Given the entirety of the patent and extrinsic support for the Plaintiff's claim, the appropriate definition for "tray" is the Plaintiff's submission - a receptacle having a top surface, sides and a bottom.
As indicated by Figures 2 and 11 of the ‘930 patent, a "shelf" may comprise multiple "trays" and multiple beverage queues. A "tray," on the other hand, comprises only one beverage queue. See e.g. ‘930 Patent, col. 3, ll. 16-19 ("Another difficulty associated with vending containers from ends of product trays . . . is the requirement of maintaining tight dimensional tolerances at the dispensing ends of the product holding trays."); col. 3, ll. 65-66 ("at the dispensing ends of the product holding trays . . . ."); col. 5, ll. 30-32 ("invention further includes a plurality of trays for aligning the containers in their respective queues."); col. 11, ll. 6-7 ("In the preferred embodiment illustrated, there are five such rows or shelves of the product trays.") (emphasis added). The court is not persuaded, however, to give the terms the lengthy and structurally limiting construction urged by the defendants.

The court defines "tray/trays" as "a receptacle configured to contain a single beverage or product queue."

The court defines "shelf/shelves" as "a generally horizontal support structure for holding multiple trays or beverage or product queues."

3. "Treated Fibers"

Claim 16 of the ‘693 patent provides in part ". . . wherein said absorbent layer has treated fibers therein, each treated fiber bearing a foraminous hydrophobic water-vapor-permeable pellicle, said treated fibers forming an area. . . ." (Emphasis added.) Fort James suggests that this term has a plain meaning to a POSITA and need not be interpreted. 42 Coating Excellence contends that the construction must require that "treated fibers be formed by spreading hydrophobe precursor on the surface of a sheet of absorbent layer such that a sublayer of fibers in the fibrous absorbent layer has a foraminous hydrophobic water-vapor permeable pellicle." 43

Fort James does not dispute that "treated" in this term is in reference to treatment with foraminous hydrophobic water-vapor-permeable pellicle. 44 Fort James simply suggests that it would be redundant to include language regarding the pellicle within a construction of "treated fibers" given the other language in the claim. 45 Coating Excellence appears to want a construction that would include express reference linking "treatment" to the "pellicle" as a defensive measure so that the concept could not be read out of the claim at a later date. 46

44 No file history or extrinsic evidence has been presented that is inconsistent with this point.

45 Hearing Transcript at p. 117, line 21 -- p. 118, line 14.

46 Hearing Transcript at p. 121, lines 6-10.
inventive pellicle is not a claim limitation. 47

47 There was some discussion at the Hearing regarding whether claim 16 is a product-by-process claim and the current status of such claims under Federal Circuit precedent. Because of Fort James' above concession, the undersigned reports that these issues need not be resolved in the context of this claim construction process.

E. "Wherein the First Layer of Foam is Treated to Have Reversible Enhanced Thermal Properties."

The final area of dispute between the parties involves the interpretation of Claim 8's phrase "wherein the first foam layer is treated to have reversible enhanced thermal properties." (emphasis added) Plaintiffs and Defendants agree that foam may be "treated" by coating it with "phase change materials" ("PCMs"), or embedding them within it. They disagree, however, whether inserting a separate "temperature regulating membrane" between the inner layer and the first foam layer also constitutes a "treatment" of the foam.

Plaintiffs argue that the prosecution history resolves the dispute. The patent examiner defined "the structure and/or chemistry responsible for the claimed 'reversible enhanced thermal properties'" ("RETPs") by reference to a passage in the patent application that now appears in the specification at col. 4, lines 21-34. That passage describes two different means by which a composite liner inherits RETPs: (1) the application of PCMs to foam; or (2) the insertion of a "temperature regulating membrane" between layers or on the outside of the liner. Plaintiffs reason that because the phrase "RETP" appears only in Claim 8, the examiner must have intended for both of these means to be ways in which foam could be "treated." Because they assented to this construction of the "structure and/or chemistry responsible" for RETPs, Plaintiffs argue, it is conclusive.

Defendants take a different tack. One skilled in the art, they argue, would understand that "treated" means "subjected to a process," and that inserting a membrane between two layers is not a "process" in the same way coating or impregnating foam with PCMs is. Defendants also argue that calling the insertion of a membrane a "treatment" would be inconsistent with the language of Claim 3, which also describes the insertion of a membrane between two claim elements but does not employ the term "treated."

The Court finds neither party's argument wholly convincing. It is not obvious from the prosecution history that just because "RETP" appears only in Claim 8, the examiner intended for all of the means by which the liner can inherit RETPs to be incorporated into the meaning of the phrase "foam treated to have…." After all, some of the embodiments that describe a membrane being incorporated into the liner do not relate to the foam layer at all. For instance, one embodiment describes apply applying the membrane "to the fibers of" the innermost liner layer. (See '810 patent, col. 4, lines 24-25.) This cannot possibly be pertinent to the foam layer, which is neither the innermost nor has "fibers." Nor is it clear, as Defendants argue, that inserting a membrane next to foam does not subject the foam to a process, if, for instance, the membrane were bonded directly to the foam layer in some way. Moreover, the absence of the term "treated" in Claim 3 is not necessarily inconsistent with the use of "treated" in Claim 8, insofar as treatment and insertion of a membrane could be synonymous.

The Court finds, however, that the weight of the evidence favors Defendants' interpretation, although not for all of the reasons Defendants cite. Claim 8 teaches a structure in which the second (foam) layer is "treated" in a particular fashion. Plaintiffs would have it that the insertion of a membrane next to that foam layer, or the attachment or application of the membrane to it, would work a change to the foam itself, so that afterwards it would be considered "treated" foam. Yet, all of the Claims in the '810 patent describe a composite material consisting of distinct elements, each having its own qualities. There is no indication anywhere in the patent that the mere attachment or application of one layer to the next renders the two layers a single, unified "treated" element. For example, Claim 8 teaches a layer of foam and a non-woven top sheet that can be directly attached to each other, without the foam being termed "treated" by the top sheet. Thus, the claim language and nature of the '810 patent foreclose Plaintiffs' suggestion that "treating" can mean inserting, applying or attaching one
The Court construes "wherein the first layer of foam is treated to have reversible enhanced thermal properties" to mean "wherein the first layer of foam possesses reversible enhanced thermal properties by means of being coated with PCMs, or having PCMs embedded within it, or by means of some other process that does not involve the physical attachment of a tangible, distinct layer of material, such as a temperature regulating membrane, to the surface of the foam."

B. The '141 Patent and the '483 Patent

Cleanox owns two patents for inventions developed by R. Vigneri for the remediation of certain groundwater contamination. See Amended Complaint at 3,  P 12. The '141 Patent was filed 12 February 1993 and was issued 15 February 1994. See '141 Patent. The '483 Patent was filed 10 February 1994 and was issued 28 May 1996. See '483 Patent.

Both patents describe their processes as "a method for remediating a hydrocarbon-contaminated region of a subterranean body of groundwater to destroy or reduce the initial levels of hydrocarbon contaminants." '141 Patent at col. 8, lines 23-26; '483 Patent at col. 9, lines 33-35. The two patents rely upon the interaction of hydrogen peroxide and the hydrocarbon contaminants to alleviate the harm caused by groundwater contaminants.

Claim One of the '141 Patent provides as follows:

1. A method for remediating a hydrocarbon-contaminated region of a subterranean body of groundwater to destroy or reduce the initial concentration levels of hydrocarbon contaminants, comprising the steps of:

   (a) providing a plurality of mutually spaced wells intersecting said groundwater region ("Step A of the '141 Patent");

   (b) determining the existence of acceptable continuity and well interflow paths for the said region by generating a test flow of a solution of hydrogen peroxide from one of said wells and monitoring pH changes at each other of said wells as a function of time to detect a pH drop of at least 0.2 ("Step B of the '141 Patent"); and

   (c) subsequent to detecting said pH drop, providing a treating flow of said hydrogen peroxide solution from one or more of said wells ("Step C of the '141 Patent").

Claim One of the '141 Patent (emphasis added).

Claim One of the '483 Patent provides as follows:

1. A method for remediating a hydrocarbon-contaminated region of a subterranean body of groundwater to destroy or reduce the initial concentration levels of hydrocarbon contaminants, comprising the steps of:

   (a) providing a plurality of mutually spaced wells intersecting said groundwater region ("Step A of the '483 Patent");

   (b) providing a treating flow of acetic acid from one or more of said wells into said groundwater region, to establish acidic conditions therein ("Step B of the '483 Patent");

   (c) introducing a turbulent flow of an aqueous solution of ferrous ion into said groundwater region, for mixing with said acidified groundwater, thereby providing a catalyst for disassociation of hydrogen peroxide ("Step C of the '483 Patent"); and

   (d) providing a treating flow of hydrogen peroxide solution from one or more of said wells into said groundwater region, said hydrogen peroxide undergoing a Fenton-like reaction in the presence of said acidic conditions and said ferrous ion to generate hydroxyl free radicals for oxidizing said contaminants ("Step D of the '483 Patent").

Step C of the '141 Patent requires the practitioner to provide "a treating flow of said hydrogen peroxide from one or more of said wells" after a drop in the pH level is detected. '141 Patent, at col. 8, line 36-38. There are two disputes between the parties as to the meaning of "treating flow": whether the term "treating flow" includes a pressure limitation; and whether the term "treating flow" includes the practice of bioremediation.

a. Whether "Treating Flow" Includes a Pressure Limitation

1. The Cleanox Argument

Cleanox argues the treating flow requirement should not be limited to a particular pressure range. See Brief -Cleanox at 6; Markman Hearing Transcript at 68:17-25. Instead, it contends that only claim 4 of the '141 Patent ("Claim Four of the '141 Patent") 16 should be read to have such a limitation because it alone contains an express pressure limitation. See Brief - Cleanox at 6. Cleanox argues that, under the doctrine of claim differentiation (the "Claim Differentiation Doctrine"), 17 Claim Four of the '141 Patent is dependant on Claim One of the '141 Patent and therefore its limitations should not be read into Claim One of the '141 Patent. See id. Cleanox states Claim One of the '141 Patent cannot have a pressure limitation because it must be broader in scope than Claim Four of the '141 Patent which has such a limitation. See id.

16 Claim Four of the '141 Patent provides that "the treating flow is provided under a pressure not more than the hydrostatic head relative to surface at the point of treating flow discharge from said well." Claim Four of the '141 Patent.

17 The Claim Differentiation Doctrine holds that narrow claim limitations cannot be read into broader ones to limit the meaning of the broader claim because each claim is distinct from other claims within the patent. See Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1277 (Fed.Cir. 1995) (citing D.M.I., Inc. v. Deere & Co., 755 F.2d 1570, 1574 (Fed.Cir. 1985)).

2. The Defense Argument

The Defendants assert "treating flow" incorporates a maximum pressure limitation that is based upon the depth of the well. See Brief - Defendants at 18 (citing '141 Patent at col. 4, lines 9-12). They argue that, based upon the language of the Specification, this limitation should be "not more than the hydrostatic head relative to the ground surface at the point of discharge from the well." See id. at 12 (quoting col. 4, line 9-12 of the '141 Patent).

The Defendants assert the pressure limitation is applicable to all of the claims, including Claim One of the '141 Patent, because the Specification does not qualify or restrict the limitation in any way. See id. at 19. In further support of their argument, the Defendants contend the Specification warns the practitioner that, if the pressure limitation is exceeded, reactants may pass upwardly out of the ground and create undesirable conditions. See id. (quoting '141 Patent at col. 4, lines 12-15). The Defendants dismiss reliance on the Claim Differentiation Doctrine by arguing that the Specification trumps the Claim Differentiation Doctrine because it provides a clear meaning for the language of the claim. See id. at 20 (citing O.I. Corp. v. Tekmar Co., 115 F.3d 1576 (Fed.Cir. 1997)).

3. Judicial Construction

The Claim Differentiation Doctrine requires each claim be distinct from the others such that the limitations of a dependent claim should not be read into an independent claim. See Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1538 (Fed.Cir. 1991) (quoting Autogiro Co. of Am. v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 404 (Ct. Cl. 1967)). Narrow claim
limitations cannot be read into broader ones because each claim is distinct from the other claims within the patent. See Transmatic, 53 F.3d at 1277 (citing D.M.I., Inc. v. Deere & Co., 755 F.2d 1570, 1574 (Fed.Cir. 1985)).

Because Claim Four of the '141 Patent contains a pressure limitation, Claim One of the '141 Patent, upon which Claim Four of the '141 Patent is dependent, by definition, is broader in scope and cannot contain such a limitation. See Transmatic, 53 F.3d at 1277-78. The language of the Specification cited by the Defendants is identical to that contained in Claim Four of the '141 Patent. See '141 Patent at col. 8, lines 50-52. Accordingly, to read Claim One of the '141 Patent as having the same scope as Claim Four of the '141 Patent would make Claim Four of the '141 Patent superfluous. See Lucas Aerospace, 890 F. Supp. at 332. In addition, the language of the Specification demonstrates a pressure limitation may, but is not required to, be employed. The Specification states: "If the pressure exceeds this [limitation], it is possible for some of the reactants to pass upwardly through the porous overburden and create undesirable conditions on the ground surface." '141 Patent at col. 4, lines 9-15 (emphasis added). Although the method contemplates the pressure may be limited, in some circumstances it may be possible to apply a greater or lesser pressure without adverse effects. Therefore, for purposes of Claim One of the '141 Patent, it is not appropriate to limit "treating flow" to a particular pressure range.

b. Whether "Treating Flow" Includes Bioremediation

1. The Cleanox Argument

Cleanox argues that chemical remediation 18 is the sole subject of both the '141 Patent and the '483 Patent. See Brief - Cleanox at 6. Cleanox contends "treating flow" should not be read so broadly to include the prior art "bioremediation 19 method." Id. at 6. Instead, it argues the term should be interpreted as a "flow of hydrogen peroxide that is in keeping with the 'chemical reaction' remediation process set out in the patent." Id. at 8.

--- Footnotes ---

18 Chemical remediation is a method involving a chemical reaction between the hydrogen peroxide and the hydrocarbon contaminants. See Brief - Cleanox at 6.

19 Bioremediation is a method whereby hydrogen peroxide is introduced into the ground to "feed" microbial life near the contamination. Microbial life then "eats" the hydrocarbon. See Brief -Cleanox at 6. Both parties recognize the distinction between bioremediation and chemical remediation.

--- End Footnotes ---

In support of its position, Cleanox points to the Specification which reveals that the patentee distinguished the bioremediation method as a prior art that he believed was ineffective. See Brief - Cleanox at 6. For example, the Specification provides:

In recent years increasing interest has also been evidenced in bioremediation technology. The technology has been of great interest, but its effective use in treating groundwater has been limited. The procedures are very complex, involving the use of expensive and complex reactors, and can cause adverse geochemical reactions, and can even introduce new toxic compounds beyond those which are being treated.

'141 Patent at col. 1, line 63 to col. 2, line 2. Accordingly, Cleanox argues that "it would be contrary to the central teaching of the Specification to read Claim One [of the '141 Patent] as covering this prior art technique that the inventor expressly discounts." Brief - Cleanox at 7.

Cleanox finds additional support for its position in another part of the Specification that states:

The treating flow may additionally contain reaction surface enhancing reagents, i.e. reagents such as dispersions of lime or the like, which provide increase or provide surfaces at which the reaction between the hydrogen peroxide and the hydrocarbon contaminants may occur. Similarly, effective amounts of catalytic agents may be incorporated into the treating solution or preferably are provided as a preinjection into the groundwater region to be treated. Typical such catalysts are initiation catalysts of various types known in the art to promote the desired reaction between the hydrogen peroxide and
hydrocarbons.

Brief - Cleanox at 7 (quoting '141 Patent at col. 3, lines 22-24) (emphasis added in Brief - Cleanox). Cleanox argues the emphasized language makes it clear that "the treating flow of hydrogen peroxide must result in a chemical reaction between the peroxide and the hydrocarbon contaminants." Id. at 7.

2. The Defense Argument

The Defendants argue "treating flow" includes both bioremediation and chemical remediation methods. See Brief - Defendants at 13. The Defendants point out there are no words in the claim or Specification which indicate "treating flow" is limited solely to chemical remediation. See id. Similarly, the Defendants argue that the preamble of Claim One of the '141 Patent generically states the claim is directed to "[a] method for remediating …," rather than a method for "chemically remediating." Id. In addition, Defendants point to the Background of the Invention portion of the Specification of Claim One of the '141 Patent which the Defendants contend "explains that the remediation of hydrocarbons can be accomplished through either chemical remediation (see ['141 Patent at col. 2, line 9,) or biological remediation (see ['141 Patent at col. 1, line 64)." See Brief - Defendants at 13.

The Defendants also assert that, if the interpretation argued by Cleanox were to be accepted, the scope of Claim One of the '141 Patent will become indefinite and unclear because there is no explanation in the patent to explain how a person can practice the invention in a manner which causes chemical rather than biological remediation. See Brief - Defendants at 14. As such, Defendants argue such an interpretation would violate 35 U.S.C. § 112, which requires the patent to include claims "particularly pointing out and distinctly claiming the subject matter which the applicant regards as the invention." Brief - Defendants at 14 (quoting 35 U.S.C. § 112).

3. Judicial Construction

The Specification in each of the '141 Patent and the '483 Patent discusses the limitations of the bioremediation technology, as a prior art, which the inventor viewed as ineffective and over which he saw his invention as an improvement. See '141 Patent at col. 1, line 63 to col. 2, line 2; '483 Patent at col. 2, line 1 to line 8. The Federal Circuit has indicated that "where a term is susceptible to two reasonable interpretations, the court can look to prior art" to assist it in construing the patent claims. Elf Atochem North Am., Inc. v. Libbey-Owens-Ford Co., 894 F. Supp. 844 at 859 (citing Rawlplug Co. v. Illinois Tool Works, Inc., 11 F.3d 1036, 1041 (Fed.Cir. 1993)); Texas Instruments, Inc. v. United States ITC, 871 F.2d 1054, 1065 (Fed.Cir. 1989). The claims then should be interpreted to exclude the prior art and thus preserve the validity of the claim. Texas Instruments, 871 F.2d at 1065. The claims are interpreted as excluding the prior art.

There are numerous references to chemical reactions throughout the Specifications which support the conclusion that the patents contemplate chemical remediation. For example, the terms "Treatment chemicals," "reaction" and "reactants" are used in the summary of invention portion of the Specifications. See, e.g., '141 Patent at col. 2, lines 9, 48 and 49; col. 3, line 16 and line 33, col. 4, line 13; '483 Patent at col. 2, lines 14, 57, 64 and 65 (Fenton's reaction); col. 3, line 20; col. 4, lines 7, 19, 36, and 48; col. 5, lines 11 and 13; col. 6, lines 8 and 20. The terms also are used in the description of the preferred embodiment. See id. at col. 7, line 2, 5 and 9. Similarly, use of the terms "catalyst" and "catalytic agents" throughout the Specifications further demonstrates that the '141 Patent and the '483 Patent contemplate chemical remediation. See id. at col. 3, lines 18, 21 and 27; col. 6, line 44; '483 Patent at col. 3, line 16; col. 7, lines 58, 66 and 67; col. 8, line 23.

* * *

Conclusion

For the reasons stated, the claim construction of the disputed terms is as follows: (1) the term "well" in Claim One of the '141 Patent and Claim One of the '483 Patent means "a structure used for both monitoring and injecting the groundwater," (2) Step B of the '141 Patent is read to require that pH be monitored for the particular purpose of determining the existence of acceptable continuity and well interflow paths, (3) the term "treating flow" in Step C of the '141 Patent is read to have no pressure limitation associated with it and to be limited to "chemical remediation", and (4) Claim One of the '483 Patent is read to require the performance of Steps A-D both separately and sequentially to practice the invention.
Claim 15 teaches:

An electric telescoping pole saw, comprising:

- an electric chain saw having a handle, a trigger, and a power cord;
- a telescoping pole assembly having telescoping tubular sections extending between an upper end and a lower end of said pole and including an adjustable coupling clamp operative when loosened to enable said sections to telescope relative to one another for adjusting the effective length of said pole and operative when tightened to secure said sections in a selected position of adjustment;
- a bracket provided on said upper end of said pole for receiving said handle of said saw and mounting saw releasably on said pole adjacent said upper end thereof;
- a trigger depression device operative to support said trigger of said saw in a depressed "on" position;
- an adjustable length extension cord accommodated within said telescoping pole having an end extending from said upper end of said pole connectable releasably with said power cord of said saw, and an opposite end extending from said lower end connectable to an electrical power source; and
- a remote switch mounted on said pole adjacent said lower end thereof and coupled electrically to said extension cord and operative when depressed to transmit electrical power to said saw to operate said saw and operative when released to discontinue power and operation of said saw.

5 Claims 1 and 3 contain the same elements and therefore construction of claim 1 is effectively construction of claim 3 and I need not construe them both.
Q. Is trigger depression device a phrase that has ordinary meaning in the field or is that a phrase that was coined for purposes of your patent?

A. I believe that's a phrase.

Q. A phrase with meaning in the industry or a phrased [sic] that was coined for purposes of your patent?

A. I believe it's a phrase in industry - I believe.

Q. When was the first time you heard the phrase trigger depression device?

A. I completely understood it the first time I heard it, I mean when the lawyers told me. I mean, I don't know when I heard it in my lifetime. When you say that to me it means to me something to hold the trigger down.

Q. I'm not asking you whether it describes the function that it performs, but I take it that you agree that that phrase does describe the function of holding down the power switch, the trigger?

A. Yes.

Q. I'm asking you instead whether you had ever heard that phrase before your lawyers mentioned it to you in connection with your patent application.

A. I really can't answer that, I don't know the answer to it. I don't know if I have heard that in my life or not.

Q. As you sit here do you recall ever hearing it before your lawyers mentioned it?

A. No.

Q: Is the phrase securing the trigger a phrase that is commonly used in the industry or was that phrase coined for purposes of your patent application?

A. I would say it's used in the industry, some hand drills have them built right in.

Q. When did you first hear the phrase securing the trigger in a tree trimming context?

A. When they wrote the patent of the saw that I designed.

Q. That was the first time you heard the phrase, quote, securing the trigger?

A. On a chain saw it is.

Q. And is that the first time you heard the phrase, quote, securing the trigger in the context of tree trimming?

A. That's the first time I ever heard it.

(223:22-224:13)
The specification, in regard to the trigger depression device reads:

According to the present invention, the trigger switch 30 is disabled by a lock device 34 such that the circuit remains closed at all times between the cord 26 and motor 20. FIG. 4 illustrates the preferred way of disabling the switch 30. As shown, a plastic band or tie 34 encircles the handle 32 and trigger 30 to hold the trigger 30 in the fully depressed condition. The tie 34 may be of the conventional type having a plastic strap 36 anchored at one end to a lock body 38 and having its opposite free end 40 extendible through a slot in the body 38 where it is gripped by a one way locking mechanism to prevent the withdrawal of the free end 40. (Emphasis added.)

"The Federal Circuit has determined that a presumption of section 112, paragraph 6 governance 'can be rebutted if the evidence intrinsic to the patent and any relevant extrinsic evidence so warrant.'" Relume 63 F. Supp. 2d at 799 quoting Personalized Media v. Int'l Trade Comm'n., 161 F.3d 696, 704 (Fed. Cir. 1998). "Throughout the rebuttal inquiry, 'the focus remains on whether the claim as properly construed recites sufficiently definite structure….'" Id. citing same and also citing Sage Products, Inc. v. Devon Industries, Inc., 126 F.3d 1420, 1427-28 (Fed. Cir. 1997). "Close scrutiny of the term 'power factor correction converter means' reveals that it implicitly elaborates sufficient structure to a person of ordinary skill in the art of power supplies." Id. In general, if the claim does not include the correct word formulation invoking § 112, the presumption is against the application of this provision. However, this presumption can be rebutted and the invoking words are not necessary. Though the term "device" is a general term, in connection with "trigger depression" and given the prevalence of triggers in the art of trimming devices, as well as the existence of the term in prior art, this term evinces sufficient structure so as not to invoke § 112.

The phrase "a troughed portion" appears in claim 1 of the '366 Patent. Baldwin argues that even though the "troughed portion" is not modified by the word "sealing," it must be construed to have the same meaning as "sealing trough" in claim 7 of the '712 Patent. Donaldson, on the other hand, asserts this phrase has a meaning readily understood by one of skill in the art and construction of the language is not necessary. After a review of the intrinsic evidence, the Court concludes that the claim language creates no ambiguity and that "a troughed portion" has a meaning readily understood by one of skill in the art. Accordingly, the Court declines to construe "a troughed portion".

Claim 1 of the '418 patent describes the textured side of the material as having "a plurality of ridges disposed between the channels, forming troughs . . . ." Plaintiffs contend that "troughs" are "sheet structures, each formed by two successive ridges and an interposed channel" or, alternatively, "the surface structures formed by two successive ridges and an interposed channel." Gore claims that the term "troughs" refers to "cuts made along an axis other than that of the channels." The illustrations of the '418 patent show depressed surface areas formed by the surrounding channels and ridges present after cutting the surface material. See U.S. Patent No. 6,921,418, at Fig. 12. That illustration is consistent with the plain and ordinary meaning of the term "trough." Additionally, that construction is consistent with the surrounding language in claim 1. The patent's description of Fig. 12 is also consistent with Plaintiffs' construction of "troughs" because it uses the terms "trough" and "cuts" interchangeably. See id. at 3:32-37 ("Additional patterns of cuts or troughs may be made along any other axis as indicated . . . ."). Claim 1 contemplates cuts that create ridges that come together to form a series troughs. Therefore, the Court adopts the construction that "troughs" are "sheet structures, each formed by two successive ridges and an interposed channel."
"Truncated Wall"

K-TEC's Proposed Construction: "[A] wall (planar or non-planar) that truncates, in essence, the typical corner that would otherwise be formed between two side walls." (Pl.'s Claim Constr. Brief at 14, Docket No. 335.)

Vita-Mix's Proposed Constructions: "A distinct planar wall that is not a curved area or surface that forms corners with the adjacent two side walls and truncates the corner that would otherwise be formed between the two adjacent side walls." (Def.'s Claim Constr. Brief at 1, Docket No. 340.)

Vita-Mix has proposed a second, alternative construction: "A wall (planar or non-planar), that truncates, in essence, the typical corner that would otherwise be formed between two side walls, that forms corners with the two side walls and that is not a single, continuously curving surface." (Id.)

K-TEC, in its opening brief, set forth its reasons why it believed the "planar" limitation proposed by Vita-Mix, was wrong. K-TEC pointed out that some of the claims of its patents expressly include "a planar truncated wall" while others do not. For example, Claim 1 of the '117 Patent describes "a fifth truncated wall disposed between two of the four side walls." (Pl.'s Claim Constr. Brief, Ex. A, Column 8.) Dependent Claim 8 recites "an apparatus according to claim 1, wherein the four side walls and the fifth truncated wall are planar." (Id.) Similarly, the '842 Patent, Claim 1, reads, "a fifth truncated wall disposed between two of the four side walls." (Pl.'s Claim Constr. Brief, Ex. B, Column 8.) Dependent Claim 7 of the '842 Patent contains the planar limitation: "an apparatus according to claim 1, wherein the fifth truncated wall is planar." (Id.) Independent Claim 11 discusses a "fifth truncated wall." (Id. at Column 9) Dependent Claim 12 again contains the planar limitation: "The blending container of claim 11 wherein the fifth truncated wall is planar." (Id.) Consequently, K-TEC argues, Vita-Mix's proposed construction runs afoul of the doctrine of claim differentiation. K-TEC stresses that "the only difference between claim 8 and claim 1 in the '117 patent is the 'planar' limitation. Likewise, the only difference between claims 7 and 12 and claims 1 and 11 in the '842 patent, respectively, is that the fifth truncated wall is planar." (Pl.'s Claim Constr. Brief, at 16-17.) K-TEC maintains, citing the decision in Sunrace Roots Enterprises Co., LTD. v. SRAM Corp., 336 F.3d. 1298, 1303 (Fed. Cir. 2003), that because the only difference between these independent and dependent claims is the planar limitation, there is a strong presumption that the planar limitation should not be read into the independent claims.

Vita-Mix presents several arguments in support of its constructions. First, it argues that during the PTO's reexamination of the '117 Patent, K-TEC distinguished its patent from an earlier patent, U.S. Patent No. 7,063,456 (the "Miller Patent") by disclaiming "all curved areas or surfaces." (Def.'s Claim Constr. Brief, at 2.) Vita-Mix makes a similar argument concerning the prosecution of the '876 Patent, contending that K-TEC distinguished a "truncated wall" from three prior art references by disclaiming curved or non-planar walls. Vita-Mix accuses K-TEC of now taking an opposite position in litigation. That is, K-TEC pointed out that some of the claims of its patents expressly include "a planar truncated wall" while others do not. For example, Claim 1 of the '117 Patent describes "a fifth truncated wall disposed between two of the four side walls." (Pl.'s Claim Constr. Brief at 14, Docket No. 335.) K-TEC denies that it disclaimed "curved walls" during prosecution of either of its patents. K-TEC contends that Vita-Mix has taken K-TEC's comments out of context. Pointing to its response to the PTO Examiner during reexamination of the '117 Patent, K-TEC maintains that the entire response makes clear that K-TEC distinguished its claimed truncated wall from the Miller patent "not because it curved, but because it did not truncate a typical corner that otherwise would be formed." (Pl.'s Reply Brief at 9, Docket No. 346.)

K-TEC's arguments concerning prosecution of the '876 Patent is much the same. According to K-TEC, Vita-Mix has again taken K-TEC's statements out of context and omitted other "critical statements" from the prosecution history. (Id. at 11.)

The court agrees with K-TEC. K-TEC's response to the Examiner during the reexamination of the '117 Patent shows that K-TEC explained that "[t]he claimed truncated wall may be planar or curved, as long as it truncates a typical corner that would otherwise be formed if the truncated wall were not present." (Pl.'s Claim Constr. Brief, Ex. P, at 3-5.) K-TEC's position was...
that the Examiner had mistakenly viewed a surface (surface 27) in the Miller Patent as a truncated wall when, in fact "surface 27 cannot be fairly considered a truncated wall... because the two side walls allegedly truncated by surface 27 would never intersect with each other and thus would never form a corner, much less a typical corner that would otherwise be formed." (Id. at 4.)

1 The court agrees with K-TEC that the words "by" and "between" are used interchangeably in the specification of the '117 Patent when describing "truncated wall" and the formation of corners.

Similarly, a careful examination of the '876 Patent's prosecution history bears out K-TEC's contention that it did not disclaim curved walls during this reexamination. In response to the Examiner's rejection of certain claims based on K-TEC's prior art jars, K-TEC emphasized that "[a] truncated wall may comprise both planar and non-planar shapes (e.g., rounded) so long as the wall truncates, in essence, the typical corner that would otherwise be formed by the intersection of two of the four side walls..." (Pl.'s Claim Constr. Brief, Ex. M, at 8-9.)

Also during the reexamination of the '876 Patent, the Examiner rejected certain claims on the grounds that it would have been obvious to combine the square blending jar in the Dickson '086 Patent with an ornamental pitcher in a design patent issued to Grimes. Contrary to Vita-Mix's contentions, K-TEC did not, in its response to the Examiner, disclaim curved walls. Instead, K-TEC argued that the Dickinson '086 Patent taught away from the Grimes Patent because the Dickinson '086 Patent taught the use of a square jar because the long blade in Dickinson would not work in the non-square jar configuration of Grimes.

Vita-Mix next argues that because the specifications of the K-TEC patents do not disclose non-planar walls, the claims themselves be construed to encompass non-planar walls. But, as K-TEC correctly points out, the specifications of the K-TEC patents do not describe the configuration of the truncated wall. The configuration of the truncated wall is not essential to its claimed novelty: a shift in the vortex resulting in a reduction of cavitation during blending.

Case law supports K-TEC's position. For example, in Computer Docking Station Corp. v. Dell, 519 F.3d 1366, 1374 (Fed. Cir. 2008), the court cautioned: "Occasionally specification explanations may lead one of ordinary skill to interpret a claim term more narrowly than its plain meaning suggests. Nonetheless, this court will not countenance the importation of claim limitations from a few specification statements or figures into the claims..." The court in Aktiebolag v. Andrx Pharms., Inc. (In re Omeprazole Patent Litigation), 483 F.3d 1364, 1372 (Fed. Cir. 2007), stated: "Absent some clear intent to the contrary, this court does not import examples from the specification into the claims." And recently, in Kara Tech. Inc. v. Stamps.com Inc., 582 F.3d 1341, 2009 U.S. App. LEXIS 21120, 2009 WL 3030360 (Fed. Cir. Sept. 24, 2009), the court emphasized, again, that "[t]he claims, not specification embodiments, define the scope of patent protection. The patentee is entitled to the full scope of his claims, and we will not limit him to his preferred embodiment or import a limitation from the specification into the claims."

Vita-Mix's proposed constructions include a limitation that requires the truncated wall to form corners with two side walls. But this limitation is found only in Claim 15 of the '117 patent, which reads: "An apparatus according to Claim 14, wherein the intersecting corners formed by the four side walls further comprise two intersecting corners formed by the truncated wall and the two of the four side walls." (Def.'s Claim Constr. Brief, Ex. A) Consequently, the court will not read the limitation of Claim 15 into the other claims; to do so would violate the doctrine of claim differentiation.

ORDER

For the above reasons, the court accepts K-TEC's proposed construction of "truncated wall."
In construing the term "trunnions" in claim 1 of the '085 patent, the district court noted that the parties did not dispute the single word "trunnion," but rather the context in which the term is used in the claim. The district court, relying on a dictionary definition of trunnions, construed the term to mean "pins or pivots usually mounted on bearings for rotating or tilting something." Markman Opinion, slip op. at 13. Reading the claim term in the context of the surrounding claim language, "hinge-forming trunnions being formed on inwardly facing surfaces of said flanges[,]" the court found that because the claim requires that the trunnions be formed "on" the inwardly facing surfaces of the flanges, they must project from the inwardly facing surface of the flanges. The court recognized that several portions of the '085 patent specification, including the "Summary of the Invention" and "Detailed Description of a Preferred Embodiment" sections, refer to the trunnions "as types of projections[,]" thereby reinforcing the conclusion that some type of projection is required. In reaching its construction, the court rejected CCL's argument that the term "trunnion" as used in the claims could be construed to cover a pure recess or indentation in the surface of the flange because "while such recess might be a trunnion, it would be one that is formed in, not on, the inwardly facing surface of the flanges." Id. Therefore, the court concluded that "the trunnions identified in the claim language are ones that project from the inwardly facing surface of the flanges." Id.

On appeal, CCL argues that the district court erred in construing "trunnions" as being limited to "projecting" trunnions. Specifically, CCL contends that the court grafted a limitation from the preferred embodiment onto the trunnion term; that limitation being some type of projection. CCL asserts that the claim language "on inwardly facing surfaces of said flanges," "simply defines the location of the trunnions 'on the flange.'" Alternatively, CCL asserts that if the trunnion term were limited to a projection, there is no reason to further limit it to a structure that does not contain a recess, especially when such a construction would exclude the preferred embodiment.

Sun Coast, on the other hand, argues that the district court correctly construed the term "trunnion" as requiring some type of projection, and thus excluding a pure recess, based on the context of the term in the claim itself and the disclosures in the specification. First, Sun Coast echoes the district court's conclusion that the claim language states that the trunnions are formed "on" the surfaces of the flanges and not "in" the surfaces, and therefore the claim language itself does not support CCL's argument that a trunnion could be a pure recess. Second, Sun Coast asserts that "[a] trunnion cannot be a [pure] recess because the specification describes a recess as part of the projecting trunnion. . . . " (Pls.-Cross Appellants' Br. 48.) Finally, Sun Coast argues that as correctly construed, the projecting "trunnions" cannot contain a recess and if such a construction excludes the preferred embodiment it is because of poor claim drafting.

"The words of a claim 'are generally given their ordinary and customary meaning.'" Phillips, 415 F.3d at 1312 (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996)). That ordinary meaning "is the meaning that the term would have to a person of ordinary skill in the art in question at the time of the invention." Id. at 1313. "The claims themselves provide substantial guidance as to the meaning of particular claim terms." Id. at 1314. In particular, "the context in which a term is used in the asserted claim" and the "other claims of the patent in question" are useful for understanding the ordinary meaning. Id. As we have stated on numerous occasions, the claims "must be read in view of the specification, of which they are a part." Markman, 52 F.3d at 979. "The specification is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term." Phillips, 415 F.3d at 1315 (quoting Vitronics, 90 F.3d at 1582).

We can discern no error in the district court's Markman construction of the term "trunnions." First, the claim language itself states "hinge-forming trunnions being formed on inwardly facing surfaces of said flanges[,]" '085 patent, col. 7, ll. 9-10 (emphasis added). We do not believe that the term "on" was merely a reference to the location of the trunnions, but rather a limitation on the types of trunnions which were being claimed. Thus, we agree that the claim language itself does not support a construction of the term that would consist of a pure recess as such a trunnion would no longer be formed "on" the surface of the flanges, but rather "in" the surface. The claim language, however, supports a construction that the trunnions must be some type of projection, as that projection would aptly be considered "on" the surface of the flanges. Second, the specification consistently refers to trunnions as being some type of projection and the preferred embodiment is described as having "a short inwardly extending trunnion-like projection 28, 30." This is not, however, a limitation which is only associated with the preferred embodiment as argued by CCL. '085 patent, col. 4, ll. 12-13. The "Summary of Invention" section states that the "trunnions which project inwardly from upper ends of flanges extend from the side walls of the calculator housing, . . . to . . . the opposite open ends of the cylindrical bores and form hinge connections for the lid structure with the calculator housing." '085 patent, col. 2, ll. 45-50 (emphasis added). Therefore, based on the context of the claim language and the description of the trunnions in the specification, we agree with the district court that the term trunnions be
construed as "pins or pivots usually mounted on bearings for rotating or tilting something that project from the inwardly facing surface of the flanges." 1

--- Footnotes ---

1 This was essentially the district court's claim construction embodied in its Markman opinion, although we have compressed the court's statements into a one sentence construction. See Markman Opinion, slip op. at 13.

--- End Footnotes ---

While we affirm the district court's Markman construction of "trunnions," we note that there is no additional limitation which prevents the trunnion from being some type of projection which contains a recess. 2 First, the context of the claim language does not exclude a projection containing a recess because such a trunnion would still be "on" the surface of the flanges. Second, such a projection is specifically disclosed as part of the preferred embodiment. Figure 9 of the '085 patent illustrates that, "one of the projections 28 is larger in diameter, and projection 28 contains a circular recess 32 including a horizontal rib 34 extending radially from the bottom of the recess 32." '085 patent, col. 4, ll. 13-17 (emphasis added).

--- Footnotes ---

2 In the district court's summary judgment order, it appears that the court may have limited the term "trunnions" to solid projections (i.e., those that do not contain a recess). While the term as construed in the Markman opinion was limited to some type of projection, thereby excluding a pure recess, there is no subsequent limitation on the projection such that it could not itself include a recess.

--- End Footnotes ---

As shown in Figure 9, projection 28 is a trunnion which contains a recess. Thus, a construction of the term "trunnion" that excludes a projection containing a recess would exclude projection 28 as shown in Figure 9. Third, as Sun Coast admits, "the specification describes a recess as part of the projecting trunnion . . . ." (Pls.-Cross Appellants' Br. 48.) Therefore, there is no apparent reason to limit the term in a way that would exclude the preferred embodiment. Accordingly, the district court may have applied a more limited construction of the term in its summary judgment order, that application was erroneous.

--- SEE FIG. 9 IN ORIGINAL ---

(d) Claim One, Clause Five

Claim 1, clause 5 reads as follows: "hinge-forming trunnions being formed on inwardly facing surfaces of said flanges[.]" The parties dispute the meaning of the word "trunnions."

Trunnion is not defined in either the claims or the specifications. Although the parties purport to only dispute the single word "trunnion," it became apparent at oral argument that they dispute not so much the definition of this word itself as the context in which it is being used in this claim. SCM in fact does not dispute that trunnions can be defined as something other than just projections. Its position is that use of the word "trunnion" in conjunction with the word "on" in Claim 1, clause 5, means that the type of trunnion contemplated by this claim language is a projection of some sort.

CCL claims that because a trunnion can be something other than a projection, the claim language should not be limited to projections. It asserts that even though the claim language states that the trunnions are formed on the inwardly facing surfaces of the flanges, they can be recessed within the flanges.

- 4918 -
We conclude that, in its ordinary meaning, trunnion is a pin or pivot that permits something to be rotated or tilted. However, in this case, regardless of whether a trunnion is necessarily a projection, the context of the claim language demonstrates that the trunnion referred to is some form of a projection.

The claim language states that the trunnions are formed on the inwardly facing surfaces of the flanges. Claim 1, Clause 5. To be formed on the flange surfaces, the trunnions must necessarily protrude from that surface. As used in the claim language, the trunnions are projections. This construction is entirely consistent with the language of other claims as well as the intrinsic evidence. For example, both claims 3 and 6 refer to the trunnions on the flanges. Claim 3, clause 3; Claim 6, clause 2.

Moreover, this construction is appropriate in light of the specifications which all consistently refer to the trunnions as types of projections. See, e.g., Col. 2:45-46 ("mounting trunnions which project inwardly...."); Col 4:12-17 ("a short inwardly extending trunnion-like projection...."); Col. 4:23-24 ("trunnion-like projections...."); Col. 5:14-15 ("the trunnion projections..."); Col. 6:23-24 ("hinge-forming trunnion projections....").

3 Because the claims themselves state that the trunnions are formed on the flanges, specifications that refer to projections are consistent with, not limitations on, the claim language.

CCL argues that an indentation in the flanges qualifies as a trunnion because it could be used to rotate something along its axis. While such recess might be a trunnion, it would be one that is formed in, not on, the inwardly facing surface of the flanges. We cannot simply rewrite the claims to accommodate CCL's argument.

Moreover, although the indentation might also be seen as being part of the surface of the flange, albeit on a different plane, the indentation still is not on the surface of the flange. While an indentation may be viewed either as being in, or part of, the surface of the flange, it is not formed on the surface of the flange.

Accordingly, we construe trunnions to mean "pin[s] or pivot[s] usually mounted on bearings for rotating or tilting something." Webster's New Third International Dictionary. In this case, the trunnions are formed on the flanges to permit rotation of the lid structure. Claim 1(a),(b). As such, the trunnions identified in the claim language are ones that project from the inwardly facing surface of the flanges.

4242

A. "Tubular."

The term "tubular" appeared in claim 18 of the '207 patent. Claim 18 depended from claim 1. Claim 1 recited in part (col. 4:59-5:2):

1. Apparatus for positioning in the mouth of an individual for selectively delivering liquid from a liquid source for consummation by the individual, said apparatus being formed of resilient, flexible material, and comprising, in combination:

   A hollow body portion defining an interior for accommodating fluid received from a liquid source, said body portion including a fluid inlet end communicating with said interior for receiving liquid from the liquid source and a fluid outlet end spaced from said fluid inlet end;

Claim 18 read (col. 6:17-18):

18. The apparatus according to claim 1 wherein said body portion is generally tubular shaped.

Defendants argue that the term "tubular" should be limited to a "hollow article having a circular cross-section." Paczonay
proposes that the term should be construed to mean "having the form of a hollow body." He relies on a dictionary definition and his purported definitions in the specification. Specifically, he described the apparatus in the specification as being formed of "resilient, flexible material and includes a hollow body portion defining an interior for accommodating fluid received from a liquid source" (col. 1:48-51). Defendants contend that plaintiff's definition of the term is far too broad and could encompass any hollow article.

The word "tubular" is a common English-language word with a readily-understood meaning. Nothing found in the specification or the claims indicates that the term should have anything other than its commonly-understood meaning. Additionally, the parties presented no evidence or argument from the prosecution history in this claim-construction proceeding, and at the hearing, the parties agreed that nothing in the prosecution history addresses the meaning of the term. Because "tubular" has a commonly-understood meaning and there is no basis on which to conclude that it was used in any specialized way, there is no need to give it further definition, with one minor exception.

This order holds that limiting the definition of "tubular" to only objects with a circular cross-section is unwarranted. Cross-section-wise, tubes come in many different shapes, ranging from circular to oval to poly-sided. The figures in the patent, for example, show the bite valve as having a roughly elliptical shape, as shown in figure 2B. This precludes any finding that the term should be restricted to objects with a circular cross-section. Accordingly, the term "tubular" will be given its commonly-understood meaning with the caveat that it is not to be restricted to objects having a circular cross-section.

e. The "tubular" limitation

Claim 1 requires a "tubular" holder for the first reflector. Defendants have no dispute that the ordinary and customary meaning of "tubular" is "having the form of or consisting of a tube." 17 Defendants state the definition of "tube" is "any various usu. cylindrical structures or devices." 18 Then, Defendants define a "cylinder" as "the surface traced by a straight line moving parallel to a fixed straight line and intersecting a fixed planar closed curve." 19 Defendants would require all sides of the "tubular" holder to be parallel when running lengthwise. The Court believes this definition to be too narrow. Defendants own definition of "tube" shows there are various structures that could be considered "tubular." One of those structures' surfaces might not necessarily move parallel in its lengthwise direction. The Court construes "tubular" to mean "having the form of or consisting of a tube." Therefore, the holder for the first reflector must "have the form or consist of a tube."

16 Doc. 29, Ex. 1 (The '433 patent), column 6, lines 25-26.

19 Id.
"surface" has a "substantially uniform thickness" and more than one slot arranged "substantially parallel to the longitudinal axis of each tubular member." There is no requirement that a tubular member be any certain length, so long as it is long enough to contain more than one slot. A "slot" is "a long narrow groove, opening or notch." Webster's at 1039.

2. "tubular sock-like projectile body"

Defendants argue that "tubular sock-like projectile body" should be given the same construction as another term in the patent, "tubular projectile body," since both terms are used interchangeably in the patent to refer to the same object. Defendants' proposed construction of the phrase is "a tube shape hollow body having a single inner compartment." Def. Br. at 6. Defendants note that both "tubular" and "sock-like" must contribute to the definition of the term, meaning that the body has a single interior shape (like a tube) but is closed on one end (like a sock). Plaintiff argues that the phrase should be construed to mean: "any unfilled tubular fabric construction material having a single chamber of at least one layer of material." Plaintiff. at "Ex. F." Defendants do not object to plaintiff's assertion that nothing in the claim requires that the tube must be composed of only one layer of material. Nor does plaintiff dispute that the tube must have a single inner chamber or compartment. As the proposed constructions are not in conflict with one another, both may be incorporated into the construction. "Tubular sock-like projectile body" therefore is construed to mean "a tube shape hollow body, composed of one or more layers of material, having a single inner compartment."

I. Tubular

At the hearing, the parties explained that the primary dispute with regard to these terms is whether or not the outer tubular must be a separate component from the tubular string. Davis-Lynch argues that the claimed invention does not require that the outer tubular be a separate component from the tubular string. Weatherford argues that the claimed invention is a tool, including an outer tubular, which must be separate from the tubular string.

The '336 patent almost always refers to the outer tubular as a separate component from the tubular string. For example, it explains that the flapper valves are mounted to an outer tubular, and that this outer tubular is "cemented, molded, or
Lynch's proposed constructions are consistent with the patent as a whole. The one potential problem with Davis-Lynch's these proposals do not accurately describe the claimed invention when it is in back pressure mode. In contrast, Davis-a temporal component that could be confusing. Because these proposals refer to the "initial" location of the inner tubular, understood by a lay jury. The Court will not adopt Weatherford's proposed constructions of these terms because they include With regard to the terms "inner tubular" and "outer tubular," the Court finds that these terms would not be readily otherwise mounted within a short piece of pipe." '336 Patent at 7:5-6, 6:55-58. This short piece of pipe is then threaded onto the tubular string and forms a portion of the tubular string. '336 Patent 7:21-23; 6:58-61. The patent further explains that, unlike the tubular string, which is intended to provide permanent support to the wellbore, the outer tubular and the material for affixing the outer tubular to the tubular string may be composed of drillable material because the entire tool may later be drilled out. '336 patent at 7:10-24. Furthermore, every figure depicting the inner workings of the invention shows the outer tubular as a component separate from the tubular string. 3 '336 patent figs. 2-9.

3 The outer tubular is labeled as element 25 in figures 2-5, but it is not separately labeled in figures 6-9. Nonetheless, figures 6-9 clearly show that the flapper valves are attached to a component separate from the tubular string. This component must be the outer tubular. Furthermore, figures 6 and 7 show that "conversion tool 14 [i.e. the entire tool including the outer tubular,]" is mounted within pipe 21 [i.e. the tubular string].'' 336 patent at 9:59-60. Figures 8 and 9 show that "conversion tool 14 may be mounted by any suitable means within collar section 21A [i.e. the tubular string]." '336 patent at 10:29-30.

The patent specification contains only a single reference to support Davis-Lynch's position. It states that "[t]he present invention may comprise an outer tubular member forming a portion of the tubular string." '336 patent at 3:41-42. In contrast to the embodiment described above, this statement appears to disclose that the flapper valves may be mounted directly to the tubular string rather than being mounted to an outer tubular affixed to the tubular string.

Although Davis-Lynch is correct to point out that the '336 patent discloses this alternative embodiment, this embodiment is outside the scope of the claims asserted in this case. This embodiment appears to be covered by claims 8, 9, 10, 11, and 23, which recite "an outer tubular member forming a portion of said tubular string." In contrast, claim 33 recites "an outer tubular affixed to said tubular string." This statement clearly describes the "outer tubular" and "tubular string" as two separate components. Furthermore, it states that the outer tubular is "affixed" to the tubular string rather than forming a portion of it.

Davis-Lynch argues the outer tubular may be indirectly "affixed" to the tubular string if it is glued to a section of pipe that is threaded into the tubular string, and the outer tubular may be directly "affixed" to the tubular string if the outer tubular is a section of pipe threaded directly into the tubular string. However, this interpretation finds no support in the intrinsic evidence. The word "affixed" appears twice in the patent specification. It states that the inner tubular "may be affixed in place" until it drops down during conversion. '336 patent at 7:28-32. It also states figure 2 depicts the "conversion tool" as "mounted, fastened, or affixed" to a section of pipe threaded into the tubular string. '336 patent at 6:55-61. In both of these statements, the word "affixed" describes the mounting of one tubular member inside another tubular member, rather than the threading together of sections of pipe. More importantly, the word "affixed" is used to describe an embodiment where the outer tubular is mounted inside the tubular string, but never used to describe an embodiment where the outer tubular forms a portion of the tubular string. '336 patent 6:55-61. Thus, there is no support for Davis-Lynch's contention that the claims at issue cover an embodiment where the outer tubular forms a portion of the tubular string.

Having resolved the parties' claim scope dispute with regard to the terms "inner tubular," "outer tubular," "tubular string," and "affixed," the Court must now determine how best to communicate these terms to a lay jury. The Court finds that the term "affixed" is readily understandable for a jury and thus no construction is necessary. See O2 Micro Int'l Ltd. v. Beyond Innovation Tech. Co., 521 F.3d 1351, 1362 (E.D. Tex. 2008); Fenner Inv. Ltd. v. Microsoft Corp., No. 6:07-cv-8, 2008 U.S. Dist. LEXIS 65686, 2008 WL 3981838 at *3 (E.D. Tex. Aug. 22, 2008) (finding that a court need not construe a disputed term as long as it has resolved the claim scope dispute between the parties). Although the Court will not construe this term, the parties may not interpret this term in a manner that is inconsistent with this opinion.

With regard to the terms "inner tubular" and "outer tubular," the Court finds that these terms would not be readily understood by a lay jury. The Court will not adopt Weatherford's proposed constructions of these terms because they include a temporal component that could be confusing. Because these proposals refer to the "initial" location of the inner tubular, these proposals do not accurately describe the claimed invention when it is in back pressure mode. In contrast, Davis-Lynch's proposed constructions are consistent with the patent as a whole. The one potential problem with Davis-Lynch's
proposals is that the terms "outer" and "inner" are vague. For example, because the tubular string is "outer" relative to the outer tubular, the tubular string could be described as "an outer part or component shaped like a tube."

The difficulty in construing these terms lies in describing where these components are located relative to one another. The patent specification overcomes this difficulty by consistently referring to the entire tool, including the inner tubular and outer tubular but not the tubular string, as "conversion tool 14" or "tool 14." See, e.g., '336 patent 6:54-58, 7:4-8, 7:46-54, 9:59-61. Every figure depicting the claimed tool labels it as element 14. '336 patent figs. 2-9. By this consistent usage, the patentee has acted as his own lexicographer and defined the claimed tool as "tool 14." See Phillips, 415 F.3d at 1316. Therefore, the Court will construe "inner tubular" as: "an inner part or component, of tool 14, that is shaped like a tube." The Court will construe "outer tubular" as: "an outer part or component, of tool 14, that is shaped like a tube." 4

4 While the Court recognizes that claim terms are typically not construed by reference to elements in the patent's figures, such references may be appropriate when they best explain the term in dispute. See, e.g., Rapistan Sys. Advertising Corp. v. Daifuku America Corp., No. 03-CV-682, 2006 WL 6112186 at *12 (W.D. Tex. Feb. 9, 2006) (construing the term "joining edges" by reference to a figure in the patent because the parties' proposed constructions did not adequately explain the term).

With regard to the term "tubular string," the Court finds that this term would not be readily understood by a lay juror. However, neither party has proposed an adequate construction for this term. Davis-Lynch's proposal inappropriately equates the term "tubular string" with a "casing/liner string," when the patent itself only lists casing and liner strings as examples of tubular strings. See, e.g., '336 patent at 1:14, 1:66, 5:58, 11:55. At no point does the patent expressly limit the term "tubular string" to mean simply a casing or liner string. Cf. Bell Atl. Network Servs., Inc., 262 F.3d at 1271 ("when a patentee uses a claim term throughout the entire patent specification, in a manner consistent with only a single meaning, he has defined that term 'by implication'"). 5 Weatherford's proposal is flawed because it does not effectively communicate that a tubular string consists of smaller sections of pipe. Because both parties' proposed constructions are deficient, the Court will construe "tubular string" as "a length of pipe run into a wellbore that is composed of smaller sections of pipe threaded together."

5 The Court also finds that Davis-Lynch's proposal unnecessarily describes the tubular string as being "cemented into the wellbore." This issue is addressed more fully below in section X.
Beginning with the language of the specification, it never expressly defines the phrase "tubular wall." It does, however, provide helpful guidance. First, the specification expressly states that "[t]he manner in which the present stent is manufactured is not particularly restricted." See Joint Statement, '037 Patent at 13:1-2. The specification then goes on to explain that, while not particularly restricted, there is a preferred embodiment of the claimed stent design that includes a preferred manufacturing mode. Specifically, the specification states: "[p]referably, the stent is produced by laser cutting techniques applied to a tubular starting material." See id. at 13:2-4. Furthermore, "the preferred design of the present stent is one of a tubular wall which is distinct from prior art wire mesh designs wherein wire is conformed to the desired shape and welded in place." See id. at 13:8-11. From this, then, it is clear that the "tubular wall" claimed by the '037 and '255 Patents is not restricted in its mode of manufacture, but that its preferred embodiment is one in which the tubular wall is not made from wire mesh that is conformed to the desired shape and then welded into place. What is not clear, however, is what the tubular wall is, or from what it is actually made.

Absent any language that actually suggests the affirmative definition for "tubular wall," the court will not read the above limitations, taken from a description of the preferred embodiment of the claimed design, into the claim language itself. And since plaintiffs' proposed construction does exactly that by lifting the specification's description of the preferred embodiment to the phrase at issue, their proposed construction is rejected. See, e.g., Teleflex, Inc., 299 F.3d 1313, 1324-26 (Fed. Cir. 2002)(limitations from the specification, such as from the preferred embodiment, cannot be read into the claims absent an express intention to do so).

Moreover, plaintiffs' proposed construction sets forth an additional qualifier -- i.e., that a tubular wall cannot be formed from "a porous flat plate welded into a tube shape" -- that is not found in the patent specification. While plaintiffs assert that this language is supported by prior art patents, specifically U.S. Patent Nos. 4,762,128 (the "'128 Patent") and 5,591,197 (the "'197 Patent" or "Orth Patent"), plaintiffs have failed to submit the '128 Patent for the court's consideration. As for the '197 Patent, which plaintiffs did not submit until after the hearing on claim construction, the section cited by plaintiffs therein fails to provide clear support for their proposed construction. See '197 Patent at 7:8-15 (noting that Figure 1 of the patent depicts a sheet of material which must be rolled into cylindrical configuration with ends "welded" together, but omitting any reference to "porous flat plate[s]").

Accordingly, and for all the above reasons, the court declines to adopt plaintiffs' proposed construction, and instead adopts defendants' proposed construction and construes "tubular wall" as: "having the form of a tube."

**B. Tufts of fibers**

With regard to the second disputed claim construction, Lydall argues that the parties and the district court agreed that "tufts of fibers" are clusters of fibers and thus that the court should have given the term this ordinary and customary meaning. Lydall asserts that nothing in the specification or prosecution history provided a special meaning or definition that would override that ordinary meaning. Lydall also contends that the specification shows various methods for needling a batt to produce tufts on the surface, including a single-sided example shown in figure 10 that would still result in tufts being present on both sides of the batt. Accordingly, Lydall argues that the court incorrectly limited the claim to the two-sided needling shown in figure 5. Lydall argues that no textual hook in "tufts of fibers" justifies reading additional limitations to the term from an example in the specification. According to Lydall, it does not matter how the tufts were created as long as the batt is needled to produce them. Finally, Lydall asserts that the court's claim construction of "tufts of fibers" overlaps with other claim constructions and renders them inconsistent.
In response, Federal-Mogul argues that Lydall's assertion that an embodiment where tufts are formed on both sides of a batt when a batt is needled from only one side is not described or shown anywhere in the patent. Such a construction, according to Federal-Mogul, contradicts the purpose of the tufts to strengthen the batt in the Z-direction. Federal-Mogul contends that there is only one embodiment of the invention, which uses two-sided needling. According to Federal-Mogul, figure 10 shows a single barbed needle at various locations as it proceeds through a batt to produce a tuft. Finally, Federal-Mogul argues that Lydall's selective appeal and position for the two claim constructions before us conflict with constructions of other claim terms.

We agree with Federal-Mogul that, as described in the '260 patent, "tufts of fibers" are only formed on the opposite side of a batt from a needle's entry point and, therefore, that the bats must undergo two-sided needling. Lydall is correct that the parties agreed that the ordinary meaning of "tufts" is "clusters." See Claim Construction Opinion, 566 F. Supp. 2d at 616. However, although the construction of a claimed term is usually controlled by its ordinary meaning, we will adopt an alternative meaning "if the intrinsic evidence shows that the patentee distinguished that term from prior art on the basis of a particular embodiment, expressly disclaimed subject matter, or described a particular embodiment as important to the invention." CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366-67 (Fed. Cir. 2002). Here, the specification clearly describes a single embodiment as the invention, viz., an insulating shield that includes a three-layered batt that undergoes two-sided needling to produce tufts on both its upper and lower surfaces. Every time the specification discusses how to create the tufts of fibers, it states that the tufts form on the opposite side of the needle's entry point. See '260 patent col.6 ll.55-59, col.9 ll.25-29, col.12 ll.62-64, col.13 ll.7-13, col.13 ll.27-31. The description of figure 10 provides a detailed explanation of how the needling accomplishes this:

The needling used in producing the present batt is illustrated in FIG. 10. As a needle 100 having a barb[101 begins to penetrate binding layer 42, the bar[b] 101 picks up and is essentially loaded with binding fibers 45 in that barb. The needle then passes through insulating layer 43 without picking up substantial insulating fibers since the barb is essentially loaded. The needle then passes through the opposite binding layer 41 such that the barb penetrates below the tufted lower surface 48 and presents a tuft 46 beyond that tufted lower surface 48. As the needle 100 is withdrawn back through binding layer 41, that tuft 46 remains at the tufted lower surface 48. Of course, during that needling operation, as is common with barbed needles, binding fibers 45 will also be pulled with the needles to form stitches 34 of those binding fibers, as shown in FIG. 5. Thus, with the retraction of the needle 100, the tufts 46 which terminate the stitches 34 of fibers 45 remain on the surface. By using conventional needling machines, where needling is conducted from both sides of batt 40, tufts will be disposed on both the tufted upper surface 47 and the tufted lower 5 surface 48, as shown in FIG. 5.

To achieve the tufted surfaces, at least the lowermost barb of any needle should pass through tufted lower surface 48 or tufted upper surface 47, depending upon the needle direction, sufficiently such that the tufted fibers remain on 10 the respective surface when the needle 100 is withdrawn from the batt 40.

Id. col.12 ll.53-col.13 ll.13 (emphases added).

The specification identifies a batt with tufts on the upper and lower surfaces as "the present invention." '260 patent col.6 ll.50. In addition, the specification consistently describes the batt with tufts on both sides. See id. col.6 ll.59-60, col.9 ll.29-30, col.13 ll.3-6, col.13 ll.30-31. Lydall's description of the "needling used in producing the present batt" makes clear that the batt must be needled from both sides to produce tufts on both surfaces. Thus, contrary to Lydall's assertions, figure 10 is entirely consistent with the remainder of the specification discussing two-sided needling. In other words, rather than disclosing a batt subjected to single-sided needling as a possible embodiment, the specification clearly indicates that all batts disclosed in the '260 patent must undergo two-sided needling. Thus, we affirm the district court's construction of "tufts of fibers" as "clusters of binding fibers which have been intentionally needle-punched on a downstroke and which extend beyond an opposite surface of the batt."

We have considered Lydall's remaining arguments and find them unpersuasive. Therefore, for the foregoing reasons, we affirm the claim constructions of the district court. Under the parties' stipulation, the final judgment of noninfringement is also affirmed.

GO BACK
a. "tulip-shaped housing part"

The parties dispute the construction of "tulip-shaped housing part." Gore's proposed construction is "a tulip (bell-shaped) structure with a closed hub end and an open tip end, and having a diameter substantially larger than the guide tube." (Gore Reply Br. 25-27; Gore Proposed Order 3.) Perouse's proposed construction is "[a] housing part [that] in its closed state is a cylinder having a diameter larger than the guide tube, and in its opened state has at least one linear separation." (Perouse Opening Br. 33-34.).

There is no indication that "tulip-shaped" has a "technical or specialized meaning" in the relevant art. (Gore Opening Br. 35.) Though "tulip" is a common word with a well defined meaning, "tulip-shaped" is too vague to have any clear ordinary meaning to one of skill in the art. Without context, it is unclear whether this language refers to an open or closed tulip, and it is unclear which specific aspects of the tulip shape the housing part must possess.

The Court looks to the specification to determine how a person of ordinary skill would interpret this term. See, e.g. Honeywell Int'l Inc. v. Universal Avionics Sys. Corp., 488 F.3d 982, 991 (Fed. Cir. 2007) ("Without a customary meaning of a term within the art, the specification usually supplies the best context for deciphering claim meaning.") Even if "tulip-shaped" were deemed to have an ordinary meaning to one of skill in the art, claim terms are construed "in the context of the entire patent, including the specification" and "a patent applicant may use the words in the specification, prosecution history, or both 'in a manner inconsistent with [their] ordinary meaning.'" CollegeNet, Inc. v. Apply Yourself, Inc., 418 F.3d 1225, 1231 (Fed. Cir. 2005). Therefore, the Court must also examine the patent specification "to determine whether the patentee has given the term an unconventional meaning." Hockerson-Halberstadt, Inc. v. Avia Group Int'l. Inc., 222 F.3d 951, 955 (Fed. Cir. 2000).

The Court finds that the patentee has implicitly provided its own definition of "tulip-shaped" in the '787 patent. The specification repeatedly refers to element number 4 in the drawings as "tulip-shaped" (see, e.g., '787 patent col.3 11. 1-42, 61-67), and explicitly states that the "housing part" is "shown in the drawings as shaped like a tulip." ('787 patent col.1 11.5-6). The patentee thus defines "tulip-shaped" to mean the shape of the closed housing part in the drawings.

--- Footnotes ---

22 The patentee makes clear that "tulip-shaped" refers to the shape of the closed housing part by stating that the stent is inserted into the "tulip-shaped" end of the tool. ('787 patent col.3 11.1-4.)

--- End Footnotes ---

Gore's "bell-shaped" and "closed hub end" limitations are easily dismissed because the drawings show a housing part that is not bell-shaped, but cylindrical (see '787 patent Figs. 3, 4), and with a proximal ("hub") end that is not closed, but open and continuous with the guide tube (see '787 patent Fig. 4). 23 Even if Gore's proposed construction reflected the "ordinary meaning" of "tulip-shaped," the construction is inconsistent with the patentee's use of the term and must be rejected. See Resonate Inc. v. Alteon Websystems, Inc., 338 F.3d 1360, 1364 (Fed. Cir. 2003) ("After identifying the ordinary meaning of a disputed claim term, we turn to the patent's written description and drawings to determine whether that meaning is inconsistent with the patentee's use of the term.").

--- Footnotes ---

23 Because Gore's proposed construction is inconsistent with the drawings, it would also exclude both of the embodiments represented by these drawings. A construction that does not include preferred embodiments within its scope is "rarely, if ever, correct." Vitronics Corp. v. Conceptronic. Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996).

--- End Footnotes ---

The parties originally agreed that a "tulip-shaped housing part" has a diameter larger than that of the guide tube. (Perouse
Opening Br. 33-34; Gore Opening Br. 35-36.) However, in its reply brief, Gore offered a different construction that required a housing part "having a diameter substantially larger than [that of] the guide tube." (Gore Opening Br. 35-36.) Gore offers no support for this new limitation and the Court finds that it is not consistent with the intrinsic evidence. For example, the drawings in the '787 patent do not show a "tulip-shaped" housing part that is "substantially larger" in diameter than the guide tube. (See '787 patent Figs. 3, 4, 6.)

The "tulip-shaped" features of the housing part depicted in the drawings are the cylindrical structure, open distal end, and larger diameter relative to the guide stem. In combination, these features roughly suggest the shape of a tulip flower attached to a stem.

Accordingly the Court construes "tulip-shaped housing part" to mean a "cylindrical housing part with an open distal end and a diameter larger than that of the guide tube."

D. Limitation to Tuna

The literal language of the Yamaoka patent claims only a process for "curing raw tuna meat" (Ex. 1, Col. 7). HISI requests that the claim be limited to tuna, and not be extended to other fish or meats. TPI "does not dispute that Claim 1 of the Yamaoka '619 patent is limited to tuna." (TPI Reply 8.) The Court concurs that the Yamaoka Patent claims only a process for curing tuna, and not any other kind of fish or meat.

B. "Turbine Pump"

Claims 1 and 14 of the '701 Patent include the term "turbine pump." The parties agree that the proper construction of this term includes "a pump that operates by rotating an impeller having vanes or blades," but Performance proposes that the claim term construction include "also known as a regenerative fuel pump." Performance bases this contention on the '701 Patent's Detailed Description of the invention in the '701 Patent which states that within the reservoir "is an electrically powered turbine pump. U.S. Pat. No. 5,257,916 ["'916 Patent"] ... illustrates and describes a turbine pump." See '701 Patent, Col. 2, lines 42-45. It is undisputed that the '916 Patent is entitled and describes a "Regenerative Fuel Pump." The '701 Patent also refers to the '916 Patent "for a full disclosure of a pump of the type shown in FIG. 1." Id., Col. 2, Ins. 66-67 - Col. 3, ln. 1.

The Court credits the testimony of Gerard Muller, a professional engineer with extensive experience in turbines and pumps. Muller testified that the figures depicted in the '701 Patent, as well as the diagrams in the '916 Patent, depict regenerative pumps. Muller also stated that a turbine pump with a circumferential array of vanes as described and depicted in the '701 Patent is a regenerative pump.

While the '701 Patent does not specifically refer to its turbine pump as a "regenerative fuel pump," it is clear from the language in the '701 Patent, as well as the '916 Patent and Muller's testimony, that the term "turbine pump" means "a pump that operates by rotating an impeller having vanes or blades, also known as a regenerative fuel pump." See, e.g., Yoon Ja Kim v. Conagra Foods, Inc., 465 F.3d 1312, 1318 (Fed. Cir. 2006) (holding that although the patent did not define the term "potassium bromate replacer" as an oxidizing agent, it made clear that the potassium bromate replacer in question was an oxidizing agent). The Court, therefore, construes the term "turbine pump" in the '701 Patent to mean "a pump that operates by rotating an impeller having vanes or blades, also known as a regenerative fuel pump."
The Court construes the term "turf maintenance operation" in claims 15, 17, and 24 of the '325 patent to mean:

- An operation for maintaining grass- or vegetation-covered soil or for maintaining sand. Such operations include mowing, sand grooming, and aeration.

Toro advocates a similar construction, but proposes that the Court construe this to mean an operation for maintaining "the turf environment including mowing, sand grooming, or aeration." Toro Opening Br. at 40 (emphasis added). Toro's proposed construction is unhelpful, however, because it defines the vague claim term "turf" by means of the equally vague term "turf environment." The key issue is what "turf" means, and Toro's construction does not answer that question, except by implication. The Court has therefore substituted "grass- or vegetation-covered soil" and "sand" for Toro's proposed "turf environment."

Textron argues, in effect, that this term does not need to be construed: It proposes construing "turf maintenance operation" to mean "an operation for maintaining turf," Textron Opening Br. at 49, which does nothing to elucidate the term's meaning. Such a construction would force the reader (or the jury) to supply the meaning of "turf," which Textron argues should have its ordinary meaning -- a meaning that excludes sand. Id.

The Court agrees with Textron that "turf" would not ordinarily include sand. But the intrinsic evidence demonstrates that Toro intended that "turf maintenance operation" include operations performed on sand, such as sand grooming. Both the '325 patent itself and the patent's prosecution history indicate that Toro intended its claims to cover sand-grooming machines, as well as mowers and aerators. See '325 patent col. 6:51-52 ("The invention could also be applied to a three wheel vehicle, such as the Sand Pro or Infield Pro . . . ."); JA 104 ("Independent claim 26 . . . . would in addition to covering riding mowers also cover other similar vehicles, such as sand trap grooming vehicles, aerating vehicles, or the like.") Toro therefore put the world on notice that "turf maintenance operation" means operations performed not only on grass- or vegetation-covered soil (i.e., on "turf"), but also on sandy areas such as sand traps and baseball diamonds.

7. "turn control mode"

This claim is used in claim 7 of the '017 and '607 Patents, claim 8 of the '967 Patent, and claims 1, 6, 18, and 23 of the '520 Patent. WG seeks to construe this term as "a control mode in which the streamer positioning devices first generate force in the opposite direction of the turn and then are directed back into position." Ion seeks to construe this term as "mode wherein streamer positioning device(s) generate a force in the opposition direction of a turn and then directing each streamer positioning device to the position defined in the feather angle mode." The primary difference between these constructions, therefore, is whether "turn control mode" should be construed with reference to the feather angle mode.

Claims 6 and 9 of the '520 Patent describe the two stages of the turn control mode. Claim 9 of the Patent, which is dependent on claim 6, addresses what happens after the streamers are directed to generate force opposite the turn: "commanding each streamer positioning device to go to a position defined by the feather angle control mode." ('520 Patent, Pl. Br. Ex. 4, Doc. No. 61, col. 11 ll. 40-44.) The construction proposed by Ion, therefore, directly mirrors the language used in the claims themselves to describe the turn control mode. WG once again argues that, because it is only the term that is being construed, and not the entire invention, it is unnecessary to describe how the mode is implemented within the construction of this term. However, WG's proposed construction is also a description of how the turn control mode is implemented, only with the reference to the feather angle mode eliminated. Therefore, WG should not try to controvert Ion's construction on the grounds that it attempts to describe the implementation of the turn control mode, as it appears to agree that some description of the implementation is an appropriate way to construe the term.

Turning then to the specific language chosen by each party to describe the implementation, Ion's construction provides a more complete description because it actually mirrors the language used within the patent-in-suit claims, which clearly refer to the feather angle mode to describe the second stage of the turn control mode. Accordingly the Court adopts Ion's construction of this term and holds that it should be construed as "mode wherein streamer positioning device(s) generate a force in the opposition direction of a turn and then directing each streamer positioning device to the position defined in the
The first step in an infringement inquiry is claim construction, and in construing the claims, we start with the language of the claims themselves. Vehicular Techs. Corp. v. Titan Wheel Int'l, Inc., 141 F.3d 1084, 1998 U.S. App. LEXIS 6859, at *8 (Fed. Cir. 1998). In construing the claim term "turnbuckle," Springfield asserts that the district court paid inadequate homage to the doctrine of claim differentiation.

The doctrine of claim differentiation embodies the notion that language in one claim should not be interpreted so as to make another claim, often a dependent claim, superfluous. See, e.g., Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1277, 35 U.S.P.Q.2D (BNA) 1035, 1041 (Fed. Cir. 1995). As a corollary, claim terms should be construed consistently, if possible, throughout a patent. See Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579, 34 U.S.P.Q.2D (BNA) 1673, 1679 (Fed. Cir. 1995). Applying claim differentiation, Springfield notes that claim 1 requires a turnbuckle with "means for adjustably and disconnectably joining," whereas claim 2 merely requires a turnbuckle with "means for disconnectably joining." Because claim 2 omits the "adjustably" requirement, Springfield asserts that the doctrine of claim differentiation compels a broader reading for claim 2 than for claim 1. Springfield contends that this difference in wording means that a turnbuckle as claimed in claim 2 does not need to be adjustable.

We conclude that claim differentiation does not provide much help in this case. Although the different wording of the two claims is relevant in construing the claim limitations, the import of the difference is substantially weakened by the fact that claims 1 and 2 would have different scopes even if the phrases at issue were read to include an adjustability requirement. The two claims are independent and contain additional limitations, beyond the "turnbuckle" limitations discussed here, which would prevent the claims from becoming impermissibly redundant even if the "turnbuckle" limitations were both construed to require adjustability. Thus, claim differentiation in this case does not give rise to the same presumption that it would in a case in which, for instance, the second claim was dependent on the first and added a single limitation to the first claim. Cf. Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1551, 37 U.S.P.Q.2D (BNA) 1609, 1612 (Fed. Cir. 1996).

Springfield next urges a "plain meaning" approach to defining "turnbuckle," and it provides a dictionary definition along with a picture of a turnbuckle. Springfield notes that the definition does not mention "adjustability." However, the definition specifically notes that the turnbuckle is "used for tightening a rod or stay," and the picture shows a structure with a rotating link threaded onto a rod. The rod has a lengthy threaded portion and the link is only threaded partially onto it. It is thus apparent from the picture that the link can be rotated to shorten or lengthen (i.e., adjust) the turnbuckle.

The '527 patent's written description also supports a definition of turnbuckle as an item that is adjustable. The Background of the Invention criticizes prior art cables for their "difficulty in securing the correct placement and tensions in the cable." Column 1, lines 20-22. The Summary of the Invention notes that "the harness cable is adjustably and disconnectedly joined in three segments by turnbuckles," column 1, lines 47-49, and the Description of a Preferred Embodiment states: "A first turnbuckle C interposed in the horizontal run beneath the loom adjustably and disconnectably joins the harness cable at each end thereof. A second turnbuckle D adjustably and disconnectably joins the harness cable between the second and third sheaves," column 2, lines 16-21. It follows by stating: "It is thus seen that an improved harness cable has been provided wherein adjustments may be made at accessible locations." Column 3, lines 3-5. Each of these passages highlights the adjustability of the turnbuckle separate and apart from its disconnectability.

The prosecution history provides further support for this claim construction. During prosecution, the Examiner rejected the claims under 35 U.S.C. § 103 over U.S. Patent No. 11,324 to Crompton in light of a British patent 627,819. The Examiner noted that Crompton disclosed all the elements of the then-claimed invention except turnbuckles, and the British patent disclosed adjustment with a turnbuckle. In response to the rejection, the applicants made minor amendments to the claims but, more importantly, they made a significant distinction related to the turnbuckle limitations (emphasis added):

Furthermore, Applicants respectfully submit that Crompton and the British patent are not combinable because there is no
suggestion, teaching, or incentive to modify the device of Crompton in the sense suggested by the Examiner.

As shown by the excerpt below, Crompton teaches that the tension in the cords of the disclosed device is adjusted by changing the position of the pulleys:

[excerpt omitted]

Crompton neither discloses nor suggests an alternate means for adjusting the tension in his device. Furthermore, since Crompton teaches that tension is adjusted by changing pulley positions, there is no incentive to modify that device by using turnbuckles. Hence, Crompton and the British patent are not combinable.

In this statement, the applicants noted that, because Crompton has an adjustability feature (i.e., moveable pulleys), there was no need for someone viewing Crompton to look for any other art containing a different adjustability feature (i.e., turnbuckles). In this way, the applicants defined a turnbuckle as something that is adjustable. Therefore, any influence that the doctrine of claim differentiation may have on claim construction in this case cannot survive the multiple statements indicating that a turnbuckle is an adjustable connector. See Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1028, 4 U.S.P.Q.2D (BNA) 1283, 1292 (Fed. Cir. 1987) ("The doctrine of claim differentiation does not allow unrestrained expansion of claims beyond the description of the invention in the specification, and explanations and representations made to the PTO in order to obtain allowance of the claims.").

As an apparently separate argument relating to claim construction, Springfield asserts that, even if a turnbuckle must be adjustable, it need not be capable of placing the cables in more than one position. Rather, Springfield asserts that a device is adjustable as long as it is capable of "bringing the cable segments to proper relative position." Appellant's Brief at 18. Springfield's proffered definition of adjustable does not square with the sources discussed above. The turnbuckle as shown in Springfield's dictionary definition is capable of moving to multiple positions, the written description differentiates between adjustability and disconnectability, and the prosecution history indicates that the applicants understood adjustment to be achieved in one instance through changing the positions of pulleys. If anything, these sources indicate that a turnbuckle is adjustable because it can bring the cable segments into proper relative position by shortening or lengthening the connection between the cables.

4255

(1) determining a twist of clothes being washed in a washer

The parties dispute the term "determining a twist of clothes being washed in a washer," which appears in Claims 1, 3, and 4. LG proposes construing the term to mean "determining a bundling [i.e., uneven distribution] of clothes being washed in a washer." (Chart at 1.) Whirlpool proposes instead that the term be construed to mean "deciding whether clothes being washed in a washer are entwined together." (Id.)

In arguing that the term "determining" should be construed as "deciding," Whirlpool refers to the written description, which states that "[w]hen the correlation coefficient of Y(n) has been determined to be higher than the [] reference value . . . , the clothes is determined as having been twisted . . . ." (474 Patent, col. 9, ll. 19-22.) The Court finds nothing in that description to support Whirlpool's argument that the term "determining" means "deciding," rather than its plain meaning. The Court therefore rejects that aspect of Whirlpool's proposed construction.

With respect to the term "a twist of clothes," however, the Court agrees with Whirlpool that the term should be construed to mean "clothes . . . entwined together." The background section of the patent states that "cloths of the clothes may be damaged when operations in the washing mode and the rinsing mode are continued under a condition that the clothes has been twisted . . . ." (Id., col. 1, ll. 40-43.) "Moreover, there is a problem that the washing degree is degraded at the twisted portion of clothes." (Id., col. 1, ll. 44-46.) The summary section states that "an object of the invention is to provide an apparatus for and a method of determining a twist of clothes being washed in a washer, . . . so that when the clothes twist signal is a meaningful signal, an operation in a clothes untwisting mode is carried out for minimizing a damage of the clothes . . . ." (Id., col. 1, ll. 49-57.) The written description states that the invention makes it "possible to minimize a damage of clothes and improve the washing degree degraded at the twisted portion of clothes." (Id., col. 9, ll. 32-35.) It is
clear, then, that "a twist of clothes" was understood to result in damage to the clothes and degradation of the washing degree at the twisted portion. That limitation comports with Whirlpool's proposed construction, "clothes . . . entwined together." In contrast, LG fails to explain how "bundling [i.e., uneven distribution]" of clothes would result in damage at a bundled, unevenly distributed portion of clothes.

The Court therefore construes the term "determining a twist of clothes being washed in a washer" as "determining whether clothes being washed in a washer are entwined together."

B. Claims

The dispute has been narrowed to the elements recited in claims 1, 15, and 16 that are directed to the conveying assembly, set forth below. (emphasis added). The numerals in brackets refer to elements circled in Fig. 2.

Claim 1 (in part)

Claim 15 (in part)

. . . said conveyor assembly [14] comprising two vertically positioned conveyors [92, 94] . . . drive means to drive said conveyors so that the upper portion [98] of one conveyor [92] travels in the same direction as the lower portion [96] of the other conveyor [94] with said one conveyor [92] supporting and linearly conveying said load [24] . . . to rotate said film roll support member so that it continuously dispenses the material around the said conveyor assembly [14] and the load [24] being supported by the one conveyor [92] to contact and wrap the load [24] and said other conveyor [94] forming a spiral wrapped load [22] . . .

Claim 16 (in part)

. . . said conveyor assembly [14] comprising at least two conveyors [92, 94] positioned adjacent to each other in a stacked relationship and driven at substantially the same speed, one of said conveyors [92] of said conveyor assembly [14] being adapted to receive a load [24] from said conveyor means and transport said load [24] in a downstream direction through and away from said wrapping area, another of said conveyors [94] being adapted to receive and carry film web wrapped around it in said downstream direction, said wrapping means dispensing film from said film dispenser around said load [24] and the lowest conveyor [94] with the film web engaging and being carried by said lowest conveyor [94] at substantially the same speed as the load [24] is being carried by the one conveyor [92] of the conveyor assembly [14] . . .

C. Accused Device

Keip's allegedly infringing device is an embodiment of the device shown in U.S. Patent No. 4,979,358 ( ’358 patent). Fig. 3 thereof, a top view of the discharge end of the conveyor, and Fig. 9, a cross-sectional view taken on the line IX-IX of Fig. 3, are reproduced below. 2

2 The parties stipulated that the allegedly infringing machines sold by Keip were accurately depicted in Figs. 1-9 of the ’358 patent.
Keip's device has a single conveyor that includes two loops or conveyor halves placed horizontally side by side. Each loop comprises a single chain with a plurality of identical one-piece, U-shaped resilient plastic lugs. The outer sides of the lugs, referred to as outer arms, are expanded as they are carried over longitudinal stationary cam plates for the entire length of the conveyor along the outer or forward path. When expanded, arms cooperate to carry the product and the film forward through and out of the wrapping area. As the resilient lugs reach the discharge end of the conveyor, arms recoil. The lugs are in their recoiled position for the entire length of the conveyor along inner or return path that does not have cam plates. When moving along the return path, recoiled arms do not interfere with the forward movement of the load and film. The recoil or collapse of the outer arms occurs as the chains are rounding the ends of the loops.

II. Analysis

On appeal of a grant of summary judgment, we independently determine whether there are any genuine issues of material fact, and if not whether the court erred either in interpreting the governing law or in applying the law to the facts. Reversal is proper if the court engaged in a faulty legal analysis in applying the law to the facts and the correct application of the law to those facts might bring a different result. The district court is required to view the evidence in the light most favorable to the party opposing the motion.

The issue before us is whether the district court properly granted summary judgment in finding that Keip's device literally infringes claims 1, 15, and 16 of the '322 patent. Determining whether the claims of a patent have been literally infringed is a two step process: first, the claims must be interpreted to determine their proper scope; thereafter, the claims as thus interpreted are applied to the accused device.

A. Claim Interpretation

Claim interpretation is a question of law amenable to summary judgment. Mere disagreement over the meaning of a term does not necessarily give rise to a genuine issue of material fact. Keip argues that the district court's interpretation of the claim language was erroneous. We agree. The district court erred first by ignoring the "at least two" claim limitation, and second, by embracing an erroneous interpretation of the term "conveyor."

Before the district court, Keip argued that the conveyor assembly, as defined by the claims, is required to have the following elements:

1. At least two conveyors; 4
2. One conveyor that is adapted to receive the load and convey it across the gap; and
3. One conveyor that is adapted to contact the film and convey the film web across the gap.
The district court disagreed and concluded that Keye could not avoid literal infringement by reading in limitations that were not in the claims. The limitations, however, are in the claims. The district court's error can be traced to its reiteration of the claims just prior to its analysis wherein it omitted the "at least two" language from the claims. Based on the thus redacted claims, the district court stated: "There is no word or phrase which requires the conveyor means or conveyors to be structurally independent of each other." No. 1:91:CV:721, slip op. at 12. That omission effectively read out the "at least two" limitation which is clearly stated in the claims.

All limitations in a claim must be considered meaningful. See Perkin-Elmer Corp. v. Westinghouse Elec. Corp., 822 F.2d 1528, 1532-33, 3 USPQ2d 1321, 1324-25 (Fed. Cir. 1987). Indeed, the language of the claims makes unambiguous reference to two distinct elements of the claimed structure: first by the "at least two conveyor [means]" language, and second by the "one of said conveyor [means]." "other conveyor means," "both conveyor means," and "lowest conveyor" language. It is clear that the claims define two separate conveyor structures; otherwise the recitation of the "at least two" limitation would be meaningless.

When claiming a combination where more than one of a certain element, here a conveyor [means], is included in the combination, the term "at least two" sets forth the minimum number of a particular element required. This interpretation gives full effect to the recitation of two distinct elements in the claimed structure. Therefore, properly interpreted, all claims at issue require two or more conveyor structures, not one. Accordingly, we interpret claims 1, 15, and 16 to require two separate conveyors.

Having properly put back into the claims the "at least two" limitation, we next interpret the term "conveyor." "Terms in claims are to be given their ordinary and accustomed meaning, unless it appears that the inventor used them differently." Envirotech Corp. v. Al George, Inc., 730 F.2d 753, 759, 221 USPQ 473, 477 (Fed. Cir. 1984). The term conveyor is neither ambiguous nor highly technical. More importantly, there is nothing in the claims, the specification or prosecution history that would suggest a meaning other than its ordinary meaning.

The district court properly concluded that the ordinary meaning of conveyor was applicable and correctly set forth its meaning as "an apparatus that transports articles from one place to another." 5 Nevertheless, as discussed below, the district court subsequently embraced Lantech's erroneous "conveying or moving surface" definition. The term conveyor, as used in the claims and described in the specification always refers to an operative device or structure which would ordinarily be considered a conveyor. A conveyor necessarily includes components such as belts, slider plates, and drives, in addition to a moving surface.

5 As defined in the American Heritage Dictionary of the English Language (1981).
A. "Two Imports"

The '701 patent claims "two inports on an upper lid thereof" to receive the paper and optical discs to be shredded. The parties agree that "two inports" means the invention possesses two inports, but Fellowes argues that the '701 patent claims two or more inports, while Michilin contends that the patent claims two, and only two, inports. (See Michilin's Resp. Brief at 9-10; Fellowes's Opening Brief at 13-14.)

The '701 patent uses the term of art "comprising" to claim all of the elements, including the "two inports," of the invention, meaning that the claimed elements are essential, "but other elements may be added and still form a construct within the scope of the claim." Genentech, Inc. v. Chiron Corp., 112 F.3d 495, 501 (Fed. Cir. 1997); '701 patent, col. 4: 54. Therefore, the '701 patent claims an invention with at least two inports.

D. U-Shaped

Brike contends that the term "U-shaped" means a structure in the shape of the letter "U." Brike's main contention is that a "U" is not a "D" and that adding structure to a "U" to turn it into a "D" invalidates Claim 8 because the prior art, the Predator II cycle, has a D-shaped footrest. To construe the term in a way which would cause an invalidation, according to Brike, can only be done if supported by clear and convincing evidence. Brike also argues that adding structure to the "U" eliminates an inherent feature of Claim 8.

Invacare contends that the term "U-shaped" means in a shape of the letter "U" and "U-shaped member" means the forwardly projected member, front most cross brace and the laterally opposite rearwardly projected member, cooperatively defining a U-shape when looked down upon from above. Invacare notes that Claim 8 uses the word "comprised," which is open-ended so that the claim encompasses all devices satisfying the elements in the claim, regardless of whether the device has additional elements not recited in the claim. Invacare also points out that the specification contemplates closing the back of the U-shape.

As a preliminary matter, I disagree with Brike's position that a claim construction argument that would invalidate a claim must always be supported by clear and convincing evidence, citing Budde v. Harley-Davidson, Inc., 250 F.3d 1369, 1376 (Fed. Cir. 2001). Budde concerned a challenge to a means-plus-function limitation that lacked disclosure of structure in the specification sufficient to be understood by one skilled in the art as adequate to perform the recited function, thus making the claim indefinite. I am construing a limitation in a different form which does not have the requirements of a means-plus-function limitation. I do this as a matter of law and do not address at this point whether the claim could eventually be invalidated for a reason such as obviousness or anticipation. Thus, the clear and convincing evidentiary standard does not apply.

The specification does not provide any additional definition of the meaning of "U-shaped," generally referring to the term as one of the building blocks of the foot and leg support:

Straps are the preferred method of leg support in this case, however, any means of supporting the rider's legs at the rear of the "U" shape 82 would work as well or even closing the back of the "U" shape 82 to make a long rectangle that supports the rider's foot and calf. . . . Tube section 82 is bent in a "U" shape with one leg of "U" telescopically inserted the smaller hole in clamp 85 and the clamp and "U" shape are then inserted telescopically into tubular section 48 or 49. Telescoping the "U" shape is the preferred means of adjustment, however brackets to 82 that can be moved forward or rearward relative to tubes 48 or 49 would also work as well.

'184 Patent, 4:45-62.
There is no need to address during claim construction whether a "U" is the same as a "D" because I am only construing the claim terms and am not deciding if they read on the accused device. Similarly, I see no reason to construe the claim with specific reference to the preferred embodiment disclosed in the specification, as Invacare contends. That is too limited of a construction. Accordingly, I construe the term "U-shaped" to mean in the shape of the letter U.

5. U-Shaped

Defendants define "U-shaped" as "precisely that [shape] illustrated by the letter 'U' itself, two upright elements connected at their ends by a curvilinear element." Plaintiff argues that "U-shaped" means "open on one side" or "open ended."

Figures 21B and 26B of the '465 Patent depict the "U-shaped" yoke:

[SEE FIG. 21B IN ORIGINAL]

[SEE FIG. 26B IN ORIGINAL]

Defendants want "U-shaped" to be limited to the shapes of the yokes seen in Figures 21 and 26 of the '465 Patent, which have two parallel sides. Plaintiff argues for a broader definition, which would include semi-circles and other shapes.

Claim 31, itself, gives no guidance in defining "U-shaped" beyond conveying that the described object is shaped like the letter "U." The dictionary definition conveys a similar meaning. See The American Heritage Dictionary of the English Language, supra (defining "U" as "something shaped like the letter U"). There is, on the other hand, no support in the claim for Plaintiffs' position that "U-shaped" describes anything that is "open ended."

Plaintiff's expert, John R. Nixon, declared that "one skilled in the mechanical arts would call U-shaped [anything] that [has] bent, angled, or tapered 'legs' extending from a curved bottom." (Pl.'s Br. in Resp. Ex. 10 at P 4.) However, Mr. Nixon offers no support for this position.

Moreover, the '465 Patent elsewhere describes a "U-shaped device [as] having two upright elements interconnected by a curvilinear element." '465 Patent col. 9, ll. 41-43. This description features not "bent, angled, or tapered 'legs'" but rather "upright elements," consistent with the definition of "U-shaped" as "shaped like the letter U."

As used in claim 31 of the '465 Patent, "U-shaped" means shaped like the letter "U."

11. "U-shaped profile"

This phrase is found in Claim 5. Plaintiff argues that this phrase should be construed as "having a profile generally in the shape of the letter 'U'." Defendants assert that the phrase need not be construed, and the Court agrees. Because the Court see no ambiguity as to the meaning of the phrase "U-shaped profile" and because its ordinary and customary meaning is clear to one skilled in the art, the Court declines to construe the phrase as it is used in the '015 Patent.

viii. U-shaped structure having two arms

Plaintiffs construe "U-shaped structure having two arms" as "a type of bridge, in the shape of the letter 'U', that receives the bridge of the frames to which it is attaching." Defendant interprets the same phrase to mean "a three-sided structure with two
of the sides being generally parallel to one another." Defendant insists that the opening of the U-shaped structure need not be at the top and Plaintiffs do not voice any disagreement.

Consistent with these interpretations, the court construes the term to mean "a three-sided structure in the shape of the letter 'U', however oriented."

3. Construction of "unassisted flow"

The next term to be construed appears in Claim 16 of the '164 patent as follows:

A method for determining a concentration of an analyte in a body fluid of a patient, comprising the steps of: creating an unassisted flow of a body fluid from the patient; transporting a portion of the body fluid into an analyte sensor configured and arranged to determine the concentration of the analyte from 500 nL or less of body fluid…

Plaintiffs propose a construction of "unassisted flow" as "creating a flow of a body fluid Cram a person without the aid of a mechanical or electro-mechanical device such as a syringe which draws the fluid from the body" and Defendant as "the emission of a useful sample volume obtained by lancing a portion of the skin without milking (i.e. without squeezing, massage) or using a syringe."

The Court finds little support for Plaintiffs' proposed construction. Plaintiffs' interpretation limits the scope of the term "unassisted" so as to only exclude flow assistance provided by mechanical and electro-mechanical devices. This interpretation would effectively bring within the ambit of the claim "follow promotion" through non-mechanical means such as "milking" 4 in which blood flow is induced through the application of hand pressure. The specification belies Plaintiffs' contention that the term "unassisted" was only intended to exclude processes using machines or devices. The patent states:

Currently available technology measures bioanalytes in relatively large sample volumes, e.g., generally requiring 3 microliters or more of blood or other biological fluid. These fluid samples are obtained from a patient, for example, using a needle and syringe, or by lancing a portion of the skin such as the fingertip and "milking" the area to obtain a useful sample volume…. Less painful methods for obtaining a sample are known such as lancing the arm or thigh, which have a lower nerve ending density. However, lancing the body in the preferred regions typically produces submicroliter samples of blood… It would therefore be desirable… to develop [an] easy to use blood analyte sensor, capable of performing an accurate and sensitive analysis of the concentration of analytes in a small volume of sample.

'164 patent, 1:1 5-36.

In this context, "milking" refers to the coaxing of blood flow by squeezing, or applying hand pressure to a flow area.

This paragraph suggests that one of the major improvements of the '164 patent over the prior art was that it permitted users to measure much smaller volumes of biological fluids than had previously been possible. According to the specification, prior to the '164 patent, users had to employ mechanical devices or physical processes such as hand "milking" 5 in order to draw out samples large enough to be measured by the then existing techniques. It stands to reason that if the inventors sought to eliminate the need to induce additional flow of fluid to create samples large enough to be measured, the improvements would have been applicable to any means of promoting additional flow, whether mechanical or through "milking." The specification makes it clear that the inventors intended to measure the small amounts of biological fluid 6 capable of being generated without "additional assistance." 7 Plaintiffs cite no evidence indicating that the term "unassisted" was intended to exclude only mechanical devices such as syringes. The inventors deliberately included the term "unassisted" in their claim; the Court must attempt to give meaning to every word in a claim when construing terms.
could have modified the term to encompass only mechanical assistance had they so intended. In light of the specification and the ordinary meaning of the terms, the Court construes, "unassisted flow" to mean "flow without the aid of any additional process or device to draw out more fluid than that which occurs once the flow has been initiated."

--- Footnotes ---

5 The Court also rejects Defendant's construction that unassisted flow necessarily requires "lancing." The ordinary meaning of "unassisted flow" does not suggest that it be limited to instances where the measured bodily fluid has been produced due to lancing.

6 The specification defines "biological fluid" as "any body fluid in which the analyte can be measured, for example, blood, interstitial fluid, dermal fluid, sweat, and tears." '164 Patent, 450-52. For example, unassisted flow would include the situation where a fingertip is punctured with a lance, and blood naturally flows to the surface of the finger at the puncture point.

--- End Footnotes ---

The sole issue on this appeal is whether the accused device contains the following claim limitation (emphasis added):

rollers each comprising a prong having a first end attached to said lifting means and an unattached free end spaced from said lifting means, said free ends of said rollers may be inserted under said object prior to lifting said object off a surface upon which said object rests.

The district court construed the above limitation as follows:

A roller or prong has an "unattached free end" within the meaning of Claim 1 when the end spaced away from the lifting means is not attached to any additional, fixed frame or structure which would prevent the roller from fitting under a bale.

Ag-Industrial raises two arguments on appeal. First, it argues that the rollers on the Ag-Industrial machine are supported at both ends by a frame and thus do not have "unattached free ends" as required by claim 1. Second, Ag-Industrial argues that the accused device does not have a "prong" within the meaning of the claim. Other than its bare assertion that the accused device "does not have rollers that each comprise 'a prong,'" Ag-Industrial did not elaborate at all in its summary judgment brief to the district court as to why the accused device lacks a "prong." Given the cursory nature of Ag-Industrial's "prong" argument, the district court's opinion understandably did not address that argument. We will, however, address each of Ag-Industrial's two arguments in turn.

We begin with Ag-Industrial's "unattached free end" argument. We construe claims in light of the claim language, the written description and the prosecution history. See Quantum Corp. v. Rodime, PLC, 65 F.3d 1577, 1580, 36 U.S.P.Q.2D (BNA) 1162, 1165 (Fed. Cir. 1995), cert. denied, 134 L. Ed. 2d 666, 116 S. Ct. 1567 (1996). In this case, we move immediately to the prosecution history because as the district court and the parties apparently found, the claim language and the written description in the specification are not particularly probative on the issue. The prosecution history here, on the other hand, is especially illuminating because it shows how the limitation at issue came into being. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1577 (Fed. Cir. 1996) ("The record before the Patent and Trademark Office is often of critical significance in determining the meaning of the claims."); Markman v. Westview Instruments, Inc., 52 F.3d 967, 980, 34 U.S.P.Q.2D (BNA) 1321, 1330 (Fed. Cir. 1995) (in banc) ("This 'undisputed public record' of proceedings in the Patent and Trademark Office is of primary significance in understanding the claims."); U.S. v. Westview Instruments, Inc., 52 F.3d 967, 980, 34 U.S.P.Q.2D (BNA) 1321, 1330 (Fed. Cir. 1995) (in banc).

In the first office action during the prosecution of the '486 patent, the PTO rejected all of the then-pending application claims as unpatentable in light of, inter alia, the U.K. '489 application and the Brambilla '270 patent. However, the Examiner clearly suggested how the applicant could possibly overcome the prior art rejections (emphasis added):
The claims would be more favorably considered if the structure of the prongs/rollers were more positively recited in terms of being attached only at one end to the frame and the other end being unattached (free) to allow insertion under a bale.

Thus, the Examiner made two points regarding Oiestad's invention: (1) one end is spaced closely and "attached" to the frame so (by implication) as to disallow insertion under a bale at that end; and (2) the other end, in contrast, is not only spaced away and unattached to the frame but also "free" from any other structure so that that end of the roller may be freely inserted under the bale. In this way, the Examiner maintained the "attached/unattached to the frame" dichotomy between the two ends of the roller, and at the same time, recognized that the unattached end additionally must be free from any other structure that may get in the way of insertion under a bale. In so instructing, the Examiner essentially told Oiestad how to overcome the prior art rejections - that the claims would be allowed if the claim language was amended to reflect the fact that Oiestad's invention used one end ("unattached" and "free") of the rollers to pick up the bale and used the same rollers for rotating the bale during wrapping. As discussed above, all the prior art devices, including the Brambilla '270 patent, used two separate mechanisms for picking up the bale and for rotating the bale during the wrapping stage.

In the amendment following the above office action, Oiestad rewrote the application claims to follow the Examiner's suggestion. Regarding the Examiner's earlier suggestion, Oiestad stated:

The present invention consists in [sic] a bale-wrapping device for wrapping cylindrical bales which picks up the bales using prongs of a lifting device which are slid under the bale, the bale then being picked up and supported by the prongs and rotated for wrapping using the same prongs to rotate the bale as were slid under the bale to pick it up. This obviously is far simpler than transferring the bale to a separate wrapping device.

Furthermore, with respect to application claim 11, which issued as patent claim 1 in suit, Oiestad stated (emphasis added):

As suggested by the examiner, claim 11 (replacing claim 1) now defines the prongs as having one end attached to the lifting means and an unattached free end for insertion under a bale prior to lifting the bale from a surface upon which it rests. Applicant believes that the amended claim 11 is now fully distinguished from the prior art and should be allowable.

Indeed, after this amendment by Oiestad, the PTO allowed all of the application claims to issue without any further office actions.

Accordingly, in light of the prosecution history, we conclude the limitation at issue - "rollers each comprising a prong having a first end attached to said lifting means and an unattached free end spaced from said lifting means . . . wherein . . . said free ends of said rollers may be inserted under said object prior to lifting" - requires the following: (1) one end of the roller (the tractor end) is spaced closely to and attached to the lifting means so that insertion of the roller at the tractor end would not be possible; and (2) the other end of the roller is spaced from and "unattached" to the lifting means and free from any other structure so that it may be freely inserted under the bale. This claim construction is consistent with the conclusion of the district court on this issue.

E. Uncompressed Position

ICU argues that the term "uncompressed position" refers to the "location in which the flexible element is not depressed into less space in the cavity" while Braun states that it means "the position of the flexible element when it is not under axial compression and closes the valve." RJCCPS at 3. The only difference in the parties' positions is whether or not the flexible element may remain under some axial compression in the "uncompressed position."

At the outset, ICU's attempt to turn "un" into "some" clearly conflicts with ordinary meaning. ICU argues that its construction is supported by a statement in the specification that "the seal has a lip . . . [that] upon assembly . . . is compressed between the locking elements." In addition, ICU maintains that the flexible element is always under axial compression by atmospheric pressure. While both of these creative arguments do confirm that there is some axial force acting on the flexible element in its uncompressed position, they still mischaracterize the relevant term. Clearly "uncompressed" refers to a lack of compression. This begs the question as to what source of compression is referenced. The
logical answer -- supported by the patent's repeated use of the relevant terms -- is that the compression is caused by the insertion of a medical implement into the valve. Col. 1:23-25 (the valve "includes a seal which, upon being compressed by a medical implement"); Col. 3:35-38 ("The third feature is that the resilient seal is adapted to be moved into a compressed state upon insertion of the tip of the medial [sic] implement into the opening and returns to a decompressed state upon removal of the tip. . . ."); Col. 42-45 ("In the compressed state, the seal section is pushed by the delivery end of the medical implement. . . ."); Fig. 5 (depicting compression of the flexible element by a syringe).

The term "uncompressed position" is therefore construed as the position of the flexible element when it is not under axial compression from a medical implement and closes the valve.

4265

D. "uncoupling the leading end"

The term "uncoupling the leading end" appears in the '269 patent, and Plaintiffs propose the following construction of the term: "To detach, disjoin or disconnect the temporary connection of the leading end." JCC at 15:9-13. Defendants object to Plaintiffs' proposed construction to the extent it is inconsistent with its proposed construction of "temporarily coupling." Finding no inconsistency, the Court adopts Plaintiffs' proposed construction of "uncoupling the leading end."

4266

In the present case, the Plaintiff argues that the intended scope of its claim covers a process for bonding both cured and uncured silicone rubber. Claim 1 calls for "placing the treated and primed surface of polyolefin in contact with the surface of an uncured elastomeric compound of molecular weight" (emphasis added). 3 As a threshold matter, Plaintiff contends that the term "uncured" as used in their claim should be construed as encompassing "any uncured or partially cured silicone." (Pl. Opp. Brief at 13). Plaintiff argues that partially cured silicone rubber contains an uncured element, and therefore based on its argued claim construction, should be considered "uncured" and within the scope of Plaintiff's Claim 1.

The Court cannot agree with the Plaintiff's suggested claim construction. The words used in the Plaintiff's claim specify that the silicone rubber elastomer to be used is "uncured," not "uncured or partially cured." 4 Plaintiff's patent refers to the silicone rubber elastomer several more times in the specification as "uncured" (in the "Discussion of Prior Art" section, "Detailed Description of the Invention" section, and in Examples one - three). While the patent specification sets forth no special meaning for the term "uncured," the Court will assume the term represents its common meaning in the scientific field. See Vitronics, 90 F.3d at 1584. In The Compilations of ASTM Standard Definitions, "cure" is defined as "to change the properties of a polymeric system into a more stable, useable condition by the use of heat, radiation, or reaction with chemical additives." 135 (8th ed. 1994) (the ASTM is the American Society for Testing and Materials). The ASTM treatise also equates "cure" with the preferred term "vulcanization." See id. "Vulcanization" is defined as "an irreversible process during which a rubber compound, through a change in its chemical structure (for example, cross-linking), becomes less plastic and more resistant to swelling by organic liquids and elastic properties are conferred, improved, or extended over a greater range of temperatures." See id. at 565. 5 Thus, the Court finds that the term "uncured" in the Plaintiff's patent claims refers to a silicone rubber elastomer that is not cured, that is, it has not been exposed to heat and/or chemicals so that its chemical structure has not irreversibly changed to exhibit the characteristics of vulcanized rubber.

3 The definition of "uncured" is dispositive on the question of literal infringement, because the Defendant's bonding process calls for a "cured" sample of silicone elastomer.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

4939
4 Using uncured silicone is necessary because the silicone and polyolefin are bonded and cured in the same step later in the process.

5 See also Hawley's Condensed Chemical Dictionary which defines "curing" generally as "conversion of a raw product to a finished and useful condition, usually by application of heat and/or chemicals that induce physicochemical changes," and the curing of rubber as: "Addition of sulfur and accelerator, followed by exposure to heat, which effects cross-linking. This converts the material from a thermoplastic to thermosetting product. High energy radiation can also be used. See vulcanization." Van Nostrand Reihold (13th ed., 1997).

6 Since "curing" or "vulcanization" is an irreversible process, the term "partially cured" is not, as the Plaintiff suggests, equivalent to the term "uncured" because any curing at all permanently alters the properties of the silicone making the physical states of uncured silicone and partially cured silicone mutually exclusive.

The Court therefore construes the term "uncured" in the Plaintiff's '148 patent claim as referring to an elastomeric compound which has not undergone any curing or vulcanization process.

7 Plaintiff's argument that the prosecution history supports the conclusion that the term "uncured" was meant to include "partially cured" is also without merit. The statement in the prosecution history referring to the Plaintiff's process as being capable of joining a polyolefin and an "uncured or partially cured" silicone rubber, indicates that the inventors distinguished between "uncured" and "partially cured," as separate physical states. (See Muldoon Decl., Ex. C at 54.) However, the prosecution history cannot be relied upon to expand the scope of Plaintiff's patent to cover both partially cured and uncured states. While the prosecution history may be used to define terms within the claim itself, it cannot be used to "enlarge, diminish, or vary" the limitations in the claim. Markman, 52 F.3d 967 (citing Goodyear Dental Vulcanite Co. v. Davis, 102 U.S. 222, 227, 26 L. Ed. 149 (1880)). Thus, while the Plaintiff's reference to both uncured and partially cured silicone in the prosecution history is useful to demonstrate that the Plaintiff knew there was a difference between the two states, it cannot be used to expand the scope of the claim itself which refers only to uncured silicone.

4. "Underside"

Microthin proposes that "underside" means "the surface of the mat that faces or contacts the surface on which the mat or pad rests, the underside or bottom." SiliconeZone again argues that the term needs no construction but has a plain and ordinary meaning.

The term "underside" in the '995 Patent is the equivalent of "lower surface" in the '311 Patent, which has already been construed. Because of the identical written descriptions between the two patents and the identical proposed constructions by the parties for the '311 Patent and the '995 Patent, the Court will again follow the same reasoning that it did before. Accordingly, "underside" means "the surface of the mat that faces or contacts the surface on which the mat or pad rests, the underside or bottom."
Advantage argues that the district court improperly concluded that the '498 patent fails to satisfy both paragraphs of 35 U.S.C. § 112, without providing reasoning for those conclusions. As to the adequacy of the written description, Advantage contends that, while the phrase "original unidentified mass" does not literally appear in the specification, one skilled in the art would recognize and know how to practice the claimed invention using "an original unidentified mass" upon reading the specification. As to definiteness, Advantage contends that, while the meaning of the phrase "original unidentified mass" is neither facially apparent nor defined in the patent specification, the prosecution history clarifies the phrase to mean any shape different from a complete impression tray. On the issue of infringement, Advantage argues, based upon its proposed construction of the phrase "original unidentified mass," that All Dental infringes the patent because its tablets are clearly not in the form of a dental impression tray.

