The third element also states that the chamber has "a piston reciprocally mounted therein, the piston sliding through the seal." The ordinary meaning of "piston" is a sliding part moved by or moving against fluid pressure. The specification is consistent with this meaning, describing the piston as being "driven and accurately positioned longitudinally within the chamber" by a stepper motor and lead screw. '562 Patent, col. 2, ll. 46-50. The specification figures are consistent with the ordinary meaning, and the patent prosecution does not reveal a contrary definition. Accordingly, the Court construes "piston" to be a sliding part moved by or moving against fluid pressure.

2924

1. "Pitch of the helix"

Plaintiffs construe the term "pitch of the helix" to mean "the distance between any point on a visible turn and the corresponding point on an adjacent visible turn." (D.I. 272 at 39) "Pitch of the helix" is not defined either in the claims or in the specification. Both parties appear to agree that pitch is the distance between turns of the helix. The parties also agree that, in the industry, "pitch is typically expressed in only inches (or millimeters) as shorthand for inches per turn." (Compare D.I. 272 at 39 with D.I. 289 at 28; D.I. 274 at S.A. 371) Consistent with the court's construction of "turn," the court shall construe "pitch of the helix" as the distance between each "turn" or "loop" or "coil" of the wire core.

2925

I. On appeal, Minebea argues that the district court's decision of noninfringement was based on an erroneous construction of the claim term "pivot." According to Minebea, by construing the term "pivot" to exclude sliding motion, the court did not give the term its ordinary meaning. Minebea contends that the ordinary meaning of "pivot" does not preclude sliding motion.

Minebea also asserts that the patentee did not disclaim sliding motion in its central pivot in either the patent specification or the prosecution history. Although the specification expressly provides that other articulating joints in the claimed invention can have both pivoting and sliding motion, Minebea argues that the specification does not suggest that those two types of motion are otherwise mutually exclusive.

1 Minebea also appeals from the district court's holding that the SPK does not meet either the "means for pivotally mounting said first and second ends" or the "means for pivotally mounting said third and fourth ends" claim limitations. Given our affirmance of the district court's judgment of noninfringement based on the "pivot" limitation, it is not necessary for us to decide whether the SPK meets the two "means for pivotally mounting" limitations.

Think Outside contests Minebea's argument that the district court improperly construed the claim term "pivot." According to Think Outside, claim 1 differentiates between the motion allowed at the central pivot and the motion allowed at the articulating joints at the ends of the lever arms in its description of each. Specifically, Think Outside cites the portion of claim 1 that requires the central pivot to form a "scissors-like linkage," whereas the joints at the ends of the lever arms must "slide in addition to pivot." Think Outside also points to portions of the patent specification to support its position. Think Outside asserts that the only type of central pivot disclosed in the specification is a structure that is fixed in position relative to the lever arms. Think Outside further notes that the written description, like claim 1, expressly states that the joints at the ends of the lever arms both rotate and slide, but conspicuously fails to mention that there is any sliding motion at the central pivot.

We agree with Think Outside that the district court did not err in its construction of the claim term "pivot." As an initial matter, we note that the parties do not dispute the portion of the district court's construction of "pivot" defining it as "a structure about which something turns or rotates." The parties, however, do disagree as to whether the "pivot" of claim 1 must be "fixed relative to the two arms."

In Phillips v. AWH Corp., 415 F.3d 1303, 1317 (Fed. Cir. 2005), we noted that it is "entirely appropriate for a court, when conducting claim construction, to rely heavily on the written description for guidance as to the meaning of the claims."

Although the dictionary definition of the term "pivot" does not appear to exclude sliding motion, the district court properly determined that the written description limits the scope of the claim term "pivot" to a structure that is fixed in position relative to the lever arms, and thus excludes sliding motion. As the written description provides, "the levelling [sic] mechanism of the present invention utilizes a scissors-like linkage" fixed at an intermediate position relative to the lever arms. See '225 Patent, col. 4, ll. 8-11. Because the linkage in a pair of scissors is fixed in position relative to the scissors, it necessarily follows that the central pivot of the written description must also be in a fixed position, as the district court's claim construction requires. Moreover, a sliding central pivot would be inconsistent with the engineering principles behind the leveling mechanism disclosed by the specification. Applying basic mechanics, because the joints at the ends of the lever
arms in the specification's disclosed embodiment are capable of sliding in their respective slots, the leveling mechanism would not also need a sliding central pivot in order to allow the keytop to travel downward when it is pressed down. In Phillips, we also stated that "quite apart from the written description and the prosecution history, the claims themselves provide substantial guidance as to the meaning of particular claim terms." 415 F.3d at 1314. There is no question in this patent that sliding and pivoting are different motions. Indeed, claim 1 provides that certain structures will "slide in addition to pivot." Such language would be superfluous if sliding motion were subsumed in pivoting motion. See id. at 1317 (explaining that the term "steel baffles" strongly implies that the term "baffles" does not inherently mean objects made of steel). Moreover, claim 1, like the written description, requires the "pivot" to "form a scissors-like linkage." Inherent in this language is the requirement that the "pivot" of claim 1 must have structural characteristics that allow it to "form a scissors-like linkage." As explained above, a structural characteristic of a pivot with "a scissors-like linkage" is to be fixed in position relative to the lever arms. Lastly, we find unavailing Minebea's argument that because the district court did not construe the term "scissors-like," we too should not consider that term in our review of the court's construction of "pivot." Such a request is tantamount to construing claim limitations in a vacuum, and is plainly inconsistent with Phillips, which compels us to construe claim limitations in the context of the claim in which they appear. Id. at 1314.

II.

BFTC's accused device, the "Spinal Care System," is also designed to protect the head and neck during a collision. However, it performs its safety function through both rotational and lateral movement of the headrest. The Spinal Care System utilizes two vertical side supports attached to the seat cushion frame; an inverted U-shaped seat back frame, rigidly attached to a headrest and suspended between the two side supports; and horizontal crossbars that traverse the seat back frame. These crossbars serve essentially the same purpose as the '019 patent's "impact plate"—when the passenger pushes back on them during a collision, the headrest and upper seat back frame are rotated to protect the passenger's head and neck.

In the court below, the parties disputed the construction of several terms of the '019 patent, but the claim limitation most pertinent to infringement was "pivot axis." The district court construed claim 1 of the '019 patent to include the following
limitation:

pivot hinges connecting the upper part with the lower part and defining a common fixed pivot axis about which the upper part and the headrest can pivot in a forward direction, and in which the impact plate can pivot in a rearward direction from a normal position . . . .

Claim Construction Order, 2002 U.S. Dist. LEXIS 26866, at *17 (emphasis in original).

To arrive at this construction, the district court looked to a scientific dictionary, which defined "axis" as a "line about which a body rotates," and to the "plain language" of Claim 1, which suggested to the court that "pivot axis" must refer to a common line defined by the location of the pivot hinges. 2002 U.S. Dist. LEXIS 26866 at *23. The court then weighed statements by the inventor during prosecution that suggested to the court that the '019 patent's invention was a simpler alternative to a prior invention in its field, claimed in United States Patent No. 5,378,043 (issued on Jan. 3, 1998) (the "Viano patent"). 1 2002 U.S. Dist. LEXIS 26866 at *42-47. The court also viewed it as significant that both the description and drawings relating to the '019 patent's sole preferred embodiment depict only rotational movement. The court felt bound to adopt a construction that would appropriately reflect what it viewed as prosecution disclaimers by the patentee of much of the Viano device's functionality and capabilities.

1 Lear also owns the Viano patent, which it initially asserted against BFTC in this litigation.

Based on its claim construction, the district court granted BFTC's motion for summary judgment of noninfringement of the '019 patent on July 30, 2002. Lear does not challenge the grant of summary judgment insofar as it relates to the doctrine of equivalents. Rather, Lear argues that the district court erred in granting summary judgment of no literal infringement.

We have jurisdiction pursuant to 28 U.S.C. § 1295(a)(1).

III.

Lear makes two arguments on appeal. First, it contends that the ordinary and customary meaning of "pivot axis" encompasses both fixed and non-fixed axes of rotation. Second, it claims that since the ordinary meaning of "pivot axis" is clear, consideration of extrinsic evidence, such as the Viano patent, during claim construction was improper.

BFTC defends the district court's claim construction. It urges that the court's construction is true to the ordinary meaning of the term "pivot axis"--both as it is defined in technical dictionaries and as it is used by Lear in the '019 patent. BFTC emphasizes that the inventor's references to the Viano patent during prosecution of the '019 patent are properly characterized as a surrender of complex mechanisms of rotation (like Viano's) in favor of a simple, fixed axis. BFTC asks us to uphold the district court's narrow construction, which it contends reflects the relative simplicity of the invention of the '019 patent.

Summary judgment is appropriate where the record shows "that there is no genuine issue as to any material fact and that the moving party is entitled to a judgment as a matter of law." Fed. R. Civ. P. 56(c); Anderson v. Liberty Lobby, Inc., 477 U.S. 242, 247, 91 L. Ed. 2d 202, 106 S. Ct. 2505 (1986). We review a grant of summary judgment of non-infringement by a district court de novo, applying the same standard as the district court. Cortland Line Co. v. Orvis Co., 203 F.3d 1351, 1355-56 (Fed. Cir. 2000). We review a district court's claim construction without deference. Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1454 (Fed. Cir. 1998) (en banc).

When construing a claim limitation, a court must avoid importing limitations from the written description and prosecution history into the claim. See Tex. Digital Sys. v. Telegenix, Inc., 308 F.3d 1193, 1204 (Fed. Cir. 2002). The words used in a claim are presumed to have their ordinary meaning. CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002). In rare instances, "an accused infringer may overcome this heavy presumption and narrow a claim term's ordinary meaning, but he cannot do so simply by pointing to the preferred embodiment or other structures or steps disclosed in the specification or prosecution history." Id.
We respectfully disagree with the district court's claim construction because we conclude that the intrinsic evidence imposes no requirement that the "pivot axis" described in Claim 1 be fixed permanently in space. Applying our presumption in favor of ordinary meaning, we hold that "pivot axis," as used in Claim 1, must refer to "a line about which a body rotates, fixed relative to a pair of pivot hinges." Dictionary definitions proffered by the parties establish that "pivot axis" must refer to a line about which rotation occurs. At the same time, the plain language of the claim requires that the location of this line be defined by the placement of the "pivot hinges." The district court concluded that the "pivot hinges" need not be rigidly attached to the side members of the seat back, see Claim Construction Order, 2002 U.S. Dist. LEXIS 26866 at *36, and there is nothing in the claim language or plain meaning of "pivot axis," as used in Claim 1, that requires that the line of rotation be permanently fixed in space.

Under CCS Fitness, when the ordinary meaning of a claim term is clear, the specification or prosecution history must contain an explicit suggestion of an alternate definition before the "heavy presumption" in favor of ordinary and customary meaning will be overcome. Here, during prosecution of the '019 patent, the inventor did emphasize the simplicity of his device relative to Viano's complex rotational mechanism, but these statements do not constitute the strong disavowal required to overcome the CCS Fitness "heavy presumption" of ordinary meaning. As far as the district court's inquiry into the specific features of the '019 invention relative to the Viano patent is concerned, since the inventor did not expressly reference to those specific distinctions to secure the patenting of his own invention, they should not influence the construction of Claim 1. Consultation of extrinsic sources, such as the Viano patent, was not appropriate in this case.

Since there is no compelling evidence that would require the ordinary and customary meaning of "pivot axis" to be narrowed or changed, that meaning must control. "Pivot axis," as defined in Claim 1, refers to "a line about which a body rotates, fixed relative to a pair of pivot hinges."

For the foregoing reasons, we vacate the district court's grant of summary judgment of no literal infringement in favor of BFTC. The case is remanded to the district court for determination of literal infringement under the correct construction of the term pivot axis.

a. The Scope of the Vaida Patent

"In determining the proper construction of a claim, the court has numerous sources that it may properly utilize for guidance . . . including both intrinsic and extrinsic evidence." Vitronics, 90 F.3d at 1582. In the first instance, however, the court must turn to "the patent itself, 4 including the claims, the specification and, if in evidence, the prosecution history," which constitute "the most significant source of the legally operative meaning of disputed claim language." Id.

4 A patent document contains several components "describing the exact scope of an invention and its manufacture." Markman, 134 L. Ed. at 581. The first patent element is the specification, "describing the invention 'in such full clear concise and exact terms as to enable any person skilled in the art to make and use the same.'" Id. (quoting 35 U.S.C. § 112). "Second, a patent includes one or more 'claims,' which 'particularly point out and distinctly claim the subject matter which the applicant regards as his invention.'" Id. (quoting 35 U.S.C. § 112).
In looking at the patent language, the Court will assign each word its plain meaning, unless the patentee has chosen "to be his own lexicographer and [to] use terms in a manner other than their ordinary meaning, [provided that] the special definition of the term is clearly stated in the patent specification or file history." Vitronics, 90 F.3d at 1582.

The Vaida patent consists of nine claims, only one of which is independent. The particular aspect of the Vaida patent at issue in the Defendant's first Motion for Summary Judgment is the reinforcement of the lower edge of each louver member by the "pivot axis" of the adjacent lower member.

In large measure, the determination of infringement in this case turns on the scope afforded the phrase "pivot axis." The Plaintiff would have the Court endow the phrase with broad meaning to incorporate any structure that "houses" the pivot axis, while the Defendant urges a definition that limits the phrase to its technical definition.

The language of the claim is plainly understood. The claim describes the manner in which the device provides continuous longitudinal support for the upper and lower edges of each louver member:

actuating means attached to the actuating section of each of said louver members for pivoting said louver members between open and closed positions, so that in said closed position, the lower longitudinal edge of an upper louver member overlaps the pivot axis of the adjacent lower louver member so that the upper and lower longitudinal edges of the closing section of said louver members are completely supported along their longitudinal lengths by said pivot axis at the upper longitudinal edge thereof and by the pivot axis of the adjacent lower louver member at the lower longitudinal edge thereof.

Vaida Patent, p. 6, lines 29-40, Plaintiff's Exhibit 1 (emphasis added). The patent clearly contemplates the use of the "pivot axis" as the means for supporting the longitudinal edges of the louver members. Cf. Cole, 102 F.3d at 531 (refusing to invoke "means-plus" statute, 35 U.S.C. § 112 P 6 (1994), when the patent explicitly states the structure performing the function). The word "pivot" has meanings as a verb, a noun, and an adjective. As a noun, a pivot is a "shaft or pin whose pointed end forms the fulcrum and center on which something turns about, oscillates, or balances." Webster's Third New International Dictionary (Unabridged) 1726 (1981). As a verb, to pivot is "to turn about or oscillate or balance on or as if on a pivot." Id. at 1727. As an adjective, as in the Vaida patent language, the word "pivot" is used to describe something as "turning on or as if on a pivot." Id. An axis is "a straight line about which a body or a 3-dimensional figure rotates." Id. at 153. In this sense, the axis is an imaginary geometrical reference line, described by all points in three dimensional space dependent on a single independent variable. As such, it has an infinitesimal width, and could not include any actual structure in the window. Technically, then, the pivot axis is the imaginary line about which each louver member rotates as it closes and opens. That definition, however, while technically correct, cannot suffice to describe the phrase as used in the Vaida patent, because the claim expressly states that the longitudinal edge of each louver is supported by the pivot axis.

V 6 An imaginary geometric frame of reference cannot provide actual support.

Henceforth, when referring to the imaginary line that defines the axis of rotation of a louver member, the Court will use the phrase, "pivot axis line," and when referring to the element of the Vaida patent claim, the Court will use only the phrase "pivot axis."
The specifications in the Vaida patent help clarify the phrase. The "Detailed Discussion of Preferred Embodiment of the Invention" states that the "pivot axis is reinforced by having [a] bead member formed therein, and may be further reinforced by providing [a] steel rod extending completely through the hollow bead member." The bead member (a hollow tube holding the pivot pins and/or the steel reinforcing rod), and the reinforcing rod are both linear cylindrical forms whose center lines describe the imaginary pivot axis line of the louvers. See Figure # 2. 7 Additionally, each of these elements form part of the pivot mechanism by which the louver rotates between the open and closed positions -- the bead member and either the pivots or the steel reinforcing rod form a hinge. Moreover, dependent claims Five and Six expressly incorporate the hollow bead member and steel reinforcing member, respectively, into the Vaida "pivot axis." Nothing else in the Vaida patent both describes the technical pivot axis line and performs the task assigned to the pivot axis by the patent. Therefore, the Court must logically conclude that the bead member and the reinforcing steel rod comprise the "pivot axis" of the Vaida patent. 8 As already noted, the patent claim expressly utilizes the pivot axis as a means for supporting the longitudinal edges of the louvers. Therefore, using the Court's definition of pivot axis, the claim is limited to louver systems that utilize the louvers' pivot axes -- structural elements that describe the imaginary axis line about which the louvers turn and which serve as elements of the pivoting mechanism -- as support for the longitudinal edges of the louvers. See Figure # 1.

7 In Figure # 2, the bead member is labeled 14a, the pivot pins 62, and the reinforcing rod 60.

8 Where the Court is deciding an issue at the summary judgment stage for which it would bear responsibility for determining at trial, and the Court has before it all of the evidence from which it would make that determination at trial (here, the patent itself and the prosecution history), the Court may determine the issue as if at trial. Posadas, 856 F.2d 399, 400.

The limited definition that the Court bestows on the phrase "pivot axis" is supported by reference to the prior art. It is common knowledge that in louver window assemblies, the louvers overlap. 9 If they did not, gaps would form between the louvers even when in the closed position. That being the case, the upper edge of each louver member always acts to provide some support to adjacent upper louver member, because in the closed position, the upper louver will rest on the lower. The problem with most of these designs, however, as demonstrated by the Plaintiff's exhibit, see Declaration of Paul Beers, Defendant's Exhibit 2, p. 2, is that the inherent support furnished by overlapping louvers is not of sufficient rigidity to prevent flexion against heavy wind loads or other external forces. See Vaida Patent, p. 1, Plaintiff's Exhibit 1. The Vaida patent expressly addresses this shortcoming by placing the louvers in a position such that the lower edges of each louver member overlap the pivot axes of the adjacent lower louver members. See Vaida Patent, pp. 1-2, Plaintiff's Exhibit 1. The prior art in this case is important because it narrows the advancement claimed by the Vaida patent - the advancement lies in the particular use of the pivot axis. Whereas the typical louver assembly (i.e., the prior art) makes use of overlapping louvers, the Vaida patent achieved an advantage in reducing deflection by extending the lower edges of its louver members over the pivot axes of adjacent lower louver members in order to make use of the structural properties of the pivot axis.

9 The Court may consider on a motion for summary judgment that of which it could take judicial notice at trial. See Harris v. H & W Contracting Co., 102 F.3d 516, 522 (1996), reh'g denied, 109 F.3d 773 (11th Cir. 1997). The Court may take judicial notice of facts commonly known. See, e.g., In re Martin's Famous Pastry Shoppe, Inc., 748 F.2d 1565, 1567 (Fed. Cir. 1984) (not error to take judicial notice of the fact "that deli counters may well display bread and rolls in close proximity to the cold cuts and cheeses purveyed there"). The Defendant's brief states that all louver windows utilize overlapping louvers. The Plaintiff's have not disputed that fact. Indeed, the Plaintiff's expert implies as much in his affidavit. See also, e.g., United States Patent No. 3,381,601; United States Patent No. 4199898.
actuating means attached to the actuating section of each of said louver members for pivoting said louver members between open and closed positions, so that in said closed position, the lower longitudinal edge of an upper louver member overlaps the pivot axis of the adjacent lower louver member so that the upper and lower longitudinal edges of the closing section of said louver members are completely supported along their longitudinal lengths by said pivot axis at the upper longitudinal edge thereof and by the pivot axis of the adjacent lower louver member at the lower longitudinal edge thereof.

Plaintiff's Exhibit 3, p. 14. The patent examiner rejected Claim One of the original application "as being anticipated by Bishop." 10 Plaintiff's Exhibit 3, p. 24. The Vaida patent applicant responded by attempting to "traverse this rejection:

In the present invention, when the louveres are in their closed position, the lower longitudinal edges of each louver overlaps the pivot axis of an adjacent lower louver member. However, in the Bishop reference . . . [the louveres] do not meet the claim limitations in lines 20 to 24 of claim 1. More particularly, these lines of claim 1 specifically recite that the upper and lower longitudinal edges of the closing section are completely supported along their longitudinal lengths: by the pivot axis at the upper longitudinal edge of that louver member and by the pivot axis of the adjacent lower louver member at the lower longitudinal edge thereof.

Plaintiff's Exhibit 3, pp. 31-32. These remarks indicate the specificity of the Vaida improvement - the use of the pivot axis as a structural support.

--- Footnotes ---

10 The patent examiner did not explain why he determined that the Bishop patent anticipated the Vaida application.

--- End Footnotes ---

2928

f. "pivot structure"

The term "pivot structure" refers to a separate, functional structure located at the lower end of the post of the shift lever between the pivot flanges that pivotally attaches the shift lever to the pivot flanges and operationally couples the shift lever to the shifter.

2929

2. Infringement

The Court finds that, as a matter of law, the accused product does not read on the following claim limitation: "said locking means including a lock member pivotably attached to said second pivoting means . . . ." Accordingly, the accused product does not literally infringe claim 3 or claim 7 of the '400 patent.

Apollo asserts that Mastercare's product reads on this claim limitation because the locking means 1 (the cam) is "free to pivot" and because it is attached to a horizontal member called the "swing arm" which in turn is attached to the second pivoting means (the pneumatic cylinder situated at the center of the door mechanism). However, the cam is not pivotably attached to the second pivoting means.

--- Footnotes ---

1 The parties dispute which element of the Mastercare product constitutes a "locking means" and whether or not there is a second pivoting means. However, for the limited purpose of this motion, the Court takes the evidence in the light most favorable to Apollo and adopts Apollo's perspective on these two issues. If the Court were to adopt Mastercare's position,
that a mechanism on the pneumatic cylinder that prevents further adjustment of the door position is the element of the Mastercare product that corresponds to the claims' "locking means," the Court would nevertheless find no literal infringement, because this other locking element is not pivotably attached to anything.

Claim interpretation "begins with the language of the claim itself." National Recovery Technologies, Inc. v. Magnetic Separation Systems, Inc., 166 F.3d 1190, 1195 (Fed. Cir. 1999) (citing Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 619 (Fed. Cir. 1995)). The terms of a claim are given their ordinary meaning as understood by one of ordinary skill in the art, unless the inventor intended the terms to be construed otherwise. Hockerson-Halberstadt, Inc. v. Avia Group Int'l, Inc., 222 F.3d 951, 955 (Fed. Cir. 2000); Karlin Technology, Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971 (Fed. Cir. 1999).

Neither party has suggested that the words "pivotably" and "attached" have meanings in the context of mechanical engineering, either generally or with respect to bath tubs, that differ from the ordinary meanings those words have to a layperson. The claim limitation requires not only that the locking means be attached to the second pivoting means, but that the attachment be pivotal. The Court finds, as a matter of law, that the claim limitation requires that the locking means be in physical proximity to the second pivoting means and that the "interface" between the locking means and second pivoting means allow the locking means to pivot relative to the second pivoting means.

Apollo seems to argue that the pivotal attachment can be accomplished by having the locking means pivot and be connected, however tenuously and with however many intervening structures, to the second pivoting means. Not only does this construction require a strained interpretation of the plain meaning of the claim language, it is inconsistent with the prosecution history of this patent. "The prosecution history (or file wrapper) limits the interpretation of claims so as to exclude any interpretation that may have been disclaimed or disavowed during prosecution in order to obtain claim allowance." Standard Oil Co. v. Am. Cyanamid Co., 774 F.2d 448, 452 (Fed. Cir. 1985).

In a response to the PTO, the patentee distinguished the invention claimed in the '400 patent from a similar device disclosed in a "510(k) pre-market notification submittal document to the Food & Drug Administration (FDA)" ("the 510(k)"). 2 Specifically, the patentee noted that, unlike the invention disclosed in the '400 patent, "the 510(k) does not show locking means having a lock member pivotally attached at the second pivoting means." Declaration of Kent R. Erickson, Ex. 8, at MAS01589-90. The 510(k) does show a tub door with a "swivel post" attached to the center of the door, and the "door pivots or swivels on this post"; a "hinge bar" running from the swivel post to the side of the door; and a "locking lever," attached to the hinge bar at the side of the door, that rotates to cause the door to lock. 3 In other words, the 510(k) discloses a pivoting locking means remotely "attached" to a centrally located second pivoting means by a non-pivoting bar. If, as the patentee asserted during the prosecution history, the claim limitation of the '400 patent does not cover the configuration of the 510(k), then it cannot cover the configuration embodied in the Mastercare tub.

2 In the response to the PTO, the patentee disputed whether the 510(k) was a printed publication for purposes of 35 U.S.C. § 102(b). Apollo, however, seems to concede that the 510(k) constitutes prior art.

Moreover, for purposes of construing the language of the '400 patent in the context of the prosecution history, the "printed publication" status of the 510(k) does not matter; it is sufficient to note that the patentee did not consider the configuration disclosed in the 510(k) to fall within the ambit of the claim language.

3 Apollo disputes that the locking lever mechanism disclosed in the 510(k) is a "locking member" within the meaning of that term in the '400 patent. Specifically, Apollo points to the Declaration of Dr. Barry Feinberg in which Dr. Feinberg opines that a locking means must cause the door to seal with the tub; in the 510(k) device, the sealing function is achieved through inflation of a rubber gasket. However, it is clear from the claim language that the "locking means" is distinct from the "sealing means" and that the function of the "locking means" is to immobilize the door in the closed position.
Moreover, because the "prosecution history estoppel precludes a patentee from obtaining under the doctrine of equivalents coverage of subject matter that has been relinquished during the prosecution of its patent application," Pharmacia & Upjohn Co. v. Mylan Pharmaceuticals, Inc., 170 F.3d 1373, 1376 (Fed. Cir. 1999), Apollo's infringement claim under the doctrine of equivalents is precluded, and summary judgment is appropriate.

IV.

This appeal raises the question of the proper meaning of the phrase "swing arm, which in turn is pivotably attached to the structure." As noted above, the district court construed the phrase to mean "a pivot, that constrains motion of an element to rotational movement but which prevents any vertical or axial movement of the element." Deere, No. 99-4100, slip op. at 9 (C.D. Ill. Nov. 14, 2001).

As a general rule, the words used in a claim are deemed to have their ordinary and customary meaning in their normal usage in the field of the invention. Toro Co. v. White Consol. Indus., 199 F.3d 1295, 1299, 53 USPQ2d 1065, 1067 (Fed. Cir. 1999). To help inform the court of the ordinary meaning of the words, a court may consult a dictionary, encyclopedia, or treatise. Texas Digital Sys., Inc. v. Telegenix Inc., 308 F.3d 1193, 1202, 64 USPQ2d 1812, 1818 (Fed. Cir. 2002). Nevertheless, an inventor may act as his own lexicographer and use the specification to supply implicitly or explicitly new meanings for terms. Markman, 52 F.3d at 979-80, 34 USPQ2d at 1330. Thus, to help determine the proper construction of a patent claim, this court consults the claims themselves, the written description, and, if in evidence, the prosecution history. Id. During prosecution, an inventor may surrender coverage of material that would otherwise be covered by a claim; however, the surrender must be clear and unmistakable. Bayer AG v. Elan Pharm. Research Corp., 212 F.3d 1241, 1252, 54 USPQ2d 1710, 1718 (Fed. Cir. 2000) ("In determining whether there has been a clear and unmistakable surrender of subject matter, the prosecution history must be examined as a whole."). To determine whether an inventor surrendered material during prosecution history, we must determine "whether a competitor would reasonably believe that the applicant had surrendered the relevant subject matter." Cybor, 138 F.3d at 1457, 46 USPQ2d at 1175. Having reviewed the prosecution history, we do not think that Banks surrendered coverage of a swing arm with any vertical motion. Rather, he only disclaimed excessive vertical and oscillatory motion. 2

- - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

2 Henceforth, when we refer to excessive vertical and oscillatory motion, we mean vertical and axial movement that goes beyond that amount of vertical and axial movement that is inherent in the kind of rotation in which the swing arm engages.

- - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

We begin our analysis with the claims themselves. The plain language of claim 1 does not exclude vertical motion from the movement of the pivotably attached swing arm. 3 The term "pivotally attached" does not have a special technical meaning to one of skill in the art. CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366, 62 USPQ2d 1658, 1662 (Fed. Cir. 2002) (stating that terms used in a claim bear a "heavy presumption" that they mean what they say and have the ordinary meaning that would be attributed to those words by persons skilled in the relevant art). The term "pivot," in the normal sense of the word, means "to turn about." Webster's Third New International Dictionary 1727 (1986). The dictionary definition defines pivot in terms of rotational motion, but does not explicitly exclude vertical movement. Since the patentee did not draft claim 1 to expressly disclaim vertical movement, the claim, in its face, is not so limited. We must further consult the specification and the prosecution history to determine whether the inventor limited the invention in the manner suggested.

- - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

3 However, claim 9, which is nearly identical to claim 1, expressly requires that the pivoting motion of the swing arm occur about a fixed axis. There is a rebuttable presumption that differing claims are of different scope. Kraft Foods, Inc. v. Int'l Trade Comm'n, 203 F.3d 1362, 1366-67, 53 USPQ2d 1814, 1817 (Fed. Cir. 2000).
The written description does not further limit the claimed term, but merely reiterates the requirement that the swing arm be pivotably attached. Additionally, the prosecution history supplied to us does not clearly and unequivocally establish that the inventor disclaimed all vertical movement of the swing arm. Rather, a competitor would reasonably believe that Banks disclaimed excessive vertical and oscillatory motion of the swing arm caused by the movement or play of the pin in the oblong hole of the TM 1500 machine.

The TM 1500 cultivating machine, which included the urethane block dampening system, is shown below:

[SEE FIGURE IN ORIGINAL]

In response to an office action of December 30, 1996 from the United States Patent & Trademark Office ("USPTO"), Evans discussed the differences between the TM 1500 machine and the purported invention. 4 His letter to the Examiner stated in relevant part as follows:

In the TM-1500 machine, the end of the swing arm conrod connected to the structure in the cultivating machine was imbedded in a block of urethane plastic inside a steel housing on the structure. [. . .]

The urethane plastic provided insufficient biasing and, therefore, the swing arm could not be pivoted to the structure as claimed in claim 1 about an axis in a fixed position, as in claim 12. Instead, as shown in the attached sketch, the receiving holes in the steel housing had to be made oblong to accommodate movement of the pivot (not shown) of the swing (conrod) along the axis of the oblong holes, i.e. axial movement of the swing arm.

Referring now to Figures 3 to 6 of the application, it will be appreciated how axial movement of the swing arm 87 would change the vertical orientation of the cultivating tool 86 as well as does the claimed pivotal rotation of the swing arm. As a result, it will also be appreciated how the biasing forces of the TM-1500 could not be uniform because the swing arm would either first move in the oblong holes on the structure and then flex the urethane block or vice versa. The result is that the swing arm does not pivot relative to the structure, as in claim 1, about a fixed axis, as in claim 12, but rather executes an oscillatory motion. The result is less uniform cultivating operation than the claimed invention, as would be anticipated intuitively from the play of the pin in the oblong hole of the structure of the TM-1500.

(emphasis added). In this response, Evans suggested that the hole through the center of the TM 1500 block was originally round to accommodate a round pin. When the swing arm failed to pivot, Banks made the hole through the center of the block oblong. The oblong hole allowed the swing arm to move vertically (called axial movement in the response) and in an oscillatory manner, leading to a change in the vertical position of the cultivating tool. 5 It is clear that Banks believed that the excessive vertical and oscillatory movement of the swing arm in the TM 1500 was undesirable, because the irregular motion of the swing arm created unclean holes. Banks, therefore, disclaimed such motion in the prosecution history. In sum, the proper construction of "swing arm, which is pivotably attached to the structure" is a swing arm that is connected to the structure in a manner so that it can rotate about the connection, but cannot move excessively in the vertical direction and cannot oscillate excessively.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

4 The response to the office action of December 30, 1996, dated May 30, 1997, added the claim limitation that the swing arm is bi-directionally biased, in order to overcome a rejection based on a prior art reference.5 The oscillatory motion likely resulted from a small amount of rotational motion in combination with the excessive vertical motion. A later preliminary amendment, dated December 9, 1997, stated with respect to the TM 1500 machine that "the oblong shape of the opening allows the conrod to shift axially as well as radially." This statement suggests that the swing arm in the prior art was able to move in a radial direction, contributing to the oscillatory motion.

B. The Swing Arm Pivotably Attached to the Aerator

Toro argues that the phrase "swing arm pivotably attached to the aerator" means an arm that is attached to the aerator frame with a pivot so that the arm can only move rotationally in one plane. As pointed out by Toro, each of the independent claims recites that the swing arm is pivotably attached to the structure in a particular manner (e.g., "pivotally attached," claims 1, 13, 15, and 17; or attached "for pivotal motion about an axis having a fixed position with respect to the structure," claims 9 and 16; or "pivoted on the structure," claims 14 and 18. Accordingly, the Court must construe the meaning of "pivotably attached" in its various forms. Toro suggests that this term means "a physical structure, a pivot, that constrains motion of an element to rotational movement in one plane." In its reply memorandum, Deere suggests that this claim language only means that the swing arm is attached to the structure by a pivot which is a shaft or pin on which something turns. There is nothing in the specification to show that the patentee intended to use the term "pivot" in a manner different from its ordinary meaning. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576 (Fed. Cir. 1996). There does not appear to be a substantial difference between the parties in their respective construction of this element except for Toro's limitation of rotation to one plane. Toro’s argument that the rotation of the swing arm around the pivot must necessarily be in one plane is erroneous since the rotation could be other than in one plane if the pivot, for instance, was in the nature of a ball joint or if the pivot was not in a fixed position. Only independent claim 9 and its dependent claims have language suggesting that the pivot is in a fixed position thereby relegating the rotation of the swing arm around the pivot to one plane. None of the remaining claims have such limiting language and as to those claims the rotation of the swing arm around the pivot is not limited to one plane.

However, as Toro contends, the prosecution history shows that Deere is estopped from asserting this construction by its contrary construction before the PTO. During prosecution, Deere distinguished its claimed invention over the prior art device, the TMI 1500 machine, by indicating that Deere's invention involved the movement of the swing arm around a fixed axis (limiting rotation to one plane) as distinguished from the TMI 1500 machine where the swing arm moved in an oscillatory motion. In their response to the examiners office action Deere stated:

In the TM-1500 machine, the end of the swing arm conrod connected to the structure of the cultivating machine was imbedded in a block of urethane plastic inside a steel housing on the structure. . . .

The urethane plastic provided insufficient biasing and, therefore, the swing arm could not be pivoted to the structure as claimed in claim 1 about an axis in a fixed position relative to the structure, as claimed in claim 12. Instead, as shown in the attached sketch, the receiving holes in the steel housing had to be made oblong to accommodate movement of the pivot (not shown) of the swing arm (conrod) along the axis of the oblong holes, i.e. axial movement of the swing arm.

Referring to Figures 3 to 6 of the application, it will be appreciated how axial movement of the swing arm 87 would change the vertical orientation of the cultivating tool 86 as well does the claimed pivotal rotation of the swing arm. As a result, it will also be appreciated how the biasing forces of the TM-1500 could not be uniform because the swing arm would either first move in the oblong holes on the structure and then flex the urethane block or vice versa. The result is that the swing arm does not pivot relative to the structure, as in claim 1, about a fixed axis, as in claim 12, but rather executes an oscillatory motion. The result is less uniform cultivating operation than the claimed invention, as would be anticipated intuitively from the play of the pin in the oblong hole of the structure of the TM-1500. (Benchbook of Exhibits in Support of the Prehearing Memorandum of Deere & Company Relating to the Markman Hearing, Doc. # 31, Exhibit D at D100111.)

Accordingly, considering the prosecution history, the proper construction of the term "pivotally attached" is the construction proffered by Toro, that being "a physical structure, a pivot, that constrains motion of an element to rotational movement in one plane."

1. "Pivotally Connected" and "Pivotally Connecting"
The parties agree that the claim terms "pivotally connected" and "pivotally connecting" mean "attached (attaching) and capable of rotating or turning about the point of attachment." (Doc. # 78, at 2). They differ as to "whether the terms . . . as used in claims 1, 11 and 13 of the '685 patent, require a direct attachment." (Doc. # 78, at 2 n.2). Plaintiff asserts that the parties' stipulated construction "encompasses [both] direct and indirect connections." (Doc. # 80, at 15). Plaintiff relies on the testimony of defendant's expert witness, Mr. Whaley, at the Markman hearing to support its proposed construction. In that testimony, Mr. Whaley admitted that the term "pivotally connected" as used in his patent, U.S. Patent No. 6,966,108, included both direct and indirect connections. (Doc. # 72, at 128, 131). Defendant, however, argues that "[t]he parties' stipulated construction requires [only] a direct connection between the components that are connected." (Doc. # 79, at 18). Defendant refers the Court to the '685 patent prosecution history, whereby the patent examiner interpreted the term "connecting" to mean "touching engagements." (Doc. # 79, at 18; # 51-6, at 4).

In the '685 patent, claim 1 refers to "the control structure including an actuator and a hinge pin pivotally connecting the actuator to the housing for movement relative to the housing to cause movement of the control structure between said first and second positions . . . ." (Doc. # 51-2, '685 patent, col. 16, lines 35-39) (emphasis added). Claim 11 states that "the lever is pivotally connected to the travel bar." (Doc. # 51-2, '685 patent, col. 18, line 2) (emphasis added). Claim 13 describes "a hinge pin pivotally connecting the lever to the housing for movement relative to the housing to cause movement of the control structure between said first and second positions . . . ." (Doc. # 51-2, '685 patent, col. 18, lines 27-30) (emphasis added).

As stated above, claims "must be read in view of the specification, of which they are a part." Vitronics, 90 F.3d at 1582 (citations omitted). The '685 patent specification states that "[t]he wider end of the intermediate connector 39 is pivotally connected to the lever 15 by hinge pin 95 through holes 96 of the lever 15 and holes 97 of the connector 39 . . . ." (Doc. # 51-2, '685 patent, col. 6, lines 39-41). The specification states that the lever includes an enlarged head and a narrow body. (Doc. # 51-2, '685 patent, col. 5, lines 28-30). Figure 4 shows that the lever, which includes items 53 and 55 that appear in the figure, is directly connected to intermediate connector, item 39a. (Doc. # 51-2, '685 patent, Fig. 4). However, the term "pivotally connected" in claim 11 does not require a direct connection. As stated above, claim 11 refers to a lever that is pivotally connected to the travel bar. Figure 4 shows that the lever, which includes items 15, 53, and 55, is directly connected to the intermediate connector, item 39, and that the intermediate connector is directly connected to the travel bar, item 41. Therefore, the lever is indirectly connected to the travel bar. As such, the Court finds that the intrinsic evidence supports the conclusion that the claims do not restrict the attachment to a direct connection. Thus, the Court finds that "pivotally connected" and "pivotally connecting" in the '685 patent mean "attached (attaching) and capable of rotating or turning about the point of direct or indirect attachment."

Pivotaly connected to, Movably connected to, & Rotatably connected to

The Court construes "pivotally connected to" to mean "a connection between two bodies allowing the bodies to change positions relative to one another around or about at least one point," "movably connected to" to mean "a connection between two bodies allowing the bodies to change positions relative to one another," and "rotatably connected to" to mean "a connection between two bodies allowing the movement of the bodies relative to one another around or about an axis."

At the Markman, MASS stated that the only dispute remaining was the meaning of “connected to.”10

fn10 At the Markman, MASS stated that the only dispute was how to define 10 “connected to.” MASS stated it was “happy” with the way Dell defined the modifiers of “connected to.” Markman Hr’g Tr. 99:12–20.

MASS’s proposed construction for “connected to” is “the secondary display is supported from and directly hinged [or joined] to the primary display.”11 MASS attempts to import limitations from certain embodiments, which is improper. See Phillips, 415 F.3d at 1323. MASS requires that the connection be a hinge and that the secondary display be supported by the primary display via the hinge. Neither of these limitations finds support in the intrinsic evidence.

The term “connected to” has its plain and ordinary meaning. Although MASS insists that this term be narrowly construed to
mean “directly hinged,” neither the intrinsic nor extrinsic evidence supports such a narrow construction. While the specification does describe direct connections associated with certain embodiments, at least one embodiment implements an indirect connection. In Figure 4, the secondary display is neither directly hinged nor directly connected to the primary display, it is indirectly connected via two arms. See ‘170 patent, Fig. 4; Col. 4:14–20 (stating that the secondary display is pivotally connected to arms, which are connected to a hinge). Thus, “connected to” is not limited to a direct connection, and the plain and ordinary meaning applies, which is simply a “connection.”

As neither the specification nor prosecution history provides special definitions for the terms, the plain and ordinary meaning of “pivotally,” “movably,” and “rotatably” applies. See Enercon, 151 F.3d at 1384. Dell’s constructions advance how one skilled in the art would understand each of the three terms. MASS does not offer competing meanings for the terms; therefore, the Court adopts Dell’s constructions, which incorporate the terms ordinary and plain meanings.

3. "Pivotally Mounted"

The claim term “pivotally mounted” appears in claim 26 of the ’946 patent. While the parties agree that the term means "attached and capable of rotating or turning about the point of attachment." (Doc. # 78). The parties differ as to whether the term "requires the actuating lever to be pivotally mounted 'directly' on the elongate plate." (Doc. # 78, at 1 n.1). Plaintiff argues that the claim language permits both a direct and indirect connection. (Doc. # 80, at 14-15). However, defendant contends that the attachment requires a direct connection between the components. (Doc. # 79, at 18).

The claim language, specification, and prosecution history do not make clear whether the disputed term requires a direction connection. Accordingly, the Court will consult extrinsic evidence to “shed useful light on the relevant art[].” Phillips, 415 F.3d 1303, 1318. At the Markman hearing, defendant's expert witness, Paul Whaley, testified that he (1) had thirty years of experience in the ring metal industry and (2) held 29 U.S. patents on ring metal designs. (Doc. # 72, at 76, 79). Mr. Whaley also testified that, in his U.S. Patent No. 6,966,108 (the '108 patent), the specification recites: "[a] ring assembly 18 is pivotally mounted to the notebook by the hinge panel 20." (Doc. # 72, at 128-29). Mr. Whaley admitted that, in the '108 patent, the ring assembly is pivotally mounted to the notebook and that "it is an indirect connection by way of the hinge panel." (Doc. # 72, at 130). The '946 patent specification statement nearly mirrors the quoted statement from the '108 patent, by stating that "[t]he lever is pivotally mounted by a hinge pin 74 to one end 42 of the elongate plate 32 in a position readily accessible for grasping and moving the lever." (Doc. # 1-2, '946 patent, col. 4, lines 14-17). Moreover, the '108 and '946 patents are similar in that they both cover the design of ring metals. Therefore, Mr. Whaley's testimony supports plaintiff's contention that the term "pivotally mounted" encompasses both a direct and indirect connection. As such, the Court finds that the claim term "pivotally mounted" in the '946 patent means "attached and capable of rotating or turning about the point of direct or indirect attachment."

The 90 [degree] Limitation in Claim 1

The final limitation of claim 1 describes a side dump trailer dumping the material from a dump body "without the necessity of pivotally moving said body greater than 90 [degree] from its non-dumping position." (filing no. 62, Ex. 1, claim 1) The parties dispute how the dump body's degree of movement should be measured. Trail King asserts that the court should construe the 90 [degree] limitation so as to include frame twist. In other words, Trail King suggests that since there is no reference to "level ground" in the 90 [degree] limitation, the dump angle should be measured from its starting position to its finished position, thereby including in the measurement any inherent feature of the trailer, such as twist or lean of the frame. Circle R counters by claiming that the measurement of the dump angle should not include any frame twist, pointing out that the claim limitation does not make use of the "frame twist" terminology. Thus, rather than applying the 90 [degree] limitation to the total amount of angular movement of the body from its non-dumping position to its fully dumped position, the 90 [degree] limitation should be applied to the pivotal movement of the body with respect to the frame.
After examining the '214 patent's claim language, the patent specification, and the patent's prosecution history, the court holds that the 90 [degree] limitation in claim 1 does not include frame twist or lean. An examination of the actual text of the 90 [degree] limitation reveals that the 90 [degree] measurement, to one skilled in the art on the application date, only takes into account the pivotal movement of the body, disregarding any additional movement resulting from frame twist. Including additional frame twist into the 90 [degree] limitation measurement would have troublesome ramifications. Inherent features of the trailer such as the strength of the steel in the trailer's frame, the type of suspension system on the trailer, and the weight of the trailer body would all have to be taken into account when designing and constructing a trailer so as to arrive at the desired amount of dump body movement. This would be a complex determination, to say the least. The simpler type of measurement by one constructing a side-dumping trailer would include only the pivotal movement of the body with respect to the frame, thereby excluding from the measurement the various inherent features of the trailer. A reasonable competitor of the patentee reading the claim language would thus be directed to measure the dumping angle using the frame as a point of reference, thereby excluding any additional movement of the dump body resulting from the inherent features of the trailer in the measurement. Because the critical measurement must be relative to the frame in both the non-dumping and fully-dumping position, an alleged infringer may not benefit from any twist or lean of the frame during the dumping process. Nothing in the prosecution history suggests a contrary construction.

2936

"pivotally secured"

The parties agreed that this element required construction; as with prior terms, they continue to disagree on the proper construction to give it.

In its post-hearing brief, Fitness Quest modifies its construction to bring it closer to Monti's proposed construction; the items in Fitness Quest's construction to which Monti objected at the hearing, however, still are present.

Fitness Quest includes two concepts in its construction to which Monti chiefly objects: first, that the guide member is "directly" secured to the user support; and second, that the user support pivots around a "stationary" pivot point. Transcript 126. Monti contends that these concepts are not necessary to an understanding of the term "pivotally secured," and accuses Fitness Quest of looking to the drawings and preferred embodiments to impermissibly limit its construction of "pivotally secured." Transcript 128.

Fitness Quest's arguments about the necessity of the words "directly" and "stationary" to an understanding of "pivotally secured" are unpersuasive. Monti's construction -- "secured through a pivoting joint" -- conveys the meaning of the term without adding unnecessary language (and hence inappropriate restriction) to the construction. This Court adopts Monti's construction: "secured through a pivoting joint."

2937

Pivoting Discharge Control Member

Herzog contends that the meaning of this term is clear on its face and should be defined simply as something that pivots and controls the discharge of material. The Court finds that this term is not clear on its face. When read in light of the specification, however, the meaning becomes clear. The specification contemplates a "pivoting discharge control member" being a "conventional" one "as taught by the [Fearon] patent." '822 Patent, at col.1, 1.67-68. The background and summary sections of the specification incorporate U.S. Patent No. 3,654,872 (filed May 11, 1970) ("Fearon") into the '822 Patent. Telemac Cellular Corp. v. Topp Telecom, Inc., 247 F.3d 1316, 1329 (Fed. Cir. 2001) ("When a document is 'incorporated by reference' into a host document, such as a patent, the referenced document becomes effectively part of the host document as if it were explicitly contained therein."). The Fearon patent contains the following definition of a pivoting discharge control member:

The discharge control member 30 comprises an arcuate top member 34 whose surface has a radius equal to the distance
from pivot point 32 to substantially the lower end of discharge opening 26. The arcuate member extends the full longitudinal width of discharge opening 26 and, in normal position, covers the discharge opening entirely, preventing discharge of any ballast material.

Fearon, at col.2, 1.19-26. In addition, the '822 Patent specification itself contains the following similar definition:

A pivoting discharge control member 21 comprises an arcuate top surface 22 with a radius approximately equal to the distance from a pivot point 23 on the end support plates 14 and 15, to the lower end of the discharge opening 11. The arcuate top surface 22 covers the entire discharge opening 11 when the discharge control member 21 is pivoted to a center position to prevent discharge of any of the ballast material 4.

'822 Patent, at col.3, 1.63 to col.4, 1.1.

When viewed in light of the specification, then it becomes clear that the phrase pivoting discharge control member actually refers to a structure which, in its normal position, covers the hopper car discharge opening to prevent discharge of material and which pivots to release material from the hopper car.

Placard

Plaintiff's Proposed Construction: A "placard" is a card used to support the display of information.
Defendants' Proposed Construction: A "placard" is a structure adapted for supporting a pressure sensitive adhesive backed label where the structure has two faces, a "release coated" face and a face with an adhesive coating.
The Court's Claim Construction: A "placard" is a structure adapted for supporting a pressure sensitive adhesive backed label.

Although MPT would prefer to leave the term placard undefined, it does not disagree with the portion of Defendants' definition that describes "a structure adapted for supporting a pressure sensitive adhesive backed label . . . ." However, MPT does take issue with the remainder of the definition. It argues that the coatings of the placard faces are defined within each claim, and therefore should not be included in a generic definition of the term placard.
The Court agrees. For example, Claim 1 of the '790 patent describes a "placard having a release coated face and an adhesive coated face" while Claim 6 of the '790 patent and Claim 1 of the '164 patent describe a "placard . . . with a release coated surface of the placard oriented outwardly" without reference to an adhesive coated face. Because the placard face coatings are further defined within each claim, the Court defines the generic placard as "a structure adapted for supporting a pressure sensitive adhesive backed label."

Claim 24 continues with limitation (b):

(b) Placing a collapsed soft tissue expander device in the pocket with the cover of the device facing the separated tissue layer;

Consistent with the earlier construction of "collapsed," the court finds this limitation to mean "placing a collapsed soft tissue expander device in the pocket with the cover of the device facing the separated tissue layer," where "collapsed," at this time and without the knowledge of the "conventional manner," means the device is empty of fluid.

Step 2 of Claim 9 requires the placing [of] said laser emitting section of said emitting means into intraluminal contact with the blood vessel at
The parties agree that "intraluminal contact" requires physical contact between the vessel wall and the laser emitting section of the optic line. The dispute is over what is meant by "placing" the laser emitting section "into intraluminal contact." Diomed argues that it means "contacting the bare tip and the inner wall of the vessel as the fiber optic line is moved within and along the vessel lumen." Diomed's Claim Construction Memorandum, at 16. Defendants contend that it means "deliberately and systematically putting the uncoated tip of the fiber optic line in physical contact with the interior surface of the artery, capillary or vein at a treatment site; this requires drainage of blood and compression of the vein."

AngioDynamics' Claim Construction Motion, Exhibit 2, at 2.

--- Footnotes ---

5 Intraluminal is a synonym for "intratubal," which means "within any tube." Stedman's Medical Dictionary, (26th ed. 1995).

--- End Footnotes ---

I find defendants' argument the more persuasive as it more closely conforms with the procedure taught in the patent, as well as with the prosecution history. As previously noted, Diomed distinguished its invention in the Patent Office proceedings from Goldman's prior art by emphasizing "contact" with the blood vessel wall.

Independent claim 1 recites a blood vessel treatment device including means "adapted for intraluminal contact with a wall of a blood vessel, for emitting laser energy to cause a decrease in the diameter of said blood vessel." Thus the device according to the claimed invention is arranged inside the vein to be treated and then the laser is directed against a wall of the vein to thereby cause fibrosis of the vein leading to a decrease in the diameter of the vein. (See specification p. 8, lines 16-28). It is respectfully submitted that a close review of the Goldman reference reveals that the device disclosed therein is not adapted to deliver energy to the vein wall in an intraluminal manner to thereby decrease the diameter of the vein.

File History, at 83-84. (Emphasis added).

To explain how this contact with the vessel wall was to be achieved in a manner different from the method taught by Goldman, Diomed directed the examiner to the discussion of compression in the specification.

Fig. 10 shows an application of a compression bandage to the leg of Fig. 9. . . . Fig. 13 shows a manual finger compression of the lesser saphenous vein at the tip of the laser energy carrier during delivery of laser energy to the leg of Fig. 9.

File History, at 29.

Figure 13 was further described in the patent as follows.

As illustrated in Fig. 13, leg 10 is then elevated and lesser saphenous vein 50 is drained of blood and compressed. The drainage of blood is important to ensure direct contact of the vessel walls with tip 41 during delivery of laser energy. . . . The above described procedure is followed, with compression of lesser saphenous vein 50 maintained around tip 41, while fiber optic line 40 is incrementally withdrawn.

File History, at 35. (Emphasis added). Thus, "placing said laser emitting section of said emitting means into intraluminal contact with the blood vessel" must, as defendants contend, be construed to mean "deliberately putting the uncoated tip of the fiber optic line in physical contact with the wall of the blood vessel, which requires the drainage of blood and compression of the vein."

10. Claim 10: Step (b)

Text:

placing the patient with respect to a second coordinate system;

'154 Patent, col. 12, ll. 67-68.

ZMED's Proposed Construction:

Placing the patient in a location relative to a second coordinate system, for example, the coordinate system of the treatment room or the second imaging device.

ZMED Opening Brief at 13.

NOMOS's Proposed Construction:

NOMOS agreed at oral argument with the ZMED construction up to the point at which ZMED describes the second coordinate system, "for example, the coordinate system of the treatment room or the second imaging device." Oral Argument at 86-87.

Construction:
Step (b) means "placing the patient in a location relative to a second coordinate system."

Commentary:

The additional detail that ZMED proposes, "for example, the coordinate system of the treatment room or the second imaging device," is unnecessary and not within the claim language, and therefore is omitted.

"Planar":

A surface that is flat.

To prove infringement, the patentee must show that every limitation in the asserted claim is met by the accused product either literally or under the doctrine of equivalents. Dolly, Inc. v. Spalding & Evenflo Cos., 16 F.3d 394, 397, 29 U.S.P.Q.2D (BNA) 1767, 1769 (Fed. Cir. 1994). We first address the literal infringement issue with respect to the limitation that the needles "extend laterally of the axis" of the branch. The district court held that the limitation requires that the needles radiate at right angles from the branch, and found noninfringement because the accused Barcana product has the needles radiating at about a 45 degrees angle to the axis of the branch.

In construing a claim limitation, we look to the claim language, the specification and the prosecution history. Quantum Corp. v. Rodime, PLC, 65 F.3d 1577, 1580, 36 U.S.P.Q.2D (BNA) 1162, 1165 (Fed. Cir. 1995), cert. denied, 134 L. Ed. 2d 666, 116 S. Ct. 1567 (1996). As the district court properly found in reference to The American Heritage Dictionary (2d ed. 1976), the term "lateral" in its usual dictionary usage means "coming from the side." The court properly noted that there is nothing in the dictionary definition that would limit the term "lateral" to "perpendicular."

The specification confirms the above interpretation. The term "extending laterally" is used several times in the specification. The most illuminating passage on the issue is found at col. 4, lines 1-5 (emphasis added):

Each transverse element itself includes a pair of twisted wires 612 and 614 that support a plurality of densely packed laterally extending filaments 616, in all respects similar to filaments 16 described above.

The above passage describes the embodiment of the patent in Fig. 7. As shown in Fig. 7, filaments 616 extend from twisted wires 612 and 614 at an angle of about 45 degrees - definitely not perpendicularly. Thus, it is clear from the above passage that the patentee used the term "laterally extending" based on its ordinary meaning: extending sideways irrespective of the angle.

The district court, in deciding the "extending laterally" issue, seems to have been most influenced by a statement made by American Permahedge during prosecution regarding a prior art patent to Goodridge. The Goodridge patent (U.S. Patent No. 3,343,357) discloses a new method of making an artificial Christmas tree branch. The branch disclosed in Goodridge is
essentially a circular brush with the needles radiating in all directions and attached to the stem at an upward angle (rather than perpendicularly as in prior art Christmas tree branches) to simulate real Christmas tree needles more closely. During prosecution, American Permahedge sought to distinguish Goodridge by the following statement (emphasis added):

In Goodridge the fibers are bunched together in discontiguous clumps, leaving defined spaces between each clump at the root, i.e. where the wires are twisted. Further, the fibers are bent permanently at an angle to the axis so that a planar array capable of forming shubbery [sic] is not possible. As a result, Goodridge could not provide a densely packed contiguous planar array simulative of shubbery [sic]. Goodridge provides a tree branch but not shubbery [sic].

The district court interpreted the above statement to mean that the patent in suit could not cover any product that had needles extending at an angle other than 90 degrees. That was error. We think that by the above statement the patentee only represented the Goodridge tree branch as having needles permanently bent at a fixed angle, radiating in all directions so that those needles cannot be flattened out to form a flat plane. Thus, as we discuss below, the above passage is pertinent on the "planar array" issue, but not on the "extending laterally" issue. We therefore conclude that the "extending laterally" limitation simply means extending from the side, with no limitations on the angle.

B

We next turn to the "planar array" issue. The dispositive question is whether the "planar array" limitation means that: (a) the branches and needles form a thin, flat plane, or (b) the overall hedge (comprised of several rows of branches) forms a plane when the branches are woven into the fence. The accused Barcana product has the needles radiating in many directions (like a circular brush) from the stem. However, when the accused products are woven into the fence, the overall finished look is more or less a uniform, planar surface. Thus, if the "planar array" limitation refers to a branch with its needles forming a flat plane, then the accused product does not infringe literally.

Claim 1, in pertinent part, reads (emphasis added):

said filament means forming a bush-like planar array that extends along the entire length of said support element, . . . so that when a plurality of such elements are thus inserted the fence assumes a hedge-like appearance.

Thus, the claim requires that the filament means (which are the needles extending from the branch) form a planar array. The claim also requires that the fence, after the insertion of the branches, assume a hedge-like appearance, not a hedge-like, planar appearance. Accordingly, we agree with the district court's claim construction that the "planar array" limitation refers to the filament means forming a flat plane before they are woven into the fence and not the overall look of the fence after the artificial greenery is woven into the fence.

The specification confirms the above interpretation. All of the embodiments shown in the specification show the needles forming a flat plane, and none of them shows needles radiating in all directions, as they do on a circular brush. See Figs. 1, 2, 6, and 7 of the '647 patent. Furthermore, the following passage clearly defines the meaning of "planar array" (emphasis added):

A plurality of mini-leaves or flat privets 524 [the needles] extend essentially laterally of a respective stem 522 as shown. Similar to element 10, element 510 has, when viewed edgewise, a flat, planar construction.

'647 patent, col. 3, ll. 50-54. Both elements 10 and 510 refer to the needles. Thus, the specification shows that the needles form a flat plane when viewed edgewise.

The file history further supports this interpretation. As quoted in the preceding "extending laterally" discussion, American Permahedge unambiguously represented to the Patent Office in response to the Goodridge prior art rejection that a Christmas tree branch configuration having needles radiating in all directions (as in the Goodridge patent) could not constitute a "planar array." The accused Barcana product, on the "planar array" issue, seems remarkably similar to the Christmas tree branch of Goodridge. The Barcana product has needles that are not flat, but rather, protrude at various angles in a three-dimensional arc. In much the same way that Goodridge's needles did not form a flat plane in the patentee's own words, the needles of the accused product do not. The "planar array" limitation is not met literally by the accused product.
The Court finds that a genuine issue of material fact precludes summary judgment in favor of FPI as to whether Pregis's Airspeed 5000 series and Airspeed SMART series machines with Pregis's Airspeed 5000 and Airspeed SMART film include every limitation of asserted Claims 1-3 and 5-14 of the Perkins '837 Patent. Among the asserted claims, Claims 1, 8, 13, and 14 are independent claims and contain identical segment "drive rollers that cause the plastic film to be gripped at or near the narrow longitudinally extending channel and drawn in a continuous and uninterrupted manner through inflation, sealing and slitting mechanisms in a planar path." Perkins '837 Patent col.14 ll.4-8, 65-66, col.15 ll.1-3, 44-48, col.16 ll.29-33 (emphasis added). After reviewing the claims, specification, and the prosecution history, the Court construes the term "planar" as "flat or level." However, "planar path" does not mean "precisely planar path" as Pregis suggests because the term "precisely planar path" never appeared in any of the communications between the agency and the applicants or in the patent itself.

I. Claim Construction

"It is well-settled that, in interpreting an asserted claim, the court should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996) (citing Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995) (en banc), aff'd 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996)). When examining the intrinsic evidence, the court should first "look to the words of the claims themselves, both asserted and nonasserted, to define the scope of the patented invention." Vitronics, 90 F.3d at 1582 (citing Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 620 (Fed. Cir. 1995)). In doing so, the court must bear in mind the "heavy presumption in favor of the ordinary meaning of claim language." Kraft Foods, Inc. v. Int'l Trading Co., 203 F.3d 1362, 1366 (Fed. Cir. 2000) (quoting Johnson Worldwide Assocs., Inc. v. Zebo Corp., 175 F.3d 985, 989 (Fed. Cir. 1999)). After considering the ordinary meaning of the claim language, the court should "review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning," Vitronics, 90 F.3d at 1582, but "any special definition given to a word must be clearly defined in the specification," Kraft Foods, 203 F.3d at 1366 (quoting Markman, 52 F.3d at 980).

Claim construction often entails a Markman hearing, the purpose of which is to provide the court with guidance on the interpretation of complex technical information. But where, as here, neither party has requested such a hearing, and the subject matter of the patent is not highly technical, the patent claims may be construed without benefit of a Markman hearing.

The key claim term is "planar plate member." As used in the '200 patent, a planar plate member is a planar member that is "a perfectly flat sheet of a material of uniform thickness throughout." WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY OF THE ENGLISH LANGUAGE 1734. All the drawings in the '200 patent depict a flat plate member of uniform thickness that is unpierced, with the exception of holes for attachment hardware, and there is nothing in the specification that redefines the term "plate" to include anything other than a sheet of uniform thickness. See Kraft Foods, 203 F.3d at 1366 (citation omitted).

As always, the claim language governs the meaning of a claim. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1992). In construing a claim, this court construes the meaning of claim language according to its usage and context. ResQNet.com, Inc. v. Lansa, Inc., 346 F.3d 1374, 1378 (Fed. Cir. 2003).

The claim language, drawings, and written description of the '200 patent offer insight into the proper construction of "planar
plate member." Every drawing containing planar plate member 20 in the '200 patent shows the planar plate member 20 as a flat structure with at least one edge aligned to a bedframe. The written description reinforces this point. It states:

Planar plate 20 is typically shaped such that at least one edge 21 is aligned with the end 13 and side rails 14 of bedframe 12. Preferably, planar plate 20 is triangular- or rectangular-shaped to provide a flush fit with end 13 and side rails 14, and corner 15 of the bedframe 12. Most preferably, planar plate 20 is trapezoid shaped, to provide a notch which allows for the bedframe's legs 16 (or wheels) to project downward.

'200 patent, col. 3, ll. 15-23. Further reinforcing this point is the relevant dictionary definitions of both "planar" and "plate." "Planar" is defined as "of or relating to a plane: lying in one plane." Webster's Third New International Dictionary of the English Language 1730 (1993). "Plate" is defined as "a perfectly flat sheet of material of uniform thickness throughout." Id. at 1734. Based upon the foregoing, a planar plate member is a flat sheet of material of uniform thickness throughout.

In the context of Mr. Leoutsakos' Motion for Partial Summary Judgment and CHP's Motion for Summary Judgment, the trial court construed "planar plate member" as a "planar member that is a perfectly flat sheet of a material of uniform thickness throughout." Because the written description of the '200 patent, the drawings of the '200 patent, and the dictionary definitions of "planar" and "plate" support the trial court's construction of "planar plate member," this court affirms its claim construction.

4. The Proper Construction of the Term of a "Planar Slot" as Used in the Claims of Both the '203 and '885 Patent.

The Parties' Proposed Claim Construction of a Planar Slot.

Plaintiff submits the following for the proper construction of the term "planar slot": 1) a slot in the guide member; or 2) an outer edge of the guide member; or 3) a surface of the guide member that can be used to position the saw used for resecting the knee.

Defendants submit the following for the proper construction of the term "planar slot": a narrow opening or groove in the guide member, but simply not an outer edge or surface of the guide member. Essentially, the parties dispute whether the planar slot's location must be "in" the guide member or "either in or on" the guide member.

Plaintiff asserts a function-way-results analysis to support plaintiff's construction of the term "planar slot." A doctrine of equivalents analysis uses the function-way-results test. The scope of structures included by the doctrine of equivalents is a question of fact for the trier of fact to determine, and thus is inappropriate at this stage of the litigation in which the court construes the literal scope of the claims as a matter of law.

Defendants submit a dictionary definition to support their interpretation of the ordinary meaning of the term "slot". "A narrow opening through which something is to be put. A groove or channel or slit into which something fits." Oxford American Dictionary, 788 (1980). Plaintiff asserts that defining "planar slot" by using the term an "opening" would contradict the patent's specification because an opening describes a structure already found in the patent's specification. The court agrees, and finds that the term "slot" is a commonly used word possessing its own ordinary meaning.

The Language of the Patents' Claims Concerning a Planar Slot.

The term "planar slot" appears in the claims 1 through 5 of the '885 patent and claims 1, 2, 3, 6, and 8 of the '203 patent. These claims do not explicitly define whether the slot is located either "in" the guide member or "in or on" the guide member. However, claim 1 of the '885 patent recites "A guide member having a first planar slot therein." The term "therein" modifying the term "planar slot" implies that the slot is located "in" rather than "either in or on" the guide member.

The Specification's Use of a Planar Slot.

The specification discloses that "A vertical guide slot is centrally located in the guide member relative to the sides." ( '203
patent, Col. 3, Lines 59-60.) That statement from the specification directly conflicts with the plaintiff's concept of a side of the guide member being a planar slot. Further, the specification discloses that, "An oscillating saw is inserted through the center slot 52 of the guide member, and the proximal tibia is then resected." ('203, Col. 5 Lines 18-20.) Similarly, "An oscillating saw is inserted into center slot 52 of the guide member, and the distal femur is then resected." ('203, Col. 6 Lines 46-48.) The words "inserted" suggest a slot "in" the guide member rather than a surface or edge of the guide member. When the specification refers to the drawings for a visual indication of the planar slot's location, the drawings illustrate a slot "in" the guide member rather than "in or on" the guide member. Nowhere in the specification do the patents indicate that the guide member's surface or edge may be use as a planar slot to guide the cutting of the saw. The court finds that the specification strongly indicates that the planar slot is located "in" the guide member.

The Prosecution History Concerning a Planar Slot.

The prosecution history sheds some light on the term "planar slot." Plaintiff told the examiner in his Amendment that "a slot in the guide member is spaced from the outer surface of the second portion of the guide rod for a distance which is equal to the determined flexion gap. (Emphasis added.)

Conclusion of the Meaning of a Planar Slot.

The court finds that the specification does not use the term, "planar slot," in a special or unique way. The court finds that plaintiff's own understanding of the location of the slot in his effort to obtain the patent was that the slot was located in the guide member. The court does not find support in the claims or the specification for plaintiff's assertion that the term "planar slot" may refer to an edge or surface of the guide member. Thus, the court construes the term "planar slot" to mean "a slot located within the guide member that can be used to position a saw used for resecting the bones that form the knee."

GO BACK

2949

Top Surface Planarity Deviation

The Court adopts ST's proposed construction and construes the term "top surface planarity deviation" as "the difference between the average height of the entire top surface and the point most removed from the average." ST's proposed definition finds support from the McGraw-Hill Dictionary of Scientific and Technical Terms, which defines "deviation" as "the difference between any given number in a set and the mean average of those numbers." Additionally, the Court rejects Motorola's proposed construction, "statistical deviation of the average height of the top surface" because the term "statistical deviation" would itself require construction for the jury.

GO BACK

2950

I. "The Plane of the Ridge Regions"

Claim 7 of the '418 patent describes "[t]he sheet of claim 1 wherein the plane of the ridge regions is substantially parallel to the plane of the trough regions." Plaintiffs contend that "the plane of the ridge regions" means "the plane defined by the areas of the ridges." Gore claims that "the plane of the ridge regions" is fatally indefinite because it is not amenable to description.

In constructing claim 11 of the '418 patent, the parties have agreed that "planar" means "flat." The parties have also agreed that "ridges" are "raised narrow regions." Based upon their agreed usage of those terms, the "plane of the ridge region" is the flat area defined by the ridges. Therefore, the term "the plane of the ridge region" is amenable to construction. Accordingly, the Court determines that "the plane of the ridge regions" means "the plane defined by the areas of the ridges."

J. "The Plane of the Trough Regions"

As previously stated, claim 7 of the '418 patent describes "[t]he sheet of claim 1 wherein the plane of the ridge regions is
substantially parallel to the plane of the trough regions." Plaintiffs claim that "the plane of the trough regions" means "the plane defined by the areas of the troughs," while Gore claims that "the plane of the trough regions" is fatally indefinite because it is not amenable to description.

As described above in Part I, the parties have agreed that "planar" means "flat." In construing claim 1, the Court has determined that "troughs" are "surface structures formed by two successive ridges and an interposed channel." See supra, Part G. Therefore, the "plane of the trough regions" is the flat area defined by the troughs. That construction is consistent with the prosecution history of the '418 patent, as the inventor originally described the "surface of the valley regions" located within the channels. Joint App., Ex. B, at FH 203. By replacing the term "surface" with the term "plane," the inventor described the flat area corresponding with the wells of the troughs. Because the only plane that runs parallel to the plane of the ridge regions corresponds with the plane of the wells located within the troughs, the term "plane of the trough regions" must refer to the plane created by the wells within the troughs. Therefore, the term "the plane of the ridge regions" is amenable to construction. Accordingly, the Court determines that "the plane of the trough regions" means "the plane defined by the areas of the troughs."

A. Plank

The '552 patent discloses a "Plank for a Bench or the Like." (R. 59, Duke Decl., Ex. A. '552 Patent.) GSC claims that six of its tables (the exception is the Enduro II five foot round table) do not infringe this patent because a table top is different from a plank. GSC's argument is supported by the ordinary meaning of the term "plank:" "a heavy thick board." The ordinary meaning of the term "board" is "a piece of sawed lumber of little thickness and a length greatly exceeding its width." Lifetime asserts that a plank can be a table top because the specification states that "the plank can be used for both the bench seats and the table top." (Id. at 5:26:27.) The associated figure, however, shows a table top that consists of three planks. (Id., Fig. 1.) The specification, therefore, indicates that a table top can consist of planks, not that a plank can be a table top. Table tops, however, can come in a variety of shapes and sizes. Side tables and buffet tables are almost always in the shape of a plank. Therefore, we find that the term "plank" includes table tops whose length greatly exceeds their width.

12. "Plastic Core Sheets"

The phrase "plastic core sheets" is construed to mean, "Sheets of plastic between which the electronic element is positioned."

The phrase appears in claim 1 of the '207 patent, for example:

A process for incorporating at least one electronic element in the manufacture of a plastic card, comprising the steps of:
(a) providing first and second plastic core sheets; (b) positioning said at least one electronic element in the absence of a non-electronic carrier directly between said first and second plastic core sheets to form a core, said plastic core sheets defining a pair of inner and outer surfaces of said core; (c) positioning said core in a laminator apparatus, and subjecting said core to a heat and pressure cycle.

'207 patent, col. 6:18-29. See also '099 patent, col. 5:13-17.

Defendant does not address this term.

Plaintiff asks me to construe the phrase, but urges that the meaning of the phrase is clear from the wording of the subject claims. (Pl. Br. at 17.) I agree.
This suit involves United States Patent No. 4,438,584 (the '584 patent), issued on March 27, 1984, to Stanley Z. Baker and Benjamin H. Baker. The patent, assigned to Eaton, discloses a "Trap for Rats, Mice, and Other Vermin." Claim 1, the patent's only independent claim, reads, with emphasis added:

A commercial trap product for catching mice or rats comprised of a generally flat support formed of a non-porous, thin sheet material, said support having at least one positioning surface, at least one indented portion having a given depth below said positioning surface, and a relatively thick layer of pressure sensitive adhesive material contained within said indented portion having a thickness of at least 1/16 inch, a plastic flow temperature above 120 degrees F. and an upper surface; said indented portion having a greater depth than the thickness of said layer of adhesive and said positioning surface being spaced above said adhesive layer upper surface.

Claim 1 thus recites a dishlike container holding a pressure sensitive adhesive material in which vermin become stuck, and thereby trapped. The commercial embodiments of the invention feature two plastic containers or traps, typically packaged together, one on top of the other, face-to-face, capable of being hung in a vertical position at the point of sale.

After a bench trial, the district court issued findings of fact and conclusions of law in which it interpreted the limitation, "a plastic flow temperature above 120 degrees F." Based on its interpretation, Atlantic's accused product was found to infringe claim 1. Additionally, the district court held claim 1 not invalid under § 103 for obviousness, or under 35 U.S.C. § 102(b) (1994) for having been on sale for more than one year before the filing date of the '584 patent. For the reasons set forth in the opinion of the district court, we hold that, on the facts presented in this case, claim 1 is not invalid under § 102(b), and we thus refer no further to that issue.

Whether claim 1 is infringed by Atlantic's accused product, and whether Eaton's commercially successful product is an embodiment of the invention claimed (the latter being germane in this case to the validity of the patent under § 103), depend on what is meant by "a plastic flow temperature above 120 degrees F." As we will explain below, the correct meaning of that term is established by reading the prosecution history of the '584 patent. That is a legal exercise which we are obligated to conduct independently. Markman v. Westview Instruments, Inc., 52 F.3d 967, 979, 34 U.S.P.Q.2d (BNA) 1321, 1329 (Fed. Cir. 1995), aff'd, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996).

The district court construed the limitation "a plastic flow temperature above 120 degrees F," with reference to the claimed adhesive, to mean:

That the adhesive has a flow characteristic which enables the trap product to be shipped and stored at the highest ambient temperature expected to be encountered in connection with such shipping and storage, namely 120 degrees F, without the adhesive flowing from the support.

A pressure sensitive adhesive material in a trap for catching mice or rats, in accordance with the invention in Eaton's '584 patent, has a plastic flow temperature above 120 degrees F if the adhesive passes the two tests established by Mr. Kenneth A. Nelson, . . ., namely (1) disposing a support, such as a tray, and the adhesive therein in an inverted horizontal orientation on an underlying substrate and exposing the support and adhesive to a temperature of 120 degrees F for sixteen (16) hours, and (2) disposing a support, such as a tray, and the adhesive therein in a vertical orientation on an underlying substrate and exposing the support and adhesive to a temperature of 77 degrees F for sixty-three (63) hours. An adhesive passes these tests and has a plastic flow temperature above 120 degrees F if the adhesive does not flow from the support onto the underlying substrate during the test. These two tests are set forth in the file history of Eaton's '584 patent.

In addition, the district court cited another test to determine if an adhesive has a plastic flow temperature above 120 degrees F. That test, devised by Findley Adhesives, Inc., called for heating the adhesive to 250 degrees F for one-half hour, allowing the adhesive to set at room temperature for 24 hours, then disposing the adhesive in an inverted horizontal orientation at a
temperature of 120 degrees F for 16 hours. With regard to those tests, the district court held that:

The two tests devised by Mr. Nelson and the test procedure established by Findley Adhesives, Inc. are appropriate for determining that an adhesive has a plastic flow temperature of 120 degrees F in accordance with the invention claimed in the '584 patent.

Based on undisputed testimony offered by Eaton, Atlantic's mouse traps—when subjected to these tests—were found to infringe claim 1. As we will explain below, however, these tests cannot, as a matter of law, be the measurement for determining if an adhesive meets the plastic flow temperature limitation of claim 1, because the tests do not measure plastic flow at 120 degrees F in a vertical orientation, which is required when the claim is properly construed.

After a thorough analysis of the prior art, the district court found the "primary indicia of patentability . . . lacking." Ashland Oil, Inc. v. Delta Resins & Refractories, Inc., 776 F.2d 281, 306, 227 U.S.P.Q. (BNA) 657, 675 (Fed. Cir. 1985), for claim 1, and that the claim would have been obvious when viewed in the light of the prior art and the level of skill in the art. Nevertheless, the district court held the patent nonobvious because of the strong commercial success of Eaton's commercial product. The finding of commercial success was based on Eaton's $17 million of sales from 1979 through 1984, and its $4 million of annual sales from 1985 through 1989.

III

The '584 patent emerged from claims originally set forth in Patent Application No. 338,621, which is a continuation of Ser. No. 53,381, filed on June 29, 1979. The examiner rejected the claims, inter alia, for failure to disclose the best mode of making the invention. The Nelson tests, used by the district court as the measurement of plastic flow temperature, assessed prior art adhesives and an adhesive which Nelson's employer, Findley Adhesives, had been requested by Eaton to prepare that would meet the limitations of claim 1. Even though Eaton had expressly directed Nelson to test the adhesives for plastic flow at 120 degrees F in an orientation other than horizontal, Nelson's test results did not refer to any tests or test results at 120 degrees F in a vertical orientation. Instead, the only 120 degrees F test performed by Nelson was on adhesive in a horizontal orientation. Nelson's tests for plastic flow in a vertical position at 77 degrees F were unrelated to the 120 degrees F plastic flow limitation in the '621 application, and were not requested by the performance specifications supplied to Nelson by Eaton. The results of Nelson's tests, as well as his test protocols, were introduced by the applicants to overcome the best mode rejection and to show that prior art adhesives failed to meet the Nelson tests.

The examiner, however, was troubled by the information disclosed in the Nelson tests. In particular, the examiner noted that one of the prior art adhesive traps tested by Nelson anticipated the claims under 35 U.S.C. § 102 (1994). Accordingly, the examiner requested additional tests by Nelson from the applicants to overcome the rejection. Eaton's attorney communicated the examiner's concerns to Nelson by letter dated November 6, 1981, which was introduced at trial on the public record as Defendant's nonprivileged Exhibit 197. In that letter, Nelson was instructed by Eaton's counsel to perform additional tests on the prior art adhesive. In particular, the attorney noted the need for a 120 degrees F test with the adhesive vertically oriented. The attorney recommended a vertical 120 degrees F test "for a period of a day or several days." Whether Nelson performed the particular vertical tests requested by Eaton's attorney is unknown, and the prosecution history of the '584 patent contains no reference to the results of such vertical tests. The examiner rejected the claims for failure to disclose best mode, nonenablability of the adhesive, and obviousness over the prior art.

On appeal to the Board of Appeals of the U.S. Patent and Trademark Office (Board), the claims were held not prima facie obvious over the prior art, and in any event not obvious because of the commercial success of Eaton's products. The applicants, in their brief to the Board, stated that the adhesive claimed must not flow when exposed to 120 degrees F in vertical orientation, even for unlimited periods of time. The requirement that the claimed adhesive not flow when exposed to 120 degrees F in a vertical orientation had been noted several times during prosecution up to the filing of the applicant's brief to the Board, and the same point was emphasized throughout subsequent prosecution proceedings. For example, the applicants stated in their brief to the Board:

Also importantly, the adhesive must have temperature-flow characteristics such that even if the surface of the adhesive is vertical, the adhesive will not flow or sag at ordinarily encountered ambient storage temperatures (less than 120 degrees F). That is to say, the plastic flow temperature of the adhesive must be above 120 degrees F. [Emphasis added.]
On another occasion, in its statement to the Patent Office dated November 19, 1985, the applicant distinguished prior art references on the basis that:

Nowhere in any of these references is there any mention whatsoever of a body of adhesive having a particular plastic flow temperature which enables a vermin trap to be shipped and stored in positions other than horizontal at the highest ambient temperature expected to be encountered in connection with such shipment and storage without the body of adhesive running from the support therefor. [Emphasis added.]

