22-33.) (Emphasis added.)

Pergo's interpretation of small play is drawn from the specification. However, the quoted portion of the specification does not include the phrase "small play." When a claim term is expressed in general descriptive words, the term typically will not be limited to a numerical range that may appear in the written description as referring to a preferred embodiment or in other narrower claims.

Mathematical precision should not be imposed for its own sake; a patentee has the right to claim the invention in terms that would be understood by persons of skill in the field of the invention." Modine Mfg. Co. v. U. S. Int'l Trade Comm'n, 75 F.3d 1545, 1551 (Fed. Cir. 1996), abrogated on other grounds, Festo Corp. v. Shoketsu Kinzoku Kogyo Kabushiki Co., Ltd., 234
F.3d 558 (Fed. Cir.) (en banc) rev'd 535 U.S. 722, 122 S. Ct. 1831, 152 L. Ed. 2d 944 (2002). Because 0.2 millimeters is discussed in the specification and it is not discussed in conjunction with "small play," the Court declines to impute a numerical limitation to the term. See Modine Mfg., 75 F.3d at 1551.

"Small" is defined as "having a relatively little size or slight dimension." See Webster's II New Riverside University Dictionary 1097. The Court defines "small play" by pairing its construction of "play" with the ordinary meaning of "small." Thus, "small play" is construed to mean "a relatively little space between the locking surfaces of interlocking panels such that the locking surfaces can be displaced relative to one another in the direction of their joined edges."

B.

The district court construed the term "small volume" to mean a device smaller than the prior art portable telephone dialers. These prior art dialers have a 4.4 cubic inch volume. Innovad, slip op. at 10-11. The specification of the '750 patent does not expressly define "small volume," but does refer to the word "small" in the general sense, i.e., not large. See, e.g., col. 3, l. 8 ("small rectangular case"); col. 2, ll. 20-21 ("two small rectangular sound ports"); col. 5, ll. 41-42 ("small quantities of portable dialer units"). The specification reiterates that the dialer's size affects its function: "The dialer unit has no keypad, it is much smaller than existing repertory dialers and thus more portable and suitable for specialty advertising purposes." Col. 2., ll. 28-31. In other words, the specification provides no specialized meaning for the term "small volume," but relates the term to the dialer's function. Specifically, "small volume" means that the dialer should be comfortably portable. Neither the words of the claim nor its context, however, limit the claimed dialer within the system to a particular volume. Thus, the term "small volume" does not limit the dialer to a particular size as long as it performs its function. The claim term "small volume" does reemphasize, however, that the portable dialer unit does not include a keypad. The specification itself notes that a keypad would inhibit the portability of the hand-held item. Id.

4. "Smooth"

Bridgeport next argues that the steps of the intermediate portion of its connectors preclude a finding that the intermediate portion is "smooth," as required by claims 5 and 9 of Patent '164:

The quick connect fitting of claim 1 wherein said connector has a flange and shoulder with smooth 14 intermediate portion there between with said adaptor carried on said intermediate portion and held in position by said flange and shoulder.

(Doc. 83, Exs. A, B (emphasis added)). "Smooth," according to Webster's Third New International Dictionary, means "having a continuously even surface" or "being without roughness, points, bumps, or ridges." WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 2152. Under this definition, the intermediate portion must have an even surface area, without threading or ridges of any type. This definition is not contradicted elsewhere in the patent documents. To the contrary, the specifications repeatedly illustrate a figure with an intermediate portion that is a perfect cylinder. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995) (en banc) ("Claims must be read in view of the specification ...."), aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996).

---- Footnotes ----

14 In claims 4, 5, and 7 of Patent '050 and in claim 8 of Patent '164, the word "smooth" is either deleted or replaced with "an." (Doc. 83, Exs. A, B).

---- End Footnotes ----
As an alternative to this ordinary meaning, Arlington contends that the patentee expressly defined, in the specifications sections of the patent, "smooth" as merely "unthreaded"—not necessarily completely even. The "operation" passage of the specifications section explains that the purpose of requiring a "smooth central section" is to ensure "good contact" between the adapter and connector. It states that one "embodiment" of the invention "is designed to be used with a number of existing threaded connectors" in "common use in the electrical industry today." (Doc. 83, Exs. A, B). While this language clearly describes a potential embodiment of the invention with an uneven intermediate portion, it does not disavow or disclaim the scope of the claims 5 and 9 of Patent '164, as required to rebut the ordinary and customary meaning of the terms. E-Pass Techs., 343 F.3d at 1368-69.

Design alternatives exist for every invention, and the fact that the inventor chose to illustrate the embodiment of certain claims but not others does not alter the scope of the unillustrated claims. Id. As stated previously, the court should refrain from importing limitations from the specifications into the claims themselves unless the patent clearly expresses such an intent. Id. While several claims of Patent '164 provide for a variation that includes a threaded adapter, these claims refer to a separate embodiment of claim 1, independent from the elements outlined in claims 5 and 9. The limiting adjective "smooth" of claims 5 and 9 neither affects nor is affected by the provisions for a threaded connector in the other claims. The statements on which Arlington bases its arguments, which plainly describe only one possible "embodiment" of the invention, are insufficient to defeat the plain meaning of "smooth." See id. The court will construe "smooth" to mean an even surface area without threading or ridges of any type.

On the basis of this construction, Bridgeport's device, as a matter of law, cannot infringe on claims 5 and 9 of Patent '164. The intermediate portion of the Bridgeport design includes two steps, meaning that the entire portion is not "smooth," as contemplated by the claims of Arlington's patent. Because these steps place Bridgeport's device outside of the language used in the patent claims, Arlington cannot establish literal infringement.

In further defense against summary judgment, Arlington argues that the doctrine of equivalents applies because the steps in Bridgeport's design serve the same function as the completely "smooth" intermediate portion of the Arlington model—i.e., ensuring a satisfactory electrical connection. As discussed previously, although the doctrine of equivalents may permit a finding of infringement by a design otherwise outside the claim language, the doctrine cannot apply if the "theory of equivalence would vitiate a claim limitation." Tronzo, 156 F.3d at 1160 (citing Warner-Jenkinson, 520 U.S. at 29). Regardless of Arlington's assertion of equivalent effect, application of the doctrine in this case would effectively eliminate the term "smooth" from the claim. Indeed, it would permit any series of threading or ridges to be employed in the intermediate portion so long as a good electrical connection was maintained. In fact, other claims of the Arlington patents do omit the term "smooth" to allow for the inclusion of threading on the connectors, suggesting that the inclusion of the term in claims 5 and 9 of Patent '164 was intended to exclude the very types of designs that Arlington now seeks to cover. The doctrine of equivalents cannot be used to vary the ordinary meaning of the claims of a patent, and, as such, has no application here. The court will grant Bridgeport's motion for summary judgment for non-infringement as to claims 5 and 9 of Patent '164.

The court will construe "smoothly" to mean "in a controlled manner."
Snap

The Defendant also seeks a hearing to offer expert testimony regarding the meaning of the term "snap." As an initial matter, the Court notes that nowhere in the Markman decision does the Supreme Court state that courts must hold a pre-trial, or pre-summary judgment, hearing on the issue of claim construction. However, since the Markman decision was handed down, a number of district courts faced with claim construction disputes have held some sort of hearing. See Comark Communications, Inc. v. Harris Corp., 1997 U.S. Dist. LEXIS 2067, 1997 WL 87260 (E.D.Pa., Feb. 24, 1997); Revlon Consumer Prods. Corp. v. L'Oreal S.A., 170 F.R.D. 391 (D.Del., Feb. 12, 1997); Lee's Aquarium and Pet Prods., Inc. v. Snap Edge Corp., 951 F. Supp. 1469 (S.D.Cal. 1997); P.A.T., Co. v. Ultrak, Inc., 948 F. Supp. 1506 (D. Kan. 1996).

A Markman hearing to define the term "snap" would only be necessary if the Court needed expert testimony to interpret the term. Absent a special definition set forth in the patent, terms in a patent are generally interpreted as having their ordinary and customary meaning to persons experienced in the field of invention. Hoechst Celanese Corp. v. BP Chemicals, Ltd., 78 F.3d 1575, 1578 (Fed. Cir.), cert. denied, 136 L. Ed. 2d 198, 117 S. Ct. 275 (1996). When construing terms of a patent, courts must first look to "intrinsic" evidence, which includes the claim itself, the specification, and the prosecution history. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996). If the meaning of a term remains ambiguous after considering the intrinsic evidence in the case then, and only then, the court may consider extrinsic evidence of meaning, such as prior art documents, dictionaries, and expert testimony. Id.

As stated, the parties in this case dispute the meaning of the term "snap" in Plaintiff's '246 patent. Claim one of Plaintiff's '246 patent provides, in its entirety:

What is claimed is:

1. A snap-n-seal connector for mechanically and electrically interconnecting a coaxial cable to an electronic device having a threaded interface connector, the coaxial cable including a center conductor, a dielectric insulator encasing the center conductor, at least one braided shield disposed about the dielectric insulator and a jacket covering the at least one braided shield, comprising:

   connector body means for coaxially receiving the coaxial cable, said connector body means including means for forming a moisture-proof seal between elements of said connector body means, nut member means adapted for rotably engaging the threaded interface connector of the electronic device, and means for mechanically and electrically engaging the at least one braided shield of the coaxial cable; and

   compression sleeve means for snap engaging into said connector body means to mechanically connect the coaxial cable to said connector body means, said compression sleeve means in combination with said connector body means forming a 360 degree uniform compressive moisture-proof seal between said compression sleeve means and the jacket of the coaxial cable, said compression sleeve means including means for forming a 360 degree uniform compressive moisture-proof seal between said compression sleeve means and said connector body means.

Nowhere in this claim, or anywhere else in the '246 patent, is the term "snap" explicitly defined. Rather, the term is used repeatedly to describe the way in which the compression sleeve engages the connector body. For example, the specification states that the "compression sleeve is configured to snap fit into the collar member," and regarding installation the specification states that "insertion force is applied to snap the compression sleeve into final engagement with the connector
body." Also, the record does not reveal any representations to the Patent and Trademark Office regarding the snap feature of this invention during the prosecution of the '246 patent.

Despite its rather common usage, after carefully considering the intrinsic evidence in this case, the Court finds that the exact meaning of the term "snap" is somewhat ambiguous.

However, rather than turning immediately to expert testimony, which the Federal Circuit has stated should be treated with "utmost caution for it is no better than opinion testimony on the meaning of statutory terms," the Court turns first to a dictionary, a source the Federal Circuit considers a more objective and reliable guide than expert testimony. Vitronics Corp., 90 F.3d at 1576, 1585.

When used as a noun, a "snap" is defined as "a catch or fastening that closes or locks with a click," and when used as an adjective, "snap" is defined as "shutting, fastening or otherwise coming together with a click or by means of a device that snaps." Webster's Third New International Dictionary 2155 (1971) ("Webster's Dictionary"). After carefully considering the language used in claim one, the specification, and Webster's Dictionary, the Court finds that the meaning of the term "snap" is the one stated in Webster's Dictionary. Thus, the Court finds that no expert testimony, and hence no Markman hearing, is needed in the instant case, and the Defendant's motion is denied.

The parties seek construction of the phrase "the lid defining a groove about its edge sized to receive and snap over the rim of the main body and form a seal" and have offered the following constructions:

. Plaintiff: The groove defined about the edge of the lid fits over the rim of the main body so that as the rim is received in the groove a portion of at least one of the lid and rim deflects to overcome an interference between them and then rebounds toward its position before deflection to form a closure to resist leakage.

. Defendant: The groove of the lid and the rim of the main body interact in a snap fit having an insertion, deflection and recovery action during assembly, which produces a clicking sound. (Defendant does not attempt to construe the last part of the phrase, "and form a seal.")

1. The parties' disputes

Although the parties seek construction of the entire phrase, their three disagreements focus on the meaning of "snap": (1) whether the "snap" feature described in the claim must create a sound; (2) whether the required snap feature prevents the lid from also having screw-on features; and (3) whether the claim's requirement that the lid form a seal is related to the snap feature.

a. Audible feedback

The parties' primary dispute is whether the "snap" feature described in the claim must create a sound. The parties agree that the snap feature must involve a deflection and recovery action (plaintiff calls it a "rebound") that occurs as the groove of the lid and the rim of the cup first interfere with each other and then pass by the interference as the lid is placed on the cup. According to plaintiff, the recovery that occurs as the interference is passed may occur slowly, while defendant contends that the recovery must occur quickly enough to produce a "clicking sound." I agree with plaintiff on this point.

Defendant can point to no intrinsic evidence that supports its contention that there must be a "clicking sound" as the lid and body are engaged. Where the patent specification refers to the "snap" feature, it does so without elaboration. '784 pat., col.3, Ins. 40-43 ("As shown in the enlarged views of FIGS. 4 and 5, the inner contour of groove 36 and outer contour of cup body rim 38 are selected to provide a slight snap fit of the lid onto the cup body, to provide a secure seal."); id., col. 6, Ins. 66-67 ("As lid 12 is snapped into place . . ."). Nowhere does the specification suggest that the feature must create a noise or even that there is any advantage to creating an audible sound.
Although defendant points to some extrinsic evidence that could support its theory, the weight of the extrinsic evidence suggests otherwise. First, defendant cites several dictionary definitions describing the term "snap" in terms of a sound created when objects make contact, but those definitions relate only to the lay meaning of the term. In some cases, this meaning might be the one that applies to a claim term, but "snap" is not a lay term in this context. As defendant acknowledges, the "snap" described in the term relates to a "snap fit," 784 pat., col. 3, lns. 40-43, and the phrase "snap fit" is one that is given a special, technical meaning, as evidenced by the various technical publications both parties cite describing "snap fit" assemblies.

Regarding the technical meaning of "snap fit," defendant cites two publications purportedly in support of its position, but only one of these suggests that a "snap fit" requires sound feedback. Dominick V. Rosato, The Plastics Engineering, Manufacturing & Data Handbook 864 (2001) (included as exhibit 1 to dkt. # 22) ("In the assembly process, a snap fit undergoes an energy exchange with a click sound."). The other technical reference defendant cites defines a snap fit as "an insertion, deflection and recovery action during assembly." Tim A. Osswald, International Plastics Handbook 500 (2006) (included as exhibit 2 to dkt. # 22). (Defendant suggests that now Osswald has provided deposition testimony supporting defendant's theory. However, Osswald stated only that "typically . . . you hear the snap" during snap fit assembly, not that audible feedback was a necessary feature.)

Moreover, as plaintiff points out, other engineering literature supports the conclusion that audible feedback is an "enhancement" that is not required for a snap fit. Paul R. Bonenberger, The First Snap-Fit Handbook 95-96, 104-105 (2000) (included as exhibit 3 to dkt. # 26) (stating that some sort of feedback is "required" in all snap fit applications, but that such feedback may be tactile, audible or visible); Robert W. Messler Jr., "Integral attachment using snap-fit features," Assembly Automation, Vol. 17, No. 2, 146 (1997) (included as exhibit 4 to dkt. # 32) (describing enhancement features, including audible feedback, as features that "are not essential" to a snap fit).

In sum, no intrinsic evidence suggests that audible feedback is required for the invention, and the extrinsic evidence weighs against reading "snap" as requiring audible feedback. Therefore, I will not read such a limitation into the claim.

b. Screw-on lid

This dispute involves the more general question whether the snap feature required in claim 1 is "incompatible" with a screw-on lid in the sense that no such lid could satisfy the "snap over" requirement. On its face, the claim's requirement that the groove of the lid be "sized to receive and snap over the rim of the main body" seems directed at snap-on lids, as opposed to screw-on lids. However, as I explained above, the phrase requires only that there be a snap fit between the lid and the body, which means the lid and body include features that cause deflection and recovery as the lid is being engaged to the body. Thus, the question must be whether such deflection and recovery assembly features inherent in a "snap fit" are incompatible with screw-on assembly features.

As to that question, defendant cites technical literature stating that "threaded fasteners" are a separate category of fastener from "snap-fit interfaces" and that "experience with threaded fasteners, the most common method of mechanical attachment, is not transferable to designing snap-fit interfaces." Paul R. Bonenberger, The First Snap-Fit Handbook 5. Although this literature suggests that threaded and snap-fit fasteners are different, it does not suggest that they are incompatible. The literature defendant cites is just as silent as the patent specification and claims on the question whether threaded attachments could be used in conjunction with the "snap" assembly described in the claim.

Defendant points out that, although the claims and specification are now silent on "threaded" connections, it was not always so. The prosecution history shows that, as it was filed originally, the specification referred to a separate "threaded connection" embodiment. In particular, it stated that, aside from the "snap connection" it described, "other methods of securing the lid to the body are envisioned. For example, a threaded connection may be provided about the cup rim." File History, dkt. # 23, exh. 4, at 82. The applicants filed an amendment withdrawing several canceled claims and redacting certain language from the specification, including the reference to the "threaded connection." In a remarks section of the amendment, the applicants stated that, aside from withdrawing the claims, they "have also redacted the specification to remove discussion of aspects of the invention not relevant to the claims as now pending."

Defendant suggests that the applicants disclaimed any cup having thread attachments. Far from it. Disclaimer occurs only
when the applicant makes "clear and unmistakable" disavowal of claim coverage during the prosecution of the patent, such as when the applicant characterizes the invention in a certain way to try to overcome rejections based on prior art. Computer Docking Station Corp. v. Dell, Inc., 519 F.3d 1366, 1374 (Fed. Cir. 2008) (citations omitted). No such disavowal occurred here. The applicants' statement that the redacted language was not "relevant" is not an express statement that cups having threaded connections (in addition to a snap feature) are not compatible with the invention covered by the claim language; at most, it was a statement that threaded connections are not necessary for any claim described in the patent, a natural result of the withdrawal of the dependent claim or claims requiring a threaded connection.

Because nothing in the intrinsic or extrinsic evidence supports defendant's contention that the snap feature described in claim 1 is incompatible with threaded connections, I conclude that no such limitation exists.

c. Relationship to sealing requirement

The third disagreement involving the "snap" feature is whether it is related to the "sealing" feature. Plaintiff contends that "it is the snap fit that forms a seal in the claimed cup," dkt. # 31, at 2 n.2, and defendant argues that "these are actually different limitations that are directed to different, unrelated functions," dkt. # 21, at 9. The language to be construed describes a lid sized to do two things ("snap over the rim . . . and form a seal"), but does not specify whether the lid is sized to snap over the rim and thereby form a seal or just sized so that it happens to do two separate things: snap over the rim and form a seal.

The specification answers this question, explaining in the context of describing an embodiment that "the inner contour of the groove 36 and outer contour of cup body rim 38 are selected to provide a slight snap fit of the lid onto the cup body, to provide a secure seal." '784 pat., col. 3, lns. 40-43 (emphasis added). Although defendant may be correct that the general function of a "snap" fit does not necessarily include a requirement that the fit also seal the lid to the body, in this case the intrinsic evidence shows that the "snap" fit in this invention is intended to form the seal disclosed in claim 1. Therefore, I agree with plaintiff that a proper construction should include language that makes it clear that the snap fit serves to seal the lid and body.

2. The court's construction

Having resolved the parties' three discrete disputes, the final question is what to do with the specific language proposed. As to this term, I have decided all three in favor of plaintiff. Defendant identifies no other problem with plaintiff's proposed construction and plaintiff's construction adequately reflects the parties' agreements about the nature of a "snap fit" and the court's conclusions with respect to their disagreements. Therefore, I will adopt plaintiff's proposed construction: "The groove defined about the edge of the lid fits over the rim of the main body so that as the rim is received in the groove a portion of at least one of the lid and rim deflects to overcome an interference between them and then rebounds toward its position before deflection to form a closure to resist leakage."

3 704

13. Snap-Together Coupling -- Snap Action Shifting Them Laterally

The parties also requested that, due to their disagreement, the Court interpret the terms "snap-together coupling" and "snap-action shifting them laterally" in claims 10, 23, and 27 of the '836 patent. Unilin maintains that "snap-together coupling" and "snap-action shifting them laterally" is "a device that serves to connect the ends of adjacent parts or objects by snap-action, which is characterized by a rapid resilient movement towards a geometry, immediately precipitated by the reduction of a resisting force, when the panels are joined by shifting them laterally in a substantially co-planar fashion." (Unilin Open. Br. 26-27.)

Alloc initially proposed its own definition. However, in its response brief, Alloc states that it has no substantial disagreement with Unilin's proposed definition. (Alloc Resp. Mem. 13.)

Claim 10 of the '836 patent uses the term in a representative fashion as follows: "the locking elements of said second pair of opposite side edges provide a snap-together coupling providing a snap-action during the coupling of two panels by shifting them laterally towards each other, said snap action being delivered substantially by said core material." ('836 patent, 17:36-
Unilin's proposed definition is consistent with the use of the terms in the claims and specification. Therefore, the Court defines "snap-together coupling" and "snap-action shifting them laterally" as "a device that serves to connect the ends of adjacent parts or objects by snap-action, which is characterized by a rapid resilient movement towards a geometry, immediately precipitated by the reduction of a resisting force, when the panels are joined by shifting them laterally in a substantially co-planar fashion."

The phrase "snap type elements" is used in claim 31 of the '486 patent as follows: "A floor covering panel according to claim 1, wherein the locking elements are snap type elements that are configured so as to snap together when cooperative locking elements of two identical ones of said panel are coupled together." ('486 patent, 16:42-46.)

Unilin's definition makes the most sense in context of the patent claims and specification. The patent specification focuses on physical action of coupling panels not on sound. The "background of the invention" portion of the patent specification, states:

"couplings are known which allow coupling parts to snap fit into each other, e.g., from the documents WO 94/1628, WO 96/27719 and WO 96/27721. The snapping-together effect obtained with these forms of embodiment, however, does not guarantee a 100-percent optimum counteraction against the development of gaps between the floor panels, more particularly, because in fact well-defined plays have to be provided in order to be sure that the snapping-together is possible." ('486 patent, 1:48-56)(emphasis added.)

A feature of the second preferred embodiment is "the coupling parts have such a shape that two subsequent floor panels can be engaged into each other exclusively by snapping together and/or turning, whereby each subsequent floor panel can be inserted laterally into the previous." ('486 patent, 2:45-49)(emphasis added.) Likewise, the detailed description states: "the coupling parts 4-5 have such a shape that two subsequent floor panels 1 can be engaged into each other solely by snapping-together and/or turning after the coupling parts are partially engaged, whereby each subsequent floor panel 1 can be laterally inserted into the previous." ('486 patent, 5:35-40.)

The foregoing excerpts from the patent specification indicate that snap action relates to the physical assembly of the panels -- not to any sound generated by such assembly. Additionally, inclusion of a statement "when coupling of the panels is competed by lateral, in-plane shifting," in the definition, as suggested by Alloc, is not supported by the specification. Therefore, the Court defines "snap type elements" as "elements that are capable of exhibiting snap action."

The next terms for construction are "snap" and "snaps up" as used in claims 1, 2, 10, 11, 19, 20, 23, 24, 27, 28, 31, 32, 35, 36, 39, and 40 of the '267 patent; in claims 1, 13, 14, 26, 39, and 50 of the '410 patent; and in claim 9 of the '907 patent. Relying on the commonly understood meaning of the words, the Plaintiffs assert that "snaps up" means "fastening or closing with a click in an upward direction." (Pls.' Open. Br. 36.)
Pergo states that "snap" and "snaps up" means that the locking strip first bends downwardly and then returns back fully to its original position. (Unilin's Open. Br. 46.) Pergo relies upon the specification which states: "Laying can also be performed by first placing both the strip panel and the groove panel flat on the subfloor and then joining the panels parallel to their principal planes while bending the strip downwards until the locking element snaps up into the locking groove." ('579 patent 6:1-5.)

Pergo also relies upon a description of a preferred embodiment as follows:

FIGS. 3a-3b show another joining method for mechanically joining together the floor panels of FIGS. 2a-c. The method illustrated in FIGS. 3a-c relies on the fact that the strip 6 is resilient and is especially useful for joining together the short sides of floor panels which have already been joined along one long side as illustrated in FIGS. 2a-c. The method of FIGS. 3a-c is performed by first placing the two panels 1 and 2 flat on the subfloor 12 and then moving them horizontally towards each other according to FIG. 3b. The inclined portion 36 of the locking element 8 then serves as a guide surface which guides the joint edge 4 of the groove panel 2 up on to the upper side 22 of the strip 6. The strip 6 will then be urged downwards while the locking element 8 is sliding on the equalising [sic] surface 42. When the joint edges 3, 4 have been brought into complete engagement with each other horizontally, the locking element 8 will snap into the locking groove 14 (FIG. 3c), thereby providing the same locking as in FIG. 2c.

('579 patent, 9:15-33.) (Emphasis added).

The construction of claim terms begins with the claims. See Phillips, 415 F.3d at 1312. Claim 1(d) of the '267 patent states:

displacing the new one of the panels in its longitudinal direction relative to the first panel towards a final longitudinal position wherein the locking element of one of the short edges of the new one of the panels and the second panel snaps up into the locking groove of the other one of the short edges, whereby the new one of the panels and the second panel are mechanically connected with each other in both in the first direction and in the second direction with respect to the thus-[sic] connected short edges.

('267 patent, 11:24-33.) (Emphasis added).

Claim 39 of the '410 patent states in relevant part:

the first and the second mechanical connections are so constructed as to allow mutual displacement of the panels in the direction of the long edges, the second mechanical connection along the long edges is so constructed as to allow the locking element to leave the locking groove if the panel associated with the locking groove is turned about its long edge angularly away from the strip, and each locking strip at the short edges is flexible and resilient such that two of the floor panels, having already been mechanically joined to a common long edge of a third of the floor panels, can be mechanically joined together at their adjacent short edges by displacing said two panels horizontally towards each other, while resiliently urging the flexible strip at one of said short edges downwards, until said adjacent short edges of the two panels have been brought into complete engagement with each other horizontally and the locking element at said one short edge thereby snaps into the locking groove at the adjacent short edge.

('410 patent, 14:40-59.) (Emphasis added). Snap means "to open or close with a click." Webster's II New Riverside University Dictionary 1100. "Up" means "moving upward." Id. at 1267. These ordinary definitions of the terms in the context of the claims well define the terms. Pergo's proposed definition of the terms as including a "full" return to an original position, is rejected because it adds limitations that are not consistent with the ordinary meaning of the claim terms and the specification. The Court defines "snaps" as "closes with a click" and "snaps up" as "closes with a click in an upward direction."

GO BACK

(11) "Disposed … so as to substantially lessen the foreshortening of said stent upon its expansion." This limitation encompasses an increase in the distance between the longitudinal positions of the ends of the flexible compensating...
members or flexible links that is caused by expansion of the stent by a balloon or other mechanical means.

3708

4. So Dimensioned As to Be Installable Within the Exit Station of the Processing Machine (Claim 1)

Plaintiff argues "so dimensioned as to be installable within the exit station of the processing machine" should be construed as "designed for use in the exit station." Defendant argues "so dimensioned as to be installable within the exit station of the processing machine" should be construed as "specifically designed for use in a claimed exit station."

The Court, for the reasons stated by plaintiff, finds "so dimensioned as to be installable within the exit station of the processing machine" is properly construed as "designed for use in the exit station."

3709

In claim 21, the limitation "providing an implantable prosthesis including a plug formed of a surgical mesh fabric which is compressible from a first configuration which is larger than the defect into a second configuration which approximates the shape of the defect so that the plug securely fits therein and occludes the defect" shall be construed to mean "using a plug formed of surgical mesh that can be compressed from a configuration that is larger than the defect or hole into a second configuration that approximates the shape of the hole, so that the plug fits into and plugs up the hole."

3710

LL. "SOCKET" AND "THE HANDLE PORTION HAVING A SOCKET"

The next claims to construe are "socket" and "the handle portion having a socket," both of which appear in claim 14. These claim terms are clearly related and dependent upon one another, so the Court will construe them together. Plaintiff argues that "socket" means "a cavity," and that having defined "socket," the claim term "the handle portion having a socket" requires no construction. Plaintiff states that its proposed construction of "socket" is based on the ordinary meaning of the claim term. Defendants argue that "socket" means "a receptive space," and "the handle portion having a socket" means "the handle portion having a receptive space." Like Plaintiff, Defendants state that their proposed constructions are based on the claim terms' ordinary meanings. Defendants also assert that their constructions are consistent with inventor testimony.

Both Parties have given the term "socket" what they assert is its "ordinary and customary meaning." Phillips, 415 F.3d at 1312 (internal quotations omitted). The Court agrees that this is a term that has a readily apparent meaning and, therefore, that further examination of intrinsic and extrinsic evidence is not necessary. While either definition would be appropriate, the Court has concluded that Defendants' proposed construction is more helpful than Plaintiff's proposal. Accordingly, the Court will construe the claim term "socket" to mean "a receptive space," and the claim term "the handle portion having a socket" to mean "the handle portion having a receptive space."

3711

4) Having a low effective elastic modulus giving a soft springy feel.

The fourth element of Claim 1 of the '955 patent requires that the frame have a "low effective elastic modulus giving a soft springy feel." Defendants argue that this expression is "non-quantifiable and highly subjective," not otherwise defined in the specification or prosecution history. They contend that since there is no legally acceptable method for interpreting this element, Plaintiffs have failed to show that Defendants' frames satisfy the element. Plaintiffs' expert Professor Beshers testified, however, that effective modulus of elasticity can be determined from stress-strain curves of material determined...
through tensile tests of the sort he in fact conducted upon Defendants' frames. From those tests, he concluded that "the effective elastic modulus [of Defendants' frames] are an order of magnitude that is roughly 10 times smaller than the ordinary elastic modula for metals." He also testified that the low effective elastic modulus is consistent with the "soft, springy feel" of Defendants' frame components. Contrary to Defendants' claim, therefore, the claimed limitation is objective insofar as the low effective elastic modulus is quantifiable.

While it may well be subjective to say that the frame components must feel soft and springy, contrary to Defendants' assertion, courts have in fact interpreted and upheld comparably subjective terms in light of the purpose of the claimed invention. In Bausch & Lomb, Inc. v. Barnes-Hind/Hydrocurve, Inc., for example, the Federal Circuit rejected the district court's holding that defendant's contact lenses were not "smooth." 796 F.2d 443, 450 (Fed. Cir. 1986), cert. denied, 484 U.S. 823, 108 S. Ct. 85, 98 L. Ed. 2d 47 (1987). The district court had relied on electron microscope photographs showing roughness on the lens surface in reaching its conclusion. The Circuit Court reversed, stating "we hold that 'smooth' means smooth enough to serve the inventor's purposes, i.e. not to inflame or irritate the eyelid of the wearer or be perceived by him at all when in place." 796 F.2d at 450; see also Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 858 (Fed. Cir. 1988), cert. denied, 490 U.S. 1068, 104 L. Ed. 2d 634, 109 S. Ct. 2069 (1989) ("The district court properly interpreted the claim in light of the prosecution history in the first trial, defining 'slightly greater' spacing in terms of its purpose . . . .'"). "Soft and springy" is no more elusive a term than those interpreted in Bausch & Lomb and Laitram.

Defendants also argue that "soft springy feel," as understood from Plaintiffs' advertisements and demonstrations, implies that the frame is easily wrapped around one's index finger. Since, according to Defendants, their expert testified it was impossible to wrap the temple of Defendants' frame without damaging one's finger, Defendants maintain their frames do not satisfy the "soft springy feel" element. The purpose of the '955 patent, however, is comfort and durability in a pair of eyeglass frames that exceeds that of conventional frames. Interpreting the "soft springy feel" limitation in light of that purpose and comparing Defendants' frames with conventional metal frames, it is abundantly clear that the NiTi SMA components of Defendants' frames have a much softer and springier feel than the conventional frames and thus possess the characteristics covered by this element of Claim 1.

The plaintiff proposes "the contact lens when hydrated has flexibility, which permits the lens to contour itself to the shape of an eye." The defendants propose "having a Shore D hardness of less than 1." The defendants contend that the patentee defined the term in the prosecution history. In response to a rejection, the applicant stated that "'hard' and 'soft' are not relative terms but are real different words as illustrated below." Patent Appl. 07/132,174, Response to Office Action, March 4, 1989, at 1. In the illustration, the applicant shows that, on a Hardness Scale (Shore D), hard contact lenses are greater than 80 and soft contact lenses are less than 5. Id. It also shows that the range between 5 and 80 is "useless" for both hard and soft lenses. Id. In another response to a rejection, the applicant again illustrated the difference between hard and soft contact lenses, where hard contact lenses had a Hardness (Shore D) of greater than 80 and soft contact lenses were less than 1. Patent Appl. 07/545,205, Response to Office Action, March 21, 1992, at 1.

The plaintiff, on the other hand, argues that these statements were not intended to define "softness," but were used as examples to educate the examiner. See Patent Appl. 07/551,156, Response to Office Action, April 20, 1992, at 13. The plaintiff also argues that there was no clear intent to redefine the ordinary meaning of the terms.

The terms "soft" and "softness" as used in claim 1 convey two different meanings. The Court will first address the construction of "soft." Specifically, the Court will construe the entire phrase "soft gas permeable contact lens." The invention of the '327 patent focuses on improving existing soft contact lenses. '327 patent, 1:14-17. The applicant distinguished prior art related to hard contact lenses by stating that, in the contact lens industry, soft contact lenses have a Hardness (Shore D) of less than five. Patent Appl. 07/132,174, Response to Office Action, March 4, 1989, at 1. The applicant also stated that a major difference between hard and soft contact lenses is that soft contact lenses (including soft gas permeable lenses) have a Hardness (Shore D) of less than one. Patent Appl. 07/545,205, Response to Office Action, March 21, 1992, at 1. One of ordinary skill in the art, therefore, would understand that a soft contact lens has a Hardness (Shore D) no greater than five. There was, however, no clear intent by the applicant to limit soft contact lenses to a Hardness
(Shore D) of less than one. Accordingly, the Court construes "soft gas permeable contact lens" to mean "a contact lens having a Hardness (Shore D) of less than five."

The Court will now address the term "softness." As stated in claim 1, the contact lens is "characterized by . . . softness . . . ." The prior art referenced in the specification characterizes soft contact lenses as those contact lenses that are flexible enough to shape to the contours of the eye. See 4,486,577 patent, 1:36-37; 4,711,943 patent, 3:10-25. The Court construes the term "softness" to mean "having flexibility when hydrated to shape to the contours of the eye."

III. "sufficient temperature to soften," "softened wear layer," and "a softened state"

The phrase "sufficient temperature to soften" is used in claim 1 of the '903 patent to describe the temperature at which the wear layer is reheated prior to being mechanically embossed. '903 12:4-6. Claim 1 of the '903 patent employs the phrase "softened wear layer" and claims 1 and 9 of the '008 patent employ the phrase "a softened state" to describe the state in which the wear layer is in when it is mechanically embossed. This claim language is in dispute and discussed here because it is related.

Mannington argues that the claim language "a sufficient temperature to soften" "means an exposure to a heating source capable of causing the cured wear layer to achieve a sufficient degree of softening to allow it to be mechanically embossed." D.I. 326 at 24-25. Again, Armstrong makes no argument with respect to this phrase since it is found only in the '903 patent. Domco, on the other hand, argues that the phrase "mean[s] that the material of the wear layer is moldable [as a result of heating], i.e., the material would be displaced to take on the pattern and shape of the texture to be imprinted, during a mechanical embossing step." D.I. 142 at 18.

Mannington argues that both "softened wear layer" and "a softened state" should be construed to "mean that the wear layer is in a cured and softened condition . . . before the wear layer is mechanically embossed." D.I. 326 at 25 (emphasis in original). In support, Mannington makes a contextual argument to assert that "those skilled in the art would understand the claims to require the cured wear layer to be in a 'softened state' prior to, rather than during, mechanical embossing." Id. at 26 (emphasis in original). Armstrong argues that the process limitation "a softened state" should not be construed and, in the alternative, asserts that "softened state" means the wear layer is at a temperature range from 240 [degrees] F to 470 [degrees] F. D.I. 324 at 25. Domco argues that "softened wear layer" and "softened state" mean that "the material of the wear layer is moldable, i.e., the material would be displaced to take on the pattern and shape of the texture to be imprinted, during a mechanical embossing step." 1 D.I. 142 at 18.

1 In its Markman brief, Domco groups the phrase "a sufficient temperature to soften" in claim 1 of the '903 patent and the phrase "a softened state" in claims 1 and 9 of the '008 patent into the same passage and makes the same argument as to each expression.

1 - - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

Clearly, the parties' arguments as to the proper construction of the phrase "a sufficient temperature to soften" are similar. This court, therefore, construes the phrase consistent with these arguments to mean that the vinyl surface covering is softened by heating such that it is receptive of embossment by mechanical means. The more poignant question, however, is temporal and relates to the proper construction of the phrases "softened wear layer" and "a softened state." In other words, do these phrases as found in the contested claims mean that the surface covering reaches a softened state as a result of heating prior to reaching the mechanical embossing tool, or are these phrases put forth in the claims such that heating to a softened state can occur nearly simultaneously with mechanical embossing? To answer this question, one must look to the context in which the phrases are used in the claims and then to the remainder of the intrinsic evidence to determine whether the inventors limited the construction of these phrases in any manner.

The expression "softened wear layer" is used generally in claims 1 of the '903 patent to describe the state the cooled and
cured surface covering is in when a "mechanically embossed … surface texture selected from the group consisting of a natural wood, stone, marble, granite, and brick [is embossed] onto said softened wear layer …." As this language reads in the claim, it is not restricted temporally. That is, as the phrase is used in the claim, the surface covering must be in a softened state at least at a finite point in time prior to being imprinted with a surface texture by mechanical means. The '903 specification does not change this reading of the claim and, in fact, supports this understanding by providing that "the wear layer is … subjected to a sufficient temperature for a sufficient time in order to soften the wear layer to a sufficient degree to allow it to be mechanically embossed." '903 at 5:63-66. As it appears in claim 1 of the '903 patent and as this court so construes, therefore, the phrase "softened wear layer" means that the claimed surface covering is in a softened condition after being cured and cooled no later than a finite point in time prior to being imprinted with a surface texture by mechanical means.

--- Footnotes ---

2 Claim 1 of the '903 patent specifies that the surface covering is placed in a softened condition because it is subject to "a sufficient temperature to soften …." '903 at 12:5-6. It follows, therefore, that as used in claim 1 of the '903 patent the surface covering is softened by the application of heat and not by some other mechanism.

--- End Footnotes ---

Claims 1 and 9 of the '008 patent make use of the similar phrase "a softened state," however, absent from the claims is definitive reference to the surface covering being both cured and cooled prior to being softened by the application of heat and then mechanically embossed. Claim 9, though, uses the word "curing" to clarify that the wear layer is applied to the foam layer before it is cured, but use of this word carries no other significance in the claim. '008 12: 13-22. This being so, this broad phrase must be construed to mean that the surface covering is in a soft condition such that it is receptive to imprinting by mechanical means. This court will not conjecture as to whether the inventors intended to draft claims 1 and 9 of the '008 patent such that imprinting by mechanical means occurred after the surface covering was cured and cooled. Had the inventors intended to write their claims accordingly, they could have easily done so. Having failed, however, to specify that the surface covering was cured and cooled before mechanical imprinting, this court will not read a cured and cooled limitation into the phrase "a softened state" as found in claims 1 and 9 of the '008 patent.

3714

Claim 1 of the '502 patent, the only claim at issue in this appeal, reads as follows (with added emphasis on the disputed terms):

1. A method for reflow soldering of surface mounted devices to a printed circuit board comprising:

   moving a printed circuit board having solder and devices disposed on a surface thereof through a first zone and in close proximity to a first emitting surface of at least one nonfocused infrared panel emitter, said first emitting surface being at a first panel temperature;

   moving said board through a second zone and in close proximity to a second emitting surface of at least one nonfocused infrared panel emitter, said second emitting surface being at a second panel temperature lower than said first panel temperature; and

   moving said board through a third zone and in close proximity to a third emitting surface of at least one nonfocused infrared panel emitter, said third emitting surface being at a third panel temperature higher than said second panel temperature, said third emitting surface heating said board and said solder to a solder reflow temperature for a period of time sufficient to cause said solder to reflow and solder said devices to said board while maintaining the temperature of said devices below said solder reflow temperature.

Proceedings Before the District Court

This action was brought on November 26, 1991 by Vitronics against Conceptronic for infringement of both the '502 patent
and U.S. Patent No. 4,833,301 ("the '301 patent"). At the time the suit was filed, Conceptronic was selling the "Mark series" line of ovens. Conceptronic later discontinued the Mark series and began selling the "HVC series" line of ovens. Prior to trial, the parties stipulated that every limitation of claim 1 of the '502 patent was met by the HVC series of ovens, except the limitation requiring the utilization of "nonfocused infrared panel emitters" and the limitation that the temperature of the devices must be maintained below the "solder reflow temperature." 2

--- Footnotes ---

1 A jury returned a verdict of non-infringement of the '301 patent. Vitronics does not appeal that verdict.

2 Whether the Conceptronic ovens utilize nonfocused infrared panel emitters is not before this court.

--- End Footnotes ---

Vitronics, by way of a request for a jury instruction, asked the court to construe the meaning of the "solder reflow temperature" limitation. The specific instruction sought by Vitronics was as follows:

In considering the question of whether the '502 method patent has been infringed by the Mark and HVC Series ovens, you have to decide whether, in use, those ovens maintain the temperature of the devices below the solder reflow temperature. The phrase "solder reflow temperature" in the '502 patent means the temperature reached by the solder during the period it is reflowing during the final stages of the soldering process, sometimes referred to as the "peak solder reflow temperature." It does not mean the "liquidus temperature," the temperature at which the solder first begins to melt. Thus, if the temperature of the devices stays below that of the solder, the '502 method patent is infringed by the Mark and HVC Series ovens.