All Dental responds that the "original unidentified mass" language does not appear anywhere in the originally filed patent application, and that it was new matter added during prosecution, arguably in violation of the statute. While acknowledging that the specification need not provide in haec verba support for the language added to the claim, All Dental argues that the originally filed disclosure did not allow one skilled in the art to immediately discern that an "original unidentified mass" limitation was part of the definition of the invention. All Dental also contends that the applicant did not properly act as his own lexicographer in defining the meaning of the phrase "original unidentified mass," as he failed to clearly define the phrase. All Dental further contends that if the phrase "original unidentified mass" is to have any meaning at all, then it must be that the material lacks a specific preformed shape and size, as the district court concluded. All Dental asserts that its accused tablets do not infringe the '498 patent because they clearly have a preformed shape, viz., a generally flat, oblong shape.

We agree with Advantage that there are no genuine issues of material fact concerning whether its patent claims comply with the written description requirement of section 112, first paragraph. While the contested language is not a model of clarity, it is also fairly simple and intelligible, capable of being understood in the context of the patent specification. It is thus reasonably clear what the invention is and that the patent specification conveys that meaning.

Section 112, first paragraph, states, inter alia: "The specification shall contain a written description of the invention." 35 U.S.C. § 112, P 1 (2000). In order to comply with the written description requirement, the specification "need not describe the claimed subject matter in exactly the same terms as used in the claims; it must simply indicate to persons skilled in the art that as of the [filing] date the applicant had invented what is now claimed." Eiselstein v. Frank, 52 F.3d 1035, 1038, 34 USPQ2d 1467, 1470 (Fed. Cir. 1995) (citing Vas-Cath, 935 F.2d at 1562, 19 USPQ2d at 1115, and In re Wertheim, 541 F.2d 257, 265, 191 USPQ 90, 98 (CCPA 1976)).

The application for the '498 patent as originally filed did not contain the phrase "original unidentified mass"; indeed, there is no mention of the starting material's shape or form anywhere in the patent specification. However, the failure of the specification to specifically mention a limitation that later appears in the claims is not a fatal one when one skilled in the art would recognize upon reading the specification that the new language reflects what the specification shows has been invented. See Eiselstein, 52 F.3d at 1039, 34 USPQ2d at 1470. Here, the invention involves heating a mass of thermoplastic material that lacks an identifiable form. That invention is described in the specification, albeit not in haec verba. It is also clear what the invention is not. It does not involve heating a thermoplastic mass having an identifiable form or shape. We therefore conclude that there are no genuine issues of material fact that the specification describes the claimed invention within the meaning of the statute. Thus, summary judgment of invalidity for failure to satisfy the written description requirement was erroneous and is therefore reversed.

- 4941 -
We also agree with Advantage that its claims comply with the definiteness requirement of section 112, second paragraph. That section states: "The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention." The primary purpose of the definiteness requirement is to ensure that the claims are written in such a way that they give notice to the public of the extent of the legal protection afforded by the patent, so that interested members of the public, e.g., competitors of the patent owner, can determine whether or not they infringe. Warner-Jenkinson, 520 U.S. at 28-29. That determination requires a construction of the claims according to the familiar canons of claim construction. Only after a thorough attempt to understand the meaning of a claim has failed to resolve material ambiguities can one conclude that the claim is invalid for indefiniteness. Foremost among the tools of claim construction is of course the claim language itself, but other portions of the intrinsic evidence are clearly relevant, including the patent specification and prosecution history. See Standard Oil Co. v. Am. Cyanamid Co., 774 F.2d 448, 452, 227 USPQ 293, 296 (Fed. Cir. 1985) ("The specification is, thus, the primary basis for construing the claims. . . . The prosecution history (or file wrapper) limits the interpretation of claims so as to exclude any interpretation that may have been disclaimed or disavowed during prosecution in order to obtain claim allowance."). The prosecution history can thus be relied upon to clarify the claim meaning and hence provide definiteness. Tex. Instruments Inc. v. Int'l Trade Comm'n, 871 F.2d 1054, 1063, 10 USPQ2d 1257, 1263-64 (Fed. Cir. 1989) ("The public is entitled to know the scope of the claims but must look to both the patent specification and the prosecution history, especially when there is doubt concerning the scope of the claims." (citing McGill Inc. v. John Zink Co., 736 F.2d 666, 221 USPQ 944 (Fed. Cir. 1984))).

In this case, the prosecution history aids in clarifying the meaning of the claim phrase "original unidentified mass." The patent applicant twice distinguished his invention over the prior art on the basis of that limitation. First, the applicant distinguished his invention over Tureaud's anatomically formed tray shape as not being an "original unidentified mass." Secondly, the applicant distinguished his invention over Ginsburg's preformed sheets of thermoplastic material as "teaching away from applying the thermosetting material in any specific form." Each of those statements made during prosecution disclaims a specific shape. Moreover, the second statement amounts to a characterization of the "original unidentified mass" limitation as not embracing "any specific form." Advantage's argument that the phrase "original unidentified mass" means any shape other than a complete dental tray gives effect to only the first prosecution statement while ignoring the second. Giving proper effect to both statements and the specification's clear indication of the nature of the invention, we conclude that the phrase means exactly what the district court said it means: "a mass that does not have a specific preformed size and shape." All Dental Prodx, 2001 U.S. Dist. LEXIS 25176, slip op. at 11. Where we differ from the district court is on whether the phrase as so construed is indefinite. The meaning of the phrase "original unidentified mass," arrived at after reviewing the specification and consulting the prosecution history, is indeed definite and clear. Thus, the district court construed the phrase correctly, yet erred in concluding that the phrase was indefinite.

4270

DISCUSSION

Analysis of patent infringement starts with “construction” of the claim, whereby the court establishes the scope and limits of the claim, interprets any technical or other terms whose meaning is at issue, and thereby defines the claim with greater precision than had the patentee. Although the construction of the claim is independent of the device charged with infringement, it is convenient for the court to concentrate on those aspects of the claim whose relation to the accused device is in dispute. On appeal the Federal Circuit is required to construe the claim de novo; thus we do so without deference to the rulings of the trial court. See generally Cybor Corp. v. FAS Technologies, Inc., 138 F.3d 1448, 46 USPQ2d 1169 (Fed. Cir. 1998) (en banc).

4271

B. The Term "Immediately"

As noted above, the district court construed "immediately" to require the activation of the blocking flange simultaneously with removal from the patient. The court decided that this term imposed a limitation upon claims where it appeared in the preamble, as well as upon two claims where it did not literally appear.
In this case, both the RE '885 patent's specification and prosecution history clearly indicate that the invention is focused on ensuring the protection of the healthcare worker, patient, and bystanders by safely covering the needle at once upon removal from the patient. The "Summary of the Invention" section of the RE '885 patent is particularly instructive:

The present invention addresses [the needlestick hazard] problem confronting the healthcare industry and is designed specifically to eliminate needlestick injuries of the type described in connection with blood collection. To this end, there is provided a new and improved system which...shields the blood-contaminated needle simultaneously with its removal from the donor...whereby the probability of an exposed contaminated point being in any injury-causing proximity to a medical worker is virtually nil....

RE '885 patent, col.2 ll.52-62 (emphasis added). The summary is of course not wholly dispositive. See Rambus Inc. v. Infineon Techs. AG, 318 F.3d 1081, 1094 (Fed. Cir. 2003) ("While clear language characterizing 'the present invention' may limit the ordinary meaning of claim terms, such language must be read in context of the entire specification and the prosecution history." (internal citations omitted)). There is nothing in the RE '885 patent specification, though, that speaks to the needle being rendered safe at any time other than the moment of removal from the patient. Furthermore, the prosecution history provides additional support for the district court's conclusion. During prosecution of the related '347 patent, the examiner rejected MBO's application in view of U.S. Patent No. 5,026,356, issued to Smith. In response, MBO distinguished its invention from and criticized the Smith patent:

Please note that in Smith...the needle 60 may be fully withdrawn from the patient's flesh by an inattentive or rushed operator in exactly the [unsafe] state, with the needle point and needle end portion fully exposed and hazardous for needlestick and contamination! It is required in Smith as a specific manipulative effort that the operator personally bodily move the [needle guard] forward...which may be overlooked in rushed or harried treatment conditions....

Reply Letter to Alexander, Examiner, In the Patent Application of Blecher et al., S.N. 07/972,013, at 8 (Nov. 15, 1993). The clear implication is that the MBO invention, in contrast to Smith, does provide assurance that the needle will be made instantly safe upon withdrawal from the patient. Prosecution arguments like this one which draw distinctions between the patented invention and the prior art are useful for determining whether the patentee intended to surrender territory, since they indicate in the inventor's own words what the invention is not. See Medtronic, Inc. v. Guidant Corp., 465 F.3d 1360, 1373 (Fed. Cir. 2006) ("A surrender can occur by argument as well as by amendment.").

The patentee here has clearly indicated via the specification and the prosecution history that the invention provides, as an essential feature, immediate needle safety upon removal from the patient. It is therefore appropriate to construe the claims so as to ensure that they, too, require that feature. The construction of the term "immediately" to mean "simultaneously with the needle's withdrawal from the patient" is correct. Where that term appears in a claim preamble, it is "necessary to give life, meaning, and vitality to the claim," and may be used as a limitation. Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1305 (Fed. Cir. 1999) (quotation marks omitted).

Reissue claims 32 and 33 do not contain the word "immediately," but the district court nonetheless used its construction of that term to limit the claims. We sympathize with the district court's choice, since we agree that safety at once upon removal from the patient is an essential element of the invention as described by MBO. However, we cannot endorse a construction analysis that does not identify "a textual reference in the actual language of the claim with which to associate a proffered claim construction." Johnson Worldwide Assocs., Inc. v. Zebo Corp., 175 F.3d 985, 990 (Fed. Cir. 1999); see also Renishaw PLC v. Marposs S.p.A., 158 F.3d 1243, 1248 (Fed. Cir. 1998) ("[I]t is manifest that a claim must explicitly recite a term in need of definition before a definition may enter the claim from the written description."); E.I. du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir. 1988) (finding it improper to impose "a limitation read into a claim from the specification wholly apart from any need to interpret what the patentee meant by particular words or phrases in the claim").

In this case, we are reviewing only certain disputed terms of the claim construction and lack the power to construe other terms not disputed by the parties. None of the disputed terms that are found in claims 32 or 33 can reasonably be construed to impose the simultaneous-safety requirement upon those claims. The district court's grafting of the "immediately" limitation into claims 32 and 33 is error. 2
1. "Undulating Contours"

Claim 1 reads in relevant part "said front portion of said side wall having inner and outer surfaces with undulating contours that define projections at said inner surface and corresponding indentations at said outer surface."

Plaintiffs urge the court to give undulating contours its ordinary meaning as defined by the dictionary definitions of undulating, meaning "to give a wave-like appearance," and contour meaning "curve." Webster's College Dictionary at 1407 (2nd Ed., 1997). Thus, they suggest that the term be construed to mean "a wavy, curve-like appearance." Eagle, on the other hand, maintains that the ordinary meaning of this term is inappropriate because the specification and the prosecution history demonstrates that Plaintiffs acted as their own lexicographer with regard to this term. Eagle relies on Texas Digital in an effort to persuade the court that undulating contours should be construed to mean "discontinuous indentations in the outer surface of the column protector." In support, Eagle relies on the written description of the '781 patent which states:

```
Each semi-cylindrical component 14 and 16 has a plurality of discontinuous indentations, generally referenced by the number 50... Each discontinuous indentation 50 has an aperture mouth 60, an aperture base 62 having a variable width, and a plurality of aperture walls 64 extending from the aperture base 62 to the aperture mouth 60.
```

('781 patent, col. 4 at lines 11-18). Eagle also points to the amended description of Plaintiffs' recently issued '640 patent, which provides:

```
Referring now to Figure 2A which is a cross-section of Figure 2 in the plane indicated, each semi-cylindrical component 14 and 16 has a plurality of discontinuous indentations, generally referenced by the number 50;... The discontinuous indentations may also be described as undulating contours, which define projections at said inner surface and corresponding indentations at said outer surface of the rounded exterior wall face 52.
```

('640 patent, col. 4 at lines 13-21).

Eagle's argument is not well-taken. As discussed above, the Texas Digital court emphasized that the terms used in a claim bear a "heavy presumption that they mean what they say and have the ordinary meaning that would be attributed to them by persons skilled in the relevant art." 308 F.3d at 1202. This presumption may be overcome only where the patentee has clearly set forth an explicit definition of the term different from its ordinary meaning. Id. at 1204. In this case, the court does not conclude that Plaintiffs clearly set forth an explicit definition of undulating contours different from its ordinary meaning. Although the '781 written description uses the term discontinuous indentations to describe the invention, this language is not a clear and explicit limitation of the term. This conclusion is reinforced by the amended description of the '640 patent which states that the "discontinuous indentations may also be described as undulating contours." (emphasis added). This equivocal language is consistent with the ordinary meaning of undulating contours and does not limit the term.

Nevertheless, Eagle points out that during the prosecution of the '640 patent, Plaintiffs specifically distinguished their invention from the prior art by arguing that their patent teaches against the use of corrugations:

```
The undersigned respectfully states that no references teach contours in conjunction with an air chamber. More specifically, the subject patent application states on page 8, lines 16-17 that discontinuous indentations are not required from low impact collisions. This teaches against the use of corrugations taught in Hanson et al. (which also does not teach an air chamber used in conjunction with an air chamber [sic]).
```

('640 patent, Preliminary Amendment at p. 9). The Federal Circuit has made clear that where the inventor disclaims certain
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

claim coverage to distinguish a prior art reference, "the prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution." Southwall Tech, Inc., 54 F.3d at 1576. Because Plaintiffs expressly disclaimed corrugations during the '640 prosecution history, undulating contours cannot be construed to include corrugations. Thus, the court concludes that undulating contours must be construed to mean a wavy curve-like appearance, but not corrugations. Based on this construction, the court concludes that no genuine issue of material fact exists as to whether the accused device literally infringes this claim. Eagle contends that its device is molded to have a series of horizontal corrugations, which does not satisfy the construction of undulating contours. In response, Plaintiffs argue that Eagle's president and its patent attorney have testified that the accused product has a "wavy profile" and has indentations. Even assuming this to be true, Plaintiffs have never disputed that the cushions of Eagle's device have corrugations. Because undulating contours as used in claim 1 does not encompass corrugations, the accused device does not literally infringe upon this claim.

4273

1. Construction of "undulating pattern"

It is undisputed that Medtronic's stents are made up exclusively of U-shaped members, and do not comprise Y-shaped or W-shaped members. (D.I. 654 at 15 & ex. C) The court's final claim construction did not require the presence of Y-shaped or W-shaped members; consequently, Medtronic was found to infringe all asserted claims of the Lau patents at trial. Medtronic argues that JMOL of non-infringement is appropriate under the proper construction of "undulating pattern" which, in its view, requires a combination of U-, W-, and Y-shaped members. (Id. at 3-15) In the alternative, Medtronic argues that a new trial is warranted because the jury verdict was based on an improper claim construction (D.I. 679 at 2-3), and/or because the jury was tainted by the court's "announcing the 'loser' of the claim construction dispute" by incorporating ACS's construction into the jury's instructions following the close of evidence (D.I. 653 at 33). 5

5 Medtronic asserts that this procedure "implicitly signaled to the jury that the [c]ourt had decided that ACS's witnesses were 'right' about claim construction (as well, perhaps, as other issues) while Medtronic's were 'wrong'", therefore effectively "telegraph[ing] to the jury that the key elements of Medtronic's infringement defense were either incorrect or irrelevant." (D.I. 653 at 33)

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

5 Medtronic asserts that this procedure "implicitly signaled to the jury that the [c]ourt had decided that ACS's witnesses were 'right' about claim construction (as well, perhaps, as other issues) while Medtronic's were 'wrong'", therefore effectively "telegraph[ing] to the jury that the key elements of Medtronic's infringement defense were either incorrect or irrelevant." (D.I. 653 at 33)

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In its jury charge, the court instructed the jury that the terms "undulating pattern" and "undulating portion" mean "a wave-like pattern." (D.I. 639 at 1883:22-23) Medtronic asserts that this construction was improper in view of the Federal Circuit's en banc decision in Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005) (hereinafter, "Phillips"). 6 (D.I. 678 at 3) Specifically, Medtronic emphasizes the court's statement that it "felt it was more important . . . under the latest iteration of what the Federal Circuit looks at to make the claim language more consistent rather than trying to make the specification, [and] prosecution history consistent with the claim language." (D.I. 637 at 1711:8-22) Medtronic argues that the court did not apply the proper weight to the specification in its analysis, violating the pronouncement in Phillips that the specification is "usually . . . dispositive; it is the single best guide to the meaning of a disputed term." (D.I. 654 at 3, citing Phillips, 415 F.3d at 1315) In Medtronic's view, the specification and the file history indicate that all claims require W-shaped and/or Y-shaped members because it is fundamental to the invention that the cylindrical elements "must be spaced apart." 7 (Id. at 14)

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

6 The court issued its final Markman order on February 16, 2005 (D.I. 615), and incorporated its claim constructions into its jury charge on February 18, 2005 (D.I. 639 at 1883:22-23). Phillips issued on July 12, 2005, after Medtronic had renewed its motion for JMOL (and moved for a new trial). (D.I. 654) Medtronic addressed Phillips in its reply brief (D.I. 678), and ACS addressed Phillips in its combined surreply (D.I. 682, tab 1).

7 According to Medtronic, if the court were to construe "cylindrical elements" as "wave-like," it was error not to construe
other claim elements (such as "interconnected" and "connected") to require spacing apart of the cylindrical elements. (D.I. 654 at 14) Because the verdict was based on a construction which is inconsistent with the description of the invention, Medtronic argues, it was improper. (Id. at 14-15)

--- End Footnotes ---

a. The Lau patents' common specification

The Lau specification consistently uses the term "undulating pattern" in a manner consistent with its ordinary meaning, i.e., wavy or wavelike. Medtronic has not pointed to any portion in the specification which purports to be a statement of manifest exclusion or restriction of the term "undulating," such as to require a combination of U-, Y-, and/or W-shaped members. See Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1324 (Fed. Cir. 2002) ("[C]laim terms take on their ordinary and accustomed meanings unless the patentee demonstrated an intent to deviate from the ordinary and accustomed meaning of a claim term by redefining the term or by characterizing the invention in the intrinsic record using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope."); see also Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir. 2004) ("Absent a clear disclaimer of particular subject matter, the fact that the inventor may have anticipated that the invention would be used in a particular way does not mean that the scope of the invention is limited to that context." (citations omitted)). Medtronic instead argues that the specification requires that the cylindrical elements "must be spaced apart," thus necessitating the presence of W-shaped and/or Y-shaped members which provide the required spacing. (D.I. 654 at 4-5, 14) The specification provides:

The resulting stent structure is a series of radially expandable cylindrical elements which are spaced longitudinally close enough so that small dissections in the wall of a body lumen may be pressed back into position against the lumenal wall, but not so close as to compromise the longitudinal flexibilities of the stent.

(col. 2, II. 1-6 (emphases added)) Though this passage makes clear that some spacing is required to ensure longitudinal flexibility, there is nothing in this portion of the specification which equivocates "undulating" with a combination of U-, Y-, and W-shaped members.

--- Footnotes ---

8 For example, the specification states that

[the] radial expansion of the expandable cylinder deforms the undulating pattern thereof similar to changes in a waveform which result from decreasing the waveform's amplitude and the frequency. Preferably, the undulating patterns of the individual cylindrical elements are in phase with each other . . . .

('154 patent col. 2, II. 35-41) Unless otherwise specified, all pinpoint citations to the specification refer to the '154 patent.

--- End Footnotes ---

Medtronic further argues that the figures of the Lau patents, as well as the specification's description of the figures, support its construction. Medtronic points to figure 5, which depicts an undulating pattern 9 with U-, Y-, and W-shaped members, with figure 11, which depicts a pattern with both U- and Y-shaped members and was described as an "alternate undulating pattern." (D.I. 654 at 5-6) According to Medtronic, there would have been no need to distinguish between the two patterns if an "undulating pattern" contains only U-shaped members. (Id. at 6-7) Medtronic, however, has not substantiated its argument that the figures do not simply depict a preferred embodiment by pointing to any language in the specification that purports to limit the ordinary meaning of "undulating pattern" to require the combination of U-, Y- and/or W-shaped members present in figures 5 and 11. See CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002) (the presumption of ordinary meaning cannot be rebutted "simply by pointing to the preferred embodiment or other structures or steps disclosed in the specification").

--- Footnotes ---

9 Medtronic emphasizes the fact that the description of figure 5 includes the phrase "the undulating pattern of the stent."
Medtronic's argument that the term "the" signifies that ACS intended to confer the "undulating pattern" with Y-shaped members is misplaced. (D.I. 654 at 6) The complete statement from the Brief Description of the Drawings concerning figure 5 states that "Fig. 5 . . . illustrates the undulating pattern of the stent shown in Fig. 4," which in turn "is a prospective view of a stent embodying features of the invention." (col. 3 II. 61-67 (emphasis added)) This statement does not preclude other stents which also embody the claimed features.

Medtronic argues that the phrase "[i]n keeping with the invention," as used in the specification's description of figures 4 and 12-14 (in which "[s]erpentine pattern 30 is made up of a plurality of U-shaped members 31, W-shaped members 32 and Y-shaped members 33"), coupled with the specification's interchangeable use of the terms "serpentine" and "undulating," confirms that the "undulating" patterns (and thus "cylindrical elements") must contain a combination of at least two of the three letter-shaped members and not merely U-shaped members. (D.I. 654 at 5-6) As an initial matter, the specification states that a "serpentine" waveform is only one example of an "undulating pattern," without exclusion. 10 The court declines to find that "in keeping with the invention" is a term of manifest exclusion or restriction, as would be required to deviate from the ordinary and accustomed meanings of the claim terms. See Teleflex, 299 F.3d at 1324.

The court notes that this is not a case where the specification describes only one way in which the cylindrical elements can be connected. The specification does not preclude the use of non-serpentine "undulating patterns" -- for example, a square or sawtooth wave pattern -- so long as the stent remains expandable and longitudinally flexible. The specification does not absolutely require that the interconnecting elements join the cylindrical elements at the peaks or valleys of the waveform, such as would be required where Y-shaped members are present. 11 (col. 3, II. 6-9 ("[p]referably, all of the interconnecting elements of a stent are joined at either the peaks or the valleys of the undulating structure of the cylindrical elements" (emphasis added)) The figures are not inconsistent with the ordinary meaning of "undulating pattern," and the language of the specification falls short of definitively limiting the scope of the claims to the particular "undulating patterns" depicted in figures 5 and 11.

As the court has previously noted, the language of the claims themselves further supports the court's construction. Claim 12 of the '168 patent separately describes "cylindrical elements having an undulating pattern of peaks and valleys," and a "weld connection" for attaching the peaks. Similarly, claims 1 and 5 of the '167 patent, as well as claims 12 and 15 of the '133 patent, first describe the cylindrical elements (having an undulating pattern) or "undulating portions" and, thereafter, state that each of these elements is "interconnected" or "connected" to an adjacent cylindrically shaped element. In view of the use of these terms in the claims, the court reasoned that...
[i]t is inconsistent to define "undulating patterns" and "undulating portions" to essentially require Y-shaped "connecting elements," (e.g., a structural feature identified at trial as the Y-shaped members), when the claims that require "undulating portions" (the claims of the '167, '168, and '133 patents) do not require such a structure. Moreover, to define "cylindrical elements" as having W-shaped and/or Y-shaped members, again, essentially requires "cylindrical elements" to have "connecting elements" when the claim either already requires the presence of "connecting elements" (e.g., claims 1 and 12 of the '154 patent) or when the claim does not require the presence of "connecting elements" ([the aforementioned claims of the '167, 168 and '133 patents]). In other words, Medtronic's proposed construction (and the construction earlier adopted by the court) serves to either make the "connecting elements" limitation surplusage or impermissibly adds such a limitation. 12

(D.I. 615) Phillips itself condones this inference. 415 F.3d at 1314 (recognizing that "[o]ther claims of the patent in question, both asserted and unasserted, can also be valuable sources of enlightenment" as to the meaning of claim terms) (citing Vitriones Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996)).

- - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

12 Further, dependant claim 5 of the '154 patent specifically requires the plurality of cylindrical elements of claim 1, additionally requiring a "plurality of peaks and valleys having a serpentine pattern," which "include a plurality of U-shaped members, a plurality of Y-shaped members, and a plurality of W-shaped members, whereby a portion of said Y-shaped members forms said plurality of said connecting elements." The incorporation of U-, Y-, and W-shaped members into the dependant claim, as well as the statement that a portion of the Y-shaped members form the connecting elements in this embodiment, gives rise to some presumption that the independent claims do not require U-, Y-, and W-shaped members, and that the required connecting element is not necessarily part of a Y-shaped member. See Phillips, 415 F.3d at 1315 ("the presence of a dependant claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim") (citing Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir. 2004)).

c. Prosecution history

There is evidence that both the examiner of the '790 application and ACS understood that Y-shaped members include a component which is a "connector element." Originally-filed dependant claims 5-7 required that the cylindrical elements included a plurality of Y- and W-shaped members, "some of said U-shaped, Y-shaped, and W-shaped members being interconnected." 13 (AX-11 at 20) The examiner rejected the claims as indefinite under 35 U.S.C. § 112, stating that "it is not apparent what applicant considers the connecting elements if the cylindrical elements included such [U-, Y-, and W-]shaped members because it appears that the Y-, and W-shaped members are nothing more than part of the normal serpentine pattern and further including the connecting element attached thereto (particularly, the Y-shaped members)." (AX-11 at 44-45 (emphasis added)) In response, ACS amended claim 5 to require a plurality of U-, Y-, and W-shaped members, "whereby a portion of said Y-shaped members forms said plurality of said connecting elements." (AX-11 at 118) ACS stated that

[c]laim 5 [was] amended to define the connecting elements as a portion of the Y-shaped members, as suggested by the [e]xaminer. As is clear, the tail portion of the Y-shaped members is the connecting element between the cylindrical elements. (Id. at 119)

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

13 Originally-filed claim 5 read:

5. The stent of claim 4, wherein said plurality of peaks and valleys include a plurality of Y-shaped members, and a plurality of W-shaped members, some of said U-shaped, Y-shaped, and W-shaped members being interconnected. (AX-11 at 20) Originally-filed claim 4 depended on claim 1, and further required that the cylindrical elements included "a plurality of peaks and valleys having a serpentine pattern." (AX-11 at 19) Claims 6 and 7 depended further from claim 5.

- 4948 -
The court declines to find that ACS's statement made in connection with dependant claim 5 was a clear indication of an intent to limit the "cylindrical elements" of all claims to a combination of U-, Y-, and/or W-shaped members. See Cannon Rubber Ltd. v. First Years, Inc., 163 Fed. Appx 870, 876-77 (Fed. Cir. 2005) (non-precedential) (substitution of operational language ("mounting a diaphragm") with different, but not narrower structural language (a "diaphragm disposed in the body"); in response to an indefiniteness rejection did not evidence a clear disavowal of subject matter that was not completely in the body). 14 This exchange demonstrates that the examiner and the applicant understood that a portion of the Y-shaped members of claims 5-7 is part of the "normal serpentine pattern" of the cylindrical element, and a portion (the tail portion) of the Y-shaped members constitutes the connecting element. Since it is not feasible to divorce the Y-shaped member from its tail portion, it follows that the incorporation of a requirement that the "undulating pattern" of the "cylindrical elements" of the independent claims contain a plurality of Y- and/or W-shaped members (in addition to U-shaped members) would necessarily import a "connecting element" limitation into those claims, rendering other limitations to connecting elements redundant or superfluous.

14 Medtronic points to an additional statement made by ACS during prosecution in response to an indefiniteness rejection in support for its argument, which fails for the same reasons. A rejection was made to original dependant claim 3 of the '154 application which related to the "projecting edges" feature of the invention. (AX-11 at 19) Specifically, the examiner stated that claim 3 was objectionable because "no specific distances have been disclosed for the outwardly projecting edges, nor any minimum distance which would enable the edges to embed in the vascular wall." (Id. at 44) In response, ACS amended claim 3 to state that the outwardly projecting edges extend "radially outwardly," and pointed to a particular paragraph in the specification, which it believed "clearly explained the dimensions of the stent and the thickness of the various members making up the serpentine pattern 30 [and] will dictate which of the U-shaped, W-shaped, and Y-shaped members that tip radially outwardly to form a projecting edge 34." (Id. at 119) Contrary to Medtronic's assertion, there is nothing in ACS's statement which purports to restrict that term, or even the term "cylindrical elements," so as to require a combination of U-, Y-, and/or W-shaped members.

d. Conclusion

Upon review of the issue, the court does not find its construction inconsistent with Phillips. The court finds the language of the specification inadequate to limit the term "undulating pattern" of the cylindrical elements beyond its ordinary meaning. ACS did not attempt to distinguish any prior art based on U-, Y-, and/or W-shaped members, nor did the examiner mention U-, Y-, and/or W-shaped members in connection with any prior art rejection. Further, importing a Y-shaped member restriction into "undulating pattern" necessarily incorporates a connecting element, rendering segregate connecting element limitations superfluous. For all of these reasons, the court finds no error in its construction of "undulating pattern" as "a wave-like pattern," consistent with the ordinary meaning of that term. Medtronic is not entitled to JMOL of non-infringement based upon an improper claim construction.

Additionally, Medtronic argues that the court's Markman decision, made after the presentation of evidence on claim construction, was improper. (D.I. 691) Medtronic cites Cytologix Corporation v. Ventana Medical Systems, Inc., 424 F.3d 1168 (Fed. Cir. 2005), in which the Federal Circuit stated that "[t]he risk of confusing the jury is high when experts opine on claim construction." 424 F.3d at 1172. Medtronic's reliance on Cytologix is misplaced, however, as that case confirms that Medtronic's objection should have been advanced prior to trial. Id. at 1173 ("in this case there is no ground for reversal since there was no objection to the expert testimony as to claim construction . . ."). The Cytologix Court noted that it appeared, in that case, that the presentation of conflicting expert views on claim construction "created confusion," which was evidenced by a verdict of infringement "that was not supported by substantial evidence." Id. at 1172-73. The opposite is the case here and, therefore, any error was harmless error in this case. 15 Medtronic is not entitled to a new trial on this ground. See Lucent Techs., Inc. v. Newbridge Networks Corp., 168 F. Supp. 2d 181, 253 (D. Del. 2001) ("The timing of the [c]ourt's claim construction decision [at the close of evidence following testimony from both parties' expert witnesses] did not
conflict with Federal Circuit case law, and in the court's view, did not unduly prejudice either party so as to warrant the granting of a new trial").

15 Additionally, the court did not require the parties to present expert testimony on claim construction. It merely delayed its construction of "undulating" until the close of evidence, as expressly permitted in Cytologix itself, and stated that the parties could "present evidence as they deem appropriate in support of their respective interpretations." (D.I. 587) See Cytologix, 424 F.3d at 1172 ("the district court has considerable latitude in determining when to resolve issues of claim construction") (citation omitted); see also Sofamor Danek Group, Inc. v. Depuy-Motech, Inc., 74 F.3d 1216, 1221 (Fed. Cir. 1996) ("Markman does not obligate the trial judge to conclusively interpret claims at an early stage in a case.").

10. "Undulating pattern," and "undulating portion." Consistent with its ordinary meaning, 17 the patents at issue and their prosecution history, 18 the court construes these phrases to mean "a wavelike pattern that includes any combination of U-shaped, W-shaped or Y-shaped members."

1. Meaning of the Term "Uneven"

A key issue for the resolution of this motion is the meaning of the term "uneven" in the context of claim 1. The term "uneven" is generally understood to mean not smooth. 4 The meaning of "uneven" within the context of claim 1, however, is even more specific. The claim references an "uneven and immobile surface . . . wherein the uneven and immobile surface allows for influx of air into the suction space." (R. 17, Pls.' Mem., Ex. 1, Pando Patent, col. 6, Ins. 5-8.) Based on the plain language of the claim, we construe the meaning of "uneven" in the claim's description of a surface as one that is "sufficiently non-smooth as to allow for the influx of air around a suction cup."

4 This ordinary meaning is also found in Webster's Dictionary, which defines "uneven" as not level, smooth, or flat; rough; irregular . . . ." (R. 15, Defs.' Exs., Ex. F, Webster's New World Dictionary Excerpt.)

In reaching this preliminary construction, we have also relied on the specification and prosecution history. The patent's specification states that "contemplated surfaces need not be smooth, but may alternatively be uneven, or have cracks or crevices." (Id., col. 2, Ins. 55-57.) It also states that the invention is meant "to be affixed to a stationary suction surface, in which an undesired influx of air can be automatically removed." (Id., col. 2, Ins. 14-16.) This reinforces our construction
that the surface must be sufficiently non-smooth as to allow for the introduction of air when a suction cup is applied. The prosecution history also supports our construction. In differentiating his claim from the Maznik patent, U.S. 5,630,517, Pando remarked that:

Maznik further teaches that his ' . . . apparatus can be . . . mounted to any smooth surface . . .'. . . however, [it] fails to teach an uneven and immobile surface. On the contrary, a smooth surface is entirely inconsistent with an uneven surface as expressly required in amended claim 1.

(R. 15, Defs.' Exs., Ex. E, Pros. Hist. at 68.) He later reiterated the distinction between "uneven" and "smooth" in another defense against the Maznik patent as prior art. (Id. at 83.)

Although we have derived our construction of the term "uneven" from our review of the intrinsic evidence in this case, we also note that support for our construction can be found in the extrinsic expert testimony that both parties offered in this case. Techtronic's expert, Albert V. Karvelis, defines the "uneven" limitation in the suction cup reference as a "suction cup that acts together with a fixed surface which is not smooth enough to prevent leakage of air, to form a vacuum chamber into which the air leaks." (R. 17, Pls.' Mem., Ex. 2, Karvelis Decl. P 28 (emphasis added).) Chervon's expert, Allan S. Myerson, gives a surprisingly similar explanation, stating that "the term 'uneven' as used in the [Pando] patent, should be construed as meaning non-smooth." (R. 15, Defs.' Exs., Ex. A, Myerson Decl. P 21.) He also explained that "an uneven surface is one that permits air to flow around the suction cup and to enter the suction space." (Id. P 25.) Dr. Myerson even noted his agreement with Dr. Karvelis on this point. (Id. P 26.)

Chervon has attempted to limit the scope of this term, however, by arguing that the term "uneven" as used in claim 1 should be limited to the following surfaces: a crude concrete wall, block or brick wall, unfinished wood, and tile wall. (R. 21, Defs.' Resp. at 10.) No such limitation is found in the claim language itself. The patent specification rejects Chervon's proposed limitation, stating that:

Contemplated surfaces need not be smooth, but may alternatively be uneven, or have cracks or crevices. For example, contemplated surfaces include crude concrete walls, block or brick walls, unfinished wood, and tile walls having spaces partially filled with grout.

(R. 17, Pls.' Mem., Ex. 1, Pando Patent, col. 2, Ins. 55-59.) The plain language of this text indicates that the specified surfaces constitute a non-exhaustive list of contemplated examples rather than a limitation of the specific surface types with which the self-mounting device can be used.

Chervon's only support for its proposed limitation is the patent examiner's statement in the prosecution history that Pando "defines an uneven immobile surface as a crude concrete wall, block or brick walls, unfinished wood, and tile wall." (R. 15, Defs. Exs., Ex. E, Pros. Hist. at 79.) Chervon fails to note, however, that in response to this statement, Pando specified that those surfaces were merely examples, stating that "the present specification explicitly defines a static surface as an 'uneven,' . . . 'immobile . . . object, for example, a wall, . . . crude concrete walls, block or brick walls, . . . and tile walls . . .'." (Id. at 83-84 (emphasis added).) Pando's characterization, and not the examiner's prior statement, is consistent with the specification language. We find that the Pando patent's specification, coupled with Pando's statements in the prosecution history, do not support Chervon's proposed limitation of the term "uneven" in claim 1 to those surfaces explicitly named in the patent specification.

"Rendering uniform"
Cytyc's proposed construction
(no construction required)
Xoft's proposed construction
Making the same, i.e., causing to have the same value or characteristic at all points.

"Means . . . for rendering uniform the radial absorbed dose profile of the emissions"
Cytyc's proposed construction
Xoft's proposed construction
Function: Modifying the ratio of the absorbed dose at a depth of interest to the absorbed dose at the surface of the tissue.

Structure: A radiation absorbing or attenuating material, e.g., air, x-ray contrast fluid, contrast media used in angiography, water, a gas, or barium sulfate.

Xoft's argument is that "uniform" must be taken literally, and the apparatus must produce radiation that does not decrease in strength with increasing distance from the source. The parties do not dispute that Xoft's construction would require a physical impossibility; the strength of radiation necessarily decreases with distance from its source. Xoft, however, seeks to interpret "uniform" in a vacuum. The meaning of a particular word in a claim must be interpreted in light of the rest of the patent.

While the patent could have been drafted with more clarity, it is readily apparent that the patentee did not contemplate absolute uniformity. Figure 4 of the patent (reproduced below) is a comparison between the distance versus radiation dose plots of two scenarios. Line 40 shows the radiation dose that would result if chamber 36 were filled with a radioactive fluid. '813 patent, col. 3, ll. 20-24. Line 42 shows the radiation dose that would result if, following the teachings of the patent, the same radioactive fluid were contained only in chamber 32. '813 patent, col. 3, ll. 24-28. As explained in the patent, "Comparing the plots 40 and 42, by providing the concentric arrangement depicted, the absorbed dose profile in the space between the 2 cm site and the wall of the outer balloon is maintained much more uniform, thus preventing over-treatment of body tissue at or close to the outer wall . . . of the instrument." '813 patent, col. 3, ll. 28-33.

The patentee obviously did not expect absolute uniformity of radiation dosing. To interpret "uniform" in the manner urged by Xoft would go against the clear intent of the patentee. In Bausch & Lomb, Inc. v. Barnes-Hind/Hydrocurve, Inc., 796 F.2d 443 (Fed. Cir. 1986), the defendant made a similar argument regarding the patentee's use of the term "smooth" with respect to the edges of contact lenses. The Federal Circuit looked to the intrinsic evidence and found that "smooth" did not mean absolutely ridge free but rather that it meant "smooth enough to serve the inventor's purposes, i.e., not to inflame or irritate the eyelid of the wearer or be perceived by him at all when in place." Id. at 450. In this case, the inventor's purpose was to deliver radiation more uniformly than had previously been done, "thus preventing over-treatment of body tissue at or close to the outer wall . . . of the instrument." '813 patent, col. 3, ll. 28-32. The court will therefore define "rendering uniform" to mean to make the absorbed dose of radiation more uniform in order to prevent over-treatment of body tissue at or close to the outer wall of the instrument.

Since limitation language "means . . . for rendering uniform the radial absorbed dose profile of the emissions" is in means-plus-function format, the function must be construed and the corresponding structure or its equivalent identified in the specification. BBA Nonwovens Simpsonville, Inc. v. Superior Nonwovens, L.C.C., 303 F.3d 1332, 1343 (Fed. Cir. 2002). As discussed, Xoft's definition of the function requires absolute uniformity which is not possible and which is not what the patent requires or the inventor intended. Cytyc's proposed definition construes the function as "modifying the ratio of the absorbed dose at a depth of interest in the target tissue to the absorbed dose at the surface tissue." Although this appears to be a function of the invention, Cytyc's definition is too broad because it encompasses absorbed doses at the surface tissue that are not substantially uniform to absorbed doses at the target tissue. In other words, Cytyc's definition would not only encompass the radiation dose profile of line 42 above, but would also encompass the radiation dose profile of line 40.
Furthermore, all radiation dose profiles between line 40 and line 42 that result in over-treatment of the surface tissue would also be included under Cytyc's definition. A more accurate construction of the function would require the absorbed dose at the target tissue and the absorbed dose at the surface tissue to be more uniform to prevent over-treatment of the surface tissue. Thus, the court defines the function of the "means . . . for rendering uniform the radial absorbed dose profile of the emissions" as making the absorbed dose of radiation more uniform to prevent over-treatment of body tissue at or close to the outer wall of the instrument.

Cytyc also identifies a radiation-absorbing or -attenuating material as the corresponding structure. At the claim construction hearing, Xoft argued that the uniformity of the radiation dose curve is solely affected by distance from the radiation source; the parties agree that this is true. See Tr. at 60-61. Although the composition of the material is not critical to the function, the radiation-absorbing or -attenuating material provides the distance necessary for achieving the uniformity in radiation dose curve. Thus, the court construes the language consistently with Cytyc's position.

**Claim Language**

"rendering uniform"

**Court's Construction**

"Means . . . for rendering uniform the radial absorbed dose profile of the emissions"

Function: Making the absorbed dose of radiation more uniform to prevent over-treatment of body tissue at or close to the outer wall of the instrument.

Structure: A radiation absorbing or attenuating material, e.g., air, x-ray contrast fluid, contrast media used in angiography, water, a gas, or barium sulfate or their equivalents.

**4277**

(12) "Uniform cellular structure." The flexible connected cells of claim 6 have the same structure.

**4278**

In this case, we have already completed the first step of the analysis by construing three elements of claim 4 of the '514 patent:

"Material for finishing" This claim element means a material that makes more durable the underlying surface of the floor, and is applied for that purpose.

"Elongated sheet" This claim element does not require the presence of material that covers the entire floor but instead can encompass material that covers less than the entire floor; nor does this claim element exclude a "panel" of material otherwise meeting the limitations of the claims.

"Uniform flexible film" This claim element means that the material must be of a uniform thickness, and excludes material in which there are any variations in thickness.

Markman Ruling and Order (Feb. 9, 1998).
The district court interpreted the limitation "uniform flexible film" to mean that, "the material must be of a uniform thickness, and excludes material in which there are any variations in thickness." Middleton, 1998 U.S. Dist. LEXIS 19428, No. 96-C6781, slip op. at 1 (Markman Ruling and Order). Ultimately, the court's infringement analysis did not turn on this limitation because the court found that 3M's FloorMinders product was not a "material for finishing," either literally or under the doctrine of equivalents.

We understand the district court's interpretation to mean that the film must have the same thickness throughout, except that normal manufacturing tolerances are allowed. Thus, while the film cannot have a thickness of 1 mil at one location and 25 mil at another, it may have variations in thickness due solely to the practical realities of the film manufacturing process. We note that at oral argument, the parties did not appear to dispute this reading of the district court's claim construction.

This appeal presents the question of the proper meaning of "uniform flexible film." As the district court correctly determined, this court did not need to and did not actually construe that limitation when reversing the grant of summary judgment in the previous appeal. Rather, this court stated its understanding of the district court's own prior construction. On remand, the district court erred by treating this court's statement as a definitive claim construction. The trial court thus construed "uniform" to mean the "same thickness throughout, except that normal manufacturing tolerances are allowed."

The term "uniform flexible film" does not appear to convey any special technical meanings. Texas Digital Sys., Inc. v. Telegenix Inc., 308 F.3d 1193, __ (Fed. Cir. 2002) (stating that there is a "heavy presumption" that claim terms mean what they say and have the ordinary meaning that would be attributed to those words by persons skilled in the relevant art (internal citations omitted)). The accustomed meaning of "uniform" is having always the same form. Webster's Ninth New Collegiate Dictionary 1290 (1985). The specification defines "flexible" as "bendability of the sheet but [] not . . . stretchability." '514 patent, col. 2, l. 67 to col. 3, l. 1. Furthermore, "film" clearly refers to the clear plastic material referenced often in the patent disclosure.

As usual, the most important indicator of the meaning of "uniform" is its usage and context within the claim itself. Thermalloy, Inc. v. Aavid Eng'g, Inc., 121 F.3d 691, 693 (Fed. Cir. 1997) (stating that "throughout the interpretation process, the focus remains on the meaning of the claim language."). The claim recites a "uniform flexible film." This term, in context, describes floor coverings. Specifically, the preamble of claim 4 recites an "improved material for finishing the top surface of the floor." '514 patent, col. 6, ll. 66-68. As noted, uniformity means that a floor covering has always the same form. Floor coverings may have the same smooth form, as in a bowling or basketball surface. Floor coverings may also have the same woven form, as in a carpeted surface. Floor coverings may also have the same textured form to prevent slippage in a setting like Grand Central Station where a wet surface may receive a lot of foot traffic. This phrase in the claim does not place any particular limitations on the concept of uniformity. Rather the claim suggests that the form of the film - whether smooth or textured - must remain the same throughout the floor surface. In this context, uniformity could apply to many different types of floor surface as long as they exhibit the same form across the relevant surface.

The written description of the patent does not suggest that the inventor provided a special meaning or definition of "uniform." Kegel Co. v. AMF Bowling, Inc., 127 F.3d 1420, 1427 (Fed. Cir. 1997). Instead the written description of the '514 patent explains that achieving a "uniform finish" of conventional varnish or urethane is difficult. '514 patent, col. 1, ll. 27-29, 37-39. Furthermore, it explains the object of the present invention is to provide a material of "uniform thickness" that can be "quickly and easily applied." Id., col. 1, ll. 66-68. Other than ease of application, the specification imparts no further insight into the meaning of "uniform." Id., col. 4, ll. 4-5. Thus, the written description neither suggests an exceptional meaning for uniform nor supports departing from the term's ordinary meaning.

This court also considers the prosecution history of the '514 patent to determine whether the applicant clearly and

The prosecution history does not show this clear and unambiguous disclaimer. During prosecution of the application that led to the '152 patent, one of the parent applications of the '514 patent, the examiner rejected the claims as obvious over Milne. The parent application of the '514 patent at that time claimed only bowling alleys and bowling alley surfaces. The claims of the parent application (later the '428 patent) included a uniform flexible film for finishing a smooth wooden surface of a bowling alley. Milne disclosed a method for adhering two types of decorative surface panels to an athletic floor: a one-eighth inch thick, high compression, stiff film; and a film sufficiently flexible to be rolled for delivery. To avoid this prior art involving the uniformity necessary for a bowling surface, Middleton amended claim 1 from "a [dry] flexible film" to "a uniform flexible film . . . covering the wood top surface of the bowling lane." In the accompanying remarks, Middleton's attorney explained:

The preformed film can be provided in a thickness that could be obtained only by applying multiple coats of a liquid varnish, and with a uniformity of thickness that is unobtainable with hand-applied liquid finishes. (Emphasis added.)

Middleton further stated:

The flexible plastic film of claim 1 essentially duplicates the characteristics of a conventional liquid varnish type of finishing while requiring less skill and time to apply and to remove. By permitting preselection of the thickness of the film and assuring uniformity of the thickness, the finishing material disclosed and claimed in the present application can provide much improved wear over conventional liquid finishes without affecting the bowling performance of the lane. (Emphasis added.)

Thus, in the context of a limited claim to bowling alley surfaces, Middleton asserted to the United States Patent & Trademark Office that the claimed flexible film avoids the thickness irregularities that result from the application of liquid varnishes. This prosecution history applies to the claims that cover smooth sporting surfaces, like bowling alleys.

The inventor later filed a continuation that broadened the invention. The broader continuation applications claimed floor surfaces in general, not just smooth sporting surfaces. Therefore, the prosecution history in the context of varnishes for smooth bowling alleys does not limit the broader claims to other flooring surfaces. Throughout, the prosecution history is consistent with the ordinary meaning of "uniform," namely that the term means having the same form. As used in the patent, the term has the broad meaning that includes both uniformity of thickness as well as uniform in irregularity; by overcoming Milne, the inventor did not limit the term to uniformity of thickness. Uniformity of thickness is within the breadth of the term "uniform" and that aspect of the term's meaning was sufficient to avoid Milne. The district court erred by limiting the scope of "uniform" to thickness uniformity. In context, as this court has explained above, the term is entitled to its full scope, which is structure that is the same in form even when that same form includes consistent non-uniform thickness or other "uniform" irregularities.

This court also takes this opportunity to comment on Middleton's argument that a flexible film is "uniform" when its thickness falls within manufacturing tolerances. According to Middleton, evidence of manufacturing tolerances includes the specification and tolerances found in the contract between 3M and Bando or Achilles for manufacture of the overlaminate films. The meaning of a patent term, however, is not subject to revision or alteration by subsequent contract between the patentee and its suppliers. The meaning of patent terms depends on the usage of those terms in context by one of skill in the art at the time of application. Schering Corp. v. Amgen Inc., 222 F.3d 1347, 1353 (Fed. Cir. 2000). Patent terms are not subject to later revision by a supply contract. If a contract supplies some insight into the understanding of skilled artisans at the time of invention, it may have some relevance to claim construction, but Middleton makes no such explanation for invoking a contract to define claim terms.

In sum, the proper construction of "uniform flexible film" is a flexible film having always the same form. Thus, a uniform flexible film includes, for example, a flexible film having the same thickness throughout, as well as a flexible film having
the same textured surface throughout. The district court granted summary judgment holding that 3M's overlaminate films do not infringe the '514 patent based solely on its construction of "uniform" to mean the "same thickness throughout, except that normal manufacturing tolerances are allowed." Because the district court erred in its construction of "uniform," this court reverses and remands for a determination of infringement in accordance with the correct claim construction.

Cannondale argues its suspension system does not infringe upon element b. of the '026 Patent because while element b. calls for a "cylinder of uniform, second diameter," the Cannondale suspension has an inner steerer tube with four flat surfaces on its outer circumference. See Defendant's Reply at 10.

As discussed above, the term "cylinder," as understood in its common meaning and defined by one of ordinary skill in the art of bicycle suspensions, is not limited to a perfectly circular tube. Cannondale argues the inclusion of the terms "uniform" and "diameter" create a claim element limited to "an object defined by two equal parallel circular bases and a perpendicular axis between them, in which the circular shape has a constant, unvarying width." See Defendants' Motion at 13.

Cannondale's definition would limit Claim 1 to an inner cylinder that is perfectly round and contains no grooves or irregularities on the outside. This definition of "cylinder of uniform, second diameter" would directly contradict the specifications and the only preferred embodiment of the '026 Patent. The specification describes an inner cylinder with grooves or tracks on the exterior of the cylinder, designed to receive the rolling bearing elements which facilitate the telescoping of the cylinders and enable the inner and outer cylinders to turn in unison. Cannondale's definition is also inconsistent with the element c. of Claim 1 describing a "rotational indexing means" between the two cylinders including a "longitudinal bearing track there between." Cannondale's definition must be rejected as inconsistent with the patent specifications and the patentee's preferred embodiment. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996) (finding a claim should be interpreted to include the patentee's preferred embodiment, where possible); Hoechst Celanese Corp. v. BP Chemicals, Ltd., 78 F.3d 1575, 1580-81 (Fed. Cir. 1996) ("it is unlikely an inventor would define the invention in a way that excluded the preferred embodiment, or that persons of skill in this field would read the specifications in such a way.").

Webster's Dictionary defines "diameter" as a "straight line passing from side to side of any figure or body, through its center." See Random House Webster's College Dictionary, p. 363, def. b., 5th edition, 1997. As Defendant offers in its Motion, "uniform" means "unvarying in significant aspects." See Motion at 13. In accordance with this common understanding and consistent with the patent specifications and preferred embodiment, a cylinder of "uniform, second diameter" is therefore more aptly understood as a tube having a consistent circumference throughout the length of its shaft without significant bulges or cavities, such that it can telescope within the first cylinder while maintaining an unvarying distance between the outermost exterior of the inner tube and the innermost interior of the outer tube. The manufacturing specifications reflect the inner tube of the Cannondale suspension has a measurable exterior diameter of 1.210 inches (after the tracks of flats are grooved in) and this diameter remains constant along the perimeter of the tube. Cannondale's suspension has a "second cylinder of uniform, second diameter." 5

5 The Court finds the prosecution history of the '026 patent does not alter the analysis of infringement of element b. Robinson's amendment to add the "of uniform…diameter" limitation simply clarified the first and second tubes or cylinders had to be of uniform diameter so as to fit inside the narrow confines of the headtube of a bicycle. The prior art, from which Robinson sought to distinguish his invention, "enlarged the annular bearing holder" to "incorporate an internal sleeve," "thereby further expanding the diameter of the outer cylinder to form the bearing holder." Robinson's patent did not seek to enlarge the headtube or unevenly enlarge the cylinders, but to fit the suspension cylinders with uniform diameters within the headtube.
Claims 1 and 5 of the '688 Patent

Claims 1 and 5 of the '688 patent are directed at the gasket means used between air duct end sections and abutting flange frames and about the corner pieces to create an air-tight seal. These claims include language describing the duct and gasket connecting means as requiring the duct end portions "to extend beyond said front surface of said corner means into abutting relation with a unitary continuous external gasket means having a uniform thickness that extends around the periphery of said duct connecting flange members and by said uniform thickness seals said duct connecting flange members and also the corner edge portions of the duct. . . ."

First, the Court construes the phrase "unitary continuous external gasket means" to require the gasket means to be a unitary (one-piece), uninterrupted gasket means having a uniform thickness that extends around the periphery of said duct connecting flange members. 5

Second, the Court construes the phrases "having a uniform thickness" and "by said uniform thickness seals . . ." to require the gasket means to be the same thickness throughout and to seal the duct connecting flange members and also the corner edge portions of the duct, forming the only seal for the corner edge portions of the duct extending beyond said front surface of said corner means.

This construction gives ordinary meaning to the terms used in the patent claims and is consistent with the prosecution history and patent specifications. Further, having considered Plaintiff Ductmate's February 20, 1990 amendments to these claims, it is stopped from arguing that the gasket means is something other than a unitary continuous external gasket means having a uniform thickness, as the Court has construed those terms. 6

3. "Said support mat is of uniform thickness between its opposite ends." Consistent with the claim language and its ordinary meaning, 27 the specification, 28 and the prosecution history, 29 the Court construes "said support mat is of uniform thickness between its opposite ends" to mean "the thickness of the mat does not vary between its ends."

4283
27 D.I. 148, ex. 6 at 1269 (defining "uniform" as "having always the same form, manner, or degree: not varying or variable"); D.I. 151, ex. E at 1290 (same).

28 '476 patent, col. 2, ll. 38-42; col. 3, ll. 49-55, 60-64; col. 4, ll. 16-22.

4. "uniformity of resulting cut surface" (claims 10, 11, 12, 13, 24, 25, 26 and 27)

Omax proposes that this should be construed to include "any aspect of uniformity for a cut surface, for example consistency of surface finish or of dimensional accuracy or precision from entry to exit of the jet through a work piece for the segment specified by the user." Flow proposes to use this construction: "Consistency of the surface finish from entry to exit of the jet through a work piece for the segment specified by the user."

For its argument, Flow relies on its proposed narrow constructions of quality of result, associated value and combining. The Court has largely rejected these narrow constructions in favor of a broad definition of quality of result and an interpretation of the combining step that allows for consideration of dimensional accuracy, such as kerf and lag. Moreover, the claim terms specifically refer to the uniformity of the resulting cut surface with regard to dimensional accuracy. '596 Patent, claim 12 ("The method of claim 10 wherein the velocity is adjusted to limit lag error when the jet traverses a curve or corner to maintain the desired uniformity of resulting cut surface."). In light of these findings, the Court adopts Omax’s proposed construction of this claim term.

3. Uniformly

The district court construed the term "uniformly" as "always the same" or "unvarying." Summary Judgment Decision, 345 F. Supp. 2d 466. Grayzel challenges this construction, arguing that the correct construction is "without fluctuation or variation; consistent." Grayzel is splitting hairs in arguing that the district court should have selected the definition "without fluctuation or variation; consistent" instead of the definition "always the same; unvarying" for the term "uniformly." The district court’s definition is synonymous with Grayzel’s proposed definition. See The Oxford Thesaurus 561 (Am. ed. 1992) ("consistent" and "unvaryingly" listed as synonyms for the adjective "uniform"). Moreover, either definition conveys that the walls of the sheath are thin for the entire length of the sheath. As such, we conclude that the district court did not err in construing the "flexible" limitation to mean "always the same" or "unvarying."

The '614 patent contains a single 9-element claim. Winco concedes that its levers contain seven of these elements. The claim recites in relevant part (with emphasis added to the elements at issue):

A hand lever mechanism . . . comprising . . .

a fastening element made of metal adapted to be placed in engagement with a member to be turned;

a hand lever made of synthetic material softer than said fastening element material;
a coupling element formed with an annular configuration consisting essentially of a metallic pressure die cast member having one side affixed to said hand lever . . . whereby said coupling element is anchored in the material of said hand lever and is rotatable therewith;

anchoring elements comprising projecting elements arranged uniformly along an outer periphery of said coupling element for anchoring said coupling element in the material of said hand lever;

DISCUSSION

I.

An accused device outside the literal meaning of the claims may still infringe by equivalents so long as each claimed element or its equivalent is found in the accused device. See Warner-Jenkinson Co. v. Hilton Davis Chem. Co., U.S. , , 117 S. Ct. 1040, 1049, 137 L. Ed. 2d 146 (1997). A patentee may prove equivalence by showing that the substituted element in the accused device performs substantially the same function, in substantially the same way, to produce substantially the same result as the claimed element. See id. at -, 117 S. Ct. at 1054; Graver Tank & Mfg. Co. v. Linde Air Prods. Co., 339 U.S. 605, 608, 94 L. Ed. 1097, 70 S. Ct. 854 (1950). "It is important to ensure that application of the doctrine, even as to an individual element, is not allowed such broad play as to effectively eliminate that element in its entirety." Warner- Jenkinson, U.S. at -, 117 S. Ct. at 1049; see also Dolly, Inc. v. Spalding & Evenflo Cos., 16 F.3d 394, 398, 29 U.S.P.Q.2D (BNA) 1767, 1771 (Fed. Cir. 1994) ("The doctrine of equivalents is not a license to ignore claim limitations."). This is particularly so for claims drawn to specific structures.

Winco moved for summary judgment of non-infringement during the course of discovery. A Markman hearing was held, and the district court construed the crucial claim terms "annular" and "uniformly." After considering the specification and the prosecution history, but relying primarily on the ordinary meaning of the term "annular," the district court construed the term as requiring the coupling element to be "circular or ring-like in shape, but not necessarily a perfect circle." Also relying primarily on the ordinary meaning, the district court construed "arranged uniformly" as requiring that "no significant portion of the outer periphery should be lacking or treated differently or in a different manner for the placement of the projecting elements." The court noted specifically that uniform arrangement does not require that the anchoring elements (projections) be equidistantly spaced.

We have reviewed independently the claim language, specification, and prosecution history. Although Winco would have us construe "annular" and "uniformly arranged" as "circular" and "equidistantly spaced," the terms are not that narrow. We discern no error, however, in the district court's constructions, and adopt them in their entireties. We therefore turn to the application of the claim as so construed to the two accused devices.

2. Construction of the Phrase "ablation is caused uniformly"

Reliant asserts that the '502 patent is also invalid for a second reason. Specifically, according to Reliant, the '502 patent is invalid because the phrase "ablation . . . is caused uniformly but only to a predetermined depth" is incurably vague, that the only rational construction of this term is absolute uniformity, and that this cannot be achieved by the described invention.

Laser responds that the ablations caused by the device described within the patent are sufficiently uniform. Laser does not, however, respond specifically to Reliant's arguments concerning the vagueness of the term "uniform" as it is used to describe the ablation produced by the control means. Laser asserts generally that there is no ambiguity in the patent claims and that the invention can perform all of the functions listed in the patent.

The Supreme Court has held that a patent must describe the exact scope of an invention and its manufacture in order to
secure to the patentee everything to which he or she is entitled and to apprise the public of that which is still open to them. Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 1387, 134 L. Ed. 2d 577 (1996). The claims of the patent foster this objective by particularly pointing out and distinctly claiming the subject matter of the patent. 116 S. Ct. at 1388; see 35 U.S.C. § 112. The Markman court held further that the limits of a patent must be known for the protection of the patentee and the encouragement of inventiveness by others; otherwise,

a zone of uncertainty which enterprise and experimentation may enter only at the risk of infringement claims would discourage invention only a little less than unequivocal foreclosure of the field, and the public would be deprived of rights supposed to belong to it, without being clearly told what it is that limits these rights.

116 S. Ct. at 1396 (citations and internal quotation marks omitted).

The construction of patent claims is an issue of law to be decided by the Court. 116 S. Ct. at 1393. In interpreting a patent claim, a court should give the words of the claims their ordinary and customary meaning unless another meaning is suggested by the specification. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). If the meaning of a word is ambiguous, the Court must look first to the patent itself and the prosecution history. Id. Usually, such analysis will resolve any ambiguity in a disputed claim term, and, in such circumstances, it is improper to rely on extrinsic evidence such as expert testimony to construe patent claims. Id. Extrinsic evidence, such as expert testimony, may be considered if needed to assist the Court in determining the meaning or scope of terms in the claims. Id. Such evidence may not, however, be used to alter or change the claims, specification and file history of the patent. Id. The Federal Circuit has held that a court "can neither broaden nor narrow claims to give the patentee something different that what he has set forth." Texas Instruments, Inc. v. United States ITC, 988 F.2d 1165 (Fed. Cir. 1993) (quoting Autogiro Co. of America v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 396 (Ct. Cl. 1967)).

Reliant asserts that the Court cannot rationally construe the means-plus-function limitation that "ablation . . . is caused uniformly but only to a predetermined depth" because nothing in the patent provides a standard of uniformity which a person wishing to avoid infringement could use to determine the degree of uniformity covered by the patent. According to Reliant, the patent does not indicate the degree of uniformity of the ablation caused by the invention. Reliant asserts that the patent is therefore invalid because it fails particularly to point out and distinctly to claim the subject matter covered by the patent. Instead, the patent leaves the limits of the patent unknown. Reliant argues also that the only workable definition of uniformity suggested by the patent is absolute uniformity; the invention, however, cannot create ablation that is absolutely uniform in depth.

In construing this phrase, the Court begins with the ordinary, customary definition of "uniformly." The Random House Dictionary does not define the adverb uniformly; it does, however, define "uniform," the adjective from which "uniformly" is derived, as "(1) identical; (2) without variations in detail, [as in] a uniform surface; (3) consistent, unvarying." Random House Dictionary, Rev. Ed. (1982) (emphasis in original). A review of the patent and prosecution history does not suggest another meaning for this term as it is used to define the control means. Neither the patent nor the prosecution history indicates the specific degree of ablation uniformity caused by the invention. The patent does not specify whether the invention causes ablation that is absolutely uniform in depth, uniform within some range, or sufficiently uniform for certain purposes but not for others. The patent and prosecution history provide no basis for the Court to choose some definition of the phrase "ablation . . . caused uniformly" other than the ordinary definition of ablation to an identical depth, or to a depth that does not vary in detail.

Laser would have the Court construe this phrase to mean ablation that differs in depth by only ten to fifteen percent in small areas, or ablation that is sufficiently uniform for certain uses. Laser points to nothing in the patent or prosecution history, however, that supports such a definition. Nor does Laser present expert testimony indicating that "uniform ablation" had this meaning to one skilled in the art. Indeed, Laser presents no expert testimony at all indicating that "uniform ablation" has a particular meaning to one skilled in the art. The Court, therefore, has no basis for construing "ablation . . . is caused uniformly" to mean ablation that differs by only a certain percentage or ablation that is sufficiently uniform for some uses.

At oral argument, Laser asserted that "uniform ablation" means that ablation is caused regardless of the condition of the tissue, whether it is damaged, diseased, pigmented, port wine stained or healthy. The Court finds this assertion unpersuasive and unsupported by the patent and prosecution history.
As indicated above, a patent must describe the exact scope of an invention in order to apprise the public of that which is still open to it. Markman, 116 S. Ct. at 1387. Without guidance as to the meaning of uniform ablation, one of ordinary skill in the art would not understand what is claimed by the patent. Seattle Box, 731 F.2d at 826. Without a meaningful, usable definition, the "zone of uncertainty" mentioned by Markman would be created. Id. Those skilled in the art would be discouraged from attempting to create devices that cause ablation to any degree of uniformity for fear that they would infringe the '502 patent. The Court, cannot, however, broaden or narrow the claims of the '502 patent to give Laser something other than that which is set forth in the patent. See Texas Instruments, 988 F.2d at 1171.

Because the Court finds nothing in the patent or prosecution history that would allow it to construe "ablation . . . caused uniformly" more broadly to mean "ablation that is sufficiently uniform for some purposes" or "an ablation level that varies by no more than ten or fifteen percent," the Court shall not construe it to include such definitions. Laser offers no expert testimony to the effect that "uniform ablation" has a particular meaning to one skilled in the art. Without any other guide for the term, the Court is left with the ordinary and customary meaning of uniform ablation, that is, ablation to an identical depth, or to a depth that does not vary in detail.

2. The "containing uniformly dispersed therein a static-reducing amount of electrically conductive particulate material" limitation

The conductive layers in the accused Nevamar static-dissipating products consist of paper which has been coated with electrically conductive carbon particles on both sides and impregnated with a polymer resin. Nevamar submitted photomicrographs of the completed layer showing that the carbon particles are distributed in two parallel planes located slightly below the two surfaces of the paper, with little or no carbon particles in the area of the plane centered between the paper surfaces.

The district court construed the "uniformly dispersed" limitation to mean that the conductive particles must be uniformly dispersed in all dimensions of the alleged conductive layer (i.e., length, width and thickness). Based on this construction, the court concluded that the "uniformly dispersed" limitation does not read on the accused Nevamar products because of the lack of uniform distribution of carbon particles across the thickness of the alleged conductive layer. This analysis is incorrect.

The written description of the '040 patent describes various types of conductive layers and corresponding methods of preparation. One such layer comprises an open-cell foam which is loaded with conductive particles by "dusting" the particles onto the surface of the foam and then "calendering" (sic) the foam to impregnate the particles therein. See '040 patent, col. 5, ll. 1-6. Although this technique is described as adequate to result in conductive particles being impregnated "generally uniformly throughout the foam", it is unreasonable to infer that this technique will result in carbon particles being uniformly distributed across the thickness of the foam. The written description of the '040 patent thus shows that the "uniformly dispersed" limitation requires the distribution of conductive particles across the length and width of the conductive layer but does not require uniform dispersion of the particles across the thickness of the layer.

Therefore, viewing the evidence and making all reasonable inferences in favor of Nevamar, there is no genuine issue of material fact precluding summary judgment concerning this issue and Charleswater is entitled to JMOL that the "uniformly dispersed" claim limitation encompasses the accused Nevamar products, even though the conductive carbon particles in the alleged conductive layer in those products are not uniformly dispersed across the thickness of the conductive layer.

1. Claim 25

An element of Claim 25 is "allowing the resultant assembly to set and dry such that the calcined gypsum forms set gypsum having voids uniformly dispersed therein." Defendants contend that "resultant assembly" means the entire board, including
edges. Defendants contend that this element should be construed as requiring a uniform distribution of voids through the entire board, including edges. It is undisputed that, in the LNA Method which uses hard edges, voids in the edges are not uniform with voids in the core.

As of the time that the ’635 patent was issued, as well as currently, nearly all commercial wallboard was manufactured with hard edges. Unless defined by the patent as meaning something else, words of a patent claim are to be interpreted in accordance with their ordinary meaning, as they would be understood by one skilled in the art. V-Formation, Inc. v. Benetton Group SpA, 401 F.3d 1307, 1310-11 (Fed. Cir. 2005); Merck & Co. v. Teva Pharmaceuticals USA, Inc., 395 F.3d 1364, 1369-70 (Fed. Cir.), cert. denied, 546 U.S. 972, 126 S. Ct. 488, 163 L. Ed. 2d 384 (2005); Duhn Oil Tool, Inc. v. Cooper Cameron Corp., 474 F. Supp. 2d 1148, 2007 WL 3316384 (E.D. Cal. 2007).

Claim 25 sets forth a method for preparing "a foamed gypsum board." It lists the elements "comprising" that method. In a patent claim, "comprising" means including. Mars, Inc. v. H.J. Heinz Co., 377 F.3d 1369, 1375-76 (Fed. Cir. 2004); Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1344-45 (Fed. Cir. 2003); Goff v. Harrah's Operating Co., 412 F. Supp. 2d 1090, 1094 (D. Nev. 2005). A method claim comprising certain elements does not need to set forth every step necessary to produce the identified product. Mars, supra; Smith & Nephew, Inc. v. Ethicon, Inc., 276 F.3d 1304, 1311 (Fed. Cir. 2001); Goff, supra. Thus, the claim 25 preamble language ("A method of preparing a foamed gypsum board comprising . . .") does not indicate that the elements that follow are sufficient by themselves to produce a foamed gypsum board. Nevertheless, defendants contend that "resultant assembly," as used in the last phrase of the claim, should be understood as referring to "a foamed gypsum board" that appears in the preamble. Instead, a proper reading of "resultant assembly" is that it refers to the particular steps set forth in claim 25 following the preamble. Those steps include placing the dispersed material between two sheets and drying that assembly. The recited steps, however, do not exclude adding other materials or dispersions before adding the second cover sheet, nor is there any mention of the forming stage of wallboard production. The resultant assembly simply refers to the described dispersion being between two cover sheets. It is consistent with claim 25 to have edges composed of different materials. The only part of the resultant assembly that need have uniformly dispersed voids is the deposited dispersion described in claim 25.

Such a reading of claim 25 is consistent with how a person skilled in the art would understand the claim. A person skilled in the art would know that wallboard is manufactured with edges that have a density different from that of the core. Such a person would understand that claim 25 does not make any claim regarding the edges of the board. Specifically, a person skilled in the art would understand that the uniformly dispersed voids exist only in the deposited dispersion described. A person skilled in the art would understand that, in the usual manufacturing process, a different dispersion with a different density would be used for the edges.

The undisputed fact that the LNA Method produces wallboard with differing densities in the core and edges does not preclude the possibility that the LNA Method infringes claim 25.

**ANALYSIS**

The parties agree that the claim construction in this case turns on the meaning of three words: "uninterrupted inner surfaces." This term appears both in Claim 1 of the ’041 patent and in the abstract of the patent. Claim 1 describes a ladder comprising two rigid uprights and "at least one rung extending horizontally between said two uprights and having apertures defined by sleeves having uninterrupted inner surfaces for receiving therethrough said rigid uprights." Def. Cl. Construction Br., Ex. 1 ( ’041 patent, p. 3). The abstract similarly states; "A rung is provided having apertures defined by sleeves having uninterrupted inner surfaces, for receiving therethrough the uprights." Id. at p. 1.

The parties also agree on the basic parameters and framework for the Court's analysis of the claim interpretation for the ’041 patent, as established in Federal Circuit decisions and described above. Each urges the Court to examine the intrinsic evidence initially, including the claim language, the specification, any drawings, the prosecution history, as well as ordinary dictionary definitions to assist in interpreting the claim language, and lastly to consult the available extrinsic evidence, including expert testimony. Intex places primary reliance on what it asserts is the clear, ordinary meaning of the claim language, as confirmed by dictionary definitions and its expert witness, Jon Ver Halen. Metalast, on the other hand,
emphasizes the prosecution history and the reading of that history by its expert, Joseph Schmerler. The parties agree that the meaning of the claim language to one skilled in the art is controlling. See, e.g., Multiform Desiccants, 133 F.3d at 1477. Intex asks the Court to keep in mind that the Federal Circuit and other courts stress that what is most important in claim construction is the concept of notice - courts must discern what the claims in the patent mean to one reasonably skilled in the art so as to put a reasonable competitor on notice as to the precise scope and meaning of the claims.

The parties further agree that "uninterrupted inner surfaces" is not a term of art having a specialized meaning to those having expertise in either ladder or swimming pool design and construction. Likewise, "uninterrupted inner surfaces" is not specifically defined in the specification of patent '041. Hence, this is not a case where the patentee has acted as his own lexicographer and expressly provided the meaning of the relevant claim term. The threshold task for the Court, then, is to determine the ordinary meaning to one skilled in the art of the words "uninterrupted inner surfaces" as used in the context of the '041 patent claim. Although the parties agree on the issue and the analytical path to its resolution, they differ significantly with respect to the suggested result. Intex staunchly contends that the ordinary meaning of the term "uninterrupted inner surfaces" is smooth, uniform, or containing no irregularities (hereinafter "smooth"). Metalast counters that, in the context of the '041 patent and its prosecution history, the term can only mean unitary or one-piece (hereinafter "unitary").

1. The Claim Language

Several observations seem particularly pertinent with respect to the claim language under consideration. First, neither of the competing constructions of the term "uninterrupted inner surfaces" urged by the parties is totally implausible, although for the reasons that will be discussed, the Court concludes that "smooth" is the more plausible construction. Viewing the three words in isolation, an uninterrupted surface would appear to be one having no gaps, splits, protrusions, ridges, or recesses -- i.e., a surface that is smooth and uniform. Although somewhat less plausible, an uninterrupted surface could also be one that is unitary -- i.e., in a single piece with no seam or connection joining parts together, as those too might be said to constitute "interruptions" to the surface. As explained further below, however, when sources such as dictionaries, drawings, and expert testimony are consulted, there is some confirmation that the ordinary meaning of "uninterrupted inner surfaces" to one skilled in the art (of either ladder or swimming pool ladder design) is smooth and uniform.

Second, and importantly, the term "uninterrupted inner surfaces" does not appear in isolation, but rather in the context of the other language of Claim 1. It is clear that while the entire term "uninterrupted inner surfaces" modifies the preceding noun "sleeves," the word "uninterrupted" itself applies to and modifies only "inner surfaces," not "sleeves." A review of the words themselves (and their placement) strongly suggests, then, that the surface of the sleeves must be uninterrupted (and hence smooth), not that the sleeves must be uninterrupted (and hence arguably unitary). See Teleflex, 299 F.3d at 1324-25 ("The words used in the claims are interpreted in light of the intrinsic evidence of record, including the written description, . . . [to] provide context and clarification about the claim terms."); Pitney Bowes, 182 F.3d at 1311 (term must be read to correspond to meaning in context). Metalast's position that "uninterrupted inner surfaces" means unitary or one-piece would be more convincing if "uninterrupted" directly modified "sleeves," suggesting that the sleeves must be a single piece. Even then, Metalast's position ultimately is really that the ladder rungs (having sleeves at each end) are to be unitary or one-piece. That interpretation is even further from the actual words as used in the claim, in which uninterrupted modifies surfaces, not sleeves, and certainly not ladder rungs. As it is, however, the words of the claim suggest that it is only the inner surfaces of the sleeves that must be uninterrupted, which is more consistent with the idea of smooth inner surfaces than with unitary inner surfaces. Indeed, the latter construction does not make much sense when one thinks of a surface, rather than the item itself, being of a single piece. The meaning Metalast suggests could certainly be more directly achieved through a different placement of the words employed.

Similarly, the phrase "for receiving therethrough said rigid uprights" immediately following the term "uninterrupted inner surfaces" appears to the Court to supply some explanation of why the sleeves are designed with uninterrupted inner surfaces. That explanation -- to enable the ladder uprights to be received readily through the sleeves in the rungs -- makes sense if the inner surface of the sleeve is smooth (without protrusions, gaps, or recesses). In other words, if the sleeves have smooth inner surfaces, then that will facilitate sliding the uprights through them, whether or not the sleeves are unitary. On the other hand, sleeves that are unitary or one-piece might still not facilitate easy receipt of uprights, if the sleeves have protrusions, gaps or recesses rather than smooth inner surfaces.

Finally, construing the term "uninterrupted inner surfaces" to mean smooth rather than unitary is also consistent with the
additional language throughout Claim 1 discussing the separate split sleeve, which has both a "split," a "recess," and a "protrusion." Hence, the sleeves in the rungs are differentiated from the split sleeves, which have gaps and protrusions, by the term "uninterrupted inner surfaces," meaning without gaps, protrusions or recesses (i.e., smooth).

One other piece of intrinsic evidence -- the drawings that are part of the '041 patent -- supports the position that "uninterrupted inner surfaces" is best construed as smooth or uniform. Figure 1 depicts the sleeve at the end of a rung, and shows the "inner surface" of the sleeve as smooth. Likewise, the axial cut-out in Figure 2, which the patent characterizes as "illustrating an elevational cross-section of the attachment of the rung to the upright," Def. Cl. Constr. Br., Ex. 1 at p. 3, depicts the inner surface of the sleeve (at 9) as smooth, but, in contrast, depicts the two parts of the upright with gaps, recesses and protrusions. Hence, the drawings are consistent with an interpretation of the claim language as requiring smooth inner surfaces on the sleeves that are part of the ladder rungs.

In sum, the Court concludes that the ordinary meaning of "uninterrupted inner surfaces" to one skilled in the art is considerably more likely to be "smooth" than "unitary," given the words employed, their context, and the accompanying drawings. Certainly, there are more explicit and direct ways to explain that rungs with sleeves at each end are to be unitary or one-piece, if that was the inventor's intent. Metalast's construction would make the word "inner" entirely superfluous, since under its construction there is nothing meaningful about having the inner surface of the rung sleeves "uninterrupted" or unitary. Intex's construction of "uninterrupted inner surfaces" as meaning smooth or uniform is consistent with both the words employed and the context, because an inner surface of the sleeves without gaps, protrusions, or recesses is important to facilitating the smooth receipt of the ladder uprights through the sleeves. Therefore, an interpretation of the language "uninterrupted inner surfaces" in Claim 1 of the '041 patent to mean smooth or uniform is, the Court concludes, the ordinary meaning to one skilled in the art. As discussed below, other available evidence supports that interpretation, although the prosecution history of the '041 patent points somewhat in the direction of Metalast's interpretation that "uninterrupted inner surfaces" means unitary or one-piece sleeves.

2. Dictionary Definitions

Relying on several dictionary definitions, Intex suggests that "interrupted" means "discontinuous," "not uniform," or lacking "continuity or uniformity," and that "uninterrupted" means "having undisturbed continuity" or "continuing without interruption" or "continuous." See American Heritage Dictionary (2d ed. 1985); http://www.Dictionary.com; Webster's New Twentieth Century Dictionary (2nd ed.); Webster's Third New Int'l Dictionary (1993). That comports, according to Intex, with the definition of "smooth" as "having a surface free from irregularities, roughness or projections" or "having no obstructions" or "having a continuously even surface" or "even and uninterrupted in flow"; it would also seem to comport with a definition of "uniform" as "marked by a lack of variation [or] change in form." American Heritage Dictionary (2nd ed. 1985); Webster's Third New Int'l Dictionary (1993). Moreover, synonyms of "uninterrupted" include "smooth" and "uniform." See Roget's Int'l Thesaurus (4th ed. 1995). Again, this evidence is consistent with an interpretation of "uninterrupted inner surfaces" as meaning "smooth" or "uniform."

Metalast's initial response was primarily to caution that dictionary definitions should be relied upon sparingly, and cannot substitute for or overcome the meaning of claim terms evident from the specification, drawings and prosecution history. Metalast also argues -- more strenuously in supplemental briefing -- that the very same dictionary definitions cited by Intex are consistent with Metalast's proposed claim interpretation as well, noting that synonyms for "uninterrupted" include "joined," "unbroken," and "seamless." See Roget's Int'l Thesaurus (4th ed. 1995). Metalast's argument, then, is essentially that a dictionary definition is of limited value and cannot overcome the clear meaning Metalast believes is furnished by the prosecution history of the '041 patent.

Recent Federal Circuit decisions, however, clarify that dictionaries are "particularly useful resources" for the court to employ at any time to ascertain the ordinary meaning of claim terms. Texas Digital Sys., 308 F.3d at 1202. They are objective, reliable sources of information shedding light on the meaning that those skilled in the art would normally attribute to the disputed language. Id. at 1202-03; see also Inverness Medical, 309 F.3d at 1378. Rather than the analytical construct urged by Metalast, in which a dictionary definition is disfavored means to overcome a meaning supplied by the claim prosecution history, the Federal Circuit instead requires clear, explicit direction in the claim specification or prosecution history to overcome "the presumption in favor of a dictionary definition." Texas Digital Sys., 308 F.3d at 1204. Here, as explained below, the Court does not agree that the prosecution history is so unequivocal as to overcome the ordinary meaning of "uninterrupted inner surfaces" as being smooth. The dictionary definitions of "interrupted" as "not uniform" or
"discontinuous" and of "uninterrupted" as "continuous" or "having undisturbed continuity" comport well with dictionary definitions of "smooth" as "having a surface free from irregularities, roughness or projections" or "having a continuously even surface" or "even and uninterrupted in flow" and of "uniform" as "marked by a lack of variation [or] change in form." Indeed, these definitions of "smooth" confirm that it is a descriptive term that is particularly appropriate when speaking of a surface, as is the case here. Those definitions support the conclusion, therefore, that the ordinary meaning of "uninterrupted," particularly in the context in which it is used in the '041 patent claim, is smooth, uniform or free from protrusions.

Thus, these dictionary definitions tend to support Intex's view that "uninterrupted inner surfaces" means smooth or uniform inner surfaces. Although Metalast contends that the dictionary definitions are equally supportive of a proposed construction of the term as unitary or one-piece, the Court disagrees. Rather, the dictionary definitions are more consistent with an interpretation of "uninterrupted inner surfaces" as meaning smooth or uniform, and hence provide support for that construction as drawn, in the first instance, from the claim language and context itself.

3. Expert Testimony of Jon Ver Halen

The primary extrinsic evidence presented by the parties is expert testimony. Intex offers Jon Ver Halen, a well-qualified expert in ladder design, construction and analysis, to assist the Court in reviewing the term "uninterrupted inner surfaces" to determine its meaning to one skilled in the art. Ver Halen's expert testimony, as clarified by Intex's counsel at the Markman hearing, is based solely on the claim language, specifications and drawings of the '041 patent, not on the prosecution history (which Ver Halen never reviewed). The Court finds that Ver Halen is very well qualified in the field of ladder analysis and design, which is the relevant "art" for the '041 patent, and that his opinion that the proper construction of "uninterrupted inner surfaces" is smooth or uniform is persuasive and therefore of value to the Court, even though it ignores the prosecution history altogether. 2

2 Intex also offers the expert opinion of a patent attorney, Robert Greene Sterne. Counsel for Intex clarified at the Markman hearing that, although Mr. Sterne has offered an opinion on claim construction, Intex does not "need" it, which the Court takes to mean that Intex is not relying on Mr. Sterne's testimony on claim construction. In any event, the Court will not consider it, given that Mr. Sterne is not one skilled in the art and the view of a patent attorney on claim interpretation is improper. See Endress + Hauser, Inc. v. Hawk Measurement Sys., Inc., 122 F.3d 1040, 1042 (Fed. Cir. 1997) ("this court has on numerous occasions noted the impropriety of patent lawyers testifying as expert witnesses").

Ver Halen correctly states that no definition is provided in the '041 patent for the term "uninterrupted inner surfaces"; hence, he has turned to the patent drawings, which he assumes partially display the "inner surfaces" of the sleeves in Figure 1. He concludes, or more specifically "speculates," from his review of the drawings that 'uninterrupted inner surfaces' means 'smooth,' i.e., having a constant radius along its length." Pl. Cl. Constr. Br., Ex. F, p. 2 P 7. Intex argues that Ver Halen's expert testimony is rooted in his expertise in ladder design, and that he is the only proper expert in the relevant art. Although the Court is persuaded that Ver Halen is qualified in a relevant art (ladder analysis and design) and that he has provided a valuable review of assistance to the Court in determining the meaning of "uninterrupted inner surfaces" to one skilled in the art, certain weaknesses in his opinion cannot be disregarded. He admits that he can only "speculate as to the meaning of " the term, and "that any person skilled in the art of ladder design would have to guess what the Patent means in Claim 1 when it claims 'sleeves having uninterrupted inner surfaces.'" Id., P 6. Even his review based on the drawings is far from unequivocal: "Based on these incomplete and inexact views of the surface of the 'sleeve', I can speculate that 'uninterrupted inner surfaces' means 'smooth', i.e., having a constant radius along its length." Id. P 7. And, of course, he did not review the prosecution history. Hence, although certainly supportive of Intex's position, Ver Halen's expert testimony is far from conclusive.

4. The Prosecution History

To combat Intex's argument that the ordinary meaning of the term "uninterrupted inner surfaces" to one skilled in the art is smooth or uniform, which is buttressed by both dictionary definitions and the expert testimony of Ver Halen, Metalast turns
to the prosecution history of the '041 patent as explained by its expert witness. Metalast's position that the claim language "uninterrupted inner surfaces," when viewed in the context of the prosecution history, can only mean unitary or one-piece is, in fact, bolstered by its expert testimony (based largely on the prosecution history). As an important part of the intrinsic evidence available to the Court, the prosecution history can be significant in assisting the Court to discern the proper interpretation of the claim language. See, e.g., Vitronics, 90 F.3d at 1582-83. Typically, however, prosecution history will not overcome the ordinary meaning of the claim language to one skilled in the art unless it is clear and unequivocal. See Inverness Medical, 309 F.3d at 1382.

As originally submitted, the '041 patent did not contain the term "uninterrupted inner surfaces." Following rejection by the patent examiner, however, an attorney for the patent applicant submitted revised claim language and accompanying remarks designed to obtain approval, in part by distinguishing the '041 patent from a predecessor, the Full patent. It is these remarks by the patent attorney addressing the Full patent that constitute the prosecution history on which Metalast places great reliance:

The rungs in the Full patent are in the form of two plates which are secured to the ropes or uprights by bolts. Each plate has semi-circular recesses in which clamps are set, see col. 2 lines 73-77, which would not constitute the sleeve defined by claim 1 of the present invention.

In the present invention the rungs have apertures defined by sleeves having uninterrupted inner surfaces for receiving therethrough rigid uprights. The sleeve of the rung slides over the split sleeve which is axially aligned around the rigid upright and engaged by recess and protrusion, so as to position the rung along the length of the rigid upright.

In the Full patent clamps are provided with encircling grooves and shoulders for receiving the plates. In order to secure the plates to the rope additional securing i.e. other than the groove, is required by way of bolts. See col. 2 line 98-103.

Applicants submit that assembly of the Full ladder would be far from simple when compared to the simple construction and arrangement achieved by the present invention, which has fewer parts and which parts merely fit together in a manner sufficient to secure the ladder in an assembled condition, without the need for additional bolting.

5. Expert Testimony of Joseph Schmerler

To explain its position based on this prosecution history, Metalast relies on an assessment by its expert witness, Joseph Schmerler, who has a degree in mechanical engineering and extensive experience in the design and construction of swimming pools, and what he characterizes as "related equipment including pool ladders." Schmerler has acted as a consultant on matters relating to various aspects of swimming pools and is well-qualified in the art of above-ground swimming pools.

There is some dispute as to the relevant art regarding the '041 patent. Intex's expert, Ver Halen, is an expert in the design, testing, specifications and construction of various kinds of ladders. Metalast's expert, Schmerler, is an expert in swimming pools and, to some degree, a purported expert in "related equipment," including swimming pool ladders. Each party asks the Court to exclude the other side's expert. The Court declines to do so.

Schmerler's expert report defines the relevant art as "the design and construction of above-ground pools and related equipment." Def. Cl. Constr. Br., Ex. 8 (Expert Report of Joseph Schmerler, p. 2). Although not perfectly clear, the Court finds that the relevant art here involves more the design of ladders and less the design of swimming pools and related equipment. The dispute revolves around language in the '041 patent that addresses how the rungs, or steps, of a ladder are attached and connected to the uprights of the ladder. The construction of the claim term -- "uninterrupted inner surface" -- in no way depends on the fact that this ladder is mainly for use in a swimming pool; what the ladder is attached to is ancillary to the proper construction of the disputed term. While the patent does note that the ladder is to be used mainly for swimming pools, it also explicitly states that it can be used for other functions, and emphasizes a focus on how the rungs are attached to the uprights:
This invention refers to a ladder and, more particularly, to the means for attachment of the rungs to the upright. Although this ladder can be constituted in any manner and applied to differing functions, it has been designed mainly to be used in swimming pools.

Def. Cl. Constr. Br., Ex. 1 ('041 Patent, p. 3 col. 1). Moreover, the '041 patent is contrasted with the Full patent for a "ship's ladder." See id. at Ex. 6 (Full patent). Thus, the Court deems the relevant "art" here to involve the design of ladders more than the design of swimming pools and related equipment.

Given this relevant art, the Court finds that Intex's expert, Ver Halen, is more qualified to offer expert testimony than Metalast's expert, Schmerler. Ver Halen has experience and expertise in the design, specifications, standards, and construction of various ladders. His experience includes working on national standardizing committees involving the testing and design of ladders, including serving on the steering committee for establishing ladder safety codes. Moreover, he has been involved with ladder stability research, accident prevention, and occupational safety issues involving ladders. See Def. Cl. Constr. Br. Ex. 10 (Ver Halen Expert Report). Schmerler, in contrast, has extensive expertise related to swimming pools, and experience in various equipment related to swimming pools, but limited direct experience with ladders. See id., Ex. 8 (Schmerler Expert Report). Indeed, neither his report nor his rebuttal report mentions his expertise or qualifications to offer expert testimony on ladders, beyond the broadly worded experience working with swimming pools and related equipment.

The Court nonetheless finds Schmerler's testimony somewhat relevant and helpful to the Court. In his deposition, Schmerler testified that he had analyzed ladders in a number of lawsuits involving injuries from above-ground swimming pool accidents, where he tested stress levels of pool ladders. While the Court concludes that Schmerler's relevant expertise is not as extensive as Ver Halen's, the Court is not prepared to exclude him as an expert witness.

Compounding the difficulty here is that the words at issue -- "uninterrupted inner surfaces" -- are not technical terms of art used in the design of ladders or even swimming pool ladders. Expert testimony, therefore, may be of limited assistance. See Howes v. Medical Components, Inc., 814 F.2d 638, 643 (Fed. Cir. 1987) (ordinary words in claims that "are not technical terms of art" do not require expert evidence). Furthermore, these three disputed words in the '041 patent were added by a patent attorney, not an expert, who had not even consulted the original Spanish-language patent he was attempting to rewrite after the examiner rejected his initial submission. See Pl. Cl. Constr. Br., Ex. D (Dep. of Holman, pp. 63-80). Hence, the value of expert testimony here may be limited. See Markman, 517 U.S. at 387 ("It often becomes necessary that [judges] should avail themselves of the light furnished by experts relevant to the significance of such words and phrases. The judges are not, however, obliged to blindly follow such testimony.") (quoting Walker, Patent Laws § 189, at 173); McNulty v. Taser Int'l, Inc., 217 F. Supp. 2d 1058, 1062 (C.D. Cal. 2002) ("Extrinsic evidence, such as expert testimony . . . is received at the discretion of the court and is not controlling.").

Metalast argues from the prosecution history that the patent applicant, through its attorney, was faced with rejection of the claims as anticipated by the Full patent. Therefore, the applicant focused on the difference between the rungs of the Full ladder, which are formed by two plate-like members with apertures formed by two semi-circular surfaces or recesses assembled by bolts, and the rungs of the '041 ladder, which are formed as a unitary member with apertures formed by a single unitary inner surface of the sleeves. According to Metalast and Schmerler, the '041 patent claims were amended to clarify that the sleeves of the rung (which defined the tubular apertures) have "uninterrupted inner surfaces," as contrasted to the tubular apertures of the Full patent rungs formed by joining and bolting the surfaces of two separate semi-circular recesses (i.e., an "interrupted" surface).

The amendment remarks lend some support to this assessment, since the two-piece formation of the Full patent rungs requiring bolts for assembly is juxtaposed with "the present invention [in which] the rungs have apertures defined by sleeves 9 having uninterrupted inner surfaces for receiving therethrough rigid uprights." What holds this proposed interpretation together is the emphasis in the amendment on "the simple construction and arrangement achieved by the present invention, which has fewer parts" than the Full ladder and no "need for additional bolting." Metalast correctly observes that Intex's interpretation that "uninterrupted inner surfaces" means "smooth inner surfaces" would not by itself advance this distinction from the Full ladder -- simple construction with fewer parts and no bolts -- that is emphasized in the amendment to the '041 patent. On the other hand, sleeves with inner surfaces that are unitary or one-piece would, in Metalast's view, result in a ladder that is easy to assemble. Both Schmerler and Ver Halen generally agree on this last point.

There is arguably some force, then, to Metalast's assessment of the prosecution history of the '041 patent. Interpreting
"uninterrupted inner surfaces" to mean a sleeve having a unitary or one-piece inner surface, rather than two separate inner surfaces that must be bolted together, advances the goal of simple construction and fewer parts identified in the '041 amendment to distinguish the Full ladder. An interpretation of "smooth" inner surfaces would not necessarily achieve that purpose and distinguish the '041 ladder from the Full ladder. Intex responds by emphasizing in the '041 amendment the patent attorney's discussion of recesses and shoulders, which are interruptions, concluding that the purpose was to eliminate such recesses and shoulders and thereby create a smooth inner surface for ease of sliding, which is in fact also simpler than the Full ladder. Although this assessment of the prosecution history is also plausible, the Court concludes that the better reading is that proposed by Metalast and its expert, Schmerler, who actually reviewed the prosecution history. 3

3 Intex's expert, Mr. Ver Halen, did not review the prosecution history, but the Court does not find this fatal to his ability to provide expertise of assistance to the Court. See ID Security Systems Canada, Inc. v. Checkpoint Systems, Inc., 198 F. Supp. 2d 598, 619 (E.D. Pa. 2002) ("The Court concludes that [the expert's] failure to review the prosecution history of the '270 patent is not fatal to his testimony. The starting point for claim interpretation is the language of the claims.").

However, the Court does not conclude that the prosecution history urged by Metalast is so clear and unequivocal that it can overcome what the Court has already found is the ordinary and customary meaning of the claim term "uninterrupted inner surfaces" to one skilled in the art. See Inverness Medical, 309 F.3d at 1382. The more persuasive reading of the prosecution history may be that it focuses on distinguishing the '041 patent claim from the Full patent in terms of the simplicity of construction and number of parts, but there is also a plausible reading that it focuses on ease of sliding (i.e., smooth surfaces without protrusions), which is likewise a simpler construction. More importantly, the relevant prosecution history is subject to some inherent doubt given that it was provided by a patent attorney attempting to overcome the examiner's rejection, but who did not rely on the original Spanish-language patent and cannot remember what he meant in any event. See Pl. Cl. Constr. Br., Ex. D (Dep. of Holman, pp. 6380 ). All things considered, the Court does not find this prosecution history to be so unambiguous as to provide a basis for the claim construction Metalast seeks, and absent clear, unambiguous prosecution history indicating a contrary intent, the ordinary meaning of the claim term must prevail. See Inverness Medical, 309 F.3d at 1382; Schwing Gmbh, 305 F.3d at 1324; 5A Chisum on Patents § 18.03 [2][d]. 4

4 To the extent that dictionary definitions provide more than one possible meaning for "uninterrupted," the prosecution history of the '041 patent may be useful in discerning which meaning was intended by the inventor. See Texas Digital Sys., 308 F.3d at 1203; Inverness Medical, 309 F.3d at 1378-79. Again, however, the history must clearly demonstrate another meaning in order to overcome the ordinary meaning. See Inverness Medical, 309 F.3d at 1379, 1382.

6. Summary

It is not necessarily enough, then, that Metalast may have the better of the argument with respect to the prosecution history. Although the Court concludes that Metalast presents a more plausible explanation of the prosecution history, it is not so clear and unequivocal as to overcome the ordinary meaning of the claim language to one skilled in the art of either ladder construction and design or swimming pool equipment construction and design. That ordinary meaning, based on the claim language, context and drawings, as well as dictionary definitions, and confirmed by the extrinsic evidence of Ver Halen's expert testimony, is that "uninterrupted inner surfaces" means smooth or uniform inner surfaces of the sleeves located at the ends of the ladder rungs of the '041 patent. As explained above, that interpretation would seem to make considerably more sense to one skilled in the art, given the language employed and its context.

CONCLUSION

For the foregoing reasons, the Court concludes that the ordinary and customary meaning of the claim term "uninterrupted inner surfaces" in the '041 patent is "smooth," "uniform" or "having no protrusions" as established by the claim language,
context and drawings, and confirmed by dictionary definitions and credible expert testimony. Although the claim prosecution history is ambiguous as to the proper construction of that term, given the circumstances of that history it is not so unequivocal as to permit a different meaning than "smooth" or "uniform" to be assigned to the term "uninterrupted inner surfaces."

I. Consistency of the Claim Construction Decision With Phillips v. AWH Corp.

Metalast contends that the Court's construction of "uninterrupted inner surfaces" is based on an erroneous "dictionary-based" methodology that has recently been rejected by the Federal Circuit sitting en banc in Phillips v. AWH Corp., 415 F.3d 1303 (Fed. Cir. 2005). Metalast's argument is based on the characterization of the claim construction opinion as applying a "presumption" that the dictionary definition of a term would govern in the absence of "clear, explicit direction in the claim specification or prosecution history." Metalast Mem. at 1. The Court agrees that Phillips clarifies the law on the role of dictionary definitions in the claim construction process. See 415 F.3d at 1312 ("We have also previously considered the use of dictionaries in claim construction. What we have said in that regard requires clarification."). Moreover, the Court believes that in so doing, the Federal Circuit necessarily overruled those cases applying a presumption that dictionary definitions govern unless refuted by intrinsic evidence such as the claim specification and prosecution history. However, this Court's claim construction opinion is consistent with the principles articulated in Phillips and assigns an appropriate secondary role to dictionary definitions -- that is, one of confirming a construction of the claim derived in the first instance from the claim language and patent specification. To the extent there is any doubt about that, this opinion confirms that secondary role for dictionary definitions.

In Phillips, the Federal Circuit discussed the differing roles of intrinsic and extrinsic evidence, and reiterated the continued validity of its prior precedent on claim construction -- particularly Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576 (Fed. Cir. 1996) -- that focused first on the claim language and the patent specification:

The claims, of course, do not stand alone. Rather, they are part of "a fully integrated written instrument," Markman v. Westview Instruments, Inc., 52 F.3d 967 at 978 (1995), consisting principally of a specification that concludes with the claims. For that reason, claims "must be read in view of the specification, of which they are a part." Id. at 979. As we stated in Vitronics, the specification is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term." 90 F.3d at 1582.

Phillips, 415 F.3d 1314-15. These principles are well-accepted, and indeed, were reiterated in Intex I. See 245 F. Supp. 2d at 68-69 (quoting Vitronics, 90 F.3d at 1582).

The Phillips court next discussed the importance of prosecution history as intrinsic evidence that may inform the meaning of claim language, but also noted the limitations of prosecution history:

Like the specification, the prosecution history provides evidence of how the PTO and the inventor understood the patent. . . . Yet because the prosecution history represents an ongoing negotiation between the PTO and the applicant, rather than the final product of that negotiation, it often lacks the clarity of the specification and thus is less useful for claim construction purposes. . . . Nonetheless, the prosecution history can often inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution. . . .

Phillips, 415 F.3d at 1317 (citations omitted).
The Federal Circuit then addressed the role of extrinsic evidence -- dictionaries, as well as other types (e.g., expert and inventor testimony and treatises). Id. Extrinsic evidence should only be considered "in the context of the intrinsic evidence," but remains a permissible secondary aid in helping the court determine what a person of ordinary skill in the art would understand claim terms to mean. Id. at 1319. In this context, the court reconsidered the precedent established by Texas Digital Systems, Inc. v. Telegenix, Inc., 308 F.3d 1193 (Fed. Cir. 2002), the "leading case" in a series of cases establishing a presumption in favor of dictionary definitions. Phillips, 415 F.3d at 1319. Under the Texas Digital approach, the presumption could be overcome only where the patentee explicitly set forth a different definition of the term or where "the inventor has disavowed or disclaimed scope of coverage, by using words or expressions of manifest exclusion or restriction." Id. The Phillips court found a presumption in favor of dictionary definitions to be inconsistent with its rulings that "the specification is the single best guide to the meaning of a disputed term." Id. at 1321 (quoting Vitronics, 90 F.3d at 1582). The Federal Circuit further explained that:

The main problem with elevating the dictionary to such prominence is that it focuses the inquiry on the abstract meaning of words rather than on the meaning of claim terms within the context of the patent. Properly viewed, the "ordinary meaning" of a claim term is its meaning to the ordinary artisan after reading the entire patent. Yet heavy reliance on the dictionary divorced from the intrinsic evidence risks transforming the meaning of the claim term to the artisan into the meaning of the term in the abstract, out of its particular context, which is the specification.

Id. at 1321. Although cautioning against giving undue weight to dictionaries, the court emphasized that judges may, in their discretion, make appropriate use of dictionaries within the context of intrinsic evidence. Id. at 1322.

With this clarification by the Federal Circuit in mind, the Court now turns to whether the Intex I claim construction decision is consistent with the principles articulated in Phillips, and in particular the secondary role assigned to dictionaries. This Court concludes that no change in the claim construction decision is warranted. The decision is properly based primarily on the intrinsic evidence, and looked to dictionary definitions to "buttress" that conclusion, consistent with Phillips. Hence, although this Court's discussion of claim construction post-Phillips would be somewhat different, the result of the analysis does not change.

The Court's claim construction decision began with a review of the legal standards generally governing claim construction. Although Metalast is correct that the decision recited the presumption in favor of dictionary definitions from Texas Digital, the decision placed significant reliance on the principle that "courts should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification, and if in evidence, the prosecution history." Intex I, 245 F. Supp. 2d at 68-69 (quoting Vitronics, 90 F.3d at 1582) (emphasis added).

Thus, the first section of the Court's analysis looked only at intrinsic evidence -- that is, the claim language, the context of the language, and the drawings accompanying the patent. The Court first observed that the claim language, standing alone, favored Intex's proposed construction of "smooth," although also noting that Metalast's proposed meaning of "unitary" or one-piece was not implausible. Id. at 71. The decision then analyzed the term "in the context of the other language of Claim 1," which strongly favored the construction of "smooth" for two reasons. Id. First, the term "uninterrupted" applies to and modifies only "inner surfaces," and not "sleeves." Id. This placement of the words strongly suggests that "the surface of the sleeves must be uninterrupted (and hence smooth), not that the sleeves must be uninterrupted (and hence arguably unitary)." Id. (emphasis in original). The decision further noted that "Metalast's position ultimately is really that the ladder rungs (having sleeves at each end) are to be unitary or one-piece," a construction "even further from the actual words as used in the claim, in which uninterrupted modifies surfaces, not sleeves, and certainly not ladder rungs." Id. at 72.

The decision next looked at the phrase "for receiving therethrough said rigid uprights" which immediately follows the term "uninterrupted inner surfaces." Id. The Court found that this phrase further supported the conclusion that "uninterrupted inner surfaces" means "smooth" because smooth inner surfaces will "facilitate sliding the uprights through them, whether or not the sleeves are unitary." Id. A unitary or one-piece sleeve, it was noted, would fail to serve this function if the sleeves have protrusions, gaps, or recesses. Id. The Court found that additional language throughout Claim 1 supported the interpretation of "uninterrupted" as "smooth" or "uniform" based on the differentiated language used to discuss the separate split sleeve, which had a "split," a "recess," and a "protrusion." Id.

The decision also relied on the drawings that are part of the 041 patent as intrinsic evidence that further supported this construction. Id. The Court explained that Figure 1, which depicts the sleeve at the end of a rung, shows the "inner surface"
of the sleeve as smooth. Id. Furthermore, Figure 2, an axial cut-out showing an elevational cross-section of the attachment of the rung to the upright, depicts the inner surface of the sleeve as smooth, but in contrast depicts the two parts of the uprights with gaps, recesses, and protrusions. Id.

Based on this intrinsic evidence, the decision then stated that "the Court concludes that the ordinary meaning of uninterrupted inner surfaces' to one skilled in the art is considerably more likely to be smooth' than unitary,' given the words employed, their context, and the accompanying drawings." Id.

Only after this initial construction did the Court consider dictionary definitions. Id. at 73. Although the Court again acknowledged that pursuant to Texas Digital there was (at the time) a presumption in favor of dictionary definitions, the Court did not rely on that presumption to reach its construction. Rather, as recounted in detail above, the Court relied on the claim language and the drawings to reach the construction of "uninterrupted" as "smooth" or "uniform," and then considered whether the dictionary definitions were consistent with that construction. This is reiterated in the final paragraph of the decision's section on dictionary definitions, which states: "The dictionary definitions are more consistent with an interpretation of uninterrupted inner surfaces' as meaning smooth or uniform', and hence provide support for that construction as drawn, in the first instance, from the claim language and context itself." Id. at 74 (emphasis added).

The Court did give less weight to one type of intrinsic evidence -- the prosecution history -- a point on which Metalast now relies very heavily. The Court conducted a detailed review of the prosecution history (aided by both sides' expert witness assessments), focusing on changes Metalast made to the claims to distinguish its ladder design from that granted to another ladder, U.S. Patent 1,349,125 ("the Full patent"). Id. at 75-78; see also Patent File History at M00670-76 (Casano Decl. Ex. B (filed Sept. 23, 2002) ("Patent File History"). The Court concluded that "the more persuasive reading of the prosecution history may be that it focuses on distinguishing the 041 patent from the Full patent in terms of simplicity of construction and number of parts, but there is also a plausible reading that it focuses on ease of sliding (i.e., smooth surfaces without protrusions), which is likewise a simpler construction." Id. at 78. The Court further explained that the prosecution history was not dispositive because "more importantly, [it] is subject to some inherent doubt given that it was provided by a patent attorney attempting to overcome the examiner's rejection, but who did not rely on the original Spanish-language patent and cannot remember what he meant in any event." Id. Giving lesser weight to prosecution history where it is ambiguous is consistent with the recognition in Phillips that prosecution history is important but may be "less useful for claim construction purposes" in some circumstances. See Phillips, 415 F.3d at 1317. Indeed, the circumstances in this case are precisely the context -- "an ongoing negotiation between the PTO and the applicant" -- that led the Phillips court to recognize the need for caution in relying on prosecution history. See id. Thus, the Court properly exercised its discretion to give less weight to the prosecution history here.

Although some references to Texas Digital and similar cases were made in declining to give greater weight to the prosecution history over and above the "ordinary meaning" of the claim terms, the Court's intent -- as evidenced by the decision read in its entirety -- was to discount the prosecution history because of the flaws described above. In addition, the "ordinary meaning" of the claim terms, as used in that section of the decision, clearly refers to the "ordinary meaning" discerned from the claim language, context, and drawings, as buttressed by dictionary definitions -- not to the "ordinary" dictionary meaning alone. See id. at 78-79.

In summarizing the claim construction outcome, the Court again emphasized the paramount role of intrinsic evidence in ascertaining the ordinary meaning of the term to one skilled in the art of ladder design:

'[The] ordinary meaning, based on the claim language, context and drawings, as well as dictionary definitions, and confirmed by the extrinsic evidence of Ver Halen's expert testimony, is that "uninterrupted inner surfaces" means smooth or uniform inner surfaces of the sleeves located at the ends of the ladder rungs of the 041 patent.

Id. at 79. Thus, based on this review of the claim construction decision, as well as the patent and prosecution history, the Court concludes that the methodology employed in the original decision is consistent with the clarified framework set out in Phillips because it relies primarily on intrinsic evidence to construe the claim and assigns only a secondary role to dictionary definitions and other extrinsic evidence. More importantly, consideration and application of Phillips in this case does not change the Court's claim construction determination.
11. Multi-precision arithmetic unit

The parties largely agree on the construction of "multi-precision arithmetic unit" with one exception. The plaintiffs contend that the "multi-precision arithmetic unit" is "a unit that can perform addition, subtraction, multiplication, division, and other integer and floating point arithmetic operations on data streams of varying sizes." The defendants object to the plaintiff's proposed construction on two grounds. First, the defendants contend that the term "unit" refers to a defined circuit block, and not circuitry distributed across the media processor, as the plaintiff argues. Second, the defendants further contend that the language "other integer and floating point arithmetic operations" should not be included in the construction. Thus, the defendants propose the following construction of "multi-precision arithmetic unit" -- "a unit that can perform addition, subtraction, multiplication, division, and other arithmetic operations on data streams of varying sizes." The 840 patent provides as follows:

Many of the logic blocks themselves can also replaced [sic] with a single multi-precision arithmetic unit, which can be internally partitioned under software control to perform addition, multiplication, division, and other integer and floating point arithmetic operations on symbol streams of varying widths while sustaining the full data throughput of the memory hierarchy.