In sum, the prosecution history abounds with unambiguous declarations by the applicants that their claimed traps would reasonably be exposed to 120 degrees F when vertically oriented. That history is consistent with the evidence introduced at trial showing Eaton's repeated efforts to test adhesives at 120 degrees F in vertical orientations, and refutes any notion that Eaton's only vertical flow concerns were satisfied by Nelson's 77 degrees F vertical test. However, despite the applicants' repeated emphasis on the requirement that the adhesive not flow when exposed to 120 degrees F in a vertical orientation, the file history contained no reference to any vertical test at 120 degrees F when the '584 patent issued on March 27, 1984.

In July of 1985, a request for reexamination was filed by Hampton Chemical, Inc., based on several prior art references not previously considered by the examiner or the Board. For purposes of our review, two items of the prior art are of concern: two U.K. patents, disclosing an adhesive in a mousetrap, and a domestic adhesive product, Formula 31, which were said to render obvious the mousetrap claimed in the '584 patent.

IV

When the patent was subjected to reexamination, the applicants, Hampton Chemical, and the examiner knew that the invention as claimed specified that the adhesive not flow when exposed to 120 degrees F in any orientation, including vertical. However, before the reexamination proceedings, no reference had been made in the file history to any test of plastic flow at 120 degrees F when the material is vertically oriented. All previous references to plastic flow in a vertical orientation were with respect to relatively long-term exposure at ambient room temperatures. In particular, the earlier references to vertical plastic flow cited the Nelson tests, which exposed the adhesive to 77 degrees F for 63 hours. The concern over possible flow at room temperature after exposure for several days stemmed from the inventors' understanding that at commercial points of sale, the packaged traps might remain suspended vertically for such times. The 77 degrees F test, while of interest to the inventors for shelf life marketability of their product, is irrelevant to the determination of whether an adhesive will flow when exposed to 120 degrees F for any period of time. In short, claim 1 of the '584 patent cannot be enforced against a mousetrap product with an adhesive which passes Nelson's 77 degrees F vertical test, but which fails the 120 degrees F test. Nor can a product which passes the 77 degrees F test, but which fails the 120 degrees F limitation, be used to demonstrate commercial success of the invention as part of a defense to legal challenge under § 103.

Before reexamination, a competitor of Eaton wishing to avoid infringement of claim 1 would not have known how to test his product to determine if it satisfied the 120 degrees F limitation when the adhesive is vertically oriented. Indeed, such a competitor, Southern Mill Creek Productions Company, Inc., had already appeared, in protest to the application before the patent issued, complaining that “no where in the confines of this Application have Applicants defined how one might measure the flow temperature of the pressure-sensitive adhesive material.” The applicants, however, took no steps to disclose a test protocol for measuring plastic flow at 120 degrees F in a vertical orientation. The record in this case reflects that Eaton learned in 1983, while Southern Mill's complaint was pending, and before issuance of the patent, that its own product failed the 120 degrees F flow test when exposed vertically for 16 hours. We do not know, however, whether that fact affected Eaton's failure to disclose a 120 degrees F vertical test protocol to the examiner.

V

During reexamination, Hampton Chemical sought to prove that Eaton's claimed mousetrap employing a special adhesive was rendered obvious in view of the two U.K. patents and Formula 31. To make its case, Hampton employed one of ordinary skill in the art, Donatas Satas, to test the adhesive disclosed in the U.K. patents. Satas selected the test protocol for the 120 degrees F limitation, and determined that the adhesive should be tested for flow at 120 degrees F for 24 hours in a vertical orientation, and for 12 hours at 120 degrees F in an inverted horizontal orientation. Satas concluded that the prior art adhesives so tested met the limitations of claim 1.
Eaton, also in the reexamination, sought to prove that Formula 31 did not meet the limitations of claim 1. Toward that end, Eaton hired John M. Questel, also one of ordinary skill in the art, to test Formula 31. Questel's tests were performed under his supervision by his employee, Lore Hise. The test protocol selected by Questel exposed the adhesive to 120 degrees F for 24 hours in both horizontal and vertical orientations. Questel concluded that Formula 31 did not meet the limitations of the claim, and that he lacked sufficient information to comment—one way or another—on the conclusion reached by Donatas Satas on the adhesive disclosed in the U.K. patents.

On March 10, 1986, the examiner rejected the claims on reexamination as obvious under § 103 over the references brought to the examiner's attention by Hampton Chemical. Eaton responded to that rejection, arguing that Questel's tests had shown Formula 31 not to be invalidating prior art, and that Satas's test results were inconclusive. In its response, Eaton relied on the Questel tests, and notably, did not question the propriety of the test protocols employed by Satas. From this episode in the file history of the '584 patent, a reasonable competitor of Eaton would surmise that Eaton would measure satisfaction of "a plastic flow temperature above 120 degrees F" by testing accused adhesives at 120 degrees F for 24 hours in both vertical and horizontal orientations. In short, after seven years of patent application prosecution, the file history clearly supplied the missing vertical 120 degrees F test parameter and a corresponding horizontal test.

VI

The final chapter of the file history of the '584 patent is the second appeal to the Board following another rejection of the claims by the examiner as obvious over the prior art, including the U.K. patents and Formula 31. Both Eaton and the examiner again relied on the Questel tests, with Eaton arguing the tests showed that the prior art failed to meet the 120 degrees F claim limitation, and the examiner arguing that the tests showed the prior art met the limitation. The Board, during the course of its detailed review of the prior art, relied on the 24-hour parameter in the Questel tests in concluding that the adhesive in Formula 31 met the 120 degrees F limitation. In light of the prior art, the Board concluded that the claims are prima facie obvious, but that the claims are nevertheless nonobvious under § 103 because of the commercial success of Eaton's product, as demonstrated to the Board by Eaton's submission of sales data and consumer testimonials. During this final chapter of the prosecution history, neither Eaton, the examiner, nor the Board referred to the then-ancient Nelson tests as the protocol for ascertaining the meaning of the 120 degrees F claim limitation. Instead, there was unanimous recognition that the Questel test protocols were understood by one of ordinary skill in the art to define the 120 degrees F claim limitation.

VII

We now turn to the events at trial in the district court. Both Eaton and Atlantic offered testimony through expert witnesses about the meaning of the 120 degrees F claim limitation. "Plastic flow temperature above 120 degrees F" is a term with no previous meaning to those of ordinary skill in the art. Its meaning, then, must be found somewhere in the patent. See 35 U.S.C. § 112, P 2 (1994) (inventor must particularly point out and distinctly claim the subject matter of his invention); In re Paulsen, 30 F.3d 1475, 1480, 31 U.S.P.Q.2D (BNA) 1671, 1674 (Fed. Cir. 1994) (inventor as lexicographer must define his terms in the patent disclosure). Both expert witnesses understood that the adhesive in claim 1 had to withstand plastic flow at 120 degrees F when subjected to horizontal and vertical tests. Both witnesses also understood that the claim prohibits plastic flow at 120 degrees F after the adhesive has been exposed to the specified degree of heat for such reasonable periods of time as the commercial product might experience during shipping and storage.

The experts, however, disagreed over the length of time that the patented product might remain exposed to 120 degrees F during shipping and storage. Eaton's expert, Richard Muny, testified regarding adhesive tests that he had been asked to run on Eaton's products and the accused products of Atlantic. Muny testified that he took no part in selecting the test protocols; instead, he simply ran his tests using protocols given to him by Findley Adhesives at the direction of Eaton. The tests used by Muny were those devised by Nelson (horizontal at 120 degrees F for 16 hours and vertical at 77 degrees F for 63 hours), plus a vertical test at 120 degrees F for 5 hours. Muny did not explain why he was asked to conduct the 120 degrees F vertical test. Muny also testified that it might go "too far" to describe these Findley tests as standard quality control procedure. Muny, however, testified that in his opinion the tests he had been asked to run reflected the time periods during which the products might be expected to be exposed to 120 degrees F when in shipment or storage.

Dr. Harold Zeliger testified that he had been retained by Atlantic to devise and carry out tests to demonstrate whether the products of Eaton and Atlantic met the limitations of claim 1. Zeliger read claim 1 to require the adhesive to resist plastic
flow when exposed to 120 degrees F in a vertical orientation. Zeliger did not state whether he tested any product for plastic flow when in a horizontal orientation. His tests exposed six commercial products of both Eaton and Atlantic to 120 degrees F, vertically oriented in their packages of two trays facing one another. Zeliger periodically examined the products being tested to determine if they had experienced plastic flow. Zeliger concluded that an adhesive "failed," when the adhesive in the two trays flowed into each other. According to Zeliger's tests, two of Eaton's products resisted plastic flow for 44 hours, but the other four Eaton products "failed," or flowed, one after 11 hours and the other three after 20 hours. Of Atlantic's accused products, one failed after 24 hours, three failed after 11 hours, and two failed after 20 hours.

Zeliger testified that, in his view, all of the products of Eaton and Atlantic failed during times he considered reasonable times when the adheres would be exposed to 120 degrees F during shipping and storage. Zeliger expressly disagreed with Muny's conclusion that five hours of exposure at 120 degrees F was the reasonable maximum exposure time. Zeliger testified that a five-hour time limit was not indicative of real world conditions. On cross-examination, Zeliger admitted that in real world conditions, one would not find exact temperatures of 120 degrees F maintained evenly over periods of time. Zeliger thus cast some doubt on his own tests as effective measurements of actual shipping and storage conditions.

After hearing all the testimony, the district court rejected Zeliger's view that infringement of claim 1 should be measured by the length of time required for the adhesive in the trap to flow when exposed to 120 degrees F in a vertical position. The district court also rejected the portion of Muny's tests that had subjected Atlantic's traps to 120 degrees F in a vertical orientation for five hours. Instead, the district court held that Nelson's tests, as conducted by Muny, proved that Atlantic's product infringed claim 1. For the reasons explained above, the district court's reliance on the Nelson tests is legal error, since those tests fail to subject the claimed adhesive to 120 degrees F when vertically oriented.

If Muny is correct that his five-hour vertical test and a 16-hour horizontal test satisfy claim 1, Atlantic's accused product would infringe claim 1 because Atlantic apparently concedes the 16-hour, 120 degrees F horizontal measurement and Zeliger proves that at least some of Atlantic's product survives for five hours when tested vertically. If, however, Zeliger is correct that the reasonable times for exposure at 120 degrees F can vary, and that his failure times are all within a zone of reasonable exposure times, then none of Atlantic's product infringes claim 1. Eaton's own product also would not meet the limitations of claim 1, and Eaton would thus be unable to claim commercial success of that product to establish that claim 1 is not obvious under § 103.

We may not rely on either Muny or Zeliger, because, as we have often stated, trial testimony regarding the meaning of a claim cannot vary the meaning of a claim that is established either by the claim itself or by the claim as correctly understood by reference to the specification and the file history. See Senmed, Inc. v. Richard-Allan Medical Indus., Inc., 888 F.2d 815, 819 n.8, 12 U.S.P.Q.2D (BNA) 1508, 1512 n.8 (Fed. Cir. 1989); see also North Am. Vaccine, Inc. v. American Cyanamid Co., 7 F.3d 1571, 1577, 28 U.S.P.Q.2D (BNA) 1333, 1337 (Fed. Cir. 1993) (patentee cannot take one position before the Patent Office and a different position before the court); Jonsson v. Stanley Works, 903 F.2d 812, 820-21, 14 U.S.P.Q.2D (BNA) 1863, 1871 (Fed. Cir. 1990) (same).

For the reasons set forth above, we have concluded that the district court erred, as a matter of law, when it construed the term "a plastic flow temperature above 120 degrees F" to exclude any amount of plastic flow when the adhesive is exposed to 120 degrees F in a vertical orientation. The 120 degrees F vertical tests proposed by Muny and Zeliger are also legally insufficient; Muny's because it sets the time for horizontal and vertical testing incorrectly, and Zeliger's because it sets no times for testing, but simply tests until failure, and then asks if the time to failure is within reasonable real world exposure times. While Zeliger's test may have some common sense appeal, it provides no certainty to Eaton's competitors, who are entitled to know the point in time at which their products will infringe claim 1. Nor does Zeliger's test give any measure of certainty to Eaton, which is also entitled to know in advance how to test competing product for infringement of claim 1.

In this case, the dispositive claim limitation is a term unknown to those of ordinary skill in the art at the time the patent application was filed. It thus fell to the applicants, as a duty, to provide a precise definition for the 120 degrees F limitation. Early in the prosecution history of the '584 patent, a competitor noted the absence of any definition of the key term. The applicants' proffer of the Nelson tests did not respond properly to the competitor's plea, because the Nelson tests failed to supply a test parameter for flow at 120 degrees F when the adhesive is vertically oriented. The record in this case amply demonstrates that the applicants intended their adhesive to withstand plastic flow at 120 degrees F when vertically oriented. Their disclosures to the examiner repeatedly stated that intention, as did their testing of products, demonstrated by evidence submitted at trial, for flow at 120 degrees F when vertically oriented. The applicants were obligated to give a meaning to the
key limitation during the prosecution history, and they did so with the Questel tests.

VIII

Having concluded that "a plastic flow temperature above 120 degrees F" means that the adhesive must resist flow when exposed for 24 hours to 120 degrees F in both horizontal and vertical orientations, we now review the holdings of the district court that Atlantic's accused products infringe claim 1, and that the claims of the '584 patent are not invalid as obvious under § 103.

To reach its idiosyncratic claim interpretation, this court relies on a few isolated excerpts from over 1400 pages of prosecution history. In particular, this court abstracts two paragraphs from an eleven-page declaration of John M. Questel, filed in the second reexamination, to convert a stringent vertical flow test into a claim requirement. In fact, neither Eaton, nor the Board, nor even Mr. Questel himself, relied on his 120 degrees F vertical flow test to distinguish prior art. The administrative record, when considered as a whole, does not support this court's adoption of this test as the measure of Eaton's claims.

This court need not have strained to interpret the claims. The patent record -- the claims, specification, and prosecution history -- provides ample support for the claim interpretation adopted by the United States District Court for the Eastern District of New York. In fact, the examiner, the Board, and at least two federal judges have already accepted the same interpretation -- a reading compelled by the prosecution history as a whole.

I.

The phrase "plastic flow temperature" has no fixed meaning in the adhesive art. However, an inventor may freely define unfamiliar claim terms in the specification or in the prosecution history. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2d (BNA) 1573, 1576 (Fed. Cir. 1996); Lear Siegler, Inc. v. Aeroquip Corp., 733 F.2d 881, 889-90, 221 U.S.P.Q. (BNA) 1025, 1031 (Fed. Cir. 1984). Eaton took that course to define its claim term.

Eaton's Patent No. 4,438,584 (the '584 patent) distinguished its ready-to-use glue trap for mice and rats from the prior art with an adhesive having a "plastic flow temperature above 120 degrees F." The inventors, Stanley and Benjamin Baker, recognized that the adhesives used in prior art traps would melt and flow at temperatures normally encountered during shipping and storage. The Bakers learned from the United States Department of Transportation that the maximum ambient temperature encountered during shipping was 120 degrees F. To solve the problem with the prior art, the Bakers set out to stabilize their adhesive at temperatures up to 120 degrees F. Thus, the requirements of secure shipping became the benchmark for "plastic flow temperature."

Throughout the lengthy administrative proceedings, Eaton and the PTO clarified this meaning of plastic flow temperature. For example, in its Amendment filed July 24, 1981, Eaton explained:

Because the plastic flow temperature is above 120 degrees F, the body of the adhesive will not flow plastically at normally encountered ambient temperatures while being shipped or stored. The traps can be disposed horizontally, upside down or vertically at normally encountered temperatures with no fear of touching of adjacent surfaces or the adhesive of one trap to the other.

Thus Eaton explained that its claimed adhesive would not flow upside-down or "vertically at normally encountered temperatures."

To underscore this message, Eaton submitted the declaration of Kenneth A. Nelson, the chemist who developed the claimed adhesive. Mr. Nelson's declaration disclosed a two-prong test for the claim requirement. That test requires, first, placing a 1/16 inch layer of adhesive upside-down in an oven preheated to 120 degrees F for sixteen hours. Second, the test requires that the adhesive be hung vertically in an oven at 77 degrees F for sixty-three hours. An adhesive meets Eaton's requirement if the glue does not flow from the tray during either of these tests.
The Board understood and accepted this specific definition of plastic flow temperature. In its November 30, 1983, opinion, the Board recognized "plastic flow temperature" as the "characteristic of the adhesive . . . required to prevent the adhesive from flowing or sagging at temperatures at which the trap is shipped, stored, or used." The Board noted that prior art publications did not anticipate Eaton's claims because they lacked adhesives with these plastic flow properties:

Prior to the instant invention, glue traps were prepared by the user rather than the manufacturer in that ready made traps could not be readily shipped and stored. Workers in this art were working to find various means to solve these problems. Appellants recognized this problem and conceived of the idea embodied in the instant claims of utilizing an adhesive having special plastic flow properties.

Thus, the full administrative record gives an explicit and reasonable meaning of "plastic flow temperature" that focuses on shipping and storage of the commercial trap product without adhesive spillage. Mr. Nelson's two-prong test makes Eaton's definition unmistakable to one of skill in the art. For this reason, the Eastern District of New York adopted the Nelson tests as the definition of "plastic flow temperature." Indeed, another district court interpreted "plastic flow temperature" in the same '584 patent precisely in accordance with Mr. Nelson's declaration. See J.T. Eaton & Co. v. Bell Lab., Inc., No. 95-C-0441-S (W.D. Wis. March 29, 1996) (oral jury instructions). Thus, the examiner, the Board (twice), and two district courts read the plastic flow limitation in accordance with the Nelson tests.

Trial testimony from one skilled in the art confirmed the logic of this uniform claim interpretation. According to this testimony, Mr. Nelson's sixteen hour inverted horizontal test at 120 degrees F properly tested the product under typical shipping conditions. After all, elevated temperatures would not last longer than normal daylight hours. Testing the adhesives beyond sixteen hours made little sense in the context of shipping these products in trucks and boxcars. Likewise, according to the same testimony, the lengthy vertical test at 77 degrees F properly reflected the prolonged periods of shelf storage at normal room temperatures. Given this logical explanation, there is little wonder every other agency and court that reviewed Eaton's claims accepted the same interpretation.

II.

Despite the overall stringency of the prosecution history, this court stretched the vertical flow test concept out of proportion, exaggerated the stringency of that test beyond the realities of storage and shipping, and made it the sole talisman of the Eaton claim. In its brief, Atlantic urged this court to find a stringent vertical flow test in a single sentence of the voluminous prosecution history:

Plastic flow temperature, as used herein, is that temperature below which the adhesive will not flow or sag even if stored with the surface of a thick (1/16 to 1/8 inch) layer of adhesive vertical for unlimited periods of time. (Applicant's Brief to Board of Patent Appeals and Interferences, December 27, 1982)

Based on this statement, Atlantic argued that an accused trap product could not infringe unless it could dangle in a vertical position at 120 degrees F for an infinite period of time without any glue flow. Like the district court before it, however, this court recognized that one skilled in the art could not reasonably rely on such obvious hyperbole as if it affected the scope of the claim. See Intervet Am., Inc. v. Kee-Vet Lab., Inc., 887 F.2d 1050, 1054, 12 U.S.P.Q.2d (BNA) 1474, 1477 (Fed. Cir. 1989) (holding that claim language controls over an attorney's "erroneous remarks" made during the course of prosecution). Accordingly, the panel rejected this rationale. In so doing, it rejected the only claim interpretation proffered by Atlantic for "plastic flow temperature."

Without any basis in argument from either party or testimony from the trial record, the panel's ultimate claim construction rests on its own collection of orphaned passages from the file history. According to the panel, these passages show that Eaton did not provide a test for measuring vertical flow. To the contrary, Eaton provided Mr. Nelson's 77 degrees F vertical test -- a test designed for temperatures where the products are likely to hang on vertical displays. Nonetheless, this court created the myth of a "missing vertical test" to justify its reliance on two paragraphs in Mr. Questel's declaration (paragraphs 22 and 23) -- a declaration filed two years after the '584 patent originally issued.

This court's reading of the record goes astray in several ways. First, nowhere does the '584 patent prosecution suggest the necessity of a 120 degrees F vertical flow test. The "missing" test was not missing at all, but was simply not required by the claims. Before the PTO, Eaton consistently stressed that the Nelson tests defined "plastic flow temperature" under
temperature conditions likely to be encountered during shipping and storage. Second, the brief extract from Mr. Questel's
declaration simply lacks the meaning and the importance attributed to it by the panel.

A.

The premise underlying this court's opinion is that Mr. Questel supplied a missing test for vertical flow two years after the
patent issued. The panel divines this premise from a few passages in which Eaton generally describes the advantages of the
claimed adhesive. For example, the panel opinion relies on Eaton's statements to the Board on December 27, 1982:

Also importantly, the adhesive must have temperature-flow characteristics such that even if the surface of the adhesive is
vertical, the adhesive will not flow or sag at ordinarily encountered ambient storage temperatures (less than 120 degrees F).
That is to say, the plastic flow temperature of the adhesive must be above 120 degrees F.

According to the panel, this quote demonstrates that "plastic flow temperature" had a vertical component that Mr. Nelson
did not measure. To the contrary, Eaton did not shirk its duty to define the claim terms. In the very same 1982 brief, when
actually distinguishing the prior art cited by the examiner, Eaton specifically cited to the Nelson tests as the definition of
"plastic flow temperature."

The record is replete with other instances in which Eaton mentioned the word "vertical" in contexts fully consistent with
using the Nelson tests as the measure of plastic flow temperature. For example, in its Amendment filed July 24, 1981, Eaton
argued:

A trap made [in the manner described in the application] has been evaluated by Kenneth A. Nelson and found to have
acceptable plastic flow characteristics. The trap can therefore be shipped or stored in vertical or inverted horizontal positions
without fear of plastic flow and thus contamination of adjacent surfaces or spilling.

Eaton simply did not argue for its patent on the basis of some undefined vertical flow capabilities. Eaton had no need to test
vertical flow above 77 degrees F because its traps would be displayed vertically only at room temperature.

More importantly, the PTO understood this simple principle. The PTO did not understand Eaton to rely on a stringent
vertical test for flow characteristics. Both the examiner and the Board expressly disclaimed any reliance on vertical or
horizontal testing to determine patentability of the claimed invention. For example, the examiner stated on May 27, 1986:

Whether the body tests were done in vertical, inverted horizontal or flat horizontal position has no relevance. The claims
do not specify what position the adhesive is in regarding vertical flow.

The Board expressed a similar view in its January 16, 1987, decision on the second reexamination:

The claims on appeal do not include any limitations restricting the orientation of the commercial trap product defined
therein to any particular horizontal, vertical, or inverted disposition, nor are there any limitations requiring flow of the
adhesive from the container to be prevented for any particular length of time.

These passages make absolutely clear that the PTO did not decide to issue the '584 patent based on any of Eaton's
statements about vertical flow or any of Mr. Questel's tests. Instead, it is this court that first imports into the claims a
supposed limitation from the prosecution history -- a limitation on which neither the applicant nor the PTO relied during
acquisition of the patent.

In fact, the PTO never objected to the phrase "plastic flow temperature" as indefinite for lack of a vertical flow test. If
vertical flow was the pivotal claim parameter perceived by this court, then the PTO should have noted its absence. Instead,
the lengthy prosecution culminated in the issuance of the '584 patent without so much as a mention of a mythical "missing"
vertical test.

Finally, Eaton did not, as the panel suggests, switch its focus from the Nelson tests to the Questel tests during the final
chapter of the prosecution. Rather, at the conclusion of the second reexamination, as at the beginning, Eaton relied on its
consistent definition of plastic flow temperature:
The terminology "plastic flow temperature" in appellants' claims on appeal has that meaning which is made clear elsewhere in the patent or in the file wrapper. . . . Appellants defined their terminology "plastic flow temperature" throughout the prosecution of their application which matured as the subject patent as being a characteristic of the adhesive which would prevent the adhesive from sagging or flowing from its support at temperatures at which their product is shipped, stored, or used.

This passage shows that Eaton did not attempt to switch arguments on the PTO in the closing chapter of the prosecution.

Perhaps aware of the danger of stringing together isolated passages out of context, this court tries to correlate these passages by reference to private communications between Eaton's lawyers and scientists. Specifically, the panel relies on Eaton's attorney's instructions to Mr. Nelson about vertical flow testing. Far from supporting the missing test myth, this tactic betrays this court's flawed method of seeking claim meaning. These privileged exchanges are not part of the public record. Even if Eaton's attorneys believed patentability turned on vertical flow at 120 degrees F, such private correspondence, not a part of the public record, cannot possibly supply evidence of claim meaning. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 979, 34 U.S.P.Q.2D (BNA) 1321, 1329 (Fed. Cir. 1995) (patent claims are construed in light of the public record), aff'd, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). Thus, this court relies not only on out-of-context extracts, but on extracts without any relevance to claim interpretation. Indeed, few of the isolated passages on which this court relies had anything to do with the meaning of the plastic flow characteristic. Neither Eaton nor the Board relied on the passages to which this court attaches dispositive significance.

For all these reasons, I must conclude that this court has created a requirement for a stringent vertical flow test that the claims, read in light of the prosecution history, do not require. Had Eaton truly acquired its patent by requiring such a test, the record would surely contain far more emphatic evidence than the few isolated passages cited in the panel opinion. See York Prods., Inc. v. Central Tractor Farm & Family Center, 99 F.3d 1568, 1575, 40 U.S.P.Q.2D (BNA) 1619, 1624 (Fed. Cir. 1996) ("Unless altering claim language to escape an examiner rejection, a patent applicant only limits claims during prosecution by clearly disavowing claim coverage.").

B.

Without doubt, the precedent of this court indicates that a patentee's remarks during patent prosecution can illuminate the meaning of the claims. See Markman, 52 F.3d at 980; Vitrronics, 90 F.3d at 1582-83. However, our precedent makes equally clear that this court construes an administrative record in its full context, not on the basis of snippets lifted out of context. See Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1565, 19 U.S.P.Q.2D (BNA) 1500, 1506 (Fed. Cir. 1991) ("We construe claims in the light of the language of the claim itself, the specification on which it is based, and the whole prosecution history.") (Rich, J., dissenting); see also Mark I Mktg. Corp. v. R.R. Donnelley & Sons Co., 66 F.3d 285, 292, 36 U.S.P.Q.2D (BNA) 1095, 1100 (Fed. Cir. 1995), cert. denied, 133 L. Ed. 2d 847, 116 S. Ct. 917 (1996). Moreover, the reviewing court must examine the full context of prosecution history to discern not only what the applicant said, but why he said it. Cf. Hebert v. Lisle Corp., 99 F.3d 1109, 1118, 40 U.S.P.Q.2D (BNA) 1619, 1627 (Fed. Cir. 1996) ("It is of course necessary to consider not only the amendments to the claims but the reason why they were made . . . .").

These basic legal principles disclose the infirmity of the court's reliance on two paragraphs from a single declaration at the end of the second reexamination. A fair reading of the declaration indicates that Mr. Questel distinguished the prior art Formula No. 31 adhesive on two grounds: (1) it exhibited unacceptable levels of cold flow (i.e., 72 degrees F) in a vertical orientation; and (2) it exhibited unacceptable levels of hot flow when tested at 100 degrees F in a vertical orientation. Thus, although Mr. Questel conducted twenty-four hour vertical tests at 120 degrees F, neither he nor Eaton ever relied on such tests to distinguish any prior art. Nor did Mr. Questel in any way suggest that he considered a twenty-four hour vertical test at 120 degrees F to be the measure of "plastic flow temperature." This record simply does not support the court's conclusion that Eaton's claims are measured by the 120 degrees F vertical flow test. See Ethicon Endo-Surgery, Inc. v. United States Surgical Corp., 93 F.3d 1572, 1581, 40 U.S.P.Q.2D (BNA) 1019, 1025-26 (Fed. Cir. 1996) (looking to "the prosecution history as a whole" to determine how one skilled in the art would understand a claim term) (Clevenger, J.).

Sadly, this court's fixation on the 120 degrees F vertical flow test foreclosed the one claim construction that was used repeatedly by all parties throughout the public record. The district court properly used that claim interpretation. This court errs in departing from the full context of the administrative record, and importing a false limitation from the prosecution
Plaintiff asserts that this term should be construed to mean "plastic film," while defendants seek the construction, "a self-supporting film or sheet of polymeric material." Their dispute ultimately comes down to whether the term requires a plastic film that is "self-supporting." 4

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

4 The parties appear to agree that whether the word "plastic" or the phrase "polymeric material" is used in the definition is immaterial.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Defendants insist that the quality of self-support is inherent in the ordinary meaning of the word "foil," pointing to household aluminum foil as an example. While acknowledging that nothing in the claims, the specification, or the prosecution history of the '613 patent explicitly defines "foil" with reference to self-support, defendants emphasize the patent's use of the word "laminate" to describe the foil, and argue that this word makes it clear that only a self-supporting film or sheet of material was contemplated. Plaintiffs, for their part, argue that nothing in the intrinsic or extrinsic evidence supports importing into the claims the "extraneous" limitation of self-support.

It is true that the word "self-support" cannot be found in the patent. The patent's use of the term "laminate" in both the claims and the specification does appear to support defendants' construction, however. At oral argument, defendants explained--and plaintiff did not dispute--that while sheets of material can be laminated together, a liquid (i.e., a non-self-supporting material) cannot.

Plaintiff emphasized, both in its briefs and at oral argument, that the specification teaches the use of polyethylene "in an almost liquid form," arguing that this demonstrates that the plastic foil need not be self-supporting. 5 But "liquid" polyethylene is disclosed only as the adhesive, inner layer of a multi-layered component collectively referred to in the claims as the "impermeable plastic foil," and does not suggest that the entire foil can be liquid.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

5 Plaintiff also pointed to similar language in claim 9, which claims "one of the polyethylene foils (1c) extruded on wet which functions as an adhesive for joining the absorbent inner layer… ."

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Moreover, claim 8, which depends from claim 1, recites, "wherein the impermeable plastic foil (1) comprises at least two foils laminated together… ." As noted above, "claim terms are normally used consistently throughout the patent," Phillips v. AWH Corp., 415 F.3d 1303, 1314 (Fed. Cir. 2005), so if the "foils" of claim 8 can be "laminated together," it is reasonable to conclude, in the absence of specific evidence to the contrary, that the "plastic foil" recited in claim 1 is capable of being laminated, i.e., it is self-supporting.

Both parties direct me to a portion of the prosecution history in which claim 1 was amended to recite, instead of an "impermeable foil," an "impermeable plastic foil." The parties agree that the reason for the amendment was to distinguish U.S. Patent 4,446,167 ("Smith"). Each side submits that the following passage supports its own construction:

While the nature of the "barrier coats" of this patent is not clear, the Examiner suggested incorporating into claim 1 a portion of previous claim 7 or 8. Accordingly, new claim 11 incorporates the plastic foil of the first portion of previous claim 7. The remainder of claim 7 has been rewritten as new claim 13 with the modification proposed by the Examiner of
using the term "laminated" in place of "joined together so as to be flat" for clarity…. It is submitted that these new claims with their plastic foils clearly distinguish over the barrier coats of the above patent.

'613 File History, Exh. F to Viskase's opening claim construction brief, p. 62-63. 6

6 This page number refers to the numbering generated by the ECF system for this exhibit, which is Docket No. 64-2.

The parties present conflicting interpretations of this portion of the file. In an earlier iteration of the referenced claims, claim 1 included the phrase "impermeable foil," while claim 7 recited a "tight plastic foil." Plaintiff contends that the patentee's insertion of the word "plastic" in claim 1 was the reason the examiner allowed the new claim over Smith. Defendants insist that it was the self-supporting nature of the plastic foil of claim 1 that was the basis for overcoming the barrier coat of Smith, reasoning that Smith (and other prior art) previously disclosed the use of plastic, so that the insertion of "plastic" could not have been the basis for overcoming Smith, and explaining that the word was inserted for clarity in response to the examiner's suggestion of incorporating part of claim 7 into claim 1. Frankly, both interpretations are plausible. Standing alone, the cited excerpt does not unambiguously support one construction or the other.

In short, I conclude that the use of the word "laminate" in conjunction with the foils described and claimed in the patent supports defendants' proposed construction, and that neither plaintiff's argument about the use of liquid polyethylene, nor the ambiguous language in the prosecution history, is a sufficient basis for second-guessing the apparent meaning of the words in the patent itself. Accordingly, I construe "plastic foil" as "a self-supporting film or sheet of plastic."

2956

The '979 patent contains nineteen claims. Only claim 17, an independent claim, is alleged to be infringed by the Lithonia fixtures. "Each claim must be considered as defining a separate invention." Jones v. Hardy, 727 F.2d 1524, 1528 (Fed.Cir. 1984); 35 U.S.C. § 282. Claim 17 claims the following invention:

A recessed lighting support frame for holding a lamp housing, comprising:

a molded recessed lighting frame member of a plastic material having an opening in which a lamp housing is mounted so that light from the lamp housing is projected through said opening; and

hangerways molded in one piece with said frame member and being disposed on either side of said opening, said hangerways adapted and constructed to receive hanger bars for supporting said frame member or said hanger bars.

The intrinsic evidence of record, consisting of "the patent itself, including the claims, the specification and, if in evidence, the prosecution history," Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed.Cir. 1996), is "the most significant source of the legally operative meaning of disputed claim language," Id., and so should be the first source to which the court refers. The words in a claim are generally given their ordinary and customary meaning unless the patentee clearly states a special definition of a term in the patent specification or file history. Id. Claims must be read in view of the specification of which they are a part. Id., quoting, Markman, 52 F.3d at 979. Finally, the prosecution history is often of significance in the construction of claims. Id., citing, Markman, 52 F.3d at 980.

Genlyte asserts that no special definitions are given to any of the terms in claim 17. It contends that we should give ordinary meaning to the terms. Reading the claim language itself, the invention taught in claim 17 comprises a plastic plaster frame having an opening in which a lamp housing is mounted so that light from the lamp housing is projected through the opening, and having hangerways which are molded as one piece with the plastic frame for holding hanger bars on either side of the opening. We find that this construction comports with the elements in claim 17 and the description of the invention contained in the specification.
Lithonia contends that in its prosecution of the '979 patent, Genlyte disclaimed all but elastomeric plastic for its plaster frame, in distinguishing its invention over the prior art patent to Druffel. Lithonia urges that the limitation is evidenced by 1) Genlyte's reference to "molded elastomer" in the prosecution history, and 2) its statement in the specification that "the present device is preferably molded of Polyman 509, a tradename of a flame retardant mix of ABS and PVC by A.L. Schulman Company." '979 Specification, Col. 8, lines 34-36.

2 Lithonia contends that ABS contains an elastomer, polybutadiene. For purposes of this opinion, we will accept this statement as true.

First, we note that "as a general rule claims of a patent are not limited to the preferred embodiment [citation omitted] or to the examples listed within the patent specification [citation omitted]." Dow Chemical Co. v. United States, 226 F.3d 1334, 1342 (Fed.Cir. 2000). Therefore, a reference to an elastomer-containing product in a preferred embodiment of the device, without more, is wholly insufficient to limit the scope of "plastic material."

If we consider the mention of Polyman 509 along with the mention of elastomer in the prosecution history, Lithonia still fails to carry the day. Lithonia suggests that the court utilize the prosecution history as an aid in construing the claim. "A claim in a patent provides the metes and bounds of the right which the patent confers on the patentee to exclude others from making, using or selling the protected invention." Burke, Inc. v. Bruno Independent Living Aids, Inc., 183 F.3d 1334, 1340 (Fed.Cir. 1999), quoting, Corning Glass Works v. Sumitomo Elec. U.S.A., Inc., 868 F.2d 1251, 1257, 9 U.S.P.Q.2d 1962, 1966-67 (Fed.Cir. 1989). Limitations, therefore, cannot be read into the claims from the specification or the prosecution history. Id., citing, Intervet Am., Inc. v. Kee-Vet Labs., Inc., 887 F.2d 1050, 1053 (Fed.Cir. 1989); Texas Instruments, Inc. v. United States Int'l Trade Comm'n, 805 F.2d 1558, 1563 (Fed.Cir. 1986)("This court has cautioned against limiting the claimed invention to preferred embodiments or specific examples in the specification."). The prosecution history would be useful only in interpreting the claims, not altering them. In this instance, we find that the term "plastic material" needs no further construction than its ordinary meaning, to one skilled in the art. Further, the prosecution history does not contain any suggestion that Genlyte clearly disavowed claim coverage to any "plastic material" which might be utilized by one skilled in the art in practicing this invention. See, York Products, Inc. v. Central Tractor Farm & Family Center, 99 F.3d 1568, 1575 (Fed.Cir. 1996)("Unless altering claim language to escape an examiner rejection, a patent applicant only limits claims during prosecution by clearly disavowing claim coverage.").

The reference to elastomer arose in remarks to an amendment filed in response to the February 8, 1991 final office action. In that action, the examiner allowed claim 17, but rejected claim 1 of the application as anticipated by the prior art patent to Druffel. 3 In order to further distinguish claim 1 over the teachings of Druffel, the words "molded plastic" were added to further define "frame," and the integrated "nailways" File History, pg. 67. The term "elastomer" is not in the claim language as originally drafted nor as rewritten. In the remarks concerning this rewritten claim, it is noted that "the frame of Druffel is apparently of sheet metal or the like and is not molded elastomer." File History, pg. 70. This remark is an observation concerning what material is utilized, and what is not utilized, in Druffel. It is not a remark which identifies the materials taught in claim 1 of the '979 patent. If the remark can be read to imply a contrast between the materials taught in Druffel and in the '979 patent, the statement simply compares Druffel's sheet metal with the '979 patent's preferred embodiment which specifies Polyman-509, by way of example.

3 On its second amendment, the claim was allowed as rewritten and became claim 3 in the patent's final form.

Further, the revisions and the single mention of "elastomer" were addressed to claim 1, not claim 17. Claim 17 had been approved without any discussion concerning the element of "plastic material." The initial rejection of the claim was on the basis that it was anticipated by the prior art patent to Cohon. The anticipation found by the examiner concerned structure rather than materials. See, Patent History, pg. 46. The term "plastic material" appeared in all drafts of claim 17, including
the approved revision.

Lithonia asserts that the same language cannot be interpreted in two different ways in two different claims in the same patent. See, Defendants' Response to Plaintiff's Motion for Partial Summary Judgement, pg. 14. However, the mention of elastomer to which Lithonia refers does not compel differing constructions of claim 1 and claim 17.

Considering the reference to elastomer in the prosecution history together with the specification still does not yield the construction sought by Lithonia. The term "molded plastic" was rewritten into claim 1 and was approved. Nothing in claim 1, in the file wrapper, or the specification, or considering all of these sources together, limits the coverage of claim 17 to elastomeric plastic.

Lithonia urges the court to construe claim 17 as teaching "a prior art plaster frame; wherein the plaster frame is formed from elastomeric plastic." Defendants' Response to Plaintiff's Motion for Partial Summary Judgment, pgs. 17-18. To the extent that this construction requires "plastic material" to be limited to elastomeric plastic, the contention is rejected for the reasons just discussed. To the extent that Lithonia seeks a finding by the court that claim 17 teaches nothing more that a prior art plaster frame formed of a different material, this contention constitutes a challenge to validity which will be addressed at a later date. A separate motion by Lithonia for summary judgement of invalidity (DN 82) and a motion by Genlyte for partial summary judgment that the patent-in-suit is not anticipated, indefinite or unenforceable (DN 80) remain pending.

2957

A. Rigid Plate

An essential component of the Briggs & Riley patent is the "rigid plate" that provides the bag's "substantially rigid framework." Briggs & Riley argues that a "rigid plate" is "a rigid, smooth flat thin piece of material," (Pl. Mem. at 4, 9; Tr. at 8), and more specifically, as articulated in the specification with "a width approximately equal to the width of the walls . . . when [the] suitcase . . . is in its contracted position" (col. 3, lines 51-53) and with "a length less than the length of the walls" (col. 3, lines 53-54). Paragon advances a broader definition of "rigid plate" and would have the Court eschew all description beyond "rigid," leaving simply "a rigid piece of material." (Tr. at 13.) Paragon argues that as articulated in the specification, the '078 Patent "is broad enough to cover any substantially rigid plate member or strip member . . . [that would] provide a rigid link between the frame members. . . when the suitcase is so expanded." (Col. 7, lines 28-36; see also Def. Reply at 3.) Citing other descriptive words used in the specification for the "rigid plate" component, such as "stiffening member" and "strip member" (see, e.g., col. 5, lines 50-51, 58), Paragon asks the Court to construe "rigid plate" as any rigid link. (Def. Reply at 4; Tr. at 10-11.)

The plain meaning of the words "rigid" and "plate" do not support Paragon's broad construction. The Oxford English Dictionary defines plate much as Briggs & Riley defines it, as "[a] flat, comparatively thin, usually rigid sheet, slice, leaf, or lamina of metal or other substance, of more or less uniform thickness and even surface." Oxford English Dictionary [hereinafter OED], available at http://www.oed.com. To accept Paragon's construction, the specification must show that the patentee intended to alter the ordinary meaning of "plate." Nothing in the specification suggests that "plate" should be given anything but its ordinary meaning. Neither the plate's purpose of providing a rigid link nor the alternative description of the plate as a "stiffening member" are inconsistent with the ordinary meaning of "plate." While the specification suggests that a "strip member" would also be covered by the Patent, even though a "strip" is generally "a narrow piece . . . of approximately uniform breadth," OED available at http://www.oed.com, "strip member" is not clearly used in the specification to define "plate," but rather is presented as an alternative structure that could perform the plate's function. To the extent that the drafters were overly ambitious in suggesting in the specification that the '078 Patent could cover other shapes besides plate-like structures to provide the required rigid link, it is the "claims, not the specifications, that afford the measure of the grant to the patentee," Milcor Steel Co. v. George A. Fuller Co., 316 U.S. 143, 145-46, 86 L. Ed. 1332, 62 S. Ct. 969, 1942 Dec. Comm't Pat. 772 (1942), and the claim covers only a "rigid plate." Alternatives suggested in the specification do not broaden the ordinary and unambiguous meaning of the word "plate." Use of "strip member," while inconsistent, is, at most, presented as an alternative means of providing a rigid link, and comes nowhere near the required standard of showing that the patentee intended an unconventional or original definition of "plate."

Accordingly, a "rigid plate" is a rigid, flat, comparatively thin piece of material of more or less uniform thickness and even
surface with generally wide breadth. Whether a particular "stiffening member" or "strip member" would fit that description, or whether there is something novel about using a "plate" that was not anticipated in prior art, are questions of fact properly reserved for later proceedings on infringement.

C. Toe and Heel Plates

Except for independent claim 17 and its dependent claims in the '466 patent, each claim of the Wrike patents requires toe and heel plate elements having an upper surface affixed to the corresponding toe and heel sole surface. See e.g., supra, claims 1 of the '584, '466, and '143 patents. Benetton and Salomon contend that the toe and heel plate elements must be construed to be separate elements from the skate boot. V-Formation asserts that the toe and heel plates in the Wrike in-line skate need not be distinct from the underside of the skate boot, and that the toe and/ or heel plate could be formed as an integrated part of the bottom portion of the skate boot.

A plain reading of the claims shows that V-Formation's claim construction cannot be correct. Each of the claims in the Wrike patents that recite a toe and heel plate further requires that the plates "have an upper surface," which is affixed to the bottom portion of the skate boot. If the claimed toe or heel plate were an integral part of the bottom portion of the skate boot, as V-Formation suggests, the upper surface of the plate would not exist, which would render immaterial portions of the recited claim. "Specific claim limitations[, however,] cannot be ignored as insignificant or immaterial." Perkin-Elmer Corp. v. Westinghouse Elec. Corp., 822 F.2d 1528, 1533 n.8 (Fed. Cir. 1987). If V-Formation's proposed claim construction were followed, the structural relationship between the upper surface of the plate elements and bottom portion of the skate book that is recited in the claims would be effectively and improperly eliminated.

The requirement that the toe and heel plates are separate from the skate boot is confirmed by the specification and file history of the '466 and '143 patents. These patents describe two alternative embodiments of the invention -- one with toe and heel plates and one in which flanges form an integral body with the base of the skate boot. See e.g., '143 patent, Figs. 1-5; cf. '143 patent, 6:65-7:5, Fig. 6; '466 patent, 6:62-7:2. During prosecution of the '143 patent, Wrike had submitted claims directed to both embodiments. Salomon Exh. 13 at V21-26. After examination by the patent examiner, however, Wrike cancelled the claims directed to the latter embodiment, id. at V85-92, demonstrating a clear and unequivocal surrender of the second embodiment disclosed by the '143 patent specification. Indeed, V-Formation admits that the integral skate boot disclosed by the '143 patent is not claimed by the '143 patent but rather is claimed in a separate, related application (i.e., claim 17 of the '466 patent). V-Formation Opp. Memo. to Salomon's Motion for Summary Judgment at 22. In view of the surrender of the integral skate boot embodiment during the '143 patent prosecution history, and V-Formation's own admission that this embodiment does not come within the scope of '143 claims, I am persuaded that "toe plate" and "heel plate" should be construed to mean structural elements that must be separate elements from the skate boot and have an actual and identifiable upper surface that is affixed to the sole surface of the skate boot.

2. "top plate"

a. Parties' Positions

The parties propose the following constructions for "top plate," which is present in claim 2 of the '631 Patent, which generally describes Dr. Rippel's invention using a "cover plate." The electrical component to be cooled sits on one side of the "top plate," and this side serves as the "first surface" as described in both claims 2 and 3. The heat sink's "fins" protrude from the other, "second surface." The primary dispute between the parties is whether the claim term "top plate" should exclude "integral" connections.

Plaintiff: A generally planar member to which fin

Defendants: A flat member that is separate
structures may be either integrally or non-integrally connected from the fin structures.

b. Court's Construction

Plaintiff suggests that "generally planar" could include the protrusions from the top plate. However, throughout the specification, the top plate is shown as flat. Figures 1 - 3 and 6 - 8 depict the top plate and planar member. In the figures, the plate is flat. Figure 6 is a picture of the fin supports. They support the fin structures between them and are not the top plate; they are labeled differently. The top plate in Figure 6 is flat. Figures 7 and 8 also depict flat top plates. Plaintiff's generally planar language is not supported by the intrinsic evidence. The Court will utilize the first part of Defendants' proposed construction, "a flat member." The Court now considers the parties' primary dispute, whether the claim term should exclude "integral" connections.

While Plaintiff asserts its proposed construction takes no position on whether or not protrusions are integrally connected to the flat member, Defendants assert the term is inconsistent with the notion that the fin structures could be integrally bound. According to Plaintiff, Defendants focus on a mechanical bonding method referenced in the specification (i.e., the use of an epoxy) and the claim language does not compel any such limitation. Plaintiff asserts there is nothing inherent in the concept of a "plate" that would prevent these connections from being "integral" connections. Plaintiff further asserts the Abstract specifically identifies soldering and dip brazing, both of which produce integral connections, as appropriate means for connecting the plate element with the fins. ('631 patent at Abstract); see also U.S. Patent No. 6,284,985 Abstract (describing circuit plates as "plates" even though a semiconductor element has been "integrally bonded" into plates).

Plaintiff further asserts the preferred embodiment in the '631 Patent specifically utilizes "a plurality of fin supports which extend integrally from and perpendicular to the top plate." ('631 Patent at 5:51-53)(emphasis added). According to Plaintiff, Defendants' narrow reading of "plate" cannot be reconciled with the structure of this preferred embodiment which makes clear that the existence of "integral" protrusions will not destroy the top plate's status as a "plate." See NeoMagic Corp. v. Trident Microsystems, Inc., 287 F.3d 1062, 1074 (Fed. Cir. 2002) (claim constructions that exclude the preferred embodiment are strongly disfavored).

Defendants' proposed construction does not import process limitations regarding the manufacture of the claimed structures as suggested by Plaintiff. 2 Defendants' proposed construction is directed to describing the relationship between the specific structural components of the invention. See Vanguard Prods. Corp. v. Parker Hannifin Corp., 234 F.3d 1370, 1372 (Fed. Cir. 2000) (affirming a construction that "describes the relationship" between two components). More importantly, Defendants' proposed construction does not import any limitations, but rather stems from the plain language of the claims. In claim 2, the heat sink assembly comprises a "top plate" having first and second surfaces, the second surface of which is for "receiving" fin structures that are "bonded to" the second surface. Similarly, claim 3 recites a heat sink assembly that comprises at least two fin structures "in intimate contact with" the second surface of a thermally conductive planar member.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

2 Plaintiff asserts the '631 Patent is an apparatus patent, not a process patent. According to Plaintiff, it would be a mistake to look past the physical configuration of the apparatus' elements by focusing instead on the manufacturing methods used to achieve that configuration.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

The heat sink has a top plate having a first surface for receiving said component and a second surface for receiving fin structures. If the inventor had intended to cover extruded heat sinks, there would have been no need for a second surface for receiving fin structures as the second surface's purpose is for receiving, gluing, bonding, or putting the separate fin structures on top of it.

The Court agrees with Defendants that the invention does not cover extruded heat sinks. Rather, the top plate should be construed as a flat member that is separate from, rather than integrally connected, to the fin structures. Therefore, the Court construes the term "top plate" to mean "a flat member that is separate from the fin structures."
B. "Moving Platform"

"Moving platform" is found in all of the claims at issue. Pictometry acknowledges that "[w]ithout reference to the '946 patent itself, the plain, ordinary meaning of the term 'moving platform' might be considered by one of ordinary skill in the art to [be] broad enough to include satellite, an aircraft or a ground-based vehicle." Def.'s Opening Mem. in Supp. of Claim Constr. at 18. Pictometry argues, however, that "when read in the context of the intrinsic record of the '946 patent as a whole, it is apparent that a 'moving platform' is limited to a ground-based platform" such as a van or a backpack. Id.

In support of its proposed construction, Pictometry contends there is language in the specification that describes "moving platform" and its ascribed characteristics in a manner that is consistent only with a ground-based platform such as a van. The language cited by Pictometry includes:

. "The present invention includes a collection system comprising video cameras, a GPS receiver, an inertial navigation system (INS) and a control computer. The collection system is mounted in a moving vehicle such as a van." '946 patent, col. 2:21-24;

. "Generally, the collection system 10 is located on a moving platform such as a moving vehicle 11, as shown in FIG. 1." Id., col. 3:36-38;

. "The INS 28 can also include an odometer coupled to an undriven wheel of the vehicle 11, which reduces the need to stop for re-alignment of the INS 28." Id., col. 8:21-24;

. "If the vehicle must be stopped for an extended period of time, or if a previously recorded street must be driven again to reach a desired location, a pause command is given by the navigator to stop the recording of both video images and positional information." Id., col. 8:44-49;

. "[T]he offset between the spatial position of the vehicle 11 and the street centerline is calculated as shown by box 132 using the images on the collected video tape 130." Id., col. 9:31-33;

. "Generally, the vehicle 11 travels to one side of the center of the street." Id., col. 10:29-30;

. "This process further takes into account changes in the location of the vehicle 11 relative to the street centerline as the vehicle 11 travels down the street, including those caused by traffic and obstructions." Id., col. 11:40-43;

. "[A]n address seen in a video image can be compared to a calculated street address. If the two addresses are not the same, the visually observed address can be used to correct the model by which the address was calculated." Id., col. 15:9-13.

The only instance in which a platform other than a van is arguably implicated, Pictometry contends, is a passage referring to another ground-based platform: "the collection system 10 can be located on or in any moving platform, including a platform capable of being carried by a single person." Id., col. 18:23-25.

Pictometry also argues the specification's explanations of how the invention works make sense only if "moving platform" is limited to a ground-based platform. For example: (1) ground-based vehicles often have "odometers" but aircraft do not; (2) ground-based vehicles, but not aircraft, travel "down the street" and encounter "traffic and obstructions"; and (3) cameras mounted on ground-based vehicles, but not aircraft, capture images in which an address can be seen. Furthermore, the patent's teaching of the calculation of the street centerline offset is possible with a ground-based vehicle but not with an aircraft. The patent teaches that calculating the offset requires (1) mounting the front and rear-facing cameras so that their lenses are aligned with the vehicle's line of travel and (2) a known vector extending perpendicularly from one of the camera lenses to the surface of the street. See '946 patent, cols. 10:37-11:1. Pictometry explains that barring serious weather conditions or extreme wheel-alignment problems, the nose of a van will remain directly in line with the van's line of travel. In addition, the distance and angle of an imaginary vector extending from a camera mounted on top of the van to the surface of the street will remain constant. With an aircraft, however, cross-winds and turbulence cause the aircraft to pitch, roll, and...
yaw. Thus, to account for such forces, the nose of the aircraft will be pointed at any given time in a slightly different direction—perhaps several degrees—from the line of travel. Similarly, the length and the angle of the vector extending down to the surface of the street also will vary as the aircraft rises, falls, rolls, pitches, and yaws when encountering wind forces and turbulence. Accordingly, because the front and rear camera lenses must be aligned with the line of travel and the angle and length of the vector extending from one of the cameras to the surface of the street must be known, the calculation of the street centerline offset as instructed in the patent is possible only with a ground-based moving platform.

Pictometry argues that its proposed construction is supported by the Federal Circuit's decisions in Nystrom v. Trex Co., 374 F.3d 1105 (Fed. Cir. 2004) (Nystrom I) and Nystrom v. Trex, Inc., 424 F.3d 1136 (Fed. Cir. 2005) (Nystrom II). In Nystrom I, a district court construed the claim term "board" in a patent for construction material for use in exterior flooring surfaces to mean "a piece of elongated construction material made from wood cut from a log." 424 F.3d at 1107, 1110. The district court adopted such a construction after finding that the patentee "had limited the scope of the claim term 'board' by statements in the specification that a board is cut or obtained from a log ... and statements by [the patentee] during [the prosecution history]." Id. at 1110. On appeal, the patentee argued that (1) "board" is not limited to conventional wood boards that are cut from logs; (2) the claim language does not contain a description of the material from which the board is composed and, thus, the claim should not be limited to a particular material; and (3) the district court erred by relying on statements in the specification and the prosecution history to limit the claim because those statements did not represent a clear disavowal of claim scope. Id. at 1110-11. The Federal Circuit agreed, concluding that "the ordinary meaning of the word 'board' encompasses both a piece of cut wood or sawn timber and a similarly-shaped item made of a rigid material" and that nothing in the specification, claim language, or prosecution history revealed a disavowal or disclaimer of the full range of that ordinary and customary meaning. Id. at 1111-1113.

One year after Nystrom I was decided, the Federal Circuit issued its decision in Phillips and, shortly after, granted a petition for rehearing in Nystrom I for the limited purpose of addressing the effects of the Phillips decision. Nystrom II, 424 F.3d at 1138. On rehearing, the patentee made the same arguments it had made in Nystrom I. See id. at 1142. The Federal Circuit acknowledged that the claims did not include any language restricting the term "board" to a particular material or describing characteristics of wooden boards cut from logs. Id. at 1143. Nevertheless, the court concluded that "[a]n examination of the term 'board' in the context of the written description and prosecution history of the ... patent leads to the conclusion that the term 'board' must be limited to wood cut from a log." Id. The court explained that although the ordinary meaning of the word "board" encompasses both a piece of cut wood or sawn timber and a similarly-shaped item made of a rigid material, the decision in Phillips made clear that the patentee was "not entitled to a claim construction divorced from the context of the written description and prosecution history," which consistently used the term "board" to refer to wood decking materials cut from a log. Id. at 1145. "The problem is that if the district court starts with the broad dictionary definition in every case and fails to fully appreciate how the specification implicitly limits that definition, the error will systematically cause the construction of the claim to be unduly expansive." Id. (citing Phillips, 415 F.3d at 1321). Applying the principles of Nystrom I and Nystrom II here, Pictometry reasons that the language of the specification shows that "moving platform" has been limited by the inventors to mean a ground-based moving platform.

Geospan responds that Pictometry's proposed construction restricts the claims to "the exact disclosed preferred embodiments" when "neither the plain language of the claims, nor the specification and file history, support [such a restriction]." Pl.'s Rebuttal Mem. [Docket No. 142] at 1. In addition, Geospan claims that Pictometry's reliance on Nystrom II is erroneous. In Nystrom II, "both parties acknowledge[d] the ordinary meaning of 'board' as a 'piece of sawed lumber,'" and the court rejected the patentee's proposed construction, which sought to "broaden the term 'board' to encompass relatively obscure definitions that [were] not supported by the written description or prosecution history." Id. at 1145. Here, by contrast, both parties have acknowledged that "the plain, ordinary meaning of the term 'moving platform' might be considered by one of ordinary skill in the art to [be] broad enough to include satellite, an aircraft or a ground-based vehicle." Def.'s Opening Mem. in Supp. of Claim Constr. at 18.

Pictometry's position that the specification limits the scope of the claim term is untenable. First, Pictometry's emphasis on the specification's description of a specific, narrow embodiment of the invention is not a proper basis for limiting the construction of the claim to that specific embodiment. See Phillips, 415 F.3d at 1323 ("[A]lthough the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments.").

Second, Pictometry's position misapprehends the import of Nystrom II and in the process, violates the very principles
articulated in that case. "In [Nystrom II], both parties acknowledged the ordinary meaning of [the claim term] . . . [and] we refused to impose a construction broader than the term's ordinary meaning. Here, on the contrary, we decline to impose a construction narrower than the term's ordinary meaning."). Acumed LLC v. Stryker Corp., 483 F.3d 800, 808-9 (Fed. Cir. 2007) (second alteration in original) (quotation and citations omitted). As in Acumed, there is no dispute that the ordinary meaning of "moving platform" can include air-based moving platforms, and Pictometry's proposed construction would improperly seek to narrow that plain and ordinary meaning.

Third, Pictometry's argument that the specification fails to explain how the invention could be applied to an air-based moving platform essentially takes the position that "moving platform" should not receive a construction that would include embodiments that are not enabled in the patent. Indeed, Pictometry expressly argues that "moving platform" should not receive a construction broader than that which is both "described and enabled" in the specification. Def's Reply Mem. [Docket No. 150] at 4. But arguments regarding enablement go to validity, not claim construction. See Roche Palo Alto LLC v. Apotex, Inc., 531 F.3d 1372, 1379 n.1 (Fed. Cir. 2008); see also Phillips, 415 F.3d at 1327 ("While we have acknowledged the maxim that claims should be construed to preserve their validity, we have not applied that principle broadly, and we have certainly not endorsed a regime in which validity analysis is a regular component of claim construction."); Motorola, Inc. v. STMicroelectronics, N.V., 2004 WL 5707527, at *13-15 (E.D. Tex. Sept. 21, 2004) (concluding that arguments that a patent failed to teach an embodiment other than the preferred embodiment and that another embodiment could not be accomplished under the teachings of the patent were enablement arguments going to validity, not claim construction). But see Chiron Corp. v. Genentech, Inc., 363 F.3d 1247, 1263 (Fed. Cir. 2004) (Bryson, J., concurring) ("I think the proper approach . . . is to . . . construe[e] claims, where possible, as they would have been understood by one of skill in the art at the time of the invention, and not construe[e] them to reach the as-yet-undeveloped technology that the applicant did not enable.") (emphasis added).

Pictometry next argues that during the prosecution of the '946 patent, the inventors and the United States Patent and Trademark Office ("PTO") examiner "consistently described the 'moving platform' as a ground-based platform." Def's Opening Mem. in Supp. of Claim Constr. at 31. Specifically, Pictometry cites the examiner's statement in an October 31, 1994 office action that:

GPS users in other field[s], however are already conscious about that [sic] GPS receivers can resolve the size of the moving platform carrying GPS receivers. For example, positional data from two GPS receivers on opposite aircraft wing tips are different, and such differences should be considered for aircraft landing application.

Hobson Decl., Ex. 4 at 10-11. But Pictometry's reliance on the quoted language assumes the examiner's reference to other fields and aircraft indicates that the examiner viewed the invention as applying to ground-based photogrammetry as opposed to the air-based field of photogrammetry. The more natural understanding of the quoted language is that the examiner was instead referring to fields other than photogrammetry, such as aircraft landing applications.

Pictometry cites several statements made by the inventors in responding to the PTO examiner as showing that the invention was limited to ground-based platforms:

. the inventors' statement that aspects of their invention were "particularly helpful for the application of short range terrestrial photogrammetry." Id., Ex. 5 at 6;

. the inventors' statement that for data collected according to the invention "to be usable for short range terrestrial photogrammetry, which differs from traditional stereophotogrammetry . . . , it is critical that for each recorded video image the position of the camera from which [it] was obtained, at the time [it] was obtained, be precisely known." Id.; and

. the statement to the examiner that prior art cited in an office action "cannot resolve the length of the van, let alone determine a precise instantaneous position and orientation of each camera at the time the image is obtained." Id., Ex. 7 at 5.

These statements during the prosecution of the '946 patent do not, however, evince a "clear and unmistakable disavowal of scope," and thus, are not a basis for limiting the meaning of the claim term. Computer Docking Station Corp. v. Dell, Inc., 519 F.3d 1366, 1374 (Fed. Cir. 2008) (quotation omitted). To the extent that the statements could be viewed as having a limiting effect, they do not indicate that the inventors were both distinguishing between ground-based photogrammetry and air-based photogrammetry and disclaiming that their invention pertains to the latter. The inventors' discussion of the prior art
Based on the intrinsic evidence—the claim language, the specification, and the prosecution history—the Court concludes that no construction of "moving platform" is necessary because the term is used in the claim in accordance with its plain and ordinary meaning to one skilled in the art and is not limited to a ground-based platform. Having resolved the construction of the claim term based on intrinsic evidence, an examination of extrinsic evidence is unnecessary.

The next term for definition is "play" in claim 49 of the ‘410 patent, in claims 2 and 11 of the ’579 patent, and in claim 1 of the RE ’439 patent. The Plaintiffs contend that play means "a dimensional relationship of the locking surfaces of interlocking panels such that the locking surfaces can be displaced or slide relative to one another in the direction of their joined edges." (Pls’ Open. Br. 38.) Pergo contends that "play" means "an intentional space allowing for free movement, displacement or sliding of joined panels relative to each other along adjacent joined edges." (Unilin’s Open. Br. 35-36.)

Claim 1 of the RE ’439 patent states:

A system for providing a joint between adjacent building panels, comprising: each of said building panels including a first edge and a second edge such that the first edge of each of said building panels forms a first mechanical connection with the second end of an adjacent one of the building panels locking the first and second edges of the building panels to each other in a first direction at right angles to a principal plane of the panels, and a locking device arranged on a rear side of the building panels forming a second mechanical connection locking the building panels to each other in a second direction parallel to the principal plane and at right angles to the first and second edges, said locking device fitting within a locking groove extending parallel to and spaced apart from the first edge of said building panels, and which locking groove is open at the rear side of the building panels, the locking device comprising a strip integrated with the second edge of each of said building panels, said strip extending throughout substantially an entire length of the second edge and being provided with a locking element projecting from the strip, such that when two adjacent building panels are joined together, the strip projects from the rear side of the second edge of the panels with its locking element received in the locking groove of an adjacent building panel, the building panels, when joined together, can occupy a relative position in said second direction where a play exists between the locking groove and a locking surface on the locking element that is facing the first and second edges and is operative in said second mechanical connection, the first and the second mechanical connections both allow mutual displacement of the building panels in a direction of the first and second edges, and the second mechanical connection enables the locking element to leave the locking groove if the respective building panel is turned about its first edge angularly away from the strip.

(’439 patent, 10:35-67.) (Emphasis added).

The parties' proposed definitions are similar. The Plaintiffs object to the inclusion of "intentional" and "free movement." The Alloc court did not revise the construction of "play" as being "space between the locking groove on a first panel and a locking element on a panel adjacent to the first panel." 342 F.3d at 1367. Play allows the displacement and disassembly of the panels. The Plaintiffs' use of the phrase "dimensional relationship" is analogous to "space," but is more cumbersome. Pergo's definition is deficient because it does not identify where the space exists. Thus, the Court defines "play" as meaning "space between the locking surfaces of interlocking panels such that the locking surfaces can be displaced relative to one
On appeal, Saunders argues that the district court improperly limited the scope of the term "pneumatic cylinder." Saunders contends that the term "pneumatic cylinder" does not inherently require the presence of a pressure activated seal and that nothing in the specification or the prosecution history suggests that the term pneumatic cylinder, as used in the patent, requires such a seal. For that reason, Saunders argues, claim 1 of the '690 patent reads on the accused products, which have pneumatic cylinders without pressure activated seals.

Claim terms are generally given the meaning those terms would have to a person of ordinary skill in the art. Phillips v. AWH Corp., 415 F.3d 1303, 1313 (Fed. Cir. 2005) (en banc). It is not disputed that the ordinary meaning of the term "pneumatic cylinder" does not require the presence of pressure activated seals. The asserted claims can be assigned a narrower scope only if there is some indication in the patent or the prosecution history that the term pneumatic cylinder was meant to have a more restrictive meaning as used in the patent, or a broader meaning was disclaimed during prosecution. See Phillips, 415 F.3d at 1316; Honeywell Int'l, Inc. v. ITT Indus., Inc., 452 F.3d 1312, 1319-20 (Fed. Cir. 2006); SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1342-44 (Fed. Cir. 2001). We conclude that the text of the '690 patent and its prosecution history do not justify such a restrictive construction of the term.

The strongest indication that the term pneumatic cylinder, as used in the '690 patent, was not meant to include pressure activated seals as a matter of definition can be found in a comparison of independent claim 1 and claim 6, one of the claims that depend from claim 1. Claim 1 recites a pneumatic cylinder but does not expressly require a "pressure activated seal." Claim 6 recites the apparatus of claim 1 and then adds a limitation reciting a pressure activated seal. Claim 6 reads as follows (emphasis added):

The apparatus of claim 1 comprising at least one pressure activated seal in the pneumatic cylinder extending circumferentially around a piston, the pressure activated seal movable between a relaxed position and an extended position so the pressure activated seal engages an internal surface on the pneumatic cylinder when the pneumatic cylinder is in the pressurized state for engagement with an inside surface of a cylinder housing when in the pressurized state.

Given that claim 6 adds the pressure activated seal limitation to claim 1, the doctrine of claim differentiation supports the inference that claim 1 encompasses cylinders without pressure activated seals. Otherwise, claim 6 would add nothing to claim 1 and the two would cover identical subject matter. See Phillips, 415 F.3d at 1314-15 ("[T]he presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim."); Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir. 2004).

The defendants argue that there is a meaningful difference in scope between claim 1 and claim 6 under their construction because claim 6 requires the seal to "extend[] circumferentially around a piston" while being movable so as to engage the cylinder in a particular place. That language from claim 6, however, is better read as simply definitional language that describes the operation of a pressure activated seal. The patent does not disclose any other way of constructing a pressure activated seal, and the recitation of the operation of the pressure activated seal adds nothing of substance to the recitation of the seal itself. The defendants have not pointed to any evidence that those of skill in the art would have understood the referenced language as carving out a subset of all pressure activated seals.

The prosecution history of the '690 patent provides further support for Saunders' argument that the term "pneumatic cylinder," as used in the patent, is not restricted to pneumatic cylinders that use pressure activated seals. The '690 patent resulted from a continuation application claiming priority to an application that specifically required at least one pressure activated seal in all its claims. When the patentees filed the continuation application, they omitted that limitation from some, but not all, of the new claims. Had they omitted the limitation from all of the claims, it might be argued that the limitation was assumed to be present and did not need to be explicitly recited. Making such a change to only some of the claims,
however, is a strong indication that the claims not reciting pressure activated seals were not intended to require them.

The Petition to Make Special is also significant because the applicants asserted in that document that a device lacking a pressure activated seal infringed the independent claims of the application. To be sure, the petition did not specifically discuss pressure activated seals. It is undisputed, however, that the petition accused the device of infringing only those claims that lacked a pressure activated seal requirement and that the accused device had no pressure activated seals. Under those circumstances, the petition indicates that the applicants did not regard the presence of pressure activated seals as a necessary condition for infringement of those claims.

B

The defendants point to various features of the patent and the prosecution history in support of their argument that one of skill in the art would necessarily conclude that only pneumatic cylinders with pressure activated seals are within the scope of claims 1 and 16 of the ’690 patent. They first contend that such a limitation is evident from the claim language requiring that the cylinder be capable of "maintaining a generally static traction force for a period in excess of 10 minutes when in the pressurized state without additional pressurized air being supplied." Because the specification does not describe any pneumatic cylinders without pressure activated seals, and because the specification does not disclose any other way to maintain the necessary traction force, the defendants argue that a person of skill in the art would understand that a pressure activated seal is necessary to maintain the recited traction force. Accordingly, they contend that the claims must be limited to pneumatic cylinders with pressure activated seals.

A patent that describes only a single embodiment is not necessarily limited to that embodiment. Liebel-Flarsheim, 358 F.3d at 906 (citing cases). "Even where a patent describes only a single embodiment, claims will not be read restrictively unless the patentee has demonstrated a clear intention to limit the claim scope. . . ." Innova/Pure Water, Inc. v. Safari Water Filtration Sys., 381 F.3d 1111, 1117 (Fed. Cir. 2004) (internal quotations omitted). While an assertion by the patentee that using pressure activated seals is the only way to maintain the needed traction force would evidence an intention to narrow the scope of the independent claims, the patent contains no such assertion.

To be sure, the specification of the ’690 patent, which is identical to the specification of the parent ’174 patent, contains passages that describe the portable traction device as comprising at least one pressure activated seal. See ’690 patent, abstract; col. 2, ll. 13-16. But those passages do not expressly state that the pressure activated seal is an essential component of the invention. While the restrictive language of the specification might be sufficient in other contexts to limit the scope of the claims, it is not sufficient in this case, where the language of the claims so clearly distinguishes between those claims that require the presence of a pressure activated seal and those that do not. See Liebel-Flarsheim, 358 F.3d at 908.

The defendants argue that the specification in this case closely resembles the one at issue in Alloc, Inc. v. International Trade Commission, 342 F.3d 1361 (Fed. Cir. 2003). In that case, the court construed the claims to include a feature that was common to all the disclosed embodiments but was not explicitly recited as a limitation in any of the claims. The claims at issue in Alloc recited floor system features related to "displacement" and "disassembly" of the flooring components. Id. at 1368. The court construed the claims to require "play" between the flooring components because the patent specifically taught that such play enabled the displacement and disassembly features and because the patent criticized prior art systems that lacked play as being impossible to disassemble nondestructively. Id. at 1369-70. In contrast, the ’690 patent does not criticize prior art cylinders based on their lack of pressure activated seals. The specification indicates that pneumatic cylinders "typically" cannot maintain an adequate traction force, but the patent does not state that the only way to accomplish the goal of maintaining traction force is through the use of pressure activated seals. Accordingly, the specification does not support the narrowing construction that the defendants propose.

The defendants next argue that in the prosecution history the applicants unambiguously disclaimed pneumatic cylinders lacking pressure activated seals. In making that argument, the defendants focus on the prosecution history of the parent ’174 patent. The fact that the prosecution history relied upon was created in connection with the parent application would be unimportant if the claim language at issue were present in both patent applications. In this case, however, all the claims in the ’174 patent explicitly require at least one pressure activated seal while the ’690 patent omits that language from the asserted claims. At the same time, the alleged disclaimer distinguishing the prior art focused on a particular claim limitation—the "pressure activated seal" limitation found in each of the claims of the ’174 patent—and was not directed to the invention as a whole. See SciMed Life Sys., 242 F.3d at 1343-44. When the purported disclaimers are directed to specific
claim terms that have been omitted or materially altered in subsequent applications (rather than to the invention itself), those disclaimers do not apply. Ventana Med. Sys. v. Biogenex Labs., 473 F.3d 1173, 1182 (Fed. Cir. 2006) ("[T]he doctrine of prosecution disclaimer generally does not apply when the claim term in the descendant patent uses different language."); Invitrogen Corp. v. Clontech Labs., Inc., 429 F.3d 1052, 1078 (Fed. Cir. 2005) ("[T]he prosecution of one claim term in a parent application will generally not limit different claim language in a continuation application."); Advanced Cardiovascular Sys. v. Medtronic, Inc., 265 F.3d 1294, 1305-06 (Fed. Cir. 2001) (omitting the claim term to which the prosecution history disclaimer argument was directed precluded those statements from being applied to the child application). Accordingly, any arguments in the prosecution history of the '174 patent that distinguish prior art based on the presence or absence of a pressure activated seal are inapplicable to the '690 patent.

The defendants contend that there is common language in the applications and that the statements in the prosecution history of the '174 patent apply to that common language. They note that the patentees distinguished the '174 patent claims not only by arguing that the prior art lacked pressure activated seals, but also by arguing that the prior art pneumatic cylinders were unable to maintain the required traction force, a requirement that is found in both the '174 patent and the '690 patent. While the statements about traction force apply to both the '174 patent and the '690 patent, they do not establish that the cylinder in the '690 patent must contain a pressure activated seal. That is, the prosecution history contains no argument that the prior art devices failed to maintain the requisite traction force because of the absence of activated seals.

The first passage from the prosecution history cited by the defendants distinguishes a prior art patent to Loveless. The relevant portion of the argument reads as follows:

The seal in Loveless is a conventional O-ring 37 that does not change shape with air pressure. The O-ring 37 is always engaged with the engagement surfaces 41, 42 so that the level of friction between the cylinder sleeve 14 and the piston 23 is generally constant. Therefore, Loveless does not disclose the claimed pressure activated seal, and no prime facie case of obviousness is set forth.

It is asserted on page 6 of the office action that the cylinder of Loveless would be able to maintain a static traction force for a period in excess of 10 minutes since the air leakage in the cylinder will not occur. There is no teaching in Loveless for this capability. Moreover, Applicants' experience has been that such pneumatic cylinders do leak over time and are not sustainable for maintaining a static traction force. Applicants submit that the combination and [sic] Dyer and Loveless fails to disclose the claimed pressure activated seal and a pneumatic cylinder capable of maintaining a static traction force for a period of time without addition of pressurized air being supplied.

The first paragraph of that passage distinguishes Loveless based on the absence of the claimed pressure activated seal and thus is not relevant to the '690 patent claims at issue. The first three sentences of the second paragraph are relevant to the '690 patent, but they argue only that the Loveless seal is incapable of maintaining the required traction force. They do not state that the Loveless cylinder lacks the capacity to maintain sufficient traction force because it lacked a pressure activated seal. Rather, the two paragraphs address different limitations of the claims, the seal and the need to maintain traction force. The last sentence is consistent with the two-part structure of the argument and in effect summarizes the two distinguishing arguments. Accordingly, the cited passage does not constitute a disclaimer of all cylinders lacking pressure activated seals, as the defendants contend.

The second passage relied on by the defendants discusses a prior art patent to Gantz. That passage reads as follows:

The use of [the] rolling diaphragm type piston and cylinder arrangement disclosed in Gantz may be the result of the small vacuum pump. The pump disclosed in Gantz develops about 0.5 torr of pressure. . . . The small pressure generated by the pump of Gantz makes an air tight piston system with little or no friction extremely important. Applicants speculate that any friction due to the sliding seals or air leakage would render the traction device of Gantz inoperative.

That argument also fails to demonstrate a relationship between maintaining the traction force and the presence of pressure activated seals. The passage argues only that the particular seal disclosed in Gantz would not be feasible for use in the patentee's invention because it does not maintain the required traction force. While that passage rejects the particular seal used in Gantz as sufficient to satisfy the requirements of the invention, it does not mean that the invention excludes all seals other than pressure activated seals.
The district court concluded that, "[a]t the very least, the specification and prosecution history . . . make claims 1 and 16 of the '690 Patent ambiguous as to whether the pneumatic cylinder must utilize at least one pressure activated seal." In that setting, the court held that it was proper to apply the maxim that claims should be construed to preserve their validity. See Phillips, 415 F.3d at 1326. The court further concluded that if claims 1 and 16 were construed broadly, they would not be enabled because the specification "would provide absolutely no indication of how to construct the claimed invention because a pneumatic cylinder 'having at least one pressure activated seal' is the only pneumatic cylinder described in the specification" and because the inventors made clear that they did not believe an ordinary O-ring seal would work in a device of the sort they claimed.

In light of the structure of the claims (with some reciting pressure activated seals and others lacking that limitation), the focus of the Petition to Make Special on the defendants' device, and the absence of any clear disclaimer in the specification or the prosecution history, we hold that the term "pneumatic cylinder," as used in the '690 patent, encompasses cylinders that do not use pressure activated seals, and that claims 1 and 16 are not ambiguous. For that reason, it was error for the district court to use the possible invalidity of those claims, if broadly construed, as a basis for construing them narrowly. See Liebel-Flarsheim, 358 F.3d at 911. That is not to say that we reject the district court's validity analysis; we hold only that the court's validity analysis cannot be used as basis for adopting a narrow construction of the claims. Instead, any validity issues that the defendants have preserved and wish to press can be addressed on remand, as was done in the Liebel-Flarsheim case. See Liebel-Flarsheim Co. v. Medrad, Inc., 481 F.3d 1371 (Fed. Cir. 2007) (holding invalid claims that had been given a broad construction at the patentee's behest in an earlier appeal).

While we reverse the district court on the issue of claim construction, we do not suggest that the resolution of the claim construction issue presented in this case, or in other similar cases, is easy or that the outcome is dictated by the straightforward application of patent law principles. Cases such as this one, in which predecessor applications or patents were drawn to narrow claims and in which the claims in the successor application are arguably broader than the invention described in the specification, present difficult questions of both claim construction and validity. Where the applicant expressly and unambiguously states his intention to claim broadly, the claim construction issue is easier and the question becomes one of validity--whether the specification supports the full breadth of the new claims. On the other hand, where--as in this case--the patentee has not been explicit about the scope of the new claims, the case can pose interdependent problems of both claim construction and validity. We have concluded that the change in claim language between the '174 patent and the '690 patent, and in particular the inclusion of the "pressure activated seal" limitation in some claims and its omission from others, is a sufficiently powerful indicator as to the proper construction of the asserted claims that it outweighs the portions of the specification in which the invention is described narrowly. We emphasize, however, that the problem is a difficult one, made more so by the failure of applicants to state expressly to the examiner, whether for tactical reasons or otherwise, the extent to which they intended their new claims to depart from the scope of the claims in the predecessor applications. In many such cases, as in this one, we and the district court are required to draw sometimes conflicting inferences from different sources of guidance as to proper claim construction and to weigh those conflicting inferences in reaching a conclusion as to the proper construction. After engaging in that process in this case, we reach a different result from that reached by the district court, but not easily.

GO BACK

7. "forced point-bonding"

KXI contends that the phrase "forced point-bonding" means two or more primary particles joined together by an adhesive where the binder has been forced under pressure into some of the primary particle's macropores or exterior voids. PUR counters that "forced point-bonding" means two or more primary particles joined together by an adhesive. PUR states that the court adopted its proposed construction of the phrase in Culligan.