Thus, Vitronics contended that, as used in the claim, solder reflow temperature means peak reflow temperature, i.e., a temperature approximately 20 degrees C above the liquidus temperature, at which the solder is completely melted and moves freely. Conceptronic, on the other hand, contended that solder reflow temperature means 183 degrees C, i.e., the liquidus temperature of a particular type of solder known as 63/37 (Sn/Pb) solder. 3

--- Footnotes ---

3 The specification of the '502 patent describes three exemplary types of solder which can be used in the solder reflow process -- 60/40 (Sn/Pb), 63/37 (Sn/Pb) and 62/36/2 (Sn/Pb/Ag) -- each of which, it indicates, has a liquidus temperature of about 190 degrees C and a peak reflow temperature of about 210 degrees to 218 degrees C. At trial, the parties appear to have discussed only 63/37 (Sn/Pb) solder, which has a liquidus temperature of 183 degrees C. However, the claims are not limited to that particular solder or a solder with that particular liquidus temperature.

--- End Footnotes ---

The district court delayed construing the disputed language until the close of testimony, at which time it ruled in favor of Conceptronic and concluded that the term "solder reflow temperature" as used in claim 1 refers to 183 degrees C. Vitronics then conceded that the court was required to grant judgment as a matter of law in favor of Conceptronic, as Vitronics had not presented any evidence of infringement under the court's interpretation of solder reflow temperature. This appeal followed.

Claim Construction Aids Before the District Court

In spite of Vitronics' early request for a jury instruction on the proper claim construction, the district court delayed announcing its claim construction until hearing all the evidence put forth at trial. During trial, and in their briefs to the district court in support of their respective claim constructions, the parties discussed the patent specification, expert testimony, prior testimony and writings of Vitronics and its employees, and technical references. The most pertinent materials are discussed below.

The Patent Specification
Vitronics relied heavily upon the patent itself to support its asserted claim construction. Although Vitronics conceded that the term "solder reflow temperature" may be ambiguous when considered in isolation, it argued that the specification clearly shows that, as used in the claim, solder reflow temperature means peak reflow temperature rather than the liquidus temperature. In particular, Vitronics pointed to that part of the specification that describes a preferred embodiment:

A preferred embodiment of the invention for reflow soldering of surface mounted devices to printed circuit boards will now be described. The printed circuit boards are typically made of epoxy-glass, such as fire retardant 4(FR-4), or polyamide glass. These boards typically degrade above temperatures of 225 degrees C. The solder may be, for example, 60/40 (Sn/Pb), 63/37 (Sn/Pb), or 62/36/2 (Sn/Pb/Ag), all of which have a liquidus temperature (i.e. begin to melt) of about 190 degrees C. and a peak reflow temperature of about 210 degrees -218 degrees C. Thus, to effect reflow soldering without damaging the board, the solder must be allowed to reach a temperature of at least 210 degrees C., but the board cannot reach a temperature of 225 degrees C.

Vitronics pointed out that, in the example described as the preferred embodiment, the temperature of the solder is raised to 210 degrees C, the peak reflow temperature, and the temperature of the devices is raised to 195 degrees C, 5 degrees above the 190 degrees C liquidus temperature. Thus, as argued by Vitronics, the term "solder reflow temperature" must be construed so that it refers to the peak reflow temperature because the claim requires that the temperature of the devices be maintained below "said solder reflow temperature"; if solder reflow temperature were construed to refer to liquidus temperature, the preferred embodiment would not be covered by the patent claims.

Expert Testimony

Conceptronic relied heavily on the expert testimony of Dr. Rothe. Dr. Rothe testified that the meaning of the term "solder reflow temperature" in claim 1 is synonymous with liquidus temperature. Dr. Rothe further testified that the solder reflow temperature for 63/37 (Sn/Pb) is 183 degrees C. Dr. Rothe likewise testified at trial that several technical articles written by those skilled in the art supported his view that solder reflow temperature refers to liquidus temperature.

The Testimony of Mr. Hall

Conceptronic also relied on the testimony of Mr. Hall, the Chief Engineer at Vitronics. At trial, Mr. Hall confirmed that during his deposition he had testified that the reflow temperature of solder was 183 degrees C. Mr. Hall also testified that, during his deposition, he had used solder reflow temperature to refer to liquidus temperature. However, at another point in his trial testimony, Hall explained that, while in his earlier deposition testimony he had used solder reflow temperature to refer to liquidus temperature, he did not suggest that was how the term was used in the patent. Rather, Hall testified the patent uses the term to refer to the peak reflow temperature.

Paper Written By Former Vitronics Employee

Conceptronic also introduced into evidence a paper written by Phillip Zarrow, a former employee of Vitronics, defining solder reflow temperature in the following manner: "As the temperature of the solder paste on the interconnect passes the solder alloy's melting point and the solder enters a molten state, the assembly enters the reflow region of the process. For 63 Sn/37 Pb, a eutectic solder and the most common SMT alloy, reflow occurs at 183 degrees C." Phillip Zarrow, Convection/Infrared and Convection Dominant Reflow Soldering of Fine Pitch SMT Devices, § 10.3.3 (1994). However, that same paper later describes the solder reflow process as taking the temperature of the solder above liquidus: "Most solder manufacturers recommend bringing the interconnection temperature approximately 15 to 25 degrees C above the alloy melting point to achieve full liquidus and assure good solder flow and aid fillet formation." Id.
Memorandum of Plaintiff Vitronics Corporation in Opposition to Motion for Summary Judgment of Defendant Conceptronic Corporation and In Support of Plaintiff's Cross-Motion for Summary Judgment of Patent Validity and Infringement

In its brief supporting its proposed construction of claim 1, both at the trial court level and here on appeal, Conceptronic similarly relied on a memorandum written by Vitronics which contains the following language: "Tin/lead solders commonly used by the electronic products industry have a 'liquidus' or 'reflow' temperature in the order of 183 degrees C, or about 361 degrees F." However, this phrase is in the background section of the memorandum and later in the same memorandum, Vitronics discussed the issue of infringement as being whether the temperature of the devices was maintained below "the temperatures of the leads at which the solder is reflowing."

Without indicating which evidence it relied upon, the district court simply ruled that solder reflow temperature meant 183 degrees C.

ANALYSIS
The Use of Intrinsic and Extrinsic Evidence in Claim Construction

A literal patent infringement analysis involves two steps: the proper construction of the asserted claim and a determination as to whether the accused method or product infringes the asserted claim as properly construed. Markman v. Westview Instruments, Inc., 52 F.3d 967, 976, 34 USPQ2d 1321, 1326 (Fed. Cir. 1995) (in banc), aff'd, U.S., 116 S. Ct. 1384, 1393 (1996); Hormone Research Found., Inc. v. Genentech, Inc., 904 F.2d 1558, 1562, 15 USPQ2d 1039, 1042 (Fed. Cir. 1990), cert. dismissed, 499 U.S. 955 (1991). The first step, claim construction, is a matter of law, which we review de novo. Markman, 52 F.3d at 979, 34 USPQ2d at 1329. Claim construction is the only step in the infringement analysis at issue in this appeal. 4

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

4 No assertion was made that defendant infringed under the doctrine of equivalents.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

In determining the proper construction of a claim, the court has numerous sources that it may properly utilize for guidance. These sources have been detailed in our previous opinions, as discussed below, and include both intrinsic evidence (e.g., the patent specification and file history) and extrinsic evidence (e.g., expert testimony).

It is well-settled that, in interpreting an asserted claim, the court should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history. See Markman, 52 F.3d at 979, 34 USPQ2d at 1329. Such intrinsic evidence is the most significant source of the legally operative meaning of disputed claim language.

First, we look to the words of the claims themselves, both asserted and nonasserted, to define the scope of the patented invention. See Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 620, 34 USPQ2d 1816, 1819 (Fed. Cir. 1995). Although words in a claim are generally given their ordinary and customary meaning, a patentee may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning, as long as the special definition of the term is clearly stated in the patent specification or file history. Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578, 38 USPQ2d 1126, 1129 (Fed. Cir. 1996) ("A technical term used in a patent document is interpreted as having the meaning that it would be given by persons experienced in the field of the invention, unless it is apparent from the patent and the prosecution history that the inventor used the term with a different meaning.") (citations omitted); Hormone, 904 F.2d at 1563, 15 USPQ2d at 1043 ("It is a well-established axiom in patent law that a patentee is free to be his or her own lexicographer and thus may use terms in a manner contrary to or inconsistent with one or more of their ordinary meanings.") (citations omitted).

Thus, second, it is always necessary to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning. The specification acts as a dictionary when it expressly defines terms used
The District Court's Reliance on Extrinsic Evidence

The proper construction of the claim term "solder reflow temperature" as set forth above, the meaning of the disputed term "solder reflow temperature" in claim 1 of the '502 patent is clear from a reading of the claim itself and the patent specification. The "peak reflow temperature" and "liquidus temperature" are clearly defined in the specification as having distinctly different meanings. Specifically, for the solders described in the specification, liquidus temperature is about 190 degrees C and the peak reflow temperature is about 210 degrees to 218 degrees C. Moreover, in the preferred embodiment described in the patent, the solder is heated to a temperature of 210 degrees C but the temperature of the devices is maintained at approximately 195 degrees C, i.e., below the peak reflow temperature (210 degrees C) but above the liquidus temperature (190 degrees C). Therefore, in order to be consistent with the specification and preferred embodiment described therein, claim 1 must be construed such that the term "solder reflow temperature" means the peak reflow temperature, rather than the liquidus temperature. Indeed, if "solder reflow temperature" were defined to mean liquidus temperature, a preferred (and indeed only) embodiment in the specification would not fall within the scope of the patent claim. Such an interpretation is rarely, if ever, correct and would require highly persuasive evidentiary support, which is wholly absent in this case. See Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1550, 37 USPQ2d 1609, 1612 (Fed. Cir. 1996); see also Hoechst, 78 F.3d at 1581, 38 USPQ2d at 1130 ("We share the district court's view that it is unlikely that an inventor would define the invention in a way that excluded the preferred embodiment, or that persons of skill in this field would read the specification in such a way.").
Since the claim, read in light of the patent specification, clearly uses the term "solder reflow temperature" to mean the peak reflow temperature, rather than the liquidus temperature, that should have been the end of the trial court's analysis. 5 Only if there were still some genuine ambiguity in the claims, after consideration of all available intrinsic evidence, should the trial court have resorted to extrinsic evidence, such as expert testimony, in order to construe claim 1. Moreover, even if the judge permissibly decided to hear all the possible evidence before construing the claim, the expert testimony, which was inconsistent with the specification and file history, should have been accorded no weight. Southwall, 54 F.3d at 1578, 34 USPQ2d at 1678; Markman, 52 F.3d at 983, 34 USPQ2d at 1333.

The file history was apparently not put into evidence.

5 Although technical treatises and dictionaries fall within the category of extrinsic evidence, as they do not form a part of an integrated patent document, they are worthy of special note. Judges are free to consult such resources at any time in order to better understand the underlying technology and to construe the claims. See Markman, 52 F.3d at 979, 34 USPQ2d at 1329. Extrinsic evidence is that evidence which is external to the patent and file history, such as expert testimony, inventor testimony, dictionaries, and technical treatises and articles. 6 Id. at 980, 34 USPQ2d at 1330. However, as we have recently re-emphasized, extrinsic evidence in general, and expert testimony in particular, may be used only to help the court come to the proper understanding of the claims; it may not be used to vary or contradict the claim language. Id. at 981, 34 USPQ2d at 1331. Nor may it contradict the import of other parts of the specification. Indeed, where the patent documents are unambiguous, expert testimony regarding the meaning of a claim is entitled to no weight. Southwall, 54 F.3d at 1578, 34 USPQ2d at 1678. "Any other rule would be unfair to competitors who must be able to rely on the patent documents themselves, without consideration of expert opinion that then does not even exist, in ascertaining the scope of a patentee's right to exclude." Id. at 1578, 34 USPQ2d at 1678-79. Nor may the inventor's subjective intent as to claim scope, when unexpressed in the patent documents, have any effect. Such testimony cannot guide the court to a proper interpretation when the patent documents themselves do so clearly.

In addition, a court in its discretion may admit and rely on prior art proffered by one of the parties, whether or not cited in the specification or the file history. This prior art can often help to demonstrate how a disputed term is used by those skilled in the art. Such art may make it unnecessary to rely on expert testimony and may save much trial time. As compared to expert testimony, which often only indicates what a particular expert believes a term means, prior art references may also be more indicative of what all those skilled in the art generally believe a certain term means. Once again, however, reliance on such evidence is unnecessary, and indeed improper, when the disputed terms can be understood from a careful reading of the public record. See Kearns v. Chrysler Corp., 32 F.3d 1541, 1547, 31 USPQ2d 1746, 1750 (Fed. Cir. 1994). Nor may it be used to vary claim terms from how they are defined, even implicitly, in the specification or file history.

Unfortunately, here the trial judge did use the extrinsic evidence to vary or contradict the manifest meaning of the claims. The trial judge was presented with expert testimony and other evidence that some of those skilled in the relevant art, including certain Vitronics employees, sometimes used the term "solder reflow temperature" and "liquidus temperature" interchangeably. He apparently relied on this testimony in reaching his conclusion that, as used in claim 1, solder reflow temperature meant 183 degrees C. However, regardless of how those skilled in the art would interpret a term in other
situations, where those of ordinary skill, on a reading of the patent documents, would conclude that the documents preclude
the term being given the meaning propounded by the expert witnesses, we must give it the meaning indicated by the
patentee in the patent claim, specification and file history. Thus, expert testimony tending to show that those skilled in the
art would, in certain circumstances, understand "solder reflow temperature" to mean the solder liquidus temperature is
entitled to no weight in light of the clear contrary meaning shown in the specification. See Southwall, 54 F.3d at 1578, 34
USPQ2d at 1678 ("Even if Southwall could show that 'sputter-deposited dielectric' has a meaning to one skilled in the art
different from the definition in the '745 specification and file history, the definition in the patent documents controls the
claim interpretation."). Because the specification clearly and unambiguously defined the disputed term in the claim, reliance
on this extrinsic evidence was unnecessary and, hence, legally incorrect.

7 Although the trial judge's reasoning does not appear in the record, he must have relied on the testimony presented by
Conceptronic that "solder reflow temperature" and "liquidus temperature" were synonymous and the undisputed testimony
that the liquidus temperature of 63/37 (Sn/Pb) solder is 183 degrees C.

Had the district court relied on the expert testimony and other extrinsic evidence solely to help it understand the underlying
technology, we could not say the district court was in error. But testimony on the technology is far different from other
expert testimony, whether it be of an attorney, a technical expert, or the inventor, on the proper construction of a disputed
claim term, relied on by the district court in this case. The latter kind of testimony may only be relied upon if the patent
documents, taken as a whole, are insufficient to enable the court to construe disputed claim terms. Such instances will
rarely, if ever, occur. Indeed, this case did not present such an instance. Even in those rare instances, prior art documents and
dictionaries, although to a lesser extent, are more objective and reliable guides. Unlike expert testimony, these sources are
accessible to the public in advance of litigation. They are to be preferred over opinion testimony, whether by an attorney or
artisan in the field of technology to which the patent is directed. Indeed, opinion testimony on claim construction should be
treated with the utmost caution, for it is no better than opinion testimony on the meaning of statutory terms. See Markman,
52 F.3d at 983, 34 USPQ2d at 1332-33 ("First, the testimony of Markman and his patent attorney on the proper construction
of the claims is entitled to no deference. . . . This testimony about construction, however, amounts to no more than legal
opinion -- it is precisely the process of construction that the court must undertake.").

3715

1. "Sole"

The definition of "sole," as used in the'446 and '026 patents is material for two reasons. First, Nike alleges that it could not
have infringed Plaintiff's patents because the CPR Wood does not meet the "sole width" limitation in each patent. Secondly,
and relatedly, Nike maintains that the CPR Wood does not meet the "ratio of the sole plate to the sole" limitation in the
patents. To address these issues, the Court must construe the meaning of "sole."

The American Heritage Dictionary of the English Language gives the following relevant definitions for the word "sole:"

1. The part on which something else rests while in a vertical position, especially:

a. The bottom surface of a plow.

b. The bottom surface of the head of a golf club.

American Heritage Dictionary of the English Language 1654 (4th ed. 2000). Possibly helpful is one of the definitions of the
verb "soling," which is "To put the sole of (a golf club) on the ground, as in preparing to make a stroke." (Id.) Therefore,
contact between the ground and a bottom surface of a club head appears to be a fundamental aspect of a "sole." Nike's
suggests that the proper construction of "sole" is that the "golf club must have distinguishable portion on the bottom of the
club head that is designed to contact the ground as the club lies at rest and that has a width between .48 and 1.52." (D.E. 23
at 6 (emphases added).) Nike argues that the "designed to" language is present in the patent itself, under the description of Wedgewood's preferred embodiment of the invention. (Id. at 6 (citing D.E. 20, Ex. A, Col. 4:29-31 ("The sole is the portion of the sole plate which is designed to contact the ground as the club lies at rest.").) Nike further claims the "designed to" language is necessary to provide predictability and certainty to the definition, since without that language, what constitutes the sole would change depending on how the club was held and upon which surface it rested. (Id. at 9.) Nike's added "distinguishable" language is designed to provide additional certainty by separating the sole from the sole plate. (Id. at 6.)

Wedgewood's proposed construction is that "sole" should be interpreted to mean "the portion of the sole plate which contacts the ground as the club head lies at rest." (D.E. 26 at 3.) Wedgewood rejects the significance of any difference between what a claim is designed to do and what it actually does and what type of "ground" the club is resting on (since "ground," in Wedgewood's view, means a "flat, planar surface"). (Id. at 4.) Moreover, Wedgewood argues that the "designed to" language in its specification, as highlighted by Nike, should be read as simply another way to write "contacts the ground," since other portions of the specification state that the sole "contacts the ground," without inclusion of the "designed to" language. (Id. at 6.) Wedgewood also responds that because "distinguishable" is not in any claim, its inclusion would amount to a wrongfully-added limitation. (Id.)

a. Intrinsic Evidence

i. Words of the Claims

The relevant claims in the '446 and '026 patents do not expressly define the term "sole," other than to state, in relevant part, that it "rests on ground as the club head lies at rest." (D.E. 20, Ex. A, Cot. 7:24-25.) Neither the claims' actual language nor the ordinary definition of the word "sole" makes any mention of the sole being distinguishable or designed to contact the ground (as opposed to merely actually touching the ground). It remains to be seen if the patentee's use of the term is consistent with the general meaning, or if Plaintiff limited the meaning in the specification or prosecution history.

ii. Specification

The specification is often the "single best guide to the meaning of a disputed term." Vitronics, Corp., 90 F.3d at 1582. It acts as a sort-of dictionary, explaining the definition and often defining terms used in the claim. See Markman, 517 U.S. at 373. However, limitations may not appear in the specification only, since "interpreting what is meant by a word in a claim is not to be confused with adding an extraneous limitation appearing in the specification, which is improper." Intervet Am., Inc. v. Kee-Vet Labs., Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989); see also Oakwood Labs., L.L.C., 2003 U.S. Dist. LEXIS 7476, 2003 WL 2101 1785, at * 5. Rather, a specification "using words or expressions of manifest exclusion or restriction" must represent a "clear disavowal of the claim scope" to be effective. Teleflex, Inc. v. Ficosa North America Corp., 299 F.3d 1313, 1327 (Fed. Cir. 2002). To avoid a situation where the specification "trumps" the claim language in construing the claim, the Federal Circuit has cautioned the courts:

Consulting the written description and prosecution history as a threshold step in the claim construction process, before any effort is made to discern the ordinary and customary meanings attributed to the words themselves, invites a violation of our precedent counseling against importing limitations into the claims. For example, if an invention is disclosed in the written description in only one exemplary form or in only one embodiment, the risk of starting with the intrinsic record is that the claim terms be limited to that single form or embodiment. Indeed, one can easily be misled to believe that this is precisely what our precedent requires when it informs that disputed claim terms should be construed in light of the intrinsic record. But if the meaning of the words themselves would not have been understood to persons of skill in the art to be limited only to the examples or embodiments described in the specification, reading the words in such a confined way would mandate the wrong result and would violate our proscription of not reading limitations from the specification into the claims.

Texas Digital Sys., Inc., 308 F.3d at 1204-05 (emphasis added).

At one point the specification states that the "sole is the portion of the sole plate which is designed to contact the ground as the club lies at rest." (D.E. 20, Ex. A, Col. 4:29-32.) At another, however, the "designed to" language is not present, (e.g. Id., Ex. A, Col. 1:29-31.) In fact, there is no other place in the entire patent where Wedgewood uses "designed to" in terms of its discussion of the club head and contact with the ground. Thus, the Texas Digital Systems warning might be apt. However,
the concern underlying the Texas Digital Systems decision is not in place in the instant case. It is apparent that the absence of the "designed to" language in much of the patent is not the result of a conscious decision to avoid the language. Instead, the "designed to" language is implicit in the parts of the intrinsic record that leave it out due to its obviousness. It goes without saying that the club must be designed to, or intended to, contact the ground as the club lies at rest--if, as is the case, the club ordinarily "contacts" the ground as the club lies at rest when it is properly held and handled for striking a golf ball. The patent itself says as much by virtue of the fact that the patent includes claims about the sole contacting the ground. Patents, by definition, are based on what that invention is designed to do, not for any conceivable use (or misuse) of that particular invention. Wedgewood itself recognizes as much, when it maintains that there is no difference between what a club is designed to do, and what it actually does. (D.E. 26 at 4.)

Thus, the Court rejects Wedgewood's contention that it is inappropriate to include the concept "designed to" when interpreting the Wedgewood patents at issue. As Nike explains, if one fails to incorporate some notion of "designed to" into the definition of the patent, there would be grave potential for indeterminacy in the patent, both as to what constitutes the "sole," but also as to what constitutes the ratio of the "sole plate" to the "sole," which is another critical aspect of the patent.

If the "designed to" concept were not included, analysis of what it means to "contact" the ground and what part(s) of the club head contact the ground would vary wildly and could be manipulated so as to affect the patent infringement analysis. For example, if the "sole" was just the portion of the club that actually touched the ground--irrespective of club design and whether the golf club is properly held and aligned to strike a golf ball--one could manipulate the "sole," for example, by simply pushing downward excessively on the club shaft so as to create an enlarged "sole." One could also manipulate the size of the "sole" by holding the club at improper angles to the ground, so that the "sole" would shrink as the club was artificially brought towards or pushed away from the golfer's body. The same result would be achieved by allowing a golfer who was too short for the club, or too tall to properly use the club, to attempt to square off to hit a shot.

One cannot have a construction that could be manipulated through the simple expedient of pressing harder on a club (and thus creating a greater "sole" and smaller "soleplate-to-sole" ratio). Nor can one have a claim construction that will vary depending on the particular angle at which any given golfer (or competing inventor) uses (or purposefully misuses) a club. To have an accurate measurement of the sole, that measurement must be consistent and identifiable. Since the sole must be "designed to" contact the ground while at rest, lest the measurements be inconsistent and the soleplate-to-sole ratio limitation be meaningless (since the sole width would be indeterminate), the "designed to" language cannot be a limitation, but rather is a mere clarification. Therefore, it is proper to hold that the sole is that part of the club that is designed to contact the ground.

The Court also agrees with Nike that the sole must be a "distinguishable portion" of the sole plate. It is clear from the specification that the bottom of the club head is comprised of a sole plate and a sole. (Id. at 8.) To be able to calculate a ratio between the width of the sole plate and the width of the sole, the two must be able to be separately calculated.

The specification indicates that the sole is contained within the sole plate and is only a portion of the sole plate. (D.E. 20, Ex. A, Col. 4:29.) The specification goes on to point out that while the sole rests on the ground, that part of the sole plate attached to the heel and toe of the club remains off the ground, such that it is the sole portion of the sole plate that generally creates a divot (by contacting the ground) during a golf swing. (Id., Ex. A, Col. 4:40-45.) In fact, the drawings attached to the patent indicate that the sole (numbered 32) is identifiable and separate from the sole plate (numbered 30). (Id., Ex. A at 4 (Fig. 5).) Even the abstract notes that "the sole plate comprises the sole which contacts the ground as the club head lies at rest..." (Id., Ex. A at 1.) By this statement, Plaintiff's patent seems to indicate that while the rest of the sole plate does not touch the ground, the sole is markedly different in that it does contact the ground.

Plaintiff maintains that requiring the sole to be a "distinguishable portion" of the sole plate would amount to importing a limitation into the claims. However, given the discussion of ratios in a variety of claims and the various distinctions in the intrinsic record between the sole and the rest of the sole plate, the Court does not see how the "distinguishable" language is a limitation. In the absence of an ability to distinguish what is the "sole" from the rest of the "sole plate," one could not coherently discuss the ratio of the soleplate to the sole as the patent specifically contemplates and incorporates. In this respect, the "distinguishable" language dovetails nicely with the "designed to" language.

Nonetheless, as explained further below, the Court finds that Nike's proposed method of ascertaining that "distinguishable portion" of the sole plate--which approach appears to require a separately delineated or demarcated subsurface either on the
sole plate or extending from it in order to qualify as the "sole" 8--is not the approach that is most consistent with the terms of the patent as they would be understood to those in the industry. Although neither party fully explores the "distinguishable portion" concept in its briefs, both Nike and Wedgewood appear to understand Nike's position as one requiring that the sole be an "extension from the bottom of the club" (D.E. 26 at 6), or at least to be some separately engineered and demarcated subsurface on the bottom of the sole. As Wedgewood explains, there is nothing in the text of the patent's language that requires or suggests such a limitation. In addition, Figures 5 through 9, included within the '446 and '026 patents, do not appear to suggest, much less require, a separately demarcated section on the sole plate face. (D.E. 20, Ex. A, at 4-6.) Moreover, although the problems of indeterminacy that Nike identifies would be intractable if there were no way to determine what distinguishable portion of the "sole plate" is actually the "sole," there is a manner of addressing that concern suggested by the arguments of the parties that does not require introducing the idea that the "sole" is a separate demarcated subcomponent of the sole plate or is an extension thereto.

8 See generally D.E. 23 at 10 (Nike asserting that "the 'sole' on the NIKE CPR Wood golf club . . . is the ornamental portion of the NIKE CPR WOOD golf club with the NIKE logo and border around it."); id. at 11 (Nike photo); D.E. 26 at 6 (discussing Nike interrogatory answer describing the "distinguishable portion" as an "extension from the bottom of the club . . . .").

Instead, as one of Nike's own exhibits states, the sole is "the bottom of a wood or iron head that would normally touch the ground." (D.E. 20, DXL, at 225 (emphasis added).) This notion of "normalcy" suggested by Nike's exhibit is more consistent with a recognition that a golf club will, if used properly, be held at a particular angle and rest in a particular manner against the ground. Such an approach also appears to comport with the understanding of both parties' experts. Plaintiff's expert spoke of "the appropriate lie angle" for testing the club and its resting point on the ground (D.E. 27 (Pl. Resp. to Def.'s SF), Ex. A (Aldrich Decl.) P 13), which angle Dr. Aldrich calculated to be 63 degrees for the Nike CPR wood. (Id. PP 13-16) Dr. Aldrich, Plaintiff's expert, also explained that he determined the "proper playing of angle of 63 degrees" with a "Mitchell Angle Machine" (id. P 14), which Wedgewood acknowledges to be a "standard piece of equipment in the club-making industry." (D.E. 38 at 6; see also D.E. 31 (Def. Resp. to Pl.'s SF) P 25 (parties agree that the "correct lie angle for the 26 degree CPR Wood is 62 degrees, +/- 1 degree"); P 26 (parties agree that the lie angle of a golf club "is a standard industry measurement"); P 18 (Defendant not disputing Plaintiff's factual assertion that the "lie angle refers to the natural position of a golf club where the club is not rocked forward on its toe or rearward on its heel").) Dr. Long, Nike's expert, similarly acknowledged the determinacy of the notion of the "standard lie angle" of a golf club. See D.E. 27, Pl. Ex. B (Long. Dep.) at 59 (Q: "So a standard lie angle --or a lie angle is a standard measurement in the club making industry, correct?" A: "That's correct."); id. at 60 (Q: "The lie angle refers to a natural position where the club is not up on its toe or on its heel, correct?" A: "That's correct."). Given that the intrinsic record does not support the idea that a "sole" must be a separately delineated or demarcated subsurface either on the sole plate or extending from it to qualify as a "sole," and given that the parties and their experts agree that a "standard lie angle" can be ascertained in the golf club industry within a specificity of plus or minus a single degree, employing the concept of "standard lie angle" seems much more reasonable and consistent with the intrinsic record and the expert testimony than importing in an entirely new limitation.

The only remaining aspect to the determinacy problem is, as Nike points out, whether the standard lie angle approach is rendered meaningless because of the fact that sometimes on a golf course there are different types of terrain. (See D.E. 23 at 9.) To be sure, this is a non-frivolous issue. However, the Court finds persuasive the solution suggested by Wedgewood--namely, that one should interpret the term "ground" in the patent's language to mean a "flat, planar surface." (See, e.g., D.E. 26 at 4.) Such an approach is also consistent with Nike's Exhibit L (the book, "Golf Club Design, Fitting, Alteration and Repair" by Ralph Maltby (4th Ed. 1995), at 225), which discusses the sole in terms of the portion of the bottom of a club that "would normally touch the ground." (Id.) Given the choice between: (1) importing a concept into the patent's meaning that appears nowhere in the text of the intrinsic record or in the accompanying drawings (namely, as Nike suggests, the notion that there must be a separately delineated or demarcated subsurface either on the sole plate or extending from it in order to qualify as the "sole"), or (2) requiring that measurements about the "sole" be made in relation to the "ground" being a "flat, planar surface" (an orthodox understanding of the term that comports with the idea of a "normal" situation in striking a golf ball), the Court considers the second course to be the one most consistent with the intrinsic record in this case and the
testimony of the parties' experts. Wedgewood, through its proffered evidence in the form of the Aldrich analyses, would not appear to be in any position to object to such a definition for "ground" in the patent. (See D.E. 27, Pl. Ex. A (Aldrich Decl.) at 3, PP 11 ("In order to make accurate measurements on the sole portion of the club at rest, the term ground is taken to be a rigid, flat surface. Any other interpretation of 'ground' would lead to erroneous measurements that could not be widely practiced by those skilled in the art.").) The approach also is consistent with the manner in which Nike's expert conducted at least some of his own testing (see, e.g., D.E. 27, Pl. Ex. B (Long Dep.) at 51 (Q. "Well, if you were talking about measurements, would you assume ground means a hard surface?" A. "I think, generally, if I were measuring a club in the laboratory, I would be using a hard, flat plate."); id. at 51 (Q. "So is it fair to say when you use 'ground' in that figure, you're using it synonymously with a flat plate?" A. "Yes.").)--although to be entirely fair to Nike, it and its expert have always raised the issue about how there is tall grass and sand on a golf course and not only flat surfaces. 9 Furthermore, when Wedgewood chose to discuss terrain that was not flat, such as in the Summary of the Invention, it did not use the term "ground" but instead specifically described the terrain's consistency and characteristics. (See, e.g., D.E. 20, Ex. 1, Col. 1:38-42 ("The golf club of the present invention is also especially useful in certain situations, including, for example, hitting a golf ball out of a difficult lie (such as from the rough or from a fairway bunker) . . . ."), Col. 4:45-47 (discussing "longer grass"), 4:54-57 (same); accord id., Ex. C, Col. 1:43-47; id., Col. 4:48-50; id., Col. 4:56-59.)

9 Nike also suggests, through its expert, for example, (see D.E. 27, Pl. Ex. B (Long Dep.), at 51), that one must consider the fact that a club often is designed with the intent that the club create a divot when it is used, and that this precludes use of a definition of the ground as a flat, planar surface. But even if a club is intended to often create a divot, indeterminacy is not lessened by viewing the meaning of "ground" in the patent as anything other than a flat, planar surface. For example, regardless of how a club is engineered, if a golf ball is lying on an incline adjacent to a fairway, the golfer likely will be standing on that flat surface and will strike the ball such that an unorthodox fraction of the normal sole actually will be creating any divot. Similarly, if a golf ball is resting in a steep sand trap, the golfer may purposefully swing behind the ball and swing much if not all of the club head under the sand. In that instance, far more of the club will pass through the sand. Unless one analyzes the "sole" in terms of an understanding of "ground" in the patent as a flat, planar surface, the fact that a club may be designed to often create a divot or contact the sand does not add determinacy to the analysis of the "sole" or the "sole plate to sole" ratio. The only way to avoid those sorts of indeterminacy issues—which otherwise can be solved by viewing "ground" as a flat planar surface and requiring the "sole" measurements to proceed with the club resting at a "standard lie angle"—is to import the notion into the patent that the "sole" must be a detectible area otherwise demarcated on the face of the sole plate or extending from the sole plate. But, as explained above, nothing in the language of the patent or the relevant drawings included with the patent application supports the latter approach.

In sum, the Court believes that the manner of solving the indeterminacy problem identified by Nike (which cannot be ignored, given that the patent expressly requires that one be able to calculate a "sole plate to sole" ratio), while remaining consistent with the intrinsic record, is to view "ground" as a flat, planar surface. That limitation, combined with the requirement that the "sole" must be measured in conformity with the "standard lie angle" recognized in the golf industry, will allow for an ascertainable "sole." The "sole," under this analysis, will be a portion of the sole plate that is "distinguishable" (and thus able to be used to calculate the "sole plate to sole" ratio) and "intended to" contact the ground. In fact, the "distinguishable" and "intended to" requirements compliment each other, in that the "sole" can be measured and distinguished as being that portion of the sole plate that is intended to and does contact the "ground" when the club is held at its proper angle, as recognized by golf professionals.

iii. Prosecution History

The Court turns to the prosecution history of the patents to inquire whether any statements made during the prosecution about the meaning of "sole" affect the term's scope. The Court notes at the outset that neither party has brought to the Court's attention any portions of the prosecution history that shed additional light on the meaning and scope of the term "sole." And after independent investigation, the Court can detect none. There is no indication in the prosecution history, for example, that Plaintiff intended to limit the definition of "sole" to any separately delineated or demarcated subsurface either on the sole plate or extending from it. And there is no suggestion that "ground" means anything other than a flat, planar surface. Nor is there any suggestion that the sole was indistinguishable from the sole plate; in fact, the intent of the
prosecution history runs parallel with the that of the specification--that the sole plate and the sole were intended to be
distinguishable.

Therefore, the Court construes the word sole to mean "the distinguishable portion of the sole plate designed to contact the
ground (i.e., a flat, planar surface) and contacting the ground as the club lies at rest, with the club contacting the ground at
the standard lie angle for the club at issue."

10 Nike generally contended that the term "about" in the patent should be construed to mean +/- .02 of an inch. This
definition would produce a specific measurement for the sole as between .48 of an inch and 1.52 inch. Although the Court
would be inclined to adopt this definition (Wedgewood does not meaningfully object to Nike's proposal), in light of the fact
that the briefing largely proceeded within the context of Nike's proposed claim construction, and the fact that the Court has
not wholesale adopted the positions of either Nike or Wedgewood, the Court will not pass definitively on the "about" issue
pending further briefing as appropriate in light of further developments in this case.

154. As previously noted, the words of a claim will be given their ordinary meaning unless it appears that the inventor used
them differently. Hoganas AB v. Dresser Industries, Inc., 9 F.3d 948, 951 (Fed. Cir. 1993). The '656 patent uses the word
"solenoid" in its normal sense to describe a conventional, electrically-operated member which linearly pulls an iron core
into a coil. Col. 1, line 30; Col. 1, line 36; Col. 6, lines 43-46. In the '656 patent specification, the solenoid is consistently
described in terms of a plunger 98 contained within a spool supporting a coil 108 which actuates the solenoid plunger to
move it linearly, with a solenoid housing which can move linearly independently of the solenoid plunger. Col. 2, lines 47,
51, 55, 61; Col. 4, lines 37-38, 46; Col. 5, lines 43, 62, 67; Col. 6, lines 9-57; Col. 7, lines 5, 8, 11, 13-16, 26; Col. 8, line 7;
Figs. 3, 5, 6, 7, 9, 10. There is no suggestion in the '656 patent that the patentee intended the term "solenoid" to include
anything other than the conventionally described mechanism.

155. Other claims of the '656 patent also define a "solenoid" in terms of a solenoid housing enclosing a plunger. See, e.g.,
Claims 9, 16. Other claims of the patent may be used to determine the scope of the claim at issue. McGill, Inc. v. John Zink
Co., 736 F.2d 666, 674 (Fed. Cir. 1984).

156. The '656 patent thus defines the "solenoid" as a structural element where (1) the solenoid is actuated only as long as
power is supplied, then returning automatically to its original position; (2) the motion of the solenoid plunger is linear; and
(3) the solenoid housing is movable.

1. Solid

Many of the claims at issue recite a top surface that is solid. See, e.g., '015, claim 1(c) ("The top surface and the sidewall
surfaces are generally solid and continuous across their entire extents."). Both parties cite the same dictionary, which defines
"solid" as "being without an internal cavity" or "not interrupted by a break or opening." Merriam-Webster's Collegiate
Dictionary 1118 (10th ed. 1997). CP focuses on the latter definition, while Anchor asserts the former, urging that "solid"
is generally understood to mean "no holes." The American Heritage Dictionary of the English Language provides that "solid"
means "not hollowed out" or "without gaps or breaks; continuous." American Heritage Dictionary of the English Language
1229 (1975).
CP additionally relies on the prosecution history of the '015 Patent in which Anchor emphasized the "elegant simplicity" of its "one block" system, stating that the solid top surface provided a smooth finish that negated the need for a top cap block. See Amendment and Verified Response at 18-22 (Ali Decl. Ex. D). After the examiner rejected various claims of the '015 Patent, Anchor submitted numerous amendments and additions to the application, as well as remarks encouraging reconsideration and explaining the invention. See generally id. Specifically, CP references Anchor's comment that "because the top and side surfaces of the block are solid (planar or finished), without recesses, cores, or protrusions, no cap blocks are required to finish a wall," arguing that this statement reflects the appropriate meaning of solid: without recesses, cores, or protrusions. Id. at 22.

Though Anchor focused in the prosecution history on promoting the benefits of its single block system, repeating multiple times the advantage of eliminating the need for a cap or top block, this cited statement does not explicitly define "solid." Id. at 18-22. Rather, it expresses a description of the surface of the block that may be read either conjunctively or disjunctively, and therefore does not purport to offer a precise definition. Other discussions in this same Amendment and Verified Response support Anchor's contention that it was arguing the solidity of its block surfaces distinguished its product from prior art with large, open holes in the block faces, indicating the varying uses of the term in the prosecution history. Id. at 52-53 (arguing that rejection in light of the Swiss Patent was incorrect because the Swiss Patent teaches large open core hole through sides of block and therefore lacked "sidewall surfaces that are solid and substantially continuous"). However, the "no holes" definition advocated by Anchor is overly narrow and use of "solid" is not so limited in the Patent record or in ordinary parlance.

Pursuant to customary usage and the context of the '015, '713 and '197 Patents, "solid" is properly understood as "without breaks or openings." This construction is consistent with the prosecution history cited by both parties, which draws a distinction between the solid top surface of the '015 Patent claims and prior art that included large open spaces within the top surface area and therefore necessitated the use of a cap block. Id. at 20, 40.

The Source of Light Element: This element of claim 2 reads:

"Solid radiation source"

The parties' primary dispute here is whether "radiation source" encompasses more than radionuclides, which the court addressed above to limit "radiation source" to radionuclides. Cytyc presents a dictionary definition of "solid," namely, "of definite shape and volume; not liquid or gaseous," from the AMERICAN HERITAGE COLLEGE DICTIONARY, 1295 (3d ed. 1997). The court will therefore define "solid radiation source" as "a radionuclide of definite shape and volume; not liquid or gaseous."
reflected light on particulates in the air which reflected light is visible from in front of and behind the vehicle.

The interpretation of the "source of light" phrase of this element is disputed. Krippelz alleges that there is no special significance to the specific type of device that is used to make the beam of light and that "source of light" can thus include an incandescent bulb and reflector combination that produces a beam. Ford objects to this interpretation for two reasons, both of which I reject. First, Ford asserts that Krippelz's construction is "contrary to the plain meaning of a 'source' because the reflector is not part of the device that generates the light." The problem with this argument is that a source -- or any device -- can have multiple component parts. It is a reasonable interpretation of "source of light" to allow it to include a device comprised of two or more component parts, such as a bulb and a reflector, producing a beam of light. Ford's second objection is that in the prosecution history, Krippelz disclaimed incandescent bulbs as the source of light, and thus incandescent bulbs cannot be the source of light. I reject this objection because when Krippelz disclaimed incandescent bulbs as a "source of light" in the prosecution history, he did so only to the extent that he rejected them or any other device that did not generate beams of light. In other words, his disclaimer was premised on their inability to generate beams of light. However, if incandescent bulbs in combination with another component part, such as a reflector, form a device which can produce beams of light, then that device can be a "source of light."