'840 patent, col. 2, 11. 58-65. Based on the cited portion of the specification, the court is persuaded that the plaintiff's construction is correct and adopts it. The court declines to further define "unit" to require a single circuit block.

C. Disputed phrase: "said connectors being unitary"

The disputed phrase is located in Claim 2 of the patent. This claim involves the connectors that permanently connect the liner to the bag. Figures 6 and 7 of the patent illustrate the concept at issue in this claim. Plaintiff proposes this claim should be interpreted as "an undivided component that extends between the bag and the liner and is connected to the bag and the liner." Defendant proposes this claim should be interpreted as "each connector being of a one piece construction." The dispute is whether the connectors must be constructed from a single piece of material. Plaintiff relies on both intrinsic and extrinsic evidence for the conclusion that the connector must simply be undivided, rather than constructed from a single piece of material. Plaintiff argues the dictionary defines "unitary" as "not divided." Plaintiff argues, in the patent, Claim 13 is dependent on Claim 2. In Claim 13, the connectors are described as comprising "two strips of overlapped plastic film heat sealed together." (Patent No. '472 Col. 5, lines. 60-62.) When formed, the connectors are thus undivided components, even though they are not a one-piece construction. Plaintiff argues the specification contains two embodiments of the connectors, neither of which support Defendant's language. The patent describes the connectors in Figures 6 and 7 as follows:

Preferably, each tab [] is a loop of fiber reinforced adhesive tape with overlapped runs adhered together and end portions [] adhered to an end portion of the liner. If a large number of liners [] are made, it may be economically desirable to make the tabs [] of two pieces of plastic film heat sealed together and integral with panel portions forming an end of the liner in a manner similar to that of making the tab[].

(Patent No. '472 Col. 3, lines 58-65.) Finally, Plaintiff relies on the prosecution history to support its interpretation of the word "unitary." The patent examiner ultimately found Claim 2 patentable after it was amended. (Pl. Ex. D at 8.) The patent examiner distinguished the Cuthbertson patent, which used straps as connectors. (Id.) The examiner concluded the Cuthbertson connectors, as well as the connectors in all other references to prior art, were not "unitary" and therefore this patent's connectors were not covered by prior art. (Id. at 8-9.)

Defendant argues the word "unitary" is most commonly used to reference a single piece construction. Defendant argues the embodiments of Figures 6 and 7, which demonstrate unitary construction through a single piece of tape folded on itself, distinguishes this construction from the embodiments in Figures 1 through 5.
The plain language of Claim 2 is somewhat ambiguous and, standing alone, does not resolve the dispute as described by the parties. Claim 13 expressly describes a connector as two strips of plastic that are heat sealed. On the other hand, Claim 10 describes a connector as a loop of fiber reinforced tape. Whether the connector is constructed of a single piece of material or whether it is multiple pieces of material fused together to form something unitary is not clarified by the language in Claim 2 or by the language in the other claims. The description of Figures 6 and 7 provides two embodiments for the connector. One embodiment is a loop of tape. The other embodiment is two pieces of plastic heat sealed together. Accepting Defendant's interpretation of the disputed phrase necessarily excludes one of the two embodiments of the connector contained in the specification. The patent examiner's comments in the prosecution history supports Plaintiff's interpretation of the disputed phrase. The patent examiner distinguishes a strap system, which was not unitary, from either of the two embodiments contained in this patent, which are unitary. As aptly stated by Plaintiff in its reply, "unitary" refers to the resulting product, not the components used during the construction process. Plaintiff's construction of the claim is persuasive and supported by the evidence. The claim at issue is interpreted to mean "an undivided component that extends between the bag and the liner and is connected to the bag and the liner."

The court held a two-day hearing to construe Claim 1 of the '437 patent, which claims:

Foldable playyard, comprising:

a unitary central hub member.

a lower frame assembly comprising corner leg connecting members and hub legs each pivotably coupled at one end portion thereof to said hub member and pivotably coupled at an opposite end portion thereof to one of said lower frame assembly corner leg connecting members such that said hub legs are collapsible by pivoting said hub legs from a substantially co-planar spread configuration wherein said hub legs diverge radially outwardly from said hub member to a compact non-coplanar configuration wherein said hub legs are substantially parallel.

an upper frame assembly comprising corner rail connecting members and side rail means each comprising a pair of side rails and a medial rail connecting member disposed therebetween, each of said rails being pivotably coupled at one end portion thereof to one of said upper frame assembly corner rails connecting members and pivotably coupled at an opposite end portion thereof to said medial rail connecting member such that said pair of rails is collapsible by pivoting said rails from a substantially in-line configuration to a substantially V-shaped configuration, and

corner legs interconnecting said upper and lower frame assemblies, each fixedly coupled at one end portion thereof to one of said lower frame assembly corner leg connecting members and fixedly coupled at an opposite end portion thereof to one of said upper frame assembly corner rail connecting members such that said corner legs are collapsible radially inwardly towards said hub member from a substantially parallel configuration wherein said corner legs are spread apart by said hub legs and side rail means to a substantially parallel compact configuration wherein said corner legs are drawn together by said hub legs and side rails means.

At the hearing, the court heard the arguments of counsel and testimony from the parties' legal and technical experts. The court also reviewed the text of the claim and the prosecution history of the '437 patent. The court defined the term "unitary"
central hub member," which was the only portion of the claim that was in dispute, as a single device comprising at least two parts pivotably coupled to and centrally located among the lower frame assembly, that enables corner legs, hub legs and side rails to collapse into a substantially parallel compact configuration without the need to disassemble fabric or other components of the structure or to release a latch or lock on the corner legs to permit the corner legs to collapse.

(Tr. 10/30/95 at 19.)

To succeed on a claim of literal infringement, a party must prove by a preponderance of the evidence that each limitation in the asserted claim is found in the accused device. Baxter Healthcare Corp. v. Spectramed, Inc., 49 F.3d 1575, 1583 (Fed. Cir.), cert. denied, 116 S. Ct. 272 (1995). When a claim does not read exactly on an accused device, the claim has not been literally infringed. Johnston v. IV AC Corp., 885 F.2d 1574, 1580 (Fed. Cir. 1989).

Century's technical expert, Manuel Raefsky ("Raefsky"), testified that three of the elements of Claim 1 of the patent-in-suit and the court's definition of "unitary central hub member" are not found in the accused device. First, the court's definition of "unitary central hub member" required that this component be a "single device." Raefsky testified that the hub in the Fold 'N Go is not a "single device," but rather is comprised of three devices: two leveling plates and a connecting link. (Tr. 11/27/95 at 54-55, 154.) He further testified that if the Fold 'N Go's hub were made into a single device, by drilling or attaching the connecting link to the leveling plates, the hub could not fold and the playyard could not operate in the way it was designed. Id. at 55.

Second, the court's definition of "unitary central hub member" required that the component be "centrally located among the lower frame assembly." Raefsky testified that the three devices that comprise the Fold 'N Go's hub are not centrally located, but rather that two of the devices -- the leveling plates -- are "off center." Id. at 59. Raefsky also stated that, if he were to view the leveling plates and the connecting link as a single device, the hub would be centrally located, but it would not work. Id. at 59-60.

Third, the language of Claim 1 describes hub legs that "diverge radially outwardly" from the unitary central hub member. Raefsky testified that the hub legs on the Fold 'N Go do not "diverge radially outwardly" from the unitary central hub member because a radius requires a straight line and the hub legs are bent, not straight. Id. at 64. In addition, Raefsky testified, the hinge pins to which the legs were fastened formed a rectangle, not a circle. Id. Therefore, because the term "radial" applies only to circles, the legs diverging from the rectangle could not be "radial." Id. at 64-65. Rather, the hub legs intersected with the hub in the form of a "chord." Id. at 65.

Having testified to the above facts, Raefsky concluded that at least three elements of Claim 1 are not present in the accused device. Id. at 76. Century's legal expert, Harris Zimmerman ("Zimmerman") also testified that the claims of the '437 patent "do not cover" the accused device. (Tr. 11/28/95 at 63.) Edward C. Teter, Century's former Vice President of Engineering, reached the same conclusion. (Tr. 11/27/95 at 9.)

Graco notes that its technical expert, Edward Magrab ("Magrab"), and its legal expert, Michael T. Platt ("Platt"), compared the accused device to Claim 1 and concluded that every element of Claim 1 was found in the Fold 'N Go. Graco is correct that its experts testified to those conclusions, but this fact is irrelevant in deciding a Rule 50 motion, in which the court must decide only whether there is a legally sufficient evidentiary basis for a reasonable jury to find for the prevailing party on a particular issue, and not which version of the evidence is more credible. The court must assess only whether the jury heard evidence that would support its findings, not whether the evidence might support a contrary finding. Graco cannot prevail on its motion by relying solely on the testimony of its experts.

Graco also argues that Century's arguments involve only claim construction and, presumably, not the application of the claims of the '437 patent to the accused device. The court disagrees. Century's arguments are based on whether there is sufficient evidence upon which the jury could base a finding that the Fold 'N Go did not literally infringe the '437 patent. The court already had construed Claim 1 of the patent and issued its definition of "unitary central hub member," and Raefsky merely applied that definition to the accused device.

Finally, Graco contends that the court should rule that the Century playyards have radially diverging hub legs. Under
Raefsky's conclusion that the legs do not diverge radially, Graco argues, "anyone could avoid literal infringement by moving a pivot pin (however slightly) out of the circumference of a perfect circle." (Pl.'s Reply Mem. Supp. J. as a Matter of Law at 7.) The court notes that Graco failed to raise this issue at the two-day claim construction hearing or during the trial. Thus, to the extent that Graco is asking the court to interpret the claims or evaluate the sufficiency of the evidence presented to the jury, it has failed to preserve these complaints for post-trial consideration. In addition, the court notes that the experts of both parties essentially agreed that the words and terms in the claims of a patent have significance. (Tr. 11/8/95 at 28; Tr. 11/28/95 at 64.) Graco's attorney drafted the claims and applied for the patent, which includes the word "radially." Graco's counsel selected the wording of the patent application and had the opportunity to decide whether to draft the claims narrowly or broadly. The court cannot rewrite a patent simply because the patentee realizes that one of the claims may be too narrow.

In conclusion, viewing the evidence in the light most favorable to Graco and giving Graco the benefit of fair and reasonable inferences therefrom, the court concludes that the jury had an ample evidentiary basis upon which to find for Century on this issue. For these reasons, the court will deny Graco's motion.

**4295**

1. **Unitary Central Hub Member**

Regalo contends that its current model playyards do not infringe Claim 1 because the requirement of a "unitary central hub member" found in Claim 1 of the '437 patent cannot encompass the two separate hinged members of the central hub in the Regalo playyards. 7 Regalo submits that interpreting "unitary central hub member" to include a hinged structure functionally reads the word "unitary" out of the claim, and makes the structure equivalent to just a central hub member. (Tr., dated 7/28/00, at 15-16.)

--- Footnotes ---

7 Regalo argues that the Graco design is inconsistent with the "bifold hub" structure of U.S. Patent No. 4,688,280 ("Kohus '280" or "'280 patent"), which Regalo likens its device to. Regalo notes that the '280 patent shows the limited motion of the legs within the plane of a hub to and away from each other that is identical to the motion of the pairs of legs in the Regalo Series 1400, 1500 and 1600 playyards, and is completely inconsistent with legs moving out of a plane. (Def.'s Mem. at 5 n.3.) In response, Graco correctly argues that the description in the '280 patent of a "bi-fold" hub does not provide any guidance in construing the '437 patent claim terms. In addition, Graco points out that Claim 1 is not directed to a hub, but to an entire combination, and that the '437 patent was issued to protect the combination of elements recited in the claims as defining over the prior art, including the '280 patent. Thus, Graco contends that even if some elements of the claimed combination were known in the prior art and were not patentable individually, that does not shield an infringer using such known elements in the claimed combination which is patentable.

--- End Footnotes ---

Graco replies that a comparison of the opened/spread and closed/folded positions of the playyards to the claims reveals that the Regalo "hinged hub" operates as a unit, i.e., always remains joined together as a unitary hub in moving from the opened to the closed position. Graco asserts that such a configuration is entirely consistent with Graco's interpretation of a unitary central hub, i.e., that is a centrally located member that operates as a unit to perform the claimed function. 8 The claimed hub member, whether or not it has multiple components, allows the pivotably coupled hub legs to be drawn upwardly and inwardly to a substantially parallel configuration.

--- Footnotes ---

8 Graco contends that what this claim calls for is a combination of elements, and what unitary calls for is that the hub member be a central hub member that functions together, and that a bi-fold hub qualifies as a species of the unitary central hub because it does perform the function of one hub member. (Tr., dated 7/28/00, at 29-30.)

--- End Footnotes ---
In resolving this issue, this Court must first look to the language of the '437 patent. In addition to the language found in Claim 1, the term "unitary" is used by the patentee in column 3, lines 21-24 of the '437 patent, which read as follows:

The foldable playyard 10 includes a flexible enclosure 54 comprising side panel portions 56, 58, 60, 62 and a floor portion 66. These portions of the enclosure are stitched together to form a unitary flexible structure.

At oral argument on the instant motions, counsel for Graco cited the above portion of the '437 patent to argue that "the patentee is using unitary to show that a number of pieces can be put together in an assemblage, so that they act as one." (Tr., dated 7/28/00, at 23-24.) We adopt this common-sense interpretation, especially in light of the parties agreement that the unitary central hub member can have multiple parts that act as one piece. Thus, this Court finds that the term "unitary central hub member" as expressed in the '437 patent does encompass the hinged hub used in Regalo's current model playyards.

Claims 1 and 5 of the '688 Patent

Claims 1 and 5 of the '688 patent are directed at the gasket means used between air duct end sections and abutting flange frames and about the corner pieces to create an air-tight seal. These claims include language describing the duct and gasket connecting means as requiring the duct end portions "to extend beyond said front surface of said corner means into abutting relation with a unitary continuous external gasket means having a uniform thickness that extends around the periphery of said duct connecting flange members and by said uniform thickness seals said duct connecting flange members and also the corner edge portions of the duct. . . ."

First, the Court construes the phrase "unitary continuous external gasket means" to require the gasket means to be a unitary (one-piece), uninterrupted gasket means having a uniform thickness that extends around the periphery of said duct connecting flange members and also the corner edge portions of the duct.

5 See File History to the '688 patent, Amendment to Ductmate's '688 patent dated February 20, 1990 at 8-9. Plaintiff Ductmate states the amendments "now specifically define the only seal for the corner edge portions as being the unitary gasket that also seals the flange members." Ductmate further states that the amended claims provide a means "whereby a seal is created at the corner sections of the duct solely by means of the gasket and without the addition of any packing strip or additional packing material." Id.

1. Language in Dispute: "A double lumen catheter comprising an elongated unitary tube including an integral septum…"

Does "unitary tube" mean (1) the tube and tip are a single unit or (2) a tube and tip are of single-piece construction (i.e. integrally formed)?

Answer: "Unitary tube" means the tube and tip are a single unit.
The claim language says "elongated unitary tube including integral septum." Integral means one-piece formation, as opposed to bonded, which is a two-piece construction. The patent does not say integral tube including integral septum. If that were the case it would be clear that the claim only covers a tube formed from a single piece and a septum formed from one piece. However, that is not what we have in claim 19.

The words integral and unitary are two different terms which are presumed to have two different meanings. Comark Communications, Inc., 156 F.3d at 1182. The patent, the prosecution history and the common usage of the terms all suggest "integral" means being formed from one piece of material while "unitary" requires the object be a single unit. Therefore, the adjective "unitary" describing the tube, requires that the elongated tube including its tip and integrated septum, be a single unit in the completed catheter product.

b). Written Description

The specification in the patent supports the construction that the elongated tube must be one unit in the completed catheter, but may be manufactured either integrally or by bonding. The specification shows an example of a unitary tube in the figures and states the tube can be made from one piece of material or multiple pieces joined together to form one unit:

   It is readily apparent to persons of ordinary skill in the art that the tip 20 as shown in FIG. 7 is easily formed from thermo-plastic material. The tip 20 including the relative concentration of material 23 is easily molded and bonded or is integrally formed from the cylindrical tube 11 by the use of internal and external mandrels and the application of heat by any number of conventional means such as RF forming, thermal forming, or infrared forming. (’968 patent, col. 4, lines 29-37). (Emphasis added).

Thus, the written description in the patent corroborates Dr. Mahurkar’s construction.

c). Prosecution History

Arrow contends the word "unitary" requires that the entire tube, including the tip, be constructed from a single piece of material. In support of this construction, Arrow cites a passage from the prosecution history which includes a discussion of the "unitary" and "integral septum" limitations:

   Claim 21 [now claim 19] further recites a double lumen catheter comprising an elongated unitary tube including an integral divider. Edelman et al. does not disclose a unitary structure. The unitary structure prevents mis-matching of components, the clotting of blood and tips breaking off into the patient. (Def. Ex. 2 at NSHN 128717).

This passage cites the advantages of the unitary structure, but does not limit the construction of the unitary tube to integral formation from a single material. This passage was presented by Dr. Mahurkar to demonstrate that the Edelman catheter is not unitary and his is. He was not equating the word "unitary" with "integral" but rather was equating "unitary" with a single unit, and explaining that the Edelman catheter has multiple pieces (the septum and the cylinder) that are not sealed. (See Edelman et al. Patent No. 4,403,983, col. 2 lines 29-32 and 46-49).

In another section from the prosecution history it is equally apparent that the word "unitary" means a single unit. In this portion of the patent prosecution Dr. Mahurkar described the tube and tip as "unitary" and then stated that the septum is "of one-piece construction with said tube." (Def. Ex. 2 at NSHN 128764). If as Arrow contends, the words "unitary" and "integral" are synonymous, Dr. Mahurkar would not have found it necessary to describe the tube and septum separately with different adjectives. The prosecution history reinforces that the ordinary meaning of "unitary" is a single unit.

d). Dictionary Definition

The word "unitary" is best construed by its ordinary usage and accustomed meaning. Webster's defines "unitary" as "having the character of a unit: whole." (Webster's II New Riverside University Dictionary 1262 (1994)). Therefore, the word "unitary" an adjective describing the elongated tube, provides that the tube, including the septum, be a single unit in the catheter.
As discussed supra, the '968 patent was also the subject of previous litigation. Judge Easterbrook analyzed claim 19 in terms of its best mode, but did not decide the issue before this Court. In re Mahurkar, 831 F. Supp. at 1378.

**Iris**

ferromagnetic: a material that exhibits ferromagnetism, but is not magnetized

magnetic material pins: pins made of a material that is capable of being magnetized, but is not magnetized

unmagnetized magnetic material: material that is capable of being magnetized but, in the absence of an applied external magnetic field, is not magnetized

--- Footnotes ---

n5 Iris offered this proposed construction at oral argument.

--- End Footnotes ---

The focus of Iris's arguments regarding these terms is that, within the context of the patent, they all refer to material that is capable of being magnetized, but is not magnetized. Iris highlights evidence in the prosecution history where the applicant sought to distinguish prior art on the basis that the supply rolls have "no magnets." (Fink Aff., Ex. C, pt. 4, at C61-C62.) The document states:

Claim 11 [issued Claim 8] is specific to the positioning of the identifier indicia, using an unmagnetized magnetic material. This feature is very important, again, from a pollution control standpoint, because there are no magnetic materials that are utilized on the roll, but yet the reliability of a magnetic sensor can be utilized using one stationary detector of the present invention.

* * *

With the present invention the magnetic material pins are cheap, they are non-polluting, and since there are no magnets, there are no plurality [sic] requirement. They can be placed on the supports or inserted into the apertures without regard to polarity.

The doctrine of prosecution disclaimer prevents a patentee from recapturing a specific meaning that it disclaimed during prosecution. Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1323 (Fed. Cir. 2003). The disclaimer must have been clear and unambiguous for the doctrine to apply. Id. at 1324. Fargo argues that there is no clear and unmistakable disavowal of the ordinary and customary meaning of "magnetic material pins." The problem with Fargo's argument, however, is that its proposed construction for "magnetic material pins" is "pins made of a magnetic material." Yet the prosecution history clearly indicates that the "invention" has "no magnets." Neither Fargo's arguments nor its proposed definition help explain how "material" that is "magnetic" is nevertheless not a "magnet."
At oral argument, Iris offered a new definition for "unmagnetized magnetic material" to counter any objection that its previous definition might have excluded the pins in the patent because they are briefly magnetized as they pass through the magnetic field that is part of the sensor. The resulting definition, "material that is capable of being magnetized but in the absence of an applied external magnetic field is not magnetized," is a better definition than Fargo's because it avoids the ambiguity of the word "permanent." In light of the prosecution history indicating that the supply rolls have "no magnets," the Court will adopt this definition for "unmagnetized magnetic material" and a similar definition for "magnetic material pins:" "pins made of material that is capable of being magnetized but in the absence of an applied external magnetic field is not magnetized." In so doing, the Court is aware that it is defining different terms to have essentially the same meaning. Although a patentee's use of different terms normally indicates that it intended those terms to carry different meanings, a reading of the patent and prosecution history does not reveal what that difference might be in this case, and Fargo's objections to Iris's proposed definitions ignore the clear statement in the prosecution history regarding the lack of magnets.

Finally, in light of that same prosecution history, the Court will adopt Iris's definition of "ferromagnetic," modified as follows: "a material that exhibits ferromagnetism, but, in the absence of an applied external magnetic field, is not magnetized." Because Iris concedes that Fargo's definition of "ferromagnetic" is correct "in the abstract," the Court will adopt Fargo's definition of "ferromagnetic" insofar as it is necessary to define the word "ferromagnetism" in Iris's definition of "ferromagnetic."

2. "unstrained resistor"

The parties' proposed constructions are as follows:

**CTS**
- a resistor mounted to the wing section but not subject to a force derived from applied weight

**TK**
- a strain resistor whose resistance changes based on the strain from an applied force, but which is not strained by the force of weight applied on the substrate

CTS again has the better view. The abstract of the '361 patent states that the strain gage includes both a strained resistor and an unstrained resistor. This indicates that one resistor is to be subjected to strain, i.e., mechanical force, whereas the other is not. Importantly, there is no indication that the unstrained resistor must be any particular type of resistor. Indeed, it is well understood in the relevant art that resistors are electronic components that may change their resistance, and thereby the resulting electronic signal, such as by way of exposure to mechanical, light or thermal changes. See McGraw-Hill Dictionary of Scientific and Technical Terms, 6th ed., page 1794-95 (defines a general resistor as "a device designed to have a definite amount of resistance; used in circuits to limit current flow or to provide a voltage drop." and further states at page 2133 one type of resistor is a "thermistor" that changes its resistance in response to temperature changes, and its name is actually "derived from thermal resistor."

CTS' use of "a force derived from applied weight" is appropriate. The "unstrained resistor" is mounted on the wing section of the substrate. The applied force acts on the "step section." The "step section" concentrates the force onto the "center section" which is adapted to flex in response. The wing section is configured such that it does not flex even if the center section does. Therefore, the resistor is not subject to the concentrated force acting on the "center section" which necessarily is a derivative of the gravitational force acting on the "step section."

TK again seeks to have the Court interpret the claim language to limit its scope to the preferred embodiment. In urging that the claimed resistor must be a "strain resistor whose resistance changes based on the strain from an applied force," TK is essentially saying that the claimed "unstrained resistor" must be a mechanical resistor. As CTS points out, this interpretation would improperly read out other types of resistors, such as thermal resistors. Claim 5 does not say "strain resistor." Rather, claim 5 simply states "resistor" and includes no restriction on the type of resistor, let alone a "strain resistor" that changes resistance based on strain from an applied force, as TK suggests. There is no clear and unmistakable indication that the unstrained resistor must be a mechanical strain resistor. The unstrained resistor is simply any type of resistor that is not experiencing any strain. In addition, "out of the strain path" refers to the configuration of the wing section, not the
unstrained resistor.

Moreover, claim 2 of the '361 patent expressly calls for strained as well as unstrained resistors of the strain gage to be connected so as to form a wheatstone bridge. '361 Pat., Col. 5, II. 28-30. Thus, according to the doctrine of claim differentiation, the scope of claim 5 cannot be limited to only resistors that respond to mechanical strain.

As such, the Court adopts CTS' proposed interpretation. The phrase, "unstrained resistor" means "a resistor mounted to the wing section but not subject to a force derived from applied weight."

D. Claims 1 & 9: "unstretched original length"

The parties generally agree that this claim should be defined as "the length of the stretched plastic film before mechanical elongation." Pliant seeks to add the word "solid" before stretched plastic film, so as to distinguish this element of the claim from the processes for producing plastic film. Yet there is no basis in the specification (or elsewhere) for adding this term. Pliant's proposed construction is unnecessary given the unambiguous meaning of the claim language and is potentially confusing. Therefore, the term "unstretched original length" is construed as "the length of the stretched plastic film before mechanical elongation."

E. "Upon"

Testing in Claim 8 comprises, inter alia, "performing predetermined operations which provide a predetermined expected response from the removable article upon the existence of correct alignment and electrical contact." As with "when," the parties dispute whether the response must be given "as soon as" the existence of correct alignment and electrical contact is detected or whether the response is given "on condition that" alignment and contact are detected, against without a temporal limitation.

The ALJ determined that "upon" had no temporal component. ID at 51 & n.18. The Commission did not review that decision.

This Court finds that for many of the same reasons that "when" is construed in its temporal sense, "upon" must also mean "as soon as." Like "when," the term "upon" has as an ordinary meaning either construction. To determine which prevails, attention must be given to the purpose of the claim in question. See Renishaw, 158 F.3d at 1251-52. As a dependent claim, Claim 8 shares independent Claim 1’s purpose in the testing step "to facilitate the rapid placement in contact because as soon as this has been done, the process stops." Col 2, Ins 23-24. Because "stopping . . . when" requires a rapid response to the existence of correct alignment and electrical contact so too does the predetermined expected response to those conditions require a rapid response to provide for rapid stopping.

G. "upon activation"

The parties dispute the meaning of the term "upon activation" as it appears in claims 37, 38, 39, 41, 42, 43, 45, 46, and 47 of the '748 Patent. Synovis contends that no construction is necessary, but if the Court decides to construe the term, it should be construed as "immediately following or very soon after activation." (Joint Statement at 22.) Gore, on the other hand, asserts that the Court should construe "upon activation" as "as a result of activation." (Id.) The difference between the parties' proposed construction centers on the requirement in Gore's proposed construction of a causal relationship between the activation of the stapler and the severance of the second region.
Synovis asserts that its construction captures the commonly understood meaning of the work "upon," which connotes a temporal relationship between events. In support of its proposed construction, Gore cites to portions of the specification, which, it argues, supports a causal relationship. These include the following: "The former region is severed and discarded upon activation of the stapler to form an anastomoses." (Abstract.) "[T]o permit the removal of one or more portions of a second region of the buttress material upon activation of a stapler knife provided by the stapler." ('748 Patent c. 2, 11: 52-55); "Preferably, the one or more portions of the second region are adapted to be removed from the tissue site upon activation of the stapler knife." ('748 Patent c. 3, 11: 44-47); "Simultaneously, or thereafter, the distal end of an annular scalpel (40) is extended through the sandwiched tissue and buttress material, until it bottoms out in a recessed annular ring within the anvil, thereby severing an inner ring of the sandwiched tissue/buttress material." ('748 Patent, c. 6, 11: 38-41.) Gore maintains that the specification makes clear that the second region is severed from the first region as a result of the activation of the stapler.

The Court concludes that the term "upon activation" does not require a causal relationship between two events. For example, claim 37 provides in part: "wherein one or more portions of the second region [of buttress material] are adapted to be removed from the tissue site upon formation of the staple seam and activation of a stapler knife." Nothing in the claim language or specification suggests that the use of the term "upon activation" requires the activation of the stapler knife to cause the removal of the second region of buttress material. Therefore, the Court believes that the use of Gore's proposed construction would only add confusion to an otherwise understandable term. Thus, the Court declines to construe the term.

1. "upon plug" (claims 1 and 6)

The parties agree that the term to be construed should be "upon plugging" rather than "upon plug." The plaintiff argues that the plain meaning of "upon plug" is "after plugging." The plaintiff states that there is no time limitation associated with this term and that it should not be construed to include a causal limitation.

The defendant's position is that events occur in the claims only after the portable storage device is plugged into the USB or IEEE 1394 interface. Therefore, the subsequent events must be direct consequences of plugging in the device. The defendant argues against the plaintiff's construction by, inter alia, stating that construing "upon plug" to mean "after being plugged in" is no limitation at all. But the defendant fails to provide a tenable argument to the court for further limiting the claim term.

The specification makes it clear that various events occur when the external storage device is plugged in. The specification, however, does not support importing a causal limitation into this claim term. For example, consider the following passages from the specification:

When the external storage device is plugged into the data processing host, the firmware coordinates with the driver in the operating system to accomplish the initialization of the device.

Col. 4, ll. 32-35.

When the external storage device is plugged into the data processing host, the driver coordinates with the firmware to accomplish the initialization of the device and notifies the operating system to assign and display a device symbol for the external storage device (steps S2, S2), then waits for the operation request.

Col. 4, ll. 47-52.

The defendant fail to support its argument that "upon plug" must require the limitation "as a direct consequence." The record does not support that limitation.

The court defines "upon plug" to mean "after being plugged in."

GO BACK
5. Claim 1 - "upper edge"

Bradford proposes that "upper edge" means "an extremity higher in place or position." Defendants suggest that "upper edge" means an "edge that faces upwardly (e.g., it does not face sidewardly)". "Upper edge" is a further limitation on the "dunnage structure" in that, inter alia, "the dunnage structure has an upper edge with a longitudinal axis." The dispute here is whether "upper edge" imposes a limitation as to the container's loading orientation, i.e., whether it is top loading only or whether the patent also claims a side-loading container. The Court concurs with Defendants' proposed definition of "upper edge".

Initially, as Defendants correctly argue, in prosecuting the '096 Patent, which is a continuation in part application of the '916 Patent, which in turn is a divisional application of the '119 Patent, Bradford distinguished the invention claimed in the '096 Patent from the '119 Patent to overcome the Examiner's rejection on the grounds of obviousness-type double patenting. Specifically, Bradford argued:

Claims 1-18 are also rejected under the judicially created doctrine of obviousness-type double patenting over the Bradford et al. patent, as modified by Rader. However, as illustrated in Bradford et al., the container therein, and its associated dunnage, is accessed from the top of the container. As such, the Bradford et al. reference clearly does not teach a dunnage structure having an open end which is in alignment with an open area of a side structure to allow access of the dunnage structure for transferring product into and out of the dunnage structure from a side of the container.

Doc. No. 48-4, at 8. Thus, the prosecution history indicates that even Bradford believes that the '119 Patent does not teach a container in which the dunnage structure is accessible from the side. See Laitram Corp. v. Morehouse Ind., Inc., 143 F.3d 1456, 1462 (Fed. Cir. 1998) ("Regardless of the examiner's motives, arguments made during prosecution shed light on what the applicant meant by its various terms."). Therefore, the prosecution history supports Defendants' contention that "upper edge" requires an upward orientation.

The Court further observes that the drawings of the various embodiments in the '119 Patent show containers in which the dunnage structure has an upward orientation. The lone possible exception is the embodiment shown in Figures 4 and 5. As discussed earlier, this embodiment of the invention utilizes folding or telescoping legs to collapse the container. While it is technically possible to access the dunnage structure from the side in this embodiment, the top member of the frame obstructs the top portion of the dunnage structure. Thus, side loading with this embodiment does not permit utilization of all of the available shipping volume in the container. The result would be that the shipper would use more shipping space than was actually needed to ship his product. Consequently, using the claimed invention in this manner would be inefficient and counter to the stated objective of reducing "the overall shipping costs associated with shipping product." '119 Patent, col. 2, ll. 44-46. See, e.g., Carroll Touch, Inc. v. Electro Mech. Sys., Inc., 15 F.3d 1573, 1578 (Fed. Cir. 1993) (rejecting patentee's proposed claim construction on the grounds that the invention would then be unable to achieve its stated objective).

The Court concludes that the "upper edge" must be facing upwardly. Accordingly, the Court holds that "upper edge" means an "edge that faces upwardly (e.g., it does not face sidewardly).

4305

1. Upper Handguard Piece

Troy proposes construing "upper handguard piece" as meaning "a front grip for a firearm to protect the hands of the user from the heat of the barrel, which attaches to the upper receiver." ARMS proposes a definition of "a device for use on a firearm that surrounds, at least partly, but does not touch, the top of the barrel."

Figure 5 from the '465 Patent depicts the upper handguard piece and the lower handguard piece:

[SEE FIG. 5 IN ORIGINAL]
Both parties define "upper handguard piece" using limitations not found in the claims. Particularly, Defendants seek a limitation of attachment to the upper receiver via a receiver sleeve. They argue that because every mention of "upper handguard piece" in the specification is accompanied by a reference to a receiver sleeve, the term should be construed to include attachment to the upper receiver via a receiver sleeve. See, e.g., '465 Patent col. 6, ll. 39-41, col. 10, ll. 22-25. This, however, is an attempt to import needless limitations from the specification.

Defendants also argue that because the '465 Patent repeatedly defines "the present invention" to include attaching the upper handguard piece to the upper receiver via a receiver sleeve, "upper handguard piece" must be construed to include attachment to the upper receiver via a receiver sleeve. The phrase "the present invention" may limit the meaning of claim terms if a contrary result is not warranted. See Netcraft Corp. v. Ebay, Inc., 549 F.3d 1394, 1398 (Fed. Cir. 2008). However, the phrase does not limit the meaning of claim terms "automatically," and "such language must be read in the context of the entire specification and prosecution history." Id.

Here, the prosecution history is revealing. The '465 Patent is a reissue of the '245 Patent. Although the specification remained the same in the reissued patent, claims 11-36 were newly added. As Richard Swan, the inventor of the '245 Patent, declared during the prosecution of the reissue patent, he was seeking the reissue patent because

[the Applicant's attorney failed to appreciate the full scope of the invention. Claims 1 and 6 are directed to a modular sleeve for attaching modular enhancements to a firearm, each reciting a universal receiver sleeve, an upper handguard, a lower handguard and a U-shaped device (yoke). The invention lies, at least in part, in the unique clamping arrangement of the yoke and the upper handguard. However, each of the claimed elements is described with narrow specificity and includes details entirely unrelated and unnecessary to define the underlying yoke invention. Failing to appreciate the full scope of the invention relating to the yoke element and its unique role in engaging the barrel nut and supporting the upper handguard on the upper receiver, the Applicant's attorney too narrowly defined the universal receiver sleeve, the upper handguard, the bottom handguard and the U-shaped device (yoke). By including overly narrow limitations in the peripheral elements and in the yoke itself, in the independent claims, all of the claims are rendered wholly or partially inoperative for protecting the full scope of the invention.

(Pl.'s Br. in Resp. Ex. 7 at 2.) The prosecution history thus reveals that claim 31 was added in part because the earlier patent had too narrowly defined the upper handguard and understated the support provided by the U-shaped device. Original claims 1 and 6 specifically state that the upper handguard piece is "joined to the underside of the forward portion of the receiver sleeve," and the receiver sleeve, in turn, is "fixedly attached to the firearm receiver top." '465 Patent col. 11, ll. 33-34, 40-42; '465 Patent col. 12, ll. 62-64, col. 13, ll. 3-5. Additionally, the U-shaped device is not described as providing support to the upper handguard. '465 Patent col. 11, l. 63 - col. 12, l. 15; '465 Patent col. 13, ll. 28-50. Newly added claim 31, on the other hand, does not describe the upper handguard piece as connected to the receiver sleeve or upper receiver, and describes the U-shaped device as "engag[ing] . . . [the] barrel nut and thereby support[ing] [the] upper handguard piece relative to [the] barrel nut." '465 Patent col. 17, ll. 10-12. Claim 31 thus eliminates the requirement that the upper handguard piece be connected to the upper receiver via a receiver sleeve, such that "upper handguard piece" is no longer "too narrowly defined," and describes the U-shaped device's "unique role in engaging the barrel nut and supporting the upper handguard on the upper receiver." (Pl.'s Br. in Resp. Ex. 7 at 2.)

In response, the Defendants argue that the prosecution history actually favors them, because Swan's declaration refers to the yoke element's "unique role in engaging the barrel nut and supporting the upper handguard on the upper receiver," thereby indicating that the upper handguard must be attached to the upper receiver via a receiver sleeve. (Id. (emphasis added).) The language of claim 31, however, indicates that the barrel nut is attached to the upper "barrel receiving receptacle" at the forward end of the receiver. As the upper handguard is supported by the yoke and barrel nut, the upper handguard is therefore supported on the barrel nut at the barrel receiving receptacle on the upper receiver. '465 Patent, col. 16, ll. 62-67 (the "receiver [has] . . . a barrel receiving receptacle," and the "barrel nut [is] received around . . . [the] barrel receiving receptacle"). While the Swan declaration does have some ambiguity, it does not support the Defendants when the claim language is viewed in its entirety. The prosecution history thus indicates that the use of the phrase "the present invention" does not limit the meaning of "upper handguard piece" to require attachment to the upper receiver via a receiver sleeve.

Construing "upper handguard piece" not to require attachment to the upper receiver via a receiver sleeve also satisfies the doctrine of claim differentiation. While the claims in the initial patent describe the upper handguard piece as attaching to the
upper receiver via a receiver sleeve, claims 31-36 do not. Terms should not be construed in a way that "wound render additional, or different, language in another independent claim superfluous." Curtiss-Wright Flow Control Corp. v. Z & J Techs. GmbH, 563 F. Supp. 2d 1109, 1118 (C.D. Cal. 2007). If "upper handguard piece" were construed to require attachment to the upper receiver via a receiver sleeve, the language in the earlier claims specifically noting the attachment would be rendered superfluous.

Thus the plain meaning of the term controls. The term "upper handguard piece" plainly refers to the upper portion of the handguard, that is, the portion which is situated above the barrel. Nothing in claim 31 specifies any other limitation.

As used in claim 31 of the '465 Patent, "upper handguard piece" means the portion of the handguard located above the barrel.

D. "First and Second Upper Mounting Portions"

The phrase "first and second upper mounting portions" is found only in Claim 6 of the '803 patent, and refers to the upper mounting surfaces of the top of the steel frames. TBC's proposed construction seeks to incorporate the same "downward angle" limitation described above into the definition of the claim term. Specifically, TBC proposes the claim term be defined as: "A first mounting portion comprising a first surface on the vertical frames and a second mounting portion comprising a second surface on the vertical frames inclined at a downward angle in relation to the first surface." As set forth below, the Court rejects TBC's proposed construction.

The specification describes the top of the steel frame as "preferably" inclined, so that the upper surface of the second rail extrusion, when mounted, will be (automatically) disposed at a downward angle with respect to the upper surface of the first rail extrusion. There is nothing in the claim language of the '803 patent or the common specification to suggest that this preferred embodiment of the steel frames should constitute the outer limits of its construction. In other words, there is nothing to suggest that in all embodiments of the invention, the first and second mounting portions of the steel frame must be disposed at any relative angle of incline. TBC has provided no persuasive reason for importing a downward angle limitation into the definition of the upper mounting portions of the steel frames in the '803 patent, particularly where that limitation is not found in the claims of either the earlier '088 or '712 patents.

Thus, the Court adopts Forecast's proposed construction of "first and second upper mounting portions": "First and second portions of a top of the vertical frames to which an object may be mounted."

4. Claim 1, Element 4, "upper and lower portions"

BMS defines "upper and lower portions" in some detail as follows:

"The upper portion of a side jamb is that portion which is in contact on an upper end with a top jamb and whose lower end is protected by the lower portion from environmental factors. The lower portion is that portion of a side jamb in contact with the lower end of an upper portion, that substitutes a material other than natural wood for what would other wise be natural wood in a standard side jamb thereby protecting the lower end of the upper portion from environmental factors."

Endura counters with a three-part proposal, in which:

(a.) '"Portion' means some part that is less than the whole;" (b.) '"Upper' means that it is relatively vertically higher than a portion that is lower;" and (c.) '"Lower' means that it is relatively vertically lower than a portion that is upper."

BMS's proposal would use the definition of three words to describe virtually the entire invention. If this definition were
accepted there would be no need for anything in claim 1 after the words "integrally formed." Endura's proposal is somewhat circular, as it describes "upper" as above "lower," and "lower" as above "upper," which is an inherent problem in defining some very basic words which indicate relative position.

The claim describes "upper and lower portions" in the context of side jambs, which by their nature are understood to be vertical. Not every word in a patent is a technical term, and the common meaning of "upper" is "higher in physical position." Merriam-Webster's Collegiate Dictionary 1294 (10th ed. 2002); see also Websters Encyclopedic Unabridged Dictionary of the English Language 1570 (1989) ("higher, as in place . . . ."). In some contexts it might not even be necessary to provide the jury with a definition of such words, as they could simply be instructed that words which are not defined are to be given their common everyday meaning.

However, in this case, underlying technology could make the terms "upper" and "lower" confusing, without a definition. This is because the side jambs are "engineered," that is, constructed from a number of pieces of wood. The invention simply uses a durable material to replace the lowest of the pieces which are joined together to produce the jamb. Therefore, there may be any number of pieces of wood which may be higher than, or above, other pieces, when the jamb is in place. It would not be helpful to leave an inference that the durable material of this invention could be one of the intermediate pieces. Therefore the court defines these claim terms as follows:

"upper portion" means: "that part of the jamb, which is less than the whole, made up of one or more pieces joined together, and which is higher in physical position in the jamb than the lower portion."

"lower portion" means: "the part of the jamb different than the upper portion, which is joined to the lower end of the upper portion."

4. "Upper surface"

Microthin urges the Court to construe "upper surface" to mean "surface of the plastic sheet that is opposite the lower surface and faces away from the surface on which the mat or pad rests, it is the surface that is contacted or acted upon by the user." SiliconeZone again argues that "upper surface" has a plain and ordinary meaning understandable to the ordinary person skilled in the art such that no construction is required.

Once "lower surface" has been construed, an ordinary person skilled in the art would understand "upper surface" to be the surface opposite the lower surface. However, nothing from the claim language or the specification requires reading into the claim the added limitation that the upper surface be "contacted or acted upon by the user," nor does this limitation add any clarity in construing "upper surface." Therefore, the Court construes "upper surface" to mean "surface of the plastic sheet that is opposite the lower surface and faces away from the surface on which the mat or pad rests."

1. "Upper Surface" and "Lower Surface"

Both the method and product claims of the patents-in-suit describe the first and second garment components and the bonding element as each having an "upper surface" and a "lower surface." For example, in Claim 1 of the 779 Patent, a method claim, step (d) of the seam manufacturing process requires "folding the first garment component over the bonding element such that the upper surface of the first garment component is folded over and abuts an upper surface of the bonding element," and step (e) requires "folding a portion of the second garment component such that a lower surface of the second garment component abuts the lower surface of the bonding element." 779 Patent at 6:40-47 (emphasis added). In Claim 20 of the 779 Patent, a product claim, the seam is defined as comprising "a bonding element . . . having an upper and lower surface," "a first garment component having an upper and lower surface," and "a second garment component having an upper and lower surface." 779 Patent at 8:7-19 (emphasis added). The 615 Patent similarly uses the terms in Claims 1 and
19, method and product claims, respectively. See, e.g., 615 Patent at 6:48-51, 8:4-16. Taltech asks the Court to construe "upper surface" and "lower surface" to have different meanings depending on whether the terms appear in the method or the product claims. Regarding the method claims, Taltech construes the terms as follows:

Upper surface and lower surface are designated at the time the first set stitch is applied to fix the garment components and bonding element together, and the upper and lower surfaces of a component/element are opposing surfaces through a thickness of the component/element, providing that the upper surface and lower surface designations of the garment components remain consistent around folds required in the claim.

Regarding the product claims, Taltech construes the terms as follows:

Upper and lower surfaces of a component/element in the final seam are opposing surfaces through a thickness of a component/element, providing that the upper surface and lower surface designations of the garment components remain consistent around folds required in the claim.

The words in italics show how the two definitions differ from each other. Taltech relies on the claims, on the specifications, on the opinion of Taltech's expert, Mr. Jack Nienke, and on a technical treatise. Esquel asks the Court to construe the terms the same for method and product claims:

The terms "upper surface" and "lower surface," as applied to each of the first and second garment components and the bonding element, mean the entire surface of each that is oriented up or down, respectively, as discerned at the beginning of the seam manufacturing process when the components are flat, such that there is only a single upper surface and a single lower surface for each garment component and the bonding element and the designation of a surface as upper and lower does not change regardless of any subsequent folding or other reorientation of a garment component or the bonding element.

Esquel relies on the specifications and on the ordinary meanings of the terms.

The Court must decide four separate issues: first, whether the Court should construe the terms differently depending on whether the terms appear in method or product claims; second, when the terms must be defined; third, whether the terms require a particular orientation at the time of designation; and fourth, how to account for the manufacturing steps in the method claims and the structural folds in the product claims.

First, the Court must determine whether it may construe the terms differently depending on whether the terms appear in method or product claims. Based on the well-established patent law principle that "claim terms are normally used consistently throughout the patent," Phillips, 415 F.3d at 1314, Esquel argues that Taltech has improperly submitted two different proposed constructions to the Court, one for its method claims and one for its product claims. Although none of the cases relied upon by Esquel squarely address the consistency issue across method and product claims, the cases repeatedly recite the "rule" requiring the same construction of a claim term that appears in more than one claim in a patent. See Nazomi Commc'ns, Inc. v. ARM Holdings, PLC, 403 F.3d 1364, 1370 (Fed. Cir. 2005); Dayco Prods., Inc. v. Total Containment, Inc., 329 F.3d 1358, 1371 (Fed. Cir. 2003); CVI/Beta Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1159 (Fed. Cir. 1997). Taltech has failed to bring any case to the Court's attention that provides an exception to the rule for claim construction across method and product claims.

Instead, Taltech argues that different constructions are necessary because of another well-established patent rule, which states that product claims are not limited by a particular manufacturing process. See AFG Indus., Inc. v. Cardinal IG Co., 375 F.3d 1367, 1372-73 (Fed. Cir. 2004) (declining to "impermissibly import a process limitation into a pure product claim"); Vanguard Prods. Corp. v. Parker Hannifin Corp., 234 F.3d 1370, 1372 (Fed. Cir. 2000) ("A novel product that meets the criteria of patentability is not limited to the process by which it was made."). The Court recognizes and honors this rule, but disagrees with Taltech's application of the rule to the present case. If the Court adopts the construction that Taltech has proposed for its method claims for all claims, there would not be any impermissible importation of a process limitation into Taltech's product claims. Taltech's proposed construction for its method claims merely designates the "upper" and "lower" surfaces at the time the first set stitch is applied to fix the garment components and the bonding element together. This fixing of garment components and the bonding element together by a first set stitch is already required by the language of Taltech's product claims. In other words, Claim 20 of the 779 Patent and Claim 19 of the 615 Patent define the invention as comprising, in part, a first set stitch that fixes the garment components and the bonding element together. 779 Patent at 8:25-
30; 615 Patent at 8:17-22. Thus, Taltech's proposed construction for its method claims does not import any limitation into the product claims that does not already exist. The Court construes the terms "upper surface" and "lower surface" the same across all method and product claims.

Second, the Court must determine the point in the manufacturing process when these labels are attached. Regarding its method claims, Taltech argues that the designations should be made when the first stitch is applied. For its product claims, Taltech argues that the designations refer to the final seam. Esquel argues that the designations should be made "at the beginning of the seam manufacturing process when the components are flat." Esquel's proposed construction is vague and improperly limits the claims to require the garment components to be flat. The Court finds Taltech's proposed construction for its method claims more specific and more accurate. The first set stitch is what fixes the positions of the garment components and the bonding element with respect to each other. See Claim 1(c) of the 779 Patent at 6:37-39; Claim 1(d) of the 615 Patent 6:44-47.

This construction regarding the timing of the designation of "upper surface" and "lower surface" is consistent with the specifications. Figures 3a and 4a show that the orientation of upper and lower surfaces of the garment components and the bonding element are meaningful only when they are brought together to form a seam, which is at the point in the seam manufacturing process when the first set stitch is applied. This construction is also consistent with the extrinsic evidence. Taltech's expert, Mr. Nienke, asserts that one of ordinary skill in the art would understand that the appropriate time of designating the upper and lower surfaces is at the time of applying the first set stitch because it is at this time that the garment components are actually fixed together to build the seam. Nienke Decl., docket no. 96, P 16. The technical treatise submitted by Taltech illustrates that stitches provide meaning for the relative positions of flat or folded fabrics in seams. See Harold Carr & Barbara Latham, The Technology of Clothing Manufacture 46 (2d ed. Blackwell Sciences 1994) (docket no. 94, Ex. G at 46).

Third, the Court must determine whether the terms require a particular orientation at the time of designation. Taltech argues that the terms merely denote relative surfaces and thus no particular orientation is required. Esquel argues that the "upper surface" faces up and that the "lower surface" faces down at the time of designation. Taltech argues that "[c]ase precedent could not be more clear" that "upper and lower surfaces are not limited to those that point upward and downward, respectively." Taltech's Responsive Brief, docket no. 108, at 6 (citing Lighting World, Inc. v. Birchwood Lighting, Inc., 382 F.3d 1354 (Fed. Cir. 2004)). Taltech misreads Lighting World, which states that "[n]othing in the patent suggests that the upper surface of the support member ceases to be the upper surface if the fixture is turned upside down or placed in some other orientation." 382 F.3d at 1365 (emphasis added). Lighting World implies that an "upper surface" of an object faces up at the time of designation and then retains its "upper" designation even if it later faces some other orientation. The widely accepted and ordinary meaning of "upper" is to face up and "lower" is to face down. Taltech does not argue that a person of ordinary skill in the art would otherwise interpret the terms. These terms must be construed to carry their ordinary meaning. See Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1562 (Fed. Cir. 1991) ("All the limitations of a claim must be considered meaningful . . ."). The specifications also show a particular orientation at the time of designation. Figures 3a and 4a show the "upper surface" of the garment components and bonding element facing up and the "lower surfaces" facing down at the time the first set stitch 38 is applied, so long as the labeling in Figure 4a takes place on the unfolded portion of the second garment component. 2 See 779 Patent at 4:4-14, 5:31-42; 615 Patent at 4:5-15, 5:32-43; Figs. 3a and 4a. For these reasons, the Court concludes that a particular orientation is required at the time of designation. Lighting World does not conflict with this conclusion.

The Court declines to adopt Esquel's proposed convention for labeling the surfaces from the bottom of the seam construction and working upwards, see Esquel's Supplemental Brief, docket no. 140, at 13-15, because it improperly imports a limitation from a preferred embodiment into the claims.

Fourth, the Court must account for the manufacturing steps in the method claims and the structural folds in the product claims. Taltech's proposed construction uses language that refers to the folding of the garment components, whereas Esquel's proposed construction refers to "any subsequent folding or other reorientation of a garment component or the bonding element." Because the claims do not include any folding of the bonding element, Esquel's inclusion of the bonding element is erroneous. See Claim 1(d) and 1(e) and Claim 20 of the 779 Patent at 6:40-46, 8:10-24; Claim 1(e) and 19 of the 615 Patent at 6:48-51, 8:23-26. Furthermore, Esquel's reference to "any subsequent folding or other reorientation" is vague. Accordingly, the Court adopts Taltech's proposed construction, with modification, and construes the terms "upper surface" and "lower surface," for both method and product claims, as follows:
"Upper surface" and "lower surface" are designated at the time the first set stitch is applied, and the upper and lower surfaces of a component/element are opposing surfaces through a thickness of the component/element, providing that the "upper surface" faces upward and the "lower surface" faces downward at the time of designation along the unfolded portions of the garment components, and providing that the upper surface and lower surface designations of the garment components remain consistent around folds required in the claim.

1. Construction of Claim 12

In fulfilling its duty to construe the claims of the '244 patent, this court is free to consult "the claim language, the written description portion of the specification, the prosecution history, [as well as] extrinsic evidence." Gentry Gallery, Inc. v. Berkline Corp., 134 F.3d 1473, 1476 (Fed. Cir. 1998); Markman v. Westview Instruments, Inc., 517 U.S. 370, 384, 116 S. Ct. 1384, 1393, 134 L. Ed. 2d 577 (1996). Claim 12 of the '244 patent provides in pertinent part that each reclining seat, having a backrest and seat cushion, must be "movable between upright and reclined positions." '244 patent; col. 5, ll. 10-11. The material question regarding the construction of this portion of claim 12 is whether it requires that the backrest itself be movable or whether a "seat" can be movable between the upright position and the reclined position without the backrest necessarily moving.

Claim 12 does not specifically state whether the seat's backrest must move in order for the seat itself to be movable between the upright and the reclined positions. Likewise, the claim does not specifically define the terms "upright position" and "reclined position." However, two of the drawings GFI submitted as part of the '244 patent's specification shed light on how the terms "upright position" and "reclined position" are to be defined.

In the specification section labeled "Brief Description of the Drawings", GFI describes Figure 3A as representing the "upright" position and Figure 3C as illustrating the "reclined" position. '244 patent; col. 2. These figures clearly demonstrate that a seat cannot move between the "upright" position and the "reclined" position unless it has a movable backrest. Therefore, after careful consideration of the claim language as well as language and drawings contained in the specification, this court construes claim 12 as requiring that each seat contain a movable backrest.

Additionally, Parkhill has requested that this court construe one element of claim 12, namely column 5 lines 22-27, as being a "means-plus-function" element and subject to a structural equivalence analysis in accordance with 35 U.S.C. § 112(6) instead of a traditional doctrine of equivalents analysis. The court finds this element to be a means-plus-function element subject to 35 U.S.C. § 112(6) and it will be analyzed in accordance with the dictates of that statute.

1. "upright standing manner" (or similar)

SVA and Royal seek a construction of these terms that would require a product, at all times, to be supported from its base with its bottom end resting perpendicular on a surface. The defendants take issue with Crane's construction because they contend that it disregards the term "standing." The court is not persuaded by SVA and Royal's argument. A reading of the phrase in the context of the claim language and the specification as a whole does not suggest that the product must be, at all times, positioned as the defendants propose. This is especially true in light of the patents' "robotic arm" embodiment, in which "a robotic arm [] grasps and lifts the selected beverage container in to the carriage frame assembly," and the patent's alternate configuration in which, "[t]he beverage capture assembly further includes a . . . circular detent portion formed therein for retaining the bottom edge of a beverage container . . . ." '930 Patent, col. 14, ll. 32-34; col. 15, ll. 21-26 (emphasis added).
For its part, Crane seeks to define the term by the orientation of the product labeling. The court is not convinced that the terms should be defined in this way. Crane's requirement that the labels be "correctly oriented" is divorced from the citations in the patent Crane relies upon for support. Each of the two citations to the specification and the one citation to the patent prosecution history discusses "visibility" of the labels, without mention of their orientation. See ‘930 Patent, col. 1, II. 57-67; col. 3, II. 34-37; ‘930 Patent Prosecution History, Resp. dated Feb. 7, 2000, at 14-15.

Based on the claim language, read in light of the intrinsic record, the court defines "upright standing manner," "standing upright manner," and "upright manner" as "having a generally vertical orientation, corresponding to that of a beverage container or other product."

D. Claims 4 and 10 Were Anticipated by Prior Art

As noted above, all of the remaining claims are dependent on Claim 1, meaning that they each incorporate Claim 1 by reference and add a single limitation to it. See 35 U.S.C. § 112; Robotic Vision Systems, Inc. v. View Engineering, Inc., 189 F.3d 1370, 1376 (Fed.Cir.1999). In a prior decision, this Court held Claim 1 invalid because each of its elements was anticipated by prior art. Display Technologies, Inc. v. Paul Flum Ideas, Inc., 75 F. Supp. 2d 283 (S.D.N.Y. 1999).

Specifically, this Court held that "each of the elements of Claim 1 [was] fully anticipated by" United States Patent No. 2,572,090 ("Refrigerator Rack Bottle Guide") (the "Allen Patent") in 1951, and also by United States Patent No. 2,218,444 ("Merchandise Dispenser") (the "Vineyard Patent") in 1940. Id. at 291, 292. Because this Court has found as a matter of fact that Claim 1 was anticipated by prior art, the proper inquiry here is whether the limitations the remaining claims add to Claim 1 were anticipated by or obvious in light of prior patents.

As described above, the 1997 PTO's Notice of Allowability related only to the structure defining the aperture, to the portion of the lead article viewable through the aperture, and to the telescopic receipt of the recesses with the front and back walls or rod members associated with the underlying support shelf. Flum argues that because none of the limitations addressed by dependent claims 2-4, 7-11 or 17 are set forth in the PTO Examiner's reasons for allowance of the '176 Patent, and none of these additional features are separately patentable, each of the remaining claims must fall with the invalidity of Claim 1.

Claim 4 adds the limitation of a rectangular aperture to Claim 1 using the following language:

4. the display rack of claim 1 wherein the bottom of said front member, the front of said track, and the front of said sidewalls define a generally rectangular aperture.

Claim 10 further limits Claim 1 by providing for:

10. The display rack of claim 1 wherein the front of said track is devoid of any transversely extending upstanding lip or wall.

An "upstanding lip or wall" is defined as any member provided at the front of the track which either cooperates with the front member in stopping the forward movement of an article or at least does not interfere with the functioning of the front member in this regard. Col 6, lines 43-54 of the '176 Patent. A "transversely extending" lip or wall would extend at least partially across the track. As such, Claim 10 requires that there be no member that extends upwardly from and across the track.

The first "downwardly and away" limitation recites: "rotating the receiving means downwardly and away from said first conveyor means to urge the received eggs downwardly." The district court construed this claim language: "The receiving means * must be rotated downwardly (i.e. toward the ground) and be rotated away from the main egg-carrying conveyor from which the eggs are released." With some slight clarification, the district court construed this claim limitation correctly.
The slight clarification notes that the limitation constrains the motion of the received eggs as well as the motion of the receiving means. Specifically, the first "downwardly and away" limitation also requires that the receiving means move the eggs downwardly.

* The district court determined that the language "receiving means" does not invoke § 112, P 6. As the district court's failure to construe this limitation as means-plus-function is not disputed by the parties, this court offers no judgment on the correctness of that determination.

The claim recites that the receiving means "urges the received eggs downwardly." The patent does not explicitly define "urge." In one sense, "to urge" means simply to press or to push. See, e.g., The Oxford English Dictionary (2d ed. 1989). This meaning of "urge," however, would place the preferred embodiment outside the claim scope. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996) (a claim interpretation that puts the preferred embodiment outside the claim scope is "rarely, if ever, correct and would require a highly persuasive evidentiary support."). Moreover this definition of "urge" makes infringement depend on the downward force exerted on the eggs by the rotating receiving means. A receiving means, such as that shown in Fig. 4 of the '494 patent, may rotate downward slowly and support the received eggs against the force of gravity. In doing so, the downward rotation would exert an upward force on the received eggs, i.e., it would "urge" the received eggs upward rather than downward as claim 28 requires. The patent does not show, however, that the downward force is a defining limitation.

Another ordinary meaning of "to urge" avoids exclusion of the preferred embodiment from the claims. Specifically, "to urge" may mean "to cause to move, hasten, or gather speed." The Oxford English Dictionary (2d ed. 1989). This definition receives support from the patent specification. The specification clarifies that "to urge" means broadly to move or to carry and that the receiving means may slow the motion of the eggs. For example, the patent specification notes that the receiving means "reduces the speed at which the eggs fall and gently moves the eggs downwardly and outwardly away from carriage assemblies." '494 patent, col. 5, ll. 55-57 (emphasis added); see also Id. col. 6, ll. 64-64, col. 7, ll. 1-3. Thus, in the context of this patent, this court employs the broader meaning of "to urge," namely, to cause to move.

Plaintiff argues that "urging in movement" means "stuffing." Plaintiff Br. at "Ex. F," while defendants construe the phrase to mean "inserting into the projectile compartment in an organized fashion," Def. Br. at 8. Defendants note that in the summary of the invention section of the patent, the manner in which the projectile is loaded into the weapon shell is highlighted. '086 patent, 1:60-65 ("More particularly, it is an object [of the present invention] to impose a low lethality contacting surface of the projectile at impact by the manner in which it is loaded into a weapon shell…."). Defendants argue that plaintiff's proposed construction of "stuffing" the body into the compartment is inconsistent with the invention description and with the preferred embodiment described in the patent.

Plaintiff responds that defendants are attempting to read limitations from plaintiff's prior '562 patent into the '086 patent claims. Plaintiff notes that it may recapture subject matter from the '562 patent that was disclosed in that patent but not claimed, including the more general method for inserting the projectile body into the shotgun shell, which includes, but is not limited to, the folding method of insertion that was claimed in the '562 patent. See Johnson & Johnston Assocs. Inc. v. R.E. Serv. Co., 285 F.3d 1046, 1055 (Fed. Cir. 2002)("A patentee who inadvertently fails to claim disclosed subject matter, however, is not left without remedy….a patentee can file a separate application claiming the disclosed subject matter under 35 U.S.C. § 120 (2000) (allowing filing as a continuation application if filed before all applications in the chain issue.").

Defendants' proposed construction does not comport with the ordinary meaning of "urging in movement," which is "pushing" or "pressing forward." Nothing in the claim language indicates that the tail must first be folded or otherwise inserted in an "organized fashion." Defendants derive this limitation from language in the specification describing the
"preferred loading sequence," in which "the tail [] is folded into a resulting bulk...and in this folded configuration is urged in movement [] into the compartment."'086 patent, 4:5-7. However, this is not a case in which "the preferred embodiment is described in the specification as the invention itself," such as to allow limitations from the specification to be read into the claim language. See Modine Mfg. Co., 75 F.3d at 1551 (reviewing specification and prosecution history of patent, during which patent seeker argued that narrower "peak heat range" was what was "sought to be covered by the applicant," and concluding that invention was thus limited to hydraulic diameters in the narrower peak heat range). "Urging in movement" is therefore construed to mean "pushing."

4315

a. "urinary bladder submucosa"

ACell asserts that the district court erred in construing the term "urinary bladder submucosa" in claims 1, 7, and 8 of the '389 patent. ACell asserts that the PTO did not grant the '389 patent inventors a patent to the naturally occurring submucosa layer of a urinary bladder, but rather that it granted them a patent covering a tissue graft composition derived from that layer. ACell argues that the '389 specification makes clear that "urinary bladder submucosa" is a defined term which was defined to expressly exclude other urinary bladder tissue layers, specifically the abluminal muscle cell layers and at least the luminal portion of the tunica mucosa layer.

Cook argues that the '389 patent specification, specifically in the "DETAILED DESCRIPTION OF THE INVENTION" section, teaches that the term "urinary bladder submucosa" is broader than ACell's proposed construction because it states that the resulting composition "typically" consists essentially of urinary bladder submucosa. Cook thus asserts that the use of "typically" implies that there is another possible embodiment of the claimed composition that merely comprises urinary bladder submucosa, but may also include other tissues.

As noted above, claim 1 recites: "A composition comprising urinary bladder submucosa delaminated from both the aboluminal muscle layers and at least the luminal portion of the tunica mucosa of a segment of a urinary bladder of a warm-blooded vertebrate." '389 patent, col. 5, ll. 20-23 (emphasis added). The '389 patent specification, in the "BACKGROUND AND SUMMARY OF THE INVENTION" section, states that "[u]rinary bladder submucosa for use in accordance with the present invention is delaminated from the abluminal muscle layers and at least the luminal portion of the tunica mucosa of the urinary bladder tissue." Id. at col. 1, ll. 55-58 (emphasis added). The first paragraph of the "DETAILED DESCRIPTION OF THE INVENTION" section states:

The tissue graft composition in accordance with the present invention comprises urinary bladder submucosa of a warm-blooded vertebrate delaminated from adjacent bladder tissue layers. The present tissue graft composition thus comprises the bladder submucosa delaminated from aboluminal muscle cell layers and at least the luminal portion of the mucosal layer of a segment of urinary bladder of a warm-blooded vertebrate. Typically the delamination technique described below provides a tissue composition consisting essentially of urinary bladder submucosa. These compositions are referred to herein generically as urinary bladder submucosa (UBS).

Id. at col. 2, ll. 1-4 (emphases added).

"[T]he specification may reveal a special definition given to a claim term by the patentee that differs from the meaning it would otherwise possess. In such cases, the inventor's lexicography governs." Phillips, 415 F.3d at 1316. We believe that this is exactly what the '389 patentees did in this case. As the above quoted portions of the specification indicate, the composition invented was defined to be "urinary bladder submucosa delaminated from aboluminal muscle cell layers and at least the luminal portion of the tunica mucosa of the urinary bladder tissue." See, e.g., '389 patent, col. 1, ll. 56-58. The specification also indicates that the resulting composition "typically" consists essentially of urinary bladder submucosa. Thus, while the composition clearly includes urinary bladder submucosa, it may also include other tissues, such as the non-luminal portion of the tunica mucosal layer. However, it cannot include that which was expressly excluded in the patentee's definition, i.e., the "aboluminal muscle cell layers and at least the luminal portion of the tunica mucosa." Therefore, we construe "urinary bladder submucosa" as it is defined in the '389 patent specification to mean "urinary bladder submucosa delaminated from the aboluminal muscle cell layers and at least the luminal portion of the tunica mucosa of the urinary bladder tissue," and it thus becomes necessary to determine which tissue layers are encompassed by the phrase "at least the
luminal portion of the tunica mucosa." 4

Because the parties' dispute does not involve the phrase "abluminal muscle cell layers," we do not address which tissue layers are referenced by that language.

4316

The phrase "used in a truck trailer" means "The retractable segmented cover systems is used with a trailer that is designed to be hauled by a truck."

4317

Claim 1 of the '960 patent is an independent claim that reads as follows as:

[a] A system for grounding a telephone system and an electrical power system, comprising:

[b] an electrical utility box for the electrical power system;

[c] a ground mechanism;

[d] a first electrical conductor connecting the ground mechanism to the utility box for electrically grounding the utility box;

[e] a clamping device connected to the utility box,

[f] and having securing means for penetrating the outer surface of the utility box without penetrating the inside of the utility box; and,

[g] a second electrical conductor for connecting the clamping device to the ground connection for the telephone system,

[h] whereby, the ground mechanism for the electrical power system serves the dual purpose of grounding the telephone system.

The parties disagree on the construction of elements [b], [c], [d], [e], [f], [g], and [h]. With respect to element [b] Senior Industries argues that "an electric utility box for electrical power" should be interpreted to mean "an enclosing structure (e.g., a box or cabinet), which holds components of electrical power equipment (e.g. a meter) and can also conduct electricity." Thomas and Betts, on the other hand, asserts that the term "an electrical utility box for electrical power" is limited to an electrically conductive hollow box enclosure (e.g. for mounting electrical power equipment). We look to the claim language, the specification and the prosecution history for an understanding of this element.

The claim language references "an enclosing structure." This language suggests that the box is hollow. Furthermore, the specification discloses an electric utility box as a metal box enclosure of rectangular shape which mounts a power meter. (See Exhibit A, Col. 3, lines 40-45). The specification notes that "while the system is illustrated in connection with an electric utility box, it will be apparent that the novel clamp 30 can be used any time an electrical and mechanical connection is to be made to a metal box enclosure." (See Exhibit A, Col. 4, lines 48-52). With respect to the metal box being hollow, this limitation was brought into the patent by an amendment by Senior Industries (See Amendment B, p.4). The meaning of the term "electrical utility box" is unambiguous in light of the intrinsic evidence. The written descriptions and the history lead us to conclude that the electrical utility box is hollow as Thomas and Betts asserts. Therefore, the proper construction
for element [b] is "an electrically conductive hollow box enclosure (e.g. for mounting electrical power equipment).

**4318**

5. Utilizing at least one of . . .

This phrase is found in Claims 9, 44, and 53 of the '193 Patent.

Phrase: Utilizing at least one of said instantaneous flow rate and said reference indicia to select one of said higher and said lower pressure magnitudes to be applied in the airway of such a patient.

Construction: Using the instantaneous flow rate or the average flow rate, or both, to determine whether to provide the previously selected higher pressure magnitude (for inhalation) or the previously selected lower pressure magnitude (for exhalation) to the patient.

Reasoning: This phrase adds the "at least one of" language to the previously construed claim language of the '802 patent. The parties do not dispute that the language means that either the instantaneous flow rate, or the reference indicia, or both, can be used to select between the higher and lower pressures. Again, the real dispute between the parties is as to the meaning of now previously defined terms such as "flow rate" and "selected higher and lower pressure magnitudes."

**4319**

4. utilizing said instantaneous flow rate and said reference indicia…

This phrase is found in Claims 3 and 24 of the '802 Patent and Claims 9, 44, and 53 of the '193 Patent.

Phrase: Utilizing said instantaneous flow rate and said reference indicia to select one of said higher and said lower pressure magnitudes for said flow of breathing gas to be applied in the airway of such a patient.

Construction: Comparing the instantaneous flow rate signal to the average flow rate signal to determine whether to provide the previously selected higher pressure magnitude (for inhalation) or the previously selected lower pressure magnitude (for exhalation) to the patient.

Reasoning: Again, the court can discern little difference between the two proposed constructions. Both parties agree that a comparison is made between the two flow rate values or signals to determine whether the patient is inhaling or exhaling, resulting in a decision as to whether to apply the higher or the lower pressure. The real dispute between the parties is as to the meaning of "flow rate" and "selected higher and lower pressure magnitudes," which phrases the court has already construed.

**4320**

d. The first disputed term in Claim 8: "Utilizing the core pins to aid in ejecting"

i. Claim language. Two terms in Claim 8 of the '809 patent are also "in dispute" at this time. The first such term is "utilizing the core pins to aid in ejecting." Claim 8, with the disputed term italicized, states the following:

8. The method of claim 7, further comprising: utilizing the core pins to aid in ejecting the plastic washing machine basket from the apparatus with the core pins forcing the plastic washing machine basket to shift relative to the mold core as the cavity sidewall members are shifted away from the mold core due to the engagement of the core pins in the beveled apertures of the plastic washing machine basket.

The '809 patent, Claim 8 (emphasis added).

ii. The parties' definitions and arguments. The parties' proffered definitions of this term are shown below, with bold font
indicating differences between their definitions. Also, the authority on which each party relies for its definition is shown just below that party's definition.

"UTILIZING THE CORE PINS TO AID IN EJECTING"

<table>

</tr>
</thead>
<tbody>
<tr>
<td>&quot;using the core pins to assist in shifting or moving the plastic washing machine basket relative to the mold core&quot;</td>
<td>&quot;using the core pins to actively assist in removing the formed plastic washing machine basket from the mold core&quot;</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Maytag's Authority</th>
<th>Electrolux's Authority</th>
</tr>
</thead>
<tbody>
<tr>
<td>'809 patent, col. 6, lines 6-44; claim 8.</td>
<td>'809 Patent at col. 2, lines 16-18; col. 6, lines 24-27; dictionary definitions of &quot;utilizing&quot;</td>
</tr>
</tbody>
</table>

In its initial brief, Maytag argues that the claim language plainly refers to using the core pins to assist in shifting or moving the plastic washing machine basket relative to the mold core and that no further construction of the claim language is necessary. In further support of this "plain language" construction, Maytag points out that the specification states, "During the initial lifting of stripper ring 96, each of the core pins 191 will be engaged within a respective aperture 44 of the basket 2 to provide a lifting force about the entire periphery of mold core 90." The '809 patent, col. 6, ll. 23-26. Maytag contends that Electrolux's construction is improper, because "aid" means "assist," but "actively assist," as Electrolux construes the term, creates a different, unwarranted connotation. Maytag also asserts that the claim refers to "ejecting," not "removing," as Electrolux contends, and that, as Maytag has previously argued, "ejecting" and "removing" are different operations in the '809 patent.

For its part, Electrolux argues in its initial brief that the '809 patent makes clear that the core pins "aid in ejecting," not merely aid in "shifting" the washing machine basket relative to the mold core. Moreover, Electrolux argues that the way in which the core pins "aid in ejecting" is by providing a "lifting force" on the washing machine tub due to engagement of the core pins with the apertures of the tub. Thus, Electrolux argues, the pins must do something active to aid in ejecting the product from the mold core. Electrolux asserts that Maytag's definition collapses Claim 8 into Claim 9 and removes important limitations from the claim term. Specifically, Electrolux argues that Maytag ignores "ejecting" and substitutes "shifting or moving," which are not the same thing, thereby making either Claim 8 or Claim 9 surplusage. Electrolux also argues that Maytag ignores "utilizing," which must indicate that the core pins are put to use to aid in ejecting the washing machine basket, not just to "shift" the basket relative to the core.

In its rebuttal brief, Maytag contends that Electrolux is asserting a construction that requires the core pins to do more than just aid, and instead, to "actively engage" in the process of ejecting the washing machine basket. Such a construction, Maytag contends, would improperly import limitations into a claim that is not otherwise so limited. In its rebuttal brief, however, Electrolux argues that the principal dispute is over the meaning of "utilizing," because Maytag wants that term left vague to facilitate its infringement argument. Electrolux argues that the context of the infringement dispute is important to construction of the term, noting that, in its own process, the core pins do not "eject," "remove," or otherwise move the molded basket. Because its process does not involve the core pins in this way, Electrolux argues that Maytag is trying to preserve its infringement argument by an improper claim construction that glosses over the function of the core pins. In light of the claim language, however, Electrolux argues that "utilizing" the core pins means that they do more than exercise some de minimis or incidental force; rather, it means that the core pins actively aid the ejection process.

In its surrebuttal, Maytag asserts that there is no basis for Electrolux's importation of the word "actively" into the construction of this claim term. There is no necessary connection, Maytag contends, between "utilizing" something and "actively assisting." Moreover, Maytag argues that Electrolux has admitted that its proposed construction is a blatant effort to compare the '809 patent with Electrolux's accused device. In its surrebuttal, Electrolux contends that no further response is required.
iii. Analysis. Beginning with the language of the claim in which the disputed term appears, see Nystrom, 424 F.3d at 1142 (construction begins with the words of the patent); Biagro, 423 F.3d at 1302 (same), the court cannot help noticing that Maytag's construction of "ejecting" in Claim 8 is different from its construction of "ejecting" in Claim 7. Where Maytag previously argued that "ejecting" in Claim 7 must mean "preparing . . . for removal," it now argues that "ejecting" in Claim 8 must mean "shifting or moving . . . relative to the mold core." As Maytag itself has asserted, "claim terms are presumed to be used consistently throughout the patent, such that the usage of a term in one claim can often illuminate the meaning of the same term in other claims." Research Plastics, Inc., 421 F.3d at 1295 (citing Phillips, 415 F.3d at 1313-14). Thus, where the court construed "ejecting the washing machine basket from the apparatus" in Claim 7 to mean "forcing the washing machine basket from the apparatus," the court is constrained, for the same reasons and for the sake of consistency, and by any reasonable reading of the patent claims, specification, and meaning of the terms, to construe "ejecting the plastic washing machine basket from the apparatus" to mean the same thing in Claim 8.

The real "fighting issue" in this claim, however, is not the construction of "ejecting," but the construction of the meaning of "utilizing the core pins to aid" in "ejecting." The parties agree, and so does the court, that "utilizing" in the context of the claim language and the specification means "using." See, e.g., MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY (10th ed. 1995) (defining "utilize vt" as "to make use of"). Thus, the focus of the dispute becomes the meaning of "to aid," i.e., how the core pins are "used" to "aid" in "ejecting the washing machine basket from the apparatus." While the court agrees with the parties that "to aid" means "to assist," in the context of the claim and the specification, the court concludes that there is nothing about the claim language that supports Electrolux's insertion of the modifier "actively" before "aid." Moreover, the court finds that the remainder of Claim 8 expressly states how the core pins are "used to assist" in ejecting the washing machine basket from the apparatus: the core pins "force the plastic washing machine basket to shift relative to the mold core as the cavity sidewall members are shifted away from the mold core due to the engagement of the core pins in the beveled apertures of the plastic washing machine basket." The '809 patent, Claim 8.

Thus, the court's construction of the disputed claim term "utilizing the core pins to aid in ejecting" is the following: "using the core pins to assist in forcing the washing machine basket from the apparatus." 

4321

a. "V-Shaped" or "U-Shaped?"

TypeRight's patents-in-suit claim a keyboard having a "common space bar means extending between said right and left groups of function keys to help form a row extending generally in a V-shape . . . ." (Emrich Decla., Exhibit 1, p. 15, column 18, lines 4-7.) 10 Microsoft argues that, as a matter of law, the Microsoft keyboards do not literally infringe upon the TypeRight patents-in-suit because the space bar of the Microsoft keyboards is indisputably not "V-shaped." Accordingly, Microsoft contends that summary judgment of non-infringement is appropriate because the Microsoft keyboards do not embody the "V-shaped" element of the patents-in-suit.

10 The above description, which is from the '484 patent, is mirrored by the '441 patent, which claims a "plurality of control key means including elongated common key means configured generally in a V-shape to still further help both sets of the wrists, hands, and forearms of the user to be maintained in substantially straight aligned positions when the thumbs of the user actuate said common key means." (Emrich Decla., Exhibit 2, p. 16, column 20, lines 17-21.)
In her Markman order, Judge Keep did not construe the term "V-shape." However, because the term "V-shape" is language taken directly from the claims at issue, the Court cannot determine the propriety of summary judgment of non-infringement on the "V-shape" element without first construing the scope of that term. Bayer AG v. Biovail Corp., 279 F.3d 1340, 1349 (Fed. Cir. 2002) (adjudication of summary judgment of non-infringement not possible without proper claim construction of relevant claim limitation).

Webster's Third New International Dictionary provides a customary and ordinary meaning of "V-shape" as: "having the general shape of the letter V or resembling a V in cross section." (Webster's Third New International Dictionary, p. 2566.) The Court finds no evidence on the record to suggest that persons of ordinary skill in the art of keyboard design would ascribe a different meaning to the term "V-shape."

On the basis of this preliminary definition, the Court notes that the Microsoft keyboards appear to fall outside the scope of the "V-shape" limitation because the Microsoft keyboards appear to have a space key, and bottom row, shaped more in the fashion of the alphabet letter "U." Stated another way, the space bar and bottom row of the Microsoft keyboards lack the distinct acuity, or "sharpness," that generally characterizes the downward-facing nadir of the alphabet letter "V." At oral argument, Microsoft emphasized this aesthetic distinction, highlighting the easily-perceived visual difference between the "obviously U-shaped" space bar (and bottom row) of the Microsoft keyboards, versus the "obviously V-shaped" space bar (and bottom row) of the Microsoft keyboards. The Court finds Microsoft's argument to be persuasive.

However, the Court notes that it cannot perform the claim construction of the "V-shape" element solely by looking up that term in the dictionary and finding that the dictionary definition comports with a common understanding of the term, as well as with the Court's own visual evaluation of the accused keyboards. The Federal Circuit has noted that dictionaries fall within a special category of interpretive evidence. Although district courts may rely on dictionaries to assist in defining the parameters of a claim element's ordinary and plain meaning, a district court must rely first and foremost on the patents' claims, specifications, and prosecution history to delineate a claim element's scope. Moreover, a dictionary definition must not contradict any unique lexicography found in, or ascertained by, a reading of the patent documents themselves. Vitronics, 90 F.3d at 1584 n.6. See also Hill-Rom Co. v. Kinetic Concepts. Inc., 209 F.3d 1337, 1340-41 (Fed. Cir. 2000); Karlin Tech. Inc. v. Surgical Dynamics. Inc., 177 F.3d 968, 971 (Fed. Cir. 1999).

Thus, the Court now turns to the '484 and '441 patents themselves to determine whether the patent language suggests any unique lexicography of the term "V-shape." Specifically, the Court must examine intrinsic evidence from the patents-in-suit to determine whether the "V-shape" element encompasses space bars (and bottom rows) possessing nadirs that are less acute or less "sharp." Stated another way, the Court must examine the patent language to determine whether the space bars and bottom rows of the Microsoft keyboard, which somewhat resemble the alphabet letter "U," fall within the "V-shape" element as defined by the '484 and '441 patents.

The '484 patent contains at least 13 references to the term "V-shape" or "V-shaped." The '441 patent contains at least 17 such references. The majority of these 30 references are not helpful in construing the scope of the "V-shape" limitation. 11 Several of the references, however, modify the ordinary lexicography of "V-shape" in a unique and important way. Claims 11 and 12 of the '441 patent describe a "plurality" of "V-shaped rows." (Emrich Decla., Exhibit 2, p. 16, column 19, lines 51-53.) These "rows" refer to the several horizontal QWERTY lines of keys that all skilled touch-typists memorize and master. Significantly, however, claims 11 and 12 of the '441 patent describe "V-shaped rows" that can be either "broken" or "unbroken." (Emrich Decla., Exhibit 2, columns 19-20.) The use of the word "broken" refers to the manner in which the '441 patent discloses the plurality of "V-shaped" rows. Namely, the patent describes rows of QWERTY keys that are separated into distinct left and right-hand groups, with a "space" between the groups, which "further help[s] the wrists, hands and forearms of the user to be maintained in a substantially straight aligned position." (Id., column 20, ll. 9-13.)

11 See, e.g., Emrich Decla., Exhibit 2, p. 9, ll. 56-60 ("Each group of character keys is arranged in a series of spaced apart staggered rows of discrete character keys and includes a common V-shaped space bar key bridging the two clusters."); Id., Exhibit 1, p. 11, column 10, ll. 17-19 ("Considering now the space bar in greater detail, the space bar is generally V-shaped and extends between or bridges the two key grouping[s]").
The '441 patent's reference to both "broken" and "unbroken" "V-shaped rows" is significant because it indicates that the patents-in-suit set forth a lexicography of the term "V-shaped" in which "V-shaped" objects may lack the acute nadir that is customarily associated with "V-shaped" objects. Stated more plainly, the '441 patent describes "V-shaped" rows that need not possess a sharp point, or any point at all. This unique lexicography of the term "V-shape" also characterizes the '484 patent, which describes a "plurality of V-shaped rows" separated into two groups "sufficiently widely spaced apart to position the hands of the user in co-extending alignment." 12 (Emrich Decla., Exhibit 1, p. 15, column 17, ll. 22, 55-60.)

--- Footnotes ---

12 Judge Keep, in her Markman order, defined "co-extending alignment" as being essentially a synonym of "substantially straight aligned position." (May 6, 1999 Markman Order, p. 21.)

--- End Footnotes ---

In accordance with the above, and for purposes of defining the scope of the '484 and '441 patents, the Court construes the term "V-shape" to mean the following: An object or sequence of objects has a "V-shape" if the object or sequence of objects is generally shaped like the letter "V." However, an object or sequence of objects may be "V-shaped" even if the nadir of such object or objects is not acute or "sharp," and even if the nadir is not characterized by a physical joining of the two legs of the "V."

**4322**

**V Shaped Material Distributing Blades**

Miner and UP assert that the term "V shaped material distributing blades" should be construed to mean a structure having two portions oriented at an angle to each other and which merge into a point at a leading edge of the blade. Herzog contends that the phrase is clear on its face and should be given its ordinary and accustomed meaning. The Court concludes that Herzog is correct.

The only clarification which can be gained from the intrinsic evidence is that the "V blades" are "shaped as a V." See, e.g., U.S. Patent 5,423,268 col.11, l.31-32 (filed Nov. 10, 1993). Dictionary definitions are similarly broad. See Random House Webster's Unabridged Dictionary 2133 (2d ed. 1997) (defining V-shaped as "having the shape of the letter V: a V-shaped flying formation."). Also, the Court searched in vain for a definition of V-shaped which insisted on the shape coming to a point. There being insufficient evidence in the patent to vary the meaning of V-shaped from its broad general meaning, the Court concludes that the phrase maintains its ordinary and accustomed meaning, which is a shape which resembles the letter V.

**4323**

**D. Reserve Vacuum Assembly**

The recitation of "reserve vacuum assembly" appears only in Claim 14 of the '553 patent, which reads: "An instrument for making a lamellar incision in a cornea of an eye comprising: . . . a reserve vacuum assembly coupled to said positioning ring to sustain the vacuum within said cavity if operation of said vacuum pump is interrupted as the head moves across the aperture." Defendants contend that a means-plus-function analysis applies, while plaintiff disputes its application.

As the term does not use the word "means," there is a presumption that the means-plus-function analysis does not apply. Reserve is defined as "something kept in store for future use." Dorland's Illustrated Medical Dictionary (25th ed. 1974). Vacuum is defined as "a space partially exhausted (as to the highest degree possible) by artificial means (as an air pump)." Merriam Webster Medical Dictionary available at http://www.intelihealth.com and Merriam-Webster's Collegiate Dictionary.
Defendant contends that vacuum forming should be construed narrowly to mean a shaping process that utilizes vacuum to
(forming: (i) positive air pressure; (ii) mechanical pressure; and (iii) negative pressure created by vacuum. (Pl's. Mem. at 12.)

(Pl's. Mem. at 11 (emphasis added).) Plaintiff elaborates that the following forms of pressure are encompassed by vacuum
the shaping of heated plastic laminate using pressure, with or without vacuum, in order to create a three-dimensional shape.

down to" the meaning of the term "vacuum forming". 3 Plaintiff contends that vacuum forming should be construed to mean
the patented device." Isogon Corp. v. Amdahl Corp., 47 F. Supp. 2d 436, 438 (S.D.N.Y. 1998). Here, the "claim dispute boils
"Claim disputes . . . often boil down to the meaning of a phrase, a word, or a single functional or structural aspect of the
patented device." Isogon Corp. v. Amdahl Corp., 47 F. Supp. 2d 436, 438 (S.D.N.Y. 1998). Here, the "claim dispute boils
down to" the meaning of the term "vacuum forming". 3 Plaintiff contends that vacuum forming should be construed to mean
the shaping of heated plastic laminate using pressure, with or without vacuum, in order to create a three-dimensional shape.

shape the heated material into its three-dimensional configuration. (Def's. Mem. at 2; Defendant's Proposed Findings of Fact and Conclusions of Law at 6.)

3 As stated supra, the parties use the disputed terms interchangeably. Accordingly, the Court uses one term to encompass them all.

4 Pressure creates the three-dimensional configuration by forcing the heated laminate onto a male mold or into the cavity of a female mold, where it cools. (Pl's. Mem. at 2.)

A. Intrinsic Evidence

Vacuum forming is not defined in the claims of the '144 Patent. Where the claims do not provide a definition, the specification is ordinarily "the single best guide to the meaning of a disputed term". Vitronics, 90 F.3d at 1582 (cited by Seb SA v. Montgomery Ward & Co. Inc., 77 F. Supp. 2d 399, 403 (S.D.N.Y. 1999)). Here, however, the specification fails to state expressly whether vacuum forming encompasses (i) positive air pressure, mechanical pressure, and negative pressure created by vacuum; or (ii) only negative pressure created by vacuum. The specification merely states, for example, that the laminate is "vacuum formed or molded into a costume component" ( '144 Patent, Col 4, lines 34-35) and that vacuum forming causes the component to retain its shape "after the component is removed from the molding apparatus," ( '144 Patent, Col 4, lines 50-53). This statement, like the other statements referring to vacuum forming in the specification, omits express mention of the type of pressure used to force the laminate to the shape of "the molding apparatus". ( '144 Patent, Col 4, line 53.) 5

5 Plaintiff argues that, although the phrase "vacuum formed or molded" ( '144 Patent, Col. 4, line 35) discussed supra does not expressly state the type of pressure used, the phrase by implication supports the expansive definition of vacuum forming urged by plaintiff. Plaintiff reasons that the phrase equates "vacuum formed" with "molded", thereby defining "vacuum formed" as any type of pressure that "molds" the heated laminate into its three-dimensional shape. However, the Court finds that the conjunction of "formed" and "molded" in the phrase "vacuum formed or molded" evokes conjunctions that prove fatal to plaintiff's argument. A careful reading of the patent and the parties' submissions pertaining to claim construction reveals that "formed" is linked to "molded" in the following instances: (i) the specification and claims refer interchangeably to "vacuum formed" laminate and "vacuum molded" laminate; (ii) plaintiff itself uses "vacuum formed" and "vacuum molded" interchangeably in its papers; (iii) the specification not only contains the phrase "vacuum formed or molded" but also its converse, "vacuum molded or formed" ( '144 Patent, Col. 4, line 54); and (iv) plaintiff's own expert states that "the inventors used the terms 'vacuum forming', 'vacuum molding', 'forming', and 'molding' interchangeably". (Declaration of William McConnell, dated Mar. 17, 2000 ("McConnell Decl.") P 37). In view of this substantial linkage between and interchangeability of "formed" and "molded" in the specific context of "vacuum formed" and "vacuum molded", the Court finds that "molded" in the context of "vacuum formed" is not an expansive description of how laminate is "vacuum formed" but rather a reference to "vacuum molded". Because "vacuum molded" is interchangeable with "vacuum formed", the Court concludes that the phrase to which plaintiff refers not only fails to support an expansive definition, it fails to support any definition.

However, the specification does contain words and phrases that, by implication, define vacuum forming to mean a process using vacuum. For example, the word "vacuum" modifies all three of the disputed terms, "vacuum formed", "vacuum molded", and "vacuum molding", and these are the only terms given in the patent to name the process of shaping the plastic. The modifier "vacuum" connotes, on its face, that the process to which the patent refers necessarily utilizes a vacuum.

Additional support for a narrow definition of vacuum forming stems from the Federal Circuit's "repeated[] emphasis" that claim language is to be interpreted in a manner "consistent with and furthering the purpose of the invention."
having expressly redefined that term. The Court concludes that the Examiner's reference to the '430 Patent is relevant to this
unusual definition of vacuum forming in the '430 Patent is incidental. If the Examiner referred to the non-vacuum process in
the portion redefining vacuum forming. (Office Action: '144 Patent, dated Mar. 20, 1997 at 3.) The Court concludes that the
Patent, Col. 2, lines 8-11) and to the integration of the resulting material by sewing ( '430 Patent, Col. 2, lines 16-18), not to
vacuum forming in the patent-in-suit. However, the '430 Patent is not cited by the Examiner for the unusual meaning that
art references, the '430 Patent, includes "vacuum formed laminate" as an element of its claims. The specification of the '430
Patent states that "vacuum forming . . . is well known and needs no further explanation." ( '430 Patent, Col. 1, lines 65-66.)
However, in spite of the fact that vacuum forming "needs no further explanation", the '430 Patent does provide one. The
specification states that use of "excess fluid" pressure "is to be considered herein [in the '430 Patent] to be embraced by the
term 'vacuum forming'. ( '430 Patent, Col. 1, lines 66-68--Col. 2, lines 1-2.) 6 The Court concludes that vacuum forming
does not ordinarily "embrace" this non-vacuum method and the inventor was invoking an inventor's privilege of redefining a
term 'vacuum forming'. See Vitronics, 90 F.3d at 1582-83 (stating that prosecution history is "often of critical significance in determining the meaning of the claims" and incorporate a review of the prior art). The prosecution history of the '144 Patent contains two prior art references: (i)
U.S. Patent No. 4,104,430 ("the '430 Patent"); and (ii) U.S. Patent No. 4,878,972 ("the '972 Patent"). The first of these prior
art references, the '430 Patent, includes "vacuum formed laminate" as an element of its claims. The specification of the '430
Patent states that "vacuum forming . . . is well known and needs no further explanation." ( '430 Patent, Col. 1, lines 65-66.)
Additional support for the narrow definition of vacuum forming is afforded by the prosecution history. See Vitronics, 90
However, in spite of the fact that vacuum forming "needs no further explanation", the '430 Patent does provide one. The
specification states that use of "excess fluid" pressure "is to be considered herein [in the '430 Patent] to be embraced by the
term 'vacuum forming'". ( '430 Patent, Col. 1, lines 66-68--Col. 2, lines 1-2.) 6 The Court concludes that vacuum forming
does not ordinarily "embrace" this non-vacuum method and the inventor was invoking an inventor's privilege of redefining a
term 'vacuum forming'. See, e.g., Home Shopping, 1998 U.S. Dist. LEXIS 2111, 1998 WL 65740, *2 (finding that an inventor may ascribe a novel meaning to a term provided that he so states in the specification).
The expansive definition in the '430 Patent does not, as plaintiff contends, support the proposition that vacuum forming in
other patents automatically encompasses non-vacuum methods. Instead, the '430 Patent teaches that the specification must
clearly delineate the expansive definition in order for vacuum forming to comprehend non-vacuum processes.
Consequently, where, as in the '144 Patent, vacuum forming is not expressly redefined, the ordinary meaning of vacuum
forming does not include this non-vacuum method. 7

--- Footnotes ---
6 Both parties characterize the use of "excess fluid" pressure as a non-vacuum process. (Rubies' Mem. Supp. Its Proposed
Findings Fact and Conclusions Law on Claim Interpretation at 10-11; Def's. Mem. at 4.) Plaintiff elaborates that "excess
fluid pressure" is an alternate name for a type of pressure that the parties have heretofore called "positive air pressure".
(Rubies' Mem. in Supp. of Its Proposed Findings Fact and Conclusions Law on Claim Interpretation at 10-11.) Defendant
does not dispute this assertion.

7 The Court rejects plaintiff's additional contention that it is not only the '430 Patent's own use of vacuum forming that
supports an expansive interpretation but also the Examiner's use of the phrase "vacuum forming" in referring to the '430
Patent that supports such interpretation. Plaintiff reasons that the Examiner's use of the term specifically in reference to prior
art in which vacuum forming includes utilization of "excess fluid pressure" mandates a similarly expansive understanding of
vacuum forming in the patent-in-suit. However, the '430 Patent is not cited by the Examiner for the unusual meaning that
Patent ascribes to vacuum forming. A careful reading of the Office Action reveals that, in comparing the '430 Patent to the
'144 Patent, the Examiner specifically refers to the portion of the '430 Patent relating to the fusion of fabric to foam ( '430
Patent, Col. 2, lines 8-11) and to the integration of the resulting material by sewing ( '430 Patent, Col. 2, lines 16-18), not to
the portion redefining vacuum forming. (Office Action: '144 Patent, dated Mar. 20, 1997 at 3.) The Court concludes that the
unusual definition of vacuum forming in the '430 Patent is incidental. If the Examiner referred to the non-vacuum process in
the '430 Patent as "vacuum forming", it was because the '430 patent itself refers to that process as "vacuum forming",
having expressly redefined that term. The Court concludes that the Examiner's reference to the '430 Patent is relevant to this
- 5000 -
claim construction solely because the '430 Patent makes manifest that express redefinition is required to expand the definition of vacuum forming to include a non-vacuum process.

Language contained in the second prior art reference, the '972 Patent, likewise supports the proposition that the ordinary meaning of vacuum forming does not encompass non-vacuum methods. The '972 Patent refers to a "vacuum molding machine" initially, in discussing the heating and forming of a "foamed polyolefin layer." ('972 Patent, Col. 5, lines 27-28 (emphasis added.).) The patent refers to a "press molding machine" in describing the subsequent process wherein, utilizing mechanical pressure to achieve the desired shape, "the foam backed fabric is drawn by means of a matched male and female press mold." ('972 Patent, Col. 5, lines 34-38 (emphasis added.).) The '972 Patent appears to distinguish the process that requires a "vacuum molding machine" from the subsequent process that requires a "press molding machine." Further evidence of this distinction is that whenever the '972 Patent discusses the process requiring the "press molding machine" the term used for the process is always "press molding" or "draw forming", never "vacuum forming". The Examiner, in reviewing the '972 Patent for purposes of comparison to the '144 Patent, likewise distinguished between the two processes. In drawing an analogy between vacuum forming in the '972 Patent and the patent-in-suit, the Examiner stated that "a vacuum molding process is employed" and specifically cited the lines in the '972 Patent referring to the "vacuum molding machine," not the lines referring to the "press molding machine" or "draw forming." (Office Action: '144 Patent, dated Mar. 20, 1997, at 3.) The language of the '972 Patent, and the way the documents contained in the file history refer to it, distinguish between vacuum forming, on the one hand, and forming that utilizes mechanical pressure, on the other hand.

8 Notwithstanding this distinction drawn by '972 Patent's specification and the Examiner, plaintiff argues that "vacuum forming" in the '972 Patent does encompass mechanical pressure and concludes that vacuum forming in the '144 Patent must do so likewise. However, even if, arguendo, vacuum forming in the '972 Patent were to be expansively interpreted, such interpretation would not form an adequate basis for expansively interpreting vacuum forming in the '144 Patent. The '972 Patent expressly describes the method and manner in which the shaping into a three-dimensional configuration occurs, referring, for example, to "mechanical" pressure, "matched molds", and "press time", all of which the specification then refers to as "draw forming" or "press molding." ('972 Patent, Col. 5, lines 34-38, 46-53.) Unlike the '972 Patent, the '144 Patent makes no mention of these indicia of a non-vacuum form of pressure. Unlike the '972 Patent, the '144 Patent uses the terms "vacuum formed" and "vacuum molded" without describing a non-vacuum process or calling the process by another name. Due to this lack of parallelism between the language of the '972 Patent and the language of the '144 Patent, it would be unwarranted to base an expansive interpretation of vacuum forming in the '144 Patent on the allegedly expansive definition in the '972 Patent. Instead, if the '972 Patent is applicable to this analysis, that applicability lies in teaching that vacuum forming does not encompass mechanical pressure without an express statement to that effect.

The Court concludes that these prior art references in the prosecution history of the '144 Patent support the proposition that the utilization of non-vacuum methods, such as "excess fluid" pressure or mechanical pressure, is not within the scope and ordinary meaning of vacuum forming. In sum, the intrinsic evidence supports a narrow interpretation of vacuum forming.

B. Extrinsic Evidence

Because a clearer grasp of the technology underlying the technical terms used in the claims would assist in resolving the ambiguity in the claim language, the Court considers the extrinsic evidence. In considering extrinsic evidence, dictionary definitions are "preferred over opinion testimony" because dictionaries are "accessible to the public in advance of litigation" and, therefore, are "more objective and reliable guides". Vitronics, 90 F.3d at 1585; see also EMI Group North America, Inc. v. Intel Corp., 157 F.3d 887, 892 (Fed. Cir. 1998) ("The Federal Circuit has admonished that claims should preferably be interpreted without recourse to extrinsic evidence such as expert testimony, other than perhaps dictionaries or reference books . . . ") (citation omitted); Tenneco Packaging Specialty and Consumer Products, Inc. v. S.C. Johnson & Son, Inc., 1999 U.S. Dist. LEXIS 17937, *5 n.1, No. 98 C. 2679, 1999 WL 1044840 (N.D. Ill. Nov. 16, 1999) ("Dictionary definitions, though extrinsic, are worthy of special note.") (citation omitted). The McGraw-Hill Dictionary of Scientific and Technical Terms (Daniel N. Lapedes, ed., 2d ed. 1978), admitted into evidence in relevant part as Defendant's Exhibit E,
defines "vacuum forming" as: "Plastic sheet forming in which the sheet is clamped to a stationary frame, then heated and drawn ... into a mold by vacuum." (Def's. Exh. E (emphasis added); Tr. at 48:1-6.) Plaintiff's own expert, 9 testified that he agreed with the dictionary's definition insofar as it narrowly defines vacuum forming as a process utilizing vacuum. 10 (Tr. at 40:5-22.)

9 Plaintiff's expert, William McConnell, has been involved in the thermoforming industry since 1948 and is currently president of a company that does consulting work in the thermoforming industry. (Exh. B att. to McConnell Decl.) "Thermoforming" means "forming by heat and pressure". (McConnell Decl. P 6.)

10 The portion of the dictionary's definition with which plaintiff's expert disagreed is not relevant to the interpretive problem before the Court. The expert, who agreed that vacuum was necessarily utilized, merely disagreed over the verb used to describe the vacuum's effect. Specifically, the expert disagreed that vacuum causes the plastic sheet to be "drawn down" to the mold, asserting that, instead, vacuum causes atmospheric pressure to "force[] [the plastic] to the shape" of the mold. (Tr. at 40:10-13.)

The Court next considers expert testimony. The only expert called was plaintiff's expert, who testified that (i) "thermoforming" is the omnibus term for the shaping of heated plastic sheets and encompasses utilization of various types of pressure; and (ii) "vacuum forming" is the thermoforming process that utilizes pressure created by vacuum. (McConnell Decl. P 21; Tr. at 32:11--33:6.) Plaintiff's own expert testified that "vacuum forming" is narrowly defined.

Q: What's your definition of "vacuum forming"?
A: Shaping of a heated sheet to the particular shape that is wanted by atmospheric pressure.

Q: Not using a vacuum?
A: That's a vacuum.

Q: Can you vacuum form without a vacuum?
A: No.

THE COURT: "The popular thermoforming method is by use of vacuum" ... and does that include vacuum molding?

THE WITNESS: Yes.

THE COURT: And does that include pressure forming by compressed air?

THE WITNESS: No.

THE COURT: Does it include the method of manufacturing something by mechanical means without hot air or without compressed air or without a vacuum?

THE WITNESS: No.

THE COURT: Thank you, Mr. McConnell.
Additionally, the textbook on thermoforming to which the expert referred in support of his opinions, pursuant to Federal Rule of Civil Procedure 26(a)(2)(B), narrowly defines "vacuum forming" as that method of thermoforming utilizing a vacuum. (Def's. Exh. C at 37; Tr. at 57:20--58:13; Def's. Mem. at 5-6; Tr. at 48:1-6 (admitting Def's. Exh. C into evidence).) Specifically, vacuum forming occurs when "vacuum is used to quickly remove the air between [the hot plastic sheet and the mold]" and the atmospheric pressure holds the heated plastic sheet in shape against the mold until the plastic has cooled. (Def's. Exh. C at 37 (emphasis added); Tr. at 57:20--58:2.) In sum, the extrinsic evidence, which comprises the dictionary definition, expert testimony, and treatise, confirms the narrow interpretation of vacuum forming that is supported by the intrinsic evidence.

Notwithstanding the intrinsic and extrinsic evidence adduced in support of a narrow definition of vacuum forming, plaintiff contends that certain testimony given by its expert supports an expansive definition. The testimony to which plaintiff refers is its expert's assertion that, although vacuum forming is officially narrowly defined today, its original meaning encompassed non-vacuum methods of thermoforming and the original meaning is still used today, incorrectly, by "those of skill in the art." (McConnell Decl. PP 22, 27, 33; Tr. at 27:5-24.) However, the expert testimony to which plaintiff refers inadequately supports an expansive interpretation for several reasons.

First, the expert's testimony supporting an expansive definition of vacuum forming lacks probative value. Expert testimony "may not be used to vary or contradict the terms of the claims as understood from the intrinsic evidence." Intellectual Property Development, 1998 U.S. Dist. LEXIS 3901, at *58, 1998 WL 142346, *21; see Novo Nordisk, 2000 U.S. Dist. LEXIS 3384, at *6, 2000 WL 294852, *2 ("Extrinsic evidence may not contradict the manifest meaning of the claims as set forth, even by implication, in the specification and prosecution history."). Here, the intrinsic evidence supports a narrow interpretation of vacuum forming that excludes non-vacuum processes. The portion of the expert's testimony that interprets vacuum forming expansively contradicts the teaching of the intrinsic evidence and, therefore, "may not be used". Intellectual Property Development, 1998 U.S. Dist. LEXIS 3901, at *59, 1998 WL 142346, *21; see, e.g., Isogon, 47 F. Supp. 2d at 444 (rejecting expert's interpretation where it contradicted teaching of intrinsic evidence).

Second, even were the expansive definition not antithetical to the interpretation derived from the intrinsic evidence, the expert proffers little evidence to support an expansive interpretation. The expert's assertion that vacuum forming may be expansively interpreted because some individuals incorrectly continue to interpret vacuum forming expansively is, as the expert himself concedes, unsupported by any reference to an authority. (Tr. at 28:3-11; 41:11-15; 57: 1-16.) In fact, the only reference offered by the expert pursuant to Fed. R. Civ. P. 26(a)(2)(B) refers to a text that defines vacuum forming narrowly. (Def's. Exh. C; Exh. D att. to Def's. Mem. at 4.)

Not only does the support offered for an expansive interpretation solely comprise the expert's statement that an expansive interpretation exists, but also that statement is vitiated by additional testimony given by the expert. While the expert did testify that vacuum forming was at one time an omnibus term that encompassed non-vacuum methods of shaping heated plastic, he also testified that the nomenclature was revised almost 40 years ago. He testified that "probably in the beginning of the 1960s" the Society of Plastics Engineers and the Society of Plastics Industry redefined vacuum forming narrowly and re-educated the public accordingly. (Tr. at 26:12--27:6; 39:13-18; 48:14-15; 55:12-16.) He further testified that the success of this re-education is manifest in that telephone books, magazines, and textbooks no longer refer to or use vacuum forming as an omnibus term comprising vacuum and non-vacuum methods. (Tr. at 29:3-7, 49:12-24.) The expert concluded, "We've done a fair job within the industry of explaining it all". (Tr. at 41:5-8.) Indeed, the reason given by the expert for why he would find it onerous to "dig up" references to works that define vacuum forming expansively is that the re-education concerning proper thermoforming nomenclature had been successful. (Tr. at 40:23--41:10.) The Court concludes that the expert testimony supporting an expansive interpretation is inadequate to substantiate plaintiff's contention that individuals skilled in the art of costume manufacture would interpret vacuum forming in the '144 Patent to encompass non-vacuum methods of thermoforming.

The intrinsic and extrinsic evidence overwhelmingly support a narrow definition of vacuum forming. Accordingly, the terms "vacuum molding", "vacuum molded", and "vacuum formed" as they appear in the claims of the '144 Patent must be construed to mean the thermoforming process that utilizes a vacuum.
a. **Vaginal Swab**

Plaintiff asserts that the term "vaginal" refers to the outer housing as the cover or sheath, and "swab" refers to the unit being used as either a swab to dry or absorb or an applicator to hold or apply treatment. Paper No. 55, 3. By contrast, Defendant offers a narrower definition that a "vaginal swab" is a stick or wire with a small piece of absorbent material attached to the end of it, which is of a size and structure for cleansing or applying medicine within the vaginal canal.

While the claim provides little guidance as to the terms "vaginal" and "swab", the '720 patent specification clarifies that Plaintiff designed the "vaginal swab" to enter into the vaginal cavity. For example, the specification defines the purpose of the invention as "a truly portable, convenient, and disposable internal vaginal cleaning device or refreshner." Paper No. 46, Exhibit F1, Col. 1, lines 46-48. Moreover, the invention in the '720 patent "is designed to dry or absorb material in the internal vaginal area." Id., Col. 3, lines 5-6. In fact, the length of the average vaginal cavity establishes the approximate length of the swab, including the core and gauze material. Id., Col. 3, lines 50-54. From the prosecution history, Plaintiff also distinguished her invention from prior art on this particular point by stating that the invention (Alvarez) lacked "an elongated structure for the swabbing element to be introduced into the vaginal cavity." Id., Ex. D10, PTO 00313.

In the face of all of this evidence, Plaintiff will not be allowed to claim that her invention is not meant to enter into the vaginal cavity. After all, "a patentee may not construe a claim term one way during prosecution in order to obtain allowance of the patent and then in a different way during litigation in order to obtain a finding of infringement." Knorr-Bremse Systeme Fuer Nutzfahrzeuge GMBH v. Dana Corp., 2001 U.S. Dist. LEXIS 1891, No. CIV. A. 00-803-A, 2001 WL 179815, at *4 (E.D. Va. 2001) (citing Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579 (Fed. Cir. 1995). Thus, the '720 patent limits the term "vaginal" to a swab entering into the vaginal canal.

As for "swab", the '720 Patent states that a vaginal swab should preferably be "comprised of fairly rigid core member, constructed either in segments or as a one piece unit, over which a thick, gauze type adsorbent pad or layer is secured." Paper No. 46, Ex. D1, Col. 2, lines 5-9. The plain meaning of the term "swab" is "a small piece of absorbent material attached to the end of a stick or wire and used for cleansing or applying medicine." American Heritage Dictionary 1810 (3d ed. 1992); Dorland's Medical Dictionary 1617 (28th ed. 1994).