The specification of the '311 patent states that forced point-bonding materials have "adhesive-like bonds between the particles caused by the melting of the binder resin and squeezing this material to a point insufficient to consolidate into a continuous web." The specification also explains forced point-bonding as follows:
In many cases involving porous materials such as activated carbon, activated aluminas, and similar porous adsorbents, the binding agent is forced into the macropores and exterior voids of the individual particles to form physical connections between particles. This 'forced point-bonding' (FPB) results in structures that are generally more fragile than those having the continuous web matrix structure.

Based on this language in the specification, the court agrees with KXI that "forced point-bonding" means two or more primary particles joined together by an adhesive where the binder has been forced under pressure into some of the primary particle's macropores or exterior voids.

13. The '622 Patent - Claim 1 - Elements [d] and [f]

44. Elements [d] and [f] of Claim 1 recite that the spacer element includes a "locking means" to interlock with "an interlocking means provided on the protruding portion of the fixture," where "one of said means is an n-sided polygon and the other means is a 2n-sided polygon."

45. The parties disagree on the meaning of the term "polygon" in element [f] of claim 1. Neither the word "polygon" nor the phrases "n-sided polygon" or "2n-sided polygon" are found in the specification.

46. "Without an express intent to impart a novel meaning to claim terms, an inventor's claim terms take on their ordinary meaning." York Prods., Inc. v. Central Tractor Farm and Family Center, 99 F.3d 1568, 1572 (Fed.Cir.1996). To find the ordinary meaning of a word, the Federal Circuit has reviewed dictionary definitions. See, e.g., Id.

47. The term polygon is defined in RANDOM HOUSE DICTIONARY OF THE ENGLISH LANGUAGE, Unabridged Edition (1979), p.1115, as follows:

Pol-y-gon . . . n. a figure, esp. a closed plane figure, having three or more, usually straight, sides. [<<L <ITALICS>polygon(um) <<GK <ITALICS>polygonon, neut. Of polygonos many-angled. See POLY -, - GON]

Thus, by definition, the term "polygon" does not require that the sides be straight.

E. Pre-calculated Calibration Plane

The dispute concerning the term "pre-calculated calibration plane" is over whether the calculation occurs in two dimensions or whether it involves a Z coordinate as well. The parties do not dispute that the calculation occurs prior to the inspection, or run-time. Scanner asserts that the term is defined as a calculation of a representation of a calibration plane in two dimensions where a three dimensional model is formed by views from two different cameras. (Scanner Post-Hr. Br. at 14). ICOS asserts that the term includes the calculation of the Z=0 world plane during the calibration process. (ICOS Post-Hr. Br. at 22).

Figure 2B is "a flow chart illustrating the steps within the pre[-]calculated calibration process." (Tr. at 144, ll. 1-3). The final step of Figure 2B, step 114, states "define X and Y world coordinates." Step 114 does not include any reference to determining the Z=0 world plane. (See Fig. 2B). According to the written specification describing step 114, however, the process includes determining the Z=0 world plane as well. (See Col. 7, ll. 6-8 ("In step 114 the processor defines the X and Y world coordinate and the Z=0 plane.")). Because the description of Figure 2B expressly states that the processor defines the Z=0 world plane, the term "pre-calculated calibration plane" is construed to define the X and Y world coordinate and the Z=0 world plane.
I. Both Cortland and Orvis are in the fishing equipment business. Cortland acquired the rights and interests to the '003 patent and a registered trademark, "CASSETTE." The '003 patent--issued from an application filed on August 2, 1990--covers a fishing reel with an interchangeable cartridge spool.

Traditionally, fishermen had great difficulty changing fishing lines in response to varying fishing conditions. To change fishing lines, a fisherman had to remove the entire reel spool from the pole and substitute another reel spool. This process made it difficult to quickly change fishing lines to accommodate changing fishing conditions. In addition, multiple spare reel spools with different fishing lines was an expensive proposition for most fishermen. The invention solves this problem by providing a fishing reel with an easily interchangeable cartridge spool that mounts onto the reel spool. Claim 1, the only independent claim, recites:

1. A fishing reel that provides for an interchangeable line bearing cartridge spool comprising:

   a housing, said housing including a flat wall, said housing having a rigid first spool receiving shaft affixed thereto and protruding away from said wall;

   a cartridge spool;

   first spool means for mounting said cartridge spool, said first spool means comprising a first end plate, a first spool axle attached rigidly to said first end plate, a second end plate, and means for connecting said second end plate to said first spool axle, said first spool axle having a hollow aperture which is fitted over said first spool receiving shaft;

   means attached to said first spool means for manually rotating said first spool means;

   said cartridge spool comprising two end plates and a central cartridge spool axle unitarily connected therebetween, said cartridge spool axle being fitted over and mounted upon said first spool axle, said cartridge spool carrying a supply of fishing line, whereby said cartridge spool can be installed on or removed from said first spool.

'003 patent, col. 6, ll. 12-34 (emphasis added). As shown below, Figure 1 of the '003 patent illustrates the invention:

GET DRAWING SHEET 1 OF 1.

Specifically, cartridge spool 26 is mounted between end plates 18a and 18d. To operate the invention, a fisherman places a cartridge spool between the two end plates, which essentially act as a reel spool of the fishing reel. The fisherman then couples female threaded connector 24a to male threaded connector 24b. The fisherman then simply attaches the assembled unit--first spool means--to fishing reel housing 12. To change fishing lines, the fisherman disengages the end plates 18a and 18d and replaces cartridge spool 26 with another cartridge spool. By carrying several different cartridges, a fisherman can speedily change lines according to different fishing conditions.

Orvis sells the accused fishing reel--marketed as Rocky Mountain Reels--having an interchangeable cartridge spool for quick and inexpensive changing of fly line. British Fly Reels, Ltd. (BFR), a British corporation, manufactures the Rocky Mountain Reels based on the technology described in Duffelen, United Kingdom Patent No. 2,183,431. BFR owns the Duffelen patent, which issued on June 10, 1987. The figure below illustrates a side elevational view of the Rocky Mountain Reel:

[SEE FIGURE IN ORIGINAL]

As shown above, the Rocky Mountain Reel contains a housing, a cartridge spool, and an end plate. The housing features a wall, a receiving shaft, and, at the base of the receiving shaft, a plastic insert with two receiving slots (not shown). The cartridge spool has two end faces connected by a cylindrical axle. A hollow, circular rubber grommet outlines the
circumference of the cylindrical axle facing the housing (not shown). The end plate includes a hollow spool axle with two prongs. For assembly, the cartridge spool slides over the spool axle, which in turn, slides over the receiving shaft of the housing. The two prongs of the spool axle then snap into the two receiving slots of the plastic insert.

On September 4, 1997, Cortland sued Orvis alleging infringement of the '003 patent and the registered trademark "CASSETTE." The district court granted summary judgment of no patent infringement. The district court determined that the Rocky Mountain Reel has no second end plate either literally or equivalently. Additionally, the district court decided on summary judgment that Orvis does not infringe Cortland's trademark. Cortland appeals.

II.

The first step, claim construction, is a matter of law, which this court reviews de novo. See Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456, 46 U.S.P.Q.2D (BNA) 1169, 1172 (Fed. Cir. 1998) (en banc). Although the central focus remains on the claim language as illuminated by the written description and the prosecution history, extrinsic evidence may supply context to understand the claim language. See Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1309, 51 U.S.P.Q.2D (BNA) 1161, 1168 (Fed. Cir. 1999); Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996).

The only disputed element of claim 1, the first spool means, contains four components: (1) a first end plate, (2) a first spool axle attached to the first end plate, (3) a second end plate, and (4) means for connecting the second end plate to the first spool axle. In dispute are the second end plate and the means for connecting.

This court first examines the meaning of the claim term "a second end plate." Claim terms receive their ordinary and customary meaning unless the patentee assigns a special meaning. See Vitronics, 90 F.3d at 1582. The plain meaning of the term "plate" means a broad, flat piece of material. See WEBSTER'S NINTH NEW COLLEGIATE DICTIONARY 901 (1990). The words and drawings in the '003 patent reinforce this customary meaning of the word "plate."

The written description of the '003 patent describes the end plate as a structure that can accommodate "frictional contact" with a cartridge spool to resist relative rotation between the cartridge spool and the end plates. See '003 patent, col. 2, ll. 54-60. Figure 1 of the '003 patent illustrates two distinct end plates 18a and 18d as flat, disc-like structures. End plates 18a and 18d have surfaces of sufficient diameter so that "the end faces of cartridge spool 26 flush against the inside of spool 18 end faces [and] keep the outside end plate 18d firmly locked in position." Id., col. 4, ll. 62-65. When in place, these end plates have frictional contact with the cartridge spool and resist rotation.

Moreover, in the '003 patent's "Brief Description of the Drawings," the patentee states that "FIG. 1 shows a side elevational view exploded of a fishing reel in accordance with the present invention including the interchangeable spool." '003 patent, col. 3, ll. 31-33 (emphasis added). Indeed, figure 1 illustrates the only embodiment of the claimed invention. In figure 1, the second end plate is a disk-like structure of sufficient diameter that is separate from the cartridge spool and abuts the end face of the cartridge spool. Thus, the specification supports the conventional meaning of the word "plate" as a broad, flat disc.

The record of the administrative proceedings before the United States Patent and Trademark Office supports this interpretation of the '003 patent. Specifically, in seeking allowance of the pending claims, the applicant stated during prosecution:

The rotatable spool fishing reel shown by Duffelen is itself completely different than applicant's reel both in structure and
function. Clearly, neither Kovalovsky or Duffelen shows a cartridge spool mounted on a conventional type spool with one of the spools functioning as a removable cartridge to the primary reel spool that functions in a conventional way. . . . The fact is that when combined, there is no logic that would allow one to end up with a spool mounted on a spool as specifically claimed in applicant's claims 1 through 8.

J.A. at 200 (emphasis added). Accordingly, the two end plates constitute outer surfaces of a "primary reel spool that functions in a conventional way." The end plates thus secure the removable cartridge spool within the conventional reel spool. To secure the cartridge spool within the reel spool, as illustrated in the patent drawings, the second end plate must be a disk-like structure that abuts the end face of the cartridge spool. The function and description of the second end plate also require sufficient diameter--approximating that of the cartridge spool--to hold the cartridge spool in place. In sum, the prosecution history also supports the customary meaning of the term "plate."

GO BACK

A. "plate"

The parties agree that the word "plate" may be used to describe flat or slightly curved disc-like structures. NJI argues that the word "plate" encompasses many other forms including bent plates, curved plates and planar plates. While Fisher acknowledges that "plates" may be bent to form other structures such as "tubes," Fisher contends that the term "plate" comprises only flat or slightly curved structures and that, once plates are combined or a plate is altered to form another structure, that structure can no longer be referred to as a "plate."

The claims of the '510 Patent refer to "plates" generically and to "plates" which are "planar." Clearly the term "plate" in isolation encompasses more than merely "planar" (flat) structures. The specification expressly defines "plate":

The term "attenuator plate" as used with respect to the structures is considered in its broadest sense, and may include screens, nets, etc., as more fully described above with respect to the FIGS. 1 through 12 embodiments.

'510 Patent at col. 7, 11. 9-13. The descriptions of Figures 1 through 12 of the Patent disclose "plates" which are "twisted in a spiral configuration" and "screens" (one variety of "plate") which are "curved." Id. at col. 5, 11. 36 & 49. The description of figures 8 and 9, however, distinguishes between "plates" and "tubes." Id. at col. 5, 11. 36-43.

The ordinary meaning of the word "plate" is a structure that is thinner than it is wide or long and that is generally flat and solid. 1 The claims and specification of the '510 patent expand that definition to encompass structures that may be flat, curved or twisted and that may be perforated such as a screen or net. The specification specifically excludes "tubes" from that expanded definition of "plate." This Court will therefore construe a "plate" as a structure that is thinner than it is wide or long and that may be flat, curved or twisted and perforated such as a screen or net but that is not a tube.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

1 Based upon the testimony of Cullen Langford, a mechanical engineer certified as an expert in valve operations and standards for valves, this Court concludes that there is no special definition of "plate" in the field of mechanical engineering and that, therefore, a person of ordinary skill in the art of valve mechanics would give the word "plate" its ordinary meaning.

GO BACK

3. work platform; planar work platform

The term "work platform" appears in claims 1 - 24 of the '874 patent, and claims 1 - 20 of the '786 patent. The term "planar
work platform" appears in claims 25 - 53 of the '213 patent and claims 10 - 12 of the '283 patent. The plaintiff proposes a common construction for both terms of "a planar surface designed to allow the child to interact with the toy by causing contact with the surface." The defendant initially proposed different constructions for each term, arguing that "work platform" meant "an integral planar physical platform of the toy housing for receiving blocks," and that "planar work platform" meant "an integral planar physical platform of the toy housing for receiving blocks and not containing defined cavities for receiving objects." In light of the intrinsic evidence, the defendant changed each of its proposed constructions to "a planar platform of the toy housing for receiving a plurality of blocks." Brief of the Defendant at 31.

The defendant's proposed construction improperly incorporates separately claimed features. For example, claim 10 of the '283 patent states "a planar work platform on which a child can make selections by causing contact across a surface of the planar work platform," as well as "correctly solved by the child causing contact with the work platform." '283 patent, cl. 10. As is evident from the claim language, the "work platform" is distinct from the interactive limitation of "causing contact." Additionally, as discussed above, the patentees' invention is not necessarily limited to children.

The defendant's construction improperly incorporates a requirement that the work platform be a part of, e.g. integral with, the toy's housing. The specification contradicts this limitation. For example, Figure 1 depicts an embodiment where the work platform is separate from toy housing, while Figure 2 depicts an alternative embodiment where the toy housing and work platform are joined in a unitary structure. See '874 patent, 3:6-67.

The defendant's attempt to incorporate the word "planar" within the construction of "work platform" is improper because the term "planar" is separately included in the claims. See '283 patent, cl. 10. Additionally, as discussed above, the defendant's proposed construction improperly incorporates the term "block."

For the foregoing reasons, the court concludes that the term "work platform" means "a surface for receiving objects," and the term "planar work platform" means "a planar surface for receiving objects."

A. Pleat

Cuno and Pall have submitted competing constructions of the term Pleat -- which appears literally hundreds of times in the '047 and '765 Patents. Pall asserts that the proper construction of the term is "two legs which are joined to one another at a crown and to a leg of an adjacent pleat at a root." Cuno argues that the term should mean "two legs which are joined to one another at the crown of the outer periphery of the filter element and which are joined to a leg of an adjacent pleat at the root of the inner periphery of the filter element." This Court finds that Pall's construction of this claim is proper.

Applying the legal standard, stated above, to the construction of the term Pleat results in a determination that it has a meaning that is broader than Cuno asserts. To interpret a term, this Court must first consider the words of the claim and all other intrinsic evidence. In this case, the consideration of intrinsic evidence ends the inquiry and provides this Court with certainty as to the meaning of this disputed term.

Pall's asserted definition of the term Pleat is supported by the wording of the claims themselves. The wording of the 143 patent claims of the asserted patents does not contain language that requires the Pleats to have crowns and roots located at the outer and inner peripheries of the filter element. Rather, the claim language Pleat is somewhat broader. Specifically, claim 1 of the '047 patent, provides that each pleat has "a pair of legs, each of the legs having a first and a second surface." '047 patent, col. 26, lines 19-20. Claims 54 and 92 of the '047 patent state, in pertinent part, that

```
each of the pleats has a curved configuration and includes a crown, a root, and a pair of legs, . . . the legs of each pleat being joined to one another at the crown and joined to a leg of an adjacent pleat at the root . . . .

'047 patent, col. 30, lines 5-9; '047 patent, col. 32, lines 34-39.
```

Other intrinsic evidence also supports Pall's construction of the term Pleat. The specifications of the asserted patents describes the term Pleat broadly without limiting the crowns and roots of the Pleats to be located at the outer and inner
Cuno argues, however, that the specifications, specifically the preferred embodiments, should limit the construing of the term Pleat to include crowns and roots that are joined at the outer periphery and inner periphery of the filter element, respectively. (Def.'s Mem. in Supp. 15.) This Court declines to agree with Cuno's argument. The Federal Circuit has made clear that descriptions and drawings of the preferred embodiments are not to be used to limit the language of the claims. See Phillips, 415 F.3d at 1323 ("although the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments"); Home Diagnostics, Inc. v. Lifescan, Inc., 381 F.3d 1352, 1355 (Fed. Cir. 2004); Anchor Wall Systems, Inc. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1306-7 (Fed. Cir. 2003). Thus, despite the fact that the patents contain a preferred embodiment, which may show and describe crowns and roots that are joined at the outer and inner peripheries, the term Pleat is not construed to contain such a limitation. See Phillips, 415 F.3d at 1323 (discussing the importance of not "importing limitations from the specifications into the claims").

3. "Pliable sheet material"

At the preliminary injunction hearing, I found that claim 1 of the '909 patent requires three things: a core made of a pliable sheet material, a layer of adhesive and a light absorbing coating. As I noted at the hearing, and as is undisputed here, defendant's product has only a layer of ink and a layer of adhesive and no pliable sheet material separating the two. (I will construe defendant's assumption that this conclusion was final as an argument that this construction is correct.) Plaintiff contends that the patent does not necessarily require three layers; it argues that the limitation may be satisfied by an ink layer and an adhesive layer that combine to form a pliable sheet material.

Plaintiff cites the following passage from the claim specification as teaching both a two-and three-layered structure:

As to the light absorbing coating 12, while it may be a coloring material or dye which permeates the body layer, the light absorbing surface may comprise a non-reflective, such as black, hypo-allergenic coating uniformly applied over the surface of the body sheet.

'909 Pat., col. 2, Ins. 37-41 (emphasis added). According to plaintiff, this passage confirms that the '909 patent encompasses two-layered devices wherein the light absorbing coating becomes "one and the same" with the body layer. To the extent that plaintiff is suggesting that this portion of the specification indicates that the color material or dye might qualify as the body layer itself, such a reading would rest on an unsustainable interpretation of the word "permeates." Instead, I understand plaintiff to posit the far more reasonable construction that the patch might consist of two layers wherein one is the adhesive layer and the other is a body material permeated with a some sort of dye. Although I would tend to agree that this portion of the patent specification reveals that the body layer and the coloring material do not need to be physically distinct, plaintiff makes a sleight-of-hand-like suggestion that because the patch might be characterized as a "two-layered" that any two layers will do. If anything, this passage indicates that there must be some sort of body material in addition to the adhesive and the dye or other coloring material.

Other portions of the specification provide further confirmation that "pliable sheet material" means something other than the dye and adhesive:

For the body sheet layer [], any economically feasible, self-sustaining, pliable sheet material may be used such as a medical grade air permeable tissue. This may be a felted fibrous material such as semi-bleached craft, porous thin plastic sheet, plastic mixed or impregnated paper tissue, or any other thin sheet material such as may be used for medical adhesive bandages, and which is susceptible to mass production die cutting or stamping of the patches.

'909 Pat., col. 2, Ins. 28-36. This specification teaches that the pliable sheet material must be akin to a medical grade air permeable tissue, a semi-bleached craft, a porous thin plastic sheet, a plastic mixed or impregnated paper tissue, or any other thin sheet material that may be used for medical adhesive bandages. Additionally, it shows that the sheet material must be sufficiently "pliable" as to be "susceptible to mass production die cutting or stamping of the patches." See also Merriam
Webster's Collegiate Dictionary 894 (10th ed. 1997) (defining "pliable" as "supple enough to bend freely or repeatedly without breaking").

In light of the above specifications, I conclude that "pliable sheet material" means a thin, flat bendable material, similar to a medical grade air permeable tissue, porous thin plastic sheet or a plastic mixed or impregnated paper tissue, having one side either coated or permeated with a light absorbing material and having a layer of pressure sensitive adhesive on its opposing side.

1. "pliable tubular body"

The parties first dispute the meaning of the language in claims 1 and 7 of the '133 patent that describes a "pliable tubular body having a closed front end and a rear edge bounding an opening into a body compartment into which an amount of lead shot is inserted prior to closure of the body compartment." '133 patent, 4:57-60. The plaintiff's proposed construction of the phrase is "a non-rigid structure having a tubular shape and a cavity of unspecific dimensions with an amount of lead shot therein." Plaint. Br. at "Ex. G." Defendants' proposed construction is "a stretchable tube shape hollow body having a single inner compartment formed by one closed end opposite one opening formed by a rear edge." Def. Br. at 14.

3 Claim 7 is identical to Claim 1, except that the word "maintained" is substituted for "augmented." Claims 1 and 7 are the two independent claims in the '133 patent.

The parties agree that the claims describe a projectile body containing a single cavity or compartment. The parties disagree as to whether "pliable" means "stretchable" or "non-rigid." The ordinary meaning of "pliable" is not "stretchable," but rather "bendable." Therefore, the claim language is properly construed to mean "a bendable tube shape structure having a single compartment that is formed by a closed front end and a rear edge that bounds an opening, through which opening an amount of lead shot is inserted prior to closing the opening."
to define the term "plug" by what it does not mean rather than by what it does mean. The discussion of the use of bone wax
in the prior art focused on problems with the manner in which it was used. They maintain that the term "plug" should not be
construed based upon its composition where there is no restriction in the claim language regarding the material composing
the plug.

The competing constructions offered by the parties present several issues: (1) whether the Court should construe the term
"plug" to cover only embodiments that do not include bone wax in light of the disclaimers in the specification; (2) whether
the World Wide Plaintiffs' construction is so broad as to encompass prior art; and (3) whether the limitations in
AnazaoHealth's proposed construction are necessary to preserve the validity of the '760 Patent.

(i). Exclusion of Bone Wax

The specification discusses complications in the prior art that "stem from the use of bone wax or other materials that are
used to plug the cannulas prior to the loading of the radioactive seeds." (‘760 Patent col. 2, ll. 1-3 (emphasis added).) The
specification then lists four drawbacks associated specifically with the use of bone wax. Id. at col. 2, ll. 4-20. Elsewhere, the
specification describes the invention as including a "biocompatible end plug which may be made of a variety of materials
including absorbable or non-absorbable suture materials either in a braided or monofilament configuration or molded
biocompatible polymers." Id. at col. 2, ll. 35-39 (emphasis added). Repeatedly thereafter, the specification refers to a
"biocompatible end plug" without further limitation as to the composition of the end plug. Id. at col. 2, ll. 53, 58. In the
Description of the Preferred Embodiments section, the material of the end plug is described as

biocompatible and biodegradable. It may be formed, for instance, of processed collagen (catgut), Nylon or various other
organic substances. A preferred material is polyglactin acid (PGA) available under the trademark POLYGLACTIN 910.

Id. at col. 4, ll. 2-7. This section also recites the exact positioning of the end plug as a significant advantage over "the
hazard positioning of the more proximate end of a bone wax material as used in the needle assemblies of the prior art." Id.
at col. 4, ll. 36-38 (emphasis added). The inventors note that other variations of the invention are contemplated. Id. at
col. 5, ll. 29.

The Federal Circuit has repeatedly cautioned against importing limitations from the specification into claim terms. See, e.g.,
Phillips, 415 F.3d at 1323-24; Callicrate, 427 F.3d at 1368; North Am. Container, Inc. v. Plastipak Packaging, Inc., 415 F.3d
1335, 1348 (Fed. Cir. 2005). At the same time, if the specification makes clear that the invention does not include a
particular feature, that feature is deemed outside the claims of the patent even though the claims might otherwise be
considered broad enough to encompass that particular feature. SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc.,
242 F.3d 1337, 1342 (Fed. Cir. 2001).

Based on a review of the intrinsic evidence, the Court concludes that the term "plug" should not be construed so as to limit
the composition of the plug to materials other than bone wax. Although the specification does discuss the disadvantages
associated with the manner in which prior art used bone wax to plug cannulas prior to loading the radioactive seeds, the
specification discloses that the end plug may be composed of any material that is suitable for brachytherapy operations.
While it lists specific examples of preferred materials, it does not limit or foreclose the use of any other materials. Nothing
in the intrinsic evidence to suggest that the inventors intended to exclude or disavow any particular material from the scope
of the claim, if that material was suitable for use in brachytherapy and could be fashioned in such a manner as to create a
plug that could be inserted into the cannula a predetermined distance from the distal end. Statements in the specification
discussing the disadvantages of prior art do not necessarily require a limiting construction, particularly where the language
of the claim and the presumption of claim differentiation call for the opposite conclusion. See Acumed LLC v. Stryker
Corp., 483 F.3d 800, 805 (Fed. Cir.) (rejecting the alleged infringer's reliance on the discussion in the specification of the
disadvantages of certain features of prior art to limit the claim of the asserted invention), cert. denied,552 U.S. 1022, 128 S.
Ct. 615, 169 L. Ed. 2d 393 (2007).

(ii). Distinguishing the Claimed Invention from the Prior Art

AnazaoHealth also cites to the prosecution history as limiting the breadth of the term to something that is a "separate
ejectable member" and of "predetermined dimensions."
Clearly, statements made during prosecution may also affect the scope of a claim. Computer Docking Station Corp. v. Dell, Inc., 519 F.3d 1366, 1374 (Fed. Cir. 2008). "Specifically, a patentee may limit the meaning of a claim term by making a clear and unmistakable disavowal of scope during prosecution." Id. (internal citation and quotation marks omitted). For example, a patentee might clearly characterize an invention in a particular way to try to overcome a rejection based on prior art. Id.

As AnazaoHealth points out, the prosecution history reveals that Claim 1 was rejected initially as being anticipated by prior art, the Mercereau Patent, et al. (U.S. Patent No. 6,450,937), which showed two different yieldable means. (W0470.) The patentees then revised Claim 1 of the ‘760 Patent to add "including a plug" after yieldable means (and later "fronctionally held"). The Remarks submitted with the revision describe Mercereau as showing a lubricious coating, some of which was allowed to accumulate by surface tension in the end of the tube to form a web. This was formed by dipping the tube into a vat of coating material, where capillary action and surface tension caused a small quantity of the coating material to remain in the forward end of the tube. The quantity of lubricious material entering the tube was "notoriously unreliable" and would extend over different distances, varying from one tube to the next. Additionally, the web was comprised of solid polymers that were not absorbable or biodegradable. (W0481.) In the second version of Mercereau, the lubricious coating was allowed to accumulate by capillary action and surface tension to form a "plug" that was "not a separate ejectable member," as described in the ‘760 Patent. Rather it was the solidified overflow into the distal end of the cannula by capillary action when the cannula was dipped into a vat. This embodiment of the prior art was considered even more unreliable in terms of the distance the material would extend into the cannula. Id.

The patentees asserted that an essential feature of their invention was the yieldable means of positioning the element a pre-determined distance from the distal end includes a plug of predetermined dimensions with a rearward end that is positioned an exact length back from the extreme distal end of the beveled point. This distance is critical and does not vary from assembly to assembly. . . . Since Mercereau clearly does not include a plug which positions an element a predetermined distance from the distal end, Mercereau does not anticipate Claim 1.

(W0481-W0482 (first emphasis added, second emphasis in original).)

According to AnazaoHealth, these statements constitute a clear and unambiguous disavowal by the patentees that the plug of their invention was anything other than one of predetermined dimensions that was separate and ejectable. The Court agrees that these statements, as well as the specification and other claims of the Patent, support AnazaoHealth's interpretation that the plug must be ejectable. However, that requirement is already included in Claim 1, which describes a "plug" as an example of a "yieldable means," i.e., "means capable of yielding, or giving way under force." Therefore, to include the limitation that the plug must be ejectable would be redundant.

The Court disagrees, however, that the these statements in the prosecution history constitute a clear disavowal of a plug being anything other than of predetermined dimensions. While the remarks describe features of the claimed invention, including a plug of predetermined dimensions, which differentiate it from Mercereau, they do not expressly disavow other embodiments of a plug for positioning an element a predetermined distance from the distal end of the cannula. See Northern Telecom Ltd. v. Samsung Elecs. Co., 215 F.3d 1281, 1294 (Fed. Cir. 2000) (refusing to limit scope of claim where statements in the prosecution history did not exclude the possibility of using a particular process); Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1458 (Fed. Cir. 1998) (holding that statements in prosecution history distinguishing prior art could not properly be interpreted as precluding coverage for every type of external reservoir). In fact, the specification and other claims in the ‘760 Patent describe methods of changing the size of the plug to enhance its frictional engagement with the wall of the cannula, which contradicts the requirement that the plug must be of predetermined dimensions. See, e.g., Claims 18-21. Rather, the critical distinction between the ‘760 Patent and Mercereau was the ability of the claimed invention to position an element a "predetermined distance from the distal end," not that the plug itself was of predetermined dimensions. The court declines to include the limitation that of "predetermined dimensions" in the definition of "plug."

(iii). Invalidity of Plaintiffs' Construction

Lastly, AnazaoHealth argues that Plaintiffs' attempts to construe "plug" in a manner than extends to bone wax renders the patent invalid for want of enablement under 35 U.S.C. § 112, P 1, because the Patent does not enable the full scope of the
invention claimed. AnazaoHealth asserts that Plaintiffs’ position puts this case squarely within the holding of AK Steel Corp. v. Sollac and Ugine, 344 F.3d 1234 (Fed. Cir. 2003).

As AnazaoHealth correctly observes, when claims are amendable to more than one construction, they should be interpreted to sustain their validity if reasonably possible. See Rhine v. Casio, Inc., 183 F.3d 1342, 1345 (Fed. Cir. 1999). Claims, however, "can only be construed to preserve their validity where the proposed claim construction is 'practicable,' is based on sound claim construction principles, and does not revise or ignore the explicit language of the claims." Generation II Orthotics Inc. v. Med. Tech., Inc., 263 F.3d 1356, 1365 (Fed. Cir. 2001). In Phillips, 415 F.3d at 1327, the Court acknowledged this "maxim," but noted that it had not been applied broadly nor had the Federal Circuit endorsed "a regime in which validity analysis is a regular component of claim construction." Instead, this principle has been limited to cases in which "the court concludes, after applying all the available tools of claim construction, that the claim is still ambiguous." Id. (quoting Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 911 (Fed. Cir.), cert. denied, 543 U.S. 925, 125 S. Ct. 316, 160 L. Ed. 2d 223 (2004). "In such cases, [the Federal Circuit has] looked to whether it is reasonable to infer that the PTO would not have issued an invalid patent, and that the ambiguity in the claim language should therefore be resolved in a manner that would preserve the patent's validity." Id.

The first paragraph of section 112 provides in relevant part that the specification shall describe "the manner and process of making and using [the invention]," in such clear and concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use [the invention]." The enablement requirement is met when one skilled in the art could, after reading the specification, practice the full scope of the claimed invention without undue experimentation. AK Steel, 344 F.3d at 1244. "That is not to say," however, "that the specification itself must necessarily describe how to make and use every possible variant of the claimed invention, for the artisan's knowledge of the prior art and routine experimentation can often fill gaps, interpolate between embodiments, and perhaps even extrapolate beyond the disclosed embodiments, depending on the predictability of the art." Id. (citing Genentech, Inc. v. Novo Nordisk A/S, 108 F.3d 1361, 1366 (Fed. Cir.), cert. denied, 522 U.S. 963, 118 S. Ct. 397, 139 L. Ed. 2d 310 (1997)).

In AK Steel, the Court held that the patent was invalid because the specification failed to enable the full scope of the patent claims where the patentee had made it clear that a specific type of material would not work with the invention, yet this material was encompassed within the construction of the claim. Id. at 1244. Here, however, as discussed above, unlike AK Steel, the patentees have not disavowed the use of any specific material, including bone wax, as a plugging material. Rather, they have disavowed the manner in which bone wax and other plugging materials were used or applied in the prior art. The Court does not find the Patent invalid for failure to meet the enablement requirement of section 112, paragraph 1.

The Court concludes that, in light of the specification, the words of the claims themselves, and the prosecution history, a person of ordinary skill in the art would interpret the claim term "plug" to mean "an object or material used to fill or seal an opening," as urged by the World Wide Plaintiffs. Thus, Claim 1 would read in relevant part, "a needle assembly comprising a cannula . . ., a line of elements . . ., yieldable means, including a frictionally held object or material used to fill or seal an opening, for positioning an element more proximate the distal end a predetermined distance from the distal end. . . ."

Poly-America maintains that the term "plug" should be construed to mean "an object that prevents, rather than one that merely throttles or constricts, extrusion of thermoplastic flow at the location where it is disposed in the first side passage." Serrot contends that the term "plug" should be construed to "mean any of various devices or masses of material, resembling or functioning as a stopper, which can be placed by any means in an extrusion passage to partially block the extrusion passage and prevent the extrusion of material in the area intended to yield a smooth surface." Concerning the phrase "to partially block the extrusion of said molten thermoplastic material from said first side passage," Poly-America urges that, read in conjunction with the term "plug," the phrase means "the plug is disposed, and prevents extrusion, only along a part of the circumference of the first side passage, so that molten thermoplastic material is extruded through the side passage except at the portion of its circumference where the plug is positioned."

2 This construction, although addressed to claim 1 and the "first side passage," would also control claim 2, the dependent
Having considered the parties' briefs and the intrinsic evidence and appropriate extrinsic evidence, the court concludes that one of ordinary skill in the art at the time of the invention would have understood the term and phrase in question to mean the following: 3

3 The request that the court construe the term "plug" arose at the November 26, 2002 pretrial conference. The court received briefing on the construction of that term, and of the phrase in question, on December 3 and 4, 2002. In order to provide the parties sufficient advance notice of its rulings before the commencement of trial on December 9, 2002, the court is filing a memorandum opinion that sets out its construction, but it reserves the option of elaborating on the ruling if necessary to facilitate appellate review.

As used in claim 1 of the '112 patent, the term "plug" means an object located in the first side passage that prevents extrusion of molten thermoplastic material through the location where the object is disposed in the first side passage. As used in claim 2 of the '112 patent, the term "plug" means an object located in the second side passage that prevents extrusion of molten thermoplastic material through the location where the object is disposed in the second side passage.

To determine whether or not a term that uses the word "means" should be construed pursuant to § 112, P 6, "the focus is on whether the claim term recites no function corresponding to the means or recites sufficient structure or material for performing that function." Apex Inc. v. Raritan Computer, Inc., 325 F.3d 1364, 1372 (Fed. Cir. 2003) (citing Rodime PLC v. Seagate Tech., Inc., 174 F.3d 1294, 1302 (Fed. Cir. 1999)). The Court finds that the term "pluggable memory key means" has sufficient structure to fall outside the ambit of § 112, P 6. There is no dispute between the parties that the term "pluggable" allows the memory key to be alternatively inserted and removed from the meter. Furthermore, there is no dispute between the parties that the "memory key" is a chip or module that contains data.

Apex/HDI contend that the prosecution history makes clear that the "pluggable memory key means" is a means plus function term. However, as pointed out by Roche in its reply brief, the references cited by Apex/HDI all refer to claim 5 to bolster their argument that Roche has failed to rebut the presumption that the language used for the term makes it a term subject to § 112, P 6. The prosecution history reads:

Claim 5 specifically recites the operation of the processor means performing certain functions in relation to a CRC value read from the pluggable key means. . . . Applicants are unable to comprehend the basis for the inclusion of claims 5 and 16 in the rejection under 35 USC 112 [sic], fourth paragraph. Applicants respectfully submit that claims 5 and 16 are clearly proper dependent claims and fall well within the bounds of paragraph 6 of 35 USC 112 [sic]. Applicants further submit that
the Examiner's statement at the bottom of page 6 of the official Office Action is in clear error when considering the recitations contained in the presently pending claims. For the record, the Examiner indicated as follows:

"The dependent limitations with respect to how the processor or pluggable memory key means is to be sued have not been given any patentable weight with respect to the apparatus limitations. Patentability of apparatus claims are dependent upon features not on how the particular feature is to be used. The claimed feature only need to be capable of performing the function". [sic]

35 USC 112 [sic], sixth paragraph provides a statutory basis for means plus function claims. Function recitations is [sic] means plus function claims limit how the "means" are to be used. Thus, by definition, the functional recitations contained in the pending claims are entitled to be given "patentable weight" and to be considered as defining Applicants [sic] invention in full conformance with 35 USC [sic]. Applicants respectfully submit the Examiner was in error in taking the above-noted position. Withdrawal of the rejection of claims 5 and 6 under 35 USC 112 [sic], fourth paragraph is respectfully requested.

***

. . . Claim 5 recites that the pluggable key means stores a cyclic redundancy check value (CRC). Claim 5 further recites a function performed by the processor means in combination with the CRC values. No such teaching is present in Keiser et al.

Apex Defs.' Exh. 2, at A70-A73. In summary the patentees stated:

In view of the above, Applicants respectfully submit that claims 1, 2, 5, 15, and 16 clearly differentiate over any teaching of Keiser et al. or any teaching which one skilled in the art might derive from Keiser et al. Applicants respectfully submit that the functional statements contained in the rejected claim must be considered in determining the patentability thereof in conformance with 35 USC 112 [sic], sixth paragraph. Reconsideration and withdrawal of the rejection of claims 1, 2, 5, 15 and 16 under 35 USC 102(b) [sic] is respectfully requested.

Id. at A73. These sections indicate that the patentees argued for evaluation of at least original claims 5 and 16 pursuant to § 112, P 6, however, there is no connection between these arguments and claim 1.

Even if there were such a connection, there is no distinguishable difference between the structure identified by a plain-meaning interpretation of the term "pluggable memory key means" and a means-plus-function interpretation of the term. The clear meaning and/or structure for the term "pluggable memory key means" in the 609 patent is: a removable and/or reinsertable read-only-memory ("ROM") chip and/or module. The parties apparently agree that the 609 patent specification repeatedly refers to interchangeably a "removably, pluggable memory module" or a "pluggable read only memory(ies)" or a "pluggable memory key" or "pluggable ROM key" or simply a "ROM key." See, e.g., 609 Patent, col. 1, ll. 9-10; id. col. 3, ll. 13-33; id. col. 3, ll. 46-64; id. col. 4, ll. 40-56; id. col. 5, ll. 5-17. It is the reinsertable, ROM or memory key/module that is inserted into an electrical receptacle of the meter, and stores parameter values and procedure routine specifications (or procedure routines), throughout the 609 patent's specification.

For the foregoing reasons, the Court finds that the "pluggable memory key means" is: a removable and/or reinsertable read-only-memory ("ROM") chip and/or module.

10. "one or more plugs for external drives and devices, and ports for switches"

This term appears in the '408 patent claim 9. Rackable contends that "one or more plugs for external drives and devices, and ports for switches" means "one or more plugs for drives and peripheral computer subsystems (such as disks, keyboards, monitors, mice, printers, scanners, tape drives, microphones, speakers, or cameras) that are external to the computer chassis, and one or more ports for switches." Supermicro asserts that "one or more plugs for external drives and devices, and ports for switches" means "one or more connectors for drives or elements that are external to the computer, and openings that provide access to switches."
Again, it is helpful to provide the full language of claim 9 of the '408 patent, which recites:

A computer comprising:

- a main board having I/O connectors including one or more data transmission ports mounted thereon; and
- a chassis comprising a front panel providing access to the I/O connectors including the one or more data transmission ports and access to each component provided for the computer selected from the group consisting of removable power supplies, removable drives, removable media drives, one or more plugs for external drives and devices, and ports for switches.

The essence of this dispute is really how "device" should be defined. It is clear to the court from the parties' arguments in their papers and at the hearing that there really is no dispute regarding the definition of "plug" or "drive;" that the drives and devices are "external" to the computer; and that "ports for switches" are openings. Accordingly, the court declines to define those terms, which are undisputed.

As for the definition of "device," Supermicro advocates a broad definition of the term, contending that "device" is synonymous with "element," and should be construed as a generic term referring to any item that is hooked up to a computer. Rackable, on the other hand, argues for a narrower definition, one that limits a "device" to a "peripheral computer subsystem" and provides examples of "peripheral computer subsystem[s]."

Rackable argues that Supermicro improperly attempts to broaden the definition of the term "device." Rackable cites to the '366 patent specification, including figure 1, in support of its argument that "referred-to 'devices'" include "peripheral computer devices, such as keyboards, monitors, mice, printers, scanners, tape drives, microphones, speakers or cameras." See '366 patent at 6:11-18. Rackable also cites to a dictionary definition for "device." See Ostrapuk Decl., Exh. DD.

Supermicro counters that Rackable's narrow definition of the word "device," limiting it to a "peripheral computer subsystem" is contrary to the specification. It asserts that the patent application intentionally chose to use the generic term "device," as opposed to the more specific "computer subsystem" or "peripheral device." Supermicro also cites to a technical dictionary definition for the term "device."

It is not necessary for the court to resort to extrinsic evidence to construe the term "device" because the specification provides meaning for the term. The related '366 patent abstract clarifies that Supermicro's broader construction of "device" is more appropriate. That abstract explains that "by placement of access space to all elements which require periodic attention at the front of each computer, the need for significant space at the rear of a computer is eliminated." '366 patent abstract. Later in the specification's "summary of invention," the specification utilizes a similar broad term for "devices" -- "attachments." '408 patent at 4:8. The specification also provides examples of such "devices," but the list is not exhaustive. In the detailed description of the embodiments, the specification provides that "a number of devices may be optionally used in this port" and then continues with a discussion of the possible types of "drives" (not to be confused with "devices"). '408 patent at 6:7-13. The specification then suggests that devices may include "USB/external SCSI or parallel port devices or other auxiliary data drives configured for plug-in use." Id. at 6:13-19. However, nowhere does the specification define "devices" as narrowly as Rackable would have the court construe it.

Because the court finds that the specification supports a broader construction of "device," and also finds that "attachment" is clearer than "element," as advocated by Supermicro, the court construes "one or more plugs for external drives and devices, and ports for switches" as one or more plugs for external drives and attachments, and ports for switches.

3. "plunger"

Plaintiff's Proposed Construction: "a device that can be inserted into a blender"

Defendant's Proposed Construction: "an elongated device having a cross-sectional size that is approximately equal to the
cross-sectional size of a member associated with the blades, which is inserted into a blender and positioned within the area where an air channel would otherwise form during blending" and "not a stirrer, i.e. not used in a stirring operation"

The Court's Construction: "a device that can be inserted into a blender"

Plaintiff argues that a "plunger" is any "device that can be inserted into a blender" including a "stir stick" such as that used in defendant's blenders. Defendant argues that plaintiff disclaimed all "stirrers," including stir sticks. Defendant also seeks a claim construction adding limitations to the claim term that would require the plunger to be "elongated," "having a cross-sectional size that is approximately equal to the cross-sectional size of a member associated with the blades," and "positioned within the area where an air channel would otherwise form during blending." Defendant acknowledges that its arguments are all directed to the functionality and operation of the plunger (that is, to limitations on the claimed method) rather than to the structure of the claim term "plunger."

The Court finds that, while the inventors have disclaimed a method of stirring to break up an already formed air pocket, such a disclaimer is not equivalent to disclaiming the structure of a stirrer. In fact, the parties have not identified any structural differences between a plunger and a stirrer. Tellingly, during the prosecution of the '892 application, the examiner equated the structure of the prior art stirrers with that of the claimed plunger in rejecting the apparatus claims as anticipated by the prior art stirrers. Further, the disclaimer of stirring methods is encompassed by the Court's construction of the term "preventing the formation of an air pocket," above.

Turning to the limitations defendant seeks to add to the term "plunger," defendant first argues the plunger must be "elongated." In the specification, the plunger is not well-defined. It is described as having a "stop member," which is a member that would keep the plunger from falling into the blender and contacting the blades in the absence of constant user attention. During prosecution, the inventors characterized the plunger portion and handle portion of the then-claimed apparatus as being "longitudinally extending members with the stop member being positioned therebetween." However, in doing so, the inventors were describing three claim elements that do not appear in Claim 1: a plunger portion, a handle portion, and a stop member. Because the intrinsic evidence lacks any clear and unambiguous characterization of the plunger as elongated, the Court declines to so limit the claim.

Defendant next suggests that the plunger must have a cross-sectional size approximating the cross-sectional size of the member associated with the blades. This limitation already appears elsewhere in the claim and need not be imported into the term "plunger."

Defendant also asks the Court to require that the plunger be positioned within the area where an air channel would otherwise form during blending. Claim 1 already contains a limitation with respect to the position of the plunger; it must be adjacent to and above the rotating blades. The meaning of "adjacent to and above the rotating blades" is also disputed by the parties and construed below. Therefore, the Court will address defendant's arguments regarding the position of the plunger below.

Finally, the Court finds no need to rely upon the dictionary definitions provided by defendant.
The district court did not provide reasoning for its conclusion that "plurality" means more than three "gaps" or "pockets" on each sidewall. Moreover, this court detects no support for this conclusion in the plain meaning of the word or any of the public documents, including the patent and the administrative record of its procurement. The term means, simply, "the state of being plural." American Heritage Dictionary Second College Edition 955 (2d ed. 1982). Thus, this term requires only at least two ridge members on each sidewall to form a load lock.

There is nothing in the file history that would alter this plain meaning. Rye, which may not qualify as prior art, discloses a bed liner with three recesses. Rye, however, does not disclose sidewall ridges. Instead, Rye secures a load with its recesses. In any event, the '876 patent differs from Rye in many more respects than simply having more than three "gaps" or "pockets." Furthermore, the administrative record does not disclose that the '876 inventors took any steps to distinguish the Rye reference other than to swear behind it. In sum, the mere invocation of Rye does not support the conclusion that "plurality" must mean more than three "gaps" or "pockets" to escape prior art.

Without reason to construe "plurality" other than in accordance with its ordinary meaning, this court notes that the district court erred by unduly limiting the meaning of "plurality."

2978

1. Count Construction

Bilstad first argues that the Board's decision must be reversed because its claim construction of the term "plurality" is erroneous. In particular, Bilstad argues that the Board's combination of multiple dictionary definitions to arrive at a range is inconsistent with precedent. 2 Wakalopulos argues instead that the Board properly construed "plurality" because the written description of the '657 patent does support a broad construction and the Board's analysis is fully consistent with precedent.

Before the Board, Bilstad and Wakalopulos offered competing definitions of the term "plurality." Wakalopulos argued that "plurality" means "a large number; multitude," whereas Bilstad argued that "plurality" simply means "two or more items." The Board began by noting that the parties did not argue that "plurality" had any special meaning in the art, nor did the parties argue that Bilstad's specification provided a definition of "plurality." Original Decision, 2003 Pat. App. LEXIS 84 at *36. The Board then consulted a dictionary to ascertain the ordinary meaning of "plurality" and was confronted with multiple definitions, including those proffered by the parties. 2003 Pat. App. LEXIS 84 at *37. Specifically, the Board noted that Webster's Third New International Dictionary included multiple definitions of "plurality," including "the state of being plural," "the state of being numerous," and "a large number or quantity: MULTITUDE." 2003 Pat. App. LEXIS 84 at *37 (quoting Webster's Third New International Dictionary 1745 (Philip Babcock Gove, Ph. D. ed. 1993) ("Webster's"). The Board also included the definition of "plural" from the same dictionary: "relating to or consisting of or containing more than one." The Board went on to state:

As is apparent from the Webster's definitions, the ordinary meaning of plurality encompasses both parties' proposed meanings. Therefore, we do not accept either party's proposed definitions because they are incomplete. Two may properly be referred to as a plurality and so may a large number. Thus, "plurality" connotes an indefinite numerical range. The range is bounded by two . . . and . . . infinity . . . .

Original Decision, 2003 Pat. App. LEXIS 84 at *37.
We see no error in the Board's construction of "plurality." When confronted with competing arguments, the Board looked to a dictionary to ascertain the ordinary meaning of "plurality." Here, the dictionary shows ordinary meanings of "plurality," including: "relating to or consisting of or containing more than one," "the state of being numerous," and "a large number or quantity." Webster's, at 1745. The Board then looked to the written description for context in ascertaining the meaning of "plurality," determined that the dictionary definitions and both Bilstad's and Wakalopulos's proffered definitions were consistent with Bilstad's disclosure, and construed the term to encompass all of those meanings. As we have stated, "if more than one dictionary definition is consistent with the use of the words in the intrinsic record, the claim terms may be construed to encompass all consistent meanings." Brookhill-Wilk 1, LLC v. Intuitive Surgical, Inc., 334 F.3d 1294, 1300 (Fed. Cir. 2003) (citing Tex. Digital Sys. Inc. v. Telegenix, Inc., 308 F.3d 1193, 1203 (Fed. Cir. 2002)). "Where there are several common meanings for a claim term, the patent disclosure serves to point away from the improper meanings and toward the proper meaning." Renishaw PLC v. Marposs Societa' Per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998); see also Tex. Digital, 308 F.3d at 1203. None of these definitions is inconsistent with the Bilstad disclosure or the Wakalopulos disclosure.

With respect to the Bilstad disclosure, the Board found that Bilstad disclosed manipulation in a small number of directions. Thus, the Bilstad disclosure is entirely consistent with the meaning of "plurality" as "relating to or consisting of or containing more than one." With respect to "the state of being numerous" and "a large number or quantity," we see nothing in Bilstad's disclosure that disclaims, disavows, or is inconsistent with such definitions of plurality. See Brookhill-Wilk, 334 F.3d at 1300. Because all of the definitions are consistent with the Bilstad disclosure, the term "plurality" when construed in view of the Bilstad disclosure is entitled to the full extent of its ordinary meaning.

Similarly, each of the ordinary meanings of "plurality" is consistent with the disclosure of the '657 patent. First, nothing in the written description of the '657 patent defines the term "plurality," nor is there any disclaimer or disavowal of the ordinary meaning of the term "plurality." See Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1327 (Fed. Cir. 2002). Second, although, as Bilstad argues, Wakalopulos uses the term "plurality" to describe a set of three items, this is simply one use of the term in a particular context. This single use alone does not limit the term. Third, the Wakalopulos written description, in Figure 3 and its accompanying text, illustrates an embodiment wherein a glove box arm is provided to allow a user to place his hand in and pick up and manipulate an object to be sterilized. This description is consistent with a construction of "plurality" that includes everything from "relating to more than one" to "a large number or quantity." Thus, the Wakalopulos written description does not limit the ordinary meaning of "plurality." We therefore conclude that "plurality" encompasses all of the relevant definitions; namely, relating to or consisting of or containing more than one, the state of being numerous, and a large number or quantity.

Bilstad, however, argues that the Board improperly incorporated the several dictionary definitions into a range from two to infinity. While it is common to consider the full meaning of "plurality" as any number greater than one, the Board's definition does little more than incorporate the several distinct definitions into a single one covering the entire scope of "plurality." In combining the definitions into a single one, the Board did not change the scope of the term or alter the ordinary meanings in any significant way. Thus, we affirm the Board's construction of the term "plurality."
Nothing in the '304 patent's specification points to a definition of "plurality" different from Webster's. Indeed, the specification always refers in the plural to the rings which comprise the drum shell. For example, in defining the sounding ring, the specification states that "one or more of such rings function as sounding rings which have a greater outer radius than the other shell rings." (Lovelett Aff., Ex. A, col. 3, lines 21-23) (emphasis added). Therefore, each of plaintiff's independent claims -- 1, 9 and 15 -- requires a "multitude of" or "numerous" annular shell rings.

The contested phrase "a plurality of beams of light" appears in claims 1 and 3 of the '272 patent. They read

1. A method for producing on a photoreceptor an image of generated shapes made up of spots, comprising: directing a plurality of beams of light toward a photoreceptor, each beam of light generating a spot on the photoreceptor and controlling a parameter of the light beams to produce spots of different sizes whereby the appearance of smooth edges are given to the generated shapes.

3. Apparatus for producing on a photoreceptor an image of generated shapes made up of spots, comprising: means for directing a plurality of beams of light toward a photoreceptor to generating a plurality of spots on the photoreceptor and means for generating spots of different sizes whereby the appearance of smooth edges are given to the generated shapes.

It is undisputed that the accused HP printers use the same prior art light scanning system as that shown in Figure 1 of the '272 patent. The HP printers employ light from a single laser source which is reflected off a polygonal mirror to a photoreceptor mounted on a drum. Instead of adjusting either the beam's intensity or diameter, as is described in the '272 patent, the accused printers solve the "jaggies" problem by modifying the duration of time the laser beam is on.

In 1990, PB notified HP that several of HP's marketed laser printers infringed the claims of the '272 patent. This action followed.

STANDARD

Summary judgment is appropriately granted when the evidentiary record reveals that there are no genuine issues of material fact and the moving party is entitled to judgment as a matter of law. Fed. R. Civ. P. 56(c). In determining whether the record presents genuine issues for trial, the court must view all inferences and ambiguities in a light most favorable to the non-moving party. See Bryant v. Maffucci, 923 F.2d 979, 982 (2d Cir.), cert. denied, 502 U.S. 849, 112 S. Ct. 152, 116 L. Ed. 2d 117 (1991). A plaintiff raises a genuine issue of material fact if "the jury could reasonably find for the plaintiff." Anderson v. Liberty Lobby, Inc., 477 U.S. 242, 252, 91 L. Ed. 2d 202, 106 S. Ct. 2505 (1986). Rule 56(c) "provides that the mere existence of some alleged factual dispute between the parties will not defeat an otherwise properly supported motion for summary judgment; the requirement is that there be no genuine issue of material fact." Liberty Lobby, supra, at 247-48. The Supreme Court noted that:

Rule 56 must be construed with due regard not only for the rights of persons asserting claims and defenses that are adequately based in fact to have those claims and defenses tried to a jury, but also for the rights of persons opposing such claims and defenses to demonstrate in the manner provided by the Rule, prior to trial, that the claims and defenses have no factual basis.

Celotex v. Catrett, 477 U.S. 317, 327, 91 L. Ed. 2d 265, 106 S. Ct. 2548 (1986). "One of the principal purposes of the summary judgment rule is to isolate and dispose of factually unsupported claims. . . [and] it should be interpreted in a way that allows it to accomplish this purpose." Celotex, supra, at 323-24. In a case of patent infringement, summary judgment is appropriate when comparison of the accused device and the claim reveals that there is an absence of disputed material fact. Chemical Eng'g Corp. v. Essef Indus. Inc., 795 F.2d 1565 (Fed. Cir. 1986).

DISCUSSION

I
Claim Construction

"The construction of a patent, including the terms of art within its claim, is exclusively within the province of the court." Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 1386, 134 L. Ed. 2d 577 (1996). In determining the meaning of a claim, the court first examines the intrinsic evidence of the record, including the claims, specification, and the prosecution history. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). Intrinsic evidence is "the most significant source of the legally operative meaning of the disputed claim language." Id. at 1582. If the intrinsic evidence does not sufficiently resolve ambiguities, then the court may consider extrinsic evidence, including expert and inventor testimony, in order to arrive at a "proper understanding of the claims." Id. at 1583.

1. Intrinsic Evidence

a. Language of the Claims

HP first argues that the term "a plurality of beams" plainly means that a device must direct "two or more beams of light originating from two or more separate light sources" toward a photoreceptor. Alternatively, they contend the "plurality of beams" limitation requires that a single light beam must be "split or divided into multiple beams." Since it is undisputed that the accused devices employ neither multiple light sources nor beam splitters, HP argues that they do not infringe the '272 patent.

PB responds that the plain meaning of a "plurality of beams" does not require a device to use either multiple light sources or beam splitters. They argue that there are no limitations in the claim which require that "each beam of light originate from a different power source or be divided into multiple beams." Rather, given the nature of the described invention, they propose that it is possible to generate a plurality of beams from a single laser source.

Interpreting the claim language is of primary importance. The "language of the claims frames and ultimately resolves all issues of claim interpretation." Abtox, Inc. v. Exitron Corp, 122 F.3d 1019, 1023 (Fed. Cir. 1997). Claim terms are to be given their ordinary and customary meaning, unless it is apparent that the inventor expressly intended a different meaning. Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578 (Fed. Cir.), cert denied, 519 U.S. 911, 117 S. Ct. 275, 136 L. Ed. 2d 198 (1996). When reviewing claim language, a court must apply "normal rules of syntax" and consider the context of the claim. Eastman Kodak Co. v. The Goodyear Tire and Rubber Co., 114 F.3d 1547, 1553 (Fed. Cir. 1997).

Applying these principles to the instant case, the court concludes that the phrase "a plurality of beams of light" when used in the '272 patent means multiple beams of light generated sequentially from one or more light sources. The plain language of the '272 claims indicates that PB's invention operates by "directing a plurality of beams of light toward a photoreceptor, each beam of light generating a spot on the photoreceptor." The relevant dictionary definition for the word plurality is a "state or condition of being plural or numerous," with the word plural being defined as "containing, consisting of, or designating more than one." See Funk and Wagnall, Standard College Dictionary, (1963). 2 Multiple beams of light can be generated sequentially over time by one laser source. The ordinary meaning of the word "plurality" contains no requirement that "a plurality of beams" be created simultaneously, as suggested by HP.

2 The conclusion that the ordinary meaning of plural is two or more also derives support from the Federal Circuit's decision in York Products v. Central Tractor Farm & Family Center, 99 F.3d 1568, 1575-76 (Fed. Cir. 1996)(holding that the word plurality means at least two).

Applying the "normal rules of syntax" to the claims provides further support for the conclusion that "a plurality of beams" can be generated sequentially. See Eastman Kodak Co. v. The Goodyear Tire and Rubber Co., 114 F.3d 1547, 1553 (Fed. Cir. 1997). Claim 1 describes a method which operates by "directing a plurality of beams of light toward a photoreceptor, each beam of light generating a spot on the photoreceptor." The use of the phrase "each beam of light generating a spot" modifies the term "plurality of beams." The use of the term "each beam" implies that multiple beams can individually strike
the photoreceptor in turn to create multiple spots. The preferred embodiment of the '272 patent describes a system in which beams of light are reflected off a rotating polygon mirror towards a photoreceptor. Sequential production of multiple light beams by one or more laser source produces a plurality of beams, which are individually directed toward the photoreceptor by the rotating mirror.

Further, if this court were to adopt HP's suggestion that multiple laser sources are required to produce a plurality of beams of light, the preferred embodiment of the '272 patent would fall outside of the claims. Figure 1 of the '272 patent depicts a device which employs a single laser source and does not discuss the use of beam splitters. To hold that a plurality of beams can only be generated either by the simultaneous operation of multiple laser sources or by the use of beam splitters would exclude coverage of the preferred embodiment from the claims of the '272 patent. "Such an interpretation is rarely, if ever, correct and would require highly persuasive evidentiary support." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996). Since such evidence is lacking in the instant case, it is logical to conclude that the preferred embodiment is covered by the patent claims. 3

3 HP argues that Claims 4-7 of the '272 patent cover the preferred embodiment. However, the file history reveals that claims 4-7 were not prosecuted in the '532 application in which Claims 1 and 2 were allowed and in which Figure 1 was included. This fact reveals that Figure 1 must relate to Claims 1 and 2 of the '272 patent.

b. The Specification

HP next argues that the specification of the '272 patent describes the apparatus in Figure 1 as a device which "directs a single beam of light toward a photoreceptor." They contend that the only instance where the specification refers to multiple beams of light is in the discussion of the two laser embodiment. "The use of the term 'beams' exclusively in connection with the embodiment of the alleged invention which employs two light sources . . . is in stark contrast to the description of the first embodiment." They contend that "a plurality of beams" can only be produced by the multiple laser version of the '272 patent, not the single laser embodiment depicted in Figure 1.

PB replies that the specification reveals that Figure 1 is "the one and only preferred embodiment" of the '272 patent. "The teaching in the specification confirms that the invention applies to printers with one or two laser power sources." PB contends that either embodiment generates the required "plurality of beams."

After reviewing the claim language, the court must review other parts of the patent document, including diagrams or figures, which are collectively referred to as the specification. Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 1387-88, 134 L. Ed. 2d 577 (1996); see also Al-Site Corp. v. Bonneau Co., 22 F.3d 1107 (Fed. Cir. 1994). "The specification contains a written description of the invention that must enable one of ordinary skill in the art to make and use the invention. For claim construction purposes, the description may act as sort of a dictionary, which explains the invention and may define terms used in the claims." Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995) (internal citations omitted). A court reviews the patent specification to determine whether the patentee "used any terms in a manner inconsistent with their ordinary meaning." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). However, although a review of the specification may add context to the claim language, it may not be used to read limitations into the claims. Constant v. Advanced Micro-Devices, Inc., 848 F.2d 1560, 1571 (Fed. Cir.), cert. denied, 488 U.S. 892, 102 L. Ed. 2d 218, 109 S. Ct. 228 (1988).

In the instant case, the specification of the '272 patent provides, 4 inter alia,

The light source, such as the laser 10, which may be a three mw helium-neon laser, generates a collimated beam 12 of monochromatic light which is direct through a neutral density filter 14 to control the light intensity. The beam 12 then passes through a modulator 16, such as an acousto-optical modulator. The beam 12 is next directed through a first lens 20 and intercepted by a knife edge 22 placed at the focal point of the first lens 20. [. . .] It is desirable to use the first order beam to produce a spot because the position of the spot can be displaced in accordance with the frequency modulation applied to the modulator which will selectively deflect the beam 12 in a desired direction such as indicated by the arrows a,
b. The first order beam 12 is then directed towards a second lens 24 which directs the converging beam onto a reflecting face of facet of a rotating polygonal mirror, herein referred to as polygon 28. The polygon 28 is continuously driven by a motor drive 30 and preferably is maintained at a constant velocity. . . . The beam 12 is thus reflected successively from each of the facets off the rotating polygon 28 and onto a photoreceptor 32.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
4 Numbered references refer to Figure 1 of the '272 patent, which is contained in Exhibit 1 of this decision.
- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The specification supports the conclusion that the phrase "a plurality of beams" when used in the '272 patent means multiple beams of light generated sequentially from one or more light sources. It indicates that reflecting each beam of light "off the rotating polygon and onto a photoreceptor" creates a small discharged area on the photoreceptor. Each symbol or picture produced by this process is composed of hundreds or thousands of these small discharged areas. since each discharged area is created by one beam of light, it takes many beams, or a plurality of beams of light, to create one image. The specification of the '272 patent teaches that that these beams can be produced sequentially by one or two laser sources. The meaning of the phrase a "plurality of beams of light" derived from the specification is consistent with the plain meaning of the claim language.

c. The Prosecution History

HP further argues that the prosecution history of the '272 patent supports the assertion that a "plurality of beams of light" requires more than one laser source. Specifically, they direct this court's attention to the PTO office action of September 23, 1981, which rejected claims 15 and 16 of the '532 application. These claims, which eventually became claims 1 and 2 of the '272 patent, were initially rejected since the examiner believed the specification did not clearly describe how "one photoreceptor would distinguish between the plural beams and how one or both beams would be controlled." HP contends that this rejection is evidence that the preferred embodiment of the '272 patent requires multiple laser sources to create a plurality of beams.

PB responds that the examiner's initial rejection was in reference to the two laser source embodiment of the application, not the "plurality of beams" language found in claim 1 and 3 of the '272 patent.

The undisputed public record of the proceedings in the PTO is of primary importance in understanding the claims. Markman v. Westview Instruments, Inc., 52 F.3d 967, 980-81 (Fed. Cir. 1995). The file history can function to limit claim construction so as to exclude any interpretation which was disclaimed during prosecution. Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570 (Fed. Cir.), cert. denied, 516 U.S. 987, 116 S. Ct. 515, 133 L. Ed. 2d 424 (1995). The prosecution history must be read "in its full context, not on the basis of snippets lifted out of context." J.T. Eaton & Co. v. Atlantic Paste and Glue Co., 106 F.3d 1563, 1576 (Fed. Cir. 1997).

In the instant case, there is nothing in the prosecution history which indicates that multiple laser sources are required to create a plurality of beams. The text of the examiner's initial rejection of the '532 application indicates that he was referring to the two laser embodiment of the invention. For example, his concern that the initial application did not teach how "one or both beams" indicates that he was discussing the two laser embodiment. Interpreting this single comment to require that the PB patent covers only multiple laser source applications would improperly "diminish or vary the limitations of the claims." Goodyear Dental Vulcanite Co. v. Davis, 102 U.S. 222, 227, 26 L. Ed. 149 (1880); see also Constant v. Advanced Micro-Devices Inc., 848 F.2d 1560, 1571 (Fed. Cir.), cert. denied, 488 U.S. 892, 102 L. Ed. 2d 218, 109 S. Ct. 228 (1988)(holding that it is improper to read limitations from the specifications into the claims).

2. Extrinsic Evidence

The court concludes that the use of extrinsic evidence is unnecessary in this case. Extrinsic evidence may be evaluated "in order to aid the court in coming to a correct conclusion as to the true meaning of the language employed in the patent." Markman v. Westview Instruments, Inc., 52 F.3d 967, 981 (Fed. Cir. 1995)(internal citations omitted). However, "reliance
on such evidence is unnecessary, and indeed improper, when the disputed terms can be understood from a careful reading of the public record." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1584 (Fed. Cir. 1996).

In this case, the meaning of the phrase "a plurality of beams of light" can be understood from a careful reading of the claims, the specification, and the prosecution history. Accordingly, consideration of extrinsic evidence is unnecessary and improper.

The "plurality of electronic switches" of Claim 8 and the "means for selectively connecting the energy source to the electrodes in a first polarity and a second polarity" of Claim 1 refer to the same element of the defibrillator. This element is generally described as a "connecting mechanism" or "connector" that connects the defibrillator's energy source to the electrodes for shock delivery. 212 Patent at 6:44-50 & Fig. 10, element no. 34. Subsequently, the patent describes the connector in substantially greater detail as a specific five-switch configuration. 212 Patent at 6:61-7:52 & Fig. 11. The dispute over these terms is whether, as Defibtech contends, Claims 1 and 8 require this five-switch configuration. Philips contends that any of numerous configurations of two or more switches known to persons of skill in the art would satisfy Claims 1 and 8.

The means-plus-function term in Claim 1 presents the easier interpretation issue. Philips points to the general disclosure of a "connecting mechanism" as sufficient disclosure of the structure corresponding to the claimed function. The court disagrees. The patent's discussion of a "connecting mechanism" discloses no structure at all. As Defibtech noted in oral argument, the "connecting mechanism" corresponds to no more than a two-dimensional box in Figure 10 of the 212 Patent. This is insufficient, as a matter of law, to fulfill the inventors' duty to pinpoint a structure that corresponds to the function cited in a means-plus-function term. See Med. Instrumentation & Diagnostics Corp. v. Elekta AB, 344 F.3d 1205, 1211 (Fed. Cir. 2003). The court cannot designate the "connector" in Figure 10 and the written description of a "connecting mechanism" as corresponding structure, because they serve merely as an introduction to the five-switch configuration in Figure 11 and the accompanying disclosure of actual structure. See Tex. Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1212 (Fed. Cir. 2002). Moreover, Philips cannot cure the lack of structure other than the five-switch configuration by noting that "[o]ther switches and switch configurations may be used, of course, without departing from the scope of the invention." 212 Patent at 7:48-49. An inventor cannot meet his obligation to disclose structure corresponding to a means-plus-function term merely by stating that the structure will be obvious to those of skill in the art. Med. Instrumentation, 344 F.3d at 1212 ("It is important to determine whether one of skill in the art would understand the specification itself to disclose the structure, not simply whether that person would be capable of implementing that structure."). Claim 1 sends the public on a search for structure corresponding to a "means for selectively connecting." It would be incongruous to conclude that the inventors satisfied their obligation to reward that search by disclosing nothing more than a "connecting mechanism." The only disclosure of structure corresponding to the "means for selectively connecting . . ." is the five-switch configuration noted above, and the court interprets the means-plus-function claim accordingly.

--- Footnotes ---

n1 Med. Instrumentation and other Federal Circuit precedent focus on an inventor's duty to "clearly link[]" structure in the specification to a means-plus-function term. 344 F.3d at 1211. Philips did not fail to "clearly link" the "connecting mechanism" to its means-plus-function term; it failed instead to pinpoint any structure for the connecting mechanism other than the five-switch configuration.

n2 The court notes that Claim 7, which depends from Claim 1, discloses the five-switch configuration. Claim differentiation compels the presumption that the terms have different scope. In this case, however, because the "means for selectively connecting" has no corresponding structure other than the five-switch configuration, Defibtech has overcome the presumption. Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1538 (Fed. Cir. 1991) ("A means-plus-function limitation is not made open-ended by the presence of another claim specifically claiming the disclosed structure which underlies the means clause or an equivalent of that structure.").
The "plurality of electronic switches" in Claim 8 presents a closer question. Freed from the strictures of means-plus-function format, the inventors arguably signaled their intent to permit other switch configurations by noting that such configurations would be apparent to those of skill in the art. 212 Patent at 7:48-49. In addition, because Claim 11 depends from Claim 8 and discloses the five-switch configuration explicitly, claim differentiation requires the court to presume that Claim 8 encompasses other configurations.

Defibtech insists that Philips disavowed all but the five-switch configuration as a "plurality of switches" in the prosecution of the patent. Defibtech points to an office action in which the examiner rejected Claims 1 and 8 as obvious in light of the Swanson Patent, which also disclosed a five-switch configuration in an internal defibrillator, although not the same configuration as in the 212 Patent. J.A. 02692. Defibtech correctly notes that the inventors disavowed Swanson's five-switch configuration. J.A. 02692, 02697. The inventors did not, however, expressly limit the invention to the five-switch configuration that they disclosed in their patent application. The inventors explained that it would take undue experimentation to implement Swanson's five-switch configuration in an external defibrillator because the configuration would not work with high voltage. J.A. 02692. In an affidavit accompanying the response to the office action, inventor Daniel Powers stated that Swanson's five-switch configuration would not work in an external defibrillator, and that "[d]eveloping a circuit design that protects the [external defibrillator] circuit from load faults is a major design challenge." J.A. 02701.

The interpretation of the "plurality of switches" term, for which the intrinsic evidence does not provide an unambiguous definition, requires the court to consider extrinsic evidence for the first time. n3 In a rebuttal report, Philips expert Dr. Leslie Geddes reviewed a different prior art reference and noted that it did not disclose "what types of switches" should be used, and that one skilled in the art would have "extensive difficulty" designing an external defibrillator switching circuit based on that reference. Snyder Decl. Ex. 12 (Geddes Rebuttal Report at 23). Unlike Dr. Powers, Dr. Geddes does not even mention the configuration of the switches. The court cannot draw conclusions regarding his views on the ease of configuring an appropriate switch array. The court concludes that Dr. Geddes' testimony lends some support to the notion that designing an appropriate switch array was no simple task for one skilled in the art.

n3 In its prior order, the court stated that the only extrinsic evidence before it was a set of dictionary definitions. October 25 order at 5. That was true for the first round of asserted terms, but the parties have introduced inventor and expert testimony in support of some of the remaining terms. The court is mindful of the Federal Circuit's cautious approach to extrinsic testimony, id., and has considered the evidence accordingly.

The court has also considered Mr. Powers' deposition, in which he testified that he knew of no functional switch configurations other than the five-switch configuration when the inventors first filed a shock delivery patent application. Powers Dep. at 85 (DM 034). Defibtech has not provided enough of the deposition transcript to provide full context for his testimony. The court determines that, like Dr. Geddes' testimony, Mr. Powers' testimony slightly strengthens the evidence in favor of a limited construction of "plurality of switches," because it shows that they, as persons of skill in the art, had no actual alternative configuration to back up their statement in the 212 Patent that other switch configurations would be apparent to those of skill in the art.

Based on all of the evidence before it, the court concludes that the "plurality of switches" is limited to the five-switch configuration disclosed in the specification. Philips cannot deny that it disavowed the Swanson five-switch configuration. Thus, the construction of "plurality of switches" is not as broad as the claim language would suggest. At best, the court could construe the term to mean "a plurality of switches, but not the plurality of switches disclosed in Swanson." Even this interpretation, however, would be unreasonable in light of the inventors' statements during prosecution. Mr. Powers admitted in prosecuting the patent that designing an appropriate switch configuration was difficult. In light of that admission, the statement in the specification that "other switches and switch configurations may be used" rings hollow, at least as a statement of what one of skill in the art could accomplish without undue experimentation. Although the inventors'
five-switch configuration might be equivalent to other configurations, the term "plurality of switches" must be limited to the disclosed five-switch configuration and those equivalents. The court therefore construes the "plurality of switches" in Claim 8 in the same manner it construed the "means for selectively connecting" in Claim 1. n4 The term requires the five-switch configuration from the 212 Patent or its equivalent.

n4 Philips suggests, without explanation, that the presence of the "plurality of switches" term in Claim 17 of the 454 Patent (which neither party has offered for construction) should affect the court's construction. Phillips Opp'n at 29. As the court previously noted, the 454 Patent incorporates the specification of the 212 Patent (October 25 order at 6), and the court finds no new disclosure in the 454 specification that would alter its construction of "plurality of switches."

The next disputed phrase is "a plurality of flexible sheet members enclosing the container." The parties agree that "plurality" means "more than one" or "two or more." It is apparently undisputed that the top and floor (bottom) "walls" are not bowed. McNeilus suggests that the claim should be construed as to require "enclosure" by four (all) bowed walls. This is, obviously, a substantial dispute; more so than some of the earlier discussed ones.

One possible interpretation is that all areas of the enclosing apparatus be flexible sheet members. Another possible interpretation is that the enclosure include a plurality (two or more) flexible members. The latter interpretation is consistent with that of the special master. The court adopts his reasoning (see pages 58-60). The court interprets the claim as requiring two or more flexible sheet members in the enclosing frame or outside walls, etc. 1

1 The parties may wish to suggest better wording as to how the total enclosure frame should be described. Neither party has discussed the "enclosure" at the two ends.

The next disputed phrase is "A Plurality Of Longitudinal Pleats". This Court construes the term "A Plurality of Longitudinal Pleats" in conformity with neither parties' proposed definition. Cuno argues that this term means "a sufficient number of longitudinal pleats to form a cylindrical filter element with pleats in intimate contact over substantially their entire height." Pall takes the position that the term means "two or more longitudinal pleats." Having reviewed the intrinsic evidence and considered the parties' positions, this Court construes this term to mean a sufficient number of longitudinal pleats to form a cylindrical filter element.

Intrinsically, the claims themselves indicate that this term must mean that the filter contain some number of pleats forming a cylindrical filter. For instance, Claim 1 of the '047 Patent states:

A filter comprising:

a cylindrical filter element having a longitudinal axis, first and second end surfaces, and a plurality of longitudinal pleats, each of the pleats having a pair of legs, each of the legs having a first and a second surface, the pleats being in a laid-over state in which the first surface of one leg of one pleat is in intimate contact with the first surface of an adjoining leg of said one pleat and the second surface of said one leg is in intimate contact with the second surface of an adjoining leg of an
adjacent pleat over substantially the entire height of each leg and over a continuous region extending for at least approximately 50% of the axial length of the filter element; and

a first impervious end cap connected to the first end surface of the filter element.

'047 patent, col. 26, lines 16-31 (emphasis added).

Pall argues that a plurality of longitudinal pleats should be construed to mean two or more pleats. In support of this construction, Pall cites to the patent specifications, in which it uses “plurality” interchangeably with “two or more.” The specifications to which Pall cites do not use plurality with respect to longitudinal pleats. '047 patent, col. 5, lines 30-34; '047 patent, col. 10, lines 1-5. The specifications that describe longitudinal pleats speak to a cylindrical filter element, which has a plurality of longitudinal pleats. '047 patent, col. 2, lines 5-8, 17-19. There is no way to read the claim language and specifications without the construction that, however many pleats comprise the filter element, there must be enough so that they form a cylinder.

Cuno argues that the term, A Plurality of Longitudinal Pleats, must also include intimate contact along substantially the entire height of each pleat. Pall counters with the principal of claim differentiation, stating that under Cuno Enhanced Coverage Linking's proposed construction, certain claims would be rendered superfluous. See TurboCare Div. of Demag Delaval Turbomachinery Corp. v. GE, 264 F.3d 1111, 1123 (Fed. Cir. 2001) (holding that claim terms should not be read to contain a limitation "where another claim restricts the invention in the [same] manner"); Comark Communs, Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998).

This Court finds that Cuno's definition limits the disputed language in a way that would render language of certain claims, including language contained in claims 39 and 40 of the '765 Patent, meaningless. As Pall notes, the patent claims have different scopes and do not all require that every pleat be in intimate contact, as suggested by Cuno.

For example, in the '765 patent, claim 8 states that intimate contact must exist between the "first surface of a first leg of one pleat with the first surface of an adjoining leg of said one pleat and a second surface of an adjoining leg of an adjacent pleat[,]" while claim 39 requires intimate contact with respect to "each of the plurality of pleats" and claim 40 with respect to "each pleat in the filter element." Although the patent claims include the terms "plurality of the longitudinal pleat" and "intimate contact" in the same claim, there are many words in between these terms and, taken together with the other claims of the '047 and '765 patents, Cuno's proposed narrow construction would render other claims redundant.

D. "Plurality"

In accordance with standard dictionary definitions, we have held that "plurality," when used in a claim, refers to two or more items, absent some indication to the contrary. York Prods., Inc. v. Cent. Tractor Farm & Family Ctr., 99 F.3d 1568, 1575, 40 U.S.P.Q.2d (BNA) 1619, 1625 (Fed. Cir. 1996) ("The term means, simply, 'the state of being plural.'"). 5 TCI does not address, or even cite, York Products in its brief, but argues that in the context of the specification and the claim language of the patents that "plurality of . . . projections" must be defined as three or more projections. TCI points to the figures of the patents, which show a preferred embodiment of the insert means having four projections and three recesses. As we have already stated, however, it is not proper to treat characteristics of a preferred embodiment as claim limitations.

5 The York Products court cited the American Heritage Dictionary Second College Edition 955 (2d ed. 1982), which defines plurality as "the state of being plural." Other dictionary definitions of plurality include "a number greater than one." Random House Webster's Unabridged Dictionary 1490 (2d ed. 1998).
therebetween" requires that the limitation be construed to cover only insert means with three or more projections. The theory is that because "recesses" is plural and because recesses are located between projections, three or more projections must exist if there are to be two or more recesses.

In the phrase "projections with recesses therebetween," the use of "recesses" can be understood to mean a single recess where there are only two projections and more than one recess where there are three or more projections. Indeed, in the present context, if the patentees had wanted to require an insert means with more than one recess, it would have been natural to limit the claimed invention to an insert means with a "plurality of recesses." The patentees, however, did not do so. Thus, we find no reason to give "plurality . . . of projections" any definition other than its ordinary definition of "two or more."

2985

1. "A Plurality of Sheets of Material"

The Special Master first observed that "[c]laims 1-6, 9-13, 15, 17, 18, 20-25, and 45 of the '668 Patent each require the recited product to incorporate a 'plurality of sheets of material.'" (R&R at 63.) That limitation was previously construed to mean "at least two pieces of material, with each piece having a fairly broad surface relative to its thickness." (8/4/04 Order accepting and adopting Special Master's R&R, as supplemented by 7/15/04 R&R.) The Special Master rejected TRW's arguments that it cannot infringe the "plurality of sheets of material" claims as a matter of law because, by virtue of its use of the One Piece Woven (OPW) technique, only one piece of fabric goes into the loom and one piece of fabric comes out of the loom (albeit with pockets that hold air). Relying on a similar argument raised and rejected in Vanguard Products Corp. v. Parker Hannifin Corp., 234 F.3d 1370 (Fed. Cir. 2000) and the text of the '668 Patent, the Special Master concluded that "the limitation 'a plurality of sheets of material' refers not to the method by which the airbag is made, but rather to the completed airbag itself." (R&R at 65.) Thus, as the Special Master observed, "TRW's assertion that, during the manufacturing process of its OPW airbags, no separate pieces of material are joined through a distinct sewing or folding step, is simply besides the point with respect to the asserted 'plurality of sheets of material' claims of the '668 Patent." (R&R at 65.) Rather, what is required is a comparison of "the structural relationship of the components of the OPW airbag." (R&R at 66.) These are product, not process claims. Drawing all justifiable inferences in favor of the non-moving party (ATI), the Special Master determined that he could not "conclude as a matter of law that the opposite sides of the compartments do not qualify as 'two pieces of material' simply because they intermittently are combined in order to form the joints between the compartments." (R&R at 66.) Because questions of material fact were found to exist, the Special Master recommended that TRW's motion for summary judgment of noninfringement be denied with respect to the limitation "a plurality of sheets of material." (R&R at 66.)