B. Term 4: "source of pressurized fluid"

The Court finds that it need not construe the claim term "source of pressurized fluid," which appears in claims 1, 9, 15, and 24 of the '325 patent and claims 1, 9, 11, and 14 of the '664 patent.

Textron argues that "source of pressurized fluid" means a pump/flow-control valve combination disclosed in the '325 patent's written description. 2 Textron Opening Br. at 16. In effect, Textron asks the Court to limit the claim language to a preferred embodiment -- that is, to read a limitation from the specification into the claims. This the Court cannot do. See SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1340 (Fed. Cir. 2001) (describing "one of the cardinal sins of patent law -- reading a limitation from the written description into the claims").

--- Footnotes ---

2 Because the written descriptions of the '325 patent and the '664 patent are identical, the Court will refer only to the '325 patent's written description.

--- End Footnotes ---

Toro argues that "source of pressurized fluid" need not be construed. Toro Opening Br. at 21. The Court agrees. The phrase "source of pressurized fluid" is comprehensible to a lay person and necessarily encompasses the pump/flow-control valve system described in the '325 patent. '325 patent Col. 5:8-10. Accordingly, the Court will not construe this term.

2. "space" or "spaces"

<table>
<thead>
<tr>
<th>Plaintiff's Construction</th>
<th>Defendants' Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>A location on a game board that can be occupied by a game piece</td>
<td>Grid-like areas, laid out in rows and columns, on the upper, playing surface of the game board where playing pieces, not lasers, are moved in turn.</td>
</tr>
</tbody>
</table>

a. Innovation's Proposed Construction
Innovention urges the Court to reject the defendants' proposed construction as improperly attempting to read in features of the '242 patent's preferred embodiments into the claim language.

b. Defendants' Proposed Construction

The defendants appear to concede in their briefs that "every time the inventors used the word "spaces", they used it to mean a location on the game board where the pieces may be located during game play.

c. The Court's Construction

Based on the claim language, and the ordinary meaning of what is clearly a structural feature that inherently defines a location, the Court finds that "space" or "spaces" are simply "[a location or] locations on the playing surface of the game board that can be occupied by one of the game pieces." The Court declines, as it did in construing "game board", to read in limitations not inherent in the ordinary meaning of the term "space." This is most consistent with the understanding of how an ordinary person skilled in the art would understand "spaces" as they relate to board games. Indeed, the Court finds that the claims themselves sufficiently define the term "space" (Claim 15, for example, teaches ")...the playing surface being segmented into a plurality of spaces, each defining a location that can be occupied by one of the game pieces"). Accordingly, a "space" or "spaces" are defined as; "A location [or locations] that can be occupied by one of the game pieces."

2. Space

Habasit contends that "space" means "the opening bounded by the web and interlinked link ends when the opening is at its maximum." (D.I. 55 at 39.) First, Habasit argues that the spaces must be open. In support of its construction, Habasit contends that, since the *941 patent was primarily designed for the food-handling industry, its belt required holes for both easy cleaning (drainage and airflow) and the flash-freezing of food. Therefore, Habasit contends, the spaces described in the '941 patent had to be opened. Because the '680 patent is a continuation-in-part of the '941 patent, Habasit concludes that the spaces of the '680 patent must also be open.

Second, Habasit argues that the space must be measured at its maximum width, regardless of whether the belt is running in a straight or curved path. Habasit observes that the '680 patent adds to its predecessor by ensuring that the maximum width of the holes remains less than ten inches. Therefore, Habasit reasons, to ensure that the space never opens large enough to endanger the fingers of an operator, the space must be measured when the hole is at its maximum width, regardless of whether the belt is running in a straight or curved path.

Rexnord contends that Habasit's proposed construction is erroneous. Rexnord argues that Habasit's construction impermissibly adds an additional limitation to "space" by requiring that the space be open. Rexnord asserts that Habasit never mentions the flash-freezing and cleaning purposes of the belt in the '680 patent, and therefore cannot add them at this point to buttress its position. The space, Rexnord contends, can be opened or closed. Rexnord next argues that "space" only occurs when the belt is running straight. Rexnord contends that, since at a curve the inside of the belt collapses, the belt is only at its maximum extension when it is running straight. Since the claim language states that the opening only occurs at the belt's "maximum extension," such extension can only occur when the belt is running straight, not at a curve.

After considering the claim language, specification, and prosecution history of the '680 patent and the parties' respective positions, the Court agrees with Habasit's interpretation of the disputed language. First, the Court concludes that a "space" can occur at both a straight or curved portion of the belt. Claim 1 states that the belt is "capable of following a curved path" and "when the belt is at its maximum extension … a space bounded by the web … has a diameter less than 10mm." ('680 patent, col. 6.) Thus, the belt is essentially designed to round curves and protect fingers. If the 10mm limitation only applied to the belt when it traveled straight, the belt would fail its objective. Second, the space is designed to be open. The '680 patent is a continuation-in-part of the '941 patent, and accordingly contains its relevant disclosures. The '941 patent disclosed that the design pertained to "light weight" and "easy to clean" plastic belt modules used "especially in conveying
food products." ('941 patent, col. 1, 1. 11-13). Thus, the '680 patent shares the '941 patent's food-handling purpose. For these reasons, the Court concludes that space means "the opening bounded by the web and interlinked link ends when the opening is at its maximum."

2. "Spaced Apart"

The term "spaced apart" in Claim 1 describes the juxtaposition of the "cutting disks." '780 Patent, col. 3, lines 46-48. Fellowes defines "spaced apart," element 1(f), to mean "there is a space between two cutting disks." Michilin reads it to mean "there is a space between the two cutting disks such that the two cutting disks do not touch." Intek proposes that it means "there is a space between the two cutting disks such that no part of the two cutting disks touch, including the central portions thereof."

Intek correctly points out that the "cutting disks" depicted in Figure 1 "do not touch each other" and that the specification describes the "spacers" as being located between each disk, from which one would infer that the disks do not touch. See '780 Patent, col. 2, lines 57-58 ("Disposed between adjacent disks 14 is a spacer 20 located adjacent to each disk."). There is nothing in the claim or the specification, however, to the effect that "spaced apart" means the "cutting disks" "do not touch." The defendants again turn to the prosecution history in an effort to limit the construction of "spaced apart." As noted above, the '780 Patent's applicants, in urging that the USPTO withdraw its rejection of Claim 1, described the Henreckson patent as teaching "the abutment of two cutting disks against each other to form a single cutting unit . . . ." Id. at FE 000453. The defendants' argument appears to be that the patentees' remarks to the USPTO, by implication, meant that the '780 Patent's "cutting disks" do not abut against each other. Two "cutting disks," however, could be spaced apart at the shaft and touch at one point or another at the cutting edge. The Court refuses to add "do not touch" onto its construction of "spaced apart" and accordingly FINDS that "spaced apart" means "there is a space between two cutting disks."

3. CONSTRUCTION OF CLAIM 3 OF THE '221 PATENT

Independent claim three of the '221 Patent teaches "[a] passive, lenticular optical device" that comprises, in pertinent part:

a sheet of transparent material having at least one side composed of a plurality of parallel, elongated, lenticular, and convex claim elements,

a message carrier spaced apart from said sheet of transparent material, by a distance substantially equal to the focal length of said convex lens elements such that the included angle of converging light rays at the focal point of each convex lens element does not exceed 30 [degrees],

the surface of said message carrier facing said sheet of transparent material having a plurality of markings patterned graphically or mechanically into a series of segments …

(Col. 8, Ins. 7-20) (emphasis added). Thus, the invention disclosed in claim three consists of (1) a sheet of transparent material and (2) a message carrier "spaced apart" from the transparent sheet (3) containing image patterns. The main element at issue in this litigation is the requirement that the message carrier be "spaced apart" from the transparent sheet. 3 4360

The parties also dispute the construction of the "included angle" limitation. The court need not address this argument since construction of the "spaced apart" limitation conclusively resolves the issue of literal infringement.

- 4360 -
Defendant insists that two articles cannot be "spaced apart" from each other if they are physically touching. (See Defs.' Mem. P. & A. Supp. Mot. Summ. J. at 16:12-13). Relying on the ordinary English definition of the terms "spaced" and "apart," Defendant argues that the "spaced apart" limitation requires "that there must be some space between the message carrier and the sheet of lenticular material." (Id. at 16:16-17) (emphasis added).

Plaintiff counters that the '221 Patent's "spaced apart" limitation does not require a physical space between the lens sheet and the message carrier. According to Plaintiff, "spaced apart" simply "means that the distance between the message carrier and the curved surface of the convex lens elements is substantially equal to the focal length of the convex lens elements." (See Pls.' Mem. P. & A. Supp. Mot. Summ. J. at 11:2-4). Plaintiff further contends that the message carrier and transparent material "can 'touch' each other yet still be 'spaced apart.'" (Id. at 8:20-23). Plaintiff asserts that this construction is warranted by the specification and the overall construction of claim three.

Having carefully considered both positions, the court agrees with Defendant and finds Plaintiff's proffered construction of claim three completely unreasonable. The first paragraph of claim three requires "a sheet of transparent material having at least one side composed of a plurality of … convex lens elements," (see Col. 8, Ins. 8-10), in other words, a lenticular sheet. Paragraph two affirmatively requires the message carrier to be "spaced apart from said sheet of transparent material." Taken together, paragraph one and two require the message carrier to be "spaced apart" from the entire lenticular sheet, not merely the convex lens elements. Had Plaintiff truly intended the "spaced apart" limitation to merely describe the physical orientation between the lens elements and the image carrier, he would have drafted the second paragraph to read, "a message carrier spaced apart from the convex lens elements of said sheet of transparent material" rather than, as it reads now, "a message carrier spaced apart from said sheet of transparent material."

This construction is supported not only by the plain language of the claims, but the '221 Patent specification. The section entitled "Summary of the Invention" includes the following discussion of the prior art:

The current state of the art subscribes to a lenticular lens array laminated to, or placed in direct juxtaposition with, an underlying message carrier sheet. This thin, laminated methodology works extremely well for non-reflectorized, hand-held novelty devices and other closely viewed articles.

(See Col. 2, Ins. 35-40). In the above-quoted passage, the inventor affirmatively acknowledged that the prior art included lenticular devices with message carriers laminated directly to the lenticular sheet, such as Defendant's accused products. Directly laminating the lenticular sheet to the message carrier and positioning the lens array towards the light source, the inventor continued, created two significant shortcomings: absorption of light rays and surface glare.

Absorption occurs: at the surface of reflective materials; in the inks used in the printed message; and, additionally, with light refraction when an adhesive is used to bond a reflective material or message to a lenticular surface.

(Col. 2, Ins. 60-64, 43-44). Although the effects of light loss can be "minimized through proper fabrication and selection of the form of materials employed," (col. 2, Ins. 65-69), the inventor next asserted that:

by turning the lenticular lens array inside the sign, facing the message carrier sheet, and by spacing the lens array apart from the carrier sheet, the spherical aberration or surface glare of the curved lens elements is substantially minimized.

(Col. 3, Ins. 1-5). Reversing the lens array and spacing the lenticular sheet apart from the message carrier, according to the specification, solved the light loss and glare problems inherent in prior art lenticular products. Although claim three does not require the lens array to face the message carrier, it indisputably requires the lens array and message carrier to be "spaced apart." The above-quoted passages and the figures in the specification confirm that "spaced apart" means what it says—there must be some space separating the message carrier from the lenticular sheet. The specification affirmatively reveals that "spacing apart" is achieved by physically separating the lens sheet from the message carrier.

Plaintiff's opposition to Defendant's motion for summary judgment, and Plaintiff's opening brief, make one recurring counter-argument: Plaintiff repeatedly asserts that Kodak's construction of the "spaced apart" limitation requires the court to read into claim three limitations found in the specification and preferred embodiment.
It is well-established that "references to a preferred embodiment, such as those often present in a specification, are not claim limitations." Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988). As a matter of claim construction, "the specification may aid the court in interpreting the meaning of disputed claim language," but "particular embodiments and examples appearing in the specification will not generally be read into the claims." Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998). This doctrine, however, has no application to this case. The plain language of claims three and nine require the message carrier and transparent lenticular sheet to be "spaced apart" from one another. The "spaced apart" language, therefore, does not merely recite a characteristic of the preferred embodiment; it describes a limitation explicit in claims three and nine. 4

4 The court has considered Plaintiff's remaining arguments and finds them too insubstantial to warrant further discussion.

C. "Spaced Apart" or "Longitudinally Spaced From"

"Spaced apart" or "longitudinally spaced from" is used in claims: 27 and 28 of the '120 Patent; and 1, 2-15, and 17 of the '982 Patent. 83 Medinol defines "spaced apart" as "separated" and "longitudinally spaced from" as "separated along the longitudinal axis." 84 Guidant, by contrast, submits that the terms mean "the apices of adjacent cells along the longitudinal axis are separated from one another in space by a flexible connector." 85

The words "spaced apart" and "longitudinally spaced from" are used in the asserted claims consistently with their accustomed meaning. In other words, "spaced apart" means "separated" and "longitudinally spaced from" means "separated along the longitudinal axis." 86 For instance, claim 21 of the '120 Patent, upon which asserted claims 27 and 28 depend, discloses:

A stent formed of a tube having a patterned shape, the patterned shape comprising:

a. first meander patterns having axes extending in a first direction;

b. second meander patterns having axes extending in a second direction, different than said first direction, wherein said second meander patterns intersect with said first meander patterns;

c. wherein said first meander patterns have loops;

d. wherein said first meander patterns are spaced apart to leave a portion of said second meander patterns between each pair of adjacent first meander patterns;

e. wherein each of said second meander patterns has at least one loop between at least one pair of adjacent first meander patterns. 87
The claim language makes clear that the term "spaced apart" means separated - i.e., that the first meanders are placed at some distance from one another. That part of the second meander pattern (a loop) is positioned in the space between first meanders is an additional limitation, independent from the words "spaced apart."

86 See Webster's New World Dictionary 1363 (2d Coll. ed. 1974 ("New World Dictionary"), Ex. I to the 8/20/04 Declaration of Fabian D. Gonell, counsel for Medinol ("Gonell Decl.") (defining "spaced" as "to arrange with space or spaces in between"), cited in Medinol's Markman Hearing Slide Presentation ("Pl. Sl.") at 47; see also id. at 63 (defining "apart" as "separately or away in place or time), cited in Pl. Sl. at 47.

87 '120 Patent, col. 8, ll. 6-20.

The prosecution history cited by Guidant fails to contradict this conclusion. Medinol argued to the PTO that "the claims have been amended to make clear that the first meander patterns are spaced from each other and that the loop is in the space between meander patterns, a limitation discussed at the interview as better defining the relationship." 88 It follows from this statement that "spaced apart" is used to describe only the relative position of the first meander patterns, not the entire structure of the stent. Accordingly, there is no basis for requiring a loop of the second meander to fill the space between first meanders. Thus, Guidant has failed to demonstrate that Medinol intended for these terms to be used in a manner contrary to their plain and ordinary meaning and "spaced apart" and "longitudinally spaced from" are thus respectively defined as "separated" and "separated along the longitudinal axis."

The disputed phrase is located in Claims 2 and 10. The dispute centers on whether the patent has a directional component such that the connectors located at the end of the bag and liner with the discharge opening must be located at the bottom of the bag. Plaintiff proposes this claim should be interpreted as "the connectors are located so that they do not touch one another and so that they are near both the end of the bag through which the contents of the bag are emptied and the sides of the bag." Defendant proposes this claim should be interpreted as "the connectors being spaced far apart from each other and being located adjacent the side wall portion of the bag and the connectors being adjacent the bottom end of the bag having the discharge opening therethrough and adjacent the bottom end of the liner having the discharge opening therethrough."

The arguments advanced in support of the competing interpretations of this phrase are, in large part, the same as the arguments advanced in support of the first disputed phrase. The conclusion is the same. The patent does not contain a directional requirement. Accordingly, Plaintiff's construction of the claim is persuasive and supported by the intrinsic evidence. The claim at issue is interpreted to mean "the connectors are located so that they do not touch one another and so that they are near both the end of the bag through which the contents of the bag are emptied and the sides of the bag."
Claim 15:
1. "two spaced-apart-and-parallel implement-support plates"

Plaintiff proposes a construction of two sides of the knife body that are parallel to each other and held spaced-apart from each other by a member, such as a post, and the attachment plate. Since they are parallel, they are spaced apart for their entire length so that they do not touch each other. Each support plate is a discrete member, and not just a portion of another member.

Defendant proposes a construction of "two implement support plates that are spaced apart and parallel. Defendant argues that under this patent it would be possible for the support plates to touch one another at some point. However, the language "spaced apart" and "parallel" indicate that the support plates cannot touch each other. The specification also establishes that the support plates do not touch:

In the preferred approach, there are two implement-support plates 72 that serve as the sides (also sometimes termed "bolsters") of the knife body 22. In this preferred approach, the two implement-support plates 72 are parallel and spaced apart by support posts in the form of rivets. In an alternative embodiment, there are separate side plates and the implement-support plate 72 is positioned between them, but that design adds unnecessary bulk and weight to the knife body.

"906 patent, Col. 5, lines 2-10.

As set out in the specification, when there are two implement support plates, they are separated by support posts, and when there are two side plates they are separated by the implement support plate. The two plates do not touch or intersect. Defendant's expert offered an alternative embodiment in which the two side plates are separated for the length of the implement support plate and then bend at one end and touch one another. This embodiment is not supported by the language of the patent, as the plates are not spaced apart and parallel if they touch at one end.

The court concludes the proper construction of this term is "two implement support plates that are spaced apart and parallel and do not touch or intersect."

2. Claim 14

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 In its entirety, Claim 14 includes the following elements:

. a box shaped fireplace having four substantially vertical walls,

. at least one of said walls having a glass access door,

. a rear wall comprising one of said remaining vertical walls having a horizontal exhaust pipe connected thereto for insertion through said outside wall of said space to be heated,

. a top wall having an outer plenum,

. a bottom wall having an outer plenum,

. a combustion chamber in said box shaped fireplace inside said vertical walls,

. said rear wall further comprising an intermediate plenum outside said combustion chamber connected to said horizontal exhaust pipe,
said rear wall further comprising an outer plenum connected to said bottom outer plenum and to said outer plenum forming a U-shaped heat exchanger for circulating interior space air around the outside of said combustion chamber of said fireplace and for exhausting heated air into said interior space to be heated,

said rear wall comprising a vertical baffle spaced apart from the rear of said combustion chamber for directing combustion gases first in a vertically downward direction and then in a vertically upward direction and into said horizontal exhaust pipe.

The contentious element of Claim 14 provides:

said rear wall further comprising a vertical baffle spaced apart from the rear of said combustion chamber for directing combustion gases first in a vertically downward direction and then in a vertically upward direction and into said horizontal exhaust pipe.

Gross Aff., Ex. 1, col. 9, line 22 to col. 10, line 22.

A. Claim Construction

Hearth offers several definitions of "baffle" including "an object placed in an appliance to change the direction or retard airflow." Shimek Aff., Ex. 9, 002410. The Court will adopt Hearth's definition of baffle for the purposes of construing this limitation.

Moreover, Claim 14 requires a vertical baffle "spaced apart from the rear of said combustion chamber." The prosecution history reveals that the original language was modified, because the patentee had identified the baffle as the rear wall of the combustion chamber. The examiner objected on the grounds that the baffle could not simultaneously be the rear wall of the combustion chamber and be outside the rear of the chamber. As a result, the patentee changed the limitation to read "a vertical baffle spaced apart from the rear of said combustion chamber." The clear implication is that there must be some distance between the baffle and the rear of the chamber.

3729
d. "spaced apart opposing pivot flanges"

The term "spaced apart opposing pivot flanges" refers to projecting rims or ribs with flat inner surfaces placed a fixed distance from each other on opposite sides of the center flange that support the shift lever pivot structure and attach it to the support via a pivot pin for turnable or rotational motion. These projections are distinct from and supported by pairs of webs that serve to connect opposite ends of each pivot flange to the center flange.

3730

5. Spaced Axially Downwardly, Spaced Axially Below, Spaced Apart

These terms are used throughout the reexamined 097 patent and are sufficiently related that the court finds it appropriate to address them jointly. Specifically, the patentee uses "spaced axially downwardly" in asserted claims 11, 27, 32, 34, and 35; "spaced axially below" in asserted claim 42, and "spaced apart" in asserted claims 19 and 28.

In the patent's claims the patentee uses each of these phrases in the same way to describe the positioning of the first and second flanges. That is, in each of the independent claims, the patentee describes the "second flange spaced axially downwardly from said first flange" or "spaced axially below said first flange." Reexamined 097 patent, Stant Ex. 2, col. 1, 11. 55-56; col. 2, 11. 59-60; col. 3, 11. 22-23; col. 3, 11. 42-43; col., 11. 60-61; col. 4, 1. 39. The patentee uses "spaced..."
Apart" in two of the dependent claims to further describe the position of the two flanges.

Again the court begins with the dictionary definitions of the words of the phrases. "Axial" means "or, pertaining to, characterized by or forming an axis." Webster's Universal, Stant Ex. 103, p. 145. "Downward," when used to indicate a relation, means "from a higher to a lower place or condition." The parties seem to agree that "below" has a similar meaning in scope to "downward." The meanings of these terms do not appear to be in dispute.

The resolution of the parties' dispute appears to turn on the word "spaced." In relevant part, "spaced" means "to place at intervals" or "to arrange with spaces between" Webster's Third, Gerdes Ex. 239. The court finds nothing in the text of the specification to indicate the patentee's intention that this word be given an alternate meaning. Based on this definition, Gerdes argues that the two flanges must be "arranged with spaces between" and "not be directly attached, i.e., directly firmly fixed, to each other." Gerdes Br., p. 14. Stant argues that the definition of "spaced axially downwardly" and "spaced axially below" does not provide any limitation on the space between the flanges, rather the phrase "spaced apart" is the only term that requires actual physical separation of the flanges and under the doctrine of claim differentiation "spaced apart" cannot have the same meaning as the other phrases.

Both parties point to Judge Dillin's Markman Entry in Stant Manufacturing, Inc. v. Tesma International, Inc., IP 96-1325-C-D/F, to support their positions. Entry Stant Mfg, Inc. v. Tesma Intl Inc., Gerdes Ex. 204 ("Tesma Entry"). Although that case involved the 097 patent and not the reexamined 097 patent, Tesma advocated a position similar to that taken by Gerdes here while Stant advanced similar arguments to those it makes in this case. The court found,

This Court does not find their positions to be in complete conflict. Clearly, the claims require two flanges, each attached to the housing at a different location. Furthermore, the two flanges must function independently of one another. However, the flanges could be abutting and still remain separately functioning structures. Such an interpretation is consistent with the claim language and specification, and it would preserve claim differentiation. Claim 1 requires two flanges, while claim 7 requires the two flanges to be spaced apart. Therefore, we conclude that a "second flange spaced axially downwardly from said first flange" and "a second flange spaced axially below said first flanges" of claims 1, 9, and 10 require the fuel cap to have two flanges, both of which are attached to the housing but not attached to each other. The second flange must be located axially below or downwardly from the first flange, but there is no limitation on the amount of space between the flanges.

Tesma Entry, pp. 20-21. The same reasoning applies in this case. First, the specification clearly indicates that the invention consists of two flanges, rather than the compound flange that appeared in the prior art. See e.g., 097 patent, col. 1, 11. 25-31. And, as Judge Dillin found, these two flanges must act independently of one another in order to achieve the desired result -- that is, the first flange breaking during an impact with the second flange remaining intact to seal the filler neck. Id.; Tesma Entry, p. 20. Further, as Judge Dillin discussed with respect to Claims 1 and 7 of the 097 patent, Claim 11 of the reexamined 097 patent requires only two flanges, while Claim 19 requires that they be spaced apart. Therefore, the court must interpret "spaced axially below" and "spaced apart" to have meanings so as not to render Claim 19 meaningless and therefore violate the doctrine of claim differentiation.

With this reasoning and the ordinary meaning of the words at issue in mind, the court agrees with the definition set forth by Judge Dillin in the Tesma Entry. Specifically, "spaced axially downwardly" and "spaced axially below" require that the invention have "two flanges, both of which are attached to the housing but not attached to each other. The second flange must be located axially [situated along the same axis] below or downwardly from the first flange, but there is no limitation on the amount of space between the flanges." Tesma Entry, p. 21. As Judge Dillin stated, this means that the flanges could be abutting -- that is, touching or bordering -- so long as they remain independently function and not attached -- that is, joined, connected, or bonded -- to one another. Spaced apart, however, requires at least some physical space between the flanges.
said shelf spaced laterally inward from said one side wall and forming a front-to-rear gap therebetween in one position of said shelf for supporting selected articles to be washed

W. Mem. 20 contends those three phrases must be read together to "properly interpret this limitation." According to Whirlpool, "the 'front-to-rear gap' must be sufficiently large to receive the 'selected articles' and the 'laterally inward' spacing must also be sufficiently large so as to provide the appropriate sized gap" (W. Mem. 21). Whirlpool emphasizes that the specification describes the gap as "allowing large articles such as cookie sheets and pizza pans to be placed between the pivotal shelf 80 and the side wall 72" ( '419 Patent col. 5, ll. 54-56).

Maytag's position (M. Mem. 26) is that the gap need not be either a long single gap or a quite wide single gap (or both) and that Whirlpool's arguments on that score lead to importing "several limitations that appear nowhere in the claims and are nowhere suggested by the specification." In particular, M. R. Mem. 14 (emphasis in original) charges Whirlpool with overreaching by claiming "that because the specification references certain large items in the gap, the gap must extend all the way from the front of the rack" and "that for 'front-to-rear' to mean orientation rather than longitudinal extent would create a 'superfluous' claim requirement." Maytag is right.

In that respect Whirlpool has glossed over (or, more accurately, has omitted entirely) the fact that the claim specifies the gap's orientation by its reference to "a front-to-rear gap therebetween." That emphasized word is not a reference back to designate the distance between the front and rear walls--terms that are regularly used throughout the patent claims, and that specifically appear in element 2 of the claim now under consideration (claim 3). Instead "therebetween" plainly refers to the space between the higher side wall and the pivotal shelf in one position of the shelf--and that being so, "front-to-rear" simply characterizes that gap in longitudinal rather than lateral terms, without in any way specifying or indicating the longitudinal dimension.

If Maytag's patent counsel, whose total work product in drafting the claims has demonstrated the typical patent lawyer's fondness for detail in drafting (and of course the typical prolific use of the adverbial form), had wished to limit the claim as Whirlpool urges, it would have been the easiest thing in the world to say "a front-to-rear gap between the front and back walls of said basic rack" (note the comparable usage in element 2) rather than the very different meaning of "a front-to-rear gap therebetween." And similarly, if Maytag's counsel had wished to limit the claim (as Whirlpool also urges) by restricting the use of the gap to such large articles as those referred to in the specification by way of illustration, it would likewise have been the easiest thing in the world to say something along the lines of the gap's "supporting particularly large articles to be washed" rather than simply referring to "selected articles." Nothing supports Whirlpool's attempted redrafting of element 5 to convert it from indicating a user's choice (of "selected articles," perhaps--but not necessarily--selected from among "large articles") into a limitation that is restricted to extraordinarily large articles or the like.

27 Note that element 3 already refers to the function of the one substantially higher side wall as providing support for the racking and washing of "large articles."

In much the same way, in turning from the length of the gap to its width, W. Mem. 22-23 offers up the unpersuasive contention that the pivotal shelf must be "spaced laterally inward" sufficiently to make the gap wide enough to accommodate cookie sheets and pizza pans. But again nothing in the claim language calls for such a restrictive construction. While W. Mem. 23 would have this Court measuring the width of cookie sheets and pizza pans to determine exactly how far "laterally inward" the shelf is placed, doing that would obviously import limitations from the specification into the claim language. Standing alone, the claim language is plain enough: It merely requires the shelf to be laterally inward so as to form the previously described front-to-rear gap. In other words, the spacing between the shelf and the side wall does not have to meet some particular measure, but must merely be located "laterally inward." 28

28 W. Mem. 23-24 contends that the term "selected articles" must have a meaning related to the cookie sheet and pizza pan
cited in the specification and cannot "mean any possible article." But while the specification may be a useful aid in claim construction, limitations in the specification are not to be imported in the claim. Instead the term "selected articles" in element 5 merely means, as the normal meaning of those words connotes, some articles that can fit into a front-to-rear gap created by placing the shelf laterally inward from the side wall.

D. Spaced Parallel Axes

The final element of Claim 1 provides:

and wherein the arms are rotatably driven in synchronism in opposite directions about spaced parallel axes extending generally transverse of the direction of movement of said bag material so that prior to sealing said bag material said sealing and stripping means are moved along said bag material to strip same.

This element is not described in means-plus-function format, because it identifies particular structure rather than the means for accomplishing a certain function.

Ishida contends that the phrase "spaced parallel axes" means two axes which are parallel and separated by a fixed distance such that the axes do not oscillate back and forth toward each other. Taylor contends that there is no requirement that the axes be fixed.

After examining the claims, the specification and the prosecution history, the Court concludes that the disputed phrase requires that the axes be "spaced" by some distance such that they do not touch, but that there is no requirement that the axes be fixed. The word "spaced" does not commonly mean "spaced and fixed." There is no indication in the specification that Taylor intended the word "spaced" to have anything other than its common meaning. Ishida points out that the specification shows fixed axes in both disclosed embodiments. However, unless a claim is written in means-plus-function format, it is improper to limit the scope of a claim to examples used in the specification. See Electro Medical Systems v. Cooper Life Sciences, 34 F.3d 1048, 1054 (Fed. Cir. 1994); Atmel Corp. v. Information Storage Devices, Inc., 997 F. Supp. 1210, 1215 (N.D. Cal. 1998). Accordingly, the Court declines to read into this element of claim 1 a requirement that the axes be fixed. Moreover, the Court concludes that the prosecution history does not, as Ishida argues, disclose that Taylor surrendered moveable axes in order to obtain the '917 patent. Lastly, the Court declines to consider materials from the European Patent Office, as these materials constitute extrinsic evidence and the Court is able to construe the patent based solely on the intrinsic evidence.

2 At the hearing, counsel for Ishida made the additional argument that it would be a physical impossibility to construct a bagmaking machine possessing the structures corresponding to the means-plus-function elements and also possessing moveable axes. The Court is not in a position to assess the validity of this argument. However, if Ishida is correct, then the Court's ruling as to this element of claim 1 will have no adverse impact on Ishida, because every machine meeting the other limitations of claim 1 necessarily will possess fixed axes.

A. The Parties' Proposed Construction

Plaintiff proposes the following terms construction:
1. Spaced relation to the uppermost portion of the first quantity of explosive material: There is an air-gap in the borehole between the top of the lower-most explosive material and the bag-like device above it.

2. First relatively large quantity of explosive material: The larger quantity of explosive material placed within the borehole.

3. Second relatively small quantity of explosive material: The smaller quantity of explosive material placed in the borehole.

4. Disposed or disposing: Placed, placing, or causing to be placed.

5. Bag-like device: An item similar to, or characteristic of, an inflatable body of flexible material that is made, or adapted, to perform a function. 4

4 See plaintiff's memorandum, footnote 2. Plaintiff proposed this definition anticipating that the court would decline to separately define the term "bag."

In contrast, defendants propose the following:

1. Spaced relation to the uppermost portion of the first quantity of explosive material: The bag-like device is sufficiently spaced within a borehole above the top of the explosive material to form an air gap in the borehole between the bag-like device and the explosive material, with the air gap being approximately 8% to 16.7% of the borehole.

2. First relatively large quantity of explosive material: The major charge or quantity of total explosive material within the borehole.

3. Second relatively small quantity of explosive material: The minor charge or quantity of explosive material within the borehole, with the major charge being 3-5 times the quantity of the minor charge.

4. Disposed or disposing: The bag-like device while in a flat and uninflated state is placed in a particular order or place to accomplish the special effect or purpose of the device.

5. Bag-like device: A device comprised of multiple polymeric sheets sealed along the edges thereof and capable of being closed at one end which lies flat when uninflated. 5

5 Defendants modified their proposed definition at the Markman hearing on July 29, 2005, after the release of Phillips by the Federal Circuit. Defendants' initial proposed construction was "a flexible device capable of being closed at one end comprised of at least one polymeric sheet sealed along the edges thereof which lies flat when uninflated, of disc-like, square, tubular, or doughnut conformation."

B. "Spaced relation to the uppermost portion of the first quantity of explosive material"; "first relatively large quantity of explosive material"; and "second relatively small quantity of explosive material"

Defendants state that plaintiff's proposed construction should be modified because it has "no limits at all," but they recognize that the parties' "proposed definitions [for these three terms] . . . are not that divergent, and consequently the
Though defendants argue that they do "not seek to limit the definition of the specific examples set forth in the '233 patent, but rather merely state[] the context of the '233 patent in a way that is not limitless" (Def. Resp. at 15), it appears that defendants have indeed suggested limitations based on the examples. Defendants' proposed constructions would not allow "the air gap" to fall below approximately 8% of the borehole, or to rise above approximately 16.7%, nor would they allow the ratio of the major charge to minor charge of explosive material fall outside the 3 to 5 range.

At the hearing conducted on July 29, 2005, defense counsel, apparently referring to Figure 10, stated that the ratio proposed with respect to the minor and major charges of explosive material was formulated using an example described in columns 11 and 12 of the '233 patent. Using the numbers provided in the example, he said, the ratio of the major charge to the minor charge appears to be 3.56. Indeed, the example at one point refers to the approximate weight of the explosive material (ammonium nitrate/fuel oil) as being 634 pounds for the major charge and 178 pounds for the minor charge, which would yield a ratio of 3.5618. Defendants suggest, to avoid unduly limiting the patent, that the ratio should fall in a range between 3 and 5. Defendants offer no basis for that selected range.

The arbitrary nature of the ratio range chosen by the defendants is illustrated by the further reference in the example to the use of still other charges:

More than two of the inflatable devices 44 can be used, additional devices 44 being used to support additional charges of explosive material at different locations within the borehole 50.

Correspondingly, additional charges result in additional air gaps and, so, the air gaps may not be squeezed into an arbitrary range of 8% to 16.7% of the borehole. 6

6 Presumably, the 16.7% figure is based on the reference in the example at column 12, lines 6 through 10, to a borehole of a length of as much as 60 feet and to two air gaps, each five feet in length, so that the ten feet of air gaps is 1/6 of a 60-foot borehole or 16.67%. The source of the 8% figure may possibly be one air gap of five feet in a 60-foot borehole which would constitute 1/12 of the borehole or 8.33%.

Similarly, according to defendants' responsive brief, they propose limiting the space relationship between the explosive material and the bag-like device based on "the context" of the disclosure of the '233 patent and to distinguish the '233 patent from an earlier one, U.S. Patent No. 4,846,278. Defendants do not elaborate on the context which they suggest supports their proposed limitation, nor do they explain how the '233 patent can be distinct from the prior patent only by the application of a limited space relation. Furthermore, defendants propose their suggested restrictions based on calculations which appear to have been generated from numbers provided in a single illustrative context.

It seems that defendants have proposed limitations arbitrarily, with no sufficient basis in the claims themselves or the specifications. Inasmuch as defendants derived the figures on which their calculations are made from selected portions of examples appearing in the '233 description of preferred embodiments, the suggested limitations are not within the broader meanings of the terms at issue.

The court adopts the construction placed on all of the terms in this category as offered by the plaintiff and set forth in items numbered 1, 2 and 3 on page 6, supra.

GO BACK
Construction of the elements must include elements with open space between them to function optimally. Although the specification and figures 1 and 3 of the '325 patent indicate the presence of space which creates a hollow channel between the elements in the completed product, the '325 patent only claims the method for creating the flexible material. It does not claim the flexible material. Therefore, the final product may have specific dimensions of open space between the elements, as the specification states ('325 patent, col. 2:64-67), but this unoccupied open space need not be present at all times during the patented process.
In construing the patent claim term "spaced separate elements," Nike also asks the court to look to extrinsic evidence, including the statements of Mr. Taylor (the inventor) (Taylor Dep. 78:3-6, 78:14-79:3, June 2, 2009, attached as Ex. C to Hill Decl.), Mr. Beall (an expert for McDavid) (Beall Dep. 30:1-4, June 9, 2009, attached as Ex. M to Hill Decl.) and Dr. Brookstein (an expert for Nike) (Brookstein Decl. at P 16). Even though extrinsic evidence should not be relied upon to determine the meaning of a disputed claim term when the patent's claims, specification, and prosecution history resolve the ambiguity, Vitronics, 90 F.3d at 1583, as is the circumstance here, the inventor's and the expert's statements which Nike presents refer to the finished product, not the patented manufacturing method protected by the '325 patent.

As a result, the court construes "spaced separate elements" to mean "distinct components that do not come in contact with each other, once they are formed in the patented manufacturing process."

4. "Spacer"

Closely related to "spaced apart" is the term "spacer" as it appears in Claims 1 and 12. Fellowes defines a "spacer," elements 1(i) and 12(g), as "a device that creates a space between two cutting disks on the cutting cylinder, the space having a width just slightly greater than an interleaving cutting disk from a mating cutting cylinder. The spacer may be separate from or integral with the cutting disk(s)." Michilin argues that "spacer" means "an element that fills a space between two adjacent cutting disks on the cutting cylinder, the space having a width that is constant circumferentially and just slightly greater than an interleaving cutting disk from a mating cutting cylinder" and further that the "spacer" is "separate from the two cutting disks." Intek argues that the "spacer" in Claim 1 is "an element that creates a space between two adjacent cutting disks on the cutting cylinder, the space having a width that is constant circumferentially, wherein the spacer is separate from the two cutting disks, and each spacer has at least two different circumferences." 9

9 For reasons that are unclear, Intek's definition of the word "spacer" in element 12(g) in the Claim Construction Chart appearing in its brief differs from its definition of "spacer" in Claim 1(i), the former having the italicized language as follows: "An element that creates a space between two adjacent cutting disks on the cutting cylinder, the space having a width that is constant circumferentially and just slightly greater than an interleaving cutting disk from a mating cutting cylinder wherein the spacer is separate from the two cutting disks, and each spacer has at least two different circumferences." Intek Br., Ex. 1. The italicized language appears in the chart but does not appear in either of the definitions of "spacer" in Intek's brief. In any event, this difference poses no challenge because Fellowes and Michilin have, appropriately in the Court's view, included the italicized language in their definitions of elements 1(i) and 12(g).

A comparison of these competing constructions reveals that the issues are whether the "spacer" must be separate from the "cutting disks," whether its width is "constant circumferentially," and whether "each spacer has at least two different circumferences." As to the first issue, Michilin and Intek both argue that the prosecution history requires the Court to construe the "spacer" as being "separate from the two cutting disks." As noted above, during the prosecution of the '780 Patent, the USPTO rejected Claim 1 on grounds that it was anticipated by Henreckson and Patent No. 1,825,223 ("the Deck patent" or "Deck"). '780 Patent, FE 000424-429; id. at FE 000394. The patentee urged that the rejection be withdrawn on grounds that, inter alia, the Henreckson patent did "not disclose a separate spacer between cutting disks where the linear measure of the spacer along its surface is greater than the distance between two adjacent disks." Id. at FE 000507. The patentees further argued that "Henreckson et al. teach the abutment of two cutting disks against each other to form a single cutting unit separated from other cutting units by spacers 30 and 36." Id. Intek and Michilin argue that in making these remarks, the patentee relinquished the interpretation that Fellowes now proposes, i.e. that the "spacer" may be either separate from, or integral to, the "cutting disk." The patentee's statement that Henreckson taught "a single cutting unit separated from other cutting units," while implying that the patentee's patent does not teach a "single cutting unit separated from other cutting units," is too vague to lead one to conclude that the patentees were necessarily disclaiming a "spacer" that is integral with the "cutting disk." The Court does not find the patentee's remarks to be sufficiently "clear and unmistakable" for prosecution disclaimer to arise. See Omega, Eng'g, 334 F.3d at 1325-26; Purdue Pharma L.P., 438 F.3d at 1136. In
The heart of the parties' dispute is whether the spacer is a device or piece, distinct from the burner body and burner pan, that holds the burner body a given distance from the burner pan base, but not a gasket or seal. The doctrine of claim differentiation is inapplicable, however, because an interpretation of the "spacer" in Claims 1 and 12 as having "at least two different circumferences" in connection with the "spacer" in the prosecution history. In its July 21, 2000, response to the USPTO's rejection of Claim 1 and other claims, the patentee argued to the USPTO that Deck, among other things, "does not disclose a cross-cut shredder having displaced cutting disks separated by [a] spacer where the linear measure of the spacer along its surface is greater than the distance between two adjacent disks and where each spacer has at least two different circumferences." Id. at col. 4, lines 2-4. The same logic applies to Claim 12, which requires that the "surface of the spacer has a linear measure greater than the distance between each adjacent disk." Id. at col. 4, lines 44-47. Moreover, as Intek points out, the drawings show a "cutting cylinder" in which each spacer has at least two different circumferences, Intek Br. 15, and the specifications refer to the "spacer" as having more than one circumference. See id., col. 3, lines 13-15 ("It will be appreciated that the circumference of the spacer 20 at least one point a is greater than the circumference of the spacer 20 at least another different point b."). Additionally, the patentee used the phrase "at least two different circumferences" in connection with the "spacer" in the prosecution history. It logically follows from Claim 1's requirement that the "surface of the spacer has a linear measure greater than the distance between the two adjacent disks" that the "spacer" has "at least two different circumferences." Id. at col. 4, lines 2-4. The same logic applies to Claim 12, which requires that the "surface of the spacer has a linear measure greater than the distance between each adjacent disk." Id. at col. 4, lines 44-47. Moreover, as Intek points out, the drawings show a "cutting cylinder" in which each spacer has at least two different circumferences, Intek Br. 15, and the specifications refer to the "spacer" as having more than one circumference. See id., col. 3, lines 13-15 ("It will be appreciated that the circumference of the spacer 20 at least one point a is greater than the circumference of the spacer 20 at least another different point b."). Additionally, the patentee used the phrase "at least two different circumferences" in connection with the "spacer" in the prosecution history. In its July 21, 2000, response to the USPTO's rejection of Claim 1 and other claims, the patentee argued to the USPTO that Deck, among other things, "does not disclose a cross-cut shredder having displaced cutting disks separated by [a] spacer where the linear measure of the spacer along its surface is greater than the distance between two adjacent disks and where each spacer has at least two different circumferences." Id. at FE 000507 (emphasis added). Fellowes contends that the defendants' construction runs afoul of the doctrine of claim differentiation. Fellowes Br. 29 (citing Clearstream Wastewater Sys., Inc. v. Hydro-Action, Inc., 206 F.3d 1440, 1446 (Fed. Cir. 2000) ("Under the doctrine of claim differentiation, it is presumed that different words used in different claims result in a difference in meaning and scope for each of the claims. This doctrine cannot be used to make a claim broader than what is contained in the written description . . . but it prevents the narrowing of broad claims by reading into them the limitations of narrower claims."). Fellowes urges the Court to reject Intek's proposed "at least two different circumferences" language on grounds that doing so is necessary to differentiate Claim 1 from dependent Claim 5, which refers to the "circumference of the spacer at at least one point" as being "greater than the circumference of the spacer at at least one other point." '780 Patent, col. 4, lines 17-19. The doctrine of claim differentiation is inapplicable, however, because an interpretation of the "spacer" in Claims 1 and 12 as having "at least two different circumferences" is supported by the plain language of Claims 1 and 12 and is not narrowed in any material way.