**I. Claim Construction**

Hemphill argues that the district court improperly construed claim 2 by "reading into" claim 2 "extraneous limitations from the specification," and by reading limitations into claim 2 that relate to claim 1. McNeil responds that the district court properly looked to the specification and prosecution history to construe claim 2. We agree.

In interpreting claims, a court "should look first to the intrinsic evidence of record, i.e. the patent itself, including the claims, the specification and, if in evidence, the prosecution history." Vtronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 USPQ2d 1573, 1576 (Fed. Cir. 1996). It is well-settled that for purposes of claim construction, the specification may act as a sort of dictionary that explains the invention and may define terms used in the claims. Markman v. Westview Instruments, Inc., 52 F.3d 967, 979, 34 USPQ2d 1321, 1330 (Fed. Cir. 1995) (en banc), aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). When the meaning of a term used in a claim is sufficiently clear from its definition in the specification, that meaning shall apply. Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1477, 45 USPQ2d 1429, 1432 (Fed. Cir. 1998). In this case, the district court properly looked to the specification for clarification of several terms which were not wholly defined in the claim language.

Similarly, the district court properly looked to the prosecution history of the 720 patent. Hemphill argues that "the district court construed the wrong . . . claim" by reading into claim 2 limitations relating to claim 1. But even where the prosecution history does not relate to the particular claim at issue, it is proper for the district court to use that prosecution history to
construe the claim at issue if the prosecution history relates to the same structure as the asserted claim. Alpex Computer Corp. v. Nintendo Co., 102 F.3d 1214, 1220, 40 USPQ2d 1667, 1672 (Fed. Cir. 1996) ("We discern no reason why prosecution history relating to the structure of . . . claim 1 is not pertinent to the same structure . . . [in] claims 12 and 13."). It is well-settled that "prosecution history is relevant not only for purposes of prosecution history estoppel but also for construing the meaning and scope of the claims." Id. at 1220, 40 USPQ2d at 1671. Thus, like the specification, the prosecution history can act like a dictionary, Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578, 38 USPQ2d 1126, 1129 (Fed. Cir. 1996), cert. denied, 519 U.S. 911 (1996), and statements made during reexamination proceedings "are relevant prosecution history when interpreting claims." E.I. Du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1439, 7 USPQ2d 1129, 1136 (Fed. Cir. 1988), cert. denied, 488 U.S. 986 (1988). In this case, in construing claim 2, the district court relied on statements Hemphill made during prosecution of the 720 patent in which she narrowed her claims to overcome prior art. The district court also relied on Hemphill's statements, described below, that she made during two reexamination proceedings in which she further limited her claims to convince the PTO to reissue them. The district court properly relied on Hemphill's statements made during prosecution and during the reexamination proceedings, even though some of those statements related to the unasserted claim 1.

The district court construed the term "swab" to mean "a small piece of absorbent material attached to the end of a stick or wire and used for cleansing or applying medicine." Hemphill, 134 F. Supp. 2d at 727 (quoting American Heritage Dictionary 1810 (3d ed. 1992))). Hemphill argues that the term "vaginal" does not limit her invention to a swab meant for use inside the vaginal cavity, but instead "pertains to the outer housing as a cover or a sheath." We agree with the district court. After determining that claim 2 "provides little guidance as to the terms 'vaginal' and 'swab,'" the district court found that the "specification clarifies that [Hemphill] designed the 'vaginal swab' to enter into the vaginal cavity," and that the "specification defines the purpose of the invention as 'a truly portable, convenient, and disposable internal vaginal cleaning device or refresher.'" Id. at 726. Thus, the district court found that the specification limits the term "vaginal" to a "swab entering into the vaginal canal." Id. The district court also found that Hemphill distinguished her invention from prior art during prosecution by stating that the prior art lacked "an elongated structure for the swabbing element to be introduced into the vaginal cavity." Id. The district court accordingly precluded Hemphill from "claiming that her invention is not meant to enter into the vaginal cavity," and construed the term "vaginal" to mean "a swab entering into the vaginal canal." Id.

Finally, the district court relied on the following dictionary definitions to determine the plain meaning of the term "swab": American Heritage Dictionary 1810 (3d ed. 1992) (defining "swab" as "[a] small piece of absorbent material attached to the end of a stick or wire and used for cleansing or applying medicine"); Dorland's Medical Dictionary 1617 (28th ed. 1994) (defining "swab" as "a wad of cotton or other absorbent material firmly attached to the end of a wire or stick, used for applying medication, removing material, collecting bacteriological material, etc."). The fact that the PTO granted Hemphill's request for reexamination in light of a patent for wrapped sanitary napkins (U.S. Patent No. 3,973,567) (the "Srinivasan" patent) and reissued her patent over Srinivasan does not alter the proper construction of the term "vaginal swab," and does not persuade us to construe the term "vaginal swab" to cover wrapped sanitary napkins. We find that the district court properly construed the term "vaginal swab."

4327

Defendants maintain that claim 1 of plaintiff's patent is invalid for anticipation by the Bradley patent. Claim 1 teaches:

A sock-type article adapted to be worn on the foot and having sole and heel regions adjacent to the sole and heel regions of a foot when worn, said sock-type article being substantially entirely formed of a light-weight, flexible material defining an interior space receivable of a foot, said material being substantially waterproof to prevent passage of water into said interior of the sock-type article through said material and at the same time moisture vapor permeable to allow passage of evaporated perspiration which may be formed on the foot from said interior of the sock-type article through said material, whereby the foot will be maintained as dry as possible when the sock-type article is worn thereon.

Herman pat., col. 4, ll. 11-24.

Although the parties might prefer to substitute their own nuanced definitions for the terms used in plaintiff's patent and the asserted prior art patent, the Court must give these terms their ordinary meanings for purposes of claim construction. See, e.g., K-2 Corp. v. Salomon S.A., 191 F.3d 1356, 1362 (Fed. Cir. 1999) ("general rule is that terms in the claim are to be
given their ordinary and accustomed meaning."") (citing Johnson Worldwide Assoc., Inc. v. Zebco Corp., 175 F.3d 985, 989 (Fed. Cir. 1999)). Thus, plaintiff must accept the plain meaning of the words contained within his patent rather than proffer an alternative reading of these terms. See, e.g., Intervet Amer. v. Kee-Vet Lab., 887 F.2d 1050, 1053 ("No matter how great the temptations of fairness or policy making, courts do not rework claims. They only interpret them.") The Court "cannot alter what the patentee has chosen to claim as his invention." SSIH Equipment S.A. v. U.S. Int'l Trade Comm., 718 F.2d 365, 378 (Fed. Cir. 1983).

"Claim construction begins with the words of the claim." Karlin, 177 F.3d at 971. "When construing a claim, a court should first look to the intrinsic evidence, i.e., the patent itself its claims, written description, and, if in evidence, the prosecution history." Id. "The court may receive extrinsic evidence to educate itself about the invention and the relevant technology, but the court may not use extrinsic evidence to arrive at a claim construction that is clearly at odds with the construction mandated by the intrinsic evidence. Id. "In defining the meaning of key terms in a claim, reference may be had to the specification, the prosecution history, prior art, and other claims. This is not, however, to be confused with reading into a claim a limitation appearing in the specification but not in the claim." Minnesota Mining & Mfg. Co. v. Johnson & Johnson Orthopaedics, Inc., 976 F.2d 1559, 1566 (Fed. Cir. 1992) (internal citations omitted).

Accordingly, the Court first considers the language used in plaintiffs patent. In the claim at issue, claim 1, the term "moisture vapor permeable" is used. Elsewhere, in claim 5 and in the specification, the term "breathable" is introduced. According to the American Heritage Dictionary of the English Language (3d ed. 1992), "breathable" means "permitting air to pass through." 3 The dictionary gives as its example, "a breathable fabric." The dictionary defines "air" as "a colorless, odorless, tasteless, gaseous mixture, mainly nitrogen (approximately 78 percent) and oxygen (approximately 21 percent) with lesser amounts of argon, carbon dioxide, hydrogen, neon, helium, and other gases." The dictionary also gives an alternate usage: "This mixture with varying amounts of moisture and particulate matter, enveloping Earth; the atmosphere" (emphasis added). Thus, the term "breathable" describes a material that allows both gases and moisture vapor to pass through it. As such, the language used in claim 1, "moisture vapor permeable," is essentially synonymous with "breathable." Accordingly, under either term, the Herman patent teaches a sock that is both waterproof and permits air, including moisture vapor, to pass through it.

3 Courts commonly consult ordinary dictionaries in order to determine the proper construction of terms used in patent claims. See, e.g., Karlin, 177 F.3d at 971.

4328

A. Claim Construction

When construing a claim, we first look to the intrinsic evidence of the patent, including the claims and the written description, and if available, the prosecution history. Vitronics Corp., v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). The claims define the scope of the invention and the written description indicates whether the inventor has used any terms "inconsistently with their ordinary meaning." Id., 39 U.S.P.Q.2D (BNA) at 1577.

In claim 1 of the '446 patent, Herman uses the term "moisture vapor permeable" to describe the material used for the insert. Looking to the written description of the '446 patent, the insert material is described as "breathable" and as "allowing passage of water vapor therethrough." Additionally, the insert material is structurally described as having pores "700 times larger than a molecule of water vapor thereby allowing water vapor which evaporates from the body to pass through the fabric . . . ." '446 pat., col. 2, II. 58-61. From this intrinsic evidence of the '446 patent it is clear that "moisture vapor permeable" describes an insert material through which moisture vapor can pass.

GO BACK

- 5006 -
Valve Actuating Portion

The parties dispute the construction of the above term as it relates to claims 1 and 7 of the 692 patent. Plaintiffs propose the following construction: "a region of the filter element whereby engagement of a valve mechanism can take place." Defendants propose the term be construed as "valve actuating portion, separate from an annular end cap portion, that engages a valve structure when the filter element is installed in a housing."

Plaintiffs contend that reading a functional requirement on the claim places a forbidden means vs. function limitation on a claim where none exists. Furthermore, the claims at issue do not require the valve actuating portion be a separate part from the annular end cap portion.

Baldwin argues the valve-actuating portion is a discrete region that must be read separately from the annular end cap portion. It is a discrete region of the second end cap as defined in the claim. It is delineated from the annular end cap because the description requires some part of the valve actuating portion, and not the annular end cap, to engage the valve structure when the filter element is installed in the housing.

According to Defendants, the below diagram shows "the '692 and '623 patent figures also confirm that the keys of the "valve-actuating portion" of the lower end cap engage the latch device and/or the valve device of the valve structure when the filter element is installed in a housing. "The figure above shows the filter housing without a filter element installed (left side) and the filter housing with the filter element installed (right side). The right side of the figure shows that the keys (118 and 119) (shown in light blue) of the valve-actuating portion engage the latch device (68) (shown in green) and/or valve device (64) (shown in red). The figure also shows that the annular end cap portion (shown in pink)..." (ECF # 40 pg. 14)

Wix Court Construction

The Wix Court construed the "Valve-actuating portion" as "to include the cylindrical portion, the annular base, and the keys, which engage the value (sp) mechanism."

Court's Construction

The Court agrees with the Wix Court's construction. As Plaintiff points out, actuate or actuating means "to put into action or motion; to move." Am Heritage Dict. (2d Edition 1985). Merriam Webster's defines it as "to put into mechanical action or motion. To move to action." Merriam Webster Online Dictionary, 2010, http://www.merriam-webster.com/dictionary/actuate. Thus, valve actuating, as Defendants stated at oral argument when discussing valve actuating, "if it doesn't take place, it doesn't work.," requires functionality. Therefore, the Court finds the "valve actuating portion" is construed as the "portion of the second end cap including a cylindrical portion, annular base and keys which engage the valve mechanism."

There is an additional issue concerning non-infringement of claim 12. Defendants contend that claim 12 is written in means plus function form thereby invoking 35 U.S.C. § 112, P 6, and incorporating by reference the specification's preferred embodiments. Because the preferred embodiments disclose only dome-shaped regions concave to the direction of flow, if claim 12 were a means plus function claim it would not read on defendants' products which are convex to the direction of flow.

The term "valve means" in claim 12, by including the term "means," invokes a presumption that the drafter intended to invoke § 112 P 6. The presumption is overcome, however, if the claim element recites sufficient structure. Allen Engineering Corp. V. Bartell Industries, Inc., 299 F.3d 1336, 1347 (Fed. Cir. 2002). "Means-plus-function claiming applies only to purely functional limitations that do not provide structure that performs the recited function." Phillips, 415 F.3d at 5007.
valve and the knob at the upper end of the slide valve. The two devices are neither structurally the same nor equivalents. Koala is designed to switch between the two positions without some of the specifications of the 161 patent, such as the slide valve's motion along the channel, the pneumatic connector must be disconnected. Furthermore, the pneumatic connector's structure is substantially and significantly different from the 161 specified structure. To perform "insubstantial changes that add[] nothing of significance to the structure . . . ." See Valmont Industries, 983 F.2d at 1043. To serve the same function of positioning between a first and second position, the pneumatic connector must be disconnected from the channel. Additionally, the slide valve has a knob at its upper end to permit movement back and forth of the slide valve within the channel. The Court construes the "valve means" element in Claim 33 to cover a structure equivalent to that described in the specification.

Thus, the Court turns to the specification to determine if the corresponding structure is defined by the language "valve means." The specification states that "valve means is comprised of a slide valve that is seated with a channel formed in the housing . . . and the slide valve has a knob at its upper end to permit movement back and forth of the slide valve within the channel." Additionally, the slide valve is specified as having "a generally square cross-sectional shape as opposed to the circular shape of channel . . . ." The Court construes the "valve means" element in Claim 33 to cover a structure equivalent to that described in the specification for the purpose stated in the claim and rejects Clinical's argument that the valve means requires a "mechanical switch."

Although the Koala's pneumatic connector serves the same function as the valve means in Claim 33, the pneumatic connector is not the same or an equivalent structure as that found in the 161 patent specification. The pneumatic connector is not a slide valve with a knob at its upper end that permits movement of the valve back and forth within the channel. To serve the same function of positioning between a first and second position, the pneumatic connector must be disconnected not slid. The Koala pneumatic connector does not have a knob that permits movement back and forth within the channel. To be considered an "equivalent" of the specification structure under section 112(6), the pneumatic connector must only have "insubstantial changes that add[] nothing of significance to the structure . . . ." See Valmont Industries, 983 F.2d at 1043. The pneumatic connector's structure is substantially and significantly different from the 161 specified structure. To perform the same function as the 161's motion along the channel, the pneumatic connector must be disconnected. Furthermore, the Koala is designed to switch between the two positions without some of the specifications of the 161 patent, such as the slide valve and the knob at the upper end of the slide valve. The two devices are neither structurally the same nor equivalents.
thus, the court holds that the Koala does not literally infringe the 161 patent with respect to Claim 33's valve means element.

4332

1. Valve pin actuator

Synventive proposes that the term be construed as

drive and alignment mechanism for translating the valve pin back and forth through the manifold and nozzle bores to seat and unseat the distal tip end of the valve pin at the mold gate and includes a valve pin assembly for maintaining the valve pin in alignment with a drive piston; the piston of the actuator is couplable to and decouplable from an actuator cap that is secured to the top end of the valve pin.

Husky proposes that the terms be construed as "drive mechanism for moving the valve pin and comprises four parts: a cylinder, a piston, a valve pin assembly, and a power circuit."

According to Synventive's definition, the valve pin actuator is not only a drive mechanism but an alignment mechanism, with the valve pin assembly component of the actuator performing the alignment function. The Lee Patent specifications state that an object of the invention is an improved valve pin actuator that provides a clearance that "allows for relative expansion between the hot runner manifold and the top clamp plate in any direction, without putting a significant side load force on the valve pin. '025 Patent col.2 l.24-29. The detailed description of the invention states that an "advantage of the actuator of the present invention is the manner in which there is essentially a self-alignment between the actuator assembly and the valve pin assembly; . . . the valve pin is supported in such a manner that would allow some limited side-to-side motion in any direction thereof as the hot runner manifold undergoes certain expansion." '025 Patent col.6 l.64-col.7 l.4. Thus, the specification describes an embodiment of the valve pin actuator in which the valve pin assembly performs an alignment function.

Reading the Lee Patents as a whole, however, this feature described in the specification cannot be read into the claims at issue in this suit. Other claims of the Lee Patents specifically claim a valve pin assembly with an alignment feature that is not claimed in the claims at issue. See, e.g., '025 Patent claims 10, 11, as they depend from claim 1. The valve pin actuator as set forth in claim 1 of the '870 Patent and claim 1 of the '116 Patent and their dependent claims does not claim an alignment feature. Were the alignment feature necessarily part of the construction of "valve pin actuator," then dependent claims 10 and 11 of the '025 Patent would be vulnerable to a validity challenge. See 35 U.S.C. § 112 P 4 (a claim in dependent form shall specify a further limitation of the subject matter claimed); Curtiss-Wright Flow Control, 438 F.3d at 1380 ("[R]eading an additional limitation from a dependent claim into an independent claim would not only make that additional limitation superfluous, it might render the dependent claim invalid.").

Under the principles of claim differentiation, the fact that the claims at issue do not specify an alignment function where other claims do suggests that the valve pin actuator is not limited to a construction that includes an alignment feature. Moreover, it appears that it is more precisely the valve pin assembly, a component of the valve pin actuator, that accomplishes the alignment. The term is construed as "drive mechanism for moving the valve pin back and forth through the manifold and nozzle bores that comprises a cylinder, a piston, a valve pin assembly and a power circuit."

4333

8. Valve pin assembly

Synventive proposes

an assembly that includes a first part for holding a top end of a valve pin and removably coupling the valve pin to an actuator piston, and a second part secured to the manifold for receiving the valve pin such that the valve pin, when
decoupled from the piston, remains extended through an injection nozzle and secured to the manifold when a top clamping plate and actuator cylinder and piston are removed from the mold, without requiring removal of the valve pin from the manifold. A valve pin assembly provides alignment between the valve pin and piston. A valve pin assembly provides radial clearance between the actuator cap and piston to prevent any substantial side load force being exerted on the valve pin.

Husky proposes "group of parts that includes a first part and a second part."

According to the '025 Patent claims, a valve pin assembly is part of the valve pin actuator, and consists of two parts, one part removably secured to the piston and one part secured to the manifold. See, e.g., '025 Patent, claims 1, 12, 20. The part secured to the piston holds a top end of the valve pin, and the part secured to the manifold receives the valve pin. Id; see also '025 Patent col.5 l.35-42 (describing a preferred embodiment of the invention). Husky's definition is devoid of context and does not assist a meaningful construction of the term.

The key disagreement between the competing constructions is Synventive's contention that the valve pin assembly provides alignment and radial clearance. As mentioned in the construction of "valve pin actuator," certain claims not at issue assert the alignment and radial clearance functions performed by the interaction of certain components of the valve pin assembly, specifically the ring, actuator cap and annular flange in the illustrated preferred embodiment. See '025 Patent col.7 l.1-17. Whereas the actuator cap is recited in three of the asserted claims, and the ring is an additional limitation recited in two of the asserted claims, the annular flange is not recited in any of the asserted claims. No other structure is apparently recited in the asserted claims that functions to provide alignment or radial clearance or interacts with the actuator cap and/or the ring to provide those functions. Reading the patents as a whole, taking care not to render language in other claims superfluous, a valve pin assembly may but is not required to provide alignment between the valve pin and the piston, and radial clearance between the actuator cap and the piston.

The term is construed as "part of the valve pin actuator that secures the valve pin to the actuator and includes a first part for holding a top end of a valve pin that is removably secured to the piston, and a second part for receiving the valve pin that is secured to the manifold."

5. "Variable"

With regard to this term, as was the case for "dead band" and "moveable/movement," Formula urges that the dead band can be varied only through axial movement of the piston. For the reasons stated above on the related arguments, we do not perceive that limitation to be included within this claim term. Rather, there is no need to look beyond the plain meaning of the term: capable of being modified, altered, or changed.

F. Claims 3 & 11: "a variable gauge thickness to trap air in said rolled film so as to facilitate the unwinding of said roll of stretched film"

Defendants also challenge Pliant's proposed construction of dependent claims 3 and 11. The disputed term is "variable gauge thickness." Plaint would construe the disputed term to mean, "the plastic film has thickness variations that help trap air and ease unwinding." Once again, Defendants propose a more detailed and limiting construction:

a variation in film thickness that is large enough to form pockets or raised portions that can trap air. The variation in thickness is deliberately produced, and thus would not include thickness variations resulting from the film manufacturing process, such as incidental impressions, scratches, or markings caused by passing the film over grooved rollers or by stretching of the film. As such, the variation in film thickness must be greater than about +/-20% to +/-30%.

The parties again agree that variable gauge thickness is not a term of art. Neither party disputes the ordinary meaning of variable. Moreover, both parties agree that gauge generally refers to thickness. I suspect that both parties would agree that
the inventor's choice of words was inapt, as under these definitions, the phrase "gauge thickness" is redundant. The specification fails to offer any insight into the term; for this reason, Pliant suggests that the term is "merely . . . a slightly different way of articulating the notion of a contoured surface that helps to trap air as the film is wound onto the roll." (Pl. Br. at 12.) Under Pliant's definition, variable gauge thickness means that the thickness of the plastic varies from point to point based on contours on the surface of the film. In contrast, Defendants rely on the same "disclaimer" argument that they offered, and I rejected, in support of their definition of "impressed, textured, surface." Once again, I am not persuaded that the inventor clearly disclaimed anything not expressly included in the preferred embodiment. Defendant Sigma also finds a lack of clarity in the claim language, the specification and the prosecution history. In essence, Sigma asks: "variable relative to what?" To answer that question, Sigma turns to extrinsic evidence. Sigma proposes that "variable gauge thickness" be construed as any thickness greater than the standard variations in thickness inherent in the manufacture of plastic films (as known to one of ordinary skill in the art at the time of the patent.) It is not necessary to turn to extrinsic evidence to address the degree to which the film thickness must vary. The claim language provides the answer to this question: the gauge must vary enough "to trap air . . . so as to facilitate the unwinding" of the roll. For this reason, I accept Pliant's proposed definition of the disputed claim. Whether or not the claim encompasses "unpatentable thickness variations" is a matter to be addressed at another time.

GO BACK

4336

3. Surface indicia have variable lengths to represent stored information

The surface indicia in claim 1 is further described as having "variable lengths to represent stored information." (Col. 5, lines 48-9) As properly construed, the phrase "variable lengths" is not limited to represent only "continuously variable lengths." (D.I. 558, at 12) Accordingly, claim 1 covers a disc-shaped member that stores information with surface indicia that have either continuously variable or discretely variable lengths. DMI admits that its CDs store information in a digital format using surface indicia with discretely variable lengths. (D.I. 347 at 5) Consequently, this limitation covers DMI's CDs.

GO BACK

4337

1. The Claim Language

We begin with the language of Claim 1 itself. As was noted above, Claim 1 of the '097 patent recites a pattern of splay "where [the offset] distance di varies between minimum distances for the first and last string ends in [the] sequence and a maximum distance for a string end between [the] first and last string ends in [the] sequence." Because the specification contains neither a definition of the phrase "varies between" nor a suggestion that AAI sought to assign to claim terms anything but their ordinary and accustomed meanings, those are the meanings we must give them. Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1388, 21 U.S.P.Q.2D (BNA) 1383, 1386 (Fed. Cir. 1992); Envirotech Corp. v. Al George, Inc., 730 F.2d 753, 759, 221 U.S.P.Q. (BNA) 473, 477 (Fed. Cir. 1984).

AAI contends, citing a number of dictionary definitions of "between" in its favor, that "the plain meaning of the words 'varies between minimums . . . and a maximum' is that the distance of string splay must change . . . [but] nothing in Claim 1 prescribes (or limits) how much or how many times the distance must change." 5 Prince, for its part, cites alternative and equally valid dictionary definitions of "between" in an effort to demonstrate that the trial court properly construed the claim to require that the offset distance di take on at least three values, i.e., a minimum, a maximum, and at least one intermediate value. 6 A comparison of these definitions with those relied upon by AAI suggests that the claim phrase "varies between" is, at best, equivocal.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

5 Were the claim to be so construed, it would cover any splay pattern with more than one offset distance and would thus read on the Vortex racket.
According to this construction, the Vortex racket cannot literally infringe the claim.

According to one ordinary sense of "between"—"in the space that separates: BETWIXT (an alleyway @ two tall buildings) (a vacuum @ two electrodes): in the midst of: surrounded by (a lion rampant @ eight crosses)." Webster's Third New International Dictionary of the English Language 209 (1976) (definition 2b of preposition "between")—only a splay pattern in which the offset distance takes on more than two values has an offset distance that varies between minimum distances and a maximum distance. According, however, to another equally ordinary sense of "between"—"from one to the other of (air service @ the two cities)," id. (definition 3a of preposition "between")—a splay pattern in which the offset distance takes on only two values has an offset distance that varies between minimum distances and a maximum distance. In sum, the dispositive claim language on its face is susceptible to two equally plausible meanings, under one of which the Vortex racket literally infringes Claim 1, and under the other of which it does not. As a result, the scope of Claim 1 cannot be defined by resort to the ordinary and accustomed meanings of its terms alone, and the specification is completely silent with regard to the meaning of "varies between."

2. The Prosecution History

Because the disputed claim and its specification do not establish the meaning of the operative claim language, we turn to the prosecution history for guidance. Our reading of the prosecution history is informed by the understanding that the documents recording this history are created by persons schooled in the art of patent prosecution.

To the trained eye, the prosecution history of the '097 patent presents a muddled and self-contradictory story. As originally filed, independent Claim 1 broadly claimed a racket with any pattern of splay, while dependent Claims 5 and 7 each claimed a particular pattern of splay. Specifically, Claim 5 recited the pattern of uniform splay, while Claim 7 recited the pattern of splay described as the preferred embodiment in the patent's specification. Thus, as originally filed, Claim 1 was certainly broad enough to cover a racket with a pattern of splay containing less than three offset distances. The examiner initially rejected Claims 1 and 5 as anticipated by Lewis, a reference teaching the pattern of uniform splay. Such a rejection was, of course, appropriate as to Claim 1 because the pattern of uniform splay taught by Lewis surely anticipates a claim broadly covering a pattern with "at least some" splay.

Before focusing on AAI's response to this rejection, we pause to note a practical aspect of patent prosecution. Specifically, when amending a claim so as to avoid a rejection based on a particular reference, the skilled patent prosecutor usually seeks to draft an amendment that narrows the claim only as much as is thought necessary to overcome the rejection. Prior to looking at AAI's response to the initial rejection, an experienced patent prosecutor might thus have expected AAI to attempt to overcome Lewis by amending Claim 1 to cover all patterns of non-uniform splay, including those with only two offset distances.

AAI's written response to the first office action does not disappoint this expectation. As was discussed above, AAI's response included two distinct amendments. First, AAI rewrote Claim 1 as new Claim 20, expressly stating that it was doing so in a manner calculated to overcome the Lewis rejection. Second, AAI rewrote Claim 7 as new Claim 21. Since the subject matter of this latter claim had already been deemed allowable by the examiner, AAI did not discuss Claim 21 beyond briefly remarking that it was an independent version of Claim 7. This brief remark sharply contrasts with AAI's detailed explanation of why, in its view, Lewis did not anticipate Claim 20, thereby lending strong support to the conclusion that AAI drafted Claim 20 to be broader in scope than Claim 21. We might well conclude that Claim 20 was directed to any non-uniform splay pattern, including a pattern having only two offset distances, were this the only evidence in the file history. It is not.

The record also contains documents clearly indicating that, with respect to the pattern of splay, AAI understood the scope of Claim 20 to approximate that of Claim 21, which both parties concede recites a pattern of splay containing at least three offset distances. The first such document is the examiner's Interview Summary Record of November 16, 1989, in which the examiner noted that AAI's "attorney explained how cl. 20 is directed to [the] preferred embodiment and how [its] recitation distinguishes over [the] cited references." In other words, according to this summary, the intended scope of Claim 20 was not the broadest scope that would nonetheless overcome the Lewis reference, but was instead the same as that of Claim 21, at least with respect to the basic pattern of splay. On this reading, Claims 20 and 21 differed only in that Claim 21, unlike
Claim 20, recited specific numerical values for the minimum and maximum offset distances.

AAI's appeal brief, like the interview summary, features the same characterization of Claim 20. There, as outlined above, AAI stated that both Claims 20 and 21 were based on the allowable subject matter that had originally appeared in Claim 7, reciting the pattern of splay in the preferred embodiment. Furthermore, AAI used the phrase "varies between" to describe the variable splay of the preferred embodiment and maintained that the "element of varying splay" was the same in Claims 20 and 21. Again, these assertions indicate that the scope of Claims 20 and 21 differed only with respect to the particular numerical embodiment described in Claim 21, but not with respect to the basic pattern of splay.

Two strong and contradictory interpretive strands thus run through the patent's prosecution history. According to the first, Claim 20 was drafted simply to avoid the Lewis reference and differs significantly in scope from Claim 21. According to the second, Claims 20 and 21 recite the same basic pattern of splay, while Claim 21 adds a numerical value limitation. Each strand, considered alone, leads to a coherent and distinct meaning of the disputed claim. One does not prevail over the other, and together they are irreconcilable. The prosecution in this case is thus unhelpful as an interpretive resource for construing the "varies between" claim limitation.

3. Claim Differentiation

Neither the claim, the specification, nor the prosecution history establishes the meaning of the phrase "varies between" in Claim 1. AAI, resorting to an interpretive guide for secondary support of its position regarding the meaning of "varies between," contends that the doctrine of claim differentiation compels us to interpret the claim as it does, i.e., to require that the offset distance take on two or more, rather than three or more, values. According to AAI, while "there is no question Claim 14 requires three or more different distances of string splay," it would constitute legal error to read the "continuously" limitation of Claim 14 into Claim 1.

AAI's argument overlooks the fact that Prince does not contend that Claim 1, like Claim 14, requires that the offset distance recited therein vary continuously between minimums and a maximum. Continuous variation, as AAI itself concedes, requires a continuous gradual change in the offset distance of parallel strings; this implies that the offset distance for each string differs from that of both adjacent strings. In contrast, Prince contends only that Claim 1 requires that the offset distance take on three or more values, a potentially broader limitation. For example, suppose a tennis racket were to employ seventeen horizontal strings but only four offset distances. Under Prince's construction, this arrangement would infringe Claim 1 because it employs more than three offset distances, but would not infringe Claim 14 because the offset distances do not vary continuously. Therefore, assent to Prince's contention that Claim 1 requires three or more offset distances would not render the "continuously" limitation in Claim 14 superfluous. In short, the choice between Prince's and AAI's construction of Claim 1 simply does not implicate the doctrine of claim differentiation, and we are left with two equally plausible meanings of Claim 1. We must therefore pursue the interpretive process to state which of the two meanings is correct.

4. Section 112

In order to decide which of the two senses of "varies between" to employ in construing the '097 patent, we refer to the statutory provision that prescribes the would-be patentee's claim drafting burden, 35 U.S.C. § 112 (1988). Specifically, paragraph 2 of section 112 requires that the "specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention." (Emphasis added). As courts have recognized since the requirement that one's invention be distinctly claimed became part of the patent law in 1870, the primary purpose of the requirement is "to guard against unreasonable advantages to the patentee and disadvantages to others arising from uncertainty as to their [respective] rights." General Electric Co. v. Wabash Appliance Corp., 304 U.S. 364, 369, 82 L. Ed. 1402, 58 S. Ct. 899 (1938). See, e.g., McClain v. Ortmary, 141 U.S. 419, 424, 35 L. Ed. 800, 12 S. Ct. 76 (1891) ("The object of the patent law in requiring the patentee [to distinctly claim his invention] is not only to secure to him all to which he is entitled, but to apprise the public of what is still open to them."); Rengo Co. v. Molins Mach. Co., 657 F.2d 535, 551 (3d Cir.) ("Its purpose is to demarcate the boundaries of the purported invention, in order to provide notice to others of the limits beyond which experimentation and invention are undertaken at the risk of infringement.") (internal quotation omitted), cert. denied, 454 U.S. 1055, 70 L. Ed. 2d 591, 102 S. Ct. 600 (1981); Hoganas AB v. Dresser Indus., 9 F.3d 948, 951, 28 U.S.P.Q.2d (BNA) 1936, 1939 (Fed. Cir. 1993) (function of claims is "putting competitors on notice of the scope of the claimed invention"). Were we to allow AAI successfully to assert the broader of the two senses of "between" against
Prince, we would undermine the fair notice function of the requirement that the patentee distinctly claim the subject matter disclosed in the patent from which he can exclude others temporarily. Where there is an equal choice between a broader and a narrower meaning of a claim, and there is an enabling disclosure that indicates that the applicant is at least entitled to a claim having the narrower meaning, we consider the notice function of the claim to be best served by adopting the narrower meaning.

--- Footnotes ---

7 Patent Act of 1870, ch. 230, § 26, 16 Stat. 198, 201 ("Before any inventor or discoverer shall receive a patent . . . he shall particularly point out and distinctly claim the part, improvement, or combination which he claims as his invention or discovery . . .").

--- End Footnotes ---

We conclude that Claim 1 of the '097 patent includes the limitation that the splay-creating string end offset distance take on at least three values, i.e., a minimum, a maximum, and at least one intermediate value. We thus affirm the district court's conclusion that Claim 1 does not literally read on the Vortex racket.

---

5. "the volume of chlorine drawn from the chlorine supply canister during a period of continuous sewage effluent recirculation varies with the duration period of continuous sewage effluent recirculation"

Cecil's argues that the key to this phrase is that chlorine is drawn from the supply canister "regardless of the duration period" of recirculation. Dkt. No. 22 at 37. Chaffin argues that the phrase means that "the longer the sewage effluent is recirculated without stopping, the greater the volume of chlorine that is dispensed." The distinction between these two interpretations is a fine one, if it exists at all. If chlorine is drawn from the supply canister regardless of the duration of recirculation, then it follows that the longer the recirculation runs, the more chlorine is dispensed (up to the limit of how much chlorine is in the supply canister, of course).

That said, Chaffin's formulation seems closer to the mark. The difference is, as with the proposed constructions of "venturi chamber," one of focus: Cecil's construction focuses on whether chlorine is drawn, while Chaffin's construction points to how much chlorine is drawn. The language of the claim, however, describes how much chlorine is drawn: the amount "varies with the duration . . . of . . . recirculation." Chaffin's construction, then, is more in keeping with the actual language of the claims.

Thus, the Court adopts Chaffin's proposed construction: "the volume of chlorine drawn from the chlorine supply canister during a period of continuous sewage effluent recirculation varies with the duration period of continuous sewage effluent recirculation" means "the longer the sewage effluent is recirculated without stopping, the greater the volume of chlorine that is dispensed."

---

8. Claim 1 - "movably coupled to the frame and operable for being moved with respect to said erected frame to vary the position of the dunnage structure and the received product within the container"

Bradford proposes a multipart or compound construction for this term consisting of the following:

a. "coupled to" - linked together, connected or joined;

b. "frame" - a structure that gives shape or support;
c. "vary the position" - to make or cause a change in place or position;

d. "operable for being moved with respect to said erected frame to vary the position of the dunnage structure and the received product within the container" - being such that use or operation is possible;

e. "dunnage structure" - a number of flexible parts held or put together in a particular way for separating and protecting the products shipped in the container.

Bradford's proposed definition is essentially an amalgam of its other proposed term constructions with the exception of the term in subpart d.

Defendants propose that the above term means "coupled to' the 'frame' so that the 'dunnage structure' is capable of being moved with respect to said erected 'frame' to make or cause a complete change in the place or position of the product and the 'dunnage structure' within the container, and excluding limited sliding of dunnage structure loops along a supporting rod." Defendants' proposed definition of this term again seeks to impose negative limitations on the claim. According to Defendant's proposed construction, this claim would not cover dunnage structures with loops that slide along a supporting rod. Defendants also contend that "vary the position" requires a "complete change of position" as opposed to just a "change of position."

In support of their construction, Defendants rely on the prosecution history of the '916 Patent in which Bradford distinguished the movement of its dunnage structure from Janus when it stated, "Applicants disagree with the Examiner's reference to Janus's teaching of dunnage structures which are moveable on the frame and the way in which such limitation is claimed and taught in the present application[.]" Doc. No. 48-3, at 6. Defendants then note that in the Janus patent, U.S Patent 5,211,290, the dunnage structures are capable of limited sliding along supporting rods. See U.S. Patent 5,211,290, Fig. 1. Therefore, Defendants contend, in distinguishing Janus, Bradford disclaimed dunnage structures which are capable of limited sliding along a supporting rod. The Court disagrees.

In order for the prosecution history to limit the scope of a claim, the applicant must clearly and unambiguously disavow or disclaim coverage of relevant subject matter. Omega Eng., Inc. v. Raytek Corp., 334 F.3d 1314, 1325 (Fed. Cir. 2003). In this case, although Bradford distinguished Janus's moveable dunnage structures from the moveable dunnage structures of the claimed invention, the scope of Bradford's disclaimer of Janus's moveable dunnage structure is not apparent from the limited excerpts of the prosecution history before the Court. In other words, the prosecution history on which Defendants rely does not indicate a clear and unambiguous disclaimer of dunnage structures which are capable of limited sliding. Therefore, the prosecution history does not limit the '916 Patent to claiming dunnage structures which are capable of limited sliding.

Moreover, it is not readily apparent to the Court that Janus even claims dunnage structures which are capable of limited sliding. Therefore, as it relates to the term "vary the position", the prosecution history cited by Defendants would not constitute a disavowal of anything that Janus claims. With regard to the preferred embodiment at issue, the specification in Janus states in pertinent part:

The bay defining element 19 defines a plurality of bays 32, five in this embodiment. A flexible lower suspension sheet 34 is mounted to the bay defining element 19 to extend across the bays 32 as shown in FIG. 1. The lower suspension sheet 34 is preferably held in place to the transverse bars 22 by split sleeves 36, as best shown in FIG. 5. The split sleeves 36 preferably snap into position over the transverse bars 22 to maintain the desired configuration for the lower suspension sheet 34 in each of the bays 32. In this way, the lower suspension sheet 34 cooperates with the lower portion 14 of the frame 12 to define five product receiving areas, one associated with each of the bays. The split sleeves 36 can be formed of any suitable material, including metals and appropriate polymers. The split sleeve can be formed to shape, and if polymeric can be either extruded or slit from a tube. A wide variety of materials are suitable, but a plastic such as polypropylene is presently preferred.

U.S. Patent 5,211,290 col. 3, ll. 59-68, col. 4 ll. 1-9. In layman's terms the embodiment in Figure 1 shows that the dunnage structures snap onto a series of supporting rods which span across the width of the container. In the embodiment depicted in Figure 1, the dunnage structures are capable of limited lateral sliding across the support rods because the dunnage structures are not as wide as the support rods are long.
It does not appear to the Court, however, that this limited ability of the dunnage structure to slide laterally is necessary to the operation of the invention in Janus. In Janus, the container in Figure 1 is reduced in size by folding it along its length so that it is actually longer in the collapsed position than in the erected position. See id. col. 6, ll. 28-37. It seems that the dunnage structure could be nearly as wide as the support rod so long as the split sleeve could rotate freely around the support rod while the container is being moved to the collapsed position. Thus, it does not appear that lateral sliding of the dunnage structure is necessary even in the preferred embodiment. Finally, having reviewed the '290 Patent, nowhere does it appear to claim limited sliding of the dunnage structure in the claims or the specification. Therefore, Bradford could not have disclaimed dunnage structures capable of limited sliding when it distinguished Janus to the Examiner.

Therefore, the Court rejects Defendants' limitation "excluding limited sliding of dunnage structure loops along a supporting rod." Additionally, the Court finds no support for Defendant's limitation that there must be a "complete change of position". Therefore, that limitation is rejected as well. The Court accepts Bradford's proposed construction of this term with the caveat, however, that the subparts will be modified to conform with the Court's previous construction of those terms. Accordingly, the Court holds that "movably coupled to the frame and operable for being moved with respect to said erected frame to vary the position of the dunnage structure and the received product within the container" means:

a. "coupled to" - linked together, connected or joined;

b. "frame" - a structure that gives shape or support but excluding a substantially continuous surface (i.e., walls), that gives shape or support to the rack container;

c. "vary the position" - to make or cause a change in place or position;

d. "operable for being moved with respect to said erected frame to vary the position of the dunnage structure and the received product within the container" - being such that use or operation is possible;

e. "dunnage structure" - a number of flexible parts held or put together in a particular way for separating and protecting the products shipped in the container.

---

1. Meaning Of "Vault".

Claim 1 of the '904 patent discloses "a vault for housing said video recorder." See claim 1 of the '186 patent. The court construes "vault" in this context to mean a durable box-type steel container, that may be locked, and that is of a size capable of housing a video recorder and being placed in the trunk of an automobile. 2

---

Footnotes

---

2 The term "vault" is used in the challenged claims of both the '186 and '904 patents. The court will construe the term "vault" as used in both patents in the same manner.

---

End Footnotes

---

The court's construction is consistent with the preferred embodiment described in the specifications. The specifications for the Peterson patents provide:

The video recorder 16, interface box 22 and environmental control unit are housed within the vault 20 which is mounted in the trunk of the patrol car 10. The vault 20 is a stainless steel vault secured with a tamper-resistant padlock. The vault 20 is fireproof and bullet-proof. It is extremely durable, much like the flight recorder box on airplanes. The interior of the vault 20 is provided with a stamped aluminum insert having recesses for receiving the video recorder, interface box and environmental control unit. A foam insert in the lid of the vault 20 is provided to cushion the components of the system in the event an effort is made to open the vault 20 or the patrol car 10 is destroyed.
The vault 20 is an environmentally controlled steel vault, substantially box-like in shape and having an upper portion hingedly connected to a lower portion. The two portions of the vault close together and are securely locked by a padlock. The padlock is of heavy-duty construction so that it will withstand efforts to unlock it and thereby gain access to the video recorder housed with in the vault 20. The vault 20 incorporates a heater and cooling element housed in the environmental control unit to maintain the temperature within the vault 20 in the range of 40 [degrees] F. to 90 [degrees] F. The vault 20 is bolted in the trunk of the patrol car.

(Emphasis added.) The specifications, especially the underlined portions above, strongly support the court's definition of vault. See Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1550 (Fed. Cir.) (interpretation of term that would exclude the inventor's preferred embodiment in the specification is rarely the correct interpretation), cert. denied, 135 L. Ed. 2d 1048, 116 S. Ct. 2523 (1996).

The court's construction is further supported by the use of the term "vault" in the other claims of the '904 and '186 patents. Claim 9 of the '904 patent requires that the vault be a "closed bulletproof and fireproof chamber." See claims 6, 14 of the '186 patent. In addition, apparatus claim 14 of the '904 patent requires that the vault be mounted in the trunk of the vehicle. See claims 6, 14 of the '186 patent. All of these references support the court's interpretation that the "vault" is a durable container, that may be locked, and that is of a size capable of being placed in the trunk of an automobile.

The prosecution history of the Peterson patents also favors the court's construction. The '904 patent application originally was rejected as "obvious" in light of a prior art magazine article that generally discussed police car video surveillance systems. The patent examiner stated that storing the video recorder in a vault was "simply a matter of design option" and was not patentable. Peterson responded that amended claim 1, which recites "that the vault is located in a locked compartment of the vehicle," 3 differs from the prior art. Peterson urged that his invention was novel and patentable because the system described in the magazine article did not speak to the specifics of storing the video recorder and clearly permitted the video tape to be rewound and played back. 4 Peterson also urged that "there is absolutely no suggestion [in the magazine article] of a vault in a locked compartment of a vehicle receiving the video recorder or storing the video tape during and after processing." Soon thereafter and without elaboration on this point, the patent examiner issued the '904 patent. From this history, it is apparent that the size of the claimed vault (capable of housing a video recorder and being stored in the trunk of an automobile) and the ability to lock the vault are essential elements of the meaning of the term "vault" as used in the Peterson patents.

3 For some reason not clear in the record or the prosecution history, claim 1(d) of the '904 patent as issued does not contain this language. The patent specification and the prosecution history, however, provide sufficient support for the conclusion that the vault in claim 1 is located in a locked compartment of the vehicle.

4 Peterson contended that his invention facilitated the stated objective of newly added claim 15 (claim 14 of the final '904 patent), i.e., to prevent the playback, rewinding, and erasure of the video tape by the vehicle operator or other individual.

The court's construction comports with the pertinent common definitions of "vault" as "a room for the safekeeping of valuables and commonly built of steel" and "a special compartment [usually] in a piece of office equipment for the safekeeping of money." Webster's New Int'l Dictionary 2536 (3d ed. 1986). Other relevant definitions of "vault" include "a room or compartment, often built of or lined with steel, reserved for the storage and safekeeping of valuables" and "a strong metal cabinet, usually fireproof and burglarproof, for the storage of valuables." Random House Unabridged Dictionary (2d Ed. 1993). These definitions support the court's construction of vault as a durable steel container, capable of being locked, and of a size capable of housing a video recorder.

The court has construed the term "vault" based solely on intrinsic evidence (the claims, specification, and prosecution history) and the pertinent dictionary definitions available to the court. Plaintiffs and defendant both agree that the meaning of the term "vault" should be ascertained solely by reviewing the intrinsic evidence and relevant dictionary definitions. The court rejects, however, the proposed definitions of "vault" advanced by plaintiffs and defendant.
Plaintiffs initially proposed in their summary judgment briefing that the term vault is "a durable, protective housing for the video recorder of the system." The court essentially has included the elements of this definition as part of its definition of vault. The court does not believe plaintiffs' definition, however, fully describes the term vault as it is used in the Peterson patents. At the Markman hearing, plaintiffs proposed that the term "vault" means "a secured durable housing in which the video recorder operates when the system is in use, and which provides a safekeeping function to protect the recording against damage and unauthorized access." Although this definition specifies many of the vault's purposes and functions in practice, the court does not believe that this definition adequately describes the inherent characteristics of the "vault" in the Peterson patents.

In its summary judgment briefing, defendant asserted that the term "vault" means "a place to house the video recorder." Defendant vigorously argued that the court should not read additional limitations contained in other dependent claims (such as bulletproof and fireproof in dependent claim 9) into the meaning of vault in independent claim 1 of the '904 patent. In sharp contrast, defendant argued at the Markman hearing that the term "vault" means a metal enclosure that has a temperature control regulator, is bulletproof, fireproof, and tamper proof, and prevents previously taped events from being taped over.

Defendant's first proposed definition does not adequately describe all of the characteristics of a "vault" as used in the Peterson patents. In addition, the court rejects defendant's second proposed definition because it is inconsistent with the doctrine of claim differentiation. As noted previously, the concept of claim differentiation provides that "each claim of a patent constitutes a separate invention and gives rise to separate rights." Jones v. Hardy, 727 F.2d at 1528. Defendant argued at the Markman hearing that the term "vault" appearing in claim 1 of the '904 and '186 patents should be read in light of the patent specifications. The patent specifications, which discuss the best mode or preferred embodiment of the invention, state that the vault has a temperature control regulator, is bulletproof, fireproof, and tamper proof, and prevents previously taped events from being taped over. Although claims are interpreted in light of the patent specification, this "does not mean that everything expressed in the specification must be read into all the claims." SRI Int'l, 775 F.2d at 1121 (quoting Raytheon Co. v. Roper Corp., 724 F.2d 951, 957 (Fed. Cir. 1983), cert. denied, 469 U.S. 835, 83 L. Ed. 2d 69, 105 S. Ct. 127 (1984)); see Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1277 (Fed. Cir. 1995); Intervet, 887 F.2d at 1053 ("Limitations appearing in the specification will not be read into claims."). "Interpreting what is meant by a word in a claim 'is not to be confused with adding an extraneous limitation appearing in the specification, which is improper.'" Id. (quoting E.I. DuPont De Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir. 1988)). The specification identifies only the best mode of practicing an invention, not the scope of the invention. 5 Transmatic, 53 F.3d at 1276. The claims measure the scope of the invention. 6 SRI Int'l, 775 F.2d at 1121. The court accordingly rejects defendant's contention that the limitations found in dependent claims of the Peterson patents (such as fireproof and bulletproof) should be read into the meaning of "vault" found in an independent claim.

--- Footnotes ---

5 Defendant is well aware that the limitations of terms found in dependent claims should not be read into those same terms found in an independent claim. Defendant argued to this court that "an additional limitation in a dependent claim should not be imported into the independent claim - even if the additional limitation is described in the specification." Def.'s Reply In Supp. Of Mot. For Summary J. at 4. With respect to the term "vault," defendant argued that "these characteristics [i.e., bulletproof and fireproof chamber] of a vault may not be implied into the vault of claim 1, because the claim element there is simply a 'vault'." Def.'s Mem. In Supp. Of Mot. For Summary J. at 17.

6 In fact, the Peterson patents state that only preferred embodiments are shown and that the scope of the invention is defined by the claims.

7 Counsel for defendant conceded at the Markman hearing that some violence to the claim differentiation doctrine would result by importing defendant's suggested limitations into the term "vault" in claim 1.

--- End Footnotes ---
3. Meaning of "Vehicle".

At the Markman hearing, plaintiffs and defendant requested the court to construe the meaning of the disputed term "vehicle" in the challenged claims. Plaintiffs contend that the term "vehicle" is "a motor vehicle such as a police patrol car." Plaintiffs offer no support for their argument that the court should include a specific example of a vehicle as part of the definition. The jury's function is to decide if a specific example meets the definition of "vehicle" as that term is used in the Peterson patents.

Defendant claims that the term "vehicle" means "a means of conveyance or transport including any type of public or private transportation." The court will adopt defendant's proposed definition, which is supported by the Peterson patents and is consistent with the ordinary meaning of "vehicle." The patent specifications provide:

> It is understood, however, that the use of the surveillance system of the present disclosure is not limited to police surveillance. The surveillance system may be used in any type of public or private transportation.

Mr. Peterson clearly attempted to maintain a broad definition of vehicle although the vehicle discussed as the preferred embodiment is a police patrol car. Plaintiffs' definition of vehicle as a motor vehicle potentially is misleading and may exclude many types of public and private transportation. Subways, trolley cars, bicycles, and stagecoaches are all means of conveyance or transport that typically are not considered motor vehicles.

The term "vehicle" should be given its ordinary and accustomed meaning because there is no indication in the patent documents that Mr. Peterson intended otherwise. See Hoeschst, 78 F.3d at 1578; Transmatic, 53 F.3d at 1276. The court's construction of "vehicle" is consistent with the common understanding of vehicle as "a means of conveyance or transport" and a "means of carrying or transporting something: conveyance." Random House Unabridged Dictionary (2d ed. 1993); Webster's New Int'l Dictionary (3d ed. 1986). Based on the patent claims, specification, and relevant dictionary definitions, the court construes "vehicle" to mean "a means of conveyance or transport including any type of public or private transportation." 8

--- Footnotes ---

8 The court notes that its construction of "vehicle" does not include specific examples of vehicles such as an automobile or patrol car. On the other hand, the court's construction of "vault" includes a limitation that the vault "is of a size capable of . . . being placed in the trunk of an automobile." The use of the term "automobile" in the definition of vault restricts the size of the vault only, but does not restrict the vault of the Peterson patents to use in a particular type of vehicle.

--- End Footnotes ---

1) Use of the term "vehicle" instead of "automobile"

Defendant argues that the new language in the reexamined claims that refers to a "vehicle" rather than an "automobile" broadens the scope of the claims. Armed with a panoply of dictionary definitions and the expert testimony of a linguist, Defendant contends that the word "vehicle" includes not only "automobiles," but means of conveyance such as trucks, boats, recreational vehicles, minivans. Def. Trial Brief, at 6. 1 All of these, indeed, are correctly termed "vehicles"--as are liquids and motion pictures when "vehicle" is used within particular contexts.

--- Footnotes ---

1 Defendant has previously urged the court that "vehicle" encompasses "any moving support or container fitted or used for the conveyance of bulky objects. For example, the term ‘vehicle’ may also include carriages, motorcycles, sleds, tanks, or...
However, no word can be usefully understood without reference to its context, and the task of the court in construing the claims of a patent is not to ransack linguistic authorities for the purest expression of the abstract idea of a "vehicle," but to understand what the word means as used in the claims under consideration. See Texas Instruments v. Cypress Semiconductor Corp., 90 F.3d 1558, 1564 (Fed.Cir. 1996)("Although the dictionary broadly defines 'conductor' as any substance that conducts an electrical charge, the patent itself belies such a broad construction.") (citing Quantum, 65 F.3d at 1580). Accordingly, Defendant's litany of vehicular examples, literally correct though it may be, is potentially highly misleading.

The real question, then, is not whether "vehicle" always means "automobile," but whether in the context of the claims to be construed the two terms are used as synonyms. Webster's defines "automobile" to mean "a usually four-wheeled automotive vehicle designed for passenger transportation and commonly propelled by an internal-combustion engine using a volatile fuel." Webster's Ninth New Collegiate Dictionary at 118 (1981). Defendant has put forth no compelling argument to show that as used in the reexamined claims "vehicle" necessarily means anything other than this. While it is true that everyday speech commonly distinguishes between "cars" and "trucks," this usage is neither uniform nor dispositive. The court must inquire whether "one of ordinary skill in the art" of the sort of sunshade set forth in the Patent in Suit would understand that "vehicle" necessarily encompasses not merely passenger vehicles but also, for example, "boats," as Defendant urges.

Here, the very breadth and flexibility of the "ordinary meaning" of the word "vehicle," as revealed by the range of dictionary citations Defendant has provided, require that the court make reference to the patent specification in order to determine what "vehicle" in this context properly means. The court is, after all, called upon to determine the "ordinary meaning [of the claim language] to one of skill in the art." Quantum, 65 F.3d at 1580 (emphasis added); see also Cypress Semiconductor, 90 F.3d at 1564. The reexamined patent, like the original patent, is entitled a "compactly foldable automobile sunshade." The reexamined patent, like the original patent, refers to the use of visors that rotate in the vehicle/automobile. These two factors strongly suggest that the most appropriate construction of the word "vehicle" is that of a light, generally four-wheeled passenger conveyance. In the context of the sunshade delineated in the original Patent in Suit, the term "automobile" does not mean anything different, but designates those conveyances most commonly called cars, minivans, recreational vehicles, sport utility vehicles, and light trucks. Excluded are boats, airplanes, tanks, and so forth. Consequently, the court finds that the use of the term "vehicle" in the reexamined patent does not of itself impermissibly broaden the scope of the claims.

In anticipation of the potential finding that "vending machine" is more than simply a name for the invention, the parties dispute the meaning of this term. They agree that the general dictionary definition of vending machine is a coin-operated machine for vending merchandise. (See Pls.' Mem. On Claim Construction 10; Aly Decl. Ex. 9). This definition may inform the claim construction of vending machine, "so long as [it] does not contradict any definition found in or ascertained by a reading of the patent documents." Phillips, 415 F.3d at 1322-23. For example, the specification clearly contemplates payment other than by coins, so an appropriate construction will not limit "vending machine" to coin operation. (See '400 Patent 2:50-61). Similarly, payment is clearly required "to initiate a vending transaction," and both the Patents' specifications and the preamble to claim 1 describe the vending of telecommunications channel access, not merchandise. (See '400 Patent 2:43-45, 16:2-6, 12-17).

Although the dictionary definition describes "vending machine" as a single unit, plaintiffs still argue that vending machine should be construed as a system and method for vending services to multiple users contemporaneously, not as a traditional "single, stand-alone device" in a fixed location. (Pls.' Mem. On Claim Construction 11-12). If the Patents' specifications "reveal a special definition given to [vending machine] by the patentee that differs from the meaning it would otherwise possess," such lexicography must control the claim construction of that term. Phillips, 415 F.3d at 1316. According to plaintiffs, the inventors intended vending machine to include "various components . . . distributed in diverse locations, rather than located in a single device." (Id. at 12). Defendant criticizes this construction as not representing the view of a person of ordinary skill in the art and offers, instead, its expert's opinion that equates "vending machine" with "essentially a
payphone for computers," as the patent specification diagrams "each show a vending machine that is a unitary, self-contained structure," and "[n]o figures in the . . . patents show it otherwise." (Cooley Aff. PP 15 and 26). In opposition, plaintiffs characterize Figure 4 as describing "not a single, stand-alone device, but . . . a block diagram . . ., including blocks representing the various components and functions that have to be present to provide telecommunications channel access," with "no requirement that the equipment providing those functions be combined into one single device." (Pls.' Mem. On Claim Construction 11). Plaintiffs' characterization disregards the fact that Figure 4, in fact, illustrates a single device labeled as item 300 in the diagram and described in the specification as the single machine to which users would connect. (See '400 Patent 11:41-43 and Fig. 4).

At the Markman hearing, plaintiffs cited the following specification language as supporting the contemporaneous use of one vending machine by multiple customers:

[I]t might be more cost effective to have one control unit operating multiple vending machines. These multiple vending machines may be arranged in the form of a kiosk to allow multiple customers access to the vending machine at the same time. Similarly, almost any combination of functional components of the vending machine could be moved to a location remote from the machine. This could be accomplished, for example, by networking a cluster of machines to a server either on site or at a remote location. ('400 Patent 4:28-37). This language describes multiple customers being served by multiple vending machines, not a single machine. That multiple vending machines may share a single control unit does not logically transform the multiple units into a single machine that serves multiple users. Plaintiffs' argument that the sharing of a single control unit by multiple vending machines somehow converts the multiple machines into a single one effectively represents the control unit to be the essence of a vending machine. Plaintiffs argue further that removing "any combination of functional components . . . to a location remote from the machine" leads to the same result, i.e., a single vending machine with multiple extensions. This position distills the essence of a vending machine into an undefined collection of whatever functional components are removed from the machine. Such construction is neither sensible nor supported by the specification or the claims, particularly claim 1 which clearly identifies several elements of a vending machine that must be present in order to embody the invention. Plaintiffs have not demonstrated that the Patents defined "vending machine" other than as a traditional stand-alone machine that serves a single customer at a time.

In light of the applicable legal standard, the parties' written submissions, and the argument of counsel, I construe the disputed claim language as follows:

<table>
<thead>
<tr>
<th>Term</th>
<th>Court's construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vending machine</td>
<td>A device for vending telecommunications channel access to a single customer at a time when the customer provides sufficient payment</td>
</tr>
</tbody>
</table>

2. "vent"

The parties have agreed on a meaning for the term "vent," which appears in claim 10. The proposed construction is "an aperture that provides an opportunity or means of escape, passage, or release." Dkt. No. 110 at 1-2. While the Court has does not disagree with the overall construction, it does believe that the word "aperture" would be unnecessarily confusing to the jury. Thus, the Court finds that the term "vent" should be construed as "an opening that provides an opportunity or means of escape, passage, or release."

1. Claim 22

Aspen and Merit agree that the old and new Aspenbasins satisfy all of the other limitations of Claim 22, except for the vent
A waste collection system comprising:

- a basin including at least one chamber configured to receive and retain fluids, the at least one chamber including a bottom surface and at least one sidewall extending substantially upward from the bottom surface to an upper rim;

- a first containment layer at least partially engaging the upper rim of the at least one chamber, the first containment layer including at least one aperture for receiving waste;

and a vent associated with the upper rim of the at least one chamber.

Accordingly, in this analysis, the only phrase needing construction is "a vent associated with the upper rim of the at least one chamber."

In its interpretation the Court will consider the ordinary meaning of "vent." In the context of waste bins and other receptacles, the ordinary meaning of "vent" is "[a]n opening provided for the discharge of pressure or the release of pressure from tanks, vessels, reactors, processing equipment, and so on." McGraw-Hill Dictionary of Scientific and Technical Terms (6th ed.), p. 2251.

The parties dispute in what way the vent is to be "associated" with the upper rim of the chamber. Aspen claims a vent associated with the clear plastic rim of the unit does not fall within the scope of Claim 22, and that the vent must be a part of the actual chamber, i.e., the basin.

Merit argues that the term "associated" means to be in a more or less close relationship, and does not mean that the vent need be actually connected to, or part of, the upper rim. Merit argues that the claim language itself, using the regular everyday meaning of "associated" should control, and not other claims, specifications or prosecution history. Merit further believes that the only limitation to the term "vent" is that it be an opening for the release of gases from the waste basin, regardless of how such vent is constructed.

In interpreting the phrase that the vent be "associated" with the upper rim, the Court will also consider the drawings contained within the '017 patent. The Court believes this is necessary in order to better understand what Merit intended when stating that the vent was to be "associated" with the upper rim. The Federal Circuit has held that such drawings are part of the specification and are relevant to claim construction. CVI/Beta Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1153 (Fed.Cir. 1997). Here, the "vent associated with the upper rim of the at least one chamber," is illustrated in Figure 2 of the '017 Patent. Structure 82 in Figure 2 of the '017 Patent illustrates the vent, and shows that the vent is a recess that extends completely through the upper rim of the sidewall of the Backstop. While Merit argues that the drawing is meant for illustrative purposes only, and should not serve as a limitation to the claim, the court believes that the drawing is an important source in interpreting what Merit intended when stating that the vent is to be "associated" with the chamber. The drawing is clearly a further description of the very vague claim language.

In considering the above, the Court concludes that the term "vent," as used in Claim 22, is meant to be a recess that extends completely through the upper rim of the sidewall of the main chamber, and allows for the escape of gas.

6. VENT MEANS, CLAIM 5

ConAgra contends "vent means" in claim 5 invokes 35 U.S.C. § 112, P 6. ConAgra contends the function of the limitation is "to vent vapor from the first vessel," and the structure of the limitation is "an opening in the flange of the second vessel" (Filing No. 64). Green did not specifically address whether "vent means" invokes § 112, P 6 but defined the term as "any opening which allows venting of the annular space" (Id.).
Section 112, P 6 of title 35 provides:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

"A claim element that contains the word 'means' and recites a function is presumed to be drafted in means-plus-function format under 35 U.S.C. § 112 P 6." Net MoneyIN, Inc. v. VeriSign, Inc., 545 F.3d 1359, 1366 (Fed. Cir. 2008). The presumption is rebutted if the claim recites sufficient structure to perform the claimed function. Id. "The first step of a 35 U.S.C. § 112, P 6 analysis is to identify the function of the claim limitation. The second step requires identification of the structures disclosed in the specification and equivalents thereof that perform the claimed function." Telemac Cellular Corp. v. Topp Telecom, Inc., 247 F.3d 1316, 1324 (Fed. Cir. 2001) (internal citations omitted).

In this case, the Court finds "vent means" in claim 5 invokes 35 U.S.C. § 112, P 6. Claim 5 states: "The utensil in accordance with claim 1, wherein said second vessel includes vent means to vent vapor from said first vessel." The claim language presumptively invokes § 112, P 6, and the claim does not recite sufficient structure to rebut the presumption. Accordingly, the Court must construe the claim as a means-plus-function limitation. The plain language of claim 5 states that the function of the limitation is to vent vapor from the first vessel. The specification identifies an opening in the flange of the second vessel as the means for performing this function (See the '083 patent, col. 5, ll. 30-33; fig. 2). 3

Thus, "vent means" in claim 5 invokes § 112, P 6. The function of the limitation is to vent vapor from the first vessel, and the means for performing the function is an opening in the flange of the second vessel.

For the "poorly ventilated area" terms, US Foam applies dictionary definitions to create its proposal whereas Defendants propose construing "poorly ventilated area" to be the same as "confined area." A confined area, as defined in the specification, has two characteristics—limited ventilation and limited access. There is no support for requiring that a poorly ventilated area have limited access. US Foam introduces a "fresh air" requirement, though it appears in one of several possible definitions for "ventilate," has no support in the claims or specification. See WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY OF THE ENGLISH LANGUAGE UNABRIDGED (1993) ("to cause fresh air to circulate through and vitiated or contaminated air to be simultaneously withdrawn from"). The Court construes "poorly ventilated area" to mean "an area where the circulation of air is poor."

XIII. "Ventilation opening"

The term "ventilation opening" appears in claims 9 and 10 of the '925 patent.

A. The Parties' Proposed Constructions

Black & Decker construes the term "ventilation opening" as "a permeable opening [may include air or moisture permeable material]." Bosch counters that the term means "an opening in the enclosure so constructed as to provide for the circulation of external air through the enclosure to remove heat, fumes, or vapor."
E. "Venturi" / "Venturi Tube" / "Venturi Passage"

Claim 1 of the '701 Patent contains the term "venturi passage," Claim 2 of the '714 Patent includes the term "venturi tube," and Claim 14 of the '701 Patent contains the single term "venturi." The parties agree that the terms "venturi," "venturi tube," and "venturi passage" should all be given the same construction. The evidence in the record establishes clearly that the ordinary and customary meaning of a "venturi" involves restricting or narrowing part of a passageway for the purpose of creating suction or, in other unrelated applications, for measuring flow rate.

TI Group argues that, acting as its own lexicographer, the patentee defined "venturi," "venturi tube" and "venturi passage" to have a different, more broad meaning. Specifically, TI Group argues that the terms should be construed to mean "a tube or wall defining a passageway that is narrower, or that has a smaller cross-sectional area, than the passageway leading to it." The patent specifications and file history do not, however, support TI Group's argument because they do not contain sufficient clarity to put one reasonably skilled in the art on notice that the inventor intended to redefine these three venturi terms. See, e.g., Merck & Co., Inc. v. Teva Pharmaceuticals USA, Inc., 395 F.3d 1364, 1370 (Fed. Cir.), cert. denied, 546 U.S. 972, 126 S. Ct. 488, 163 L. Ed. 2d 384 (2005); Innova/Pure Water, Inc. v. Safari Water Filtration Systems, Inc., 381 F.3d 1111, 1117 (Fed. Cir. 2004). As a result, the Court will construe these claim terms in accordance with their ordinary and customary meaning, as understood by a person of ordinary skill in the art who has read the entire patent.

Performance proposes that the terms should be construed to mean "a tube or passageway with wider sections at both ends of said tube or passageway." This proposed construction is more narrow than a reading of the full Patents allows. For example, Figure 1 of the '714 Patent reflects a venturi with a wider section as part of the tube or passageway. Figure 7 of the '714 Patent, on the other hand, reflects a venturi with the wider sections separate from what is labeled the venturi. As a result, the Patents make clear that the wider sections at both ends of the tube or passageway may be, but are not required to be, part of
TI Group's proposed construction, on the other hand, is more broad and general than is supported by the Patents. TI Group proposes that the venturi terms include any tube or other passageway that leads from a larger area, regardless of where the fluid from the tube or passageway flows and regardless of whether the flow of fluid through the tube or passageway exerts suction. As mentioned above, a person of ordinary skill in the art who has read these patents in their entirety would understand that the term "venturi" necessarily involves a tube or passageway, with larger areas at both ends, which creates or exerts suction. TI Group's proposed construction fails to require the larger area into which the fluid flows, and it fails to include the concept of suction which is vital to the term "venturi" as commonly understood by persons skilled in the art of fluid mechanics.

Having reviewed the patents in full and all other relevant evidence in the record, the Court construes the terms "venturi, "venturi tube" and "venturi passage" for purposes of these Patents to mean "a tube or other passageway for exerting suction, which tube or passageway is narrower than the areas at both ends." The larger areas at each end may either be part of the tube or passageway or be separate areas to which the tube or passageway is connected.

1. "venturi chamber"

The parties included the phrase "venturi chamber" in their Joint Claim Construction Statement. Dkt. No. 20. Cecil's Opening Claim Construction Brief, however, argued that no construction of the term was necessary because the term was not ambiguous. Dkt. No. 22, at 26. Chaffin, by contrast, proposed that "venturi chamber" means "a region in a tubular fluid pathway in which suction is produced due to a constriction." Cecil's, in its response, renewed its argument that "venturi chamber" need not be construed, but argued alternatively that Chaffin's construction is incorrect, and suggests instead that "venturi chamber" be construed as "a volume in which a significant drop in pressure relative to atmospheric pressure is caused by the flow of a liquid through that volume." Dkt. No. 26, at 21.

The Court agrees with Cecil's that "region" is ambiguous, and that "volume" is a better description of the venturi chamber in Chaffin's invention. As to the remainder of the construction, however, the difference appears to be in focus rather than a more fundamental disagreement. Chaffin's construction focuses on the actual effect of the venturi chamber and the reason for its use: the creation of suction. Cecil's construction focuses on the means by which that suction is created: a pressure drop. Cecil's construction, however, omits the means by which the drop in pressure is created: a constriction in the pipe. Dictionary definitions of "venturi" typically include the concept of restriction: "A short tube with a constricted throat . . .," THE AMERICAN HERITAGE DICTIONARY 1982 (3d ed.); "a short tube with a tapering constriction in the middle that causes an increase in the velocity of flow of a fluid and a corresponding decrease in fluid pressure . . .," MERRIAM-WEBSTER'S COLLEGE DICTIONARY 1311 (10th ed.).

Thus, with the slight change from "region" to "volume," the Court adopts Chaffin's construction of "venturi chamber": "a volume in a tubular fluid pathway in which suction is produced due to a constriction."

The '167 patent claims a self-forming hinge element that has a molded-in depression that defines an "essentially vertical depending straight wall." The specification and prosecution history do not define "essentially vertical," although "vertical" and "essentially vertical" are used interchangeably in the specification. Bailey asserts that the magistrate judge erred in construing the term "essentially vertical" to mean vertical or deviating only a few degrees from vertical. Bailey proffers a more expansive meaning, claiming that "essentially vertical" encompasses angles ranging from 45 to 90 degrees. Bailey supports his interpretation with expert testimony that "essentially vertical" means between 45 and 90 degrees to one of ordinary skill in the art. Bailey, Civ. A. No. 91-13121-MLW, slip op. at 15 (Mar. 11, 1997). M & N's experts, on the other hand, testified that the term means 90 degrees plus or minus a few degrees. Id. The magistrate judge construed "essentially vertical" as urged by M & N and determined that the 62 and 68 degree walls of the accused lids did not meet this claim.
Id. at 31. We agree with the magistrate judge's claim construction ("essentially vertical" means "vertical or a few degrees from vertical") and therefore uphold his infringement decision with respect to this limitation. Giving the claim language its ordinary meaning, walls deviating 22 and 28 degrees from vertical would not be "essentially vertical."

B. Application to this Case

Before the Court construes the relevant claim language in this case, some further understanding of the similarities and differences between Pro-Tech's Sno Pusher and defendants' Sno-Pro is needed. There is no real dispute here that plaintiff's Sno Pusher does use horizontal and vertical channels to provide added strength to the blade. The real issue, with respect to infringement at least, is whether the term "vertical channel," as used in the '755 patent, is broad enough to include defendants' "boxed gusset" design. Is defendants' design such that it utilizes channels?

As illustrated in Figure 4 of the '755 patent, there are three horizontal channels (designated "11" in Figure 4 of the patent, which is attached as Exhibit A to this Decision and Order) running across the back of the blade, and three vertical channels ("12") between the horizontal channels. The patent states that all the channels are welded to the blade. '755 Patent col. 2 line 37.

According to defendants, their Sno-Pro design does not utilize vertical reinforcing channels, but rather "boxed gussets." A gusset, in general, is a flat, usually angled piece of metal used for strengthening a structure. Defendants' expert, Ronald N. Salzman, who holds a doctorate in Mechanical Engineering, describes a boxed gusset as "a double gusset with a plate welded between." Salzman Aff. (Dkt. # 56) P5(F). A critical issue in this case is whether defendants' boxed gusset constitutes a "channel" as that term is used in the '755 patent.

The relevant claim language of the '755 patent states that it claims "an upstanding transverse blade with a front, back, and bottom, said blade including a plurality of horizontal and vertical reinforcing channels on the back thereof ...." The claims themselves give no further explanation of what is meant by "channel." The specification also gives no definition of "channel," though it does state that "welded straight channels are inherently stronger and not prone to failure by buckling, as compared to typical prior art vertical curved ribs cut from steel plate." '755 Patent col. 2 lines 38-41.

The claims do, however, appear to draw a distinction between a "channel" and a "gusset." In addition to claiming "a plurality of horizontal and vertical reinforcing channels on the back" of the blade, Claim 1 claims "a horizontal backing member with a plurality of vertical gussets mounted on said blade along and behind the bottom thereof." '755 Patent col. 3 lines 21-26.

The Merriam-Webster Online Dictionary (http://m-w.com) gives several definitions for the word "channel," the most apt of which is "a long gutter, groove, or furrow; a metal bar of flattened U-shaped section." Similary, the Oxford English Dictionary (http://oed.com) defines "channel" as a "lengthened groove or furrow on any surface," and also states that "channel" can be "short for channel bar," which is defined as "an iron bar or beam flanged to form a channel on one side." Those definitions do aptly describe the channels shown in Figure 4 of the '755 patent, which appear to be long pieces of metal with a bracket-shaped ("]) cross-section.

Plaintiff's expert, James B. Taylor, who holds a doctorate in Industrial Engineering, opines that "the 'boxed gusset' utilized
by the defendants is a vertical channel as it comprises all of the elements one of ordinary skill in the art at the time of the invention would have understood (i.e., a pair of sides or flanges connected to and extending in parallel from a web).” Taylor Aff. (Dkt. # 71) P16. He states that the fact that defendants' boxed gusset has triangular rather than rectangular sides is immaterial, because "all cross sections of the [boxed gusset] channel are "U" shaped …." Id. P14.

Salzman, on the other hand, states in his affidavit that a boxed gusset is not the same thing as a channel. He opines that "channels are hot-rolled factory made structural steel shapes" that are "identified as 'C', 'MC', or 'U' shapes in the art." Salzman Aff. PP5(E), 5(F). He adds that a "gusset … is a piece of steel plate used as a reinforcement to provide stiffening," and that "welding a plate between two gussets does not create a channel." Id. P5(F).

Based simply on the claim language and the ordinary meaning of the term "channel," it is not immediately apparent whether "channel" should be construed to include a "boxed gusset." Given its commonly understood meaning, the term "channel" would not generally bring to mind an object with triangular sides. At the same time, though, it does seem that one could construct a channel by welding three metal plates together to form a U or bracket shape.

As stated, however, the third category of intrinsic evidence that a court may consider is the prosecution history, which "contains the complete record of all the proceedings before the Patent and Trademark Office, including any express representations made by the applicant regarding the scope of the claims.” Vitronics, 90 F.3d at 1582. Based upon the prosecution history of the '755 patent, I conclude that the term "channel," as used in the patent, does not include a "boxed gusset."

"Even where the claim language is not ambiguous, 'the prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution.' Scheuer v. Laboratory Computer Systems, Inc., 308 F.3d 1304, 1313 (Fed. Cir. 2002) (quoting Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir.), cert. denied, 516 U.S. 987, 133 L. Ed. 2d 424, 116 S. Ct. 515 (1995)). "Thus, the prosecution history limits even clear claim language so as to exclude any interpretation that was surrendered during prosecution, but only where the accused infringer can demonstrate that the patentee surrendered that interpretation 'with reasonable clarity and deliberateness.'" Id. (quoting Pall Corp. v. PTI Techs., Inc., 259 F.3d 1383, 1393 (Fed. Cir. 2001), vacated on other grounds sub nom. PTI Techs., Inc. v. Pall Corp., 535 U.S. 1109, 153 L. Ed. 2d 152, 122 S. Ct. 2324 (2002)) (additional internal quotes omitted).

The inventor, Michael Weagley, submitted a patent application for a snow pusher on October 28, 1996. See Basch Aff. (Dkt. # 70) Ex. I. Claims 1 and 2 of the application stated in part that Weagley claimed a snow pusher with "an upstanding transverse blade including a plurality of horizontal and vertical reinforcing channels on the back thereof …." Id. 5, 6.

On May 12, 1997, the examiner rejected Claims 1 and 2, in part on grounds of obviousness. In particular, the examiner stated that an existing patent ("Goldberg") "shows a snowplow having a transverse blade with vertical channels … but does not show horizontal channels." He also stated that another patent ("Meyer") "shows a snow plow blade with a rubber edge having horizontal channels …." Basch Aff. Ex. I at 22. He then stated that "it would have been obvious to one of ordinary skill in the art to modify Goldberg to include horizontal channels as taught by Meyer to improve the strength of the blade with these reinforcement members." Id.

In response to that decision, Weagley submitted an amended application on August 13, 1997. In support of the amended application, Weagley stated that the patent examiner's reference to Goldberg as a patent for a snowplow blade with vertical channels on its back "is a misperception. Goldberg's 'angle bars' … are not channels." Basch Aff. Ex. I at 30. Similarly, Weagley asserted that the examiner's description of the Meyer plow as having horizontal channels on its back was also a "misperception. Meyer's angle irons … are not channels. The applicant's [i.e. Weagley's] channels give strength and rigidity to the blade structure, and for this purpose, channels are greatly superior to angles." Id.

On September 8, 1997, the Patent and Trademark Office allowed the amended application. In his reasons for allowance, the examiner stated that "the prior art of record fails to show or suggest a snows [sic] pusher that includes a blade having vertical and horizontal reinforcing channels …." Gianforti Aff. Ex. J at 3 (emphasis in original). The examiner, then, apparently agreed with Weagley that the reinforcing structures disclosed by the Goldberg and Meyer patents were not "channels."

It appears clear then that during the prosecution of the patent application, Weagley expressly limited the scope of the term
"channel" in order to avoid rejection of the application based on prior art. Although the prior art apparently did not employ boxed gussets, Weagley made clear that he did not intend the term "reinforcing channels" to include all types of reinforcing structures on the back of the plow blade. 4 Weagley apparently did this in order to avoid prior art, i.e. Goldberg and Meyer.

Despite Weagley's reference to "Meyer's angle irons," the Meyer patent does not appear to use that term. Rather, it calls for "vertical supports" that "extend along the back of the blade," and "transverse supports extending transversely across the back of the blade to combine with the vertical support for rigifying the body portion." Gianforti Aff. Ex. F, col. 5 lines 1-6.

Plaintiff cannot obtain here what it abandoned during prosecution of the patent. "Claims that have been narrowed in order to obtain issuance over the prior art cannot later be interpreted to cover that which was previously disclaimed during prosecution." Elekta Instrument S.A. v. O.U.R. Scientific Intern., Inc., 214 F.3d 1302, 1308 (Fed. Cir. 2000) (citing Graham v. John Deere Co., 383 U.S. 1, 33, 15 L. Ed. 2d 545, 86 S. Ct. 684 (1966)). See also Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir. 1995) ("Claims may not be construed one way in order to obtain their allowance and in a different way against accused infringers"); Lemelson v. General Mills, Inc., 968 F.2d 1202, 1206 (Fed. Cir. 1992) ("Prosecution history is especially important when the invention involves a crowded art field, or when there is particular prior art that the applicant is trying to distinguish"); cert. denied, 506 U.S. 1053, 122 L. Ed. 2d 131, 113 S. Ct. 976 (1993); Advance Transformer Co. v. Levinson, 837 F.2d 1081, 1083 (Fed. Cir. 1988) ("Positions taken in order to obtain allowance of an applicant's claims are pertinent to an understanding and interpretation of the claims that are granted by the PTO, and may work an estoppel as against a subsequent different or broader interpretation").

I am aware that the Court should "consider[] the prosecution history … to determine whether the applicant clearly and unambiguously 'disclaimed or disavowed [any interpretation] during prosecution in order to obtain claim allowance.'" Middleton, Inc. v. Minn. Mining & Mfg. Co., 311 F.3d 1384, 1388 (Fed. Cir. 2002) (quoting Standard Oil Co. v. Am. Cyanamid Co., 774 F.2d 448, 452 (Fed. Cir. 1985)). I also recognize that Weagley did not expressly distinguish channels from "boxed gussets," since neither the Goldberg nor Meyer patent employed boxed gussets. Nonetheless, Weagley did make clear that the term "channel," as used in the patent application, was not meant to include all reinforcing mechanisms.

I also note that it appears from the '755 patent itself that this is a "crowded art field," which makes prosecution history "especially important…." Lemelson, 968 F.2d at 1206. The patent states that "snow pushers of various configurations are presently known," and that "they are typically characterized by one or more of the following: a relatively complex mounting arrangement, a steel blade as the snow scraper, a relatively light construction backed with ribs and angles." '755 patent, col. 1, lines 9-13. The patent examiner's initial rejection of the patent application on grounds of obviousness also suggests that the field is a crowded one. The '755 patent may represent some improvement over prior art, but it seems clear that the patentee was not striking out into virgin territory.

Plaintiff's expert, Dr. Taylor, opined that a person of ordinary skill in the art would understand the term "channel" to mean "a mechanical structure with a U-shaped cross section," and that "a channel includes a pair of parallel sides or flanges … that extend from the edges of a web or back … in a direction generally perpendicular to the web." Taylor Aff. P13. He also states that "depending upon the orientation of the channel as described in the '755 patent, the sides or flanges would either lie parallel with a generally horizontal plane (horizontal channels) or in a generally vertical plane (vertical channels), and could be curved so as to enable welding to the rear surface of the curved pusher blade." Id.

Based on that construction of "channel," Taylor further opines that a "simple observation of the cross-section of [defendants'] 'boxed gusset' clearly shows it to be a channel," because "all cross sections of the channel are 'U' shaped." Id. P14. I am not persuaded by that reasoning. Focusing solely on the cross-section, and ignoring the other attributes of the defendants' design seems unwarranted. Likewise, Taylor states that "the non-rectangular nature of the side flanges [of defendants' boxed-gusset design] is not a distinguishing feature as all cross sections of the channel are 'U' shaped," but he
offers no real reason why the boxed gusset's U-shaped cross-section renders its triangular sides "not a distinguishing feature."

After considering the relevant evidence and opinions of the parties' experts, I believe that the triangular shape of the sides of defendants' boxed gusset design is significant, and that it does not create a "channel" as that term is used in the '755 patent. The vertical channels depicted in the '755 patent have a curved back that parallels the curvature of the snow plow blade, so that the channel has a uniform depth throughout. Defendants' design, on the other hand, uses pairs of triangular-shaped gussets with a metal plate welded between them. The back of this "boxed gusset," i.e., where the connecting plate is located, is not curved, nor does it follow the shape of the blade, but rather slants at a downward angle from near the top of the back of the pusher blade to the horizontal posts that connect the blade to a vehicle. Thus, while the backs of plaintiff's vertical channels run parallel to the back of the blade, the back of defendants' boxed gusset runs from near the top of the back of the blade to some point some distance from the blade, near the connecting mechanism. Such a structure does not call to mind a "groove" or "furrow," which, as stated, is the commonly understood meaning of "channel."

Another difference between the two designs is that, although any given cross-section of the boxed gusset might indeed be U-shaped, the depth of the cross-section would vary depending on where the cross-section was taken. The depth would be greatest at a cross-section bisecting the boxed gusset, and smallest at a cross-section near either end of the connecting plate. A cross-section of one of plaintiff's channels, however, would be the same at any point along its length.

In accordance with the commonly understood meaning of the term "channel," and in light of the prosecution history, I therefore conclude that, as used in the '755 patent, "vertical channel" refers to a structure with a U- or bracket-shaped cross-section that runs vertically down the back of the plow blade, and which generally conforms throughout its length to the shape or curvature of the back of the blade. It does not, then, include a so-called "boxed gusset," with a back that does not conform to the blade's shape, but rather slopes at a downward angle away from the top of the blade.

4353

D. "A vertical lock spindle rotatably attached to said respective one of said at least one side rail"

The "vertical lock spindle" component, as used in Claims 10 and 18, is also the subject of widely disparate constructions by the parties. Pedicraft argues that the proper construction of this phrase is "the portion or sub assembly of a side rail positioning mechanism that is arranged vertically along the side rail between the handle component and the locking component and is connected to the side rail so that portions of the lock spindle rotate relative to the side rail to allow the locking and releasing of the side rail from the various up and down positions." Dkt. 65, pg. 19. In stark contrast, Stryker asserts that the proper construction is simply "a long, rotating, vertically-oriented rod which serves as an axis of rotation for the lock pins for locking the side rail." Dkt. 66, pp. 27-28.

Pedicraft's construction argument centers around its assertions that a "vertical lock spindle" can be an assembly of parts as opposed to a single item (i.e., a rod), and that "rotatably attached" is not necessarily limited to rotation around a vertical axis, but can include rotation around another axis. Dkt. 65, pg. 20. According to Pedicraft, Claim 10 expressly presents the vertical lock spindle as "a subcomponent of a side rail positioning mechanism," which is recited as having a "plurality of lock pins." '855 Patent, Col. 9, Claim 10. It points to the testimony of Mr. Lockwood as establishing that one skilled in the art would understand this claim as including an assembly that includes a vertical lock spindle and lock pins. Dkt. 62, pp. 53-54. Additionally, it claims the Patent Examiner also characterized the vertical lock spindle within Claim 10 as an assembly of components. Dkt. 65, pp. 20-21.

Pedicraft's further point of contention is that the phrase "rotatably attached" does not necessarily require that the vertical lock spindle rotate about a vertical axis. It asserts that Claim 10 only recites that a vertical lock spindle is "rotatably attached," but does not specify the axis of rotation -- only that the lock pins themselves are "spaced vertically." Id. at pp. 21-22. This lack of specification regarding the actual axis of rotation is purportedly reflected throughout the '855 Patent, and Pedicraft adds that the prosecution history of the patent also supports its contention that the term "vertical" only describes the direction of locking, as opposed to the axis of rotation. Mr. Lockwood also apparently supported this proposed interpretation, based on the patent specification and claims, that the scope of Claim 10 is not limited to a spindle assembly rotating about a vertical axis, but could include rotation about another axis as well. Dkt. 52, pp. 57-58.
Stryker essentially argues that Pedicraft's proffered construction of the "vertical lock spindle" claim is both bizarre and provides little in the way of informative structure. Instead, consistent with the ordinary meaning of the term "spindle" and the words of the patent itself, Stryker asserts that the Court should construe the "vertical lock spindle rotatably attached to said respective said one of said at least one side rail" claim to mean "a long, rotating, vertically-oriented rod that serves as an axis of rotation for the lock pins for locking the side rail." Dkt. 66, pp. 28-29. In support of this construction, Stryker points to the dictionary definition of "spindle" as a rod that serves as an axis for spinning, as well as the testimony of Dr. Dyro, who described the spindle element, from the perspective of one skilled in the art, as "a long rotatable rod." Dkt. 63, pg. 22; Texas Digital, 308 F.3d at 1203.

Once again, Stryker's proposed construction comports with both common usage and common sense. The Court agrees that Pedicraft's "multi-part assembly" construction does not provide sufficient structural guidance as to what would properly fall under the language of the claim, instead offering broad and vague functional language in an attempt to include any number of assemblies within its scope -- particularly, Stryker's product. There is no evidence to suggest that a "spindle" can ever be defined as a multi-party assembly, and Pedicraft does not offer a sufficient explanation as what parts would be included in a multi-part "spindle." Instead, "spindle" is a term that is well-known to those skilled in mechanics, and it is clearly defined in any dictionary as a single rod. See Dkt. 66, pp. 29-30. In fact, even Mr. Lockwood described a "spindle" as a "shaft that rotates," indicating a single piece as opposed to some vague assemblage of parts. Dkt. 62, pp. 118-19. In the file history, the Patent Examiner also acknowledged as much by analyzing prior art as containing an assembly of parts, one piece of which was a spindle. Dkt. 66, pp. 30-31; Dkt. 62, pp. 122-23.

The Court also agrees with Stryker's contention that a "vertical lock spindle" anticipates rotation about a vertical longitudinal axis. The claim language in Claims 10 and 18 expressly contemplates a spindle that rotates vertically and has lock pins "spaced vertically thereon," thus clearly indicating that the spindle is oriented vertically and has a longitudinal axis that is necessarily vertical. There is no support for venturing outside the plan language of the '855 Patent claims, the ordinary meaning of these terms, as well as common sense. Accordingly, the Court adopts Stryker's construction that this "vertical lock spindle" element should consist of "a long, rotating, vertically-oriented rod that serves as an axis of rotation for the lock pins for locking the side rail."

The parties dispute the construction of the claim limitation "so that said pair of magnetic members can vertically engage corresponding magnetic members on a primary spectacle frame." Aspex posits that this limitation should be construed to mean "the pair of magnetic members can magnetically engage corresponding magnetic members on the primary spectacle frame in a plane that is substantially vertical when the eyeglass device is worn either by contacting corresponding surfaces of the primary spectacle frame magnetic members or by magnetically attracting those corresponding surfaces without actual contact." Ps. Br. 17. E'Lite maintains that this limitation should be construed to mean "so that the pair of magnets can magnetically engage corresponding magnets on a primary spectacle frame along a vertical polar axis." D. Br. 24.

Regarding the term "magnetic members," the court relies on its earlier conclusion that it need not now construe this phrase. See supra § III(D)(1).

The principal difference between the parties' proposed construction is the meaning of "vertically engage." Aspex maintains that this language means that, when the magnetic members are engaged, their surfaces form a plane parallel to that formed by the spectacle's lenses when worn. Ps. Resp. Br. 10. Thus Aspex argues that claim 23 requires vertically oriented magnetic members. Aspex, however, glosses over an important distinction. In claim 23, "vertically" modifies the verb "engage." "Engage" describes the movement or force between the magnetic members as they are coming together or being attracted to each other by magnetic force. The adverb "vertically" describes the direction of this movement or force. Thus "vertically engage" means that the movement or force between the magnetic members occurs along a vertical axis. This also means that, when the magnets finally come together, their surfaces form a plane that is perpendicular to the axis of engagement. Therefore, magnetic members that engage vertically possess horizontal orientation. The court thus adopts E'Lite's proposed addition of "along a vertical polar axis" to the disputed limitation, because it conveys this distinction with greater clarity.

Concerning its proposed elaboration of "magnetic engagement," Aspex contends that the specification's description of FIG.
7 indicates that the corresponding magnetic members of the primary frame and auxiliary frame can engage without touching. The specification also states that having the magnetic members engage without physical contact is only "one embodiment" of the invention. Ps. Br. 17. According to E'Lite, Aspex's proposed elaboration of "engaged" as "either by contacting corresponding surfaces of the primary spectacle frame magnetic members or by magnetically attracting those corresponding surfaces without actual contact" is confusing and unnecessary, because E'Lite agrees that the magnets of its invention engage one another.

In § III(D) the court addresses this specific construction dispute in construing "cooperate," which the parties agree means magnetic engagement. For the same reasons, the court concludes that the magnetic engagement of claim 23 encompasses two forms: physical contact and attraction at a distance.

The court construes "so that said pair of magnetic members can vertically engage corresponding magnetic members on a primary spectacle frame" to mean "so that the pair of magnetic members can magnetically engage corresponding magnetic members on the primary spectacle frame along a vertical polar axis, either by contacting the primary spectacle frame's magnetic members or by magnetic attraction without physical contact."

Claim 1(a)(ii) - "vertically movable"

Plaintiff does not include this phrase in its interpretation of claim 1(a)(ii), proposing that this subsection means, "a carriage bolt head fits in the slot in the slotted plate." (Pl. Mem. Claim Chart at 7.) Defendant argues that plaintiff attempts to eliminate the element of "vertically movable" from its claim. Defendant proposes that this subsection should be interpreted as, "A carriage bolt with a head that is free to move vertically in the slot of the flat piece of metal." (Def. Brief Addendum B.)

Defendant contends that the phrase "vertically movable" means that the carriage bolt is "free to move vertically." Defendant contends that reference to such vertical movement is made in the specification, citing column 2, lines 10-12 and 30-31. Defendant also refers to the prosecution history as supportive of its contention, (Stahl Decl. Ex. A at 2, 3; B at 4). Plaintiff replies that the patent shows a head on a carriage bolt and a slot in which the head is received. It asserts that "The carriage bolt head 12 slides in the slot during installation and the bolt is then tightened to lock the unit in place," citing column 2, lines 10-13. (Pl. Reply at 3.) In its conclusion, plaintiff states that claim 1 "specifies that the carriage bolt head is vertically movable within a slot of the slotted plate," and defendant rewrites the phrase to require that "the carriage bolt head 'is free to move vertically in the slot.'" (Pl. Reply at 6.) Plaintiff contends that it cannot be said that the carriage bolt is free to move vertically "at all times," but fits into a slot and is movable along the slot until it is positioned where it can be tightened for the purpose of locking the unit in place. In a heading of defendant's reply, defendant states: "the chain tensioner under the patent must be vertically movable," and in the body of its reply, defendant contends that, "the bolt holding the chain tensioner can move up and down as is taught in the patent." (Def. Reply at 2.)

At the claim construction hearing, defendant additionally argued that the word "movable" is used three times in claim 1 and the term "movable" in the phrase "vertically movable" should be consistent with its uses describing the chain and the rubbing block as movable; and that the claim distinguishes between "movable" and "attached," and to adopt plaintiff's revised construction would render the word "attached" meaningless. Defendant further argued that the meaning given must be given to the tensioner unit as completed. Defendant argued that the court must construe the claim to give meaning to the language, "vertically movable," included in the claim. Plaintiff argued at the hearing that the bolt moves in the slot for the same reason it did in the prior art--to allow the initial positioning of the unit, then it is tightened in place by the nut. Plaintiff argued that there is nothing in the patent disclosing that the bolt is vertically movable within the slot during operation of the device, or any reason for a vertical movement.

The court agrees with defendant that meaning has to be given to the phrase, "vertically movable," included in claim 1(a)(ii) and cannot be omitted. The court begins with the claim language, both of asserted claims and of nonasserted claims. Vitronics Corp., 90 F.3d at 1582 ("First, we look to the words of the claims themselves, both asserted and nonasserted, to define the scope of the patented invention.") The claim language of claim 1(a)(ii), which is at issue, states that it is the carriage bolt head that is vertically movable. Claim 1(a)(ii) states that a carriage bolt with a carriage bolt head is vertically
movable within the slot of "said slotted plate," referring back to the slotted plate stated in (a)(I). Claim 1(a) goes on to state that an inner slide plate, top block, and outer slide plate are "fixably attached" to "said carriage bolt," referring back to the carriage bolt stated in (a)(ii), by a nut. This language and the language of claim 1 as a whole suggests that the tensioning unit as a whole does not move.

In support of their respective positions, both parties cite the language in the specification referring to the prior art, column 2, lines 10-12, where it is stated in pertinent part and in context: "Slotted plate 9 is attached to the case 1 by means of slotted plate fasteners 11. A carriage bolt 10 with a carriage bolt head 12 slides up and down within the slot 13 of the slotted plate 9. The carriage bolt 10 is meant to lock unit in place." (Specification column 2, lines 8-13 (portion cited by parties emphasized).) The parties agree that in the prior art, the tensioning unit was fixed in place and did not move vertically. The second reference, column 2, lines 30-31, cited by defendant in support of its construction of the phrase, refers to plaintiff's new chain tensioner, and states: "Carriage bolt 10 with carriage bolt head 12 within the slot 13 of the slotted plate 9 fits through the inner slide plate hole 26, the top block hole 14, and the outer slide plate hole 25 where it is held by a washer 19 and nut 20." (Specification column 2, lines 30-34 (portion cited by defendant emphasized).) In context, the portion of the sentence cited by defendant does not reference movement of any kind, but describes the assembly of the portion of the unit attached to the carriage bolt.

Defendant provides the dictionary meaning of "vertical" as, "being or situated at right angles to the horizon; upright," and of "movable" as, "possible to move." (Am. Heritage Talking Dictionary (1997 ed.). Plaintiff does not comment on these definitions.

Defendant also relies on the prosecution history, which shows that plaintiff apparently agreed with an objection of the PTO examiner, stating in its patent "Amendment" that, in the drawings, "The slotted plate 9 and slot 13 have been changed in Figure 2, 4, 5 and 6 to more clearly show the slotted plate 9," and "These changes show the carriage bolt to be vertically moveable." (Stahl Decl. Ex. A at 2, 3; B at 4.) There is nothing in the prosecution history to support defendant's argument made at the hearing that the PTO "made [plaintiff] put that language in to make it compatible so you have a unit that is movable and not fixed like the prior art." (Feb. 27, 2004, Tr. at 27.)

At the hearing, the court was informed that plaintiff adopted the slotted plate of the prior art, and that the slotted plate comes with the cycle and that the slotted plate and the bolt are utilized in its new tensioner.

Reading the entirety of the claims and the specification does not indicate that plaintiff's chain tensioning unit itself moves up and down. The reference to the prior art indicates that the tensioning unit was locked in place by means of a carriage bolt, and one skilled in the art would understand that the tensioning unit did not move. There is nothing in the summary of invention, description of the preferred embodiment, or the claims read as a whole which indicates that the new tensioning unit moves vertically up and down. The background of the invention notes, "The prior art does not disclose an effective simple mechanism for control of vibration, particularly in motorcycle chains." (Specification, column 1, lines 28-30.) The summary of invention states:

A rubbing block is provided with indentations such that the rubbing block is free to along [sic] the vertical axis but not the horizontal axis. Springs are provided between the base of the rubbing block and shims. The number of shims is adjusted to provide a pre-load compressive force to the springs.

It is an object of this invention to provide an efficient simple chain tensioner.

It is another object to provide an efficient, simple chain tensioner.

It is a final object to provide a chain tensioner which damps the natural vibration in a motorcycle primary chain.

(Specification, column 1, lines 33-45.) The claims and description of the new unit disclose that the inner and outer slide plates, which are attached to the carriage bolt, rest on the bottom of the case. The claims and description disclose that these slide plates contain the rubbing block in contact with the chain which is movable during operation of the cycle. At least one shim--which is not disclosed to be fixably attached or secured to the slide plates--fits between these slide plates, and rests on the bottom of the case. (See Specification, column 2, lines 19-27, 43-48; column 3, lines 4-5; column 4, lines 4-9.) If the claim language was construed as defendant argues--to mean that the tensioning unit moves up and down during operation of
the cycle, the unit would be inoperable because it would come apart as the slide plates, attached to the carriage bolt, moved upward. The court cannot give claim language a meaning which would render the invention inoperable. To accept defendant's interpretation and meaning of the phrase "vertically movable" as used in claim 1 would render the new tensioning unit inoperable.

It is clear from the summary of invention, the description of the tensioning unit of prior art, the drawings, and the comments of counsel at the hearing, that the unit of prior art was fixed in place 2 and, due to vibration over time, the unit would have to be manually adjusted by means of moving the carriage bolt holding the rubbing block up or down in the slot of the slotted plate to contact the chain. Figures 1 and 2, disclosing the prior art, shows the carriage bolt (with the fixed rubbing block removed) resting toward the bottom of the slot in the slotted plate. And while not determinative, the drawings disclosing the preferred embodiment of the new tensioning unit, Figures 3, 4 and 5, show the carriage bolt holding the sliding plates and the rubbing block at the top of the slot in the slotted plate. With the carriage bolt near at the top of the slot in the slotted plate, and the sliding plates attached to the carriage bolt and resting on the bottom of the case, it does not appear from the disclosures that plaintiff's tensioning unit moves up and down as defendant asserts.

--- Footnotes ---

2 The description refers to a "fixed rubbing block," and states that, "The carriage bolt 10 is meant to lock unit in place." (Specification column 1, line 66; column 2, lines 10-11.)

3 The description of prior art states, "A carriage bolt 10 with a carriage bolt head 12 slides up and down within the slot 13 of the slotted plate 9." (Specification column 2, lines 10-12.)

--- End Footnotes ---

Here, plaintiff adopted the slotted plate and carriage bolt of prior art, in which "A carriage bolt 10 with a carriage bolt head 12 slides up and down within the slot 13 of the slotted plate 9," (Specification column 2, lines 10-12), and "The carriage bolt 10 is meant to lock unit in place," (Specification column 2, lines 12-13.) Plaintiff's construction of the phrase "vertically movable"--that the carriage bolt head moves up and down in the slot during installation to allow initial positioning of the unit--in claim 1(a)(ii), which states in full: "a carriage bolt with a carriage bolt head vertically movable within a slot of said slotted plate," is consistent with the understanding of one skilled in the art and consistent with the disclosures of the patent specification. Plaintiff's construction is not inconsistent with the dictionary meaning of the words.

Accordingly, the court construes the phrase "vertically movable" in claim 1(a)(ii) as, "which can be moved up and down to position the unit prior to operation," so that claim 1(a)(ii) should be construed to read in its entirety: "A carriage bolt with a head which can be moved up and down to position the unit prior to operation within the slot of the slotted plate."

---

2. "Vertically-projecting, columnar support elements" Used in Claims 9 and 42.

Nike argues that this phrase should be defined as: "support elements resembling a column and projecting in a vertical direction." Adidas proposes: "a support element that is shaped like a column having an outer surface forming a continuous perimeter around its upright axis and a substantially circular cross section." For purposes of analysis, it is helpful to consider the components of this phrase separately, although they must be combined to determine the meaning of the claim.

"Vertically Projecting"

At the hearing, the parties agreed that "vertically projecting" meant to be oriented generally from the sole of the shoe toward the upper, as opposed to being oriented between the lateral and medial sides of the foot. So we know that the support element must have a shape which is oriented (projects) from the sole toward the upper. In other words, the element can not be of a completely irregular shape; it must have an axis which can be oriented. This comports with the specification.

See '796 patent, col. 3,11.39-41 (columns are loaded substantially axially during foot strike); '796 patent, col. 7, 11. 36-37
"Columnar Support Elements"

Beginning, as always, with the claim language, it is clear from the previous discussion that each of the support elements has an axis running from the sole toward the upper to provide support for the foot, which is in the upper. But the claim does not state precisely what is meant by "columnar." There is no indication in the patent that "columnar" is used in any special technical sense, and it is not specially defined in the patent. The figures depict supports with a generally circular outside perimeter. They may be tapered, or barrel shaped, and the circumference may be grooved, or otherwise not be perfectly smooth. The written specification describing the figures certainly does not contradict this impression.

Nike asserts that "columnar," as used in the claim could include virtually any shape or configuration, relying on the structure shown in Figures 20-22, described as an alternative embodiment with a "single columnar support element. 3 See '796 patent, col. 10, 11. 63-65. Nike also relies upon Figures 23-24, described as a second alternative embodiment with "a single columnar support element." See '796 patent, col. 11, 11. 8-11.

However, during the prosecution of the patent, the examiner noted that these two embodiments were "patentably distinct species of the claimed invention" and required the applicant to elect a single disclosed species, pursuant to 35 U.S.C. § 121. See Office Action 12/07/2001, p. 2, Ex. J to Nike's Opening Claim Construction Brief, [Doc. # 69, Attachment # 1, p. 43 of 54]. The applicant elected to pursue what was called the first species, or Group 1, shown in Figures 3-17, reserving the right to file divisional applications as to the other two groups or species. See Response to Restriction Requirement, 1/2/2001, p. 1, Ex. J to Nike's Opening Claim Construction Brief, [Doc. # 69, Attachment # 1, p. 46 of 54].

At the Markman hearing, the parties agreed that this meant that the claims of the '796 patent do not cover or read on the inventions shown in Figures 20-22, or Figures 23-24. Additionally, Nike argues strenuously that the election to pursue only the first species supports a construction that each support is only on one side of the heel or the other. This carries to extremes the concept of "having one's cake and eating it too." How is one skilled in the art supposed to know that specification language, which the patentee has clearly agreed is not covered by the claim, should be used to define the claim? Such statements should not be relevant to the invention ultimately claimed in the '796 patent. See LG Electronics, Inc. v. Bizcom Electronics, Inc., 453 F.3d 1364, 1378 (Fed. Cir.2006). Any other rule would encourage patentees to describe every known and imaginable variation of multiple inventions in the application, agree with the examiner that most of the description applies to other inventions, and after the patent is issued assert that their claims cover the disavowed structures or methods.

Nike also argues that the prosecution history supports its argument that "columnar" denotes any vague, undefined shape, so long as it is oriented to take up some of the space between the sole and the upper. In discussing new claims 80 and 115, which became '796 patent Claims 9 and 42 respectively, the applicant stated to the Examiner: "In other embodiments, however, the support elements have a rectangular shape. Accordingly, the columnar support elements of the present invention may have a variety of shapes that each have a discrete and vertically-projecting configuration." See Supplemental Information Disclosure Statement, 1/2/2001, p. 16 in Ex. J to Nike's Opening Claim Construction Brief, [Doc. # 69, Attachment # 2, p. 24 of 60]. The problem with this statement is that it is not correct. The patent does not depict or describe any "columnar" support element, which is not shown or described as cylindrical or having a circular cross-section.

Additionally, in the same Statement, the applicant distinguishes U.S. Patent No. 6,305,100 ("Komarnycky") by stating: "In rejecting the original claims that [sic] Examiner analogized ridges 12 on outer sole 10 to the claimed support elements. Unlike the recitations of independent claim 80 (Claim 9 in present patent), however, ridges 12 do not have the required columnar structure." See Supplemental Information Disclosure Statement, 1/2/2001, p. 19 in Ex. J to Nike's Opening Claim Construction Brief, [Doc. # 69, Attachment # 2, p. 27 of 60]. But the "ridges 12" in the Komarnycky Patent's Figure 1 are vertically projecting, rectangular structures which slope toward the center. See Appendix I to this Opinion (comparison of
Figure 1 of the Komarnycky patent with Figure 7 of the '796 patent). So the applicant has clearly stated that these rectangular shapes are not "columnar." Applicants cannot expand the scope of their claims, as described in the specification, by contradictory statements to the Examiner. See Honeywell Intern., Inc. v. ITT Industries, Inc., 452 F.3d 1312, 1318-1319 (Fed. Cir. 2006)

Contradicting Nike's assertion that "columnar" includes other shapes is a distinction made in the specification. "In a preferred embodiment, the article of footwear contains two forms of support elements, cylindrical columns and an aft support." 796 patent, col. 5, 11. 5-7 (emphasis added). Recognizing the patentee's choice to distinguish between two forms of support, and to call only one of them "cylindrical columns," is not the same as importing limitations from the preferred embodiment.

In a more detailed description, the specification states: "Sole 106 is further comprised of support elements 108, consisting of columns 108a-108d and aft support 108e …." 796 patent, col. 6,11.54-57 (emphasis added). Examining the various figures, the "aft support" is the only one that does not have a cylindrical shape, and it is never described as "columnar." See 796 patent, col. 8, 11. 57-60.

Nike also raises the issue of claim differentiation. Dependent Claims 11 and 48 expressly limit independent Claims 9 and 42 respectively, by saying "said support elements have a cylindrical configuration." Nike argues this implies that Claims 9 and 42 include other configurations.

"'[C]laim differentiation' refers to the presumption that an independent claim should not be construed as requiring a limitation added by a dependent claim." Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374,1380 (Fed. Cir. 2006). But it is only a presumption - a guide, not a hard-and-fast rule. See Kraft Foods Inc. v. International Trading Co., 203 F.3d 1362, 1368 (Fed. Cir. 2000). The patentee in this case had unbridled discretion in his choice of words for Claims 9 and 42. He chose to modify "support elements" with the word "columnar." Nike can not be heard to say this word has no meaning, and that the columnar support elements of Claims 9 and 42 have no definable shape, simply because another claim uses an additional modifier with virtually the same meaning. Patent practitioners have "long recognized that "claims may be multiplied … to define the metes and bounds of the invention in a variety of different ways." Tandon Corp. v. U.S. International Trade Commission, 831 F.2d 1017,1023 (Fed. Cir. 1987) citing Bourns, Inc. v. United States, 537 F.2d 486, 492, 210 Ct. Cl. 642 affd. per curiam, 537 F.2d 486, 210 Ct. Cl. 642, 199 USPQ 256 (Ct.C1. 1976). 4

--- Footnotes ---

4 This advice is still being presented to practitioners. See T. Lohse, "Effective Patent Prosecution: Critical Choices, Drafting Techniques, and Strategies," pp. 2-80 (presented at 11<the> Annual Advanced Patent Law Institute, University of Texas School of Law) (recommending the filing of the broadest possible generic and subcombination claims" and also "claims of narrow and intermediate scope" to increase "the probability of infringement that is literal …" and to increase the chances of an application of the doctrine of infringement.)

--- End Footnotes ---

Nike adamantly insists that "columnar" has a plain and ordinary meaning, and that its construction - "support elements resembling a column …" reflects that plain and ordinary meaning. But Nike could not give any description of "columnar" or "column" that did not use these very words. An orbicular definition is not helpful, and "vertically-projecting columnar" cannot mean that any blob of material in any shape will do. "I know it when I see it" is not what Congress intended in enacting 35 U.S.C. § 112 P 2.