This Court accepts and adopts the Special Master's recommendation. Despite TRW's claims to the contrary, drawing all justifiable inferences in favor of ATI, and considering testimony of ATI's experts Dr. Beholz and Dr. Watson and proffered micrographs, this Court agrees that questions of material fact exist as to whether the accused OPW airbags incorporate the limitation "a plurality of sheets of material."

2986

2. "pocket" -- Amesbury argues that this phrase should be construed as meaning "a contour formed to mate with a rivet or fixed structure", whereas Caldwell has construed the phrase as "a U or C-shaped channel bounded on three sides with an opening designed to mate with a rivet."

The parties agree that, however described structurally, the "pocket" must be shaped to "mate" with something, which the parties agree means "to join or fit together" with that something. As to the something', Amesbury argues that the "pocket" must be "formed to mate with a rivet or fixed structure". However, Claim 2 specifically says that the "pocket" is "adapted to mate with a rivet". Thus, even though, the specification describes a "fastener, such as a rivet", [368 Patent, col. 6, 1. 41], I find that the Claim is clear -- the "pocket" must be shaped to mate (ie. "to join or fit together") with a rivet.
The crux of the debate revolves around what shape dimensions and descriptors should be included in the reference to "pocket" in Claim 2. I will consider the Claim terms, the specification, and the prosecution history to determine the structural description implicit in yet another metaphor.

Claim 2 states that the "second end of the frame of the balance shoe further forms a pocket positioned in the second end of the frame adapted to mate with a rivet." [368 Patent, col. 8, 11. 60-63.] In the Summary of the Invention, the patent describes a "frame pocket sized to receive a fastener", [368 Patent, col. 2, 11. 3-4], and how "the balance shoe can be further secured to the rigid U-shaped channel with a fastener that interfaces with a frame pocket in the balance shoe." [368 Patent, col. 2, 11. 38-41.] The specification mentions the "pocket" four times. In the detailed description of the invention, the patent describes how "to accommodate the fastener, the snap lock balance shoe can form a connection pocket sized to receive or mate with the fastener", [368 patent, col. 5, 11. 37-40], and how during installation one of the steps "is to slide the snap lock balance shoe into the rigid U-shaped channel such that the fastener is received in the connection pocket of the snap lock balance shoe." [368 patent, col. 6, 11. 42-46.]

Amesbury argues that nothing in the specification requires the "pocket" to have a specific shape, other than a shape capable of mating with a rivet. Thus, while conceding it may not be the best choice of words, Amesbury proposes the term "contour". On the other hand, Caldwell argues that describing the "pocket" as a "contour" shaped to mate with a rivet insufficiently describes what the patentee meant by "pocket". Instead "pocket" should be construed as "a U or C-shaped channel bounded on three sides with an opening" shaped to mate with a rivet.

Caldwell's reference to the file history and the deposition of the inventor, Gary Newman, to elucidate the patentee's understanding of the term "pocket" is unavailing. While some of the patentee's initial claims were rejected as being anticipated by Schmidt's "Locking Slide Balance", U.S. Patent No. 5,301,467, 15 that patent did not have a "pocket" to fasten the balance shoe inside the U-shaped channel of the window balance with a horizontal rivet as is described in the 368 Patent. Rather, the Schmidt 467 Patent described a new design for the "locking slide block", the component referred to as the "balance shoe" in the 368 Patent. The figures and the specification in the 467 Patent do not demonstrate how the "counter-balance spring", which is not shown, is attached to the metal plate at the top of the "locking slide block". It is clear from the patentee's response to the initial rejection, that what distinguishes the 368 Patent from the 467 Patent is that the top' or "second end" of the balance shoe is "adapted to be received by a U-shaped channel of a window balance." The mating of the "pocket" and a rivet through the U-shaped channel referenced in Claim 2 is part of the design for securing the balance shoe within the U-shaped channel of the window balance. 16 Consequently, neither party has identified anything in the file history that aids in the interpretation of the term "pocket". As to Mr. Newman's deposition, I will not treat a non-lawyer's response as an admission as to the proper construction, even though "[testimony against a patentee's own interest . . . is perhaps the most persuasive extrinsic evidence." Bristol-Myers Squibb Co. v. Tera Pharmaceutical USA, Inc. 288 F.Supp.2d 562, 585 (S.D.N.Y. 2005). I have only been provided with a snippet of Mr. Newman's deposition testimony and I credit Amesbury's suggestion at the hearing that Mr. Newman may have been describing the "pocket" in the patent's figures rather than explaining what he as the inventor meant by choosing to use the term "pocket" in Claim 2.

15 The Examiner wrote that "Schmidt discloses a balance shoe assembly 20 ["locking slide block" in the patent] for a sash comprised of a frame 24 ["housing" in the patent], . . ., a connecting device 28 ["metal plate" in the patent], which connects the shoe to a counter-balance spring and has a pocket therein, and is received within the frame 24, . . ., and a frame pocket, which can receive a fastener." [Smalley Declaration, Exhibit L, at C000793] The "frame pocket" does not refer to the same component or element as the "pocket" in the 368 Patent; it refers to a "channel" at the bottom' of the block/shoe that receives the locking cam. The Examiner's other use of "pocket" seems to refer to the "pocket" in the "metal plate" at the top' of the "locking slide block" that attaches to the counter-balance spring. The Schmidt 467 Patent itself never uses the term "pocket". The patentee seems to have understood this distinction when responded to the rejection.

16 The other way that the shoe is attached within the window balance is by the "connecting device", also referred to in Claim 2.

Returning back to the specification, I find that the function of the "pocket" is clear -- to receive a rivet, thereby aiding to secure the balance shoe within the U-shaped channel of the inverted window balance. This function defines the shape. Consequently, I find that the shape of the "rivet" in effect defines the shape of the interfacing pocket.

Neither of the parties has presented any argument on how the term "rivet" should be construed. However, I find that the
ordinary meaning of "rivet" as understood by a person of skill in the art is readily apparent. Thus, I will construe the term according to the "widely accepted meaning" of these "commonly understood words". Phillips, 415 F.3d at 1314. The term "rivet" encompasses a variety of fasteners consisting of a shaft with heads on either end. Typically the shaft is a smooth cylinder, as depicted as 635 in Figure 6A shown below, for instance.

As a result, the "pocket" would typically have to be shaped to receive a smooth cylinder through the shoe. However, the patent does not require that the "pocket" and rivet match perfectly. As a result, the "pocket" could have a cylindrical contour with a diameter long enough to fit the rivet or the "pocket" could be a "U-shaped channel bounded on three sides", as depicted as 213 in Figure 3B shown above, with a height and depth long enough to fit the rivet. The problem with Caldwell's suggestion is that it requires the pocket to have sides, which denies the possibility that the indent might actually be a cylindrical match to the rivet without sides per se. Consequently, to the extent any ambiguity remains about the shape of the "pocket", I will adopt as a definition a notch shaped to mate with a rivet, thereby aiding to secure the balance shoe within the U-shaped channel of the inverted window balance.

Nevertheless, I will adopt Caldwell's suggestion that the definition of "pocket" must incorporate the idea that the rivet slides into the "pocket" through an opening. The installation discussion in the specification explains that "the snap lock balance shoe ["is to slide"] into the rigid U-shaped channel such that the fastener is received in the connection pocket of the snap lock balance shoe". [368 patent, col. 6, 11. 42-46.] In order for the balance shoe to be installed in this way, the "pocket" must have an opening into which the rivet can slide. Without incorporating the idea of an opening, one could erroneously interpret the term "pocket" to include a fully enclosed channel through the balance shoe, in which the rivet would have to be thread through rather than snapping in. However, it is clear from the specification that this is not what the patentee understood the term to connote.

Construction -- A notch with an opening shaped to mate (ie. "to join or fit together") with a rivet, thereby aiding to secure the balance shoe within the U-shaped channel of the inverted window balance.

A. "Point" as used in Claims 1, 5, 6, 21, and 27 of the '416 Patent and Claim 6 of the '730 Patent 2

The claims and patents are hereafter abbreviated as follows: [Patent number]:[Claim number(s)]. For example, claim 1 of the '416 patent is claim 416:1; claims 1, 5, 6, and 8 of the '416 patent are claims 416:1, 5, 6, and 8.

The term "point" is found in several claims and in both patents. Alden asserts that the term should be construed to mean "a small central area of the tip of the bit where the scraping and rearward edges and tapered surfaces converge. The term point does not refer to a dimensionless dot." Alden Br. at 5. Eazypower's construction is "the position where the scraping edges intersect" for claims 416:1, 5, 6, and 8 and "the position where the scraping edges and rearward edges intersect" for claims 416:21 and 27 and 730:6. Eazypower Br. at 10, 25. The dispute is essentially whether, as Alden asserts, the "point" can have some amount of material to it such that the edges do not intersect at the axis, or is a geometric dot where edges intersect, as Eazypower asserts.

1. Claim Language

a. Claim 416:1

The claim reads, in full:
For removing damaged screws, a bit having an axis and a tip end formed with a point and a rear end formed in hexagonal cross-section adapted for installation in a chuck of a variable speed reversible drill, the tip end having a plurality of longitudinal recesses uniformly disposed about the tip end, each bordered by a longitudinal surface facing in a counter-clockwise direction, the surface formed with a distal straight scraping edge, the scraping edges of the recesses each being in a plane including the axis and being at an acute angle less than 70 [degrees] to the axis, and a support portion behind each scraping edge, the support portions each defined by a relief surface curving away from the scraping edge down to a rearward edge bordering one of the longitudinal recesses, each rearward edge also lying in a plane including the axis and being disposed at more acute angle to the axis than the scraping edge angle.

DX B, col 3, lns 50-65. 3 The relevant language is "a bit having an axis and a tip end formed with a point." Nothing in the claim either refers to the intersection of edges or describes the point as a "central area."

b. Claim 416:5

Claim 416:5 reads:

A method for unscrewing threaded fasteners installed in an object and having a head with a deformed end surface, the method comprising the steps of:

a. providing a bit having an axis and a tip end formed with a point, the tip end having a plurality of longitudinal recesses uniformly disposed about the tip end, each bordered by a longitudinal surface facing in a counter-clockwise direction and being in a plane including the axis, and formed with a straight scraping edge, the scraping edges of the recesses each being at acute angles to the axis and a support portion behind each scraping edge, the support portions at the tip end each defined by a relief surface curving away from the scraping edge down to a rearward edge bordering one of the longitudinal recesses, each rearward edge also lying in a plane including the axis and being disposed at more acute angle to the axis than the scraping edge,

b. engaging the head with the tip end with the scraping edges engaging the end surface of the fastener,

c. rotating the bit in a counter-clockwise direction.

DX B, col 4, lns 12-32. There is no material difference in the language of claims 416:1 and 5 related to the term "point."

c. Claim 416:6

Claim 416:6 reads:

In combination:

a. a threaded fastener having an axis, a threaded section and a head section, the head section being formed with a generally radial end surface having a damaged cross slot having sloping sidewall portions defining a first angle to the axis, and

b. a cylindrical extraction bit having an axis aligned with the axis of the fastener and a tip end formed with a point, the tip end having a plurality of longitudinal recesses about the tip end, each bordered by a longitudinal scraping surface facing in a counter-clockwise direction and having a scraping edge, the scraping edges each lying in a plane including the axis of the bit and disposed at a second angle to the axis, the second angle being less sharp than the first angle, the scraping edges
engaging the end surface of the faster at the margin of the cross slot.

DX B, col 4, lns 33-49. Again, nothing about the claim language dictates either proposed interpretation.

d. Claim 416:8

This claim reads:

A tool for removing damaged screws comprising: a bit having an axis and a tip end formed with a point and a rear end formed in hexagonal cross-section adapted for installation in a chuck of a variable speed reversible drill, the tip end having a plurality of longitudinal recesses uniformly disposed about the tip end, each bordered by a scraping surface facing in a counter-clockwise direction, the scraping surface formed with a distal straight scraping edge, the scraping edges of the recesses each being disposed at a scraping edge acute angle to the axis less than about 70 [degrees], and a support portion behind each scraping edge, the support portions each defined by a relief surface curving away from the scraping edge down to a rearward edge bordering one of the longitudinal recesses the rearward edge being disposed at a more acute angle to the axis than the scraping edge acute angle.

DX B col 4, lns 58-67; col 5, lns 1-5. This claim does not materially differ from claim 416:1.

e. Claim 416:21

This claim states:

A tool for removing damaged screws as defined in claim 16 herein the rearward edge borders one of the longitudinal recesses and meets at a point with the scraping edge associated with the scraping surface of the one of the longitudinal recesses.

DX B, col 6, lns 13-17. The limitations added to claim 416:16 by claim 416:21 refer to the recesses meeting "at a point." This language, by itself, does not lead the to Court to accept either proposed claim construction, as the recesses could meet at a point regardless of whether the intersection of the recesses forms the point. In other words, even if the "point" is more than the intersection of the recesses and has its own material, the recesses could meet "at [the] point."

f. Claim 416:27

This claim uses the same "meets at a point" language as claim 416:21. DX B, col 6, lns 52-56. There are no other relevant differences.

g. Claim 730:6

This claim reads exactly the same as claim 416:6, except that claim 730:6 refers to "a pair of longitudinal recesses," as opposed to "a plurality of longitudinal recesses." DX A, col 4, lns 37-54.

2. Specification

The '416 specification states, under the heading of "Summary of the Invention," that "[t]he edges meet in a point at an obtuse angle." DX B, col 1, lns 35, 43-44. Because this language appears in the portion of the specification purporting to describe the invention as a whole, it is highly relevant in construing every claim. See Honeywell, 452 F.3d at 1318. Stating that the edges "meet in a point" implies that the point is formed by the intersection of the edges.

Under the heading "Detailed Description of the Embodiments," the patent states that "the two scraping edges are in the same plane and intersect at the axis of the bit in a point." DX B, col 2, lns 7, 38-39. The figures that illustrate the embodiments also show edges intersecting to form a point. DX B, figs 1, 2, 4, 5a, 5b, 5c, 5d, 6, 7a, 7b, 7c, 7d. This supports Eazypower's position, but because the language and figures describe only particular embodiments, they are accorded limited weight in construing the claim terms. See Phillips, 415 F.3d at 1323. Nonetheless, the embodiments are consistent with the language found under "Summary of the Invention."
The specification to the '730 patent, beneath the heading "Detailed Description of Embodiments," states that "[t]he point, having the angle of about 110 [degrees] to 140 [degrees] when engaging the vestiges of a standard screw slot serves as a centering means." DX A, col 2, lns 51-53. Alden argues that this implies a structural area of contact with the damaged screw, but has not explained why a point formed by the intersection of the edges would not serve the same purpose. Further, Figure 2, to which this language points, shows what appears to be a dimensionless point at the tip of the bit that does not contact the damaged screw. DX A, fig 2.

Because the '416 patent is a continuation of the '730 patent, the Court considers the '730 specification in construing all of the claims. Cf. Advanced Cardiovascular Systems, Inc. v. Medtronic, Inc., 265 F.3d 1294, 1305 (Fed. Cir. 2001) ("The prosecution history of a related patent can be relevant if, for example, it addresses a limitation in common with the patent in suit.").

3. Prosecution History

During the examination process for the '730 patent, the examiner cited patent 500,213 ("Richards patent"). DX A (cover sheet). In rejecting the '730 patent on September 24, 2002, the examiner stated that "Richards discloses the claimed invention comprising, as shown in Figs. 2 and 4, a bit having an axis and a tip end formed with a point" and concluded that the '730 patent was anticipated by Richards. DX C, tab 5, page 3. 4 Alden amended the '730 patent in light of the September 24 rejection, keeping the "tip end formed with a point" phrase. Alden argues that because the patent was issued with the phrase "tip end formed with a point," "point" should be construed by reference to the Richards patent. DX C, tab 8, page 2.

Alden asserts that "[t]he metal drill shown in the Richards [patent] has cutting edges which taper toward a central area in the center of the tip, not a geometric dot." Alden Br. at 6. The basis of Alden's assertion that the "point" in Richards is not formed by intersecting edges is Figure 1 in the Richards patent. Alden has not sufficiently demonstrated what Figure 1 of the Richard patent shows, and has not cited any portion of the written specification or claims of the Richards patent. Therefore, the Court gives the Richards patent no weight. Cf. Franklin Elec. Co. v. Dover Corp., 2007 U.S. App. LEXIS 5083, 2007 WL 634430, at * 6 (Fed. Cir. March 1, 2007) (rejecting construction based on figure where written specification did not describe limitation allegedly shown in figure because "patent figures are generally not intended to convey such detail"), citing Hockerson-Halberstadt, Inc. v. Avia Group Int'l, 222 F.3d 951, 956 (Fed. Cir. 2000). 5

Alden submitted the affidavit of Yvon Desaulniers, Alden's President. DX E. The Desaulniers affidavit describes Alden's
process for manufacturing bits, which it asserts is consistent with the patent. Desaulniers states that because of manufacturing tolerances and design integrity concerns, the edges "approach close to the axis of the bit at the tip, but do not actually intersect the axis." Id. The affidavit does not provide Desaulniers' education or training, and fails to establish that Desaulniers is a person of ordinary skill in the art of designing or manufacturing bits; it merely states that he is the President of Alden. Therefore, the Court finds the Desaulniers affidavit unpersuasive.

5. Construction

The claim language itself does not dictate a construction. The specification states under "Summary of the Invention" that the edges meet in a point. The Richards patent and Desaulniers affidavit on which Alden relies are entitled to no weight. Therefore, the Court accepts Eazypower's proposed construction of "point": "the position where the scraping edges intersect" for claims 416:1, 5, 6, and 8 and claim 730:6, and "the position where the scraping edges and rearward edges intersect" for claims 416:21 and 27.

6 Alden has provided a separate argument for the phrase "meets at a point" as used in claims 416:13, 21, and 27, but asserts the same construction. Eazypower relies on its arguments related to the term "point." The Court construes "meets at a point" as used in claims 416:13, 21, and 27 consistent with its construction of the term "point."

I. Point of Sale Location

The district court made several findings with regard to the construction of the expression "point of sale location." We address these findings below, agreeing with some and disagreeing with others.

1. In response to the district court's request for binding definitions of the disputed terms, described earlier, IGE identified the passage at column 5, lines 47-50 as defining a point of sale location. That passage states that a point of sale location is "a location where a consumer goes to purchase material objects embodying predetermined or preselected information." Freeny patent, col. 5, ll. 47-50. The district court held this definition to be correct, and we agree. Clear support is provided for this definition in the Freeny patent specification at column 5, lines 47-50.

2. The district court further held that, although point of sale locations are not restricted to retail locations, a home is not a point of sale location. See Interactive Gift Express, 47 U.S.P.Q.2D (BNA) at 1810 & n.9. IGE contends that the district court was wrong. IGE argues that a point of sale location is simply the location at which the consumer makes or effects a purchase. IGE argues that the concept of a home being a point of sale location is not new, citing home shopping networks, pay-per-view cable television, and home Internet shopping. IGE further argues that the specification defines a home as a point of sale location and discloses at least two embodiments in which the home is a point of sale location. IGE also argues that the
prosecution history lists several transmission systems that could be adapted for use in the home. The appellees respond that IGE's asserted definition before the district court precludes a home from being a point of sale location, and that any references in the specification to homes as point of sale locations cannot overcome this definition. The appellees further respond that the rest of the intrinsic evidence, as well as the extrinsic evidence of standard dictionaries and references, supports the district court's construction.

We agree with IGE's position that a home is not precluded from being a point of sale location. Looking first, as we must, to the claim language itself, we find nothing precluding a home from being a point of sale location. See Vitronics, 90 F.3d at 1582, 39 U.S.P.Q.2D (BNA) at 1576. Except for requiring that an IMM be present, the independent claims are silent regarding the possible venues of a point of sale location.

Looking next to the specification, see id. at 1582, 39 U.S.P.Q.2D (BNA) at 1577, we acknowledge the great likelihood that a point of sale location will not be a home, given that: (1) IGE's asserted definition, with which we agree, requires that a consumer go to a point of sale location "to purchase material objects," Freeny patent, col. 5, ll. 48-49; and (2) the specification requires, and IGE does not dispute, that the IMM be located at the point of sale location, see, e.g., Freeny patent, col. 5, ll. 32-33, col. 12, ll. 66-67. However, IGE's asserted definition, premised on the specification at column 5, lines 48 and 49, does not preclude a home from serving as a point of sale location, and the specification further describes a vending machine embodiment that could be utilized in a home. See Freeny patent, cols. 26-27. This intrinsic evidence unambiguously allows a home to serve as a point of sale location. Therefore, it is unnecessary to address IGE's arguments alleging that the prosecution history additionally supports our conclusion.

Given the lack of ambiguity in the intrinsic evidence, it would be improper to address any of the parties' arguments relating to extrinsic evidence, such as other examples of point of sale locations and standard references. See Vitronics, 90 F.3d at 1583, 39 U.S.P.Q.2D (BNA) at 1577 ("In those cases where the public record unambiguously describes the scope of the patented invention, reliance on any extrinsic evidence is improper.").

3.

The district court also held that a point of sale location "must have . . . at least two blank material objects." Interactive Gift Express, 47 U.S.P.Q.2D (BNA) at 1810. IGE argues that this limitation is not recited in the claims or required by the specification and has improperly been read into the claims from a particular embodiment. The appellees respond that the specification supports the requirement that there be two or more blank material objects. We agree with IGE that a point of sale location need not have two blank material objects.

We begin, as we must, with the language of the claims. See Vitronics, 90 F.3d at 1582, 39 U.S.P.Q.2D (BNA) at 1576 (stating that construction begins with the claim language). The claim language specifically recites "reproducing in a material object." Freeny patent, col. 28, l. 44 (claim 1; emphasis added); id. at col. 36, l. 63 (claim 37; emphasis added). Although the single element of claim 37 initially mentions material objects in the plural, it is later modified by a singular reference and does not require more than one material object. Compare id. at col. 36, l. 49 with id. at l. 63. The preambles of the independent claims similarly recite plural "material objects," but they do so in the context of multiple IMMs and/or multiple point of sale locations. See, e.g., id. at col. 28, ll. 22-24 (claim 1); id. at col. 36, ll. 45-46 (claim 37). The preambles do not require multiple material objects at each point of sale location. Given the preambles' generality, we need not consider whether they are more than statements of intended use.

We look next to the specification. See Vitronics, 90 F.3d at 1582, 39 U.S.P.Q.2D (BNA) at 1577. We note that the district court based the requirement of two blank material objects on a passage in the specification stating that "each point of sale location has . . . a plurality of blank material objects." See Interactive Gift Express, 47 U.S.P.Q.2D (BNA) at 1805 (citing to the Freeny patent, col. 12, ll. 66-68). From the passage itself, it is unclear whether this isolated statement in the specification is intended to be a general statement or to be limited to a particular embodiment. However, there is nothing in the rest of the specification supporting the position that a point of sale location is defined as having at least two blank material objects. To the contrary, it is clear that the IMM requires only a single material object to fully process a consumer's request. See, e.g., Freeny patent, col. 5, ll. 21-31 ("Each [IMM] 14 is constructed to . . . provide . . . information . . . to a reproduction unit 24 which is adapted to reproduce received information in a material object.") (underlining added). Further, the opening sentence of the background section of the Freeny patent states that "the present invention relates generally to a system for reproducing information in a material object." Freeny patent, col. 1, ll. 7-8 (emphasis added).
Accordingly, we hold that the entirety of the specification dictates that the reference to a plurality be understood to refer to a "supply" of blank material objects, and that the supply can consist of one material object. See Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1345, 47 U.S.P.Q.2D (BNA) 1418, 1425 (Fed. Cir. 1998) (basing the claim construction on the entire written description, despite an isolated passage in apparent conflict).

4. The district court also held that a point of sale location must have blank material objects "available for sale to consumers." Interactive Gift Express, 47 U.S.P.Q.2D (BNA) at 1810. IGE argues that this limitation is not recited in the claim or required by the specification and has improperly been read into the claim from a particular embodiment. Notably, the appellees do not argue in defense of this limitation. We agree with IGE that a point of sale location need not have any blank material objects separately for sale.

Looking again to the claims, nothing in the claim language itself requires that blanks be for sale. The claims require only that information be reproduced in a material object. See, e.g., Freeny patent, col. 28, ll. 22-23 (preamble to claim 1) and 44-45 (step four of claim 1); id. at col. 36, ll. 45-46 (preamble to claim 37) and ll. 62-63 (single element of claim 37). Looking next to the specification, we note that nothing in IGE's asserted definition, derived from the Freeny patent at column 5, lines 47-50, requires that blanks be for sale. That definition refers exclusively to the purchase of non-blank material objects, that is, to "material objects embodying . . . information." Id.

The district court based its conclusion that blanks must be for sale on the passage at column 13, lines 25-44. See Interactive Gift Express, 47 U.S.P.Q.2D (BNA) at 1805. However, that passage does not state that the blanks are sold to the customers as blanks, but only that the retailer is reimbursed for the cost of blanks on which information is reproduced. See Freeny patent, col. 13, ll. 25-44. The district court, therefore, misconstrued the specific embodiment in that passage. Further, there is no support in the rest of the specification for this requirement; all of the embodiments are directed at providing material objects with information on them and not at selling blank material objects. See, e.g., id. at col. 13, ll. 1-13 (reproducing information on an 8-track or cassette tape); id. at col. 22, l. 62 - col. 23, l. 6 (describing various material objects in which information can be reproduced); id. at cols. 26-27 (describing the reproduction of information in the vending machine embodiment). Indeed, the opening sentence of the background section of the Freeny patent states that "the present invention relates generally to a system for reproducing information in a material object." Freeny patent, col. 1, ll. 7-8 (emphasis added).

5. Accordingly, we construe a point of sale location to be a location where a consumer goes to purchase material objects embodying predetermined or preselected information. This construction permits a home to be a point of sale location. A point of sale location need not have more than one blank material object and it need not have any material objects separately for sale as blanks.
Kathrein argues the terms "pointer element" and "point element" should be given their plain and ordinary meaning. (See '130 Patent, Claim 1, Col. 5, ll. 61-67 & Col. 6, ll. 1-19; id., Claim 24, Col. 8, ll. 10-38.) Kathrein states that Claim 1 of the '130 Patent requires a pointer element that extends from the pivoting axis across two concentrically arranged stripline sections. (See id., Fig. 2.) Thus, according to Kathrein, the pointer element extends in one direction only. (Pl.'s Claim Construction Br. 11.)

However, RYMSA argues that Kathrein's proposed construction of "pointer element" and "point element" ignores an exemplary embodiment described in the specification and depicted in Figure 5 of the '130 Patent. (See '130 Patent, Claim 24, Col. 8, ll. 10-38; id., Col. 5, ll. 32-44; id., Fig. 5.) Courts "normally do not interpret claim terms in a way that excludes disclosed examples in the specification." Verizon Servs. Corp. v. Vonage Holdings Corp., 503 F.3d 1295, 1305 (Fed. Cir. 2007); see MBO Labs., Inc. v. Becton, Dickinson & Co., 474 F.3d 1323, 1333 (Fed. Cir.2007) ("[A] claim interpretation that excludes a preferred embodiment from the scope of the claim is rarely, if ever, correct.") (internal citation omitted); Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578 (Fed. Cir. 1996) ("[I]t is unlikely that an inventor would define the invention in a way that excluded the preferred embodiment, or that persons of skill in this field would read the specification in such a way.").

Independent Claim 24, in pertinent part, claims a "radio-frequency phase shift assembly coupled to a feedline comprising . . . at least two stripline sections offset with respect to one another . . . wherein [they] . . . are disposed in straight lines parallel to one another . . . [and] the tapping element comprises a pointer element which rotates about the pivoting axis." (See '130 Patent, Claim 24, Col. 8, ll. 10-33.) The specification states that Figure 5 "shows two straight striplines . . . which are . . . offset with respect to one another through 180[degrees] with respect to the pivoting axis." (Id., Col. 5, ll. 32-35.) Thus, Figure 5 shows one stripline positioned outward from the pivoting axis and another stripline positioned parallel to the other stripline on the opposite side of the pivoting axis, such that the pointer element points in one direction in relation to one of the striplines and, at the same time, points in the opposite direction in relation to the other stripline. (See id., Fig. 5.)

The Court agrees with RYMSA that the construction of "pointer element" and "point element" must be consistent with and support the language of Claims 1, 4 and 24, as shown in the embodiments of Figures 2, 4, 6, and 7 of the original specification. (See Defs.' Claim Construction Br., Ex. 2 at 44-49.) Because Kathrein's claim interpretation excludes one of its exemplary embodiments, the Court rejects it.

However, the Court also finds fault with RYMSA's proffered claim interpretation: "device that is shaped to point or indicate one or both direction(s) along a line." (Defs.' Claim Construction Br. at 18.) RYMSA's claim interpretation's inclusion of the phrase "device that is shaped" is unnecessary for a jury to understand that a pointer element must not be amorphously shaped such that it does not point. Further, RYMSA's inclusion of the phrase "along a line" is confusing because it is unknown whether "along a line" means along a line on the stripline or along a line on the pointer element or point element itself. Thus, the Court also rejects RYMSA's claim interpretation. Instead, the Court construes the terms "pointer element" and "point element" to mean "an indicator that points either unidirectionally or bidirectionally in two opposite directions."

7. "polygon"

This phrase is found in claims 12, 33, 47, and 58-75 of the '037 patent, and in claims 13-14, and 19-25 of the '255 patent. See Joint Statement, '037 and '255 Patents. Originally, plaintiffs contended that "polygon" should be construed to mean "a closed figure made up of curved lines, straight lines, or a combination of curved and straight lines" and defendants contended that the phrase should be construed to mean "a closed arrowhead shape." As with the disputed phrase "arcuate," however, the court requested at the claim construction hearing that the parties attempt to arrive at a jointly agreed upon construction, in view of the court's inclination to adopt plaintiffs' proposed construction, modified to include the term "arrowhead."

Unsurprisingly, the parties have not been able to agree upon a jointly proposed construction. Plaintiffs now propose that "polygon" be construed as "a closed figure made up of curved lines, straight lines, or a combination of curved and straight lines, for example, a closed arrowhead shape." Defendants, by contrast, propose the following construction: "a closed
On the whole, the court finds defendants' proposed construction more persuasive. Beginning with the specification, it clearly describes "the present invention" as an expandable stent, which in turn has a longitudinal axis and a porous surface "defined by a plurality of intersecting members arranged to define a first repeating pattern comprised of a polygon having a pair of side walls substantially parallel to the longitudinal axis." See Joint Statement, '037 Patent at 5:5-12. Thus, a first repeating pattern is comprised of a polygon with side walls essentially parallel to the longitudinal axis. Turning to the actual description of the various figure drawings of the patent, the specification explains that a first repeating pattern -- comprised of a polygon -- might look like the portion of Figure 1A that is labeled 'A.' See id. at 8:35-37 ("As illustrated and with further reference to FIG. 1A, repeating pattern A is a polygon comprising a pair of side walls 35, 40"). And viewing that portion labeled "A," it is, in fact, a closed figure in the shape of an arrowhead. Thus, the phrase "polygon" is referenced by the specification as a closed figure in the shape of an arrowhead.

Moreover, defendants correctly note that the specification, in discussing all the "illustrated embodiments" of the '037 patent, nearly all of which contain adjacent rows of "repeating pattern A" and repeating pattern B, expressly describes those repeating patterns as "polygons or "arrowheads."" See id. at 8:58-60 (emphasis added). This implies, as defendants propose, that polygon be construed to mean a "closed arrowhead shape." Plaintiffs correctly point out, however, that a polygon, as described in the patent, can include curved flexure members, and sides that include a sinusoidal -- or curved -- shape. For just as defendants rely on the description attached to the figure drawings of the patent, which indicate that polygons are synonymous with arrowheads, those descriptions and illustrations also indicate that the polygon shapes include curvatures. See id. at figures 5-10; see also 4:26-28 ("polygon comprises the sinusoidal or S-shaped section"). Defendants, moreover, do not appear to dispute this. See Joint Statement at p. 17 (defendants' acknowledgment that "as used in the patents, a polygon can have curved sides").

In sum, while the intrinsic evidence supports construction of a "polygon" as a closed "arrowhead" shape, it also makes clear that this shape can include "curved lines, straight lines, or a combination of curved and straight lines." Accordingly, the court adopts defendants' current proposed construction, which is most consistent with this understanding, and construes "polygon" as: "a closed arrowhead shape made up of curved lines, straight lines, or a combination of curved and straight lines.

Porcelain Powder

Ivoclar asks the Court to construe the claim "porcelain powder" as "porcelain matter in a finely divided particulate state." Def. Mem. at 3. PSN, on the other hand, seeks to construe the same claim as "a medium containing porcelain particles." Defendant's Local Rule 56.1 Statement of Facts, Ex. 14 (hereafter "Def. 56.1 Ex. 14"). The parties do not dispute that the '530 Patent describes applying a porcelain powder that has been mixed into an "opaque water slurry," while the Empress product uses a "ceramic ingot" that has been heated into a "flowable" state.

Ivoclar relies on several technical dictionary definitions of "powder" as "finely divided particles." See Def. 56.1 Exs. 15-17. Therefore, maintains Ivoclar, a hard ceramic ingot cannot be a powder. But the Phillips decision specifically cautions courts against using the analysis urged by Ivoclar- that is, reading the claimed term in isolation and relying upon a dictionary definition of that term that is at odds with the use of the term throughout the specification of the patent. See Phillips, 415 F.3d at 1321. A person of ordinary skill in the art is presumed to read the claimed term in the context of the entire patent. Phillips, 415 F.3d at 1313. Ivoclar maintains that only powder, and not a solid form of powder, can be a "powder" in the '530 Patent. But taking Ivoclar's proposed construction to its logical conclusion, the claimed step "applying porcelain powder to the surface of said statue" would mean that someone following the '530 Patent must apply powder, alone, to the surface of the statue to form the veneer. At no point in the '530 Patent summary, preferred embodiment, or example does the Patent describe use of the porcelain powder without a medium. To the contrary, the specification describes complimentary functions for the medium, such as adding pigment to the medium to render the porcelain opaque. See '530 Patent, col. 4, ll. 4-9.

The preferred embodiment and example in the '530 Patent describe applying the porcelain powder to the statue after mixing
it with water. To read the term "porcelain powder" as excluding porcelain powder in a medium, as proposed by Ivoclar, would make it impossible to make the invention as described. See Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578 (Fed. Cir. 1996) ("[I]t is unlikely that an inventor would define the invention in a way that excluded the preferred embodiment, or that persons of skill in this field would read the specification in such a way.") Therefore, the Court construes the claim "porcelain powder" as proposed by PSN: a porcelain powder is a medium containing porcelain particles.

2993

Dandy's next claim construction argument is that the court erred by interpreting the pores in the "porous material" to be of a certain size (1/2 inch). At the threshold, we disagree with the premise of Dandy's argument -- the court's construction did not require a specific size of pore. The court construed "porous material" as being a material having small openings (or pores) that allow gasses and liquids to pass through while sediment and other solids are substantially blocked from passing through. "Sediment," in turn, was construed as dust, soil, silt, and other particulates of a type suspended in runoff waters. The court, then, merely applied its constructions of "porous material" and "sediment" to the accused product -- and its outer layer containing 1/2 inch holes or pores -- and determined that the "porous material" limitation was not met because 1/2 inch holes cannot block particulate matter.

2994

DISCUSSION

I.

In the 1980s, Aronowitz and Louis Terminiello (Terminiello) began researching methods for testing heterogeneous bodily fluids for the presence of certain materials. Technical Chems. I, slip op. at 2-3. Such methods are useful in testing biological fluid samples, containing multiple components, for the presence of analytes such as glucose, cholesterol, and urea. Aronowitz's and Terminiello's research efforts resulted in the technology disclosed in the '192 and '580 patents.

The '192 patent, entitled "A Dry Reagent Delivery System With Membrane Having Porosity Gradient," discloses a system for detecting the presence of an analyte in a heterogeneous fluid sample. Claim 11, the only independent claim of the '192 patent at issue, provides:

A dry chemistry reagent system for detection of an analyte in a heterogenous [sic] fluid sample, said system comprising:

a porous membrane of essentially uniform composition and a porosity gradient from one planar surface thereof to the other, wherein said porous membrane's inherent fluid absorption and distribution characteristics have been modified by imbibing a conditioning agent, an indicator, flow control agent and reagent cocktail into its matrix, the effect of such absorption being to effect an essentially uniform distribution of indicator, flow control agent and reagent cocktail within the porous membrane thereby enhancing the uniformity of internal structure of said film so as to enhance the uniformity of absorption and modulate the rate of absorption of the fluid sample and its interaction with the reagent cocktail.

'192 patent; col. 22, ll. 56-68, to col. 23, ll. 1-5. This system is commercially embodied in products known as test strips. When a biological fluid sample, such as a drop of blood, containing the analyte for which a test is being conducted is placed on the reaction zone of the test strip, a chemical reaction occurs. The reaction produces a characteristic color change that indicates the presence of the analyte.

The '580 patent, entitled "Assay Kit Including An Analyte Test Strip And A Color Comparator," discloses a kit comprised of a test strip and a color comparator. The test strip functions in a manner similar to that disclosed in the '192 patent. The color comparator consists of a series of color fields which correlate color intensity to corresponding numerical values of the amount of analyte present. The color comparator contains apertures that allow a section of the reaction zone of the test strip, where the characteristic color change occurs, to be compared to the various colors on the comparator, while shielding the remainder of the reaction zone and the inert support medium of the test strip from view. The kit allows the user to compare
the characteristic color intensity of the indicator in the reaction zone of the test strip to the color comparator and thereby
determine the numerical amount of analyte present in the sample. Claims 1 and 8 of the ’580 patent, the only claims of the
’580 patent at issue, provide:

1. A test means comprising:

(a) a test strip which includes an inert support and a sample receptive medium comprising a dry chemistry reagent system
specific for an analyte of interest which upon interaction with said analyte produces a characteristic color indicative of an
assay value of said analyte of interest, said receptive medium being positioned on said test strip so as to be bordered on one
or more sides by said inert support;

(b) a color comparator including a plurality of different color fields representing a range of assay values of said analyte
physically arranged in a predetermined ordered succession for comparison with the color of the sample receptive medium of
the test strip, each of said color fields having an aperture which permits viewing therethrough of at least a portion of a
reaction zone of the sample receptive medium after said analyte has reacted to produce a color therein, and

2. means for positioning said test strip relative to the aperture of each of said color fields so as to mask from view the inert
support which borders the reaction zone of the sample receptive medium.

8. A test means comprising an analyte test strip having an analyte reaction zone and a color comparator therefor, said color
comparator comprising a plurality of color fields physically arranged in a linear succession, each successive field connoting
a different numerical assay value of said analyte, characterized in that each color field has an aperture therethrough entirely
framed by said color field, each aperture permitting at least a portion of said reaction zone to be viewed when said reaction
zone is positioned behind the color field framing the aperture.

’580 patent; col. 4, ll. 60-68, to col. 5, ll. 1-14, 46-56.

II.

The ’192 patent issued on September 27, 1988, and the ’580 patent issued on October 31, 1989. Aronowitz and Terminiello
assigned both patents to Technimed Corp. (Technimed), a Florida corporation formed by Aronowitz in the 1970s. Technical
Chems. I, slip op. at 2-3. Aronowitz originally served as Technimed's President and later as its Executive Vice President and
Technical Director. Id. at 2. Aronowitz claims that at the time he assigned his interest in the patents to Technimed, he also
executed an additional agreement whereby the patents would revert to him if Technimed failed to successfully
commercialize the inventions disclosed in the patents. Id. at 3.

Technimed attempted to commercialize the inventions claimed in the patents by entering into an agreement with HDI on
April 15, 1988 (1988 agreement). Id. The agreement consisted of two parts: (1) a Supply Agreement, under which HDI was
to purchase glucose and cholesterol test strips from Technimed, and (2) a Contingent Manufacturing Agreement, which
allowed HDI to become licensed to make glucose and cholesterol test strips using Technimed's technology if Technimed
was unable to meet HDI's demand for these products. The Contingent Manufacturing Agreement was conditioned on HDI
having purchased specified minimum quantities of test strips from Technimed. Under the Contingent Manufacturing
Agreement, HDI was assessed royalties based on the number of strips it produced, subject to a minimum annual royalty
provision.

On January 8, 1990, the parties entered into a second agreement (1990 agreement). The 1990 agreement invoked the
Pursuant to the 1990 agreement, Technimed released certain technical information and "Know-How" to HDI, and HDI was
licensed to manufacture glucose and cholesterol test strips. Id. at 3-4. As part of the 1990 agreement, HDI purchased a
portion of Technimed's test strip manufacturing facilities and hired nine employees who were working in test strip
manufacturing-related positions at Technimed. The district court found that almost simultaneously with the 1990 agreement,
Technimed assigned the ’192 and ’580 patents to Pacific National Bank (Bank) as part of a refinancing agreement. 1
1 The court noted that TCPI and Aronowitz failed to present any evidence to support their claim that the ’580 patent had been assigned to the Bank. Technical Chems. I, slip op. at 4.

Id. at 4. Shortly thereafter, Technimed defaulted on its obligations to the Bank. Id. at 4-5.

On September 24, 1992, Aronowitz obtained a Partial Final Judgment By Default against Technimed in the Circuit Court of the Seventeenth Judicial Circuit in and for Broward County, Florida. The judgment was in a suit by Aronowitz against Technimed in which Aronowitz asserted that Technimed had failed to commercialize the inventions of the two patents, as required under an agreement which Aronowitz alleged existed between Technimed and himself. Technical Chems. I, slip op. at 5. This judgment purported to rescind the assignments from Aronowitz to Technimed and purported to give Aronowitz superior rights relative to Technimed in the ’192 and ’580 patents, as well as in U.S. Patent No. 4,790,979 (the ’979 patent). On October 14, 1992, Aronowitz obtained a Final Judgment By Default against the Bank. Id. This judgment purported to give Aronowitz superior rights relative to the collateral claim of the Bank. 2

2 It is unclear from the Judgment By Default and from the record evidence which patent or patents were covered by this judgment.

On November 2, 1992, Aronowitz granted TCPI, the company of which he is President and Chief Executive Officer, a purportedly exclusive license under the ’192 and ’580 patents. Id.

As early as 1991, Technimed had attempted to terminate the 1988 and 1990 agreements, claiming that HDI had failed to pay the required royalties. In fact, Technimed and Aronowitz threatened to terminate the agreements on at least two occasions. Id. On November 22, 1993, TCPI and Aronowitz sued HDI, alleging willful infringement of the ’192, ’580, and ’979 patents. 3

3 At the close of plaintiffs' case, the court entered judgment as a matter of law, in favor of HDI, under Fed. R. Civ. P. 52(c), with respect to all claims under the ’979 patent. Technical Chems. II, slip op. at 1. The ’979 patent is not at issue in this appeal.

TCPI alleged that the Ultra+ test strips manufactured by HDI infringed the ’192 patent. Technical Chems. I, slip op. at 6. TCPI also alleged that HDI's LipoScan Total Color Cholesterol Chart and Ultra+ Blood Glucose Color Chart infringed the ’580 patent. Id. After filing the action, TCPI and Aronowitz sent a letter to HDI dated October 18, 1994, entitled "Formal Notice of Termination of License." The letter purported to terminate, because of HDI's alleged failure to pay royalties, whatever rights HDI had by virtue of the 1988 and 1990 agreements. Id. at 5.

III.

The case was tried to the bench from September 18-22, 1995. Id. at 1. After trial, the court determined that Aronowitz and TCPI had standing to assert the ’192 and ’580 patents against HDI, subject to any existing license HDI had previously been granted by Technimed. Technical Chems. I, slip op. at 9-10. The court also determined that HDI had not infringed independent claim 11 and dependent claims 14 and 15 of the ’192 patent, either literally or under the doctrine of equivalents. 4
With respect to the other claims of the '192 patent, the court stated: "Because of the absence of any evidence to support a finding of infringement on claims 1 through 10, 12, 13, 16 through 40, the Court concludes that such claims have not been infringed." Technical Chems. I, slip op. at 14.

Id. at 17-18. The court further determined that HDI's LipoScan product and its Ultra+ Blood Glucose Color Chart, when used in conjunction with the Ultra+ test strips, were within the scope of the claims of the '580 patent. Id. at 20. The court concluded, however, that HDI had not infringed claims 1 and 8 of the '580 patent because it was validly licensed pursuant to the 1988 and 1990 agreements. Id. at 21-22. The court additionally concluded that HDI had not materially breached the agreements and that, therefore, the agreements could not have been terminated. Technical Chems. I, slip op. at 21-22. Finally, the court held that HDI was not required to pay royalties under the agreements because the contingencies giving rise to royalty payments had not occurred. Id. On August 30, 1996, the court entered final judgment in favor of HDI on all counts. Technical Chems. II, slip op. at 2-3.

We address the arguments of the parties in turn, beginning with the infringement issues. A determination of infringement requires a two-step analysis. "First, the claim must be properly construed to determine its scope and meaning. Second, the claim as properly construed must be compared to the accused device or process." Carroll Touch, Inc. v. Electro Mechanical Sys., Inc., 15 F.3d 1573, 1576, 27 U.S.P.Q.2D (BNA) 1836, 1839 (Fed. Cir. 1993). Claim construction is a question of law, which we review de novo. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 979, 34 U.S.P.Q.2D (BNA) 1321, 1329 (Fed. Cir. 1995) (in banc), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996). Infringement, both literal and under the doctrine of equivalents, is a question of fact which we review for clear error when tried to the court. See SRI Int'l v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1125, 227 U.S.P.Q. (BNA) 577, 589 (Fed. Cir. 1985) (in banc); Critikon, Inc. v. Becton Dickinson Vascular Access, Inc., 120 F.3d 1253, 1255, 43 U.S.P.Q.2D (BNA) 1666, 1668 (Fed. Cir. 1997). In interpreting the claims of a patent, the court first looks to the intrinsic evidence of record, including the claims of the patent, the specification, and the prosecution history. See Vitronics Corp. v. Conceptor Inc., 90 F.3d 1573, 1576, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). When intrinsic evidence unambiguously delineates the scope of the patented invention, resort to extrinsic evidence, including expert testimony, is unnecessary. See id. at 1583, 39 U.S.P.Q.2D (BNA) at 1577.

Claim 11 of the '192 patent requires "a porous membrane of essentially uniform composition and a porosity gradient from one planar surface thereof to the other." '192 patent; col. 22, ll. 59-61. The district court construed this limitation to mean "that the untreated membrane, to which the dry chemistry reagent system is added, must have a porosity gradient[,] . . . a gradual change in the porosity from one planar surface [of the membrane] to the other." Technical Chems. I, slip op. at 15-16. The court determined that the claimed membrane was "prior to conditioning, anisotropic, in that there existed a density gradient from one planar surface to the other." Id. at 16. The court rejected TCPI's and Aronowitz's argument that a "'porosity gradient' can also be characterized by differences in the density of the two planar surfaces [of the membrane], rather than a gradual, continuous change in the internal structure." Id. at 16-17.

TCPI and Aronowitz argue that the court misconstrued claim 11 by limiting the term "porosity gradient" to gradual changes in porosity from one planar surface of the membrane to the other. They contend that "porosity gradient" means that one surface of the membrane or the area immediately contiguous thereto is denser than the other surface of the membrane or the area immediately contiguous thereto. We cannot agree.

The language of claim 11 requires that the porosity gradient run "from one planar surface [of the membrane] . . . to the other." '192 patent; col. 22, ll. 60-61. The specification provides that the membrane of the claimed invention "is, prior to conditioning, anisotropic, in that there exists a density gradient from one planar surface to the other." Id.; col. 11, ll. 32-34. Since the patentee did not express in the patent an intent to impart a novel meaning to the term "gradient," we give that term its ordinary meaning. See York Prods., Inc. v. Central Tractor Farm & Family Ctr., 99 F.3d 1568, 1572, 40 U.S.P.Q.2D
(BNA) 1619, 1622 (Fed. Cir. 1996). "Gradient" is defined as a "change in the value of a quantity . . . per unit distance in a specified direction." Webster's Third New International Dictionary 985 (1986). We agree with the district court that "porosity gradient", as used in the claims of the '192 patent, requires "a gradual change in the porosity from one planar surface [of the membrane] to the other." Technical Chems. I, slip op. at 16. The term "gradual" is used to describe the change in porosity in contrast to a discontinuity. Thus, moving from one surface of the membrane to the other, porosity changes continuously, rather than exhibiting two regions of uniform porosity separated by a plane of discontinuity. Under TCPI's and Aronowitz's proffered construction, the claimed membranes could consist of two layers joined at a single plane. Such a structure does not contain a gradient as the term is ordinarily defined, but rather a discontinuity. We reject this construction because it is inconsistent with the claims and the specification, which require that the porosity gradient run "from one planar surface [of the membrane] to the other" rather than existing at only a plane of discontinuity within the membrane.

The district court also construed claim 11 to require that "the untreated membrane, to which the dry chemistry reagent system is added, must have a porosity gradient." Id. at 15-16. While claim 1 of the '192 patent addresses the membrane prior to chemical conditioning, claim 11 is directed to a system in which the membrane has "been modified by imbining a conditioning agent, an indicator, flow control agent and reagent cocktail into [the membrane's] matrix." '192 patent; col. 22, ll. 63-65. Claim 11 does not require the membrane to have a porosity gradient prior to chemical conditioning, but instead requires that the membrane of the chemically conditioned reagent system have a porosity gradient. In other words, the proper construction of claim 11 requires the membrane to have a porosity gradient, but does not require the gradient to be present prior to chemical conditioning. The court thus erred in reading the "prior to conditioning" limitation from the specification, see '192 patent; col. 11, ll. 31-34, into claim 11. See Constant v. Advanced Micro-Devices, Inc., 848 F.2d 1560, 1571, 7 U.S.P.Q.2D (BNA) 1057, 1064 (Fed. Cir. 1988) ("Although the specification may aid the court in interpreting the meaning of disputed language in the claims, particular embodiments and examples appearing in the specification will not generally be read into the claims."); E.I. Du Pont De Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433, 7 U.S.P.Q.2D (BNA) 1129, 1131 (Fed. Cir. 1988).

2995

8. "Port"

The term "port" can be found twice in Claim 5 of the '477 Patent. See '477 Patent col. 9 ll. 5-6 ("the fluid receptacle provided with a port"); id. col. 9 ll. 12-15 ("said body shaped to fit substantially water-tight within said port such that said first open end faces inside said fluid receptacle and said second open end faces outside said fluid receptacle"). However, Millipore initially sought to have the term "port" construed to include other parts that permit attachment of additional devices to the port, such as seals, alignment features, clamps, and collars, which in combination permit the additional devices (here, the fluid sampling device) to be in fluid communication with a fluid receptacle.

While the language of Claim 5 itself does not provide any other language helpful in further construing the term "port," the specification provides some assistance. The specification of the '477 Patent expressly provides as follows:

Although port insert 10 is structured to fit snugly within host port, to prevent it from being popped into or out of the port during use, additional mechanical restraints are highly desirable. As shown in FIG. 2, this is accomplished by means of a threaded collar 40 that engages with and holds an annular lip 45 provided on the port insert when said collar 40 is screwed into port 5. Other mechanical restraints - such as clamps, screws, bolts, or mated interlocking parts - are known in the art.

Id. at col. 5 ll. 11-19. From the specification, it is therefore clear that the port is distinct and separate from the mechanical restraints, such as clamps, screws, bolts, or mated interlocking parts. Construing the term "port" to include such restraints would therefore be improper.

Consequently, I adopt Gore's construction of the term "port" and construe that term, as Millipore now agrees, as "a part of a fluid receptacle that provides an opening to the receptacle."
8. Ports

The fifth element of Claim 1 is "two ports for aspirating and dispensing fluid from the chamber." The ordinary meaning of "port" is an opening. The specification and figures are consistent with the ordinary meaning, and the prosecution history does not contain a contrary definition. Accordingly, the Court construes "port" to be an opening.

7. "Port Insert"

The term "port insert" appears in Claim 1 of the '477 Patent. See '477 Patent col. 8 l. 38. Millipore Enhanced Coverage Linking initially argued that this term is not a claim limitation but rather a collective term for the elements of the claimed device recited in paragraph (a) of Claim 1. To support its argument that the term "port insert" is not a claim limitation, Millipore observes that this term precedes the transitional term "comprising." This fact alone supports a finding, according to Millipore, that the term "port insert" was part of a preamble, i.e., the language preceding the transitional term "comprising," thereby preventing this term from being a claim limitation.

Usually, "the preamble does not limit the claims." Allen Eng'g Corp. v. Bartell Indus., Inc, 299 F.3d 1336, 1346 (Fed. Cir. 2002). Yet, "the preamble may be limiting 'When the claim drafter chooses to use both the preamble and the body to define the subject matter of the claimed invention.'" Id. (quoting Bell Comm'n's Research, Inc. v. Vitalink Comm'n's Corp., 55 F.3d 615, 620 (Fed. Cir. 1995)). Here, Millipore ignores the fact that Claim 1 of the '477 Patent begins with the preamble "[a] fluid sampling device comprising" before defining the term "port insert." See '477 Patent col. 8 l. 37. Under these circumstances, I conclude that the term "port insert" is not solely a part of the preamble and should be construed as a claim limitation.

Accordingly, I now turn to the construction of the term "port insert" as a claim limitation. Anticipating that the term "port insert" might be determined to be a claim limitation, Millipore initially sought to have this term construed as "device to be mated with a port." Gore countered that the term "port insert" should be construed to mean "a structure installed into a port provided on a fluid receptacle." I note that the specification contemplates an embodiment ",[w]hen the port insert is installed into a suitable port," '477 Patent col. 2 ll. 21-22. In this instance, I find that using the specification would merely interpret the meaning of a claim rather than to import limitations from the specification into the claim. See Phillips, 415 F.3d at 1323.

Consequently, I construe the term "port insert," as Millipore now concedes, to mean "structure installed into a suitable port."

5. Portable

The term "portable electronic navigational aid device" appears in claims 9, 10 and 11. The dispute is over the term "portable." The parties advance the same arguments they made in the context of the '873 patent. For the reasons discussed in section C.9, I construe "portable" as "easily transportable."

6. Portable

The term "portable" appears in Claims 1, 38, 40, and 49 of the '529 Patent. Plaintiffs assert that the portable limitation
means "a structure (upon which the bin, conduit and meter are mounted) that is capable of transportation with some particulate matter in the bin." Defendants propose that this limitation should be construed as "a structure of sufficiently small size and sufficient durability to be transported with an operationally significant amount of particulate matter in the bin."

The ordinary meaning of the term "portable" is "capable of being carried" or "easily or conveniently transported." Webster's Third New International Dictionary 1768 (1993). In the context of the independent claim language of the '529 Patent, the term "portable" requires that the device be sufficiently portable to allow "transportation with particulate matter in the bin." ('529, c. 8, ll: 60-62; c. 11, ll: 32-34; c. 11, ll: 65-67; c. 12, ll: 46-48.) The background of the invention describes a "device and method for shipping and dispensing precise amounts of dry particulate matter, such as fertilizer and pesticide products and such, into a liquid carrier stream." ('529, c. 1, ll: 5-8.) The summary of the invention states that the invention "features a means of transporting and storing a dry particulate matter, and then dispensing controlled quantities of that material directly into a stream of liquid carrier." ('529, c. 1, ll: 35-38.) The patent specification further states as follows:

In some embodiments, the method also includes, before distributing each device, filling the bin of the device with the corresponding quantity of agricultural chemical; and then, after accepting the returned devices, refilling the bins of the devices with additional agricultural chemicals. . . . Additionally, transportation of pre-mixed liquid chemicals can be avoided, with the chemicals being transported all the way to their use site in dry form.

('529, c. 3, ll: 36-40, 45-57.)

First, the Court agrees with Defendants that a construction of the portability limitation of each of the contested claims of the '529 Patent must include some reference to transporting an operationally significant amount of particulate matter. If the Court were to construe the portable limitation without such a requirement, the Court would have to define the claim language to allow portability with any amount--even a dusting--of particulate matter in the bin. This construction would not square with the Patent specification and claim language that clearly contemplates transporting the device with an operationally significant, or usable, amount of particulate matter in the bin. Second, the Court does not agree with Defendants' attempts to import size and durability limitations into the claim construction. Such requirements are not supported by the claim language or the prosecution history of the '529 Patent. Thus, the Court construes the "portable" limitation of Claims 1, 38, 39, and 40 to mean a structure (upon which the bin, conduit, and meter are mounted) that is capable of being transported with an operationally significant amount of particulate matter in the bin.

2. "Portable Housing"

Plustek asks the Court to construe this term as "a compact case that can be made of light but rigid plastic material and that houses only a color image sensing module and a motion mechanism," the same as its proposed construction for "main case." Alternatively, "a compact case compatible with portability that can be made of light but rigid plastic material and that houses only a color image sensing module and a motion mechanism."

Syscan prefers "a mobile case."

The portable housing must be the main case. The specification fails to mention or describe the term "portable housing", although the claims recite the term. See e.g., Dang Decl., P 2, Ex. A ('124 Patent), 11:28 (claim 8), 12:4 (claim 15), 12:50 (claim 21). In fact, the first time the term "portable housing" is mentioned is in claim 8. See Dang Decl., P 2, Ex. A ('124 Patent), 11:28. In addition, the claims consistently recite that the image sensing module is mounted in the portable housing. See e.g., Dang Decl., P 2, Ex. A ('124 Patent), 11:29 (claim 8), 12:5 (claim 15), 12:51 (claim 21). The specification discloses only one structure, the main case (also referred to as the "main module" or the "compact case"), that contains the image sensing module and the motion mechanism. See e.g., Dang Decl., P 2, Ex. A ('124 Patent), Fig. 4A (element 402 is the main case, element 406 is the image sensing module, and element 408 represents the motion mechanism), 5:18-20 ("both image sensing module and motion mechanism are housed in a compact case"), 5:27-29 ("Main case 402 houses an image sensing module and motion mechanism... "). Although the specification does not include the term "portable housing", the claims actually recite the term. See e.g., Dang Decl., P 2, Ex. A ('124 Patent), 11:28 (claim 8), 12:4 (claim 15), 12:50 (claim 21).
When the patentee wanted to claim that a particular element resides in the portable housing (or main case), the patentee specifically did so. See e.g., Dang Decl., P 2, Ex. A ('124 Patent), 11:29-30 ("an image sensing module mounted in the housing …" emphasis added), 10:44 ("a main case housing an image sensing module and a motion mechanism …" emphasis added).

For all the above reasons, this Court construes the term "portable case" to be "a compact case that can be made of light but rigid plastic material and that houses only a color image sensing module and a motion mechanism."

4. "portable ultrasound diagnostic instrument"

Plaintiffs' construction: an ultrasonic diagnostic instrument used to evaluate a patient's condition or state and that by design is carried or moved about.

Defendant's construction: an ultrasound instrument used to evaluate a patient's condition or state and that can be easily carried.

The parties' proposed constructions of this term differ only with respect to whether the instrument must be "designed to be carried or moved about" or "easily carried." On this front, the parties engage in a battle of dictionary definitions, both contending that their dictionaries prove that their construction is accurate. This is not a winning or productive strategy.

Fortunately, the patent specification helps settle the dispute. The parties agree that the Background Art portion of the patent specification is important. In it, the patentee describes "premium ultrasound systems" that are "mounted in carts for portability." '651 pat., col. 1, lns. 12-13. Defendant argues that this reference was meant as a point of comparison. That is, it should be understood from this passage that the claimed invention was not like these examples of prior art in that it could be carried, not just mounted in a cart and moved around. Plaintiffs draw another conclusion, which is more consistent with the use of language in the '651 patent. They contend that by describing the "portability" of systems that weigh several hundred pounds and are cart-mounted in the specification and then using the term "portable" in the claim language, the patentee made clear that in the context of the '651 patent, "portable" is a term that relates to units that can be easily moved about by means other than carrying. I agree. An inventor "may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning." Bell Atlantic Network Services, Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1268 (Fed. Cir. 2001). The inventor in the '651 patent used the term "portability" to describe ultrasound units that could not be carried. Therefore, there is no reason to believe that the use of the term "portable" in the claim terms should be so limited.

Court's construction: an ultrasonic diagnostic instrument used to evaluate a patient's condition or state and that by design is carried or moved about.

GO BACK

3002

The dispositive question in this case is whether the word "portion" as used in the claims of the 550 patent should be limited to parts of an object that are "separate," as opposed to parts that can be either "separate" or "integral." Since each of Laitram's accused conveyor belts contains chain links having an integral, or one-piece construction, Rexnord contends that the broader interpretation should be adopted. Not surprisingly, Laitram argues that the narrower interpretation requiring separate parts should prevail.

A

Cases presenting issues of claim interpretation are often close. When words used in claims have more than one possible meaning, our canons of claim interpretation are the tools that permit resolution of disputes as to the correct meaning of
claim language. In this case, the district court recognized that the word "portion" could be defined, from the perspective of
dictionary sources, as both Rexnord and Laitram contend. The district court correctly understood the need to examine the
intrinsic record of the patent, its specification and its file history, to determine which meaning of the term must govern.
Examination of a specification or of a file history entails close scrutiny. For the reasons set forth below, we conclude that the
district court's analysis of the specification and the file history led it to the wrong legal conclusion.

We begin our claim construction analysis as it always should: with the language of the claims. Johnson Worldwide Assocs.,
175 F.3d at 989, 50 U.S.P.Q.2D (BNA) at 1610; Renishaw PLC, 158 F.3d at 1248, 48 U.S.P.Q.2D (BNA) at 1120; AbTox,
Inc. v. Exito Corp., 122 F.3d 1019, 1023, 43 U.S.P.Q.2D (BNA) 1545, 1548 (Fed. Cir. 1997). As we have often stated
before, as a general rule, all terms in a patent claim are to be given their plain, ordinary and accustomed meaning to one of
ordinary skill in the relevant art. Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295, 1299, 53 U.S.P.Q.2D (BNA) 1065,
1067 (Fed. Cir. 1999) ("Words in patent claims are given their ordinary meaning in the usage of the field of the invention,
unless the text of the patent makes clear that a word was used with a special meaning."); Johnson Worldwide Assocs., 175
F.3d at 989, 50 U.S.P.Q.2D (BNA) at 1610; Renishaw PLC, 158 F.3d at 1249-50, 48 U.S.P.Q.2D (BNA) at 1120. In
addition, unless compelled to do otherwise, a court will give a claim term the full range of its ordinary meaning as
understood by an artisan of ordinary skill. Johnson Worldwide Assocs., 175 F.3d at 989, 50 U.S.P.Q.2D (BNA) at 1610;
"plasticizer" given full range of ordinary and accustomed meaning to those of ordinary skill in the arts of polymer chemistry
and the plastics industry). Furthermore, a claim term should be construed consistently with its appearance in other places in
the same claim or in other claims of the same patent. See Phonometrics, Inc. v. Northern Telecom Inc., 133 F.3d 1459, 1465,
45 U.S.P.Q.2D (BNA) 1421, 1426 (Fed. Cir. 1998) ("A word or phrase used consistently throughout a claim should be
interpreted consistently."); CVI/Beta Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1159, 42 U.S.P.Q.2D (BNA) 1577, 1586
(Fed. Cir. 1997) ("We are obliged to construe the term 'elasticity' consistently throughout the claims."); Southwall Techs.,
Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579, 34 U.S.P.Q.2D (BNA) 1673, 1679 (Fed. Cir. 1995) (holding that claim terms
found in different claims should be interpreted consistently).

Once a disputed claim term is identified by the parties and its plain meaning to the ordinarily skilled artisan is ascertained
by the court, the next step is to examine the written description and the drawings to confirm that the patentee's use of the
disputed terms is consistent with the meaning given to it by the court. Watts v. XL Sys., Inc., 232 F.3d 877, 882, 56
U.S.P.Q.2D (BNA) 1836, 1839 (Fed. Cir. 2000); Markman v. Westview Instruments, Inc., 52 F.3d 967, 979, 34 U.S.P.Q.2D
(BNA) 1321, 1329 (Fed. Cir. 1995) ("Claims must be read in view of the specification, of which they are a part."); aff'd, 517
U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). This confirmatory step is necessary for several reasons. First, patent
law permits the patentee to choose to be his or her own lexicographer by clearly setting forth an explicit definition for a
claim term that could differ in scope from that which would be afforded by its ordinary meaning. Mycogen Plant Science v.
Monsanto Co., 243 F.3d 1316, 1327, 58 U.S.P.Q.2D (BNA) 1030, 1039 (Fed. Cir. 2001) ("[A] patentee is free to be his own
lexicographer, so long as the special definition of a term is made explicit in the patent specification or file history.").
Second, because a claim construction that would exclude the preferred embodiment "is rarely, if ever, correct and would
require highly persuasive evidentiary support," Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583, 39 U.S.P.Q.2D
(BNA) 1573, 1578 (Fed. Cir. 1996), a court mindful of this canon of construction would need to examine the written
description and the drawings to determine whether the preferred embodiment falls within the scope of a construed claim.
Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1580-81, 38 U.S.P.Q.2D (BNA) 1126, 1130 (Fed. Cir. 1996)
(refusing to adopt a claim construction of "stable" that would exclude the preferred embodiment disclosed in the
(Fed. Cir. 2000) (adopting a claim construction in light of the prosecution history and the unambiguous language of an
amended claim which excluded a preferred and sole embodiment disclosed in the specification).

Furthermore, an examination of the written description and drawings is necessary to determine whether the patentee has
disclosed subject matter or has otherwise limited the scope of the claims. SciMed Life Sys., Inc. v. Advanced
Cardiovascular Sys., Inc., 242 F.3d 1337, 1344, 58 U.S.P.Q.2D (BNA) 1059, 1065 (Fed. Cir. 2001) (relying on a disclaimer
in the written description of subject matter that could have otherwise fallen within the scope of the claim language); Watts,
232 F.3d at 882, 56 U.S.P.Q.2D (BNA) at 1840 (restricting claim limitation to a particular structure based in part on
distinguishing remarks contained in the specification). And, of course, if "the term or terms chosen by the patentee so
deprive the claim of clarity that there is no means by which the scope of the claim may be ascertained" by one of ordinary
skill in the art from the language used, a court must look to the specification and file history to define the ambiguous term in
the first instance. Johnson Worldwide Assocs., 175 F.3d at 990, 50 U.S.P.Q.2D (BNA) at 1610.
After examining the written description and the drawings, the same confirmatory measure must be taken with the
prosecution history, since statements made during the prosecution of a patent may affect the scope of the invention. See
(affirming the use of prosecution history to construe a claim). The comprehensive examination of the claims, the
specification, and the prosecution history in the claim construction process is not meant to impose an undue burden on
the district court, but instead serves to ensure that all pertinent intrinsic evidence is considered in the proper interpretation of a
claim. Markman, 52 F.3d at 979, 34 U.S.P.Q.2d (BNA) at 1329 ("To ascertain the meaning of claims, we consider three
sources: The claims, the specification, and the prosecution history.") (quoting Unique Concepts, Inc. v. Brown, 939 F.2d
1558, 1561, 19 U.S.P.Q.2d (BNA) 1500, 1503 (Fed. Cir. 1991)). Likewise, the parties should provide the district court with
all relevant arguments and point out with specificity the relevant statements in the specification and prosecution history in
support of their arguments.

In this case, the district court noted that the plain, ordinary meaning of "portion" included two possible readings--parts that
were "separable from the whole" and parts that were "not separated from the whole." Rexnord, slip op. at 24-25. Instead of
giving the term the full range of its ordinary meaning (which would encompass both readings), the district court incorrectly
concluded that the term was uncertain. Id. Upon considering the intrinsic evidence, the district court determined in the first
instance that the term should be construed to have the narrower meaning of "separate" parts. In doing so, the district court
relied solely on the preferred embodiment in the written description and its drawings (which admittedly reads on the
narrower meaning of the key word) and on one passage from the prosecution history. Concerning the latter, the district court
concluded that the examiner's objection during prosecution to a particular paragraph structure used in an original claim
implied that the examiner viewed the "portions" to be separate pieces. Rexnord, slip op. at 36-37. For the reasons explained
below, we conclude that the district court erred in its assessment of the written description and of the prosecution history.

B

The parties agree that the dictionary definition of "portion" is "a part of any whole, either separated from or integrated with
it." Random House Unabridged Dictionary 1507 (2d ed. 1993). Hence, according to its ordinary meaning, so long as a
"portion" of an object is a "part" of that object, it can connote either the quality of being "separate" or of being "integral." That
there is no doubt that "portion" has a broad meaning is evidenced by Laitram's explicit concession at oral argument that
the dictionary definition contemplates both meanings.

In the 550 patent, the patentee used the word "portion" in the phrases "link module portion" and "cantilevered portion" to
describe the two parts of the "chain link." 1 The district court construed the claims so as to require the "link module portion"
and the "cantilevered portion" to not only be distinct parts of the "chain links" (which is agreed by both parties to be proper)
but also to be separate from one another. In so doing, the district court held that the claimed "chain link" structure must be
limited to a two-piece embodiment, as opposed to encompassing both one- and two-piece embodiments. The primary
rationale articulated by the district court for its claim construction was that, of the embodiments Rexnord alleged to be
disclosed by the 550 patent, the only one described with detail in the written description and depicted in the drawings of the
550 patent was a two-piece embodiment. Rexnord, slip op. at 28-31. The district court also noted that no "figure or
embodiment described in the specification describes a one-piece construction explicitly." Id. at 31 (emphasis added).

--- Footnotes ---

1 Although claims 12 and 16 contain slight variations of the phrases "link module portion" and "cantilevered portion" used
in claim 5, these differences are insignificant for the purposes of this appeal. For instance, claim 12 uses "second portion"
instead of "cantilevered portion." But the operative language, "portion," remains the same. Also, claim 16 uses "first side
dge" and "second side edge." However, for purposes of Laitram's motion for summary judgment of noninfringement, the
parties agree that "side edge" is equivalent to "end portion." Rexnord, slip op. at 27.

--- End Footnotes ---

Our case law is clear that an applicant is not required to describe in the specification every conceivable and possible future
embodiment of his invention. See SRI Int'l v. Matsushita Elec. Corp. of America, 775 F.2d 1107, 1121, 227 U.S.P.Q. (BNA)
577, 585 (Fed. Cir. 1985) (en banc). "If structural claims were to be limited to devices operated precisely as a specification-
described embodiment is operated, there would be no need for claims. Nor could an applicant, regardless of the prior art, claim more broadly than that embodiment.” Id. In short, it is the claims that measure the invention, as informed by the specification. As we noted long ago: “Specifications teach. Claims claim.” Id. at 1121 n.14, 585 n.14.

Since the preferred embodiment of the invention, in all of its representations (drawings and text), is a two-piece structure (the "link module portion" being separate from the "cantilevered portion"), one would not expect to find a description of an "integral" structure under the heading of "Description of A Preferred Embodiment." Indeed, no one contends that the preferred embodiment could be an integral structure. Therefore, references to the preferred embodiment simply beg the dispositive question, rather than answer it.

When we examine the section in the written description entitled, "Summary of the Invention" (a pertinent place to shed light upon what the patentee has claimed), we find only three references to distinct embodiments that mention "link modules" and "cantilevered" portions. One of the three embodiments unquestionably teaches a "separate" attachment. 550 patent, col. 2, ll. 34-39 ("In one embodiment . . . each chain link includes a molded plastic link module. . . and an attachment that is mountable in cantilevered relation on the side of the link module." (emphases added)). This teaching should come as no surprise, since there is no dispute that the plain meaning of the word "portion" is broad enough to cover separate structures. Significantly, though, the other two embodiments do not describe two-piece, or separate, constructions. In fact, the embodiment disclosed at column 2, lines 40-57, is described completely without the use of any words that connote a quality of being "separate"--such as "attachment," "mountable," "second piece," or "securable." Cf., 550 patent, col. 8, ll. 61-64 ("Each of the chain links 256 also includes a second piece comprising an attachment 272 that is securable in cantilevered relation to a link module 260. . . ." (emphases added)). Similarly, the embodiment disclosed from col. 2, line 63, to col. 3, line 9, describes another embodiment without the use of any words that might connote a "separate" attachment. Hence, in the "Summary of the Invention" section, there are two embodiments that support a broader interpretation of "portion," as opposed to one embodiment that requires "separate" parts. Moreover, the written description explicitly states that aside from the preferred embodiment, "the invention is capable of other embodiments and of being practiced or being carried out in various ways." 550 patent, col. 3, ll. 57-59. The inventor was careful to consistently use phrases throughout the written description such as: "In one embodiment . . .", "Before one embodiment . . .", "of other embodiments . . .", "of a preferred embodiment . . .", or "In the particular embodiment . . .". These phrases reflect the inventor's teaching that his invention could be embodied "in various ways." Finally, the inventor explicitly qualified his detailed "Description of A Preferred Embodiment" by stating that "it is to be understood that the invention is not limited in its application to the details of construction and the arrangements of components set forth in the following description or illustrated in the drawings." 550 patent, col. 3, ll. 54-57.

When the claim language is assessed on its own, and when the written description is examined carefully, one finds that the patentee has described an invention that embraces, through the word "portion," structure that may be either "integral" or "separate."

Given that the plain meaning of "portion" and the specification both support an interpretation that can cover either one-piece or two-piece embodiments, the remaining inquiry is whether such construction must be altered or discarded because of statements made during the prosecution history. The district court singles out a part of the prosecution history where the examiner contested the accuracy of the inventor's indented paragraph structure in proposed claim 33 (issued as claim 5). The examiner stated:

The paragraph in [claim 33] defining the "cantilevered portion . . ." must be moved to the left to line up with "a link module portion" because the cantilevered portion is defined as "extending laterally from said link module portion" and therefore can not also be part of the link module portion as claimed.

To spell out our understanding of the examiner's rejection, the following is proposed claim 33 as originally presented to the examiner with lines and arrows added to convey the thrust of the examiner's remarks:

33. A conveyor apparatus comprising

a frame,

a sprocket supported by said frame,
a first conveyor supported by said frame and including
an article supporting surface defining a plane, and
a transition section supported by said sprocket along an arcuate path deviating from said plane, and
a second conveyor supported by said frame, oriented transversely to said first conveyor, and including
a plurality of elongated chain pins, and
a plurality of chain links interconnected by said chain pins and respectively including
a link module portion including
an article supporting surface generally coplanar with said article supporting surface of said first conveyor, and
a cantilevered portion extending laterally from said link module portion, from said chain pins, extending over said sprocket, and into overhanging relation to said transition section of the first conveyor to provide an extension of said second conveyor article supporting surface, and including
a lower edge portion contoured to follow the arcuate path of said transition section.

(emphases added). The examiner, in rejecting the proposed claim, made it explicitly clear that the basis for his rejection was that, from a logical standpoint, the paragraph structure was inaccurate, as opposed to being too broad in light of the prior art. In other words, the examiner rejected the proposed claim because, as a technical matter, if the "cantilevered portion" was "extending laterally from" the "link module portion," it could not be simultaneously a part of the "link module portion" (as suggested by the alignment in the original indented paragraph structure). It is significant that the examiner made no explicit reference or hint to any notion of "separate" or "integral." The district court, however, interpreted the examiner's statements, without further elaboration, to compel the conclusion that the examiner must have viewed "the cantilevered portion as a separate part of the chain link with equal status to the link module." Rexnord, slip op. at 36 (emphasis added). Although, no doubt, the "cantilevered portion" shares distinct and equal status with the "link module portion" from a hierarchical standpoint, it does not necessarily follow that the two portions must be "separate."

For example, a typical tapered bottle includes a "cylindrical portion" and a "neck portion." It would indeed be technically inaccurate to describe the bottle as including a "cylindrical portion" which, in turn, includes a "neck portion" (especially if the "neck portion" is described as "extending laterally from" the "cylindrical portion"). The inaccuracy stems from the fact that the "neck portion" should not be viewed as a sub-part of the "cylindrical portion," but rather, should possess equal status with the "cylindrical portion" as parts of the same bottle. Hence, to be accurate, the bottle ought to be described simply as having a "cylindrical portion and a neck portion." However, it does not follow, as made obvious by this simple illustration, that the two "portions" must be physically separate. There is no doubt that within the structure of a bottle, the "cylindrical portion" and the "neck portion" must be integral. Therefore, although the "link module portion" and the "cantilevered portion" possess equal status as distinct parts of the "chain link," it cannot be said that they must be separate. The district court arrived at its contrary conclusion based solely on the preferred embodiment and a single piece of prosecution history which is simply silent regarding the notions of "separate" and "integral."

At most, the prosecution history is inconclusive regarding the proper interpretation of the word "portion." If read as the district court did, the examiner's comments make no sense; if read properly to require clarification that the "link module portion" and the "cantilevered portion" have equal status, the examiner's comments support a broad reading of "portion." Furthermore, we may presume that the examiner gave the terms in the proposed claim their "broadest reasonable interpretation consistent with the specification," since he was obliged to do so. See Hyatt v. Boone, 146 F.3d 1348, 1355, 47 U.S.P.Q.2d (BNA) 1128, 1133 (Fed. Cir. 1998) (regularity of routine administrative procedures is presumed); In re Hyatt, 211 F.3d 1367, 1372, 54 U.S.P.Q.2d (BNA) 1664, 1667 (Fed. Cir. 2000) ("During examination proceedings, claims are given their broadest reasonable interpretation consistent with the specification."); see also Manual of Patent Examining Procedure § 2111 ("Claim Interpretation; Broadest Reasonable Interpretation"). Given the examiner's obligation to confer
the broadest reasonable interpretation on "portion," if the examiner wanted to hinge patentability upon the "link module portion" being structurally separate from the "cantilevered portion," he would have said so, and required a specific amendment to reflect the separate structures.

Moreover, elsewhere in the claims, the word "portion" is used by the patentee to indicate parts of the invention that are undisputably "integral" with their neighboring parts. In claim 5, the patentee makes reference at col. 11, line 8, to a "lower edge portion" that no doubt refers to an integral part of the "cantilevered portion." This "lower edge portion" is the arc-shaped part on the bottom of the "cantilevered portion" referred to in the written description as "stiffeners or gusset members on the underside of the top plate." 550 patent, col. 9, ll. 19-20. In claim 16, the patentee also specifies that the chain link modules must "extend in cantilevered relation over a portion of the transversely oriented conveyor" which, again, no doubt refers to an integral part of the transversely oriented conveyor. 550 patent, col. 14, ll. 3-4.