The Court FINDS that "spacer" as used in Claims 1 and 12 means "a device that creates a space between two cutting disks on the cutting cylinder, the space having a width just slightly greater than an interleaving cutting disk from a mating cutting cylinder," and "each spacer has at least two different circumferences," and the "spacer" "may be separate from or integral with the cutting disk(s)."

2. "spacer"

This claim term appears in claims 1 and 15 in the '068 patent (it does not appear in the '726 patent). Travis proposes the following construction: "structure(s) that space(s) the burner pan apart from the burner body to form a gas distribution chamber." It became clear at oral argument that under Travis' construction, a "spacer" could be either integrated into the burner body or burner pan, a fence, a gasket, or a gasket combined with either of the first two. Heath proposes the following construction: "a device or piece, distinct from the burner body and burner pan, that holds the burner body a given distance from the burner pan base, but not a gasket or seal." The heart of the parties' dispute is whether the spacer is
considered distinct 1) from the burner pan and burner body, and 2) from a gasket or seal (Hearth's position), or silent as to both of these particular questions (Travis' position). Based on the intrinsic evidence, the Court agrees with Hearth's proposed construction and therefore construes the term "spacer" to mean "a device or piece, distinct from the burner body and the burner pan, that holds the burner body a given distance from the burner pan base, but not a gasket." The parties should note that this construction allows the gasket to be a component of the spacer; what it does is prohibits the spacer from being only the gasket.

In the '068 patent, the term appears in claim 1 as follows:

a burner assembly for burning a fuel gas from a gas source, comprising:

a burner pan . . . ;

a spacer extending away from the burner pan;

a burner body[,] . . . the lower portion of the burner body being sealably connected to the spacer and being supported apart from the burner pan by the spacer forming an interior gas distribution chamber between the burner pan and the burner body . . . .

(The '068 patent, 11:38-42 (emphasis added)).

Claim 15 has similar language:

a burner assembly . . . comprising;

a burner pan[,] . . . the burner pan having a base;

a spacer extending away from the base of the burner pan;

a burner body[,] . . . the burner body being coupled to the spacer with the lower portion of the burner body being spaced apart from the base of the burner pan by the spacer to form an interior gas distribution chamber therebetween . . . .

(Id., 12:46-49 (emphasis added)).

Lastly, claim 3, which is dependent on claim 1, reads in part: "The burner assembly of claim 1 wherein the burner pan includes a base spaced apart from the burner body and the spacer is a distribution fence projecting from the base . . . ." (The '068 patent, 11:62-64 (emphasis added)).

The ordinary and plain meaning of the term "spacer" supports the Court's construction. "Spacer" is defined as "a device or piece for holding two members at a given distance from each other." (Zeuli Decl., Ex. B-1 (Merriam-Webster's, 3d ed. 1981)). 1 Because the term is not defined anywhere else in the '068 patent such that it would have a different meaning from its ordinary and plain dictionary meaning, the dictionary definition has significant weight. Travis maintains that this definition does not specify whether the spacer is part of any other structure. While that is technically true, the Court concludes that it is reasonable to infer from this definition that the device or piece holding the two members is distinct from those two members.

--- Footnotes ---

1 In the joint claim chart, Travis cites a definition for "space," but not for "spacer."

--- End Footnotes ---

The claim language further supports the Court's construction. At its simplest, claims 1 and 15 refer to three distinct components of the burner assembly: 1) burner pan, 2) spacer, and 3) burner body. This plain language implies that the spacer is a distinct piece from the burner body and/or burner pan. Further, the claims state that the spacer connects to or is
coupled with the body, extends away from the pan, and holds the pan and the body apart from each other. Connecting or coupling two things (i.e. the spacer and the burner body) unequivocally connotes two distinct objects. Travis contends that "extending away from" does not necessarily require two distinct structures; rather, it refers to a configuration. However, even if "extending away from the burner pan" describes only a configuration, the claim language makes clear that the spacer keeps the burner body apart from the burner pan. If the spacer could be considered part of the burner pan, then this language would not make any sense because the burner pan, of which the spacer is a part, would directly touch the burner body. This would contradict the plain language of the claim. Therefore, the spacer cannot be integrated into the body or pan. However, the spacer can be a fence. Claim 3 makes clear that the spacer can be a distribution fence.

The prosecution history neither compels nor prohibits this construction. Claims 1 and 15 of the '068 patent, as originally filed, did not include this term. (Ex. 4 at 101-02 (claim 15 was originally number as claim 16)). As discussed above, these claims were rejected as anticipated by the prior art in the Shimek '743 patent. When Travis amended the claim language to make it patentable over the Shimek '743 patent, Travis inserted the spacer language quoted above. (Id.). The accompanying remarks stated that this claim was amended:

> to clarify that the burner body includes a spacer extending away from the burner pan . . . . The burner body's lower portion is sealably connected to the spacer and is supported apart from the burner pan by the spacer forming an interior gas distribution chamber between the burner pan and the burner body. Shimek '743 does not disclose, teach, or suggest a burner assembly having a burner pan, a spacer extending away from the burner pan, and a burner body with the lower portion as recited in the claim 1 as amended. Shimek '743 is silent with respect to a spacer. Further, the underside of [the] ceramic-fiber top of Shimek '743 is highly contoured so that a spacer is unnecessary. Accordingly, Shimek '743 teaches away from the spacer.

( Id. at 97).

Based on this language, Hearth argues that Travis told the patent examiner that Shimek '743 did not have a spacer and that the "legs" on the Shimek '743 that extended downward from the burner body to the base or plate, thereby forming a gas chamber between the body and plate, were not spacers. Hearth asserts that because Travis distinguished its spacer from Shimek '743's "legs" in this way, Travis cannot now argue that the spacer could be attached to the burner body since that would effectively negate the distinction it made during the prosecution history. Travis counters that it did not disclaim a spacer that is part of the body or pan. Contrary to Heath's contention, Travis maintains that it did not tell the patent examiner that Shimek '743 did not have a spacer or that the legs in Shimek '743 were used in place of a spacer. Therefore, according to Travis, its spacer may or may not be attached to the body or pan.

Hearth's argument is unpersuasive because the premise is faulty. Hearth refers to "legs" on the burner body. However, based on this Court's review of the Shimek '743 patent, the specification does not identify legs on the burner body. The specification refers only to the burner body, which is number 12 in the specification figures, and does not identify legs as a separate part of that burner body. Because there is not a clear identification of burner body legs in Shimek '743, Travis cannot be said to have clearly and unambiguously distinguished its spacer from the "legs" on the Shimek '743 burner body. Similarly, the statement that the Shimek '743 is silent with respect to a spacer does not constitute a clear and unambiguous disavowal of a spacer that is part of the burner body or pan. At the same time however, even if the Shimek '743 did not explicitly identify the downward extensions on the burner body as "legs," the fact that they were represented in the drawing and served to space the underside of the burner body apart from the burner base or plate, together with the fact that Travis maintained that the Shimek '743 was silent with respect to a spacer, imply that Travis was disclaiming a spacer that was part of the burner body. However, it is doubtful that this is a sufficiently clear and explicit disclaimer as required by 3M Innovative Properties Co.,

Similarly, the statement in the prosecution history that Shimek '743 did not disclose a spacer must be read in the full context of the sentence in which the statement appears. As discussed above, this full statement asserts that the combination of elements was not present in the Shimek '743. Therefore, this statement cannot be interpreted as a disclaimer of a spacer that is part of a burner body or pan.

As to whether the spacer is distinct from a gasket or seal, the doctrine of claim differentiation favors construing the term "spacer" as not a gasket or seal. However, this does not mean that a gasket or seal could not be a part of the "spacer." Claims 10 and 20 of the '068 patent (which are dependent on claims 1 and 15 respectively), both state "[t]he burner assembly of
claim 1 [or claim 15] further comprising a gasket sandwiched between the burner pan and the burner body." (The '068 patent, 12:26-28 and 13:22-24). Both claim 1 and claim 15 require a spacer. Therefore, if a spacer could be the exact same thing as a gasket, as Travis contends, then the gasket required by dependent claim 10 and claim 20 would be superfluous and redundant. See Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998) ("There is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims. To the extent that the absence of such difference in meaning and scope would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference between claims is significant.") (quotations and citation omitted).

At oral argument, Travis argued that the gasket requirement of claims 10 and 20 is not redundant because either there would be two gaskets (i.e. the spacer, which could be a gasket, and the gasket referred to in claims 10 and 20) or the spacer is a fence or integrated into the burner body or burner pan and claims 10 and 20 merely add a gasket such that the spacer is the fence or integrated into the burner body or burner pan plus the gasket. The first argument does not make much sense and is contrary to the principle that different claim terms are presumed to have different meanings. The second argument, however, is persuasive. While the spacer cannot be the exact same thing as a gasket, the spacer can be a fence plus a gasket. Nothing in the specification limits "spacer" to only the fence. Indeed, the fact that both "spacer" and "fence" are used in the claims disfavors construing these terms as absolutely interchangeable.

The prosecution history does not include any reference to a gasket or seal. Shimek '743 included a "silicon adhesive," assigned number 25 in the figures, to seal the burner body to the burner base or plate. Therefore, nothing in the prosecution history speaks to this particular question.

3737

E. "spacer means" (claims 6, 10, and 20)
PolyVision's proposed construction
Smart's proposed construction
An element that maintains a space between the membrane and the conductive eleme...
A suitable insulator such as plastic in the form of a peripheral spacer rail establi...

Initially, the Court must determine whether this term is a means-plus-function limitation under 35 U.S.C. § 112 P 6, which provides: "An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof." This type of "claiming applies only to purely functional limitations that do not provide the structure that performs the recited function." Phillips, 415 F.2d at 1311. A claim limitation that actually uses the word "means" gives rise to a rebuttable presumption that § 112, P 6 applies. Personalized Media Commc'n, LLC v. Intel Trade Comm'n, 161 F.3d 696, 703-04 (Fed. Cir. 1998). The presumption is rebutted where the claim, in addition to the functional language, recites structure sufficient to perform the claimed function in its entirety. See Altiris, Inc. v. Symantec Corp., 318 F.3d 1363, 1375 (Fed. Cir. 2003). PolyVision contends that although the limitation invokes a § 112, P 6 claim element, it identifies sufficient structure to rebut the presumption. This argument fails because "spacer" or "spacer means" is not definite structure. See Unidynamics Corp. v. Automatic Products International, Ltd., 157 F.3d 1311, 1319 (Fed. Cir. 1998) (holding that the recitation of "spring means" did not disclose sufficient structure to take the claim element out of the ambit of § 112, P 6). The claim is thus limited to the structure disclosed in the specification for performing the "spacing" function and its equivalents.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

2 The Court further notes that no evidence, whether intrinsic or extrinsic, indicates that the term "spacer" has an established meaning in the art for performing a specified function. See Watts v. XL Sys., Inc., 232 F.3d 877, 880-81 (Fed. Cir. 2000) ("As an aid in determining whether sufficient structure is in fact recited by a term used in a claim limitation, this court has inquired into whether the term, as the name for structure, has a reasonably well understood meaning in the art.") (internal quotations omitted).
The specification identifies the structure as "peripheral rail 20," that is "a suitable insulator such as plastic." (Col. 3, ll. 20-23; Col. 3, ll. 46-47 (stating that "[s]ubstrate 16 rests on base4, and supports peripheral spacer rail 20").) Smart's proposed construction corresponds to the structure disclosed in the patent, and the Court will adopt it, with an amendment to include "structural equivalents thereof."

3738

"Spacing Surface" (‘177 Patent):

A generally planar surface that is distinct from, and located between, the kayak’s seating surfaces, providing at least enough separation between seating surfaces to enable a paddler seated on one seating surface to paddle without interfering with a paddler or passenger occupying another seating surface.

3739

d. spacings between the internal surface of the casing and the pen periphery defining one or more passageways for the flow of air blown into the casing

P&M construes this phrase as describing "open areas bounded by the inner wall of the casing and the outside of the pen through which air can pass." (Pls. Opening Mem. at 26.) Rose Art maintains that this phrase should be construed as "open areas through which air can flow through the mouthpiece, through the casing, through the passageways, and over the nib of the pen." (Def. Reply at 9.) The specification describes the spacings as the open area between the outside of the reservoir pen and the inside of the casing: "In use, air is blown by the user through the mouthpiece 3 and the annular passageways defined between the opposed surfaces of the pen body 2 and the internal surfaces of the casing 1." (‘300 patent, col. 3, ll. 26-29.) Adoption of the construction suggested by Rose Art would impermissibly add additional functional limitations to the claim concerning the passage of air through the casing which are not required by the plain language of the claim. Electro Med. Sys., 34 F.3d at 1054. Accordingly, this phrase will be construed to describe "open areas bounded by the inner wall of the casing and the outside of the pen through which air can pass."

3740

6. Claim 1 - "spanning between said side walls"

Bradford proposes that "spanning between said side walls" means "extending from one of the two 'side walls' to the other one of the two 'side walls'." Defendants propose that "spanning between said side walls" means "reaching, at least in combination with an additional component(s), completely from one of the two 'side walls' to the other, opposing one of the two 'side walls'." This term is a further limitation on "dunnage structure" and "upper edge" in that the upper edge of the dunnage structure must have a longitudinal axis which spans between the side walls. The basic dispute between the parties over this term is Defendants' inclusion of the additional limitation regarding "at least in combination with other components."

In support of their definition, Defendants argue that in the preferred embodiments, the dunnage structure usually does not span from one side wall to the other without utilizing other elements, such as rails and cables. The Court notes, however, that the specification, specifically in regard to Figure 1D, contemplates that the dunnage structure may be attached directly to the side walls:

FIG. 1D illustrates another version of the container of the invention wherein the various support structures are eliminated. Therein, the dunnage structures, such as pouches 40, are directly coupled to the side walls without cables 32. For example, the pouches 40 have ends 45 which extend through openings 47 formed in the side walls. The pouch ends 45 are secured to
the side walls 14 by mounting collars 51 or other appropriate devices.

'T19 Patent, col. 10, ll. 37-44. Thus, except for mounting collars or other devices, the invention can be practiced without the limitation of "at least in combination with additional components." Technically, mounting collars would constitute "additional component," but the dunnage structures cannot suspend themselves in mid-air inside of the container. One skilled in the art would certainly realize that the dunnage structures need some support within the interior of the container, whether it be through rails and cables, which are then attached to the side walls, or by directly coupling the dunnage structure to the side walls. Thus, the additional limitation Defendants seeks to impose on this term is not necessary. Therefore, Defendants' definition is rejected.

Accordingly, the Court holds that "spanning between said side walls" means "extending from one of the two 'side walls' to the other one of the two 'side walls'."

3741

6. "SPECIAL PROCEDURE"

The term "special procedure" appears in claims 1, 9, 14, and 18 of the 537 patent and claims 1 and 10 of the 728 patent. Claim 1 of the 537 patent has the relevant term at issue. It claims, in relevant part:

a method for improving airline luggage inspection by a luggage screening entity, comprising: making available to customers a special lock having a combination lock portion and a master key lock portion, the master key lock portion for receiving a master key that can open the master key lock portion of this special lock, the special lock designed to be applied to an individual piece of airline luggage, the special lock also having an identification structure previously provided to the luggage screening entity, which special lock the luggage screening entity has agreed to process in accordance with a special procedure.

537 patent, col. 6, 11. 6-18. Claim 1 also addresses "marketing the special lock to the consumers in a manner that conveys to the consumers that the special lock will be subjected by the luggage screening entity to the special procedure. As with the other terms, claims 9, 14, and 18, as relating to "special procedure", largely track the language in claim 1, and similarly, claims 1 and 10 of the 728 patent do so as well.

Travel Sentry's proposed construction of "special procedure" is "[a] procedure whereby a baggage screening entity has instructed baggage screeners to look for indicia on luggage locks and, upon finding the indicia, the baggage screener would, if necessary to inspect a piece of luggage, use a single master key provided to the luggage screening entity to open the luggage lock and then relock it after inspecting the bag." Tropp proposes that "special procedure" be construed as "[a] procedure for processing 'special locks,' as recited in respective claims, in which the luggage or baggage screening entity has agreed to act pursuant to a prior agreement to look for the identification structure while screening luggage or baggage, and, upon finding said identification structure on an individual piece of luggage or baggage, to, e.g., use the master key previously provided to the luggage or baggage screening entity to, if necessary, open the individual piece of luggage or baggage."

While both proposed constructions are long in verbiage, there is about a penny's worth of difference between them, if that much. Travel Sentry, in fact, concedes that its construction is not materially different from Tropp's. (Markman Hr'g Tr. 10). Tropp, for his part, repeats his objection to adding the word "single" before "master key", and disagrees with interpreting "special procedure" with the unsupported limitation that a screener must relock the bag after inspecting it.

Again, the Court agrees with Tropp that the claims do not support a requirement that the special procedure involves "a single master key" only (emphasis added). With respect to the additional step of relocking the lock after inspecting a bag--while a reasonable expectation and (presumably) desired result at the conclusion of a baggage screening process, it is, ultimately, an limitation unsupported in the claims. See Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1249 (Fed. Cir. 1998)("If we need not rely on a limitation to interpret what the patentee meant by a particular term or phrase in a claim, that limitation is 'extraneous' and cannot constrain the claim"). In both the 728 and 537 patents, the relocking of a bag is not addressed in the claims themselves nor is it mentioned in the specification of either patent. The written descriptions, in
highlighting the important objectives and advantages of the invention, focuses on allowing luggage screeners to avoid damaging travelers' luggage and avoiding the hassle, labor, expense, and resulting injuries that arise from clipping locks. The "special procedure" in the patents' claims, read in light of the specifications, appears to focus on the opening of luggage as opposed to the relocking of it.

Therefore, while Travel Sentry's position is reasonable, the Court declines to read a limitation into the term "special procedure" requiring screeners to relock the bag after an inspection. To that end, the Court, with modification, adopts the following proposed construction (particularly where Travel Sentry has acknowledged no significant difference in the two constructions) and construes "special procedure" as a procedure for processing special locks, as recited in the respective claims, in which the screening entity has agreed to act pursuant to a prior agreement, to look for the identification structure while screening luggage, and, upon finding that identification structure on an individual piece of luggage, to, use the master key previously provided to the screening entity to, if necessary, open the luggage.

Specularly-Reflective Surface

Claim 1 includes the limitation that the sample chamber include "an elongated hollow tube . . . having a specularly-reflective surface on its inner walls for transmitting radiation introduced at one end of the tube to the other end of said tube by means of multiple reflections from said specularly-reflective surface." '332 Patent, col. 6, ll. 6-11. The district court construed "specularly-reflective surface" to be "a surface that will transmit radiation down the length of the tube by means of multiple reflections from such surface."

Digital Control argues that this construction is incorrect, asserting that the claim limitation requires a surface with a polished or mirror-like surface finish. Specifically, Digital Control points to optical dictionaries which imply such a limitation and the repeated reference in the specification that the sample chamber acts as a "light pipe." Edwards contends that "specularly-reflective" does not require a mirror-like smoothness on the surface. In fact, Edwards concedes that if "mirror-like" describes the behavior of light incident on the surface, "there may be no quarrel [with the definitions of specularly reflective offered by Digital Control]."

Nothing in the '332 patent's specification suggests the applicant intended the term specularly reflective to have a meaning different from its plain meaning. Indeed, the specification makes no attempt to define the term. The same can be said of the prosecution history. "Specular reflection" is defined as "pertaining to the manner in which light is reflected, as by a mirror or speculum" and a "specular reflector" is "a reflector that exhibits specular reflectance, producing a direct image of its source." The Photonics Dictionary (2000). Naturally, whether a surface is specularly reflective depends on the type of light that is being reflected. Accordingly, we construe "specularly-reflective surface" to be a surface that reflects light as by a mirror or speculum and note that the district court's construction appears to read the term "specular" out of the phrase "specular reflection."

The parties dispute the meaning of the words "spherical mass" as used in the preamble to claim 1 of the '731 patent:

A bowling ball having a spherical mass of preselected density and a spherical surface equidistant from a center of the spherical mass....

In construing claim 1, the court should look first to the intrinsic evidence of record: the '731 patent itself, including the claims and the specification. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). Brunswick asserts a "spherical mass" necessarily includes the core of the sphere, especially where reference is made to the "center" of the spherical mass. Plaintiffs respond that the center of a spherical mass is a geometric position, not a tangible, physical object. Thus, a hollow sphere still has a geometric center at the point where the radii (extending in from the surface of the sphere) converge. Moreover, plaintiffs argue that the '731 patent elsewhere identifies the spherical mass as "mass 12" and the weight...
The term "spike" appears in the claims recited in the ‘592, ‘862 and ‘866 patents, and throughout the Common Specification. Alaris proposes that the term "spike" be defined as: "An elongated structure having a pointed tip for piercing the seal. The pointed tip may be sharp or slightly rounded." ICU proposes the broader definition, "an upward projection."

In terms of its focus on a pointed tip and the purpose of piercing, the definition proposed by Alaris comports more closely with the ordinary meaning of the word. "spike." However, as Phillips instructs, in construing a disputed term the court must look to the specification to see whether a different or more specific meaning is given to the term therein. In fact, the specification repeatedly and uniformly describes the spike as a pointed instrument for the purpose of piercing a seal inside the valve. For example, under the section entitled "Background of the Invention," the Common Specification states that "[t]his invention relates … [a] two-way valve … which includes a seal which, upon being compressed by the medical implement, is pierced to open the valve." ‘862 Patent at 1:18-25. 1 Under, the section entitled, "Summary of the Invention," the Common Specification states that "[a] two-way valve is employed utilizing a reusable seal that may be repeatedly pierced by an enclosed, protected, non-metallic spike rather than an exposed needle." Id. at 2:40-43. Under the section entitled "Operation," the Common Specification states that the "nose of the medical implement is inserted into the valve …, pushing the nose against the seal to compress the seal sufficiently to allow the tip of the spike to pierce the seal …" Id. at 14:67-71. Furthermore, all of the figures in the Common Specification that depict a spike portray it as elongated and pointed, and the two figures that show an activated valve show the spike piercing the seal. Nowhere in the Common Specification is piercing described as optional, or is any non-piercing item described as a spike. The Summary of the Invention also states that the "tip [of the spike] may be sharp or slightly rounded." Id. at 3:10.

1 Except where otherwise noted, all references herein to the Common Specification shall be to the ‘862 patent.

Nevertheless, ICU contends that the Common Specification discloses a wider array of possible spikes, of which the pointed piercing version is only one, albeit the preferred, embodiment. However, ICU's position finds little support in the Common Specification. ICU argues, for example, that claim 1 of the ‘866 patent, which recites "a spike having a tip, at least one hole located at or near said tip," describes a spike that is flat on top instead of being pointed. ‘866 Patent at 15:36-37. But Alaris's definition, which includes the sharp or slightly rounded' language from the Common Specification, does allow for the possibility of a hole at the tip of the spike. Moreover, as Alaris notes, spikes featuring an angled tip allowing for a hole at the end while still having an acute tip were well-known at the time the original patents were filed in the early 1990's.

ICU devotes considerable attention to a single instance in the Common Specification in which the preferable distance from the spike tip to the lip of the housing is said to be approximately from 0.525" to 0.1". ‘862 Patent at 8:28-29. According to ICU, focusing on the longer end of this range, the Common Specification discloses a short, "stubby" spike that would be incapable of piercing or even reaching the seal. This argument fails for three reasons. First, in the context of a patent that repeatedly and consistently describes and portrays the operation of the patented device in terms of the piercing function of the spike, it is not reasonable to expect that even a person skilled in the art would be able to extrapolate from a single reference to a particular dimensional range a spike of a completely different purpose than that otherwise disclosed throughout the patent. Second, even if one were able to extrapolate the short, non-piercing spike from the reference to this dimensional range, it is not at all clear how such a spikes would operate or function in the context of the device disclosed. Finally, ICU's extrapolation of a short, non-piercing spike from the 0.525" to 0.1" range conflicts with another statement in the Common Specification, only two sentences later: "The spike tip is thus embedded in the seal cap prior to use or may be
approximately 0.025" distal the seal cap when the valve is in the closed position." Id. at 8:21-24. As Alaris correctly points out, the only way to reconcile the so-called short spike with the 0.025" distal requirement would be for the seal cap itself to be at the longer end of its range disclosed in the Common Specification, thereby closing the gap between the spike and the seal and preserving the critical piercing function of the spike. The Common Specification does not disclose an unpointed and/or non-piercing spike.,

ICU also draws attention to dependent claim 13 of the '592 patent, which recites, in relevant part, that the end of the spike 'is pointed so that it can pierce [the] seal." '592 Patent at 16:44-45. It argues that because this dependent claim recites the concepts of pointed and piercing, those concepts cannot be part of the proper construction of the term "spike" under the doctrine of claim differentiation. However, these concepts are not the only limitations contained in claim 13, which also requires that the end of the spike "enter into a portion of [the] medical implement when said medical implement is connected to [the] valve." Id. at 16:45-47. Because "pointed" and "piercing" are not the only differences distinguishing dependent claim 13, the claim would not be rendered superfluous by including these concepts in the construction of "spike." See, e.g., Kraft Foods Inc. v. Int'l Trading Co., 203 F.3d 1362, 1368 (Fed. Cir. 2000)("[T]hat the claims are presumed to differ in scope does not mean that every limitation must be distinguished from its counterpart in another claim, but only that at least one limitation must differ."). Moreover, dependent claim 13 was only added to the '592 patent in 2001, years after the filing date of the original patents, the issuance of the '866 and '862 patents, and the introduction of the allegedly infringing Alaris products.

The Common Specification clearly and uniformly describes a spike as having a pointed tip and being for the purpose of piercing the seal. Accordingly, the court finds that the proper construction for the term "spike" is "an elongated structure having a pointed tip for piercing the seal, which tip maybe sharp or slightly rounded."

B. Spike

Federal's proposed interpretation of the term "spike" is that a spike is "an elongated, pointed object, one end of which is sharp and strong enough to pierce a tire to allow air to escape and an opposite end of which is small enough to be inserted into the hole of the frame." In its briefs dealing with the renewed summary judgment motion, PMG does not appear to offer any contrary interpretation of that term. Nevertheless, this Court has reviewed that term under the Markman standards set forth above and finds that Federal's interpretation is supported by the evidence presented. Therefore, this Court interprets the term "spike" as being an elongated, pointed object, one end of which is sharp and strong enough to pierce a tire to allow air to escape and an opposite end of which is small enough to be inserted into the hole of the frame.

8. Claim 9, Element [c]: "an anchor spindle."

Preliminarily, the defendants correctly note that the claims use the terms "anchor spindle" and "locking spindle" in a manner different from the specification. The specification describes the anchor spindle 200 as the spindle that includes a head portion 230. Misaligning head portion 230 with slot 15 engages head portion 230 with inner surface of wall 10, thereby inhibiting removal of lock interface 55 from computer 5. '557 Patent, Col. 5 11.1-26. The specification further describes the "locking spindle" as the spindle that includes a locking pin 265. Subsequent insertion of locking pin 265 into slot 15 inhibits realignment of head portion 230 with slot 15.

The claim language describes the two spindles in precisely the opposite manner. Claim 9 recites a "locking spindle having a body portion and a head portion, said head portion having a peripheral profile complementary to said security slot, said head portion adapted for insertion into and withdrawal from said slot when in a first position and for engagement with an interior surface of said wall when in a second position such that said head portion is associated with said portable device while in said second position." '557 Patent, Claim 9, Element [b] (emphasis added). Likewise, claim 9 includes "an anchor spindle having a body portion and an anchor portion, said anchor portion adapted for insertion into and withdrawal from said slot..."
when said head portion of the locking spindle is in said second position, said anchor portion inhibiting transition of said head portion from said second position to said first position, and said anchor spindle body portion adapted for association with said locking spindle body portion." '557 Patent, Claim 9, Element [c] (emphasis added).

Notwithstanding the transposition of the terms "anchor" and "locking," the court defines "spindle" according to its ordinary meaning. The term "spindle" is defined as "any shaft, rod or pin that turns around or on which something turns, as an axle, arbor, or mandrel." The balance of the language of the claim limitation sufficiently defines the anchor spindle such that the claim terms need no further definition.

3. "Spiral installation drive surface"

"Spiral" means a three-dimensional curve that turns around an axis at a fixed or varying distance.

The parties do not dispute the meaning of "installation drive surface." The dispute is whether the term "spiral," found in Claim 1, means rounded or helical.

The court concludes that spiral is used according to its ordinary definition, cited above. The term helical is impermissibly narrow; a helix describes a type of spiral that turns around an axis at a constant diameter, whereas the term spiral can also encompass a three-dimensional curve that turns around an axis at a varying distance. Palmetto attempts to narrow the definition by citing what appear to be helical drive surfaces depicted in Figure 4. There is no indication that the patentee intended the claims and the embodiments to be strictly coextensive; rather, Figure 4 is exemplary in nature. 420 Patent, col. 7, lines 19 (illustrating "one embodiment"). As such, the court declines to depart from the ordinary meaning of "spiral" and impose a limitation on the term based on one figure disclosed in the specification. Gart, 254 F.3d at 1342; Phillips, 415 F.3d at 1323. As to NPI's proposed definition, the court finds no support in the intrinsic evidence that the patentee intended to act as his own lexicographer in defining "spiral" to mean round.

a. "elongated spokes"

The parties first ask the court to construe the following terms: "spoke," "spokes" and "elongated spokes." Plaintiff defines "spoke" as "any of the braces or bars extending between the hub and the rim of a wheel," and "spokes" to mean "more than one spoke." (Pl.'s Br. at 5.) Plaintiff also proposes construing the term "elongated spokes" as "separate, individual spokes that are spaced apart to inherently define a radially extending opening between the spokes." (Id.) Plaintiff further contends that these elongated spokes are indirectly connected to the rim by a separate connecting member and, therefore, do not extend all the way to the rim. (Id.)

Defendants disagree, and contend that "spokes" are defined as "rods or braces that carry forces between the rim and the hub and extend from the rim to the hub." (Defs.' Br. at 8.) Defendants also assert that the "spokes" of Claim 1 need not have a particular shape." (Id. at 13-14.) Furthermore, Defendants claim that "the '194 Patent does not require removing the material [webbing] between the spokes." (Id. at 14.)

As an initial matter, "spokes" and "elongated spokes" have the same meaning. After reviewing the '194 Patent specification, the court notes that "elongated spokes" and "spokes" are used interchangeably by the patentee. Accordingly, the court interprets "spokes" and "elongated spokes" as having the same meaning.

As for the construction of "spoke," the court finds persuasive Defendant's contention that "spokes" are most properly defined as "rods or braces that carry forces between the rim and the hub." 3 Defendants' proposed construction of the definition and function of "spokes" is supported by the '194 Patent specification, which states in relevant part:
Spokes displaced from a radial line carry wheel torque loads as tensile stress. This is beneficial because the spokes are very strong in tension. If spokes were located on a radius, torque loads would be carried as bending stress on the spokes. The spokes are very weak bending in the circumferential (wheel torque) direction.

('194 Patent, col. 3, lns. 64-67; col. 4, lns. 1-2.) This paragraph, when read in conjunction with Figures 2, 3, 4 and 5 regarding both embodiments in the '194 Patent specification, shows that the spokes' specific function is carrying forces (wheel torque loads) between the hub and the rim of the wheel. The court therefore agrees with Defendants' proposed construction of "spokes."

--- Footnotes ---
3 Spokes, however, are not the only structures that carry forces between the rim and the hub. The flanges, though not a part of the spoke arrangement, also provide a force-carrying function between the rim and the hub of the wheel.

--- End Footnotes ---

The court also agrees with Defendants' claim that the spokes need not have a particular shape; in that the spokes need not "have a long and narrow shape." Indeed, the patent specification itself clearly states that "the present invention is not limited to . . . spokes that are substantially longer than they are wide." ('194 Patent, col. 5, ln. 51-53.)

--- Footnotes ---
4 In the joint claim chart, Plaintiff proposes such a construction, though Plaintiff appears to abandon this argument in its brief.

--- End Footnotes ---

The court does find, however, that the two elongated spokes of each spoke arrangement must be spaced apart by a radially extending opening. Both Figures 2 and 3 of the '194 Patent show an extended opening between two elongated spokes of the spoke arrangement. The extent of the opening is determined by the width of the cross-bar that connects the inner ends of spokes, which can be seen in both Figures 2 and 3. The specification itself frequently refers to the spokes as "two spokes," ('194 Patent, col. 3, lns. 15, 18), "spoke pairs," (id. at col. 5, lns. 11-12, 18-19, 33, 52), and "individual spokes," (id. at col. 5, lns. 42-43).

Moreover, the '194 Patent emphasizes the importance of having the spokes straddle the radius:

[I]t should be noted that the spokes 32a, 32b of each pair[] extend inward from rim 26 on either side but not along a radius of rim 26. Rather they straddle a common radius, preferably in approximate parallel relationship with the latter and, at the same time, they straddle the axis of rotation of the rim. This is important for the following reasons. Spokes displaced from a radial line carry wheel torque loads as tensile stress. This is beneficial because the spokes are very strong in tension. If spokes were located on a radius, torque loads would be carried as pending stress on the spokes. The spokes are very weak in bending in the circumferential (wheel torque) direction.

('194 Patent, col. 3, lns. 58 - col. 4, lns. 2.) As Plaintiff argues, if the two spokes were connected by webbing, instead of being spaced apart by a radially extended opening, that webbing would sit on the radius of the rim and frustrate this important goal.

The patent specification also implies an opening between the spoke pairs by referring to the cross-bar as connecting the inner ends of the two spokes. ('194 Patent col. 3, lns. 15-18 ("[E]ach spoke arrangement is an integrally formed unit which includes two spokes . . . joined together at their radially inner ends by a cross bar . . . "); id. at col. 5, lns. 11-14 ("[E]ach arrangement includes two spokes . . . having inner ends joined to one another by a cross-bar . . . "). Plaintiff submits that "[i]f the two elongated spokes were already connected by full webbing, there would be no need to connect their ends with a cross-bar." (Pl.'s Br. at 8.) The court finds these arguments persuasive, and will construe the spokes as being spaced apart by a radially extending opening.
Finally, the parties contest whether the spokes must extend from the hub to the rim. Defendants claim that "[t]he spokes must extend from the rim to the hub," (Defs.' Br. at 8), while Plaintiff contends that "[n]othing in the '194 Patent explicitly or implicitly requires that the . . . elongated spokes must extend all the way to the rim," (Pl.'s Br. at 8). Defendants rest their argument on Figure 5, which depicts a spoke with length "l" extending the full length between the hub and the rim, and on subsection (c) of Claim 1, which calls for a "means for connecting the outer ends of said spokes to said rim." (Defs.' Br. at 8; '194 Patent col. 6, lns. 13-14.) Defendants argue that if a spoke does not extend all the way to the rim, that spoke could not be "connected" to the rim. Defendant's position is not supported by the patent specification.

The '194 Patent does not require, by implication or otherwise, that a spoke must come into direct contact with the rim. While it is true that the spokes must be connected to the rim, subsection (c) of Claim 1, construed below, provides the means to do so. The means may simply be a bolt, weld or similar fixed connection, if the spoke itself extends to the rim, but it may also be a flange to which the spoke is attached, combined with a bolt, weld or similar fixed connection, allowing the spoke to come into contact with the rim indirectly. Figures 5 and 3 illustrate this point. In Figure 5, the spoke is defined with a length "l" that extends from the hub to the rim. In that case, the only connecting means required would be a bolt, weld or similar fixed connection affixing the spoke to the rim directly. Figure 3, however, shows a spoke with length "l" that extends less than the full distance to the rim, i.e., only to the flange. In this illustration, it is the flange that provides a means to connect spoke to rim.

Defendant's proposed construction would exclude the preferred embodiment shown in Figure 3. 5 "A claim interpretation that excludes a preferred embodiment from the scope of the claim 'is rarely, if ever, correct.'" Globetrotter Software, Inc. v. Elan Computer Group, Inc., 362 F.3d 1367, 1381 (Fed. Cir. 2004) (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996)). Accordingly, the court rejects Defendants' proposed construction, and finds that "spokes" need not extend from the hub to the rim.

--- Footnotes ---

5 The court rejects Defendants' unsupported conclusion that Figure 3 "is not an embodiment claimed by the '194 Patent." (Defs.' Reply at 8 n.3.)

--- End Footnotes ---

2. Claim 9

The parties have submitted the following phrase in Claim 9 of the '596 Patent for construction by the court (phrase for construction is underlined; phrases already construed in Claim 1 are italicized):

A wheel support assembly adapted to bolt to a vehicle axle for supporting a tire, said assembly comprising: a) an outer annular rim having an outer annular surface configured to support a tire and inner annular surface; b) a hub adapted to mount to the end plate of a vehicular axle, said hub having a plurality of bars which have outwardly-most extending ends, each end of which displays a predetermined curvature, said bars being connected to one another to form a hub body defining (1) a common center point and (2) an overall contact face defined in part by said bars; the contact face including outwardly-most extending ends corresponding to the ends of said bars and displaying predetermined curvatures corresponding to the outwardly-most extending ends of said bars, the predetermined curvatures of the ends of said contact face displaying the radii of curvature smaller than the distance from said center point of the contact surface to the outwardly-most extending ends of said bars; each of said bars having a through hole (1) which is adapted to receive an axle bolt and (2) which extends in a direction perpendicular to said contact face such that, when the wheel structure is mounted to said vehicular axle, said contact surface is contiguous with the axle end plate; and c) a plurality of spoke arrangements each having an outer end and an inner end[,] said outer end adapted to connect to said rim, and said inner end adapted to connect to said hub.

The parties agree that "spoke arrangements" are "rods or braces extending between the rim and the hub of the wheel." ('596 Patent JCC at 6.) The parties disagree, however, on whether "spoke arrangements" must contain multiple spokes.
Defendants contend that "[t]he '596 Patent, by incorporation of the '194 Patent, defines 'spoke arrangements' to require multiple spokes." (Defs.' Mot. at 25.) Defendants support their argument by submitting that "[t]he patentees chose to employ the term 'spoke arrangements' rather than the term 'spokes,'" (id.), and that Plaintiff "improperly attempts to convert that claim limitation into a 'plurality of spokes,'" (Defs.' Reply at 12). Furthermore, Defendants argue that, by definition, "one needs more than one spoke in order to 'arrange' those spokes." (Defs.' Mot. at 25.) Defendants therefore submit the following proposed construction: "a number of arrangements each of which is comprised of at least two spokes where the spokes of the arrangement reach from the hub to the rim." (Id.)

Plaintiff, however, argues that "[e]ach 'spoke arrangement' does not require 'at least two spokes where the spokes of the arrangement reach from the hub to the rim.'" (Pl.'s Br. at 31.) Plaintiff points out that "[n]owhere in the intrinsic evidence, including the specification of the '596 Patent, is the phrase 'at least two spokes' found." (Id. at 33.) While Plaintiff concedes that the '596 Patent incorporates the '194 Patent by reference, Plaintiff claims that the '596 Patent "did not limit the claims in the '596 Patent to any specific wheel assembly structure." (Id.)