Resort to "plain and ordinary meaning" and to dictionaries should not override analysis of the intrinsic evidence. The discussion at the hearing of the plain and ordinary meaning of "column" and "columnar" reflects the dangers of a court attempting to arrive at a lay definition, without sufficient consideration of the intrinsic evidence. In any case, dictionaries of ordinary usage use terms such as "round shaft," "tube," and "cylinder" when defining columns, and their illustrations are of cylindrical structures such as Doric and Ionic columns, perhaps with tapers or fluting. See, e.g., OXFORD ENGLISH DICTIONARY ONLINE available at http://dictionary. oed.com (architectural definition of "column" is "a cylindrical or slightly tapering body of considerably greater length than diameter, erected vertically as a support for some part of a building."); THE MERRIAM-WEBSTER THIRD NEW INTERNATIONAL DICTIONARY, UNABRIDGED (2002)
("column" means "a pillar consisting of a shaft, a capital, and usually a base, the shaft being of a circular section except as it is fluted or channeled."); THE MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY TENTH EDITION (1993) ("column" means "a supporting pillar, especially one consisting of a usually round shaft, a capital, and a base"). 5

At the hearing, the court questioned the parties closely about whether columnar implied that the vertical axis must be greater than the distance across the cross-section of the support axis. In general usage, columns are frequently depicted and described as being long and narrow. Nike points out that in all of the figures in the patent, the vertical axis of the "columnar" support elements is shorter than the distance across the cross-section. These figures are not necessarily scale drawings. Figures generally may not be used to define precise dimensions, nor to contradict the written description in a claim or specification. However, these figures give an indication of relative sizes. It would be unusual to define a claim so as to exclude the embodiments depicted in every figure in the patent, and the court will not do so in this case.

The applicant chose to withdraw from consideration the embodiment shown in Figures 23-24, and evidently never pursued a divisional application. He also chose to limit Claims 9 and 42 by modifying "support elements" with the word "columnar." He chose to include in the specification describing the columnar support structures, only examples and drawings of structures which have a generally circular cross-section, while support structures of other shapes are labeled as "aft support." The applicant told the Examiner that the generally rectangular vertically projecting structures in Komarnycky are specifically not "columnar." A vague contradictory statement in the same document is not grounds for ignoring or expanding the word "columnar." The presumption of claim differentiation is not strong enough to ignore, or ascribe an amorphous meaning to, the word. Nike has strongly and unqualifiedly represented and argued that the court should adopt the "plain and ordinary" meaning of columnar. The primary definitions and illustrations of column and columnar in dictionaries denote a cylindrical structure. This comports with the court's analysis of the specification and file history, and gives no reason to adopt a different definition. The court will define this term as follows:

"Vertically-projecting columnar support element" means: "a generally cylindrically shaped supporting structure, which may be tapered at either or both ends, and/or grooved or fluted, the non-circular axis of which is oriented generally from the sole to the upper and not between the medial and lateral sides of the foot."

4. Claim Term Four -- "Vertically Up"

The term "vertically up" is found in Claims 12-14, 20-21 and 24-25 of the '704 patent. Plaintiff asks the Court to construe the term as generally upright. Plaintiff bases its argument on a definition from the Merriam Webster's Ninth New Collegiate Dictionary, as well as specific claims in the '704 and '057 patents. Plaintiff also introduces extrinsic evidence in the form of testimony by R. Lee Rawls.

Defendant asks the Court to construe the term as the end of the rod that is not attached to the base extends in a direction generally perpendicular to the plane of the horizon and in a direction away from the earth. Defendant bases its argument on a definition from the Merriam Webster's Ninth New Collegiate Dictionary, as well as specific claims in the '704 and '057 patents. Defendant also introduces extrinsic evidence in the form of testimony by Evan R. Flavell.

It appears to the Court that the parties essentially present the same proposed construction of the claim. Both parties agree that "vertical" means upright. However, defendant argues that plaintiff's proposed definition of "generally upright" fails to account for the entire term "vertically up" because "up" specifically means a direction away from the center of the earth. Defendant notes that at an end that extends vertically down from a base might be considered "generally upright" simply because it is vertical. Thus, defendant argues that it is important to construe the term "vertically up" as extending in a
direction away from the center of the earth.

In the context of this patent, it appears that the term "vertically up" means "generally upright," or in a perpendicular position. The Court notes that in writing the claims, the inventor did distinguish the rods as not simply vertical, but vertically "up," as illustrated in Figures 1, 4 and 12-22. In addition, in the detailed description of the device, the inventor notes that the free ends of the rods extend "upward" from the frame. '704 Patent at 4:2-4. However, in examining the prosecution history of the claim, the inventor clearly explains that his figures depict just one conceivable embodiment of his invention. (See, e.g., Dkt. # 319, Ex. D at NAUT 003317). Thus, the term is not limited to an extension in a direction away from the center of the earth. The Court believes no extrinsic evidence is necessary to construe this term.

ConAgra defines "vessel" as a "container capable of holding liquid" (Filing No. 64). Green defines "vessel" as "a container capable of holding food" (Id.). The primary distinction between the parties' constructions is ConAgra contends a vessel must always be capable of holding liquid food, while Green contends a vessel may be, but is not required to be capable of holding liquid food.

The intrinsic record supports ConAgra's construction, and therefore, the Court finds that vessel means a container capable of holding solid and liquid food. Claim 1 of the '083 patent states the cooking utensil contains "a first microwave transparent vessel for holding a first food material" and "a second microwave transparent vessel for holding a second food material." The claim language does not specify whether a vessel must be capable of holding liquid food; however, the specification and prosecution history clarify that the '083 patent uses vessel to refer to a solid container.

There are several indications in the patent specification that the first and second vessels are solid containers. Foremost, the specification states that spaghetti sauce can be placed in the first vessel and describes how "liquid contents" can be dispensed from the first vessel (the '083 patent, col. 5, ll. 34-36; col. 6, ll. 45-49). Second, figure 3 of the '083 patent depicts the outside of both vessels with cross hatching to indicate the vessels are solid containers. Third, the stated purpose of the invention compels a finding that the second vessel is a solid structure. The summary of invention section of the specification states the following:

During use, a first food is placed in the first vessel and the second food is placed in the second vessel . . . The second vessel is placed in the first vessel to displace a portion [sic] the food in the first vessel thereby forming a hollow void in the center of the food.

(Id. at col. 3, ll. 3-11; see also fig. 3).

As described in the detailed description section of the patent specification, the displaced food forms an annular column of food around food in the second vessel (See id. at col. 4, l. 62 - col. 5, l. 5; fig. 3). As a result, the annular column of food (i.e. food in the first vessel) shields food in the second vessel from microwaves passing through the side of the utensil (Id. at col. 6, ll. 27-30). When the second vessel is placed into the first vessel, the side and bottom walls of the second vessel are in contact with food in the first vessel and food in the second vessel at the same time. Impliedly, the second vessel's walls must be solid such that food in the first and second vessel does not mix (Id. at fig. 3).

The prosecution history provides additional evidence that the side wall of the second vessel must be solid. Initially, the examiner rejected claims 1-11 of the '083 patent as obvious over United States Patent No. 4,532,397 (the "McClelland patent") and United States Patent No. 4,233,325 ("Slanguan et al.") (Filing No. 67-4, Exh. B). Green requested reconsideration, and as a result, the examiner determined Green's invention was distinguishable from McClelland's invention on the ground that Green's invention permitted two foods to be in contact with opposite sides of the second vessel's side wall without mixing. Specifically, the examiner remarked:

The patent to McClelland discloses a structure that does not disclose the two spaced, frusto-conical walls of the applicant's claimed invention. There is no provision for two spaces in the McClelland device to hold two food materials
separate and apart from one another yet in contact with a common wall such that convection heat can be transmitted through the common wall from one food material into the other.

(Id. at p. 3).

In order for the second vessel's side wall to achieve the result stated by the examiner, the side wall must be solid. Otherwise, foods on opposite sides of the wall would not remain separate and apart. 1

--- Footnotes ---

1 Green argues that even perforated walls could keep two solid foods apart. Notwithstanding the fact that the specification specifically describes using the first vessel for liquid, even two solid foods would not necessarily remain entirely separate during microwave cooking.

--- End Footnotes ---

Based on the intrinsic evidence, one of ordinary skill in the art would conclude the '083 patent uses vessel to mean a container that must be capable of holding both solid and liquid food. If the Court adopted Green's construction of the term, a perforated container could be a vessel. Such a construction is not supported by the intrinsic record and contradicts the embodiment described in the specification.

Green contends that even if the first vessel refers to a solid container, the specification does not support the conclusion that the second vessel must also be capable of holding liquid. Essentially, Green claims the term vessel should be construed differently for first vessel and second vessel. This argument fails because claim terms should generally be construed consistently throughout the claims, 2 and nothing in the intrinsic record indicates that vessel should be construed differently for first vessel and second vessel.

--- End Footnotes ---

CLAIM 1

Four issues remain with respect to claim 1, below, with the disputed language in italics:

1. A fuel delivery system for removing undesired components from fuel delivered from a fuel tank to an engine comprising, in combination: [issue # 1]

   an engine; 2

   initial fuel filter means for removing water from fuel received from the fuel tank; and [issue # 2]

   secondary fuel filter means including an outlet in fluidic communication with said engine and an inlet in fluidic communication with said initial fuel filter means and located downstream therefrom for receiving fuel containing an undesired gas from said initial fuel filter means and separating substantially all of said undesired gas from fuel received therein prior to passage of said fuel through the outlet, [issue # 3]

   said secondary fuel filter means including a vessel defining a hollow interior chamber in fluidic communication with a return line in fluidic communication with said fuel tank for returning fuel and undesired gas thereto, and a filter media positioned within said chamber for immersion in fuel received therein and a conduit located within said filter media for

---
delivering fuel passing through said filter media to said outlet. [issue # 4]

2 The parties initially disputed the construction of "an engine," but agreed at the Markman hearing that their differences were not material and to construe it as "an internal combustion engine."

Claim 1; Issues 3 & 4 -- The Secondary Fuel Filter Means and The Vessel

With regard to the secondary fuel filter means, the Court must first determine whether it is in fact a means-plus-function claim. Defendants assert that it is a means-plus-function claim governed by § 112, P6, with two separate functions: first, a means "for receiving fuel containing an undesired gas from said initial fuel filter means," and second, a means "for separating substantially all of said undesired gas from fuel received therein prior to passage of said fuel through the outlet." While Plaintiffs essentially agree that the element provides for these two functions, Plaintiffs assert that there is sufficient structure in the claim elements themselves to take the claim elements out of the scope of § 112, P6.

"The use of the word 'means,' which is part of the classic template for functional claim elements, gives rise to 'a presumption that the inventor used the term advisedly to invoke the statutory mandates for means-plus-function clauses.'" Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1422-23 (Fed. Cir. 1997) (quoting York Prods., Inc. v. Central Tractor Farm & Family Ctr., 99 F.3d 1568, 1574 (Fed. Cir. 1996)). The case law recognizes two specific rules, however, which "overcome this presumption." The first is where a claim element uses the word "means," but does not recite any function. Such an element does not invoke § 112, P6. Rodime PLC v. Seagate Technology, Inc., 174 F.3d 1294, 1302 (Fed. Cir. 1999), cert. denied, 528 U.S. 1115, 120 S. Ct. 933, 145 L. Ed. 2d 812 (2000). "Second, even if the claim element specifies a function, if it also recites sufficient structure or material for performing that function, § 112, P6 does not apply." Id.; accord, Phillips, 415 F.3d at 1311 ("Means-plus-function claiming applies only to purely functional limitations that do not provide the structure that performs the recited function."); Sage Prods., 126 F.3d at 1427-28.

To determine whether the element specifies a function, the court relies primarily on the claim language itself. York Prods., 99 F.3d at 1574. Here, the Plaintiffs do not dispute that the claim element specifies the two functions recited by Defendants, and the plain language of the claim supports this conclusion. Plaintiffs assert, however, that there is sufficient structure recited in the claim element itself to take it outside the bounds of § 112, P6. To avoid P6, it is not necessary to recite "every last detail of the structure disclosed in the specification for performing the claimed . . . function . . . . Instead, the claim need only recite 'sufficient' structure to perform entirely the claimed function." Rodime, 174 F.3d at 1304.

The Court agrees that the element contains sufficient structure with respect to the first function of "receiving fuel containing an undesired gas from said initial fuel filter means." The claim element itself specifies a structure, namely, "an outlet in fluidic communication with the engine and an inlet in fluidic communication with the initial fuel filter means," and the location of the inlet is further specified as being "downstream" from the initial fuel filter means. 4 See Phillips, 415 F.3d at 1311 (no means-plus-function claim where claim language identifies "internal steel baffles" as the structure for performing the function of increasing the shell's load-bearing capacity); Environco Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 1365 (Fed. Cir. 2000) (use of term "baffle," itself a structural term, together with the description in the claim, overcomes presumption of § 112, P6).

4 Assuming arguendo the Court were to construe the element as a means-plus-function claim, it would make little difference in interpretation. The corresponding structure appears at col 1., lines 65-67; col. 2, lines 45-49; col. 3, lines 45-47. It includes an inlet in fluidic communication with an inlet line and an outlet fluidically connected to an outlet line leading to the engine, and equivalents thereof.
Read in isolation, however, this element would not appear to specify any structure for the second function of "separating substantially all of said undesired gas from fuel received therein prior to passage of said fuel through the outlet." Plaintiffs assert that the necessary structure is found in the next element, which describes in detail the structure of the function of separating the gas from the fuel. The Court agrees. Read together, the two elements sufficiently describe the structure of this secondary fuel filter means, as understood by those skilled in the art, to rebut the presumption that it is a means-plus-function term. See Allen Eng'g, 299 F.3d at 1348 (sufficient structure recited in claim itself for "gearbox means for rotating said blade means"); Environco, 209 F.3d at 1365-66 (Fed. Cir. 2000) (sufficient structure recited in claim for "baffle").

With regard to the second function, as set forth in the claim itself, the secondary fuel filter means includes (i) "a vessel defining a hollow interior chamber," (ii) which vessel is "in fluidic communication with a return line," (iii) which return line is "in fluidic communication with said fuel tank for returning fuel and undesired gas thereto," and there is also (iv) "a filter media positioned within said chamber," (v) which filter media is immersed in the fuel received in the chamber, and (vi) a "conduit" which is "located within said filter media for delivering fuel passing through said filter media to said outlet." Again, these terms are sufficiently clear to one skilled in the art for the structure and location of the elements to be understood. As such, the Court construes the claims pursuant to "standard claim construction rules." Environco, 209 F.3d at 1365.

Looking to the disputed language related to the first function, Defendants assert that the term "communicate" means "to be connected," and that elements thus include "an inlet connected to the initial fuel filter means and "an outlet connected to the engine." The language proposed by Defendants implies a direct physical connection. There is no support for such a limitation, however, in either the claim language itself or the specification. The claim language states that the inlet and outlet will be in "fluidic communication." One with ordinary skill in the art would understand this to mean that fluid would flow from the initial fuel filter to the inlet and from the outlet to the engine, but no direct connection is necessarily required by this language. For example, in another embodiment of the invention, the fuel presumably could travel through yet another process before delivery to the engine. Consistent with such a possibility, the Court notes that claims 8 and 14, which describe the filter, speak of "direct fluidic communication," while other claims, including claims 1 and 15, which describe a more generalized fuel delivery system, do not.

In connection with the second function, Defendants assert that the elements of the secondary fuel filter include "a vessel with an uppermost housing portion and a lowermost canister portion defining a hollow chamber." While these limitations are part of the preferred embodiment, they are not suggested by the claim language itself, which describes only "a vessel defining a hollow interior." As such, there is no basis for importing this limitation into this term. See Arlington Indus., Inc. v. Bridgeport Fittings, Inc., 345 F.3d 1318, 1327 (Fed. Cir. 2003). Moreover, the limitations suggested by Defendants are found in dependent claim 3, and under the doctrine of claim differentiation, it is improper to incorporate these elements into claim 1. Liebel-Flarsheim, 358 F.3d at 910; Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998).

Next, again construing "fluidic communication," Defendants assert that the return line is "connected to the vessel and the fuel tank." The Court rejects this interpretation for the same reason stated above. The claim language requires only that the interior chamber be "in fluidic communication with" a return line "in fluidic communication with" the fuel tank. Use of the term "connected to" unnecessarily limits the element.

With regard to the filtering function itself, Defendants assert that the proper construction is "a filter media, which allows fuel to pass but not air, positioned with the chamber and immersed or submerged in the fuel." Plaintiffs propose for their construction, that "the second fuel filter separates substantially all of the undesired gas from the fuel prior to the passage of the fuel through the outlet. Undesired gas is any undesired entrained air and other vapors and gasses entrained in the fuel."
While the Court rejects Defendants' contention that this should be construed as a means-plus-function claim, the Court finds that the words "undesired gas" and the function of "separating substantially all of said undesired gas," are ambiguous, thus requiring an examination of the intrinsic evidence. The Court cannot accept Defendants' construction, however, that the filter "allows fuel to pass but not air," as it is not supported by the specification. In referencing the secondary fuel filter, the specification repeatedly references the removal of "residual air bubbles, entrapped and entrained in the fuel." Col. 1, lines 52-54 (emphasis added). The specification and drawings state that the filter media separates these bubbles. See col. 2, lines 22-23, 29-31; col. 5, lines 26-39. Thus, the Court finds that "undesired gas" means any "undesired bubbles of entrained air or other vapors and gasses entrained or entrapped in the fuel."

Finally, Defendants assert that the word "immersion" should be construed to mean "submerge which in turn means immerse which means to cover completely with liquid; submerge," citing to the American Heritage Dictionary (1986). Asserting that the language is not ambiguous, Plaintiffs assert the following construction: "The second fuel filter also includes a filter media positioned within the interior chamber of the vessel so that the filter media can be immersed in the fuel received in the chamber." The Court believes that the term "immersion" as used herein would be understood by those skilled in the art, and that further definition is unnecessary. Multiform Desiccants, 133 F.3d at 1477. Moreover, the definition proposed by Defendants does not do anything to better clarify the language.

As such, the Court construes the secondary fuel filter means and vessel as follows:

"The secondary fuel filter, which is located downstream from the initial fuel filter, includes an outlet in fluidic communication with the engine and an inlet in fluidic communication with the initial fuel filter. The secondary fuel filter receives fuel containing an undesired gas from the initial fuel filter and separates substantially all of said undesired gas prior to passage of the fuel through the outlet. Fluidic communication means that fluid can transfer from one element to another. Undesired gas is any undesired bubbles of entrained air or other vapors and gasses entrained or entrapped in the fuel.

The secondary fuel filter also includes a vessel defining a hollow interior chamber, which chamber is in fluidic communication with a return line, which is in fluidic communication with the fuel tank, for returning fuel and undesired gas to the fuel tank. The secondary fuel filter also includes a filter media positioned within the chamber of the vessel so that the filter can be immersed in the fuel received in the chamber. The secondary fuel filter also has a conduit located within the filter media for delivering fuel passing through said filter media to the outlet."
The parties also dispute the term "vibrating disc." LG proposes construing the term to mean "circular object that is moving back and forth." (Chart at 14.) Whirlpool proposes instead that the term be construed to mean "a 'disc' is a thin, flat circular object," and that a "vibrating disc" be construed to mean "a disc that moves back and forth between a maximum position of the disc and a minimum position of the disc." (Id. at 14-15.)

The parties agree that "disc" should be construed to mean a circular object. Whirlpool, however, argues that the term should be further limited to mean thin and flat. It has identified no intrinsic evidence to support that limitation, and the Court therefore rejects its argument with respect to that term.

The background section to the patent states that "[i]n order to wash clothes in a conventional automatic washing machine using low frequency vibration, a low frequency vibrating disc placed in a washing tub generates a specified low frequency vibration . . . . The level of the low frequency is specified in accordance with the shape of the washing tub, the shape of the vibrating disc and the mixing ratio of the multi-phase washing medium." ('886 Patent, col. 1, ll. 16-25.)

In support of its proposed construction for the term "vibrating," Whirlpool refers to the written description for Figure 2, which is a "sectional view of a low frequency vibration type washing machine having shrinkable shielding means in accordance with an embodiment of the present invention." (Id., col. 2, ll. 22-24.) The written description states that "the height of the shrinkable shelder 4 is equal to the distance from the inner bottom of the washing tub 1 to the maximum vibrating position of the disc 2," and that "the shrinkable shelder 4 should be designed such that it can be elastically shrunk and extended in the vibration stroke [between the maximum and minimum positions] of the vibrating disc." (Id., col. 2, ll. 45-55.) That description, however, concerns only one of the preferred embodiments described in the patent. The patent describes two additional preferred embodiments. Although each of them refers to a vibrating disc, they do not discuss any maximum or minimum heights for the vibrating disc. (See id., col. 3, ll. 5-25.)

Moreover, the written description states that "[a]lthough the preferred embodiments of the present invention have been disclosed for illustrative purposes, those skilled in the art will appreciate that various modifications, additions and substitutions are possible, without departing from the scope and spirit of the invention as disclosed in the accompanying claims." (Id., col. 3, ll. 27-32.)

The Court therefore rejects Whirlpool's proposed construction, and construes the term "vibrating disc" to mean a "circular object that is moving back and forth."

**GO BACK**

The parties first dispute the proper construction of certain terms in claim 1(d), which claims an element of the invention as follows:

1. An archery bow stabilizer, comprising:

   * * *

   d) at least one vibration dampener adjustment member having openings therethrough matching the number and circumferential spacing of said stabilizer rods and a diameter larger than the diameter of said stabilizer rods freely receiving said rods therethrough.

Plaintiff's Complaint, Exhibit 1 (the '325 patent). The bone of contention as to this element, as asserted in the parties' briefs,
is whether the language requiring "at least one vibration dampener adjustment member having openings therethrough" requires that the adjustment member consist of a single piece through which openings are "bored," or whether it can instead encompass an "adjustment member" made up of multiple pieces that create "channels" through which the stabilizer rods pass. At oral arguments, Specialty also suggested that "openings therethrough" would not encompass "openings" that left a "gap" at some point on their perimeter. Kudlacek argued that the patent language did not require that the "openings" be completely enclosed.

The court agrees with the parties that the proper construction of element (d) of claim 1 can be discerned from the language of the claim illuminated by "intrinsic" evidence. See, e.g., CAE Screenplates, Inc., 224 F.3d 1308, 2000 U.S. App. LEXIS 21293. 2000 WL 1199247 at *7; KCJ Corp., 223 F.3d 1351, 2000 U.S. App. LEXIS 20963, 2000 WL 1165522 at *3. Indeed, the meaning of this portion of claim 1 can be determined according to the "ordinary meaning" rule, because Kudlacek has not acted as his own lexicographer defining any of the terms used in novel ways. See Schering Corp., 222 F.3d 1347, 2000 WL 1055975 at *5; Tate Access Floors, Inc., 222 F.3d at 965, 2000 WL 1055981 at *4; Hockerson-Halberstadt, Inc. 222 F.3d at 956, 2000 WL 1035753 at *2-*3; Optical Disc Corp., 208 F.3d at 1334.

Use of the word "member" does not necessarily define a component made of a single piece or exclude a component made up of multiple pieces. For example, the pertinent definition of member is "a constituent part of a whole," see, e.g., MERRIAM WEBSTER'S COLLEGIATE DICTIONARY (10th ed., 1995), and the synonym "part" is defined, inter alia, as "a constituent member of a machine or other apparatus." See id. Ordinary experience teaches that a constituent part or member of a machine or apparatus may itself consist of one or several components, depending, for example, on the intricacy of the "part" or "member" and the machine or apparatus to which it belongs.

Specialty nevertheless contends that "member" here must mean a single piece, because the "Description of the Preferred Embodiment" refers to a "member" with "through bores," while "bore" in turn is defined as a "cylindrical hole made by or as if by boring." Specialty's argument fails for at least two reasons.

First, nothing about use of the "through bores" language in the "Description of the Preferred Embodiment" in the '325 patent demonstrates an express intent to define "vibration dampener adjustment member having openings therethrough" in a novel way. See, e.g., Schering Corp., 222 F.3d 1347, 2000 U.S. App. LEXIS 18360, *13, 2000 WL 1055975 at *5 ("Without an express intent to impart a novel meaning to claim terms, an inventor's claim terms take their ordinary meaning") (quoting York Prods., Inc., 99 F.3d at 1572). Thus, the "through bore" language of the "Description of the Preferred Embodiment" does not constitute a specialized definition of the "openings therethrough" language of the claim. See id.

Furthermore, 'although the specifications may well indicate that certain embodiments are preferred, particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments.'" KCI Corp., 223 F.3d 1351, 2000 U.S. App. LEXIS 20963, *10, 2000 WL 1165522 at *4 (quoting Electro Med. Sys., S.A., 34 F.3d at 1054) (emphasis added); Tate Access Floors, Inc., 222 F.3d at 966, 2000 WL 1055981 at *6; Kemco Sales, Inc., 208 F.3d at 1362. Here, the language of the claim--which requires a "vibration dampener adjustment member having openings therethrough"--is undoubtedly broader than the language of the "Description of the Preferred Embodiment"--which describes a "member . . . provided with a plurality of through bores. . . ." The '325 Patent, "Description of Preferred Embodiment" at 2; and compare, e.g, MERRIAM WEBSTER'S COLLEGIATE DICTIONARY (10th ed., 1995) (defining "bore" as "a usu. cylindrical hole made by or as if by boring"), with id. (defining "opening" as "something that is open: as a (1): BREACH, APERTURE"). Thus, it is improper to read the narrower "through bores" language of the "Description" into the broader language of the claim. See KCI Corp., 223 F.3d 1351, 2000 U.S. App. LEXIS 20963, 2000 WL 1165522 at *4.

Similarly, although the "openings therethrough" are shown in the "Description of the Preferred Embodiment" and figures of the patent as completely enclosed, nothing about the language of the claim itself requires that the "openings therethrough" be completely enclosed or excludes the possibility that there will be "gaps" at some point on the perimeter of the "openings."

Consequently, the language of element (d) of claim 1 encompasses a "vibration dampener adjustment member" comprised of either a single piece or multiple pieces joined together so that the member has "openings therethrough" that permit the stabilizer rods to pass through the "adjustment member" and the "adjustment member" partially or completely encloses the "openings therethrough."
The term "vibratory dispenser" is disputed by the parties. AutoMed asserts that the term "vibratory dispenser" should be construed to mean "a dispenser that uses vibration to aid in the dispensing function." (P. SJ for Infr. 6). This construction cannot be correct because, according to AutoMed's patents, vibration is required to move the medication from the canister into a vial. Both of AutoMed's patents contain claims that indicate that vibration causes the dispensing of the medication.

Claim 1 of the '927 Patent contains the following element:

*at least one vibratory dispenser operatively controlled by the controller and including a coupling for attachment of an oral solid medication container in a detachable relationship, the dispenser providing vibration to a coupled container in response to the prescription information so that medication is dispensed from the container into a vial. ('927 Patent Col. 16 L. 48).

Claims 1 and 20 of the '671 Patent contain the following element:

*a controller operatively controlling the vibratory dispenser, said controller causing the vibratory dispenser to vibrate the coupled canister such that the medication contained in the coupled canister is dispensed in a predetermined manner. ('671 Patent Col. 16 L. 50). Furthermore, the specification explicitly states that "the canister is vibrated by the drive unit in order to move countable solid drugs from the canister into a vial." ('671 Patent Col. 8 L. 1-3). The claims and specifications themselves indicate that vibration causes the pills to be dispensed. Therefore, the proper construction is that a "vibratory dispenser" is a device that uses vibration in order to dispense medication, and not a device that merely assists in the dispensing.

Even AutoMed's own expert agrees with this construction, and defines a "vibratory dispenser" as "a device that dispenses a product using vibration." (Spong Tr. 40:23-42:6).

The district court construed "vibratory dispenser" as "a device that uses vibration in order to dispense medication, and not a device that merely assists in the dispensing," thereby rejecting AutoMed's proposed construction, "a dispenser that uses vibration to aid in the dispensing function." Claim Construction Opinion, 2005 U.S. Dist. LEXIS 26032, slip op. at 18-19. Microfil argues that under the district court's construction, vibration must be the exclusive force causing the dispensing of medication. AutoMed challenges Microfil's interpretation of the district court's construction and maintains that vibration need not be the sole force used to dispense medication.

We agree with the district court's construction, but clarify that to the extent Microfil reads it to require the use of vibration alone to dispense pills, it is incorrect. Nothing in the language of the claims or the specifications indicates that the term "vibratory" should be interpreted to mean "vibratory only." Even Microfil has previously admitted that the claimed dispenser requires gravity--in addition to vibration--to effectively dispense pills. See Br. Supp. Defs.' First Mot. for Partial Summ. J. for Non-Infringement (Dckt. No. 47) at 10. The preferred embodiments corroborate this admission; both specifications indicate that internal ramps position pills to be dispensed through a gate on the bottom of the container or canister, which opens to allow pills to drop out during the vibratory dispenser's operation. This precludes any claim construction wholly excluding the role of gravity. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996). Thus, we affirm the district court's construction with the clarification that natural forces--including gravity--are not excluded from the dispensing process.

For this term, Kwitek proposes:

The external aspect of the grip made of a soft material having viscous and elastic properties that has a hardness level between 2 and 35 on the Shore A Durometer Test scale.

Pilot suggests: "the external layer of the grip having viscous and elastic properties."

Both parties incorporate "viscous" and "elastic" in their definitions. These words appear in the specification, and are used in patents listed in the "References Cited" section of this patent. Neither of the briefs nor technology synopses defined either word. Both of these words have specific meanings when used in a scientific context to describe the properties of materials. While it may be easily apparent to one skilled in the art that "viscoelastic" combines "viscous" and "elastic," which are terms understood by those skilled in the art, the substitution of two technical words for one does not explain much to a jury.

The '190 patent describes one embodiment "wherein the viscoelastic hand/finger surface is a viscous liquid material contained within an elastomeric bag." '190 patent, col. 2, ll. 5-6. Another embodiment uses "silicone gel or silicone oil." '190 patent, col. 2, ll. 8-9. "The viscoelastic hand/finger surface provides individuals with a soft and individually conforming gripping surface." '190 patent, col. 2, ll. 63-65. After several similar descriptions, the specification states: "While preferred materials are disclosed above, other materials exhibiting similar properties may be used . . . ." '190 patent, col. 4, ll. 41-43.

Similar descriptions of soft materials which will fairly easily change shape in response to pressure are described in the McCall patent, which is listed in the '190 patent and referred to in Pilot's brief. That patent describes a pen grip "with a soft, deformable grip . . . ." '599 patent, col. 2, ll. 7. A helpful description is: "the deformable putty viscous material . . . ." '599 patent, col. 2, ll. 34. Another is: "A deformable medium such as a relatively viscous putty . . . ." '599 Patent, col. 4, ll. 30-31.

To one skilled in the art a "viscous" material used in the context on a pen grip means "a soft material which will change shape under the pressure applied by fingers gripping a pen when it is used to write." This comports with the specification of the '190 patent, see col. 2, ll. 64-64, and with the definition in dictionaries. See ACADEMIC PRESS DICTIONARY OF SCIENCE AND TECHNOLOGY (1992) ("viscous" means "characterized by a high degree of friction between component molecules as they slide by each other"); THE AMERICAN HERITAGE SCIENCE DICTIONARY (2005) ("viscous" means "having relatively high resistance to flow"); THE MERRIAM-WEBSTER THIRD NEW INTERNATIONAL DICTIONARY, UNABRIDGED (2002) ("viscous" means "having a ropy or glutinous consistency and the quality of sticking or adhering"). At the hearing, the parties agreed to this definition. See Tr. p. 14, ll. 3-25.

"Elastic" is also a term describing a physical property of materials, familiar to those skilled in the art, and used in patents in this field. The patent in dispute describes the grip as made of a material that is "a responsive, solid-phase polymer material (FIGS. 1 and 2) or a gelatinous material interposed within a more resilient material . . . ." '190 patent, col. 3, ll. 1-3. In other words, either the grip material itself will tend to return to its original shape after being deformed, or the covering surrounding the gelatious material will. This comports with standard dictionary definitions. See MCGRAW-HILL DICTIONARY OF SCIENTIFIC AND TECHNICAL TERMS (2003) ("elastic" means "capable of sustaining deformation without permanent loss of size or shape"); THE MERRIAM-WEBSTER THIRD NEW INTERNATIONAL DICTIONARY, UNABRIDGED (2002) ("elastic" means "capable of recovering size and shape after deformation.") At the hearing, the parties agreed that elastic means "the hand/finger surface will tend to return to its original shape after being deformed." Tr. p. 15, ll. 4-11.
The parties agree that the "viscoelastic" surface described in the claim has both viscous and elastic properties. In other words it will change shape under the pressure exerted by fingers holding the writing instrument and will tend to return to its original shape when released. This comports with the specification in the '190 patent, and in earlier referenced patents such as the McCall patent. Standard dictionaries give similar definitions of "viscoelasticity." See ACADEMIC PRESS DICTIONARY OF SCIENCE AND TECHNOLOGY (1992) ("viscoelasticity" means "a condition of a liquid or solid that exhibits viscosity but also memory of past deformation, with the ability to store energy elastically and to dissipate energy due to viscosity of the medium.")

The real dispute in this case is whether the claim should be interpreted to include the range of hardness levels stated in the specification but not in the claim itself. Kwitek proposes to include in the definition the words "that has a hardness level between 2 and 35 on the Shore A Durometer Test Scale."

As the parties agreed, a Durometer is a device used to measure the hardness of materials by applying pressure with a small probe. See Tr. p. 24, l. 12 - p. 25, l. 7. The softer the material, the farther the probe reaches into the material. The distance the probe moves is shown on a scale. One standard of measurement used on the scales of instruments designed to measure the hardness of materials such as plastics and rubber is called the Shore A scale.

The specification of the '190 patent states:

the hand/finger surface to the present grip is an ultra-soft material. This endows the grip with an inherent tactile feel . . . The ultra-soft hand/finger surface can be measured in terms of hardness by the Shore A Durometer Test. The present grips have durometers in this scale between approximately 2 and 35, and more preferably 25 or less.

'190 patent, col. 3, ll.4-13. The specification also states that in the preferred embodiment, the shell "preferably has a Shore A hardness of 20-25." '190 patent, col. 3, ll.51-52. This degree of hardness maintains the shape of the grip and prevents damage from chemicals and oils. '190 patent, col. 3, ll. 53-55.

As frequently occurs, the parties cite opposing axioms. Pilot asserts that the court may not import limitations from the specification to the claim. Kwitek argues that a patentee may act as his own lexicographer, and that by referring to the Durometer and Shore A scale, the inventor did so. Alternatively, Kwitek states that applying the specified Durometer range "gives life meaning and vitality to the claim." The rules of construction are helpful guideposts. But, in the end, the court must determine the meaning the term would have to a person of ordinary skill in the art, who reads the claim in the context of the specification and prosecution history, at the time of the effective filing date of the patent. Phillips, 415 F. 3d at 1313.

It is clear from the specification that the viscoelastic hand/finger surface is soft -- soft enough to be compressed or deformed under the pressure exerted by fingers holding a writing instrument. It is also clear that the surface will tend to return to its original shape when the writing instrument is released.

The reference to the Durometer range between 2 and 35 is found in the section titled "DESCRIPTION OF PREFERRED EMBODIMENTS." '190 patent, col. 3, l.13. It also is used only in conjunction with a description of a particular embodiment with an "ultra-soft" material. Elsewhere, embodiments are described as having a "soft" surface, but no Durometer reading is given. On the other hand, the preferred embodiment of the shell, described in the claim as having "hardness" at col. 8, ll. 66-67, is described in the specification as having a "Shore A hardness of 20-25." '190 patent, col. 3, ll. 51-52. This is well within the range ascribed to the "ultra-soft" hand/finger surface." '190 patent, col. 3, ll. 10-13.

The patentee could have included a Shore A hardness range as part of Claim 1, or in a dependent claim. It would not have been unusual to have seen several dependent claims stating various hardness measurements to cover various possible embodiments, if precise hardness measurements were really a limitation of the claim.

Another problem with Kwitek's argument is that a Durometer test of a material measures how far a probe will penetrate into a material. It is an empirical test which can be used to ensure that one batch of material is the same as, or similar to another. A Shore A reading test may measure the "hardness" (resistance to penetration) of a material. But "no simple relationship exists between indentation hardness determined by this test method and any fundamental property of the material tested." ASTM D 2240 - 00, "Standard Test Method for Rubber Property -- Durometer Hardness," ASTM International, pp. 1-2 as found in Ex. D to Kwitek's Opening Claim Construction Brief [Doc. # 56, Attachment # 4, pp. 20-21 of 50].

- 5046 -
Additionally, the patent describes embodiments in which the hand/finger surface is formed from silicone gel or silicone oil and contained within an elastomeric bag. See '190 patent, col. 2, ll. 5-9; '190 patent, col. 4, ll. 36-40. What does the Durometer measure: the hardness of the oil or the covering? How puncture resistant is the covering and what is the measurement if the probe penetrates it?

The claim term "viscoelastic" doesn't really tell one skilled in the art much about hardness as measured on the Shore A scale by a Durometer. And a particular Shore A reading on a Durometer does not tell one skilled in the art how viscoelastic a substance is. Defining the disputed term as including the limitation of a Shore A hardness level would be adding something that just is not in the claim, nor defined by the patentee acting as his own lexicographer.

The court will construe this term as follows:

"Viscoelastic hand/finger surface" means "the external layer of the grip is soft enough to change shape under the pressure exerted by fingers gripping a writing implement to write and which will tend to return to its original shape when released."

4366

1. Vision Correction Power/Vision Correction Value

The parties agree that the claims of the Portney Patents variously refer to the terms "vision correction power" or "vision correction value" synonymously. Those terms are found in Claims 1, 10(b), 14, 15, 19, 28, 29, 30, 32, 33, 34, 35, 36 and 41-44 of the '461 patent; Claims 1 and 8 of the '108 patent; Claims 1, 2, 3, 4, 5, 7, 10, 12, 13, 14, 17 and 18 of the '839 patent; Claims 1, 3, 4, 5, 7, 10, 13, 16 and 17 of the '625 patent; Claims 1, 2, 3, 5, and 8 of the '744 patent; Claims 1, 4, 7 and 14 of the '389 patent; 1, 4, 9 and 10 of the '711 patent; and Claims 1, 3, 5 and 10 of the '340 patent.

Vision Advancement argues that the common and ordinary meanings of "Vision Correction Power/Vision Correction Value" should prevail and cites to two medical dictionaries to propose a construction of "The measure of magnification required or used to neutralize a harmful or undesirable condition or to improve the condition of a person's eye sight." Vistakon advances the construction of "The dioptric power or value needed in a lens prescription to correct a refractive error; the dioptric power of the lens is measured with the lens off-eye."

At the Markman hearing, Vision Advancement agreed to the following alteration of Defendant's construction, "The dioptric power or value in a lens to correct refractive error." However, Vision Advancement maintains that Vistakon's construction further requiring that the lens be "measured with the lens off-eye" is too limiting because it is not needed to define the term. Vistakon claims that the Portney Patents' only reference to vision correction power is to the power of a lens measured off-eye and that there is no mention in the patents of determining the power of the lens on-eye. Because, Vistakon argues, Portney never suggested to the examiner that the power of the lens--his or prior art lenses--should be determined on-eye, it stands to reason that the power of a lens should be measured off-eye. While it is true that the prosecution history can inform the meaning of claim language, see Phillips, 415 F.3d at 1317, the Court is not willing to import what was not mentioned in the patent or prosecution history. There is no statement that the power of the lens must be measured off-eye. Nor will the Court import that limitation into the claims because there is no statement that the lens can be measured on-eye. See Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1326 (Fed. Cir. 2003) (opining that for prosecution disclaimer to arise, the alleged "disavowing actions or statements made during prosecution [must] be both clear and unmistakable").

Therefore, the Court construes "Vision correction power/value" to mean the "The dioptric power or value in a lens to correct refractive error."
A. Claim Definiteness

Sunglass Hut argues that the phrase "vivid colored appearance" appearing in claim 1 is indefinite. Even if vividness is based on the disclosed "differential effect," according to Sunglass Hut, one skilled in the art cannot tell which values of differential effect qualify as vivid and which do not. Sunglass Hut further contends that the district court did not and could not define the bounds of the phrase.

Oakley responds that the phrase can be defined from the structure, formula, and examples disclosed in the patent. Oakley cites the proposition that compliance with section 112, paragraph 2, does not require a particular number as a cutoff. According to Oakley, the specification's numerical examples, including some values of differential effect that do create a "vivid colored appearance" and one that does not, are sufficient.

We agree with Oakley that Sunglass Hut has not raised a substantial question as to whether the phrase "vivid colored appearance" renders the claims indefinite in violation of 35 U.S.C. § 112, P 2. That paragraph provides: "The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention." 35 U.S.C. § 112, P 2 (2000). "The primary purpose of the definiteness requirement is to ensure that the claims are written in such a way that they give notice to the public of the extent of the legal protection afforded by the patent, so that interested members of the public, e.g., competitors of the patent owner, can determine whether or not they infringe. That determination requires a construction of the claims according to the familiar canons of claim construction." All Dental Prodx, LLC v. Advantage Dental Prods., 309 F.3d 774, 779-80, 64 USPQ2d 1945, 1949 (Fed. Cir. 2002) (citations omitted).

One of those canons is that a patentee need not define his invention with mathematical precision in order to comply with the definiteness requirement. In re Marosi, 710 F.2d 799, 802-03, 218 USPQ 289, 292 (Fed. Cir. 1983). In Marosi, we held that the phrase "essentially free of alkali metal" was not indefinite, where the specification defined it as containing only residual impurities, such as 4 ppm (parts per million). Id. at 802, 218 USPQ at 292. Marosi disclaimed a level of 3819 ppm disclosed in the prior art, and the PTO took the position that one skilled in the art would not know where to draw the line between 4 ppm and 3819 ppm. Id. We sided with Marosi, explaining that his invention "does not reside in such a number" and that a skilled artisan would draw that line between unavoidable impurities and essential ingredients. Id. at 803, 218 USPQ at 292.

Unlike the situation in Marosi, the numerical value of the differential effect in this case is a distinguishing feature over the prior art. That is so because the language of the claim associates vividness with the differential effect, and the specification presents examples of numerical values of the differential effect that either qualify as vivid or do not. More precisely, the language of the claim itself confirms that the lens's "vivid colored appearance" results directly from the "differential effect." '902 patent, col. 24, ll. 62-64 (reciting "said differential effect . . . producing a vivid colored appearance" in claim 1). Moreover, the claim itself defines the lens's structural attributes that produce the "differential effect." Id. at col. 24, ll. 67-69 (reciting "the reflectance of said semireflective layer and the thickness of said dielectric layer producing . . . a differential effect").

Accordingly, the specification presents a formula for calculating the differential effect for a number of examples in which the differential effect is either great enough to produce a "vivid colored appearance" or not. Those values that qualify as producing a "vivid colored appearance" range from 5.45% to 405% under various circumstances, whereas the only disclosed value of maximum differential effect that does not produce a "vivid colored appearance" is 2.3%. Id. at col. 9, ll. 59-65. Thus, while the specification does not indicate so explicitly, the dividing line must be somewhere between 2.3% and 5.45%.

Although the difference between those values is seemingly slight, and comparison of one differential effect value to another may present an apples-to-oranges problem due to the different reference intensities involved, the specification purports to indicate that the difference is significant, brushing aside any comparison difficulties. See '902 patent, col. 11, ll. 5-16 (purporting that differential effects of 5.45% above 8[D] and 25.96% above 8[A] are "much larger than the 2.2% found for the 90% reflecting case" (emphasis added)); see also id. at col. 12, ll. 37-40 (purporting that 7.5% is "much greater than that
obtained (2.2%) for a 90% reflecting layer case" (emphasis added)). Faced with those examples and comments, we conclude that one skilled in the art would, in reasonable likelihood, understand that a lens exhibiting a maximum differential effect not substantially greater than 2.2% does not have a "vivid colored appearance."

Indeed, we conclude that one skilled in the art would interpret the phrase "vivid colored appearance" in light of the specification to require that the maximum differential effect equal or exceed about 5.45%, and we thus construe the phrase for purposes of the preliminary injunction.

That is not to say that Sunglass Hut cannot ultimately succeed on the merits of its indefiniteness argument later in the litigation, after further development of the record. We simply hold that, recognizing the presumption of validity and the fact that the '902 patent has already been subjected to reexamination, Oakley has at this point in the case shown that it is reasonably likely to withstand such a validity challenge.

(3) Plurality of voids extending between said top and bottom

This term can be found in claims 1 and 11 of the '874 Patent. Innovative argues that "voids extending between said top and bottom ends" means gaps or spaces which extend in the space between the top and bottom ends." Defendants construe the term to mean "multiple openings entirely disposed within the walls of the first coupling, which are not grooves, and extend the entire length of the coupling."

Requiring the voids to extend the entire length of the coupling is contrary to the ordinary meaning of "between." For that reason alone, I disagree with the defendant.

The figures accompanying the patents, which show that the voids do not go through to the top because they are only visible from a bottom view, not a top view. Pl's Markman Br. p. 21.

The ordinary meaning of the language together with the drawings in the patents establish that "plurality of voids" means "gaps or spaces which extend in the space between the top and bottom ends."

"method for using vulcanized rubber" and "shredded vulcanized rubber particles" Claim 5

The Merriam-Webster Online Dictionary defines "method" as "a way, technique, or process of or for doing something." Merriam-Webster Online Dictionary (visited May 15, 2007) <http://www.m-w.com/dictionary/method>. The term "vulcanization" means "the process of treating crude or synthetic rubber . . . to give it useful properties." Merriam-Webster Online Dictionary (visited May 15, 2007) <http://www.m-w.com/dictionary/vulcanization>. Therefore, the Court defines "method for using vulcanized rubber" as "the process of treating crude or synthetic rubber . . . to give it useful properties."

Pursuant to this Court's Markman Order, the term "wafer" means "a thin, generally cylindrical, slice of semiconductor material used as a base for an electronic component or circuit." The term "a first axially symmetric region" means "a region that is symmetric about the central axis of the wafer." The term "substantially free of agglomerated vacancy [or interstitial] defects" means "a concentration of such agglomerated defects which is less than the detection limit of these defects, which is currently about 1000 defects/cm3." The term "agglomerated vacancy intrinsic point defects" means "defects caused by the reaction in which vacancies agglomerate to produce D-defects, flow pattern defects, gate oxide integrity defects, crystal originated particle defects, crystal originated light point defects, and other such vacancy related defects." Finally, "agglomerated silicon self-interstitial intrinsic point defects" means "defects caused by the reaction in which self-interstitials
agglomerate to produce dislocation loops and networks, and other such self-interstitial related defects.

3. Wafer Cassette (Claims 1 and 21)

Plaintiff argues "wafer cassette" should be construed as "a structure that holds one or more wafers." Defendant argues "wafer cassette" should be construed as "an open structure that holds one or more wafers."

The Court finds "wafer cassette" is properly construed as "a wafer carrier that holds one or more wafers and keeps them separate."

6 The Court has not adopted either party's proposed construction. Defendant has failed to show the claimed "wafer cassette" must be "open" at all times. Both parties' reference to a "structure that holds one or more wafers" fails to provide sufficient clarity; both parties agree, however, that a "wafer cassette" is a type of "wafer carrier" that, in addition to holding wafers, keeps them separate. (See Pl.'s Opening Brief on Claim Construction at 16; Gwozdz Decl. PP 23-24, Ex. H.)

3. The "Wafer Support" Limitation

Finally, Semitool argues that the district court erred by construing the phrase "wafer support for detachably supporting wafers thereon" in the '708 patent to be a means-plus-function limitation under 35 U.S.C. § 112, ¶ 6 because that phrase is a generic expression for a variety of well-known physical devices used to hold or grasp a wafer and release it. Novellus responds that the phrase is purely functional, and that because the claims do not recite any specific structure for performing that function, the district court properly construed that term to be a means-plus-function limitation.

The failure to use the word "means" creates a presumption that § 112, ¶ 6 does not apply, which can be rebutted by both intrinsic evidence and any relevant extrinsic evidence. Personalized Media, 161 F.3d at 703, 48 U.S.P.Q.2D (BNA) at 1886 (citing Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1213, 48 U.S.P.Q.2D (BNA) 1010, 1016 (Fed. Cir. 1998)). "In deciding whether [the] presumption has been rebutted, the focus remains on whether the claim as properly construed recites sufficiently definite structure to avoid the ambit of § 112, ¶ 6." Id. (citing Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1427-28, 44 U.S.P.Q.2D (BNA) 1103, 1109 (Fed. Cir. 1999)).

We agree with Semitool that the district court erred in construing the phrase "wafer support for detachably supporting wafers thereon" to be a means-plus-function limitation. The "wafer support" limitation does not use the word "means," and therefore this limitation is presumed not to invoke § 112, ¶ 6. Id. Furthermore, none of the intrinsic or extrinsic evidence rebuts this presumption because the term "support" is a sufficient recitation of structure. The word "support" is a well-known term in the mechanical arts for a number of objects capable of providing some type of foundation for another object. See Knight's American Mechanical Dictionary 2455 (1876) (defining "structure" as "[a] term of very general import. A stand, frame, or bed for an . . . apparatus, implement, tool"). The fact that the term "support" does not specifically evoke a particular structure does not change the fact that it does connote structure. See Greenberg v. Ethicon Endo-Surgery, 91 F.3d 1580, 1583, 39 U.S.P.Q.2D (BNA) 1783, 1786 (Fed. Cir. 1996) (stating that a claim term "need not call to mind a single well-defined structure" to fall within the ambit of § 112, ¶ 6, and that the relevant inquiry is whether the claim term "has a reasonably well understood meaning in the art"). We conclude that the "wafer support" limitation conveys sufficient structure to preclude the application of § 112, ¶ 6, and therefore interpret that limitation to mean any device capable of both holding or grasping a semiconductor wafer and releasing it at some later time.
4373

3. The "Wafer Support" Limitation

Finally, Semitool argues that the district court erred by construing the phrase "wafer support for detachably supporting wafers thereon" in the '708 patent to be a means-plus-function limitation under 35 U.S.C. § 112, P 6 because that phrase is a generic expression for a variety of well-known physical devices used to hold or grasp a wafer and release it. Novellus responds that the phrase is purely functional, and that because the claims do not recite any specific structure for performing that function, the district court properly construed that term to be a means-plus-function limitation.

The failure to use the word "means" creates a presumption that § 112, P 6 does not apply, which can be rebutted by both intrinsic evidence and any relevant extrinsic evidence. Personalized Media, 161 F.3d at 703, 48 U.S.P.Q.2D (BNA) at 1886 (citing Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1213, 48 U.S.P.Q.2D (BNA) 1010, 1016 (Fed. Cir. 1998)). "In deciding whether [the] presumption has been rebutted, the focus remains on whether the claim as properly construed recites sufficiently definite structure to avoid the ambit of § 112, P 6." Id. (citing Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1427-28, 44 U.S.P.Q.2D (BNA) 1103, 1109 (Fed. Cir. 1997)).

We agree with Semitool that the district court erred in construing the phrase "wafer support for detachably supporting wafers thereon" to be a means-plus-function limitation. The "wafer support" limitation does not use the word "means," and therefore this limitation is presumed not to invoke § 112, P 6. Id. Furthermore, none of the intrinsic or extrinsic evidence rebuts this presumption because the term "support" is a sufficient recitation of structure. The word "support" is a well-known term in the mechanical arts for a number of objects capable of providing some type of foundation for another object. See Knight's American Mechanical Dictionary 2455 (1876) (defining "support" as "[a] term of very general import. A stand, frame, or bed for an . . . apparatus, implement, tool"). The fact that the term "support" does not specifically evoke a particular structure does not change the fact that it does connote structure. See Greenberg v. Ethicon Endo-Surgery, 91 F.3d 1580, 1583, 39 U.S.P.Q.2D (BNA) 1783, 1786 (Fed. Cir. 1996) (stating that a claim term "need not call to mind a single well-defined structure" to fall within the ambit of § 112, P 6, and that the relevant inquiry is whether the claim term "has a reasonably well understood meaning in the art"). We conclude that the "wafer support" limitation conveys sufficient structure to preclude the application of § 112, P 6, and therefore interpret that limitation to mean any device capable of both holding or grasping a semiconductor wafer and releasing it at some later time.

4374

a. "waist area" or "waist area of the garment"

The terms "waist area" and "waist area of the garment" are construed by the court to mean an area of the garment that is above and distinct from the hip area of the garment. To rule otherwise would conflict with Orr's definition given in both the patent specification and during prosecution of the '364 patent; more importantly, to interpret the terms "waist area" and "waist area of the garment" in any other way would ensnare prior art -- the Santoni patent -- and thus invalidate the '364 patent.

This term was defined both in the patent specification, and by the patentee during prosecution. The '364 patent states, "The two garment pieces 16 and 18 are connected together generally only at the waist area of the garment preferably about the waistline 58. . . . " '364 patent at col. 4, lines 44-48. As shown in Fig. 1 on the '364 patent, the waistline 58 is the uppermost portion of the garment, about the waist. In Fig. 4 of the '364 patent, the "waist area" is specifically marked as 74, again referring to the top of the garment and what might be considered the waistband. See '364 patent at col. 5 lines 18-21.

Moreover, during prosecution of the '364 patent, the patentee distinguished the Santoni reference on the grounds that are even more telling. The patentee distinguished the Santoni reference on the grounds that "the slots 8 and 9 shown in the Santoni reference particularly in Figure 3 extend only from the leg of the garment to the sides of the garment substantially below the garment waist defined by the waistband 4." See Amendment A at 11, Defendants' Appendix at 60. In making this statement, Orr defined what the court will call the "hip area" of the garment. This is an area near the upper leg and to the
Jump to:  A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

sides of the garment where the crotch sections attached to one another in the Santoni patent.

In distinguishing the Santoni patent, the patentee defined the "garment waist area" as a distinct area, separate from the hip area of the garment. Therefore, the terms "waist area" and "waist area of the garment" are construed by this court in such a way as to distinguish them from the hip area of the garment. To interpret the terms "waist area" and "waist area of the garment" in any other way would ensnare prior art -- Santoni -- and thus invalidate the '364 patent. See Tate Access Floors, Inc., 279 F.3d at 1366-67.

The Santoni patent, issued in 1971, disclosed a type of ladies tights with overlapping crotch portions and an openable crotch structure. During prosecution, the patent office initially rejected claim 1 of the '364 patent because it was "clearly anticipated" by Santoni. Office Action mailed by the US Patent and Trademark office on April 27, 1990, P 3. The similarities between Santoni and the '364 patent are shown below (below to the left is an excerpt of Figs. 1 and 3 of the '364 patent, and below to the right is an excerpt of Figs. 3 and 4 of the prior art Santoni).

[SEE PICTURE IN ORIGINAL]

In response to the Patent Office's rejection of the original '364 patent application (which explained that claim one was clearly anticipated by Santoni), Orr distinguished Santoni by arguing that the "slots 8 and 9 shown in the Santoni reference particularly in Figure 3 extend only from the leg of the garment to the sides of the garment substantially below the garment waist defined by the waistband 4." Amendment A at 11, Defendants' Appendix at 60. The "slots" are the leg openings 8 and 9 identified in the Santoni Figures 3 and 4 above. As can be seen from Figures 3 and 4 above, the slots 8 and 9 are attached at an area near the top of the leg or hip. Therefore, slots that do not extend above the hip area of the garment into the waist area are not covered by the claim one limitations of the '364 patent.

--- End Footnotes

The size and arch support limitations proposed by defendant and the "high-surface area" limitation proposed by Messer are not supported by the ordinary and customary meaning of the words used in the disputed term, nor do they receive support from the context in which the term appears in the claim language. Indeed, the proposed limitations appear only in claims dependent on Claim 1 and not in Claim 1 itself, giving rise to a presumption that the limitations are not present in the independent claim. See Phillips, 415 F.3d. at 1315. Because the term "wakeboard traction pad" is used in Claim 1, the
presumption suggests that the disputed term cannot be construed to include any of these three limitations.

Moreover, the size and arch support limitations proposed by defendants are drawn, in part, from language in the specification. However, the words used in independent Claim 1 are not subject to the clarifications defendants propose, and therefore the claim cannot be so constrained on the basis of the specification language. See Renishaw, 158 F.3d 1248-1249.

Finally, nothing in the prosecution history submitted into evidence suggests that the disputed term should be given a construction that deviates from that suggested by its ordinary and customary meaning and its context within the claims.

For the foregoing reasons, I reject as unsupported the size and arch support limitations proposed by defendants and the "high-surface area" limitation proposed by Messer, and conclude instead that the term "wakeboard traction pad" should be construed to mean "a pad with a friction-enhancing top surface, the bottom surface of which may be attached to the top surface of a wakeboard."

4376

B. "wakeboard traction surface"

The term "wakeboard traction surface" appears only once in the patent claims, as the subject of independent Claim 21. Defendants contend that "wakeboard traction surface" should be construed to mean "the top surface of a wakeboard traction pad." Messer argues that the term should instead be construed to mean "any friction-enhancing finish or surface placed on the top surface of a wakeboard."

Both proposed definitions entail difficulties. On defendants' proposed construal, the terms "wakeboard traction surface" and "wakeboard traction pad," while not precisely synonymous, could be used interchangeably without changing the scope of the patent claims' coverage. However, applicable case law instructs that, in the absence of evidence to the contrary, different terms should be construed as connoting distinct meanings. See CAE Screenplates, 224 F.3d at 1317; Applied Med., 448 F.3d at 1333 n.3.

Plaintiff's proposed construal, by contrast, falls afoul of dependent Claim 22, which describes "[a] wakeboard incorporating the traction pad of claim 21." '051 Patent, 12:46-47 (emphasis supplied). It is presumed that patent terms have the same meaning wherever they are used in a patent, see Phillips, 415 F.3d at 1317, and the reference in Claim 22 to a "traction pad" described in Claim 21 suggests that a "wakeboard traction surface" must in some sense constitute or form part of a traction pad.

Although the conflict between these principles of patent construction suggests the possibility of a drafting error, in which either the word "surface" in Claim 21 or the word "pad" in Claim 22 was mistakenly selected, it is not for this court to determine the patent applicant's intent in selecting particular claim terms. See Markman, 52 F.3d at 985 ("No inquiry as to the subjective intent of the applicant or PTO is appropriate or even possible in the context of a patent infringement suit. The subjective intent of the inventor when he used a particular term is of little or no probative weight in determining the scope of a claim. . . "). Instead, this court must look to the claim language as approved by the Patent and Trademark Office and construe the claims for what they actually recite, adhering as closely as possible to the principles of patent construction set forth above.

The language of Claim 21 provides support for Messer's contention that "wakeboard traction surface" must be construed as distinct from a "wakeboard traction pad." The claim expressly describes "a sloping surface," the contours of which serve to define characteristics or to perform functions elsewhere described, in different terms, as features of a pad. Specifically, the
language of Claim 21 describing the arch support of the traction surface can be contrasted with the language of dependent Claim 15 and independent Claim 19 describing a pad incorporating an arch support; the latter language expressly describes a ridge traveling along the top surface of the pad from one end of the pad to the other, see '051 Patent, 10:39-42, 12:1-4, whereas the former language defines the arch support purely as a characteristic of the "sloping surface," see '051 Patent, 12:41-42. The focus in the claim language on the contours of the surface suggests that the traction surface of Claim 21 is intended to overlay a contoured substrate, rather than merely to constitute one side of a pad such as that claimed in Claims 1 or 19.

For the foregoing reasons, I reject the construction proposed by defendants, and conclude instead that the term "wakeboard traction surface" should be construed to mean "a friction-enhancing finish or surface material that may adhere or be attached to the top surface of a wakeboard."

4377

2. WALL

ConAgra defines "wall" as a "barrier capable of being in contact with two food materials while holding them separate and apart from one another" (Filing No. 64). Green contends "wall" "defines the outside of a vessel for maintaining relative position of food, not a barrier" (Id).

In accordance with the above discussion, the Court finds that "wall" means a barrier. The patent uses wall to define the boundaries of a vessel. Claim 1 states the first vessel has "a bottom wall" and "a substantially frusto-conical side wall converging toward said bottom wall," and the second vessel has "a bottom wall" and "a frusto-conical side wall having an upper end." Figure 3 of the patent specification shows the bottom and side walls form the outermost boundary of a vessel. The specification does not explicitly use the term barrier to define a vessel's wall, but such a construction is implicit in the specification. As discussed above, figure 3 depicts the bottom and side walls of both vessels as solid and the bottom and side walls of the second vessel must be solid to prevent foods in the first and second vessels from mixing when the vessels are nested. Further, during prosecution of the patent, the examiner removed his obvious objection based on the understanding that the second vessel's side wall could be in contact with two different foods while keeping the foods separate and apart. Parts of the specification and prosecution history regard specific walls of the first or second vessel, but wall should be construed consistently for the side and bottom walls of both vessels.

4378

c. "Rear Wall"

Plaintiffs argue that the AMP device does not have a rear housing wall as recited in Claim 1. They say that the back of the AMP device is completely open, exposing the conductor wires. Maxconn disagrees, stating that the claim does not require that the lead wires be enclosed under a solid rear wall.

i. Claim language

The claim requires a "rear wall," '317 patent at 4:58, but does not contain any language describing the nature or design or this rear wall. The claim itself sets forth no limitation requiring that the conductor wires from the plug receiving opening be encased within a thick rear wall or behind a solid rear wall.

ii. Specification

Figures 3 and 4 of the '317 patent show a rear wall which is essentially just a square-like outline, the thickness of the top, bottom, and side walls, the vacant interior of the square exposing the wires and pins which connect the device to a printed-circuit board. Pocrass believes that Figures 3 and 4 contain a drafting error, and that the rear view in those figures was intended to be a cross section showing the wires placed behind or within a solid type of rear wall.
While Figures 1 and 2 of the '317 patent explicitly show cross-sections by means of the standard drafting technique of cross-hatching, Figures 3 and 4 contain no cross-hatching. Furthermore, Figures 3 and 4 would make no sense if the rear wall was understood as a cross-section, because it is clear that the electrical lead wires 50 and 52 lie within slots located on the outer portion of the rear wall. See Figure 1 of the '317 patent. If these figures represented true cross sections, items 50 and 52 would have been omitted.

The specification describes the rear wall as a structure that defines the rear of the plug opening, and which "extends transversely" across the rear of the housing:

Opening 26 is further defined by a rear wall 16 which extends transversely across the rear portion of the housing 10. Outer rear wall surface has formed therein a plurality of alternating inwardly extending slots 38 which longitudinally extend within the rear wall 16 and top wall 18, FIGS. 3 and 4.

'317 patent at 3:16-21. The specification explains the claim term "rear wall" as that piece which lies at the rear of the plug receiving opening. The specification does not indicate that the rear wall somehow encloses all of the conductor wires. It is not specified that an encasement or wall must completely or even partially cover the wires extending from the light emitting source.

iii. Prosecution History

The prosecution history does not help to clarify the meaning of rear wall.

iv. Extrinsic Evidence

Pocrass testified that Figures 3 and 4 of the '317 patent contained a significant mistake in the omission of the cross-hatching, therefore failing properly to indicate that these are cut-away or sectional views of the rear of the invention claimed under the '317 patent. Mr. Pocrass also testified that the written description of Figures 3 and 4 incorrectly failed to indicate that they are cut-away or sectional views.

The Court did not find Pocrass's testimony credible, or if credible, sufficient to overcome the clear import of the figures in the specification. Credible testimony was presented that RJ connectors were frequently made with open backs. As Mr. Lazar testified, the point was that there be a stopping surface to that the plug does not go through the back.

Plaintiffs stated that the Pocrass invention was essentially an adaptation of the Bogese II patent. Essentially the first claim of Bogese II mirrors the first claim of the '317 patent, without the light emitting devices. Figure 3 of the Bogese II patent "is a rear view of the preferred embodiment illustrated in FIG. 1." (See Figure G, below.) The view shows the conductor wires exposed, but secured to the device at the top by indentations pressed into the outer edge of the top wall.

v. Construction

In conclusion, the "rear wall" described in Claim 1 need not be a solid rear wall, but can be an outline in which the interior wires of the device are left exposed. While Mr. Pocrass may have intended a different meaning for "rear wall," that meaning was not expressed in the patent itself. His self-serving testimony is given no deference.
Another element included in claim 1 is:

a third wall defining a soil container, said soil container being fluidly connected to said guide chamber by said aperture in said second wall.

Here M. Mem. 18 asks only that the "third wall" be construed as "a wall" and not as the "cover" or top of the soil container. Because "wall" in the quoted context is not dispositively self-defining, it becomes appropriate to refer to the specification.

On that score Whirlpool says (W. Mem. 16):

The specification identifies the soil container chamber 54 as being defined by the lower housing wall 49 (the bottom), the soil container wall 56 (one side), the second upstanding annular wall 50 (the opposite side) and the cover 30 (top). All of these "walls" are joined together to receive and hold soil laden liquid from the pump chamber....

But that last use of "walls" to convert "the cover 30 (top)" into the "third wall" is no better than a linguistic sleight of hand. It flies directly in the face of Whirlpool's own specification (col. 4, ll. 4-9)(emphasis added):

As shown in FIG. 2, the soil separator 20 further includes an annular cover 30 which is disposed over and secured to soil container wall 56 by screws 31. When in place, cover 30 and soil container wall 56 combine to form a low-pressure water seal, preventing leakage of water therebetween.

And as will next be shown, it is likewise at war with the portion of Whirlpool's specification (col. 5, ll. 47-49) that the first sentence in its above-quoted Mem. 16 paraphrases:

Soil container chamber 54 is generally defined by lower housing wall 49, soil container wall 56, second upstanding annular wall 50 and cover 30.

To begin with a nonissue, the "first wall" referred to in claim 1 is indisputably separate from the "soil container chamber." Next, the claim, the specification language and the drawings all confirm that the "second wall" is what is uniformly identified by the number 50 (described at col. 4, l. 20 as "upstanding wall 50," and at col. 5, ll. 29-30 and l. 33 and ll. 48-49, and col. 6, ll. 50-51 as "second upstanding annular wall 50"). Only one other "wall"--necessarily the "third-wall"--is referred to, and that is "soil container wall 56."

All that being true, there is no way that Whirlpool can legitimately characterize "annular cover 30" as a "wall" (either as part of the third wall or otherwise). That cover is listed separately at col. 5, l. 49 as one of the components that "generally define[""] the soil container chamber, and col. 4, ll. 5-6 describe that cover as "disposed over and secured to" the third wall--totally inconsistent with the contention that the cover can be part of the third wall.

In short, Maytag is right and Whirlpool is wrong. Because the '433 Patent's specification expressly distinguishes between what it labels "walls" and the "cover" of the soil container, the third wall does not include the cover. All other terms in the claim element will be given their plain and ordinary meaning.

2. Wall Depth

The language of claim 1 requires "at least one ball projecting wheel . . . mounting a pneumatic tire having . . . a wall depth ranging between about 5-10 cm." '325 patent, col. 4, lines 4-9 (emphasis added). Dependent claims 2 and 3 include the same "wall depth" element as independent claim 1. See '325 patent, col. 4, lines 4-14. Both parties agree that "wall depth" refers to a radial dimension. They disagree, however, as to whether that measurement should be taken as the radius of the wheel or the pneumatic tire. Jugs argues that the claim language is unambiguous that while the wheel mounts a pneumatic tire, the "wall depth" relates only to the tire. Jugs also points to a statement in the specification that states "[t]he foregoing
advantages are achieved by providing pneumatic tires 14 that may range in . . . wall depth." '325 patent, col. 3, lines 7-11.

To the contrary, Trend argues that figure 1 of the '325 patent clearly shows that the "wall depth" is measured from the outermost edge of the wheel to the outermost surface of the tire. See id. at fig.1. Trend points out that other than figure 1, neither the body of the specification nor the claims explicitly define "wall depth" or provide how "wall depth" is measured.

The court finds that the intrinsic evidence supports Trend's proposed construction that "wall depth" is measured along the outermost edge of the wheel to the outermost surface of the pneumatic tire. "The construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction." Phillips, 415 F.3d at 1316 (quoting Renishaw PLC, 158 F.3d at 1250). Here, the claim language supports the conclusion that the "wall depth" is measured along the outermost edge of the wheel because the "wall depth" measurement recited in independent claim1 is in reference to a pneumatic tire that is mounting a wheel. See '325 patent, col. 4, lines 4-9 ("at least one ball projecting wheel . . . mounting a pneumatic tire having . . . a wall depth ranging between about 5-10 cm") (emphasis added). Furthermore, figure 1 of the '325 patent clearly shows that "wall depth" is measured from the outermost edge of the wheel to the outermost surface of the tire. See id. at fig.1. In addition, Jugs' reference to "wall depth" in the specification does not negate Trend's proposed construction because the reference is to the "description of the preferred embodiment" where the pneumatic tire is already in combination with a wheel. See id. at col. 1, line 54-col. 3, line 18; see also id. at figs.1-5. Interpreting the language of claim 1 in light of the definition of wall depth provided in figure 1, the court finds Trend's proposed construction to be the most correct. Thus, the court construes "wall depth" to mean:

a measurement along a radius of the wheel from the outermost edge of the wheel to the outermost surface of the pneumatic tire.

4381

Construction of Claim 12

Claim 12 has three limitations on which the parties focus. The Court addresses each of these claim phrases in turn. First, claim 12 requires that the golf club inventions have "a high impact forward wall . . . having a ball impacting face wall with a plurality of generally parallel grooves." Col. 11, lines 14-18 (emphasis added). The context of this claim specifically and of the patent as a whole suggests that the "high impact forward wall" simply has a face, not a "face wall," with many, roughly-parallel grooves on that face. 5 The phrase "face wall" is not used in these other claims as a shorthand for the composite plastic covering wall. Instead, in these other claims, "face wall" generically refers to the ball striking surface, regardless of whether it is metal or plastic.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

5 Literally read, the claim would require a wall that has a wall. This construction does not make sense and thus will not be adopted, see Baxter Int'l Inc. v. Mcgaw, Inc., 1996 U.S. Dist. LEXIS 1527, No. 95 C 2723, 1996 WL 66139, *7 (N.D. Ill. Feb. 12, 1996) (rejecting claim construction that made "no sense"), despite Golfsmith's reliance on the examiner's reasons for allowance in support of its argument that this language requires two walls. The examiner's reasons, which purport to relate to Claims 1-14 and mention two separate walls, only state that these claims were allowed over the prior art "in part" because of the two-wall system. The two-wall system does not purport, by the examiner's own words, to be the only reason for allowance.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Comparing Claims 1 and 12 also illustrates that the latter claim only requires one wall. By contrast to claim 12, Claim 1 requires two distinct walls - one metal and one plastic wall - so that the thickness of the metal wall can be reduced without it caving in when the golfer, swinging the club head upwards of 100 mph, hits the golf ball. In a Claim 1 golf club, a face-reinforcing matrix juts forward from the forward wall and second plastic wall provides a smooth covering surface to the matrix of supporting bars. Unlike Claim 1 and other claims in the '941 patent that describe in detail two "walls," see, e.g., Col. 9, lines 21-25, Claim 12 never mentions a separately molded, plastic covering wall. Claim 12 also does not require a reinforcing matrix of bars jutting out from the forward wall. Instead, as noted in more detail below, it simply requires a
forward wall with "substantially uniform thickness," Col. 11, lines 20-21. In short, Claim 12 requires one, not two walls.

Contrary to Karsten's argument, the golf clubs described in Claim 12 require only one wall. **Claim 12 first requires that the golf clubs have "a high impact forward wall . . . having a ball impacting face wall with a plurality of generally parallel grooves." Col. 11, lines 14-18 (emphasis added). The context of this claim specifically and of the patent as a whole suggests that the "high impact forward wall" simply has a face, not a "face wall," with many, roughly-parallel grooves on that face. The phrase "face wall" is not used in these other claims as a shorthand for the composite plastic covering wall. Instead, in these other claims, "face wall" generically refers to the ball striking surface, regardless of whether it is metal or plastic.**

Another way of looking at it is that the word "wall" is used to mean two different things. First for example, by wall it means an entire structure that divides two rooms. Second, by wall it means the surface of that structure viewed from inside either of these rooms. In any case, it could not require two of the first types of walls.

Comparing Claims 1 and 12 also illustrates that the latter claim only requires one wall. By contrast to claim 12, Claim 1 requires two distinct walls -- one metal and one plastic wall -- so that the thickness of the metal wall can be reduced without it caving in when the golfer, swinging the club head upwards of 100 mph, hits the golf ball. In a Claim 1 golf club, a face-reinforcing matrix juts forward from the forward wall and second plastic wall provides a smooth covering surface to the matrix of supporting bars. Unlike Claim 1 and other claims in the '941 patent that describe in detail two "walls," see, e.g., Col. 9, lines 21-25, Claim 12 never mentions a separately molded, plastic covering wall. Claim 12 also does not require a reinforcing matrix of bars jutting out from the forward wall. Instead, as noted in more detail below, it simply requires a forward wall with "substantially uniform thickness." Col. 11, lines 20-21. In short, Claim 12 requires one, not two walls.
burst pressure is determined at 37 degrees C."

Both parties agree that the correct equation for the "wall tensile strength" is:

$$\left[ \text{burst pressure (psi)} \times \text{nominal balloon diameter} \right] / 2 \times \text{wall thickness}$$

As with "elastic stress response," the parties disagree on whether the temperature at which the burst pressure is determined is limiting. This is a case where the patentees acted as their own lexicographers. '364 patent 3:47-61. Accordingly, the term "wall tensile strength" means "a value calculated according to the equation [shown in the '364 patent at 3:55] where the burst pressure is determined at or about normal human body temperature."

(1) "a washing tub for receiving a multi-phase washing medium therein"

The parties dispute the term "a washing tub for receiving a multi-phase washing medium therein." The parties agree that the term "washing tub" should be construed to mean "container," but disagree regarding the term "receiving." LG proposes construing the term to mean "a washing tub [i.e., container] for receiving the multi-phase washing medium and clothes." (Chart at 11.) Whirlpool proposes instead that the term be construed to mean "a container that holds a multi-phase washing medium." (Id.)

In support of its proposed construction, Whirlpool refers to the background section of the patent, which describes the washing medium as "in" the washing tub, and describes the clothes in the washing bin as "circulating" in the washing medium in the tub. ('886 Patent, col. 1, ll. 20-21, ll. 54-55.) These descriptions, however, do not require that the washing tub hold the washing medium. For example, the clothes could be circulating in a washing medium that is continuously flowing in and out of the washing tub. Nothing in the patent limits the washing tub that is "receiving" the washing medium from releasing it as well.

The Court therefore construes the term "a washing tub for receiving a multi-phase washing medium therein" to mean "a container for receiving the multi-phase washing medium and clothes."

i. "rubber particles are . . . selected from the group consisting of waste rubber buffings and ground tires" Claims 2 and 6

As stated previously, this is a closed Markush group, limiting the rubber particles to either "waste rubber buffings" or "ground tires" but not both. With regard to the definition of "waste rubber buffings," Green Edge does not offer any definitions for these terms, but claims that, although the patent describes the processes used in grinding and buffing, it does not make the processes part of the claimed invention. Further, the patent does not limit the type or size of rubber particle. However, the undersigned finds that these alternative terms require definitions. Therefore, the Court will adopt the well-reasoned definitions proffered by GroundScape. "Waste rubber buffings" are "a product obtained from a tire re-treading process in which tread is removed from the used tire body by a buffing device," and "ground tires" are "the product of a tire recycling process in which the entire body is reduced to pieces by grinding or shredding." (Moy Decl. Exh H) Indeed, Green Edge acknowledged this during the Markman hearing by agreeing with the Court that "[b]uffing is the retread, and ground tires is the full tires." (Hearing Transcript, p. 8) These definitions do not restrict the size or shape of the rubber particles; however, they give plain and ordinary meaning to the alternatives contained in the closed Markush group.

GO BACK

4386

The first clause found in limitation '(a)' of claim 1 teaches of water flowing through a "water-permeable outer surrounding wall of a basket." Contech suggests that the term "basket" may be defined simply as a "container for housing a bed of
material," and that it can consist of "any particular size or shape." (Pl.'s Opp. Mem. at 8-9.) Contech further asserts that the "water-permeable outer surrounding wall" of the basket only requires that the outer wall include "at least one opening to permit storm water to infiltrate the basket," and that the term "wall" potentially includes both horizontal or vertical walls. (Id. at 9.) Under this construction, Contech suggests that a cylindrical basket can be described as having "a circular top wall, a circular bottom wall and a vertical side wall." (Id.) BaySaver and Accubid, however, argue that Contech's definition is overbroad. Instead, the movants suggest that the method encompassed by the limitation defines a "basket" to have water-permeable, vertical, mesh walls that permit the storm water runoff to infiltrate "the product through the side walls and travel[] sideways and downwards through the filter and out the drain at the bottom." (Def.'s Mem. at 13.)

Because there is no indication that the '527 patent defines the "water-permeable outer surrounding wall of a basket" clause in an idiosyncratic fashion, the words in the claim should be given their "ordinary and accustomed meaning." Frank's Casing, 292 F.3d at 1374. According to the claim language, the defined "wall" of the basket should be both "water-permeable" and "surrounding." Although the court agrees with Contech that the basket and its "surrounding wall" need not necessarily take a cylindrical form, the ordinary meaning of "surrounding" and "wall" would envision a vertical structure that encloses the basket. Cambridge Dictionaries Online defines a "wall" to be a "vertical structure . . . that divides or encloses something." Cambridge Dictionaries Online, http://dictionary.cambridge.org (last visited August 31, 2007) (emphasis added). The foundation and cover of a basket would not ordinarily be defined by the term "wall," but rather by language that may include terms such as "base," and "ceiling" or "top," respectively. Furthermore, the ordinary meaning of a "water-permeable" wall would describe a structure that is porous, and therefore capable of permitting storm water infiltration. Merriam-Webster's Online Dictionary defines "permeable" as "having pores or openings that permit liquids or gasses to pass through." Merriam-Webster's Online Dictionary, http://m-w.com (last visited August 31, 2007). Therefore, as construed by the court, the '527 patent filtration basket must be enclosed by vertical, porous walls that allow storm water to infiltrate the filter material following a horizontal flow. This construction of the clause is supported by the context provided by the intrinsic evidence, and prevents the claim from being interpreted in an unreasonably broad manner.

Recognizing that the specification and preferred embodiments of a patent should not be read to limit the claim language, Phillips, 415 F.3d at 1323, the court finds that the intrinsic evidence here confirms the court's ordinary understanding of the claim. The specification describes a filtration method that requires water to flow initially through an outer water-permeable wall, then through a bed of filter material, and finally through an "inner water-permeable wall spaced from, and surrounded by, the outer wall." ('527 patent, col. 3, ln. 5-8.) The specification further describes the "typically cylindrical" basket to have an outer wall, possibly "fabricated from steel wire mesh," and a "base (circular in the case of a cylindrical basket) of water-impermeable material, such as plastic or metal, that extends horizontally engaging the lower end of the outer surrounding wall thereby sealing the underside of the basket." (Id. at col. 6, ln. 6-11, 33-37 (emphasis added.)) The language in the specification thus confirms, but does not limit, an ordinary understanding of the claim language. The term "wall" is used to describe vertical walls, while the term "base" is specifically employed to describe the horizontal foundation of the basket. The vertical permeable wall is made of a porous material, steel wire mesh in this embodiment, while the impermeable base is non-porous, in this example plastic or metal. As element '(b)' of independent claim 1 demonstrates, the storm water runoff is filtered by passing horizontally through a filter material located between the outer and inner permeable walls, where it then enters the interior drainage space of the filter basket.

This construction of the first clause found in element '(a)' of claim 1 does not limit the claim to any specific preferred embodiment of the invention or specific description found in the specification. For example, the patented "basket" may take a variety of shapes, including cubic or cylindrical, and the outer water-permeable wall need not be made of "steel wire mesh." Instead, this claim construction construes the claim language according to its ordinary meaning, which is supported by the inventor's choice of language in the specification. The inventor recognized the language distinction between a surrounding "wall," which would be vertical, and a "base," which would be horizontal. (See '527 patent, col. 6, ln. 5-11, 33-37.) Furthermore, the inclusion of a "cylindrical external housing comprising means for admitting air into the [lower end] of the housing" in the '639 patent demonstrates the distinction between a wall being "water-permeable," or porous, as compared to being impermeable, except for containing a simple opening to allow water or air intake. (Patent '639, col. 8, ln. 65-67.) The water-permeable filtration "basket" taught by the '527 patent is housed within the impermeable "external housing" container taught by claim 6 of the '639 patent. (Id. at col. 5, ln. 25-27.) Thus, as the '639 patent language makes clear, a proper construction of the term "basket" in the '527 patent should not analogize the filter basket to any housing "container" with an opening that allows for water intake. See Aquatex Indus., Inc. v. Techniche Solutions, 419 F.3d 1374, 1382 (Fed. Cir. 2005) (using patents incorporated by reference to aid in claim construction). Rather, as the inventor demonstrates, the patented filtration "basket" must have porous and vertical outer walls that allow storm water to filter

- 5060 -
radially through the filtration bed, and into the interior drainage space.

1. "Water pump"

Intex contends that Aqua surrendered its right to claim external pumps during prosecution of the '133 patent. Intex states that because the examiner did not recognize any claims in the application that would mature into the '133 patent as generic, and because Aqua allowed the patent to issue without the PTO declaring that it contained a generic claim, that Aqua "unambiguously elected cleaners with internal pumps."

Aqua's position is that although the examiner never acknowledged Claim 1 to be generic, nothing in the language of the claim limits its scope to solely internal water pumps, and thus the Court should find that the patent covers both internal and external water pumps. Aqua cites Insight Technology, Inc. v. Surefire LLC, Nos. 04-074, 03-253, 2006 U.S. Dist. LEXIS 11762, 2006 WL 519672 at *8 (D.N.H. Feb. 28, 2006), as support for its argument that the Court may find a claim to be generic, regardless of the actions of the PTO during prosecution. Additionally, both parties agreed at the Markman hearing that the findings of the examiner, while persuasive authority, are not binding on this Court. (Tr. at 40; Tr. at 56.)

Intex has given no reason to construe the term "water pump" in a manner different from its customary and ordinary meaning. Because there is nothing in the language of the claim or specification to limit the term "water pump" to only internal pumps, the term shall be construed to cover both internal and external water pumps.

1. "Water Vapor Impermeable Polymer Layer"

Claim 1 of the '182 patent requires, among other things, the presence of a "water vapor impermeable polymer layer." Claim 16 of the '693 patent requires, among other things, a "water-vapor-impermeable polymeric layer." Other claims of the patents also require this water vapor impermeable layer or an "impermeable polymer layer." While the disputed term must be construed as a whole in the context of the claim and patent as a whole, the gist of the parties' dispute relates to the meaning of the word "impermeable."

Fort James proposes the following construction: "The polymer [or polymeric] layer must be a substantially continuous film, and although pinholing in the film can and does occur, the amount of pinholing should be minimized to reduce the passage of water vapor through the film so as not to adversely affect the function of the food wrap." 7 In its submissions and argument, Fort James acknowledges the language in the specification that describes the impermeable polymer layer as a "complete barrier." Fort James, however, takes the position that "complete barrier" refers to the continuous nature of the polymer barrier resulting from the extrusion process. Further, Fort James contends that POSITA would understand that water vapor could pass through the water vapor impermeable polymer layer by at least two means: (1) diffusion through the polymer structure and (2) flow through any pinholes created after the extrusion of the polymer layer. 8

7 Plaintiffs' Final Proposed Claim Constructions [Dkt. No. 175] at p. 2.

8 Hearing Transcript at p. 24, lines 12-16; p. 31, line 18 -- p. 32, line 2.
Coating Excellence proposes the following construction: "a polymer having a water-vapor transmission rate (WVTR) equal to zero; preventing passage of water-vapor; being a complete barrier to water-vapor; being impervious to water-vapor." 9 In its submissions and argument, Coating Excellence, among other things, focuses on the specification reference to the impermeable polymer layer being a "complete barrier" and underscores the specification references to the layer "preventing" the passage of water vapor. 10

10 Hearing Transcript at p. 52, line 25 -- p. 54, line 7. While Coating Excellence's proposed construction refers to a WVTR of zero, at the Hearing, Coating Excellence would not commit regarding whether or not the inventive polymer barrier is 100% impermeable. Coating Excellence indicated that the proper construction should be "to prevent the passage of water. That it has to be a complete barrier..." Hearing Transcript at p. 63, lines 11-14. Its subsequent filing retained the original proposed construction requiring a WVTR of 0.

The undersigned finds that the meaning of the term "water vapor impermeable polymer layer" is not "immediately apparent." See Phillips, 415 F.3d at 1314. While the meaning of the words water vapor and polymer layer do not appear to be disputed by the parties, the meaning of the term as a whole and the meaning of the word impermeable in the context of the term as a whole are not self-evident. Accordingly, it is appropriate to consider the "those sources available to the public" noted above in Phillips.

Coating Excellence correctly notes that the inventors in both patents describe the function of the water vapor impermeable polymer layer as a condensation surface with respect to water vapor and characterize it as a "complete barrier." (E.g., '182 patent, col. 4, lines 16-17, 35; '693 patent, col. 7, line 3.) It is also correct that there are a number of references establishing that one of the functions of the polymer barrier is to prevent the passage of water vapor. (E.g., '182 patent, col. 4, lines 21-22.) 11 But these references do not answer the key question regarding whether the "complete barrier" needs to be 100% water vapor impermeable (i.e., absolutely no water vapor passes through it). The proper construction must include an interpretation of what a "complete barrier" is in the context of these two patents so as to avoid the need for subsequent claim construction at summary judgment or trial. Several portions of the intrinsic record are informative.

As a starting point, there is no basis in the specification to support Coating Excellence's proposed construction to the extent that it would require a Water Vapor Transmission Rate of 0. The term Water Vapor Transmission Rate does not appear in the specification. The specification contains no quantitative descriptions of the impermeable polymer barrier that would support the notion that absolutely no water vapor can pass through such layer.

The specifications of both patents, however, do explain that water vapor may pass through the impermeable polymer barrier as a result of pinholing. ('182 patent, col. 5, lines 58-65; '693 patent, col. 16, lines 27-34.) The language in both specifications is essentially identical.

---

9 - 5062 -
Because the layer 40 is impermeable, extrudate 70 should be extruded as a pinhole free film at a thickness sufficient to be able, when cooled, to form an impermeable barrier. Although some pinholing may occur as a result of paper fibers penetrating through the polymer film when the polymer film contacts layers 20 and 30, the amount of pinholing should be minimized to reduce water vapor loss, and hence heat loss.

--- Footnotes ---

12 The language quoted above is from the '693 patent. Unlike above, the '182 patent begins with "Because layer 40" and uses "must" instead of "should."

--- End Footnotes ---

Thus, the inventors inform the public that, as a result of putting the three layers together, there may be pinholes in the impermeable polymer layer that permit passage of water vapor. Nevertheless, such polymer layer remains "impermeable" and a "complete barrier" within the context of the patents as long as the amount of pinholing is minimized to reduce passage of water vapor and heat loss. Id.

The specifications also reflect that the polymer layer is not expected to perform its functions indefinitely. The specifications reflect that inventive wrap is only expected to perform its functions during the holding period -- the time period after the foodstuff is prepared and before it is eaten. For instance, the Background section of the '182 patent states, "Composite wrap materials have long been used to package hot foodstuffs. In addition to keeping the foodstuff relatively fresh for a period of time, the wrap facilitates heat retention by the foodstuff after it is made, but before it can be consumed." ('182 patent, col. 1., lines 19-23 (emphasis added); see also col. 4, lines 27-28 ("thereby maximizing sandwich temperature during holding").)

The '693 patent likewise refers to the wrap performing its functions during a holding period. The patent states, "it is difficult to provide a suitable but inexpensive and ecologically sound environment for maintaining hot sandwiches in a palatable condition for the storage interval between preparation and consumption, particularly for periods of more than several minutes." ('693 patent, col. 1, lines 21-25; see also col. 1, lines 50-52 ("if the sandwich is stored for several minutes longer than the usual holding time") (emphasis added); col. 2, lines 40-43 ("a sacrifice of heat retention or storage time (holding period) could be required").) 13

--- Footnotes ---

13 At the Hearing, Coating Excellence stated that it would not be appropriate to bring any temporal limitation into consideration for the construction of this term because the patents also could cover cold food. Hearing Transcript at p. 68, line 17 -- p. 69, line 7. The undersigned need not and has not determined whether the patent covers cold food. The inventive polymer barrier plainly functions relative to water vapor given off by hot foodstuffs, and the specifications provide ample support for the notion that barrier is not expected to perform its function indefinitely in this regard.

--- End Footnotes ---

--- Footnotes ---

14 Defendants' Hearing Binder, Tab 3.

--- End Footnotes ---

Gatward relates to a composite wrap material for foodstuffs. The '182 patent inventors describe Gatward as having a thermoplastic material that is semi-permeable to water vapor. The '182 patent inventors further state that the drawback of
this "semi-permeable" material is that "the heated foodstuff is giving off its own heat via the water vapor which is allowed to pass through the semi-permeable thermoplastic material, thereby permitting the foodstuff to cool off." ('182 patent, col. 2, lines 3-7.) The Gatward patent itself recites, "said thermoplastic film containing microperforations of such magnitude as to permit transmission of water vapor." ('840 patent, col. 6, lines 10-12.)

Gatward also is discussed in the file history of the '182 patent. Specifically, there is discussion in the October 17, 1990, Amendment. 15 Coating Excellence contends that this discussion constitutes a disavowal of any construction of the term "impermeable" that would permit the passage of water vapor through the polymer layer. Specifically, in responding to a rejection under Section 103 (obviousness), the '182 patent inventors distinguished Gatward as follows: "In stark contrast to the present invention, Gatward teaches a microporous polymer structure which allows water vapor to escape. While this prevents sogginess, the hot food cools very rapidly." 16 This file history argument is consistent with the characterization of Gatward in the specification and the above noted language of the Gatward patent itself.

--- Footnotes ---

15 This "Amendment" can be found at Plaintiffs' Hearing Binder, Tab C. 1 .C, at p. 7. The parties agree that the inventors made no amendment relative to the argument that Coating Excellence suggests constitutes a disavowal. Coating Excellence is correct, however, that there potentially could be a disavowal even absent an amendment. The "Amendment" also includes discussion at pages 2-3 in which the polymer layer is referred to as a "complete layer." The issue being addressed was whether a wax/polymer blend properly could be considered a polymer, not whether any amount of water vapor can pass through the polymer layer. In any event, as is the case with the specification, the reference to "complete barrier" by itself does not answer the question of what "impermeable" or a "complete barrier" means in the context of the patents at issue.

16 Plaintiffs' Binder at Tab C.1.C. at p. 5.

--- End Footnotes ---

The undersigned finds that the file history argument regarding Gatward does not constitute a disavowal of a construction of "impermeable" that would permit some passage of water vapor through the polymer layer. 17 See Purdue Pharma L.P. v. Endo Pharms., Inc., 438 F.3d 1123 at 1136, 2006 U.S. App. LEXIS 2887 at *34 (Fed. Cir. 2006) (requiring that a disavowal be "clear and unmistakable"). The pertinent, critical distinction between Gatward and the invention of the '182 patent is that Gatward avoids water vapor caused sogginess of foodstuff by purposefully removing the water vapor through microperforations in the thermoplastic layer. The '182 patent does not seek to avoid water vapor caused sogginess in the same way. Instead, the '182 patent's inventive wrap avoids water vapor caused sogginess in foodstuff through a polymer layer that acts as a condensation surface coupled with an absorbent layer that absorbs the condensate. ('182 patent, col. 4, lines 17-23.) This improves on Gatward by facilitating heat retention. This distinction does not require that there be no passage whatsoever of water vapor through the polymer layer of the '182 patent, provided that the polymer layer/absorbent layer combination performs its function and the heat retention goal is met.

--- Footnotes ---

17 The statements made in this same "Amendment" regarding the Barner reference, which together with Gatward had been the basis for the examiner's rejection under Section 103 (obviousness), likewise do not constitute such disavowal. The Barner composite wrap requires that the top be opened where there is hot food emitting water vapor. Nothing in this discussion should be taken as any comment regarding the propriety of the examiner's rejection under Section 103 or any comment on any validity or invalidity issue.

--- End Footnotes ---

In summary, after examination of the intrinsic record, the undersigned finds that POSITA would understand that the polymer layer of the '182 patent can be "impermeable" and a "complete barrier" even if some amount of water vapor passes through the polymer layer, provided that the polymer/absorbent layer combination constitutes the mechanism for avoiding water vapor caused sogginess in the foodstuff and such passage is minimized so as to reduce resulting heat loss during the holding period. 18
There was discussion at the Hearing regarding certain test results found in the file history of the '693 patent. Plaintiffs' Hearing Binder, Tab C.1.E. The undersigned understands that these tests were submitted to the United States Patent and Trademark Office after the notice of allowance relating to the '693 patent and were relative to a validity issue. The undersigned has placed no weight on the tests or the discussion regarding the tests in connection with this claim construction.

b. Review of extrinsic evidence

The undersigned finds that no extrinsic evidence is necessary to construe the term "water vapor impermeable polymer layer." It should be noted, however, that the extrinsic evidence submitted by the parties and reviewed by the undersigned generally supports the proposed construction of the term water vapor impermeable polymer layer and further explains how water vapor can pass through the polymer layer in the context of the inventions of the '182 and '693 patents. The undersigned briefly addresses this extrinsic evidence below.

i. Bezigian Testimony

Mr. Bezigian is a Coating Excellence witness. He obtained a Bachelor in Science in Plastics Engineering from the University of Lowell in 1977 and a Master of Business administration from Bryant College in 1987. He has held numerous technical and manufacturing roles at major film and paper converters in the United States, including James River Corp., and has been a consultant to the film and paper converting industries since 1991. He also is an Adjunct Professor at the University of Massachusetts-Lowell where he lectures on the topics of extrusion coating, cast film and packaging. The parties agree that Mr. Bezigian has the background, education and training of a POSITA with regard to the two patents in dispute.

20 He is identified in Defendants' Notice of Witness Testimony To Be Presented at Markman Hearing [Dkt. No. 67], but ultimately did not provide live testimony. The statement of his qualifications is excerpted from this Notice.

James River deposed Mr. Bezigian on June 29, 2005. During the deposition, Mr. Bezigian testified that "impermeable means that nothing goes through." The undersigned places no weight on this conclusory opinion. As noted above in Phillips, "conclusory, unsupported assertions by experts as to the definition of a claim term are not useful to a court. Similarly, a court should discount any expert testimony 'that is clearly at odds with the claim construction mandated by the claims themselves, the written description, and the prosecution history, in other words, with the written record of the patent.'" 415 F.3d at 1318 (internal citations omitted).

21 Excerpts of the Deposition ("Bezigian Test. at ") can be found at Plaintiffs' Hearing Binder, Tab G.1.
Bezigian also testified that no one to his knowledge has ever made a product covered by the patents at issue. Id. at p. 105, lines 4-6. Nothing in this Report and Recommendation should be considered to be a comment on or conclusion regarding whether any specific foodstuff wrap products fall or have fallen within the scope of one or more claims of the '182 or '693 patents.

23 The same rationale applies to Mr. Bezigian even though he was not identified as an expert.

--- End Footnotes ---

Mr. Bezigian's technical testimony regarding polymers and the extrusion of polymers, in contrast, is instructive. Mr. Bezigian repeatedly testified that moisture vapor barriers made from polymers and used in industry may reduce, but not eliminate, the movement of water vapor through the polymer barrier. Further, he testified that a polymer layer thick enough to prevent the passage of water vapor could not be extruded and would not be a sandwich wrap. The following excerpt is illustrative:

Q Okay. Well, is it a question of degree? In other words, the thicker the polyethylene, that the less water vapor will pass through? And, again, by pass through, I want to isolate down to the -- -- to at the molecular level as opposed to pinholes or through the fold. If you're just talking at the molecular level, no matter what the thickness is, will some water vapor pass through the molecular structure of polyethylene?

A I mean there's a practical limit in extrusion coating. Extrusion coating is generally where you put a layer of five or six or maybe ten mills maximum thickness onto a substrate. Even that, I believe, would pass moisture. If it was an inch thick or a half an inch thick or a quarter of an inch thick, I don't believe it would, but that has to be borne out by testing.

Q Okay.

A But a quarter inch thick of polyethylene is rigid, it's not flexible, it's not made by extrusion coating. And it wouldn't be sandwich wrap. Anything in the normal extrusion coating range of, say, quarter of a mill to around a mill has a moisture vapor or water vapor permeability rate. Those words are used kind of interchangeably.

Q Has one greater than zero?

A Yes.

Q So anything greater -- -- so, in other words, you cannot extrusion coat a polyethylene layer that has a water vapor transmission rate of zero

A Correct.

Q Can you extrusion coat any polymer that would have a water vapor transmission rate of zero?

A I would believe that answer would be no.

--- Footnotes ---

24 Bezigian Test. at p. 82, lines 2-7 (stating that he is not aware of any extruded sandwich wrap where WVTR equals 0).
25 Coating Excellence, at the Hearing, characterized the manner in which water can pass through the polymer layer as theoretical chemistry. Hearing Transcript at p. 58, lines 4-11. However, there is no factual support for this distinction. Such view is also inconsistent with Coating Excellence's agreement that Mr. Bezigian has the background and other characteristics of a POSITA.

i. Mueller Testimony

Louann Mueller also is a Coating Excellence witness. 26 She received her Bachelor of Business Administration with a minor in Paper Sciences from Western Michigan University in 1984. While there, she took courses in pulp and paper engineering, organic chemistry, paper manufacturing and testing. She worked for James River from 1987 to 1996. She has worked as a Technical Manager for Coating Excellence. Her responsibilities have included work on composite food wrap products. Recently, she was promoted to Vice President of Printing and Laminating. 27 The parties agree that Ms. Mueller has the background, education and training of a POSITA with regard to the two patents in dispute.

ii. Crotogino testimony

Dr. Crotogino is a Fort James witness. 31 He has a Bachelor of Applied Science degree in chemical engineering and a Ph.D. in chemical engineering from McGill University in Montreal. Dr. Crotogino worked for the Pulp and Paper Research Institute of Canada from 1976 until his retirement in 2004. The parties agree that Dr. Crotogino has the background, education and training of a POSITA with regard to the two patents in dispute.

26 Ms. Mueller is identified in Defendants' Notice of Witness Testimony To Be Presented at Markman Hearing [Dkt. No. 66], and the above description of her background is taken from that Notice.

27 Hearing Transcript at p. 143, lines 20-21.

Ms. Mueller testified at the Hearing. Her testimony as a whole is consistent with that of Mr. Bezigian. On direct examination, she testified that "I'm not familiar with any polymer that is 100 percent impermeable to water vapor." 28 She also testified that the higher density polyethylene, which is a better barrier to water vapor than low density polyethylene, is not used in sandwich wrap. 29 While on cross-examination, Ms. Mueller did state her view of "impermeable to be zero percent water vapor," 30 the undersigned places no weight on this conclusory statement.

28 Hearing Transcript at p. 149, lines 2-3.

29 Hearing Transcript at p. 146, line 21 -- p. 147, line 4; p. 153, lines 7-22.

30 Hearing Transcript at p. 158, line 19.

iii. Crotogino testimony

31 Plaintiffs' Notice of Live Testimony at Claim Construction Hearing [Dkt. No. 171] at pp. 1-3. The summary of Dr. Crotogino's qualifications come from this Notice.
Coating Excellence deposed Dr. Crotogino on June 30, 2005. Dr. Crotogino's testimony is consistent with the notion that impermeable is a relative concept regarding foodstuff wraps. He testified that one needs to consider the function of the wrap "within the useful life of the product," there is no such a thing as a "complete barrier," and "pores are indigenous to any material basically." 33

32 Excerpts of the Deposition ("Crotogino Test. at    ") can be found at Defendants' Hearing Binder, Tab 9.

33 Crotogino Test. at p. 104, lines 3-13; p. 118, lines 14-17. The portion of the transcript referenced in Defendants' Response to Plaintiffs' Final Claim Construction Statement [Dkt. No. 180], page 76, lines 6-22, simply reflects Dr. Crotogino agreeing with certain of the specification language, not saying what that language means.

COATING EXCELLENCE SUBMITTED A 1988 DEFINITION OF "IMPERMEABLE" FROM WEBSTER'S NEW WORLD DICTIONARY. 34 IT STATES THAT "IMPERMEABLE" MEANS "NOT PERMEABLE; NOT PERMITTING FLUIDS TO PASS THROUGH IT; IMPENETRABLE." THIS IS AN EXAMPLE OF THE SORT OF SITUATION NOTED IN PHILLIPS WHERE BLIND RELIANCE ON GENERAL PURPOSE DICTIONARY DEFINITIONS WILL NOT RESULT IN A CONSTRUCTION THAT COMPORTS WITH THE MEANING TO A POSITA. 415 F.3D AT 1321. THE UNDERSIGNplaced no weight on this definition.

2. Coating Excellence refers to U.S. Patent No. 5,368,946 ("946 patent"), issued November 29, 1994, claim 2 of which refers in part to a specified Water Vapor Transmission Rate. 35 While this supports the notion that the concept of a Water Vapor Transmission Rate was known in the art during the pertinent time periods, it does not support any argument that the patents at issue should be read to require a Water Vapor Transmission Rate of 0. 36

37 Coating Excellence also submitted a TAPPI Water Vapor Transmission Rate test. 37 Again, because the intrinsic record provides no support for incorporating a WVTR into the claims, this extrinsic evidence should be given no weight. 38

The undersigned further notes that the test at Tab 18 states in Note 1 that "WVTR is a distinctive characteristic, often
erroneously termed 'permeability.'” Defendants' Response to Plaintiffs' Final Claim Construction Statement also references certain tests that were not included in Defendants' Hearing Binder. In any event, no weight should be placed on test methodologies that are not referenced in the intrinsic record.

c. Recommended claim construction

In summary, the undersigned recommends that the term "water vapor impermeable polymer layer" and alternative references to the impermeable polymer layer of the '182 and '693 patents be construed to mean: "A polymer layer that is substantially impermeable to water vapor. Substantially impermeable means that some amount of water vapor may pass through the polymer layer, provided that the polymer/absorbent layer combination constitutes the mechanism for avoiding water vapor caused sogginess in the foodstuff and such passage is minimized so as to reduce resulting heat loss during the holding period.”

I. "a wear layer on top," "a wear layer located on top," and "a wear layer located on"

The parties dispute the meaning of "a wear layer on top" of claim 1 of the '903 patent, "a wear layer located on top" of claim 1 of the '008 patent, and "a wear layer located on" of claim 9 of the '008 patent.

Mannington asserts that a "wear layer" is "a portion of a cushioned sheet vinyl floor covering that protects the pattern and design of the floor covering.” D.I. 326 at 9. Manning further argues that the "wear layer" does not, necessarily, include a "top coat." Id. at 10. In contrast, Armstrong argues that "a wear layer is the portion of a resilient floor covering that contains or protects the pattern and design, exclusive of temporary finishes or maintenance coatings.” D.I. 324 at 21. Moreover, Armstrong contends that the "wear layer" includes a top coat as the "uppermost layer" of the surface covering and when present, this "top coat" forms an "integral component of the 'wear layer'.” Id. at 21. Domco argues that "the wear layer is not necessarily in direct contact with the design layer, but necessarily above the design layer.” D.I. 142 at 16.

This court construes "wear layer" consistent with that disclosed in the '903 and '008 specifications and understood in the art to mean one or more layers of PVC or like material that can include a top coat layer of non-PVC polyurethane or like material and, when present, the top coat layer is considered part of the composite layer loosely called a "wear layer" in the vinyl surface covering industry. '903 8:28-30; '008 8:39-47 (describing a "top coat" layer as a "wear layer top coat"); 1995 ASTM, F1303-95 §§ 3.1.1, 4.1.1, and 4.1.2 (wear layer "grades shall be classified by the total wear layer thickness (sum of PVC and non-PVC wear layers)"). As used by the inventors in the '903 and '008 patent and provided for in the specifications, however, the "wear layer top coat" when comprising part of the surface covering of the embodiment of the '903 and '008 inventions being practiced is "adhered to the embossed wear layer," therefore, the "wear layer top coat" as used in these patents is not mechanically embossed when present. '903 8:29-30; '008 8:40-41.

The phrases "a wear layer on top," "a wear layer located on top," and "a wear layer located on" are construed in accord with their ordinary meaning to mean that a "wear layer" is applied over top of or above the design layer. This claim language is broad enough to permit intervening layers between the design and the "wear layer."

A. "Weather stripping"

The Court will adopt the construction of "weather stripping" proposed by Defendants: a sealing material added to a fabric or screen track. The Court does not find the specification or prosecution history shows that weather stripping has been given a meaning in the '998 Patent different from the ordinary and accustomed meaning of the term weather stripping. In reaching the conclusion to adopt Defendants' proposed construction, the Court considered the definition of weather stripping in...
Webster's Third New International Dictionary (1981): "a strip of material to cover the joint of a door or window and the sill, casing, or threshold so as to exclude rain, snow, and cold air." The claims at issue in this case make clear that the weather stripping is added to the fabric or screen tracks: "elongated, facing, weather stripping located in each fabric track" (claim 14); "the screen tracks carry elongated weather stripping" (claim 21). The function of the weather stripping in the '998 Patent is to assist in retaining the screen in the screen track, but this proposed construction by Plaintiff does not include a description of what the ordinary and accustomed meaning of the function of weather stripping is, i.e. to seal, and it does not include the notion that the weather stripping is added to the screen or fabric tracks.

A. Weather stripping

Having reviewed the claim language, the specification and the prosecution history, the Court does not find that the term "weather stripping" is restricted to "fibrous pile, brush or bristle material." Thus, Defendants' proposed construction of this term, as set forth above, will be rejected. The Court will adopt the construction of "weather stripping" proposed by the Defendants in the Larson v. AluminArt case: a sealing material added to a fabric or screen track.

The Court does not find the specification or prosecution history shows that weather stripping has been given a meaning in the '998 Patent different from the ordinary and accustomed meaning of the term weather stripping. In reaching the conclusion to adopt the AluminArt Defendants' proposed construction, the Court considered the definition of weather stripping in Webster's Third New International Dictionary (1981): "a strip of material to cover the joint of a door or window and the sill, casing, or threshold so as to exclude rain, snow, and cold air." The claims at issue in this case make clear that the weather stripping is added to the fabric or screen tracks: "elongated, facing, weather stripping located in each fabric track" (claim 14); "the screen tracks carry elongated weather stripping" (claim 21). The function of the weather stripping in the '998 Patent is to assist in retaining the screen in the screen track, but this proposed construction by Plaintiff does not include a description of what the ordinary and accustomed meaning of the function of weather stripping is, i.e. to seal, and it does not include the notion that the weather stripping is added to the screen or fabric tracks.

3. "Web"

Claim 1 describes the cantilevered leg as abutting the "web" of the rail. Both parties agree that the web includes the thin section of track between the head and the base. However, they disagree as to how far the web extends. Plaintiff maintains that the web includes one-half of the curved junction between the web and the base of the rail, or "fillet." (Plf. Brief at 14). Defendants argue that this term should be narrowly construed to exclude the "fillet." (Def. Brief at 13-15).

The precise issue before the Court is where the web starts and the base ends. This question is not answered by the claim, specification, or prosecution history. The term "web" refers only to that portion of the rail abutting the cantilevered leg when installed. (Id., Exh. 1, col. 6, ln. 38-40). No distinction is made between the web and the fillet. Nor was any such mathematical precision necessarily required. See Modine Manufacturing Co. v. United States International Trade Commission, 75 F.3d 1545, 1557 (Fed. Cir.), cert. denied, 116 S. Ct. 2523 (1996), quoting Shatterproof Glass Corp. v. Libbey-Owens Ford Co., 758 F.2d 613, 624 (Fed. Cir.), cert. dismissed, 106 S. Ct. 340 (1985) ("if the language is as precise as the subject matter permits, the courts can demand no more").