Given the claim language's abundantly clear use of the word "portion" to refer to parts that are "integral" and not "separate," we are obliged to give "portion" the broader interpretation that encompasses both "separate" and "integral" parts of the invention. The fact that the patentee did not explicitly disclose a one-piece embodiment in the specification or that the examiner failed to require an illustration of a one-piece construction is not enough to import a "separate" limitation from the specification into the claims.

In the end, we have a term, "portion," that is unambiguous in encompassing meanings of both "integral" and "separate." When the invention is being described in the specification (as opposed to when the preferred embodiment is being described), we have two distinct embodiments distinguished from one other embodiment. With the score two to one (i.e., two embodiments broadly defined as opposed to one narrowly described), the embodiments not restricted to "separate" structures must be understood to refer to a single structure that includes both the "link module" and "cantilevered" portions.

The only possible basis for dismissing the otherwise dispositive intrinsic evidence requiring "portion" to mean both "integral" and "separate," is the isolated comment by the examiner. It is true that the two embodiments permitting "integral" parts both refer to a "cantilevered portion extending laterally from the link module portion," which of course is the language of the claim itself. Indeed, the reason why the examiner required original claim 33 to be rewritten as it now appears in claim 5 was the examiner's conclusion that if something is "extending laterally from" other structure (viz., the "cantilevered portion" "extending laterally from" the "link module portion"), the two structures must be distinct (as opposed to separate). As noted earlier, we reject the notion that the examiner's requirement that the paragraph structure of claim 33 be rearranged is dispositive of the claim interpretation issue.

For the foregoing reasons, we hold that the district court should have construed "portion" broadly to contemplate parts that are either "separate" or "integral." Because the district court unnecessarily limited the meaning of the disputed term, we reverse and remand for proceedings consistent with this opinion.

I construe the term to mean: "a part of any whole."
### B. Effect of Prior Litigation

As stated above, SunTiger prevailed in a prior patent infringement suit against Scientific Research Funding Group (SRFG) on the same patents now in question. Both SunTiger and Sunglass Products have stipulated that the claim construction in the prior suit will control here:

The patents-in-suit have already been construed by the U.S. District Court for the Eastern District of Virginia [and that] construction . . . is binding on the parties in this case. To the extent that the terms in the asserted claims were not construed in the said prior litigation, the parties are asking the Court to make a claim construction based on the arguments submitted in the summary judgment motions.

Stipulation at 1-2. "In a patent litigation action, where the parties do not dispute any relevant facts regarding the accused product but disagree over possible claim interpretations, the question of literal infringement collapses into claim construction and is amenable to summary judgment." Rheox, Inc. v. Entact, Inc., 276 F.3d 1319, 1324 (Fed. Cir. 2002).

The relevant terms and their stipulated construction are as follows:

<table>
<thead>
<tr>
<th>Term</th>
<th>Stipulated Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;substantially block&quot;</td>
<td>&quot;... in reference to wavelengths, it is defined as blocking over 99% of the incident radiation at each and every wavelength&quot; and &quot;[in] reference to polarization, it is defined as blocking 80% or more of the horizontally polarized incident radiation at each and every wavelength&quot;</td>
</tr>
<tr>
<td>&quot;substantially transmit&quot;</td>
<td>&quot;... in reference to wavelengths, [it] is defined as transmitting more than 1% of the incident radiation at each and every wavelength&quot; and &quot;[in] reference to polarization, it is defined as transmitting more than 20% of the horizontally polarized incident radiation at each and every wavelength&quot;</td>
</tr>
<tr>
<td>&quot;sharp cut-on&quot;</td>
<td>&quot;... sharp cut-on is defined in the context of a dye or filter, having a cut-on slope that at some concentration or dye density rises more than one half percent (0.5%) change in transmission for every one nanometer of increasing wavelength change. The cut-on slope is that portion of the transmission spectra of a cut-on dye that represents the transition between [the] substantially blocking and the substantially transmitting region.&quot;</td>
</tr>
<tr>
<td>&quot;cut-on filter&quot;</td>

<td>&quot;portion&quot;</td>
<td>&quot;... part or share of something&quot;</td>
</tr>
</tbody>
</table>

Plaintiff SunTiger contends that this Court cannot apply the stipulated construction in a way that would contradict the
finding of the Eastern District of Virginia that YE-82 infringed SunTiger's patents. Pl.'s Mot. at 1 ("[T]he YE-82 lens material must literally infringe whatever claim construction the Court adopts in this case."). In essence, SunTiger argues the following: (1) the parties have stipulated to the prior construction, (2) the decision in the prior suit does not bind this Court, but (3) any ruling that this Court issues must not be inconsistent with the fact that YE-82 was found to infringe its patents.

I disagree with this assessment. My decision is not foreordained by the result in SunTiger, Inc. v. Scientific Research Funding Group. SunTiger attempts to elevate the prior claim construction to the level of a decision. Despite the parties' agreement that the prior claim construction would be binding, that prior court's decision applying its own construction is only persuasive. Although the parties have agreed to be bound to the use of the prior construction, they have not agreed that this Court's application of that construction must be consistent with prior decisions involving a different defendant and different lenses. Indeed, were consistency with prior results necessary, that would be tantamount to an improper form of collateral estoppel against a current party, i.e., Sunglass Products, which was not a party (nor a party in privity) to SunTiger v. Scientific Research Funding Group. Cf. MCA Records, Inc. v. Charly Records, Ltd., 865 F.Supp. 649, 654 (C.D. Cal. 1994) ("[D]ue process requires that the party to be estopped must have had an identity or community of interest with, and adequate representation by, the losing party in the first action as well as that the circumstances must have been such that the party to be estopped should reasonably have expected to be bound by the prior adjudication.").

Kristar's '574 patent claims as follows:

A contaminant absorbing drainage trough apparatus for use with a water drainage structure, said water drainage structure having an inside surface, said drainage trough apparatus enabling collection of contaminants while permitting passage of drainage water through said drainage structure, said drainage trough apparatus comprising:

- a non-perforated outside wall portion;
- a perforated bottom portion connected to said outside wall portion;
- a non-perforated inside wall portion connected to said perforated bottom portion;
- a trough portion defined by said outside wall portion, perforated bottom portion, and inside wall portion; and
- a filter media portion removably placed in said trough portion, wherein when said trough apparatus is installed on the inside surface of the drainage structure so that drainage water that would normally flow directly through the drainage structure is caused instead to flow through said filter media portion, said filter media portion removes contaminants that may be carried in the water, while permitting the water itself to pass through the drainage structure.

This claim language refers to "non-perforated outside wall portion," "perforated bottom portion," and "non-perforated inside wall portion." It is clear from the context of the claim language and the specifications in the patent that "non-perforated inside wall portion," means "that portion of the trough structure which constitutes the inside wall." Similarly, "perforated bottom portion," means "that portion of the trough structure which constitutes the bottom section." Finally, "non-perforated outside wall portion" means "that portion of the trough structure which constitutes the outside wall."

Kristar suggests a rather strained definition of the word "portion." It argues that by referring to a "non-perforated inside wall portion," the patent covers any device in which a portion of the side wall is non-perforated. One only needs to examine the plain meaning of the claim language to determine that Kristar's proposed construction is incorrect. Therefore, the Court construes the language of the patent as described above. As shall be explained below, this construction disposes of Kristar's argument that the new SIFT Filter, even with its partially-perforated side wall, infringes the '574 patent.
On appeal, KriStar argues that the district court erred in concluding that there is no genuine issue of material fact as to literal infringement and infringement under the doctrine of equivalents. With respect to literal infringement, KriStar argues that the district court misconstrued claim 1 of the patent. According to KriStar, the "bottom portion" referred to in claim 1 denotes the lower part of the trough, regardless of its structure. KriStar contends that the bottom portion of the SIFT filter includes not only the solid bottom of the trough, but also the perforated section of the inside wall of the trough, because the perforated section is on the lower part of the inside wall. Thus, KriStar argues that the "bottom portion" of the SIFT filter is perforated, as required by claim 1. The upper portion of the inside wall, according to KriStar, constitutes the non-perforated "inside wall portion" referred to in the claim.

We reject KriStar's proposed claim construction. The patent claims a trough that is defined by a non-perforated inside wall portion, a non-perforated outside wall portion, and a perforated bottom portion. The claim language makes clear that all three components are essential to defining the trough. Under KriStar's interpretation, the outside wall, the bottom, and the inside wall would not necessarily reflect different structural components. Because the bottom would include at least part of the vertical wall on the inside of the drain, it would be impossible to determine where the bottom portion ended and the inside wall portion began. In fact, as long as the trough had a small unperforated segment at the top of the inside and outside walls, the claim would read on any other structure and arrangement of perforations, because any part of the trough containing perforations could be defined as part of the "bottom portion."

The claim language does not allow such an interpretation. The bottom portion of the trough cannot be arbitrarily defined as all portions of the trough below the point at which any perforations are found, regardless of the structure of the trough and the location of the perforations. To define the "bottom portion" of the trough to include the entire perforated segment of the inner wall would abandon the requirement that the trough consist of three distinct structures.

The Application To "Portion" In The Patent Claim

Although Overbreak does not explicitly state that it believes that the term "portion" is ambiguous, it is clear from the briefs that its interpretation of that term is at odds with Spinmaster's interpretation, and I must rule on how that term should be construed in the context of the claim. Claims 1-3, 6 and 9 specifically refer to a flying toy containing a hub that has an "upper portion," a "lower portion," and a "center portion." Spinmaster claims that the term "portion" can refer to both separate parts as well as regions of a whole item. Overbreak argues that "portion" should only refer to a separate part, as if the patent said "separate portions" or "severable portions."

The Davis patent specification supports Spinmaster's interpretation. The specification contains two "embodiments" of the claimed device. The first embodiment has a hub with two separate parts, referred to as an "upper section," a "lower section," which are "received by an inner hub" (Davis, col. 2, lines 59-61). In the second embodiment, "the upper hub section and lower hub section are integrally formed as a single piece" (Davis, col. 5, lines 12-14). In both cases, the specification refers to two "sections," the only difference is that in one embodiment the two sections are received by an inner hub, while in the second there is no need for the inner hub because the two parts are already joined as an integral whole. Both parties agree that the patent claims the first embodiment from the specification, but then Overbreak attempts to ignore Davis' use of the exact same terms to describe the second embodiment. It can be inferred from Davis' use of "section" to refer to both embodiments and then his use of "portions" to refer to "sections" that he intended to adopt a similar meaning for the term "portion" in the actual claim as well.
Overbreak believes that the patent prosecution history supports its interpretation of "portion" because the original versions of claims 1, 6 and 12 submitted to the PTO only used the terms "upper" and "lower" portions, with no reference to a "center" portion. 2 Overbreak contends that this wording means that the claims initially only covered the second embodiment of the invention and, after speaking with an examiner, Davis changed the terms to describe "upper," "lower" and "center" portions in the final application. According to Overbreak, this was done to correspond with the "upper" and "lower" sections and "inner hub" referred to in the first embodiment of the invention. In Overbreak's view, that change implies a conscious decision by Davis to claim only the first embodiment instead of the second. However, Overbreak has not raised any substantial question that this change was an attempt to escape rejection. It seems more likely that this was an attempt to improve the clarity of the description. Overbreak also is not able to show a clear disavowal of claim coverage by Davis; it may or may not be implied by the change in language, but an implication still would not meet the appropriate standard.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

2 Although Overbreak puts forth this argument toward the issue of infringement, discussed infra, it is more applicable to the claim construction, so I have addressed it here instead.

Dictionary definitions are considered extrinsic evidence. Phillips, 415 F.3d at 1318. Such extrinsic evidence should not be used to change the meaning of the claims, and may only be considered within the context of the intrinsic evidence. Id. at 1319. The common definition of "portion" (already recognized by the Federal Circuit) is, "a part of any whole, either separated from or integrated with it." Random House Unabridged Dictionary 1507 (2d ed. 1993); Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1344 (Fed. Cir. 2001). "Hence, according to ordinary meaning, so long as a 'portion' of an object is a 'part' of that object, it can connote either the quality of being 'separate' or of being 'integral.'" Rexnord, 274 F.3d at 1344. This definition also supports Spinmaster's interpretation. Therefore, it is highly likely that I would construe the claims in the '586 patent to refer to an "upper portion," a "lower portion" and a "center portion" of a hub in which the "upper section" and "lower section" can be either separate parts received by an "inner hub," or parts of an integral whole.
Amarr identifies three areas of dispute in this claim term: whether "clearance" and "gap" have the same meaning; whether some portion of clearance must be maintained along the entire length of the panels; and whether "deflection" properly references both situations where the panels are deflecting differently from one another and situations where they are deflecting similarly. Transcript at 92-93.

As discussed infra, Amarr conceded at the Markman hearing that "clearance" could be used in place of Amarr's preferred "gap." See Transcript at 35.

This Court addressed infra Amarr's argument concerning the notion of a particular clearance being necessary along the entire joint between two panels in its discussion of the first claim term at issue, and will not further address it here, except to say that Amarr's proposed construction constitutes an unnecessary limitation on the meaning of the claim term and it will not be accepted.

Amarr's concern regarding the word "deflection" is misplaced. It is particularly difficult for this Court to accept Amarr's contention that the word is improper when a variant of it -- "deflecting" -- is found in Amarr's own proposed construction. Amarr's proposal to add the word "sagging" is equally unavailing, given that Amarr merely contends that "deflection" is a technical term . . . sagging is something that would be much easier for the jury to understand." Transcript at 99. Wayne-Dalton pointed out that "deflection," as used in this claim term, is not limited to sagging -- although that can be a form of deflection -- and the term therefore should not be so limited; Wayne-Dalton further noted that deflection vis a vis other panels is not the only possible form of deflection referenced in this term, and Amarr's attempted limitation on that point should not succeed. Transcript at 106-07.

In considering the terms that have gone to a jury without construction in patent litigation, this Court is not even remotely persuaded that the word "deflection" is beyond the jury's capacity to understand, nor is the Court inclined to limit its meaning here to "sagging," as Amarr proposes. Further, Amarr's proposed construction of "variations in the deflection of said panels" as "when one of those panels is deflecting or sagging differently than the other" is unduly limited. As noted in section 3 of this Memorandum Opinion and Order, it is plain that the patentee of the 872 Patent knew how to so restrict the meaning of "deflection," in that various forms of the word "sag" appear throughout the specification and in other claims. See Acumed, 483 F.3d at 807. The fact that the patentee chose not to do so here is significant and should not be disregarded in the absence of clear evidence that the intent was to so limit the language of this term. Amarr has offered no such clear evidence; and the inference it seeks will not be made.

The language of the claim term at issue requires no construction. It will be accorded its ordinary and customary meaning.

A. "a first portion of the elements of said pattern are of a first shade and a second portion of the elements of said pattern are of a second shade different from said first shade" (Disputed Terms 1 and 2)

The above language appears in claim one of the 477 patent. As Plaintiff points out, the Court interpreted language nearly identical to that in dispute here in its June 18, 2001 Order Denying Plaintiff's Motion for a Preliminary Injunction. In that order, the language at issue appeared in claim 17 of the patent. Although it denied Plaintiff's motion on other grounds, the Court nonetheless adopted Plaintiff's position as to this language, finding that the limitation proposed by the defendant was not present in the claim language. (P.I. Order, 6:4-10). 2

2 The Court incorporates that earlier order in this analysis.

At issue in construing this language is the degree to which the two colored portions of the iris section may intermix or overlap. Plaintiff's position is that the first portion, which includes a pattern of opaque dots of one shade or color, may cover
most, if not all, of the iris section of the eye. (Joint Statement of Disputed Terms ("Joint Statement"), Term 1). As a result, the second portion, which consists of opaque dots of a totally different color or of the same basic color but having a different intensity from the first shade, may overlay significant portions of the first shade. Therefore, necessarily, "the second portion may comprise primarily elements of the second shade but with some elements of the first shade showing through the interstices of the second portion." (Joint Statement, Term 2). According to Plaintiff, this is permissible "as long as the inner portion (a product of overlap) is of a 'noticeably different shade' from the outer portion…" (Joint Statement, Term 1).

By contrast, Defendant asks this Court to interpret the language in claim 1 as allowing for little or no overlap between the first and second shades. Defendant relies on what it argues is the plain language of the claim, which contemplates two shades of totally different colors that cannot be intermixed. (Joint Statement, Term 2). 3

3 Apart from the declaration of Silver, the defendant cites only to two sections of the specification in support of this position. One section addresses an undisputed point -- that the second shade must be either of a totally different color than the first shade or of the same basic color, but having a different intensity. (Shull Decl., Ex.B at 56, col. 3, ln. 36-41). The other does not support the defendant's position. (Shull Decl., Ex. B at 56, col. 4, ln. 48-58).

The limitation proposed by the defendant is not supported by the intrinsic evidence. Rather, the language of the specification expressly supports Plaintiff's position. Specifically, it states that the outer pattern (first shade) "comprises a substantial portion of the area of the iris and is not merely a thin outer ring at the periphery…" (Shull Decl., Ex. B at 57, col. 6, ln. 55 - 58). This supports Plaintiff's argument that the first shade may cover most of the iris. In addition, and more significant, the preferred embodiment expressly contemplates overlap between the elements of the first shade and the second shade. For example, the specification states, "[the lens] will thus have an outer portion comprised solely of elements of the first shade…and an inner portion comprised primarily of the second shade…" (Shull Decl., Ex. B at 57, col. 6, ln. 61-65) (emphasis added). In addition, it states, "It [elements of the first shade] covers most of the iris section…After the ink is cured, the first pattern is overprinted with the pattern shown in FIG. 2 [elements of the second shade]…" (Shull Decl., Ex. B., col. 6, ln. 16-21). As these statements indicate, the preferred embodiment of the 477 patent expressly provides for intermixing of the first and second shades. Thus, Defendant's position would appear to exclude from coverage the preferred embodiment of the 477 patent. As Federal Circuit case law indicates, "such an interpretation is rarely, if ever correct." Vitronics, 90 F.3d at 1583. In short, as stated in this Court's prior order, because the specification does not require the complete absence of elements of the first shade from the second, "Defendant has provided no intrinsic basis for reading such a limitation into the claim language." (P.I. Order, 6: 9-10).

4. "PORTION OF THE LUMEN"

Claims 1, 11, 12 and 15 use the phrase "portion of the lumen" or "lumen portion." The parties agree that the term "lumen" is universally known to mean "the cavity of a tubular organ." I agree with Ethicon that "portion of the lumen" means "segment of the lumen." Indeed, the '148 Patent uses the word "segment" interchangeably with "portion." For instance, the "Summary of the Invention" reads:

the surgical device of the present invention includes a main housing adapted to be positioned within the bowel, a mechanism for first intussuscepting a segment of the bowel to be removed, a mechanism for anastomosis of the remaining portions of the bowel prior to the resection and a mechanism for resecting the intussuscepted segment of the bowel to be removed.

See Col. 2, lines 32-38 (emphasis added).
The "Background Information" also uses the word "segment," when discussing resecting, removing, attaching or intussuscepting something:

the techniques of resecting a segment of the colon ... where a segment of the diseased bowel must be removed... . The first step is mobilization of the segment to be resected... . Second, resection of the segment to be removed follows the mobilization procedure. Often in removing the interior segment... . Following the resection of the segment to be removed, the remaining ends are anastomosed to guarantee the continuity of the intestinal track.

See Col. 1, lines 18-37 (emphasis added).

Further, in discussing the first embodiment of the invention, the drafters use "segment" and "portion" interchangeably:

following the anastomosis of the bowel sections and the severing of the intussuscepted bowel segment, the surgical tool 10 can be withdrawn, ... bringing with it the resected portion of the bowel. The resected portion of the bowel remains attached to the tool 10 by ligation member 26 around central post 14.

See Col. 5, lines 12-17 (emphasis added); see also Col. 3, lines 62-66; Col. 4, lines 18-20 and 24-27.

It is not clear whether Ravo and Nicolo object to defining the term "portion of the lumen" to mean "segment of the cavity of a tubular organ." Nowhere in their two briefs do I see a discussion of the word "segment." Instead, Ravo and Nicolo discuss whether the inversion of the intussuscepted lumen requires the inversion of multiple layers which may make up the entire lumen wall or simply the inversion of the innermost layer. To the extent that this is a point in dispute, or is even relevant to the issue of claims construction - I find the '148 Patent is silent in this matter. Further, neither Ravo and Nicolo nor Ethicon offered any admissible expert testimony on the issue of whether the thickness of the walls of various tubular organs varies and whether or not it is possible to intussuscept or invert only certain layers of those walls. As such, I cannot resolve the issue at this juncture.

GO BACK

3012

B. an implant, at least a portion of which is expandable" ('753 patent) and "at least a portion of the tubular member has a second cross sectional size ... larger than the first cross sectional size to thereby lock the tubular member against tissue in the human body" ('290 patent)

17) The term "expandable" only appears in the specification with regard to the distal suture anchor of Figure 9 that "expands" to block removal of the suture. D.I. 70, Ex. A at Abstract; 2:27; 3:21-22; 8:44-9:2. This device has nothing to do with tubular members. The device of Figures 11A-C, which Dr. Bonutti pointed to as support for his claims (D.I. 70, Ex. N at 7; D.I. 70, Ex. O; D.I. 70, Ex. P), does not undergo expansion, but rather spreads. To the extent Figure 11 could be considered to expand at all, it necessarily must expand only in part. The body or sleeve of the rivet remains the same diameter so that the head has a greater diameter than the sleeve. That is how the rivet locks in place. This is no disclosure of a fully expandable device such as a stent. The claims are limited to what Dr. Bonutti "actually invented." Phillips, 415 F.3d at 1316 (quoting Renishaw, 158 F.3d at 1250).

18) Consistent with the claim language, the specification, and the prosecution history, the Court construes the language "an implant, at least a portion of which is expandable" from claim 1 of the '753 patent as meaning "a portion, but not all of the implant, is expandable."

19) Consistent with the claim language, the specification, and the prosecution history, the Court construes the language "a tubular member ... mechanically expandable ... from a contracted condition ... to an expanded condition in which at least a portion of the tubular member has a second cross sectional size ... larger than the first cross sectional size to thereby lock the tubular member against tissue in the human body" from claim 1 of the '290 patent as meaning "a portion, but not all, of the tubular member is expandable so that when expanded, its cross-sectional size is larger than its initial cross-sectional size. The expansion of only a portion of the tubular member enables it to be locked against tissue."
J. "Portion with a Substantial Longitudinal Component"

Claims 56-58, 61, 63, 65-66, and 68-70 of the '381 Patent contain references to "portion with a substantial longitudinal component." 130 Medinol proposes that this term means "a part of a member that has ends at positions a discernable distance from each other with respect to the stent's longitudinal axis." 131 Guidant suggests a different definition: "A stent element that is substantially more horizontal than vertical along the stent's horizontal [i.e., longitudinal] axis." 132 The Cordis court defined a similar term, "member having a longitudinal component," as follows: "A 'member' is a structural element that has its ends at different longitudinal positions with respect to the stent's longitudinal axis. A member's 'longitudinal component' is the distance between the longitudinal positions of the first and second ends of the member." 133

The parties' dispute stems from their conflicting views as to the plain meaning of the word "substantial." 134 Medinol suggests that the meaning of "substantial" as it relates to the disputed phrase, is captured by the construction, "a part of a member that has ends at positions a discernable distance from each other with respect to the stent's longitudinal axis." 135 Because substantial means "of or having substance," Medinol's use of "discernable" to describe "of or having substance" in this context is consistent with the ordinary meaning of "substantial." Guidant counters that "substantial" means that the stent element must be more horizontal than vertical, with respect to the longitudinal axis. This argument lacks merit, however, because it imposes an additional restriction supportable by neither the ordinary meaning of the words or the patent specification. That is, Guidant's definition requires that a portion with a substantial longitudinal component has a greater longitudinal length, when compared with its circumferential length. But imparting special meaning to the phrase is not warranted by the intrinsic record. Thus, "portion with a substantial longitudinal component" means a part of a member that has ends at positions a discernable distance from each other with respect to the stent's longitudinal axis.

131 Pl. Mem. at 23.132 Def. Mem. at 27.
133 Cordis Order at 2.
134 See, e.g., Tr. at 150 (Lehman) (noting that the parties disagree as to the "plain meaning" of "substantial"); Pl. Sl. at 109 (presenting the "plain meaning" of the words); Def. Reply at 17 ("Medinol's definition is simply inconsistent with both the dictionary and any common understanding of 'substantial' and should be rejected."). Indeed, the specification uses these words in accordance with their accustomed meaning, and nothing in the intrinsic record suggests that Medinol intended for these words to have a special meaning for purposes of the asserted claims.

135 Pl. Mem. at 23 (emphasis added). Medinol notes that the plain meaning of: (1) "'portion' is 'a part . . . of anything,'" id. at 24 (quoting New World Dictionary at 1110-11); (2) "'substantial' is 'having substance,'" id. (quoting New World Dictionary at 1420); (3) "'longitudinal' is 'of or in length' or 'running or placed lengthwise,'" id. (quoting New World Dictionary at 834 (defs. 1-2)); and (4) "'component' is 'an element or ingredient,'" id. (quoting New World Dictionary at 291).
2. "Position" and "Location"

The terms "position" and "location" are used in the claims in their ordinary sense. That ordinary sense is the common, broad understanding of both of these words as "where a thing is." The fact that "position" and "location" are broad terms does not detract from their clarity. The terms are not restricted to providing geodetic information and certainly not restricted to a particular coordinate system.

The broad sense of these terms can be seen in claim 1, for example, which uses the term "position" twice without any modifier or qualification before using the term in the context of a GPS receiver. Therefore, even accepting LET's argument that a GPS receiver always provides position or location using latitude/longitude or some other geodetic information, claim 1's use of the term "position" is not restricted to that narrow understanding. That is, claim 1 refers to the position of the cup without requiring it to be provided in terms of latitude/longitude or any other coordinate system. It is entirely consistent with claim 1 for the position of the cup to be expressed in relative terms such as, for example, 100 yards north of the first tee. It is true that any differences in how the positions of the cup and the ball are stored would have to be resolved before a distance could be computed. However, claim 1 does not limit the ways in which such differences can be resolved.

The term "location" is used interchangeably with "position" in the claims and has the same broad ordinary meaning. For example, the claims alternate between reciting the displaying of a position (claim 11) and the displaying of a location (claim 19), and between reciting the determining of a position (claim 1) and the determining of a location (claim 19). And it appears that claim 1's reference to the "position" of a remote receiver is intended to have the same meaning as claim 19's reference to the "location" of a remote receiver.

Because "position" and "location" are used in their ordinary sense in the claims, we look to the specification only to determine if the patentee defined these terms differently. Interactive Gift Express, 231 F.3d at 865, 56 U.S.P.Q.2D (BNA) at 1652. In the specification, we find that the word "position," not surprisingly, can be used to mean many things, such as: (1) "known position" (col. 2, ll. 37-38); (2) "apparent position" (col. 2, ll. 38-39); (3) "corrected position" (col. 6, l. 45); and (4) "position A," a position on the X-Y grid of a display, not providing latitude/longitude or any other geodetic information (col. 6, l. 66). Similarly, the word "location" has various uses, including: (1) "apparent location" (col. 2, l. 29); (2) "corrected location" (col. 2, l. 32); and (3) "a location (e.g. 'A') on the display" (col. 6, ll. 57-58). These uses show the synonymous meaning attributed to the words "position" and "location" by the patentee in referring to positions or locations that were: (1) fixed or relative; (2) geodetic or not; and (3) in latitude/longitude, some other coordinate system, or none at all. These uses also show consistent attribution by the patentee of the common, broad understanding that one skilled in the art would have of these terms. The patentee did not, therefore, redefine these terms in the specification, and they retain their ordinary meaning.

LET argues that the specification's use of the terms "position" and "location," with respect to the ball and the cup, must presume the existence of latitude/longitude information. LET concludes, therefore, that these terms must be construed to require that a latitude/longitude be provided. This argument is not persuasive. Any position or location will have a latitude/longitude, but the specification does not define position or location to require that a latitude/longitude be specified. For example, the specification uses these terms with respect to the mark "A" on the display screen of one of the embodiments, but the user of the preferred embodiment is never informed of the latitude/longitude of this mark, being told only its distance to the ball, the cup, or another mark. '093 patent, col. 6, l. 54 - col. 7, l. 36.
location at which the coupon will be positioned for insertion into a container. '901 patent, col. 13, ll. 53-54. Claim 20 of the '280 patent refers to the sensing position of the coupon sensor, which generates a sensing signal upon sensing the presence and absence of the forwardmost coupon, and then, in combination with a timing signal creates a first output signal that causes the bursting of the coupons. '280 patent, col. 18, ll. 4-18. The abstract, summary of the invention, and detailed description of both patents require that the coupon sensor be in a particular position: between the feed rolls and the positioning rolls. '901 patent, abstract; col. 3, ll. 25-28; col. 5, ll. 48-52; col. 6; ll. 6-9; col. 7; ll. 27-30; col. 11, ll. 56-58. '280 patent, abstract; col. 3, ll. 27-29; col 5, ll. 46-49; col. 6, ll. 4-6; col. 7, ll. 21-24; col. 11, ll. 35-37. Throughout the written description, the sensing position is defined only at this location. This location is not merely a preferred embodiment, as Unique asserts. Rather, this location is the only embodiment disclosed in the summary of the invention and throughout the disclosure. This sensing position appears to be necessary to the proper operation of the invention because the claimed device is orchestrated to receive a message from the sensor only when the presence and absence of the forwardmost coupon is detected between the feed rolls and the positioning rolls. See, e.g., '901 patent, col. 13, ll. 53-55; '280 patent, col. 18, ll. 3-5. Northfield asserts that, if the coupon sensor position were beyond the positioning rolls, then the claimed device would not function properly. At least two coupons would be burst with each activation because the sensor would detect the next succeeding coupon only after it had already been burst from the web. We cannot interpret claim terms in a vacuum; resort to the specification is necessary in this case to determine what the patentee meant by the coupon sensing position. Although there is a fine line between interpreting claim language in light of the specification and reading a limitation from the specification into the claim, Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186-87, 48 U.S.P.Q.2D (BNA) 1001, 1005 (Fed. Cir. 1998), we do not improperly cross that line when we interpret "sensing position" consistently with the clear guidance in the specification as to that term.

In SciMed Life Systems, Inc. v. Advanced Cardiovascular Systems, Inc., 242 F.3d 1337, 58 U.S.P.Q.2D (BNA) 1059 (Fed. Cir. 2001), we affirmed the district court's narrow claim construction because the abstract limited the patents to particular lumen catheters, the patents distinguished the prior art on the basis of such catheters, and the "Summary of the Invention" portion of the written description characterized the invention as having that type of catheter. Id. at 1343, 58 U.S.P.Q.2D (BNA) at 1064. Similarly, in this case, in every statement in the written description referring to the coupon sensing position, the patentee emphasized that it is located between the feed rolls and the positioning rolls, and this location appears to be necessary for the proper timing sequence of positioning the coupons into containers. In Wang Laboratories, Inc. v. America Online, Inc., 197 F.3d 1377, 53 U.S.P.Q.2D (BNA) 1161 (Fed. Cir. 1999), we determined that the claim term "frame" was necessarily limited to a character-based protocol because that was the only embodiment that was described and enabled in the specification. Id. at 1382, 53 U.S.P.Q.2D (BNA) at 1165. We sought in that case, and in this one, to interpret the claims to preserve, rather than defeat, their validity. Id. at 1383, 53 U.S.P.Q.2D (BNA) at 1165. The only coupon sensing position described and enabled in the '901 and '280 patents is between the feed rolls and positioning rolls. Finally, we are not persuaded by Unique's claim differentiation arguments that the coupon sensor cannot be limited to a particular location in claim 1 of the '901 patent or claim 20 of the '280 patent because other claims in those patents explicitly limit the sensor location. The doctrine of claim differentiation does not broaden claim terms beyond their correct scope, determined in light of the intrinsic evidence and any relevant extrinsic evidence. Id. at 1384, 53 U.S.P.Q.2D (BNA) at 1166. We therefore interpret the coupon sensing position in the claims as being between the feed rolls and the positioning rolls.

Having construed the position of the coupon sensor in light of the specification, and in view of our discussion on infringement, infra, we do not reach Northfield's arguments about other asserted claim limitations and the prosecution history of the '280 patent.

3016

F. "positionable between"

The parties agree that this phrase means "able to be switched between." Fox, however, would add another phrase, "at the preference of the user." Fox argues that "positionable between" must include this limitation, as the specification of the '049 Patent describes a mechanism that can be switched on or off by the user. Even if the specification of a patent only describes one embodiment of an invention, the patent will not be limited to that embodiment unless the "patentee has demonstrated a clear intention to limit the claim scope using 'words or expressions of manifest exclusion or restriction.'" Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004). No such limiting intention can be found within the '049 Patent. The phrase is construed as "able to be switched between."
C. Base . . . positionable on a surface so as to permit a video game player to stabilize said base by placing lower body weight on said base

The Defendants contend that this limitation excludes a base that would be stable without the application of the player's lower body weight. The Defendants seek to have the Court distinguish between a base that requires a player's lower body weight to be stabilized and one that may be somewhat stable alone, but can be made more stable by application of the player's lower body weight on the base.

As noted above, in the context of the 754 Patent, the word "stabilize" is used as a relative term, that is to mean "to make more stable" rather than to mean to render a completely unstable object a completely stable one.

The Court concludes that the limitations here at issue should be construed to include a base that would permit (but would not require) a player to make it more stable by application of the player's lower body weight on the base. Thus, the limitation would exclude a base that did not permit the use of a player's lower body weight to render it more stable. But, the limitation would not exclude a base that was somewhat stable alone, but would be made more stable by application of the player's lower body weight.

B. "Member positionable within said first hole and being extendable within said slot" and similar language as used in Claims 20, 43 and 48 of the '588 patent

The parties dispute two elements of this claim language: the meaning of "member" and of "positionable within said hole and being extendable within said slot." The pertinent language of Claim 20 of the '588 patent, with the disputed terms in italics, is representative:

20. A mounting device attachable to a raised portion on a building surface, said mounting device comprising:

   . . .

   (d) a securing assembly comprising a first hole extending from one of said side surfaces through said mounting body to interface with said slot and a first member positionable within said first hole and being extendable within said slot to secure at least said upper part of said raised portion within said slot by engaging said upper part of said raised portion within said slot with said first member.

The first disputed term, "member," is defined broadly by common and technical dictionaries to mean a "structural unit such as a . . . beam or tie, or a combination of these" or a "distinct part of a whole." CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1367 (Fed. Cir. 2002) (internal quotations and citations omitted). In CCS Fitness, the Federal Circuit found that these definitions encompass units of a larger whole and thus that the term "member" was not limited to single, unitary structure as asserted by the defendant in that case. See id.

Contek points to the prosecution history of the '248 and '588 patents to argue that "member" has a more limited meaning in these patents, namely a unitary blunt-nosed screw. CFE concurs that the prosecution statements relied upon by Contek show that Mr. Haddock and his counsel limited "member" to a "blunt-nosed fastening device," Pls.' Report in Further Support of Pls.' Markman Positions (Doc. 49) at 9, but dispute that the statements further limited this device to a unitary structure.

I find that the relevant prosecution history establishes that "member" as used in the '588 patent means "blunt-nosed screw." First, Claim 2 of the '248 patent application claimed a means for frictionally engaging that "comprises a member extendable from a wall of said cavity to contact said external surface of said one raised portion." Pls.' Markman Br., Ex. 3 [hereinafter
fails to cite any intrinsic or external evidence supporting this proposed interpretation. That this requirement is satisfied if only a portion of the member(s) is capable of placement within the hole. CFE also emphasizes that this phrase should be interpreted to mean that the member is "wholly or partially positionable within a fastening hole." Jt. Notice & Stip. Concerning Markman Hearing (Doc. 54), Ex. 1 (Plaintiffs' proposed interpretation, emphasis added). The ordinary meaning of a "member positionable within" the fastening hole, however, does not suggest this construction is consistent with the specification of both asserted patents.

The referenced claims further require that the "member" or "members" be "positionable within" one or more holes in the "mounting body" and "being extendable within said slot to secure" the upper part of the raised portion "within said slot by engaging" the raised portion within the slot with the member(s). '588 patent, col. 20, ll. 33-37 (Claim 20); see id., col. 22, l. 66 - col. 23, ll. 3 (Claim 43), col. 23, ll. 7-12 (Claim 48). These terms are not defined in the claim language, specification or prosecution history, which leads me to consult dictionary definitions to determine their ordinary and customary meaning. The root of the term "positionable" is the verb "position, " whose ordinary meaning as relevant here is "to put in a or the proper position: PLACE, SITUATE." Webster's Third New Int'l Dictionary at 1769; see Knopik v. Amoco Corp., 96 F. Supp. 2d 892, 905 (D. Minn. 2000), aff'd, 95 Fed. Appx. 332 (Fed. Cir. 2004). The ordinary meaning of "within" as used here is "in the inner or interior part of: INSIDE OF." Webster's Third New Int'l Dictionary at 2627; see Watson Indus., Inc. v. Murata Elec. N. Am., Inc., 301 F. Supp. 2d 933, 942 (W.D. Wis. 2003), aff'd, 115 Fed. Appx. 441 (Fed. Cir. 2004). It is undisputed that the referenced "hole" is an opening in the "mounting body," which is the metal block or clamp, that extends from the outer surface of the clamp through the clamp body to the slot or cavity that surrounds the metal roof's standing seam. n6 Given these ordinary meanings and my construction of the term "member" to mean "blunt-nosed screw," I find the phrase "member positionable within first said hole" means the blunt-nosed screw, whether a unitary or multi-piece structure, is capable of being placed inside the hole that extends through the clamp to the slot surrounding the standing seam. This construction is consistent with the specification of both asserted patents. n7

The conclusion does not mean, however, that the term "member" as stated in Claims 20, 43 and 48 must be unitary in structure. Contek's arguments in this regard are based on its contention that a "screw" or "blunt-nosed screw" can only be a unitary structure. I reject this contention for the reasons stated earlier in this decision. "Member" as used in the referenced claims means "blunt-nosed screw," which may have either a unitary or multi-part structure.

The conclusion does not mean, however, that the term "member" as stated in Claims 20, 43 and 48 must be unitary in structure. Contek's arguments in this regard are based on its contention that a "screw" or "blunt-nosed screw" can only be a unitary structure. I reject this contention for the reasons stated earlier in this decision. "Member" as used in the referenced claims means "blunt-nosed screw," which may have either a unitary or multi-part structure.

n7 CFE asserts that this phrase should be interpreted to mean that the member is "wholly or partially positionable within a fastening hole." Jt. Notice & Stip. Concerning Markman Hearing (Doc. 54), Ex. 1 (Plaintiffs' proposed interpretation, emphasis added). The ordinary meaning of a "member positionable within" the fastening hole, however, does not suggest that this requirement is satisfied if only a portion of the member (screw) is capable of placement within the hole. CFE also fails to cite any intrinsic or external evidence supporting this proposed interpretation.

The parties agree that the final portion of this disputed language, the phrase "member . . . being extendable into said slot"
means that the "member" must be able to enter the slot or cavity of the clamp and physically contact and deform the roof seam. See Pls.' Report in Further Support of Pls.' Markman Positions (Doc. 49) at 9; Defs.' Br. re: Interpretation of Pls.' Patents (Doc. 35) at 27-28. This construction is supported by the dictionary definition of the relevant terms and is also consistent with the intrinsic evidence. Accordingly, I find this phrase means that the "member," construed for the reasons stated above to mean "blunt-nosed screw," is able to enter the slot of the clamp and physically contact and deform the roof seam.

The primary claims terms at issue are "positional coordinates," "identification of a position" and "relative to" in independent claims 1, 17 and 26. The patent's specification (together with the plain language of the claims and the prosecution history) mandates the court's construction of "positional coordinates" as "a set of coordinates defining a single reference point within a corresponding geographic vicinity which operates to determine the corresponding geographic vicinity." CIVIX slip op. at 35. CIVIX argues that the term should be construed to refer to any "collection of values sufficient to identify a vicinity . . .". This argument reads out the word "coordinates" in the claim, and is contrary to the repeated language and examples in the specification and the claims stating that the positional coordinates represent a single location, within a vicinity. (See '525 patent, col. 5, II. 16,17 ("The positional coordinates locate one location within the geographic vicinity . . ."); col. 8, II. 36-38 (stating that figure 4A "illustratively shows the positional coordinates . . . for each vicinity. . ." and depicting geographic vicinities each centered around positional coordinates)). Figures 3A and 3B are limited to the user display and do not correspond to the "positional coordinates" limitation of the claims. The Semple letter in the file history, which the inventor with counsel chose to include in the '525 patent's public record, further confirms this construction.

E. "Positioned"

Switchcraft and ADC disagree over whether the term "positioned" is ambiguous and requires construction. The term "positioned" is used in claims 16 and 21 as follows:

16. . . . wherein said projections are positioned to provide impedance matching of said coaxial device jack device with said telecommunications line

21. . . . wherein said projections are positioned such that impedance through said jack device is within a range of . . .

Switchcraft proposes the Court should interpret "positioned" as it is defined by Webster's New Collegiate Dictionary: "to put in proper position." Supra at 890 (1979). Switchcraft argues the '378 patent and the record consistently used the term "positioned" to denote the purposeful placement of an element to provide impedance matching. Switchcraft cites to language in the '378 patent teaching, "through the use of waveguides such as waveguides 210 through 222, impedance matching is achieved." '378 patent at 9:20-21. It also relies on the prosecution history statement that "waveguides . . . are positioned adjacent to the moveable portions within the switch so as to provide impedance matching." Patent Application File History at 104-05. During the course of this litigation, ADC also stated "the '378 patent discloses and claims the use of a waveguide projecting from a sidewall (claim 1) or a plurality of projections from the side walls (claim 16) having particular shapes, in a particular location, and extending from a particular portion (sidewall(s)) of the housing." ADC Prior Art Statement (Stephen Decl. Ex. F) at 6 (emphasis added). ADC further elaborated "that by adding specially shaped structures (sometimes called 'waveguides') at select locations within ADC's switching jack it was possible to provide a jack with improved performance over large bandwidths." Pl.'s Markman Brief at 3-4 (emphasis added). Switchcraft claims these statements, coupled with the language in claims 1 and 16, evidence an intent requirement that the elements be specifically positioned, or "put in proper position" to impedance match.

ADC contends "positioned" is well-understood and does not require interpretation. It denies the term "positioned" itself has
any intent requirement that projections be placed in a proper or specific location. Instead, it argues other language in claim 16 teaching that projections extend “from said side walls” and are “adjacent to said moveable portions” and “provide impedance matching of said coaxial jack device with said communications jack,” rather than the term "positioned," explain the location of the projections. ADC argues Switchcraft's argument conflates these claim limitations into an intent requirement for "positioned." In the event the Court believes interpretation of "positioned" is necessary, however, ADC proposes it be interpreted as "placed."

Switchcraft's argument that the term "positioned" denotes an intent requirement to properly place an element for the purposes of impedance matching is rejected. Again, intent is generally not relevant to whether a product directly infringes a patent. See, e.g., Florida Prepaid Post Secondary Edu. Expense Bd., 527 U.S. at 645; Intel Corp., 946 F.2d at 832. Switchcraft again argues, based on Koito, that the use of "positioned" injects a scienter requirement into the '378 patent. 381 F.3d at 1150.

The terminology at issue in Koito is distinguishable from "positioned" at issue in the instant case. Again, Koito dealt with a method claim rather than the apparatus claim presently before the Court. Second, "predetermined" inherently requires foreknowledge in a manner "positioned" does not. The Court accepts ADC’s interpretation that the other limiting language in claim 16, rather than an intent requirement in "positioned," dictate placement of the projections.

Having found "positioned" does not carry an intent requirement, it is unnecessary to further construe the term. As the Federal Circuit has explained:

The Markman decisions do not hold that the trial judge must repeat or restate every claim term in order to comply with the ruling that claim construction is for the court. Claim construction is a matter of resolution of disputed meanings and technical scope, to clarify and when necessary to explain what the patentee covered by the claims, for use in the determination of infringement. It is not an obligatory exercise in redundancy.

U.S. Surgical Co. v. Ethicon, 103 F.3d 1554, 1568 (Fed. Cir. 1997). Switchcraft's proposed interpretation of "put in proper position" effectively adds the word "proper" to the claim. Rather than defining "position," the chief impact of adding "proper" would be to add a limitation not present in the claim.

The parties' dispute concerning this claim term tracks that discussed above with respect to Claims 9 and 12 of this patent and Claim 12 of the '286 Patent. As with those other claim terms, nothing in the actual claim language or specifications expressly states that these elements are "directly" adjacent to one another. And, as plaintiff argues, a construction using the phrase "directly next to" would exclude the very instrument the inventors were disclosing in the patent because there must be some space between the two elements in order for the instrument to work properly, and a claim interpretation that excludes the device disclosed is rarely the correct interpretation. See Pl. Reply Br. at 4-5 & n.9, citing '544 Patent, 4:5-6, 11-13 (describing the dysfunctionality that would arise if the two elements were "directly next to" each other); see also Playtex Prods., 400 F.3d at 904 ("Claim constructions that exclude the preferred embodiment are rarely, if ever, correct.") (internal citation omitted). n14 Accordingly, because nothing in the intrinsic evidence supports adoption of defendant's more restrictive definition and, in fact, such a definition might exclude the patentees' preferred embodiment, the Court will construe the claim term in accordance with the term "adjacent" in Free Motion Fitness, 423 F.3d at 1348-49, supra, as "placed so as to be near the jaw member."

n14 Defendant further argues that the "tissue receiving stops" must be "directly next to" the "blade surface," because the pair of stops define the proximal end of the exposed blade surface so as to prevent tissue from moving past the proximal end of
that surface. See Def. Claim Construction Br. at 15-16; '544 Patent, 4:5-6, 6:43-44. This argument, however, ignores the use of the word "proximal" in the specification language, and that a construction of "adjacent" as simply "near" would also fulfill the requirement that the pair of stops define the "proximal" end of the blade surface and would prevent tissue from moving past that "proximal" end.

GO BACK

3022

Positioned between

The term "positioned between" is used twice in Claim 1. First, a combustor is recited as being "positioned between" the high pressure compressor and the high pressure turbine. Second, the externally mounted intercooler is "positioned between" the low pressure compressor and the high pressure compressor. Rice proposes to construe the term as "in an intermediate position relative to." Rolls-Royce disputes this construction as improperly indicating a spatial relationship and proposes to construe the term as "positioned to receive the air flow directly from and to provide the air flow directly to." Rice replies that Rolls-Royce is misunderstanding its construction. Rice's only dispute with the construction proposed by Rolls-Royce is the "directly" limitation. Rice agrees that as to the intercooler, the construction proposed by Rolls-Royce correctly refers to "a position in the air flow path."

The only support offered by Rolls-Royce for inclusion of the limitation "directly" is a reference to Fig. 1 showing the intercoolers connected in the air flow path that extends from the low pressure compressor to the high pressure compressor. Apparently, Rolls-Royce's position is that "directly" signifies that there is nothing in addition to the intercooler in that air flow path other than ducting. The specification, however, does not indicate any requirement to exclude additional equipment from that air flow path. Moreover, the inventor's choice of the term "positioned between," rather than some more restrictive language to indicate that only the intercooler is in the air flow path, indicates that inclusion of the limitation "directly" in the construction is not appropriate.

The Court construes "positioned between" as to the combustor to mean "positioned to receive the air flow from the high pressure compressor and to provide the combustion gas to the high pressure turbine."

The Court construes "positioned between" as to the intercooler to mean "positioned to receive the air flow from the low pressure compressor and to provide the air flow to the high pressure compressor.

GO BACK

3023

1. Construction of Claim 1 of the '574 Patent

As stated above, the claim interpretation analysis begins with the language of the claims.

The relevant portion of claim 1 states the following:

1. An adjustable in-line skate comprising:

   . . . the liner including a generally inelastic heel portion and an extendible region positioned between a toe region of the liner and the tongue, the extendible region being configured to allow the toe end to be moved longitudinally relative to the tongue and heel end such that the liner can accommodate feet of different sizes.

(See Def.'s Ex. A at col. 4, lines 30-41)

First Team argues that claim 1 of the '574 patent includes the following three limitations: (1) an extendible region of the liner positioned between the toe region and the tongue; (2) a toe region made of an inelastic material while the extendible region is made of an extendible material; and (3) a toe region that moves longitudinally relative to both the tongue and the heel region. (See Def.'s Mem. at 15-16) Contending that its Xpander and Transformer skates do not include any of those
limitations, First Team argues that its skates cannot literally infringe the '574 Patent.

The parties do not dispute that one limitation of claim 1 is that the extendible region of the liner is "positioned between" a toe region and tongue of the liner. What is disputed, however, is the proper scope of this limitation. First Team argues that proper construction of the claim requires that the extendible region be distinct and separate from the toe region of the liner. Benetton disagrees, and contends that "between-ness" does not require a specific demarcation line. (See Hearing Tr. at 14.15-14.18)

In order to construe the phrase "positioned between," the Court looks first to the claim language, the written description, and the prosecution history. See Zelinski 185 F.3d at 1315. Because the intrinsic evidence does not clearly and precisely provide a special meaning or definition for the phrase "positioned between," the phrase is given its "ordinary and accustomed meaning[,]" or "if a term of art, it is given the ordinary and accustomed meaning as understood by those of ordinary skill in the art." Zelinski, 185 F.3d at 1315. Here, neither party has contended that the phrase "positioned between" is a term of art. The Court therefore reviews the ordinary and accustomed meaning of the phrase.

a. Ordinary and Accustomed Meaning of "Positioned Between"

The phrase "positioned between" is susceptible to varying meanings. The most relevant question in determining its meaning here is whether the phrase requires that the extendible region be positioned entirely between a toe region of the liner and the tongue, or if the phrase requires only that portions of the extendible region sit between the toe region of the liner and the tongue. "Positioned" is the verb form of "position," and simply means to put or to place. See WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY OF THE ENGLISH LANGUAGE (3d ed., Merriam-Webster, Inc. 1993). Of more significance to the construction of the claim at hand is the definition of the word "between." The term "between" can have a variation of meanings. "Between" can refer to the space "in an intermediate position in relation to two other objects," or it can refer to the space "limited by two objects." Id. The former definition of "between" supports the interpretation that the claim limitation is met as long as some portion of the extendible region is located between the toe region and the tongue. The latter definition is consistent with the interpretation that the extendible region of the liner must be located entirely between the toe region and the tongue.

Zelinski v. Brunswick Corp., 185 F.3d 1311, provides considerable guidance regarding how to analyze particular words and phrases when construing a claim. In Zelinski, the case turned upon the meaning of a very similar phrase: "located between." Id. at 1315. The claim at issue in Zelinski described a bowling ball that utilized a weight block, which, among other things, was comprised of two elongate sections, the second of which was "located between the center of the spherical mass and the first elongate section." See id. at 1313 (emphasis added). The district court had construed the relevant limitation to require that the second elongate section "be located entirely between the center of the spherical mass and the first elongate section." Id. at 1314 (citing Zelinski v. Brunswick Corp., 996 F. Supp. 757, 761 (N.D. Ill. 1997) (emphasis in original)). Because not all of the annular ring of the allegedly infringing bowling ball was located between the center of the spherical mass and the first elongate section, the district court held there could be no literal infringement of the patent in question. See id.

In beginning its review of the lower court's decision, the Federal Circuit in Zelinski first recognized that because "neither the claims nor the written description specifically define the phrase 'located between,' and "the prosecution history of the [relevant] patent contained no relevant amendments or explanations," the court would construe the phrase "by its ordinary and accustomed meaning to one of ordinary skill in the art." Id. at 1316 (citing Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1387, 21 USPQ2d 1383, 1386 (Fed. Cir. 1992)).

The Federal Circuit determined that language within the intrinsic evidence existed to suggest that the district court interpreted the phrase "located between" too narrowly. See id. By reviewing the written description within the patent, the Zelinski Court determined that the second elongate section did not need to be entirely located between the first elongate section and the center of the spherical mass. See id. (emphasis in original). The Court pointed to the portion of the description which stated that no portion of the weight block is disposed in the bottom portion of the ball, followed by the statement that the entire weight block is "relatively localized" in the top half of the ball. See id. (citations omitted). Based on this language, the Zelinski Court found that the relevant claim would be satisfied "if the bulk of the second elongate section is between the first elongate section and the center of the spherical mass, and the entire weight block is in the top half of the
Here, as in Zelinski, the specific meaning of the word "between" is similarly uncertain. Review of the claim's language alone does not clearly define the precise scope of the claim limitation, and the Court must look to the other intrinsic evidence. See Athletic Alternatives, Inc. v. Prince Mfg., Inc., 73 F.3d 1573, 1579, 37 USPQ2d 1365 (Fed. Cir. 1996) (where the language of the claim, "varies between," was susceptible to two equally plausible meanings, the court looked to other intrinsic evidence to construe the claim terms).

b. The Relevant Prosecution History

Insofar as the written description does not clearly and precisely define the meaning of "positioned between," the Court turns to the prosecution history for guidance. 6 The Federal Circuit has shed considerable light on the importance of reviewing intrinsic evidence, including the prosecution history, in construing claims:

Arguments and amendments made during the prosecution of a patent application and other aspects of the prosecution history as well as the specification and other claims must be examined to determine the meaning of terms in the claims. The prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution. Claims may not be construed one way in order to obtain their allowance and in a different way against accused infringers.

Southwall Techs., Inc. v. Cardinal IG, Co., 54 F.3d 1570, 1576, 34 USPQ2d 1673, 1676 (Fed. Cir. 1995) (internal citations omitted).

6 The written description of the patent does provide some details concerning the embodiment of the liner and, specifically, the location of its extendible section. For instance, the written description of the preferred embodiment states that the "expandable resilient section" is positioned surrounding the "instep" area of the foot. The instep area generally refers to the arched, middle area of the foot, thus excluding the toe region. This description of the preferred embodiment thus supports the claim construction that the extendible region be positioned entirely between the toe region of the liner and the tongue. However, the Court will focus the discussion regarding the interpretation of this limitation on the patent's prosecution history, which is more conclusive as to proper placement of the liner's extendible region. See discussion, infra.

Additionally, the written description of the '574 patent specifically describes the "preferred embodiment" of the invention, and not the invention generally. Although a court may "construe claims in light of the teaching of the specification, [it may] not treat characteristics of a preferred embodiment as claim limitations." Dayco Products, Inc. v. Total Containment, Inc., 2001 WL 818229, at * 6 (Fed. Cir. 2001) (citing Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186, 48 USPQ2d 1001, 1005 (Fed. Cir. 1998); see Interactive Gift Express, Inc. v. Compuserve Inc., 2001 WL 792669, at * 16, 59 USPQ2d 1401 (Fed. Cir. 2001) (finding that where a preferred embodiment specified certain features that were not recited in the independent claims, a court could not read those features into the claims) (citing Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865, 9 USPQ2d 1289, 1299 (Fed. Cir. 1988) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations"); Electro Med. Sys. S.A. v. Cooper Life Sci., 34 F.3d 1048, 1054, 32 USPQ2d 1017, 1021 (Fed. Cir. 1994) (stating that "particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments"). This rule does not contradict the general principle that "claims must be read in view of the specification, of which they are a part." SciMed Life Sys., Inc. v. Advanced Cardiovascular Systems, 242 F.3d 1337, 1349, 58 USPQ2d 1059 (Fed. Cir. 2001) (quoting Markman, 52 F.3d at 979-980). A patent's written description can "provide guidance as to the meaning of the claims, thereby dictating the manner in which the claims are to be construed, even if the guidance is not provided in explicit definitional format." SciMed Life Sys. F.3d at 1344; see also, Northern Telecom Ltd. v. Samsung Electronics Co., 215 F.3d 1281, 1295, 55 USPQ2d 1065 (Fed. Cir. 2000) (citation omitted) (stating that "the plain and ordinary meaning of claim language controls, unless that meaning renders the claim unclear or is overcome by a special definition that appears in the intrinsic record with reasonable clarity and precision") (emphasis added). Descriptions limited to the preferred embodiment, however, cannot limit claim language.
Prior to its amendment, claim 1 stated that the liner included "an extendible region positioned adjacent to a toe region of the liner, the extendible region being configured to allow the toe end to be moved longitudinally relative to the heel end such that the liner can accommodate feet of different sizes." (See Amendment and Response, Def.'s Exh. G at 2) As mentioned above, this claim was rejected as unpatentable. Describing its rationale for rejecting the claim, the Office Action states:

Scholz teaches having a sock-like structure (liner) with a generally inelastic heel region . . . and an elastic extendable region . . . positioned adjacent to a toe region of the liner, the extendable region being configured to allow the toe end to be moved longitudinally relative to the heel end such that the liner can accommodate feet of different sizes.

(See Office Action, Def.'s Exh. B at FT000969)

Review of the Scholz patent reveals an invention that claims: "A stocking protector with narrow rubber strips running approximately horizontally between the toe and heel cap placed on the sides, characterized in that the bottom part . . . of the toe cap . . . is connected to the bottom part . . . of the heel cap . . . by a flat, elastic connecting piece . . . consisting of one piece and corresponding to the width of the sole of the foot." (See Scholz, German Patent No. 597,644, Def.'s Exh. F at FT000481C (emphasis added))

As previously mentioned, Benetton amended its claims for purposes of patentability. With respect to the extendible region of the liner, Benetton replaced the phrase "positioned adjacent to a toe region of the liner" with the phrase "positioned between a toe region of the liner and the tongue." (See Amendment and Response, Def.'s Exh. G at FT000985) In discussing the rejection of its claims, Benetton commented that the claim was "amended to include the recitation that the extendible region of the liner is positioned between the toe region of the liner and a tongue of a liner. . . . None of the prior art references of record in this application, either alone or in reasonable combination, teaches or suggests the non-obvious combination of elements recited by claim 10 [now claim 1]." (See Amendment and Response, Def.'s Exh. G at FT000987)

Benetton's amendment specified that the location of the extendible region was between a toe region and tongue, and not simply adjacent to a toe region, in order to distinguish the liner from the prior art. If the extendible region of Benetton's liner extended beyond the tongue toward the heel, that liner would wholly resemble the stocking protector claimed in the Scholz patent. Indeed, the Notice of Allowability states that the "positioned between" amendment was significant to the patent examiner reviewing the claims:

The prior art does not show a liner for an adjustable in-line skate that includes an extendible region positioned between a toe region of the liner and tongue, wherein the extendible region is configured to allow the toe end to be moved longitudinally relative to the tongue and the heel end. Scholz shows an elastic region in a liner, however, the elastic region is not arranged between the toe end and the tongue area.

(See Notice of Allowability, Def.'s Exh. I at FT001007 (emphasis added))

When Benetton amended its claim and added the "between" language, it represented to the Patent Office that portions of the liner's extendible region would not carry over beyond the tongue towards the heel. The claim must be construed in the same fashion. Because the claim must be interpreted to require that no part of the extendible region extends beyond the tongue towards the heel, the claim must also be construed to mean that no part of the extendible region extends in the other direction -- beyond the toe region toward the toe end. The Court therefore concludes that the only reasonable construction of the claim is that the extendible region of the liner must be positioned entirely between the toe region of the liner and the tongue.

GO BACK

3024
B

Here, the district court found the plain meaning of the term "positioned between" to be uncertain, encompassing two alternative meanings, either referring to the space "in an intermediate position in relation to two other objects" or to the space "limited by two objects." Benetton, slip op. at 12. The court found the first definition supportive of a claim
interpretation requiring only that some portion of the extendible region be located between the toe region and the tongue (thus leaving open the possibility that the extendible region extends to cover the entire front portion of the liner). In contrast, the court found the second definition consistent with an interpretation that the extendible region must be located entirely between the toe region and the tongue (requiring some form of toe region distinctly separate from the extendible region). Id. at 12-13.

The preferred embodiment of the liner shows the elastic extendible region as strictly defined by two rigid borders, the tongue and the rearward defining line of the toe region. The written description of the drawing refers to a "generally inelastic toe portion" joined to "the generally inelastic main body portion" by "an expandable resilient section." '574 patent, col. 3, lines 62-64. These references in the specification support the notion that the toe portion and the main body portion have distinct, carefully delineated boundaries. The district court, however, was careful not to use the preferred embodiment to narrow the disputed claim limitation. Instead, the district court rested its conclusion on evidence found in the file history.

With regard to the prosecution history, the district court examined the effect of the patentee's amendment and statements to distinguish over the PTO's rejection in light of the Scholz prior art patent. In order to distinguish over Scholz's disclosure of a stocking protector with an elastic extendable region in the mid-foot area, the patentee replaced the phrase "positioned adjacent to a toe region of the liner" with the phrase "positioned between a toe region of the liner and the tongue." As the district court correctly noted, if the extendible region of the liner defined in the patent reached beyond the tongue and toward the heel, "that liner would wholly resemble the stocking protector claimed in the Scholz patent." Benetton, slip op. at 17. It was therefore necessary for the patentee to amend the claim to avoid this potential conflict with Scholz. According to the district court, the patentee included the "between" language to create a clear rear boundary of the extendible region, the tongue, and that the same reasoning required finding a front boundary of the extendible region, namely the toe region. In the district court's own language,

Because the claim must be interpreted to require that no part of the extendible region extends beyond the tongue towards the heel, the claim must also be construed to mean that no part of the extendible region extends in the other direction - beyond the toe region towards the toe end.

Id. at 17-18.

As the accused device has an extendible region which covers the entire forward part of the shoe, the court found that no toe region separate from the extendible region existed, and thus that the extendible region could not be "between" the toe region and the tongue. Id. at 18-19. As a result, the district court concluded that summary judgment of noninfringement was appropriate. Id. 1

--- Footnotes ---

1 The district court noted that it was uncertain as to the definition or extent of the recited toe region, stating that "the Court does not mean to suggest that the toe region is clearly marked. For the purposes of this action, it is unnecessary to know the exact area of what is referred to in the claim as the 'toe region.'" Benetton, slip op. at 18.

--- End Footnotes ---

For the reasons given below, we conclude that this was in error.

C

The critical phrase in question is "extendible region positioned between a toe region of the liner and the tongue." Benetton argues that while the claim explicitly requires the heel to be inelastic, it says nothing about the elasticity of the toe nor about the existence of any particular boundary location between the extendible region and the toe region. As a result, according to Benetton, the district court improperly construed the claim to exclude a liner in which the entire forward part of the liner is elastic. First Team argues that such an interpretation would have the effect of reading the claims to merely require an extendible region positioned forward of the tongue, essentially reading out the meaning of the word "between."

As the district court correctly noted, the adverb "between" can refer to the space "in an intermediate position in relation to
two other objects," or to "filling the space limited by two objects." Id. at 12. While the former definition would allow the extendible region to overlap with the toe region, the latter would suggest the contrary.

The district court focused its attention on the need to define the word "between" in the context of this patent, and in the process did not focus on whether the term "toe region" bears a particular meaning. The patent speaks in terms of "portion" and "region" when describing the toe area of the boot and liner. The claim terms and the written description consistently refer to "portion" when defining the toe area of the boot, and thus define the toe area of the boot as restricted by delineated boundaries. Not so with respect to the toe area of the liner. The claim language speaks of a "toe region." The patentee's deliberate choice of different language to define the toe area of the boot and of the liner certainly suggests that the two terms need not bear the same meaning. The written description's use of "portion" to describe the toe area of the liner is consistent with the preferred embodiment of the liner, which indeed shows a clearly delineated toe area, a toe "portion." But as the district court correctly surmised, we cannot narrow the meaning of toe "region" simply because of the preferred embodiment.

We find the interpretation of "toe region" to be of critical importance in construing the claims. It is precisely the positioning of the extendible region in relation to the toe region that the parties adamantly dispute. To the extent that the "toe region" refers to an object distinctly separate from the "extendible region," there is a need for a delineating boundary of some kind between the two. Such a case would correspond with the district court's analysis of the latter of the two definitions of "between." In contrast, if the "toe region" of the liner is merely understood as an indeterminate reference to the generic part of the liner where the toes reside, then it is eminently possible for the extendible region extending forward of the tongue to lie between the toe region and the tongue, while at the same time extending yet further to cover the entire front portion of the liner.

The most relevant dictionary definition of "region" is "an indefinite area surrounding a specified body part." Webster's New Third International Dictionary 1912 (1993). Other definitions similarly comprise a quality of indefiniteness. Id. (providing alternative definitions as "a major indefinite division of inanimate creation" and "a broad geographical region . . ."). We note that in common parlance, when a weather forecast predicts thunderstorms between the Mississippi and Ohio Rivers, there is some sense that the rivers delimit the zone of rain on either side. In contrast, if the prediction is for thunderstorms between the Mississippi River and the Northeast region, residents of Missouri can leave their raincoats at home while those as far away as Maine may feel compelled to bring theirs out.

The preferred embodiment does depict an "extendible section" distinctly separate from the inelastic toe. Figure 2 of the '574 patent (below) illustrates this.

GET DRAWING SHEET 1 OF 8.

The preferred embodiment provides that "The present liner 110 includes a generally inelastic toe portion 112 joined to the generally inelastic main body portion 114 by an expandable resilient section 116 positioned surrounding the instep area of the foot." '574 patent, col. 3, lines 62-65 (emphasis added).

As our "case law is clear that an applicant is not required to describe in the specification every conceivable embodiment of the invention," Rexnord, 274 F.3d at 1344, 60 U.S.P.Q.2D (BNA) at 1856, it would of course be improper to conclude that merely because the preferred embodiment and the drawings reveal an inelastic toe clearly distinct from an "extendible section," the claim language itself must contain a similar requirement. Rather, the importance of the written description here lies in its use of language. The written description does not refer to a "toe region," but rather to a "toe portion." This is consistent with the references in the patent to the different component parts of the in-line skate itself as definite, distinct "cuff," "heel," and "toe" "portions." See '574 patent, col. 1, lines 42-47 (stating that "the heel portion includes a sole and the heel portion is fixed to the frame" and "the toe portion is slidable relative to the heel portion"). In contrast, the term "region" is not used in the specification at all. 2 This difference in usage suggests that the patentee employed "portion" to refer to distinctly separate objects, while reserving "region" to refer to a more indeterminate area.

--- Footnotes ---

2 Indeed, unlike the "toe," "cuff," and "heel" "portions," there is no anatomical reason why an "extendible region" could not overlap entirely with the "toe region."
Next, we consider the effect of the patentee's amendment to distinguish over the prior art Scholz patent, a diagram of which is reproduced below.

[SEE FIGURE IN ORIGINAL]

The examiner stated:

Scholz teaches having a sock-like structure (liner) with a generally inelastic heel region (d) and an elastic extendible region (e) positioned adjacent to a toe region of the liner, the extendable region being configured to allow the toe end to be moved longitudinally relative to the heel end such that the liner can accommodate feet of different sizes.

In response, the patentee amended the claims as follows (additions are underlined, deleted elements are in brackets):

a liner having a heel end, [and] a toe end, a cuff and a tongue, the liner sized for the toe end to be received within the toe portion, and the heel end to be received within the heel portion, and the cuff to be received within the cuff portion of the boot, the liner including a generally inelastic heel region and an extendible region positioned [adjacent to] between a toe region of the liner and the tongue, the extendible region being configured to allow the toe end to be moved longitudinally relative to the tongue and heel end such that the liner can accommodate feet of different sizes.

According to First Team, in delineating the tongue as a clear rear boundary for the extendible region, this amendment must also be interpreted as requiring a clear forward boundary between the tongue and the toe region. We agree with First Team that Scholz stood in the patentee's way, but we do not agree that the patentee needed to provide both a precise front and rear boundary for the extendible region in order to distinguish the invention over Scholz. The mere fact that the patentee added a further level of specificity as to the rear boundary does not necessarily say anything about the forward boundary of the extendible region. See Spectrum Int'l, Inc. v. Sterilite Corp., 164 F.3d 1372, 1378-79, 49 U.S.P.Q.2D (BNA) 1065, 1069 (Fed.Cir.1998) (stating that "Explicit arguments made during prosecution to overcome prior art can lead to narrow claim interpretations . . . . 'by distinguishing the claimed invention over the prior art, an applicant is indicating what the claims do not cover' (quoting Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1304, 41 U.S.P.Q.2D (BNA) 1364, 1368 (Fed. Cir. 1997))). It was enough for the patentee to mark a clear boundary in the heel area to overcome Scholz, as the district court recognized. First Team's argument, and the district court's conclusion on the point, assumes that a patentee surrenders more than is necessary to overcome prior art. That view is mistaken; we can fairly presume that the patentee makes only necessary surrenders.

Further, the examiner's Notice of Allowable Subject Matter indicates a similar understanding of the amendment, stating that "Scholz shows an elastic region in a liner, however the elastic region is not arranged between the toe end and the tongue area." (emphasis added). In employing the term "toe end" rather than "toe region," the examiner indicated an understanding that the amended language merely served to introduce a rearward boundary, rather than a forward one, on the "extendible region." Indeed, the examiner's language would appear to contemplate precisely the situation posed by the accused device, in which the elastic region of the accused product extends to cover the entire front part of the shoe.

D

In the context of this patent, we think it clear that the patentee chose the claim's words with care. "Portion" is a word used to define an area that has particular boundaries. "Area" is a word used in the written description to describe a part of a foot, as in "surrounding the instep area of the foot." '574 patent, col. 3, line 65. "Area" lacks the precision of "portion," as does "region."

Both the language of the claims and the specification support an interpretation of "toe region" as a generic reference to the region of the liner where the toes reside rather than requiring a discrete part of the liner separate from the "extendible region." Further, the prosecution history clearly indicates that in amending the patent claims, the patentee had no need to introduce a requirement of a fixed forward boundary to the "extendible region." Nor did the examiner understand the amendment to have such an effect. As a result, the disputed phrase "extendible region positioned between a toe region of the
linier and the tongue" should be construed to cover a liner in which the "extendible region" overlaps or entirely covers the "toe region."

10. The Opening at the Distal End of the Tube Positioned Longitudinally From the Tube

The next disputed claim term, "the opening at the distal end of the tube positioned longitudinally from the tube," is found in Claim 3 as set forth above.

Erbe's Proposed Definition: The opening at the distal end of the tube is perpendicular to the longitudinal axis of the distal end of the tube.

Canady's Proposed Definition: The opening of the distal end of the tube is on the longitudinal axis of the tube.

(Docket No. 42, p. 14). In reading the claim language, I find it to be ambiguous. As a result, I turn to the specifications, and in particular the figures showing the opening at the distal end of the tube. See, e.g. Docket No. 42, Ex. 1, Figs. 13-15 and 20. This shows that the opening at the distal end of the tube is perpendicular to the tube. Consequently, I construe the term "the opening at the distal end of the tube positioned longitudinally from the tube" to mean the opening at the distal end of the tube that is perpendicular to the tube.

3026

Housing Opening/Source of Light Positioning Element: This element of claim 2 reads:

said opening and said source of light being positioned to prevent said beam of light from directly impinging on said side of said vehicle.

Krippelz argues that this element merely provides that there is a structural relationship or cooperation between the relative positioning of the source of light and the opening to prevent the beam of light from "directly impinging" on the side of the vehicle but does not require that the beam of light actually not strike the side of the vehicle. Rather, the beam of light must not directly strike the vehicle. Therefore, he argues that this element is still present in a device where the beam light is redirected, such as by a lens. Ford, on the other hand, argues that the prosecution history precludes such an interpretation and requires an interpretation that the beam of light not impinge on the vehicle at all. What Ford fails to consider is that there is a distinction between "impinging" and "directly impinging" that must be taken into consideration. There is merit to Krippelz's argument that the phrase "directly impinging" refers to "light that emanates directly from the source of light in the absence of any intervening optical elements that redirect the light." Construing the phrase to mean "simply that no light from the source strikes the vehicle," as put forth by Ford, would ignore the claim language "directly." In fact, Ford's interpretation would be sufficiently conveyed solely by the word "impinging." Failing to distinguish direct from indirect or re-directed rays would give no meaning to the word "directly," but it is fundamental that claims must be given their proper meaning. Stiftung, 945 F.2d 1173, 1177. Correctly construed, preventing the "beam of light" from "directly impinging" means that no light directly from the source strikes the vehicle! Therefore, I hold that the beam of light referred to in claim 2 likewise must not directly impinge on the vehicle itself to satisfy the element of the claim.

through said inner tubular flow path to be defined. Being the inner tubular.

Clubs 34, 35, 37
flow through the path for flow through the inner tubular so as to allow for pressure build up.

Davis-Lynch argues that this term only requires that the drop member limit fluid flow through the inner tubular to allow pressure to build up. Weatherford maintains that the drop member must completely seal the flow path through the inner tubular. In other words, the parties dispute the meaning of the word "restrict." This word has a "widely accepted meaning," and nothing in the claim language compels the Court to disregard this meaning. Phillips, 415 F.3d at 1314. The commonly understood meaning of "restrict" is to limit rather than to completely seal, thus, unless the patentee has implicitly limited the scope of this term, the Court presumes that Weatherford's proposal is inappropriate. See Brookhill-Wilk 1, LLC v. Intuitive Surgical Inc., 334 F.3d 1294, 1301 (Fed. Cir. 2003); Aloft Media, LLC, 2009 U.S. Dist. LEXIS 24124, 2009 WL 803133 at *3; see also Phillips, 415 F.3d at 1312-13.

12 Although Weatherford proposes that the term "restrict" be construed as "block," Weatherford's brief makes clear that it believes this term requires the drop member to "completely seal" the drop member receptacle.

Weatherford argues that the patentee has limited the scope of this term because the specification refers to the drop member as "sealing" the drop member receptacle to build up fluid pressure. '336 patent at 4:55-56, 8:60-65, 10:15-19. However, these statements in the specification do not demonstrate that the claims at issue require this limitation. The patent does not state that the invention as a whole requires the drop member to seal the drop member receptacle. Cf. Verizon Servs. Corp., 503 F.3d at 1308 ("when a patent thus describes the features of the 'present invention' as a whole, this description limits the scope of the invention"). At best, Weatherford has shown that the '336 patent discloses one embodiment in which the drop member seals the drop member receptacle. Weatherford has not shown that the limitation of this embodiment should be imported into the claims at issue. See E.I. du Pont de Nemours & Co., 849 F.2d at 1433 (explaining that Courts must not import extraneous limitations from the specification into the claims).

While Weatherford focuses on embodiments in the specification that discuss sealing the drop member receptacle, the term to be construed is "restrict." This word appears several times in the specification, and it always refers to some sort of obstruction that limits, but does not completely seal off the pathway through the tubular string. '336 patent 1:31-37, 6:29-36, 7:49-54, 9:51-54. Thus, the patentee has not implicitly given the term "restrict" a meaning different from its commonly understood meaning. See Bell Atl. Network Servs., Inc., 262 F.3d at 1271. Overall, Weatherford has failed to show why a limitation in one preferred embodiment should be imported into the claims at issue. Having rejected Weatherford's argument, the Court will not construe the term at issue. See O2 Micro Int'l Ltd., 521 F.3d at 1362; Fenner Inv. Ltd., 2008 U.S. Dist. LEXIS 65686, 2008 WL 3981838 at *3.

3028

A. "a manifold positioned within an open end" of an atomizing tank

As shown in the figures included in the patent, the atomizer portion of the manifold (20) is inserted into the end of the atomizing tank (12). (Doc. 25, Exh. 1, figs. 1-4). Defendants argue that the language of Claims 1 and 7 that states that the manifold is "positioned within an open end" of an atomizing tank means that the manifold must be "actually within" the open end or mouth of the tank.

This interpretation, according to the defendants, is mandated in light of an Amendment filed on April 11, 1997. The original application stated that the manifold was "adjacent" to the atomizing tank. The Amendment substituted the term "within" for "adjacent" to describe the location of the manifold.
The Amendment clarified the location, because "adjacent" does not precisely convey the structure of the invention, which involves injection of aerated water into the atomization tank through a nozzle (40). Atomization can occur only if the aerated water is introduced into the tank, which requires placement of the nozzle portion of the manifold into the tank.

The term "adjacent" describes something that is next to, but not necessarily a part of, an adjoining item, artifact, or structure. Penetration into the atomizing tank, which would not necessarily be described through use of the term "adjacent," is an integral element of the patented method and apparatus. The Amendment, accordingly, clarified the description, and made it more accurate.

The Amendment did not limit the scope of the patent by requiring (as defendants contend) that the manifold be "actually within" the open end or mouth of the tank. (Doc. 27 at 4). Rather, as is clear from a reading of the patent and its figures, the atomizing nozzle and atomizing tank (i.e., outlet) tube (65), both of which are part of the manifold, are located in the open end of the atomizing tank. It is not necessary for any other portion of the manifold to occupy the opening, nor is it necessary that the nozzle and outlet tube take up the entire cavity formed by the opening and the open end of the atomizing tank. The figures clearly show that the cavity is sealed by a cap through which the atomizer and outlet tube are held in place, and the cap contains the actual openings through which each passes. As a result, and as described in Claims 1 and 7, the manifold is "positioned within an open end" of an atomizing tank.

8. "positioned within the catheter shaft"

The plaintiffs propose that this term carry its plain meaning. The defendants propose "connected at spaced locations to the inner wall of the catheter shaft."

The defendants argue that the patent never suggests or teaches that the stiffening wire would not be attached at all. In support, the defendants cite a few passages from the specification, including a statement in the Summary of Invention section: "[t]he stiffening wire is attached to the inner wall of the catheter shaft at a plurality of points along its length...." 358 Patent at 2:37-41.

The defendants’ argument is not persuasive. Claim 6, which depends from claim 5, recites only one additional limitation: "the stiffening wire is attached to the inner wall of the catheter shaft at at least two spaced locations." 358 Patent at 7:49-51. In light of claim 6, the meaning of "positioned within the catheter shaft" can be informed by the presumption of claim differentiation. Nothing in the intrinsic record rebuts this presumption.

This phrase is easily understood as written and no construction is needed.

III. Claim Construction of Disputed Terms

A. '529 Patent Claim Language (Exhibit 2 to Doc. 141)

1. A method of anterior cruciate reconstruction surgery of the knee, comprising the steps of:

   forming a [sic] opening in a femur, the opening having an entrance facing a joint of the knee;

   forming a transverse hole in the femur extending completely across the femur, the transverse hole extending through a first sidewall of the opening on a first side of the femur, intersecting the opening, and extending through an opposite sidewall of the opening on an opposite side of the femur;
positioning a flexible strand in the knee such that the flexible strand extends from outside of the knee, through the transverse hole and into the opening in the femur through the first sidewall of the opening, out through the entrance of the opening and through a tunnel in the tibia, and, after forming a loop outside of the tibial tunnel, extending back into the tibial tunnel and into the opening through the entrance of the opening, and out of the knee through the transverse hole in the opposite sidewall of the opening;

looping a graft over the loop of the strand extending outside of the tibial tunnel;

pulling the loop of the graft through the tibial tunnel and into the opening; and

securing the graft in the opening by advancing an implant transversely into the opening and under the graft.

2. The method of claim 1, wherein the strand is used as a guide for advancing the implant transversely into the opening and under the graft.

3. The method of claim 1, wherein the implant has a threaded back end, the method further comprising the step of securing the implant in the knee by engaging a wall of the transverse hole with the threaded back end of the implant.