The '596 Patent specification does incorporate the '194 Patent by reference: "[t]he present invention relates generally to wheel support assemblies for vehicular tires and more particularly to the center hub portion thereof, especially one of the design disclosed in Assignee's Fitz et al U.S. Pat. No. 6,042,194 which is incorporated herein by reference." ('596 Patent, col. 1, Ins. 6-10.) The '596 Patent incorporates the '194 Patent both as an example of a wheel that would benefit from the '596 Patent, and to emphasize that the '596 Patent hubs can be made of stamped sheet metal according to the '194 Patent. ('596 Patent, col. 3, Ins. 41-46.)

Although the '596 Patent incorporates the '194 Patent, it does not do so to define the term "spoke arrangements." in the '596 Patent. 10 No language in the '596 Patent specification supports this contention, and the term, "spoke arrangements" has not been specifically defined in the '596 Patent. Advanced Display Sys. v. Kent State Univ., 212 F.3d 1272, 1282 (Fed. Cir. 2000) (indicating that to incorporate material by reference, the host document must identify with detailed particularity the specific material it is incorporating and clearly indicate where that material is found in the documents); see also In re Seversky, 474 F.2d 671, 674 (C.C.P.A. 1973).

Absent an express patent definition, terms expressed in general descriptive words in a claim are to be given their ordinary meaning. Renishaw PLC v. Marposs Societa' Per Azioni, 158 F.3d 1243, 1249 (Fed. Cir. 1998); CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1367 (Fed. Cir. 2002). Dictionary definitions may be used to establish a claim term's ordinary meaning. Renishaw PLC, 158 F.3d at 1249; Rexnord Corp., 274 F.3d at 1344. The construction must be true to the claim language and naturally align with the patent's description. Renishaw PLC, 158 F.3d at 1250; see also Young Dental Mfg. Co., Inc., v. Q3 Special Prods., Inc., 112 F.3d 1137, 1142 (Fed. Cir. 1997).

The parties agree that spokes are "rods or braces extending between the rim and the hub of the wheel." ('596 Patent JCC at 6.) The ordinary definitions of the word "arrangement" are "the act or process of arranging or being arranged," "the condition of being arranged," and "the manner in which a thing is arranged." The Oxford Dictionary and Thesaurus 1470 (Am. ed. 1996). The word "arrange" is ordinarily defined as "put into the required or suitable order." Id. Accordingly, the term "spoke arrangements" can be construed as the "proper order of each of the bars running from the hub to the rim of a wheel." Nothing in either this ordinary dictionary definition or the intrinsic evidence precludes Plaintiff's construction, in which each "spoke arrangement" can consist of either a single spoke or a set of multiple spokes in between the hub and the rim of a wheel. Accordingly, the court finds that each "spoke arrangement" need not contain multiple spokes, and rejects Defendants' proposed construction.

GO BACK
In the underlying patent litigation, this Court construed the term "spool tree" to mean "a tree having no internal valves." In the License Agreement, the parties agreed that the scope of the patent claims "shall be governed by the claim construction decision of Judge Atlas dated May 9, 2002." See License Agreement, P 10.7. Kvaerner argues that the arbitrator's decision that its Side Valve Trees infringe the '119 Patent was in manifest disregard of the Court's claim construction.

Kvaerner argued during the arbitration that its Side Valve Trees included an "internal valve" and, therefore, did not infringe Cooper Cameron's '119 Patent. The arbitrator clearly recognized that this Court's claim construction was binding. See Hearing Transcript, Exh. K to Motion to Vacate, pp. 157, 169. Kvaerner argued that this Court's claim construction of "spool tree" limited infringement to those devices that contained no valves anywhere within the entire tree body. The arbitrator, noting that this Court in its full claim construction decision stressed that the '119 Patent features a horizontal tree design with no valves in the vertical bore, 3 rejected Kvaerner's argument and determined that "internal" valves for purposes of the Court's claim construction of "spool tree" were valves that are located inside the vertical bore. The arbitrator then, after receiving and considering evidence from both parties, made the factual finding that Kvaerner's Side Valve Tree did not contain internal valves because it does not have valves inside the vertical bore.

--- Footnotes ---
3 See, e.g., Memorandum and Order, [Doc. # 311] in Civil Action No. H-97-0155, p. 29 n. 38; p. 34.
--- End Footnotes ---

The arbitrator recognized and complied with his obligation to follow this Court's claim construction. The arbitrator, based on the Court's claim construction as set forth in the entire claim construction decision, understood that a "spool tree" for purposes of the '119 Patent was a horizontal tree design with no valves in the vertical bore. Based on the evidence in the record, the arbitrator found that Kvaerner's Side Valve Tree did not include a valve in the vertical bore and, therefore, was a "Licensed Product" for which Kvaerner owed royalties under the License Agreement. Kvaerner has not shown that this finding was based on a manifest disregard for the law.

---

"The construction of a patent, including the terms of art within its claim, is exclusively within the province of the court." Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 1386, 134 L. Ed. 2d 577 (1996). In determining the meaning of a claim, the court first examines the intrinsic evidence of the record, including the claims, specification, and the prosecution history. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). Intrinsic evidence is "the most significant source of the legally operative meaning of the disputed claim language." Id. at 1582. If the intrinsic evidence does not sufficiently resolve ambiguities, then the court may consider extrinsic evidence, including expert and inventor testimony, in order to arrive at a "proper understanding of the claims." Id. at 1583.

1. Intrinsic Evidence

a. Language of the Claims

HP first argues that the meaning of the phrase "spots of different sizes" as used in the claims of the '272 patent is ambiguous. They contend that the term "spot" can mean either a light spot generated by the laser beam or a discharged region on the
PB responds that the claim language clearly indicates the term "spots" means "discharged regions on the photoreceptor which attract toner." They argue that the claims reveal that "spots of different sizes" give rise to "generated shapes" which have the appearance of "smoothed edges." They contend that since "a single laser beam projected spot . . . will not result in generated shapes having the appearance of smoothed edges," the word "spot" must refer to discharged areas on the photoreceptor.

Interpreting the claim language is of primary importance. The "language of the claims frames and ultimately resolves all issues of claim interpretation." Abtox, Inc. v. Exitron Corp, 122 F.3d 1019, 1023 (Fed. Cir. 1997). Claim terms are to be given their ordinary and customary meaning, unless it is apparent that the inventor expressly intended a different meaning. Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578 (Fed. Cir.), cert denied, 519 U.S. 911, 117 S. Ct. 275, 136 L. Ed. 2d 198 (1996). When reviewing claim language, a court must apply the "normal rules of syntax" and consider the context of the claim. Eastman Kodak Co. v. The Goodyear Tire and Rubber Co., 114 F.3d 1547, 1553 (Fed. Cir. 1997).

In the instant case, the plain language of the claims does not unambiguously support either proposed definition of the phrase "spots of different sizes." As used in the claims of the '272 patent, the term "spot" could mean either light spots or discharged areas on the photoreceptor. The relevant dictionary definition for the word "spot" is "any small portion of a surface differing from the rest." See Funk and Wagnall, Standard College Dictionary (1963). This definition alone does not differentiate between the two proposed definitions. Additionally, applying the normal rules of syntax to the claims do not clearly delineate the meaning of the word. For example, the phrases "each beam of light generating a spot" and "controlling a parameter of the light beams to produce spots of different sizes" could be construed to mean either spots of light or discharged areas on the photoreceptor.

Further, PB's assertion that shapes with smoothed edges can not be generated by light spots is not determinative of the meaning of the terms "spots." The claims are not directed toward the generated shapes themselves, but rather a method of making those shapes (Claims 1 and 2) or an apparatus for generating those shapes (Claim 3). The formation of different sized light spots is the first step in the process which gives rise to the shapes. Thus, the shapes are generated by the formation of light spots.

The claim language does not plainly reveal whether the term "spot" means a light spot or a discharged area on a photoreceptor. Since the language of the claims is ambiguous, we turn to an analysis of the specification, "which is the single best guide to the meaning of a disputed term." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996).

b. The Specification

HP next argues that the specification of the '272 patent "clearly uses the word spot to refer to a light spot." They point to numerous instances where the specification "refer[s] to [the] motion of a spot, a property . . . certainly not possessed by an exposed region on a photoreceptor."

PB replies that the word spot has two different meanings in the specification. They claim that "up to column 5, line 62, the terms 'spots' is used in the specification to refer to the laser light beam spot." However, PB argues that "there is a clear transition in the context and usage of spots" after that point. They argue that after column 5, line 62, the term spots is used to refer to discharged areas on the photoreceptor, and this definition should be applied when interpreting the claim language.

After reviewing the claim language, the court must review other parts of the patent document, including diagrams or figures, which are collectively referred to as the specification. Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 1387-88, 134 L. Ed. 2d 577 (1996); see also Al-Site Corp. v. Bonneau Co., 22 F.3d 1107 (Fed. Cir. 1994). "The specification contains a written description of the invention that must enable one of ordinary skill in the art to make and use the invention. For claim construction purposes, the description may act as sort of a dictionary, which explains the invention and may define terms used in the claims." Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995) (internal citations omitted). Although "inventors may be their own lexicographers, they must use words in the same way in the claims and in the specification." Fonar Corp., v. Johnson and Johnson, 821 F.2d 627, 632 (Fed. Cir. 1987). When a patentee uses "words which were defined in the specification," they "must be given the same meaning when used in the
claims.” McGill Inc. v. John Zink Co., 736 F.2d 666, 673 (Fed. Cir. 1984). A court reviews the patent specification to
determine whether the patentee "used any terms in a manner inconsistent with their ordinary meaning." Vitronics Corp. v.
Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996).

In the instant case, the specification of the '272 patent indicates that the word "spot" means a spot of laser light. The word
"spot" is used 44 times in the specification. PB concedes that 42 of the 44 times the word "spot" is used it refers to the light
spot created by the laser beam. Their assertion that the remaining two uses of the word "spot" require a different definition
is incorrect. Specifically, they refer the court to the following section:

The use of different spot sizes can effectively be employed as letters or numbers are created so as to avoid roughened
dges and improve character formation. The system of this invention can also employ two power sources using parallel laser
beams with each of the beams being of a different diameter and corresponding spot size. This will provide a matrix of dots
having different sizes for forming a single generated character. The different dot size will intermesh to create letters and
numerals having smoother appearance.

When read in light of the entire specification, this section is consistent with the word spot meaning a spot of laser light. PB's
invention does employ light spots to form generated characters. The characters are not formed directly by the light spots
themselves, but by the discharged areas on the photoreceptor subsequently created by the light spots. The discussion in the
cited section above is fully consistent with this interpretation. It discusses how the laser beams create spots which "in turn
provide a matrix of dots." These "different size dots intermesh to create letters and numeral having a smoother appearance."

Read in its entirety, the specification of the '272 patent indicates that the word "spot" means a light spot. Since inventors
"must use words in the same way in the claims and in the specification," it is logical to conclude that the word spot also
means a light spot when used in the claims of the '272 patent. Fonar Corp. v. Johnson and Johnson, 821 F.2d 627, 632 (Fed.
Cir. 1987); see also McGill Inc., v. John Zink Co., 736 F.2d 666, 673 (Fed. Cir. 1984) (holding that words defined in the
specification must be given the same meaning when used in the claims). 2 Allowing PB to employ two different definitions
for the same word in a single specification would undermine the requirement that the claims clearly "demarcate the

2 PB also argues that interpreting the word spot to mean light spot would exclude the preferred embodiment from being
covered by the claims of the '272 patent. Specifically, they contend that varying the intensity of the laser beam, which is the
preferred embodiment as recited in claim 2, "does not change the size of the diameter of the projecting laser beam light
spot." However, the court's determination that "spot" means "light spot" does not invalidate or exclude any claim of the '272
patent. One common convention in the digital printing field is to define the size of a light spot as the area of light where the
intensity exceeds a fixed threshold. Under this definition, the size of a projected light spot would change when the intensity
of a light beam is varied. Thus, the preferred embodiment as recited in claim 2 is encompassed by the court's claim
construction and no new limitations have been introduced. See Eastman Kodak Co. v. The Goodyear Tire & Rubber Co.,
114 F.3d 1547, 1556 (Fed. Cir. 1997) (courts should seek to interpret claims to preserve, rather than defeat, their validity).

c. The Prosecution History

HP further argues that the prosecution history of the '272 patent supports the assertion that the word spot means a light spot.
Specifically, they point to the fact that the examiner amended the title to include the term "Light Spots." They contend that
this fact provides further support for the conclusion that the word spot in the '272 patent means a light spot.

PB responds that a change of title does "not cast doubt on the meaning of the claim language." They argue that there "is no
requirement that the title describe all embodiments an invention."

The undisputed public record of the proceedings in the PTO is of primary importance in understanding the claims. Markman
v. Westview Instruments, Inc., 52 F.3d 967, 980-81 (Fed. Cir. 1995). The file history can function to limit claim construction
so as to exclude any interpretation which was disclaimed during prosecution. Southwall Technologies, Inc. v. Cardinal IG

In the instant case, the prosecution history is consistent with the conclusion that the word "spots" means "light spots" in the '272 patent. According to Patent Office procedure, "where the title is not descriptive of the invention claimed, the examiner should require the substitution of a new title that is clearly indicative of the invention." M.P.E.P. § 606.01 (1979). After evaluating the application, the examiner was in the best position to fully understand the nature of the invention and the meaning of the terms used in the patent. It is relevant that he chose to modify the noun "spots" with the adjective "light." This is reflective of his understanding that the word "spots" means "light spots" in the '272 patent.

2. Extrinsic Evidence

The court concludes that the use of extrinsic evidence is unnecessary in this case. Extrinsic evidence may be evaluated "in order to aid the court in coming to a correct conclusion as to the true meaning of the language employed in the patent." Markman v. Westview Instruments, Inc., 52 F.3d 967, 981 (Fed. Cir. 1995) (internal citations omitted). However, "reliance on such evidence is unnecessary, and indeed improper, when the disputed terms can be understood from a careful reading of the public record." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1584 (Fed. Cir. 1996).

In this case, the meaning of the phrase "spots of different sizes" can be understood from a careful reading of the claims, the specification, and the prosecution history. Accordingly, consideration of extrinsic evidence is unnecessary and improper.

* * *

CONCLUSION

For the foregoing reasons, the court concludes that the phrase "spots of different sizes" as used in the '272 patent means light spots of various sizes. Since it is undisputed that the accused devices do not employ light spots of different sizes, the defendant's motion for summary judgment (document no. 178) is GRANTED.

GO BACK

3752

A. Spots of Different Sizes

The term "spots of different sizes" is used in both Claim 1 and Claim 3 of the 272 patent. Hewlett argues that the term "spots of different sizes" must be construed by the court because, although the Federal Circuit specifically construed this phrase, it did not address how the specific size of a single spot is determined in order to determine if the spots are of different sizes. Pitney responds that the Federal Circuit has already defined "spots of different sizes" and that its definition should be adopted.

In 1997, Hewlett filed a motion for summary judgment in which it argued that the accused Hewlett products do not meet the "spots of different sizes" limitation because "spots" should be interpreted to be "light spots" rather than areas of discharge on the photoreceptor. Judge Covello granted the motion, agreeing that "spots" should be limited to "light spots." Pitney II, 69 F. Supp. 2d at 328-31. The Federal Circuit vacated Judge Covello's ruling, finding that he had misconstrued the claim term "spots of different sizes." Pitney III, 182 F.3d at 1313. "The dispute centered on whether the term spots of different sizes ' refers to the spots of light generated by the light beam on the photoreceptor . . . or describes the spots of discharged area on the photoreceptor that result from contact with the light beam . . . " Id. at 1303.

In construing the term, the Federal Circuit found that the term "spot" was used in several portions of the patent and the meaning varied depending on its use."Where the language of the written description is sufficient to put a reader on notice of the different uses of a term, and where those uses are further apparent from publicly-available documents referenced in the patent file, it is appropriate to depart from the normal rule of construing seemingly identical terms in the same manner." Id. at 1311. The Federal Circuit found that, in the context of the prosecution history, a reader was on notice that the term "spot" has different meanings in the written description depending on its context. Id. Turning to the disputed part of the written
description, the Federal Circuit found that "spot size" means "the area of discharge on the photoreceptor." Id. The court held "that the 'spots' that can be of different sizes' are the spots of discharged area on the photoreceptor, not the spots of light produced by the laser beam." Id. at 1313.

Hewlett argues that the Federal Circuit's definition does not assist the fact finder in determining whether a given method or apparatus produces 'spots of different sizes' because it does not address how to determine the size of a spot. According to Hewlett, most laser printers do not print with discrete, circular spots—they print with line segments. Hewlett argues that if Pitney's definition is adopted, the fact finder will not know, for example, whether each line segment is a single spot or each line segment is comprised of a number of spots.

Pitney responds that, although the Federal Circuit did not expressly address the actual size of the claimed "spots of different sizes," its definition is sufficient to define the term. Pitney thus proposes that "spots of different sizes" are "spots of discharged area on the photoreceptor that make up the generated shapes, which have the appearance of smoothed edges." According to Pitney, the 272 patent teaches how to combat the problem of "jaggies," which results from using similarly sized toner spots. In order to combat the problem of "jaggies," a printer must be able to produce spots that are smaller than the nominal spot size for that printer. The nominal spot size is based on the number of spots the printer prints per inch. For example, a 300 dpi printer prints a 300 spots per inch. To smooth "jaggies," such a printer must be able to print spots smaller than the spot necessary for a 300-spots-per-inch spot. Thus, according to Pitney, the meaning of "spots of different sizes" is clear from the Federal Circuit's definition.

In both Claim 1 and Claim 3, "spots of different sizes" are produced by the method or apparatus for the purpose of providing the appearance of smoothed edges. Neither of the claims limit how the size of the spot is determined. Thus, the ordinary meaning of "spots of different sizes" is simply spots that differ in size, regardless of the method used to determine that the sizes are different.

Neither the specification nor the prosecution history of the 272 patent limit how the size of the spot is determined. However, Pitney did limit the determination to some extent during the prosecution history of the 021 patent. It is appropriate to consider the prosecution of related applications in construing terms common to both the patent under consideration and the related application. Jonsson v. The Stanley Works, 903 F.2d 812, 818 (Fed. Cir. 1990). The disclosure about "spots of different sizes" in the specification of the 272 patent was carried forward into the specification of the 021 patent. Therefore, the prosecution history of the 021 patent and any construction of the term "spots of different sizes" contained in the 021 patent are appropriately considered in construing this claim.

The PTO granted a request for reexamination of the 021 patent based, at least in part, on the existence of IBM's Sharp patent. Declaration of Perry M. Goldberg in Support of Hewlett-Packard Company's Opening Mem. Regarding Claim Const. Issues, Dkt. No. 267 [hereinafter HP Ex.], Ex. M at 2. The Sharp patent discloses a method and apparatus for increasing the resolution of an image by using fiber optics to direct beams of light to a film photoreceptor. U.S. Patent No. 3,573,789 ("Sharp patent"), HP Ex. C. Through a "Resolution Expander," data bits, or pixels, are expanded into several data bits, or sub-pixels. Sharp pat., col. 5, 11. 60 - col. 6, ll. 2. Thus, the printer is no longer only limited to filling all or none of an original pixel. A fraction of the area of the original pixel can be filled, resulting in improved resolution.

In the reexamination of the 021 patent, Pitney argued that the Sharp patent did not disclose the use of "dots of different sizes." According to Pitney, the term "dots" means the basic, unitary elements comprising the printed characters or image and the basic, unitary element disclosed in the Sharp patent is a sub-pixel that is 1/4 an original pixel. Pitney argued that groups of sub-pixels could not be considered "dots of different sizes" because they were merely groupings of the same sized dots.

The examiner found that Sharp does use dots of different sizes because, when compared with the size of the original pixel, the sub-pixels were a range of four different sizes: 1/4 dot, 1/2 dot, 3/4 dot, and full dot. Pitney appealed and the Board of Patent Appeals and Interferences found that Sharp could not be considered to have dots of different sizes because the term "dots" is used with regard to the different sizes of the basic printing units. Pitney thus admitted, and the Board of Patent Appeals agreed, that the 021 patent is devoid of any suggestion that different groups of same-sized dots are to be considered dots of different sizes. The court concludes that a grouping of same sized spots that creates a larger spot is not a spot of a different size for purposes of the 272 patent.
Beyond this limitation, Hewlett argues that the size of each spot should be defined by reference to the basic, unitary elements in the on-off signal that make up each image. However, because the 272 patent discloses a method and apparatus for varying spot sizes by varying the intensity, time, or beam diameter of the individual light beams that create the spots, Hewlett's proposed definition for determining whether spots differ in size is too limited. Other than the limit Pitney admitted in distinguishing the Sharp patent, nothing in the claims, the specification, or the prosecution history indicates that Pitney intended to limit the way the size of the spots is determined.

The court concludes that "spots of different sizes" are single spots, or areas of discharge on the photoreceptor, that differ in size. Such a difference in size is not caused by grouping together the same sized spots.

3753

ii. "A spring" is not limited to an elongated flexion spring

Claim 9 also recites that the contactor has "a spring." Perimeter, looking to the patent's Description, argues that the spring must be an elongated flexion spring. See '900 Patent col.6 1.39-42 ("The contactor . . . includes . . . an elongated flexion spring. . . ."); figs. 3, 8, 10. Claim 9, however, cannot be limited based solely on the preferred embodiment. See Ekchian, 104 F.3d at 1303; Intervet American, Inc., 887 F.2d at 1053. Indeed, the Summary indicates that the spring is not necessarily limited to an elongated flexion spring at all, remarking only that "the spring may be in the form of an elongated flexion spring. . .." '900 Patent col.11.64-65 (emphasis added).

The broader interpretation of "a spring" is further supported by the doctrine of claim differentiation. Here, claim 20, which is ultimately dependent on claim 9, reads as follows: "The device in accordance with claim 13 or 16 wherein the spring is an elongated flexion spring. . .." '900 Patent col. 12; 60-61. Claim differentiation is at its strongest "where the limitation sought to be 'read into' an independent claim already appears in a dependant claim." Seachange Int'l, Inc., 413 F.3d at 1368-69 (citing Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir. 2004)). Through the doctrine of claim differentiation, the term "a spring" as used in claim 9 is broad enough to cover various types of springs, while the spring recited in claim 20 is specifically an elongated flexion spring.

Claim 21, which includes "a contactor having an elongated flexion spring . . ." '900 Patent col. 13 1.5, provides additional evidence that claim 9 should not be limited to an elongated flexion spring. Although claim 21 is an independent claim, under the doctrine of claim differentiation "there is still a presumption that two independent claims have different scope when different words or phrases are used in those claims." Id. at 1369.

In addition to Perimeter's proposed construction with the spring and contact arm forming a unit, each party also provides an independent construction for "a spring." Invisible Fence proposes "[a] spring for biasing the battery toward the opening, or equivalent thereof," while Perimeter proposes "[a] spring for biasing the battery toward the opening and that spans between and connects with the ends of the contact arms at the base of the battery holder." (Joint Statement 4.)

Since both parties ostensibly agree that the spring is "for biasing the battery toward the opening," a point we discussed earlier, we include the limitation "for biasing the battery toward the opening" in our construction of "a spring."

Furthermore, Invisible Fence once again includes the phrase "or equivalent thereof" in its proposed construction of "a spring." We addressed this issue in regards to the construction of "a contactor," and for the reasons stated above, we decline to add "or equivalent thereof" to our construction of "a spring" as well.

Perimeter proposes that the spring "spans between and connects with the ends of the contact arms at the base of the battery holder." (Joint Statement 4.) Since we earlier concluded that the spring is not required to connect with the contact arms, we decline to include any reference to such a connection in our construction of "a spring." The language of claim 9, however, supports the inclusion of "at the base of the battery," as it provides that the spring is "located inside the battery holder between the base of the battery holder and the battery. . .." '900 Patent col. 11 1.37-38.
Insofar as Perimeter proposes in its construction of "a spring" that claim 9 requires a pair of contact arms, we decline to include this limitation for the reasons to be discussed infra.

(iii) Claim 15

Independent claim 15 contains the limitations: (1) at least one "clamping member," (2) "pivotally mounted," and (3) urged by a "spring" in a direction towards the opposing wall means and aperture to fixedly support a piece of string. (PX 3, col. 8). The parties appear to disagree as to the interpretation of "spring." Defendants argue that the word "spring" is ambiguous because it is so broad, encompassing any "elastic body or device that recovers its original shape when released after being distorted." (Def. PFFCL at 37 (quoting Webster's Third New International Dictionary (1993)). Hence, defendants argue, reference must be made to sources other than the claim itself, including the specification, and that the word "spring" in claim 15 refers to an extension or torsion spring, not to any kind of spring. (Id. at 37-38). In contrast, Kwik argues that the word "spring" is not to be limited by the specification, and contends that "'spring' certainly calls to mind a reasonably well defined structure, used in common parlance and by persons skilled in the art to designate structure." Hence, Kwik argues, "spring" refers to any spring, functioning in any way. (Pl. Reply to Def. PFFCL at 8-9).

I agree with defendants' proposed construction. The word "spring," by itself, is so broad as to be ambiguous. I do not believe that as used here it calls to mind a "reasonably well defined structure." Rather, many structures could serve as a spring, including structures made not from wire but from plastic. (See 10/21/04 Tr. at 81-84). Moreover, I accept defendants' expert's testimony that the rotational movement required of a pivotally mounted clamping member could only be accomplished with certain springs. Hence, I conclude that the reference to "spring" in claim 15 is to an extension or torsion spring.

E. "Spring-Biased Mechanism"

The term "spring-biased mechanism" is used in the independent claims, 1 and 32. Insight contends that the important meaning is that the spring is forcing or biasing another part or mechanism. Glock contends that the term means a system of parts that includes a spring "which exerts force on at least one of the other parts." SureFire contends that the term does not need to be construed because it is clear to one skilled in the art. Based on the interpretations proposed by Insight and Glock, they appear to agree that a spring-biased mechanism means the mechanism is in its forced state. Consonant with the terminology used in construing "positioning mechanism," "spring-biased mechanism" is a structure that includes a spring which is exerting force on at least one other part of the structure.

A. "Said Vertical Supports Spring-Biased So As To Maintain Said Vertical Supports and Said Platforms in a Parallelogram Configuration"

The two vertical supports, the floor platform, and the shoe platform form a parallelogram. There is a spring between the two vertical supports that causes the vertical supports to return more readily to a "neutral" or vertical position, in which the parallelogram is a rectangle. The Court construes the claim term "said vertical supports spring-biased so as to maintain said vertical supports and said platforms in a parallelogram configuration" to mean "a spring biased against the vertical supports that causes the vertical supports and the platforms to be maintained in a parallelogram configuration."
DISSENT

GAJARSA, Circuit Judge, dissenting.

The majority avoids the critical issue upon which this decision turns; i.e., whether 35 U.S.C. § 112, P 6 governs the claim construction of the "spring means" limitation. In a brief footnote, the majority sweeps and brushes aside the means-plus-function analysis as unnecessary in light of the "plain language of the claims." Maj. Op. 8 n.3. Without having analyzed the scope of the claims, the majority somehow concludes that the claim language covers only devices having separate "spring means" and "hinged arm" structures. Then applying this simplistic claim construction to analyze the sufficiency of the evidence, the majority improperly overturns the jury's verdict finding infringement. For these reasons, I respectfully dissent.

Although the majority ignores the issue completely, the parties have vigorously contested the claim construction of the "spring means" limitation and have made this issue the focal point of their legal position before the district court and this court. The limitation reads: "a spring means connected to said hinged arm for urging said guard along said needle cannula toward said second position." '544 patent, col.7 ll.33-35. The parties disagree over whether the "spring means" language should be construed as a means-plus-function limitation pursuant to § 112, P 6. The majority, however, dismisses the means-plus-function analysis entirely in a single footnote, asserting that the language of the claims is "unambiguous":

Tyco . . . contends that a separate spring is required because the spring means limitation is in means-plus-function format, see 35 U.S.C. § 112, P 6 . . . We need not reach this argument, however, because we conclude that--regardless of whether the asserted claims invoke section 112, paragraph 6--an added spring element is required by the plain language of the claims.

Maj. Op. 8 n.3. First, it is unclear what the majority means by "an added spring element." An "added spring element" does not appear in the "plain language of the claims," specification, or prosecution history of the patent. Second, claim construction is necessary to determine the scope of the claims. Markman v. Westview Instruments, Inc., 52 F.3d 967, 976 (Fed. Cir. 1995) (en banc), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). The majority opinion injects ambiguity into the claims and fails to construe the claims as required by our case law. See, e.g., Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005) (en banc); Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576 (Fed. Cir. 1996). It is impossible for the majority to determine the scope of the claims without undertaking a means-plus-function analysis. Accordingly, the majority's claim construction is premised upon an inadequate foundation.

If a claim element "contains the word means' and recites a function," there is a presumption that the claim is in means-plus-function format. Envirco Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 1364 (Fed. Cir. 2000). That presumption can be rebutted, however, if the claim also "recites sufficient structure to perform the claimed function." Id. If the claim term "is one that is understood to describe structure . . . [i]t is simply a substitute for the term means for." Lighting World, Inc. v. Birchwood Lighting, Inc., 382 F.3d 1354, 1360 (Fed. Cir. 2004).

To determine whether the claim term should be construed as a means-plus-function limitation, we begin by evaluating how the term "spring" is used in the specification and the intrinsic record. Phillips, 415 F.3d at 1315 ("[T]he specification is always highly relevant" and is "the single best guide to the meaning of a disputed term"). Next, the court should consider whether the "spring means" limitation contains additional structure to rebut the means-plus-function presumption. See Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1427 (Fed. Cir. 1997) (holding that where a claim recites a function, but goes on to elaborate sufficient structure, the claim is not in means-plus-function format).

In this case, the written description defines the term "spring means" as a type of device that imparts a function of urging the safety guard toward the needle tip. A "spring" as defined in the written description denotes a type of device with a generally understood meaning in the mechanical arts. See Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996). Each embodiment described in the patent employs a type of spring; e.g., coil springs, plastic springs, hinged springs, and over-centered springs. '544 patent, col.3 ll.5-7; id. at col. 4 ll. 40-42; id. at col. 5 ll.9-16; id. at col.6 ll. 38-42. None of the embodiments employ any structure other than springs. Indeed, the patent contains no suggestion that the claims include urging mechanisms other than springs. Accordingly, the intrinsic evidence demonstrates that the '544 patent defines "spring
means" as a particular structure—a spring.

Next, the court in a proper claim analysis should consider whether the claims elaborate sufficient structure to rebut the means-plus-function presumption. The '544 patent claims state that the function of the "spring means" is for "urging the guard along said needle cannula." Id. at col. 7 ll.34-35. The claims go on to recite additional structure to achieve that function. Claim 1 recites "spring means connected to said hinged arm," id. at col.7 ll.34-35 (emphasis added), and claim 24 recites "spring means extending between said mounting means and said hinged arm," id. at col.10 ll.17-20 (emphasis added). Thus, the claim language demonstrates that the combination of the "spring means" and "hinged arm" perform the "urging" function. Accordingly, the claims include additional structural limitations to rebut the means-plus-function presumption.

Tyco obviously disagrees with this conclusion; however, its reliance on Unidynamics Corporation v. Automatic Products International, 157 F.3d 1311, 1314 (Fed. Cir. 1998) is unavailing. This court in Unidynamics applied § 112, P 6 to the claim limitation "spring means tending to keep the door closed." In that case, the patent's written description stated that "[t]he spring . . . is an example of spring means tending to keep the door closed." Id. at 1319 (emphasis added). Accordingly, the "spring means" was not defined solely as a spring structure, but as any type of structure to perform the function. Furthermore, the Unidynamics court noted that the claim language did not provide additional structure following the "spring means" language. Id. It merely recited a function of "tending to keep the door closed." Id. Therefore, the court there properly concluded that "spring means" was a means-plus-function limitation because neither the claim language nor the written description provided sufficient structure to rebut the § 112, P 6 presumption. Id.

In this case, however, the written description defines "spring means" as a spring structure. For example, each embodiment employs a spring structure; e.g., coil springs, plastic springs, hinged springs, and over-centered springs. Unlike Unidynamics, the spring is not just an example of a spring means to perform the function; it is the only type of structure disclosed in the written description. Moreover, the claim language itself provides additional structure following the "spring means" language. For example, claim 1 recites "spring means connected to said hinged arm," '544 patent, col.7 ll.34-35 (emphasis added), and claim 24 recites "spring means extending between said mounting means and said hinged arm," id. at col.10 ll.17-20 (emphasis added). Unlike Unidynamics, the claim language itself includes additional structure; e.g., the hinged arm and mounting means—to perform the function of urging the guard along the needle cannula. Here, the means-plus-function presumption is rebutted and the claims should not be construed according to § 112, P 6. Therefore, the district court correctly construed the "spring means" limitation according to its ordinary meaning: "[t]he hinged arm is connected to a spring that moves the guard along the cannula toward the second position." Becton, Dickinson & Co. v. Tyco Healthcare Group, Tyco Healthcare Group, LP, No. 02-1694-GMS, 2004 U.S. Dist. LEXIS 18637, 2004 WL 2075413, at *4 (D. Del. Sept. 16, 2004).

The majority first approves of the district court's claim construction, see Maj. Op. 8-9, but then proceeds to improperly import an extraneous limitation into the claims, which is contrary to our case law. See Comark Commc'ns, Inc. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998). The majority asserts that "the unequivocal language of the asserted claims of the '544 patent requires a spring means that is separate from the hinged arm" because they are written as separate limitations in the claim language. Maj. Op. 9. However, the unequivocal language articulates no requirement for separate structures. It merely recites "a spring means connected to said hinged arm for urging said guard along said needle cannula toward said second position." The majority's limitation requiring two separate structures is not supported anywhere in the intrinsic or extrinsic record. Such a claim interpretation violates our established tenants of claim construction prohibiting the court from reading extraneous limitations into the claims. E.I. du Pont de Nemours & Co. v. Phillips Petroleum, 849 F.2d 1430, 1433 (Fed. Cir. 1998) ("It is entirely proper to use the specification to interpret what the patentee meant by a word or phrase in the claim . . . . But this is not to be confused with adding an extraneous limitation appearing in the specification, which is improper.") (citation omitted).

The majority relies on CAE Screenplates, Inc. v. Heinrich Fiedler GmbH & Co., 224 F.3d 1308, 1317 (Fed. Cir. 2000), which states that "we must presume that the use of . . . different terms in the claims connotes different meanings." (emphasis added). While this is correct, the majority fails to recognize that "the use of two terms in a claim requires that they connote different meanings, not that they necessarily refer to two different structures." Applied Med. Res. Corp. v. U.S. Surgical Corp., 448 F.3d 1324, 1333 n.3 (Fed. Cir. 2006) (emphasis added); see also Intellectual Prop. Dev., Inc. v. UA-Columbia Cablevision of Westchester, Inc., 336 F.3d 1308, 1320 (Fed. Cir. 2003). Indeed, it is well established that a single structure in an accused device may satisfy two different claim limitations. Intellectual Prop., 336 F.3d at 1320 n.9 ("[W]e
see no reason why, as a matter of law, one claim limitation may not be responsive to another merely because they are located in the same physical structure”); In re Kelley, 305 F.2d 909, 915-16, 49 C.C.P.A. 1359, 1962 Dec. Comm'r Pat. 681 (CCPA 1962) (stating that two claim terms may read upon the same physical structure). In the absence of evidence requiring two structures, the claim language must be interpreted broadly to read upon an accused product containing the two claim terms, regardless of whether those elements are encompassed in one or two structures.

In the '544 patent, nothing in the claim language, written description or prosecution history requires that the "spring means" and "hinged arm" be separate structures. The plain language of the claims includes no such "separate structures" limitation. To the contrary, the written description contemplates that the "spring means" and "hinged arm" be included as part of the same "hinged arm assembly." See, e.g., '544 patent, col.4 ll.40-44 (stating that a spring may be encompassed "between" the joints of the hinged arm assembly); id. at col.5 ll.66-68 ("proximal and distal segments . . . of [the] hinged arm assembly . . . can be articulated about [the] hinges."). In other words, the "hinged arm assembly" is described as a structure with the "spring means" and "hinged arm" as components of that structure. There is no support in the written description requiring that the "spring means" and "hinged arm" be separate structures themselves. Accordingly, a proper claim construction does not require two separate structures for the "spring means" and "hinged arm." The majority's ruling improperly imports an extraneous limitation into the claims and fails to give the claim language its full, literal scope. By injecting this additional and extraneous limitation, the majority sidesteps the required analysis of whether the "spring means" limitations are prescribed by § 112, P 6.

3758

4. "Spring means for yieldably biasing the handle means to the first position"

This phrase also appears in asserted Claim 10. Gerdes argues that it is written in means-plus-function format and therefore § 112, P 6 applies. Stant, on the other hand, argues that because the term "spring" connotes sufficient structure to perform the function of biasing the handle means to the first position, it has overcome the presumption that the "means for" language requires the application of § 112, P 6. This phrase requires that the court begin by presuming that the patentee intended § 112, P 6 to apply. Greenberg, 91 F.3d at 1584. Stant may only overcome this presumption by demonstrating that Claim 10 recites a sufficient structure to perform the function required of "spring means" in the claim -- that is, biasing the handle means to the first position. See Envirco Corp, 209 F.3d at 1365. The court finds that Stant has not met this burden.

The term "spring" is clearly a structural term. See Unidynamics Corp. v. Automatic Products Intern., Ltd., 157 F.3d 1311, 1319 (Fed. Cir. 1998). As the court found in Unidynamics, however, the simple inclusion of a structural term is not sufficient to take this phrase outside the coverage of § 112, P 6. Id. In Claim 10, the patentee specifically claims that the "spring means" must function to "bias[] the handle means to the first position." 055 patent, col. 15, 11. 14-15. The patentee does not, however, provide any recitation of the structure required to perform this function other than the word "spring" itself. Nothing in the claim further describes the location or extent of the structure, the claim simply recites the function of the element "spring." See Unidynamics Corp., 157 F.3d at 1319. In addition, in contrast to the "closure means" discussed in Section B(4), nothing in the specification provides evidence that the term "spring" alone connotes a sufficient structure to enable one with skill in the art to determine the exact element required to perform the stated function. Further, while not conclusive, the court finds persuasive the fact that the court in Tesma found this particular element to be a means-plus-function element. Tesma Entry, p. 19.

Thus, the court finds that "spring means" for "biasing the handle means to the first position" is a means-plus-function element and must be limited to the corresponding structure set forth in the specification of the 055 patent. 35 U.S.C. § 112, P 6. Specifically, this "spring means" consists of a torsion spring connected to the top spring mount on the handle cover and the bottom spring mount on the core as is described in the specification and pictured in Figure 9. See 055 patent, col. 7, 11. 26-28, Fig. 9.

3759

2. ANALYSIS
The first claim construction issue is whether the limitation "spring means tending to keep the door closed" is a means-plus-function expression, governed by § 112, P 6, which reads (emphasis is ours):

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

We agree with the district court that the phrase "tending to keep the door closed" is functional language modifying "spring means." We disagree with the district court, however, that the recitation of "spring," which is structural language, takes the limitation out of the ambit of the construction dictate of § 112, P 6.

The use of the term "means" generally (but not always) shows that the patent applicant has chosen the option of means-plus-function format invoking § 112, P 6 construction. See Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1584, 39 U.S.P.Q.2d (BNA) 1783, 1786-87 (Fed. Cir. 1996). The written description also supports this choice by stating that "the spring 46 is an example of spring means tending to keep the door closed." '750 patent, col. 3, ll. 31-32. The recitation of the word "spring" does not vitiate the patentee's choice. See Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1536, 19 U.S.P.Q.2d (BNA) 1367, 1369 (Fed. Cir. 1991) ("The recitation of some structure in a means-plus-function element does not preclude the applicability of section 112, P 6 [when it] merely serves to further specify the function of the means."). But see Data Line Corp. v. Micro Techs., Inc., 813 F.2d 1196, 1201, 1 U.S.P.Q.2d (BNA) 2052, 2055 (Fed. Cir. 1987) (proper means-plus-function format sets forth a means for performing a specific function without reciting any specific structure for performing that function). Our decision in Cole v. Kimberly-Clark Corp. also is not in conflict with our decision here.

In Cole, we interpreted the following claim phrase involving easily removable training pants for toilet training of toddlers: "perforation means extending from the leg band means to the waist band means through the outer impermeable layer means for tearing the outer impermeable layer means for removing the training brief in case of an accident by the user." We held that the perforation means did not meet the requirement of § 112, P 6 because it not only described definite structure, perforations, that supported the described function, tearing, but also described the location and extent of the structure. Cole, 102 F.3d at 531, 41 U.S.P.Q.2d (BNA) at 1006. Here, spring is the only recitation of structure with the remainder pertaining solely to the function of the means limitation.