Defendants point out that the patent drawings show the leg contacting the web somewhere near the middle and well above the fillet. (Plf. Brief, Exh. 1, Fig. 2 & 5). In addition, the specification provides that "the bottom side 344 of the leg 340 is preferably parallel with the bottom surface 324 of the main body 320." (Id., Exh. 1, col. 4, ln. 18-19). This configuration effectively prevents contact with the fillet. However, a claim is not limited to a preferred embodiment unless it clearly so states. Johnson Worldwide Associates, 175 F.3d at 992; Virginia Panel Corp. v. MAC Panel Co., 133 F.3d 860, 866 (Fed. Cir. 1997), cert. denied, 525 U.S. 815, 119 S. Ct. 119 (Fed. Cir. 1998). Although a narrow disclosure may limit the scope of the claim in some instances, such is not the case here. Cf. Gentry Gallery, Inc. v. Berkline Corp., 134 F.3d 1473, 1479 (Fed. Cir. 1998) (where patent for sectional sofa clearly identified console between dual recliners as the only possible
location for controls, claim could not be read to include controls located elsewhere). The broad language used in the claim and specification is sufficient to include a definition of web that incorporates some or all of the fillet.

The Court is unable to determine how far the web extends based solely on intrinsic evidence. Under these circumstances, reliance on extrinsic evidence is proper. See Bell & Howell Document Management Products Co. v. Altek Systems, 132 F.3d 701, 706 (Fed. Cir. 1997) (court may rely on extrinsic evidence only when claim language remains "genuinely ambiguous" after consideration of intrinsic evidence). Plaintiff has offered the declaration of William K. Hull, one of the inventors, to assist in the interpretation of this term. Hull explains that a person of ordinary skill in the art of embedded railway track assemblies and elastomeric railway inserts "would understand the term 'web' of the rail to mean the portion of the rail between the 'head' of the rail and the 'base' of the rail . . . extending down to approximately the middle of the curved junction between the web and the base of the rail." (Hull Decl. P 6). Defendants have presented no evidence to the contrary. Accordingly, the Court finds that the "web" of the rail includes one-half of the curved junction between the web and base of the rail, or "fillet."

4 In their post-submission brief, defendants cite several cases for the proposition that the opinion of an inventor is entitled to no weight. This is true when the intrinsic evidence is sufficient to allow the Court to construe the disputed terms. See, e.g. Bell & Howell Document Management Products, 132 F.3d at 706 ("any expert testimony that is inconsistent with unambiguous intrinsic evidence should be accorded no weight"); Senmed, Inc. v. Richard-Allan Medical Industries, Inc., 888 F.2d 815, 819 n.8 (Fed. Cir. 1988) (trial court improperly relied on inventor's testimony because disputed term was "clearly neither a technical term nor a word of art having special meaning to those skilled in the art"). In this case, the Court is unable to interpret the term "web" based solely on intrinsic evidence.

B. Web

552 patent claim 1 states that a plank comprises "an elongated unitary structural element formed of a synthetic resin material and including a substantially flat load web defining a load surface and an undersurface." (Id., Claim 1.) GSC claims that six of its tables (the exception is the Enduro II five foot round table) have table tops that are not webs because the table tops have separate upper and lower walls. The only relevant meaning of the term "web" is a "thin metal sheet, plate, or strip." The specification also indicates that the web of the plank is a thin sheet of plastic; one side of the sheet is the top of the plank or load surface and the other side of the sheet is the bottom of the plank or undersurface. (See id., Fig. 4.) Accordingly, we construe the term "web" to mean a "thin sheet, plate, or strip."

e. "webs connecting opposite ends of each of said pivot flanges to said center flange in spaced relationship therefrom"

The terms "webs connecting opposite ends of each of said pivot flanges to said center flange in spaced relationship therefrom" means flat, narrow and rigid connecting plates that hold the pivot flanges in fixed distance from each other on opposing sides of the support, forming a looped structure defining a generally open, accessible bottom area that facilitates manual manipulation and positioning of the pivot structure on the pivot flanges from above and below, and within which the shift lever can be inserted during assembly. These structures extend from and connect the front and rear ends of each of the pivot flanges to the center flange.
In this case, the claim terms "heat weld" and "welding" are essential to defining the invention at issue. Claims 1(c) and 14(c) use those terms to describe the process of connecting the mesh layer to the guard layer. (Doc. No. 52: L.B. Plastics Mem., Ex. 3). However, "heat weld" and "welding" are not defined in the claims. Merriam-Webster's Online Dictionary defines "weld" as to unite [plastics] by heating and allowing the [plastics] to flow together. Merriam-Webster Online Dictionary, http://www.m-w.com/dictionary/weld. This definition is consistent with the intrinsic language of the patent. For example, the Detailed Description of the Invention section of the patent states, "The mesh layer is preferably formed of PVC-coated, woven fiberglass fabric which readily fuses to the polymer guard panel during welding to form continuous and secure weld lines and along the entire length of the mesh layer." (Doc. No. 52: L.B. Plastics Mem., Ex. 3). The term "fuses" involves melting together by heat. Trilogy Communications, 109 F.3d at 742. Therefore, the Court construes the terms "heat weld" and "welding" in the '700 patent to require the PVC-coated mesh to melt and thereby form a bond with the guard panel.

L.B. Plastics first argues that the district court erred in construing the term "weld" to require melting of the screen and guard panel, and that consequently the district court's grant of summary judgment of noninfringement was improper.

In construing claims we search for the ordinary and customary meaning of a claim term to a person of ordinary skill in the art. We determine this meaning by looking first at intrinsic evidence such as surrounding claim language, the specification, the prosecution history, and also at extrinsic evidence, which may include expert testimony and dictionaries. Phillips v. AWH Corp., 415 F.3d 1303, 1314-19 (Fed. Cir. 2005) (en banc). The specification of the '700 patent describes "a composite gutter guard according to the present invention" and discloses that "[t]he mesh layer . . . is attached to the guard panel [] by continuous ultrasonic or heat welding." The attachment involves the use of a mesh preferably constructed of a material "which readily fuses to the polymer guard panel [] during welding." '700 patent col.3 ll.31-32, 39-44 (emphasis added).

Since the intrinsic record provides no further guidance to the meaning of the terms "weld," "fuse" or "ultrasonic or heat welding," the district court properly turned to extrinsic evidence in this case and consulted dictionaries. See Phillips, 415 F.3d at 1317-18. Here general and technical dictionaries clearly confirm the district court's construction of the disputed term "weld" to require melting of the parts that are being joined. See Webster's Third New International Dictionary 2594 (2002) (defining "weld" as "to unite or consolidate . . . by heating to a plastic or fluid state the surfaces of the parts to be joined and then allowing the metals to flow together"); McGraw-Hill Dictionary of Scientific and Technical Terms 2288 (6th ed. 2003) (defining "welding" as "[j]oining two metals by applying heat to melt and fuse them"); see also D.C. Miles & J.H. Briston, Polymer Technology 651 (Chem. Pub'g Co., 1979) (describing ultrasonic welding as a process where "the mechanical energy of motion is transformed into heat which melts the mating surfaces of the plastics"). The definition of "fuse"--terminology used in the specification to describe the "welding" process--is also consistent with the district court's construction of the term "weld." See Webster's at 925 (defining "fuse" as "reduce to a liquid or plastic state by heat: dissolve, melt . . . liquefy").

2 L.B. Plastics argues that "welding" includes attachment by adhesives, citing testimony of the inventor of the '700 patent that "one of ordinary skill in the relevant art . . . considers [heat welding and hot melt gluing] to be essentially the same." Pet'r Br. at 30-31. This testimony is irrelevant as there is no suggestion that Davis testified that the term "welding" has a special meaning within the art that is different from its ordinary meaning.

Consequently, we conclude that the district court correctly construed the term "welding." The district court granted summary judgment of no literal infringement after it found that "[t]here is no dispute that the mesh layer in Amerimax's gutter guard is not attached to the guard panel by 'welding' as construed above." L.B. Plastics, 431 F. Supp. 2d at 582. Having found that no dispute of material fact existed under the correct claim construction, the district court properly granted summary judgment on the issue of literal infringement.
6. "Weld connection." Consistent with the asserted claim at issue, 10 the specification 11 and the prosecution history, 12 the court construes "weld connection" to mean "a weld."

--- End Footnotes ---

1. Construction of the Claim Term "Well" in the '141 Patent and in the '483 Patent

The term "well," in both its singular and plural forms, appears in Steps A-C of the '141 Patent and the '483 Patent. See Claim One of the '141 Patent; Claim One of the '483 Patent. The term, however, is not expressly defined in the claims or in the specifications (the "Specification" or the "Specifications") of either patent. See id. The parties appear to agree the term does not have a specialized meaning. Cleanox contends the term should be construed in accordance with its ordinary meaning, as interpreted by one reasonably skilled in the art. See Brief - Cleanox at 4-5; Reply Brief - Cleanox at 3.

a. The Cleanox Argument

Cleanox contends the term "well" is a common English term and should be defined as "any device that allows access to groundwater." Brief - Cleanox at 4; see Markman Hearing Transcript at 64:8-10; 67:5-10. In support of its position, Cleanox cites the deposition testimony of an expert for the Defendants, Dr. Piotrowski, who testified that "a well usually means a device that allows access to groundwater." Id. (citing deposition transcript of Piotrowski at 67). 11 In addition, Cleanox asserts that Webster's Ninth New Collegiate Dictionary definition 12 of the term is consistent with its own. See id. at 5 n. 5.

--- Footnotes ---

11 Dr. Piotrowski asserted that the standard meaning of the term "well" should not be used for claim construction purposes. See Brief - Cleanox at 4 n. 4.
12 According to Cleanox, Webster's Ninth New Collegiate Dictionary defines the word "well" a "a pit or hole sunk into the earth to reach a supply of water." See id. at 5 n. 5.

--- End Footnotes ---

Cleanox argues that, although it is possible for a "well" to perform two functions, i.e., "both to withdraw material and input material," id. at 5, it is properly defined as "any device that allows access to groundwater." See id. at 4 and unnumbered page 5 of Tab A thereto; see also Markman Hearing Transcript at 64:17-65:1, 67:15-68:1. Cleanox cites certain portions of the Specification as support for its interpretation because the Specification utilizes permissive language such as the word "can" in at least one place when discussing the possible uses for a well, namely withdrawing and/or inputting material. 13 See Brief - Cleanox at 5. As such, Cleanox contends the interpretation by the Defendants of the term as requiring both "monitoring and injecting the groundwater" to practice the invention improperly reads limitations from the preferred
embodiment into the claims. See id. at 3; Reply Brief - Cleanox at 3.

13 The Specification states, in relevant part, that "it will be appreciated that a monitoring flow can be withdrawn from the well, as can a treating or test flow be injected via the well into the groundwater into which the well intersects." See '141 Patent at col. 6, lines 20-24.

b. The Defense Argument

Defendants contend the Cleanox definition of the term "well" is too narrow. See Brief - Defendants at 8. They assert the proper definition should be "a structure used for both monitoring and injecting the groundwater." Id. at 6-10. In support of this definition, and to counter that portion of the Piotrowski deposition testimony upon which Cleanox relies, Defendants also cite a portion of Piotrowski deposition wherein Dr. Piotrowski states that, in the context of patents, the term "well" means a device that provides the dual purpose of enabling both monitoring and injecting of groundwater. See Reply Brief - Defendants at 2-3 (citing deposition transcript of Piotrowski at 80-81).

The Defendants reason the term "well" must contemplate a device to allow more than a limited "access" only to remove groundwater as Cleanox contends. Defendants argue the Specification uses the term "borehole" when referring to a hole in the ground that allows withdrawal access to groundwater. See Brief - Defendants at 7-9. In addition, Defendants argue the Cleanox definition is overly narrow because the Specification indicates that a "well" is comprised of more structural elements than simply a "borehole." See id. at 8. In support of this assertion, Defendants point to the description in the Specification of a "well" which indicates that it contains at least a well casing, seal, slotted well screen, sand/gravel pack, and injection string, in addition to the borehole itself. See id. at 8.

Defendants further argue the patent requires the well to be used for both "monitoring and injecting." See id. at 9. As support, they cite numerous portions of the Specification that refer to the wells as both "monitoring and injecting wells." See id. at 9-10 (citing '141 Patent at col. 5, line 35, wells 12, 14, 16, and 18). For example, Defendants point to Figure 3 which is described as "a schematic cross-sectional view through a representative monitoring end [sic] injection well of the types utilized in [Figures 1 and 2]." '141 Patent at col. 5, lines 22-25. Defendants contend that, because the Specification indicates the wells have dual functions, the term must be read to require both "monitoring and injecting." Brief - Defendants at 10. Finally, Defendants argue that in order for the invention to be practiced, a "well" must enable both a "monitoring flow" to be withdrawn from it and a "treating or test flow" to be injected into it. Id. at 10.

c. Judicial Construction 14 of the Term "Well"

14 A trial judge has an independent obligation to determine the meaning of the claims, regardless of the arguments advanced by the parties. A "judges task is not to decide which of the adversaries is correct." Lubrezol, 64 F.3d at 1556. The positions of Cleanox and the Defendants have been set out to give context; the declaration of the meaning of the claims at issue is the result of an independent assessment following review of the submissions and arguments of counsel.

Although both parties refer to certain extrinsic evidence in their briefs to support their respective interpretation of the term "well" (e.g., a dictionary and expert testimony), they nevertheless state that the meaning of the term can be determined by examining only the intrinsic evidence. The parties have stated as much in their briefs and their 8 October 1997 letters to the Court. See Cleanox's and Defendants' 8 October 1997 Letters; see also Markman Hearing Transcript at 72:19-23; Brief - Cleanox at 4-5; Brief - Defendants at 7.

The words of the claim themselves, and as used in the Specification, adequately describe the scope of the term "well." There is no ambiguity as to the meaning of the term. Accordingly, extrinsic evidence is neither necessary nor appropriate to
construe its meaning. Cybor Corp., 138 F.3d at 1454; Vitronics, 90 F.3d at 1576. In addition, because the term "well" is not
defined in Claim One in either patent, the Specification may be used as a dictionary to explain the invention and interpret
the claims. See Markman, 52 F.3d at 979; Vitronics, 90 F.3d at 1582. When using the specification to define a term in the
claim, however, it is recognized "there is a fine line between the use of the specification to clarify otherwise cloudy terms in
the claim and the extraction of limitations from the specification to impose those limitations on the claim." CCPI v.
(Fed.Cir. 1997); Electro Med. Sys., S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed.Cir. 1994); In Re Van
Geuns, 988 F.2d 1181, 1184 (Fed.Cir. 1993); Intervet Am., Inc. v. Kee-Vet Labs., Inc., 887 F.2d 1050, 1053 (Fed.Cir. 1989)).

The term "well" in Claim One of the '141 Patent and in Claim One of the '483 Patent should be, and is, read as a structure
which enables both monitoring and injecting groundwater; that is a device to both withdraw and input. The Description of
Preferred Embodiment for each of the patents at issue consistently describes the wells as having a dual purpose, for
"monitoring and injecting." See, e.g., '141 Patent at col. 5, lines 22-25; col. 5, line 35; col. 5 line 54; '483 Patent at col. 6,
lines 53-54; col. 7, line 5-6. Indeed, each of the patents refer to the well depicted in Figure 3 as a "monitoring and injection
well." See, e.g., '141 Patent at col. 5, line 54-55; '483 Patent at col. 7, lines 5-6. Although nothing in the Specification
requires that the wells be used for both purposes, implicit in Claim One of the '141 Patent and Claim One of the '483 Patent
is the requirement that the wells be used in such a fashion.

A review of the language used in Claim One of the '141 Patent reveals the term well must be read as a device having a dual
purpose enabling one to inject or withdraw. For example, Step A of the '141 Patent uses the language "a plurality of
mutually spaced wells intersecting said groundwater region." Step A of the '141 Patent; see Step A of the '483 Patent. There
must be a purpose for such language. This purpose is revealed in the remaining steps of the '141 Patent. 15

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

15 As noted, the '483 Patent results from a "continuation-in-part application filed in the application resulting in the '141
Patent." See supra note 1 (quoting Brief - Defendants at 16-17 n.3). Significantly, neither Cleanox nor the Defendants
suggests "wells" should be construed differently in the '483 Patent.

- - - - - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - -

In order to determine the existence of acceptable continuity and well interflow paths, as required by Step B of the '141
Patent, a practitioner is to practice the invention by

    generating a test flow of a solution of hydrogen peroxide from one of said wells and monitoring pH changes at each other
of said wells as a function of time to detect a pH drop of at least 0.2; and (c) subsequent to detecting said pH drop, providing
a treating flow of said hydrogen peroxide solution from one or more of said wells.

Step B and Step C of the '141 Patent (emphasis added).

Construction of this language reveals a practitioner must use this plurality of mutually spaced wells to inject or generate a
test flow and withdraw a sample to monitor or detect a pH change and then inject or provide a treating flow from one or
more of said wells. A review of the Specifications of the '141 Patent and the '483 Patent reveals the inventor did not use the
term well in a manner inconsistent with the ordinary meaning of that term, as construed in this opinion.

In the '141 Patent in the section entitled "Summary of Invention" the implicit dual use of the wells becomes apparent. For
example, it is stated:

    Pursuant to the invention, a plurality of mutually spaced wells are provided by sinking same into the groundwater region,
with which the bottoms of the wells intersect so as to provide a means for injection of the reactants used in the invention. In
the course of practicing the invention, a treating flow of hydrogen peroxide is provided from one or more of the wells.
Periodically the treating flow is stopped and a determination made of the hydro carbon contaminant levels at each said well.

'141 Patent at col. 3, lines 1-10 (emphasis added).
In a preferred mode of practicing the present invention, the existence of acceptable continuity and well interflow paths for
the groundwater region to be treated is established by initially generating a test flow of a solution of hydrogen peroxide
from one of the wells and monitoring the pH changes at each other of the wells as a function of time.

Id. at col. 3, lines 52-58 (emphasis added).

Subsequent to detecting the said pH drop a treating flow of the hydrogen peroxide solution is then provided from one or
more of the wells. The treating flow is again periodically stopped and the hydrocarbon contaminant levels measured at each
well for ….

Id. at col. 3, line 67 to col. 4 line 3 (emphasis added).

In typical treatment arrangements pursuant to the invention at least three injection wells are utilized which are separated
about the periphery of the groundwater region to be treated. The test flow is injected at one of said well and the pH changes
are monitored at the other said well.

Id. at col. 4, lines 47-53 (emphasis added).

The Summary of Invention in the ’141 Patent also addresses the concept of, from time-to-time, the injection or monitoring
through these wells. See, e.g., ’141 Patent at col. 4, line 6 to col. 5, line 4.

The Summary of Invention section of the ’483 Patent is no less specific in referring to the wells as injection and monitoring
wells.

Pursuant to the invention a plurality of mutually spaced wells are provided which intersect the groundwater region. A
treating flow of acidic acid is provided from one or more of the wells into the groundwater region, to establish acidic
conditions therein. A turbulent flow of an aqueous solution of ferrous ion is introduced into the groundwater region, for
mixing the acidified water, thereby providing a catalyst for disassociation of hydrogen peroxide. A treating flow of
hydrogen peroxide solution is then provided for one or more of the wells into the groundwater region, the hydrogen
peroxide undergoing a Fenton-like reaction in the presence of the acidic conditions and ferrous ion to generate hydroxyl free
radicals for oxidizing the contaminants.

… The existence of acceptable continuity and well interflow paths for the region are determined by monitoring pH
changes at each other of said wells as a function of time to detect a pH drop of at least 0.2.

’483 Patent at col. 3, lines 9-27 (emphasis added).

Comprising the steps of: providing a plurality of mutually spaced wells intersecting said static plume groundwater;
measuring the change in water depth at each of said wells following atmospheric precipitation, to determine by common
depth changes the likelihood of said plume; confirming the existence of the static plume by generating a test flow of a
solution of hydrogen peroxide or acidic acid from one of said wells and monitoring the absence of pH changes at each other
of said wells as a function of time; and providing a treating flow of solutions of acidic acid, of ferrous ion, and of hydrogen
peroxide from each of said wells to establish a radial sweep about each said well, ….

Id. at col. 3, line 61 to col. 4, line 5 (emphasis added).

In a preferred mode of practicing the present invention, the existence of acceptable continuity and well interflow paths for
the groundwater region to be treated is established by initially generating a test flow solution of hydrogen peroxide from
one of the wells and monitoring the pH changes at each other of the wells as a function of time. A pH drop of at least 0.2 is
considered to be indicative of satisfactory conditions …. Subsequent to detecting the said pH drop, a treating flow of
hydrogen peroxide solution is then provided for one or more of the wells. The treating flow is again periodically stopped
and the hydrocarbon contaminant levels measured at each well until the initial concentration levels drop below
predetermined acceptable values.

Id. at col. 5, lines 3-22 (emphasis added). The dual purpose of the wells contemplated in the ’483 Patent is also demonstrated
in other areas of the section entitled Summary of Invention. Id. at col. 5, line 36 to col. 5, line 29.

A review of the language which precedes Claim One in each of the patents demonstrates that the "plurality of mutually spaced wells" referred to in sub-part (a) in Claim One of each of the patents refers to a dual purpose well. Moreover, each of the patents refers to the wells as "monitoring and injecting wells." See, e.g., '141 Patent at col. 5, line 35; col. 5, line 54; '483 Patent at col. 6, lines 53-54; col. 7, line 5.

If a practitioner were using the wells solely for injecting the treating flow, he or she would not know which of the plurality of wells to use to inject the flow. Only use of the well or wells for monitoring can lead to the selection of the correct well or wells for injecting. Conversely, if a practitioner were using the wells only for monitoring a flow, he or she could not to treat the site. Finally, the Specification also supports the Defendants' definition of the term because the Specification indicates that a "borehole," and not a "well," is the device that simply provides access to water. See '141 Patent at col. 5, line 55; '483 Patent at col. 7, line 6. A "well," on the other hand, must perform other functions in light of its many different structural elements, as intended by the '141 Patent and the '483 Patent.

Each reference to the Specifications for the '141 Patent and the '483 Patent reinforces a natural reading of the term "well." The Specifications have been used solely to provide a context and to sharpen the construction of the claim language.

* * *

Conclusion

For the reasons stated, the claim construction of the disputed terms is as follows: (1) the term "well" in Claim One of the '141 Patent and Claim One of the '483 Patent means "a structure used for both monitoring and injecting the groundwater," (2) Step B of the '141 Patent is read to require that pH be monitored for the particular purpose of determining the existence of acceptable continuity and well interflow paths, (3) the term "treating flow" in Step C of the '141 Patent is read to have no pressure limitation associated with it and to be limited to "chemical remediation", and (4) Claim One of the '483 Patent is read to require the performance of Steps A-D both separately and sequentially to practice the invention.
At oral argument, Mantech all but abandoned the definition of "well" that would equate it with access to groundwater and maintained that a structure that could either inject or monitor satisfies the term "well" as used in the claims and does not contradict the written description. According to Hudson, however, if each of the wells in the claimed system cannot perform both monitoring and injecting functions, the method of the invention cannot be practiced as claimed. Thus, Hudson asserts that Mantech's fall-back argument that the wells do have to provide not only access to the groundwater, but also either monitoring or injecting, contradicts the plain meaning of the claims and the written description, and thus violates Vitronics. On the other hand, Mantech's primary argument, that the court must accept the plain meaning of the term "well," implies that Vitronics requires reliance on the extrinsic evidence.

The main issues on appeal, therefore, are (1) whether it was legally correct claim construction methodology under Vitronics for the district court to accept the extrinsic evidence as background information, but reject it as the basis for construing the claims and construing the claims solely on the basis of the intrinsic evidence; and (2) whether, assuming the court did not violate Vitronics, the "dual-function" construction is correct.

A. Limited Reliance on Extrinsic Evidence

Both Mantech and Hudson argued before the district court that the dispute over the proper meaning of the claim term "well" could be resolved without resorting to extrinsic evidence. See CleanOX, slip op. at 4-5 n.3. However, each side presented the testimony of an expert witness in case the court determined that extrinsic evidence was necessary. At the conclusion of the Markman hearing, however, the court advised the parties that the expert testimony "was accepted only for the purpose of background in the technical area" and construed the claims at issue based solely upon the intrinsic evidence. Id. at 5.

Mantech asserts on appeal that the established definition of "well" comports fully with the patents' specifications. Therefore, according to Mantech, the district court erred in not applying the established meaning. Mantech Enhanced Coverage Linking implies that under a proper interpretation of Vitronics, the district court was obligated to rely on the extrinsic evidence here.

Hudson responds that the extrinsic evidence of the established meaning of the term "well" contradicts the meaning taught by the specifications. Hudson contends that relying on such expert testimony would require ignoring clear intrinsic evidence and improperly basing the construction instead on contrary extrinsic evidence, the expert testimony, in violation of Vitronics. Hudson asserts, therefore, that it would have been improper for the judge to rely on expert testimony for more than background in the relevant art and the patents in suit because the intrinsic evidence unambiguously reveals a different meaning of the term "well." In addition, Hudson argues that because the witnesses disagreed, the extrinsic evidence on application of the established meaning to the claim term is in conflict. Further, asserts Hudson, Mantech did not establish that the term "well" as used in the patent was ambiguous and could not be interpreted without extrinsic evidence, another requirement of Vitronics.

The district court agreed with Hudson that "the words of the claim and the specification adequately describe the scope of the term 'well,'" as used in the patents. CleanOX, slip op. at 25. Therefore, after admitting the extrinsic evidence as background in the relevant technology, the court held that the written description and the claims were not ambiguous and that the meaning of the claim term "well" was clear. See id. at 26-27. The district court, therefore, correctly followed the guidance set forth in Vitronics for limiting reliance on contrary extrinsic evidence.

Mantech's argument, that the court should have relied on expert testimony which, we hold, contradicts the plain meaning of the specification and would result in exactly what Vitronics and prior cases cited therein forbid. See Vitronics, 90 F.3d at 1584, 39 U.S.P.Q.2D (BNA) at 1578 ("As we have recently re-emphasized,.extrinsic evidence in general, and expert testimony in particular, may be used only to help the court come to the proper understanding of the claims; it may not be used to vary or contradict the claim language.") (emphasis added) (citing Markman v. Westview Instruments, Inc., 52 F.3d 967, 981, 34 U.S.P.Q.2D (BNA) 1321, 1331 (Fed. Cir. 1996), aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1997)); see also Bell and Howell Document Management Prods. Co. v. Altek Sys., 132 F.3d 701, 706, 45 U.S.P.Q.2D (BNA) 1033, 1038 (Fed. Cir. 1997) (holding that when the intrinsic evidence is unambiguous, it is improper for the court to rely on extrinsic evidence for purposes of claim construction).

In this case, the district court was legally correct both in admitting and accepting the testimony of the parties' expert witnesses "for the purpose of background in the technical area at issue," CleanOX, slip op. at 5, and then basing its claim construction solely upon intrinsic evidence. Although this information always may be admitted by the trial court to educate
itself about the patent and the relevant technology, the claims and the written description remain the primary and more authoritative sources of claim construction. Thus, they always must be considered and where clear must be followed. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 981, 34 U.S.P.Q.2D (BNA) 1321, 1331 (Fed. Cir. 1996), aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1997) (holding extrinsic evidence may be used for the court's understanding of the patent); see also Cybor, 138 F.3d at 1454 n.3, 46 U.S.P.Q.2D (BNA) at 1173 n.3. In this case, the claims and written descriptions are dispositive, for they clearly define a "well" more narrowly than the extrinsic evidence. Therefore, it was not legal error as Mantech Enhanced Coverage Linking proposes for the district court to refuse to rely on the expert testimony for anything more than background.

B. Construction of the Term "Well"

Mantech here challenges the district court's construction of the claim term "well." According to Mantech, the district court improperly limited "well" as used in the claims to the dual-function structure disclosed in the preferred embodiment. Mantech initially asserts on appeal that the proper construction of the term "well" as used in the patents in suit is "any device that allows access to groundwater." Mantech refers specifically to the '141 patent at column 6, lines 20-24, which states that "it will be appreciated that a monitoring flow can be withdrawn from the well, as can a treating or test flow be injected via the well into the groundwater which the well intersects," to show that a "well" as used in the patents does not have to both monitor and inject. Mantech emphasizes the use of the word "can" in the specification instead of "must" or "shall" to indicate that each function is possible but is not required.

Hudson asserts that another patent term, "borehole," describes a structure by which groundwater merely is accessed, and applying that construction to "well" would make use of the term "borehole" elsewhere in the specification unnecessary and hence contrary to the expressed intent of the inventor.

Under proper claim construction methodology, we look first to the language of the claims. See Bell Communications Res., Inc. v. Vitalink Communications Corp., 55 F.3d 615, 619, 34 U.S.P.Q.2D (BNA) 1816, 1819 (Fed. Cir. 1995). For example, step (a) of claim 1 of the '141 patent requires:

(a) providing a plurality of mutually spaced wells intersecting said groundwater region;

'141 pat., col. 8., ll. 27-28. This limitation itself requires neither monitoring nor injecting at any of the mutually spaced wells. Step (b), however, requires:

(b) determining the existence of acceptable continuity and well interflow paths for said region by generating a test flow of a solution of hydrogen peroxide from one of said wells and monitoring pH changes at each other of said wells as a function of time to detect a pH drop of at least 0.2; and 8

Id. at col. 8, ll. 29-34 (emphasis added). The emphasized phrases indicate that one well must be used for testing, i.e., injecting the test fluid, and the rest of the wells for monitoring. Step (c) then requires:

(c) subsequent to detecting said pH drop, providing a treating flow of said hydrogen peroxide solution from one or more of said wells.

Id. at col. 8, ll. 35-37 (emphasis added). The second emphasized phrase indicates that only one well need be used for providing the treating flow, i.e., injecting the treating flow; all the wells need not inject. Indeed, all but that one well could merely monitor. Step (c), therefore, could read on several alternative systems, ones with only dual function wells, ones with only single function wells, and ones with some single function and some dual function wells. For example, in an array of four wells, well A might inject only and wells B, C, & D monitor only. First, A would inject the test fluid while the others monitored. Then, A would inject the treating fluid. Claim 1 would read literally on this system.

8 We construe "generating" to be synonymous with "injecting" as is "providing," used later.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

8 We construe "generating" to be synonymous with "injecting" as is "providing," used later.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -
As the district court correctly determined, therefore, a method in which all of the wells both monitored and injected would be covered by this claim. Mantech, however, conceded at trial that Defendants' wells do not all perform both functions. The construction of "well" originally asserted by Mantech, i.e., "any device that provides access to groundwater," is too broad because it would include structures that neither monitor nor inject. All the "wells" recited in claim 1 perform at least one such function. A structure which merely provides access, therefore, is not a "well" covered by claim 1. A system incorporating wells that either monitor or inject and possibly, but not necessarily, do both, however, still would be covered by claim 1 of the '141 patent and claim 1 of the '483 patent. 9

9 Providing an additional structure that neither monitors nor injects, however, does not necessarily remove the accused method from the scope of the claims simply because such a structure would not be a "well" as defined in the patents. See A.B. Dick Co. v. Burroughs Corp., 713 F.2d 700, 703, 218 U.S.P.Q. (BNA) 965, 967-68 (Fed. Cir. 1983) ("It is fundamental that one cannot avoid infringement merely by adding elements if each element recited in the claims is found in the accused device. ").

Finally, we must look to the written description, to determine what one of ordinary skill in the art at the time of the invention would have understood the term as used in the patent to mean. 10 See Markman, 52 F.3d at 983, 34 U.S.P.Q.2D (BNA) at 1335. If the written description supports the definition of the term that is apparent from the claim limitation, then reading in a further limiting definition would be improper.

10 As mentioned above, there is no relevant prosecution history.

The wells are introduced in the written description as "monitoring and injecting wells," '141 pat., col. 5, ll. 34-35, and, indeed, the preferred embodiment of the invention as shown in Figure 3 discloses a well that both monitors and injects. This passage is consistent with the wells as performing both monitoring and injecting; it hardly mandates, however, that each and every well used to perform the method must both inject and monitor. Later it is stated that "a monitoring flow can be withdrawn from the well, as can a treating or test flow be injected via the well into the groundwater which the well intersects." Id. at col. 6, ll. 20-24. This passage indicates that the inventor expressed an intent that a well be used for either injecting or monitoring, or both.

Hence, although the definition of "well" adopted by the district court, "a structure used for both monitoring and injecting the groundwater," CleanOX, slip op. at 43, may at first seem to be in accordance with the language of the specification, it is actually narrower than that intended by the inventor when the entire patent is read in light of the nature of the invention as described and claimed. The claims do not require such a narrow construction of the term "well" and neither does the written description. In fact, both support a broader construction.

The district court erred because it, in essence, incorporated from the preferred embodiment into the claims a narrow definition for the claim term "well," as "a structure used for both monitoring and injecting groundwater." CleanOX, slip op. at 43 (emphasis added). In the context of the written description and the claims, however, it is clear that the term "well" has a more inclusive meaning than that given by the district court: as used in the patents, a "well" is a structure connecting the surface to the groundwater that can either monitor or inject, or both, but it need not do both.

We thus hold that the meaning of the claim term "well" in the patents in suit is a structure that enables either monitoring or injecting of groundwater, or both. 11 Therefore, the methods practiced by the Defendants could indeed infringe the patents, contrary to the district court's summary judgment. We therefore vacate the district court's summary judgment of noninfringement and remand the case for further determination of infringement consistent with the correct claim construction. 12
11 We note that this construction also is in accordance with the specification and claims of the ‘483 patent.

12 We lack information on the accused methods. This case was terminated essentially on the basis of the Markman hearing. Although there was an oral motion for summary judgment based on Mantech's concession it could not prove infringement using the district court's claim construction, no written pleadings or supporting affidavits or depositions were submitted regarding infringement. Thus, we cannot consider on appeal whether as a matter of law the accused system(s) infringe(s) one or both asserted claims.

--- Footnotes ---

11 Similarly, the reference to the block as "available in a wide variety of materials, shapes and volumes of the sample wells" in ’610 Patent col. 3, ll. 41-42 begs the question of what "well" means because the materials, shapes, and volumes for the required wells neither necessitate above surface structures nor are inconsistent with variations in the recesses themselves.
The ordinary meaning of the preposition "for," see Webster's New World Dictionary of the American Language 544 ("with the aim or purpose of; suitable to; appropriate for"); demonstrates the intended use of the well is that it be capable of holding a tube, and does not require that the tube actually be seated in the well, even though "one embodiment" requires the tubes be "seated in the sample block," ‘610 Patent, col. 8, l. 65 and col. 9, ll. 31-32, at least while performing PCR.

4401

H. "Wells"

Claim 1 of the ‘418 patent further describes the textured surface as "comprising a pattern of ridges and troughs, the pattern including a plurality of parallel wells." Plaintiffs claim that "wells" are "the lowest regions of the channels," while Gore contends that the term "wells" is fatally indefinite because it is not amenable to description.

The language of the patent describes the wells as a part of the ridges and channels formed by cutting the surface material. Based on the diagrams included with the patent, the ridges come together at an angle to create channels that have low points. See id. Fig. 12. The plain and ordinary meaning of "well" includes "something resembling a well in being . . . deep . . . ." See Pl. Claim Constr. Mem., Ex. H, Webster's Ninth New Collegiate Dictionary (1987), at 1338. Therefore, in the context of the ridges and channels described in claim 1 of the ‘418 patent, the deepest part of the channels would be the well. The term "wells" is amenable to construction and the Court determines that "wells" are "the lowest regions of the channels."

GO BACK

4402

c. "Wheel"

Both parties request that the Court construe the term "wheel." This term appears in the claim provision that the invention comprise "a wheel mounted chassis extending in a longitudinal direction." ('618 patent, col. 7.)

The defendants assert that "wheel" means "a circular rim with a rubber tire that revolves on an axle and rides directly on the road." The plaintiffs contend that "wheel" has the broad dictionary and "common sense" meaning of:

a circular frame of metal, wood, or other hard material that may be solid, partly solid, or spoked and that has a hub at the center for attachment to or suspension from an axle on which it may revolve and bear a load; a circular framework often with cogs or teeth on the rim used to transmit or modify force and motion in machinery or a mechanical contrivance. A wheel includes, but is not limited to, a rim on which a rubber tire is mounted, a sprocket wheel (both a driven wheel, and [a] non-driven or idler wheel) used on a track of a tracked machine, a guide wheel used on a track of a tracked machine, and an endless track of a tracked machine.

The defendants maintain that the definition of "wheel" is limited by the patent specification's provision that "the plant 1 may then be hauled along a road on the wheels 3(a)." The defendants argue that this description makes clear that "wheel" was intended to refer to a wheel that rides directly on a road. The defendants further object to the plaintiff's inclusion of an "endless track of a tracked machine" in its definition of "wheel." The defendant asserts that tracks (such as would conventionally appear on a military tank) are treated as separate structures from wheels in the construction industry. Since the patentee made no reference to "tracks" in the '618 patent, tracks should not be incorporated into the definition of "wheel".

The plaintiff asserts that "wheel" has a common, non-technical, meaning, and that nothing in the patent contravenes this. The plaintiff also notes that Powerscreen's own documents refer to the track assemblies of Powerscreen's track-mounted screeners as including "wheels." (See Whyte Decl., P 25.)
Neither party argues that "wheel" has a special technical meaning in the relevant art. Nonetheless, the entirety of the patent document suggests that the "wheels" on which the device is mounted must be wheels on which the device rides. The essence of the invention is that it is easily movable, and the inclusion of wheels in the design directly serves this goal. Thus, "wheel" cannot refer, as the plaintiff requests, to a "circular framework often with cogs or teeth on the rim used to transmit or modify force and motion in machinery or a mechanical contrivance."

However, the Court also rejects the defendants' definition of "wheel" as limited to a wheel that is tire-mounted and rides directly on the road. This may be the manner of wheel depicted in the preferred embodiment of the invention, but the patent claims themselves are amenable to other types of wheels. To limit the claims to tire-mounted wheels riding directly on the road would improperly import elements of the preferred embodiment into the claim itself.

The Court also rejects the plaintiff's assertion that "wheel" includes the "endless track on a tracked machine". This definition is unsupported by intrinsic or extrinsic evidence. The patent never mentions "tracks" or "tracked machines", and an endless track conflicts in several ways with the dictionary definition the plaintiffs urge for "wheel"--not the least of which is that an endless track is not "circular." The opinion of the plaintiff's expert, Steven A. Whyte, that an endless track would be understood to be a "wheel" by one skilled in the art is similarly unsupported by reference to any extrinsic material. The Court thus rejects this contention.

As such, the Court attaches to the term "wheel" a modified form of its generic, dictionary meaning that excludes wheels not used for bearing the plant's weight and moving it, but includes wheels that are not merely tire-mounted. Thus, the Court construes wheel to mean: "a circular frame that has a hub at the center for attachment to or suspension from an axle, on which it revolves, and that serves to bear the weight of the screening plant."

A. Construing The Term "Wheel-and-axle assembly" in the 476 Patent

The term "wheel-and-axle assembly" means an assembly formed from the arm member's multisided part collar in cooperation with the multisided positional mount.

Claims 1, 5, and 11 cite two elements that cooperate to form a wheel-and-axle assembly: a "multisided part collar" and a "multisided positional mount." Claim 5 further specifies that a multisided positional mount is comprised of a disc-shaped wheel portion and multisided axle portion. From here, Palmetto contends that the definition of wheel-and-axle assembly must include a "concentrically mounted disk portion" in addition to the multisided part collar and multisided positional mount.

The court adopts NPI's interpretation that the "wheel-and-axle assembly" requires nothing more than what the inventor claims: a multisided positional mount and a multisided part collar. Biagro, 423 F.3d at 1302 ("claim construction begins with, and remains focused on, the language of the claims."). Here, only Claim 5 imparts a limitation that the wheel-and-axle assembly must also include a disc-shaped wheel portion. Claims 1 and 11 make no mention of such an element. Given that each claim in a patent is presumptively different in scope, the court declines to construe Claims 1 or 11 to contain a limitation expressed only in Claim 5. Comark, 156 F.3d at 1186-87. Here, the "disc-shaped wheel portion" is an optional element, but not necessary to define a wheel-and-axle assembly.

The inclusion of a "disc-shaped button or wheel portion" in describing one embodiment of the assembly does not change this result. At the outset, the court notes that the inventor need not describe all possible forms in which the claims may be reduced to practice. Gart v. Logitech, Inc., 254 F.3d 1334, 1342 (Fed. Cir. 2001) (noting that "drawings [depicting the preferred embodiment] are not meant to represent the invention or to limit the scope of coverage defined by the words used in the claims themselves."). What is more, the written text and figures describing a particular embodiment should be read in light of the specification as a whole. Beckson Marine, Inc. v. NFM, Inc., 292 F.3d 718, 724 (Fed. Cir. 2002) ("this court does not construe the figures depicting a single preferred embodiment as limiting the claim terms in light of other language in the written description embracing other . . . structures.").

Here, Figures 3A and 3B illustrate one embodiment of a wheel-and-axle assembly formed of the positively-positionable
mount formed on a mounting base. The figures include a depiction of a positively-positionable mount shaped like a mushroom, which includes a "disc-shaped button or wheel portion." 476 Patent, col. 3, lines 56-58. To paraphrase NPI, this button or wheel acts as a "stopper," NPI Brief at 9, to ensure that "the arm members of the coupler . . . can obtain a suitable grip [around the axle]." Id., col. 4, lines 4-7; see also, id., col. 4, lines 31-35 (describing same). Despite this stated objective, the drawings do not include the coupler's rigid arm members (of which the multisided collar is part). The accompanying description to the Figures, however, explicitly references the arm members and directs the reader to further discussion that follows. 476 Patent, col. 4, lines 4-7. Not only does the court refuse to read Figures 3A and 3B in isolation from the remaining written description, Beckson, 292 F.3d at 724, but the inventor expressly instructs against it. Indeed, throughout the specification, the inventor describes the coupler's rigid arm members in relative orientation to the multisided positional mount's multisided axle portion. E.g., id., col. 4, lines 20-25; id., col. 5, lines 4-8; col. 6, lines 18-21. Thus, the fact that Figures 3A and 3B include a disc-shaped wheel portion and omit the multisided collar is not dispositive in light of the surrounding written description and the clear language of the claims themselves.

4404

b. "wheel face outer surface"

Lacks argues that the "wheel face outer surface" is an element of claim 1 that has a flexible meaning and thus a varying location on the outer face of the wheel. Defendants argue that if it has any meaning at all, it must describe the entire area of the outer face of the wheel that exists within the circumscribing boundary of the axial peripheral lip. 5

--- Footnotes ---

5 Once again, this construction is defendants' alternative argument to their primary argument that the phrase "wheel face outer surface" is indefinite.

--- End Footnotes ---

Claim 1 first mentions "wheel face outer surface" near the end of its preamble:

A method for providing a decorative surface on a composite vehicle wheel having a web portion and a peripheral rim portion for mounting a vehicle tire, said peripheral rim portion defining an axial peripheral lip circumscribing said peripheral rim portion and structural means interconnecting said web portion and said peripheral rim portion, said web portion and said peripheral rim portion defining a wheel face outer surface....

'809 patent, col. 10, lines 65-67 and col. 11, lines 1-5. This passage indicates that the scope of "wheel face outer surface" bears some relation to the web portion, the peripheral rim portion, and the axial peripheral lip -- at the least, that the "wheel face outer surface" includes exposed surface of the web and peripheral rim portions but not the axial peripheral lip. The claim's second, and more revealing, reference to the phrase cements its relationship to the axial peripheral lip: "said thin solid formed ornamental panel being shaped to cover said entire wheel face outer surface and not cover said axial peripheral lip." '809 patent, col. 11, lines 8-11.

Lacks argues from these references, and in particular from the use of the article "a" in the first reference, that the wheel face outer surface need not cover the total area of exposed surface within the circumscribing boundary of the axial peripheral lip. This construction fails, however, in light of my earlier construction of the axial peripheral lip, which concluded from the claim language that the axial peripheral lip and the cladding must abut each other. By sharing a common border, the axial peripheral lip and the cladding make it impossible for there to be exposed surface between them. This construction, furthermore, comports with the requirement that the cladding must cover the "entire wheel face outer surface" yet "not cover" the axial peripheral lip. Implicit in that requirement is the idea that the "wheel face outer surface" must be the area of exposed wheel surface that lies within the boundary of the circumscribing axial peripheral lip.

While the specification in a few places appears to suggest that the wheel face outer surface might be something less than the entire area within the boundary of the axial peripheral lip, those suggestions are outweighed by the central thrust of the specification's description, especially the diagrams of the preferred embodiment. Furthermore, as the invention of the '809
The patent was intended to address a need in the prior art for a cladding that covered "the entire wheel surface," see '809 patent, col. 3, lines 62-67, and col. 4, lines 1-8, the phrase "wheel face outer surface" must mean the maximum extent of the wheel's exposed surface area that can be covered by the cladding while still heeding the "not cover said axial peripheral lip" limitation.

In light of the intrinsic evidence of record, I conclude that a person of ordinary skill in the art of cladded wheels would understand "wheel face outer surface," as used in claim 1 of the '809 patent, to mean the entire area of the wheel's exposed outer face that lies within the circumscribing boundary of the inner shoulder of the axial peripheral lip. I find it unnecessary to consider any extrinsic evidence because the intrinsic evidence of record 6 has resolved the meaning and scope of "wheel face outer surface." See id.

6 Neither party has offered prosecution history evidence on "wheel face outer surface."

Lacks also challenges the court's construction of "wheel face outer surface" in the '809 and '906 patents. The district court construed the term to mean "the entire area of the wheel's exposed outer face that lies within the circumscribing boundary of the inner shoulder of the axial peripheral lip." Id. at 712. On appeal, Lacks argues that the dimensions of the cladding define the "wheel face outer surface," so long as the cladding covers some of the web and rim portions. 4 Again we are not persuaded.

4 The web portion of the wheel is the central portion of the wheel composed of "spokes, spiders, or webs." '809 patent, col. 6, lines 64-66. The rim portion is that portion of the wheel that circumscribes the web portion.

Lacks' proposed construction is simply not consistent with the language of the claims. As the district court noted, the limitation first appears in the preamble of claim 1 of the '809 patent: "A method for providing a decorative surface on a composite vehicle wheel having a web portion and a peripheral rim portion for mounting a vehicle tire... said web portion and said peripheral rim portion defining a wheel face outer surface." '809 patent, col. 10, lines 65-67, col. 11, lines 3-5 (emphasis added). The limitation also appears later in the claim: "said thin solid formed ornamental panel being shaped to cover said entire wheel face outer surface and not cover said axial peripheral lip." Id. col. 11, lines 8-11. From this language the district court reasoned that "wheel face outer surface" must be the "area of the wheel's exposed outer face that lies within the circumscribing boundary of the inner shoulder of the axial peripheral lip." Lacks, 55 F. Supp. 2d at 712.

Given this clear language, Lacks' arguments to the contrary are not persuasive. The district court's construction is the only reading consistent with the plain language of the claim limitation and we therefore uphold the district court's construction of "wheel face outer surface."

I now turn to the "wheel face outer surface" claim limitation. The claim language expressly characterizes the wheel face outer surface, providing that "said web portion and said peripheral rim portion define a wheel face outer surface." '809 patent, col. 11, ll. 4-5. This appears to be a closed definition, the wheel face outer surface consisting of only two elements—the central web portion and the peripheral rim portion. The claim language further defines the axial peripheral lip as "circumscribing said peripheral rim portion," id. at col. 11, ll. 1-2, and requires that the ornamental panel cover "said entire
To my mind, this claim language explicitly defines the wheel face outer surface as extending precisely up to the terminal boundary of the peripheral rim portion--the axial peripheral lip. Indeed, despite its differing construction of "axial peripheral lip," this is what the district court concluded as well. This interpretation would thus allow no portion of the peripheral rim portion to be uncovered by the ornamental panel.

Such a conclusion is problematic, however, given Figures 3 and 5 of the '809 and '906 patents. These clearly depict the ornamental panel as only covering part of the peripheral rim portion. The above interpretation would thus read out the preferred embodiment.

As a general rule, claim interpretations, which operate to exclude the preferred embodiment, are "rarely, if ever, correct and require highly persuasive evidentiary support." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583, 39 USPQ2d 1573, 1578 (Fed. Cir. 1996). However, we have found that such a conclusion can be mandated by clear intrinsic evidence, such as "unambiguous" claim language. Elekta Instrument v. O.U.R. Sci. Int'l, 214 F.3d 1302, 1308, 54 USPQ2d 1910, 1914 (Fed. Cir. 2000). See also Rheox, Inc. v. Entact, Inc., 276 F.3d 1319, 61 USPQ2d 1368 (Fed. Cir. 2002) (reaching a claim interpretation excluding some of the preferred embodiments in light of the prosecution history). Here, the claim language is quite explicit in both defining the "wheel face outer surface" and in requiring it to be completely covered by the ornamental panel, and I would find that it constitutes an exception to the general rule.

Indeed, the linkage of the two claim requirements, that the cladding cover the entire wheel face outer surface, but that it not cover the axial peripheral lip only has meaning in the situation where the axial peripheral lip is actually providing a boundary for the overlay. Any other construction of "wheel face outer surface" would essentially mean that there is a separate interior boundary for the overlay coverage. In such a situation, the requirement that the overlay not cover the axial peripheral lip is surplusage.

Rejecting the above construction leaves open a substantial question as to what the "wheel face outer surface" actually is. Lacks's suggestion that it merely requires partial coverage of the "peripheral rim portion" is extremely unsatisfying. First, the claim language describes "said web portion and said peripheral rim portion defining a wheel face outer surface." If this language includes both elements in the definition, then full coverage is required. If it does not, Lacks's suggestion that "partial" coverage of the rim portion suffices would make the use of "entire" completely meaningless--there would be no way to define how much coverage of the peripheral rim portion is required.

The district court used the Hayes diagram to evaluate the accused device. Lacks's brief references the same diagram. It discloses an ornamental panel terminating, as the district court found, "just shy of the tip of the lip." Neither of the parties dispute that this is an accurate representation of the accused product.

Employing the claim constructions given above, the district court's finding of noninfringement can be sustained. Even if the accused product meets the limitation requiring that the ornamental panel not cover the "axial peripheral lip," the ornamental panel does not cover the entire wheel face outer surface, as there is a gap between the ornamental panel and the axial peripheral lip. The district court's grant of summary judgment of noninfringement of the claims of the '809 and '906 patents was correct, for the reasons I have stated.

13. Claim 17 - "operable for moving into an engagement position when"

The full text of this portion of Claim 17 is "operable for moving into an engagement position when the container body is erected to thereby receive a product placed in the container for shipment". However, only the phrase contained in the heading above is at issue. This term is another limitation on "dunnage structure" in that it must be operable for moving into an engagement position when the container body is erected.

Bradford proposes that this term means "being 'coupled to' the two 'sides' such that the 'dunnage structure' is capable of being moved into an engagement position during the time that the two 'sides' of the container body are being erected to
thereby receive a product placed in the container for shipment." Defendants propose that this term means "being 'coupled to' the two 'sides' such that the 'dunnage structure' is capable of being moved into an engagement position during the time that the two opposing 'sides' of the container body are being erected to thereby receive a product placed in the container for shipment." The difference between the parties' definitions is Defendants' addition of the limitation "opposing" to the term.

"Opposing" is an appropriate limitation to add to this term. Whether it be "sides" or "side walls", the specification consistently indicates that the dunnage structure is coupled to support structures which oppose each other. For instance, the "Summary of the Invention" states the following about one embodiment:

When the side walls are erected, multiple flexible support structures, preferably flexible cables, extend between the opposing side walls with their ends secured to the rail elements to span across the container. The pliable dunnage pouches, made of a suitable cloth or plastic material are secured to the support cables[.]

'119 Patent, col. 4, ll. 3-8 (emphasis added). With regard to the sleeve pack embodiment, the Summary states:

[T]he sleeve pack includes two opposing, non-foldable side walls and two opposing foldable side walls, which are hingedly coupled, along vertical edges thereof, to the non-foldable side walls. The dunnage of the invention is coupled to either the foldable or non-foldable side walls.

Id. col. 6, ll. 41-46 (emphasis added). With regard to the embodiment in Figure 4, the specification states:

In accordance with the principles of the present invention, two opposing sides 74, 76 of the top member 64 include elongated support rail elements 78, which extend generally the entire length of sides 74, 76 and support dunnage structures, such as dunnage pouches 82, on the rack 60.

Id. col. 12, ll. 28-34 (emphasis added). With regard to Figure 6, the specification states that the dunnage structures are suspended from rail elements which are fixed to "opposing ends". Id. col. 14, ll. 31-43. Thus, the specification makes clear that the dunnage structures must be coupled to opposing support structures.

Accordingly, the Court holds that "operable for moving into an engagement position when" means "being 'coupled to' the two 'sides' such that the 'dunnage structure' is capable of being moved into an engagement position during the time that the two opposing 'sides' of the container body are being erected to thereby receive a product placed in the container for shipment."

6. "When installed"

Claim 1 provides that the cantilevered leg abuts the web of the rail "when installed." (Id., Exh. 1, col. 6, ln. 41-46). Since the size of the gap between the panel and rail may fluctuate under actual operating conditions, there may be times when the leg does not contact the rail. According to plaintiff, "infringement that occurs some of the time is still infringement . . ." Plaintiff therefore reasons that "when installed" necessarily means "at any time when installed." (Id. at 15).

This argument obfuscates the important distinction between claim construction and infringement. The Court must first construe the patent claims before the fact finder determines whether infringement has occurred. The ordinary and accustomed meaning of "install" is "to set in position or adjust for use." WEBSTER'S II NEW COLLEGE DICTIONARY at 574; see also MERRIAM WEBSTER'S COLLEGIATE DICTIONARY at 606 ("to establish in an indicated place, condition, or status . . ."). Neither the specification nor prosecution history suggest a different interpretation. Therefore, the filler is installed when it is placed in its intended position--abutting the web of the rail.
The main dispute concerns the requirement that "the probe generate a trigger signal when said sensing tip contacts an object and said stylus holder is thereby deflected relative to said housing." The district court determined that "when" is defined by reference to this entire claim limitation, such that "when" means as soon as contact is made and deflection occurs. See Renishaw, 974 F. Supp. at 1089. On appeal, Renishaw argues that "when" should receive one of its broader dictionary definitions: "at or after the time that," "in the event that," or "on condition that," so that the claim would read on a device that does not generate a trigger signal until an appreciable amount of time after contact is made and deflection begins. Because infringement of this limitation depends on the meaning of the word "when," we refer to it in the remainder of the opinion as the "when" limitation. We agree with the district court's construction of this claim limitation and, because all limitations must be met for there to be infringement, we need consider only this limitation.

The ultimate issue is the manner in which "when" defines the timing of probe triggering vis-a-vis contact of a stylus with a workpiece. The issue brings into sharp focus the convergence of the two canons of claim construction discussed above. According to Renishaw, the accused probes escape infringement only if a narrowing limitation is read into "when" from the written description. Marposs counters with an argument that the claim is properly construed to require a finding of noninfringement because the correct meaning of the claim term "when" is embedded throughout the specification.

Neither party forwards a technical meaning for "when" in the applicable industry. However, there are several closely-related, but distinct, common meanings for "when," most cited by Renishaw on appeal. These include: at or during the time that; just at the moment that; at any or every time that; at, during, or after the time that. n4 Renishaw asserts that nothing in claim 2 places an outer endpoint on the time at which a trigger signal must be generated, other than that the device be capable of generating some trigger signal. Therefore, contends Renishaw, the trial court's definition of the term was overly narrow, and the claim is properly defined simply as "at or after the time that." For its part, Marposs argues that the '904 patent's written description exhibits a clear intent to provide triggering as soon as possible after contact with a workpiece, not at appreciable times after contact. Marposs argues that in claim 2 the use of "when" provides an entry point into the claim for that intent.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n4 These definitions are taken from Webster's Ninth New Collegiate Dictionary 1342 (1985); Webster's Third New International Dictionary 2602 (1993); and the Chambers Concise Dictionary 1223 (1992).

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

The explicit language of claim 2 is our starting point. There, the claim states that a signal is generated "when" there is contact with a workpiece "and said stylus holder is thereby deflected." The claim ties the signal to contact and deflection, thus showing that the trigger signal cannot occur until the probe has contacted the workpiece and the stylus has deflected some amount. In other words, contact and deflection are a condition precedent to signaling. Thus, the claim itself precludes us from viewing "when" as requiring signaling at the precise moment of contact, for some deflection must occur before signaling. The district court also recognized this. See Renishaw, 974 F. Supp. at 1071; see also Manteech Envtl. Corp. v. Hudson Envtl. Servs., Inc., 152 F.3d 1368, 1998 U.S. App. LEXIS 18753, No. 98-1079, slip op. at 12-13 (Fed. Cir. Aug. 13, 1998) (looking to other terms in a claim to construe a limitation in dispute); Phonometrics, Inc. v. Northern Telecom Inc., 133 F.3d 1459, 1465, 45 U.S.P.Q.2D (BNA) 1421, 1426 (Fed. Cir. 1998) (same).

Mere recognition that "when" is not limited to the precise moment of contact, however, does not make the term clear, or mandate a meaning of "when" to include any time after contact as long as a measurement is derived from stylus contact. That is because "when" is not a broad and general term when standing in isolation. Instead, it has several meanings, each of which may prevail based on the context. Here, we have bounteous context. Claim 2 does not exist in rarefied air, but rather is surrounded by a patent disclosure of singular purpose. As evidenced by the several common meanings of "when," the term is imprecise as used in the '904 patent. The term is not ambiguous, however, because the written description provides overwhelming evidence to guide a proper interpretation of the term. See Vitronics, 90 F.3d at 1583, 39 U.S.P.Q.2D (BNA) at 1577. Replete with references that indicate that the patentee was preeminently concerned with generating a trigger signal as soon as possible after contact, the written description lends precision to the term "when." The written description shows that the patentee's invention is directed at a machine that produces very accurate, very precise probe readings by maintaining
tight control over the position of the stylus. In the context of the invention, such readings can only be obtained if the probe triggers very, very soon after contact.

For example, in describing the invention’s place within the prior art, the ’904 patent notes: "When the stylus contacts a workpiece surface, a trigger signal is generated by the probe, which is used to trigger the taking of a reading of the instantaneous position of the movable spindle, quill or arm." Col. 1, ll. 36-42. Likewise, the Summary of the Invention states that the preferred embodiment of the probe "includes means for providing a signal when said stylus contacts a workpiece," col. 3, ll. 28-29, and that the movable elements are displaced "out of said rest position when said stylus contacts a workpiece," col. 3, ll. 21-22.

Statements in the "Description of Preferred Embodiments" also use the term "when" to describe a time very close to the precise instant that the stylus contacts the object to be measured and not some appreciable time thereafter:

When the stylus 14 contacts a workpiece, from any direction, the stylus is deflected. For example, if the contact is in a horizontal direction, the stylus 14 tilts, about a point of contact between the surfaces 20 and 22. At this time, the cylinders 34 and balls 36 remain engaged with each other, and the tilting is accommodated by flexing of the planar spring 30. . . .

When the deflecting force on the stylus 14 ceases (i.e. when the probe is moved so that the stylus 14 no longer contacts the workpiece) the stylus member 12 is returned to its axial and lateral rest position by the action of the spring 24.

Col. 4, l. 52 to col. 5, l. 7. This passage refers to "when" as "at this time," i.e., when the planar spring is flexing and the cylinders, or analogously, the legs of the trampoline, have not yet lifted out of their moorings. In other passages, the written description states: "The instant at which the stylus tip 15 first contacts a workpiece can be detected in various possible ways," col. 6, ll. 10-11, that the photoelectric sensor is responsive to motion caused "when the stylus 14 begins to deflect upon contact with a workpiece," col. 6, ll. 33-34, "when the stylus 14 is deflected by contact with a workpiece, the cage 86 initially remains stationary in its kinematic rest position," col. 8, ll. 60-63, "all of the embodiments of FIGS. 4-10 may have any of the arrangements for detecting the instant of contact between the stylus tip and a workpiece," col. 9, ll. 16-20, and:

In operation, when the stylus 14 is deflected by contact with a workpiece, at first the skirt 72 and cage 64 lift or tilt bodily from the surfaces 74. . . . Also for the same reason, when eventually the stylus returns to its rest position, there is little or no hysteresis in its rest position.

However, the above bodily lifting or tilting of the cage 64 upon deflection of the stylus only lasts for a very small amount of stylus deflection.

Col. 8, ll. 11-13 (emphasis added to all quotations). These passages make abundantly clear that "when" in the patent means at the time of, and not some appreciable time thereafter. See Autogiro Co., 384 F.2d at 397, 155 U.S.P.Q. (BNA) at 702-03 ("Words must be used in the same way in both the claims and the specification.").

To the extent that these passages refer to the preferred embodiment, they cannot be read into the claims without some hook. The claim term "when" is that hook. Each of the passages above show that the patentee wanted "when" to mean as soon as possible after contact. In contrast, Renishaw's proferred construction of "when," which would sweep in any time whatsoever after contact, is so broad that it would require us to ignore the abounding statements in the written description that point decidedly the other way.

Renishaw might have us save its claim by placing a functional limitation on the claim such that "when" would permit signaling at any time after contact but no longer than would permit accurate measurement of the workpiece. However, this limitation appears nowhere in the claims; rather, it comes from a concept of operability. To the extent Renishaw must refer to the written description, the patentee's extremely detailed account of his invention in that written description shows that his aim was to generate a signal as soon as possible after contact, not to generate a signal at appreciable times after contact. Any delay in signaling with Renishaw's probes creates an unrecoverable error, because they must equate the position of the probe at the moment of signaling with the position of the workpiece. Therefore, delay in signaling while the probe continues to move creates an error. The patentee strove to eliminate this error, and the entire patent document exhibits his intent to
make the delay between contact and signaling as small as possible.

Our construction of "when" matches that of the district court. Although the district court initially construed "when" to mean "at the time that," it recognized that its choice of words could be read out of context to require immediate signaling, a physical impossibility. The district court therefore clarified its construction as follows:

While it is of course true that the laws of nature dictate that no detection device can be "absolutely instantaneous," the claims, specifications, figures, and Mr. McMurtry's testimony confirm that the patented probes signal as soon as possible when the stylus tip contacts the workpiece. The quicker the Renishaw probes trigger, the better their performance. In short, the patents teach the quickest signaling possible, and there is no suggestion otherwise. In fact, Mr. McMurtry stated that he taught good probes with quick signals, "wouldn't do anything but that, but to teach the best."

Renishaw, 974 F. Supp. at 1071. Consistent with this understanding and with the understanding that the claimed probes operate at a micron-level scale, we hold that claim 2 covers probes which signal within a nonappreciable period of time after contact such that the delay in signaling is insignificant when compared to the sensitivity and accuracy of the probe.

1. Claim 1, Element [b]: "a pin for extending into said security slot . . . when said slot engagement member is in locked position."

For the reasons expressed above, the term "when" is defined as "at or during the time that." The balance of the claim language needs no construction.

The parties dispute whether the clause "for extending into said security slot proximate said slot engaging portion when said slot engagement member is in said locked position" describes a functional attribute of the pin or a purely structural one. At the district court the parties agreed that in this context "when" means "at or during the time that," and on appeal they frame the question as whether "extending" is an "active verb" or a "state of being." The district court ruled that "extending" is used as an active verb, and that the pin must extend at or during the time that the slot engagement member is in the locked position. Kensington states that the court's construction is inconsistent with the plain meaning of the claim language, that the court improperly excluded the embodiments of patent figures 11 and 13 from the scope of the claims, and that this construction violates the doctrine of claim differentiation because during reexamination "when" was amended to "after" in other claims, which are presumptively of different scope, but was not amended in claim 10.

The specification shows that in operation of the patented device the slot engagement member is first placed in the security slot and then rotated to reach the locked position. The pin extends into the slot and prevents rotation to the unlocked position. The specification describes some embodiments in which the pin is extended into the slot before the slot engagement member is rotated, and others wherein the pin is extended after the locked position is reached by rotation. The '989 patent, a divisional in a family of patents claiming priority to U.S. Application Ser. No. 07/824,964, is directed to the invention exemplified in Figure 14, depicting an embodiment in which the pin is extended after the slot engagement member is in locked position. Figure 14 is shown on the front page of the '989 patent. See 37 C.F.R. § 1.84(j) ("One of the [drawings] should be suitable for inclusion on the front page of the patent application publication and patent as the illustration of the invention.") The claim states that the pin is "for extending" when the slot engagement member is in locked position (that is, after it is in the slot and rotated). Viewed in light of the specification, the phrase "for extending" is a functional restriction on the pin. See, e.g., K-2 Corp. v. Salomon S.A., 191 F.3d 1356, 1363, 52 USPQ2d 1001, 1004 (Fed. Cir. 1999) ("[T]he functional language is, of course, an additional limitation in the claim.") Kensington's argument that "for extending" describes a "state of being" that encompasses a pin that extends into the slot before locking is negated by the explanation and argument during prosecution. We conclude, as did the district court, that the participle "extending" refers to
During prosecution of the reexamination application, in response to a rejection of independent claims 1, 10, and 11 under 35 U.S.C. § 103, the applicant described the device of the Jacobi reference with: "A pin 25 is movable when the locking member is in the locked position to prevent the locking member from rotating," and also distinguished the reference on other grounds. In addressing a rejection of claims 1-3 under 35 U.S.C. § 102 and § 103 based on the Young reference, the applicant distinguished the pin, argued that "for extending" is a functional recitation that must be given patentable weight, and identified "when said slot engagement member is in said locked position" as a limitation not present in the references. The examiner accepted this argument, which the applicant consistently applied to the pin element of independent claims 1, 10 and 11, and withdrew rejections related to the Young reference, stating: "In Young, the slot engagement member 60 is put into its locking position when the pin enters the slot . . . . Because Young fails to teach a pin coupled through the housing which extends into the security slot after the slot engagement member is in the locked position the 102 rejection was improper." Statements made during prosecution which clearly disclaim a particular claim interpretation will limit the scope of the claims. Ballard Medical Products v. Allegiance Healthcare Corp., 268 F.3d 1352, 1359, 60 USPQ2d 1493, 1498 (Fed. Cir. 2001). See Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576, 34 USPQ2d 1673, 1676 (Fed. Cir. 1995) ("The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution.")

The Young reference was cited against claims 1-3. Kensington then amended independent claim 1, changing "for extending . . . when" to "and extending . . . after." Kensington also made changes to other aspects of claims 1 and 10 responsive to other rejections. The examiner then issued a Notice of Intent to Issue Reexamination Certificate, with a statement of Reasons for Allowance which reiterated his understanding that the pin is extended after the slot engagement member is in locked position:

The following is an examiner's statement of reasons for allowance: the instant invention is allowable over the prior art of record in that the prior art fails to teach or make obvious a computer locking system combining a computer having an aperture with a locking assembly as particularly claimed. In particular the prior art fails to teach or make obvious a computer locking assembly having a locking member which is rotatable to a locked position after being placed through an opening in a computer having a configuration matching that of the locking member and subsequently a pin being placed into the opening after the locking member is rotated to the locked position to hold the lock device within the computer such that the computer can be locked to another object using a cable to prevent theft of the computer.

Kensington did not respond to this statement. Although there is no obligation to respond to an examiner's statement of Reasons for Allowance, and the statement of an examiner will not necessarily limit a claim, Bell Atlantic Network Services, Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1273, 59 USPQ2d 1865, 1874 (Fed. Cir. 2001), in this case the examiner simply repeated the arguments that the patentee had presented.

The pin was claimed in original claim 10 in the same terms as in claim 1, but claim 10 was not amended. Although Kensington argues that the examiner's Reasons for Allowance apply only to the claims in which "for extending . . . when" was replaced with "and extending . . . after" during reexamination, the examiner made no such distinction, and Kensington made no arguments for claim 10 that could suggest that this statement did not apply to all the claims. See Tandon Corp. v. United States International Trade Comm'n, 831 F.2d 1017, 1023, 4 USPQ2d 1283, 1288 (Fed. Cir. 1987) (recognizing that "two claims which read differently can cover the same subject matter.")

We conclude that the pin clause of claim 10 must be construed in the same way as the pin clause of claim 1, for the examiner's Reasons for Allowance make clear that the examiner and the applicant understood that the invention requires that the pin extends (actively) into the slot after rotation. See Modine Mfg. Co. v. United States International Trade Comm'n, 75 F.3d 1545, 1551, 37 USPQ2d 1609, 1612 (Fed. Cir. 1996) ("It is incorrect to construe a claim as encompassing the scope that was relinquished in order to obtain allowance of another claim, despite a difference in the words used.").

Kensington also argues that the specification includes embodiments, shown in Figures 11 and 13, that are not within the scope of claim 10 as construed by the district court. However, embodiments in which the pin extends through the slot before rotating to locked position were claimed in U.S. Patent No. 5,381,685, not in suit. The '989 patent is a division related to the '685 patent, and was filed in response to a restriction requirement. See 35 U.S.C. § 121 ("If two or more independent and distinct inventions are claimed in one application, the Commissioner may require the application to be restricted to one of
the inventions.") The '685 patent contains claims that do not limit pin extension temporally and claims that require that the pin extends into the slot before the slot engagement member is rotated to locked position. Figure 14 was selected "as the illustration of the invention" of the '989 patent. See 37 C.F.R. § 1.84(j). The presence in the '989 specification of embodiments carried over from the parent application, but claimed in other patents, does not serve to broaden the scope of the '989 claims that were the subject of the divisional application.

3. Engagement Position Signal Limitation

222. Claim 1 of the '275 patent includes the limitations of: (1) "providing a signal when said stylus engages said object thereby indicating the position thereof" and (2) "means for providing said signal when said stylus engages the object." The claims, specification, and prosecution history unambiguously indicate that the signal is generated at the time that the stylus first engages the object, thereby indicating the position of the stylus at contact. Tr 1334. See PP 62-68 supra. Accordingly, based on the specification and prosecution history of the '275 patent, the term "when" as used in claim 1 of the '275 patent, and as the term would be understood by those skilled in the pertinent art, must be construed to have the ordinary meaning of "at the time that."

223. The Court's construction of the signaling limitation is consistent with the Federal Circuit's interpretation of the same preamble claim language in Zeiss. Moreover, Renishaw is judicially estopped from asserting a different interpretation in light of its position in the Zeiss case that the language imposed "a requirement that a stylus/object engagement-position be indicated" and the Court's acceptance of that position. See P 67 supra.

8. "Stopping . . . when"

The displacing step (c) also provides for "stopping the relative displacement of corresponding contact surfaces when said testing determines said alignment and existence of correct electrical contact." As with displacing, the parties dispute whether stopping can be done manually. They also dispute whether "stopping . . . when" requires stopping as soon as the test is positive or whether the claim embraces a more leisurely stopping as well.

As to whether stopping may be manual, the ALJ concluded that it could be. In the Matter of Certain Removable Electronic Cards, Inv. No. 337-TA-396 (Initial Determination) [hereafter "ID"] at 55. The Commission disagreed. "We believe that the failure to describe a display element of some kind, or otherwise indicate how the user would know to perform stopping, is significant." ITC at 14. "We find that the specification does not teach that stopping can be performed manually."

This Court also finds that stopping cannot be accomplished manually. The term "stopping" alone does not require this result. But taken in context, the specification clearly contemplates automated stopping. Even in the alternative embodiment allowing for manual displacement, the inventor presumes that stopping will be accomplished by the electric device rather than the card holder. Col. 8, Ins. 26-37. As to the Commission's reasoning, it is not just the absence of a display element but the absence of any means for ensuring that once good electrical contact is achieved, it is maintained during manual stopping. Thomson's reference to the file wrapper is more on point for this purpose, because Moreno did stress to the PTO the non-obviousness and novelty of his invention for performing a electric test to achieve good contact. The Court understands Moreno's statement that in his invention the card is "subsequently aligned[] by an electric device," although appearing to refer to displacing, actually refers to stopping because the card is "aligned" at the point that displacement stops. See Prosecution History at II00133.

On the question of how quickly stopping occurs, Thomson urges that it be done as soon as possible. Innovatron argues that the term "stopping . . . when" does not mean "stopping . . . as soon as" but "stopping . . . if" good contact has been established, without a temporal limitation. The Commission held that
The phrase 'stopping . . . when' means stopping that occurs as a result of a positive test for correct alignment and electrical contact, and that is instantaneous or nearly instantaneous such that relative displacing is halted before the corresponding contact surfaces are moved from a position of proper alignment and correct electrical contact to a position out of such alignment and contact.

ITC at 15.

This Court concurs in the Commission's reading. The most common use of the term "when" is to indicate a point in time. For example, of the six definitions set forth in one respectable dictionary, the first five have a temporal meaning; only the sixth supports Innovatron's conditional reading. See WEBSTER'S II at 1313; see also Renishaw, 158 F.3d at 1250-53 (construing "when" to mean "as soon as" rather than "upon condition" after extensive discussion). The specification also supports reading "when" to mean "as soon as." When disclosing his invention, Moreno wrote:

(d) Testing . . . and stopping the . . . displacement when the electric contact has been established. This step of the process has as its purpose, in combination with the preceding steps, to facilitate the rapid placement in contact because as soon as this has been done, the process stops.

Col. 2, lines 18-24. Either the specification guides selection of which ordinary meaning to ascribe to "when," cf. Renishaw, 158 F.3d at 1251, or, alternatively, even if "when" did not have "as soon as" as its ordinary meaning, Moreno has acted as his own lexicographer and imposed that meaning in the disclosure.

The "cutting" step

Claim 1 of the '361 patent states, in relevant part:

1. A method of making a pizza comprising the steps of . . . (b) placing a plurality of separated individual food portions on the dough base such that, when the dough base is cut into substantially equally sized portions, each individual food portion is located upon a portion of each piece . . .

Defendant says that the phrase "such that, when the dough base is cut into substantially equally sized portions, each individual food portion is located upon a portion of each piece" is an essential limitation of the claim requiring that the pizza be cut in a specific manner. Plaintiff contends that the phrase should be construed as an optional step that merely explains where the food portions should be placed, and says that the phrase really means: "if the dough base were cut into equal slices, a food portion would be on each slice." Plaintiff argues that cutting the pizza such that there is an individual filled pocket on each piece is not required, but that "it is enough that it is possible to do so."

But the plain language of the claim says "when," not "if." If the patent applicants had wanted the language to be hypothetical, they would have drafted it in that manner.

The ordinary meaning of "when" in "when the dough base is cut" is that at some point, the dough base will be cut, not that it may be cut. Plaintiff's argument that "when" cannot actually mean "when" because the unbaked dough base is never cut is without merit; the applicants expressly refer to an unbaked dough base in other parts of the patent claims, but not in the language at issue.

Where the plain import of the language is clear, the court will not engage in speculative interpretation. See Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1344 (Fed. Cir. 1998) (actual words of claim are the controlling focus and the ordinary meaning of the claim language controls); see also White v. Dunbar, 119 U.S. 47, 52, 7 S. Ct. 72, 74-75, 30 L. Ed. 303 (1886) ("The claim is a statutory requirement, prescribed for the very purpose of making the patentee define precisely what his invention is; and it is unjust to the public, as well as an evasion of the law, to construe it in a manner different from the plain import of its terms.").

To determine whether the inventor used an ordinary term with a special meaning, the court reviews the specification and
prosecution history. CVI/Beta Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1153 (Fed. Cir. 1997).

If the applicants wanted "when" to mean "if," they should have clearly so stated in the specification or file history. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). But the applicants never argued in the specification or during prosecution that cutting the pizza to preserve the pockets on each slice was merely optional. See Laitram Corp. v. Morehouse Indus., Inc., 143 F.3d 1456, 1463 (Fed. Cir. 1998) (noninfringement where nothing in the written description suggests patentee's interpretation).

On the contrary, the applicants repeatedly stressed that their invention featured fillings enclosed in sealed pockets, and that the pockets should be preserved by cutting pieces around them. For example, the summary of the invention states that "because the closed pockets are uniformly distributed about at least a portion of the base of the pizza shell, those pockets facilitate cutting that portion into a plurality of substantially equally sized pieces with one pocket on each piece." See Laitram, 143 F.3d at 1463 (noninfringement where patentee recited disputed limitation in the summary of the invention).

The description of the invention states that the "pinched ends of the pockets facilitate cutting the pizza shells in a plurality of equally sized pieces, by providing a visual guide as to where the pizza shells should be cut" (emphasis supplied); and "cutting the pizza shells . . . into a plurality of pieces without cutting through the interior of pockets . . . insures that any food or filling in those pockets does not accidentally spill from those pockets as the individual pizza pieces are cut and handled."

The specification thus teaches that the objective of having sealed, closed pockets of filling on the pizza is so that the filling will be neatly contained within one pocket in each serving. Cutting the pizza in the manner specified in claim 1 is essential to that purpose. See Applied Materials, Inc. v. Advanced Semiconductor Materials, Inc., 98 F.3d 1563, 1574 (Fed. Cir. 1996) ("although patent claims are not ordinarily limited to the inventor's purpose, when that purpose is included in the claims it serves as a limitation of the claimed invention").

Furthermore, if the method was not limited by the cutting feature, there would be no advantage, to the consumer, of having sealed pockets of fillings on top of a pizza. When asked by the court during oral argument why such sealed pockets would be necessary if the patent did not require that the pizza be cut to preserve the pockets, plaintiff responded: "it does make it easier, for example, to make the pie." But plaintiff presents no evidence that that explanation was ever contemplated by the inventors. Ease of preparation as an advantage of having sealed pockets was not described in the specification, nor was it argued during the prosecution of the patent or in plaintiff's memoranda to the court.

Put simply, if cutting around the sealed pockets so that the contents do not spill out is not a required element of the patent, plaintiff's invention would make no sense. Construing the step of cutting the pizza so that the individual, sealed pockets are on each slice as an essential limitation of the invention preserves the "internal coherence" of the patent. See Markman v. Westview Instruments, Inc., 517 U.S. 370, 389, 116 S. Ct. 1384, 1395, 134 L. Ed. 2d 577 (1996) (task of the court is to determine whether a definition fully comports with the specification and claims and will preserve the patent's internal coherence).

Finally, the prosecution history shows that the applicants added the disputed language to the patent claim to overcome the patent examiner's rejections. On December 16, 1985, the examiner rejected the pending method claims 14-24 as "obvious manipulations [of the prior art] in [the] absence of unexpected or unobvious functions and/or results for same," and also rejected claims 14-18 as differing from the prior art "primarily in that they call for a pizza product" but that "it is not seen that this difference constitute[s] unobvious subject matter.

In response, the applicants amended prosecution claim 14(b) to recite: "placing a plurality of separated individual food portions on the dough base such that, when the dough base is cut into substantially equally sized portions, each individual food portion is located upon a portion of each piece " (amendments emphasized). That language was brought to the examiner's attention in the remarks accompanying the amendments, which were "in accord" with the applicants' interview with the examiner. The claims were allowed in the next office action.

The court concludes that the language was amended to provide the unobvious or unexpected function and/or results that the examiner demanded by describing a method to create a pizza with an enclosed pocket on each slice. Where language is added to overcome a rejection that an invention was obvious under the prior art, it is deemed to be an essential part of the
4. Meaning of "Whenever"

Semmler now argues that in distinguishing the prior art cited by the examiner, it was only necessary for him to show that his invention effected a fuel cut during both open and closed throttle overrunning and that accordingly, he is "not estopped to assert the doctrine of equivalents against Honda's fuel cut system that also cuts the fuel during both open and closed throttle over-running." Plaintiff's Combined Memorandum in Opposition to Honda's Motion for Summary Judgment of Non-Infringement and Invalidity, page 18. He argues that in the phrase "whenever the engine is over-running," he used the word "whenever" in its adverbial sense meaning "no matter when," instead of "each and every time." In this manner, Semmler is able to assert that in the proceedings before the patent office, he did not limit his invention to a device which would interrupt fuel supply each and every time the engine is overrunning, but that his claims were broad enough to cover any device which, like the accused device, effects both open and closed throttle fuel cuts. These arguments are unpersuasive.

The word "whenever" can be used as an adverb and as a conjunction. When used as an adverb, the word "whenever" means "at whatever time," or "no matter when," such as in the sentence: "We can leave whenever." Webster's Third New International Dictionary 2602 (1981). The word "whenever" can also be used as a subordinating conjunction which connects a subordinate clause to a main clause. When used as a conjunction, the word "whenever" can mean "at any or all times that" or "in any or every instance in which." Id. This use of "whenever" is meant to convey the existence of a consistent cause and effect relationship between the events in the "whenever" cause and the events in the main clause. Examples of this usage are: "Whenever it rains, he carries his umbrella."; "Whenever the large hand of the grandfather clock is over the number twelve, the chimes ring the hour." The word "whenever" used as a conjunction may also take its adverbial meaning. Examples of this would include: "Whenever [at whatever time, no matter when] you need help, I will assist you."; "Whenever you are ready, we will leave." In this latter usage, the word "whenever" begins a clause containing a conditional event or circumstance which may or may not happen to trigger the result in the main clause. This meaning of "whenever" entails an element of randomness and uncertainty, leaving open the possibility that the conditional event may never occur.

In the claims of the Semmler patent, the phrase "that is, whenever the engine is over-running" is a parenthetical phrase which explains the preceding phrase "whenever engine speed exceeds that speed which is associated with a predetermined state of the selecting means" and further defines the fixed relationship which will trigger the fuel cut. Claim 1, of the Semmler patent, Joint Exhibit I, column 9, beginning at line 46, reads as follows:

the two said monitoring means being linked together in a control circuit which provides a fixed relationship between the state of the said selecting means and engine speed, in such a manner that whenever engine speed exceeds that speed which is associated with a predetermined state of the selecting means, that is, whenever the engine is over-running, the said switching means operates the said control device to interrupt the supply of fuel[.] (Emphasis added).

In this sentence, the first "whenever" is used as a subordinating conjunction linking the phrases "whenever engine speed exceeds that speed," with the phrase "the said switching means operates the said control device." Semmler concedes that the first "whenever" should be given the meaning "each and every time," but argues that in the parenthetical phrase, it should be given its adverbial meaning, "no matter when." However, since the second "whenever" commences a parenthetical phrase intended to explain the preceding "whenever" phrase and to function as a definition of that phrase, it is logical to conclude that both "whenevers" are used in the same sense, meaning "each and every time."

Further, since the topic at issue is a device which produces a result, i.e., the interruption of fuel, upon the occurrence of a stimulus, i.e., where engine speed exceeds that speed which is associated with a predetermined throttle setting, it makes more sense, in terms of describing a working, effective invention, to construe "whenever" as meaning that the fuel supply is cut each and every time the stimulus of engine overrunning occurs. This usage is more appropriate in a description of how a device works. As indicated by the previous examples, construing the word "whenever" in its conditional sense of "at whatever time" or "no matter when" suggests that the condition, engine overrunning, might never occur. Such a suggestion, in addition to being inconsistent with the normal operation of an automobile, would also be out of context in and irrelevant.
to a description of how a device works in response to the stimulus of overrunning when it does occur. Even if "whenever" is defined as "at whatever time" or "no matter when", the second "whenever" clause, given its context, could only be reasonably construed as meaning that the fuel saving is effected "each and every time the engine is overrunning, regardless of at what time that occurs." Thus, in this instance, "at whatever time" and "each and every time" would no doubt mean the same thing to a person skilled in the art of automotive fuel control systems.

5. Driveability Issue

The Court has determined that "whenever" as used in the Semmler patent, has its usual and customary meaning, that is, "each and every time." Semmler argues that a device constructed in accordance with this interpretation would render an automobile "virtually undriveable, fundamentally unsafe, and certainly unsaleable." Plaintiff's Combined Memorandum In Opposition To Honda's Motions For Summary Judgment of Non-infringement and Non-validity, page 3. Whether or not this is the case, it is irrelevant. As the Court noted in its opinion and order of September 30, 1996, at p. 17: "There is no discussion of driveability problems in relation to setting the fuel cut. Fuel saving, not driveability, is the primary goal of the invention as described by Semmler." Some of the patents for automotive fuel control systems presently before the Court contain provisions for avoiding driveability problems. With the possible exception of teaching that the overrunning fixed relationship should be set in such a way that the maximum vehicle speed can be obtained under the most favorable anticipated operating conditions, the Semmler patent ignores driveability problems. Evidence in the Markman hearing indicated that potential licensees of the Semmler device rejected it because of anticipated driveability problems. See, e.g., exhibits CC and HH. Semmler's arguments about driveability problems have not persuaded the Court to modify its interpretation of Semmler's claims as set forth in its orders of September 30, 1996 and December 16, 1996. Those arguments were fully considered by the Court when it interpreted the patent claims.

6. Whereby Low Pressure is Maintained Throughout said Annular Space (Claims 9 and 15)

Plaintiffs focus on the term "low pressure" and define it as "any pressure below atmospheric pressure." 57 Defendant's position is that the whereby clause is meaningful and is limiting. 58 Defendant focuses on three terms within the clause, "low pressure," "maintained," and "annular space." Defendant originally argued that the term "low pressure" is a relative term that is vague in the context of claims 9 and 15 because it lacks a reference point. 59 In its response brief, Defendant suggested that the specification and prosecution history dictate a meaning of "less than approximately 100 mbars." 60 Defendant argues that "to maintain" means actively to keep in existing state. 61 As for "annular space," Defendant proposes that it includes both the free passageway and the microporous insulation. 62 Plaintiffs do not contest that the clause has meaning, but take issue with Defendant's definitions of "low pressure" and "maintained."

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -

Although the court does not agree with Defendant's reasoning, the court does agree that the whereby clause has meaning as
a limiting clause. Of the three terms in that clause on which Defendant focused, only one, "low pressure," requires much
discussion. The court begins there. One dictionary definition of the word "low" is "below a standard or average." Webster's
II New Riverside University Dictionary 706 (1984). The court is convinced that atmospheric pressure (1000 millibars or 1
bar) is a standard recognized by persons skilled in the art of the patent. Accordingly, the definition proposed by Plaintiffs,
"any pressure below atmospheric pressure," provides the term with its ordinary meaning. The term is easily understood and
is not vague.

"Unless compelled otherwise, a court will give a claim term the full range of its ordinary meaning as understood by persons
skilled in the relevant art." Tex. Digital Sys., Inc., 308 F.3d at 1202. A court should not narrow a claim term simply based on
descriptions of the invention in the specification and prosecution history. See CCS Fitness, Inc., 288 F.3d at 1366. Rather,
the ordinary meaning applies unless the patentee expressly narrows it, for example, by providing his own definition, by
distinguishing the claim term from a prior invention, or by disclaiming certain subject matter. Id. at 1366-67. The party
seeking to narrow the definition bears the burden of overcoming the presumption in favor of the term's ordinary meaning.
Id. at 1366.

Defendant's efforts to narrow the meaning to cover only pressures below 100 millibars are unavailing for several reasons.
First, the doctrine of claim differentiation supports the conclusion that different claims have different scopes. See Sunrace
Roots Enter, v. Sram Corp., 336 F.3d 1298, 1302 (Fed. Cir. 2003). "Our court has made clear that when a patent claim does
not contain a certain limitation and another claim does, that limitation cannot be read into the former claim in determining
either validity or infringement." Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1326 (Fed. Cir. 2003) (internal
quotation marks omitted). In this case, only claim 1 is limited to pressures below 100 millibars. 63 If not for this difference,
claims 9 and 15 could have been written as dependent claims on claim 1.

63 Compare 547 patent at 9:13-14 (stating "whereby low pressure below 100 millibars is maintained throughout said
annular space") with id. at 9:50-51; 10:32-33 (stating "whereby low pressure is maintained throughout said annular space").

64 Defendant contends that low pressure can only be construed to mean pressure below 100 millibars and, therefore, must
be so construed throughout the patent. Defendant relies on Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1538 (Fed. Cir.
1991), which quotes Autogiro Co. of Am. v. United States, 384 F.2d 391, 404, 181 Ct. Cl. 55 (Ct. Cl. 1967), as stating:

The concept of claim differentiation . . . states that claims should be presumed to cover different inventions. This means
that an interpretation of a claim should be avoided if it would make the claim read like another one. Claim differentiation is
a guide, not a rigid rule. If a claim will bear only one interpretation, similarity will have to be tolerated.

Because the court disagrees with Defendant that "low pressure" is narrowed in any respect by the intrinsic evidence as
explained in this section, the court finds that the cited case law is inapplicable. Certainly, "low pressure" retains the same
meaning throughout the claims, it simply does not retain the added limitation of claim 1.

Second, the specification supports a broad reading of "low pressure." In one place, the specification calls for pressure in the
range of .5 millibars to 100 millibars, stating: "One result achieved by the invention is that a partial vacuum will prove
sufficient resulting advantageously in a reduced pressure of between 0.5 mbars and 100 mbars." 65 However, in another
embodiment, it is contemplated that "depression on the order of 1 to 100 mbars, which optionally might not exceed a low
pressure value of about 900 mbars" could be used under certain circumstances. 66 In light of this second embodiment,
the first does not evidence an intention to depart from the full range of ordinary meaning. Rather, the two references together
support a finding that the patentee intended for low pressure to carry a broad meaning.

65 547 patent at 3:26-29; see also 7:19-20, 64-67.

66 Id. at 8:41-52 (emphasis added). Because the remainder of this sentence also refers to a pressure of fifty bars, the section
is confusing to Defendant. See Defendant's Response Brief on claim Construction, Docket Entry No. 26, pp. 1-2. "It is unclear from that passage exactly what pressure would be considered low." Id. at p. 2. The court is not similarly confused. The sentence speaks of "overpressure" and pressures "as high as 50 bars," while specifically referring to 900 mbars as "a low pressure value." 547 patent at 8:47, 49, 52.

Third and last, the prosecution history indicates that the patentee relinquished a portion of the full range of meaning attributable to the term "low pressure" with regard only to claim 1. Upon application, the examiner rejected claims 1-3 over U.S. Patent No. 4,718,459 ("Adorjan"). 67 Interestingly, the rejected claim 3 included a pressure requirement of 0.5 to 100 millibars. 68 The examiner explained that Adorjan discloses a double-casing pipe for subsea pipelines, an annular sealed space, coaxially-arranged pipes, flexible open-pore microporous material, and a free passageway for gas flow. 69 With regard to low pressure, he noted that Adorjan "described that the gas can be at 0.896 Pascals in certain water depths, which suggests at lesser depths lesser pressure is needed, and that this pressure falls between the range set forth in claim 3." 70

Defendant's hearing exhibits, Tab 6, Office Action Summary dated Aug. 18, 1999, p. 3. The original claims read as follows:

1. A double casing pipe to be especially used in offshore oil pipelines, characterized in that, in an annular sealed space (5) located between an inner tube (1) and an outer tube (2) both coaxially arranged inside each other, there is included a self-sustaining plate (7, 8, 9) made of open pore-microporous [sic] material, which is flexible enough to be wound around the inner tube (1), and in that there is provided outside said material within said annular space, a free passageway to allow longitudinal gas flow whereby low pressure is maintained throughout said annular space.

2. A pipe according to claim 1, characterized in that said passageway is in the form of an annular layer which remains free between the plate of microporous material and the inner wall of the outer tube, said plate being inferior in thickness to said annular space (5).

3. A pipe according to [sic] claims [sic] 1 or 2, characterized in that said low pressure is comprised between 0.5 [sic] and 100 millibars.

Defendant's hearing exhibits, Tab 2, original claims.

In his responsive amendment, the patentee made several changes to claim 1, but did not amend the low pressure requirements. 71 Instead, he argued that Adorjan requires that high pressure, not low pressure, be maintained in the annular space, in order to keep water out. 72 In response to this attempt to traverse his rejection by distinguishing Adorjan, the examiner stated:

With respect to the gas pressure, applicant only claims low pressure, which is a relative term, and therefore the pressure set forth in Adorjan is considered to be a low pressure. Also, due to the fact that the pressure of Adorjan is dependent upon depth of the pipe in water, a pipe used for shallow water depths would have a relatively low gas pressure needed, and would still meet applicant's claim language. 73

Thereafter, the patentee acquiesced and added the limitation to claim 1 requiring that pressure below 100 millibars be maintained. 74 This amendment also contained two previously dependent claims rewritten into what eventually became
claims 9 and 15. Neither contained the 100 millibar limitation. The patentee explained the changes to claim 1, "In order to overcome [the] rejection, Claim 1 has been amended to make it clear that the self-sustaining plate is made of an open-pore microporous insulating material and that low pressure below 100 mbars is maintained throughout the annular space in which the self-sustaining plate is located." In addition, the patentee again argued against the examiner's position that Adorjan employs low pressure in the annulus:

Contrary to the present invention, Adorjan teaches that a high pressure should be maintained throughout the annular space.

... The Examiner relies upon a typographical error . . . wherein Adorjan states, at 300 feet (91.4 meters), the external pressure on a pipeline will be 129.9 pounds per square inch (0.896 Pa). Thus, gas in the annulus must be pressurized to a value greater than 129.9 psi (0.896 Pa).

This statement contains an error because the text should read, 0.89 MPa' and not merely 0.896 Pa. If one thinks about it, the value of 0.896 Pa is completely absurd since a person of ordinary skill in this technology knows that 91.4 meters of water produce a pressure of about 9 bars which is 0.9 MPa. Thus, the apparent inadvertent deletion of the M creates an error by a factor of approximately 1 million.

Ultimately, the examiner approved the 547 patent with the additional low pressure limitation in claim 1, but not in claims 9 and 15. The discourse between patentee and examiner suggests at least two plausible reasons for approval; either the two clarifications to claim 1 satisfied the examiner or the patentee convinced the examiner that he had misread Adorjan. Either way, the examiner allowed the patentee's choice of words in claims 9 and 15, which facially did not include the limitation that the pressure be below 100 millibars. The court concludes from this fact that claims 9 and 15 were patentable (because of other limitations they contained), without narrowing the bounds of "low pressure." Defendant conceded as much during the Markman hearing.

79 Defendant's Markman hearing arguments.
- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

From a close review of the prosecution history, the court concludes that the only clear disavowal of subject matter in the prosecution history relates to claim 1. Cf. Sunrace Roots Enter., 336 F.3d at 1306 (stating that prosecution history cannot be
used to narrow a claim absent a clear disavowal. Even though prosecution history estoppel affects claim 1, it does not preclude the construction of "low pressure" advanced by Plaintiffs and recommended by this court or otherwise limit claims 9 and 15 in any way.

The next term of the whereby clause that is in contention is "maintained." "Maintain" means to continue, to carry on, or to preserve or to keep in an existing condition. Webster's II New Riverside University Dictionary 717 (1984). The court finds no support in the intrinsic evidence or elsewhere for Defendant's suggestion that the pressure must be actively maintained. Sealing a pipe section effectively maintains the pressure. Finally, with regard to "annular space," the parties agree that it includes both the free passageway and the microporous material. To the extent any definition is necessary, the court concurs with the parties.

In summary, the court recommends that "whereby low pressure is maintained throughout said annular space" be construed to refer to pressure below atmospheric pressure that is preserved within the annular space, which includes both the free passageway and the microporous insulation.

5. "whereby rotational movement of the mounting means is inhibited" -- This term appears in both Claims 1 and 8. The parties agree that the "whereby" clause only modifies the preceding clause describing the "projection means" in Clause 8, but the parties disagree about what the clause modifies in Claim 1.

Claim 1: ". . . and a means for mounting said coiled ribbon spring, . . . and said mounting means being secured in said channel means, said mounting means having a raised spine positioned between and in the same plane as said inwardly turned opposed flanges of said channel means whereby rotational motion of said mounting means in inhibited."

Claim 8: ". . . and a means for mounting said coiled ribbon spring, . . ., said mounting means being secured in said channel means and the mounting means having projection means positioned between said inwardly turned opposite flanges of the channel means within which the mounting means is positioned, whereby rotational movement of the mounting means in inhibited."

I find that as a matter of syntax, the "whereby" clause only modifies the preceding clause describing the raised spine. Amesbury's citation to Idexx Laboratories, Inc. v. Abaxis, Inc., 222 F.Supp.2d 66, 73-74 (D. Me. 2002) is unavailing. There is no rule that a "whereby" clause must modify the entire claim limitation. In fact, the Court in Idexx concluded that the "syntax of the sentence alone does not answer [the] debate" of whether the "whereby" clause at issue in that case modified only the three steps explicitly recounted or the entire description of the claimed method. Id.

"What controls here is no legal test' derived from some different fact situation but common sense interpretation of language according to the rules of grammar in the context in which it occurs." In re Dean, 48 C.C.P.A. 1072, 291 F.2d 947, 952-53, 1961 Dec. Comm'r Pat. 474 (1961)(emphasis added). It seems clear that the "whereby" clause only modifies the description of the "raised spine", not that description and the preceding clause which is set off by a comma. There is certainly no basis in the syntax of Claim 1 to conclude, as Amesbury argues, that the rotation of the mounting means is inhibited "either by the structure of the mounting means alone or in conjunction with the way it is installed in the mounting assembly." It would actually make more sense if the "whereby" clause in Claim 8 modified both the of requirement of being secured in the channel and having projection means positioned in a certain way. However, the parties agree that even in Claim 8, the "whereby" clause only modifies the "projection means".

To the degree that there is any confusion or ambiguity in the syntax of Claim 1, I find that on balance the prosecution history supports my conclusion that the "whereby" clause only applies to the "raised spine" described in Claim 1. I look to the prosecution history as urged by Caldwell, because the specification could be interpreted to add to the confusion and ambiguity Amesbury is attempting to exploit.

Some sections of the specification clearly link the prevention of rotation with the positioning of the "raised spine". For example, the description of the mounting element in Figures 7 and 8 explains that the width of the raised spine formation is arranged such that it is a snug fit between the open lip portions of a channel to inhibit a rotational, pivoting or twisting motion. [638 Patent, col. 5, 11. 7-13.] The specification makes this point even more clearly with respect to the "lateral ears"
formation, which has the same purpose as the "raised spine", since the "lateral ears . . . are intended to prevent rotation of the mounting element about a fixing screw . . . received, in use, in recessed bore." [638 Patent, col. 4, 11. 44-47.]

In contrast, other parts can be read to mean that the fixing screw is also supposed to prevent rotation. According to the specification, "the mounting element may be provided with formations conformed so as to cooperate with a portion of the sash frame within which the element is to be received, such that contact of said formations with said sash frame inhibits in a rotational, pivoting, or twisting sense of the element relative to the sash frame." [638 Patent, Summary, col. 2, 11. 59-64 (emphasis added).] The use of the word "may" in this description is confusing and misleading because both of the independent claims require respectively a "raised spine" or "projection means" that inhibits rotation. The Summary of the Invention then sets out in a separate paragraph that "it will be apparent that the mounting element does not rotate or otherwise move with the spring but is substantially stationary when the spring is in operation." [638 Patent, Summary, col. 2, 11. 65-67.] The fact that the two sentences are separate paragraphs could be read to mean that even without the formation described in the first paragraph, the mounting element does not rotate. And the only explanation for non-rotation is that the mounting element is be secured to the window frame by a fixing screw.

Despite the ambiguity in the specification, the prosecution history "inform[s] the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution, making the claim scope narrower than it would otherwise be." Phillips, 415 F.3d at 1317. Originally Claim 1 made no mention of the "raised spine . . . whereby rotational motion of said mounting means is inhibited." The patent examiner denied the patent, rejecting Claims 1-5 and 8-9 because they were clearly anticipated by Sterner's "Coil spring counterbalance hardware assembly and connection method therefor", U.S. Patent No. 5,157,808 and Foster's "Spring sash counterbalance", U.S. Patent No. 3,992,751. It is only when the patentee sought to amend the claims in light of the rejection that he added "said mounting means having a raised spine positioned between and in the same plane as said inwardly turned opposed flanges of said channel means whereby rotational motion of said mounting means is inhibited." In explaining the change, the patentee emphasized that "none of the cited art show anti-rotational means which interact with flanged channels to prevent rotation of the mounting means." Consequently, I find that the "whereby" clause only modifies the description of the "raised spine", not that description and the preceding clause which is set off by a comma.

Having reached this conclusion, however, I do not mean that the fixing screw or other fixing method that secures the mounting element to the window jamb channel cannot contribute to the substantially stationary position of the mounting element when the spring is in operation. There is nothing in the Claims or the specification that would prohibit attributing any anti-rotational effect to the method of fixing or securing the mounting element to the window jamb channel. The Claims recognize, for instance, that if a mounting element without a raised spine was fixed to the channel, it might not rotate or pivot under minimal stress. But when the window sash was opened with a certain amount of force or opened a certain distance, the force might overcome the anti-rotational inertia effect of simply being secured by a fixing screw. Therefore, it is the addition of the "raised spine" in this patent that inhibits any rotation of the mounting element under any normal condition.

Construction -- The mounting means is to be secured in the channel means. And the mounting means is to have a raised spine positioned between and in the same plane as said inwardly turned opposed flanges of said channel means whereby rotational motion of said mounting means is inhibited.

7. What is the Proper Construction for the Phrase "whereby said substantially uniform particulate mixture is deformed, consolidated into a desired form and solidified in the extrusion die and is extruded from said die cavity as a solid composite porous article" in the '948 Patent?

Claim 1 of the '948 patent contains the phrase "whereby said substantially uniform particulate mixture is deformed, consolidated into a desired form and solidified in the extrusion die and is extruded from said die cavity as a solid composite porous article." KXI contends this "whereby" clause merely states the necessary result of operating a device containing the claimed elements. According to KXI, it does not add any additional claim limitations. Culligan contends the "whereby" clause adds a limitation to the claim. Culligan construes the "whereby" clause to mean that, as a necessary result of the above steps, the "substantially uniform particulate mixture' changes form due to softening, is shaped under pressure and is
solidified, all within the extrusion die, and the resulting product is extruded from the die as a solid composite article having pores.

KXI argues that the Federal Circuit teaches that a "whereby" clause that merely states the result of the limitations in the claim, "adds nothing to the patentability or the substance of the claim[,]" citing Texas Instruments v. ITC, 988 F.2d 1165, 1172 (Fed. Cir. 1993). According to KXI, the "whereby" clause of claim 1 "merely states the necessary result of operating a device containing the claimed elements," and therefore, "does not add any additional claim limitations."

Culligan argues that the "whereby" clause was added to the claim to overcome an examiner's objection, and as such it "must be deemed an essential feature necessary to the establishment of infringement[,]" citing Eltech Sys. Corp. v. PPG Indus., Inc., 710 F. Supp. 622, 633 (W.D. La. 1988), aff'd 903 F.2d 805 (Fed. Cir. 1990). See also Quality Semiconductor, Inc. v. Pericom Semiconductor, Inc., No. C-95-01785 MHP, 1998 WL 118186, at *5-6 (N.D. Cal. March 2, 1998); Thermalloy Inc. v. Aavid Eng'g, Inc., 935 F. Supp. 55, 60 (D.N.H. 1996, aff'd, 121 F.3d 691 (Fed. Cir. 1997).

According to Culligan, during the prosecution of the '948 patent, the patentee amended claim 1 to include the present "whereby" clause "for the express purpose of distinguishing that claim over the prior art." The patentee made the following amendment: "whereby said [solid composite material] substantially uniform particulate mixture is deformed, consolidated into a desired form and solidified in the extrusion die and is extruded from said die cavity as a solid composite porous article." The patentee added this language to claim 1 to overcome a rejection based on the prior art of the Leitl and Zavasnik patents.

According to Culligan, the patentee relied on the amended "whereby" clause to distinguish the Leitl and Zavasnik patents. For example, the patentee distinguished the invention of the application from Zavasnik as follows: "solidification [in the Zavasnik extruder] . . . takes place outside the extrusion die, i.e., in the water chamber (12), whereas in the claimed invention of this Application, deformation, consolidation and solidification of the particulate matter occurs in the die cavity."

The court agrees with Culligan that the patentee amended claim 1 by adding the "whereby" clause to overcome a rejection by the examiner, and then relied on the amendment to distinguish prior art. The court finds the "whereby" clause does not merely state the result of the limitations of the claim, but adds limitations to the claim. The court construes the "whereby" clause according to the ordinary meaning of its terms. Accordingly, the court finds the phrase, "whereby said substantially uniform particulate mixture is deformed, consolidated into a desired form and solidified in the extrusion die and is extruded from said die cavity as a solid composite porous article[,]" means that, as a necessary result of the above steps, the "substantially uniform particulate mixture" changes form due to softening, is shaped under pressure, and is solidified, all within the extrusion die, and the resulting product is extruded from the die as a solid composite article having pores.

Claim 1 concludes with a "whereby" clause:

whereby said vascular cavity is occluded by said distal tip, and any thrombus formed by use of said tip

('136 Patent, Col. 9:17-19.)

The parties dispute the proper construction of the "whereby" clause. A "whereby" clause in a method claim may express the intended result of a process. See Minton v. Nat'l Ass'n of Securities Dealers, Inc., 336 F.3d 1373, 1381 (Fed. Cir. 2003). The "whereby" clause may also express a limitation on the method and thus be part of the method itself. Hoffer v. Microsoft Corp., 405 F.3d 1326, 1330 (Fed. Cir. 2005). In this case, the Court finds that with respect to Claim 1, the "whereby" clause imposes a limitation. The "whereby" clause requires that the occlusion be composed of both the distal tip and any thrombus formed by use of the distal tip.

The Court construes "whereby said vascular cavity is occluded by said distal tip, and any thrombus formed by use of said tip"
As a consequence of the method, a vascular cavity is blocked by the detached distal tip and any thrombus formed by use of the distal tip.

**4420**

e. "whereby the processing does not require[] movement or operator handling of said wafers between said steps"

The phrase "whereby the processing does not require[] movement or operator handling of said wafers between said steps" appears in Claim 1 of the ‘532 patent. An almost identical phrase appears in Claims 54, 55, 57 and 58. CFMT asserts that this phrase precludes movement of the wafers between steps of the claimed process. According to CFMT, however, the phrase does not preclude all movement of wafers. YieldUP counters that the phrase excludes any cleaning process in which wafers are moved between vessels between steps of the process.

The specification of the ‘532 patent states that the invention does not require "handling by a human or robotic operator of the wafers between the steps of a multi-step fluid process such as prediffusion cleaning." During the prosecution of the ‘532 patent, the inventors distinguished their invention from the prior art because each step in the invention is carried out in a single vessel. For example, to overcome the examiner's rejection based on the Aigo and Gluck references, McConnell and Walter stated that "the wafers are apparently still moved from step to step in the wafer boat . . . ." Therefore, the court finds, as advocated by YieldUP, that the phrase "whereby the processing does not require[] movement or operator handling of said wafers between said steps" excludes any cleaning process in which wafers are moved between vessels between steps of the process.

**4421**
f. "wherein, during use"

The phrase "wherein, during use" appears in independent claim 9. Boston Scientific asserts that the phrase is unambiguous and needs no further explanation. ev3 proposes that the phrase be construed as "[a] user, such as an interventional cardiologist, positions the guidewire across the portion of the vessel that has been narrowed by disease, manually expands the filter and deploys the stent in the portion of the vessel that has been narrowed by disease, removes the catheter from the vessel, and leaves the stent in place."

Ev3’s proposed limitations on "wherein, during use" conflict with the Court's previous construction of the phrases "deploying the filter" and "filter . . . deployment capabilities" as not requiring manual action. In addition, the phrase "wherein, during use" is readily understood. Therefore, the Court declines to construe the phrase.

--- Footnotes ---

5 Similarly, the Court declines to construe the phrase "wherein, during use" in the ‘987 and ‘505 Patents.

--- End Footnotes ---

**4422**

III

M-3 contends that there is a genuine dispute of material fact as to whether Cargo's Model A contains the key limitation: "the counterbalancing means . . . wherein each spring element is tensioned so as to be able to independently restrain the door against opening once the door is in a closed position" (the "independent spring restraint feature"). '828 patent, col. 4, l. 65 -
First, we must construe the key limitation in claim 1 of the '828 patent. Claim construction is a matter of law that we review without deference. Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1455, 46 USPQ2d 1169, 1174 (Fed. Cir. 1998) (en banc). Claim language must be interpreted in light of the specification and prosecution history. Biovail Corp. Int'l v. Andrx Pharms., Inc., 239 F.3d 1297, 1301, 57 USPQ2d 1813, 1816 (Fed. Cir. 2001).