B. '477 Claim Language (Exhibit 1 to Doc. 141)

1. A method of anterior cruciate reconstruction surgery of the knee, comprising the steps of:

   forming an opening in a femur, the opening having an entrance facing a joint of the knee;

   forming a transverse hole in the femur extending completely across the femur, the transverse hole extending through a first sidewall of the opening on a first side of the femur, intersecting the opening, and extending through an opposite sidewall of the opening on an opposite side of the femur;

   positioning a flexible strand in the knee such that the flexible strand extends from outside of the knee, through the transverse hole and into the opening in the femur through the first sidewall of the opening, out through the entrance of the opening and through a tunnel in the tibia, and, after forming a loop outside of the tibial tunnel, extending back into the tibial tunnel and into the opening through the entrance of the opening, and into the transverse hole in the opposite sidewall of the opening;

   looping a graft over the loop of the strand extending outside of the tibial tunnel;

   pulling the loop of the graft through the tibial tunnel and into the opening; and

   securing the graft in the opening by advancing an implant transversely into the opening and under the graft.

2. The method of claim 1, wherein the strand is used as a guide for advancing the implant transversely into the opening and under the graft.

3. The method of claim 1, wherein the implant has a threaded back end, the method further comprising the step of securing the implant in the knee by engaging a wall of the transverse hole with the threaded back end of the implant.

The language of the claims in the ‘529 and ‘477 Patents are identical with the exception of the last clause in the section beginning "positioning a flexible strand." The last clause in the ‘427 Patent does not have the words "and out of the knee through."

*   *   *

E. "Positioning"

Mitek argues that the "positioning" clause requires a two-step process, first the flexible strand is pulled though the entire transverse tunnel in the femur, and then a loop of the strand is formed outside of the tibial tunnel by pulling the flexible strand using a tool, such as a tunnel hook. Mitek cites to the Abstract in the ‘477 patent which includes the following
language: "A flexible strand is drawn with the pin through the bone. A looped portion of the strand is diverted so as to protrude out of the entrance to the longitudinal socket. The ends of the strand remaining accessible on either side of the bone." (Doc. 140, Exh. 1, Abstract). Mitek cites to the Summary of Invention arguing it refers to the two-step process as follows: "Next, a flexible strand, preferably a wire formed of nitinol, is attached to the guide pin and pulled through the femur. Equal lengths of the strand protrude from the medial and lateral sides of the femoral shaft, and are secured to prevent accidental pull-out. The tunnel hook is withdrawn, the strand being captured in the slot of the hook." (Doc. 140, Exh. 1, 2:57-62). Mitek claims that the two-step procedure is not just the preferred embodiment, but characterizes the overall invention, citing to Detailed Description of the Preferred Embodiments which states that the "method of the present invention is described with reference to FIGS 10 through 16." (Doc. 140, Exh. 4:62-63). Later in the Detailed Description of the Preferred Embodiments, the following language appears, the flexible wire "is hooked onto hook 18 on the proximal end of drill pin. By pulling on the drill pin, the graft-passing wire is drawn through the femur until it is positioned with equal lengths at either end protruding from the medial and lateral sides of the femoral shaft. Hemostats 74 are clipped onto the ends of the wire to prevent them from being pulled into the transverse femoral tunnel as shown in FIG 14." (Doc. 140, Exh. 1, 5:51-58). Mitek argues that no other procedure is mentioned to position the flexible wire, into the opening and then forming a loop through the tibial tunnel. (Doc. 140, Exh. 14, p. 2).

Arthrex argues that the flexible strand extends from the outside of the knee, through the transverse tunnel, into the femoral socket through a first sidewall of the femoral socket, out of the entrance to the femoral socket, down through the tibial tunnel, out of the tibial, back up through the tibial tunnel, into the femoral socket, and into the transverse tunnel on the opposite sidewall of the femoral socket. Arthrex argues that the patents are not limited to Mitek's asserted two-step procedure.

The Court will begin its analysis by reviewed the language of the claim and the specification. The positioning clause contains the following procedure:

positioning a flexible strand in the knee such that the flexible strand extends from outside of the knee, through the transverse hole and into the opening in the femur through the first sidewall of the opening, out through the entrance of the opening and through a tunnel in the tibia, and, after forming a loop outside of the tibial tunnel, extending back into the tibial tunnel and into the opening through the entrance of the opening, and into the transverse hole in the opposite sidewall of the opening.

(Doc. 140, Exh. 1, 6:42-50). The language in the Summary of the Invention, is as follows when describing the flexible strand in the femur:

Next, a flexible strand, preferably a wire formed of nitinol, is attached to the guide pin and pulled through the femur. Equal lengths of the strand protrude from the medial and lateral sides of the femoral shaft and are secured to prevent accidental pull-out. The tunnel hook is withdrawn, the strand being captured in the slot of the hook. The hook is retracted completely, through the femoral socket and out of the tibial tunnel, such that a loop of the flexible strand protrudes from the entrance to the tunnel.

(Doc. 140, Exh. 1, 2:57-62).

The Detailed Description of the Preferred Embodiments provides the

nitinol graft-passing wire 30 is hooked onto hook 18 on the proximal end of drill pin 12. By pulling on the drill pin, the graft-passing wire is drawn through the femur until it is positioned with equal lengths at either end protruding from the medial and lateral sides of the femoral shaft. Hemostats 74 are clipped onto the ends of the wire to prevent them from being pulled into the transverse femoral tunnel 70 as shown in FIG 14.

Referring to FIGS 13 and 14, once the graft-passing wire has been drawn through the femur, tunnel hook 2 is retracted from femoral socket 60 and tibial tunnel 56, pulling graft-passing wire 30 with it to form a loop that protrudes from the entrance of the tibial tunnel.

The preferred embodiment in the patents is limited to the two-step procedure raised by Mitek. From the Summary of the
Invention and the Detailed Description of the Preferred Embodiments, the preferred method is to insert the flexible strand through the transverse tunnel in the femur, through a hook on the proximal end of a drill pin, and then through the remaining transverse tunnel. Next, the hook pulls the flexible strand through and out of the tibial tunnel. However, the claim language itself is not limited to this process. A court may not limit a claim to the preferred embodiment or make an inferences from the description of the preferred embodiment. Bell Atlantic Network Services, Inc. v. Covad Comm'c'ns Group, Inc., 262 F.3d at 1273. The claims are not limited to an embodiment even if the embodiment is very specific. LizardTech, Inc. v. Earth Resource Mapping, Inc., 433 F.3d at 1377. In this case, the claim language is not limited to the preferred embodiment or the language in the Summary of the Invention. Rather, the actual claim language allows for the flexible strand to extend from the outside of the knee, through the transverse hole, into the opening in the femur, through the first sidewall of the opening, out through the entrance of the opening, through a tunnel in the tibia, making a loop outside of the tibia, back through the tunnel in the tibia, into the opening, and into the transverse hole in the opposite sidewall. The prosecution history is not useful regarding construing the "positioning" clause in that Mitek cites to statements by the Patent Examiner, however his statements alone cannot limit a claim. Bell Atlantic Network Services, Inc. v. Covad Comm'c'ns Group, Inc., 262 F.3d at 1273. 6

6 The Court did not rely on the dictionary definitions as asserted by Mitek in that the Court relied on intrinsic evidence to make its determinations.

Relying on the claim language itself, and the specification, the Court determines that "a person of ordinary skill in the art" would construe the "ordinary and customary meaning" of the "positioning" clause not to be limited to the two-step method asserted by Mitek. Rather, to the meaning as set forth by Arthex which is the following: "positioning a flexible strand in the knee such that the flexible strand extends from outside of the knee, through the transverse tunnel on one side of the knee and into the opening in the femur. The flexible strand then extends out through the entrance of the opening and through and out of a tibial tunnel. The flexible strand then extends back into and through the tibial tunnel and into the opening, and into the transverse tunnel on the opposite sidewall of the opening. A loop exists where the flexible strand is at its furthest point outside the tibial tunnel." 7

7 Although the language in the '529 patent differs slightly from the '477 patent, the claim construction by the Court applies equally to both patents.

The Court, for the reasons stated by Vnus, finds "positioning … at a treatment site" does not require construction.
Each of the asserted independent claims (3, 5, and 8) recites a "positioning means," the interpretation of which is central to this case. In claim 3, this element reads:

- positioning means for moving said transducer means between the concentrically adjacent tracks on said micro hard-disk;
  said positioning means including:
    - two support arms each supporting one of said read/write heads with each read/write head being mounted at one end of its respective support arm;
    - a pivot shaft having an axis located on one side of said support arms and spaced away from said support arms;
    - a positioning arm to which the other ends of said support arms are attached, said positioning arm having one end thereof coupled to said pivot shaft;
    - a bearing assembly supporting said pivot shaft for rotational movement thereby enabling said positioning arm to be pivoted about the axis of said pivot shaft;
    - a stepper motor having an output drive shaft;
    - means for operating said stepper motor in step increments; and
    - a tensioned steel band coupling said drive shaft of said stepper motor to the other end of said positioning arm, said band being arranged in a pulley arrangement whereby rotational movement of said stepper motor causes pivoting of said positioning arm about said pivot shaft for moving said support arms and the read/write heads in incremental steps with each increment causing said read/write heads to move from one track to the next adjacent track on said micro hard-disk.

Claims 5 and 8 recite an almost identical "positioning means" to each other, but somewhat different from that of claim 3:

- positioning means for moving said first and second transducer means between the concentrically adjacent tracks on said micro hard-disks, said positioning means including a positioning arm disposed within the sealed housing, a pivot shaft coupled to one end of said positioning arm and supporting said positioning arm for rotational movement relative to said micro hard-disks, four support arms, each supporting one of said heads at one end and each connected to said positioning arm at its other end, a stepper motor having a shaft extending into said sealed housing and means for operating said stepper motor in step increments, each increment causing said read/write heads to move from one track to the next adjacent track on said micro hard-disks . . . .

Rodime accuses Seagate's ST157 hard drive of infringing the '383 patent. The parties do not dispute that Seagate's drive incorporates some of the thermal compensation mechanisms disclosed in the '383 patent. Specifically, Seagate's drives use materials with favorable thermal compensation properties in their positioning mechanisms. Seagate's ST157 also relies, however, on a "thermal pin" which works in conjunction with the selection of materials to provide thermal compensation. This pin within Seagate's positioning mechanism has a precise amount of stiffness. When temperature rises and the disk components begin to expand, this expansion stresses the thermal pin causing it to bend. The bending of the pin causes a corrective movement of the head to maintain it at the proper position in the track.

* * *

III.

Determining infringement is a two-step process. This court first construes the claims, then compares the properly construed claims to the accused device. See Cybor Corp. v. FAS Tech., Inc., 138 F.3d 1448, 1454, 46 U.S.P.Q.2d (BNA) 1169, 1172 (Fed. Cir. 1998) (en banc). A central issue in this case is the district court's interpretation of the "positioning means" in
The prepositional link "for" ties the "means" to its function. Later in the same element, the claim reiterates: "causing said
language itself clearly states the function of the positioning means: to move the transducer between tracks on the hard-disk.

Based on these principles, the district court's strained interpretation of the claimed function cannot stand. The claim
be read into the claims.

A claim need not claim every function of a working device. Rather, a claim may specify

The word "means" is "part of the classic template for functional claim elements." Sage Prods. Inc. v. Devon Indus., Inc., 126
F.3d 1420, 1427, 44 U.S.P.Q.2D (BNA) 1103, 1109 (Fed. Cir. 1997). Accordingly, in determining whether a claim element falls within § 112, P 6, this court has presumed an applicant advisedly used the word "means" to invoke the statutory mandates for means-plus-function clauses. See id. Two specific rules, however, overcome this presumption. First, a claim element that uses the word "means" but recites no function corresponding to the means does not invoke § 112, P 6. See id. at 1427. Second, even if the claim element specifies a function, if it also recites sufficient structure or material for performing that function, § 112, P 6 does not apply. See id. at 1427-28 ("Where a claim recites a function, but then goes on to elaborate sufficient structure, material, or acts within the claim itself to perform entirely the recited function, the claim is not in means-plus-function format."); Personalized Media Communications, Inc. v. International Trade Comm'n, 161 F.3d 704 ("In deciding whether [the] presumption has been rebutted, the focus remains on whether the claim as properly construed recites sufficiently definite structure to avoid the ambit of § 112, P 6."); Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531, 41 U.S.P.Q.2D (BNA) 1001, 1006 (Fed. Cir. 1996) ("An element with such a detailed recitation of structure . . . cannot meet the requirements of § 112, P 6.").

In claim 3, the element at issue begins: "positioning means for moving said transducer means between the concentrically adjacent tracks on said micro hard-disk." Claims 5 and 8 use language nearly identical to claim 3, but with the addition of "first and second" before "transducer." Because the element uses the word "means," this court presumes that § 112, P 6 applies. This court next looks to whether the element specifies a function for performing the claimed means. In making that determination, this court relies primarily on the claim language itself. See York Prods., Inc. v. Central Tractor, 99 F.3d 1568, 1574, 40 U.S.P.Q.2D (BNA) 1619, 1624 (Fed. Cir. 1996).

The claim element clearly associates the function of "moving said transducer means between the concentrically adjacent tracks" with the "positioning means." The district court, however, interpreted the element to require more than movement between tracks: "In the disputed claims, the positioning means must not only function to move the head from track to track, it must be able to record data onto a disk and retrieve that data at a later time. Accordingly, the positioning means . . . must be able to accurately locate a track upon which information was recorded at an earlier time." (emphasis added). The district court reasoned that the positioning means could only achieve such "accuracy" with thermal compensation. Thus, according to the district court, thermal compensation must be a function of the claimed means.

In so construing the claims, the district court erred by importing the functions of a working device into these specific claims, rather than reading the claims for their meaning independent of any working embodiment. See Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1278, 35 U.S.P.Q.2D (BNA) 1035, 1041 (Fed. Cir. 1995) ("The district court erred by importing unnecessary functional limitations into the claim."); Constant v. Advanced Micro-Devices, Inc., 848 F.2d 1560, 1571, 7 U.S.P.Q.2D (BNA) 1057, 1064 (Fed. Cir. 1988) ("Although the specification may aid the court in interpreting the meaning of disputed language in the claims, particular embodiments and examples appearing in the specification will not generally be read into the claims."). A claim need not claim every function of a working device. Rather, a claim may specify improvements in one function without claiming the entire machine with its many functions.

Based on these principles, the district court's strained interpretation of the claimed function cannot stand. The claim language itself clearly states the function of the positioning means: to move the transducer between tracks on the hard-disk. The prepositional link "for" ties the "means" to its function. Later in the same element, the claim reiterates: "causing said
read/write heads to move from one track to the next adjacent track on said micro hard disk." The claim says nothing about accurate placement of a head within a track. Nor does it mention thermal compensation in any respect.

The specification underscores the function of movement amongst tracks. It explains that the "positioning mechanism moves the transducer between the tracks." Col. 3, ll. 45-46 (emphasis added). Again at col. 3, ll. 53-56, the specification states that the "positioning means moves the transducer along an arcuate path that extends in the radial direction with respect to the disk" so that "the transducer can move between the innermost and outermost tracks on the disk." Col. 3, ll. 53-56 (emphasis added). These passages emphasize that the function expressly recited in claims 3, 5, and 8 is the claimed function.

To summarize, § 112, P 6 presumptively applies to the "positioning means" in the asserted claims because that element employs traditional "means" language. In addition, the claim language links the means with a function, namely, moving the transducer between tracks on the hard-disk. Accordingly, to this point, the claim element would appear to fall within § 112, P 6. The final step in the analysis, however, requires this court to determine whether the claim nevertheless recites sufficient structure for performing the moving function to take it outside the bounds of that provision.

Following the portion of the claim element quoted above ("positioning means for moving said transducer means between the concentrically adjacent tracks on said micro hard-disk"), claim 3 further provides a list of the structure underlying the means: "said positioning means including: two support arms ... a pivot shaft ... a positioning arm ... a bearing assembly ... a stepper motor ... means for operating said stepper motor ... and a tensioned steel band ... " The claim also recites the specific location and interconnection of each of these structural sub-elements. The pivot shaft, for example, has "an axis located on one side of said support arms and spaced away from said support arms." The positioning arm has attached to it "ends of said support arms" and is also "coupled to said pivot shaft." The tensioned steel band couples "said drive shaft of said stepper motor to the other end of said positioning arm." This detailed recitation of structure for performing the moving function takes this claim element out of the scope of § 112, P 6.

The analysis of claims 5 and 8 proceeds similarly. Those claims recite: "positioning means for moving said first and second transducer means between the concentrically adjacent tracks on said micro hard-disks, said positioning means including a positioning arm ... a pivot shaft ... four support arms ... a stepper motor ... and means for operating said stepper motor." In addition to the recited structure, these claims also recite the interconnection of the structural components and their location with respect to other elements of the claimed combination. For example, the positioning arm is "disposed within the sealed housing." The pivot shaft is "coupled to one end of said positioning arm" and supports "said positioning arm for rotational movement relative to said micro hard-disks." As with claim 3, this detailed recitation of structure for performing the moving function removes this element from the purview of § 112, P 6.

In reaching the opposite conclusion, the special master seemed concerned that the claim did not recite every last detail of structure disclosed in the specification for performing the claimed moving function. This court's case law, however, does not require such an exhaustive recitation to avoid § 112, P 6. Instead, the claim need only recite "sufficient" structure to perform entirely the claimed function. See Sage, 126 F.3d at 1427-28; Personalized Media, 161 F.3d at 704. Based on the structure disclosed in the specification for performing the moving function, these claims recite nearly all (if not all) of the structural components of the positioning mechanism. In any case, they clearly recite more than sufficient structure for moving the transducer from track to track. Moreover, this case is different from Laitram -- relied on by the district court -- where the claim element merely recited "some" structure that only "served to further specify the function of [the] means." 939 F.2d at 1536. Rather, in the words of Laitram, the structure specified in claims 3, 5, and 8 tells what the means "is structurally." Id.

The district court thus erred in interpreting the claims at issue to require the function of thermal compensation and further erred in using § 112, P 6 to read the structure for performing thermal compensation into the claims. As discussed above, the "positioning means" in claims 3, 5, and 8 does not require the function of thermally compensating and recites sufficient structure to fall outside the limits of § 112, P 6.

On appeal, Seagate argues that the district court correctly interpreted the "positioning means" in claims 3, 5, and 8 to include the thermal compensation function. Moreover, Seagate notes, because the claims do not contain structure for the thermal compensation function, these claims fit within the regime of § 112, P 6. To strengthen this argument, Seagate points to the modifier "positioning" in "positioning means." According to Seagate, "positioning denotes placement beyond mere moving." As noted above, however, the language of claims 3, 5, and 8 do not recite a thermal compensation function at all.
Beyond their claim language, however, the context for claims 3, 5, and 8 within the patent underscores that they do not include a thermal compensation function. For example, the language of claim 11, not asserted in this litigation, supports the reading of claims 3, 5, and 8 to require only a moving function. Claim 11 recites: "positioning means for moving said transducer means between the tracks on said hard-disk, said positioning means being formed of selected materials for compensating for any mispositioning arising from thermal effects . . . ." (emphasis added). Thus, the "positioning means" claimed in claim 11, unlike those in claims 3, 5, and 8, explicitly adds the function of "compensating for any mispositioning arising from thermal effects." In other words, the narrower claim 11 adds a thermal compensation function expressly not included in the broader claims 3, 5, and 8. Had Rodime intended or desired to claim thermal compensation as a function of the positioning means in the asserted claims, it could have done it explicitly, as in claim 11. The absence of any such explicit language, however, shows that claims 3, 5, and 8 do not include the function of thermal compensation.

Any difficulty in identifying the function performed by the claimed means apparently stems from the description of the preferred embodiment of the positioning mechanism, which has thermal compensation built into it. As the specification explains: "By appropriately selecting materials of different coefficients of thermal expansion for the various components of the positioning mechanism, it is possible to provide thermal compensation so as to ensure that the read/write heads remain on track irrespective of thermal effects." Col. 8, ll. 22-27. This passage, however, merely highlights the unremarkable fact that a particular means may perform more than one function. It does not follow, however, that the positioning means in claims 3, 5, and 8 necessarily performs both these functions. See Velo-Bind, Inc. v. Minnesota Mining & Mfg. Co., 647 F.2d 965, 968-69, 211 U.S.P.Q. (BNA) 926, 929 (9th Cir. 1981) (declining to interpret "cutting means" to include a binding function merely because the specification disclosed a hot knife that performed both cutting and binding). Indeed, the two functions are not inextricably intertwined. Rather, the specification associates separate structure with each separate function. The specification teaches one of ordinary skill in this art to construct and use a positioning mechanism to move the transducer heads from track to track without "appropriately selecting materials of different coefficients of thermal expansion." While such a construction would not compensate for thermal effects, it would nevertheless operate to move the read/write heads from track to track. In other words, thermal compensation is an additional function, with separate, additional structure, included within this patent as a separate claimed feature within the broader parameters of the entire claimed invention. Each claim, however, need not carry the limitations of narrower, specific claimed features. The specification makes this distinction and supports the interpretation of this language of claims 3, 5, and 8 which recite only the function of movement between tracks.

Finally, the prosecution history of these claims also supports the express claim language. During reexamination, the examiner rejected claim 11 -- which specifically recites thermal compensation as a function of the positioning means -- based on European Patent Application No. 0,055,568. That reference describes a thermal compensation system in a prior Rodime hard-disk. Responding to that rejection, Rodime distinguished its claimed thermal compensation structure from the prior art. The examiner, recognizing the additional function in narrower claim 11, cited no thermal compensation art against claims 3, 5, and 8, nor did Rodime raise thermal compensation at all in relation to those claims. This prosecution history accords with this interpretation of the language of the claims. The claim language does not recite any thermal compensation function in claims 3, 5, and 8 and the examiner understood that interpretation. In addition to the claim language, this prosecution history also served to notify the public of differences between the narrower functions of claim 11 and the broader functions of claims 3, 5, and 8.

In sum, claims 3, 5, and 8 do not warrant interpretation under § 112, P 6 because they recite sufficient structure to perform the entire claimed function. By applying § 112, P 6 to these claims, the trial court mistakenly read limitations from the specification into the claims. Properly interpreted, the asserted claims do not require thermal compensation. Because the district court granted summary judgment of noninfringement on grounds relating only to the particular thermal compensation scheme used in Seagate's drives, this court vacates that judgment and remands for further proceedings to determine whether Seagate has infringed the claims.

D. "Positioning Mechanism" and "Positioning Member"

The parties agreed that "positioning member," which is used in claim 10, means "a structure that positions the auxiliary-device relative to the weapon." They state in their stipulation that they disagree about the construction of "positioning mechanism" as used in claims 5 and 21. In their submissions on claim construction, Insight and SureFire agree that
"positioning mechanism" and "positioning member" should be construed to have the same meaning. Glock contends that no construction is necessary. To avoid any confusion or inconsistency between the terms, both terms are construed to have the same agreed meaning.

A review of the proffered constructions shows that the parties agree that this claim requires the protective barrier device to be in front of frangible portions of the structure. The parties' disagreement centers on whether the claim term requires spacing of the barrier device apart from a structure's frangible portions at a minimum calculable distance.

In its rebuttal statement, Plaintiff states that the specification does not define the term "juxtaposed," but that the term's ordinary meaning is placed side-by-side. Plaintiff also contends that the specification does not contemplate that there be any spacing between the barrier device and a structure's frangible portions. Defendants counter in their rebuttal statement that "[t]he centerpiece of [Patent '852's] specification devotes significant passage as to this feature of using a formula for calculating minimum spacing requirements." At the hearing, both parties agreed that the term "juxtaposed" should be defined.

The Court agrees with Defendants. The Court looks to the specification for guidance in ascertaining the scope of the instant claim term and, in particular, the meaning of the term "juxtaposed." Although "juxtaposed" is not expressly defined in the specification, the specification is replete with passages showing that this term should be construed to mean spaced apart from a structure's frangible portions. This Court counts over ten such specification passages. For instance, the specification's summary of the invention section states that "[t]he flexible barrier of the invention is placed a distance out from the surface to be protected" and that the barrier's deflection "is a determinate of the minimum distance that this barrier is to be spaced out from the frangible area to be protected." Patent '852, col. 3, Ins. 10-12; Ins. 19-21. The specification further states that "[t]his invention provides a method of calculating the minimum spacing of said barrier from the frangible surface" and "[t]he use of flexible fabric distance out from the frangible area as a protective barrier allows extended deceleration…[b]y mounting the protective barrier device some distance from the frangible surface, a distance that is calculable, the missile can be decelerated to a stop prior to contacting the frangible surface." Patent '852, col. 3, Ins. 45-47; col. 4, In. 61-col. 5, In. 1.

The summary of the invention section goes on to state that "[a] feature of this invention is spacing the barrier out from and in front of the frangible area to be protected… [a]other feature is the formula for calculating minimum spacing" and "[t]he barrier is sufficiently spaced from the structure being protected in order to absorb and dissipate the energy from impact prior to the impacting object reaching the structure." Patent '852, col. 5, Ins. 17-22; Ins. 30-33. As part of the detailed description of the preferred embodiment, the specification states that "to calculate the minimum distance that the barrier must be placed out from the area to be protected, the frontal area, weight and speed of the test missile must also be known." Patent '852, col. 6, Ins. 50-53. The detailed description also sets forth criteria "constitut[ing] the basis for calculating the spacing of the barrier from the object being protected" and that "[s]aid spacing is calculated" according to a three-step process expressly set out in the specification. Patent '852, col. 8, Ins. 24-43.

The foregoing specification statements clearly establish a proper basis for this Court to construe this claim term as proposed by Defendants. Indeed, the specification goes to great lengths to describe the patented invention as requiring spacing of the
barrier device apart from a structure's frangible portions at a minimum calculable distance. Thus, this Court adopts Defendants' proposed construction and constructs the instant claim term to mean "the protective barrier device is positioned in front of the frangible portions, and is spaced apart from the frangible portions of the structure at a minimum calculable distance."

3035

x. Positively Driving (Claims 1, 31)

134. This claim terminology is used to describe the lever operating means of Claim 1, which is admitted to be a means-plus-function element. The terminology also is used to describe the lever moving element of Claim 31 which has been shown above to also be in the means-plus-function format.

135. The specification of the '656 patent describes the claim term "positively driving" as providing "positive" engagement of the lever with the cam wheel. As described in the specification of the '656 patent, when the proper conditions are met, the solenoid housing shifts linearly to release the spring-biased spring at the lower end of the cantilever arm, thus causing the lever to be pushed into contact with the cam to enable withdrawal of the bolt. Thus, as described and illustrated in the '656 patent, "positive" driving is associated with pushing the lever into the cam wheel.

136. During prosecution of the '656 patent application, LaGard expressly disclaimed operation of a lock mechanism that depended on the force of gravity to move the lever into contact with the cam. PX 45, p. 141.

3036

C. Mixing v. Positive Mixing

81. A third significant claim interpretation issue involves the meaning of the terms "intermixing" and "positive intermixing." MCI's position, as expressed by Mr. Vilhauer, is that these terms mean the same thing, i.e., simply "mixing." But this interpretation is contradicted by the file history of the '971 Patent. The original application Claim 42 called only for "intermixing" the feed additives. This claim was rejected by the patent examiner and withdrawn by the applicant. The claim was then re-submitted as calling for "positive intermixing," and was subsequently allowed by the patent examiner, as Claim 94 of the patent. The applicant's attorney argued before the Patent Office that the claim was now distinguished over the "known prior art." Since the prior art before the patent examiner included various references which disclosed "mixing," the term "positive mixing" should be construed as being limited to a type of mixing which was not before the Examiner. The only such type which was not before the examiner and is also supported by the patent specification is mechanical mixing.

3037

B. Positively different

The parties dispute the meaning of "positively different," which is used in claim 1 to describe two different directional relationships: (1) "the second plastic layer has a second-direction-flow-record which is positively different from said first-direction flow record" '268 Patent, col. 8, lines 39-42, and (2) "the first plastic flows in the first-cavity-flow-channel in a direction which is positively different from said first predetermined general direction." Id. col. 8, lines 58-61. Claim 21 uses "positively different" in the same way as claim 1, except that in instance (2) the claim refers to the second plastic flow in the second-cavity-flow-channel as being "positively different" from the second predetermined general direction. Id. col. 11, lines 32-35. Ordinarily, a term appearing multiple times should be interpreted consistently, see Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1345 (Fed. Cir. 1998), and therefore the court will construe "positively different" in a fashion that embraces all of the uses of the term in claims 1 and 21.

The parties agree that "positively different" has no specialized meaning to persons of ordinary skill in the injection molding
art. Thus, the ordinary meaning of "positively different" controls, absent some indication that the inventor used the term in a fashion other than according to its ordinary meaning. Karlin Tech., Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971 (Fed. Cir. 1999). The claim language itself does not provide a definition of "positively different," and therefore the court will turn to the dictionary to ascertain the customary meaning of the phrase. The dictionary defines "positively" as "definitely" or "expressly," Oxford English Dictionary (2nd Edition 1989), or "extremely, obviously, notably, certainly." Webster's Third New International Dictionary 1770 (emphasis omitted). Different means "having characters or qualities which diverge from one another; having unlike or distinguishing attributes; not of the same kind; not alike; of other nature, form, or quality." Oxford English Dictionary (2nd Edition 1989). Of these definitions of "different," "not alike" is most consistent with the use of the word "different" in the '268 patent, and therefore the court will adopt that meaning. See Inverness Med. Switzerland GmbH v. Princeton Biomeditech Corp., 309 F.3d 1365, 2002 WL 31428861 at *4 (Fed. Cir. Oct. 31, 2002). Thus, the ordinary meaning of "positively different" is "definitely or certainly not alike."

Next, the court examines the written description and drawings to determine whether the patentee's use of "positively different" is consistent with the term's ordinary meaning. The specification does not provide an explicit definition of "positively different." However, in the description of the preferred embodiments, the written description states:

The flowed second plastic is then adjusted in the second-layer-defining-mold-cavity section 4, to thereby form a second plastic layer 15, so that the second plastic layer 15 has a second-direction-flow-record, similarly indicated by the second arrow 14, which is approximately at a right angle to the first-direction-flow-record and therefore is positively different from the first-direction-flow-record, indicated by the first arrow 12 . . . .

'268 Patent, col. 4, lines 11-18 (emphasis added). In addition, the drawings, which show the flow directions and flow records as arrows, always show the first and second flow records at right angles to one another. Koito therefore argues that "positively different" means that the flow records and flow directions must intersect at 90 degree, or substantially 90 degree angles. Turn-Key argues that the claim language contains no such numerical limitation, and that adopting such a construction would improperly import a limitation based on the preferred embodiment into the claims.

The court need not decide whether adopting Koito's construction would indeed cross the line between using the written description as an aid in interpretation (which is permissible), and using it to import limitations into the claims (which is not), because Koito is simply incorrect: the written description clearly indicates that directions intersecting at other than 90-degree angles can still be "positively different." As noted above, the claims use "positively different" both to describe the difference between the first and second flow records, and to describe the difference between the flow direction through and out of the flow channel (i.e., between the direction of flow in the flow channel and the "predetermined general direction" of flow through the layer-defining-cavity-section). As Koito notes, the preferred embodiments consistently show the difference in flow records as approximately 90 degrees. However, the patent also teaches that the two flow directions can be "positively different" even while the angle between them is as little as 45 degrees, as shown by arrows 33 and 32 in Figure 6 of the patent. The specification specifically describes flow directions 32 and 33 as being "positively different." '268 Patent, col. 6, lines 16-26. Thus, it is clear that two flow directions can be "positively different" without intersecting at a 90 degree angle. Furthermore, Figure 6 illustrates a preferred embodiment of the invention, and this preferred embodiment would be excluded from the scope of the claims if the court were to limit the term "positively different" to angles of 90 or substantially 90 degrees. The Federal Circuit has repeatedly cautioned that an interpretation that excludes the preferred embodiment is "rarely, if ever, correct," Vitronics, 90 F.3d at 1583, and without highly persuasive support -- which Koito has not provided -- the court is unwilling to adopt such an unduly narrow construction of "positively different." In addition, the specification teaches a method of obtaining a variety of angles between the flow directions by varying the relative cavity thicknesses of the flow channel and layer-defining-mold-cavity-section. See '268 Patent, col. 6, lines 24-26, 38-40. The patentee, therefore, obviously did not contemplate limiting the angle between the flow directions to a specific number, but rather envisioned a range of possible angles obtainable by the patented method. And, the patentee clearly did not intend the phrase "positively different" to refer only to 90 or substantially 90 degree differences, or he would not have used that phrase to describe the various angles between flow directions obtainable by the patented method.

In short, the specification does not explicitly or implicitly narrow or otherwise contradict the rather broad customary meaning of "positively different;" indeed, it is consistent with that meaning. Nor have the parties pointed to any portion of the prosecution history in which the patentee either explicitly defined or otherwise limited the scope of the "positively different" limitation. Thus, this term carries its ordinary meaning. The court therefore holds that "positively different," in accordance with its dictionary definition discussed above and consistent with the patentee's use of the term in the
specification, means "definitely or certainly not alike," and therefore this claim limitation requires that the two flow records, as well as the directions of flow through the flow channel and adjacent layer-defining-cavity-section be definitely or certainly not alike.

At issue in this appeal is the "means for positively engaging" limitation found in independent claims 1, 18 and 22. The district court did not treat this limitation as a means-plus-function claim subject to the requirements of section 112, P 6, and construed "positively engaging" to "require both prevention of up and down movement and lock-up with the wall of the hole." Both parties assert that the critical "means for positively engaging" limitation is in means-plus-function form, subject to the requirements of 35 U.S.C. § 112, P 6 (1994). The parties disagree, however, as to the meaning of the term "positively engaging."

We agree that this limitation is in means-plus-function form, see Micro Chemical, Inc. v. Great Plains Chemical Co., Inc., 194 F.3d 1250, 1257, 52 U.S.P.Q.2D (BNA) 1258, 1265 (Fed. Cir. 1999); Al-Site Corp. v. VSI Int'l, Inc., 174 F.3d 1308, 1314 1318, 50 U.S.P.Q.2D (BNA) 1161, 1166 (Fed. Cir. 1999), and that the district court erred when it did not analyze the claim under section 112, P 6. This error is harmless, however, because the same result is required under the proper claim construction.

The first step in analyzing a claim written in means-plus-function form is to identify the claimed function. See Chiuminatta, 145 F.3d at 1308, 46 U.S.P.Q.2D (BNA) at 1755. We agree with the parties that the claimed function in this disputed limitation of representative claim 1 is "positively engaging." The next step is to construe the meaning of the words used to describe the claimed function, using ordinary principles of claim construction. Terms in a claim are to be given their ordinary and accustomed meaning, within the context of the claim. See Johnson Worldwide, 175 F.3d at 989-90, 50 U.S.P.Q.2D (BNA) at 1610. The heavy presumption in favor of the ordinary meaning of claim language is overcome if the meaning of the term is unclear from the context of the claim, see id.; or if the patentee has chosen to be his or her own lexicographer by clearly setting forth an explicit definition for a claim term. See id.; In re Paulsen, 30 F.3d 1475, 1480, 31 U.S.P.Q.2D (BNA) 1671, 1674 (Fed. Cir. 1994) (applicant may act as his own lexicographer, but definition must be done with "reasonable clarity, deliberateness and precision"); Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1387-88, 21 U.S.P.Q.2D (BNA) 1383, 1386 (Fed. Cir. 1992) ("where an applicant chooses to be his own lexicographer and to give terms uncommon meanings, he must set out his uncommon definition in some manner within the patent disclosure so as to give one of ordinary skill in the art note of the change"); Lear Siegler, Inc. v. Aeroquip Corp., 733 F.2d 881, 888-89, 221 U.S.P.Q. (BNA) 1025, 1031 (Fed. Cir. 1984) (same).

Koenig argues that the ordinary meaning of "positively engaging" controls in this case, and sets forth that meaning as "resisting of axial movement." This is a case, however, in which the heavy presumption in favor of the ordinary meaning is overcome because the patentee has chosen to act as his own lexicographer and present a clear alternative definition for "positively engaging." See Paulsen, 30 F.3d at 1480, 31 U.S.P.Q.2D (BNA) at 1674; Intellicall, 952 F.2d at 1387-88, 21 U.S.P.Q.2D (BNA) at 1386. During prosecution, a rejection was made under 35 U.S.C. §§ 102 (b) and 103 over several prior art references, including the Langenbach reference. Arguing against the prior art, Koenig proclaimed his right to act as his own lexicographer, stating "as taught so eloquently in Autogiro Company of America v. U.S., … patent law allows the inventor to be his own lexicographer." Koenig then defined "positively engaging" and "reactive force" in terms of the structure and function of collar 200, the preferred embodiment. Specifically, Koenig stated that positive engagement is achieved by the interaction of collar 200 with the discontinuity in the wall of the hole so that axial force is resisted. Koenig added, when defining "reactive force," that this interaction introduces an interference so that "lock-up" is achieved. From these definitions, we conclude, as did the district court, that "positively engaging" requires (1) resisting axial movement by the interaction of a collar with a discontinuity or groove in the wall of a hole; and (2) introduction of an interference so that "lock-up" is achieved.
Koenig argues, however, that the district court erred by reading into the claims limitations from the preferred embodiment, collar 200, based on remarks made by Koenig during prosecution. According to Koenig, applicant sought to "clarify" the meaning of "reactive forces, in the context of discussing "positively engaging." We disagree with this re-characterization of Koenig's statements during the prosecution of the '392 patent. During prosecution, Koenig defined "positively engaging" by explicitly referencing the preferred embodiment, collar 200. This definition was presented with the requisite "reasonable clarity, deliberateness, and precision," Paulsen, 30 F.3d at 1480, 31 U.S.P.Q.2D (BNA) at 1674, and Koenig further referenced his definition when arguing over the asserted prior art. Having advanced this definition during prosecution, Koenig may not now assert a broader meaning for the term.

2. The Term "Pot" in the '658 Patent

Kress argues that the term "pot" in the '658 patent does not require the slag pot to be full. Essentially, Kress argues that the definition of "pot" can be a pot that is always empty or almost empty. This argument fails, however, in light of the claims and the written description.

a. The Language of the Claims

As already discussed, claim 1 sets forth a pair of actuators that can tilt the cradle from the first position to the second, or carrying position, and then to the third, or dumping, position. This dumping function would be rendered completely meaningless and superfluous if the term "pot" could mean a pot that was "always empty" because there would, obviously, be nothing to dump. In addition, claim 3 also clearly contemplates that the term "pot" must include a pot that is, at times, full. Specifically, claim 3 states that the struts described in claim 2 are to be "linear actuators which, when fully extended, support said cradle so that the pot is slightly tilted to the rear to minimize spilling to the front and to reduce sway." (emphasis added) If the term "pot" could mean a "pot that is always empty or almost empty," then the reference to, and concern with, spillage would be unnecessary.

b. The Written Description

In addition, the written description also contemplates that the term "pot" must include a pot that is, at times, full. For example the written description provides "to eliminate the load on the main actuator hydraulic system and its links during travel of the carrier while carrying a loaded pot, . . . a pair of struts in the form of simple two-position linear actuators are [sic] mounted on the frame . . . ." (emphasis added and numerical references omitted). Again, the written description contemplates the definition of "pot" must include a pot that is, at times, full when it provides the following advice against "spillage": "the pot is held tilted slightly rearwardly . . . to reduce the swing of the pot during acceleration in transport and to encourage and [sic] spillage toward the rear so as to minimize the likelihood of spillage over the projection." (numerical references omitted). This concern with spillage, which appears in both claim 3 and the specification, would be unnecessary if the term "pot" could mean a pot that is "always empty or almost empty." In addition, the written description begins by stating that "it is therefore the primary aim of this invention to provide a slag pot carrier of relatively simple design that will lift, transport and dump small load slag pots or similarly shaped boxes weighing, when loaded, 35 tons or less." Again, this passage demonstrates that the term "pot" was intended to mean a pot that is sometimes full (i.e., when the carrier is transporting the slag to the dump) and is sometimes empty (i.e., after the slag is dumped and the carrier is returning to the steel mill). We hold that the term "pot" means a pot that is sometimes full and sometimes empty. In short, we do not leave common sense on the side of the road when we construe patent claims.

- 3613 -
identifying those claims in which the parties indicate the disputed terms occur. In so doing, the Court notes that it has nevertheless considered each term in the context of the entire patent, including the specification and the unasserted claims.

Plaintiff a combination of galvanic and electrolytic power sources
Defendant generates, rather than consumes, power

The parties agree that the term "power source" means, at a minimum, something that generates, or contributes power to the patch. Plaintiff argues that the term "power source" also includes parts of the patch, which, although they may not individually generate power, are used to regulate the provision of power to the patch. Defendant responds that the term "power source" cannot include portions of the patch that do not directly generate power to the patch.

The Court finds that defendant's proposed definition is the most appropriate construction of the term "power source." The ordinary and customary meaning of the term "power source," means something that is a source of, or generates, power. Further, this construction of the term "power source" is supported by the claim specification. In particular, the description of Figure 10 in the '014 specification refers to a patch that contains both a battery as well as electrodes, but makes clear that the pair of electrodes would provide power to the patch in addition to the battery:

Figure 10 represents a schematic diagram of another multiple-cell . . . embodiment of the power source . . . [with] an electrolytic battery or cell that produces one volt. To this is added . . . a galvanic cell [pair of electrodes] that also produces one volt . . . resulting in an overall total system that will theoretically produce a two-volt source . . . .

The Court construes the claim term "power source" to mean only parts of the patch that generate power, and parts of the patch that merely regulate the provision of power to the patch, but do not individually generate power, are not part of the "power source."

IX. "Power tool"

The Court next addresses the term "power tool" from claim 7 of the '059 patent.

A. The Parties' Proposed Constructions

Black & Decker proposes construing the term "power tool" as "an electrically powered tool." Bosch proposes that the term "power tool" means "a device that aids in accomplishing a task that is powered by an energy source."

B. The Parties Arguments

The Court agrees with Black & Decker that Bosch's proposed construction is overly broad because it would cover devices such as a bicycle or a toothbrush. Bosch derives its proposed construction from the dictionary definition of the word "tool" (i.e., a device that aids in accomplishing a task). The Federal Circuit in its en banc decision in Phillips recently warned against using dictionary definitions to construe claims when the intrinsic evidence would be clear to one of ordinary skill in the art. Therefore, the Court construes the claim term "power source" to mean only parts of the patch that generate power, and parts of the patch that merely regulate the provision of power to the patch, but do not individually generate power, are not part of the "power source."

The intrinsic record does not support the broad construction proposed by Bosch. The "Objects Of The Invention" section of the specification provides that: "It is yet another object to be able to power the radio with modular batteries normally used in professional portable power tools." ('059 patent, col. 1, ll. 55-57.) Further on, the specification states that the invention may include "an adapter engageable with a secondary direct current power source, such as a tradesworker's hand tool battery pack." ('059 patent, col. 2, ll. 28-30.) Black & Decker also points out that The New Shorter Oxford English Dictionary (1993) defines "power tool" as "an electrically powered tool." This confirms the understanding that one of ordinary skill in the art would have of the term "power tool" based on a reading of the intrinsic record, and specifically the specification. Accordingly, the Court construes the term "power tool" as "an electrically powered tool."
n10 Although this construction essentially recites the claim term itself, counsel for Bosch conceded at the Markman hearing that people understand what a "power tool" is. (Markman Transcript at 69:17-20.) Accordingly, the Court does not find it necessary to further define a term that the trier of fact will already understand.

6. Claim 16

Initially, AnazaoHealth and the World Wide Plaintiffs identified six terms requiring construction in Claim 16, a dependent claim. They have since agreed on the construction of three of those, "distal end," discussed above; "seals" as meaning "closes the distal tip of the cannula, thereby preventing radioactive seeds from spilling out of the cannula or bodily fluids from entering the cannula prematurely;" and "sterile," as meaning "free from living germs or microorganisms." The Court adopts those constructions.

Two of the remaining terms, "line of elements" and "end plug," have already been construed by the Court. The Court adheres to those prior constructions. 33

The intrinsic evidence contains several references to the needle assembly being pre-loaded. The title of the '760 Patent is "Pre-loaded Needle Apparatus." The Summary of the Invention describes one of the advantages of the Patent as being that the needle assembly may be delivered to the user already loaded and sterile, which reduces preparation time as well as personal exposure to radioactive seeds. ('760 Patent col. 2, ll. 23-26.) This is reiterated in the prosecution history, which states that a new Claim 21 34 was added to recite this improvement disclosed in the specification. (W0483.)
The claim at issue in IPXL read:

covered both the system and the user's active "use" of the system. Therefore, was ambiguous under section 112, paragraph 2. Id. In that case, the claim at issue clearly was not sufficiently precise to provide competitors with an accurate determination of the "metes and bounds" of the user of the apparatus later performed the claimed method of using the apparatus. Id. Thus, the Court concluded that such a procedure was to take place? Or, does it mean that it just had to be pre-loaded in a different room? The intrinsic evidence of record does not answer these questions. The specification simply states that the needles could be delivered to the user already loaded and sterile, (760 Patent col. 2, ll. 24-25), but there is no limitation on where the pre-loading had to take place. Therefore, the Court declines to add this limitation to the construction of the term "pre-loaded." Instead, the Court construes the term "pre-loaded" according to its customary meaning - "loaded beforehand."

As to AnazaoHealth's argument that the patentees' introduction of the term "pre-loaded" as a claim element created an ambiguity between what is claimed in dependent Claim 16 and what is claimed in Claim 9, the independent claim on which it depends, the Court disagrees. Claim 9 expressly claims as a distinct element, "a line of elements in the cannula." Thus, AnazaoHealth argues, the World Wide Plaintiffs' interpretation of "pre-loaded" logically means that the needle assembly, already containing a line of elements, is somehow again being loaded beforehand at a facility other than the location of the procedure. As AnazaoHealth points out, it does not make sense that the needle assembly would be loaded with a line of elements twice. This simply is not a logical reading of dependent Claim 16.

As the prosecution history reveals, Claim 16 was added to "recite the improvement disclosed by the specification by which the needle assembly may be delivered to the user already loaded (pre-loaded) and sterile." (W0483.) The Court finds that when "pre-loaded" is given its ordinary and customary meaning of "loaded beforehand" or already loaded, this claim is not rendered "insolubly ambiguous," as urged by AnazaoHealth. Cf. Star Scientific, Inc. v. R.J. Reynolds Tobacco Co., 537 F.3d 1357, 1371 (Fed. Cir. 2008), cert. denied, ___ U.S. ___, 129 S. Ct. 1595, 173 L. Ed. 2d 678 (2009).

Alternatively, AnazaoHealth argues that even if a reasonable construction of the term "pre-loaded" could be determined, the Plaintiffs' proffered construction would render the claim invalid because it combines a product claim ("the assembly as claimed in Claim 9") with a method claim ("wherein the needle assembly is pre-loaded with said line of elements and is sterile"). The Federal Circuit has squarely held that a single claim purporting to cover both an apparatus and a method for using that apparatus is invalid as a matter of law under 35 U.S.C. § 112 P 2, citing IPXL Holdings, LLC v. Amazon.com, Inc., 430 F.3d 1377, 1384 (Fed. Cir. 2005). Here, as in IPXL Holdings, AnazaoHealth asserts that it is unclear whether infringement of claim 16 would occur when someone created a needle assembly comprising a line of elements, or when the off-site facility loaded it beforehand and sterilized it. Thus, it would be invalid because, in reciting both an apparatus and the method for using the apparatus, it would not apprise a person of ordinary skill in the art of its scope. Id. at 1384. Again, the Court disagrees.

Section 112, paragraph 2, requires that the claims of a patent "particularly point[] out and distinctly claim[] the subject matter which the applicant regards as his invention." 35 U.S.C. § 112 P 2. A claim is considered indefinite if it does not reasonably apprise someone skilled in the art of its scope. IPXL, 430 F.3d at 1384. In IPXL, the Federal Circuit considered for the first time the issue of whether a single claim that covers both an apparatus and a method of using that apparatus is invalid. Id. The Court held that where a claim combines two separate statutory classes of invention, a manufacturer or seller of the apparatus would not know from the claim whether it might also be liable for contributory infringement if a buyer or user of the apparatus later performed the claimed method of using the apparatus. Id. Thus, the Court concluded that such a claim was not sufficiently precise to provide competitors with an accurate determination of the "metes and bounds" of the protection involved and, therefore, was ambiguous under section 112, paragraph 2. Id. In that case, the claim at issue clearly covered both the system and the user's active "use" of the system. 35
The system of claim 2 [including an input means] wherein the predicted transaction information comprises both a transaction type and transaction parameters associated with that transaction type and the user uses the input means to either change the predicted transaction information or accept the displayed transaction type and transaction parameters.

430 F.3d at 1380 (emphasis in original).

In this case, however, Claim 16 describes an apparatus - a "needle assembly," modified by the term "sterile," which is simply an adjective that further describes the apparatus. It does not describe a separate method of use. Where "[t]he clause at issue is not a separate method step, but rather is descriptive of the apparatus itself," the holding of IPXL is not implicated. Sienna LLC v. CVS Corp., No. 06 Civ. 3364, 2007 U.S. Dist. LEXIS 2, 2007 WL 13102, at *8 (S.D.N.Y. Jan. 3, 2007). As the court noted in Ricoh Co., v. Katun Corp., 486 F. Supp. 2d 395, 412 (D.N.J. 2007), in almost all cases where this issue has been raised post-IPXL, the courts have found that the suspect claims did not cover both an apparatus and a method, but rather were apparatus claims containing functional limitations. (Citing cases).

Accordingly, the Court construes the term "pre-loaded" as "loaded beforehand."

8 The Court has not adopted defendants' proposed construction that the compression must be external to the "body"; although the specification states that a tourniquet "can be used" to "externally compress" the vein, see, e.g., '433 Patent, col. 4, ll. 18-25, the specification does not include language limiting the patent to only that manner of external compression. Additionally, the Court has not included in its construction the phrase "the vein such that the inner wall of the vein," because such language is already included in Claim 1. See id., col. 19, ll. 20-21. Finally, the Court has not included in its construction defendants' proposed additional phrase "collapses into contact with the electrode device"; such language is a proposed construction of "is brought toward the working end of the catheter," which is not one of the ten disputed terms before the Court.

The plain meaning of the next disputed term, "one piece caliper," as confirmed by reference to a standard dictionary, is "a caliper constructed or formed as a single, integral piece." See Webster's Third New International Dictionary 1576 (1993). The same dictionary also identifies the plain meaning of the next disputed term, "preassembled," as simply "assembled beforehand." See id. at 1783. Likewise, standard dictionary definitions establish that the plain meaning of the terms "largely closed" and "substantially closed," used interchangeably throughout the '445 patent claims and specification, is "for the most part, to a large degree, or in the main closed." See id. at 1273, 2280.
2) "Predetermined Accurate Work Position"

The relevant portion of Claim 1 reads:

said method comprising the steps of positioning said two planar abutment surfaces of said broach cutting tool member contiguous said first planar and said second planar abutment surfaces, respectively, of said broach tool holder and simultaneously locating said bottom end surface of said broach cutting tool member on said intermediate surface of said broach tool holder whereby when said broach cutting tool member is positioned in said broach tool holder a predetermined accurate work position is established for said broach cutting tool member … '857 Patent, Col. 7, ll. 57-67.

Utica contends that the term, "predetermined accurate work position," should be given the ordinary meaning that a person of ordinary skill in the art would attribute to it. Utica asserts that "predetermined" means to determine beforehand or to settle in advance, and that "accurate" means free from error or mistake, precisely fixed, executed with care. Webster's. Utica proposes that predetermined accurate work position means "a work position that was determined in advance and in which care was taken to make it as free from error or mistake as reasonably possible." Pl.'s Post-Markman Br., p.6. Utica also relies on Roseliep's testimony that the predetermined accurate work position is determined by the designer in advance by measuring from the center axis of the tool to the planar surfaces, and then machining the planar surfaces to accurately reflect that measurement. Hearing Tr., p. 27. Utica posits that Federal Broach's President, William Martin ("Martin"), also testified that the cutting tool's work position is measured from the center axis of the cutting tool to the appropriate surface. Hearing Tr., p. 91.

Federal Broach contends, however, that predetermined accurate work position means "a position in which the tool is supported on the tool holder with the complementary planar abutment surfaces of the tool and the tool holder in engagement with one another with no clearance between the surfaces." Def.'s Post-Markman Br., p.6. To support its contention, Federal Broach relies on Claim 1's plain language, as well as the specification that "it is an object of the present invention to provide a cutting tool retention device that provides for accurate positioning of a cutting tool by eliminating any clearance between the cutting tool and the tool holder." '857 Patent, Col. 2, In. 61. Federal Broach further relies on the specification that "the accuracy in positioning the cutting tool 12 is improved because the clearance between the mounting block hole and the cutting tool, as shown in the prior art, is eliminated." '857 Patent, Col. 6, In. 45 (referencing FIGS. 1-5). Federal Broach also references Utica's statements to the PTO on two occasions that

when the broach cutting tool is mounted in a broach tool holder, the two precision planar faces of each of the broach cutting tool and broach tool holder are forced against each other by the use of the locking force applied against the oblique portion of the third planar surface locking so as to generate an accurate work position. See Def.'s Markman Br., App. C, Preliminary Amendment, Aug. 22, 2000, p. 10; PTO Prosecution History, Dec. 21, 2000, Reply, p. 8.

Utica's contention that predetermined accurate work position should be limited to its ordinary meaning is expressly contradicted by the specification's clear, unambiguous, and express language that an object of the invention is to eliminate any clearance between the cutting tool and the tool holder. In its initial brief, Utica represented to this Court that:

In other words, the flat mounting surfaces of the tool holder against which the corresponding abutment surfaces of the cutting tool will be radially positioned are fixed and not subject to accumulated clearances or tolerances that would compromise the accuracy of that location, as the wedge like device locates and locks the cutting tool into the tool holder. Because the flat mounting surfaces of the tool holder are in a fixed position, rather than fitted into a slot or bore, there is a net surface that remains in the same position as the cutting tool is located and locked into place. This creates a predetermined accurate work position not only when the tool is initially installed, but also when resharpened, refurbished, or replacement tools are positioned and locked into the tool holder. Pl.'s Br. Regarding Claim Construction, p. 9 [Emphasis added].

The Court is not persuaded that the term "predetermined accurate work position" should be given its ordinary meaning, and doubts that upon reading the '857 Patent in its entirety, particularly upon reviewing Roseliep's representations to the PTO, a person of ordinary skill in the art would ascribe the meaning for which Utica advocates. In fact, the specifications state that
"it should be appreciated by those skilled in the art that the closer the tolerance obtained in manufacturing the flat faces … the higher the accuracy of the radial positioning of the cutting tool." '857 Patent, Col. 4, ll. 27-32. Though the language of Claim 1 itself does not limit the term "predetermined accurate work position" to the elimination of clearances, this Court cannot ignore the construction Roseliep gave when he presented his invention to the PTO in order to obtain the patent. Teleflex, 299 F.3d at 1326.

The Court agrees that the term "predetermined" means determined beforehand or settled in advance. Webster's. The Court finds that Roseliep's and Martin's testimony that the cutting tool's position is measured from its center axis to the appropriate surface of the tool holder is consistent with this definition. As previously indicated, however, the specifications and the prosecution history, here in evidence, indicate that the inventor intended to deviate from the ordinary meaning of the term "accurate," by "characterizing the invention in the intrinsic record using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope." Teleflex, 299 F.3d at 1327; see also Beckson Marine, Inc. v. NFM, Inc., 292 F.3d 718 (Fed. Cir. 2002)(explaining that "the inventor may act as his own lexicographer and use the specification to supply implicitly or explicitly new meanings for terms"). The inventor amended Claim 1 with the PTO to indicate that the predetermined accurate work position specifically meant that the "planar faces of the tool and tool holder are forced against each other." Def.'s Markman Br., App. C, Preliminary Amendment, Aug. 22, 2000, p. 10; PTO Prosecution History, Dec. 21, 2000, Reply, p. 8.

While adhering to the admonishment that claim terms should be given their ordinary meaning and that the limitations of the specifications should not be imported into the claim language, the Court may look to the specifications for guidance and context for claim construction, as well as to the prosecution history when it appears that the inventor offered a particular embodiment in order to obtain the patent. Ecolab, 264 F.3d at 1366 (Fed. Cir. 2001). The Court, thus, is constrained to grant a construction of the term predetermined accurate work position that includes a reference to the elimination of clearances because it appears that the inventor ascribed that meaning to the claim term in the patent's specifications, as well as in the inventor's representations to the PTO and to this Court.

The Court finds that the term "predetermined accurate work position" means the fixed placement of the tool in the tool holder. This placement is achieved by precisely measuring the distance from the surface of the center axis of the tool to the appropriate surfaces of the tool holder in advance, such that the flat mounting surfaces of the tool directly contact the corresponding surfaces of the tool holder, without any spaces in between, thereby maintaining the cutting tool's original placement until the tool is removed.

3. Predetermined Asymmetric Isodose Curves

This term appears in asserted Claims 1 and 8 of the '142 patent. For example, Claim 1 requires "the radiation source further being asymmetrically located and arranged within the expandable surface to provide predetermined asymmetric isodose curves with respect to the apparatus volume." Id. at 9:3-6. The parties propose the following constructions:

*   *   *

SenoRx asserts that its proposed definition is more consistent with the claim language. SenoRx asserts that Hologic's proposed construction, in particular "the longitudinal axis" limitation, is a limitation found in some but not all of the embodiments of the patent and thus should not be part of the construction of the term. SenoRx points to the specification that states:

The present invention solves the problems described above by providing an interstitial brachytherapy apparatus for delivering radioactive emissions in an asymmetric fashion to target tissue surrounding a surgical extraction site. . . .

Id. at 2:56-59.

In one configuration, asymmetric isodose curves are created in the target tissue by shaping or locating the radiation source so as to be asymmetrically placed with respect to a longitudinal axis of the apparatus. . . .

Id. at 2:65-3:1.
In another example, the radiation source comprises a plurality of spaced apart solid radioactive particles disposed within the apparatus volume and arranged to provide a predetermined asymmetric isodose curve within the target tissue.

Id. at 3:7-11 (emphasis added). Asymmetry in the isodose curves, SenoRx argues, need not be limited to longitudinal asymmetry. SenoRx further points to Claim 6, which explicitly requires an elongated member "shaped to provide asymmetric placement of a radiation source with respect to a longitudinal axis through the apparatus volume." Thus, asserts SenoRx, when the inventors intended to define asymmetry with respect to the longitudinal axis of the device, they did so explicitly. Finally, SenoRx points to the testimony of Hologic's expert Dr. Verhey who testified as follows:

Q. Is the radiation profile that is provided by the embodiment of Figure 3 asymmetric with respect to the longitudinal axis of the device?

A. No, actually, it's not with respect to the longitudinal axis.

Verhey Depo Tr. at 146:13-17.

Hologic asserts that SenoRx's proposed construction is incorrect. Hologic asserts that the radiation sources in the claims are arranged asymmetrically so as to not be on the longitudinal axis and it is a direct result of this arrangement that creates the "predetermined asymmetric isodose profile." Hologic looks to the specification for support, including the same language cited by SenoRx. Hologic also explains that Dr. Verhey made a mistake during his deposition.

It does appear Dr. Verhey may have made a mistake with respect to Figure 3. However, although the specification and claims frequently refer to symmetry with respect to the longitudinal axis, they do not always do so. Claim 6 does include a specific requirement that the asymmetry be longitudinal. The patentee did not do so in Claims 1 and 8. No express limitation suggests that those claims require configurations with isodose curves that are asymmetric only with respect to the longitudinal axis. The Court therefore interprets "predetermined asymmetric isodose curves" to mean "isodose curves determined before radiation is administered which are not substantially the same shape as the apparatus volume and/or not concentric with the apparatus volume."
path is stored somewhere in the memory of the control unit. Notably, the selection step requires that only one of the bevelling paths be selected from the collection. The whereby clause which states that the control means "controls the displacement of said lens in accordance with the selected intermediate path to form the edge of the lens", by its very language, also requires that the path selected from the collection be the actual bevel path that is taken when the bevelling wheel makes contact with the edge of the lens.

B. Specification

As mentioned earlier the bevel path is described in the specification as when the point of contact of the lens with said grinding wheel follows a specific path. The specification explains that by knowing the location of the reference paths, the thickness of the lens can be determined such that a bevelling path can be selected that would fall between the two reference paths.

There is nothing in the specification which discusses using equations or formulas to store, compare and select a bevel path. In describing the storing, comparing and selecting steps the specification refers to the paths as "stored typical paths" or "stored specific typical paths," suggesting that the number of paths is limited. In fact the specification also explains that "a limited number of specific typical paths can be permanently stored."

The specification also explains that the apparatus is preferably equipped with a keyboard where the operator can preselect a path from the collection of typical paths stored in the computer.

Whether stored "point by point" or by another means, the overall impression rendered from reading the specification is that the number of these stored paths is limited. This would also exclude using equations to calculate bevelling paths which could result in millions of bevelling paths.

C. Prosecution History

The arguments made in response to the rejections from the PTO do not assist the court in interpreting the meaning of the phrase "predetermined belling path."

We conclude that claim 1 is limited to storage, comparison and selection of a collection of paths that have been determined beforehand, i.e. they actually exist in the memory of the control means of the device and are not calculated from a combination of different values using equations. It is these paths in memory which will be compared to the reference paths and out of these paths will be selected the path that the bevel will take. While in practice, equations or formulas can be used in a bevelling apparatus which would require that the machine choose between different routes, that choice is not the selection of a discreet actual path for a bevel that is to be placed on the lens. That the route may be based on a characteristic representative of a bevel path is irrelevant, the literal language of the claims requires that what is stored, compared, and selected be an actual bevelling path, not a parameter or characteristic of the bevelling path.

2. Predetermined Condition.

The Court believes, contrary to Leviton, that the term "predetermined condition" is not clear on its face to one of ordinary skill in the art and that, therefore, it requires construction. The term "predetermined condition" is not specifically defined or described in the '766 patent. See The '766 Patent. The Defendants' initial proposed construction of the term is "the occurrence of a current imbalance from an actual or artificially induced ground fault." Defendants' Memo at 32.

In their initial memorandum in support of their proposed claim constructions, the Defendants' assert that the specification describes only three conditions in which the "circuit interrupting portion" would cause "electric discontinuity:" sensing an actual fault, pressing the test button, and pressing the reset button. See Defendants' Memo at 32; The '766 Patent, Col. 7, ll. 13-18; id. at Col. 7, ll. 19-23; id. at Col. 8, ll. 35-38; id. at Col. 6, ll. 8-12. The Court agrees that those are the only three conditions that the specification describes that would lead the circuit interrupting portion to cause electric discontinuity. See The '766 Patent. The Defendants, in their initial claim construction briefing, also maintain that those three conditions have
one thing in common: they create a circuit imbalance from an actual or artificially induced ground fault. See Defendants' Memo at 32-33; The '766 Patent, Col 3, ll. 1-5; see id. at Col 3, ll. 21-31.

In further support of their construction, the Defendants cite Dr. De La Ere's testimony concerning the '558 patent. See Defendants' Response at 14. The Defendants point out that Dr. De La Ere testified that "predetermined condition" meant the same thing in U.S. Pat. No. 6,040,967 ("the '967 patent") and the '558 patent, see Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d at 1334 ("We presume, unless otherwise compelled, that the same claim term in the same patent or related patents carries the same construed meaning."); August 31 De La Ere Deposition at 68:17-20; id. at 69:3-6, and that he admitted that the term "test cycle," as used therein, was synonymous with "stimulating a ground fault," see Defendants' Response, Exhibit A, Deposition of Jaime De La Ere at 149:18 (taken December 14, 2004)("December 14 De La Ere Deposition"); id. at 150:2.

Leviton contends that the '766 patent incorporates by reference the language concerning "predetermined condition" contained in the '967 patent. See Leviton's Response at 11-12. The Court concurs. See The '766 Patent at Col. 1, 12-15. With regard to "predetermined condition," the '967 patent states: "Predetermined conditions include, without limitation, ground faults, arc faults, appliance leakage faults, immersion faults and a test cycle." The '967 Patent at Col.2, ll. 25-27. Leviton also contends that "arc faults" and "test cycles" do not necessarily create or require current imbalances. See Leviton's Response at 12. The Defendants respond to that contention by noting that may be true, but pointing out that in such "open-neutral" test circumstances, the circuit interrupting portion does not cause electrical discontinuity -- because no electricity is flowing through the device -- and that the relevant claim expressly states: "A circuit interrupting portion configured to cause electrical discontinuity." Transcript at 53:9-54:18 (Fry); The '766 Patent, Claim 1. Essentially, the Defendants argue that the claim language effectively excludes "open-neutral test cycles" that do not cause current imbalances, and that, therefore, the "upon the occurrence of a current imbalance" portion of their proposed claim construction is correct. See id. The Court also notes that the proposed construction the Defendants presented at the Markman hearing replaced "ground fault" with "electrical fault," seemingly acknowledging that the '967 patent was incorporated by reference and that it allows for the possibility that the circuit interrupting portion may cause electrical discontinuity upon the occurrence of arc faults, appliance leakage faults, immersion faults, in addition to ground faults and test cycles. See Defendants' Presentation at 73.

--- Footnotes ---

1 Leviton does not discuss the circumstances surrounding such "arc faults," and thus fails to give the Court sufficient information to evaluate this element of Leviton's contention.

--- End Footnotes ---

The Court believes that the term "predetermined condition" is not clear on its face to one of ordinary skill in the art and that, therefore, construction is required. The Court finds that the '967 patent is incorporated by reference in the '766 patent, and that, as a result, it is proper to use "electrical fault," rather than "ground fault." Defendants' Memo at 32; Defendants' Presentation at 73. Moreover, the Court notes that Dr. De La Ere has testified that, for purposes of the '558 patent, "test cycle" is synonymous with "stimulating a ground fault," see December 14 De La Ere Deposition at 149:18; id. at 150:2, and that it is not disputed that ground faults create and/or require current imbalances. Further, the Court agrees with the Defendants and finds that the claim language excludes "open-neutral test cycles" that would not create or require current imbalances. As such, the Court will adopt the Defendants' proposed claim construction for "predetermined condition."
material from within the bag is discharged more freely, said engagement of the neck within the predetermined shape minimizing tearing stresses placed on the bag by the opposed members.

Plaintiff contends that "[p]roperly construed in view of the patent specification, this limitation means that:

   When the opposed members engage a bag opening to restrict discharge of material from the bag by moving the opposed members closer toward each other, the confined shape between the opposed members is substantially maintained while the confined area between the members is changed so that the opposed members engage the bag neck evenly from all sides to minimize tearing stresses on the bag. Movement of the opposed members toward each other gathers the neck of the bag so that it may be easily tied, and movement of the members away from each other enlarges the bag opening so that material within the bag is discharged more freely."

"Plaintiff's Motion For Claim Construction" (Document No. 62 at 2) (emphasis added).

Defendant contends that for claim 20 the "language should be construed to require:

   The predetermined shape (or spatial contour decided beforehand) formed between the opposed parts must be maintained (or kept in its existing shape) when the confined area between the members changes or becomes different as the members move."

"Defendant's Memorandum In Support Of Its Motion..." (Document No. 77 at 4).

Based on the same reasoning as described in the analysis above, the undersigned finds Defendant's construction more persuasive. Viewing the patent as a whole, and relying principally on intrinsic evidence, the undersigned again finds that a "predetermined confined shape" is properly construed in the context of this patent as describing a shape or contour that is preset by the apparatus and is not altered (or changed) by the functioning of the apparatus. In other words, the area of the shape created by the apparatus may enlarge or shrink with its movement, but the shape itself should remain constant.

In reaching this construction, the undersigned finds the language of the claim most instructive: "maintaining the predetermined confined shape between the opposed members while changing the confined area thereof during said movement of the opposed members..." (Patent P.8, L. 47-50) (emphasis added). As discussed in the analysis of claim 1 above, the juxtaposition of words chosen by the patent's author are telling - "maintaining the predetermined confined shape" compared to "while changing the confined area" describes a shape that is maintained, or stays the same or is constant, while in contrast the area changes.

This construction rests on the "bedrock principle of patent law that the claims of a patent define the invention to which the patentee is entitled the right to exclude." Innova, 381 F.3d at 1115. The undersigned's construction also "indulge[s] a 'heavy presumption' that claim terms carry their full ordinary and customary meaning, unless the patentee unequivocally imparted a novel meaning to those terms or expressly relinquished claim scope during prosecution." Omega Engineering, Inc. v. Raytek Corp., 334 F.3d 1314, 1323 (Fed. Cir. 2003) (citations omitted).

"Predetermined constant spacing between said inner spatial volume and radiation transparent wall"

Cytyc's proposed construction
The spacing between the inner spatial volume and the radiation transparent wall of the outer, closed, inflatable chamber, when inflated, can be made constant in all directions if the outer chamber is spherical, or constant along a radial plane if the outer chamber is not spherical

Xoft's proposed construction
(indefinite)
Xoft argues that the '813 patent is indefinite because it does not disclose how one "predetermines" the amount of spacing. Xoft points out that the spacing between the edges of the inner and outer volumes may change as parts of the apparatus are inflated or deflated, so the spacing is not constant. Cytyc's expert explained that "predetermined constant spacing" means that "the spacing between the inner spatial volume and the wall of the outer inflatable chamber can be made constant in all directions if the outer chamber is spherical, or constant along a radial direction if non-spherical, whenever the outer chamber is inflated." Su Decl. (dkt. # 49), Ex. D (Verhey Decl.) at 7 (citations omitted). Cytyc also argues that "[o]ne skilled in the art knows how to determine an appropriate 'predetermined constant spacing' and Xoft provides no evidence, testimony, or case law to the contrary. Xoft cannot possibly show that the term is indefinite by clear and convincing evidence." Reply Br. (dkt. # 53) at 15.

Because 35 U.S.C. § 282 gives a patent "a statutory presumption of validity," a challenger bears the burden of proving "by clear and convincing evidence" that a patent is invalid. Monsanto Co. v. Scruggs, 459 F.3d 1328, 1336-37 (Fed. Cir. 2006), "[P]atent documents need not include subject matter that is known in the field of the invention." S3 Inc. v. NVIDIA Corp., 259 F.3d 1364, 1371 (Fed. Cir. 2001). From the testimony of Dr. Verhey, it appears that one skilled in the art would know how to "predetermine" the amount of spacing. 5 See Tr. at 56-61, 85-89. Xoft offered no evidence suggesting otherwise. As the burden of proof is Xoft's, its indefiniteness argument necessarily fails given the absence of supporting evidence. The court will therefore adopt Cytyc's proposed construction of "predetermined constant spacing between said inner spatial volume and radiation transparent wall" modified only to make the definition easier to understand. A separate construction for "predetermined constant spacing" is not necessary.

5 Xoft argues that the size of the cavity determines the size of the apparatus when fully inflated, but this alone does not determine the spacing between the inner spatial volume and the wall of the outer chamber.
one another from a hub body defining (1) a common center point and (2) an overall contact face defined in part by said bars; the contact face including outwardly-most extending ends corresponding to the ends of said bars and displaying predetermined curvatures corresponding to the outwardly-most extending ends of said bars, the predetermined curvatures of the ends of said contact face displaying radii of curvature smaller than the distance from said center point of the contact surface to the outwardly-most extending ends of said bars; each of said bars having a through hole (1) which is adapted to receive an axle bolt and (2) which extends in a direction perpendicular to said contact face such that, when the wheel structure is mounted to said vehicular axle, said contact surface is contiguous with the axle end plate.

Plaintiff first proposes construing the term "outwardly-most extending ends" as defining "a 'contact face radius' which is less than the distance from the wheel center to the outwardly-most extending ends of the contact face," (Pl.'s Br. at 31.) Plaintiff next contends that "[t]he 'contact face radius' must be the same as a 'bar radius' defined by the outwardly-most extending ends of the bars." (Id.) Finally, Plaintiff submits that "[b]oth the 'contact face radius' and the 'bar radius' must be 'predetermined', i.e., selected or determined prior to the forming (stamping) operation of the hub." (Id.)

In their brief, Defendants object only to Plaintiff's proposed location of the outwardly-most extending ends, as illustrated by reference numeral 104a in Plaintiff's edited reproduction of Figure 7. (Id. at 32.) Claim 1 requires that the "predetermined curvatures correspond[] to the outwardly-most extending ends of said bars." ('596 Patent, col. 4, ln. 12-14.) Defendants argue that the "outwardly-most extending ends of said bars" are illustrated in Figure 3 by reference numeral 47. (Defs.' Reply at 13.) Plaintiffs, however, argue that reference numeral 47 only designate the "ends" of the bars and not the "outwardly-most extending ends of said bars." (Pl.'s Sur-Reply at 13.) Plaintiff contends that Figure 3 fails to identify the outwardly-most extending ends, which Plaintiff claims are illustrated in Figure 1 by reference numeral 18 and in Figure 2 by reference numeral 36. (Id.)

Because the '596 Patent specification refers to Figure 3 reference numeral 47 as simply the "end" of the bar, ('596 Patent, col. 3 ln. 7, 14), and refers to Figure 1 reference numeral 18 and Figure 2 reference numeral 36 as the "outwardly most extending ends" of the bar, ('596 Patent, col. 2, Ins. 37-38, 58-59), the court finds that only Figures 1 and 2 designate by numerical reference the outwardly-most extending ends of the bar. Plaintiff's edited Figure 7 reference numeral 104a corresponds to Figure 1 reference numeral 18 and Figure 2 reference numeral 36 and appropriately illustrates the outwardly-most extending ends as the ends of the bar that is farthest from the center of the hub. Accordingly, the court will adopt Plaintiff's proposed construction in its entirety.

C.

The clause of claim 1 set forth above also requires that each deposited sheet move in a "predetermined direction along a predetermined path." Weber patent, col. 9, ll. 34-35. Grapha asserts that this phrase means only that the sheets must travel on the drum axially from one end to the other along a "non-random" path, and that the plain meaning of this language does not require that the path be helical. A "non-random" path ensures that each sheet will be properly positioned with respect to subsequent sheet feeding units or other elements of the machine, and arrives at the proper time and in the proper alignment. Hence, the path may be, but is not required to be, helical.

Ferag reads this language in the Weber patent as requiring a helical path because the only path described in the Weber patent is a helical path, and in fact, no other path could be created because in the Weber machine, there is constant axial and rotational movement. Ferag points out that the patent specification states, "a sheet transporting device which serves to advance folded sheets in a predetermined direction (preferably along a helical path)" and further states, "moving the sheets on the carriers in parallelism with the axis so that the sheets advance along the aforementioned helical path." Weber patent, col. 3, ll. 11-14, 48-50.

Grapha responds that Ferag's reading violates the doctrine of claim differentiation, which requires that claims should be presumed to cover different inventions. Claim 20 of the Weber patent claims "the machine of claim 1, wherein said path is a helical path." Because Claim 20 claims a "helical path," the "predetermined path" in Claim 1 cannot mean "helical": "An interpretation of a claim should be avoided if it would make the claim read like another one." Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1538 (Fed. Cir. 1991).

The doctrine of claim differentiation is not a hard and fast rule, however; indeed, "if a claim will bear only one interpretation, similarity will have to be tolerated." Id. In the Weber patent, a "helical" path is the only interpretation the element "predetermined path" can bear. The Weber patent teaches against changing the direction of the sheets, and therefore, requires a continuous rotational and axial movement, which results in a helical path. Although the patent does state that a helical path is "preferable," there is no other path that could be created by application of the Weber patent.

As interpreted, this element does not read onto the IPEX machine either literally or under the doctrine of equivalents. Ferag's IPEX machine moves sheets in a stepwise fashion, not helical. The axial motion of the sheets is not continuous in the IPEX machine. Indeed, during 75% of a revolution, the sheets do not move axially, only circularly. Axial and circular motion occur together in less than 25% of a revolution, which creates only a small section of a helix. May 15, 1996 Trial Tr. at 48 (Felix direct). Therefore, there is no literal infringement.

Even under the doctrine of equivalents, there is no infringement because there are substantial differences between a stepwise path and a helical path. Principally, the stepwise path allows for the alignment of sheets because the absence of continuous axial movement permits the operator of the IPEX machine to monitor the quality of the gathered product. One of the major advantages of the IPEX machine is its ability to monitor product integrity throughout the binding process. See Pl.'s Ex. 395 (Field dep. at 20-21). Furthermore, the stepwise path avoids the problem of having axial movement on the bottom side of the drum, where the sheet would rub against the belts. Therefore, Grapha's helical path and Ferag's stepwise path are substantially different in manner and in result.

e. "Predetermined Distance"

The fifth term requiring construction in Claim 1 is "predetermined distance." Claim 1 recites a "yieldable means, including a plug, frictionally held, for positioning an element more proximate the distal end a predetermined distance from the distal end." ('760 Patent col. 5, ll. 46-48.) This phrase is also used in Claim 9, which refers to "a generally cylindrical end plug frictionally held in the distal end having a rearward end extending from the distal end a pre-determined distance." Id. at col.
The World Wide Plaintiffs maintain that an important feature of their invention is the consistent positioning of the first seed in the needle assembly, unlike prior art which was notoriously unreliable in this regard. Thus, for the positioning to be consistent, the measurement must be determined beforehand. AnazaoHealth argues that its construction is compelled by the description of the invention and its prosecution history, which repeatedly refer to predetermined distance as being an exact distance back from the extreme distal end of the needle tip. Id. at col. 3, ll. 61-64. The Terwilliger Plaintiffs, in their response to this argument in Claim 9, assert that AnazaoHealth's definition improperly imports an exactness requirement, despite the fact that all manufacturing processes have some degree of reasonable and necessary tolerance. Additionally, they argue that the "predetermined distance" is not necessarily limited to the extreme end of the distal tip.

The specification describes the invention as "exactly locat[ing] the first seed a repeatable and known distance from the distal end of the cannula," id. at col. 2, ll. 27-29, the clear implication being that the distance was known beforehand. One of the claimed advantages of the invention is that the needles can be preloaded, which would require knowing the spacing of the seeds beforehand.

The normal definition of "predetermine" is "to determine beforehand." Webster's at 1786. Nothing in the specification defines "predetermined" in a non-standard way. The Court agrees with the World Wide Plaintiffs that the ordinary and customary meaning of "predetermined" to one skilled in the art would be something that is specified or determined beforehand. See Crystal Semiconductor Corp. v. TriTech Microelectronics Inl'l, Inc., 246 F.3d 1336, 1350 (Fed. Cir. 2001) (holding that "predetermined distance" meant "a distance that is determined before the fourth conductive layer is disposed on the substrate and is sufficiently close to the second shielded conductive layer to provide acceptable shielding"); Koito Mfg. Co. v. Turn-Key-Tech, LLC, 381 F.3d 1142, 1150 (Fed. Cir. 2004) (construing the phrase "predetermined general direction" as requiring that the flow direction be chosen or known beforehand, or in other words, as requiring intent or foreknowledge in the fixing of the flow direction); Precor Inc. v. Fitness Quest, Inc., No. C05-0993L, 2006 U.S. Dist. LEXIS 63244, 2006 WL 2469123, at *5 (W.D. Wash. Aug. 23, 2006) (construing "predetermined distance" as "a distance determined beforehand"); Garmin Ltd. v. Tomtom, Inc., No. 06-C-0062-C, 2006 U.S. Dist. LEXIS 61187, 2006 WL 6005801, at *32 (W.D. Wis. Aug. 24, 2006) (defining predetermined as "specified").