We hold, however, that the district court's failure to apply § 112, P 6 was merely harmless error because we reach the same result of noninfringement. The proper construction of a means-plus-function limitation requires interpreting the limitation in light of the corresponding structure, material, or acts described in the written description, and equivalents thereof, to the extent that the written description provides such disclosure. In re Donaldson Co., 16 F.3d 1189, 1193, 29 U.S.P.Q.2d (BNA) 1845, 1848 (Fed. Cir. 1994) (in banc). Structure disclosed in the specification, however, is only "corresponding" structure to the claimed means under § 112, P 6 if the structure is clearly linked by the specification or the prosecution history to the function recited in the claim. B. Braun Med., Inc. v. Abbott Lab., 124 F.3d 1419, 1424, 43 U.S.P.Q.2d (BNA) 1896, 1900 (Fed. Cir. 1997); see also Chiuminatta Concrete Concepts, Inc. v. Cardinal Indus., Inc., 145 F.3d 1303, 1308, 46 U.S.P.Q.2d (BNA) 1752, 1755-56 (Fed. Cir. 1998); Pennwalt Corp. v. Durand-Wayland, Inc., 833 F.2d 931, 934, 4 U.S.P.Q.2d (BNA) 1737, 1739 (Fed. Cir. 1987) (in banc) ("To determine whether a claim limitation is met literally where expressed as a means for performing a stated function, the court must compare the accused structure with the disclosed structure, and must find equivalent structure as well as identity of claimed function for that structure."). cert. denied, 485 U.S. 961, 99 L. Ed. 2d 426, 108 S. Ct. 1226 and 1009 (1988). To determine the specific function associated with the means limitation requires construction of the claim language, which is a question of law that we review de novo. Chuiinattia, 145 F.3d at 1308, 46 U.S.P.Q.2d (BNA) at 1755.

The function of the spring means as specified in the claims is "tending to keep the door closed." The structure associated with this function is described in the written description as follows (emphasis ours):

As may best be seen in FIGS. 3, 4, and 5, the door 37 is attached to a generally rectangularly shaped housing 48 for enclosing the storage and dispensing area 7. The door 37 is mounted on a strip hinge 47 with spring 46 which tends to keep the door 37 in a vertical or closed position. The spring 46 is an example of spring means tending to keep the door closed. . . . The door 37 tends to be pressed against gaskets 53 and 55 by the spring 46 to seal the storage and dispensing area 7.
Figure 5, reproduced below, shows the only disclosed example of the spring means. We agree with the district court that this function, when read in light of the written description, "tending to keep the door closed" requires a closing action in addition to keeping the door closed once it is in a closed position. The written description indicates that the word "tends" requires that the spring work to keep the door in a vertical or closed position to press it against gaskets to seal the storage and dispensing area. The structure described in the written description to carry out this function is a spring in a strip hinge. Section 112, P 6 requires that the LCM4 vending machines have a spring, or equivalent structure, to carry out the identical function of tending to keep the door closed, but it need not be in a strip hinge. The district court correctly determined that, as a matter of law, neither the padded bracket nor the magnet perform that function. No reasonable jury could determine that either structure "tends to keep the door closed" as that function is properly interpreted because neither "tends" to close the door. Gravity performs the action of closing the door in both LCM4 versions. Therefore, neither version of the LCM4 machine literally infringes any claim of the '750 patent.

3760

Spring Pin

Every claim of the '664 patent calls for a "spring pin." Zettl suggests that the spring pin is a resilient, elastic or flexible elongated part for fastening the two earring components together. Defendants agree with Zettl's definition for the most part except to insist that the spring pin must also be curved. In doing so, Defendants seek to read the limitation of Claims 11, 14, 16, 17, 20, 21, and 22 - which call for a spring pin "curved to form an arc" - into the remaining claims which merely call for a spring pin.

The Court rejects Defendants' caveat that a spring pin must necessarily be curved. The descriptive part of the specification is generally considered the best means of determining a disputed term. Vitronics, 90 F.3d at 1582. In the '664 patent, the specification describes one embodiment of the invention, a ring-shaped earring, that makes use of a curved spring pin. (‘664 patent, Col. 2, ln. 31-33). The specification, however, does not require that the spring pin always be curved. In fact, the specification explicitly describes another embodiment that does not make use of a curved spring pin. (Id., Col. 2, ln. 59-61; Fig. 4). Therefore, the "spring pin," as disclosed in the 664 patent, is any resilient, elastic or flexible elongated part for fastening the two earring components together.

3761

A. The District Court's Claim Construction

The district court looked to the prosecution history of the '745 patent to interpret the claim term "sputter-deposited dielectric." The district court concluded the prosecution history requires that a "sputter-deposited dielectric" be formed by a one-step reactive sputtering process and specifically not by a two-step process in which a metal layer is first deposited and then later oxidized. 6 Because Cardinal's titanium oxide layer is formed by a two-step process in which the titanium is first deposited as a metal layer and then later oxidized, the district court concluded Cardinal's titanium oxide layer could not be a "sputter-deposited dielectric." Because Cardinal's product does not have a "sputter-deposited dielectric" layer "directly contiguous" with the silver layer, the district court further held that, as a matter of law, Cardinal's product could not literally infringe the '745 patent.

6 Although the district court erred in assuming that the entirety of Cardinal's dielectric layer, rather than only the titanium oxide layer, was formed by a two-step process, this error did not undermine the court's analysis because claim 14 requires that the "sputter-deposited dielectric" layer be "directly contiguous" with the silver layer. Thus, if the titanium oxide layer, which is "directly contiguous" with the silver layer, cannot be described as a "sputter-deposited dielectric," Cardinal cannot
literally infringe that claim even though its zinc oxide layer can be described in this manner.

We agree with this analysis. Arguments and amendments made during the prosecution of a patent application and other aspects of the prosecution history, as well as the specification and other claims, must be examined to determine the meaning of terms in the claims. E.I. du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1438, 7 U.S.P.Q.2D (BNA) 1129, 1135 (Fed. Cir.), cert. denied, 488 U.S. 986, 102 L. Ed. 2d 572, 109 S. Ct. 542 (1988). The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution. ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1580, 6 U.S.P.Q.2D (BNA) 1557, 1561 (Fed. Cir. 1988); Senmed, Inc., 888 F.2d at 818-20, 12 U.S.P.Q.2D (BNA) at 1511-13 (rejecting patentee's interpretation of claim term "on" as inconsistent with position taken during prosecution of patent application). Claims may not be construed one way in order to obtain their allowance and in a different way against accused infringers. Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1562, 19 U.S.P.Q.2D (BNA) 1500, 1504 (Fed. Cir. 1991).

In the office action, dated July 5, 1988, the examiner made only one rejection based on prior art, rejecting all the pending claims as anticipated by, or alternatively, as obvious in view of Franz, U.S. Patent No. 3,846,152:

Franz teaches employing alternate layers of metal/metal oxide to a transparent substrate such as glass or plastic and the use of a protective layer to make a transparent heat reflecting window . . . . The metal layer is sputter deposited and the metal oxide layer is sputter deposited as a metal and then oxidized, see col. 4, lines 25-28. It is unclear whether the "metal oxide is sputter-deposited" limitation is meant to encompass the situation where the metal oxide is sputter deposited as a metal and later oxidized. Until clarification the examiner most [sic, must] interpret the claims broadly.

In response, Southwall amended an independent claim to describe the dielectric as a "sputter-deposited inorganic metal oxide, compound or salt." 7 Southwall explained the amendment:

7 Earlier versions of some original '745 claims had also used the narrower limitation "inorganic metal oxide, compound or salt" rather than "dielectric," which was used later. Although Southwall attempts to make much of this difference, it does not affect our analysis because in both instances the key phrase the meaning of which is at issue, "sputter-deposited," is used in exactly the same manner, to modify the general class of dielectric materials as the list of specific dielectric materials. The arguments regarding the "sputter-deposited inorganic oxide, compound or salt" made during prosecution are thus relevant to our interpretation of "sputter-deposited dielectric" for purposes of literal infringement as well as to the application of prosecution history estoppel to limit the range of equivalents accorded that term.

It is believed that the claims as last presented distinguished patentably over the Franz and Yatabe disclosures but to provide yet additional clear bases for distinction the claims have been amended to specify that the dielectric layer is laid down as a sputter-deposited inorganic metal oxide, compound or salt[]. As pointed out in the specification such layers can be laid down directly by reactive sputtering processes in which the metal is sputtered off of a metal target and directly converted to the oxide, compound or salt by the presence of a suitable gaseous reactant.

(Emphasis added.) In this response Southwall necessarily disclaimed the examiner's interpretation of "sputter-deposited" metal oxides as encompassing a two-step process in which metal is first deposited as a metal and then oxidized. In contrast to the examiner's interpretation in his office action being responded to, Southwall explained that its sputter-deposited dielectric is laid down in a one-step reactive sputtering process. Thus, the prosecution history limits the interpretation of "sputter-deposited dielectric" layer to exclude any dielectric layer formed by the two-step process. Because Cardinal's titanium oxide layer is formed in this manner it cannot be a "sputter-deposited dielectric."

Southwall argues, however, that Cardinal's two-step process is an indirect method of forming a "sputter-deposited dielectric," but is still a sputter-deposition process because Cardinal's titanium dioxide layer exists only by virtue of sputter-deposition. The titanium metal is sputter-deposited and converted to the oxide during sputter-deposition of zinc oxide.
According to Southwall, the statement in the prosecution history, "such layers can be laid down directly" implies that the layers can also be laid down indirectly. However, Cardinal's titanium oxide layer is not laid down by sputter deposition as defined in the '745 patent, only the titanium metal layer is. The titanium oxide is formed by treating deposited titanium metal with oxygen. Although this occurs while a different material, zinc oxide, is being sputter-deposited, the reason for the presence of the oxygen does not change the post-deposition oxidation process by which the titanium oxide is formed and does not convert that process into a sputter deposition, i.e., a one-step process.

Because we conclude that a "sputter-deposited dielectric," as that term is used in claim 14, cannot be formed by a two-step process in which a metal layer is first sputter-deposited and then oxidized, we can only conclude that Cardinal's product does not have a "sputter-deposited dielectric" layer "directly contiguous" with the silver layer. Therefore, like the district court, we hold that as a matter of law Cardinal's product cannot literally infringe the '745 patent.

B. Southwall's Arguments

Southwall argues that "sputter-deposited dielectric" must be interpreted to also include a dielectric layer formed by the two-step deposition process oxidizing it because Southwall presented evidence that persons of ordinary skill in the art construe the expression to include any dielectric that results from materials laid down by sputtering. Southwall's evidence is affidavit testimony by its two experts describing Cardinal's titanium oxide layer as a "sputter-deposited dielectric." Alternatively, Southwall argues that any conflict between its experts and the prosecution history as to the meaning of "sputter-deposited dielectric" creates a genuine fact issue which makes summary judgment inappropriate.

Southwall imposes a contorted and incorrect analytical framework on the issues of claim interpretation and literal infringement when it argues:

2. The uncontroverted testimony of the experts below establishes that those skilled in the art consider a dielectric layer formed either by reactive sputter-deposition or by sputter up-oxidation [the two-step process] of a sacrificial layer to constitute a "sputter-deposited dielectric." Thus, the term "sputter-deposited dielectric" is literally met by the accused Cardinal structure;

3. Therefore, since the claim as written literally describes the Cardinal structure, the arguments made with respect to that term in the file history must be reviewed to determine whether that expression was given a special meaning in Southwall's arguments which excludes the Cardinal structure. If the phrase was accorded a special meaning in the file history, a determination must be made as to whether the file history should be used merely to "interpret" the claims, or whether a file history estoppel by argument exists as to one or more of the claims.

Appellant's Brief at 35.

Southwall's framework fails in several respects. First, the evidence offered by Southwall does not establish the ordinary meaning of "sputtered-deposited dielectric" to one skilled in the art. In his declaration Dr. Stephen F. Meyer merely stated "it seems to me that [Cardinal's] dielectric layer as a whole (including both the titanium dioxide [sic, oxide] and the zinc oxide) could quite fairly be characterized as a 'sputter-deposited dielectric'." Similarly, Robert L. Cormia's declaration states, "it is my opinion that the 'titanium' barrier layer that Cardinal deposits immediately after each of the silver layers is a 'sputter-deposited dielectric' in the LOE2 coatings, as that phrase is used in the '745 Patent." Neither Meyer nor Cormia testified as to how one skilled in the art would interpret the term "sputter-deposited" when viewed in light of the claims, specification and prosecution history. This testimony provides only conclusory legal opinions as to whether Cardinal's titanium oxide is a "sputter-deposited dielectric" rather than evidence of how that term is commonly used and understood in the art. See Becton Dickinson & Co., 922 F.2d at 797, 17 U.S.P.Q.2D (BNA) at 1100 (affidavit of expert on what constitutes an "extension" in the context of the asserted claim was only legal opinion which did not create a material fact issue).

Second, Southwall assumes that a claim term is only interpreted by first looking to its meaning in the art and then limiting that meaning in accordance with any relevant prosecution history, by either interpretation or prosecution history estoppel. The terms in a claim, however, are not given their ordinary meaning to one of skill in the art when it appears from the patent and file history that the terms were used differently by the applicant. Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1387, 21 U.S.P.Q.2D (BNA) 1383, 1386 (Fed. Cir. 1992). A patentee may not proffer an interpretation for the purposes of litigation that would alter the indisputable public record consisting of the claims, the specification and the prosecution
history, and treat the claims as a "nose of wax." Senmed, Inc., 888 F.2d at 819 n.8, 12 U.S.P.Q.2d (BNA) at 1512 n.8. In other words, evidence extrinsic to the patent and prosecution history, such as expert testimony, cannot be relied on to change the meaning of the claims when that meaning is made clear by those documents.

Because the meaning of "sputter-deposited dielectric" as used in claim 14 is clear from the prosecution history of the '745 patent, Southwall's expert affidavits cannot alter that meaning. Even if Southwall could show that "sputter-deposited dielectric" has a meaning to one skilled in the art different from the definition in the '745 specification and file history, the definition in the patent documents controls the claim interpretation. See Markman, slip op. at 21. Thus, we may not consider Southwall's opinion expert testimony as we interpret claim 14 as a matter of law. Because the expert testimony is entitled to no weight, it cannot create a genuine issue of material fact precluding summary judgment. Claim interpretation, as a question of pure law, is amenable to summary judgment and disagreement over the meaning of a term within a claim does not necessarily create a genuine issue of material fact. See id. at 18; Intellicall, Inc., 952 F.2d at 1387, 21 U.S.P.Q.2d (BNA) at 1386. Any other rule would be unfair to competitors who must be able to rely on the patent documents themselves, without consideration of expert opinion that then does not even exist, in ascertaining the scope of a patentee's right to exclude.

Southwall further argues that the district court erred by failing "to recognize that in some claim combinations, the two-step process would not be literally covered by the claims, while in other claim combinations, the claim may be patentable for other reasons and literally cover a two-step dielectric process." Appellant's Brief at 44. Southwall then presents extended discussion tracing the development of claim 14 from the application through the prosecution to show that the cited arguments it made during prosecution did not apply to any earlier version of claim 14.

Whether claim 14 derived from any application claim discussed in the prosecution history is irrelevant to our interpretation of claim 14 in light of that history. "Sputter-deposited dielectric" cannot be interpreted differently in different claims because claim terms must be interpreted consistently. See Fonar Corp. v. Johnson & Johnson, 821 F.2d 627, 632, 3 U.S.P.Q.2d (BNA) 1109, 1113 (Fed. Cir. 1987), cert. denied, 484 U.S. 1027, 98 L. Ed. 2d 764, 108 S. Ct. 751 (1988). Interpretation of a disputed claim term requires reference not only to the specification and prosecution history, but also to other claims. Id. at 631, 3 U.S.P.Q.2d (BNA) at 1112. The fact that we must look to other claims using the same term when interpreting a term in an asserted claim mandates that the term be interpreted consistently in all claims. Id. at 632, 3 U.S.P.Q.2d (BNA) at 1113 (examining use of term "standard" in nonasserted claims to interpret same term in asserted claims). Accordingly, arguments made during prosecution regarding the meaning of a claim term are relevant to the interpretation of that term in every claim of the patent absent a clear indication to the contrary.

II. Infringement Under The Doctrine of Equivalents

The issue presented by this appeal is whether, because of the manner of its manufacture, Cardinal's titanium oxide layer is excluded, as a matter of law, from the range of equivalents that can be accorded the limitation "sputter-deposited dielectric." 8 The district court applied prosecution history estoppel in holding that the range of equivalents could not extend to Cardinal's dielectric layer because, "the Examiner specifically rejected any process where the 'metal oxide is sputter-deposited as a metal and later oxidized.' The Cardinal process is such a process." Slip op. at 20. Having concluded that the range of equivalents accorded this limitation in claim 14 could not encompass Cardinal's titanium oxide layer, the district court correctly held that as a matter of law Cardinal's product could not infringe the '745 patent under the doctrine of equivalents.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

8 Cardinal does not contest for purposes of this appeal that "but for" the titanium oxide sacrificial barrier layer, factual issues exist as to whether its product infringes claim 14 under the doctrine of equivalents. Because claim 14 recites a "sputter-deposited dielectric" layer which is "directly contiguous" with a silver layer, additional layers in Cardinal's product intervening between its own "sputter-deposited dielectric" and silver layers would prevent infringement because a limitation would be entirely lacking from the accused device. Southwall suggests no way in which Cardinal's product can satisfy the "directly contiguous" limitation, even equivalently, if the titanium oxide layer is not a "sputter-deposited dielectric."

GO BACK

B. Construction of "squeezing extruder throat"

The proper construction of "squeezing extruder throat" is a passageway or channel that 1) has an inlet opening wider than a W-beam guardrail so that the guardrail fits inside the opening; and 2) flattens a W-beam guardrail by using the energy of an impacting vehicle to force the guardrail through the throat, where the flattening is caused by passing through a width of the throat that is narrower, in at least one dimension, than the width of an unflattened guardrail. This construction does not require that the beam be flattened into a relatively flat plate; rather, it only requires that the beam be flattened some as it passes through the throat. This construction also does not require the flattening accomplished by the squeezing extruder throat to be the primary or exclusive energy absorbing mechanism of the terminal. It merely requires that the flattening of the beam dissipate some energy.

The parties' proposed constructions and briefs in support raised four relevant issues regarding the construction of this limitation. The court will address these individually.

1. Must "squeezing extruder throat" mean a tapered, narrowing, funnel-shaped structure?

Defendants assert that the claim language, specification and prosecution history of the patent each require the conclusion that a squeezing extruder throat claims only a narrowing, tapered, funnel-shaped structure. Defendants argue that the word "squeezing" in the claim language requires that conclusion, because "squeezing" incorporates the concept of narrowing described in the specification and the prosecution history. Defendants specifically point to language in the specification describing a terminal that flattens a guardrail by squeezing it between narrowing walls. The summary of the invention describes "an extruder throat that is narrower in width than the feeder chute." '928 patent, col. 2, lines 48-50. The summary goes on to say "this reduction in width flattens a W-beam guardrail." Id. The preferred embodiment and the referenced drawings include an "extruder chute [that] is funnel shaped and narrows down to an extruder throat." '928 patent, col. 4, lines 44-45; FIG. 3. Defendants also point out that during prosecution, the patent examiner only granted the patent after an interview with the applicants where it was agreed that the "applicant will file an amendment further distinguishing the extrusion terminal having a narrowing channel which flattens the W-beam." Examiner Interview Summary Record, dated November 7, 1989, Exhibit D, Tab 12, Defendants' Written Submission Regarding Claim Construction Under Markman
Plaintiffs argue that there is no need to look to the specification or the prosecution history to interpret the "squeezing extruder throat" limitation because the ordinary meaning of the terms "squeezing," "extruder," and "throat" are known to persons of ordinary skill in the relevant art. Plaintiffs point out that these terms can have various meanings depending on the context and urge that these terms must be given "all [their] correlative meanings." Plaintiffs' Reply to Defendants' Written Submission for Claim Construction Under Markman (Dkt. # 34), filed July 22, 1999, at 2. Despite Plaintiffs' urging against consideration of the specification to narrow the scope of this limitation, Plaintiffs rely heavily on one paragraph of the specification to support a broad construction. That paragraph states:

> It should be understood, however, that the extruder terminal can be designed to bend the W-beam guardrail without first flattening it. This can be accomplished by the elimination of the extruder throat and designing the extruder chute without a reduction in width so that flattening does not occur. With these changes, the unflattened W-beam guardrail is fed directly into the bending chute.

The court agrees that the claim language itself, which is the ultimate focus in claim construction, indicates that a squeezing extruder throat must narrow. Claim 1 speaks of a "squeezing extruder throat for telescoping over said guardrail and flattening the guardrail." For the squeezing extruder throat to "telescope" over the guardrail, as Claim 1 expressly requires, it must be wider than the guardrail, and for the squeezing extruder throat to flatten the guardrail merely by the forcing of the guardrail through the throat, it must contain a portion that is narrower than an unflattened guardrail. Hence, by physical necessity, there must be a narrowing between the wider and the narrower portion. Furthermore, while, the inconsistent terminology used in the claims and the specification requires a careful reading of the patent to ascertain its meaning, it is clear that the squeezing extruder throat described in the claims performs the same functions as the structures in the specification that are described as narrowing or funnel-shaped, and thus, incorporates the concept of narrowing.

Plaintiffs contend that "squeezing" does not imply narrowing and that it is improper to limit the scope of the language "squeezing extruder throat" based on the specification or the prosecution history because the terms "squeezing," "extruder," and "throat" each have an ordinary meaning that is known to persons skilled in the art relevant to this patent. But Plaintiffs acknowledge that these are broad terms subject to multiple meanings, depending on the context, and yet, in the same breath, urge the court to ignore their context, namely, the specification and the prosecution history. Such an approach would be at odds with the rule that "where there are several common meanings for a claim term, the patent disclosure serves to point away from the improper meanings and toward the proper meaning." Renishaw, 158 F.3d at 1250. Plaintiffs would have the court read this limitation word by word so that "squeezing extruder throat" does not claim anything less than every possible meaning of the individual words. This approach ignores the fact that the words are used together to convey the idea of a specific thing. "Extruder" modifies "throat"; "squeezing" modifies "extruder" and "throat." Thus, the limitation "squeezing extruder throat" is a combination of the individual terms that does not have a recognizable ordinary meaning, but instead, takes on a specific technical meaning that can only be properly understood in relation to the description of the operation of this device in the patent specification. Ignoring this would broaden the claims beyond what is patentable, i.e., what is described by the patent in sufficient detail to enable a person of ordinary skill to make the invention. An applicant for a patent bears the burden of particularly pointing out and distinctly claiming the invention he seeks to patent; therefore, when a "claim is susceptible to a broader and a narrower meaning, and the narrower one is clearly supported by the intrinsic evidence while the broader one raises questions of enablement," a court must adopt the narrower meaning. Digital
Biometrics, 149 F.3d at 1344. That is exactly the situation presented in the instant case. A squeezing extruder throat could be given a broad meaning to include all the ordinary meanings of the individual terms in the phrase, but there is clearly support in the claims, specification, and prosecution history for limiting the meaning to require narrowing. And choosing a broader construction that does not require a narrowing throat does raise questions of enablement. It is conceded by both sides in this litigation that a squeezing extruder throat must flatten a guardrail by squeezing it. A narrowing throat is the only disclosed structure for accomplishing that squeezing and flattening. Since there is nothing in the specification that would teach a person of ordinary skill in the art to make a squeezing extruder throat that does not include narrowing, a construction that does not include narrowing would raise a serious question of enablement.

Plaintiffs assert that a broader construction of "squeezing extruder throat" is consistent with the specification and does not raise questions of enablement because one paragraph of the specification states that "the extruder terminal can be designed to bend the W-beam guardrail without first flattening it . . . by elimination of the extruder throat and designing the extruder chute without a reduction in width." '928 patent, col. 6, lines 21-25. But this paragraph does not enable one to make a squeezing extruder throat without narrowing; rather, it eliminates the squeezing extruder throat entirely. The specification cannot be used in this way to broaden the claims by eliminating one of the express claim limitations. A patentee may not state throughout the specification and claims that an invention includes a particular limitation and then be allowed to avoid that limitation in a later infringement suit by reference to one paragraph in the specification that describes an alternative lacking that limitation. See Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1562 (Fed. Cir. 1991).

Plaintiffs further assert that, since Claim 1 requires "flattening and bending," the claim should be construed broadly enough to read on a device that "flattens in the bending process." Transcript of Markman Hearing, July 22, 1999, at 35, lines 4-6. In other words, Plaintiffs assert that the patent would read on a device that achieves some incidental flattening when it bends the guardrail by forcing it through an arc-shaped structure that does not narrow. Following this logic would effectively delete the "squeezing extruder throat" limitation from the claim. Such reasoning ignores the fact that Claim 1 describes one limitation for bending - a "bending means"- and another limitation for flattening- a "squeezing extruder throat." Flattening caused by bending does not satisfy the claim language, which clearly requires the flattening to be accomplished by squeezing.

The prosecution history is also consistent with requiring a squeezing extruder throat to narrow. It is proper to consider the interview summary in claim construction as it is part of the prosecution history. See Athletic Alternatives, Inc. v. Prince Mfg., Inc., 73 F.3d 1573, 1576 (Fed. Cir. 1996). At the conclusion of his November 7, 1989 interview with the '928 patent applicants, the examiner intended for the applicants to amend their claims to include the concept of "narrowing," as evinced by his statement to that effect in the interview summary. Although the applicants did not add the word "narrowing" to the claims, they did insert the limitation "squeezing extruder throat" after the interview. See Amendment, filed December 5, 1989, at 2, Exhibit D, Tab 13, Defendants' Written Submission Regarding Claim Construction Under Markman (Dkt. # 32), filed July 12, 1999. The exclusion of the words "narrow" or "narrowing" from the approved claim appears likely to indicate that the examiner was satisfied that the insertion of the words "squeezing" and "extruder" incorporated the narrowing concept, not that he had relaxed or eliminated the requirement.

That conclusion is further supported by the ordinary meaning of the individual terms "squeezing" and "extruder," without reference to the specification or prosecution history. The most common dictionary meaning of "extruder" is a device that "shape[s] by forcing through a die." Merriam Webster's Collegiate Dictionary (10th ed. 1997); see also McGraw Hill Dictionary of Scientific and Technical Terms (5th ed. 1994) ("a device that forces ductile or semisoft solids through die openings of appropriate shape to produce a continuous film, strip, or tubing"); Academic Press Dictionary of Science and Technology (1992) ("a device used to push a semisoft or ductile solid material through a die so that it is molded into a continuous form such as a strip or tubing"). A "die," in this context, is "a perforated block through which metal or plastic is drawn or extruded for shaping." Merriam Webster's Collegiate Dictionary (10th ed. 1997). The "die" is a necessary component of an extruder, and to impart shape to ductile or semisoft solids the die must be narrower, at least in one dimension, than the width of the mass of solids being forced through it. If the die were wider in all dimensions than the mass of solids being forced through it, the extruded material would not be shaped by the die because the mass would not come into contact with any opposed shaping edges of the die. "Extruder" thus implies the inclusion of a downstream width that is narrower than the upstream width. To accomplish the extrusion, an extruder must have an outlet (equivalent to a die) that contains a width that is narrower than its inlet. Therefore, the ordinary meaning of "extruder" in "squeezing extruder throat" implies forcing the guardrail through a structure that is narrower than the portion that telescopes over the guardrail. The most common meaning of "squeeze" is "to exert pressure, esp. on opposite sides of." Merriam Webster's Collegiate
Dictionary (10th ed. 1997). Thus, the ordinary meaning of "squeezing" is consistent with requiring a structure that uses narrowing walls to exert pressure on opposite sides of a guardrail, particularly in the context of this patent where "squeezing" is used in conjunction with the word "extruder."

Although a squeezing extruder throat must narrow, it is improper to read the limitations "funnel-shaped" "or "tapered" into this limitation. It is proper to construe words in the claim using the specification, but not to add limitations to the claims when no words in the claim require such a limitation. See Johnson Worldwide, 175 F.3d at 989-90. Neither of these limitations is expressly included or implied by the ordinary language of the claims. The term "funnel-shaped" connotes a conical shape, see Merriam Webster's Collegiate Dictionary (10th Ed. 1997) ("usu. a hollow cone"), and while a conical shape may be the best mode to accomplish the narrowing from the inlet to the flattening width of the throat, other shapes that would be apparent to a person of ordinary skill in the art could be employed to accomplish the reduction in width. There is no word in the claims that can reasonably be interpreted as requiring a conical shape, in contrast to, for example, the presence of the words "squeezing" and "extruder," which provide a basis in the claims for a narrowing requirement. The word "tapered" is not even used in the specification and connotes a gradual decrease in size that is not claimed as a limitation. See Merriam Webster's Collegiate Dictionary (10th ed. 1997) ("to diminish gradually"). While a gradual decrease in size may be in the structure of the preferred embodiment, it is not an inherent limitation of a "squeezing extruder throat," which could just as easily narrow abruptly so long as the guardrail can be forced through it and squeezed in the process.

2. Must a squeezing extruder throat flatten the guardrail into a relatively flat plate?

Defendants contend that a squeezing extruder throat must flatten the guardrail into a "relatively flat plate," relying on that language in the "summary of the invention" portion of the specification. '928 patent, col. 2, lines 22-23. That construction improperly imports a limitation from the specification that does not exist in the claims. Claim 1 says that the squeezing extruder throat is for "flattening the guardrail," '928 patent, col. 6, lines 48-49, with no mention of the degree to which it must flatten. This is analogous to the situation that was presented in Ekchan v. Home Depot where the accused infringer sought to limit the construction of "conducting" liquids to a specific range of conductivity disclosed in the specification. 104 F.3d 1299 (Fed. Cir. 1997). The Ekchan court held that the liquid must merely be sufficiently conductive to perform its function, i.e., to act as a capacitor. See id. at 1303. In the instant case, the function of the squeezing extruder throat is to employ flattening to dissipate some of the energy of an impacting vehicle. As will be discussed in greater detail later, the patent language acknowledges that some energy will necessarily be dissipated by bending as well as flattening. Therefore, in this context, "flattening" means a degree of flattening sufficient to dissipate some of the energy of an impacting vehicle.

Additionally, Defendants' proposed construction would mean that there would be no literal infringement of the '928 patent by a device that exactly copies the '928 patent but merely changes the width of the squeezing extruder throat to flatten the guardrail less than "relatively flat." A patentee should not have to resort to the doctrine of equivalents, under which the patentee would surely succeed, to show that a mere change in the dimensions of a device, without any change in the function, way, or result, infringes the patent.

3. Must the flattening of the guardrail occur prior to any bending?

Defendants assert that flattening must occur before bending so that the squeezing extruder throat must be located upstream of the bending means in any device that infringes the '928 patent. Defendants point to the syntax of the specification language, which speaks of "flattening and bending," '928 patent, col. 2, line 35, and the claim language, which describes a bending means that bends and remotes "the flattened guardrail," '928 patent, col. 6, lines 53-54. Defendants also rely on the description and drawings contained in the preferred embodiment that depict a flattening-before-bending structure. Plaintiffs counter that it is merely in the preferred embodiment that flattening occurs before bending, and that such a requirement is expressly disclaimed by the following language in the specification: "It should be understood, however, that the extruder terminal can be designed to bend the W-beam guardrail without first flattening it." '928 patent, col. 6, lines 20-22.

The court agrees with Defendants that the language cited by Plaintiffs does not support Plaintiffs' position because that language describes an embodiment in which a flattening device, a necessary limitation of Claim 1, is eliminated altogether. Nonetheless, the court concludes that flattening before bending is not a limitation of the claims. As discussed earlier, the squeezing extruder throat and bending means are separate limitations. If these and all other claim limitations are found in an accused device, infringement will not be precluded merely because they are found in different locations. See Corning Glass Works, 868 F.2d at 1259-60.
Defendants urge the court to adopt a construction of "squeezing extruder throat" that dissipates the energy of an impacting vehicle "by flattening, . . . not by shredding or kinking." Defendants' Submission of Joint Proposed Order Regarding Claim Construction Under Markman (Dkt. # 45), Exhibit A, at 2. This narrow construction implies that flattening must be the exclusive means of energy dissipation and is not supported by the claims, the specification or the prosecution history. To begin with, a construction that precludes the patent from encompassing devices that shred or kink is inconsistent with the law of infringement. Infringement occurs if all the elements of the claimed device are present in the accused device, regardless of whether additional features are incorporated in the accused device. See Amstar Corp. v. Envirotech Corp., 730 F.2d 1476, 1483-84 (Fed. Cir. 1984).

It is true that the patent examiner only approved the patent after the patentee distinguished the extrusion terminal as having a narrowing channel that flattens the W-beam. But nothing in the prosecution history indicates that such a device could not also shred or kink the guardrail. Certainly, the terminal in the '928 patent would not be anticipated by, or obvious in view of, devices that dissipated energy by shredding or kinking. The addition of a narrowing channel sufficiently demonstrated the novelty of the invention and distinguished the invention from prior art to overcome the "anticipation" and "obviousness" objections of the examiner, 3 regardless of other similarities to prior art retained by the invention. This is evidenced by the repeated references to dissipating energy by "flattening and bending" in the applicants' arguments that were eventually accepted by the examiner. See Patentee's Request for Reconsideration, filed February 16, 1989, at 2-3, Exhibit D, Tab 7, Defendants' Written Submission Regarding Claim Construction Under Markman (Dkt. # 32), filed July 12, 1999. The squeezing extruder throat must flatten by squeezing, i.e., by forcing the guardrail through a structure that is narrower than the width of the guardrail, but nothing precludes a squeezing extruder throat from incorporating a design that also shreds, bends or kinks the guardrail.

3 One patent anticipates another if each and every element of the claimed invention is disclosed in a single prior art reference or is embodied in a single prior art device or practice. Minnesota Mining and Mfg. v. Johnson & Johnson Orthopaedics, Inc., 976 F.2d 1559, 1565 (Fed. Cir. 1992). Anticipation requires identity. See id. An invention is obvious in view of prior art when the invention combines known components to achieve a new system and the prior art contains some suggestion, motivation, or teaching whereby a person of ordinary skill would have selected the components that the inventor selected and used them to make the new device. See C.R. Bard, Inc. v. M3 Systems, Inc., 157 F.3d 1340, 1351 (Fed. Cir. 1998). Thus, to overcome the examiner's anticipation and obviousness objections, the applicants for the '928 patent did not need to expunge all similarities to prior art. They merely needed to either introduce a single element that was not included in the prior art, and/or combine known elements in a way that was not suggested or taught by the prior art.

Utilization of other methods for dissipating energy in addition to flattening is also consistent with the patent specification which includes numerous references to "flattening and bending," for example: "A still further object of the present invention is to provide a new and improved method for dissipating the impact energy of a vehicle colliding with an end of a guardrail by flattening and bending the guardrail." '928 patent, col. 4, lines 31-34. An even more explicit reference to dissipation of energy by a means in addition to flattening is: "The radius of the bending chute can be selected to bend the W-beam guardrail, in a circular path, an elliptical path, a spiral or any other configuration desired. It has been determined that different path result [sic] in different rates of dissipation of energy." '928 patent, col. 4, line 65-col. 5, line 1.
Court's previous claim construction was based on an incomplete understanding of the physics of guardrail end terminals as understood by those skilled in the art.” Pls.’ Mot. for Recons. at 8. Defendants argue that the new evidence is merely a new wording of a previously rejected theory. Defs.’ Resp. to Pls.’ Mot. for Recons. at 4. Defendants further argue that Dr. Bligh's declaration is extrinsic evidence by an interested witness, and therefore, should not be considered. Id. at 7-10.

The new evidence proffered by Plaintiffs' is undoubtedly extrinsic. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1584 (Fed. Cir. 1996) ("Extrinsic evidence is that evidence which is external to the patent and file history, such as expert testimony, inventor testimony, dictionaries, and technical treatises and articles."). "In most situations, an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term. In such circumstances it is improper to rely on extrinsic evidence." Id. at 1583. That was exactly the situation in the instant case. The court found, after extensive analysis, that only intrinsic evidence was needed.

However, even considering Plaintiffs' new extrinsic evidence in the form of the declaration of Dr. Bligh, the court is of the opinion that its construction of the term "squeezing extruder throat" on page 19 of its memorandum opinion and order dated September 20, 2000, is correct. See 121 F. Supp. 2d at 1041. That is, the "squeezing extruder throat" is "a passageway or channel that … flattens a W-beam guardrail by using the energy of an impacting vehicle to force the guardrail through the throat, where the flattening is caused by passing through a width of the throat that is narrower, in at least one dimension, than the width of the unflattened guardrail." Id. (emphasis added).

The Plaintiffs request the court to "modify" its construction of the term "squeezing extruder throat" to be "a passageway or channel which, when a guardrail is forced through it, causes the guardrail to flatten by the guardrail bearing against the walls of the passageway or channel." Pls.’ Mot. for Recons. at 8 (emphasis added). This language proposed by the Plaintiffs is not inconsistent with the court's construction of the term except that this language omits the statement that the throat narrows to a width narrower than the unflattened guardrail. Obviously, in order for the guardrail to flatten by "bearing against the walls of the passageway or channel", the passageway or channel must at some point become narrower than the unflattened guardrail so that "bearing" takes place. The court's original construction makes explicit what must be implicit in the Plaintiff's proposed modification. Therefore, the court declines to adopt the Plaintiffs' proposed modification.

9. squeezing said housing

The term "squeezing said housing" appears only in element (f) of claim 12. Chip-Mender argues that the term means "squeezing said housing"--that no independent construction is required. Sherwin-Williams contends that "squeezing said housing" means "providing sufficient force by a person's hand to deform the housing and force paint out of the applicator."

Chip-Mender argues that the meaning of the term "squeezing said housing" is clear when the term is viewed in the context of the specification. Chip-Mender notes that the specification states that "[t]he housing may be formed of a flexible material such that squeezing or applying pressure to the same also applies pressure to the paint composition found within the reservoir" (citing '299 patent, col. 1, II. 62 - col. 2, II. 2). Chip-Mender also cites the description of the preferred embodiment shown in Fig. 1, (citing id., col. 3, II. 41-46 and Fig. 1). Chip-Mender asserts that even Sherwin-Williams' '548 patent uses the terms "squeezing" and "housing" in the ordinary way (referring to claim 20 of that patent, "the housing comprises a resilient material capable of being squeezed to apply pressure to paint composition positioned in said reservoir and thereby increase a rate of flow of the paint composition").

In opposition, Sherwin-Williams asserts that Chip-Mender does not dispute that "squeezing said housing" should be construed to involve a force no greater than a person's hand. Thus, Sherwin-Williams argues, Chip-Mender essentially agrees with Sherwin-Williams' proposed construction.

The court finds that "squeezing said housing" means "squeezing said housing." No construction is necessary, as both sides agree that "squeezing" means "squeezing" or "applying pressure." Sherwin-Williams' proposed limitation—that the squeezing force be applied by a person's hand—is unnecessary. Moreover, there is nothing in the intrinsic record that would require that "squeezing" be limited in this manner.
The '299 patent discloses a small paint-applicator system, designed to touch up small chips or scratches on vehicles such as automobiles. The specification describes the invention as "utilizing a housing that is preferably of a size and proportion to be hand held." '299 patent, col. 1, ll. 64-65. Despite the use of the word "preferably," there is no indication anywhere in the patent that the applicator is not intended to be hand-held. Nevertheless, Chip-Mender is also correct that the "squeezing by hand" limitation does not appear anywhere in the patent.

In addition, the additional language that Sherwin-Williams proposes--sufficient force… to deform the applicator and force paint out of the applicator--is simply a paraphrase of the limitations that follow "squeezing said housing" in claim 12. That subsection of the claim states, "squeezing said housing to increase flow of said paint from said reservoir through said passageway to said nib and transferring to the painted surface of the vehicle." Id., col. 6, ll. 30-33. Logically, the flow will not increase when the housing is squeezed unless the squeezing "deforms" the housing. If the housing were rigid, the "squeezing" would not have the effect of "increasing the flow" of the paint or forcing the paint out of the applicator. It is unnecessary to add the additional language proposed by Sherwin-Williams, as that meaning is contained in the limitations that follow "squeezing said housing" in claim 12.

3765

The only term in dispute is "stabilizing supports," which appears in three independent claims (Claims 1, 24, and 41) and in eleven dependent claims (Claims 12, 17-19, 34, 38, 46, 49, 50, and 51.) The independent claims are set out below with the disputed terms in bold.

1. A device for dispensing an amount of fluid from a stoppered container to a target surface, comprising:

   a dispenser body having a passageway formed therein, one end of said dispenser body including a surface for engaging said stoppered container and another end of said dispenser body including stabilizing supports for engaging said target surface, and said passageway including means for passing through said stoppered container to interior portions of said stoppered container, for accessing the fluid in said stoppered container and for dispensing said fluid from said passageway and to said target surface responsive to forces applied relative to said dispenser body.

24. A device for dispensing an amount of fluid from a stoppered container, in combination with a stoppered container and a target surface in operative association with said dispensing device, wherein said dispensing device includes a dispenser body having a passageway formed therein, one end of said dispenser body including a surface in contact with said stoppered container and another end of said dispenser body including stabilizing supports in contact with said target surface, and wherein said passageway includes means for passing through said stoppered container to interior portions of said stoppered container, for accessing the fluid in said stoppered container and for dispensing said fluid from said passageway, to said target surface, responsive to forces applied to said stoppered container and developed between said dispensing device and said target surface.