M-3 suggests that the claim should be construed so that the springs act to restrain the door against any "opening." Appellant's Reply Br. at 8-9. On the other hand, Cargo argues that each spring must be independently tensioned so as to "limit or restrict the door from opening once it is closed," but not "to restrict the door from any movement whatsoever." Appellees' Br. at 20-21. We agree with Cargo's claim interpretation.

The language of the claim requires that the device "restrain the door against opening." The dictionary definition of "restrain" includes both "prevent" and "moderate or limit the force." Webster's Third New International Dictionary 1936 (1968). This definition supports the view that the claim limitation encompasses restricting the door from opening, without restraining the door against any opening. The specification also indicates that Cargo's broader definition was valid:

'[The] door remains partially counterbalanced even in the event that one spring breaks so that a closed door will remain closed instead of dropping immediately to the open position. Furthermore, if a spring breaks when door is being opened or closed, door will open to the open position, but with less force than would be the case using a single spring system, an important safety feature of the present invention.'

'828 patent, col. 4, ll. 30-37 (numbering omitted) (emphasis added).

The specification focuses on the safety aspect of decreasing the force associated with opening ramp doors. As long as the door is at least partially counterbalanced against opening, this feature is achieved. In light of the claim language and the specification, we construe the "independent spring restraint feature" as requiring two springs that are independently sufficient to counterbalance the door and reduce the force with which the ramp door swings open, although each spring acting alone does not have to restrict the door from any movement whatsoever.

4423

(7) "Wherein said loops disposed on said first meander patterns and said loops disposed on said second meander patterns are disposed and adapted to cooperate so that upon the expansion of said stent said loops change shape to compensate for the tendency of said stent to foreshorten when said stent is expanded." The loops disposed on the first meander patterns and the loops disposed on the second meander patterns must be oriented in different directions, one a generally vertical direction and one a generally horizontal or longitudinal direction. This limitation encompasses growth of one of the sets of loops in the longitudinal direction that is caused by expansion of the stent by a balloon or other mechanical means.

4424

1. "wherein said metal block further comprise[s] a plurality of receptacles for supporting a plurality of containers"

This claim element limits the metal block to one having a plurality of recesses. As acknowledged by Applaera, the term "receptacles" equates to the written specification's "reaction well" or "reaction vessel." See Markman Tr. Vol. 1 [Doc. # 681] at 120:4, 13-15. By further specifying that the "reaction well" of the specification is "for supporting a plurality of containers," the claim designates the first of the two alternative kinds of reaction wells described in the specification, see '675 Patent, col. 7, l. 63 - col. 8, l. 3 ("The heat exchanger 10 supports the reaction well 40, which may be a recess machined into the heat exchanger, but preferably is a plastic container which holds the fluids involved in the reaction and which sits in a recess formed in heat exchanger 10."). Because nowhere does the specification envision that the preferred reaction well, a plastic container which holds fluids, would in turn be used for supporting another container. Thus, the language of the claim as defined in light of the specification rebuts assigning "receptacle" its ordinary meaning. See e.g., Webster's New
World Dictionary of the American Language 1185 (2d college ed. 1984)("anything used to contain or hold something else; container; vessel.").

4425

2. "wherein the bias element operates on the blade through a cavity formed in the handle, the cavity extending parallel to and spaced outwardly from the plane of travel of the blade"

Plaintiff proposes "at least a portion of the bias element is positioned within a recess or cavity in the handle. A second portion transmits force from the first portion to the blade, which is outside the cavity."

Defendant proposes "wherein the bias element imparts the rotational force onto the blade through a cavity formed in handle."

This phrase is the same as the second and third disputed terms from claim one, except "bias element" has replaced "spring."

The court finds it is clear on its face.

4426

7. Wherein the Circumference of the Spacer at at Least One Point is Greater Than the Circumference of the Spacer at at Least One Other Point

At issue here is the meaning in dependent Claim 5 of the italicized portion of the following phrase: "The cutting cylinder of claim 1 wherein the circumference of the spacer at at least one point is greater than the circumference of the spacer at at least one other point." '780 Patent, col. 4, lines 17-19 (emphasis added). Fellowes argues that this phrase, element 5(b), means "the circumference of the spacer is different at at least two different points." Michilin proposes that it means "the spacer's circumference, which extends completely around the shaft, is different at at least two different points, and each spacer has at least two different circumferences." Intek's proposed construction is identical to the claim language itself.

All three parties' constructions recognize, as the specifications and Figures 2 and 3 make clear, that the circumference of the "spacer" differs at different points of the "spacer" depending upon the embodiment, of which more than are within the scope of the patent. See id. at col. 3, lines 13-25 ("It will be appreciated that the circumference of the spacer 20 at at least one point a is greater than the circumference of the spacer 20 at at least another different point b . . . . It should be understood that the spacer 20 described above can be changed in many ways yet still remain within the scope of the invention."). The parties' constructions also recognize the need to read the phrase at issue in Claim 5, which is dependent upon Claim 1, consistently with Claims 6, 7 and 8, each of which are dependent upon Claim 5 and teach specific variations of Claim 5 by offering ways in which the circumference of the "spacer" at one point differs from the circumference of the "spacer" at another point. See e.g. id. at col. 4, lines 20-23 (Claim 6 teaches "the cutting cylinder of Claim 5 wherein the circumference of the spacer at its center is greater than the circumference of the spacer at at least one of its edges").

It appears that the only issues for construction are whether, for purposes of Claim 5, the circumference of the "spacer" "extends completely around the shaft," and whether "each spacer has at least two different circumferences."

The observation that the "spacer's" circumference "extends completely around the shaft" appears to be redundant in light of the plain and ordinary meaning of the word "circumference," a word that the specifications do not define. See WEBSTER'S THIRD NEW INT'L DICTIONARY 409 (defining "circumference" as "the surface or outer limits of a sphere or rounded body [and] the measure of the perimeter of a great circle or sphere"). Michilin's view that "each spacer has at least two different circumferences" is compelled by the plain terms of Claim 5, which refers to two different circumferences: one "at one point" and one at "one other point." '780 Patent, col. 4, lines 17-19. Michilin's construction also finds support in the file wrapper, in particular the patentee's remarks requesting that the USPTO withdraw its rejection of Claim 5, among other claims which, the USPTO found, were anticipated by Deck. To distinguish Deck, the patentee stated, "Deck does not disclose a cross-cut shredder having displaced cutting disks separated by spacer where the linear measure of the spacer along is surface is greater than the distance between two adjacent disks and where each spacer has at least two different circumferences.") (emphasis added). See id. at FE 000507.
For these reasons, the Court FINDS that "wherein the circumference of the spacer at at least one point is greater than the circumference of the spacer at at least one other point" in Claim 5 means "the spacer's circumference is different at at least two different points," and further that "each spacer has at least two different circumferences."

8. "Wherein the Circumference of the Spacer at its Center is Less Than the Circumference of the Spacer at at Least One of its Edges"

Claim 7 of the '780 Patent, which is dependent upon Claim 5, reads in its entirety: "The cutting cylinder of claim 1 wherein the circumference of the spacer at at least one point is greater than the circumference at at least one other point." '780 Patent, col. 4, lines 17-19 (emphasis added). Fellowes and Michilin construe the italicized phrase, element 7(b), to mean "the circumference of the spacer is smaller at its center than at one or both of its edges" and further that "for a separate spacer, the edge would be the end of the surface, and for an integral spacer the edge would be where the surface meets the disk." Intek defines element 7(b) to mean that "the circumference of the spacer, which is separate from the two cutting disks, is smaller at its center than at one or both of its edges."

The parties all agree that the circumference of the "spacer," for purposes of Claim 7, is "smaller at its center than at one or both of its edges." In addition, the Court has already dealt with the issue of whether the "spacer" is "separate from the two cutting disks." See supra elements 1(i) and 12(g). The only issue with respect to element 7(b), then, is whether to add the sentence proposed by Fellowes and Michilin in which a distinction is drawn between the "edge" of "a separate spacer" and the "edge" of "an integral spacer." The Court sees no need to embellish the claim and therefore refuses to adopt it in this particular claim construction. Accordingly, the Court FINDS that "wherein the circumference of the spacer at its center is less than the circumference of the spacer at at least one of its edges" means "the circumference of the spacer is smaller at its center than at one or both of its edges."

4428

D. Claim 34

A device as in claim 33 wherein the differential expansion portion is formed from an elastomer material and is bulbous in shape when such portion is fully expanded.

The parties agree that the differential expansion portion is formed of a substance which is rubber like and resembles a bulb when it is fully expanded. The court finds this phrase is construed as "a device as in claim 33 wherein the differential expansion portion is formed from a substance having the elastic properties of rubber and resembling a bulb shape when it is fully expanded."

4429

4. "wherein the first length of the distal portion of the guide wire tube and the first diameter for the distal portion of the guide wire tube being selected such that when a guide wire is within the guide wire lumen, blood is substantially prevented from entering the proximal portion of the guide wire lumen and a less viscous anticoagulation in the proximal portion of the guide wire lumen is allowed to coat the surface of the guide wire within the distal portion of the guide wire lumen."

The Court first turns to a preliminary dispute as to whether the language after "wherein" consists of claim limitations or whether it simply states the results of other structural limitations. A "wherein" clause may raise a question as to the limiting effect of the language in the claim. See Manual of Patent Examining Procedure § 2111.04 (8th ed., 5th rev. 2006). A determination of whether a "wherein" clause is a limitation in a claim depends on the specific facts of the case. Id. The issue in this case is whether the recited structure regarding the length and diameter differences between the proximal and distal portions of the guide wire lumen have the effect of substantially preventing blood from entering the proximal portion of the
guide wire lumen and allowing a less viscous anticoagulant in the proximal portion in the guide wire lumen to coat the
surface of the guide wire in the distal portion of the guide wire lumen, as stated in the "wherein" clause, or whether the
recited structure is limited by the "wherein" clause.

The plaintiff contends that the "wherein" clause includes functional limitations on the capability of the catheter. According
to the plaintiff, these functional limitations, in addition to the structural limitations of the guide wire lumen, distinguish this
invention from prior art.

The defendant, on the other hand, argues that the "wherein" clause is not material to patentability and, therefore, is not
limiting. In support of its argument, the defendant points to the prosecution history where the examiner rejected claims as
anticipated by prior art and characterized the "wherein" clause as "a recitation of the intended use of the claimed invention"
and requested "a structural difference." Office Action, Nov. 6, 1998, at 4. In response to this rejection, the applicants
amended their claims to include new structural limitations, specifically adding the requirement that the proximal portion of
the guide wire tube be longer and have a larger diameter than the distal portion. Amendment, Feb. 8, 1999, at 2-4.

The Court agrees with the plaintiff that the "wherein" clause provides functional limitations. Reading the claim as a whole,
the "wherein" clause describes the limitations for selecting the "first length" and the "first diameter." In addition, the
prosecution history shows that the examiner requested that the applicant modify claims to recite specific structure in order
to differentiate the invention from prior art. Office Action, Nov. 6, 1998, at 4. The applicants, after modifying their claims,
stated that the modified structure was distinguishable over prior art because it had been sized to prevent blood from entering
the proximal portion of the guide wire lumen while a less viscous anticoagulant in the proximal portion of the guide wire
lumen is allowed to coat the surface of the guide wire within the distal portion of the guide wire lumen. Amendment, Feb. 8,
1999, at 4. Accordingly, the "wherein" clause states functional limitations on the structure. The Court now turns to the three
disputed terms in the "wherein" clause.

F. The "Wherein" Clauses

Claim 3 of the '820 Patent describes the following invention:

An energy-absorption system for positioning along a roadway to absorb the energy of an errant vehicle, the energy-
absorption system comprising:

an impact head;

an angled cutter; and

an elongated cuttable member horizontally mounted between two parallel guardrails;

wherein the energy absorption system is positionable along a roadway to cooperate with the upstream portion of a
roadside hazard; and

wherein the impact head is in operational connection with the cutter and the cuttable member such that the impact of an
errant vehicle with the impact head will cause the cutter to cut at least a portion of the cuttable member to absorb the impact
energy of the errant vehicle.

('820 Patent, col. 9, ln.22-ln.42). Trinity contends that the two limitations of claims 3 and 14 beginning with the word

Section 112, P6 provides:

an element in a claim for a combination may be expressed as a means or step for performing a specified function without
the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding
structure, material, or acts described in the specification and equivalents thereof.

Section 112, P6 operates to restrict claim limitations drafted in means-plus-function format to those structures, materials, or acts disclosed in the specification that perform the claimed function, and their equivalents. Personalized Media Communns., L.L.C. v. ITC, 161 F.3d 696, 702 (Fed. Cir. 1999).

Whether claim language invokes section 112, P6 is a question of law. Id. A claim limitation that uses the word "means" raises a rebuttable presumption that section 112, P6 applies. Apex, Inc. v. Raritan Computer, Inc., 325 F.3d 1364, 1372 (Fed. Cir. 2003) (citing CCS Fitness, 288 F.3d at 1369). By contrast, a claim that does not use the word "means" triggers the rebuttable presumption that section 112, paragraph 6 does not apply. The presumption that section 112, P6 does not apply can be rebutted if the claim "fails to recite sufficiently definite structure" or "recite[s] a "function without reciting sufficient structure for performing that function."Id.; Watts v. XL Systems, Inc., 232 F.3d 877, 880 (Fed. Cir. 2001). The presumption that section 112, P6 does not apply to a claim not reciting the word "means" when the claim "relies on functional terms rather than structure or material to describe performance of the claimed function." Apex, 325 F.3d at 1372. This burden must be met by a preponderance of the evidence.

To determine whether a claim limitation recites sufficient structure, a court examines whether the "term, as the name for structure, has a reasonably well-understood meaning in the art," even if the claim term "does not call to mind a single well-defined structure." Id. at *6 (quoting Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996). Even if a particular mechanism is defined in functional terms, that is not sufficient to convert a claim element containing those terms into a "means for performing a specified function" under section 112, P6. Greenberg, 91 F.3d at 1583. Trinity has the burden of producing evidence to rebut the presumption; KEI continues to bear the burden of proof "in the sense of the risk of nonpersuasion." Apex, 325 F.3d at 1372.

The recitation of the structural relationship of elements using functional limitations does not automatically place the claim in means-plus-function format. "It is good practice also to specify the functional or operational cooperation between the elements [of a claim]. . . When this is done, the claim not only tells where the parts are and how they are interconnected or associated, it tells how they function together and operate on the workpiece to accomplish the result stated in the preamble." ROBERT C. FABER, LANDIS ON MECHANICS OF PATENT CLAIM DRAFTING § 30 (4th ed. 1999).

The "wherein" limitations of claims 3 and 14 of the '820 Patent do not contain the term "means," so this court must apply the presumption that section 112, P6 does not apply. Both of the "wherein" limitations use structural language to describe the placement of the various parts of the invention. The first "wherein" limitation states that "the energy-absorption system is positionable along a roadway to cooperate with the upstream portion of a roadside hazard." ('820 Patent, col. 9, ln.34-36). This "wherein" limitation describes a structural feature of the claimed invention, namely, that it is positionable along the roadside in a particular way to enable the invention. The first portion of claims 3 and 14 list the parts of the invention -- an impact head, an angled cutter, and an elongated cuttable member. Trinity correctly points out that without further specificity as to the placement of these parts, the description of the invention's structure is incomplete. (Def.'s Markman Ex. 79).

The "wherein" clauses provide the necessary additional specificity. The first "wherein" clause describes where the invention must be placed relative to the roadside hazard. The energy-absorption system is on the side of the road and, specifically, in a location where it can cooperate with the roadside hazard. This limitation narrows the places on the side of the road where the energy-absorption system can be placed. This is a structural limitation. The "function" described by this "wherein" limitation is "cooperation" with the upstream part of the roadside hazard. The structural aspect of the "wherein" clause is that the invention is "positionable" to provide the "cooperation" between the invention and the roadside hazard.

The second "wherein" clause recites the structural limitations specifying the relative positions of the parts comprising the claimed invention. The impact head is in "operational connection" with the cutter and cuttable member, in such a way that if a car collides with the impact head, the cutter and cuttable member will be forced together and the cutter will cut the cuttable member. The term "operational connection" describes the structural relationship among the impact head, cutter, and cuttable member that the claim requires for the cutter to perform the function of cutting the cuttable member when a car collides with the impact head. In other words, the impact head, cutter, and cuttable member of claims 3 and 14 of the '820 Patent cannot be arranged in any way. Rather, the impact head, cutter, and cuttable member must be arranged in a specific way to achieve the desired function.
A person of ordinary skill in the art would recognize the second "wherein" clause as describing how the parts of claims 3 and 14 must fit together to perform the desired function of cutting the cuttable member upon a vehicle's impact. Trinity's expert, Malcolm Ray, stated that "what the second "wherein" clause tells us is that we need to arrange the parts as well as others that we get from the specification such that they work, such that they get the cutter to cut." (Transcript of Markman Hearing, p. 132, 1.3-1.8). A claim limitation describing how to "arrange" a list of parts, even if the arrangement is defined in functional terms, provides a structural limitation. Greenberg, 91 F.3d at 1583. Trinity has failed to rebut the presumption that section 112, P6 does not apply to the "wherein" clauses of claims 3 and 14 of the '820 Patent.

3. wherein the ratio of said hard segments to said soft segments is such as to provide

The plaintiffs propose that this term carry its plain meaning. The defendants propose "wherein the ratio of said hard segments to said soft segments is substantially lower than 50% such as to provide." The defendants admit that the specification does not disclose any specific values for the ratio between hard and soft segments in this block copolymer. Defendants' Response Brief at 23. To support its inclusion of the "substantially lower than 50%" limitation, the defendants rely on statements made during prosecution to distinguish the present invention from U.S. Patent No. 4,950,239 ("the Gahara patent"). Id. at 23-26. Specifically, the applicant stated that the ratio was "considerably different" and "substantially lower than" that in the Gahara patent. Wu Decl. Ex. 16 at MEDBSC00003949. The "50%" comes from a passage in the Gahara patent's specification. Wu Decl. Ex. 17 at BSCMDT0112650 [Gahara Patent at 3:54-62] ("[t]he proportion of 'soft' segments derived from the component (b) in the polyurethane is advantageously in the range of about 2 to 50 percent preferably in the range of about 2 to 25 percent...").

The plaintiffs argue that the applicants' statements distinguished the Gahara patent on the basis that it was directed to a noncompliant balloon. Plaintiffs' Reply Brief at 12. In addition, the plaintiffs argue that "the applicants' statements in the prosecution history relied on by [the defendants] are subject to multiple reasonable interpretations and thus no prosecution history estoppel should attach." Id. at 13.

The alleged disclaimer in the prosecution history, however, is too vague to support a limitation of "substantially lower than 50%." See Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1323-25 (Fed. Cir. 2003) ("where the patentee has unequivocally disavowed a certain meaning to obtain his patent, the doctrine of prosecution disclaimer attaches and narrows the ordinary meaning of the claim congruent with the scope of the surrender"). The prosecution statements do not attempt to quantify, but rather state that the applicant's invention differed from the prior art.

At oral argument, the defendants argued that under Phillips the court should look to the discussion in the prosecution history to inform the meaning of the claim term. Nothing in the patent, or the prosecution history, quantifies this ratio. The court declines defendants' invitation to import this numeric limitation from the specification of a prior art patent. Accordingly, the term does not need to be construed.

9. "Wherein the Surface of Each Spacer Has a Linear Measure Greater Than the Distance Between Each Adjacent Disk"

At issue in Claim 9, which is dependent upon Claim 1, is the italicized portion, element 9(c), as follows: "The cutting cylinder of claim 1 wherein a spacer is located between each adjacent disk and wherein the surface of each spacer has a linear measure greater than the distance between each adjacent disk." '780 Patent, col. 4, 30-33.

Fellowes construes the disputed language to mean "the linear measure of the surface of each spacer follows the surface of the spacer and is greater than the linear distance of the space between the two adjacent cutting disks measured parallel to the shaft." Michilin reads it to mean "the linear measure of the surface of each spacer follows the surface of the spacer between the two adjacent cutting disks, and is greater than the linear distance of the space having a constant circumferential width.
between the two adjacent cutting disks measured parallel to the longitudinal axis of the shaft” (emphasis added). Intek's construction is identical to Michelin's except without the word "circumferential."

The dispute over this phrase is largely the same as before, i.e. whether the width between adjacent "cutting disks" is "constant." The defendants' construction is yet another attempt to read the width of the "cutting disks" as being "constant" -- which the Court once again rejects. Claim 9 includes no such limitation, on its face or by inference. See '780 Patent, col. 4, lines 30-34. Accordingly, the Court adopts Fellowes' construction and FINDS that "wherein the surface of each spacer has a linear measure greater than the distance between adjacent disk" in Claim 9 means "the linear measure of the surface of each spacer follows the surface of the spacer and is greater than the linear distance of the space between the two adjacent cutting disks measured parallel to the shaft."

(7) "wherein when the primary frame is supporting the auxiliary frame, each magnetic material of the primary frame magnetically engages in a lateral manner with one of the magnetic materials of the auxiliary frame for securing said auxiliary frame to said primary frame."

Plaintiffs construe the term "supporting" to mean "that the primary frame maintains the auxiliary frame in position so as to keep the auxiliary frame from falling, sinking or slipping off the primary frame." JS, Exh. A at 18. Plaintiffs further contend that the phrase "magnetically engaging" means "that the magnetic material of the first flanges engages the magnetic material of the corresponding studs either by touching or through magnetic attractive forces without touching." Id. at 20. Plaintiffs argue that the phrase "lateral manner" means "that the magnetic engagement between the magnetic material of the primary frame and the magnetic material of the auxiliary frame is in the horizontal plane." Id. at 22.

Conversely, Defendant argues that the entire phrase in question means that "when the auxiliary frame is mounted on the primary frame, the magnet of the primary frame is attracted to the magnet on the arms or extensions of the auxiliary sunglasses frame to secure or attach the auxiliary sunglasses frame to the frame of the primary eyeglasses." JS, Exh. C at 109.

Preliminarily, the Court notes that Defendant has not offered any support for its proposed limitation that the auxiliary frame be one securing sunglass lenses. See Def.'s Opposition at 16-18. As such, the Court declines to adopt such limitation.

Defendant's construction of the word "supporting" as "mounted on" is limited to a mode of attachment and fails to capture the breadth of the term's ordinary meaning. See Webster's, Nicodema Decl., Exh. 5 at 155, defining "support" to mean "[t]o maintain in position so as to keep from falling, sinking, or slipping." As such, the Court adopts Plaintiffs' construction of the term "supporting," which is consistent with the dictionary definition.

As to the phrase "magnetically engages," the Court construes it to mean magnetically attracts or is attracted magnetically, with the magnetic attraction taking place with or without actual physical contact. See supra section "III B 2 a (14)," discussing the construction of the term "engage" in the '545 Patent. Defendant does not dispute that "lateral manner" means "in the horizontal plane," and the Court agrees with such construction. See Figures 2 and 3 of the patent. Koo Decl., Exh. C at 19.

Based on the above, the Court construes the phrase in question to mean: wherein when the primary frame is maintaining the auxiliary frame in position so as to keep the auxiliary frame from falling, sinking or slipping off the primary frame, each magnetic material of the primary frame magnetically attracts or is attracted by one of the magnetic materials of the auxiliary frame, with the magnetic attraction taking place with or without actual physical contact and in the horizontal plane.

2. Durable Syringes/Disposable Prefilled Syringes
At issue here is whether the language "Pen-type insulin syringe . . . which accepts cartridges" 4 applies only to pens which accept replaceable prefilled insulin cartridges or also applies to disposable pen syringes that include a pre-filled insulin cartridge. Throughout the prosecution history of the patents, it is abundantly clear that the claim language applies to both durable pen syringes and prefilled pen syringes.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - 

4 "Pen-type insulin syringe . . . which accepts cartridges containing . . . ." (Claims 1-4 of the '323 patent & Claims 11-14 of the '906 patent.)

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - 

Claims 3 and 9 of the '535 patent recite that the pen syringe, which parent claim 1 recites as including a cartridge containing insulin, "is a disposable device prefilled with insulin." Thus, the disposable pen syringe claimed in claims 3 and 9 must accept the insulin cartridge at some stage of the manufacture. Both disposable syringes (claims 3 and 9) and durable syringes (claims 4 and 10 of the '535 patent) accept cartridges containing insulin. The difference is that disposable syringes are manufactured so that, once the cartridge is inserted, it cannot be removed and replaced by the user.

Becton argues that the language applies only to pen syringes that accept replaceable, refilled insulin cartridges, and not to durable pen syringes that are prefilled with insulin. It relies statements by an attorney for Novo, (see Sharrott Decl., Exh. 8), which are confusing and could be read to limit the scope of Claims 1-4 to only those pen syringes that accept replaceable insulin syringes, to the exclusion of any pen syringes that are prefilled with insulin which do not accept replaceable cartridges.

However, this Court finds that this one set of statements by Novo's attorney in the 1996 Amendment are inconsistent with the totality of the prosecution history, and are not entitled to the dispositive effect that Becton gives it. As a result, this Court construes the language "Pen-type insulin syringe . . . which accepts cartridges" to apply both to durable pen syringes which accept replaceable pre-filled cartridges and disposable pre-filled insulin pen syringes.

BACKGROUND

Neutrik is the assignee of the 749 patent. The 749 patent covers a plug and socket that makes an electrical connection. It addresses the problem of making and disengaging a connection under power. The effectiveness of an electrical connection is in part a function of the amount of overlapping or touching conductive surface area. During times of low contact surface area, i.e., initial contact when plugging-in or final contact when unplugging, overloads can shorten the useful life of electrical connectors, or cause malfunction. The invention of the 749 patent provides a connection system whereby there is no increase or decrease in surface area over time. In the 749 patent, and in its embodiment, the SPEAKON connection, the full contact surface area engages or disengages at once.

The 749 patent discloses a cylindrical socket 1 and counterpart cylindrical plug 22. 749 patent, col. 3, II. 5, 67. Grooves 11 & 12 guide the plug into the socket by the noses 25 and 26 on the plug. Id. at col. 4, II. 39-43. Once the plug is inserted, the contacts 7 (socket) & 27 (plug) are staggered relative to each other by an angle. The plug contacts 27 are metal rods embedded in the inner side wall of the plug. The socket contacts 7 "comprise a longitudinally extended lamella with an angled connection clip 18," id. at col. 3, II. 41-42, and contact vanes 21 extending 1 from the contact, id. at col. 3, II. 41-42. The socket contact 7 mounts inside the groove 17 of the center shaft 6 of the socket. Id. at col. 3, II. 52-53. After the plug is inserted to full depth, it is rotated to a locking position, causing the contact vanes 21 of the socket contact 7 to come into full surface area contact with the plug contact 27. Id. at col. 4, II. 48-64.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - 

1 "Contact vanes 21, which start out at the wall of the shaft 6, extend in the circumferential direction of the shaft 6, and increase thereby their distance from the wall of the shaft 6 serving as a contact support." 749 patent, at col. 3, II. 53-56.
Claim 1 of the 749 patent is at issue. It is in "Jepson" format. Neutrik twice amended this claim. The first amendment is shown in single underlining. The second is shown in double underlining.

1. In an electric plug-and-socket connection including a cylindrical plug connector and a cylindrical plug-inn counterpart connector, each connector having an axis, each connector including contact supports and contacts . . . 2 the improvement comprising the other contacts in the other contact support each having at least one elastically deformable contact vane, the at least one contact vane extending in circumferential direction from the wall of the contact support and at a distance from the wall of the contact support which increases in circumferential direction.

2 In the claim 1 quotation above, lines 46-67 of column 5 of the 749 patent are omitted.

As the district court noted, Neutrik amended claim 1 of the 749 patent twice during prosecution, in each case in response to the examiner's rejections based on U.S. Patent No. 4,826,454 to Kissling ("the Kissling patent"). In the Kissling patent, a metal electrical contact 124 is disclosed by the figures in the Kissling patent. The Kissling patent recites an assembly of such contacts 121-28 & 131-38. Kissling patent, col. 6, II. 66-67.

Switchcraft manufactures a socket that is compatible with the Neutrik SPEAKON plug. The Switchcraft socket has a contact vane that extends axially along a portion of the length of the center shaft of the socket. At its tip, where it makes contact with the connector in the Neutrik SPEAKON plug, the Switchcraft contact has what the district court characterized as a "bump." First Order at 10.

Neutrik originally sought a preliminary injunction against Switchcraft. On July 25, 2000, the district court denied the injunction in an order that analyzed the likelihood of success of a literal or doctrine of equivalents infringement claim. First Order at 14, 18-19. Then, on March 22, 2001, the district court granted summary judgment to Switchcraft on all of Neutrik's claims. Second Order at 13-14. In doing so, it expressly incorporated and relied on its earlier analysis of the patent infringement issues, and did not further discuss those issues in the Second Order.

For purposes of the preliminary injunction, Switchcraft had conceded the validity of the 749 patent. However, Switchcraft argued that a properly construed claim would not cover the Switchcraft contact because its contact vanes extend from their supports in an axial direction, not in a circumferential direction, and that the distance between the vane and the support increases in the axial direction, not the circumferential direction. Neutrik argued that the "bump" on the tip of the Switchcraft vane embodies a contact that increased in distance from the contact support in a circumferential direction. The district court reviewed a dictionary definition of the word "vane," and then surmised that "vane," as applied to the Switchcraft contact, referred to the entire piece of metal extending from the contact base, not just the bump at the tip. It found that the Switchcraft vane extends from its base in an axial direction, and that just because a small portion of the vane has a round shape does not mean that the vane also extends circumferentially from its base.

The district court characterized Neutrik's argument as stating that the limitation is met if just a portion of the contact vane is extending in a circumferential direction. First, the court noted that the claim did not say "or any portion of the vane." Second, as an alternative basis, it noted that the "bump" of the Switchcraft contact is not attached to the wall of the contact support, and thus cannot be said to extend from it. Third, it found that the distance between the bump and the wall of the support did not increase in the circumferential direction. Fourth, the district court reviewed the two amendments to the claim and concluded that they supported its claim construction, in particular because the Kissling reference showed a contact, like the Switchcraft contact, with a rounded bump on the tip.

The district court next found that the Switchcraft contact did not infringe under the doctrine of equivalents. It agreed with
Neutrik that the Switchcraft contact performs substantially the same function and produces substantially the same result, in substantially the same way. However, the district court applied prosecution history estoppel to conclude that a reasonable competitor would believe that Neutrik had surrendered equivalents "that only extend axially" for its contact vane. As a result, there was no infringement under the doctrine of equivalents.

With respect to the trade dress infringement claim, the district court noted the physical description of each product. Neutrik alleged that six common design elements indicated trade dress infringement. The district court noted that to protect an unregistered product design as a trade dress, a party must show, as a threshold matter, that the product's design, not its packaging, is non-functional, and that secondary meaning is present. Second Order at 5. Then, a showing of likelihood of confusion is required.

The district court stated that the test for functionality is whether a product feature "is essential to the use or purpose of the article or [] affects the cost or quality of the article." Second Order at 5 (quoting Knitwaves, Inc. v. Lollytogs Ltd., 71 F.3d 996, 1006 (2d Cir. 1995) (internal quotations omitted)). A factor in establishing non-functionality is demonstrating that feasible or cost-effective design alternatives exist. Second Order at 6 (citing Stormy Clime Ltd. v. ProGroup, Inc., 809 F.2d 971, 977 (2d Cir. 1987)).

The district court found that Neutrik's only "evidence" of non-functionality was its own conclusory statements. The only design alternative Neutrik presented was that there is no need for the raised circular rim, and that the outer portion of that rim need not be circular. The district court found, however, that Switchcraft rebutted that evidence because it presented the design requirement of a raised circular rim in order to rear mount the socket. The circular shape is necessitated by the fact that panel manufacturers precut round holes for mounting of sockets like the Neutrik and Switchcraft devices. The district court noted that Switchcraft also presented evidence that the other elements of the Neutrik design are standard industry practice, such as the triangle to indicate orientation, or a rectangular base to allow for "rows" of contacts to be mounted. Thus, Neutrik had not only failed to carry its burden of demonstrating non-functionality of its trade dress, it had failed to rebut Switchcraft's evidence of functionality.

Although noting that it could have stopped after its functionality analysis, the district court also found Neutrik's evidence of secondary meaning lacking. Neutrik only described its sales and advertising generally - it presented no evidence of customer recognition of its product based on product-design trade dress.

With respect to the motion for additional discovery, the district court denied Neutrik's request for additional discovery under FRCP 56(f). The district court noted that in order to justify additional discovery, a party must demonstrate how the additional information will raise a genuine issue of material fact. Second Order at 12 (citing Sage Realty Corp. v. Insurance Co., 34 F.3d 124, 128 (2d Cir. 1994)). The district court found that the requested additional information would not raise such an issue.

4 For example, Neutrik attempted to justify its discovery request based on the hope that it could overcome its failure to meet its burden on its trade dress claim by reviewing Switchcraft's design views for its own socket, including the extent to which it was based on functional considerations or copied from Neutrik. The district court concluded that even if Neutrik recovered information showing Switchcraft was copying, this would only impact secondary meaning and Neutrik had not supported its trade dress case on the other required factor, non-functionality.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

3 The six alleged elements are: (1) black color; (2) rectangular base; (3) raised outer circular rim; (4) placement of lettering that designates the manufacturer on the bottom end of the rectangular base; (5) small triangular impression on the top of the base that points downward; and (6) rounded corners on the rectangular base.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -
Neutrik timely appealed from the district court's grant of summary judgment. We have jurisdiction pursuant to 28 U.S.C. § 1295(a)(1).

DISCUSSION

We review a district court's grant of summary judgment without deference. Atmel Corp. v. Info. Storage Devices, Inc., 198 F.3d 1374, 1378, 53 U.S.P.Q.2D (BNA) 1225, 1227 (Fed. Cir. 1999). Summary judgment is appropriate when the moving party demonstrates that "there is no genuine issue as to any material fact and that the moving party is entitled to a judgment as a matter of law." Fed. R. Civ. P. 56(c); Celotex Corp. v. Catrett, 477 U.S. 317, 322-23, 91 L. Ed. 2d 265, 106 S. Ct. 2548 (1986). On summary judgment, the evidence must be viewed in the light most favorable to the party opposing the motion, Poller v. Columbia Broad. Sys., Inc., 368 U.S. 464, 473, 7 L. Ed. 2d 458, 82 S. Ct. 486 (1962), with doubts resolved in favor of the nonmovant, Cantor v. Detroit Edison Co., 428 U.S. 579, 49 L. Ed. 2d 1141, 96 S. Ct. 3110 (1976); Transmatic, Inc. v. Fulton Indus., Inc., 53 F.3d 1270, 1274, 35 U.S.P.Q.2D (BNA) 1035, 1038 (Fed. Cir. 1995). Once the moving party has satisfied its initial burden, the opposing party must establish a genuine issue of material fact and cannot rest on mere allegations, but must present actual evidence. Anderson v. Liberty Lobby, Inc., 477 U.S. 242, 248, 91 L. Ed. 2d 202, 106 S. Ct. 2548 (1986). Issues of fact are genuine only "if the evidence is such that a reasonable jury could return a verdict for the nonmoving party." Id. at 248. A disputed fact is material if it might affect the outcome of the suit such that a finding of that fact is necessary and relevant to the proceeding. Anderson, 477 U.S. at 248; General Mills, Inc. v. Hunt-Wesson, Inc., 103 F.3d 978, 980, 41 U.S.P.Q.2D (BNA) 1440, 1442 (Fed. Cir. 1997).

On procedural issues, this Court follows the rule of the regional circuit, unless the issue is in an area of law exclusively assigned to the Federal Circuit. Vivid Techs., Inc. v. Am. Sci. & Eng'g, Inc., 200 F.3d 795, 809, 53 U.S.P.Q.2D (BNA) 1289, 1297 (Fed. Cir. 1999). For issues of discovery under Rule 56(f), this Court applies the law of the regional circuit. Id. The Second Circuit reviews a district court's rulings on discovery issues under an abuse of discretion standard. Paddington Partners v. Bouchard, 34 F.3d 1132, 1138 (2d Cir. 1994).

On appeal, Neutrik argues that claim 1 covers a contact vane where only a portion of the allegedly infringing vane extends in a circumferential direction with increasing distance from the contact support of the socket's center shaft. Neutrik asserts that the Switchcraft contact infringes the claim because it has an elastically deformable contact vane, and, although the vane extends axially along the center shaft, the tip portion additionally extends in a circumferential direction with increasing distance. In essence, Neutrik argues that the tip portion of the Switchcraft contact vane can satisfy the "extends circumferentially with increasing direction" limitation of the contact vane element, while the entire Switchcraft vane satisfies the "elastically deformable" limitation. 5 Neutrik also argues that the district court incorrectly interpreted the limitation "extending in circumferential direction from" by reading into the claim an attachment requirement only found in the preferred embodiment.

5 Neutrik also argued that rather than a single element with various limitations, claim 1 specifies the following three elements: (1) the elastically deformable vane; (2) which extends in circumferential direction from the wall; and (3) which also increases in distance from the wall in a circumferential direction. However, this Court views the claim differently, as disclosing a single element, the contact vane, with the following limitations applied to the contact vane: (a) elastically deformable; (b) extends in circumferential direction from the wall; and (c) as it extends, increases in distance from the wall in a circumferential direction.
Switchcraft responds that the district court properly construed claim 1 as requiring that the entire contact vane, i.e., the piece protruding from the center shaft of the socket, must meet the limitations, including the limitation that the vane extend with increasing distance from the center shaft in a circumferential direction, and be elastically deformable.

We agree with Switchcraft that the district court properly granted summary judgment that the Switchcraft contact vane does not infringe the 749 patent. Further, we agree that the district court properly construed claim 1. In construing patent claims, we first look to the intrinsic evidence of record -- the claims, the specification, and, if in evidence, the prosecution history. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2d (BNA) 1573, 1576 (Fed. Cir. 1996). Claim 1 is directed to a contact vane that is elastically deformable and extends with increasing distance in a circumferential direction from the wall of the contact support. The claim is thus limited to cover devices where the entire length of the protruding contact vane extends in a circumferential direction. The plain language of the claim suggests that the entire contact vane have the property of elastic deformability: "elastically deformable contact vane." Further, the other limitations disclosed by the claim imply that the deformation should occur in the circumferential direction because the contact vane must also extend, circumferentially, at an increasing distance. By implication, then, the deformation would have to occur in the circumferential direction under the language of the claim.

The prosecution history supports this interpretation of the claimed contact vane. Neutrik applied for the 749 patent on November 9, 1988. On September 8, 1991, Neutrik responded to an office action from the United States PTO for the application. The examiner rejected claim 13 (which eventually became claim 1 in the issued patent) as obvious over the admitted prior art (in the Jepson preamble) in view of the Kissling patent. The examiner seemed to believe that the Kissling patent's contacts, such as contact 124, disclosed an elastically deformable contact vane. Neutrik added the language "in circumferential direction" to the claim, and responded to the examiner as follows:

[The claim] has been amended to make it clear that the contact vanes extend in circumferential direction from the wall of the contact support. . . . [the Kissling patent contacts] extend in the axial direction of the assemblies. In accordance with the present invention, on the other hand, the contact vanes [21] extend in the circumferential direction from the wall of the contact support and at an increasing distance from the wall of the contact support.

In January 1992, the PTO responded. It again rejected the claim as obvious, this time because the Kissling patent disclosed an elastically deformable contact vane that extends from the wall of a contact support in circumferential direction. The examiner stated that "web portions 134, 124" extend parallel to the longitudinal axis. He noted that Neutrik's arguments from the previous amendment were not persuasive because the claim language was still broad enough to read on the Kissling patent because:

[The Kissling patent] shows contact vanes which extend in both the axial direction and the circumferential direction in three dimensional space. The contact vanes . . . extend at an increasing distance from the wall of the contact support in the axial direction, but they also extend in the circumferential direction. The claim language does not sufficiently describe the structure to define over the art of record.

Neutrik added the language "which increases in circumferential direction" to the claim, and responded to the examiner as follows:

[The Kissling patent] clearly shows that the contact pieces . . . are punched out and extend at such an angle that the distance from the housing wall 106 increases in axial direction. In accordance with the present invention as claimed, on the other hand, the circumferentially extending contact vanes have a distance from the wall of the contact support which increases in circumferential direction. (emphasis in original)

The 749 patent subsequently issued on April 27, 1993.

Neutrik thus distinguished the Kissling patent by emphasizing that Neutrik's contact vane extends, with increasing distance, in the circumferential direction, whereas the contact vane in the Kissling patent extended in the axial direction. Neutrik's arguments during prosecution disclaimed contact vanes similar to those disclosed in the Kissling patent. We therefore conclude that claim 1 should be interpreted so as to exclude contact vanes that extend with increasing distance in the axial
If ambiguity remains after consideration of the intrinsic evidence, "extrinsic evidence may also be considered, if needed to assist in determining the meaning or scope of technical terms in the claims." Pall Corp. v. Micron Separations, Inc., 66 F.3d 1211, 1216, 36 U.S.P.Q.2D (BNA) 1225, 1228 (Fed. Cir. 1995) (citations omitted). Here we view the intrinsic evidence regarding the contact vane as unambiguous, and thus need not discuss extrinsic evidence.

4436

10. "Cooling Said Core While Applying a Second Pressure"

The phrase "cooling said core while applying a second pressure" is construed to mean, "Cooling said core during the time that a second pressure is applied."

The phrase appears in claim 1 of the '207 patent:

(i) heating said core for a first period of time; (ii) applying a first pressure to said core for a second period of time such that said at least one electronic element is encapsulated by said core; (iii) cooling said core while applying a second pressure to said core.

'207 patent, col. 6:31-36.

The only dispute between the parties is the meaning of the word "while." Plaintiff asserts that "while" means "during the time that." Defendant urges that the phrase means "that cooling starts later than, or at the same time as, applying a second pressure." (Def. Br. at 43.) In other words, Defendant asks me to conclude that the word "while" fairly implies the moment at which the process of providing the pressure starts -- and, in particular, to exclude from the ambit of the claims any process that involves the application of the "second pressure" before the core cooling begins, even if the cooling and the second pressure proceed simultaneously for some period of time.

Defendant's attempt to limit the claim in this way is unavailing. Webster's defines "while" to mean "during the time that" -- in other words, simultaneously or concurrently. Defendant's suggestion that this word says or implies anything about the relationship between the time the cooling begins and the time the application of pressure begins makes no sense. The claim language neither says nor implies anything about whether (1) cooling starts before pressure, (2) pressure starts before cooling, or (3) they start at the same time. The claim language requires only that the cooling and second pressure be happening simultaneously, regardless of the start sequence of the cooling and the application of pressure.

At the Markman hearing, the parties illustrated this term with the example of taking a nap "while my roommate goes shopping." The illustration works well. Clearly, as long as roommate # 1 is napping at any point in time during roommate # 2's trip to the store -- regardless of when the nap commenced -- roommate # 1 would have been napping "while" roommate # 2 went shopping.

4437

1. Claim Construction

In the '037 patent, the parties dispute the meaning of the last limitation of claim 15: "automatically rotating each reagent container of the first set about its respective axis while it is being scanned." Bayer proposes that the phrase be construed as "automatically rotating the containers of the first set about their axes during the time that the bar codes on those containers are read." Abbott, on the other hand, proposes that the phrase be construed as "Automatically rotating each individual reagent container about its respective axis during the time its (i.e., the same container's) bar code is being read by the bar code reader." (D.I. 296.) Thus, the parties' disagreement centers around what it means to automatically rotate a container "while it is being scanned." Bayer's proposed construction is relatively broad, and literally encompasses devices that automatically rotate the containers at some time during the overall scanning process. In contrast, Abbott's construction is
relatively narrow, and literally encompasses only those devices that continuously (and automatically) rotate the containers while the bar code reader is active.

A text search of the entire patent reveals that the word "scan" is used only in the claims, and not in the specification. Even so, "the context in which a term is used in the asserted claim can be highly instructive." Phillips, 415 F.3d at 1314. Although it is the last limitation of claim 15 that is at issue here, it is the second-to-last limitation that provides the instructive context:

scanning the bar code on one of the reagent containers of one of the first and second sets by passing a scanning light beam between two of the containers of the other of the first and second sets to determine the identity of the reagent contained therein.

'037 patent, col. 58, 11. 13-17 (emphasis added). This claim language clearly and unambiguously defines "scanning" as "passing a scanning light beam." Therefore, the phrase "while it is being scanned" is properly construed as "while it is being passed by a scanning light beam." It does not refer to the overall process of reading bar codes, as Bayer suggests. Thus, the court will construe the last limitation of claim 15 as "automatically rotating each reagent container of the first set about its respective axis while it is being passed by a scanning light beam."

GO BACK

5. "while maintaining the plunger free of contact with the pitcher"

Plaintiff's Proposed Construction: "while maintaining the plunger free of contact with the pitcher"

Defendant's Proposed Construction: "throughout the mixing process (or while the blades are rotating), no part of the plunger contacts the pitcher"

The Court's Construction: "while maintaining the device free of contact with the pitcher"

This phrase has acquired its ordinary and customary meaning. Defendant asks the Court to require that the plunger not contact the pitcher "while the blades are rotating." But, the claim already requires the blades to be rotating. Thus, such a limitation need not be added to this claim element. The Court replaces the word "plunger" with the word "device" to be consistent with the earlier construction of the term "plunger." The dictionary definitions suggested by the defendant are unnecessary and not helpful to the Court.

GO BACK

4439

a. heated "out of contact with oxygen"

Seven of the claims at issue state that the material being processed is kept "out of contact with oxygen:" 9

'934 Patent, claims 23, 50; '814 Patent, claim 7: "said material irradiated . . . and then heated while out of contact with oxygen in a concentration greater than 1% volume by volume"

'814 Patent, claim 19: "irradiating . . . and annealing said material while out of contact with oxygen in a concentration greater than 1% volume by volume"

'308 Patent, claim 1: "irradiating . . . and heating the polyethylene material forming the implant . . . while said polyethylene material is prevented from contact with oxygen in a concentration greater than 1% volume by volume"

'308 Patent, claim 12: "creating free radicals in the polymer chain by irradiating the ultra-high molecular weight polyethylene material [and] preventing oxygen from bonding with the said created free radicals by preventing them from coming into contact with oxygen in a concentration greater than 1% volume by volume . . . and heating the polymer . . .
prior to exposing the free radicals to oxygen above the said concentration"

'308 Patent, claim 24: "ultra high molecular weight polyethylene material . . . which has been irradiated . . . and then heated while out of contact with oxygen in a concentration greater than 1% volume by volume"

Howmedica argues that the Court should interpret "while out of contact with oxygen in a concentration greater than 1% volume by volume" as "without the UHMWPE [ultra-high molecular weight polyethylene] material contacting the surrounding atmosphere that contains oxygen in a concentration greater than 1% volume by volume." Defendants argue that "while out of contact with oxygen in a concentration greater than 1% volume by volume" means "in an airtight package with less than 1% oxygen by volume." Defendants refer to the process described in the summary of the invention and the preferred embodiment in the specification to narrow the scope of the invention. The Court rejects defendants' argument.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

9 Five claims, which the Court will discuss later, state that the material is surrounded by a "layer of material" that prevents contact with oxygen when heated.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

Defendants point out that the specifications only describe a process whereby the implant is irradiated and heated after it is placed in a package from which the oxygen is expelled. Nevertheless, the Court does not find that the specification was intended to implicitly limit the meaning of "while out of contact with oxygen in a concentration greater than 1% volume by volume" to "in an airtight package." In the context of other claims in the patents, the claims at issue clearly intend a broader meaning for "out of contact with oxygen" than "in an airtight package," and so the Court will give the term the broader meaning.

i. '934 Patent, claims 23, 50

Related dependent claims do not support defendants' definition of the phrase "while out of contact with oxygen in a concentration greater than 1% volume by volume" in independent claim 23 of the '934 Patent. Dependent claim 33 is for "[t]he medical implant as set forth in claim 23 wherein an oxygen impermeable packaging material is the layer used to prevent the polyethylene material from contacting oxygen." '934 Patent, claim 33. The Court will not read a limitation expressly stated in the dependent claim (claim 33) into an independent claim that does not contain that limitation (claim 23). See Phillips, 415 F.3d at 1314-15. The limitation in dependent claim 33 implies that "while out of contact with oxygen in a concentration greater than 1% volume by volume" in claim 23 of the '934 Patent is intended to contemplate methods of segregating the material from oxygen that do not involve "oxygen impermeable packaging materials."

Similarly, dependent claim 55 of the '934 Patent limits the device set forth in claim 50 to processes whereby an "oxygen impermeable packaging material" is used to prevent contact with oxygen. The Court finds that the irradiation and heating steps described in claims 23 and 50 of the '934 Patent are not limited to heating and irradiation "in an airtight package"—unlike the processes described by dependent claims 33 and 55, which are so limited.

ii. '308 Patent, claims 1, 12

Identical logic dictates that independent claims 1 and 12 of the '308 Patent are not limited to heating and irradiating the polyethylene "in an airtight package." Dependent claims 2 and 3 of the '308 Patent are for the method set forth in independent claim 1, but specify that the process takes place in an oxygen impermeable packaging material:

2. The method set forth in claim 1, wherein the contact with oxygen is prevented by sealing the polyethylene within an oxygen impermeable barrier.

3. The method as set forth in claim 2, wherein the oxygen impermeable barrier is a packaging material.

'308 Patent, claims 2, 3. Once again, the Court will not read the limits expressly stated in the dependent claims (i.e. claims 2 and 3) into the independent claim (i.e. claim 1). See Phillips, 415 F.3d at 1314-15. Dependent claims 13 and 14 of the '308
Patent similarly limit the process described in claim 12, and the express limits of the former claims should not be imported into the latter. Accordingly, the Court finds that claims 1 and 12 of the '308 Patent are not limited to a process whereby the polymer is heated and irradiated "in an airtight package."

iii. '308 Patent, claim 24

Claim 24 of the '308 Patent contains language which is very similar to that of claims 1 and 12 of that patent. In general, similar terms in different claims should be construed consistently. See Phillips, 415 F.3d at 1314 ("usage of a term in one claim can often illuminate the meaning of the same term in other claims"). The Court construes "heated while out of contact with oxygen" in claim 24 of the '308 Patent consistently with "heating . . . while . . . prevented from contact with oxygen" in claim 1 of the '308 Patent. In addition, the language of claim 24 of the '308 Patent is nearly identical to the language of claims 23 and 50 of the '934 Patent and claim 7 of the '814 Patent, which the Court has already found do not require segregation "in an airtight package." Claim 24 of the '308 Patent does not require segregation from oxygen "in an airtight package."

iv. '814 Patent, claims 7, 19

Independent claim 19 of the '814 Patent does not require an "airtight package" to surround the material during the irradiation and heating steps. Unlike claim 19, dependent claim 20 of the '814 Patent refers to an "oxygen impermeable barrier around [the polyethylene material] prior to irradiating." Because a court should not read express limitations from dependent claims into independent claim's that lack that limitation, "while out of contact with oxygen" in claim 19 should not be limited to claim 20's ["surrounded by an] oxygen impermeable barrier." Accordingly, the Court will not limit the term "while out of contact with oxygen" in claim 19 to "in an airtight package," the even narrower construction that defendants urge for the claim.

The Court construes "while out of contact with oxygen" in claim 7 of the '814 Patent consistently with the term's use in claim 19. Neither claim requires that the heating step occur "in an airtight package."

4440

3. "Buoy as a whole is kept underwater"

APL argues for the following construction of the phrase "buoy as a whole is kept underwater" as it is used in Claim 1: "fully equipped mooring buoy is completely submerged, and no parts float on the surface of the sea." SBM maintains, contrary to APL's contention, that this claim phrase does not preclude the use of a second, non-mooring surface buoy.

When a patent claim uses the word "comprising" as its transitional phrase, the use of "comprising" creates a presumption that the body of the claim is open. In the parlance of patent law, the transition "comprising" creates a presumption that the recited elements are only a part of the device, that the claim does not exclude additional, unrecited elements. See KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000). Here, both parties agree that Claim 1 recites "a catenary anchor leg mooring buoy comprising": (1) three "means for connecting"; (2) a "buoyant body"; (3) a "turntable"; (4) a "rigid mooring arm"; and (5) a "swivel," and that these elements make up the "buoy as a whole." Because Claim 1 contains this "open-ended" claim phrase language, however, SBM contends that the "buoy as a whole" could be "comprised of" other elements, such as an additional, non-mooring surface buoy.

It is well-settled that consistency in claim interpretation is important. Burke, Inc. v. Bruno Indep. Living Aids, Inc., 183 F.3d 1334, 1337 (Fed. Cir. 1999) (citing Markman, 116 S. Ct. at 1396). Claim 1 of the '183 Patent requires that the "buoy as a whole" be "kept underwater." Any additional, unrecited elements covered by the "comprising" language, therefore, must also comport with the limitation in Claim 1 that all of the catenary anchor line mooring buoy's components be kept underwater in order to preserve internal consistency within the claim. See Applera Corp. v. Micromass UK Ltd., 186 F. Supp. 2d 487, 503 (D. Del. 2002) ("[C]omprising' can neither narrow nor broaden the meaning of the claim limitations subsequently recited."). Since the presence of an additional part or component of the mooring buoy floating on the surface of the sea would contradict the requirement in Claim 1 that all of the catenary anchor line mooring buoy's components, recited and unrecited, be kept underwater, Claim 1 does not cover a catenary anchor line mooring buoy featuring...
component(s) that float on the surface of the sea.

Accordingly, the Court agrees with APL's proposed construction of the phrase "buoy as a whole is kept underwater" as it is used in Claim 1 of the '183 Patent.

4441

f. "Oiling wick"

Lastly, the method of claim 23 requires, in addition to the steps in claim 21, the step of "applying a gun oil to an oiling wick attached to the gun barrel cleaning device for oiling the inside of the gun barrel." Michaels contends that the phrase "oil wick" has its ordinary meaning and simply refers to a portion of the device that contacts the inside of the barrel to spread oil. It is not limited to a frayed end, but may be formed from a loop or fold of a fabric sheath. Col 7, lines 55-57.

Clean Gun argues that such an overly broad construction is not supported by the specification. Although the specification indicates that a gun barrel cleaning device might have a wick that is a frayless loop, it also states that the "oiling wick of the invention" is disclosed in Figure 3, which includes the folded sheath with a frayed end. Col 7, lines 13. In addition, the applicant elected Figures 10 and 10A which show a folded and stitched sheath with a frayed end.

Clean Gun ignores the fact that all of the drawings in the application, not just Figure 3, are referred to as preferred embodiments. Even with respect to Figure 3, the specification gives two options by stating that the oiling wick is either "folding in upon itself with its frayed end extending from the insertion," but "can also be formed from a loop or fold of tubular sheath." Col 7, lines 54-57. The specification also states that other structures may be used as an oiling wick, such as the end of the cleaning section as shown in Figure 4. Col 10, lines 21-26.

Since this court does not adopt the scope of the restriction requirement urged by Clean Gun, it must ipso facto reject Clean Gun's limited construction of "oiling wick." Accordingly, this court adopts the ordinary meaning of "oil wick" to refer to a portion of the device that contacts the inside of the barrel to spread oil and may be formed from a loop or fold of a fabric sheath.

4442

IV. The requirement for "wicking barriers" in the lighting elements

A. Claim Interpretation

Claims 1 through 9 and 21 through 26 of the '709 reissue patent and claims 2 through 5 of the '397 patent specify one or more wicking barriers. Claim 1 of the reissue patent states in pertinent part: "A lighting assembly comprising . . . a closure assembly enclosing said electrical lighting elements, said closure assembly including a potting body, in which are embedded said electrical lighting elements, and a potting base, said electrical elements being sealed against moisture from said lamp assembly by a said wicking barrier and from said housing." '709 reissue patent, col. 6, lines 13-19. Claim 21 of the reissue patent reads: "A lighting system comprising . . . a submersible connector electrically coupled between said lamp assembly and said electrical lighting elements, including a wicking barrier between said submersible connector and said transformer; . . ." '709 reissue patent, col. 9, lines 6-10. Finally, claim 2 of the '397 patent states: "A lighting system comprising . . . leads from said electrical lighting elements for coupling with a source of electrical power, said electrical lighting elements being separately sealed from said leads by a wicking barrier." '397 patent, col. 6, lines 11-14.

Defendant contends that the "wicking barrier" elements referred to in claims 21 through 26 of the reissue patent and claims 2 through 5 of the '397 patent are part of the "electrical lighting elements" recited in those claims, and are not part of the "connector" recited in claims 21 through 24 of the reissue patent and claims 2 through 5 of the '397 patent. For instance, according to the language in claim 2 of the reissue patent, which provides that "leads from electrical lighting elements for coupling with a source of electrical power, said electrical elements being separately sealed from said leads by a wicking barrier," the electrical lighting elements are sealed from the leads by the wicking barrier, such that the wicking barrier must
necessarily be located at the electrical elements where the leads connect to them. Additionally, the claims indicate that the wicking barriers are not part of the submersible connector. 15

15 "A lighting system comprising . . . electrical lighting elements including a transformer, said electrical lighting elements being sealed against moisture separate from said lamp cavity; a submersible connector electrically coupled between said lamp assembly and said electrical lighting elements, said electrical lighting elements including a wicking barrier between said submersible connector and said transformer; . . ." ’709 reissue patent, col. 8, line 66 - col. 9, line 10.

Plaintiff contends that nothing in the claims prohibits an interpretation that the wicking barriers could be adjacent or even unitarily constructed with a submersible connector. In support, Plaintiff points to several of the claims indicating different arrangements for the wicking barriers, which purport to show that there is no limitation precluding association of the submersible connector with the wicking barrier. 16

16 For instance, claim 21 of the reissue patent states " . . .said electrical lighting elements including a wicking barrier between said submersible connector and said transformer. . ." Claim 22 depends on claim 21, and additionally requires "a second wicking barrier between said lens and said transformer." ’709 reissue patent, col. 9, lines 8-10; 15-17.

Plaintiff's contention that nothing in the claims prohibits an interpretation that the wicking barriers could be "adjacent" to a submersible connector is inapposite, as Defendant's motion does not seek a ruling as to how close together the connector and wicking barrier might be. Based upon the language of the claims in question, the Court determines that the connector and the wicking barrier cannot be integral. For example, with respect to claim 21, if Plaintiff's interpretation were to be adopted (i.e., that the wicking barriers can be unitarily constructed with the connector), the connector would have to be a part of the electrical lighting elements because the wicking barrier itself is required by claim 21 to be part of the electrical lighting elements. However, claim 21 also states that the "submersible connector [is] electrically coupled between said lamp assembly and said electrical lighting elements." The submersible connector cannot be both part of the electrical lighting elements and between the electrical lighting elements and the lamp assembly.

A similar interpretation applies to claim 22, which states that said electrical lighting elements further includes [sic] a second wicking barrier between said leads and said transformer," referring to the leads from the electrical lighting elements for coupling with a source of electrical power recited in claim 21. Plaintiff maintains that the "wicking barrier is not prohibited from being adjacent or integrally composed with a submersible connector which provides leads to the source of electrical power." Pl. Opp. p.18. Plaintiff's interpretation makes sense only if the submersible connector itself is located between the electrical lighting elements and the leads to the source of electrical power, since that is where the claim specifies that the second wicking barrier must be located. The submersible connector could not be located at the end of the leads where they connect to the power source.

With respect to claim 25, the claim recites that a first wicking barrier and a second wicking barrier are included in the same closure assembly that includes the electrical lighting elements. The claim further states that the first wicking barrier is between the transformer of the electrical lighting elements and the leads to the source of electrical power. 17 The Court determines that the language of the claim indicates that the first wicking barrier would have to be at the end of the leads where they connect to the transformer, as opposed to the end of the leads where they connect to the power source. Additionally, as claim 25 requires the second wicking barrier to be in the closure for the transformer, the second wicking barrier is likewise at the transformer-end of the connection between the transformer and lamp assembly. 18

17 "A lighting assembly comprising . . a closure including a potting body in which said electrical lighting elements are
embedded, a first wicking barrier electrically between said leads and said transformer in said closure assembly and a second wicking barrier electrically between said lamp assembly and said transformer in said closure assembly." '709 reissue patent, col. 9, lines 41-47.18 Defendant notes that the placement of the first wicking barrier in Figure 2 is consistent with its interpretation.

The Court thus determines that the "wicking barrier" cannot be integral with a submersible connector.

4443

Claim 1 of the '046 patent describes an abrasion resistant rail seat for use with concrete ties in which an elastomeric rail pad insulates the rail from the rail tie. The improvement is comprised of "interposing an abrasion resistant plate between said rail pad and said rail tie, . . . said abrasion resistant plate being wider than said rail and extending beyond the flange of said rail." 046 patent, col. 2, ll. 50-55 (emphasis added). In its claim construction order, the district court construed the phrase "wider than [said] rail" so as to require the abrasion resistant plate to be "wider than the rail along it's [sic] entire length, including within the cutout portions." Pandrol II, slip. op. at 6. In its subsequent infringement analysis, the district court concluded that the accused product was "effectively the same width as the rail," and did not meet the "wider than said rail" limitation. Pandrol I, slip. op. at 8. However, we do not have to determine whether the district court's infringement analysis was correct, because we conclude that the district court's claim construction of "wider than said rail" improperly required the abrasion plate to be wider than the rail along its entire length, including within the cutout portions.

The prosecution history of the '046 patent reveals that the "wider than said rail" language was introduced as part of a broader limitation which was added by amendment to distinguish a prior art patent issued to John Buckett, U.S. Patent No. 4,925,094 ("Buckett"). The broader limitation, "being wider than said rail and extending beyond the flange of said rail," was added to distinguish the Buckett abrasion plate that was "substantially the same width as said rail flange." Buckett, col. 4, ll. 11-12. Accompanying the claim amendment was a chart prepared by the inventor to highlight the differences between the claimed invention and Buckett. One entry in the chart stated the following:

Plate extends significantly beyond the rail flange which is essential to prevent significant abrasion occurring beneath the outer pad edges. Although there is very little vertical pressure in this area there is a great deal of horizontal pad movement which causes slurry like material to wear the concrete. One of the reasons for the shoulder cut out is to enable the abrasion plate to extend well beyond the edges of the rail flange.

J. App. at 504 (emphasis added). As Pandrol correctly points out, the above statements relate only to the corner "extensions" of the plate, as opposed to the cutout portions. Based on this chart fragment, we conclude that the single limitation of "being wider than said rail and extending beyond the flange of said rail" only applies to the corner portions of the plate, and not along the rail's entire length.

4444

1. Claim Construction

Plaintiff has moved for summary judgment on its claim of patent infringement. The first step in a patent infringement action is to properly construe the claim to determine its scope and meaning. Carroll Touch, 15 F.3d at 1576. In construing asserted claims, "the general rule is that terms in the claims are to be given their ordinary and accustomed meaning . . . ." Johnson Worldwide Associates, Inc. v. Zebco Corp., 175 F.3d 985, 989 (Fed. Cir. 1999). Generally, both Claims 1 and 2 of the '878 Patent describe an assemblage of credit cards and currency. The product itself is simply a rubber band fitted with a metal band which secures the credit cards and currency, serving essentially the same purpose as a money clip.

The point of contention between the parties in regard to construction of the '878 Patent is the definition of the word "widthwise." In both Claims 1 and 2, the rubber band is described as "a sized rubber band in encircling relation widthwise
of said assemblage." Bryden Aff. Exs. A, C. Defendants offer the following definition of "width": "the measurement of the extent of something from side to side." See Lome Aff. [Docket No. 19] Ex. 5 (American Heritage Dictionary); see also Bryden Aff. Ex. H (same definition in Webster's New Riverside University Dictionary); Bryden Aff. Ex. I (same definition Webster's New College Dictionary). Defendants seize on the word "widthwise" to argue its product does not infringe on the '878 Patent, claiming its product does not fit widthwise over the assemblage; but rather fits "lengthwise" over the assemblage. The parties dispute, however, which measurement of a credit card constitutes its width as opposed to its length. While Defendants contend the width of a credit card is the shorter of the two measurements, Plaintiff states the width can refer to either measurement of a credit card, and further contends that when referring to a credit card, "width" generally refers to the measurement from side to side.

The Court determines the term "widthwise," given its common meaning, can refer to either dimension of a credit card. "Width," as commonly defined, measures a distance from side to side - however, determining which measurement on a three dimensional object is "side to side" as opposed to "top to bottom" is a matter of perspective. Indeed, Defendant Lome repeatedly referred to the longest dimension of a credit card as its "width" in his own deposition, despite arguments in his briefs to the contrary. Lome Deposition (Hearing Exhibit). While not in and of itself dispositive of the issue, Lome's testimony indicates that in this context, "width" should be interpreted broadly.

---

1. "wire"

Although not raised by the parties, the Court considers the word "wire" as it appears in Claim 25. The '133 Patent is the first Patent which has come to the Court's attention which uses the word "wire" without a modifier in its claims. 23

---

23 The parent '136 Patent uses "guidewire" and "core wire." The '578 Patent uses the word "core wire." The '126 Patent also uses the word "wire," however, there were no claims from that patent submitted for construction.

---

Claim 25 is a method claim. The word "wire" appears in the first step: "Disposing a wire near an opening into said body cavity." In the Summary of the Invention, the word wire is discussed as having multiple meanings, depending upon its use:

The term "wire" should be understood to collectively include both guidewires and tips and simply wires without distinct tip structures.

('133 Patent, Col. 4:9-11.) Although this statement is included in the Summary, the word "guidewire" is not used in any of the claims of '133 Patent nor is the word "guidewire" used in the claims of the '578 Patent from which the '133 Patent is a continuation. The only patent claims which contain the use of the word "guidewire" are claims of the '136 Patent.

As it is used in Claim 25, "wire" is an apparatus with a detachable distal tip which can be disposed into a body cavity. The second step of the method of Claim 25 provides: "disposing a separable distal tip of said wire into said body cavity..." Thus, "wire" as it is used in Claim 25 of the '133 Patent is defined the same as "guidewire" in the '136 Patent.

The Court construes "wire" as it is used in the '133 Patent to mean:

A part of an apparatus of the invention which is a thin, flexible, continuous length of metal, of circular cross-section which has a detachable tip.
1. "wire guide" and "wire guide mounted on the distal region" 10

10 The term "wire guide" appears in several claims of the '987 Patent, and the term "mounted on" appears in both the '987 and '505 Patents. With respect to the term "mounted on," the parties' dispute centers on the relationship between the wire guide and the support wire. Therefore, the Court focuses on the construction of the term "wire guide" and the phrase "wire guide mounted on the distal region."

Boston Scientific argues to the extent that construction is warranted, the Court should construe "wire guide" as "a tube or other component with an aperture designed to engage the guidewire and track the support wire along the guidewire." Boston Scientific also seeks to construe the phrase "mounted on" as "assembled on for use together with." ev3 seeks to construe "wire guide mounted on the distal region" as follows: "A part attached at a fixed position to the support wire that has an opening for another wire to pass through so the other wire can lead the support wire to a location. The wire guide is not a separate sheath or rapid exchange catheter, nor is it an opening in a separate catheter or sheath."

Both parties acknowledge that the term "wire guide" has no established meaning in the art. The Court first consults the claim language and the remainder of the specification to discern what a person of ordinary skill in the art would have understood the term to mean. See Phillips, 415 F.3d at 1314. Relevant portions of the claim language of the '987 Patent read:

1. A method for deploying a percutaneous medical instrument, comprising the steps of:

   providing a guidewire and a support wire, the support wire having a distal region, a wire guide mounted on the distal region, and an expandable filter mounted on the distal region; . . . advancing the support wire along the guidewire with the wire guide of the support wire engaging the guidewire

6. The method of claim 1, wherein the wire guide comprises a ring having an aperture adapted to receive the guidewire.

19. A percutaneous filter system, comprising: . . . a wire guide mounted on the distal region of the support wire and slideably engaging the guidewire, . . .

22. The system of claim 19, wherein the wire guide comprises a ring having an aperture adapted to receive the guidewire.

29. The method of claim 1, wherein the wire guide is mounted on the support wire within the filter.

30. The method of claim 1, wherein the wire guide is mounted on the support wire distal the filter.

The term "wire guide" appears throughout the remainder of the '987 Patent. For example, the Abstract provides in part: "A guided filter system for temporary placement of a filter in an artery or vein is disclosed. The system includes a guidewire slideable through a wire guide included in a distal region of a support wire." In addition, the Summary of the Invention provides in part:

In one embodiment, the filter system comprises a guidewire and a support wire having an expandable filter, e.g., a
parachute, basket, or scroll, mounted on a distal region of the support wire. The distal region of the support wire includes a wire guide, which slideably engages the guidewire. In certain embodiments, the wire guide comprises a ring having an aperture adapted to receive the guidewire.

In a first method of using the guided filter system, the filter and the distal region of the support wire are advanced over the guidewire, having the wire guide of the support wire engaging the guidewire, i.e., like a monorail catheter engaging a guidewire.

'987 Patent, col. 3, ll. 9-65 (emphasis added). The term "wire guide" also appears repeatedly throughout the Brief Description of the Drawings and the Detailed Description. In the Detailed Description, the term "wire guide" is identified as a specific part: "wire guide 26." For example, the first reference to "wire guide" reads:

Wire guide 26 is included in distal region 11 of the support wire. The wire guide may be mounted within the filter (as shown in FIG. 1B and FIG. 1C) or at any other suitable position on support wire 10 proximal of the filter (as shown in FIG. 1E), or on a distal extension of the support wire which extends beyond the filter (as shown in FIG. 1F).

'987 Patent, col. 5, ll. 35-41. The wire guide is also specifically identified as number 26 in the related Figures 1B-1F. These figures all correspond to the description of the "first embodiment."

The '987 Patent also describes "another embodiment," in which "the filter further includes a capture sheath which covers the filter and is removeable from the filter, the sheath having a port in its distal region adapted to receive the guidewire in the manner of a rapid exchange catheter." '987 Patent, col. 5, ll. 48-51. This sheath-based embodiment is depicted in Figures 1G, 1I, 1J, and 1K. In contrast to the figures depicting the "wire guide" embodiment, these figures do not include any structure designated as a "wire guide" or that corresponds to reference number 26. Instead, these figures depict embodiments using a "sheath" or a "rapid exchange catheter."

Despite the distinction between the two embodiments and the identification of "wire guide" as a particular component in reference to the "first embodiment," Boston Scientific argues that it would be improper to construe the term so as to limit it to embodiments in which the term "wire guide" explicitly appears in the specification. Instead, Boston Scientific proposes that the term "wire guide" should encompass embodiments disclosed in the '987 Patent that do not expressly refer to a "wire guide." Specifically, Boston Scientific proposes that "wire guide" should include the sheath-based embodiments depicted in Figures 1G, 1I, 1J, and 1K. The Court disagrees. As outlined above, the '987 Patent describes two distinct structures for guiding a wire over another wire: a "wire guide" and a "sheath" (or "rapid exchange catheter"). In particular, claims 1-30 recite the "wire guide" limitation and claim 31 recites the "sheath" limitation. 11 The '987 Patent also describes a "wire guide" as a specific component of the "first embodiment." The figures that include the "wire guide" are described in the patent and the "wire guide" structure is labeled with reference number 26. In contrast, the '987 Patent describes "another embodiment," that includes a "sheath" or "rapid exchange catheter" with a hole in it that slides along a wire. The hole is referred to as a "port (60)," a "skive (61)," and a "skive (77)", but not a "wire guide (26)." '987 Patent, col. 5, ll. 54-57. Further, neither the figures depicting nor the portion of the detailed description relating to this second embodiment describe any structure designated with reference number 26.

Footnotes

11 In particular, claim 31 reads:

31. A percutaneous filter system, comprising:

a guidewire;

a support wire having a proximal end, a distal end, a distal region, and an expandable filter mounted on the distal region of the support wire, the support wire adapted to receive a percutaneous medical instrument; and

a sheath which removeably covers the support wire and filter, the sheath having a proximal end, a distal end, and a distal
region, the distal region having a lumen which receives the filter and an aperture adapted to pass the guidewire,

wherein, during use, the guidewire is positioned in a vessel at a region of interest, the sheath carrying the support wire is advanced along the guidewire until the filter reaches the region of interest, and the sheath is withdrawn to expose the filter.

Based on the claim language and the specification, it is evident that the "wire guide" and "sheath" are distinct structures. Accordingly, the Court declines to construe the term "wire guide" to encompass the sheath-based embodiments of the '987 Patent.

The Court now turns to the "mounted on" claim language. The term "wire guide mounted on the distal region" appears in independent claims 1 and 19 of the '987 Patent. In relevant part, claim 1 reads: "the support wire having a distal region, a wire guide mounted on the distal region." Claim 19 provides in pertinent part: "a wire guide mounted on the distal region of the support wire and slideably engaging the guidewire." In each claim, the language expressly indicates that the wire guide is mounted on the support wire. Boston Scientific argues that its proposed construction--"assembled on for use together with"--reflects the ordinary meaning of the words, which do not connote any sense of permanence or fixed attachment. In contrast, ev3 argues that the appearance of the phrase "mounted on" in these claims conveys a sense that the wire guide is permanently attached to the support wire.

To determine the meaning of "mounted on," the Court looks first to the intrinsic evidence. Claim 19 describes the relationships between the "wire guide" and two other components--the support wire and the guidewire. The claim language instructs that the "wire guide" is "mounted on the support wire," but "slideably engaging" the guidewire. The use of two claim terms--"mounted on" versus "slideably engaging"--"in close proximity in the same claim gives rise to an inference that a different meaning should be assigned to each." Bancorp Servs., L.L.C. v. Hartford Life Ins. Co., 359 F.3d 1367, 1373 (Fed. Cir. 2004). This inference supports a construction in which the wire guide (1) is located at a fixed position relative to the support wire, and (2) allows the guidewire to slide relative to its position.

With no strong extrinsic evidence to the contrary, the Court relies on the intrinsic evidence to conclude that the phrase "mounted on" requires fixed attachment. The Court therefore construes "wire guide mounted on the distal region" as "a part attached at a fixed position to the distal region of the support wire that has an opening for another wire to pass through so the other wire can lead the support wire to a location." The Court declines to construe the terms "wire guide" and "mounted on" independently of the Court's construction of "wire guide mounted on the distal region."

7. "Wire-like." Consistent with claim 1 of the '331 patent and claim 1 of the '278 patent, 16 the written description 17 and the prosecution history, 18 the court construes "wire-like" to mean "a metal material capable of being bent to form peaks."

--- Footnotes ---

16 '331 patent, col. 7, ll. 3, 21-23; col. 8, ll. 6-7; '278 patent, col. 6, l. 55.
17 '331 patent, col. 4, ll. 63-70; col. 5, ll. 1-13; '278 patent, col. 4, ll. 57-70; col. 5, ll. 1-7.
19 Defendants argue that the use of "wire-like" renders certain patent claims indefinite. The Federal Circuit has explained that a claim satisfies § 112 P 2 if one skilled in the art would understand the bounds of the claim when read in light of the specification. See Miles Lab. v. Shandon, Inc., 997 F.2d 870, 875 (Fed. Cir. 1993). In determining whether this standard is met, the Federal Circuit has advised that a claim is not indefinite merely because it poses a difficult issue of claim construction. Exxon Research & Eng'g Co. v. United States, 265 F.3d 1371, 1376 (Fed. Cir. 2001). Rather, the Federal Circuit has held a claim sufficiently clear to avoid invalidity on indefiniteness grounds "if the meaning of the claim is
discernible, even though the task may be formidable and the conclusion may be one over which reasonable persons will disagree." Id. "A determination of claim indefiniteness is a legal conclusion that is drawn from the Court's performance of its duty as the construer of patent claims." Personalized Media Communications, LLC v. Int'l Trade Comm'n, 161 F.3d 696, 705 (Fed. Cir. 1998). The court finds that "wire-like" is not indefinite, as one of ordinary skill in the art could discern from the specification and prosecution history that the term was limited to a metal material that is capable of being bent.

a. "wire loop"

The term "wire loop" appears in claim 1. Boston Scientific argues that the term is unambiguous and needs no further construction. ev3 proposes that the term be construed as "a loop or a hoop-shaped frame that maintains the filter mouth in an open position and defines the mouth of the filter." After reviewing the intrinsic evidence, and the prosecution history in particular, the Court declines to construe the term "wire loop."

GO BACK

3. "the conductive wire portion of which contacts said gel layer"

Claim 2 of the '884 Patent describes the "connection means" of Claim 1 as an insulated wire, "the conductive wire portion of which contacts said gel layer." Cardiac Science maintains that "conductive wire portion of which contacts said gel layer" should be construed as "electrically connected to the gel layer." Philips contends that this phrase should be construed as "conductive wire portion of insulated wire is in direct contact with the gel layer, without the use of a conductive contact layer, for example an intermediate metallic layer." Philips also renews its disclaimer arguments, as discussed in Section II.D.1, above.

The Court finds that "conductive wire portion of which contacts said gel layer" should be construed as "the conductive wire portion of the insulated wire that is in contact with the gel layer." The phrase needs no further construction.

GO BACK

a. "wires for cutting said housing part into several sections"

i. "wires"

The parties first dispute whether the claim term "wires" should be limited to structures made of metal. Gore argues that the ordinary meaning of "wires" requires a metallic structure and cites dictionary definitions that support this interpretation. (Gore Opening Br. 33; Matsumura Decl. PP 51-55.) Perouse argues that "wires" are not limited to metal structures because the term "wires," as used in the relevant art, refers to both plastic and metal structures. (Perouse Opening Br. 22.)

The intrinsic evidence does not resolve this dispute. As Gore correctly notes, the specification is silent regarding the material or materials used to make the "wires." (Gore Opening Br. 33.) Because the intrinsic evidence gives no indication that the material of the wires is significant, this would seem to support Perouse's broader construction. However, because the intrinsic evidence is somewhat ambiguous, it is appropriate to consult extrinsic evidence. See Pickholtz v. Rainbow Techs., Inc., 284 F.3d 1365, 1373 (Fed. Cir. 2002) ("Only if a disputed claim term remains ambiguous after analysis of the intrinsic evidence should the court rely on extrinsic evidence."); see also Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1309 (Fed. Cir. 1999) ("[I]t is entirely appropriate, perhaps even preferable, for a court to consult trustworthy extrinsic evidence to ensure that the claim construction it is tending to from the patent file is not inconsistent with clearly expressed, plainly apposite, and widely held understandings in the pertinent technical field.")
The dictionary definitions cited by Gore support its contention that "wires" are metal structures. However, Perouse's expert suggests that "wires" has a particular meaning to persons of skill in the art that may differ from its dictionary definition. See Phillips, 415 F.3d at 1322 ("[A] general usage dictionary cannot overcome art-specific evidence of the meaning' of a claim term. . . . Even technical dictionaries . . . may suffer from some of these deficiencies." (quoting Vanderlande Indus. Nederland BV v. Int'l Trade Comm'n, 366 F.3d 1311, 1321 (Fed. Cir. 2004))). The Court is persuaded by the extrinsic evidence cited by Perouse's expert that a person of skill in the art would not interpret "wires" as being limited to structures made from metal. In particular, Perouse's expert cites a number of patents from the 1980s and 1990s relating to implantable medical devices in which "wires" is used to include both metal and plastic structures. (Golds Decl. P 14, Ex. 25, 26, 21, 28.) While the Federal Circuit has cautioned that expert testimony may be unreliable because it is prepared for the purpose of litigation, the Court believes this concern is minimized here where the expert testimony is supported by the patent literature. See Phillips, 415 F.3d at 1318 ("[E]xtrinsic evidence consisting of expert reports and testimony is generated at the time of and for the purpose of litigation and thus can suffer from bias. . . .").

Therefore, the Court's construction of "wires" is not limited to structures made of metal.

The Court also adopts Perouse's proposed construction of "wires" to mean "threads." Gore's proposed construction of "structures" is obviously too broad and inconsistent with any reasonable definition of "wires." The specification appears to use the terms "wires" and "threads" interchangeably. The abstract of the '787 patent states that "cutting threads cause the housing to open longitudinally into several petal-like parts" ('787 patent Abstract), while in the body of the patent, these "cutting" elements are referred to as "wires." ('787 patent Abstract, col. 1 11.54-55, col.3 11.19-39). This construction is also consistent with dictionary definitions cited by Gore, several of which refer to a wire as a "slender, flexible structure" or "thread." (Matsumura Decl. P 54.)

The Court construes "wires" to mean "threads."

ii. "for cutting said housing part"

"Cutting" is a common, nontechnical term used in the '787 patent consistent with its ordinary meaning, "to penetrate with an edged instrument which severs the continuity of the substance." The Oxford English Dictionary, v.4 at 172. The specification uses "cutting" to refer to the creation of separations in the housing part by the wires of the first embodiment. ('787 patent col.1 11.54-57, col.3 11.5-43.) The operator induces tension in the wires by pulling on the actuation handle and these wires then cut the housing part into sections. ('787 patent col.1 11.54-57, col.3 11.5-43.) There is nothing in the intrinsic evidence to warrant departure from the ordinary meaning of this term.

Gore construes "cutting" to mean "severing." 19 (Gore Reply Br. 19-20.) Because "severing" ordinarily requires the complete separation of a part from the whole, Gore's construction is too narrow. "Cutting" does not require complete severance, nor does the intrinsic evidence describe a housing part from which a portion has been severed. Gore's construction would therefore exclude the "wires" embodiment described in the '787 patent, because the wires of this embodiment do not necessarily "sever" the housing part from the tool. A construction that does not include preferred embodiments within its scope is "rarely, if ever, correct." See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996).

- - - - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - - -

19 While the language of Gore's proposed construction (as worded in Gore's proposed order) was "cutting or severing," Gore's reply brief clarifies that the intended construction is "cutting, i.e., severing." (Gore Proposed Order 2; Gore Reply Br. 20.)

- - - - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - - -

Perouse construes "cutting" to mean "dividing." This construction is too broad because there are ways to "divide" a housing part that do not involve "cutting." For example, removal of the cord in the '787 patent's "gussets" embodiment divides but does not cut the housing part.
Therefore, the Court cannot accept either party's proposed construction and instead adopts its own construction that is more consistent with the ordinary meaning of the word. The Court construes "wires for cutting said housing part" to mean "threads that can penetrate and completely or partially divide said housing part."

iii. "into several sections"

Finally, the parties dispute the construction of the claim term "several." Perouse contends that "several" means "more than one," while Gore proposes "more than two." The Court believes that "several" is typically used to mean "more than two," but will review the evidence to determine whether a different construction is appropriate.

The specification and drawings depict a housing part that is cut into three sections, which is consistent with either proposed definition. Because the intrinsic evidence is ambiguous, the Court will consider extrinsic evidence. Perouse's expert states that "several" does not have a particular meaning in the art, but contends that the ordinary meaning is "more than one." (Golds Decl. P 88.) The dictionary on which Perouse's expert relies is ambiguous, however, as it includes definitions for "several" as both "more than one" and "more than two but fewer than many." (Golds Decl. P 88, Ex. 5 at 1078.) Gore's expert assumes without discussion that "several" is defined as "more than two." (Matsumura Decl. PP 51-52, 55.) In its reply brief, Gore notes an additional dictionary definition that defines "several" as "[a]s a vague numeral: Of an indefinite (but not large) number exceeding two or three; more than two or three but not very many." (Gore Reply Br. 20 n.14.) The parties cite no additional extrinsic evidence in support of their constructions.

While each construction finds some support from dictionary definitions, there is slightly more support for Gore's proposed construction of "more than two." The Court also believes "more than two" is more consistent with the use of "several" in common parlance. The Court therefore construes "several" to mean "more than two."

Accordingly, the Court construes the phrase, "wires for cutting said housing part into several sections," to mean "threads that can penetrate and divide said housing part into more than two sections." 20

--- Footnotes ---

20 Perouse provided a construction for "sections" in its opening brief. (Perouse Opening Br. 28-29.) However, Core did not construe this term in its briefing or address its construction during the Markman hearing. Therefore, the Court presumes this claim term is not in dispute and does not require construction.

--- End Footnotes ---
than the magnet it protects. To put it another way, the magnet protector is "taller" than the magnet it protects, so that during rotation, as described above, the particles hit the casing wall, are pushed upward, and then attach themselves to the magnet surface. The specifications of the 787 patent, 106 the 781 patent, 107 the 386 patent, 108 the 539 patent, 109 and the 117 patent 110 all explain that a protector extends farther out than does its corresponding magnet to protect the magnet when the tool is rotated. The drawings of all five patents support this interpretation as well.

1. With a wick to convey a combustible liquid to the burner

The clause "with a wick to convey a combustible liquid to the burner" is found in phrase 4 of claim 1. There are two disputes associated with this phrase, namely: (1) whether the "liquid" is a required limitation of the claim; and (2) whether Defendant's proposed language of "This term may not be construed to encompass a wick that extends through the cavity to the upper surface of the catalytic combustion burner" should be added as a negative limitation. The Court looks at each of these in turn.

* * *

The Wick Limitation

Defendants seek to add the limitation, "This term may not be construed to encompass a wick that extends through the cavity to the upper surface of the catalytic combustion burner." Plaintiffs argue no portion of the patent or prosecution history supports such a limitation.

Defendants point to the prosecution history and argue that the Applicants of the '061 patent disavowed a wick extending up and through the cavity of the burner. Defendants point to the same response to the office action referenced above and argue that the Applicants expressly distinguished the positioning of the prior art wicks, i.e., wicks that extended through the upper part of the cavity and were in contact with the atmosphere. See Doc. No. 58, Ex. 3, at P130240. According to Defendants, because the Applicants expressly disavowed via arguments submitted to the Patent Office for purposes of establishing patentability over the prior art, Plaintiffs are now precluded from asserting a claim construction without such a limitation.

In the response referenced above, the Applicants noted that "FR 2 530 144 discloses a catalytic combustion burner provided with a cavity filled by a wick which extends up to the upper part of this cavity and which is consequently in contact with the atmosphere." Id. (emphasis added). The point made by the patentee was that, in FR 2 530 144, the wick extended to a point where it blocked ingress of air to the cavity. However, the prior art did not solve the problem of wick burning, noting that "the wick which is very close to the catalytic combustion zone will burn and char and carbonize and produce carbon particles." Id. As a result, in the absence of oxygen, the wick in close contact with the stone in the device of FR 2 530 144 would carbonize.

The patent-in-suit did not attempt to solve the problem of wick burning through the positioning of the wicks, as Defendants...
contend. Rather, the novelty of the present invention is the "presence of at least one open channel located in the upper part of the burner." See Doc. No. 58, Ex. 3, at PB0238-39. The present invention provides the open passage that permits air to enter into the cavity to avoid carbonization. As the Applicants stated, the "presence of at least one open channel is neither disclosed in, or suggested by, either EP 0 277 875 or FR 2 530 144." Id. at PB0239.

The Court finds that the open channel provided the inventive step over the prior art, not the placement or positioning of the wick. Consequently, the Court will not construe the term as requiring the negative limitation asserted by Defendants.

4. "With From Approximately 10 to 40 Bristles Per Turn of the Helix"

Plaintiffs contend that the phrase "turn of the helix" refers to a "visible row or visible turn" of the helical array of bristles, which corresponds to a 180 degree rotation of the mascara brush about its longitudinal axis. Defendants argue that the ordinary meaning of "turn" is "rotation or revolution," which suggests a 360 degree rotation of the brush about its axis.

Consistent with both the court's interpretation of the word "bristle" and with the specification's description of the manufacturing process, the court interprets the word "turn" to be the "loop" into which the bristle bundles are inserted. At the outset, the patentee describes the conventional mascara brush as having "from 50 to 60 bristles per turn." ( '622 patent, col. 1, lns. 20-21) In more particularly describing the various manufacturing stages of the conventional brush, the patentee explains that,

with the bristle bundles 6 thus disposed, the rake-like device 8 is brought near the twisted wire 2b until the bundles 6 each penetrate with one of their ends into a loop 5 perpendicular to the median line of the twisted wire 2b until the wire comes to occupy a median position in relation to the bundles 6 of the bristles which then project from the latter on either side by a practically identical distance.

At that moment, the twisting movement, already effected to constitute the twisted wire 2b, is continued so that the pitch of the wire becomes progressively smaller, the two iron wire strands becoming contiguous and the bundles 6 of the bristles being simultaneously deformed to lead to the above-mentioned spiral form whose pitch is of the order of 2 mm.

To obtain the bristles 3, polyamide filaments are used with a diameter of approximately 0.8 mm. The number of bristles constituting one bundle 6 is the order of sixty. Thus, the brush represented in FIG. 5 has a helical array of bristles relatively tightly placed against each other.

To obtain the brush 1 represented in FIG. 6, which conforms to the present invention, the above indicated method is used except that the depth of each tooth of the rake-like device 8 for dispensing the bundles 6 of the bristles is halved and that, moreover, the bristles 3 have a diameter of approximately 0.17 mm. It follows from this that the number of bristles per turn of the brush 101 of FIG. 6 is 15; it has therefore been reduced by 75%, the reduction by half of the overall volume of the bristles being combined with a reduction by half due to the doubling of the diameter of the bristles.

('622 patent, col. 5, lns. 8-38) (emphasis added). The primary lesson to be gleaned from this language is that the patentee only counted the "bristles" once; he did not double the number of bristles once the "bundle 6" was inserted into the "loop" or "turn" and deformed by being twisted at its median point.

This construction finds support in other parts of the specification and of the prosecution history. For instance, the specification states that "when the bristles are implanted between the turns of the core, there is a softening of the bristles due to the deformation . . . ." ( '622 patent, col. 3, ln. 68 - col. 4, Ins 1-2) (emphasis added).

Moreover, in discussing the remedy to the "flattening" problem of conventional mascara brushes, the specification notes that in the present invention,

the bristles of one turn cannot, by bending over as they pass through the wiper lip, also produce the bending over of the bristles of the following turn; on the contrary, they interpenetrate between the bristles of this following turn. . . .
('622 patent, col. 2, lns. 43-48) (emphasis added). In other words, as the brush emerges from the wiper, the first turn of bristles to encounter the wiper will interpenetrate "the following" turn. If a "turn" referred only to a 180 degree rotation on the brush's longitudinal axis, then the bristles of one turn could not interpenetrate the bristles of "the following" turn because those "following" bristles would be on the other side of the axis (i.e., 180 degrees away). 6

5 Plaintiffs argue that the bristles form a "double helix" and that by rotating it 360 degrees two "visible rows of the helical array will be traversed along the length of the brush." (D.I. 272 at 34) Neither claim 1 nor the specification speaks of a double helix.

6 The same is true if one uses (as plaintiffs sometimes do) "adjacent" in place of "following." If a turn is 180 degrees, the "adjacent" turn is the next, contiguous 180 degrees. See Webster's at 26 (defining "adjacent" as, inter alia, "having a common border").

The prosecution history is not inconsistent with this interpretation. In a request for reexamination, L’Oreal submitted a variety of brush photographs to the examiner to distinguish the '622 patent from prior art. These photographs depict magnified views of prior art brushes and of the brush disclosed in the '622 patent. (See generally D.I. 273 at SA 168-76) The caption to each of these photographs identifies the number of turns on the brush and the number of bristles per turn. Significantly, in each of these photographs more than 180 degrees of the mascara brush is visible. (See, e.g., D.I. 273 at SA 173-75)

In sum, in determining the number of bristles "per turn of the helix," one should count the number of bristles included in each original bundle that is inserted into each "turn" or "loop" or "coil" of the core. This number should be consistent with the number of bristles visible on each half of the "turn," but neither a 360 degree nor a 180 degree construction is entirely consistent with the intrinsic evidence of record.

In the Sevenson litigation, this court also construed the words in claim 1(f), which requires "withdrawing said steam from said confined space." In this court's claim construction opinion in Sevenson, it construed "elongated confined space" not to require the confinement of steam because several dependant claims (5, 6, 7, and 9) disclosed methods for accumulating, transmitting, treating, and filtering steam before discharge. Applying the principle of claim differentiation, the court concluded claim 1's use of the term "confined" should be limited to the confinement of sludge and calcium oxide, and not steam, which was addressed by the other dependent claims. See Manchak v. Chemical Waste Mgmt., 1997 U.S. Dist. LEXIS 22303, C.A. No. 95-709, slip op. at 30-32.

On appeal, the Federal Circuit held that the plain meaning of the term "confined space" is that it "must also confine steam." Manchak, 217 F.3d 860, [WL] at *3. The Federal Circuit rejected this court's reliance on claim differentiation, noting that dependant claims 5 through 9 would not make sense unless the structure of claim 1 already confined the steam to be processed. Id. 217 F.3d 860, [WL] at 3. The Federal Circuit also found its construction to be consistent with the embodiment depicted in one of the figures and with the prosecution history. Id. It therefore held that a device that "has a safety screen on top that allows the steam formed by the exothermic reaction to . . . escape [freely]," could not infringe, either literally or under the doctrine of equivalents, the "confined space" claim limitation. Id. 217 F.3d 860, [WL] at *2, 5-6. The court will therefore define "elongate confined space" to mean "an elongate space that must confine the reaction product of calcium oxide and sludge, including steam."

In the Sevenson litigation, this court also construed the words in claim 1(f), which requires "withdrawing said steam from said confined space." Sevenson argued that this claim limitation should be construed to require "an active means of
removing steam from the elongate confined space," as opposed to permitting steam to escape passively into the environment. The court rejected this construction of claim 1(f), noting that dependant claim 5 discloses a process by which steam accumulates in the confined space and proceeds down a passage to the exterior of the confined space. Claim 6, which is dependant on claim 5, discloses using a stream of air to withdraw steam from the confined space. Because claim 6 discloses an active system for withdrawing steam, the court employed the canon of claim differentiation to conclude that claim 1(f)'s "withdrawing" requirement should be more generally understood as encompassing either active or passive means for steam removal.

While addressing the court's construction of "confined space," the Federal Circuit did not reach the construction of the term "withdrawing." Manchak, 217 F.3d 860, [WL] at *3. Several defendants argue, however, that the Federal Circuit's analysis supports a more narrow construction of withdrawing than was employed in Sevenson. DCWASA, for example, argues that the "passive" escape of steam is not covered by the "withdrawing" claim limitation. It notes the Federal Circuit stated that "the step of 'withdrawing said steam from [said] confined space' in claim 1 also would make little sense if the steam were not confined in the space to begin with." Id. 217 F.3d 860, [WL] at *3. DCWASA posits that because claim 1 requires both the confinement and removal of steam from the confined space, the mere passive escape of steam from the ends or top of an accused device is not covered by the claim term "withdrawing."

In response, Manchak argues in support of the court's prior ruling that the "withdrawing" claim limitation is satisfied by either active or passive removal of steam from the confined space. He notes that the Federal Circuit did not reach "withdrawing." Indeed, it noted that dependant claim 6's active means of discharging steam by means of an air flow distinguished it from claim 1. Thus, claim 1 should be read to apply to the active or passive removal of steam from the confined space.

The plain meaning of "withdraw" is "to take back or away" or "to remove from use or cultivation." Webster's Ninth New Collegiate Dictionary, 1355 (1991). Nothing in this definition suggests the manner in which the removal of steam must occur. Nor does any part of the claim specification suggest that this withdrawing must occur actively. Thus, the court will continue to construe the phrase "withdrawing said steam from said confined space" to mean "removing, either by active or passive means, steam from the elongate confined space."

165. This claim terminology describes the position of the movable link element when it is spaced from the cam. This term is used in the '656 patent specification in various contexts, but always in the same way to describe the condition when the bolt is "withdrawn", Col. 1, lines 32-33; or to describe the condition when "the detent [ball] 96 is unextended or withdrawn", Col. 6, lines 22-23. Thus, the term is used to be synonymous with "unextended", where the spherical detent ball is not projected, extended or protruded outwardly of the solenoid housing. See Col. 6, lines 16-19. That is, the withdrawn position is the opposite of the engagement position where the detent ball has projected above the surface of the solenoid housing.

Next, the district court construed the claim language "in," "within," and "between." Each of these claim construction issues is similar to the interpretation of "between" discussed above in relation to claims 5 and 33-36 The district court construed these words more narrowly than required by the claim language and context. The word "in" does not require that something be completely and continuously inside of something else. The word "within" does not require that something be completely and continuously within something else. Further, as discussed above in more detail, the word "between" does not require that something be completely and continuously between two things.

Nothing in the specification or the prosecution history supports such narrow readings, and no testimony was offered to suggest that these narrow interpretations are the correct meaning to one skilled in the art. Consulting the claim language again, the "between" requirement may be satisfied even if a component extends beyond the specified boundaries. In the
same way, the "in" requirement may be met by a component which is located, at least in relevant part, in the defined space, as the "within" requirement may be met by a component which located, at least in relevant part, within the defined area. Accordingly, this court vacates the district court's grant of summary judgment of non-infringement, both literal and under the doctrine of equivalents, as to claim 11 and remand for a trial on the merits.

3. Within

TI Group next argues that the district court's definition of the term "within" is also unnecessarily narrow. The district court construed "within" to mean that "the pumping means components are located inside the reservoir." Markman Order at 2. TI Group argues that this construction is more narrow than the ordinary and customary meaning of the term "within," and is not consistent with the written description. VDO argues that the narrower construction is appropriate in light of the dictionary definitions and written description.

Again, both parties offer competing dictionary definitions in support of their argument. TI Group urges us to adopt the definition "in the limits of, not outside or beyond," 20 The Oxford English Dictionary 456-58 (2d ed. 1989), or "in the limits or compass of; not beyond," Webster's at 2627. VDO points instead to the definitions reciting "in the inner part or interior of." 20 The Oxford English Dictionary 456-58 (2d ed. 1989), or "on the inside or on the inner side," Webster's at 2627. Because all of the offered definitions are facially relevant, we rely on the written description to "point away from the improper meanings and toward the proper meanings." Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. Sept. 16, 1998).

TI Group argues that the written description does not require the pumping means to be located within the reservoir, and further argues that, if the patentee had wished to draw such a distinction, the language for doing so was available. TI Group argues that because the patentee used the allegedly broader term "within," rather than "inside" or "on the interior," the full breadth should be afforded to the scope of the limitation. VDO argues in response: (1) that the structures illustrated in the drawings of the written description show the pumping means located inside of the reservoir; (2) that TI Group's argument "ignores the primary (and most relevant) definition of 'within'"; and (3) that statements made by TI Group during prosecution of a Japanese counterpart application confirm that the patentee intended "within" to mean "inside."

With respect to VDO's first argument, regarding the drawings being limited to the construction it urges, we have held that "the mere fact that the patent drawings depict a particular embodiment of the patent does not operate to limit the claims to that specific configuration." Anchor Wall Sys. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1306-07 (Fed. Cir. 2003) (citing Hockerson-Halberstadt, Inc. v. Avia Group Int'l, Inc., 222 F.3d 951, 956 (Fed. Cir. 2000)). The drawings, without more, are insufficient to cabin the scope of the ordinary and customary meaning of the term "within" in this case. As to VDO's second argument, regarding the "primary definition" of "within," we again reiterate that a patentee is entitled to a definition that encompasses all consistent meanings. Brookhill-Wilk 1, LLC, 334 F.3d at 1300. Finally, with respect to VDO's argument regarding statements made during foreign prosecution, we decline to comment, given our conclusion below, and note only that "the varying legal and procedural requirements for obtaining patent protection in foreign countries might render consideration of certain types of representations inappropriate" for consideration in a claim construction analysis of a United States counterpart. Caterpillar Tractor Co. v. Berco, S.p.A., 714 F.2d 1110, 1116 (Fed. Cir. 1983).

Although VDO's arguments in favor of the district court's construction are not persuasive, we nonetheless conclude that the district court's construction of "within" was correct because the dictionary definitions TI Group urges us to adopt are not so different from those urged by VDO and adopted by the district court. TI Group's definition is "within the limits of, not outside or beyond." VDO's definition is "on the inside." Certainly, in ordinary and customary usage, what is not outside is on the inside. Thus, we affirm the district court's construction of the term "within" as meaning "inside."

4458

III
The district court's determination of no infringement of the '322 patent rested on claim construction. Claim 1 of the '322 patent is the only independent claim and all the asserted claims contain the limitations of claim 1. Claim 1 of the '322 patent shows the pertinent limitation in the context of the entire claim:

1. A hand-held device for entering information into an electronic system via a keyboard, the device comprising:

   a housing having a grippable portion which permits the device to be held in one hand with the thumb free to move at least temporarily to a predetermined key-actuation position while the device is held,

   a concavity in said housing at said key-actuation position, and a thumb-associable cluster of keys forming a keyboard within said concavity, each of the plurality of keys in said cluster being selectively actuable via mixed lateral and slight endo, translation of a thumb within said concavity, whereby information is entered into an electronic system.

'322 Patent col.8 ll.16-31 (emphases added). The district court construed "a concavity in said housing at said key-actuation position, and a thumb-associable cluster of keys forming a keyboard within said concavity" to mean "that the concavity must be formed by a depression in the housing of the device, and that all keys comprising the keyboard must be contained entirely within the concave area and sunk below the surface of the housing, so that the thumb movement occurs within the concave area." Motionless Keyboard, 2005 WL 1113818, at *19.

On appeal, MKC argues that "a concavity in said housing at said key-actuation position, and a thumb-associable cluster of keys forming a keyboard within said concavity" means that the tops of the keys themselves can form the concavity. Thus, under MKC's proposed construction of the claims, the keys or portions thereof themselves can form a concavity within the housing. MKC wants a broad construction of the concavity. Appellees, to the contrary, agree with the district court's narrower construction.

The claim language "a concavity in said housing at said key-actuation position, and a thumb-associable cluster of keys forming a keyboard within said concavity" defines well the limitation. '322 Patent col.8 ll.21-23 (emphases added). By using the terms "concavity in said housing" and "keyboard within said concavity," the patentee defined a depression within the housing of the device and set the keyboard entirely within that depression. The district court correctly grasped and conveyed this meaning.

The specification underscores the correctness of the trial court's construction: a "keyboard is positioned in a concavity or depression in the housing." '322 Patent col.4 ll.58-59 (emphasis added). To confirm this reading, all keyboard renderings in Figures 1, 3-5, 7, and 8 in the '322 patent show a concavity in the housing of the device with the keyboard totally within the concavity. '322 Patent Fig. 1, 3-5, 7, and 8. Figure 4, for instance, shows the concavity:

GET DRAWING SHEET 4 OF 6.

't32 Patent Fig. 4. Thus, this court agrees with the district court's claim construction of this limitation.

4459

4. Having defined "aperture" above, the court must also construe the meaning of insert as asserted in patent '135. Defendant asserts that the limitation in claims 1-18 requiring the insert be adapted to fit or accommodated "within the aperture" restricts the types of inserts to those with outer dimensions conforming to or smaller than the aperture's outer edge. (Lamson Markman Brief, p. 23). The words of the claims limit the scope of the insert to "within the aperture." The specification describes the preferred embodiment of the insert as follows:

The insert 14 has a top edge 42, a bottom edge 44 and two side walls 46 and 48. A flange 50 extends around the periphery of the insert 14. The flange 50 is sized and adapted to fit securely within the recess of the base plate 12 in order to form a connection with the base plate 12. A raised ledge 51 is located on the face of the insert 14 around the periphery of the aperture 26 and flange 50.
(Col. 4, lines 5-12) The court construes the above language to describe an insert, separate from, but connected to a flange and a raised ledge. The size of the flange and raised ledge should therefore not be taken into consideration when ascertaining the size of the insert. The notice function of the patent is sufficiently served, by reference to the specification and the drawings, to inform the public that the insert, required by the claims to be "within the aperture" does not include the flange and raised ledge described therein which clearly do not fit "within the aperture." The flange and the raised ledge are limitations in the specification that were not and should not be imported into the claim language. While it is proper to use the specification to interpret words and phrases in the claims, it is improper to import extraneous limitations from the specification into the claims. "By 'extraneous,' we mean a limitation read into a claim from the specification wholly apart from any need to interpret what the patentee meant by particular words or phrases." E.I. Du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir. 1988). None of the claims in Patent '135 require the insert to be limited in scope by connection to a flange or a raised ledge. The claims, do, however, specifically require that the insert fit "within the aperture." In order to accomplish this, the insert must have an outer dimension conforming to, or smaller than, the outer dimensions of the aperture to fit within the aperture. Therefore, this court finds that the insert as described in the claims must have an outer dimension conforming to or smaller than the outer dimensions of the aperture, and does not include the flange and the raised ledge so as to fit "within the aperture."

GO BACK

4460

The determinative phrase in this case is that the active electrode must be "configured to be exposed to said whole blood sample without an intervening membrane or other whole blood filtering member." The ordinary and natural meaning of the phrase "without an intervening membrane or other whole blood filtering member" is without any type of filter whatsoever -- neither an intervening membrane nor any other whole blood filter. The absence of any filter was the innovation of the '551 patent and plaintiff's products are manufactured with no whole blood filter. Based on the evidence submitted, the Court finds that the FastTake TM product does contain a whole blood filter, and, consequently it does not infringe Abbott's patent.

Abbott does not seriously dispute that the FastTake TM product filters whole blood from reaching the carbon layer. The FastTake TM product consists, in relevant part, of a carbon layer and a gel membrane located above the carbon; a whole blood sample is placed on top of the gel membrane. The evidence indicates that the gel membrane -- containing the enzyme and the mediator -- filters the whole blood, allowing only the plasma to reach the carbon element. Moreover, this is an intended result; Self Care was issued a patent for this innovation.

Abbott argues that the presence of a filtering element in the FastTake TM product is irrelevant because that filter is not an intervening filter, a filter located physically between the whole blood and the active electrode, and thus, FastTake TM infringes the '551 patent. The FastTake TM filter is located between the enzyme/mediator and the carbon, thereby allowing the whole blood to be in direct contact with the enzyme/mediator. In order to rule that the FastTake TM product infringes the '551 patent, the Court would have to rule, first, that the word "intervening" applies to both "membrane" and "other whole blood filtering member"; and, second, that an "intervening" filter is one that is located physically between the whole blood and the active electrode -- which Abbott defines as the carbon and the enzyme and the mediator. The Court finds both contentions problematic.

First, the Court does not read the word "intervening" as applying to the phrase "other whole blood filtering member." The term "intervening" is placed only before "membrane." The Court reads the term "intervening membrane" as constituting one way, but not the only way, of filtering whole blood. Thus, any active electrode with a whole blood filter does not infringe the '551 patent. If Abbott had intended the '551 patent to claim an active electrode with a non-intervening filter then it should have written, "without an intervening membrane or other intervening whole blood filter."

The purpose of a filter is to prevent oxygen-carrying red blood cells found in whole blood from coming in contact with and fouling the carbon element. The FastTake TM product has a filter -- a silicon gel that filters the whole blood cells, allowing only the plasma (which has a lower concentration of oxygen than whole blood) to contact the carbon, thus, reducing fouling. The '551 patent, however, teaches how to construct a device with no filter -- the whole blood directly contacts the carbon.

In the '551 patent, the key concept appears to be the absence of a filter not the position of one. Nowhere in the '551 patent does it teach how to build an active electrode with a whole-blood filter. Indeed, Abbott represented to the Patent & Trademark Office ["PTO"] that it was submitting claims covering an active electrode with the filtering membrane absent. In
its December 3, 1997 amendment to the '551 patent, Abbott stated that it was filing new claims "which focus on the feature that the active electrode is directly exposed to a whole blood sample without the intervention of a barrier material such as a membrane or gel which filters out larger molecules or other blood components expected to interfere with the active electrode's operation." [Emphasis in original]. Accordingly, the Court holds the phrase "other whole blood filtering member" is not limited by the term "intervening." 1 Consequently, since the evidence indicates that defendants' FastTake TM product contains a "whole blood filtering member," their product does not infringe the '551 patent.

--- Footnotes ---

1 The word "intervening" is not defined in the specification, indeed, the word is not even used in the specification. Abbott argues the word should be defined as "physically between," whereas the defendants argue for a functional definition, "come between as an intervening force." As a general rule of claim construction, ambiguous terms should be given a narrow reading, excluding ambiguously covered subject matter. See Ethicon Endo-Surgery v. United States Surgical Corp., 93 F.3d 1572, 1581 (Fed. Cir. 1996). Since the Court holds that "intervening" does not apply to the phrase "other whole blood filtering member," the Court does not decide which definition of "intervening" is appropriate.