The Court finds that it unnecessary to add to the construction "the distance from the distal and of the cannula," as urged by the Terwilliger Plaintiffs, or "back from the extreme distal end of the needle tip," as suggested by AnazaoHealth. Both Claims 1 and 9 reference a "predetermined distance" from the distal end. Therefore, to add this language referring to the distance from the distal tip would be redundant.

The more difficult issue is whether the construction of "predetermined distance" should include the concept of exactness as urged by AnazaoHealth and whether including this term would inject an ambiguous term. The World Wide Plaintiffs maintain that it is not the "exact" distance that the first seed is located from the distal end of the cannula that must be determined beforehand; rather, the positioning of the first seed only needs to be precise and repeatable from assembly to assembly during the same procedure. The Terwilliger Plaintiffs raise concerns that AnazaoHealth's requirement of exactness would not permit any tolerance in the measurement of the predetermined distance, including any manufacturing tolerances.

AnazaoHealth's position finds considerable support in the specification, which repeatedly uses the words "exact," "exactly," or "precise" to describe the positioning of the plug and the first seed.

The needle assembly of the invention exactly locates the first seed repeatable and know distance from the distal end of the cannula in each needle . . . ("760 Patent col 2, ll. 26-30.)

The end plug . . . is positioned at an exact length back from the extreme distal end of the tip . . . This distance is critical and does not vary from assembly-to-assembly. Id. at col. 3, ll. 61-65.

It will be understood that the exact positioning of the rear end surface 32a at the pre-established distance back from the tip . . . The arrangement of the present disclosure enables the operator to be assured of the precise positioning of the front end of the first seed . . . Id. at col. 4, ll. 33-41.
Thus, in the 6a, 6b, and 6c embodiment, the first seed 28 is positioned precisely. . . . Id. at col. 5, ll., 12-13.

Here again, the rearward surface 332a is the means for precise positioning of the forward end of the first seed. Id. at col. 5, ll. 26-28.

The difficulty the Court has with AnazaoHealth's proposed construction that includes the term "exact" is that "exact" is a relative term. Including it in the construction of "predetermined distance" only serves to interject ambiguity into the claim. 20 The Court has reviewed countless number of patent cases involving the phrase "predetermined distance," and in the vast majority of cases, no construction of this phrase was even required. See, e.g., Gemtron Corp. v. Saint-Gobain Corp., 572 F.3d 1371, 1375 (Fed. Cir. 2009); Helena Labs. Corp. v. Alpha Scientific Corp., 274 Fed. Appx. 900, 903 (Fed. Cir. 2008); Intamin Ltd. v. Magnetar Technologies, Corp., 483 F.3d 1328, 1332 (Fed. Cir. 2007). The Terwilliger Plaintiffs argue that including the word "exact" eliminates all manufacturing tolerances. The Federal Circuit, however, has held that manufacturing tolerances are "immaterial to claim construction." Senmed, Inc. v. Richard-Allan Medical Indus., Inc., 888 F.2d 815, 820 (Fed. Cir. 1989)(internal citation omitted), disapproved of on other grounds by Cardinal Chem., Co. v. Morton Intl, Inc., 508 U.S. 83, 113 S. Ct. 1967, 124 L. Ed. 2d 1 (1993). The Court finds that one of ordinary skill in the art would construe "predetermined distance" as "a measurement that is specified or determined beforehand," and that no further "exactness" standard needs to be read into this claim term.

20 What is an "exact predetermined distance" as opposed to a "predetermined distance"? If the distance is specified beforehand, does that not define what is the "exact" distance? For example, if the physician specifies beforehand that the first seed is to placed 5 mm. from the distal end of the cannula, or 5.2 mm., or 5.225 mm., or whatever distance, does that not determine how exact the measurement must be?

3055

D. Predetermined General Direction

The parties dispute the meaning of "predetermined general direction," which appears in steps (a), (d), and (g) of claims 1 and 21. Step (a) recites "injecting a quantity of first plastic into the first mold cavity so that the first plastic flows in the first-layer-defining-mold-cavity-section in a first predetermined general direction." '268 Patent, col. 8, lines 19-22 (claim 1); col. 10, lines 61-64 (claim 21) (emphasis added). Step (d) recites "injecting a quantity of second plastic into the second mold cavity so that the second plastic flows in a second predetermined general direction . . . " Id. col. 8, lines 30-36 (claim 1); col. 11, lines 4-10 (claim 21) (emphasis added). Step (g) of claim 1 recites "directing the first plastic into the first-layer-defining-mold-cavity-section via the first-cavity-flow-channel, so that the first plastic flows in the first-cavity-flow-channel in a direction which is positively different from said first predetermined general direction." Id. col. 8, lines 56-61 (emphasis added). Similarly, step (g) of claim 21 recites "directing second plastic [sic] in the second-layer-defining-mold-cavity-section via the second-cavity-flow-channel, so that the second plastic flows in the second-cavity-flow-channel in a direction which is positively different from said second predetermined general direction." Id. col. 11, lines 30-55 (emphasis added).

The parties agree that "predetermined general direction" is not a term of art in injection molding, and therefore the ordinary meaning of the claim term controls, absent some indication that the patentee used this term in a fashion inconsistent with its customary meaning. The patent does not specifically define this term in either the written description or the claims themselves, and the parties have not presented the court with any evidence that the patentee limited this term during prosecution. Thus, the court will look to a standard English dictionary to help provide the customary meaning of this claim term.

The dictionary defines "predetermined" as "determined beforehand," Oxford English Dictionary (2d Edition 1989), and "general" as "applicable to or characteristic of the majority of individuals involved: prevalent," Webster's Ninth New Collegiate Dictionary 510 (1986). Therefore, the ordinary meaning of "predetermined general direction" is the prevalent
direction of plastic flow, and the ordinary understanding of the term further requires that the prevalent direction be determined before injection of the liquid plastic into the mold cavity. While it does not provide an explicit definition of the term, the written description is consistent with the ordinary meaning of predetermined general direction. The patent teaches that the direction of flow out of the flow channel and into the layer-defining-mold-cavity-section is largely a function of the relative cavity thicknesses in the first mold cavity. E.g. '268 Patent, col. 4, lines 38-40. Thus, according to the teachings of the patent the mold cavity design, together with the injection parameters, can -- and in the claimed invention, must -- be arranged to result in a predetermined prevalent flow direction. The preferred embodiments provide further support for a construction of "predetermined" as "determined beforehand." As Koito notes, the preferred embodiments have first and second flow records in the cross-laminated section that are at right angles to each other. See id. at col. 4, lines 11-22. 4 While the invention is not limited to the ninety degree angles of the preferred embodiments, the specificity of the angles called for in the preferred embodiments nevertheless demonstrates that the invention involves distinct flow directions determined in advance.

4 As discussed in the court's construction of "flow record," below, the first and second predetermined general directions of flow are preserved in the first and second flow records.

Turn-Key objects that this definition of "predetermined" improperly injects an intent element into the infringement inquiry by requiring proof of the mental state of the mold designer. Turn-Key's objection is without merit. It is true, of course, that "there is no intent element to direct infringement" of a patent. Intel Corp. v. United States Int'l Trade Comm'n, 946 F.2d 821, 832 (Fed. Cir. 1991). This simply means that a patent may be infringed regardless of whether the accused infringer intended to copy the patented design--or even knew of the patent at all. The issue of intent to infringe, and the cases cited by Turn-Key on this point, are simply irrelevant to the problem facing the court today, which involves interpretation of a claim limitation that expressly requires a particular direction to be "predetermined." The patentee chose this wording during prosecution, and there is no indication that he used the word inconsistently with the ordinary meaning discussed above. That meaning requires that the flow direction be determined prior to injection of the plastic into the mold.

For the reasons discussed above, the court construes "predetermined general direction" as the prevalent direction of flow determined before injection of the liquid plastic into the mold.
prosecuted based upon an understanding that incubation period meant time.

* Alternatively, Lifespan argues, based on the specification, that even if the patent is construed to refer to a time period, the length of the predetermined time period may depend on the glucose concentration that it encountered during the test (20 seconds for one concentration and 30 seconds for another), and that "predetermined incubation period" should be construed to include a choice of a time period that is affected by the results of the test while it is being conducted. Whether or not that is so, there is no contention here that the allegedly infringing product requires a choice to be made among predetermined time periods known in advance. Rather, the time period for the test in the allegedly infringing method is constantly variable, depending on the conditions encountered during the test.

5. Predetermined Minimum Safety Distance

The fifth disputed claim term "predetermined minimum safety distance" is found in Claims 1 and 35 as set forth above.

Erbe's Proposed Definition: The minimum distance between the electrode and the tissue to be coagulated that allows the electrode to operate in a safe manner.

Canady's Proposed Definition: A sufficient distance to prevent an electrode from coming into contact with the tissue under any circumstances; the distance being greater than 2 mm.

(Docket No. 42, p. 5). From the claim language itself, it is evident that the electrode cannot come in contact with the tissue. See, (Docket No. 42, Ex. 11, col. 1, II. 35-37 and col. 15, II. 44-46). As a result, I agree with Canady to the extent that the term is construed to mean the minimum distance to prevent an electrode from coming into contact with the tissue.

I do not agree with Canady, however, that the term should be construed with the further limitation of "the distance being greater than 2 mm." Canady's looks to the prosecution history to support this limiting definition. (Docket No. 66, pp. 25-26). After a review of the cited documents (Docket No. 63, Exs. 16 and 17), I am not persuaded that Erbe characterized the predetermined minimum safety distance as being greater than 2 mm. Consequently, I construe the claim term "predetermined minimum safety distance" to mean the minimum distance to prevent an electrode from coming into contact with the tissue.

3059

i. "Predetermined Number of Cardiac Cycles"

The crux of the Parties' dispute regarding this element is the meaning of the term "predetermined number of cardiac cycles." Specifically, Medtronic argues that the ordinary meaning of the word "cycles" and the specification support an interpretation requiring more than one cardiac cycle. Guidant, on the other hand, proffers a definition in which "cardiac cycles" encompasses both the singular and the plural of the word "cycle." Guidant argues that under the rules of grammar, a plural noun may refer to a set that includes only one item. For support, Guidant relies on Astra Aktiebolag v. Andrx Pharms., Inc., 222 F. Supp. 2d 423, 469 (S.D.N.Y. 2002).

The plural form of a word "pertain[s] to more than one." The Random House College Dictionary 1022 (rev. ed. 1982). Thus, the ordinary meaning of the word "cycles" means more than one cycle. At the Markman hearing, Guidant argued: "Just as it is appropriate to say 'one or more apples' and grammatically incorrect to say 'one or more apple,' it would have been incorrect for the claim to recite 'a predetermined number of cardiac cycle.'" Guidant Exh. 67 at GR08.14. Guidant's
argument is misplaced. The claim does not state "one or more cardiac cycles." Had the claim included that language, there
would be no question that the claim was intended to include the singular.

The Court finds that the instant patent can be distinguished from the patents at issue in Astra, the case relied upon by
Guidant, because the Astra patents stated that the inventions required "one or more layers of materials," and "one or more
layers comprising materials." Astra, 222 F. Supp. 2d at 469. The Astra court found that even though the term "materials"
was used, the patents were clearly intended to include the singular, and that the plural form was merely used to "comply
with grammatical correctness." Id. This is not the case with the '836 Patent: the patentee did not state "one or more cardiac
cycles." Therefore, unless the specification clearly indicates that "cardiac cycles" was intended to include the singular, the
ordinary meaning will control.

As discussed above, the specification includes three different preferred embodiments. All the embodiments state that pacing
is conducted for "consecutive" cardiac cycles. See '836 Patent, 8:35-36; 9:5-6, 29. The term "consecutive" implies that
pacing for more than one cardiac cycle is required for stabilizing the cardiac rate of the heart before shock. The Court is
aware that it may not limit the claim language by importing limitations from the specification. See Tex. Digital Sys., Inc. v.
Telegenix, Inc., 308 F.3d 1193, 1204 (Fed. Cir. 2002). The Court merely cites this specification language to demonstrate that
in the context of the patent, the ordinary meaning of the word "cycles" makes sense. See Renishaw PLC v. Marposs Societa'
per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998).

Guidant also argues that the use of the open variable "N" in figures two through four of the patent indicates that any number
of cardiac cycles may be chosen, including one. The Court agrees with Guidant that "N" is an open ended variable, and that
"N" does not necessarily imply that any certain number of cardiac cycles must be employed. However, the Court does not
agree that in the context of this patent, "N" can represent only one. The ordinary meaning of the "cycles" precludes that
interpretation, and the intrinsic evidence supports this ordinary meaning.

The parties disagree about the meaning of "predetermined" and "expected." Curiously, Innovatron urges a narrow reading
under which, "predetermined operations' and 'predetermined expected response' are technical terms and mean operations
and responses, respectively, that are established at the time of design and do not change over time." Innovatron's Prop. Or.

Thomson, on the other hand, argues that:

'Predetermined' means 'determined beforehand.' 'Expected' means 'predicted' or 'to look forward to the probable
occurrence or appearance of.' Neither word requires a determination at the time of the design of the electric device which
cannot change over time.

Thomson's Prop. Or.

The ALJ adopted Innovatron's narrow construction. The Commission disagreed. "We find nothing in the specification or the
claim that indicates that predetermined operations must be established at the time of design." ITC at 8. "We believe
'predetermined' should be construed to have its ordinary dictionary definition." "Accordingly, we construe 'predetermined' to
mean determined or decided in advance." ITC at 9. "We also disagree with the ALJ's construction that 'expected' means 'not
changing over time.' We find no indication in the patent that expected should be construed other than in accordance with its
ordinary dictionary meaning." "Taking these definitions together, we construe 'expected' in the phrase 'a predetermined
expected response' to mean a response that is predicted to occur." ITC at 9.

The burden is on Innovatron to show that "predetermined operations" and "predetermined expected response" are technical
terms narrower in scope than when used ordinarily. Innovatron argues that these "are not terms that one normally confronts
in everyday conversation." Innovatron's Post-Hrg. Reply at 22. Innovatron argues that this observation justifies reliance on
extrinsic evidence. Innovatron then relies on Dr. Kuc's testimony to support its argument.
The Court will not go down that path. Innovatron cites no authority for the proposition that a term not frequently used in conversation must be a term of art. On the contrary, "absent a special and particular definition created by the patent applicant, terms in a claim are to be given their ordinary and accustomed meaning." Renishaw, 158 F.3d at 1249. Nothing in the claim language, the specification, nor the prosecution history indicates that Moreno intended a "special and particular definition" to attach to these terms. Moreover, reading "predetermined" to mean "determined beforehand" and "expected" to mean "predicted" is entirely consistent with the purpose of the method and the specification. 7

7 Independently, the Court has considered and rejected two arguments that would support Innovatron's reading. First, it may have been that in 1978 "predetermined" meant at the time of design because the technology required that the system be hard wired. However, no persuasive evidence was introduced to compel that result. Second, the term "predetermined expected response" is potentially redundant when given its ordinary meaning. The term "expected" implies that a determination or prediction has been made prior to receipt of the response. That being so, "predetermined" only makes express a necessary implication of the term "expected." However, "predetermined" does not require "at the time of design," and the Court is persuaded that "predetermined" adds enough by requiring that the "expectation" arise from a conscious prediction to find that giving the terms their ordinary meaning does not produce a redundancy.

9. **Predetermined pattern of slits**

FieldTurf's Proposed Construction: "An arrangement of openings, cuts"

SCG's Proposed Construction: "An arrangement of longitudinal openings placed according to a plan established before the longitudinal openings are created"

SCG's Proposed Construction of "pattern of slits": "An arrangement of openings along a longitudinal axis before the arrangement is produced"

SCG's Proposed Construction of "predetermined": "According to a prior plan"

SCG's Proposed Construction of "slit": "Opening formed by slicing a frayed sheet along a longitudinal axis"

The Court's Claim Construction: "An arrangement of openings or cuts according to a prior plan"

The various SCG constructions of "predetermined pattern of slits," "pattern of slits," "slit" and "predetermined" all boil down to the overall concept of a predetermined pattern of slits as "an arrangement of longitudinal openings placed according to a plan established before the longitudinal openings are created." FieldTurf essentially omits the "predetermined" aspect of the claim in its definition, dismissing it with the general argument that "predetermined" improperly places a temporal aspect into the claim and that it is lacking support in the specification. However, the "predetermined" limitation is in the claims because FieldTurf put it there. It cannot now complain that predetermined requires the "pattern of slits" to be "predetermined." The Court also finds that SCG's proposed construction of predetermined as "according to a prior plan" is appropriate. The Court of Appeals for the Federal Circuit has given predetermined a similar meaning. Planet Bingo, LLC v. Gametech Int'l, 472 F.3d 1338, 1344 (Fed. Cir. 2006) (holding that a "predetermined winning combination" for a game requires a "winning combination before the game begins"); Pause Tech. LLC v. TiVo Inc., 419 F.3d 1326, 1335 (Fed. Cir. 2005) (holding that "the district court properly construed 'time interval of predetermined duration' to mean that the duration of the time interval for recording signals into the buffer memory must be fixed prior to operation"); Koito Mfg. Co. v. Turn-Key-Tech, LLC, 381 F.3d 1142, 1150 (Fed. Cir. 2004) (explaining that predetermined "connotes an element of forethought and planning"). However, the Court declines to adopt SCG's proposed definition for a "predetermined pattern of slits" because it includes unnecessary and redundant language such as longitudinal, which is set out earlier in the same claim phrase. Accordingly, the Court construes a "predetermined pattern of
slits as "an arrangement of openings or cuts according to a prior plan".

3062

As to the term "predetermined plunger performance," again the initial focus is on the word "predetermined." The ordinary meaning of "predetermine" is "to determine beforehand." Webster's, supra, at 1786. This is the meaning consistent with that found by Special Master Williams in construing the separate phrase "predetermined . . . time increment," Markman Report at 23, and we conclude that it is also the meaning that should apply to the phrase "predetermined plunger performance."

The written description is consistent with this construction, noting that an operator may set a window for operation beforehand. '991 patent, col. 10, ll. 2-6. We disagree with the district court's implicit conclusion that "predetermined plunger performance" necessarily has the same construction as "normal plunger performance." Predetermined in this context simply means determined beforehand, and may include performance that is normal or subject to correction. The coincidence of a particular predetermined window with a good window is irrelevant. There is no requirement, either in the claim itself or in the written description, that the values selected beforehand in the limitation "predetermined plunger performance" must represent the good window, as with "normal plunger performance." There is also nothing in the claim language, written description, or prosecution history to require that the upper and lower values that define the window of "predetermined plunger performance" be set independently of each other. The values must just be determined beforehand.

3063

(a) '575 Patent, Claim 21

A proportional positive airway pressure apparatus for delivering pressurized breathing gas to an airway of a patient, said apparatus comprising:

- a gas flow generator;

- a patient interface adapted to couple said gas flow generator to an airway of a patient;

- a sensor adapted to detect at least one physiological condition of such a patient, wherein said physiological condition is suitable for use to differentiate between an expiratory phase and an inspiratory phase of a breathing cycle of such a patient and to output a signal indicative thereof;

- a pressure controller associated with at least one of said gas flow generator and said patient interface to control a pressure of said breathing gas provided by said gas flow generator;

control means for controlling said pressure controller so as to cause said breathing gas to be delivered to such a patient at a first pressure level during at least a portion of said inspiratory phase of said breathing cycle and in accordance with a predetermined pressure profile during said expiratory phase of said breathing cycle, wherein a shape of said predetermined pressure profile is set independent of any monitored respiratory characteristics of such a patient.

* * *

2. Predetermined Pressure Profile

This phrase is found in Claims 21 and 43 of the '575 Patent.

Phrase: Predetermined Pressure Profile

Construction: This phrase is not part of the means plus function language.
Reasoning: The dispute between the parties regarding construction of this phrase is the extent to which section 112, P 6 applies. Defendant contends that no structure in the specification is linked to the "Predetermined Pressure Profile", making the claim fatally flawed. Plaintiff claims that "Predetermined Pressure Profile" is not part of the means plus function language, and is to be construed in accordance with standard claim construction standards.

Limitations contemplated by section 112, P 6, often referred to as means-plus-function or step-plus-function limitations, recite a specified function to be performed rather than the structure, material, or acts for performing that function. Such limitations are "construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof." 35 U.S.C. § 112, P 6 (1994); IMS Technology, Inc. v. Haas Automation, Inc., 206 F.3d 1422, 1429-30 (Fed. Cir. 2000). In claim 21, the recited function consists of controlling said pressure controller. The claim recites no structure supporting the means for performing that function. Therefore, in accordance with § 112, P 6, the means is construed to cover the disclosed structure, PPAP circuitry, and its equivalents. We reject defendant's argument that the "Predetermined Pressure Profile" is part of the means plus function language. Rather, we find that it is not part of the steps that perform the recited function of controlling, and is therefore not subject to construction under section 112, P 6.

5. "Predetermined Rate"

Claim 59 recites, in part, "engaging said clutch at a predetermined rate to transfer torque from said primary drive line to said secondary drive line" and "disengaging said clutch at a predetermined rate to substantially inhibit torque transfer from said primary driveline to said secondary driveline." The dispute regarding this claim is over the meaning of the term "rate."

BorgWarner:

A "predetermined rate" is a preset time for each step of the clutch engagement and disengagement. (Plaintiff's Markman Brief, at 27).

NVG:

A pre-set change in the clutch engagement or disengagement per pre-set time interval. (Markman Brief of NVG, at 27).

Here, the parties claim to agree that a rate is defined as a relationship between two variables, but apparently disagree as to what those two variables are. BorgWarner contends that they are the number of times the clutch engagement is changed -- a potential number of steps -- and a period of time. NVG, on the other hand, argues that the rate must involve the force or pressure of clutch engagement and a period of time.

BorgWarner defines "predetermined rate" as a pre-set number of steps that can occur per a unit of time. In the specification, it is explained each step lasts 30 milliseconds before the engagement level can be changed. As a result, in BorgWarner's interpretation, the clutch engagement may be changed at a rate of 200 times per minute. NVG adds to this ratio the "amount of clutch engagement," interpreting the rate to involve the act of engagement, the pressure or force of the engagement, and the time period. At the same time, NVG allows that the term "rate" refers to a relationship between only two variables. (Post Markman Hearing Brief of NVG, at 12). This would allow for BorgWarner's interpretation: the variables would be the number of engagement steps and the period of time. Clutch force or pressure would be a third variable. Accordingly, we construe this claim as the number of engagement steps that can occur per a unit of time.

A. Construction of the "Predetermined Sequence" Limitation As Originally Recited

As explained more fully below, after examining the claims of the '444 Patent as recited in the original issue, the specification, and the prosecution history that led to the '444 patent, the Court concludes that the "predetermined sequence"
limitation as originally recited in independent claims 1, 14 and 25 means:

the order in which eggs are released from the egg-carrying conveyor so that each released egg drops into the receiving station for the egg's particular grade, the order being defined before the eggs arrive at the locations from which they are released.

Additionally, the Court interprets the "predetermined sequence" limitation in dependent claim 30 to mean an order that causes eggs to drop into particular receiving stations and that also effects an equal distribution of released eggs across the width of the receiving station.

1. Examination of the Claim Language

The '444 Patent as originally issued contains four independent claims. 4 Three of those claims -- apparatus claim 1, apparatus claim 14, and method claim 25 -- contain similar language: in the preamble, the three claims recite that eggs are conveyed "to a receiving station . . . at which the eggs are packaged according to their . . . physical characteristics"; in the body, they recite that eggs having the same physical characteristics are released "in a predetermined sequence" at that receiving station. 5

4 "Claims can either be independent or dependent. An independent claim does not refer to any other claim of the patent and is read separately to determine the scope of the patent." Baracuda Int'l Corp. v. Hoffinger Indus., Inc., 4 F. Supp. 2d 1188, 1193 (N.D. Ga. 1998); Pave Tech., Inc. v. Snap Edge Corp., 952 F. Supp. 1284, 1295 (N.D. Ill. 1997).

5 Independent apparatus claim 14 recites in relevant part:

An apparatus for delivering eggs to a receiving station of an egg grading apparatus at which the eggs are packaged according to their individual physical characteristics, comprising:

. . .

means, disposed on said frame means, for actuating said releasable egg-engaging means when said egg-engaging means are conveyed to said receiving station so as to release eggs having the same physical characteristics from said egg-engaging means in a predetermined sequence at said receiving station,

. . .

'444 Pat., col. 15, ln. 16-19, 26-31.

The fourth independent claim, method claim 29, recites, in the preamble, steps for transferring eggs from a variable speed conveying means to a receiving station, and also recites, in the body, steps for "providing a plurality of egg receiving means at the receiving station" and "releasing the eggs at a point prior to the egg receiving means." Dependent method claim 30, which refers to claim 29 and thus incorporates all of the limitations or words of claim 29, 6 includes a "predetermined sequence" limitation. 7

6 "[A] dependent claim refers to at least one other claim in the patent and thus incorporates all of the limitations or words of that other claim to which the dependent claim refers. Accordingly, to determine what a dependent claim covers, both the dependent claim and the claim or claims to which it refers must be read." Johns Hopkins Univ. v. CellPro, 894 F. Supp. 819 (D. Del. 1995).

7 Dependent method claim 30 recites:
The method of claim 29, wherein the step of releasing the eggs comprises releasing the eggs successively from the conveyor means at the receiving station in accordance with a predetermined sequence in order to effect an equal distribution of the released eggs across the width of the receiving station.

'444 Pat., col. 118, ln. 5-10.

Giving the language used in independent claims 1, 14, and 25 its ordinary meaning, see Desper Products, Inc. v. QSound Labs, Inc., 157 F.3d 1325, 1336, 48 U.S.P.Q.2D (BNA) 1088 (Fed. Cir. 1998), the Court preliminarily construes the term "sequence" as used in the phrase "predetermined sequence" to mean "the order in which the eggs are released from the egg-carrying conveyor so that each released egg drops into the receiving station for the egg's particular grade," and the term "predetermined" to mean that the sequence is determined "before the eggs arrive at the locations from which they are released."

The "predetermined sequence" limitation in dependent method claim 30 further recites steps for achieving "equal distribution" of eggs across the width of a receiving station. Giving the language in dependent claim 30 its ordinary meaning, therefore, the Court preliminarily interprets the term "sequence" in that claim to mean "the order in which the eggs are released from the egg-carrying conveyor so that each released egg drops into the receiving station for the egg's particular grade and so that released eggs are evenly distributed across the width of a receiving station." The term "predetermined" has the same meaning in dependent claim 30 as it does in independent claims 1, 14, and 25.

2. Review of the Specification and Prosecution History

"Although words in a claim are generally given their ordinary and customary meaning, a patentee may . . . use terms in a manner other than their ordinary meaning, as long as the special definition of the term is clearly stated in the patent specification or file history." Vitronics, 90 F.3d at 1582, 39 U.S.P.Q.2D (BNA) at 1577. The Court therefore reviews the specification and the prosecution history to determine whether a special definition of the phrase "predetermined sequence" is clearly stated. See id.

A review of the specification and prosecution history reveals that the patentee did not use the phrase "predetermined sequence" in an uncommon way, and, consequently, the Court finds that the inventor intended to give the phrase its ordinary meaning. Plaintiffs, however, argue that the only embodiments described in the specification disclose "receiving means" that are divided into channels, and that the specification therefore must be read to limit the phrase "predetermined sequence" to mean the sequence in which eggs are released into particular channels of a particular receiving station. 8 (Pls.' Br., Doc. # 113 at 10-12.)

Plaintiffs' argument misapprehends the principle that claims are interpreted in light of the specification. "Although the specification may aid the court in interpreting the meaning of disputed claim language, particular embodiments and examples appearing in the specification will not generally be read into the claims." Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186, 48 U.S.P.Q.2D (BNA) 1001, 1005 (Fed. Cir. 1998) (quoting Constant v. Advanced Micro-Devices, Inc., 848 F.2d 1560, 1571, 7 U.S.P.Q.2D (BNA) 1057, 1064 (Fed. Cir. 1988)). Moreover, the specification expressly states:

the invention has been described with reference to specific exemplary embodiments thereof. It will, however, be evident that various modifications and changes may be made thereunto without departing from the broader spirit and scope of the invention as set forth in the appended claims. The specification and drawings are, accordingly, to be regarded in an
illustrative rather than in a restrictive sense.

'444 Pat., col. 13, ln. 44-52. Accordingly, the Court declines Plaintiffs invitation to limit the phrase "predetermined sequence" to the embodiments set forth in the specification.

In sum, because neither the patent specification nor prosecution history set forth a special definition of the phrase "predetermined sequence," the Court gives the phrase its ordinary meaning as stated above.

B. Construction of the "Predetermined Sequence" Limitation After Reexamination

The '444 Patent was reexamined twice. As explained more fully below, the Court construes the "predetermined sequence" limitation after reexamination to mean the following: In claims 14-16, 19-22, 33-35, 38, 41-43, 67-69, 72, 74 and 76, the phrase "predetermined sequence" means:

the order in which eggs are released from the egg-carrying conveyor so that each released egg drops into the receiving station for the egg's particular grade, the order being based on the stored physical characteristics of the eggs and defined before the eggs arrive at the locations from which they are released.

Additionally, the Court concludes that for claims 25-28, and 56 the "predetermined sequence" limitation means an order that determines into which receiving station each egg drops and also "effects an equal distribution of released eggs across the width of the receiving station." In claim 44, 45 and 48-51, the phrase "predetermined sequence" means:

the order in which eggs are released from the egg-carrying conveyor so that each released egg not only drops into the receiving station for the egg's particular grade but also drops into a different channel than an adjacently conveyed egg is dropped when adjacent conveyed eggs have substantially the same physical characteristics, the order being based on the stored physical characteristics of the eggs and defined before the eggs arrive at the locations from which they are released.

In claims 54 and 55, the phrase "predetermined sequence" means:

the order in which eggs are released from the egg-carrying conveyor so that each released egg drops into the receiving station for the egg's particular grade, the order being defined before the eggs arrive at the locations from which they are released.

1. Examination of the Reexamined Claim Language

During the first reexamination (the "B1 Reexamination"), Defendant amended claims 14 and 25 and added several new claims. 9 All the amended and new claims include a limitation that eggs are released in a "predetermined sequence." The new and amended claims use the limitation in the same manner in which the original patent claims used the limitation, and the Court therefore interprets the phrase "predetermined sequence" in the new and amended claims in accordance with its ordinary meaning, as set forth above.

9 The new independent claims are apparatus claims 33 and 44 and method claims 54 and 56.

After the B1 Reexamination, two more reexamination requests were filed. The Patent and Trademark Office merged the requests into a single reexamination (the "B2 Reexamination"). See 37 C.F.R. § 1.565(c). Defendant again amended the '444 Patent during the B2 Reexamination, and added to some of the claims a limitation that the order in which the eggs are released is based upon their stored physical characteristics. 10 The meaning of the phrase "predetermined sequence," however, remained unchanged.
10 First, Defendant amended claims 1, 14, 25, 33, 44 and 56 to recite a new limitation regarding storage of the measured physical characteristics of the eggs and release of the eggs "in a predetermined sequence" based on the stored characteristics.

Second, Defendant amended claims 25 and 56 to recite a new limitation that the eggs are released in a "predetermined sequence" in order "to effect equal distribution" across the width of the receiving station.

Finally, Defendant amended claim 44 to add a limitation that the receiving station has a plurality of adjacent channels so that adjacently conveyed eggs having substantially similar physical characteristics are released and drop into different channels at the receiving station.

In addition to amending the existing claims, Defendant added new claims 67 and 76, which include a limitation regarding storage of the physical characteristics, and release of eggs "in a predetermined sequence" based on the stored characteristics. See B2 Certificate, col. 1, ln. 30 - col. 12, ln. 46.

2. Review of the Specification and Reexamination History

Defendant did not amend the specification during any of the reexaminations, and nothing in the history of the B1 Reexamination indicates that Defendant intended the phrase "predetermined sequence" to have a special or unusual meaning. The B2 Reexamination history likewise does not provide cause to depart from an ordinary construction of the "predetermined sequence" limitation.

As noted above, reexaminations occur when "a substantial new question of patentability affecting any claim of a patent is raised" by new information about prior art. 35 U.S.C. § 304. The B2 Reexamination followed a request for reexamination based on new information about prior art of U.S. Patent No. 3,224,579 issued to Alvoid V. Scollard, et al. ("Scollard '579") and published Netherlands Patent Application 67,06017 ("Netherlands '017").

During the B2 Reexamination, the patent examiner initially rejected claims 1, 14, 25, 33, 44, and 56 on the ground that they were unpatentable over the prior art of Scollard '579 and Netherlands '017, and advised Defendant to amend existing claims and to add new claims to distinguish its invention. In response to this advice from the patent examiner, Defendant amended several claims "to specify more clearly that the eggs are released in a predetermined sequence based on a prior determination and storage of the physical characteristics of the eggs." Reexam. Cont. No. 90/0011573, Patent Owner's Amendment, June 15, 1989 at 27-28.
Amendment, June 15, 1989 at 26. 13

The central issue addressed by the B2 Reexamination is the patentability of the combination of the following features:

1. A means or method for determining a physical characteristic of each of the eggs and storing the measured characteristics;
2. A means or method for controlling the discharge of the eggs by the stored physical characteristics; and
3. A means or method for controlling the position of the release point to accommodate changing operating conditions.

The examiner advised Defendant to "amend claims to define the measurement & storage of the measured characteristics to distinguish over the balance beam weighing arrangement of Scollard et al. [and to] amend claims to define the equal distribution feature." Reexam. Cont. No. 90/001573, Examiner Interview Summary Record, Paper No. 14, June 8, 1989.

In light of those amendments, the patent examiner withdrew the rejection of the claims, agreeing with Defendant's position that the amended claims were distinguishable from the prior art, in part because the prior art did not contain any "teaching or suggestion of determining and storing the physical characteristics of the eggs, and then, based on the stored characteristics, selectively releasing the eggs in a predetermined sequence with compensation for trajectory dependent upon conveyor speed." Id. at 27.

The "predetermined sequence" limitation thus played a central role in the B2 Reexamination. The prosecution history does not, however, use or imply a special definition of the phrase "predetermined sequence." In sum, because the specification was not amended during reexamination, and because the reexamination history does not set forth a special definition of the disputed phrase, the Court construes the "predetermined sequence" limitation in the amended and new claims in accordance with its ordinary meaning, as stated above.

C. Comparison of the Original and Reexamined Claims

A comparison of the original claims of the '444 Patent with the amended claims of the '444 Patent shows that Defendant did not delete the "predetermined sequence" limitation from the original patent, but, in several instances, narrowed its scope. Specifically, Defendant amended claims 1, 14, 25, 33, 44, and 56 to recite a new limitation regarding storage of the measured physical characteristics of the eggs and release of the eggs "in a predetermined sequence" based on the stored characteristics. Defendant also added claims 67 and 76, each of which recites this new limitation.

IV. CONCLUSION

Because the amended and new claims did not violate 35 U.S.C. § 305, it is ORDERED that Plaintiffs' Motion for Partial Summary Judgment is DENIED.

3066

"Predetermined spacing"

Cytyc's proposed construction: (no construction required)
Xoft's proposed construction: (indefinite)

"A predetermined spacing is provided between said inner spatial volume and the expandable surface element" / "A predetermined spacing between said inner spatial volume and the expandable surface element"
Xoft's contention that these phrases are indefinite is based on its argument that "expandable surface element" means "deflated balloon or cage," and Xoft has again presented no evidence to back up arguments that the phrases are indefinite. No construction of "predetermined spacing" is necessary. The court will adopt Cytyc's proposals and define both of the long phrases ("a predetermined spacing is provided between said inner spatial volume and the expandable surface element" and "a predetermined spacing between said inner spatial volume and the expandable surface element") as "the distance between the inner spatial volume and the expandable surface element is determined in advance."

B. The '133 Patent - Claim 10

Claim 10 patent provides:

The apparatus of claim 1 where said distal tip is detached from said wire by applying a positive direct current to said distal tip for a predetermined time period.

The parties dispute the meaning of only one phrase of Claim 10: "applying a positive direct current to said distal tip for a predetermined time period."

The written description discusses the phrase "predetermined time period" in connection with an embodiment of the invention:

As will be described below in greater detail in connection with the third embodiment of FIG. 3, after placement of secondary coil 28 within the interior of the aneurysm, a direct current is applied to wire 10 from a voltage source exterior to the body. The positive charge on secondary coil 28 within the cavity of the aneurysm causes a thrombus to form within the aneurysm by electrothrombosis. Detachment of the tip occurs either: (1) by continued application of current for a predetermined time when the portion 18 is exposed to blood; or (2) by movement of the wire to expose portion 18 to blood followed by continued current application for a predetermined time. Ultimately, both threadlike portion and stainless steel coil 26 will be completely disintegrated at least at one point, thereby allowing wire 10 to be withdrawn from the vascular space while leaving secondary coil 28 embedded within the thrombus formed within the aneurysm.

('133 Patent, Col. 7:61 - 8:10.)

The written description discusses other embodiments in which detachment is achieved by conditions other than applying current for a predetermined time period:

Many alterations and modifications may be made by those having ordinary skill in the art without departing from the spirit and scope of the invention * * * Still further, the diameter of the wire, various of the wire described above and the stainless steel coil immediately proximal to the detachable tip may be provided with differing diameters or cross sections to vary the times and current magnitudes necessary in order to effectuate electrolytic detachment from the tip. Still further, the invention may include conventional electronics connected to the proximal end of the wire for determining the exact instant of detachment of the distal tip from the wire.

('133 Patent, Col. 12:17-35.)
The Court finds that one of ordinary skill in the art would understand the term "applying a positive direct current to said distal tip for a predetermined time period" to have its customary meaning, namely, applying current for a time period that is determined in advance.

The Court construes "predetermined time period," as it is used in the phrase, "applying a positive direct current to said distal tip for a predetermined time period" in Claim 1 of the '133 Patent to mean:

applying a positive direct current to the distal tip for a time period determined in advance of the initiation of the detachment process.

A. The Proper Construction Of The Term "Predetermined Weight."

Independent claims 1, 7, 11, and 20 all require a method that produces product portions that have "a predetermined weight." Specifically, Claim 1 provides in relevant part:

A method for forming, cooking and processing a meat or poultry containing food product . . . comprising the steps of . . . dividing said lengths of cooked product into a plurality of cooked product portions which have a hand-formed, randomly shaped irregular appearance and have a predetermined weight.

('094 patent, col. 9, lns. 4-7). Claim 7 provides:

A method for producing a plurality of pre-cooked meat product portions comprising the steps of . . . continuously cutting said elongated continuous lengths of cooked product on a second side of said extrusion plate thereby producing a plurality of randomly shaped, irregular cooked product portions which have a predetermined weight.

('094 patent, col. 9, lns. 44-48). Claim 11 provides:

A method for making a precooked meat or poultry product comprising the steps of . . . cutting said lengths of cooked emulsion during extrusion to form randomly shaped irregular pieces of finished product having a cross-section less than the cross-section of the formed emulsion and having a predetermined weight.

('094 patent, col. 10, lns. 7-11). Finally, claim 20 states:

A method for making a precooked sausage product suitable for use as a pizza topping comprising the steps of . . . simultaneously cutting said lengths of extruded precooked sausage product to form a plurality of randomly shaped irregular precooked sausage portions which have a predetermined weight.

('094 patent, cols. 10-11, lns 67-3).

Defendants contend that the term "predetermined weight," as used in the asserted claims, refers to a single weight that is selected prior to the beginning of the claimed process. Defendants further contend that each piece of the cooked product portions must have precisely the same pre-selected weight. Pointing out that the inventors did not provide any special definition for the above term, Defendants argue that the construction they advance is required by not only by the plain meaning of the term but also by the patent specification and prosecution history. We disagree.

In interpreting the asserted term, we begin with the words of the claims themselves. Vitronics, 90 F.3d at 1582. Defendants define the term "predetermined weight" by resort to the dictionary definition -- namely -- a weight determined beforehand and, from this definition, contend that the weight must be a single weight rather than a range of weights. The Defendants' method of defining the term does little, however, to clear up the confusion surrounding the term's proper definition because the problem is not in defining the two words "predetermined" and "weight." Rather, the dilemma lies in understanding how these two words relate to the claims as a whole in defining the claimed invention.
To resolve this problem, it is necessary to look at both the claims and the patent specification, in its entirety. Having done so, we conclude first that the term "predetermined weight" modifies or defines, in the words of claim 1, "a plurality of cooked product portions." Thus, it is not the individual pieces of each portion that must have a "predetermined weight." Rather, it is the portions as a whole (in this case, portions, e.g. per pizza, of Italian sausage pizza topping) which must have a predetermined weight. The question that then remains is whether the term "weight" refers to a single weight or a range of weights. We conclude that the term "weight" refers to a single weight. We reach this conclusion based on the language of the specification. Specifically, the specification uniformly refers to a predetermined weight rather than a predetermined range of weights. Nowhere in the specification is a range of weights ever referred to. This omission is especially noteworthy in light of the numerous other references to ranges contained in the specification. Thus, it is clear that the patentee included ranges where he intended them to apply.

2 For example, the specification provides ranges for the lengths and diameters of casing materials (col. 6, lns. 11-13); the temperature to which the food emulsion is to be heated (col. 6, lns. 13-16); the cooling temperature for the emulsion (col. 6, lns. 32-34); and the force to be applied to the cooked food product during the extrusion step (col. 6, lns. 46-48).

However, in concluding that the term "weight" refers to a single weight rather than a range, we do not imply that the weight must be exact. Rather, the use of a single weight implicitly acknowledges the existence of a weight tolerance. This finding is supported by both common sense and the patent specification itself. Specifically, the patent specification provides for a process which is capable of forming a "plurality of different shapes and sizes of food products with very close weight tolerances which have the appearance of being hand formed." (’094 patent, col. 1, lns. 61-63). Additionally, common sense establishes the practical impossibility of producing, by machine, multiple food product portions which have precisely the same weight.

Thus, after reviewing the claims and specifications, we construe the term "predetermined weight" to mean that each of the food product portions must have the same predetermined weight within a very close weight tolerance.

1. Preformed

Plaintiff Minuteman contends that the term "preformed", if determined to require further definition, should be construed to mean "formed before." Defendants contend that "preformed" should be construed to mean "a predetermined shape." The specification is useful in resolving the parties' dispute over the meaning of the word "preformed." The specification describes the shape and flexibility of the molded pocket (Def. Ex. A, Col. 2, lines 8-10). In describing the molded pocket's shape, the specification explains, "The molded pocket is made of a synthetic rubber and is of a thickness that is flexible yet will retain its original shape under its own weight." Webster's Third International Dictionary defines "preformed" as, "to form beforehand", "shape previously", "to fix or determine the form of beforehand", or "predetermine." Therefore, in light of the specification and the dictionary definitions of "perform", the construction most in line with the specification's guidelines is the Defendants' proposed definition. Therefore, the Court will construe "preformed" to mean "a predetermined shape."

3. Preformed endless loop

Wadsworth argues the phrase "preformed endless loop" in the '329 Patent is "literally inaccurate as the loop to which Callicrate refers has two ends that are joined together and therefore the loop involved with this structure is not literally 'endless.'" Wadsworth argues Callicrate's endless loop must be defined by the description set forth in the '329 Patent's
specification and is confined to a loop that is large enough to pass over the animal's scrotal pouch without stretching. Wadsworth distinguishes its own endless loop from Callicrate's, noting that it is truly endless and that it must be stretched before attaching it to the scrotal pouch.

Callicrate counters that Wadsworth is reading ambiguity into the phrase "preformed endless loop" so he can confine the phrase to the language set forth in the '329 Patent's specification. Callicrate further states that the '329 Patent's specification defines "preformed endless loop" as a loop "having either a unitary structure or a loop formed by joining two ends of a linear length of material." Callicrate also argues that Wadsworth's proposed size limitation is unsupportable because the argument is based on language in the specification rather than language in the claim itself.

Wadsworth does not offer any support for his argument. The language of the claims in the '329 Patent do not limit the size of the loop, nor do they state that the loop must be circular. Contrarily, the claims in the '329 Patent speak of the preformed endless loop having a "forward end and a rearward end." This language undermines Wadsworth's argument that the loop must be circular.

Wadsworth is attempting to limit the structure of the preformed endless loop to that disclosed in the preferred embodiment. However, Callicrate did not use the term "means" in relation to the preformed endless loop. Therefore, he is not presumed to have invoked the means-plus-function language of 35 U.S.C. § 112, Par. 6. The language of the Claims is clear and the Court cannot read in limitations from the specification. Therefore, Callicrate's interpretation is the most accurate.

4. Conclusion

According to the discussion above, the '329 Patent is interpreted as follows:

1. "preliminarily"

Initially, the parties dispute the meaning of the language in claims 1 and 91 of the '086 patent: "using preliminarily an unfilled tubular sock-like projectile body having a closed front end and a rear edge bounding a rear opening thereinto." '086 patent, 5:5-7. Plaintiff argues that this phrase describes the initial shape of the projectile body, "preliminarily" or "prior to" taking the first step in the patented preparation process. Under plaintiff's proposed construction, the "projectile body" may have multiple openings at earlier stages in the preparation sequence, as long as a closed front end is formed prior to 1 taking the first enumerated step in plaintiff's patented preparation method, which is filling the sock-like body with shot.

Defendants disagree. They argue that the inclusion of the word "preliminarily" requires "that the method of shaping a low lethality projectile starts with using an unfilled tubular sock-like shape, i.e., a tube shape hollow body having a single inner compartment formed by one closed end opposite one opening formed by a rear edge." Def. Br. at 6. 2 Defendants argue that the claim requires that the projectile body have only one opening at the very beginning of the preparation process, prior to the employment of any steps taken to shape the projectile body, not merely prior to the first enumerated step in plaintiff’s patented preparation method.

The plain meaning of "preliminarily" is "at first" or "prior to." In the patent claims, "preliminarily" is used as an adverb which modifies "using," meaning that the claimed preparation process begins by using "an unfilled tubular sock-like projectile body having a closed front end." Therefore, the claim covers all processes which use an "unfilled", "tubular", "sock-like" projectile body prior to taking the first enumerated step in the preparation process of filling the projectile body with shot.

Independent Claims 37, 56, and 75 are apparatus claims that include a limitation wherein the device scans "a preselected segment of a central portion of each bill." The Court in its Markman Order construed this phrase to mean "a central, approximately two-inch portion of a bill scanned across the central portion of the narrow dimension of the bill."

It is undisputed that S-Machines use four optical sensors to scan bills. Two of the sensors scan each bill from above, while two other sensors scan the underside of each bill, as the bills pass between the sensors. By using four sensors, two segments on each bill surface are simultaneously scanned. Each scanned segment is approximately 0.39 inches wide and extends across the bill's narrow dimension. The inner edge of the segment scanned by the first upper sensor is offset 1.30 inches from the center of the bill. The second sensor scans a segment that is 0.2 inches away from the first segment. Thus, the first segment is offset 1.30 to 1.69 inches from the center of the bill, and the second segment is offset 1.89 to 2.28 inches from the bill's center.

U.S. currency measure approximately 6 inches in its long dimension, or about 3 inches on each side of center. Thus, the S-Machines scan segments that are on the outer third of each bill -- 40% to 70% removed from the center of the bill.

Defendants assert that there must be central segments within the central portion as construed by this Court. The Court agrees. There are central segments. However, for infringement, these central segments must be within the approximately two-inch portion of a bill scanned across the central portion of the narrow dimension of the bill.

Further, many of Cummins' assertions for finding infringement are nothing more than its Markman positions re-cast in different clothing. Cummins' positions regarding central portion were rejected during claim construction and the Court continues to reject them now.

The S-Machines do not scan the two-inch central portion of the bill. Rather, the S-Machines scan segments that are on the outer third of the bill -- 40% to 70% removed from the center of the bill. Accordingly, the S-Machines do not infringe independent claims 37, 56, and 75. Summary judgment of non-infringement is therefore proper as to Claims 37-40, 42, 44-47, 55-59, 61, 63-66, 74-75. 3

Footnotes

3 Infringement under DOE is equally inappropriate because such a result would ignore the express claim limitation of central portion. See K-2 Corp., supra.
Claim 30 also contains the limitation "to preserve structural integrity." Beginning with the claim language itself, this phrase is commonly understood to mean to "keep safe from injury, harm, or destruction," or to protect the soundness of, the "arrangement of . . . parts in a . . . body." Merriam Webster's Collegiate Dictionary (10th ed. 1996).

The patent specifications do not provide a definition different than this ordinary meaning. The Defendants have argued, based on the testimony of their expert, Giampaolo, that the patent specifications refer to preserving structural integrity as avoiding cracking of components of the gas turbine. The patent specifications, after describing essentially the language of Claim 30 regarding "preserving the overall structural integrity of the gas turbine engine," state that:

In this regard, temperature shocks due to very rapid modification of the mass flow of nebulized water to the compressor inlet 102 can induce cracking in certain alloyed components within the gas turbine engine.

(P1, col. 17, ll. 33-36) (emphasis added). In another portion of the patent specifications, however, the concern of preserving structural integrity is again described, and the specifications further state:

For example, the size and spacing of the increments should be such that the housing 125 and rotor shaft 127 are not caused to expand or contract to such different degrees and at such different rates, that a mechanical rub occurs between these elements because of axial misalignment.

(Id. at col. 18, ll. 58-63). In light of these different descriptions, including but not limited to cracking, the Court construes the term in its more broad form to include protecting, or keeping from harm or destruction, the parts and arrangement of components of the gas turbine engine.

The claim term "preslit" appears in claims 1 and 2 of the '862 Patent. RyMed contends that if construction of this claim term is required, then construction in Alaris should be adopted. (D.I. 116, at 33.) In particular, RyMed contends that this construction is correct because the Common Specification's antecedent bases for the term "preslit" all refer to cutting of the seal before activation of the valve. (Id. at 33-34.) ICU takes issue with the Alaris construction for its use of the word cut, which ICU contends is an improper limitation on how the opening is formed. (D.I. 118, at 27.) Further, ICU contends that the Common Specification only requires the slit to be placed in the seal "prior to use," not "before axial compression." (Id. at 27-28.)

In the Court's view, ICU's proposed construction is more appropriate. As the Alaris court noted, the word "preslit" does not appear anywhere in the Common Specification, yet the word "precut" appears numerous times. See '866 Patent, col. 4: 1-4 ("The proximal end of the seal may be precut to form a tiny orifice therein that allows the tip of the spike to pass therethrough easily upon compression of the seal"); id. at col. 4: 47-49 ("Typically, the pressure responsive element is a section of the seal having an entryway into a precut orifice."). However, "[w]here a specification does not require a limitation, that limitation should not be read from the specification into the claims," E.I. DuPont de Nemours & Co., v. Phillips Petroleum Co., 849 F.2d 1430, 1433 (Fed. Cir. 1988) (citing Specialty Composites v. Cabot Corp., 845 F.2d 981, 987 (Fed. Cir. 1988)(emphasis in original)). Despite several uses of this word, the Common Specification does not require that "preslit" can only mean "precut," and in fact, suggests that the preslit can be made through piercing. See '866 Patent, col. 14: 3-7 ("Prior to the use of valve 10, it is preferable that the seal caps 40 or 92 be pierced centrally by a steel needle in the axial direction, precutting the seal to provide the slit 11 in order to allow for more rapid decompression. . ."). Accordingly, it is unnecessary to use the Common Specification to impose a limitation on how the preslit must be made.

Although RyMed contends that construing "preslit" to mean "beforehand" is nebulous and offers no real construction, (D.I.
165, at 34), the Common Specification provides clear guidance on when the slit must be made: "[p]rior to use of the valve." '866 Patent, col. 14: 3. Thus, the Court concludes that "preslit" means "an opening made beforehand."

3075

B. "Preslit Orifice"/"Seal Being Preslit"

Either or both of the terms "preslit orifice" and "Seal being preslit" appear in claims recited in the '509, '592 and, '862 patents, although neither term or any variation thereof appears in the Common Specification. Alaris proposes the following definition for these terms: "an opening that is cut in the seal before the seal is axially compressed." ICU in turn proposes the following definition: "an opening made or formed beforehand."

ICU added the "preslit" terms to its patent claims several years after filing the original application from which the Common Specification derives, and as such the word "preslit" does not appear in the Common Specification. However, every claim term must have an antecedent basis in the specification. See Tandon, 831 F. 2d at 1024; Lockwood, 107 F.3d at 1572 ("[A]ll the limitations must appear in the specification.").

The seal disclosed in ICU's original 1991 application contained no orifice at all until punctured by the spike during use. However, in 1992 ICU added new matter to the Common Specification containing various references to the term "precut". For example, the following references to precutting were added to the Summary of the Invention: "[t]he proximal end of the seal may be precut to form a tiny orifice therein that allows the tip of the spike to pass therethrough easily upon compression of the seal"; and "[t]ypically, the pressure responsive element is a section of the seal having an entryway into a precut orifice." '862 Patent at 4:3-6, 4:49-51 (emphasis added). Under the "Detailed Description of the Preferred Embodiment" section, the Common Specification states that "[p]rior to the use of the valve 10, it is preferable that the seal caps 40 or 92 be pierced centrally by a steel needle in the axial direction, precutting the seal to provide the slit 11 in order to allow for more rapid decompression and reformation of the seal upon piercing by the spike." Id. at 14:3-8 (emphasis added). These and other similar references to "precutting" are the only antecedent bases in the specification for "preslit", making clear that the term refers to cutting of the seal prior to axial compression, i.e., before activation of the valve. This meaning also comports with the ordinary meanings of the component prefix "pre-" and word "slit The court thus agrees with Judge Stotler's July 2004 Order that ICU's proposed construction, which would encompass any opening in the seal, however made, finds no support in the Common Specification. See July 2004 Order at Sec. III, PP13-22.

The court therefore finds that the proper construction for the term "preslit orifice" is "an opening that is cut in the seal before the seal is axially compressed," and that the proper construction for "being preslit" is "having had an opening cut in the seal before the seal was axially compressed."

3076

A. "Spherically-Shaped" and "Pressed Against"

Claim 1 recites that the screw "head is pressed against the hollow spherically-shaped portion." The court construed "spherically-shaped" to mean "approximately spherical, such as a globe or a basketball." The parties do not dispute this construction on appeal. The parties dispute, however, whether the "pressed against" limitation requires that the screw head engage the entire spherically-shaped portion or whether it is enough that the head engage just the "edge" of the spherically-shaped portion.

In determining the meaning of the disputed claim limitation, we look principally to the intrinsic evidence of record, examining the claim language itself, the written description, and the prosecution history, if in evidence. See Phillips, 415 F.3d at 1312-17. First, the claim language does not indicate that "hollow spherically-shaped portion" must be limited so as not to include the edge of that portion, nor does it indicate how much of the hollow spherically-shaped portion must be "pressed against" the screw head. Claim 4, which depends from claim 1, requires that "the radii of the hollow spherically-shaped portions (9, 19) and of the spherically-shaped screw head (4) [be] substantially equal." '678 patent, col. 4, ll. 37-40.

- 3646 -
That implies that independent claim 1 must be broad enough to read on a device with components of unequal radii that nonetheless are pressed against each other. If the screw head has a smaller radius than the hollow spherically-shaped portion, the only part of the spherically-shaped portion against which the screw head would be pressed would be the edge of the hollow spherically-shaped portion.

Second, the specification does not indicate that the "hollow spherically-shaped portion" must be limited to exclude the edge of that portion or that "pressed against" requires a certain amount of contact between the spherically-shaped portion and the screw head. In the absence of a stated reason to exclude the edge, it would ordinarily and customarily be understood that the referenced portion includes any and all parts of the structure. Similarly, in the absence of a stated reason to require a certain amount of contact, it would ordinarily and customarily be understood that the referenced portion is pressed against a screw head when any amount of that portion presses against the screw head. Figures 1 and 2 of the ‘678 patent depict hollow spherically-shaped portion 9 in crosshatching that appears to include the edge of the portion. The corresponding description of that portion does not exclude the edge, noting that "[a] portion 9 in the form of a hollow spherical segment is provided in the interior immediately adjacent to the bore." ‘678 patent, col. 2, ll. 21-23. That description indicates that the relevant portion extends all the way to the bore, which necessarily implies that it includes the edge. Further, the description does not indicate how much of the spherically-shaped portion presses against the screw head; rather, it notes only that there is "contact" between the components. Id., col. 2, ll. 33-34. The prosecution history provides no further guidance.

For the foregoing reasons, we find Medtronic's argument unpersuasive, and we conclude that "hollow spherically-shaped portion" includes the edge of that portion and that the screw head is "pressed against" the "hollow spherically-shaped portion" if it presses against all or any part of that portion--including the edge.

### 3077

The Court defines "pressed meat" as "meat products that are formed from multiple joints of meat, that is, from pieces of meat that are separated from the bone and from one another into numerous small pieces, then reformed into a single conjoined meat product." Logan uses the clause "not pressed meat" in his response to the Office Action to distinguish it from the term "a single joint of meat." Additionally, he describes a "pressed meat" product as having a lack of structural support, as well as a lower commercial appeal and value, than "a single joint of boneless meat." Logan proposes that the Court define "pressed meat" in accordance with 9 C.F.R. § 319.105 which provides the following definition for pressed ham: "[f]inely divided (chopped, ground, flaked, chipped) cured ham products such as 'ham patties,' 'chopped ham,' 'pressed ham,' and 'spiced ham.'" 9 C.F.R. § 319.105(a). This regulation further provides the minimum meat Protein Fat Free (PFF) percentage requirements for various types of cured pork products. On the other hand, the defendant, based upon the declaration of Dr. Mills, contends that "pressed meat" should be defined as "meat products that are separated from the bone and from one another into numerous small pieces, then reformed into a single conjoined meat product." Dr. Mills asserts that a person having ordinary skill in the art of the '374 Patent would not need to refer to a government regulation to obtain an understanding of the term "meat." Additionally, the Court notes that Logan's response to the Office Action refers to pressed meat in the context of Ferrarini, a French patent. It, therefore, seems misplaced for the Court to rely on a federal regulation to define "pressed meat" in this context. Viewing the extrinsic evidence in the context of the intrinsic evidence, the Court defines "pressed meat" as "meat products that are formed from multiple joints of meat, that is, from pieces of meat that are separated from the bone and from one another into numerous small pieces, then reformed into a single conjoined meat product."

### 3078

2. "Pressing"

Plaintiff argues that the term "pressing" means "to push downward into a position without the need to force fit." (Id. at 17). Defendants object to this proposed definition to the extent it seeks to modify the claim language. In particular, defendants point out that neither the claim nor the specification address the method or process by which the filler is to be pressed into the space between the rail and the panel. Therefore, the term "pressing" should not exclude installation procedures that require force fitting.
The common and ordinary meaning of "press" implies nothing about the degree of force necessary to accomplish an action. See WEBSTER'S II NEW COLLEGE DICTIONARY at 875 ("to exert steady force or weight against"); MERRIAM WEBSTER'S COLLEGIATE DICTIONARY at 922 ("to act upon through steady pushing or thrusting force exerted in contact"). However, the prosecution history tends to support plaintiff's argument. On August 19, 1995, the patent examiner noted that the invention claimed both a product and a process of installation and needed to be restricted to one or the other. He distinguished the product from the process because "the insert could be installed by an entirely different process, such as force fitting without rotating a leg . . ." (Plf. Brief, Exh. 3, Office Action Summary of Aug. 19, 1995 at 2) (emphasis added).

5 The prosecution history thus injects a degree of ambiguity into the meaning of the term "pressing."

Both sides rely on extrinsic evidence to resolve this ambiguity. Defendants have submitted the declaration of Chris Gaudet, an expert in the field of railroad crossing materials and accessories. Gaudet states that "press" and "pressing" are not terms of art and have no special significance in the railroad industry. (Gaudet Decl. P 2). However, these terms must be construed in light of the relevant claim and specification. See Vitronics, 90 F.3d at 1582. To that end, plaintiff has submitted the declaration of William K. Hull, one of the inventors of the '947 Patent. Hull explains that persons of ordinary skill in the art would understand that the inserts should be installed:

"by rotating the leg around the rail head and pressing the inserts into position between the rail and the gauge panel . . . A person of ordinary skill in the art would understand that the inserts do not need to be, and should not be, beaten down with powerful swings of a spike maul or forced down with a heavy piece of railroad track equipment such as a back hoe bucket or a ballast regulator, as such actions may result in 'overdriving' the inserts into an improper position. Therefore, a person of ordinary skill in the art would understand that the terms 'pressing' and 'pushed,' as used and described in the subject patents, would be to press or push, or their equivalent . . . with hand tools such as the lining bar, spike maul, or their equivalent."

(Hull Decl. P 10). This testimony is consistent with the particular niche plaintiff's product was designed to fill. See CVI/Beta Ventures, 112 F.3d at 1160. Other than defendants' insert, plaintiff's invention is the only elastomeric flangeway filler that can be retrofit without moving the gauge panel from its center position. (Hull Decl. PP 3 & 8). The unique ability to "press" this insert into position without disturbing the surrounding materials supports a definition of the term that excludes force fitting. Accordingly, the Court finds that the term "pressing" means "to push into position without the need to force fit."

GO BACK

3079

A. Claim 12

Claim 12 of the 844 patent states:

12. A method for the simultaneous removal of a plurality of hairs from a skin region . . ., the method comprising the steps of:

   (a) placing an applicator in contact with the skin surface in said skin region; and

   (b) applying optical radiation of a selected wavelength and of a selected fluence through said applicator to said skin region . . .;

   pressure being applied to the applicator during steps (a) and (b) so as to cause the applicator to deform the skin region thereunder.

- 3648 -
In this Court's claim construction order, the term "applicator" was construed as meaning "[a] device for applying optical radiation," and the phrase "pressure being applied to the applicator . . . so as to cause the applicator to deform the skin region thereunder" was construed as meaning "pressure being applied to the applicator so as to cause the applicator to compress the area of skin under it." (Feb. 24, 2004 Order, at 3).

Cutera seemingly concedes that the CoolGlide handpieces are "applicators" within the meaning of claim 12, but denies that pressure is applied to the handpieces. Cutera's first argument is that pressure is not applied to the CoolGlide handpieces because doing so would make little sense. Cutera points out that the 844 patent calls for pressure to be applied to the applicator in order to achieve a specific purpose, i.e., "more efficient delivery of light to the follicular target regions" (Garretson Decl., Ex. A, at 6:60-66). Because applying pressure to Cutera's devices allegedly would not achieve this result, Cutera maintains that pressure is not applied to the accused devices within the meaning of claim 12.

However, claim 12 does not refer to the reasons for applying pressure to the applicator; it merely describes the application of pressure as part of the patented method. The Court's Markman order construed claim 12 simply as specifying that a certain amount of pressure (i.e., an amount sufficient to compress the underlying skin) be applied to the applicator. (See Feb. 24, 2004 Order, at 3). The issue before the Court, therefore, is not why pressure is applied to the accused devices (or why not), but rather whether or not pressure sufficient to compress the underlying skin is applied to the accused devices. On this issue, summary judgment is inappropriate. According to Cutera, no "appreciable" compression of the skin occurs during use of the accused products, and any compression of the skin is "minimal." (Cutera Jan. 14, 2005 Mem., at 13 n.6). The chilled footplate is, Cutera maintains, never pressed into the skin, but is instead "glided over the skin." (Id. at 12). Whether compression of the underlying skin occurs during use of the Cutera devices, however, and whether pressure results in compression that is "appreciable" or more than "minimal" are disputed questions of fact. As Palomar notes, Cutera's training and instruction materials warn users to ensure that the footplate remains in contact with the skin, "especially over curves." (Saxton Decl., Ex. 15, at ALT 000137). Reasonable jurors could find that pressure sufficient to compress the underlying skin was required in order to maintain constant contact between the footplate and curved areas of skin. Furthermore, a video displayed at oral argument on Cutera's motion depicts through animation the application of a Cutera product; the animation shows the skin beneath the Cutera device being somewhat compressed as the footplate passes over the skin. Perhaps most significant, the record includes the notes of Michael Sasnett, the designer of a prototype of the CoolGlide products, which state that the handpiece is to be pressed upon the skin. (Saxton Decl., Ex. 22, at ALT 017390).

Cutera argues that even if the skin beneath the applicator is somehow compressed, there is no evidence in the record that such compression results from pressure being brought to bear upon the applicator, and further challenges the relevance of Sasnett's notes, which it claims reflect only early stages of product development. On a motion for summary judgment, however, the Court draws inferences in the nonmovant's favor; in doing so, it is clear that a material issue of fact exists as to whether pressure sufficient to compress the underlying skin is applied to Cutera's CoolGlide devices. For substantially the same reasons, a factual dispute exists as to whether Cutera intends that its customers apply pressure to its devices so as to compress the skin under them and thereby induces infringement. Accordingly, summary judgment as to both direct infringement and inducement of infringement of claim 12 is denied.

3. "Pressure controlled valve . . . to prevent liquid from exiting the carafe through the liquid passageway"

The term "pressure controlled valve" is specifically defined in the patent: "As used herein, the term 'pressure controlled valve' means that the described valves are moved between opened and closed positions by pressure of liquid and/or gas, and not by mechanical contact with any part or component by manipulation." Column 5, lines 13-17. What is disputed is whether the term "solely" should be imported into this definition.

a. The Parties' Proposed Construction

Defendants argue that the purpose of the patent is to address the problem of losing heat from a thermal carafe. They claim that the invention seeks to accomplish this objective by use of a pressure controlled valve that is "operated (opened and closed) solely by liquid and/or gas pressure." (emphasis added). They maintain that a valve that moves by force of gravity is
not within the patent because such a valve would not prevent hot gasses from escaping the carafe. They argue that Sunbeam's broad construction would defeat the purpose of the invention.

In contrast, Sunbeam objects to the importation of the term "solely" into the interpretation of the term "pressure controlled valve." Sunbeam argues that the definition does not require that the uni-directional flow be in any particular direction, be completely air-tight and water-tight, or be solely moved by liquid and or gas pressure. Rather, Sunbeam maintains that it is sufficient for the flow to be substantially one-way and for liquid and/or gas pressure to play a role in moving the valve between open and closed while not requiring manual manipulation. According to Sunbeam, a minimal amount of air flow may occur when the valve is used in practice and that a slight amount of leakage occurs does not absolve patent infringement.

c. The Court's Construction

It is appropriate for a court to look to the written description for guidance as to the meaning of the terms. Phillips, 415 F.3d at 1316. Where specifications reveal a particular definition given to a claim term, the inventor's lexicography governs. Id. Here, the conflict of construction occurs because "pressure controlled valve" is described in two instances -- once with the limiting word "solely" and once without. However, the Court defers to the specific definition of "pressure controlled valve." At the end of the specifications, the patent clearly reads: "As used herein, the term 'pressure controlled valve' means that the described valves are moved between opened and closed positions by pressure of liquid and/or gas, and not by mechanical contact with any part or component by manipulation." Column 5, lines 13-17. As such, the inventor has told us precisely what he intended "pressure controlled valve" to mean. And this definition does not include the word solely. Accordingly, the Court follows the instructions of the inventor and construes the claim term as "a valve, moved between open and closed positions by pressure and/or gas and not by mechanical contact with any part or component by manipulation."

3081

I. Claim Construction for "Pressure Controlled Valve"

DeLonghi requests that the Court correct its claim construction for the term "pressure controlled valve," because it believes that the claim construction stated in the Opinion includes a typographic error. DeLonghi notes that the Court states: "the Court defers to the specific definition of 'pressure controlled valve' [that is found] [a]t the end of the specifications." However, the Opinion omits the words "or by", as well as a preceding comma, which are found in the cited section of the specification of the '719 patent. The specification reads:

As used herein, the term "pressure controlled valve" means that the described valves are moved between opened and closed positions by pressure of liquid and/or gas, and not by moving mechanical contact with any part or component, or by manipulation.

Col. 5, lines 13-17, of the '719 patent (emphasis added). DeLonghi asks the Court to amend its Order to avoid any confusion.

The omission of the words ", or by" was a typographic error. The Court amends its Order to reflect the correct construction.

3082

3. pressure conveying element ('626 patent, claims 34, 38, 41, 44)

This term appears in asserted independent claims 34, 38, 41, and 44 of the '626 patent. The parties' dispute centers on whether this term requires construction, and, if so, whether the patent requires specific pressure-conveying components.

Plaintiffs propose that "pressure conveying element" means "a pressure conveying element." Fresenius proposes that "pressure conveying element" means "an assembly including at least (1) a pressure transfer element (e.g., 102) in contact
against the diaphragm of the pump chamber to apply positive and negative fluid pressure to the diaphragm; (2) pneumatic control valves; (3) inflatable reservoir/main bladder (e.g., 128; (4) a conduit for transporting positive pneumatic pressure from the source to the inflatable reservoir (e.g., 216); (5) a pressure regulator communicating with the inflatable reservoir; and (6) a carrier (e.g., 104) that moves the pressure transfer element."

The court finds that the claims and specification support the plain and ordinary meaning. In some cases, "the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and . . . involves little more than the application of the widely accepted meaning of commonly understood words." Phillips, 415 F.3d at 1314. Here, the widely accepted and commonly understood meaning of "pressure conveying element" makes sense in conjunction with the rest of the asserted claims in the '626 patent.

For example, claim 34 recites "a pressure conveying element carried within the housing for conveying fluid pressure to the diaphragm to operate the pump chamber and valve . . . ." '626 patent, 42:66-43:2. In other words, the claim itself explains that the "pressure conveying element" is for "conveying fluid pressure to the diaphragm to operate the pump chamber and valve." Similarly, claims 38, 41, and 42 all recite "a pressure conveying element carried within the housing for conveying fluid pressure . . . to operate the pump chamber and valve . . . ." '626 patent, 43:59-64, 44:23-31, 44:56-61. The claim language therefore suggests that the court should not further limit this term.

Nothing in the specification indicates that any further limit should be placed on this term. The patent describes several different types of pressure-conveying elements. See '626 patent, 13:50-57 ("As Fig. 15B shows, when the main bladder 128 inflates, it presses the plate 104 against the spring element 132. The open cell structure of the spring element 132 resiliently deforms under the pressure. The piston element 102 moves within the window 134 into pressure contact against the cassette diaphragm 59.") and Fig. 15B; '626 patent, 13:6-8 ("The ports 120 convey positive or negative pneumatic pressures from the pneumatic pressure distribution module 88 (as will be described in greater detail later)"); id., 19:66-68 ("Valve A6 is either opened to convey air in the main branch line 216 to the low pressure reservoir 214 or closed to block this conveyance.")

However, because the '626 patent does not suggest that the "pressure conveying element" is limited to any particular embodiment, specific "pressure conveying" components cannot be read into the claim. Fresenius' proposed construction would improperly exclude the above-described embodiment, because the embodiment lacks the six specific features Fresenius has included in its proposed construction.

The doctrine of claim differentiation also precludes Fresenius' attempt to read the additional specific components into the general and straightforward term "pressure conveying element." Dependent claims 2 and 3, which depend from independent claim 1 (not asserted here), recite the same structural limitations on "pressure conveying element" that Fresenius proposes to read into claim 1 (except for the second item - "pneumatic control valves").

Under the doctrine of claim differentiation, the "pressure conveying element" in claim 1 must have a broader and different scope than the specific configuration claimed in claims 2 and 3. The additional limitations claimed in claims 2 and 3 would be redundant if "pressure conveying element" itself necessarily included these structures. See SunRace Roots Enter. Co., Ltd. v. SRAM Corp., 336 F.3d 1298, 1303 (Fed. Cir. 2003). Fresenius points to no language in either the claims, the specification, or the prosecution history that expressly requires that the additional limitations to "pressure conveying element" in dependent claims 2 and 3 be imported into the construction of "pressure conveying element" generally. See id.

"Pressure conveying element" means "pressure conveying element."
Clinical Innovations argues that these claim terms should be construed to mean:

The catheter includes a structure that can detect, ascertain, or determine changes, alterations, or transformations in fluid pressure that exist outside the distal end of the catheter (such as the uterus). There are no limitations on the type of pressure detector or in its location in the catheter. 17

Utah Medical argues that they should be construed to mean:

The pressure being exerted against the exterior of the distal end of the tube is translated for detection using either an interior balloon, an exterior balloon, or an interior/exterior balloon. (The '529 patent has excluded at least sensor-tipped catheters, such as the accused device, from the scope of this claim limitation by asserting, for example, that they kill expectant mothers and their unborn babies). 18

Because the specifications reveal the correct claim scope, including a disclaimer, and because the claims are means-plus-function limitations, the Court agrees that the claims are limited to balloon configurations for the following reasons:

1. Specification Disclaimer

Utah Medical contends that Clinical Innovations disclaimed sensor-tip configurations in the specifications of the '524 Patent and in the prosecution history. Utah Medical contends that Clinical Innovations disclaimed sensor-tipped devices by its statements in the patent disparaging sensor-tipped devices. Clinical Innovations disparaged the sensor-tip devices because, among other reasons: "they cause discomfort during insertion" and the "major disadvantage of inserting sensor-tipped IUP devices, as well as fluid-filled IUP devices, is the possibility of perforating the placenta or uterus as a result of the higher insertion force required to insert a larger tip . . . deaths have been reported of both fetuses and mothers from damage caused by insertion of sensor-tipped devices." 19 Clinical Innovations also listed as disadvantages of sensor-tipped devices the tingling caused by the electrical current running to the sensor in the tip and difficulties in recalibration.
Clinical Innovations contends that the '524 patent, as a continuation of the application that became the '497 patent, which in turn, is a continuation-in-part of the '879 patent, must be considered as a family of patent application. It contends that to construe the '524 patent as limited to the balloon configuration would "totally vitiate" the patent. It contends that the case Ventana Medical Systems, Inc. v. Biogenex Laboratories, Inc is squarely on point in its ruling that "general statements by the inventors" in the Background section should not, "without more, . . . be interpreted to disclaim every feature of every prior art device discussed in the 'BACKGROUND ART' section of the patent." 22

20 A position clarified by Clinical Innovations' counsel at argument.

21 473 F.3d 1173 (Fed. Cir. 2006).

22 Id. at 1181.

Under the doctrine of specification disclaimer:

"[T]he specification may reveal an intentional disclaimer, or disavowal, of claim scope by an inventor. In that instance, . . . the inventor has dictated the correct claim scope, and the inventor's intention, as expressed in the specification, is regarded as dispositive." 23

23 LG Electronics, Inc. v. Bizcom Electronics, Inc., 453 F.3d 1364, 1378 (Fed. Cir. 2006) (quoting Phillips, 415 F.3 at 1316 and citing SciMed Life Sys. v. Advanced Cardiovascular Sys., 242 F.3d 1337, 1341 (Fed. Cir. 2001)). In LG Electronics, the Court found that "because the statements relied upon by defendants relate to the invention not elected during prosecution, there is no clear disavowal with respect to the invention actually claimed" in the patent in suit.

In the situation of "an intentional disclaimer, or disavowal, of claim scope by the inventor," 24 the Court "interprets the claim more narrowly than it otherwise would to give effect to the inventor's intent to disavow a broader claim scope." 25

24 Phillips, 415 F.3d at 1316.25 Ventana, 473 F.3d at 1181 (citing Phillips, 415 F.3d at 1316).

Further, the specification is always highly relevant to the claim construction analysis.

In explaining the importance of referring to the specification in determining and understanding the meaning and scope of a patent claim, we have stated that "the specification 'is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term.'" Furthermore, "the specification may reveal an intentional disclaimer, or disavowal, of claim scope by the inventor. In that instance as well, the inventor has dictated the correct claim scope, and the inventor's intention, as expressed in the specification, is regarded as dispositive." 26

Having considered the entire patent, the Court finds that this is a case like SciMed Life Systems, 27 and SafeTCare Mfg., 28 where we must "rely on the specification merely to understand what the patentee has claimed and disclaimed." 29 As explained in SafeTCare,

We "recognize that the distinction between using the specification to interpret the meaning of a claim and importing limitations from the specification into the claim can be a difficult one to apply in practice." In this case, however, we are not in danger of importing any limitations from the specification into [the claim]. Rather, we rely on the specification merely to understand what the patentee has claimed and disclaimed. [Phillips] (finding "the inventor's intention" to be "expressed in the specification"). In this case, the written description repeatedly emphasizes [an attribute]. The inventor makes clear that this attribute of the invention is important in distinguishing the invention over the prior art. Thus, we are persuaded by the language used by the patentee that the invention disclaims [the attribute distinguished]. 30

--- End Footnotes ---

In the present case, the specifications repeatedly emphasize and discuss the balloon configuration and its attributes. The inventor makes it clear that the attributes of the balloon configuration are important in distinguishing the prior art. The prior art of the sensor-tipped configurations is clearly disparaged and disclaimed.

Reading the specifications, the Court is convinced that what is intended to be claimed are the attributes of the balloon configuration that are repeatedly described therein as important in distinguishing the invention over prior art. In contrast, the partially clear nature of the tube, emphasized at argument as the improvement added to the family of patents by the '524 patent, is referred to in the nature of an aside. 31

--- Footnotes ---

31 E.g., Col. 7, lines 10 to 15.

--- End Footnotes ---

Clinical Innovations also contends that sensor-tipped configurations are also described in the specifications because the use of a pressure transducer is described. However, the use of a pressure transducer is discussed in the specifications as used in combination with a balloon configuration is such a manner that it is not a sensor-tipped catheter that is described. 32

--- Footnotes ---

32 E.g. Col. 6, lines 10 through 30; col. 12, lines 28-46; col. 2, lines 7-9 (prior art).

--- End Footnotes ---

In sum, the Court finds that Ventana is distinguishable because the present case involves much more than "general statements by the inventors indicating that the invention is intended to improve upon prior art . . . ." 33 The present case is one like SafeTCare where the Court in construing the claims is "relying on the specification merely to understand what the patentee has claimed and disclaimed." 34 The Court finds that the specification makes it clear that what was claimed is the
balloon configuration and what was disclaimed is the sensor-tipped configuration. For this reason, the Court need not address the parties' arguments regarding prosecution history.

33 Ventana, 473 F.3d at 1181.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

Accordingly, the Court construes "a structure for detecting changes in fluid pressure external to said first, distal end of said elongated outer tube;" "a pressure detection device for detecting pressure changes external to said distal end of said elongated outer tube;" and "a pressure detection device associated with said second lumen of said elongated tube structure for detecting changes in fluid pressure external to said first end of said elongated tube structure" in claims 1, 13, and 25 to mean "the pressure being exerted against the exterior of the distal end of the tube is translated for detection using either an interior balloon, an exterior balloon, or an interior/exterior balloon."