41. A method for dispensing an amount of fluid from a stoppered container to a target surface utilizing a dispensing device including a body having a passageway for communicating fluid through said dispensing device, a surface for engaging said stoppered container and stabilizing supports for engaging said target surface, an entry tip in communication with said passageway and extending from the surface for engaging said stoppered container, and a dispensing tip formed in said passageway, said method comprising the steps of:

   introducing said entry tip into said stoppered container and bringing said engaging surface into contact with said stoppered container;

   placing said stoppered container and said dispensing device on said target surface so that said dispensing device is in contact with and is positioned over said target surface;

   applying a force against said stoppered container, relative to said target surface, compressing said stoppered container relative to said dispensing device; and

   releasing said force applied against said stoppered container, dispensing said amount of fluid from said dispensing tip and
to said target surface.

Helena proposes to define "stabilizing supports" as follows:

At least two elements, neither of which is part of the dispensing tip, and expressly excluding the dispensing tip, with the physical elements simultaneously contacting the target during fluid dispensing and which, independent of manual assistance, bear the weight of the device plus the stoppered container in a manner which is resistant to change and which maintain the dispensing tip a distance above and not in contact with the target during fluid dispensing.

Alpha suggests:

A solid member or portion thereof extending from or constituting a part of the dispenser body, located at an end of a dispenser body other than the end that includes a surface for engaging a stoppered container, that provides a point of contact at which the dispenser body can engage with a target surface when liquid is dispensed from the stoppered container.

Claims Require More Than One Stabilizing Support

The parties agree that the term "stabilizing supports" must include at least two elements. Helena points to the fact that throughout the patent, the term used is the plural form, "stabilizing supports" (emphasis added). The same is true of all references in the prosecution history. The invention is a "dispenser" identified as item 20 in the figures. The "stabilizing supports" portion is labeled as item 26 in figure 2. All of the figures show a dispenser with the "stabilizing supports" portion (whether actually labeled "26" or not) having two or more surfaces that engage the target. All references in the specification to item 26 use the plural form, "stabilizing supports."

While Alpha's proposed definition is in the singular - "stabilizing support," Alpha admits that "the dispenser of the claimed invention includes at least two such stabilizing supports as defined above (in Alpha's proposed definition)." Alpha's Opening Claim Construction Brief [Doc. # 35, p. 13], statements by Alpha's counsel at Markman hearing.

However, the term does not require more than two elements or points of contact which can engage the target. Claim 12 describes a dispenser "wherein said stabilizing supports define a plane spaced from said dispensing tip by a defined gap." An engineer would know that three points define a plane. Since this limitation is in a dependent claim, it implies that the same limitation is not included in the independent claim, Claim 1.

Stabilizing Supports Must Touch Target Surface

The stabilizing supports are designed to come into contact with the target surface. Claims 1 and 41 use the language "stabilizing supports for engaging said target surface." Claim 24 states: "stabilizing supports in contact with said target surface." The parties agreed at the Markman hearing that both terms mean that the stabilizing supports must touch the target surface.

In case there was any doubt, every description in the specification has the supports touching the target surface. And, in a response to a rejection of all claims by the Examiner, the patentee distinguished an earlier patent for dispensing carpet adhesive, (U.S. Patent No. 3,589,820 - Ward) by noting that in Ward the supporting structure did not come into contact with the surface on which the adhesive was placed. Amendment by Patentee, December 7, 1993, pp. 4-5, Bates stamped A00086-87, Exhibit 3 part 4 of Helena's Opening Claim Construction Brief, [Doc. # 32, Attachment # 9, p. 11-12]. This is a clear attempt by the patentee to differentiate the present invention from prior art in which the support does not touch the target surface.

Alpha now insists that no more than one stabilizing support need to touch the target surface at any one time. This argument, which is opposed by Helena, is without support in the specification or prosecution history, and directly contradicts statements made to the patent examiner after all claims were rejected. The patentee had the power to choose the words of the patent, and nowhere modified "stabilizing supports for engaging said target surface" as used in Claims 1 and 41 with a phrase such as "only one of which need to actually touch said target." Likewise, the patentee never attempted to expand "stabilizing supports in contact with said target surface" as used in Claim 21, with a phrase such as "although only one support has to really be in contact with the target."
While this issue may be important in a later argument about equivalents, it is not crucial to the court's claim construction. The term "supports" can be construed without describing how many touch the target surface at any one time. The Stabilizing Supports Transfer Pressure to the Stopper So Fluid is Dispensed

The inventor chose not to define "stabilizing supports" in the patent. Claim 21 states that the supports must be "in contact with said target surface." Claims 1 and 41 state that the supports are "for engaging the target surface." However we must look to the rest of the patent to determine what the stabilizing supports are or do. The Abstract concisely states their function: "The supports also transmit reactive force from the target surface to compress the rubber stopper of the closed specimen tube." This is apparent from figures 1, 2, 4, & 5, and is described in detail at Col. 4, L. 9-55. In other words, as the user pushes the stoppered container, to which the invention is attached, against the target surface, the stabilizing supports transfer the force of the resistance from the target (or more precisely the supporting surface underneath the target) against the flexible rubber stopper so that it distends into the container, thus reducing the volume of the container.

The Dispensing End is Not a Stabilizing Support

Helena argues that the opening of the passage way out of which fluid is dispensed (the dispensing tip") 2 can not be one of the supports. Claims 1 and 41 state the the stabilizing supports are "for engaging" the "target surface." Claim 1, Col. 5, L. 60-61; Claim 41, Col 8, L. 8. Claim 24 describes "stabilizing supports in contact with said target surface." The "target surface" is the object on which the fluid is to be deposited, such as a microscope slide. This is described in the specification, and shown in the diagrams. Col. 4, L. 46-52; Col. 5, L. 4-12; Fig. 4; Fig. 5.

2 Alpha objected to describing the end of the passageway out of which fluid is dispensed as the "dispensing tip," even though it was consistently so described in the specification. Therefore, unless otherwise noted, "dispensing end" shall be used herein to refer that end of the "passageway" described in Claims 1, 24, and 41, out of which fluid is dispensed.

While Claim 17 describes an adjustable gap Col. 6, L. 48-51, there is no description of an embodiment in the patent or the prosecution history, which has the dispensing end coming into contact with the target surface. The specification describe numerous problems if the dispensing end comes into contact with the target surface. A seal may be formed against the target surface, which would prevent fluid from exiting or would damage cells due to the pressure." Col. 1, L. 47-5. Contact between the dispensing end and the target could also result in fluid being sucked back into the device. Col. 1, L. 50-54. Contamination can occur if the dispensed fluid comes in contact with a stabilizing support. See Col. 2, L. 39-44.

Nevertheless, at the Markman hearing Alpha argued that Claim 1 could be read to include a dispensing end which might touch the target surface, if that surface was a blotting material, gauze, or other soft absorbent material. Alpha does not explain why the court should ignore the numerous and consistent references in the specification and prosecution history to the stabilizing supports extending a "predetermined distance" beyond the dispensing end, which determines the amount of fluid released. Instead Alpha relies solely upon the canon of construction that claim language should be interpreted broadly, and that limitations in the specification should not be imported into the claim language.

Regardless of the requirement to give the claim language a broad reading, and to avoid importing limitations, the specification makes clear that the dispensing end does not engage the target surface to provide the reactive force that compresses the stopper, like a support does. If it did, it would block the flow of fluid from the passageway (especially if soft blotter material or gauze was forced up into the passageway), and possibly contaminate the specimen or crush cells in the specimen.

By the end of the hearing Alpha agreed that the stabilizing supports had to prevent the dispensing end from being pressed or forced into the target surface so as to block the opening or drive surface material or fluid back into the opening or passageway. Therefore, while a very broad reading of the claim language might allow the dispensing end to touch the target surface, the dispensing end can not be a stabilizing support, which, the parties agree, transmits reactive force to the stopper. The Stabilizing Supports Help Keep The Dispensing End In Position on the Target

Helena argues that the definition of the term should state that "independent of manual assistance," the stabilizing supports...
"bear the weight of the device plus the stoppered container in a manner which is resistant to change." This is an overly complicated limitation which is likely to lead the jury to believe that the invention must be able to stand erect on its own, "without manual assistance." Nothing in the patent or patent history indicate that device must be able to bear weight without manual assistance. In fact it is very unlikely that a device of about the same diameter of a long narrow test tube is going to stand up or "bear weight" without manual assistance, except in the most carefully controlled conditions. It is even more unlikely that one skilled in the art would read "stabilizing supports" to mean that the device is designed to encourage technicians to leave a glass tube of biologically hazardous fluid standing on its end, outside of a rack or holder, supported only by a dispenser of about the same diameter as the tube.

One skilled in the art would realize that when the container is not safely in its rack or holder, it will be in the hand of a user. It will not be standing on end waiting for the slightest breath of air to knock it to the floor, thus releasing infectious fluids. The dispenser does not have to support or "bear the weight" of the device or the container.

As discussed above the stabilizing supports have to be stiff enough, and strong enough, to keep the dispensing tip from being forced into the target surface when the user is pushing on the "stoppered container." Additionally the specification describes the need for the device to "stabilize itself against a target surface" if "off-perpendicular forces are applied" to prevent the dispensing end from wandering from the location where the liquid is to be applied. Col. 1, L. 54-58. See also Col. 2, L. 44-47, which describes "stabilizing supports which are adequately spaced apart to also stabilize against the target surface if force is applied at a non-perpendicular angle." Col. 2, L. 44-47 (emphasis added).

As Alpha agreed at the Markman, the stabilizing supports tend to keep the dispensing end in the same position relative to the target surface each time pressure is applied and a drop of fluid is dispensed. This is true even if the direction of force applied to the container by the user is not exactly in line with the stoppered container or the dispensing tip. In other words, if a user happens to push on the container at an angle, the device will not simply lay down or lean over, but will tend to remain on same line relative to the target surface, which will tend to keep the dispensing end in the same position relative to the target. This comports with the common definition of "stabilize" - to make stable, steadfast, or firm, to hold steady. THE MERRIAM-WEBSTER THIRD NEW INTERNATIONAL DICTIONARY, UNABRIDGED (2005).

Therefore the court will define this terms as follows:

"Stabilizing supports" means: two or more parts or projecting surfaces at the end of the dispenser from which fluid is dispensed, other than the end of the passageway out of which fluid is dispensed, which: make contact with the target surface; keep said passageway opening from being forced into the target surface; tend to keep the end of the passageway out of which fluid is dispensed in the same position relative to the target surface; and which transfer back to the stopper, the force applied by the user on the container and/or dispenser for the purpose of dispensing fluid.

The Parties agree that "stabilizing the cardiac rate" means "establishing a steady ventricular cardiac rate." The ordinary meaning of stabilize is "to hold steady: as . . . to limit fluctuations of." Webster's Ninth New Collegiate Dictionary 1146 (1990). However, Medtronic goes on to argue that this term also means that the steady ventricular rate must be "impervious to perturbations." At the Markman hearing, Medtronic argued that its interpretation of "stablizing" was consistent with Guidant's interpretation. Tr. at 178:18-19. However, Medtronic's proffered construction would require that fluctuations be totally eliminated. "Eliminate" is not the same as "limit." Guidant's interpretation better reflects the true meaning of this element. Thus, the element requires that fluctuations are limited, not that they are eliminated.

D. "stably positioned upon the staple cartridge and/or anvil components of the stapler instrument," "adapted to assist in positioning and/or retaining the buttress material," and "adapted to position and/or retain the materials in place"
The Court discusses the above terms together because the parties' proposed constructions are essentially the same for each term and the construction of the first term will apply to the construction of the second and third. Claim 37 and 45 of the '748 Patent refer to "buttress material adapted to be [] stably positioned upon the staple cartridge and/or anvil components of the stapler instrument." 14 Synovis contends that no construction is necessary, but if the Court decides to construe the term, it should construe it as "located so as to avoid becoming dislodged, during the course of its normal use, from the staple cartridge and/or anvil components." (Joint Statement at 13.) Gore, on the other hand, asserts that the Court should construe the phrase as "positioned in a secure fashion upon the staple cartridge and/or anvil components of the stapler by virtue of its physical structure without the need for adhesives or ties." (Id.)

14 Claims 37, 41, and 45 refer to a region of buttress material that is "adapted to assist in positioning and/or retaining the buttress material." Claims 37, 41, 44, 45, and 48 all reference a structure "adapted to position and/or retain the materials in place."

Synovis claims that its proposed construction is consistent with the language of the claim terms and with the intrinsic evidence. Specifically, Synovis asserts that the claim terms all discuss positioning and retaining the buttress material on the stapler components. Synovis points to language in the Summary of the Invention that explains that the buttress material is designed so as "to avoid being dislodged or delaminated from its position in the course of positioning." (748 Patent c. 2, 11: 62-63.) Synovis asserts that Gore's inclusion of the requirement that the positioning occur "by virtue of its physical structure without the need of adhesives or ties" is unjustified. Synovis asserts that the specification repeatedly refers to adhesives, ties, and gels as optional features for further enhancing the positioning of the buttress material.

Gore asserts that Synovis' proposed substitution of the word "located" for "positioned" would not be helpful to the jury and that the concept of "normal use" is not supported by the claims and would add ambiguity. In addition, Gore asserts that Synovis' construction does not capture a critical aspect of the invention--that the stable positioning of the buttress materials is attributed to its physical structure. Gore also cites to portions of the specification that it argues describe the invention in a way that requires that the buttress material be capable of being stably positioned by virtue of its physical structure.

It is apparent that the parties' dispute centers on the inclusion of the language "by virtue of its physical structure without the need for adhesives or ties." With the exception of this language, there is no significant difference between the parties' proposed constructions. The Court concludes that the intrinsic evidence does not support the additional language proposed by Gore. First, the Summary of the Invention reads in part:

The preformed tissue portions permit the placement and retention of the portions upon respective stapler components, preferably without the need for adhesives, ties, and the like. The preformed tissue portions can be treated (e.g., chemically treated) and/or manipulated (e.g., sewn) to retain suitable three dimensional structure and topographic features (e.g., raised/indented portions, ridges) that permit them to be positioned in a secure fashion upon a respective stapler component, e.g., by press or friction fit onto the corresponding grooves, apertures, ridges and edges of the stapler device component.

(748 Patent c. 3, 11: 25-35.) The phrase "preferably without the need for adhesives, ties, and the like" suggests that the specification describes a desirable, but not mandatory, embodiment of the patent. See Cordis Corp. v. Medtronic AVE, Inc., 339 F.3d 1352, 1357 (Fed. Cir. 2003). The Summary of the Invention also reads: "By virtue of its physical structure, optionally aided with ancillary materials described herein, the material retains sufficient properties, including shear resistance, to avoid being dislodged or delaminated from its position in the court of positioning." (748 Patent c. 2, 11: 59-64.) In addition, there are several references in the patent specification to the potential use of adhesives. (748 Patent c. 3, 11: 16-20 ("Also optionally, positioning of the material upon a respective component can be accomplished or facilitated by the use of ancillary materials, such as gels or ties."); id., c. 10, 11: 33-40 (example 1); id., c. 11, 11: 58-64 (example 2.).)

The Court concludes that the specification does not support the addition of the language "without the need for adhesives or ties" to the otherwise clear and understandable claim language. In addition, the Court determines that the structure of the buttress material to be "stably positioned" is described in the claim language and declines to construe the claim term so as to
add the language "by virtue of its physical structure." Instead, the Court determines that the meaning of the "stably positioned" terms are readily understandable and no construction is necessary.

To reach inequitable conduct, the trial court necessarily construed the claims. According to Agfa, the trial court misconstrued the term "stack," common to all asserted claims. As a representative example of the asserted claims, claim 1 of the '452 patent recites:

1. A method for automatically selecting a plate for imaging in an automated plate handler, comprising the steps of:
   a. automatically positioning a plurality of stacks of plates stored in the plate handler and placing a stack of the plate size required for an imaging job in an access position;
   b. automatically separating and removing a single plate from the stack of plates in the access position and transferring the single plate out of the plate handler for imaging; and
   c. automatically removing a slip sheet from on top of the stack of plates in the access position.

'452 patent, col. 11, l. 66-col. 12, l. 11 (emphasis added). Agfa argues that the term "stack" covers only a horizontal arrangement of plates, like those shown in figure 1 of the '452 patent, reproduced above. The trial court disagreed, construing stack as "encompassing a number of plates arranged together in an orderly fashion, regardless of the orientation (horizontal or vertical) of the collection as a whole." Decision, slip op. at 22. This court perceives that the trial court's construction, and its reasoning leading to that construction, is sound.

The trial court first consulted the ordinary meaning of "stack," for which it cited a dictionary definition. As this court explained in Phillips v. AWH Corp., the ordinary meaning of some claim terms "may be readily apparent even to lay judges, and claim construction in such cases involves little more than the application of widely accepted meaning of commonly understood words." 415 F.3d 1303, 1314 (Fed. Cir. 2005) (en banc) (citation omitted). "In such cases, general purpose dictionaries may be helpful." Id. This case falls squarely within those guidelines from Phillips. The customary meaning within this field of art does not limit the term "stack."

The meaning of the claim language does not limit "stack" to plates arranged one on top of another. Accordingly, when a stack is tilted more than 45 degrees, it remains a stack because the plates are still arranged in a top-to-bottom fashion. After all, the top of a plate remains its top even when that plate tilts beyond 45 degrees. In other words, the relationship of plates in a stack depends on the orientation of those plates relative to one another. The orientation of the resulting stack from the vantage point of elements outside the stack is irrelevant.

Moreover, nothing in the disclosures of the asserted patents suggests that "stack" has any meaning in the art that would limit its scope to horizontal stacks. The trial court buttressed its construction with the observation that three of the asserted patents include dependent claims that further specify a horizontal (or other particular) arrangement of the claimed stacks. See, e.g., '250 patent, col. 12, II. 16-18 (claim 2) ("The method according to claim 1, wherein the stacks of plates stored in the plate handler are positioned substantially horizontally."). Properly applying the claim differentiation guideline in the context of dependent claims, the trial court correctly found support for the proposition that those dependent claims suggest that the "stack" standing alone is not limited to horizontally positioned stacks. See Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380 (Fed. Cir. 2006) (explaining the presumption that independent claims do not include the limitations added by their dependent claims).

Similar to this court in Phillips itself, the trial court declined to limit these patent claims to their preferred embodiment. The asserted patents indeed depict a horizontal arrangement of stacks as the preferred embodiment. See, e.g., '452 patent, figure 1 (reproduced above; elements 26 are the stacks). As noted, this court has repeatedly rejected the contention that depiction of a single embodiment in a patent necessarily limits the claims to that depicted scope. See Phillips, 415 F.3d at 1323. This case illustrates again the reason for this court's refusal to limit broader claim language to a preferred embodiment in the patent specification. Of necessity, any depiction of any stack will necessarily show that stack arranged in a particular
manner. Nothing beyond that depiction, however, limits the claim language--the defining portion of the patent document--to some particular orientation. Without any indication beyond the necessary depiction to suggest limiting the invention to this single embodiment, the broader language of the claims cannot carry that unexpressed and unintended (at the time of patent drafting) limitation.

As indicated in the "Background of the Invention" section of the patent, the laser engraving process is intended "for marking and engraving brick or other like ceramic material which can produce a distinctive, long lasting image in a manner that is efficient, safe, and environmentally sound." '335 Patent, Col. 1, ll. 29-32. Claim 1, an independent claim of the patent, sets out a description of the laser engraving process as a whole. The parties dispute the second section of claim 1, which articulates the three stages of the laser engraving process:

- a first stage in which said laser removes a portion of said ceramic material to form said depth for said marking within and below said ceramic surface;
- a second stage in which said laser continues to deliver energy to melt and vitrify said ceramic material whereby it is fused into surrounding unmelted ceramic material within said depth; and
- a third stage in which said laser removes residue from said ceramic surface to effect said adherent, contrasting marking.

'335 Patent, Col. 4, ll. 25-34.

Plaintiff asserts the following construction of claim 1:

The term "stage" as used in claim 1 and the specification means a physical effect caused by the laser [and] should not be confused with the term "pass" which means a separate and distinct movement of the laser beam over the area to be marked. . . . The three stages are not required to take place in distinctive, separate laser passes, and can all occur in one pass of the laser.

Jt. Motion, p.3. Defendant urges a construction that "the term 'stage' refers to [discrete] elements of the process in Claim 1"; that "each stage is described in the patent as having a different result on the brick or substrate"; that the first two stages cannot "take place simultaneously, with one laser pass"; and that "there is no disclosure to be found anywhere in the patent to indicate that the process can be accomplished in a single step, nor is there any disclosure that any two of the stages can be combined." Jt. Motion, pp. 2, 4, 14.

As a threshold matter, the Court finds that the parties do not dispute that the patented engraving process involves three ordered, progressive changes in the ceramic material. Plaintiff states that the patent "describes the three stages of claim 1 as comprising progressive physical effects arising during the laser engraving process in creating a vitrified mark in a brick." Jt. Motion, p.6 (emphasis added). Defendant contends that the intrinsic evidence "conclusively establishes that each stage constitutes a discrete, sequential step in the process." Jt. Motion, p.11 (emphasis added). See Jt. Motion, pp. 13-14 (defendant asserting that the changes to the ceramic material must occur in set order). The issue before the Court is whether, under claim 1's construction, the three stages comprised of progressive changes in the ceramic material can be achieved in fewer than three discrete passes of the laser.

A number of general principles of claim construction have been enunciated in the case law, many of which are helpfully articulated by the Federal Circuit Court of Appeals in Vitrronics Corp. v. Conceptronic, Inc., 90 F.3d 1576 (Fed.Cir. 1996). The scope of potential consideration includes intrinsic evidence, namely "the patent itself, including the claims, the specification and, if in evidence, the prosecution history," and extrinsic evidence, such as technical treatises, dictionaries, and prior art. Id. at 1582. "It is well-settled that, in interpreting an asserted claim, the court should look first to the intrinsic evidence of record," which "is the most significant source of the legally operative meaning of disputed claim language." Id. The claim language itself is examined, and "words in a claim are generally given their ordinary and customary meaning." Id. Exegesis of the specification is said usually to be "dispositive," as "it is the single best guide to the meaning of a disputed term." Id.
The Court thus begins its analysis with an examination of the plain language of claim 1. Claim 1 does not reference how many laser passes are necessary to achieve the sought after effects. In fact, the term "pass" does not appear in claim 1. Moreover, while three stages are referenced, claim 1 does not define the term "stage." Claim 1 does describe "a second stage in which said laser continues to deliver energy..." '335 Patent, Col. 4, ll. 28-29 (emphasis added). Defendant asserts that "the specification... shows that the laser is operated robotically using computer software" and "the word 'continues' merely expresses a timing sequence." Jt. Motion, p.15. The Court finds that "continues" is ambiguous regarding whether in the second stage the laser operator continues the same laser pass or continues with a new pass of the laser.

There is nothing inherent in the language of claim 1 that necessitates three separate laser passes, which militates in favor of plaintiff's position. Examination of the other claims further bolsters plaintiff's position. See Bell Atlantic Network Services, Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1274 (Fed.Cir. 2001)("It is true that limitations stated in dependent claims are normally not to be read into the independent claim from which they depend.") (citation omitted). The Court notes that while the term "pass" is not used at all in independent claim 1, "pass" is used throughout dependent claim 2:

The process of claim 1 in which said laser hatches over said engraving area, said laser being programmed to direct light beams in hatching passes of parallel orientation, each subsequent adjacent beam pass overlapping a prior pass by one half of a diameter of said beam, whereby a heating efficiency is enhanced.

'335 Patent, Col. 4, ll. 35-40 (emphases added). The multiple uses of "pass" in claim 2 and the term's total omission in the description of the stages in claim 1 appear to be purposeful. Consideration of the particular language conveys this, as well as the general common sense principle of claim differentiation, which is the presumption that the use of different words or phrases in separate claims conveys a difference in meaning and scope. Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed.Cir. 1998).

Furthermore, dependent claims 5-8 set out the three different beam frequencies and writing speeds comprising the three passes of the laser that match those of the preferred embodiment, which is described in the patent specification. Plaintiff makes a persuasive argument that claim 1 does not encompass the preferred embodiment because the parameters for the preferred embodiment are set out separately in claims 5-8:

Claims 5-8 cite as limitations the specific parameters described in each pass covered in the respective stages of the preferred embodiment. In those claims, each stage encompasses a distinct pass of the laser and a different set of laser parameters for achieving the physical effect of that stage. If the three stages of claim 1 were to be construed as being limited to comprising three different passes of the laser with the laser parameters of the preferred embodiment, claims 5-8 would be rendered superfluous.

Jt. Motion, p.9. Under the doctrine of claim differentiation, broader construction is given to the independent claim to avoid rendering the dependent claim redundant. Dow Chemical Co. v. United States, 226 F.3d 1334, 1341-42 (Fed.Cir. 2000). The construction of claim 1 compared to the other claims strongly supports a determination that claim 1’s construction is not limited to three laser passes.

Looking beyond the claims, the specification does not expressly define or modify "stage." 1 The term "pass" is used in the specification only for the preferred embodiment, which specifically utilizes three passes of the laser. The "Use" section of the specification states that the "preferred mode of carrying out the inventive process" involves "[a] red clay paving brick having a relatively smooth surface" and "an appropriate lens" with "laser peak power... sufficient to vaporize and melt the brick material." '335 Patent, Col. 3, ll. 35-42. This preferred mode involves three passes of the laser using three different laser beam frequencies and writing speeds. After describing the preferred embodiment, the specification states, "Various changes and modifications may be made within this invention as will be apparent to those skilled in the art. Such changes and modifications are within the scope and teaching of this invention as defined in the claims appended hereto." '335 Patent, Col. 4, ll. 9-13.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

1 Defendant attaches as exhibits certain dictionary definitions of "stage" and "engrave." "Judges... may... rely on
dictionary definitions when construing claim terms, so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents." Vitronics, 90 F.3d at 1584 n.6. The Court does not rely upon either definition, finding that either party's position could be supported by the definitions.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The Federal Circuit Court of Appeals "consistently declines to construe claim terms according to the preferred embodiment." Northern Telecom Limited v. Samsung Electronics Co., 215 F.3d 1281, 1293 (Fed.Cir. 2000)(citations omitted). "Although the specification[] may well indicate that certain embodiments are preferred, particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments." Electro Medical Systems v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed.Cir. 1994)(citation omitted). See also Texas Instruments, Inc. v. United States Int'l Trade Comm'n, 805 F.2d 1558, 1563 (Fed.Cir. 1986)("This court has cautioned against limiting the claimed invention to preferred embodiments or specific examples in the specification.") (citation omitted).

Plaintiff contends that the preferred embodiment cannot limit claim 1, stating that claim 1 includes both thermal ablation, which does not require laser setting reconfiguration for each stage, as well as mechanical ablation, which requires laser setting reconfiguration for each stage and which is used for the preferred embodiment. See Jt. Motion, pp. 6-9. Plaintiff also explains that:

the specification does not limit the laser settings in carrying out the three stages, and need not, because a person having skill in the art would know the capabilities of the laser in bringing about the specific effects. . . . Because the three stages represent progressive physical effects that occur through continual application of the laser beam to the brick surface, the laser settings may be the same for each stage. Alternatively, the laser settings may be different for each stage to emphasize the effect of that respective stage.

Jt. Motion, p.7. Defendant does not specifically address the issue of whether claim 1 includes both thermal and mechanical ablation.

While defendant states on page 15 of the joint motion that it "does not seek to read into the claim term the preferred embodiment provided in the patent," it relies on the preferred embodiment when arguing its position. On pages 19-20 of the motion, defendant cites specifically to the description of the "preferred mode" laser settings in order to support its argument that the stages in claim 1 cannot occur in one pass.

Defendant also cites to the figure descriptions found in the specification. See, e.g., Jt. Motion, pp. 18-19. Defendant asserts that the figures of the patent demonstrate that the three stages of claim 1 require three passes of the laser, stating, "FIGS. 1-3 of the patent[] show the same starting location, on the brick, for the laser beam depicted in each figure, for each stage. The figures, therefore, show that the laser returns to the start point after each stage is finished in order to begin the next stage." Jt. Motion, p.4.

However, while the Court does not disagree that the figures represent three passes of the laser, it notes that the patent specification states, "For purpose of illustration of this invention a preferred embodiment is shown and described hereinbelow in the accompanying drawing [sic]. It is to be understood that this is for the purpose of example only and that the invention is not limited thereto." '335 Patent, Col. 1, l. 65 - Col. 2, l. 2 (emphases added). Furthermore, even a consistent feature of the patent's drawings cannot, without more, be construed as a limitation on a claim which contains no language indicating incorporation of that feature. See Advanced Cardiovascular Systems, Inc. v. Scimed Life Systems, Inc., 261 F.3d 1329, 1339 (Fed.Cir. 2001)(citing Johnson Worldwide Associates, Inc. v. Zebraco Corp., 175 F.3d 985, 992 (Fed.Cir. 1999)).

Other than the parts of the specification relating to the preferred embodiment, the term "pass" (or any variation thereof) is not used in the specification. The patent holder is not obligated to include all embodiments in the specification. See, e.g., Smith v. Snow, 294 U.S. 1, 11, 79 L. Ed. 721, 55 S. Ct. 279, 1935 Dec. Comm'r Pat. 757 (1935)("It is not necessary to embrace in the claims or describe in the specification[] all possible forms in which the claimed principle may be reduced to practice."). See also SRI Int'l v. Matsushita Electric Corp., 775 F.2d 1107, 1121-22 (Fed.Cir. 1985). The Court finds unpersuasive defendant's arguments that would import to claim 1 the limitation of the preferred embodiment described in the specification.
The prosecution history of the patent may provide information relevant to claim interpretation, such as "any express representations made by the applicant regarding the scope of the claims." Vitronics, 90 F.3d at 1582. There exists a potential overlap with the extrinsic evidence, in that "included within an analysis of the file history may be an examination of the prior art cited therein." Id. at 1583. Plaintiff asserts that the prosecution file history is not helpful, while defendant contends that "the examiner clearly understood the applicant's invention as a sequential three step process for laser engraving, and allowed claim 2, as amended, for that reason." Jt. Motion, p.18. Upon an examination of the file history, the Court does not find it instructive on the instant issue.

The original claim 1, which comprises the first paragraph of the '335 patent's claim 1 with minor modification, was rejected in the patent examiner's office action dated January 20, 1996. The patent examiner rejected the original claim 1 pursuant to 35 U.S.C. § 102(b):

[The claim is rejected] as being anticipated by either of Noda et al or the article to Vol'ter and Sviridov. Either applied reference teaches the instant process for engraving ceramic surfaces using a laser involving a removal step and a melting and solidifying step in which melted material is fused into a surrounding, apparently unmelted area (ie, the unmelted bearing base of Noda et al and the walls of the grooves in Vol'ter et al). It is submitted inherent that an adherent, contrasting marking occurs in the process of each applied reference.

Exh. A4 of Jt. Motion, p.3, P3. The original claim 2, which comprises the remaining portion of the '335 patent's claim 1 with minor modification, was initially rejected because of indefiniteness. However, the patent examiner stated that the original claim 2, and original claims 3-9 rejected on the same grounds, "would be allowable if rewritten to overcome the rejection under 35 U.S.C. § 112 and to include all of the limitations of the base claim and any intervening claims." Exh. A4 of Jt. Motion, p.3, P4. The applicants filed a claim amendment in March 1996 in response to the rejections, merging the original claims 1 and 2 and changing, inter alia, "melting and fusing" in the original claim 2 to "engraving," calling the amended version "claim 1." The amended claim 1 was allowed in May 1996. Exh. A6 of Jt. Motion.

According to defendant, "Stage one . . . establishes the patentably distinct subject matter allowed by the examiner. . . ." Jt. Motion, p.13. Defendant states the following:

The prosecution history clearly demonstrates that the examiner thus allowed original claim 2, as amended, to claim an engraving process taking place in three stages, and that the first stage 'does not involve any melting or fusing, but . . . evaporation.' Stage one of the amended claim (present claim 1) is critical because it applied a new digging, or depth formation, step to distinguish it over the prior art. Because the applicant amended then claim 2 exactly as suggested by the examiner, without any argument whatsoever, it is clear that the applicant acquiesced in the examiner's view of the invention.

Jt. Motion, p.17. Defendant continues that "because the Defendant's accused process for laser marking bricks reads only on the Plaintiff's original claim 1 . . . [plaintiff] attempts to now broaden the permissible scope of present claim 1," resulting in "a broad construction [that] defies the clear prosecution history." Jt. Motion, p.18. Defendant's argument and the file history do not reflect on the number of laser passes used in the laser engraving process of the '335 patent. Whether the first stage is the critical component of claim 1 necessary to distinguish the invention from the prior art is not a question for determination at this time.

Consideration of extrinsic evidence is resorted to "only if there [is] still some genuine ambiguity in the claims, after consideration of all available intrinsic evidence." Vitronics, 90 F.3d at 1584. Opinion testimony from an expert or an inventor is not properly relied upon if inconsistent with the specification and file history, and may not be considered unless "the patent documents, taken as a whole, are insufficient to enable the court to construe disputed claim terms" - an instance which "will rarely, if ever, occur." Id. at 1585. The patent documents themselves are sufficient to determine the claim construction at issue here, and the Court does not rely on extrinsic evidence in making its decision.

Based on the rationale set forth above, the Court concludes that claim 1 is properly construed as describing three progressive physical effects that may be obtained in fewer than three laser passes.
3. The "Staggered to the Right" Element

In its third and final argument pertaining to literal non-infringement, Microsoft asserts that the Microsoft keyboards do not, as a matter of law, infringe upon claims 1 through 4 of the '484 patent. (Micro. Memo. ISO MSJ, p. 8.) Microsoft notes that claims 1-4 of the '484 patent require the "B" key to be staggered to the right of the "G" key, and require the "G" key to be staggered to the right of the "T" key. According to Microsoft, however, the B, G, and T keys of the Microsoft keyboards slope in just the opposite direction. That is, Microsoft contends that the B key of the Microsoft keyboards slopes gently to the left of the G key, and that the G key slopes gently to the left of the T key. Thus, Microsoft contends that, as matter of law, the Microsoft keyboards indisputably do not literally infringe upon the '484 patent.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

15 The '484 patent, in describing the right end group of keys in the left hand group, states:

said column of the right end group of keys being staggered rightwardly to further help facilitate using the conventional QWERTY left hand digit touch typing keystroke technique wherein the QWERTY key means bearing the letter B is staggered substantially rightwardly of the QWERTY key means bearing the letter G and wherein the QWERTY key means bearing the letter G is staggered substantially rightwardly of the QWERTY key means bearing the letter T.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

Microsoft's "stagger to the right" argument arises from Judge Keep's Markman construction of the term "key." Judge Keep construed the term "key" to mean "a part of the keyboard that, if pressed, causes the computer to take some action." Under this construction, the "keys" of the Microsoft keyboards include the blank, unraised areas that are appended as the right halves of the T and G keys. Reading Judge Keep's Markman order faithfully, these blank areas are part of the T and G keys because, if pressed, the computer will perform some function.

Turning to the Microsoft keyboards with a faithful reading of Judge Keep's definition of "key" in mind, the Court notes that the right-hand edge of the B key does indeed slope gently to the left of the G key's right-hand edge, and the right-hand edge of the G key does indeed slope gently to the left of the T key's right-hand edge. For two reasons, however, this observation does not entitle Microsoft to summary judgment of non-infringement.

First, while Microsoft focuses intently on the design of the right-hand edges of the T, G, and B keys (as defined in the Markman order) the Court notes that, with regard to the left-hand edges of the T, G, and B keys, the keys do in fact stagger in a pronounced rightward fashion. That is, with regard to their left-hand edges, the B key is staggered to the right of G key, and the G key is staggered to the right of the T key. Although Microsoft chooses to focus on the right-hand edges of the three keys in concluding that the keys slope gently leftward, the Court notes that a reasonable juror could just as easily focus on the left-hand edges. Thus, the Court finds that reasonable jurors could disagree, depending upon which edges of the keys the jurors focus upon, as to whether the T, G, and B keys stagger leftward or slope rightward.

Second, the Court notes that, with regard to the Microsoft keyboards, the gentle "sloping" of the T, G, and B keys is just that: sloping. The only "staggered" portions of the Microsoft keys include (1) the left-hand edges of the keys, as discussed above; and (2) the right-hand edge of the B key, along with the raised, central ridges of the G and T keys. A cursory visual examination of the "staggered" portions of the T, G, and B keys quickly reveals that all of these "staggered" portions stagger rightward, with the G key to the right of the T key, and the B key to the right of the G key. Consequently, the Court finds that a reasonable juror could find that the three keys "stagger" to the right yet, at the same time, "slope" to the left.

At oral argument, Microsoft attempted to refute the above two points by suggesting that a key is not "staggered to the right" unless the entire key -- meaning each side of the key -- is staggered rightward. Thus, according to Microsoft, summary judgment of non-infringement is warranted because the T, G, and B keys of the Microsoft keyboards are "staggered to the right" only with regard to one side of the three keys, rather than with regard to both sides of the keys.
Because Microsoft's argument raises a question pertaining to the definition of claim language, the Court must once again engage in Markman claim construction. Bayer AG v. Biovail Corp., 279 F.3d 1340, 1349 (Fed. Cir. 2002)(adjudication of summary judgment of non-infringement not possible without proper claim construction of relevant claim limitation). Specifically, the Court must determine, with regard to the '484 patent, whether the claim term "staggered" encompasses objects, such as the T, G, and B keys on the Microsoft keyboards, that stagger on one side, yet that form a sloping or straight line on the other.

Webster's Dictionary defines "staggered" as "marked by an alternating or overlapping arrangement." (Webster's Third New Int'l Dict., p. 2220.) The Court finds no evidence to suggest that this definition does not comport with the ordinary meaning of "staggered" as it would be understood by persons of ordinary skill in the keyboard art. However, the definition is not especially helpful for purposes of this motion, as it does not indicate whether objects are "marked by an alternating or overlapping arrangement" if the objects overlap solely along one side.

The '484 patent refers to the term "stagger" or "staggered" at least 21 times. The majority of these references fail to shed light on the particular question before the Court. However, on the basis of several specific references, the Court finds that the '484 patent sets forth a lexicography of the term "staggered" that includes objects which "overlap" or stagger along one side, yet which form a straight or sloping line along another side.

In the disclosure section of the '484 patent, the patentee refers to Figure 1 of the patent, which discloses four rows: "A," "B," "C," and "D." (Emrich Decla., Exhibit 1, p. 11, column 9, ll. 12-18 and Figure 1.) These four rows refer to the basic left-hand QWERTY keys that all touch-typists memorize and master. With regard to rows A through D, the patent discloses a straight or moderately sloping "transverse" line along which all four rows are aligned. (Id., ll. 5-7 and Figure 1.) The patent further discloses that, in each of the four rows, the left-most key is smaller than the left-most key directly below it. (Id., ll. 12-16 and Figure 1.) That is, the "--" key is smaller than the "tab" key, the "tab" key is smaller than the "caps lock" key, and the "caps lock" key is smaller than the "shift" key. 16 (Id.) The patent further discloses that, "due to the increasing size difference between [the] character keys …, the character rows A, B, C and D are staggered from one another." (Id., ll. 16-18.)

The '484 patent ascribes numbers, rather than functions, to the disclosed keys. The Court refers to the keys by their functions or characters for ease of reference.

The Court finds it significant that the patent describes rows A, B, C and D as "staggered" immediately after disclosing that the rows are situated in a straight, or "transverse," line along their left edges. By using the term "staggered" in this manner, the Court finds that the patentee adopted a lexicography of the term "staggered" that encompasses objects which overlap or "step" along one side, yet that form a straight or sloping line along a different side. This finding is further supported by the patentee's reference, in at least three other places in the specifications, to "staggered rows," as opposed to "staggered keys." (Id., columns 8:65, 9:49, 11:53.) By repeatedly referring to these rows, all of which form a straight line along one edge, as "staggered," the patentee indicated that, for purposes of the '484 patent, the scope of the "staggered" element includes those objects which "overlap" or "step" along one side, yet which form a straight or sloping line along another side.

</tr>
</tbody>
</table>
Genus's expert, Oldham, agrees with ASM's expert, Peltzer, that "stagnation point flow" is a well-known theoretical concept in fluid dynamics that is "generally understood to refer to flow toward a solid surface in which the gas or fluid approaching the surface divides into streams proceeding away from the point at which the central streamline intersects the surface." (Oldham Rebuttal Report at 4.) The parties' experts also agree that to create a stagnation point flow, the gas need not flow at a uniform speed. (Oldham Expert Report at 3 ("Said [stagnation point flow] need not be perpendicular, of uniform velocity, or from a source of a particular size."); Peltzer Rebuttal Report at 4-5 ("The flow need not be uniform in magnitude for stagnation point flow to occur.").)

3 The parties' arguments do not distinguish between "stagnation point flow" (claim 1) and "stagnation flow point" (claim 6). "There is no dispute, therefore, that a 'stagnation flow point' is a characteristic of stagnation point flow." (Genus Opp. Brief at 11.)