--- End Footnotes ---

9. "Without appreciable shortening." Consistent with the prosecution history, 16 the court construes "without appreciable shortening" to mean "the stent does not substantially shorten upon expansion."

--- Footnotes ---

--- End Footnotes ---

E. Disputed phrase: "all of said connectors being constructed, arranged, located and connected to said liner such that said liner is not withdrawn from said bag and can collapse upon itself during discharge of the contents thereof independently of and without being substantially restricted by said bag from collapsing"

The disputed phrase is located in Claims 2 and 10. The parties disagree on the manner in which the bag must collapse. The parties also disagree how the word "substantially" must be afforded meaning. Plaintiff proposes this claim should be interpreted as "the build of the connectors, their attachment to the liner and the places at which they are attached to the liner allow the liner to remain attached to the bag while the contents of the bag are emptied and also allow the liner to cave in as the contents of the bag are emptied without being strongly held back by the bag, even as the bag itself does not cave in." Defendant proposes this claim should be interpreted as "all of the connectors are constructed, arranged, located and connected to the liner so that the liner is not withdrawn from the bag, and all of the connectors being constructed, arranged, located and connected to the liner such that the liner vertically collapses upon itself during the discharging of the contents independently of the bag, and the liner vertically collapses without the bag restricting the vertical collapsing movement of the liner." Defendant argues the patent language supports the interpretation that the liner must collapse vertically. Plaintiff argues the bag must simply collapse and that the patent language does not support any requirement that the collapse must occur vertically. Plaintiff argues Defendant's construction fails to give meaning to the word "substantially."

Plaintiff argues the phrase refers to both a structure and a function. Plaintiff argues a collapsible bag collapses from all directions, not just vertically. Plaintiff argues limiting a collapse to a vertical flattening is inconsistent with the plain meaning of the word "collapse" and is unsupported by the specification and the prosecution history. Furthermore, the phrase "substantially restricting" does not mean "preventing." Plaintiff argues no evidence supports an interpretation of the phrase
to mean "preventing."

Defendant argues the patent supports its interpretation of the disputed phrase. The patent describes the container as "collapsible" and capable of being shipped in a collapsed or flat condition. (Patent No. '472 Col. 1, lines 5-6, 15-18.) The description further states the bag and liner, when empty, can be folded or collapsed into a preferably flat form. (Patent No. '472 Col. 1, lines 23-25, 29-32.) Defendant reasons the description of the liner collapsing on itself while inside the bag thus describes a liner that has vertical movement, much like a building that is collapsing. This interpretation is further reinforced by the description that the liner should not be connected to the bag at all four corners on both ends. If the liner were connected to the bag at all four corners at both ends, the liner could not fall on itself as the contents were discharged. In order to fall on itself, Defendant argues the collapse must occur vertically.

Defendant argues the Schnaars patent uses the words "inflation" and "expand" to describe what happens to the liner when air is forced into the collapsed liner. (Def. Ex. E - Patent No. '291 Col. 4, lines 45-67.) As opposed to an expanded or inflated bag, a collapsed bag is vertically flat, not just caved in on itself. Defendant points out the arrows in the Schnaars patent in Figure 3 show the bag inflates vertically.

Finally, Defendant argues other inventions by the same individuals who invented this bag and liner use the word "collapse" in a similar manner. The inventors of the patent at issue here also patented a collapsible liner for a cage. (Def. Ex. G.) In that patent, the liner collapses on itself in a vertical manner to lie flat at the bottom of the cage when the contents are discharged. The patent describes the liner as collapses from an upstanding position to a knocked down position. (Def. Ex. G - Patent No. '824 Col. 1, lines 40-49.) The case walls can then be folded over the collapsed liner. (Patent No. '824 Col. 1, lines 50-51.)

In its reply brief, Plaintiff argues the portion of the patent describing how the bag can be folded does not support Defendant's claim construction. The configuration of the empty bag does not describe the manner in which the bag emptied. A bag that collapses on a horizontal axis could also be folded flat.

The word "collapse" does not limit the external and internal forces upon object to a vertical flattening. It may well be that gravity is the primary force upon the liner as it empties and, as a result, the liner flattens downward. The plain language in Claims 2 and 10, however, does not limit the collapse to a vertical flattening. Furthermore, the language in the Claims and the specification does not indicate a requirement that the collapse occurs in a vertical manner. Defendant, notably, does not identify where the word "vertical" appears in either the Claims or the specification. Defendant's proposed construction, by limiting the collapse to a reduction in the height of the vertical axis, would necessarily require the liner to maintain its width and depth. Nothing in either the claims or the specification supports such construction. The language used in other patents does not establish that this patent was intended to deflate or collapse in a vertical manner exclusively. Accordingly, Plaintiff's construction of the claim is persuasive and supported by the intrinsic evidence. The claim at issue is interpreted to mean "the build of the connectors, their attachment to the liner and the places at which they are attached to the liner allow the liner to remain attached to the bag while the contents of the bag are emptied and also allow the liner to cave in as the contents of the bag are emptied without being strongly held back by the bag, even as the bag itself does not cave in."

4463

The magistrate judge is also correct in construing the phrase "without imparting external pressure" as meaning "under a vacuum." This is clear from the "embodiments" section of the patent, where the patentee indicates that "the sintering process was carried out with the vacuum degree of 0.1 to 10 Torr ...." More importantly, the patentee argued before the patent examiner that "the sintering process is carried out under a vacuum (0.1 to 10 Torr) .... Thus, an expensive high pressure apparatus is not required in order to obtain the present invention super alloy having a high abrasion proof property and long durability. Timm et al. fails to suggest such an unexpectedly advantageous result." Cerametal's Exhibit G, p. 161 (emphasis in original). The patentee also told the patent examiner that "Timm et al. fails to teach a binding material selected from the iron group and a sintering process without pressure." Id. at 180. The patentee made these representations in its effort to have the examiner reconsider his rejection of the initial patent application. When the patentee amended its application to include the language "by liquid phase sintering without imparting external pressure," the patent examiner allowed the application. In explaining his reasons for doing so, the examiner stated that "the claimed composition, produced by liquid phase sintering" was now distinguished from Timm. Id. at 189.
In the second step of Claim 13 the parties also dispute the meaning of the term "passing . . . without mechanically agitating said wash load."

Whirlpool contends that "without mechanically agitating said wash load" should be construed to mean "without using the means for providing agitation to agitate the wash load." Defendants contend that "without mechanically agitating" should be construed to mean that the clothes do not move relative to each other.

In the specifications Whirlpool distinguished its invention from the prior art by noting that its spin-wash operation does not involve mechanical agitation of the clothes load:

The applicants have, however, discovered a concentrated washing operation that can be successfully practiced in a vertical axis automatic washer at water to cloth ratios well below five to one, through the use of a concentrated spin-wash operation which does not involve mechanical agitation of the clothes load.

's66 Patent, col. 2 ll. 13-18 (emphasis added).

Step 72 is to apply the concentrated detergent solution to a spinning wash load. This is referred to as the spin wash cycle in that the clothes load is not mechanically agitated.

's66 Patent, col. 5 ll. 35-38 (emphasis added).

In construing a term used in the patent it is appropriate to consider how the term is defined in the specifications. Finnegan Corp. v. International Trade Comm'n, 180 F.3d 1354, 1364 (Fed. Cir. 1999). In the summary of the '666 invention the inventors explained the invention as follows:

Very little water is required during the concentrated washing step, and no mechanical agitation is applied to the clothes during this operation. That is, the clothes do not move relative to each other during the concentrated wash step, even though they are being spun about the vertical axis of the machine.

's66 Patent, col. 2 ll. 28-34 (emphasis added). In discussing the prior art, the '666 Patent specifications similarly equate mechanical agitation to the movement of clothes relative to each other:

The known prior art wash methods, whether practiced in a horizontal axis or a vertical axis machine, employ varying amounts of mechanical agitation of the clothes load. That is, during the concentrated washing operation the individual items of clothing are moved relative to each other and relative to the wash basket or drum.

's66 Patent, col. 2 ll. 48-54 (emphasis added). The specifications further provide that during the spin wash cycle "the clothes load is not mechanically agitated, it merely is spun with the wash basket and held by centrifugal force against the basket wall during the spinning while the concentrated solution is applied to the spinning wash load." '666 Patent, col. 5 ll. 37-41 (emphasis added).

In its response brief Whirlpool asserted that "reversing direction during the spin wash does not constitute 'mechanical agitation' within the meaning of claim 13." Pl. Resp. Br. at 17. The Court rejects this broad statement as it is contrary to the representations during the prosecution history. During the application process for the '666 Patent Whirlpool distinguished its invention from prior art that achieved mechanical agitation by slowing, stopping, or reversing the direction of rotation of the wash tub to cause a tumbling and mechanical agitation of the clothes in the wash tub. During the application process for the '666 Patent the Examiner rejected claims 1-13 as being unpatentable over prior art, particularly Spendel and Marshall. Whirlpool responded to that rejection in Amendment "A," filed with the Patent Office on August 17, 1987. Spendel involved a horizontal axis washer, where the wash load was tumbled through the spray of detergent solution. Whirlpool distinguished Spendel as follows:
The clothes are tumbled within the horizontal drum through the use of an eccentric drive for the drum to provide a varying rotational speed thus providing conventional mechanical agitation to effect cleaning.

Def. Ex. L, Amendment "A" at 10, LGE 235 (emphasis added). Marshall involved an angled axis which permits a tumbling of the clothes during a spinning process. Whirlpool distinguished Marshall as follows:

Marshall specifically desires to maintain an annular layer of water within the wash tub in which the clothes are carried to assist in the mechanical agitation achieved by Marshall through the use of slowing or stopping and sometimes reversing the direction of rotation of the wash tub to cause a tumbling and mechanical agitation of the clothes in the wash tub.

D Ex. L., Amendment "A" at 11, LGE 236 (emphasis added). Whirlpool then represented to the Patent Office that the '666 invention was not anticipated by Spendel or Marshall because both Spendel and Marshall "provide and require mechanical agitation of the wash load during the step of applying the solution to the clothes load" and therefore failed to teach or suggest "to pass the detergent solution through the wash load without mechanical agitation." Def. Ex. L., Amendment "A" at 15, LGE 240.

Defendants contend that Whirlpool's construction of "without mechanically agitating" to mean "without using the means for providing agitation" is an attempt to adopt a definition that covers mechanical agitation of clothes during the wash process so long as that agitation is caused by some structure other than the claimed "means for providing agitation." Defendants contend that this construction ignores the definition of agitation in the patent and Whirlpool's representations made during the patenting process. Defendants contend that because Whirlpool gave notice of its intention to exclude from the scope of its claims washers that periodically interrupt or change rotation of a wash basket during a wash cycle during the prosecution history to gain allowance, it cannot now change its position and argue a contrary interpretation of its claims before this Court. See Standard Oil Co. v. American Cyanamid Co., 774 F.2d 448, 452 (Fed. Cir. 1985) ("the prosecution history (or file wrapper) limits the interpretation of claims so as to exclude any interpretation that may have been disclaimed or disavowed during prosecution in order to obtain claim allowance."). Defendants "are entitled to rely on the record made in the Patent Office in determining the meaning and scope of the patent." Lemelson v. General Mills, Inc., 968 F.2d 1202, 1208 (Fed. Cir. 1992).

Whirlpool distinguished its invention from prior art by defining "without mechanical agitation" to mean that the clothes did not move relative to each other. Defendants contend that Whirlpool should not now be allowed to argue that agitation of the clothes during the wash process is allowed so long as that agitation is caused by some structure other than the claimed "means for providing agitation."

Defendants are understandably concerned that Whirlpool's definition limits the mechanical agitation to the "claimed" means of agitation. Whirlpool has acknowledged that there are a number of means of agitating clothes or moving clothes relative to each other, including the use of agitators, tumbling, and reversing the direction of rotation of the wash tub. Any of these can be a "means for providing agitation to agitate the wash load." The specification and the prosecution history demonstrate that if a mechanical process causes the clothes to move relative to each other, then that process constitutes mechanical agitation. It is possible for there to be more than one means of agitation, or moving clothes relative to each other. Claim 13 does not tie the absence of mechanical agitation to any particular agitating structure. The Court is satisfied that Defendants' concerns will be resolved if Whirlpool's definition is changed from "the means" for providing agitation to "a means" for providing agitation. That construction is consistent with the claim, the specifications and the prosecution history. Accordingly, the Court will construe "without mechanically agitating" as "without using a means for providing agitation to agitate the wash load."

This Court has construed the relevant terms of Claim 13 as follows: (1) the corresponding structure for the "means for providing agitation" is "a device that moves cloth items to and fro"; (2) the term "passing … through said wash load" means "passing [detergent solution] through the wash load, not merely over or around"; (3) the term "passing an amount … in excess of that necessary to saturate the wash load" means "continuously passing a concentrated detergent solution so that the total amount passed through would be greater than the amount necessary to saturate the wash load; and (4) the term...
"without mechanically agitating said wash load" means "without using a means for providing agitation to agitate the wash load." Order Construing Terms at 2-3.

Whirlpool has moved for reconsideration of certain aspects of this Court's decision regarding the term "without mechanically agitating said wash load." Claim construction is subject to revision and the court may revisit and alter its claim construction as its understanding of the claimed technology evolves. Jack Gutman, Inc. v. Kopykake Enterprises, Inc., 302 F.3d 1352, 1361 (Fed. Cir. 2002) ("District courts may engage in a rolling claim construction, in which the court revisits and alters its interpretation of the claim terms as its understanding of the technology evolves."). See also Utah Med. Prod., Inc. v. Graphic Controls Corp., 350 F.3d 1376, 1381-82 (Fed. Cir. 2003) (finding no error where district court clarified its original construction to more closely align its interpretation with claim language and specification's description of the function).

The Court construed the term "without mechanically agitating" to mean "without using a means for providing agitation to agitate the wash load." Order Construing Terms at 3. In its motion for reconsideration Whirlpool does not challenge the Court's construction of the term itself, but instead challenges this Court's rejection of Whirlpool's assertion that reversing direction during the spin wash does not constitute "mechanical agitation" within the meaning of Claim 13. See Opinion at 33. This Court observed that Whirlpool had acknowledged in the specifications and in the prosecution history that there are a number of means of agitating clothes, including the use of agitators, tumbling, and reversing the direction of rotation of the wash tub. According to Whirlpool, the Court committed palpable error by including "tumbling" and "reversals" as forms of mechanical agitation for the vertical axis washing machine required by Claims 13 and 14 of the '666 patent. Whirlpool contends that the Court failed to appreciate that the prosecution history statement was made in the context of horizontal or angled axis machines, not the vertical axis machines which are the subject of the '666 patent.

This Court was fully aware that the prior art in Spendel and Marshall involved horizontal and angled axis machines rather than vertical axis machines. Nevertheless, in the specifications the '666 patent refers to agitation as the movement of clothes relative to each other. Opinion at 32-33. Tumbling and reversals, to the extent they move clothes relative to each other, are sufficient to constitute agitation. Gravitational and liquid forces can work to move clothes relative to each other in a vertical axis machine, just as they can in a horizontal or angled axis machine. They may not do it to the same degree, but they can cause agitation to occur. The Court accordingly reaffirms its original rejection of Whirlpool's contention that reversing direction during the spin wash does not constitute "mechanical agitation" within the meaning of Claim 13.

In their briefs both Whirlpool and Defendants suggest that this Court has already concluded that reversing direction necessarily constitutes agitation. (Reply Br. at 1). (Opp. Br. at 6). Both parties have overstated this Court's construction of the term "mechanical agitation." This Court rejected the assertion that reversing direction cannot constitute mechanical agitation in a vertical axis machine. However, this Court has never held that reversing direction, without more, is necessarily sufficient to constitute agitation.

In response to Defendants' motion for summary judgment of infringement. Whirlpool now requests that this Court revisit its Order construing terms and construe "without mechanically agitating" as "without using the agitation means to agitate the wash load," or alternatively, "without using a means for providing agitation in a vertical axis washer to agitate the wash load." (Pl. Br. in Opp. at 12). Whirlpool's request to revise the construction of the term is denied. The Court is not convinced that its original construction of the term was erroneous or that any further construction is required.

A. The '133 Patent - Claim 1

Claim 1 of the '133 patent provides:

An apparatus for forming an occlusion within a body cavity comprising:

a wire adapted to be disposed near an opening into said body cavity;

a separable distal tip of said wire adapted for disposition into said body cavity to form said occlusion within said body
cavity about said distal tip; and

a selectively detachable coupling between said distal tip and said wire characterized by detachment of said distal tip from
said wire without necessarily displacing either said distal tip or said wire during detachment to leave said distal tip within
said body cavity with said occlusion being formed within said body cavity,

whereby said body cavity is occluded by said distal tip, and an occlusion is formed by use of said tip without necessarily
altering desired placement of said distal tip during detachment or applying any force by said distal tip to any surface within
said body cavity by reason of said detachment.

The parties dispute the meaning of only one phrase of Claim 1: "detachment of said distal tip from said wire without
necessarily displacing either said distal tip or said wire during detachment." 22 The focus of the dispute is the phrase
"detachment . . . without necessarily displacing."

22 The parties have stipulated that they will rely on the construction of this term as a representative of similar terms which
appear in the following patents: Claim 25 of the '133 patent (and claims dependent therefrom), Claims 1, 2, 3, 9 of the '126
patent (and claims dependent therefrom), and Claim 1 of the '963 patent (and claims dependent therefrom).

Claim 1 is an apparatus claim. The apparatus comprises a wire, a separable distal tip and a selectively detachable coupling.
The disputed phrase is a limitation on the "selectively detachable coupling." The limitation requires that the "selectively
detachable coupling" function in a particular manner, namely, detach the distal tip from the wire "without necessarily
displacing either said distal tip or said wire during detachment." The Court finds that one of ordinary skill in the art would
understand that the phrase "detachment . . . without necessarily displacing" is being used with a plain and customary
meaning.

necessarily" means "without necessity." Id., 1200. The word "displacement" means "to move out of its place." Id., 528.
There is nothing in the written description to support giving the phrase "detachment . . . without necessarily displacing" any
specialized meaning.

Although the specific phrase "detachment . . . without necessarily displacing" is not used elsewhere in the specification,
Claim 1 contains the following "whereby clause:"

whereby said body cavity is occluded by said distal tip, and an occlusion is formed by use of said tip without necessarily
altering desired placement of said distal tip during detachment or applying any force by said distal tip to any surface within
said body cavity by reason of said detachment.

A "whereby" clause in an apparatus claim may express the intended result from using the apparatus. See Minton, 336 F.3d at
1381 (Fed. Cir. 2003). Considering the "whereby" clause from the perspective of a person of ordinary skill in the art, the
Court finds that the "whereby clause" means that after the distal tip is placed into the vascular cavity, the selectively
detachable coupling detaches the tip from the wire. Detachment is accomplished without any change in the position of the
tip being necessary to achieve detachment and without requiring the application of any force by the tip on any surface in the
vascular cavity.

The Court construes "detachment . . . without necessarily displacing," as it is used in the phrase "detachment of said distal
tip from said wire without necessarily displacing either said distal tip or said wire during detachment" in Claim 1 of the '133
Patent to mean:

- detachment accomplished without necessitating movement of the distal tip to accomplish detachment and without
necessitating that force be applied by the distal tip on any surface of the vascular cavity to accomplish detachment.
b. "without significantly damaging said material"

Finally, the parties disagree on the phrase, "without significantly damaging said material," in claim 10 of the 329 patent. Callicrate asks the Court to construe the phrase as "without causing significant damage to the ligature material." NAIC asks the Court to adopt the following meaning: "without causing significant damage to the ligature material." The Court notes that although the term "significantly" appears in both the claim language and the specification, NAIC provided no argument in its Markman brief or at the April 12, 2005 hearing to support its deletion of the term from its proposed construction. NAIC's proffered construction would require the grommet to securely fasten the loop without causing any damage to the ligation material and clearly conflicts with the claim language and specification. Thus, the Court rejects NAIC's urged interpretation that would omit the term "significant" and adopts Callicrate's proposed interpretation.

63 The Court has already addressed and rejected NAIC's attempt to limit the ligature material to surgical tubing. See the Court's construction of "elastomeric ligature material" at supra, Part IV.A.2.a.

b. "Flexible … without stressing"

BOC contends in this regard that the language of claim 1 which describes the proper amount of pressure to be exerted by the probe for accurate measurement of oxygen saturation is too indefinite to answer the following question. "How thick or how thin, and how flexible or how inflexible should a manufacturer make a probe to avoid the limitation 'being flexible also to conform to said skin without stressing either of said skin and the underlying tissue'"? (D.I. 126 at 9) As an example of the problem it envisions, BOC notes that "the degree of tightness on the finger is dependent upon the skill of application of the person putting it on." (D.I. 126 at 10) Likewise, the "degree of tightness [which] sufficiently occlude[s] the flow of blood within the digit so as to 'begin' to interfere with the measurement being taken" is essentially a subjective determination incapable of precise definition. (D.I. 126 at 10) There are several fallacies inherent in BOC's analysis. One is that it focuses upon the application of the invention, which admittedly is beyond the control of the inventors, rather than the structure of the invention itself. The second is that BOC analyzes this limitation in isolation from the remainder of the specification and claim language recited above. When read in context and in light of the specification, the limitation "flexible … without stressing" is not so indefinite as to render claim 1 of the '014 patent invalid. In describing a support structure which is "flexible also to conform to said skin without stressing either of said skin and the underlying tissue," claim 1 describes a structure which is pliant enough and flat or level enough to conform to or fit the contour of virtually any convex portion of a patient's skin.

16 Significantly, the application of the invention is within the control of those skilled in the science of oximetry. See, e.g., DX 216, the instruction sheet for the OxyTip: "Important: Be sure to apply only enough pressure to ensure the detector is flush against the skin. Do not restrict circulation." (Emphasis in original)

17 This phrase describes the support structure, not the method of attachment by "an adhesive layer;" obviously, however, the method of attachment is likewise relevant to the concern that the probe operate "without applying pressure to the tissue of the skin of the patient being measured." (D.I. 122 at 1068)
C. Without the Application of Independent Means . . .

Phrase: without the application of independent means for urging said sleeve member toward said trailing end of said bit holder

Construction: the interference fit between the sleeve and the bit holder is itself sufficient, without the use of any additional device or structure, to prevent rotation or axial movement of the sleeve

Reasoning: Again, defendant contends that this claim element invokes means plus function analysis because it includes the word "means". According to defendant, because the specification does not list the independent means that are excluded from the claim, there is no valid construction to this claim. We disagree. Use of the word means in this instance does not invoke means plus function. Rather, these "independent means" are being excluded, not claimed. Taken to its logical conclusion, under defendant's theory, even though "independent means" are not being claimed, and in fact, are specifically excluded, the inventor would have had to list every possible device or structure that could be used under any circumstances to hold a sleeve in place. This is not required. The claim element is clear, and easily understood -- if anything other than interference fit is required in order to hold the sleeve in the bit holder, then the accused device falls outside the claims.

Our construction is consistent with the language and meaning of the patents, and the prosecution history. The novelty disclosed in the patents was that the interference fit itself was enough to keep the sleeve secure in the bit holder. In the prior art, some other device or structure had to be used to hold the sleeve in place. In these patents, no other device or structure was needed to hold the sleeve in place. This exact point of novelty was discussed in the prosecution history sections to which both parties cite. Our construction recognizes this point of novelty. Whether a retaining clip, or some other item, is necessary to hold the sleeve in place in an accused device, or is superfluous, is a question of fact, and of infringement.

GO BACK

"wood flour"

Marley proposes that the limitation "wood flour" should be construed to mean wood flour in its raw particle form in the first stage of the process (the first and second time the term is used in Claim 1) and as wood flour in the form of pellets in the second stage (the third time it is included in Claim 1). Mikron proposes that the term is defined as a finely ground, particulate of wood at all times.

The parties agree that wood flour is a finely ground, particle of wood. The preferred embodiment supports such construction, stating: "the wood flour is preferably hardwood in the form of sawdust. The wood flour is ground to a preferred particle size ...." Furthermore, the parties agree that the first two times the term is used in Claim 1, wood flour is in the form of a finely ground particle. The dispute arises the third time the term is used in Claim 1. Marley asserts that the form of the wood flour is a pelletized form. Mikron asserts that the wood flour is still in the form of a finely ground particle.

Generally, the same wording appearing in the same claim is interpreted consistently. See Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1345 (Fed. Cir. 1998). However, identical terms may take on different meanings if the language of the written description is sufficient to put a reader on notice that the term has different meanings. See Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1310-11 (Fed. Cir. 1999).

Here, the term wood flour is used three times in Claim 1. The specification provides that wood flour is a finely ground particle [of wood]. Marley attempts to read the term "pellet" into the term the third time it is used in Claim 1. However, when the inventors wanted to specify that the form of the material was "pellets", they did so throughout the specification, i.e., "after preparation of the polymer and wood fiber pellets", "the polymer/wood fiber pellet". Marley contends that construing the term wood flour the third time the term is used as only a particle of wood and not a pellet renders the embodiments nonsensical and defeats the entire purpose of the invention. However, the term wood flour can still be
The limitation "wood flour" is construed to mean a finely ground particle of wood.

The parties dispute the calculation of the amount of wood flour in the final product based on the limitation "wood flour 15-140" as found in Claim 1. The parties agree that minimum amount of wood flour used in the first stage or formulation is 11.11% (15 parts/135 total parts). The parties also agree that minimum amount of wood flour used in the second stage or second formulation is 10.7% (15 parts/140 total parts). The difference in the amount of wood flour between the first and second stage is due to the addition of up to 5 parts of blowing agents during the second stage, changing the total amount of parts to 140.

Marley contends that the percentage of wood flour in the final product is 1.18% based on its interpretation that the wood flour in the final product is a portion of the pellets, which are a portion of the final mixture. Accordingly, Marley contends that the percentage of wood flour in the final product is 11.1% of 10.7%. However, Marley's construction is based on its interpretation that the list of materials in each stage is a "recipe" and that an amount of 100 parts of polymer resin could be used in the first stage, and an additional 100 parts of polymer resin could be used in the second stage. The same would apply to the other ingredients, up to 5 parts of stabilizers and lubricants and up to 10 parts of process aids in both the first and second stage. This interpretation is not supported by the claim or the specification.

Claim 1 states that, during the first stage of the process, an extrudable material is produced; this extrudable material consists of certain ingredients up to certain parts. Obviously if the extrudable material consists of these ingredients, these ingredients were combined to form the extrudable material. The extrudable material, which consists of the stated five ingredients, is then cut to form pellets of said extrudable material. Additional polymer resin and a blowing agent are then added with the pellets, and an extrudable foam material is formed. The claim then recites that the foam material consists of the original five ingredients as well as the blowing agents up to a maximum number of parts. The maximum number of parts for each of the original five ingredients is unchanged. The only ingredients added to the pellets in the claim is additional polymer resin and a blowing agent. Accordingly, the list of ingredients in the second stage of the process is not a "recipe" to make the foam material. Instead, it is a list of the components of the foam material.

This conclusion is further supported by the specification, which states, in pertinent part:

Only a portion of the total desired amount of resin is used in making the pellets. The remainder of the resin is added when making the final extrusion composite. For example, in a composite having 100 parts total of PVC resin, only 40 parts resin will be added to the mixture to form the pellets. The remaining 60 parts resin will be added in forming the final product.

Based on this interpretation, the theoretical minimum amount of wood flour found in the extrusion of the first stage or first formulation is 11.19% (15 parts/134 total parts). A total of 135 parts cannot be used to make this theoretical calculation because the specification clearly states that not all of the maximum 100 parts of resin are added in the first stage. The theoretical minimum amount of wood flour found in the extrusion of the second stage or second formulation is 10.7% (15 parts/140 total parts). Therefore, this theoretical minimum percentage of wood flour in the final product would also be 10.7% as no materials are added following the second stage. Accordingly, the limitation "wood flour 15-140" as found in Claim 1 is construed to have a theoretical minimum percentage of wood flour in the final product of 10.7%.
The second limitation of Claim 1 provides that the frame portion must be in the work-hardened pseudoelastic metallurgical state. Defendants contend that the phrase "in the work-hardened pseudoelastic state" has narrow meaning, covering only frames that are work-hardened while in the pseudoelastic state. Relying upon this definition, Defendants argue that Plaintiffs have failed to show that Defendants' frames were work-hardened while in the pseudoelastic state, hence they have failed to prove that those frames "read on" this limitation of the claim. For their own part, Defendants offer no evidence whether their frames were work-hardened while within or without the pseudoelastic state.

Plaintiffs concede that work-hardening material while in the pseudoelastic state is an acceptable, perhaps even the preferred, means for reaching the work-hardened pseudoelastic state, but insist that there is no indication in the patent for limiting the claim to this particular process. See Specialty Composites, 845 F.2d at 987 ("Nowhere does the specification in the '487 patent teach that external plasticizers must be used." (emphasis in original)). The Court agrees.

The words of Claim 1, in the Court's view, in no way specify or limit the method or process by which such a state is reached. Claim 1 does not appear to be a process claim, neither is it a "product by process limitation" as suggested by Defendants' expert Mr. Bjorge. Under 35 U.S.C. § 112 a patentee is only required to provide one process that would enable one skilled in the art to make the invention and to disclose the best mode known for making or using the patented product. See SRI, 775 F.2d 1107 at 1121 (Markey, CJ., plurality opinion). "A product patent gives the patentee the right to restrict the use and sale of the product regardless of how and by whom it was manufactured." United States v. Studiengesellschaft Kohle, m.b. H., 216 U.S. App. D.C. 303, 670 F.2d 1122, 1127 (D.C. Cir. 1981).

While Defendants cite various remarks made by Plaintiffs during the prosecution of the patent to read this process limitation into the claim, the Court finds that, at most, those remarks may be understood as illustrating structural differences between prior art and the claimed invention, not as establishing process limitations on the claim. See SRI, 775 F.2d 1107, 1119-20 (Markey, CJ., plurality opinion); Intervet America v. Kee-Vet Labs., Inc., 887 F.2d 1050, 1054 (Fed. Cir. 1989).

Defendants admit that their frames are work-hardened and pseudoelastic. The Court therefore finds Plaintiffs are likely to establish at trial that Defendants' frames meet the second limitation of Claim 1.

--- Footnotes ---

2 The Court refers to the issue of "mechanical energy" versus "mechanical motion," as the "mechanical limitation." The Court refers to the latter part of Coast's proposed construction as the "orientation limitation."

--- End Footnotes ---

The '215 Patent is directed, in general, to an improvement in a breather structure in four-cycle engines for work machines, and the inventors explain that trimmers, grass cutters or rammers are examples of such "work machines." ('215 Patent at 1:6-16.) In their description of the preferred embodiment, the inventors use a rammer as an exemplary "work machine." (Id. at 3:51-52 (describing an "engine body 11 of a four-cycle engine E for driving a rammer 10, which is a work machine").)
However, the inventors also note that "[t]he application of the present invention is not limited to the rammer 10 and the present invention can be put into practice widely in any field relating to a work machine that is connected to the crankshaft 14 so that the axis of the cylinder bore 16 becomes almost vertical when the machine is used." (Id. at 9:13-18.) These examples of work machines demonstrate that a work machine is a device driven by a four-cycle engine, i.e. it is powered by the engine.

The claim language does not require that the work machine produce "mechanical motion." Although the examples of work machines in the specification may, in fact, do so, the inventors clearly stated that the application of the invention was not limited to those machines. (Id. at 9:13-18.) Rather, the inventors stated that the invention could be put to use in a "work machine that is connected to the crankshaft … so that the axis of the cylinder bore … becomes almost vertical when the machine is used." (Id.) There is nothing in this language that supports Coast's position that the "work machine" produce mechanical motion. Accordingly, the Court rejects this aspect of Coast's proposed construction.

The Court, however, agrees with Coast's proposed construction regarding the "orientation limitation." It is true that the claims refer only to instances when the work machine is being used, rather than when it is not in use. However, as set forth in the specification, "an object of the present invention [was] to provide a breather structure in a four-cycle engine that can prevent the lubricating oil from entering the intake system when the engine body is tilted downward." (‘215 Patent at 1:53-57.) The inventors describe the prior art in connection with the fact that "the attitude of a work machine such as a trimmer, a grass cutter or a rammer varies from when it is operating to when it is not operating," and state that "the oil surface inside the crank chamber also varies from when it [the work machine] is operating to when it is not operating." (Id.) Because of the variation in attitude and oil surface, it is necessary "to arrange the breather structure for guiding breather gas from the crank chamber into an intake system so that the lubricating oil is prevented from entering the intake system when it [the work machine] is not operating." (Id. at 1:22-25.) The inventors note that in work machines such as grass cutters or rammers, "the engine body may be tilted thereby making the cylinder bore almost horizontal when the machine is not being used." (Id. at 1:40-42.) The prior art breather structures, however, were not able to address "a state where the engine body is tilted downward." (Id. at 1:45-48.)

In addition to the above cited references, there are other references in the specification to the fact that the cylinder bore is horizontal when the work machine is not in use and is vertical when the work machine is in use. (See, e.g., id. at 1:15-16, 1:66-2:1, 2:26-27, 2:44-52, 3:57-59, 7:11-13.) The inventors also state that when the engine body is tilted downward, the axis of the cylinder bore becomes horizontal, which suggests that when the engine body is tilted downward, the work machine is not in use. (See, e.g., id. at 7:11-13, 8:36-44.) Finally, although the inventors state that the application of the invention is not limited to a rammer, they do state that the invention can be put into practice in any field "relating to a work machine that is connected to the crankshaft … so that the axis of the cylinder bore … becomes almost vertical when the machine is used." (Id. at 9:13-18 (emphasis added).) As Coast notes, the inventors' choice to use word "becomes" suggests that they recognized that the work machine has a different orientation prior to its use. All of these references in the specification give meaning to the term "work machine" and demonstrate that although a work machine may not be limited the specific types of work machines referenced therein, the work machine of the claims is a work machine that varies in orientation when it is in use to when it is not in use.

Accordingly, the Court construes the term "work machine" to mean: "a device for transferring mechanical energy from a four-cycle engine, the orientation of which varies from when it is in use to when it is not in use."

2. Working Channels

The second disputed claim term "working channels" is found in Claims 1 and 35 as set forth above.

Erbe's Proposed Definition: A channel of an endoscope through which a device (e.g., flexible endoscopic tubes, optical means and/or surgical instruments) may be inserted.

Canady's Proposed Definition: A channel into which a surgical instrument may be inserted.
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

(Docket No. 42, p. 1). In attempting to construe the term "working channels," I turn to the claim language. An endoscope, as defined by Claim 1, has "working channels" with "an opening at each end" of every channel. Docket No. 42, Ex. 1, col. 11, ll. 14-16. The clear purpose of which is to allow for the insertion of tubes (col. 11, ll. 17), optical means (col. 11, ll. 44-48), and surgical instruments. Canady cites to the prosecution history, and specifically the '009 application, as support for its definition. (Docket No. 66, p. 22). Because I find that the language of the claim to be unambiguous, I need not consult the prosecution history. According, the claim term "working channel" is construed to mean a channel of an endoscope that has an opening at each end through which a device may be inserted.

The parties agree that if we affirm the ITC's construction of "working channel," then the ITC's non-infringement determination was correct, and we need not reach the other issues raised in this appeal. This is so because the parties agree that the claims require more than one "working channel" (a "plurality") and that under the ITC's claim construction the endoscopes in question only had a single "working channel." Under that construction there would be no direct infringement and, consequently, no basis for a finding contributory or induced infringement.

The ITC and Canady argue that the claim construction of "working channel" by the ITC as "a channel through which a device that performs work may be inserted," was correct. In contrast, ERBE argues that "working channel" should be construed broadly "to mean 'a channel of an endoscope through which work is performed,' where 'work' includes visualization through an optical means, coagulation of tissue, irrigation, inflation, and suction." Appellants' Br. 15.

We note initially that ERBE's construction is overly broad insofar as it tends to treat channels dedicated exclusively to suction or gas delivery as "working channels." ERBE has conceded that a "working channel" must be an "instrument channel." 3 We think that under this construction, channels which perform only suction or only gas delivery are not working channels because such channels are not instrument channels. This is so even though the specification says that suction and gas delivery can be done within a "working channel." There is no suggestion that a channel which can perform only that one function is a working channel. See '745 Patent col.2 ll.62-67 ("[s]ince the working channel itself serves for the delivery of gas"); id. col.4 ll.51-54 ("in which working channel 7 serves as gas supply conduit 11"); id. col.10 ll.49-51 ("Continuous or interrupted suction through the second channel should be applied if using a double-channel therapeutic endoscope."). Thus, the fundamental disagreement between the parties boils down to whether fixed optics are a "working channel." ERBE presented evidence that the 2.3mm KLS Martin probes had been used with such a fixed optics endoscope. 4

--------------- Footnotes ---------------

3 Appellants' Br. 34 ("The '745 specification uses the terms 'working channel' and 'instrument channel' interchangeably, which is consistent with the use of the terms by practitioners.").

4 The ALJ also found that ERBE presented no evidence that the 1.5mm KLS Martin probes had ever been used. This finding is supported by substantial evidence.

--------------- End Footnotes ---------------

We review claim construction de novo. Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456 (Fed. Cir. 1998) (en banc). The claims "must be read in view of the specification, of which they are a part." Phillips v. AWH Corp., 415 F.3d 1303, 1315 (Fed. Cir. 2005) (en banc) (quoting Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995) (en banc)). We generally do not construe claim language to be inconsistent with the clear language of the specification; "[u]sually, it is dispositive." Phillips, 415 F.3d at 1315 (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996)).

ERBE's contention that fixed optics constitute a "working channel" is inconsistent with the figures in the specification that show a fixed optics installation but do not label that installation as constituting a "working channel." Figure 1 of the specification, reproduced below, shows an optical lens labeled 5, and two "working channels" labeled 6 and 7:
Figure 1 of the '745 Patent is described in the specification as:

FIG. 1 shows a flexible endoscope known as such, which is provided with a device in accordance with the invention, which device comprises a tube out of PTFE or the like material. . . . The tube 2 protrudes out of the distal end of a working channel 7. At the distal end of the endoscope a lens 5 of a viewing optics is provided. Furthermore, the distal end of a second working channel 6 can be seen. The tube 2 is connected through a gas supply conduit 3 with a not shown gas reservoir which may be a gas cylinder filled with argon.

'745 Patent col.3 l.63-col.4 l.6 (emphases added). Figure 1 thus shows two "working channels," which are distinct from the labeled lens of a viewing optics. There is no ambiguity in this figure or in this description; fixed viewing optics are not in a "working channel." The description and labeling of Figure 12, shown below, is similar:

The same embodiment of the invention is shown by Figures 1 and 12. Id. col.3 II.40-42. Figure 12 of the '745 Patent is described in the specification as:

In the embodiment shown in FIG. 12 the distal end of the tube 2 or of the attachment 11, respectively, may be tilted with respect to the exit direction, e.g. by providing flexible bellows 15 between the tube 2 [shown in unnumbered working channel 7] and the orifice 9, whereby the adjustment of the direction takes place by means of a manipulator 14, which simply may be rope 14, which rope extends through the second working channel 6 of the endoscope, so that the direction of the orifice 9 can be changed by pulling the rope at the end of the endoscope in the direction of the arrow.

Id. col.5 ll.21-31 (emphasis added). Figure 12 shows two "working channels," 6 (labeled) and 7 (unlabeled), and neither includes fixed optical means. Again, the optical means (labeled 5) are not described as part of or inside any of the "working channels." Moreover, in Figure 12, though the "working channels" are shown extending through the endoscope, the optical means are not similarly shown to be within any kind of channel. Nowhere does the specification indicate that a "working channel" can be a fixed optics installation.

The dictionary definition of "working" also supports the ITC's interpretation. Dictionaries are "among the many tools that can assist the court in determining the meaning of particular terminology to those of skill in the art of the invention." Phillips, 415 F.3d at 1318. The dictionary definition of the adjective "working" is "1: adequate to permit work to be done . . . 2: assumed or adopted to permit or facilitate further work or activity." Webster's Third New International Dictionary 2635 (Merriam-Webster 2002). The relevant dictionary definition of "work" is "activity in which one exerts strength or faculties to do or perform." Id. at 2634. This suggests that a "working channel" is not stationary (as with a fixed optics installation) but is a channel through which work or activity may be done during the procedure.

ERBE argues, however, that the language of claim 1 demonstrates that a fixed optics installation does in fact constitute a "working channel." We disagree. Claim 1 requires "optical means positioned within a second working channel of the endoscope." '745 Patent col.11 ll.44-45. Claim 1 also requires each "working channel" to have "an opening at each end" of the endoscope. Id. col.11 l.16. In light of the figures showing that a fixed optics installation is not a "working channel," claim 1 must be construed to refer to movable, not fixed, optics. The fact that the optics are described as "positioned" does not suggest that they are fixed rather than movable.

Contrary to ERBE's argument, the patent does contemplate a movable optics installation. The specification describes optical means within an instrument channel, stating that the probe "can be seen well through a viewing lens at the distal end of the endoscope, which lens is associated with a viewing optics arranged in an instrument channel of the endoscope." Id. col.2 ll.41-45. The specification makes clear that an instrument channel is a channel in which surgical tools can be inserted during the procedure. Id. col.10 ll.29-33. There was also uncontroversial testimony in the record that movable optics were well-known and widely used at the time of the patent application as an alternative to fixed optics. The way to reconcile claim 1 with the specification is thus to construe claim 1 as referring to movable optics. In short, fixed optics do not involve a "working channel."
As noted above, the parties agree that infringement requires the accused devices to be used with an endoscope having at least two "working channels" and that the accused devices have only a single "working channel" if the fixed optics are not a "working channel." Based on our claim construction, the ITC correctly concluded that ERBE presented no evidence that any accused device had been used with an endoscope that had at least two "working channels" and, therefore, that there was no evidence of direct infringement and thus no basis for finding induced or contributory infringement. In light of this holding, we need not address the other arguments raised on appeal. Accordingly, we affirm.

---

Working Surface

The asserted claims contain the term "working surface." ReedHycalog contends that the term means "any portion of the PCD body which, in operation, may contact the object to be worked." For the Impact Strength Patent's claims, ReedHycalog construes "PCD" as "polycrystalline diamond or diamond-like elements." With respect to the other asserted claims, ReedHycalog does not propose a construction for "PCD." DI argues that "working surface" means "a top layer (with or without a chamfer)." The parties dispute whether the "working surface" of a PCD body is limited to the PCD body's top layer.

---

Footnotes

7 DI does not dispute the ReedHycalog's construction of "PCD" for the different patents.

---

The claims and specifications do not limit the working surface to the top layer. The specifications expressly define the working surface as "any portion of the PCD body which, in operation, may contact the object to be worked":

The working surface 4 is any portion of the PCD body 8 which, in operation, may contact the object to be worked. In this specification, when the working surface 4 is discussed, it is understood that it applies to any portion of the body 8 which may be exposed and/or used as a working surface. Furthermore, any portion of any of the working surface 4 is, in and of itself, a working surface.

The specifications also state that the working surface of the PCD cutting element "may be a top working surface 70 and/or a peripheral working surface 72." Id. at col. 12:44-46. These passages refer to Figures 1A and 1B from the Patents-in-Suit, both of which depict the working surface, identified by reference numbers 4, 70, and 72, as encompassing the top and peripheral surfaces of the PCD body:

[SEE Figures 1A and 1B from the Patents-in-Suit IN ORIGINAL]

This disclosure is in accord with the claims, which do not limit the working surface to the top surface. For example, the Impact Strength Patent claims a PCD element where the working surface is adjacent to both a leached volume and an unleached volume, which matches the top and peripheral working surfaces disclosed in Figures 1A and 1B above. '662 Patent, col. 18:23-31 (claiming "a body having a working surface" wherein "a first volume of the body adjacent to working surface contains a catalyzing material" and "a second volume the body adjacent to the working surface is substantially free of the catalyzing material"). Further, the claims in the Thermal Characteristic Patents and Depth Patents do not restrict the working surface to the top layer of the PCD body. E.g., '447 Patent, col. 14:24-33; '214 Patent, col. 14:32-43.

Despite the specifications' definition of "working surface," DI argues that the Impact Strength Patent's inventors limited the term to a "top layer (with or without the chamfer)" during prosecution before the U.S. Patent & Trademark Office ("PTO"). The prosecution history, however, does not support DI's position.

The doctrine of prosecution history disclaimer "limits the interpretation of claims so as to exclude any interpretation that
may have been disclaimed or disavowed during prosecution in order to obtain claim allowance." Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1323 (Fed. Cir. 2003). For the doctrine to apply, the disclaimer of claim scope must be clear and unmistakable. Computer Docking Station Corp. v. Dell, Inc., 519 F.3d 1366, 1374 (Fed. Cir. 2008). Prosecution disclaimer does not apply where the prosecution history is ambiguous. See id. at 1375.

The doctrine of prosecution disclaimer does not apply in this case. During prosecution, the Examiner rejected the Impact Strength Patent's pending claims under 35 U.S.C. § 103(a) as an obvious variation of U.S. Pat. No. 4,766,040 ("Hillert") in view of U.S. Pat. No. 6,344,149 ("Oles"). DI's Responsive Brief, Ex. H, at 2. In response to the rejection, the applicants quoted Hillert's specification to summarize the reference, which discloses a diamond tool that consists of three superhard layers, one of which Hillert refers to as the "top layer or working surface." Id. at 2-3; Hillert, Fig. 1, col. 4:30-41. The applicants concluded that "the working surface (or top layer) of Hillert et al comprises a homogeneous diamond layer," and proceeded to contrast the "working surface (or top layer)" disclosed in Hillert with the "working surface" of the applicants' invention:

[I]n the present invention, the working surface is not homogenous, but rather has at least two distinct regions or volumes; one volume contains a catalyzing material, and the second volume is substantially free of the catalyzing material. Both volumes are present at the working surface. Even though these two volumes have different amounts of catalyzing material, the impact strength of the two volumes is substantially the same. The advantage of this arrangement is that the two volumes will wear differently when used, and therefore they can be arranged so that the working surface selectively wears in favorable geometries.

Nothing in the prosecution history equates the "working surface (or top layer)" disclosed in Hillert with the "working surface" of the applicants' invention. This discussion states the opposite--that the "working surface" of the Impact Strength Patent may cover multiple volumes and not only the homogenous top layer disclosed in Hillert. This is consistent with the Impact Strength Patent's claims, which require the working surface to span leached and unleached regions. '662 Patent, col. 18:23-31. Thus, the prosecution history of the Impact Strength Patent does not limit the term "working surface" to "a top layer (with or without the chamfer)."

For the above reasons, the Court construes "working surface" as "any portion of the PCD body which, in operation, may contact the object to be worked." "PCD" means "polycrystalline diamond or diamond-like elements" when used in the Impact Strength Patent's claims. See Tyler I Claim Construction Opinion & Order, 11, 13. With respect to the other asserted claims, "PCD" does not require construction. See id. at 13.

2. "workpiece"

KLA proposes that a person skilled in the art reading claim 1 would consider "workpiece" to mean a silicon wafer or similar article susceptible to the types of defects the '525 patent was intended to detect. D.I. 344 at 12-13. ADE would have this court construe the word "workpiece" as a silicon wafer or equivalent article with particle and COP defects. D.I. 396 at 1-2. Clearly, the parties' interpretations of "workpiece" are similar. ADE's construction, however, expressly states that "workpiece" refers to articles with particle and COP defects; whereas, KLA's downgrades the importance of the presence of COP defects on the surface of the "workpiece."

Surely, the word "workpiece" conjures up the notion that something is being acted upon. In the case of claim 1 of the '525 patent, the thing doing the acting is a beam of P-polarized light. The word "workpiece," however, is broad in that it may encompass almost any article. One must, therefore, check the context in which the word is used to determine what the inventors meant. In claim 1, it is evident that "workpiece" refers to an item susceptible to particle and pit defects because the presence of such is being determined in the last step of the method claimed. Although the meaning intended by the inventors becomes clearer with reference to the context, particle and pit defects may also have a broad meaning. Thus, the word "workpiece" may still mean many things. In this event, a person of ordinary skill in the art would look to the '525 written disclosure to determine what the inventors intended by using the word "workpiece" to define their invention.
On numerous occasions, pit and COP defects are mentioned in the written description of the '525 patent in the same breath. It is clear that these words are interchangeable. For example, the disclosure provides that "if the defects are pits or 'COPS' (crystal originated pits) in the wafer surface, they are not removed by recleaning." '525 at 1:25-30. A person of ordinary skill in the art would readily understand that a pit as used in claim 1 refers to a COP defect. This, however, does not end the inquiry. One must also discover what type of "workpiece[s]" contain COP and particle defects. The inventors specify that "the present invention relates to surface inspection systems and methods and, more particularly, to the inspection of articles or workpieces, such as silicon wafers..." '525 at 1:15-18. Later, in the description of the preferred embodiment, the inventors specify that Figure 1, provided below, represents "a surface inspection system 20 for detecting defects such as particles, pits and the like on a surface of a workpiece W or article, such as a silicon wafer."

[SEE FIGURE 1 IN ORIGINAL]

The '525 patent unquestionably discloses an invention capable of detecting the presence of particle and COP defects on the surface of silicon wafers. Although the inventors do not specifically state in claim 1 that the "pits" referred to on the surface of the "workpiece" are COPS, that meaning was clearly intended. To hold oppositely would require inventors to turn patent claims into catalogues of lexicons. This court refuses to render such a holding when the written disclosure establishes the meaning of the words used in the claim. In as much as KLA implicitly attempts to construe "workpiece" so that a "pit" is not a "COP," this court disagrees. Such an interpretation would be inconsistent with the purpose of the '525 patent and is improper. See Hockerson-Halberstadt, Inc. v. Avia Group Int'l, Inc., 222 F.3d 951, 956 (Fed. Cir. 2000) (citing Renishaw PLC, 158 F.3d at 1250). Accordingly, the word "workpiece" is construed to mean a silicon wafer or similar article susceptible to particle and COP defects.

5. "Workstation"

The claim language and specifications of the '415 and '670 patents refer to "workstations" as individual components of a laboratory automation system, each of which is capable of performing a test:

The specification of the '670 patent makes clear that a predetermined test is performed at each workstation:

The container is removably mounted in an independent carrier designed to carry an individual specimen of a number of different sizes and shapes through a laboratory to one or more of a plurality of work stations, where a predetermined test will be performed on the specimen. Once the carrier has arrived at the predetermined work station, the carrier is removed from the conveyor and a test is conducted on the specimen.

(Filing 64-4, Ex. D, at 2:21-28 (emphasis added).) Further, claim 1 of the '670 patent refers to "work stations" (plural) where "tests" (also plural) are performed. (Id. at 6:2-3, 6:7-9.)

Claim 1 of the '415 patent also indicates that a workstation is any component that is capable of performing at least one test on a specimen. The first mention of the term provides that the LAS determines "the most direct route from the receiving station to a first workstation for conducting the highest priority test of the first specimen." (Filing 64-3, Ex. C, at 6:19-21.) Additional uses of the word "workstation" in claims 1 and 2 of the '415 patent also link "workstation" to the performance of a test: "each workstation adapted to conduct a predetermined test" (id at 6:24-25); "the LAS operating a gate at the first workstation to direct the carrier to a workstation auxiliary conveyor, for conducting a test on the specimen" (id. at 6:28-30); "[t]he method of claim 1, further comprising the steps of: conducting the first predetermined test on the first specimen after the step of directing the first carrier to the first workstation auxiliary conveyor." (Id. at 6:34-37.)

The references in the specification of the '415 patent likewise indicate the performance of a test at each workstation. For example, in describing figure 2, the description of the preferred embodiment recites:

Thus, if time constraints require that the test of workstation 34 be performed first, and that a test of workstation 32 be performed at some time after the test of workstation 34, the specimen can travel on conveyor 24 past workstations 30 and...
32, directly to workstation 34, for immediate testing.

(Id. at 4:21-26; see also id. at 4:62-63 ("[i]f the particular test . . . is performed at workstation 30"); id. at 5:16-17 ("[o]nce the test performed by workstation 30 has been completed").)

Contrary to Siemens' argument that "workstation" should be construed to mean a "specimen analyzer that performs one or more tests," neither the '415 nor the '670 patents clearly express any intent on the part of the University to limit the generic term "workstation" in this manner. Rather, the patents describe a functional method for the automatic testing of laboratory specimens on a test-by-test basis and never describe a "workstation" as an "analyzer" or "specimen analyzer." Where an inventor relies on "the intended broad scope of the appended claims" in describing his invention, the court should not construe that scope narrowly when the language of the claims does not require or even suggest the narrow construction.

(Filing 64-3, Ex. C, at 5:60-6; Filing 64-4, Ex. D, at 5:34-35. 2) See Martek Biosciences Corp. v. Nutrinova, Inc., 579 F.3d 1363, 1377 (Fed. Cir. 2009) (the meaning of a claim term is only narrowed when the patentee makes a clear and unmistakable surrender of subject matter during prosecution); Innova/Pure Water, Inc. v. Safari Water Filtration Systems, Inc., 381 F.3d 1111, 1120 (Fed. Cir. 2004.)

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

2 Both patents provide:

Whereas the invention has been shown and described in connection with the preferred embodiment thereof, it will be understood that many modifications, substitutions and additions may be made which are within the intended broad scope of the appended claims. There has therefore been shown and described an improved method for automatic testing of laboratory specimen.

(Emphasis added.)

4479

Worm Gear

Molon Motor and Merkle-Korff propose different constructions of the term "worm gear," as follows:

Molon's proposed construction of "worm gear" -- a gear having a screw thread (for example, helical or spiral) that may mesh with a toothed wheel, typically used to connect non-parallel, non-intersecting shafts.

Merkle-Korff's proposed construction of "worm gear" -- a "worm gear" means a worm, which is a shaft with continuous single, double, or quadruple thread screws that completely encircle the axis of the shaft. The "worm gear" typically does not permit back drive, and meshes with a toothed gear to transfer conjugate rotary motion between two shafts at an inclined angle.

Merkle-Korff asserts that the 785 patent should include the following limitations: (1) that the shaft must have continuous threads that completely encircle the axis of the shaft; (2) that the thread screws must be single, double, or quadruple; (3) and that the worm gear does not typically permit backdrive.

Molon asserts Merkle-Korff's proposed construction has numerous problems. First, Molon asserts that Merkle-Korff's construction would wrongly read limitations from the preferred embodiment into the claim, citing Teleflex Inc. v. Ficosa North America Corp., 299 F.3d 1313, 1328 (Fed. Cir. 2002) (the Federal Circuit has "cautioned against limiting the claimed invention to preferred embodiments or specific examples in the specification"). Further, the numerical limitations for the number of thread screws wrongly adds narrowing modifiers before an otherwise general term that stands unmodified in the claim, citing Bell Communications Research v. Vitalink Communications Corp., 55 F.3d 615, 621-22 (Fed. Cir. 1995).
Merkle-Korff responds by asserting that these limitations are not preferred embodiments but are, rather, descriptions of the invention detailed in the 785 patent's "Summary of the Invention."

Molon asserts that its construction encompasses the ordinary and plain meaning of the term "worm gear." Citing standard technical reference manuals, Molon asserts that its construction captures the meaning of the term. On the other hand, Merkle-Korff states that Molon is using the term in the 785 patent in an unusual way -- i.e., to refer to what is typically called the "worm" as the "worm gear" and to refer to what is typically called the "worm gear" as the "worm wheel." Merkle-Korff further argues that a European patent application made by Molon supports its contention that Molon is not using the ordinary construction of the term "worm gear." Molon asserts the information related to the European application is extrinsic evidence.

A patentee may not state that the claims of a patent do not cover a particular device during prosecution and then change that position during an infringement suit. Springs Window Fashions LP v. Novo Industries, L.P., 323 F.3d 989, 995 (Fed. Cir. 2003). However, the prosecution history may not be viewed as evidence of the subjective intent of the patent applicant or the patent examiner. "Representations during prosecution cannot enlarge the content of the specification"; and it is proper, instead, to rely on the specification itself for guidance in analyzing the claims. Biogen, Inc. v. Berlex Labs., Inc., 318 F.3d 1132, 1139-40 (Fed. Cir. 2003). Here, there is nothing in the prosecution history that would support deviation from the plain and ordinary meaning.

Adopting Merkle-Korff's construction, however, would improperly add a claim limitation from the specification. See Texas Digital Sys., Inc. v. Telegexnix, Inc., 308 F.3d 1193, 1204-05 (Fed Cir. 2002). Limitations from the specific embodiments of a patent that are described in the drawings and specification of a patent cannot be read as limitations into the claims. Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182 (Fed. Cir. 1998). The specification may be used to interpret the claims; it may not be used as a source for adding extraneous limitations. Transmatic v. Gulton Indus., 53 F.3d 1270, 1277 (Fed. Cir. 1995).

Molon's proposed definition of the term "worm gear" properly describes the claim.

Claim 42 of the '456 patent provides: "A surgical device as recited in Claim 41, wherein said driving means are operably connected through said threaded aperture to a worm gear positioned and disposed within said main housing so as to transmit motion thereto." Defendants argue that this term should be construed as "a gear whose threads wind up in a spiral fashion with a single continuous groove around the outside of the gear." (Defs.' Br. at 54.) Plaintiff explains that defendants have confused the worm gear for the worm, noting that worm is defined as "[a] shank having at least one complete tooth (thread) around the pitch surface; the driver of a worm gear," while worm gear is defined as "[a] gear with teeth cut on an angle to be driven by a worm; used to connect nonparallel, nonintersecting shafts." (Pl.'s Reply Br. at 45 (citing McGraw-Hill Dictionary of Scientific and Technical Terms 2176 (5th ed. 1991)). The specification of the '456 patent supports these definitions: the "screw-like threaded surface of the worm 115 . . . successively engage the drive recesses on the worm gear 120 to effect rotation thereof." Col. 14, Ins. 64-67. Figure 11 of the '456 patent further demonstrates that it is the worm that includes the continuous spiral. I therefore conclude that the term worm gear shall be construed as consistent with its normal dictionary definition: gear with teeth cut on an angle to be driven by a worm, and is used to connect nonparallel, nonintersecting shafts. 26

26 Worm is construed as: a shaft with at least one complete tooth or thread around its surface such that when it rotates, it drives the worm gear.
1. Construction of "Wound"

Defendants argue that the district court erred by vacating its construction of "wound" when the term's meaning was critical to the obviousness inquiry. According to Defendants, this error allowed KCI to improperly avoid the prior art by arguing claim construction to the jury. Specifically, Defendants take issue with KCI's characterization at trial of the Chariker-Jeter, Svedman, Johnson, and Davydov references as "draining fistulae," "irrigating wounds," "immobilizing skin grafts," and "draining bodily fluids," respectively, as opposed to "treating wounds with negative pressure." Defendants' expert testified that under the plain and ordinary meaning of "wound," each of the prior art references disclosed "treating a wound with negative pressure." The effect of this, according to Defendants, was that the jury was improperly forced to choose between competing claim constructions offered by the experts.

Defendants ask us to adopt their proposed "plain and ordinary meaning" construction, taken from Stedman's Medical Dictionary: "(1) trauma to any of the tissues of the body, especially that caused by physical means and with interruption of continuity [or] (2) a surgical incision." They argue that the specification's use of broad language when describing the wounds that can be treated shows that the ordinary meaning, as defined in the dictionary, was intended. See '643 patent col.12 ll.41-42 ("Negative pressure appliances are useful for treating a variety of wounds."); id. col.13 ll.24-25 ("The present invention also includes a method of treating damaged tissue . . . ."). Additionally, Defendants cite the numerous examples in the '643 patent's specification that describe open wounds, infected wounds, burn wounds, skin graft and skin flap wounds, decubitus ulcer wounds, incisional wounds, chronic open wounds secondary to stasis ulcers, and wounds which respond to increased blood flow, to support their proposed construction.

KCI responds that any error resulting from the district court's failure to construe the "wound" phrases is harmless because Defendants' proposed construction is incorrect as a matter of law and the jury's verdict demonstrates that it adopted the correct construction. According to KCI, the correct construction of "wound" is "tissue damage to the surface of the body, including the epithelial and subcutaneous layers." KCI argues that while the specification may refer to a "variety of wounds," each and every example specifically described is a skin wound. Therefore, KCI alleges, the Stedman's Medical Dictionary definition is broader than the scope of the specification and cannot be used to define "wound" as used in the claims. Further, KCI notes that under Defendants' proposed construction, "wound" would include, in addition to fistulae, "conditions such as ruptured appendices and stomach ulcers" that the specification in no way suggests can be treated according to the claimed invention. Appellee's Br. 53.

As a threshold matter, it appears that the parties' dispute over the construction of "wound" only affects the Chariker-Jeter and Davydov references. At trial, KCI did not contest that "wounds" were the subject of both the Svedman and Johnson articles. For example, KCI's expert, Dr. Orgill, testified that, in the Johnson reference, "[t]he skin graft is closing the wound." J.A. 204,899. Similarly, Dr. Orgill described the Svedman article as teaching "irrigation of a wound." J.A. 204,923. Therefore, the effect of any error in the failure to construe "wound" is limited to the Chariker-Jeter and Davydov references.

3 Defendants also argue that KCI improperly distinguished the prior art on the ground that it did not "treat" wounds. However, Defendants have not alleged error in the district court's construction of "treating" as "giving medical care to," nor have they asked us for a construction of "facilitating the healing of." See Second Amended Order Construing Patent '643 and '081 Claim Term at 2. Therefore, we confine our inquiry to the construction of "wound."

We agree with KCI that "wound," as used in the asserted patents, does not cover the fistulae described in the Chariker-Jeter publications and the "pus pockets" described in the Davydov references. As this court held in Phillips v. AWH Corp., "the specification is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term." 415 F.3d 1303, 1315 (Fed. Cir. 2005) (en banc) (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996)). All of the examples described in the specification involve skin wounds, not fistulae or pus pockets.
wounds. See id. at 1321 ("Properly viewed, the 'ordinary meaning' of a claim term is its meaning to the ordinary artisan after reading the entire patent."). To construe "wound" to include fistulae and "pus pockets" would thus expand the scope of the claims far beyond anything described in the specification. See Nystrom v. TREX Co., 424 F.3d 1136, 1145 (Fed. Cir. 2005) ("[I]n the absence of something in the written description and/or prosecution history to provide explicit or implicit notice to the public--i.e., those of ordinary skill in the art--that the inventor intended a disputed term to cover more than the ordinary and customary meaning revealed by the context of the intrinsic record, it is improper to read the term to encompass a broader definition simply because it may be found in a dictionary, treatise, or other extrinsic source."). We further conclude that the district court's failure to instruct the jury on the construction of "wound" in this case was harmless. See B. Braun Med., Inc. v. Abbott Labs., 124 F.3d 1419, 1423 (Fed. Cir. 1997) (holding that the district court's pre-Markman failure to instruct the jury on the construction of a means-plus-function limitation was harmless because the jury adopted the correct construction). Because the jury's verdict is supported under the proper construction, and because we perceive no danger under the circumstances of this case that the jury may have used an incorrect construction of "wound" that might have prejudiced Defendants, there is no need to remand for a new trial.

4 While O2 Micro International, Ltd. v. Beyond Innovation Technology Co., 521 F.3d 1351 (Fed. Cir. 2008), permits a remand for further claim construction, it does not require one. Remanding is particularly unnecessary in this case, where claim construction was briefed before the district court and the disputed term was initially construed but later vacated because the parties did not use the construction in front of the jury. See id. at 1363 (remanding because "the district court is in the best position to determine the proper construction of this claim term in the first instance").

4482

DYK, Circuit Judge, dissenting.

I respectfully dissent from the majority's holding that affirms the judgment that the claims are nonobvious. In my view, the majority improperly holds that the claim term "wound" can be limited to the disclosed embodiments in the specification, and, having done so, then misreads the specification as showing only embodiments treating harm to the surface of the body or skin wounds. Under the correct construction of this claim term, the asserted claims of U.S. Patent Nos. 5,636,643 ("'643 Patent") and 5,645,081 ("'081 Patent") would have been obvious. 1

The proper construction of the term "wound" was extensively disputed pre-trial. Defendants Medela AG and Medela, Inc. ("Defendants") argued that "wound" should be construed according to its plain meaning as "injury." Defendants alternatively argued that "wound" should be construed as found in Stedman's Medical Dictionary (26th ed.): "(1) trauma to any of the tissues of the body, especially that caused by physical means and with interruption of continuity [or] (2) a surgical incision."

Plaintiffs Kinetic Concepts, Inc., KCI Licensing, Inc., KCI USA, Inc., and Wake Forest University Health Sciences ("Plaintiffs") argued that "treating a wound" should not be construed at all because it is well within the common experience and understanding of every juror. Plaintiffs argued in the alternative that "wound" should be construed as "tissue damage to the surface of the body, including the epithelial and subcutaneous layers." Although both parties introduced expert reports
on claim construction to the district court, neither party relies on these expert reports on appeal.

At trial, Plaintiffs argued the definition of "wound" to the jury in an effort to distinguish the prior art, particularly the public uses of Chariker and Jeter that involved applying negative pressure to surgical incisions including both a hole in the skin and a "fistula" or hole in an internal organ. Plaintiffs argued to the jury that a "fistula" was distinct from a "wound," and that the purpose of the public uses of Chariker and Jeter was "fistula drainage" as opposed to "wound healing." 2

Footnotes
2 In opening and closing arguments, Plaintiffs attempted to distinguish the public uses of Chariker and Jeter by focusing on the fact that the method was usually used when there was a fistula: "this [Chariker-Jeter] is about fistulas, not about the wounds that we are talking about," J.A. 200862; "Remember Chariker-Jeter is healing -- is drainage, not healing. Chariker-Jeter is fistula only," J.A. 205656; "Now, let's talk about Chariker-Jeter and I will repeat myself 400 times and I will shut up. Chariker-Jeter, fistulas, fistulas, fistulas, fistulas. It's about drainage," J.A. 205665. The testimony of Plaintiffs' expert witness on validity, Dr. Orgill, is also illustrative:

  Q: Is that wound healing?
  A: No. That's fistula drainage.

  Q: And why isn't that wound healing?
  A: Well, Chariker-Jeter describes that they stop this device when the fistula closes. And usually these devices take about 16 days, that's what they describe in their article, for this nasty fluid to stop coming out. And after that, when the fistula closes, then that's when the wound healing or the rest of the wound can start to heal.

  J.A. 204932-35. Cross-examination on the definition of wound included an answer from this witness that "[v]ery often people with the definition of tissue would separate tissues from organs, so, in other words, many people in their definition of tissue might not consider, for example, a kidney to be a tissue. I understand some people would, but some people would separate organ from tissues." J.A. 205092. Testimony by an inventor also focused on this distinction: "It's totally different. They're treating drainage. We're treating a wound. . . . We're treating to close a wound. They're treating to control the fistula."

End Footnotes

II

The district court's failure to construe the term "wound" was a clear error. We have held that "[w]hen the parties raise an actual dispute regarding the proper scope of [the patent] claims, the court, not the jury, must resolve that dispute." O2 Micro Int'l Ltd. v. Beyond Innovation Tech. Co., 521 F.3d 1351, 1360 (Fed Cir. 2008). It is improper to argue claim construction to the jury because the "risk of confusing the jury is high when experts opine on claim construction." CytoLogix Corp. v. Ventana Med. Sys., Inc., 424 F.3d 1168, 1172-73 (Fed. Cir. 2005); see Sundance, Inc. v. Demonte Fabricating Ltd., No. 2008-1068, 550 F.3d 1356, 2008 U.S. App. LEXIS 26082, *19-20, n.6 (Fed. Cir. Dec. 24, 2008). In this case, the definition of the term "wound" was central to the case and a primary focal point of the Markman hearing; as a result, the court should have construed the term "wound."

The appellees do not dispute that it was error to fail to construe wound, instead claiming that the issue "need not be resolved, however, since any error was harmless" under the claim construction now adopted by the majority. Appellee's Br. 51. The majority agrees. However, there is no suggestion by either the majority or the appellees that the verdict could be
sustained under the appellants' proposed construction. Thus, the crucial question is whether the majority's claim construction is correct. In my opinion it is not.

III

The majority construes "wound" to mean "tissue damage to the surface of the body, including the epithelial and subcutaneous layers" because "[a]ll of the examples described in the specification involve skin wounds." Maj. op. at 9-11. It is the words of the claim that define the scope of the patent. See Phillips v. AWH Corp., 415 F.3d 1303, 1312 (Fed. Cir. 2005) (en banc). The words are generally construed according to their ordinary and customary meaning, that is, "the meaning that the term would have to a person of ordinary skill in the art in question at the time of the invention." Id. at 1313. This meaning is to be interpreted in the context of the entire patent, including the specification. Id. However, it is improper to import limitations from the specification into the claims where there is no indication that the specific examples in the specification are intended to be strictly coextensive with the claim. Id. at 1323.

The majority holds that the term "wound" should be understood as limited to damage to tissues near the surface of the body, particularly the skin, and should not include damage to organs. The majority points to no medical dictionary or other extrinsic evidence supporting this claim construction. The specification does not define "wound" or provide any examples of the types of harms that would not qualify as wounds under the claim terms. Nor does the specification state that the examples listed in the specification were intended to describe the entire invention. See SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1343-44 (Fed. Cir. 2001) (specification described "all embodiments of the present invention"). Nonetheless, the majority concludes that, because the specification examples supposedly only include descriptions of damage to the skin, the specification limits the kinds of wounds encompassed by the claim. In my view, our decision in Phillips bars us from construing the claims as limited by the specification examples, and the majority's approach is without support in our post-Phillips cases.

But even if the examples could limit the claims, in my view the examples here are not limiting, and indeed the specifications confirm the inappropriateness of the majority's construction. The specifications of both patents make clear that the examples are merely "illustrative." 3 The specifications also state that the invention is "useful for treating a variety of wounds." '643 Patent col.12 ll.41-42. "Wounds that have exhibited positive response to treatment by the application of negative pressure include infected open wounds, decubitus ulcers, dehisced incisions, partial thickness burns, and various lesions to which flaps or grafts have been attached." '643 Patent col.2 ll.58-62. (emphasis added). The use of the illustrative and open language of "include" demonstrates that there may be other types of wounds that the specification does not expressly point out, but that would nonetheless be covered by the claim term "wound." See SanDisk Corp. v. Memorex Prods., Inc., 415 F.3d 1278, 1284 (Fed. Cir. 2005); Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1344-45 (Fed. Cir. 2003).

Throughout the specifications, the term "wound" is used only in this broad and inclusive way. See, e.g., '643 Patent col.13 ll.23-29.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 The '081 Patent specification states: "[t]hese examples are provided for illustrative purposes only and are not to be taken as limiting," col.5 ll.47-49, and "[t]he foregoing examples are illustrative of the present invention, and are not to be construed as limiting thereof," col.9 ll.46-48. See also '643 Patent col.21 ll.43-45 ("The terms and expressions which have been employed are used as terms of description and not of limitation.").

- - - - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Moreover, the majority is incorrect in asserting that "[a]ll of the examples described in the specification involve skin wounds." Maj. op. at 11. In fact, a number of examples illustrate that the wounds at issue are not merely skin wounds but deep wounds that include damage to more than the skin, such as wounds in which bone was exposed, '643 Patent col.19 ll.35-39, col.20 ll.23-27, large quantities of fluid were draining, '643 Patent col.19 ll.23-26, surgical incisions cut through the abdominal wall and did not heal, '643 Patent col.19 ll.55-65, or bone was infected, '643 Patent col.20 ll.49-61. See also '081 Patent col.8 ll.58-67, col. 9 ll.19-27, ll.35-41. These examples disclose wounds with far more than mere "damage to the epithelial and subcutaneous layers," suggesting that other kinds of damage, including fistulae caused by surgical incision, would be within the definition of "wound" as used in the claim. These examples explicitly identify benefits achieved in the healing of interior tissue. For example, '643 Patent col.19 ll.55-65 and '081 Patent col.8 ll.60-65 describe increased healing
of the abdominal wall by granulation tissue in and through Prolene mesh, and '643 Patent col.19 ll.23-26 and '643 Patent col.20 ll.25-35 describe draining fluid from interior infections. 4

4 To be sure, one of the identified purposes of the invention applies only to the skin. See '643 Patent col.1 ll.20-25 (describing the "zone of stasis" in which blood flow to the skin around a wound is restricted as a problem addressed by the invention). However, we have held that "[t]he court's task is not to limit claim language to exclude particular devices because they do not serve a perceived 'purpose' of the invention. . . . An invention may possess a number of advantages or purposes, and there is no requirement that every claim directed to that invention be limited to encompass all of them." E-Pass Techs., Inc. v. 3Com Corp., 343 F.3d 1364, 1370 (Fed. Cir. 2003).

In view of the inclusive language and examples of the specification, I would find a dictionary frequently used by a person of ordinary skill in the art significant in understanding the meaning of "wound" in the claim. See Phillips, 415 F.3d at 1322-23 ("[J]udges are free to consult dictionaries and technical treatises . . . when construing claim terms, so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents." (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1584 n.6 (Fed. Cir. 1996)). The definition of "wound" provided by Stedman's, an accepted medical dictionary, 5 includes "trauma to any of the tissues of the body" and "surgical incision." In light of the disclosures of the specifications and the additional support of the dictionary, in my view the term "wound" as used in the claim includes fistulae caused by surgical incision.

5 Plaintiffs' expert witness testified that Stedman's is a medical dictionary used in the profession. Plaintiffs even referenced the definition of wound provided by Stedman's in filings to the FDA describing the full scope of wounds that could be treated by their device.

The final disputed term is "written material." Here, the primary disagreement is whether "written material" encompasses figures or pictures that may appear on a page of the book, or whether the term is limited to words.

The claim language itself provides guidance as to what the inventor intended by "written material." Claim 1 states that the audio signals produced by the toy are "audio interpretation[s]" of the "written material." Although "written material" is not further described in claim 1, claim 2 and claim 10 specify that for these claims, "written material" is a "set of words." ( '213 patent, col. 5, 1. 26 & col. 6, 1. 24.) Claim I does not so limit "written material." Thus, it is clear that the inventor intended "written material" to encompass something broader than just words. If the inventor intended "written material" to only mean words, there would be no reason to further specify in claims 2 and 10 that, at least for those claims, "written material" consisted of words.

The specification and prosecution history further supports a broad construction of "written material." Claim 1 states that the "written material" is capable of "audio interpretation" and the specification specifically describes what can be audibly interpreted by the toy. The toy can provide "an audible translation of the text" or alternatively the toy can provide "an audible translation of pictures or figures." ( '213 patent, col. 3, 11. 44-49.)

Finally, the prosecution history reveals that the word "symbol" was originally used in the claim language and was later amended to "written material." (Pls.' Br. Ex. B at 40, 49.) Something can be "written material" without being a "symbol." This indicates that the inventor intended to broaden the scope of what could be audibly translated by the toy to include
Accordingly, "written material" will be construed as "words, figures, or pictures."

4484

4. "X-ray film" is construed to mean "a film produced by radiation of high energy and short wavelength capable of passing through objects opaque to light."

4485

2. "Y-shaped"

Spire contends that the term "Y-shaped" should be construed as describing something "shaped like the letter Y." Spire argues that, as a result, the definition requires that the top two branches of the letter "Y" form some perceptible angle less than 180 degrees. Arrow proposes a definition that does not restrict the angle, but merely denotes the splitting of the lumens from the central portion of the multi-lumen catheter to create separate extension tubes at either end. Arrow's definition would include, say, an apparatus with junctions shaped like the letter "T" or like an arrow.

"Y-shaped" is a simple, non-technical term whose ordinary meaning is self-explanatory: having the shape of the letter "Y". Thus, I construe the term "Y-shaped" in the patent strictly to denote this shape. The angle between the two forks or branches of the letter "Y" distinguishes it from the letter "T" (exactly 180 degrees), a single, vertical line (zero degrees), and an arrow shape (greater than 180 degrees). In order to take the shape of the letter "Y", the inside angle between the branches of a "Y-shaped" apparatus must be less than 180 degrees. 7

7 Admittedly, the branches of the letter Y necessarily form two angles between them, summing 360 degrees. The angle referred to here is the angle between the branches that is not bisected by the trunk of the letter (designated as [alpha] and [theta] in Figures 2 and 5, respectively). I refer to this angle as the "inside" angle, even though the description is somewhat tautological.

It follows, also, that the minimum angle between the branches of the "Y" must be greater than zero. I recognize, in the context of this case, that a "Y" shape may be created by splitting separate extension tubes at either end from the central tube. The extension tubes may be located directly beside each other so that the angle between them is so imperceptible as to approach zero degrees, but the separation of the two tubes from the central tube nevertheless creates a "Y-shape" in the sense that a divergence -- some separation greater than 0 degrees -- is present where the tubes intersect. Thus, for something to be in the shape of the letter Y, there must be two branches intersecting at a single trunk separated by an inside angle that measures between 0 and 180 degrees.

The specification supports this definition. In a preferred embodiment, the proximal extension tubes are joined to the central portion by a Y-shaped junction, or "trunk." Id. at col. 8, 11. 22-25, 34-38. There is an angle of separation of approximately 5 degrees between the arterial and veinal tubes. Id. at col. 8, 11. 44-48. The extension tubes at the distal end are arranged similarly, with the angle of separation ranging between 10 and 30 degrees. Id. at col. 7, 11. 14-19. These angles fall well below the 180 degree limit and form recognizable, albeit in the case of the proximal ends, barely discernible, "Y" shapes. See Figures 2, 5.

Figures 7 and 8 illustrate the situation in which something closer to but still greater than zero degrees separates the extension tubes. These figures depict the extension tubes held closely together by a connector or a sheath so that the catheter can pass through the subcutaneous tunnel. Figures 8A and B make clear that although the extension tubes (marked by
Although not illustrated in the diagrams, this near "zero degree" arrangement may also arise when no trunk piece is used to connect the extension tubes to the central tube. The specification describes an embodiment in which the trunks, labeled 30 and 32 in Figures 2 and 5, respectively, are eliminated. '198 patent at col. 7, 27-36; col. 8, 11. 57-67. The extension tubes are then connected directly to the central tube portion. This would result in the central tube essentially being split in two at each end. The angle between the tubes would be as close to zero as is imaginable but the splitting imports divergence and this arrangement would consequently be covered by the claims.

I recognize the specification states that the tubes may be arranged at "any desired angle." '198 patent at col. 7, 11. 19-20; col. 8, 11. 49-50. Arrow seizes upon this language to argue that "Y-shaped" should be construed with no limitation on the angle between the tubes. I disagree. In the context of the entire specification, which repeatedly describes the apparatus joints as "Y-shaped," the phrase "any desired angle" must be construed to refer only to the possible angles of a Y-shaped junction.

In sum, drawing from both parties' proposed definitions, the term "Y-shaped" denotes the shape of the letter "Y," meaning the shape formed by two branches which intersect at a single trunk to form an inside angle that measures between 0 and 180 degrees.

A determination of infringement requires a two-step analysis. See Gentry Gallery, Inc. v. Berkline Corporation, 134 F.3d 1473, 1476 (Fed. Cir. 1998). "First, the claim must be properly construed to determine its scope and meaning. Second, the claim as properly construed must be compared to the accused device or process." Carroll Touch, Inc. v. Electro Mechanical Sys., Inc., 15 F.3d 1573, 1576 (Fed. Cir. 1993).

While the parties did dispute the proper construction of each element of Claim 3, the focus of the Court's ruling on whether defendant's Series 7000 satellites infringe the Rahn patent is on the proper construction of "yaw momentum commands," which appear in elements [b] and [d]. See Rahn patent col. 11:9-20. In element [d], a "modeling circuit" determines "appropriate roll commands, pitch commands, and yaw momentum commands to established [sic] a particular aim point for a selected target." Rahn patent col. 11:15-20. These commands are then received by element [e]'s "short term tracker circuit," which "provide[s] attitude control information in response to said commands." Id. col. 21-25. In element [b], the "momentum biasing attitude control apparatus" "effect[s] attitude control in response to" these same "roll commands, pitch commands, and yaw momentum commands." Id. col. 11:9-11.

Element [b] suggests that the "roll commands, pitch commands, and yaw momentum commands" function as instructions for moving the satellite -- i.e., changing its attitude. SSL's proposed construction of these terms partially conforms to that suggestion:

A "roll command" is a command (e.g., rotate 3 degrees clockwise) which, if all other inputs to the short term tracker (element e) are unchanged, will cause a corresponding rotation of the spacecraft about its roll axis.

A "pitch command" is a command issued by the modeling circuit (e.g., roll 1 degree counterclockwise) which, if all other inputs to the short term tracker are unchanged, will cause a corresponding rotation about the spacecraft's pitch axis.

A "yaw momentum command" is a command issued by the modeling circuit (e.g., increase or decrease momentum by a certain amount) which, if all other inputs to the short term tracker are unchanged, will cause a corresponding change in the component of angular momentum along the yaw axis.

SSL's Reply in Support of Its Cross-Motion for Partial Summary Judgment that Lockheed Martin's Series 7000 Satellites Literally Infringe the Rahn Patent at 6. 4 But while the above constructions of "roll command" and "pitch command" describe what these instructions will do (i.e., cause a certain rotation of the satellite about the roll or pitch axis), the proposed construction is deficient in that it does not describe the effect of the "yaw momentum command" on the satellite's attitude, which is the clear purpose of the commands.

- 5161 -
4 After the August 1, 1997 hearing on claim construction, SSL submitted a Supplemental Memorandum Regarding Construction of Certain Rahn Patent Claim Terms. In that memorandum, SSL slightly modified its construction:

"Roll commands," "pitch commands" and "yaw momentum commands" are signals that are sent to the short term tracker circuit (element [5]). If the other inputs to the short term tracker remain unchanged, then: (a) a change in the "roll commands" will cause the spacecraft's aim point to rotate by a corresponding amount about the roll axis; (b) a change in the "pitch commands" will cause the spacecraft's aim point to rotate by a corresponding amount about the pitch axis; and (c) a change in the "yaw momentum commands" will cause a corresponding change in the component of angular momentum along the yaw axis.

Memo at 2.

Lockheed proposes that the Court look to the patent language to arrive at a complete understanding of "yaw momentum commands." Lockheed argues that "yaw momentum commands," as the term is used in the Rahn patent, are commands to momentum/reaction wheels "used to control the roll angle" of the satellite. Lockheed's Motion at 28. The yaw momentum command, according to Lockheed, instructs the momentum biasing apparatus to change the relative speed of its momentum/reaction wheels, thereby changing the balance of yaw momentum between the wheels and causing the satellite to rotate about its roll axis.

Because SSL is unable to offer a sufficiently concrete construction of what a "yaw momentum command" does, the Court agrees in large part with Lockheed's proposed construction. Language in the patent relating to "yaw momentum commands" is sparse, but two passages in particular from the background section are helpful. The first is in reference to "roll ground track errors" (i.e., the satellite's erroneous pointing north or south of where it should be pointing on earth): "The yaw momentum storing wheels are controlled to minimize nutation and allow for roll tracking." Rahn patent col. 3:43-45. The second, one of the objectives of the background control system: "To provide for roll angle tracking by varying a distribution of yaw momentum between a roll angle [magnetic flux], and a yaw momentum in the wheels …. Distribution of yaw momentum is controlled by varying a speed of a momentum wheel through the yaw momentum command …." Id. col. 4:50-55 (emphasis added).

The patent discloses only one such arrangement, in its description of "specific embodiments": "at least two nonparallel momentum/reaction wheels in a pitch/yaw plane of a spacecraft. Included among acceptable wheel configurations are the L-wheel system and the V-wheel system …." Id. col. 9:6-10. While the Court is mindful of the prohibition on importing limitations from the specification into the claims, in order to determine the meaning of the term "yaw momentum command," the Court is forced to rely on the above language. As a result, the Court concludes that "yaw momentum commands" are instructions to at least two nonparallel momentum/reaction wheels in a pitch/yaw plane of a spacecraft concerning the wheels' relative rates of speed, the purpose of which is to control the angular momentum in the yaw direction and to control the attitude of the satellite by changing the roll angle.

IV. Yield Strength

Claim 5 of the suit patents requires that a frame component have "a yield strength greater than 30,000 psi." '112:12:40-41; '955:14:24-25. Defendants argue that this claim term should be interpreted to require a component to exhibit the stated yield strength at a temperature at which 3% heat recoverable shape-memory and elasticity occurs, i.e., at -20 [degrees] C, and that the evidence presented at trial was insufficient to support the jury's finding that the Turaflex frames possessed the required yield strength at that temperature.

Defendants argued that claim 5 should be interpreted to require the stated yield strength at -20 [degrees] C in their motion for a directed verdict. Defendants have not presented any evidence or posed any arguments which this Court did not
thoroughly consider before denying defendants' motion for a directed verdict at the close of the evidence at trial. Tr. 2915:23-2917:16; 2926:11-19. The reasons for denying that motion are nevertheless amplified below.

A. Claim Construction

Although claim 1 expressly requires that a component exhibit certain characteristics over a stated temperature range, there is simply no mention of a temperature range requirement in claim 5. In light of the temperature range requirement in claim 1, it is clear that the tendency of shape-memory alloys to behave differently at different temperatures was neither overlooked by the inventors or the PTO, nor beyond their ability to address with claim requirements. The absence in claim 5 of a limitation with respect to temperature makes it clear from the plain language of the claim terms that no such limitation was intended.

Defendants assert, however, that the specifications of the suit patents indicate that the yield strength requirement of claim 5 must be met at temperatures as low as -20 [degrees] C. While it is "proper to use the specification to interpret what the patentee meant by a word of phrase in the claim," it is not proper to add "an extraneous limitation appearing in the specification." E. I. Du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir.), cert. denied, 488 U.S. 986, 102 L. Ed. 2d 572, 109 S. Ct. 542 (1988). An extraneous limitation is one which is "read into a claim from the specification wholly apart from any need to interpret what the patentee meant by particular words or phrases in the claim." Id. In other words, the language contained in the patent specifications may be used only to interpret ambiguous claim terms, and not to impose additional limitations on the claims. See SRI Int'l., 775 F.2d at 1121.

In this case, the phrase "a yield strength greater than 30,000 psi" as used in claim 5 clearly makes no reference to a temperature range. Accordingly, it is not proper to look to the patent specifications to determine whether or not claim 5 requires that a component possess this yield strength at any specific temperature.

Moreover, the portions of the specifications cited by defendants do not require that an alloy possess the yield strength stated in claim 5 at temperatures as low as -20 [degrees] C. Defendants rely upon a statement in the specifications that work-hardening, followed by partial annealing, results in a component that, "below M[,]s, has a combination of higher yield strength, very springy elastic behavior, and some shape-memory characteristics." 14 955:6:31-34. Although this portion of the patent specification discusses the yield strength of an alloy below its M[s] temperature, there is no indication in the specification that the M[s] temperature referred to is as low as -20 [degrees] C. Indeed, in discussing the shape memory features of the frame components for purposes of Claim 5, the specifications refer to figure 2G, which depicts the behavior of an alloy at some point below M[s], but in no way indicates that the alloy has an M[s] temperature as low as or close to -20 [degrees] C. 955:5:37-41.

The only temperature range requirement imposed by the suit patents is the -20 [degrees] C to +40 [degrees] C range over which claim 1 requires that a component exhibit at least 3% elasticity. The discussion of claim 1 in the specifications of the suit patents indicates that the M[s] temperature does not necessarily approach -20 [degrees] C. Rather, the M[s] temperature depends upon the alloy selected. In discussing Claim 1, the patent specifications describe the behavior of frame components at temperatures below M[s], which may fall above -20 [degrees] C. 955:5:37-40, 50-61. Thus, even if the specifications were read to impose a limitation on claim 5, they might arguably require only that a frame component possess the stated yield strength at some temperature below M[s], but not necessarily at temperatures as low as -20 [degrees] C.

Defendants next assert that plaintiffs implicitly conceded that Claim 5 requires an alloy to possess the stated yield strength at -20 [degrees] C by seeking a finding of infringement with respect to Turaflex Model 841 under the doctrine of equivalents. The evidence at trial presented by plaintiffs established that the yield strength of this frame at -20 [degrees] C was below the 30,000 psi required by claim 5. Defendants reason that, had plaintiffs asserted that claim 5 required only that the 841 possess the requisite yield strength at any temperature, plaintiffs would have sought to prove literal infringement by relying upon tests which demonstrated that Model 841 had a yield strength of 52,000 psi at 40 [degrees] C. Plaintiffs'
attempt to demonstrate at trial that the 841 exhibited the requisite yield strength at -20 [degrees] C, however, does not compel this Court to read such a limitation into claim 5, which itself contains no reference to temperature which even arguably applies to yield strength. Accordingly, I conclude that claim 5 should not be construed to require that its stated yield strength requirement be met at -20 [degrees] C.

Defendants do not challenge the sufficiency of the evidence at trial that the accused frame components possessed the required yield strength at higher temperatures, nor could they. The jury, reading the plain language of claim 5, might well have concluded that the yield strength requirement stated in claim 5 need not be met at -20 [degrees] C, and relied upon Beshers' test results at higher temperatures, indicating yield strengths well in excess of 30,000 psi. PX 20. 15 These results provided ample support for the jury's finding that the accused frame components infringed the yield strength element of claim 5.

--- Footnotes ---

15 Beshers' data at higher temperatures, with a substantial margin for error and obtained before several cycles of tests were performed, are not subject to the attack levelled by defendants, discussed below, at the results which Beshers obtained at -20 [degrees] C.

--- End Footnotes ---

I. "Yieldable"

As a preliminary matter, Plaintiff argues that construction of the term is only necessary as it relates to claim 1 of the '111 patent because, the term appears only in the preamble, but not the body of claim 33 of the '527 patent. 15 Moreover, Plaintiff states that "yieldable," as used in the '527 patent refers to an intended benefit of the invention, but not an explicit patent claim. 16 Defendants counter that Plaintiff is barred from so arguing because, under a current re-examination of the '527 patent before the United States Patent and Trademark Office ("USPTO"), Plaintiff is claiming that the term "yieldable" does constitute a claim within the patent. 17

16 Id.
17 Docket No. 356, at 8 n.9, Ex. I.

--- End Footnotes ---

"[C]lear reliance on the preamble during prosecution to distinguish the claimed invention from the prior art transforms the preamble into a claim limitation because such reliance indicates use of the preamble to define, in part the claimed invention." 18 Similarly, Plaintiff's reliance on the preamble as a source to distinguish patents during its reexamination should also result in the preamble being construed as a claim limitation in this case. Defendants correctly point out that "claims may not be construed in one way in order to obtain their allowance and a different way against accused infringers." 19 The Court will therefore construe the term "yieldable" as used in both claim 1 of the '111 patent, and in the preamble of claim 33 of the '527 patent.

--- Footnotes ---

Plaintiff argues that the term "yieldable" as used in its patents means "able to give way under force or pressure." Plaintiff emphasizes that the term should reflect the shape memory properties of the patented material. Plaintiff points to the specifications in the '111 and '527 patents which state that "the cushioning element is yieldable as a result of compressibility" and that it "yields under the weight of the cushioned object." On the other hand, Defendants argue that the term means "having a yield point." Defendants support this interpretation by pointing to extrinsic evidence, namely, the Random House Webster's Unabridged Dictionary, and a technical manual, the Standard Terminology Relating to Rubber.

The Court finds that, based upon the specifications, the term "yieldable" as used in Plaintiff's patents is more aptly construed as "able to give way under force or pressure." The Court is unconvinced that the extrinsic evidence proffered by Defendants provides the correct ordinary and accustomed meaning as understood by one of ordinary skill in the art. Rather, given the use of the term in the specifications, and the intended nature of the invention, namely, to maintain shape memory, Plaintiff's definition properly encompasses the scope of the correct meaning. Defendants' proposed definition, on the other hand, incorporates one aspect of being yieldable, namely, able to pass a yield point, but fails to address the broader meaning inferred by a reading of the specifications.

The third term in Claim 1 on which the parties seek construction is "yieldable means." Claim 1 recites "a needle assembly comprising a cannula . . ., a line of elements, yieldable means, including a frictionally held plug." The World Wide Plaintiffs construe this phrase as a "means capable of yielding, or giving way, under force." AnazaoHealth proffers a more restrictive construction, that is "a plug used to position the first seed in the needle at an exact distance from the distal tip of the needle and that is capable of holding and giving way under force." It appears from the two proposed definitions that the parties do not have a meaningful disagreement over the construction of the word "yieldable." The primary disagreement involves whether "yieldable mean" should be construed as a means-plus-function term under 35 U.S.C. § 112, P 6. If section 112, P 6 is found to apply, then the claim term is construed by identifying the "function" associated with the claim language, and then identifying the corresponding "structure" in the specification associated with the function. The claim is then construed as limited to that structure and its equivalents. Depuy Spine, Inc. v. Medtronic Sofamor Danek, Inc., 469 F.3d 1005, 1023 (Fed. Cir. 2006), cert. denied,552 U.S. 940, 128 S. Ct. 58, 169 L. Ed. 2d 243 (2007). AnazaoHealth insists that the phrase must be construed as a "means-plus-function" limitation with the "structure" limited to a plug, which could perform the stated function and which was also disclosed as the preferred embodiment for positioning the element a "predetermined distance from the distal end."
18 35 U.S.C. § 112, P 6 provides:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

The World Wide Plaintiffs respond that the means-plus-function analysis applies only to purely functional limitations that do not provide any structure for performing the recited function. Here, they maintain, sufficient structure is disclosed to perform the recited function of "positioning an element . . . a predetermined distance from the distal end." AnazaoHealth replies that the World Wide Plaintiffs have failed to explain how a "yieldable means" could encompass anything other than a plug and, to the extent that this claim is interpreted more broadly, it would be invalid in light of prior art references that disclosed various "yieldable means." (W0470, W0476-W0482.)

(i). "Means-Plus-Function"

The determination of whether a claim term is written in a means-plus-function format is a question of law for the court. Linear Tech. Corp. v. Impala Linear Corp., 379 F.3d 1311, 1318 (Fed. Cir. 2004). "Means-plus-function claiming applies only to purely functional limitations that do not provide the structure that performs the recited function." Depuy Spine, Inc., 469 F.3d at 1023 (quoting Phillips, 415 F.3d at 1311). "If the word 'means' appears in a claim element in association with a function," there is a rebuttable presumption that section 112, paragraph 6 applies. See Callicrate v. Wadsworth Mfg., Inc., 427 F.3d 1361, 1368 (Fed. Cir. 2005); see also Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1584 (Fed. Cir. 1996). This presumption may be rebutted, however, when the claim element recites a sufficiently definite structure to perform the claimed function. See Phillips, 415 F.3d at 1311; Callicrate, 427 F.3d at 1368. The Federal Circuit has held that in determining whether sufficient structure is recited by a term used in a claim limitation, the court may inquire into whether the "term, as the name for structure, has a reasonably well understood meaning in the art." Greenberg, 91 F.3d at 1583.

Here, although Claim 1 uses the term "means" in the phrase "yieldable means," creating a rebuttable presumption of a "means-plus-function" limitation, the claim then specifically identifies a structure, i.e., a frictionally held plug, capable of entirely performing the function of "yielding." The Federal Circuit has held that "[m]eans-plus-function claiming applies only to purely functional limitations that do not provide the structure that performs the recited function," Phillips, 415 F.3d at 1311, which is not the case here. See also Watts v. XL Systems, Inc., 232 F.3d 877, 880-81 (Fed. Cir. 2000) (holding that the focus is whether the claim recites a sufficiently definite structure, but noting that the claim limitation need not connote a precise physical structure).

(ii). Limiting "Yieldable Means" to a "Plug"

AnazaoHealth argues that even if section 112, paragraph 6 does not apply, "yieldable means" must still be limited to a plug. The Court disagrees. By defining the "yieldable means" as limited to a plug, AnazaoHealth ignores the broader language in the specification and claims, which contemplate other means for achieving the recited function in Claim 1. The claim itself states "yieldable means, including a frictionally held plug." The Federal Circuit has repeatedly recognized that use of the term "including" is an open term, synonymous with "comprising," thereby permitting the inclusion of unnamed components. See Hewlett-Packard Co. v. Repeat-O-Type Stencil Mfg. Corp., 123 F.3d 1445, 1451 (Fed. Cir. 1997), cert. denied, 523 U.S. 516-522 U.S. 812, 118 S. Ct. 56, 139 L. Ed. 2d 20 (1997).

Here, although Claim 1 uses the term "means" in the phrase "yieldable means," creating a rebuttable presumption of a "means-plus-function" limitation, the claim then specifically identifies a structure, i.e., a frictionally held plug, capable of entirely performing the function of "yielding." The Federal Circuit has held that "[m]eans-plus-function claiming applies only to purely functional limitations that do not provide the structure that performs the recited function," Phillips, 415 F.3d at 1311, which is not the case here. See also Watts v. XL Systems, Inc., 232 F.3d 877, 880-81 (Fed. Cir. 2000) (holding that the focus is whether the claim recites a sufficiently definite structure, but noting that the claim limitation need not connote a precise physical structure).

(ii). Limiting "Yieldable Means" to a "Plug"

AnazaoHealth argues that even if section 112, paragraph 6 does not apply, "yieldable means" must still be limited to a plug. The Court disagrees. By defining the "yieldable means" as limited to a plug, AnazaoHealth ignores the broader language in the specification and claims, which contemplate other means for achieving the recited function in Claim 1. The claim itself states "yieldable means, including a frictionally held plug." The Federal Circuit has repeatedly recognized that use of the term "including" is an open term, synonymous with "comprising," thereby permitting the inclusion of unnamed components. See Hewlett-Packard Co. v. Repeat-O-Type Stencil Mfg. Corp., 123 F.3d 1445, 1451 (Fed. Cir. 1997), cert. denied, 523 U.S. 516-522 U.S. 812, 118 S. Ct. 56, 139 L. Ed. 2d 20 (1997).
Additionally, the specification states, "The positioning means for the first seed may take one of a variety of forms, all of
them yieldable to permit the seed to be pushed past the distal end in the implantation." (‘760 Patent col. 2, ll. 30-33
(emphasis added).) "The needle assembly of the invention may include a biocompatible 19 end plug. . . ." Id. at col. 2, ll.
34-35 (emphasis added). Thus, the specification makes clear that a plug is not the exclusive manner in which to attain the
recited function in Claim 1. In fact, the ’760 Patent expressly discloses an alternate embodiment where the yieldable means
comprise the combination of a plug and a resilient tongue formed in the cannula wall. Id. at col. 5, ll. 1-20 & fig. 6d.
Nothing in the prosecution history suggests otherwise. Moreover, AnazaoHealth’s proposed definition that limits the
yieldable means to a plug is redundant of the language already recited in the claim, “including a . . . plug.” Id. at 5:46-48.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -
19 The Patent uses this spelling throughout. The correct spelling is "biocompatible."
- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

The Court finds that the World Wide Plaintiffs’ proposed construction comports with the customary and ordinary meaning
when viewed in the context of the intrinsic record. The Description of the Preferred and Other Embodiments discusses what
the patentees meant by "yieldable means:"

In all embodiments, no matter by what means, the end plug is yieldably held in precise position and may be forced
outward as the cannula is drawn backward on the stylet. The position of the end plug 32 in the cannula 12 is yieldable.
Before yielding, the plug seals the needle and keeps the seeds from spilling out the needle or body fluids from entering
the needle prematurely.

Id. at col. 4, ll. 17-21; see also id. at col. 2, ll. 31-34. The only construction that is consistent with the claim language and
the entire disclosure in the specification is one that construes the phrase as "means capable of yielding, or giving way under
force."

GO BACK

4490

6. Yoke

Plaintiff urges the court to define "yoke" as "a clamp or vise that holds two parts together." Defendants construe "yoke"
more generally as "something that connects or joins together, a bond or tie."

Figures 21-22 and 26-27 of the ’465 Patent depict the yoke:

[SEE FIG. 21A IN ORIGINAL]
[SEE FIG. 21B IN ORIGINAL]
[SEE FIG. 21C IN ORIGINAL]
[SEE FIG. 21D IN ORIGINAL]
[SEE FIG. 21E IN ORIGINAL]
[SEE FIG. 22 IN ORIGINAL]
[SEE FIG. 26A IN ORIGINAL]
Plaintiff argues that "yoke" is commonly used to mean "clamp or vise," and provides a dictionary definition of "yoke" that supports limiting "yoke" to meaning a "clamp or vise."

Claim 31, however, uses "yoke" generally to refer to something that connects various parts of the handguard. The claim states that a "yoke" is "removably secured to [the] rearward end of [the] upper handguard" and "cooperatively engage[s] [the] outer surface of [the] barrel nut." '465 Patent col. 17, ll. 7-12. The definition of "yoke" appears to be dependent on the definition of "engage," and the '465 Patent provides no further insight into what a "yoke" is other than that it "engages the barrel nut." '465 Patent col. 10, ll. 6-7.

The claim makes no mention of a clamp or vise; as such, these limitations will not be imported into the definition of "yoke." Defendants' definition does not preclude the yoke from being a clamp or a vise, but does not require it to be one, consistent with the language and structure of claim 31.

As used in claim 31 of the '465 Patent, "yoke" means something that connects or joins together.

3. Zone

The term "zone" is found in Claims 1, 5, 10(a), 20, 21, 22, 23, 28, 29, 30, 31, 32, 35, 36, 37, 38 and 41-44 of the '461 patent; Claim 12 of the '744 patent; and Claims 9 and 10 of the '711 patent.

Vision Advancement contends that the term "zone" should be given its plain and ordinary meaning and proposes a construction of "One or more regions distinguished from adjacent parts by a distinctive feature or characteristic." Vistakon, on the other hand, proposes a construction of "A complete cycle, such as from the intermediate power through the high power, then back through the intermediate power to the low power, and finally back to the intermediate power."

Vision Advancement argues that Portney's various references to "zone" in the '961 patent show that he did not act as his own lexicographer and define the term narrowly as proposed by Vistakon. Vision Advancement first points to the repeated descriptions of the prior art as having zones, even though none of those prior art references disclose a "complete cycle" of powers as proposed by Vistakon. See, e.g., Col. 1:25-33; 1:34-41; 2:3-7; 2:16-20. Vision Advancement also points to other uses of zone in the specification that do not refer to a complete cycle: (1) "the radial width of the zone for far-to-near transition is larger than the radial width of the zone for near-to-far transition", 2:45-50, and (2) "the small centrally placed "zone" of a constant curvature." 5:13-14. Finally, Vision Advancement argues that Vistakon's narrow definition of zone is inconsistent with the use of that term in the other claims, such as claim 19.

Vistakon argues that the inventor expressly defined zone in the specification as "a zone is considered to include a complete cycle, i.e., from the intermediate power through the high power, then back through the intermediate power to the low power, and finally back to the intermediate power." See Col. 5:15-19. Vistakon contends that the reference to the centrally placed zone was merely Portney defining an exception to its definition of zone. Finally, Vistakon argues that its definition is "compatible" with the use of "zone" in claim 19.

The Court agrees with Vision Advancement that "zone" is not limited to a complete cycle. As noted by Vision Advancement, "zone" is used in the '461 patent to refer to various optical regions, many of which do not refer to a complete cycle. The
Court turns first to the claims. In each of the claims in which "zone" appears, the claim itself defines what is required of the zone with respect to vision correction power or value. Claim 1 does require a complete cycle in a zone. Claim 1 states that "each cycle of such continuous variation from one value to the other and then back to the first being repeated in a plurality of zones." However, independent claims 10, 19, and 36 do not require such a cycle for a zone. For example, claim 19 refers to "each of said zones having a first region with near correction power, a second region with far vision correction power and an intermediate vision region between the first and second regions. . ." Claim 19 does not require that the zone include a full cycle of power, which for claim 19 would require the power return to the near vision correction power. The Court will not add the additional requirement that a zone must have a complete cycle of power variation when the claims expressly provide for what power variation is claimed (e.g., near to far in claim 19).

As pointed out by Vision Advancement, "zone" is used in the specification to refer to areas that have a complete cycle as well as areas that do not have a complete cycle. Vistakon relies primarily on the description at Col. 5:15-19 to argue that the patentee acted as his own lexicographer in defining "zone." The Court disagrees. The patentee's use of "zone" does not demonstrate that he expressly defined "zone" as a complete cycle. As discussed above, the patentee used "zone" to refer to less than a complete cycle in many places in the specification and the claims. Additionally, the language relied on by Vistakon is a description of a preferred embodiment and is specifically in reference to Figure 4. 5:5-19. Without clear indicia that the patentee defined zone to include a complete cycle, the Court will not impose that description of a preferred embodiment onto the meaning of "zone." See Tex. Instruments, Inc. v. Int'l Trade Comm'n, 805 F.2d 1558, 1563 (Fed. Cir. 1986).

Vistakon further argues that there is no explanation in the patent of what a "distinctive feature or characteristic" would be as Vision Advancement proposes. The Court agrees that the Vision Advancement's construction of zone as "regions distinguished from adjacent parts by a distinctive feature or characteristic" is unnecessarily vague. As discussed above, "zone" refers to areas having certain optical characteristics such as variations in power. Thus, the Court construes "zone" as "One or more areas distinguished by optical characteristics."

Turning to the term "transition zone" in Claim 22 of the 011 Patent, it is unclear exactly how the parties proposed definitions differ from one another. NMT argues that "transition zone" means "the portion of the outer body between the barrel portion and the smaller diameter nose portion of the body," and RTI argues "an area between the barrel portion and the smaller diameter nose portion of the syringe body." According to the proposed definitions, it appears that the only dispute between the parties is whether the "transition zone" is part of the "body." 5

5 RTI's Markman Brief contains allegations that NMT would require the "transition zone" to be tapered. The Court does not find that argument in NMT's submissions and thus disregards it.
4. "transition zone"

a. Parties' Positions

The parties propose the following constructions for "transition zone," which is present in each asserted claim. Dkt. No. 114.

<table>
<thead>
<tr>
<th>RTI</th>
<th>BD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portion of the syringe located between the barrel and the nose</td>
<td>Portion of the syringe with varied inner diameter located between the barrel and the nose</td>
</tr>
</tbody>
</table>

RTI contends this term should not be limited to the preferred embodiment, which identifies a transition zone with a sloping inner wall. Dkt. No. 111 at 21. While RTI concedes that the transition zone has a "constricted portion," it believes that the patent does not require that the transition zone have a varied inner diameter. Id. BD counters by arguing that the phrase "most constricted part of the transition zone" pertains to the whole invention and requires a varied inner diameter. Dkt. No. 112 at 28 (citing '733, 14:8-10).

Judge Davis previously construed this term in connection with the '011 and '077 Patents. See RTI v. New Medical Techs., Civil Action No. 4:02-CV-34, Dkt. No. 110 at 15 (E.D. Tex. March 8, 2008). Judge Davis did not limit the term to a varied inner diameter. Id.

b. Court's Construction

Once again, the Court finds no reason to deviate from Judge Davis' previous construction. See RTI v. New Medical Techs., Civil Action No. 4:02-CV-34, Dkt. No. 110 at 13-14 (E.D. Tex. March 8, 2008). In addition, the Court finds no reason to limit the term to the preferred embodiment. Accordingly, this Court finds that term "transition zone" means "portion of the syringe located between the barrel and the nose."
prisms, configured to adjust a dimension of an illumination beam."

25 And the term "zoom optical system . . . to adjust a size of said illumination beam" means nothing more. In its construction of this term, ASML ably recounts the operation of a "zoom optical system." See '336 Patent at 37:14-37:41. But however precise ASML's discussion of the invention's function, it is a discussion at best orthogonally related to the court's construction of the relevant "zoom optical system . . . illumination beam" term. The parties ask the court to describe and to define what a particular device is; they do not ask the court--and the court is not otherwise required in the name of claim construction--to recite the particularized operation of that device, thereby folding the entire description of the invention into one claim term. As the Federal Circuit has cautioned, claim construction does not permit a court to invest, through some form of linguistic alchemy, every discrete claim term with a prolix definition. See, e.g., Intervet Am., Inc. v. Kee-Vet Lab., Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989) (noting that, in looking to the specification to construe claim terms, courts must scrupulously avoid reading "limitations appearing in the specification . . . into [the] claims"). As the Federal Circuit has also cautioned, claim construction does not involve reading single claim terms to denote entire patent specifications. Id.