The parties disagree whether stagnation point flow requires that the gas flow be directed perpendicular to a surface. Oldham states that the flow "need not be perpendicular.[.]" (Oldham Expert Report at 3.) In the previous paragraph, however, he states that "basic texts describe the classic stagnation point flow at the center of a flow as resulting from a flow field starting at infinity and striking an infinite plane orthogonally." Id. (citing F. Rosenberger, Fundamentals of Crystal Growth I.) The Oxford English Dictionary defines "orthogonally" as "at right angles." In fact, Rosenberger contains a diagram, very similar to Figure 3 of the '165 patent, which shows a gas flow which is initially perpendicular to a surface and then all but the centermost point of the flow curves away as it approaches the surface. (Oldham Expert Report, Ex. C, Rosenberger at 258, fig. 5.8.) Rosenberger states that "Stagnation flow, as depicted in two dimensions in Fig. 5.8 occurs when a fluid stream impinges on a wall at right angles to it and flows away radially in all directions." Id. Oldham provides no support for his contention that stagnation point flow can also occur when the gas flow is not directed perpendicular to a surface. The Court agrees with ASM that "the fact that stagnation point flow requires an initially perpendicular flow is clear from the Rosenberger text cited by Dr. Oldham." (Peltzer Rebuttal Report at 5.) Peltzer states that if the flow is not perpendicular, it "would not divide into streams proceeding away from the point where the central streamline intersects with the surface, as they do in stagnation point flow." (Id.) Instead, "all of the streamlines would flow either to the left or to the right." (Id.) Accordingly, the Court finds that the ordinary meaning of "stagnation point flow" is a flow toward a solid surface in which the gas or fluid approaching the surface divides into streams proceeding away from the point at which the central streamline intersects the surface. In order to achieve a stagnation point flow, the direction of the flow initially must be perpendicular to the surface.

Genus argues that the patent specification and prosecution history taken together demonstrate that the term "stagnation point flow" is not being used in the patent claims in its ordinary sense. Genus contends, that as used in the '165 patent, the term "stagnation point flow" is not subject to any reasonably definite meaning.

The patent specification itself provides two definitions of "stagnation point flow." First, it provides:

Referring next to FIG. 3, a cross-sectional view in a plane containing the axis of symmetry of the flow of the gas 11 as it approaches the substrate 10 is shown. The gas 11 initially has a generally uniform velocity directed perpendicular to the entire surface of substrate 10. The solid substrate, as the gas 11 approaches the substrate, causes the velocity vector to become parallel to the surface of substrate 20 and flow away from the axis of symmetry. At one point 21 on the axis of symmetry, generally referred to as the stagnation point, there is theoretically no flow of gas. The axially symmetric gas flow resulting from uniform gas flow toward a surface is generally referred to as stagnation point flow.

- 4419 -
As described by the present application, creation and maintenance of the stagnation point flow can only be achieved by and radial gas flow vectors establishes a point of no gas flow, or a stagnation point flow, at the center of the susceptor. The uniform velocity of the horizontal lines of the specification explain that "a stagnation point flow is achieved only where the velocity vector of the gas flow is uniformly directed perpendicular to the substrate." ('165 Prosecution History at 53-54.)

Thus, the definitions of "stagnation point flow" found in the specification, read in context, are essentially identical to the ordinary definition of "stagnation point flow."

Genus' argument largely rests on statements found in the prosecution history, which it contends demonstrates that the inventors did not use "stagnation point flow" in its ordinary sense. Genus contends that these statements demonstrate that the inventors were concerned with uniform speed of the gas flow, as well as uniform direction of the gas flow, in creating a stagnation flow point. Because the parties agree that uniform speed of gas flow is not necessary to create a stagnation point, Genus contends that the inventors used the term "stagnation point" in a non-standard manner.

The original claims in the patent application that led to the '165 patent made no mention of stagnation point flow. The relevant portion of claim 1, as originally filed, claimed only an "apparatus for directing a flow of gas carrying the deposition material perpendicular to the semicircular substrate, said flow of gas generally having an axial symmetry with respect to a center of said substrate." ('165 Prosecution History at 0014.)

The relevant portion of original claim 11, which became claim 6 of the '165 patent, claimed a "gas flow means for producing a flow of gas having axial symmetry across said circular substrate." (Id.)

The patent examiner rejected those claims as obvious in light of two prior art patents (Brunner and Bergfelt), which the patent examiner believed disclose apparatuses for chemical vapor deposition of a material on a substrate comprising a device for directing a flow of gas carrying the deposition material perpendicular to the surface. (Id. at 35-36.)

The inventor also rejected those claims as obvious in light of another patent (Huffman), without explaining precisely why the claims of the '165 patent were obvious in light of that patent. (Id. at 36.)

In response, the inventors amended claim 1 by adding a requirement that the apparatus have a "means for varying a distance between said apparatus and said substrate and maintaining said flow of gas perpendicular to said substrate." (Id. at 0040.)

The inventors amended claim 11 (the current claim 6) by adding a requirement that the gas flow have "a substantially uniform magnitude of velocity directed perpendicular to" the substrate. (Id.)

The inventors attempted to amend claims 1 and 11 again. (Id. at 0051-52.)

A stagnation point flow is achieved only where the velocity vector of the gas flow is uniformly directed perpendicular to the surface of the substrate. Upon reaching the substrate surface, the perpendicular velocity vector is re-directed horizontally and radially outward from the central point of the susceptor with uniform velocity. The uniform velocity of the horizontal and radial gas flow vectors establishes a point of no gas flow, or a stagnation point flow, at the center of the susceptor.

As described by the present application, creation and maintenance of the stagnation point flow can only be achieved by
having and maintaining a uniform gas flow velocity vector perpendicular to the surface of the susceptor. The resulting radial
gas flow vector is horizontal and passes across the substrate surface permitting uniform deposition of the chemical vapor
deposition materials onto the substrate surface.

(‘165 Prosecution History at 53-54.)

The inventors also stated that:

While Brunner and Bergfelt appear to disclose a substrate orientation which is in direct opposition to the gas flow source,
there is no disclosure of an apparatus, as in the present invention, to insure that the gas flow velocity is uniform and
perpendicular to the substrate surface, thereby creating a stagnation point gas flow at the center of the substrate. At no point
in Brunner or Bergfelt is there disclosed a similar apparatus, as in the present invention, having a plurality of gas flow
apertures which impart uniformity to the gas flow velocity and insure a perpendicular flow vector relative to the substrate
surface. The pertinent sections of the Brunner and Bergfelt disclosures cited by the Examiner merely teach a general
orientation of the substrate relative to the gas flow.

(Id. at 0054-55.) As Peltzer points out, the Brunner patent discloses fixtures for imparting complex motion to the substrate
during coating operations, so that the substrate can be pivoted to any angle in relation to the gas flow. (Peltzer Rebuttal
Report at 6, and Ex. A (Brunner patent No. 3,889,632) 2:11-12, 3:33-35, 4:28-32.) In the Bergfelt patent, the gas flow is
distributed to multiple substrates at a variety of angles that appear never to be perpendicular to the substrate. (Id., and Ex. B
(Bergfelt patent No. 4,222,345) Fig. 1.)

The inventors also sought to distinguish Huffman:

It is crucial, according to the present invention, that the gas flow have a substantially uniform velocity vector directed
perpendicular to the substrate surface. According to the express teaching of Huffman et al. the gas flow cannot be directed
perpendicularly to the substrate with the offset nozzle arrangement disclosed therein.

(‘165 Prosecution History at 57.) Huffman discloses an offset gas flow nozzle that distributes gas to an offcenter portion of a
rotating substrate. (Peltzer Rebuttal Report, Ex. C (Huffman patent No. 3,745,969) at Fig. 3, 1:62-2:6, and 4:29-60.) Peltzer
agrees with the inventors that the Huffman invention does not flow gas perpendicularly toward the substrate, and instead
discloses a gas flow nozzle that distributes gas in an angle corresponding to the angle of the nozzle, which is 40 degrees in
the preferred embodiment. (Peltzer Rebuttal Report at 6, and Ex. C. (Huffman patent No. 3,745,969) at Fig. 3 and 4:44-48,
5:64-67.)

The inventors thus attempted to distinguish Brunner, Bergfelt, and Huffman by arguing that those inventions, unlike the
invention of the ‘165 patent, did not require a perpendicular flow of gas towards the substrate. Genus instead focuses on the
inventors' use, in this portion of the prosecution history, of phrases such as "the gas flow velocity is uniform and
perpendicular to the substrate surface" and "apertures which impart uniformity to the gas flow velocity and insure a
perpendicular flow vector relative to the substrate surface." Genus contends that these phrases demonstrate that the
inventors were concerned with uniform speed of the gas flow, as well as uniform direction of the gas flow, in creating a
stagnation flow point.

The Court agrees that there is some ambiguity in the language used by the inventors. The key point of the inventors' argument
to the patent examiner in this section of the prosecution history, however, is that the prior art (Brunner, Bergfelt
and Huffman) does not disclose an apparatus that requires perpendicular flow so that a stagnation flow point occurs. Any
other statements by the inventors in this section of the prosecution history that arguably might be interpreted as suggesting
that uniform speed of gas flow is also necessary are not clear enough to demonstrate that the inventors were using an
unusual definition of "stagnation point flow." See CCS Fitness, 288 F.3d at 1366 (noting that a claim term will not be
construed in accordance with its ordinary meaning if the patentee acted as his own lexicographer and clearly set forth a
definition of the disputed claim term in either the specification or prosecution history).

Genus also argues that later statements in the prosecution history again demonstrate that the inventors used a non-standard
definition of "stagnation point flow." After the amendment just discussed, the patent examiner again rejected claims 1 and
11 for the same reasons, and also because the amendment to add the "stagnation point flow" limitation raised new issues.

- 4421 -
(‘165 Prosecution History at 60-61.) The inventors ultimately filed a continuation of the prior patent application, apparently with the new amendments to claims 1 and 11. (Id. at 78; see id. at 95-96.) Claims 1 and 11 were rejected again, this time primarily in light of a European patent, PCT 85/03460. (‘165 Prosecution History at 89-90, and 93.) Oldham refers to the European patent as the Schmidt ‘460 PCT Application. The patent examiner rejected claims 1 and 11 as obvious "over the European patent in view of Nishizawa, Robinson or Brandolf." (Id. at 89.) The patent examiner also rejected claims 1 and 11 as obvious over Brunner and Bergfelt "in view of the European patent in combination with Nishizawa, Robinson or Brandolf." Id.

The patent examiner finally allowed the claims after the inventors proposed additional amendments, which added the limitation that the apertures be in a generally circular configuration with a radius substantially equal to that of the substrate, and that the apertures be coaxially aligned with the substrate. Id. at 96, 101. These changes in alignment appear to be designed to influence the direction of the gas flow, rather than its speed. The inventors successfully argued that these amendments distinguished their invention from the prior art:

Independent claims 1 and 11 [now claim 6] have been amended to positively recite and claim the that [sic] the apertures in the gas injector are arranged in a circular configuration which has radius equal to the radius of the circular substrate and coaxially aligned with the center of the substrate. As disclosed in the Specification at Page 6, lines 1-12, 4 a stagnation point flow is achieved only where the velocity vector of the gas flow is uniformly directed perpendicular to the surface of the substrate. Upon reaching the substrate surface, the perpendicular velocity vector is re-directed horizontally and radially outward from the central point of the susceptor with uniform velocity. This flow profile establishes isotherms at the substrate surface and an axially symmetric flow away from the center of the substrate. The uniform velocity of the horizontal and radial gas flow vectors establishes a point of no gas flow, or a stagnation point flow, at the center of the susceptor.

(Id. at 97.) From this language, it appears that the inventors of the ‘165 patent are describing how a stagnation point flow can be achieved using the apparatus of the invention, but are not disagreeing with the common meaning of the term.

--- Footnotes ---

4 Page 6, lines 1 through 12, of the specification, as originally filed, corresponds to column 3, lines 43 through 55, of the issued patent.

--- End Footnotes ---

Genus argues that the inventors of the ‘165 patent also used a non-standard meaning of "stagnation point flow" in attempting to overcome the patent examiners' rejection of certain claims as obvious in light of four prior art patents (the European patent, Nishizawa, Robinson, and Brandolf). The inventors argued the following:

As described by the present application, creation and maintenance of the stagnation point gas flow can only be achieved by having and maintaining a uniform gas flow velocity vector perpendicular to the entire surface of the susceptor. This is accomplished by the present invention by providing the gas injector with apertures having a circular configuration corresponding to the circular configuration of the substrate. The pending claims have been amended to further clarify and point out this important distinction.

Even a cursory review of the European Patent discloses that the gas injector 1-3 in Fig. 1, is a nozzle shape which does not have an opening corresponding in radius to the radius of the substrate 1-10. Indeed, the flow of reactant material 1-3 forms a jet 1-7 which impinges on the substrate and transports the depositing species. As described on Page 19 of the European patent at line 7, the "flow geometry, flow speed and the carrier gas pressure can be arranged so that the synthesis of the depositing saturated vapor species occurs near the center of the forming jet and does not allow time for diffusion of this species to the walls of the apparatus . . . ." By its own terms, the European patent is designed and intended to permit variable velocity gas flows by providing a jet flow. This is completely contrary to the present invention where the gas flow velocity is substantially uniform across the entire substrate surface.

Similarly, a review of Nishizawa, Brandolf, Robinson, and McNeilly, reveals no hint that it is known to provide gas inlet apertures in a circular configuration corresponding to that of the substrate and coaxially aligned therewith.
Accordingly, none of the references cited discloses the additional features, as presently claimed, whereby the gas injection apparatus is formed with a plurality of apertures arranged in a circular configuration having a radius substantially equivalent to that of the circular substrate and coaxially aligned with the center thereof. The stagnation point flow established with these features is not replicated nor disclosed by any of the art cited and relied upon by the Examiner.

(‘165 Prosecution History at 98-99 (emphases added).) Oldham construes this language as stating that none of the prior art references disclose creation of a stagnation point flow, and states that the European patent "describes an opposing flow which would fit a real world definition of stagnation point flow." (Oldham Expert Report at 4.) Although the language could certainly be more clear, the Court does not agree that the inventors were claiming that the prior art failed to disclose stagnation point flow. Rather, it appears that the inventors were arguing that none of the prior art inventions created a stagnation point flow in the same manner as the ’165 invention, i.e., by using gas flow apertures in a circular configuration coaxially aligned with the substrate, with the radius of the substrate and the gas flow apertures being substantially equivalent, or made that method obvious. (See Peltzer Rebuttal Report at 8.)

The European Patent does not use a circular pattern of gas flow apertures covering substantially the entire area of the substrate, but instead introduces the gas to the substrate through a narrow nozzle that, while aimed perpendicular to the substrate, is much narrower in circumference than the substrate. (Oldham Expert Report, Ex. D at Fig. 1.) Although the European Patent does claim to create a stagnation point (id. at 8:24-9:3, 41:15-18, and Fig. 8), nothing in the European Patent discloses that it can be accomplished by injecting the gas through a circular pattern of gas flow apertures that have essentially the same radius as the radius of the substrate. In fact, the European patent expressly assumes that the nozzle will be smaller than the substrate. Id. at 4:23-26 ("The nozzle 1-1 and the substrate 1-10 may move relative to one another in order to change the area of the substrate's 1-10 surface which is directly under the nozzle 1-1 and thereby coat a larger portion of that surface.") In essence, the European patent uses a narrow jet, in contrast to the broad showerhead of the ’165 patent. The Court also agrees with the inventors and the patent examiner that Nishizawa, Robinson, and Brandolf reveal "no hint that it is known to provide gas inlet apertures in a circular configuration corresponding to that of the substrate and coaxially aligned therewith." (’165 Prosecution History at 99; see also Reines Decl., Exs. M (Nishizawa patent No. 4,540,466), N (Robinson patent No. 3,916,822), and O (Brandolf patent No. 4,511,593.).)

The Court agrees with Genus, however, that the inventors' statement that "as described by the present application, creation and maintenance of the stagnation point gas flow can only be achieved by having and maintaining a uniform gas flow velocity vector perpendicular to the entire surface of the susceptor" is odd. Read in context with the remainder of the inventors' statements in this section of the prosecution history, the Court interprets this statement as requiring that the initial direction of the gas flow be perpendicular to the entire surface of the substrate, and that the width of the gas flow must be wide enough to cover the entire surface of the substrate. It is apparently undisputed that the European patent creates stagnation point flow with a narrow gas flow that is not as wide as the substrate. One of the ways to overcome the heavy presumption that a claim term carries its ordinary and customary meaning is to show that the patentee distinguished that term from prior art on the basis of a particular embodiment. CCS Fitness, 288 F.3d at 1366-67. Here, the inventors appear to have distinguished the European patent on the ground that the stagnation point flow achieved there was not achieved by arranging the gas flow apertures in a generally circular configuration axially aligned with the substrate, with the radius of the substrate substantially equivalent to that of the configuration of the gas flow apertures. One could legitimately argue that the definition of "stagnation point flow" in the context of the ’165 patent should be limited to the stagnation point flow that is created by that configuration of gas flow apertures. It is meaningless to do so, however, because each of the independent claims specifically recites that configuration of gas flow apertures.

More troublesome, however, is the inventors' statement that:

By its own terms, the European patent is designed and intended to permit variable velocity gas flows by providing a jet flow. This is completely contrary to the present invention where the gas flow velocity is substantially uniform across the entire substrate surface.

(’165 Patent Prosecution History at 98.) At deposition, Peltzer strongly suggested that this portion of the prosecution history addressed the speed of the flow:

Q: Okay. And they're explaining that the gas flow velocity must be substantially uniform across the entire substrate
surface, correct?

A: Yes. This refers to specific location.

Q: So one of the reasons that a jet flow as described in the European patent is different from the gas flow described in the '165 patent is that in the jet flow there's a much larger magnitude of velocity at the center of the wafer and a much smaller magnitude of velocity at the edges, correct? That's what they're explaining here?

A: Yes.

(Peltzer Dep. 183:14-25.) Later in the deposition, however, Peltzer retracted this statement somewhat:

Q: So one of the things he's saying is that the European patent doesn't -- it may show stagnation point flow, but it doesn't show stagnation point flow where the magnitude of the velocity is -- the stagnation point flow is different because the magnitude of velocity in the middle is different than the magnitude at the edges, correct, that's one of the reasons it's different?

A: Well, the term "stagnation point flow," there is a concept of stagnation point flow, which is well known. In the '165 what is described is an apparatus that produces stagnation point flow with particular characteristics, that is, of axial symmetry and all of the attributes that we described in column 4 of the '165. 5

(Id. 184:17-185:6.) The topic was then abandoned at the deposition.

5 Column 4 of the '165 patent does not discuss uniformity of the speed of the gas flow, and column 3 states only that "because of the relatively small size of the apertures 74, the magnitude of the gas velocity will generally be uniform among all of the apertures 74 as the gas passes through toward the plane of substrate 10." ('165 patent 3:65-69.)

The Court has no reason to doubt Peltzer's statement that in a jet flow there is a much larger magnitude of velocity at the center of the wafer and a much smaller magnitude of velocity at the edges. The inventors' discussion of the jet flow of the European patent at page 99 of the prosecution history, however, is in the context of explaining how the gas flow in that invention is not directed to the entire surface of the substrate, unlike the gas flow in the present invention:

Even a cursory review of the European Patent discloses that the gas injector 1-3 in Fig. 1, is a nozzle shape which does not have an opening corresponding in radius to the radius of the substrate 1-10. . . . This is completely contrary to the present invention where the gas flow velocity is substantially uniform across the entire substrate surface.

('165 Patent Prosecution History at 99.) The Court interprets this language consistently with the inventors' other statements that a key distinguishing feature of the '165 invention is the configuration of gas flow apertures that correspond to the size of the substrate, and thus produce a uniformly directed gas flow perpendicular to the substrate. The Court is not convinced that this language demonstrates that the inventors used "stagnation point flow" in a nonstandard way.

Indeed, at the claim construction hearing, Peltzer clarified his prior statements and testified that the particular stagnation point flow of the '165 patent does not require uniform magnitude of velocity, and that the European patent "is distinguished by requiring that the apertures be disposed in a generally circular configuration over the entire surface of the substrate." (Transcript 92:24-93:14.) Although Peltzer later testified that the speed of the gas flow is "uniform across a horizontal plane," (id. 99:5-100:17), he was not then attempting to explain how the inventors distinguished the European patent or to define the concept of stagnation point flow.

ASM has consistently argued that only claim 6 requires that the speed of the gas flow be uniform, because only claim 6 requires "a flow of gas having a substantially uniform magnitude of velocity." ('165 patent 6:26-27.) Claim 1, on the other hand, contains no such limitation, as Peltzer testified at the claim construction hearing. (Transcript 102:4-20.)
Genus also argues that ASM has admitted in previous litigation that "stagnation point flow" has a non-standard meaning in the context of the '165 patent. In answers to interrogatories propounded in 1993 in Advanced Semiconductor Materials America, Inc. v. Applied Materials, Inc., C-95-20169 RMW ("ASM v. Applied Materials"), ASM was asked to define the term "stagnation point flow" as used in the '165 patent claims. ASM ultimately answered the interrogatory by pointing to the language from the patent specification and prosecution history that has already been quoted above, stating that "this definition is consistent with the way in which the term is used in the relevant art," and pointing to a definition from F. Rosenberg, Fundamentals of Crystal Growth I: Macroscopic Equilibrium and Transport Concepts. (Reines Decl., Ex. G at 085810-11.) According to ASM's interrogatory responses, that treatise provides that stagnation point flow "occurs when a fluid stream impinges on a wall at right angles to it and flows away radially in all directions." (Id. at 085811-12.) Contrary to Genus' argument, the definition ASM proposed in that litigation is consistent with the definition it proposes now, and with the ordinary meaning of the term. 6

--- Footnotes ---

6 Genus also argues that there is no way to measure whether a "stagnation point flow" actually exists in a CVD reactor, but that is an issue of indefiniteness or enablement, not an issue for claim construction.

--- End Footnotes ---

Accordingly, the Court concludes that "stagnation point flow" should be construed in accordance with its ordinary meaning:

Stagnation point flow is achieved when a flow toward a solid surface in which the gas or fluid approaching the surface divides into streams proceeding away from the point at which the central streamline intersects the surface. This point is called the "stagnation flow point." In order to achieve a stagnation point flow, the direction of the flow initially must be perpendicular to the surface.

3772

1. "Stainless steel"

The term "stainless steel" is used in claims 1, 7, 13, and 15 of the '668 patent. The parties have offered the following constructions of this term:

| THE '668 PATENT |
|-----------------|------------------|------------------|
| Claim Term      | Rivard's Proposed Definition (if any definition required) | Ideal's Alternative Definition |
| a. Stainless steel (In claims 1, 7, 13, and 15) | A large group of corrosion resistant steels that contain 10% or more of chromium and may contain other elements. | Corrosion resistant steel |

Rivard contends that "stainless steel" is ambiguous, in part, because "stainless steel" is sometimes specified in the patent as comprising, inter alia, 4-25% by weight of chromium, but Rivard asserts that an alloy containing as little as 4% chromium is not "stainless steel" within the ordinary meaning of the term or within the meaning disclosed by the specification. Rivard points out that the specification states that "[t]he stainless steel alloy can comprise any corrosion-resistant magnetic material with an elemental composition within the range set forth in" certain specified patents. See the '668 patent, Co. 5, II. 24-28. Rivard asserts that the patents referred to specify that chromium in excess of 8% is required to obtain the corrosion resistance desired, not as little as 4% as elsewhere stated in the claims and specification of the '668 patent, and those patents suggest other conflicts with the percentages of other components expressly stated in the '668 patent. Rivard acknowledges that the patent states that, in case of conflict between the specification and patents incorporated therein by reference, "the
present description, including definitions, will control," see the '668 patent, Col. 3, ll. 44-48, but apparently contends that this statement does not dispel the ambiguity. Rivard also notes that one of the patents for "stainless steel" incorporated by reference in the Detailed Description, U.S. Patent No. 4,969,963 to Honkura, is described contrariwise in the prosecution history to the '668 patent as "completely unsuitable for the needle of the method claimed in the ["668 patent."] Joint Exhibit 1002, Joint Appendix at 492. Rivard also points out that the prosecution history reveals that the patentee confirmed that the properties of stainless steel are dependant upon the constituents of the steel. Finally, Rivard cites extrinsic evidence in the form of ordinary and technical dictionary definitions defining "stainless steel" as having at least 10 percent chromium. Consequently, Rivard argues that the ordinary meaning of "stainless steel" is "a large group of corrosion resistant steels that contain 10% or more of chromium and may contain other elements." In the alternative, Rivard argues that the patents sufficiently redefine "stainless steel" to mean alloys limited to the compositions disclosed in the patents. Indeed, in its rebuttal brief, Rivard argues that the use of "stainless steel" in the specifications and claims of the patents-in-suit results in defining five particular formulations of stainless steel. Rivard then contends that only one of those formulations is explicitly claimed in independent claims 1, 7, 13, and 15 of the '668 patent and claims 5 and 12 of the '196 patent, while any of the five formulations could apply to references to "stainless steel" without specification of a chemical composition in claims 1-4, 7-11, and 14 of the '196 patent.

Ideal, on the other hand, contends that the meaning of "stainless steel" is well known to one of ordinary skill in the art. Ideal also asserts that Rivard's attempt to narrow the definition is improper, because it lacks even an iota of support in the intrinsic evidence, and the extrinsic evidence that Rivard cites is irrelevant. More specifically, Ideal argues that both the patentee and the examiner recognized that "stainless steel needles" were well known in the prior art, but that nowhere in the prosecution history was there any reference to or unmistakable limitation of "stainless steel" to an alloy comprised of 10% or more of chromium. Ideal contends that the extrinsic evidence on which Rivard relies is irrelevant, because resort to such evidence cannot overcome the ordinary and customary meaning of the term in the context of the claim term and the embodiments described in the patents-in-suit. In the alternative, Ideal asserts that "corrosion-resistant steel" is an appropriate construction of "stainless steel" that is found in, and well-supported by, the intrinsic evidence, stays true to the claim language, and naturally aligns with the description of the invention.

b. Analysis

The appropriate place to begin construction of claim terms is with the words of the claims. Nystrom, 424 F.3d at 1142 (courts must "begin [their] claim construction analysis with the words of the claim"); see also Playtex Prods., Inc., 400 F.3d at 906 ("It is axiomatic that claims, not the specification embodiments, define the scope of protection."). The court notes that the term "stainless steel" is never used in the claims of the '668 patent without specification of its chemical composition. See the '668 patent, Claim 1 ("stainless steel which comprises" certain elements in ranges of percentages by weight); Claim 7 ("stainless steel comprises" certain elements in ranges of percentages by weight); Claim 13 ("stainless steel comprising" certain elements in ranges of percentages by weight); Claim 15 ("stainless steel tubular injection needle, wherein the injection needle . . . comprises" certain elements in ranges of percentages by weight). Consequently, the court concludes that it is unnecessary to construe the term "stainless steel" in isolation.

More specifically, "comprising" is an "open-ended" term, which raises a presumption that the list of elements is nonexclusive. Dippin' Dots, Inc. v. Mosey, 476 F.3d 1337, 1343 (Fed. Cir. 2007). Nevertheless, it "is not a weasel word with which to abrogate claim limitations." Id. (quoting Spectrum Int'l, Inc. v. Sterilite Corp., 164 F.3d 1372, 1380 (Fed. Cir. 1998)). As the Federal Circuit Court of Appeals has explained,

"Comprising" appears at the beginning of the claim--"comprising the steps of"--and indicates here that an infringing process could practice other steps in addition to the ones mentioned. Those six enumerated steps must, however, all be practiced as recited in the claim for a process to infringe. The presumption raised by the term "comprising" does not reach into each of the six steps to render every word and phrase therein open-ended--especially where, as here, the patentee has narrowly defined the claim term it now seeks to have broadened.

Dippin' Dots, Inc., 476 F.3d at 1343.

Similarly, here, "comprising" is "open-ended" only to the extent that it indicates that the alloy may be comprised of other elements not specified. Cf. id. Indeed, the Detailed Description demonstrates the correctness of such an interpretation, because it specifies, first, that the alloy comprises several elements in specified weight percentage ranges, then adds that preferred embodiments may include additional elements in specified weight percentage ranges. See the '668 patent, Col. 5,
II. 23-44. On the other hand, "comprising" cannot be used as a "weasel word" to abrogate the express claim limitations requiring that the "stainless steel" be comprised of specific elements. Cf. Dippin' Dots, Inc., 476 F.3d at 1343 ("[Comprising] 'is not a weasel word with which to abrogate claim limitations.'") (quoting Spectrum Int'l, Inc., 164 F.3d at 1380). Thus, from the plain language of the claim term, whatever the term "stainless steel" might mean, standing alone, in other contexts, in the context of the '668 patent claims, "stainless steel" necessarily "comprises" specified elements. That being so, the court declines to construe the term "stainless steel" in isolation. Instead, the court will pass on to the question of the proper construction of "stainless steel comprising" specified elements, which is the second term in the '668 patent for which the parties dispute the proper construction.

III. Disputed Patent Claim Term "Making One Side of the Plurality of Spaced Separate Elements to Stand Proud of the Surface of a Jig"

McDavid argues that the contested phrase means "making one side of each of the elements to stick out from the surrounding surface of a jig." (Dkt. No. 67, Pl. Claim Construction Mem. 8.) Nike, however, suggests that "causing one side of each of the spaced separate elements to be raised above the surface of the jig during bonding" is the appropriate construction. (Dkt. No. 94, Def. Resp. Claim Construction Br. 11-12.) The key disputes involve (1) whether the terms "making" or "causing" should be used and (2) whether "during bonding" should be added to the end of the construed claim-term phrase. 2

2 The parties originally seemed to dispute the meaning of "stand proud." Nike's original construction stated that the elements must "raise above" the surface of the jig, whereas McDavid contended that the orientation did not matter and that each element must simply stand out from the surface of the jig. In its responsive brief Nike admitted that McDavid's construction was almost correct, except that it did not include the phrase "during bonding." (Dkt. No. 95, Def. Resp. Claim Construction Br. 11.) As a result, this court construes "stand proud" to mean "each element stands out from the surrounding surface of the jig."

First, the court finds that the term "making" is a common, non-technical word. At least one of the common meanings of the term "making" is "the act or process of . . . causing." Merriam-Webster's Collegiate Dictionary 751 (11th ed. 2005). The parties have not argued that "making" has a specialized meaning nor does the court believe that it has one. Additionally, other than indicating that the words "making" and "causing" are synonyms in the context of the '325 patent, Nike has not explained why the court should construe "making" as "causing." Accordingly, "making" is used without modification in the court's construction of the disputed claim language.

Additionally, the parties dispute whether "during bonding" should be included in the construction. Nike argues that the plain language of the claims, the written description, the prosecution history, and the extrinsic evidence all establish that the elements stand proud during bonding because these sources demonstrate that the purpose of the "stand proud" step is to facilitate bonding. However, the court finds that it would be improper to add "during bonding" to the disputed claim language because the plain language of the '325 patent indicates that the spaced separate elements may begin standing proud before the bonding step occurs. For example, in one embodiment the patent provides:

The foam is then placed onto a cutter and pressed down with a press so that the cutter cuts through the foam to form a plurality of separate cubes. The press is then removed whereupon owing to its resilient nature, the foam will tend to spring back slightly so that the exposed surface of each cube stands proud to lie above the surface of the cutter. Excess material from between the elements is then removed.

Next, a layer of fabric is placed over the foam and cutter and a heated platen is brought into contact with the fabric. Heat is conducted through the fabric to the foam and activates the adhesive, bonding the fabric to the foam.

('325 patent, col. 5:39-52) (internal references to the drawings omitted). The use of "[n]ext" demarcates the standing proud
step from the bonding step in the '325 patent's claims, thereby illustrating that the spaced separate elements may stand proud prior to the commencement of bonding. For that reason, requiring that "making one side of the plurality of spaced separate elements to stand proud of the surface of a jig" occur "during bonding" would contradict the express language of the patent.

Nike's reliance on, Gemtron Corp. v. Saint-Gobain Corp., 572 F.3d 1371 (Fed. Cir. 2009), in its supplemental brief does not support a different result. In Gemtron, the patent at issue claimed a refrigerator shelf which was made by inserting a piece of glass into a plastic frame while the plastic frame was temporarily flexible. Gemtron, 572 F.3d at 1375. The Federal Circuit affirmed the inclusion of the language, "when glass is being inserted in the frame" in construing a disputed claim term. Id. at 1373. This language added an explicit limitation regarding when the plastic frame would be flexible, even though the original claim language included no such restriction. See id. at 1377. Nike argues that based on Gemtron, the court should include the temporal limitation of "during bonding." However, based on the court's determination that adding the phrase "during bonding" in defining the disputed claim language would contradict the express language of the '325 patent, the court finds that Gemtron is inapposite.

For the foregoing reasons, the court construes the claim term "making one side of the plurality of spaced separate elements to stand proud of the surface of a jig" to mean "making one side of each element stand out from the surrounding surface of a jig."

III. Analysis

GSK. argues that summary judgment is appropriate because the proper interpretation of "stand-up toothpaste container," as used in the '706 patent, excludes devices, such as the Floss 'N' Cap, which do not retain their shape when the toothpaste is discharged. Grussmark counters that "stand-up toothpaste container" is not so limited, and the Floss 'N' Cap, as a toothpaste container which physically stands up on a counter, infringes the '706 patent. Because, as explained below, the Court construes the claim term "stand-up toothpaste container" to specifically exclude a toothpaste container that does not retain its shape, and the undisputed evidence before the Court demonstrates that the Floss 'N' Cap does not retain its shape after discharge of its contents (see Def. SF P 12), the Court finds that summary judgment of non-infringement is proper.

A. Claim Interpretation

As precedent instructs, the Court begins its interpretation of the claims in the '706 patent by looking to the language of the patent itself. See Hockerson-Halberstadt, Inc. v. Avia Group Int'l, Inc., 222 F.3d 951, 955 (Fed. Cir. 2000); Desper Prods., 157 F.3d at 1333. "As a starting point, the court gives claim terms their ordinary and accustomed meaning as understood by one of ordinary skill in the art." Hockerson-Halberstadt, 222 F.3d at 955. Here the relevant claim language recites a "stand-up toothpaste container comprising flexible tube means for storing toothpaste." ('706 patent, col. 7, lines 22-23; id., col. 7, lines 57-58.) The analysis focuses on the term "stand-up toothpaste container." 5 The ordinary and accoustomed meaning of a "stand-up toothpaste container" is simply a toothpaste container that stands upright on a flat surface. (See, eg., Pl.SF PP 21.22.)

5 Grussmark argues at length in his response brief about the meaning of "flexible" in the '706 patent. If, however, the Floss 'N' Cap is not a "stand-up toothpaste container" as recited by the patent, whether the product contains a "flexible tube means" is irrelevant.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

While the ordinary and accustomed meaning of a term "initially serves as a default meaning" in the patent, a "patentee may act as a lexicographer and ascribe a different, or modified, meaning to the term." Hockerson-Halberstadt, 222 F.3d at 955 (citing, inter alia, Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1477 (Fed. Cir. 1998). The Court, thus, "must examine a patent's specification and prosecution history to determine whether the patentee has given the term an unconventional meaning." Id. (citing, inter alia, Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). "The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed
during prosecution." Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (7th Cir. 1995). The Court must assess the totality of the prosecution history, including arguments made to overcome or distinguish references, to determine whether a patentee relinquished a particular claim construction. See Rheox, Inc. v. Entact, Inc., 276 F.3d 1319, 1326 (Fed. Cir. 2002). A disclaimer in the prosecution history will be held to narrow a claim only where the disclaimer was both clear and unmistakable. See Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1325 (Fed. Cir 2003).

In analyzing the prosecution history of the '706 patent, the Court finds that Grussmark used the term "stand-up toothpaste container" to mean something more than merely a toothpaste container which is capable of standing up. In response to Grussmark's continuation application for the '706 patent, the patent examiner rejected proposed claim 21, stating, "In Fig. 5, Chari shows a combination dental floss dispenser and stand-up toothpaste container according to claim 21." (Def. Ex. F at 3.) In Grussmark's attempt to overcome the rejection of this claim, Grussmark specifically distinguished his "stand-up toothpaste container" from the Chari container which has walls that "may be rolled up . . . for the purpose of forcing toothpaste from the container" because that kind of container "will be unstable due to the offset weight of the rolled portion [which will] prohibit the container and dispenser from standing up on end." (Def. Ex. K at 10.) In contrast, the "stand-up toothpaste container" of the '706 patent is one which "will retain its shape even after discharging any part of the contents of the container." (Id. (emphasis added).) 6

6 The Court rejects Grussmark's argument that these statements are inapplicable because proposed claim 21 asserts a "stand-up squeezable toothpaste container," which requirement is not present in claims 1 through 3 at issue. (See D.E. 49 at 2-3.) First, when the patent examiner first rejected claim 21 as being anticipated by Chari, the claim recited a "stand-up toothpaste container." (See P1. Ex. 3 at Bates GSK 003653.) Grussmark amended the claim to add "squeezable," but the claim was nonetheless rejected. Second, Grussmark apparently used the terms "stand-up squeezable toothpaste container" and "stand-up toothpaste container" interchangeably (see, e.g., Def. Ex. K at 10-11; '706 patent, col. 7, lines 20-22 ("A combination of a dental floss dispenser and a stand-up squeezable toothpaste container, said stand-up toothpaste container comprising . . ..")), and the Court finds no reason to believe that Grussmark's disclaimers do not apply to "stand-up toothpaste container" throughout the patent.

Grussmark made other statements during prosecution consistent with his disclaimer related to proposed claim 21. Grussmark appealed to the PTO's Board of Patent Appeals and Interferences the rejection of several claims in the application. (See Def. Ex. M.) In Grussmark's Summary of the Invention in that appeal, Grussmark specifically described what he called "a 'stand-up' type squeezable toothpaste container having either a flip-open cap or a screw-on cap." (Id. at 3.) According to Grussmark, "The stand-up container is different from previous containers because it is made from a flexible plastic material which retains its shape after discharging any part of the contents of the container and because the container is suitably balanced to stand in an upright position on the base of the flip-open or screw-on cap without easily tipping over." (Id. (emphasis added).) These statements are unambiguous and are amenable to a single interpretation: Grussmark's invention is different because it retains its shape. Compare Cordis Corp. v. Medtronic AVE Inc., 339 F.3d 1352, 1360 (Fed. Cir. 2003) (no clear and unmistakable surrender where purported disclaimer by patentee was "amenable to multiple reasonable interpretations").

The Court finds that Grussmark's statements constitute a clear and unmistakable disclaimer as to what type of container is not a "stand-up toothpaste container." Specifically, Grussmark clearly and unmistakably disclaimed from the definition of "stand-up toothpaste container" a toothpaste container, like the container pictured in Chari Figure 5, which has walls that do not retain their shape when the toothpaste is discharged. See generally SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., 242 F.3d 1337, 1341-42 (Fed. Cir. 2001) ("Claims are not correctly construed to cover what was expressly disclaimed." (internal quotation and citation omitted)) (disclaimer in specification). Thus, the Court finds that a "reasonable competitor, reviewing . . . the statements made by the applicant to distinguish the claimed invention from [Chari], would conclude that the claimed invention did not cover a device like [Chari's]." Springs Window Fashions LP v. Novo Indus.. LP, 323 F.3d 989, 995 (Fed. Cir. 2003)–or, put differently, that the claim term "stand-up toothpaste container" excludes a toothpaste tube that does not retain its shape after discharging the contents of the container.
As explained in Part II.B below, the evidence is undisputed that GSK’s Floss ‘N’ Cap, while capable of standing up, does not retain its shape after toothpaste is discharged. (Def. SF P 12.) Thus, there is no dispute in the case that would require the Court to interpret the claim term "stand-up toothpaste container" beyond determining that this type of container has been disclaimed.

GSK also argues that the claim should be limited to stand-up toothpaste containers made solely of plastic because that is the only embodiment expressed in the specification. The Federal Circuit, however, has "expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment." Liebel-Flarsheim Co. v. Medrad. Inc., 358 F.3d 898, 906 (Fed. Cir. 2004). Thus, even though the '706 patent specification describes a "stand-up toothpaste container" as one made of plastic (see, e.g., '706 patent, col. 1, line 38; id., col. 3, lines 26-27), the Court does not read that limitation into the claim, as there is no "clear indication in the intrinsic record that the patentee intended the claims to be so limited." Liebel-Flarsheim Co., 358 F.3d at 913. The claim language itself does not limit "stand-up toothpaste container" to ones made solely of plastic. Instead, the claim describes generally the characteristics of the container, i.e. flexible, rather than its chemical (or other) composition. Nor does the prosecution history indicate that a stand-up toothpaste container is made of plastic only. Unlike the language in the prosecution history regarding the physical characteristics of the claimed container, i.e. that it does not roll down or lose its shape when toothpaste is squeezed out of it, nothing in the prosecution history indicates that Grussmark needed to distinguish all plastic containers in order to overcome rejection. See Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1303 (Fed. Cir. 1997). Thus, the Court finds that the term "stand-up toothpaste container" as used in the '706 patent is not limited to containers made solely of plastic.

D. Pit configuration standard of the optical disk

The plaintiffs note that there is no known definition for the phrase "pit configuration standard." They therefore use dictionary definitions of "standard" and their definitions of optical disk and pit and propose that the term mean "a recognized arrangement of depressions formed in an optical storage medium." The defendants contend that the phrase means, "the set of rules and procedures governing the track pitch, as well as the arrangement, form, figure, and shape of the pits on a particular optical disk." After reviewing the briefs and the arguments of the parties, the court is persuaded that the plaintiffs' construction of this phrase is correct. The court defines "pit configuration standard" to mean "a recognized arrangement of depressions formed in an optical disk."

1. Standard Insulin Needle Fitting/Standard Mounting