2. Means-Plus-Function

Utah Medical contends that the phrases "pressure detection device" and "a structure for detecting changes" are a means-plus-function limitation under § 112, 35 which provides:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof. 36

36 Id.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

This section "operates to restrict claim limitations drafted in such functional language to those structures, materials, or acts disclosed in the specification (and their equivalents) that perform the claimed function." 37

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

37 Personalized Media Communications, LLC v. International Trade Com'n, 161 F.3d 696, 703 (Fed. Cir. 1998).

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

The parties agree that if the phrase does not contain the term "means," it is presumptively not subject to § 112. 38

"However, a limitation lacking the term 'means' may overcome the presumption against means-plus-function treatment if it is shown that the claim term fails to recite sufficiently definite structure or else recites function without reciting sufficient structure for performing that function." 39

38 Massachusetts Institute of Technology (MIT) and Electronics For Imaging, Inc. v. Abacus Software, 462 F.3d 1344, 1353 (Fed. Cir. 2006) (quoting CCS Fitness Inc. v. Brunswick Corp., 288 F.3d 1359, 1369 (Fed. Cir. 2002)).

39 Id. (quoting CCS Fitness, 288 F.3d at 1369) (quotation marks omitted).
The parties rely on many of the same cases, such as Lighting World, Inc. v. Birchwood Lighting, Inc., 40 and Personalized Media Communications, LLC v. Int'l Trade Comm'n. 41

In considering whether a claim term recites sufficient structure to avoid application of section 112, P 6 we have not required the claim term to denote a specific structure. Instead, we have held that it is sufficient if the claim term is used in common parlance or by persons of skill in the pertinent art to designate structure, even if the term covers a broad class of structures and even if the term identifies the structures by their function.

* * *

Thus, while it is true that the term "connector assembly" does not bring to mind a particular structure, that point is not dispositive. What is important is whether the term is one that is understood to describe structure, as opposed to a term that is simply a nonce word or a verbal construct that is not recognized as the name of structure and is simply a substitute for the term "means for." The court in Personalized Media Communications drew the pertinent distinction in holding that the term "detector," although broad, is still structural for purposes of section 112 . . . because it "is not a generic structural term such as 'means,' 'element,' or 'device'; nor is it a coined term lacking a clear meaning such as 'widget' or 'ram-a-fram.'" 42

--- Footnotes ---

40 382 F.3d 1354, 1358 (Fed. Cir. 2004) (holding that "the presumption flowing from the absence of the term "means" is a strong one that is not readily overcome").

41 161 F.3d 696 (Fed. Cir. 1998).

42 382 F.3d at 1359-60 (citing and quoting Personalized Media, 161 F.3d at 704) (other citations omitted).

--- End Footnotes ---

Utah Medical argues that terms such as "structure" and "pressure detection device" do not denote any particular structure. It also argues that it has rebutted the presumption by showing that the '524 patent uses the terms "pressure detection device" and "pressure detection means" interchangeably. 43 It contends that because the other structure disclosed in the specification for performing the pressure detection function is a balloon configuration, the claims are limited to that balloon configuration.

--- Footnotes ---

43 Citing Lightening World, 382 F.3d at 1362 and citing the '524 patent col. 3, lines 44-50 (Summary of Invention referencing "pressure detection device" and "pressure detection means").

--- End Footnotes ---

Clinical Innovations relies upon Personalized Media's holding that "detector," unlike the term "device" denotes a type of structure. 44 It argues that a specific kind of structure is required--namely one for fluid pressure detecting, pressure detection, or fluid pressure detection. It argues that under Personalized Media, adding a qualification in front of the noun "detector" does not render it insufficient for purposes of § 112.

--- Footnotes ---

44 161 F.3d at 704.

--- End Footnotes ---

- 3656 -
"The task of determining whether the limitation in question should be regarded as a means-plus-function limitation, like all claim construction issues, is a question of law for the court . . ." 45 The Court finds that the resolution of this issue depends upon the noun that is being qualified. The noun "device" is a "generic structural term." 46 So, too, is the noun "structure." As such they are not sufficient to preclude application of § 112. Detector, is of course, "a sufficiently definite structural term to preclude the application" of § 112. 47 But, in the instant case, the claims involve the nouns "device" and "structure," not the noun "detector." Unlike Personalized Media, where an adjectival qualification (digital) was added to "an otherwise sufficiently definite structure" (detector); in the present case the qualification (pressure detecting) is added to an otherwise insufficiently definite structure--"device" or "structure."

45 Lighting World, 382 F.3d at 1358.
46 Personalized Media, 161 F.3d at 704.47 Id. at 705.
- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - -

The claims do not use the phrase "pressure detector." Instead, they use the phrases "pressure detecting device" and "structure for detecting pressure"--phrases that describe a function, not a definite structure. By using the phrase "pressure detecting device," which does not identify a definite structure, Clinical Innovations has included not just the definite structures known as detectors, but also any indefinite structure or device that arguably performs that function, a means plus function limitation.

Having carefully considered the nuanced case law in this area, the Court finds that the use of the phrases "pressure detection device" and "a structure for detecting changes" is a means-plus-function limitation under § 112. The function disclosed is detecting pressure. Because the only structures disclosed in the '524 Patent are balloon configurations, the Court construes the claims as limited to balloon configurations and their equivalents.

10. Pressure Responsive Element

As mentioned above, Aqua-Lung seeks to have "pressure responsive element" carry the same definition as "retractable filter cover," namely as: "A gas pressure-responsive valve closure element that covers the filter and has a rounded or tapered heard to seal the gas inlet opening from the inside in the absence of applied gas pressure, and which is displaced axially against the action of a spring to open the gas inlet opening in the presence of applied gas pressure." Two Forty proposes a significantly broader construction of the term as "a portion of the device which responds to a force, such as by an object or fluid pushing against it."

The phrase "pressure responsive element" or alternately "pressure responsive member or element" appears extensively throughout the '130 application as filed and the claims of the '609 and '674 patents. The summary of the '609 patent provides that: "A pressure responsive element is disposed within the passageway for selectively opening and closing of the inlet opening to fluid flow in response to fluid pressure exerted thereon at the inlet opening." 4:4-7 (emphasis added). In the first seven embodiments of the specification, the element is described particularly and identified in the corresponding figures as "88." In its description of the first embodiment, for example, the '609 patent explains: "A pressure responsive member or element 88 is positioned within the bore 78 proximate the upper or inlet end 64. In this particular embodiment, the pressure responsive element 88 is in the form of a piston 90 having a head portion 92 terminating in an upper curved surface 94 which seals against the lip 82 and projects outwardly from the opening 80." Id. at 9:17-23 (emphasis added).

The phrase appears in claims of the '609 patent, for example, as "a pressure responsive element mounted within said duct proximate said gas inlet opening and adapted for movement between a first position for sealing said duct to prevent gas from entering said inlet opening, and a second position for opening said duct to permit gas to enter said inlet opening and pass through said duct[.]" Claim 1 at 17:60-65 (emphasis added). The term also appears in the claims of the '674 patent. See Claim 1 at 26:43-48 ("A filter assembly for use with a regulator device, said filter assembly comprising . . . a pressure
Responsive element located within the bore and moveable between a first position and a second position.

As explained in the discussion of "retractable filter cover," Aqua-Lung's proposed construction is too narrow in that it imports specific structural limitations, i.e. the shape of the head and the spring, into the definition. Conversely, Two Forty's definition as essentially any element that responds to a force is too generic and lacks meaning derived from the specification. In light of the stated purpose of the invention, one skilled in the art would understand that the "pressure responsive element" provides a seal against fluid flow in order to prevent contamination of a regulator. As identified by Aqua-Lung, one skilled in the art would understand that the "pressure responsive element" is the same object as the "retractable filter cover." Based on the foregoing, the construction adopted for "pressure responsive element" will be "an element of a device which can move from a first position where it prevents fluid flow into the device, to a second position, where it allows fluid flow into the device."

**D. "Pressure Sealing Engagement."**

The term "pressure sealing engagement" is recited in claim 5, which recited as follows (col. 17:41-57):

5. An improvement in a bundle breaker as defined in claim 1 comprising:

   a. said first and second fluid pressurized structures are each formed with a generally planar upper rigid wall affixed to said first and second clamp means, and a depending perimeter wall affixed to and extending downwardly from said generally planar upper rigid wall of said first and second fluid pressurized structures;

   b. said first and second flexible members are joined to said respective perimeter walls in pressure sealing engagement therewith; and

   c. said first and second engagement areas of said first and second flexible members each present a substantially planar unbroken surface area with infinite indentation flexibility upon the application of forces to any portion of said substantially planar unbroken surface area.

At the hearing, the differences between plaintiffs' and defendant's constructions fell away, and the parties and the Court were able to agree on the following construction: "an interface between two surfaces that maintains liquid or gas pressure." Accordingly, the term "pressure sealing engagement" is held to mean "an interface between two surfaces that maintains liquid or gas pressure."

**3085**

a. "Pressure sensitive adhesive." A composition which allows adhesion to be initiated through the application of pressure.

**3086**

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

7 Parties agree that the similar terms, "pressure-sensitive variable conductance sensor," 7 "pressure-sensitive analog sensor," "pressure-sensitive variable conductance structural arrangement," "pressure-sensitive variable conductance structure," "pressure-sensitive variable sensor," and "pressure-sensitive . . . button sensor," which appear in the '802, '991, '525 and '700 patents should be construed the same way.
Introduction

Anascape proposes that this term should mean "an electricity manipulating device for varying electrical output proportional to varying physical force."

Microsoft contends that this term should be defined as follows:

A pressure-sensitive variable-conductance sensor has material to contact conductive elements. This type of sensor has a conductivity that changes due to a volume effect. As pressure on the material increases the material volume decreases. This decrease in volume of the material increases the internal conductivity through the material. As a result, the conductivity through the sensor increases.

A pressure-sensitive variable-conductance sensor does not include a variable conductivity sensor utilizing a micro-protrusion surface area effect. In such a sensor, as pressure on the material increases the surface area of contact between the microprotrusions and the conductive elements increases. As a result, the conductivity through the sensor increases.

Here, the central question is whether a PSVC sensor must utilize PSVC material. The patent uses language of requirement in this regard, and every embodiment described incorporates PSVC material. The court concludes that sensors using PSVC material are what the patents disclose.

Analysis

It is clear from the claim language that a sensor is an electricity manipulating device. 8 '802 Patent, Col. 12, ll. 29-30; '991 Patent, Col. 14, ll. 60-62. The specifications also describe a sensor as an "electricity manipulating device." See '802 patent, Col. 3, ll. 39-42. In differentiating the present invention from prior art, the specifications of the patents state that a "pressure sensitive variable conductance analog sensor" is different from a prior art on/off sensor due to its ability to vary electrical output or flow proportional to varying physical force. Compare '991 Patent, Col. 1, ll. 42-56 with '991 Patent, Col. 6, ll. 2-5.

See also '084 Patent, Col. 2, ll. 8-12. Anascape's proposal includes these elements. Microsoft's wants to add the presence of PSVC material, and the absence of other material, as limitations.

Many of the claims in the patents state specifically that the PSVC sensor (or the means for creating an analog output proportional to varying physical pressure) utilizes PSVC material. These include: '802 Patent, Claims 1-4, 7, and 10; '084 Patent, Claims 1-11; '886 Patent, Claim 7.

Other claims refer to a PSVC sensor or a button which manipulates electric current or imagery relative to physical pressure (or means or a method for the same) but there is no express statement that PSVC material is utilized. These include: '802 Patent, Claims 5, 9, 12, 13, 14, 15, 16, and 17; '991 Patent, Claim 11, 23, 29, and 44. Anascape therefore argues that claim differentiation mandates a construction by which the analog sensor may, or may not, have PSVC material. Claim differentiation is a guide to proper construction, not a card that trumps a careful review of the specification and prosecution history. See Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380-1381 (Fed. Cir. 2006).

The real issue is whether a PSVC sensor must have it, somewhere, at least some PSVC material as defined above. Here the court is faced with the familiar duel between powerful opposing canons of construction. Anascape argues that "limitations may not be imported from the specification to the claims." Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 904 (Fed. Cir. 2004), cert. denied, 543 U.S. 925, 125 S. Ct. 316, 160 L. Ed. 2d 223 (2004).

Even if a specification describes only a single embodiment, the claims "will not be read restrictively unless the patentee has
demonstrated a clear intention to limit the claim scope using "words or expressions of manifest exclusion or restriction." Id. at 906. On the other hand, the same case recites that claims must be read in the context of the specification, and notes the "particular difficulties" which arise when the claim language is broad but the specification is narrow. Id. at 905. The importance of the specification has since been given even more emphasis. Phillips, 413 F.3d at 1315.

The specification of the '802 patent describes a sensor in which the flow of current through the PSVC material (Item 36 in fig. 7 & 8) is increased because "material 36 which is flexible deform[s] with additional applied pressure to somewhat flatten-out and contact additional surface area of both traces 32 and 34." The results include "additional conductivity changes . . . by the additional surface contact area." See '802 Patent, Col. 8, 58 - Col. 9, l. 4, Fig. 7 & 8. There is increased conductivity through the PSVC material due to the surface effect.

Another specification explicitly describes an embodiment in which the intrinsic conductivity of the PSVC material does not change very much during deformation. The patentee points out that in the prior art a "carbon-rich conductive pill or disc" had been used as "simple On/Off momentary-On switches" but not to provide "action intensity control of electronic imagery." '991 Patent, Col 9, ll. 16-36. "Carbon-rich pills are typically made of granular carbon in high concentrations in a silicone rubber binder producing a resilient conductive material resistant to mechanical bouncing when depressed onto a surface." '991 Patent, Col. 9, ll. 28-31.

The patentee states he had discovered that such a carbon rich pill or disc could be used in his variable conductivity invention. '991 Patent, Col. 9, ll. 39-47. Anascape points out that the carbon-rich pill does not change its conductivity very much with deformation, so one skilled in the art would know that the surface effect would be a significant contributor to variable conductivity in such a device. '991 patent, Col. 9, ll. 43-60.

Resistivity in a device with a carbon-rich pill changes only within a narrow range of approximately 3 thousand ohms to a low value near 10 ohms. Id. In that particular configuration, most of the change in conductivity of the sensor as a whole will come from the deformation of the domed/convex conductive material 36 as it presses against the contact wires - the surface effect.

Microsoft responds with "fire" from its own canon: claim language can not be read to exceed the scope of the unequivocal language of the specifications of the patents. See Nystrom v. Trex Co. Inc., 424 F.3d 1136, 1143 (Fed. Cir. 2005), cert. denied, 547 U.S. 1055, 126 S.Ct. 1654, 164 L. Ed. 2d 396 (2006). Microsoft argues that the specifications of the patents compel a construction of "pressure-sensitive variable conductance analog sensor" that excludes the possibility that electrical conductivity is modulated only by varying the surface area of contact between micro-protrusions and conductive elements, as for example explained in the Yaniger patent. Microsoft does not point to any clear disclaimer by the patentee of an embodiment which includes only a surface area effect.

Microsoft cites Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361, 1372 (Fed. Cir. 2004) and Honeywell Int'l, Inc. v. ITT Indus., Inc., 452 F.3d 1312, 1318 (Fed. Cir. 2006) and argues that with regard to the presence of PSVC material in the sensors, the following statements in the specification of the patents use language of requirement, not preference:

1. In the "Summary of the Invention": "The present invention involves the use of structures (pressure sensors) having pressure-sensitive variable-conductance material across proximal circuit traces in order to provide variable output ." '802 Patent, Col. 2, ll. 55-58.

2. "Pressure-sensitive variable-conductance material 36 is an important aspect of the present invention." '802 Patent, Col. 6, ll. 49-50.

3. "With the present sensor in all embodiments shown and described herein, pressure-sensitive variable-conductance material 30 is positioned as a variably conductive element . . . ." '084 Patent, Col. 8, ll. 10-12.

4. "At this point in the disclosure it should be quite clear that the pressure-sensitive variable conductance material 30 is a very important aspect, as is the tactile feedback from the snap-through dome-cap 16 of the present invention." '084 Patent, Col. 6, ll. 53-56.

5. In the "Summary of the Invention": "The present invention involves the use of structures (pressure sensors) having
pressure-sensitive variable-conductance material across proximal circuit traces in order to provide variable output." '991 Patent, Col. 2, ll. 59-62.

6. "Pressure-sensitive variable-conductance material 36 is an important aspect of the present invention." '991 Patent, Col. 6, ll. 53-54.

7. The '886 patent describes related prior art having a dome cap with a conductive "pill" referred to as the "active element." '886 Patent, Col. 1, ll. 36-37. The specification then goes on to say: "With applied varying pressure changes, the active element changes it's conductivity . . . . This pressure-sensitive variable-conductance aspect of the active element in the . . . dome cap opens many new and valuable possibilities of use." '886 Patent, Col. 3, ll. 14-23.

Microsoft's argument is bolstered by the fact that every single embodiment described in the four patents is of a sensor that utilizes PSVC material. As discussed above, there are descriptions of the surface area effect when the PSVC material is flattened across contacts. That is always an additional effect, involving PSVC material. Even the description of the use of a carbon-rich pill with a narrow range of resistivity changes did not imply an embodiment with no PSVC material. Rather, that discussion concluded by pointing out that a greater range of resistivity change could be achieved by replacing the carbon with tungsten carbide. "Therefore, tungsten carbide is a preferred active material for use with the present invention." '991 Patent, Col. 10, ll. 1-3.

Finally, two of the patents cite the '471 Patent (Mitchell) while discussing sensors '886 Patent, Col. 2, ll. 16-28; '084 Patent, Col. 2, ll. 13-22. As mentioned earlier, all four patents referred to the Mitchell patent as having information about PSVC material that increased conductivity through the volume effect. It only teaches sensors that use such material.

The '886 Patent refers to Mitchell as "describing sensors which utilize pressure-sensitive variable-output material to produce analog output" but distinguished that invention only by noting that Mitchell did not use or suggest an elastomeric dome cap to carry the PSVC material, to transfer force, or to provide tactile feedback. '886 Patent, Col. 2, ll. 36-48.

The '084 Patent cites the Mitchell patent as describing sensors which use PSVC material, but distinguishes it only with: "Mitchell fails to anticipate any structuring useful for providing a tactile feedback discernible to a human user of his sensors." '084 Patent, Col. 2, ll. 20-22. These references to the PSVC sensors disclosed in the Mitchell patent, which all use PSVC material, have "particular value as a guide to the proper construction of the term" "PSVC sensor." LG Elec., Inc. v. Bizcom Elec., Inc., 453 F.3d 1364, 1375 (Fed. Cir. 2006), cert. granted, 128 S. Ct. 28, 168 L. Ed. 2d 805 (2007)(No. 06-936, 2007 Term).

The question is whether, in light of the foregoing, one of ordinary skill could read the patent and conclude that patentee was claiming sensors without PSVC material? In view of Phillips and the resulting line of decisions that have wrestled with the "don't import limitations" - "read claims in light of the specification" dichotomy, the court thinks not. Anascape argues that a skilled artisan would realize that a depressible sensor suitable for game controllers that varies electric current in response to varying pressure only by action of a surface effect, is equivalent to such a sensor with PSVC material. That is an argument for infringement by equivalents - a matter for trial, not claim construction. The court will construe this claim term as follows:

"Pressure-sensitive variable-conductance analog sensor" means: "an electricity manipulating device that uses pressure-sensitive variable conductance material to vary electrical output as varying physical force is applied."

The similar terms, "pressure-sensitive variable-conductance sensor," "pressure-sensitive analog sensor," "pressure-sensitive variable-conductance structural arrangement," "pressure-sensitive variable-conductance structure," "pressure-sensitive variable sensor," and "pressure-sensitive . . . button sensor," which appear in the '802, '991, '525 and '700 patents shall be construed the same way.

---

1. "Pressure-sensitive variable conductance material." Used in '084 Patent, Claims 5-6, 11; '802 Patent, Claims 1, 7, 10; '886 Patent, Claim 7; '991 patent, claims 12, 29, 31, 50.
Introduction

Anascape proposed, "a conductive element that provides for variable electrical flow dependent upon the applied force." Microsoft suggested that this term means:

Material that has a conductivity that changes due to a volume effect. As pressure on the material increases the material volume decreases. This decrease in volume of the material increases the internal conductivity through the material. As a result, the conductivity through the sensor increases.

This does not include material utilizing a micro-protrusion surface area effect. In such material, as pressure on the material increases the surface area of contact between the micro-protrusions and the conductive elements increases. As a result, the conductivity through the sensor increases.

The main point of contention is whether the construction should exclude the surface effect - the increased flow of current as two conductors come into contact over a greater area. Because the specification describes a surface effect, it will not be excluded.

Analysis

The skilled artisan would know, and the parties agreed, that "conductivity" (resistance to the movement of an electrical charge) is the inverse of "resistivity." Trans. p. 9-10. In other words, as resistivity goes down, conductivity goes up. The parties also agreed that, as used in these patents, conductivity may refer to resistive or rectifying properties depending on the pressure sensor material utilized. See '802 Patent, Col. 3, ll. 2-3 & '991 Patent, Col. 3, ll. 7-8; Trans. p. 10-11.

This claim, like many others in the patents, says the material is "positioned as a variably conductive element." So Anascape's suggestion to define the "material," which can be used or positioned as an element as "an element," could be misleading, or at the least redundant. Nothing in the patents hints that the PSVC material is a device, like a transistor or a relay in a circuit. It is a substance or compound, as described in detail at '802 Patent, Col. 6, l. 50 - Col. 7, l. 21.

The claim states that the electrical conductivity of the substance (the PSVC material) is altered relative to received force. '084 Patent, Col. 12, ll. 50-52. See also '802 Patent, Col. 2, l. 67 - Col. 3, l. 5. In other words, PSVC material "changes its conductivity with applied pressure to alter the conductance of the electrical path provided thereby . . . ." '802 Patent, Col. 6, ll. 24-26. See also '991 Patent, Col. 6, ll. 28-30.

Referring to "the present invention," the patentee stated "Compressive force against pressure-sensitive variable conductance material 30 causes it to become sufficiently conductive as to allow current flow therethrough, the degree of conductivity being dependant upon the applied, received, or transferred pressure or force." '084 Patent, Col 9, ll. 1-6.

In another patent, the PSVC material is labeled the "active element." '886 Patent, Col. 1, ll. 36-37. "The active element, while a moderate to poor conductor when not under compressive force, drops in resistivity when placed under compressive force, such drop in resistivity being related to the amount of compression of the active element." '886 Patent, Col. 3, ll. 16-20.

The patents describe PSVC material as formed from conductive particles in a rubbery or elastic type binder. The patents specifically refer to U.S. Patent No. 3,806,471 (Mitchell), as having "[a]dditional information regarding such materials." See '886 Patent, Col. 9, ll. 6 43-47; '084 Patent, Col. 7, ll. 8-12; '991 Patent, Col. 6, ll. 61-66, '802, Col. 6, ll. 57-62.

- - - - - - - - - - - - - Footnotes - - - - - - - - - - - - -

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - -
The '471 patent describes and diagrams the way in which the conductive elements in PSVC material are forced closer together as pressure is applied. This creates a greater number of electrical pathways between the conductive elements, thus increasing the conductivity of the material. See '802 Patent, Col. 6, l. 55 - Col. 7, l. 11; '471 Patent (Mitchell) Col. 2, l. 58 - Col. 3, l. 5, Fig. 3-6. This is sometimes referred to as the "volume effect."

Microsoft's proposed definition seeks to exclude "material utilizing a microprotrusion surface area effect." This effect is explained in U.S. Patent No. 5,296,837 (Yaniger). Briefly, a thin coat of resin with conductive particles such as carbon mixed with particles of a less conductive material (stannous oxide in the preferred embodiment) is applied to a supporting ply, creating a base. The stannous oxide particles are larger than the more conductive particles and create "micro-protrusions." As flexible conductors on a flexible base are pressed down on the base, the conductors make contact with the conductive resin and the circuit is completed. As more pressure is applied, more of the flexible conductor material is pushed down around the micro-protrusions, resulting in more contact with the conductive resin and thus a greater flow of current.

The parties do not dispute that one skilled in the art would know that bringing two conductors into contact over a greater area will result in an increase in current flow, assuming voltage is constant. This will be referred to as the "surface area effect." Once good contact is made between conductors of a material with low resistivity (high conductivity) such as copper, the change in resistance as surface area contact is increased might be insignificant, when compared to the overall resistance of the circuit. But with materials of higher resistivity (lower conductivity), such as the PSVC materials described in these patents, the increase in current flow resulting from increasing the area of contact between conductors (the surface area effect) can be significant. See '084 Patent, Col. 7, ll. 28-37.

The problem with expressly excluding a surface area effect in the definition of PSVC material is that Figures 7 and 8 of the '802 patent, and the accompanying text of the specification, describe additional current flow through the PSVC material caused by greater surface area contact between the PSVC material 36 and the circuit traces 32 and 34 (the open electrical contacts in the circuit) as the PSVC material is compressed and flattens across the traces. '802 Patent, Col. 8, l. 58 - Col. 9, l. 4, Fig. 7 & 8. In short, Microsoft's construction improperly limits the definition of the disputed claim term by excluding a preferred embodiment.

Of course, simply because a greater flow of current can be achieved between two electrical contacts by increasing pressure on them, or increasing the surface area of contact, does not mean either contact is made of a PSVC material. The metal used for car battery terminals and cable clamps would not fit the patent's description of a pressure-sensitive variable conductance material, nor would it be recognized as such by a skilled artisan. However, tightening the clamp on the terminal could still improve the flow of current. PSVC material, as described in the claims and specification, and as known to those skilled in the art, must itself change in conductivity as a result of pressure, even though in certain applications increasing the surface area of contact may also increase the flow of current. The court will define this term as follows:

"Pressure-sensitive variable conductance material" means: "a substance that changes in conductivity to allow a greater flow of electric current through it, as pressure is applied to it."

Microsoft stated this definition was acceptable and Anascape's only concern was that "changes in conductivity" was redundant and might be used in later arguments before a jury. Trans. p. 29-32. Since the specifications of the patents make it clear that the conductivity of the material itself changes, even if in some applications there is a surface effect, the slight redundancy is justified. Learned counsel are well equipped to handle a misleading argument before the jury.

Anascape suggests that this term should be construed as "variable electrical flow produced by a button associated with an electricity manipulating device for varying electrical output proportional to varying physical force." Microsoft contends that this term should mean "the conductivity of a pressure-sensitive variable-conductance sensor."

The proposals are substantially similar. In the end the definition of this term really depends on the construction of the prior term, because there is no real dispute over what a button on a game controller is. See Trans. p. 68-71. The button, or dome
cap 28, with the pressure-sensitive conductance material together comprises the sensor. '802 patent, col. 8, ll. 36-45. The court will define this term as follows:

"Pressure-sensitive variable conductance of one of said buttons" means: "the conductivity of a pressure-sensitive variable-conductance sensor associated with one of said buttons."

3090

a. Claim Construction of '744 Patent

i. Claim 1

Claim 1 of the '744 patent reads as follows:

A turf treating machine comprising:

(a) a frame;

(b) means connected to said frame for propelling said frame over the turf to be treated;

(c) a plurality of fluid nozzles mounted on said frame, each of said fluid nozzles being a specified distance apart from adjacent nozzles and having an input port and an output port, the output port of each nozzle being a specified distance above said turf;

(d) pressurized fluid generating means mounted on said frame.

(e) control means connecting said pressurized fluid generating means to the input ports of each of said nozzles so as to produce periodic fluid injections from the output port of each said nozzle at a system pressure sufficient, commensurate with the spacing of said nozzles, to cause said fluid to penetrate through said turf into the soil in a first direction and at the same time create a dispersion of said fluid in a direction generally outward from said first direction of penetration sufficient to coat with dispersion patterns from adjacent nozzles to lift and fracture the soil so as to reduce the general turf and turf subsoil density.

The parties agree that the only disputed clauses in claim 1 are (d) and (e).

Defendant contends that clauses (d) and (e) of claim 1 are means-plus-functions clauses while plaintiff counters that these are not. Whether a claim limitation is in means-plus-function format is a matter of claim construction and is thus a question of law. See Kemco Sales, Inc. v. Control Papers Co., Inc., 208 F.3d 1352, 1360 (Fed. Cir. 2000). Title 35 § 112, P 6 provides that a patentee may define the structure for performing a particular function generically through the use of a means expression, provided however that it discloses specific structure corresponding to that means in the patent specification. See 35 U.S.C. § 112, P 6. See also Valmont Indus., Inc. v. Reinke Mfg. Co., Inc., 983 F.2d 1039, 1042 (Fed. Cir. 1993) (explaining that the patent applicant must describe in the specification some structure which performs the specified function recited in the limitation). The Federal Circuit has referred to § 112, P 6 as embodying a statutory "quid pro quo" since the duty to link or associate structure to function is exchanged for the convenience of utilizing § 112, P 6. See Kemco, 208 F.3d at 1360; B. Braun Medical, Inc. v. Abbott Labs., 124 F.3d 1419, 1424 (Fed. Cir. 1997).

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.
Once a court establishes that a means-plus-function limitation is at issue, it must construe that limitation to determine what the claimed function is and what structure is disclosed in the written specification that corresponds to the "means" for performing that function. Kemco, 208 F.3d at 1360; Chiuminatta Concrete Concepts, Inc. v. Cardinal Indus., Inc., 145 F.3d 1303, 1308 (Fed. Cir. 1998) (after establishing that a means-plus-function limitation is at issue, the district court must construe the function recited and determine what structure has been disclosed in the specification that corresponds for performing that function); Odetics, Inc. v. Storage Tech. Corp., 185 F.3d 1259, 1264 (Fed. Cir. 1999) (claim limitations written as means-plus-function limitations pursuant to 35 U.S.C. § 112, P 6 must be construed to cover the structure described in the patent specification for accomplishing the recited function and any equivalents thereof). A court, however, may not import functional limitations that are not recited in the claim or structural limitations from the written description that are unnecessary to perform the claimed function. Wenger Mfg., Inc. v. Coating Mach. Sys., Inc., 239 F.3d 1225, 1233 (Fed. Cir. 2001).

Use of the term "means" in a claim limitation creates a presumption that § 112, P 6 has been invoked, but that presumption may be rebutted if the properly construed claim limitation itself recites sufficiently definite structure to perform the claimed function. See Kemco, 208 F.3d at 1361. Conversely, absence of the word "means" creates a presumption that § 112, P 6 has not been invoked, but that presumption may likewise be rebutted if the claim limitation is determined not to recite sufficiently definite structure to perform the claimed function. See id.

In particular, plaintiff argues that in clause (d) no function can be associated with the term "means," and thus this clause can only be construed as reflecting an "apparatus providing pressurized fluid." Plaintiff also argues that both clauses (d) and (e) recite sufficient structure to remove them from treatment under § 112, P 6. Plaintiff lastly contends that even if clauses (d) and (e) are construed as means-plus-function clauses, the RZI 700 still infringes as a § 112, P 6 equivalent. 5

5 Plaintiff specifically asserts that defendant's solenoid actuated valve system is the equivalent of plaintiff's mechanical cam actuated valve system when considered "within the context of the invention as a whole." (Pl.'s Reply Mem. Supp. Summ. J. at 11.)

After a careful review of the '744 patent, the court determines that clause (d) of claim 1 is not a means-plus-function clause. Clause (d) calls for a "pressurized fluid generating means." Although containing the word "means," the court agrees with plaintiff that in the absence of an associated function, the use of this word does not signal a means-plus-function clause, but rather indicates an "apparatus providing pressurized fluid." Simply put, in clause (d) there is no function associated with the word "means." Any person of ordinary skill in the art would agree that this element merely refers to an apparatus for providing pressurized fluid, i.e., a pump. Clause (d) is thus construed as covering an apparatus to provide pressurized fluid, i.e., a pump.
PolyVision contends that pretensioned refers only to the condition or state of the flexible member having tension in its installed configuration, while Smart contends that this term refers to the process of applying spring tension to the flexible member.

PolyVision's primary support for its proposed construction is a definition from a mechanical engineering dictionary, which defines pretension as: "The amount of tensile load applied to a bolt or tie-rod when it is installed, but not subjected to its working environment." Dictionary of Mechanical Engineering (4th ed. 1996). PolyVision contends that this definition shows that engineers use the term "pretensioned" to refer to a member that is stressed in its installed condition. It further argues that this definition comports with the usage of the term in the written description, which states:

In this pretensioned condition, any expansion or contraction will be accommodated by a deflection outwardly or inwardly, respectively, of section 46 and its counterpart sections so that an opposing or counter tension or force, arrow 30, is always being applied to membrane 24 to keep it taut and away from surface 18.

(Col. 3, ll. 57-62.)

The primary difficulty with PolyVision's proposed construction is that it is based upon a technical dictionary definition that really has no relevance to the subject matter of the invention at issue. The definition refers to a bolt or a tie-rod, neither of which is a subject of the patent, and the definition in fact refers to a measurement of tensile strength, which is not addressed in the patent. More importantly, although Phillips acknowledges that such extrinsic evidence has its place in construing a patent, it counsels that it is less reliable for a number of reasons but, primarily, because it "is not part of the patent and does not have the specification's virtue of being created at the time of patent prosecution for the purpose of explaining the patent's scope and meaning." Phillips, 415 F.3d at 1318.

Turning to the written description, the Court notes that the description and drawings disclose a substantial basis for concluding that the inventor intended the term "pretension" to connote imparting spring tension to the flexible member. The summary of the invention discloses the focus of the invention as follows:

The invention results from the realization that a truly self-tensioning membrane digitizer can be effected by attaching the membrane in a support structure that includes flexible walls which are pretensioned to deflect and maintain tension on the membrane to keep it spaced from the substrate despite expansion or contraction of the membrane. . . .

(Col. 2, ll. 9-14, 26-28 (italics added).) According to this language, then, to accomplish the purpose of the invention, some force or tension must be applied to the flexible walls themselves in order to allow the opposing flexible walls to maintain the tension on the membrane. This is the essence of "self-tensioning."

Fig. 1, set forth below, illustrates this application where the flexible walls are "pretensioned" or pushed inward relative to the frame.

(GET DRAWING SHEET 1 OF 5

The specification explains that "[f]lexible wall 22 is pretensioned by pushing inwardly as indicated by arrow 29 toward base 14 and toward digitizer area 28 before membrane 24 is attached to wall 22 at 26." (Col. 3, ll. 32-35.) It further explains that flexible wall 22 is in the phantom position indicated by the dotted line and then, after being pushed, assumes the position shown in the full line 22. (Col. 3, ll. 35-38.) In that position, "flexible wall 22 applies a counter tensioning force as indicated by arrow 30 which pulls membrane 24 taut across digitizer area 28 over pacer 20." (Col. 3, ll. 38-40.)

Fig. 5, shown below, shows a different construction in which the flexible sections are pretensioned by applying an outward force.
GET DRAWING SHEET 3 OF 5

The flexible wall 22a is pushed outwardly in the direction shown by arrow 90, and the membrane is attached to the flexible wall. (Col. 4, ll. 24-27.) "After the attachment is complete at 26a, the now pretensioned wall 22a tends to return to its initial position, exerting a tensioning force 92 which stretches membrane 24 tautly over spacers 20a establishing a separation between membrane 24 and conductive surface 18a." (Col. 4, ll. 24-29 (emphasis added).) Similarly, Fig. 9 shows an embodiment of the invention using compressible foam members in place of flexible walls. Column 4, lines 54-67, which describe that particular embodiment, states that "[p]eripheral compressible member 22c is pretensioned by compressing it inwardly toward substrate 16c in the direction of arrow 29c." (emphasis added.) It also notes that after compression, the membrane is attached to the bottom of the substrate and the compression member is then released, pulling the membrane taut across the digitizer area. (Col. 4, l. 67 - Col. 5, ll. 1-4.)

Consistent with this construction, Fig. 4 shows a "jig" or a box "which can be used to pretension" the flexible walls "while the membrane is being attached." (Col. 2, ll. 60-62.) The specification explains that the digitizer is placed into the jig, forcing the peripheral flexible wall 22 inwardly while membrane 24 is attached to flexible wall 22. (Col. 2, ll. 65-67 - Col. 4, ll. 1-2.)

Based upon the foregoing, the Court concludes that Smart's proposed construction is consistent with the patent and accurately describes the term "pretension" as used by the inventor. (Col. 3, ll. 48-52 (stating that "[t]he pretensioning of flexible wall 22 is done simply by applying a lateral force 29, FIG. 3A, to each of the flexible wall sections, for example section 46, while membrane 24 is being attached at 26 to flexible section 46").)

PolyVision contends that Smart's construction must be rejected because it improperly reads manufacturing limitations into a product claim. PolyVision cites AFG Industries, Inc. v. Cardinal IG Co., 375 F.3d 1367 (Fed. Cir. 2004), and 3M Innovative Properties Co. v. Avery Dennison Corp., 350 F.3d 1365 (Fed. Cir. 2003), as support for this argument. However, those cases are distinguishable from the instant case because the products involved in those cases -- multiple layers in a glass product in AFG Industries and "multiple embossed patterns" in connection with pressure sensitive adhesives in 3M Properties Co. -- were not tied to any specific manufacturing process. In contrast, regardless of whether the "jig" shown in Fig. 4 or some other method is used, the flexible sections must be pretensioned by exerting an inward or outward force, as the case may be, in order to obtain the self-tensioning feature of the invention. PolyVision further contends that Smart's proposed construction, which states a process involving pushing the flexible walls inward or outward and then attaching the membrane, is at odds with the plain language of the patent that "[t]he flexible sections are attached to the membrane and pretensioned counter to the tension of the tensioned membrane for deflecting to maintain tension on the membrane to sustain the spaced relationship of the membrane relative to the structure." (Col 2, ll. 21-25.) The Court disagrees. Rather than stating that the membrane may first be attached to the flexible sections before they are "pretensioned," the quoted language merely describes the purpose of the flexible sections in the invention as: (1) attached to the membrane; and (2) pretensioned. Finally, the Court rejects PolyVision's argument that limiting the term "pretension" to the process described in the preferred embodiment is improper. The inventors chose to act as their own lexicographers in defining the term "pretension" and the preferred embodiment, as well as the remainder of the specification, show the precise meaning of this term. See Phillips, 415 F.3d at 1316.

I. PolyVision's Motion Regarding the '309 Patent

PolyVision contends that reconsideration of the Court's construction of the claim terms "pretensioned" and "biased to tension" is required under the Federal Circuit's decision in Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361 (Fed. Cir. 2007), which, according to PolyVision, "clarified and narrowed the law on reading manufacturing limitations into product claims." (PolyVision's Br. Supp. at 2.) The Court has read Andersen and, for the reasons set forth below, disagrees with PolyVision that Andersen compels a different result.

Initially, the Court notes that, contrary to PolyVision's reading, Andersen does not appear to establish any new rule or limitation regarding incorporating "manufacturing limitations" into product claims. Rather, it applied well-established rules of construction (in fact, the same rules which this Court applied in its construction of the claims) to reach the particular
Although PolyVision first cited Andersen in the instant motion for reconsideration, the Court notes that the decision was issued on January 26, 2007, and PolyVision had ample time to bring the decision to the Court's attention prior to its issuance of its claim construction memorandum, had it believed it important to do so.

PolyVision contends that this case is distinguishable from Andersen, which limited the product claim to method of manufacture, for several reasons. First, it contends that contrary to the Court's construction, the specification discloses two embodiments shown in Figures 9 and 10 in which the membrane is attached to the support substrate rather than the flexible members. It also asserts that the specification describes an embodiment in which one end is fixed and the other is flexible, such that the membrane could be attached to the fixed end prior to the storing of spring energy rather than afterward, as required by the Court's construction. This argument fails for several reasons. First, according to the Court's construction, the pretensioning occurs by pushing or imparting spring energy to the flexible member and then attaching the membrane to the flexible member. The fact that the membrane is attached to the support substrate instead of the flexible member in Figures 9 and 10 is irrelevant because the specification explains that the compressible flexible member in Figure 9 is first pretensioned by compressing it inwardly toward the substrate, following which the membrane is affixed to the bottom of the substrate. (Col. 4, ll. 65-67 to Col. 5, ll. 1-2.) Thus, in either situation (attachment to the flexible member or the support substrate), the flexible member is pretensioned (pushed to impart spring energy prior to the attachment of the membrane). PolyVision's point regarding a fixed-end configuration is unavailing, because even in such a configuration, the flexible member would still be pretensioned prior to attachment of the membrane to either the flexible member or the support structure, as required by the invention.

Second, PolyVision argues that the '309 patent specification contains none of the limiting words present in the patents in Andersen, such as "necessary," "critical," or "controlling." The Court rejects this argument because, as fully set forth in the Court's claim construction memorandum, the specification establishes that pretensioning requires that tension be imparted to the flexible members prior to the attachment of the membrane. Thus, while the specification may not contain the exact words of limitation used in the patents in Andersen, the specification establishes that the flexible members must be tensioned prior to the attachment of the membrane.

PolyVision's final argument is that, unlike Andersen, the prosecution history in this case contains no clear disavowal of claim scope to a specific manufacturing process. Nothing in Andersen suggests that the prosecution history must contain a disclaimer of claim scope limiting the claims to a particular manufacturing process. The court in Andersen looked to the prosecution history only because the specification was not entirely clear with regard to the process limitation. The prosecution history resolved this question. In this case, the absence of a disclaimer from the prosecution history is irrelevant because the specification provides sufficient guidance on the proper construction of the disputed claim language.
7. prevent airway collapse, wherein said minimally sufficient pressure is a summation . . .

This phrase is found in Claim 23 of the '575 patent.

Phrase: prevent airway collapse, wherein said minimally sufficient pressure is a summation of a pressure needed to prevent airway collapse and pressure needed to overcome respiratory effort

Construction: prevent airway collapse, wherein said minimally sufficient pressure is a summation of a pressure needed to prevent airway collapse and pressure needed to overcome respiratory effort.

Reasoning: This phrase requires no construction by the court.

Second, the Court finds that "prevent pivoting" means to hinder pivoting from the initial position to the ready position, by less than 45 degrees. Because the customary meaning of "prevent" can be to stop or to hinder, the Court turned to the specification for guidance because "it is dispositive; it is the single best guide to the meaning of a disputed term." Vitronics Corp., 90 F.3d at 1582. To begin, the specification defines the initial position as the locked position and the ready position as the position where the arm is secure and abutting the dimples. When describing the term "prevent pivoting," the specification states that the abutment is positioned such that "further rotation would be restricted . . ." within 45 degrees from the initial position to the ready position. Specification at column 4, 1. 39 (emphasis added). In the Webster's Third New International Dictionary, restrict is defined as "to hamper or to diminish." Indeed, the specification uses the word "restrict" several times to describe what the abutment does to the arm.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

2 Even the definition of "prevent," provided by the Defendants, in the Third College Edition of Webster's New World Dictionary defines prevent as to "hinder."

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Finally, the Court considered the prosecution history and the prior art. In considering the prosecution history, the Court notes that Plaintiff surrendered coverage of latches that do not hinder the latch from pivoting by more than 45 degrees as a condition of receiving its patent and in order to fall outside of the Wolf patent. 3 Thus, an abutment that restricts or hinders rotation beyond 45 degrees is the key delineation between the prior art and Plaintiff's '834 patent. The Court has specifically construed this claim in such a way so as to preserve the validity of the claim. See Modine Mfg. Co. v. I.T.C., 75 F.3d 1545, 1557 (Fed. Cir. 1996).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 The Wolf patent required an abutted latch arm that pivoted past 45 degrees.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In connection with the prosecution history and the prior art, the Court has considered the purpose of the patent. The specification described the purpose of the limitation on the rotation of the arm beyond 45 degrees as a means to prevent a "hazard to adjacent equipment and/or personnel." Specification at column 1, 1. 45-46. While the Court acknowledges that the intent of this patent's design was to hinder rotation beyond 45 degrees in order to reduce the possibility that somebody will be hurt by an arm on the latch that could easily rotate 145 to 165 degrees, such a purpose does not mean that the arm must stop at 45 degrees. Rather, the Court interprets the claim and its intent to mean that the abutment hinders movement.
beyond 45 degrees from the ready position, as a safety mechanism, but does not stop a full rotation of the arm. Therefore, the Court hereby finds that the scope of the ‘834 patent includes two key limitations: (1) an abutment positioned in the path of the latch arm, even if only slightly and (2) this abutment hinders the arm from pivoting more than 45 degrees from its initial position.

C. "Prevent"

1. The claim term and proposed constructions

The relevant portion of claim 42 recites:

42. . . . said shield having forward and rearward edges, said forward edge being adapted for releasable engagement upon a rearward side of a pair of eyeglasses and said rearward edge adapted to engage with a wearer's face and prevent the passage of solid and liquids therebetween. . . .

'688 patent at 14:1-6 (emphasis added).

Preventive proposes a construction of "hinder" for the term "prevent," based in part on dictionary definitions that denote several degrees of meaning. Panoptx contends that the phrase should be construed, as for "blocks" and "resists," to mean "stops or does not allow the passage of liquids or solids." Panoptx argues this construction would be consistent with the alleged overall purpose of the invention, and because "blocks" and "prevent" both appear in claim 42 they should have the same meaning.

2. Plain meaning of the claim

The ordinary meaning of "prevent" is to "keep from occurring." Globetrotter Software, Inc. v. Elan Computer Group, Inc., 362 F.3d 1367, 1380 (Fed. Cir. 2004) (citing Random House Webster's Unabridged Dictionary 1535 (2d ed. 1998)). The claim recites that the rearward edge of the shield is adapted to engage the face so as to keep liquids and solids from passing between the face and the shield edge. Thus, the claim language is focused on the properties of the rearward edge, and the importance of achieving conformal contact between the shield system and face. By this contact, the shield is intended to "prevent" seepage along the interface by preventing gaps from appearing at the interface between face and shield. The claim language does not require any other mechanism, such as applying pressure to keep the shield against the face, to ensure that such a gap does not open or that the interface is resistant to seepage. Thus, the plain meaning of "prevent" as used in the claim is to stop the passage of solids and liquids between the shield and the face.

The claim language, however, is not clear about the degree to which the shield edge stops fluids and solids. This uncertainty arises because of the range of meanings associated with troponyms of "prevent." Manners of "preventing" include: deflect, avert, obstruct, hinder, thwart, frustrate, baffle, stop and block. WordNet: An Electronic Lexical Database (Christiane Fellbaum, ed., MIT Press 1998), available at http://wordnet.princeton.edu; see also Sightsound.com, Inc. v. N2K, Inc., 391 F. Supp. 2d 321, 334-35 (W.D. Pa. 2003) (concluding based on the breadth of definitions in multiple dictionaries that "prevent" incorporates both the "concept of absolutely stopping . . . as well as merely hindering the event" by making it difficult for the event to occur). Given this range of possibilities, it becomes necessary to consult the specification to determine the scope of the invention. Interactive Gift Exp., 256 F.3d at 1331.

3. Specification

The critical question is whether the invention, as described by the specification, requires the shield edge to absolutely prevent the passage of materials between the face and shield, such that it would be appropriate to limit the claim accordingly. An objective of the eye shield system is to provide a sufficient fit "between the shield and the face to adequately protect the eyes from materials splashed onto the face." ‘688 patent at 2:42-43. The shield is to be "resilient and to mold itself to the contours of the face, thus creating a seal preventing entry into the protected area of either liquids or solids splashed on the face." Id. at 3:15-18.
Consideration of the specification as a whole indicates that the eye shield system is not intended to be perfect. First, the words used by the patentee in the summary of the invention, "adequately protect," indicate a tolerance for less than absolute protection. The plain meaning of adequate itself admits of a variable degree of protection that is commensurate with the circumstances. The specification contains no explicit notice that the eye shield system must only provide the highest level of protection, that is, it must be an impermeable shield. Protection adequate to the needs of "any workers who must wear some protective shield" is within the scope of the claim. Therefore, less-than-impermeable shielding is part of the invention.

Second, the lack of any mechanism to ensure a tight, secure fit of the eye shield system to the head and face of wearer also indicates a tolerance for less than absolute protection. The means for keeping the system in place is generally described with reference to Figure 1, as follows: "[w]hile standard temple connectors are shown it is understood that the temple connectors may be of various shapes and may extend around the head of a user and may be adjustable. Any of these types of temple connectors that hold and retain the eyeglasses or eye goggles on a user's head are acceptable." '688 patent at 4:5-10. Based on this description, one of skill in the art would not understand the invention to require positively securing the shield against the face by anything more than the downward angle of a standard temple connector pressing against the rim of the ear. Gas masks and safety goggles known in the art that do absolutely prevent the entry of liquids require more secure retention means in order to create such a seal, but this invention lacks any such teaching or limitation.

Where a claim is expressed in general descriptive words, the court will not put a narrowing modifier before an otherwise general term that stands unmodified in a claim. Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1249-50 (Fed. Cir. 1998). "Prevents" connotes a range of degrees of "keeping from occurring." Panoptx' preferred reading would essentially require the claim to be rewritten as "absolutely prevents." Absent clear indication in the specification to justify this narrowing interpretation, and in view of the invention as understood as a whole, the broader interpretation is preferred.

4. Conclusion

The term "prevent the passage of solids and liquids" as used in claim 42 means to "substantially stop the passage of solids and liquids." 7 See Playtex Products, 400 F.3d at 907. The rearward edge engages with the face to stop, although not to the degree of absolutely stopping, the passage of liquids and solids at the interface. The specification does not require the term to carry only the most restrictive meaning that the rearward edge of the shield "not allow" the passage of liquids or solids.

7 Claim 42 incorporates the two construed terms "blocks passage of liquids and solids" and "prevent passage of liquids and solids." The two should not, simply because they appear together in the claim, have the same meaning. In fact, the presumption is the opposite. See Innova/Pure Water, 381 F.3d 1111, 1119: Pickholtz v. Rainbow Technologies, Inc., 284 F.3d 1365, 1373 (Fed. Cir. 2002). Here, the two refer to different protective modalities. "Blocks" modifies the shield material itself, whereas "prevents" is a limitation on the interface between shield and face. That both are construed in a similar sense - stopping, but not absolutely - is not to say they have the same meaning. The different modes, made operational by different principles, are however understood to achieve a similar degree of performance from the intrinsic evidence, read as a whole.
passage means to pass from one place to another. As such, in the context of the claims at issue, the court interprets the wall means to call for a virtual elimination of any air from passing through the seal. On the other hand, the shaft seal means requires a disruption of any smooth, continuous air travel, which could include something less than a virtual stoppage.

This interpretation is further supported by the specification in this case. As to the wall means, the specification describes a mounting plate and sealing compound that "effectively prevents passage of atmospheric air." The inclusion of a suitable sealant demonstrates a desire for an airtight seal. The use of the word "effectively" does not detract from this conclusion. Effective means to produce a desired effect. Adding the word "effectively" simply reinforces the need for an airtight seal.

Regarding the shaft seal means, the specification states that such seal is to be used to "provide a gas tight seal." Gastight means impervious to gas. Gas, in turn, is defined as a gaseous mixture other than atmospheric air. Thus, gastight does not necessarily mean airtight. Accordingly, the specification is consistent with the interpretation of the claim that allows for some air to pass through the shaft seal means.

The prosecution history sheds additional light on this interpretation. In response to an initial rejection of the patent, the applicant argued that "preventing the passage of atmospheric air through the upright passage to the propeller and further providing a mechanical shaft seal … has been found essential to avoid cavitation at the propeller." This reflects an understanding by the applicant that the wall means only was designed to prevent the passage of air. In a later argument, the applicant submitted that it would not be obvious from the prior art to "additionally provide a mechanical shaft seal … for the dual purpose of preventing the flow of atmospheric air through the shaft enclosure to the anti-deflection bearing and also to prevent flow of atmospheric air through the shaft enclosure to the propeller." This reinforces the court's view that the shaft seal was not intended to prevent virtually all air from passing through.

Thus, it is evident from reading the claim language, the specification and the relevant prosecution history that the wall means was intended to create an airtight seal while the shaft seal means was intended to allow some amount of air through. The critical question remains, however, as to how much air is some air in the context of the shaft seal claims.

Plaintiff contends that any amount of air is acceptable so long as it does not allow for cavitation of the propeller and drying of the anti-deflection bearing. It is apparent from a reading of the specification and prosecution history, however, that plaintiff's claims contemplate a minuscule or negligible amount of air to pass through the shaft seal. While some amount of air greater than that may not cause cavitation or bearing drying, so long as it is more than a minuscule or negligible amount, it does not run afoul of the claims at issue.

Plaintiff places heavy reliance on the case of Read Corp. v. Portec, Inc., 970 F.2d 816 (Fed. Cir. 1992), in arguing that the term "prevent" in the claims must be interpreted to mean preventing sufficient amounts of air to achieve the function attributed to it in the specification, that is, to eliminate excess vibration of the propeller and drying of the anti-deflection bearing. The court is unpersuaded by the Portec case, however, as there the claim limitation described the short end of the device as closed and the long end of the device as "completely" open. Id. at 823. Thus, the court in Portec concluded that "closed" did not mean completely closed. Id. Accordingly, a jury could reasonably find that the accused device literally infringed so long as its short end was sufficiently closed to the ground to effect its intended purpose of separating the soil types during the scooping process. Id.

In this case, the claim language, specification and history do not leave the question of how much air is allowable open-ended as was the case in Portec. Here, the court has already interpreted the claims to require the allowance of only a minuscule or negligible amount of air. 2 Anything greater will not literally infringe the patent.

2 Having so interpreted the claims as to the wall seal means and the shaft seal means, the court denies plaintiff's motion for
Aqua-Aerobic argues that both of these claim clauses must be interpreted as permitting the passage of more than a minuscule or negligible amount of air, for its engineering expert testified that persons of skill in this field of mechanics would understand that the structure described in the specification is not air-tight. Aqua-Aerobic states that the correct claim construction is that the seals prevent the passage of sufficient air to cause cavitation at the propeller. From this construction, Aqua-Aerobic argues that the Aerators mixer must be in infringement because it does not experience cavitation at the propeller.

Aerators responds that the specification states, clearly and explicitly, that the patented invention is the sealing of the system to exclude all atmospheric air. Aerators argues that the claims must be construed as they are written and as the invention is described in the specification, and that these critical limitations can not be negated by a litigation position, even if supported by evidence, that contradicts the plain reading of the specification and claims. Aerators states that its system is not air-tight, and that its expert witness demonstrated that the Aerators mixer passed significantly more than a negligible or minuscule amount of air. Thus Aerators states that its mixer can not infringe the claims.

The expert witnesses for both sides agreed that persons of skill in this field would understand that the structure described in the '771 patent is not air-tight. The district court stated that it had not considered the expert evidence, stating that Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583, 39 U.S.P.Q.2D (BNA) 1573, 1577 (Fed. Cir. 1996) barred consideration of evidence extrinsic to the patent documents. However, expert testimony that is admissible in the proceeding, see Fed. R. Evid. 702, 3 may be considered by the court and given weight appropriate to its content. See Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1308, 51 U.S.P.Q.2D (BNA) 1161, 1167 (Fed. Cir. 1999) ("Despite the district court's statements to the contrary, Vitronics does not prohibit courts from examining extrinsic evidence, even when the patent document is itself clear.")

The experts agreed that the system is not air-tight. However, the district court's claim construction is in accord with the teachings of the specification, which do not permit more than a negligible or minuscule amount of air to enter and pass through the mixer. The undisputed testimony that experts would understand that the described sealing system would not produce an air-tight device, does not broaden the claims to the extent Aqua-Aerobic now proposes, that its claims should be construed to reach a system that passes a significant amount of atmospheric air. This is directly contrary to the limitations in the claims and the description in the specification.

Expert testimony is often useful to clarify the patented technology and to explain its meaning through the eyes of experience, but it may not correct errors or erase limitations or otherwise diverge from the description of the invention as contained in the patent documents. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 981, 34 U.S.P.Q.2D (BNA) 1321, 1331 (Fed. Cir. 1995) (en banc) ("Extrinsic evidence is to be used for the court's understanding of the patent, not for the purpose of varying or contradicting the terms of the claims.") aff'd, 517 U.S. 370, 38 U.S.P.Q.2D (BNA) 1461, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). The district court correctly rejected Aqua-Aerobic's proposal that the claim should not
be limited by the amount of air that passes or flows through the system but instead should be construed to cover any downflow mixer that does not suffer cavitation at the propeller. That is not the invention described and claimed by the patentee.

Aerators presented, through its expert, experimental evidence that the Aerators mixer admits more than a negligible or minuscule amount of air to the propeller. This evidence was not controverted by any technical submission of Aqua-Aerobic, although Aqua-Aerobic’s expert generally criticized the experiment and the conclusion drawn. However, Aqua-Aerobic did not proffer any evidence to show the extent of Aerators’ exclusion of air, or to show any relation between the absence of cavitation in the Aerators mixer and the exclusion of air. Aqua-Aerobic relied solely on Aerators’ advertising statement that its mixer does not add air to the system being mixed, and on the argument that since the Aerators mixer does not experience cavitation it must practice the ‘771 invention. Aerators responds that it indeed does not experience cavitation, and attributes this result to improved design, not to the exclusion of air.

Aqua-Aerobic did not proffer evidence whereby a reasonable jury could have found infringement, either literally or under the doctrine of equivalents, of claims that permit no more than a minuscule or negligible amount of atmospheric air to pass to the propeller. The summary judgment of non-infringement is AFFIRMED.

3098

1. "preventing the formation of an air pocket"

Plaintiff's Proposed Construction: "preventing the formation of an air pocket"

Defendant's Proposed Construction: "throughout the mixing process (or while the blades are rotating) the potential for the formation of an air pocket around the rotating blades is eliminated before the air pocket can begin to form" and expressly excludes "stirring to disperse, dislodge, or break-up an air pocket after it has begun to form"

The Court's Construction: "preventing the formation of an air pocket [around rotating blades positioned in a pitcher of a blender] but not including a method of stirring to disperse, dislodge, or break-up an air pocket after it has begun to form"

Plaintiff urges the Court to adopt the ordinary meaning of this phrase but then goes on to assert that the ordinary meaning of "preventing" includes eliminating an existing air pocket so long as it is eliminated before it becomes so large that it creates dead space around the blades. Defendant, on the other hand, asserts that the word "preventing" must be construed to exclude methods that eliminate an existing air pocket, such as stirring, based on the doctrine of prosecution disclaimer. Defendant also seeks to add a limitation requiring the method to be performed "throughout the mixing process (or while the blades are rotating)." Plaintiff responds by arguing that there was no unambiguous disclaimer of claim scope during prosecution and that, in any event, the disputed term appears in the preamble of the claim and, thus, should not limit the scope of the claim.

The preamble will be relevant to the scope of the claim if it limits the claimed invention or is "necessary to give life, meaning, and vitality to the body of the claim." E.g., MBO Labs., Inc. v. Becton, Dickson & Co., 474 F.3d 1323, 1330 (Fed. Cir. 2007) (holding that where the patentee provided a specific meaning for a term in the specification and the prosecution history, that term, which appeared in the claim preamble, was limited to the meaning given it by the patentee).

The Court finds that the term "preventing" in the preamble of Claim 1 is "necessary to give life, meaning, and vitality to the body of the claim." First, the inventors repeatedly emphasized during prosecution that preventing the formation of an air pocket was fundamental to their invention and used this argument to distinguish their invention over the prior art. See In re Cruciferous Sprout Litigation, 301 F.3d 1343, 1347 (Fed. Cir. 2002) (a preamble may be limiting if it recites an essential step or the inventor relied on the preamble during prosecution to distinguish the claimed invention from the prior art). Further, the term "preventing" also appears in the body of the claim: "thereby preventing the formation of an air pocket." "When limitations in the body of the claim rely upon and derive antecedent basis from the preamble, then the preamble may act as a necessary component of the claimed invention." NTP, Inc. v. Research in Motion, Ltd., 418 F.3d 1282, 1306 (Fed. Cir. 2005).
The Court also finds that plaintiff's proposed claim language is contrary to the plain and ordinary meaning of "preventing." To "prevent" something is to keep it from occurring at all. Plaintiff's position would expand the meaning of "preventing" beyond its ordinary and customary meaning to include "eliminating" an air pocket that has already formed. Plaintiff's position finds no support in the intrinsic evidence. First, plaintiff argues that there is a difference between the "air pocket" and the "dead space" or the "air pocket around the blades." Plaintiff directs the Court to the following from the specification in an attempt to establish this point: "In the absence of the plunger accessory [], and in particular when processing viscous fluids, such action may tend to form an air channel extending from the blades to the top of the fluid much like a whirlpool. Eventually, an air pocket will form around the blades which renders the blades ineffective for a total blending of the fluid." These sentences, however, do not distinguish a nascent "air pocket" from an "air pocket around the blades." Instead, they distinguish the "air channel" from the "air pocket." This excerpt from the specification does not support plaintiff's position that "preventing" can also include "eliminating."

Plaintiff also argues that the inventors' statements during prosecution do not amount to a "clear and unambiguous" disclaimer of stirring operations, because the prosecution history directed to the apparatus claims cannot serve to limit the method claim of the '021 Patent. However, the cases cited by plaintiff in support of this argument all involved instances where the words used in the method claims in dispute were different from the words in the earlier-prosecuted apparatus claims. Such is not the case here. The claim term "preventing the formation of an air pocket" appeared in the preamble of at least one of the independent apparatus claims of the '892 application. Thus, any arguments made to the examiner defining the word "preventing" are relevant to the interpretation of the identical term that appears in Claim 1 of the '021 Patent.

During prosecution of the '892 application, the inventors presented argument to the examiner to overcome rejections based on prior art. The inventors responded to all of the novelty rejections together: "Turning now to the rejections based on prior art, … It is believed that these rejections are in error based primarily on a fundamental distinction between the present invention and the prior art." In their remarks to the examiner, the inventors repeatedly emphasized that their invention was the prevention of the air pocket, which invention was "fundamentally" different from stirring to dislodge an already formed air pocket. Nothing about those statements was ambiguous.

The inventors also made this distinction specifically in the context of the method claim: "Because the operation of the plunger of the present application is completely distinguishable from a stirring operation, Applicants have also added a method claim." (emphases added) The referred to "stirring operation" was defined elsewhere by the inventors as dispersing or dislodging an air pocket. Accordingly, stirring operations were expressly and unambiguously disclaimed during prosecution.

Plaintiff also argues that the statement in the specification that the plunger "can also be utilized by the user as a stirring mechanism" requires the Court to adopt a contrary meaning. The Court disagrees. The Court must construe the claim terms in light of the specification and also the prosecution history. While the specification may provide for multiple objects of the invention or broad meanings of claim terms, the inventors may also limit the meaning of those claim terms during prosecution. E.g., Phillips, 415 F.3d at 1317. That is exactly what the inventors did here.

Finally, defendant seeks the addition of a limitation to this claim element, namely that the method be performed "throughout the mixing process (or while the blades are rotating)." While, as a practical matter, it may make sense that the plunger must be present in the pitcher at all times during mixing to prevent the formation of an air pocket, defendant points to no evidence in the specification or prosecution history to so limit the claim. Further, the claim already provides for a "method of preventing the formation of an air pocket around rotating blades." (emphasis added) Therefore, the Court finds it inappropriate to add defendant's proposed limitation to Claim 1.

In sum, the Court finds that the prosecution of the '892 application does serve to limit the term "preventing" as it appears in Claim 1 of the '021 Patent. The Court agrees with defendant that plaintiff has disclaimed "stirring to disperse, dislodge, or break-up an air pocket after it has begun to form." Because the Court needs no assistance in understanding the technology involved or the meaning of the terms at issue, the Court declines to consider the dictionary definitions provided by defendant.
The Court adopts Dell’s construction and construes “primary display” to mean “a first display in a multi-display system.” The only dispute relates to the meaning of “primary.”

MASS proposed the term be construed as “the original, principal electronic display supported by the computer’s main chassis and supplying a visible display area of a given size.” MASS offers no intrinsic support for requiring the primary display to be the “original, principal” display. MASS ignores its own extrinsic evidence’s definition of “primary;” instead, it relies on the definition of “secondary” for support. MASS also requires the display to be supported by the computer’s main chassis, which is an improper attempt to import a limitation from a preferred embodiment. See Philips, 415 F.3d at 1323.

As with the “connected to” terms, neither the specification nor claim language provide a special meaning for “primary”; thus, its plain and ordinary meaning applies. See Enercon, 151 F.3d at 1384. As MASS’s own extrinsic evidence confirms, “primary” ordinarily means of “first rank” or “first in order of time.” See MASS’s Response Brief, Ex. H. Also, the inventor implicitly adopted Dell’s proposed ordinary meaning by using the term “first” and “primary” interchangeably to describe display. See '170 patent, Col. 6:50–51 (“system of claim 20 . . . adjacent said first display”). Dell’s proposed construction properly incorporates this ordinary meaning. Accordingly, the Court construes “primary” to mean “a first display in a multi-display system.”

7. “[P]rimary metal particles settling area"

This term is contained in an independent claim in the 781 patent 115 and the 117 patent. 116

As to this term, the Court construes the following meaning: the first and most important settling area, also implying there is more than one settling area. The claim language of both patents explicitly states the exterior surface of the magnets defines a primary metal particles settling area. While the 781 patent Abstract and specification make no special reference to a primary settling area, the Abstract of the 117 patent explains that each magnet member forms a primary debris settling area. Further, the specification explains that the primary debris settling area is "defined by the exterior surface of the magnet member" 117 and a secondary debris settling area is "defined by a surface, which is located immediately behind the inclined surface of the protector." 118 The specification language establishes that there are two distinct settling areas, with two distinct definitions, when mention is made of primary and/or secondary.
(2) "primary spectacle frame" (claims 12, 16 and 24) Plaintiffs argue that "primary spectacle frame" means "the entirety of the primary eyeglass frame with the exception of the lenses, the plastic nose pieces (which touch the upper sides of the wearers's nose), and the legs . . . which extend back over the wearer's ears." JS, Exh. B at 1. Plaintiffs further state that the primary spectacle frame "includes the lens rims (if provided), nose bridge, extensions, projections (if provided), and first magnetic member." Id.

Defendant does not dispute the components which Plaintiffs contend are included in the primary spectacle frame. Instead, Defendant contends that the primary spectacle frame also includes "two lens rims of a continuous eye-loop type to secure eyeglass lenses as depicted in Figures 1 and 3" of the patent. JS, Exh. D at 1. Defendant's proposed construction infers that the primary spectacle frame cannot include rim locks. 5 Defendant points to a statement that David Chao, the inventor of the '747 patent, made during the prosecution of patent application 847,710 (the "'710 Application"). 6 Def. Opposition at 6:9-13. Specifically, David Chao stated that "[t]he [Richard] Chao ['207] Patent has not explicitly described using rim locks to attach primary frames to auxiliary frames. In fact, there is no discussion of rim locks in the Chao Patent." Prosecution File History of the '207 Patent, Declaration of Dave B. Koo ("Koo Decl."), Exh. O at 1459.

5 A "rim lock" is a structure built in the lens rim of the spectacle frame, which allows the spectacle frame to be opened so that lenses can be easily inserted. The rim lock usually includes an upper and a lower member, each with a hole for engaging with a fastener. See e.g., U.S. Patent Application No. 847,710, Koo Decl., Exh. O at 1398 and 1404 (describing a spectacle frame with rim locks).

6 Patent Application No. 847,710, filed on April 28, 1997, was directed to an eyeglass assembly wherein the spectacle frame includes rim locks. See Koo Decl., Exh. O at 1396. The application was deemed abandoned by the PTO on August 16, 1999, after the applicant failed to timely respond to a PTO office action. See PTO Notice of Abandonment, Id. at 1471-72.

The PTO examiner, however, was not persuaded by David Chao's attempt to distinguish the '207 Patent on the basis of rim locks. Specifically, in a subsequent and final Office Action dated January 3, 1999, the PTO examiner stated:

Claims 1-2 [of the 710 Application] are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claim 1 of [the '207 Patent]. Although the conflicting claims are not identical, they are not patently distinguishable from each other because the claimed invention in claims 1-2 is substantially similar to that in claim 1 of Chao '207 [Patent].

Koo Decl., Exh. 0 at 1466.

In addition, since the patentee is not required to describe in the specification every conceivable embodiment of his or her invention, the '545 Patent did not need to include a discussion or drawings of primary frames with rim locks for the claims to cover that particular embodiment. See Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1344 (Fed. Cir. 2001) (stating that a patentee "is not required to describe in the specification every conceivable and possible future embodiment of his invention.").
Therefore, the court declines to limit the definition of a "primary spectacle frame" to a continuous eye-loop type. Instead the Court construes "primary spectacle frame" to mean the entirety of the primary eyeglass frame with the exception of the lenses, the plastic nose pieces (which touch the upper sides of the wearer's nose), and the legs, which extend back over the wearer's ears; thus, the primary spectacle frame includes the lens rims (if provided), nose bridge, extensions, projections (if provided), the first magnetic member and conceivably rim-locks.

2. "Printed board" and "Wire on a printed board"

The parties have asked the court to construe "printed board" and "wire on a printed board." Because construction of these two terms involves the resolution of a single disputed issue, namely, whether a wire on the printed board must be printed or can be discrete, the court will address the construction of these terms together.

Claim 1 of the '641 patent uses these terms as follows:

1. A modular jack to be mounted on a circuit board, said modular jack comprising:
   
a printed board containing an electronic element for suppressing noise;

   a contactor for contacting with a plug, said contactor being electrically connected with the electronic element by a wire on the printed board;

   a terminal for contacting with the circuit board, said terminal being electrically connected with the electronic element by a wire on the printed board; and

   an insulating housing for encasing the printed board.

As to "printed board," Murata proposes the following construction:

A generally flat piece of material typically fabricated from insulating material that provides support and structural integrity for a plurality of interconnected components comprising a circuit. In printed circuit board technology, some or all of the conducting interconnection pattern is formed on the board.

Murata's Opening Brief, at 17. Bel Fuse proposes:

A flat board made of nonconducting material on which electronic components are adapted to be mounted and electrically connected by a pattern of conductive metal pathways or traces that are printed on the surface of the printed board.

Bel Fuse's Responsive Brief, at 11. Thus, the parties' primary dispute as to the construction of "printed board" is whether all of the wires on the printed board must be printed.

As to "wire on the printed board," Murata proposes: "A conductive metallic element interconnecting various regions, or contributing to the interconnecting of various regions, on the printed board." Murata's Opening Brief, at 20. Bel Fuse proposes: "A conductive metal pathway or trace formed (printed) on a surface of a printed board for electrically connecting components held on the board." Bel Fuse's Responsive Brief, at 11. As with "printed board," the parties dispute whether a "wire on the printed board" must be a printed wire.

The court begins with an examination of the specification of the '641 patent. As part of the summary of the invention, the specification states: "A contactor for contacting with a plug and a terminal for contacting with a circuit board are electrically connected with the electronic element by wires on the printed board. "641 Patent, col. 2, ll. 1-4. The specification also describes three preferred embodiments. As to the first embodiment, it states that "the printed board 30 has printed wires 33 and 34 on both sides," id. at col. 3, ll. 23-24 (emphasis added), and "[i]n order to increase and decrease the number of signal circuits, it is only required to change patterns of the wires 33 and 34 on the printed board 30." Id. at col. 3, ll. 59-62.
"Design of the wires 34 on the printed board 30 is comparatively free, and the pitch P among the holes 32, that is, the pitch among the terminals 36 can be set to 1.02 mm which is the pitch of an ordinary circuit board on which the modular jack is mounted." Id. at col. 4, ll. 11-16. Likewise, the second and third embodiments disclose printed wires. See id. at col. 4, ll. 22-23 ("printed wires 44 and 45 on the board 41 are connected to chip inductors 40."); col. 4, ll. 37-39 ("printed wires 54 and 55 and an earth electrode 57 on the board 51 are connected to the [chip] capacitors 50."). Finally, the specification states:

Although the present invention has been described in conjunction with the embodiments above, it is to be noted that various changes and modifications are apparent to those who are skilled in the art. Such changes and modification are to be understood as included within the scope of the present invention defined by the appended claims.

Id. at col. 4, ll. 50-56.

Thus, the preferred embodiments in the specification of the '641 teach only printed wires on the printed board, but the specification does not expressly exclude the use of discrete wires and states that the invention includes variations to the preferred embodiments that would be apparent to persons of ordinary skill in the art. The question then becomes whether a person of ordinary skill in the art would recognize that some of the printed wires could be replaced by discrete wires.

Murata argues that jumper wires are well-known in the art; jumper wires create "a direct electrical connection, which is not a portion of the conductive pattern, between two points in a printed circuit." The Modern Dictionary of Electronics 532. Murata also cites a photo of an IBM circuit board which includes a jumper wire and the NASA Workmanship Standards which provide standards for the use of jumper wires on printed boards. Exs. 26 and 30 to Murata's Opening Brief. Because the use of jumper wires is well-known in the art and the patent does not specifically exclude them, Murata argues that "printed board" as used in claim 1 of the '641 patent can include discrete wires as well as printed wires and that "wire on a printed board" as used in claim 1 can be either a discrete wire or a printed wire.

Bel Fuse argues that a "wire on a printed board" as used in claim 1 includes only printed wires. Bel Fuse relies on the description of the preferred embodiments in the specification of the '641 Patent, which, as discussed above, include only printed wires. Bel Fuse also argues that one of the objects of the invention of the '641 Patent is that "[a] change in wire patterns on the printed board meets an increase of the required number of signal circuits, thereby never requiring more space." '641 Patent, col. 2, ll. 15-18. Because wire patterns on a printed board are composed of printed wires, Bel Fuse argues that, to achieve this advantage, the invention must include only printed wires. However, Bel Fuse has not explained why this advantage could not be achieved if a discrete wire was used for a connection while the remaining pattern was composed of printed wires, and Bel Fuse does not argue that discrete wires on the type of printed board used in the '641 patent are not known in the art.

Significantly, limiting a "printed board" to one with only printed wires or traces and a "wire on a printed board" to a printed wire would restrict the interpretation of these terms to the preferred embodiments, despite language in the specification saying that modifications apparent to a person of ordinary skill in the art are not excluded. Murata has provided evidence that the use of jumper wires is known in the art, and Bel Fuse has provided the court with no reason to believe that such the modification of using a jumper wire(s) would not have been apparent to a person of ordinary skill in the art. Thus, the court finds that adopting a construction that excludes discrete wires would improperly import a limitation from the specification into the claims. Phillips, 415 F.3d at 1323 (stating that courts should avoid "reading limitations from the specification into the claim"). The court construes "printed board" as "a generally flat piece of material typically fabricated from insulating material that provides support and structural integrity for a plurality of electrically interconnected components comprising a circuit, with some or all of the conducting interconnection pattern formed on the board," and the court construes "wire on the printed board" as "a conductive metallic element interconnecting various regions, contributing to the interconnecting of various regions, on the printed board."

3103

J. Ref. Nos, 15, 22, and 24 "Printer."

This disputed term is recited in or referred to in Claims 5, 21, and 24.
The parties have agreed that Ref. Nos. 15, 22, and 24 should be grouped together because they can be decided on the construction of the single term "printer."

The Court adopts the reasoning set forth in Ref. No. 13, discussing the inventor's intention that the printer provide no additional record of the voting event. The Court construes the term "printer" as follows:

A printer that retains no record of the data printed (including but not limited to a thermal jet printer, a dot matrix printer, an ink-jet printer, a bubble jet printer, a laser printer, and the like).

---

1. The '798 patent -- Claim 1.
   a. "Printer." This phrase is not limited to the IBM 3800 printer. See Moore U.S.A. v. Standard Register Co., 229 F.3d 1091, 1111 (Fed. Cir. 2000).

5. "PRIOR AGREEMENT"

Travel Sentry proposes that "prior agreement" be defined as an "an agreement that is binding and enforceable by law between the baggage screening entity and another party to process locks pursuant to the special procedure." Tropp advances an alternative definition: "a prior arrangement between the luggage or baggage screening entity and another party to process special locks in accordance with a special procedure."

The term "prior agreement" appears in claims 1,9,14, and 18 of the 537 patent and claims 1 and 10 of the 728 patent. The dispute over whether the term "baggage" should be construed as synonymous with "luggage" having been resolved, the principal remaining difference in the parties' proposed constructions hinges on whether a prior agreement, within the meaning of the claims, must be understood as a legally binding and enforceable agreement. Essentially, Travel Sentry argues that the whole objective of the invention is defeated if the screening entity can choose whether or not to follow the agreed-upon special procedure at its own whim. (Pl.'s Br. 13).

The patent claims themselves lend no support to narrowly construing "prior agreement" as an agreement that is legally binding and enforceable by law. "Prior agreement", as reflected in the claim language of both patents, contemplates some coordination and pre-planning on the part of the screening entities regarding possession of the master keys to the special locks. That is all. Additionally, the specifications of both patents fail to draw any distinctions about how formal such arrangements should be; neither party has pointed to any prosecution history supporting any such limiting distinction. Since the Court finds no need to construe "prior agreement" claustrophobically, it rejects any requirement that a "prior agreement" must be a legally binding and enforceable one. Therefore, the Court construes the term "prior agreement" as "a prior arrangement between the luggage screening entity and another party to process special locks in accordance with the special procedure."

9. "prisms"

As claim 1 describes it, a photolithographic "exposure apparatus" includes, inter alia, a "plurality of prisms of which at least one is movable along the optical axis, arranged on the optical axis." See Patent '336 at 44:27-38. Two questions grow from this claim text: one, whether the generic "prisms" term embraces so-called conical (or cone) prisms or is limited to polyhedral forms, and, two, whether Nikon nevertheless acted as its own lexicographer when using the word "prisms." See Anchor Wall Systems, Inc. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1306 (Fed. Cir. 2003) ("The presumption in
favor of the ordinary meaning of claim language as understood by one of ordinary skill in the art may be overcome where the
patentee chooses to be his or her own lexicographer by clearly setting forth a definition for a claim term in the
specification.”) (citation omitted); see also Akamai Techs., Inc. v. Cable & Wireless Internet Servs., Inc., 344 F.3d 1186,

Taking the second question first, the court finds that Nikon did not act as its own lexicographer regarding the term "prisms." The Federal Circuit has long noted that, when attempting to act as a lexicographer, a patentee must posit new or different definitions with clarity, deliberateness, and precision. See, e.g., In re Paulsen, 30 F.3d 1475, 1480 (Fed. Cir. 1994). Nikon did not do so here, leaving completely impressionistic any attempt to assign "prism" a meaning different from--or otherwise antithetical to--common understanding. The specification language does, of course, expressly disclose a "so-called cone prism having a conical shape inclined incidental surface and the emission surface so that the irradiation light beams are formed into the annular band shape." See Patent '336 at 32:24-30 (referencing Figure 23A). But the specification language posits this disclosure in reference to a different embodiment and a distinct function (viz., to distribute an illumination beam in an annular portion) than those at issue in the relevant claim language. Id. at 45:29-45. Plain as it is that Nikon referenced "so-called cone prism[s]" in crafting the '336 patent invention, the evidence Nikon adduces does not "provide [the type of] reasonable clarity, deliberateness, and precision sufficient to narrow the definition of the claim term in the manner urged." Abbott Labs. v. Syntron Bioresearch, Inc., 334 F.3d 1343, 1354-1355 (Fed. Cir. 2003). But it is unnecessary to rely on Nikon's self-styled lexicography to fit conical prisms within the broader meaning of the "prisms" term. Prisms of a cone shape are expressly contemplated by the patent, and no linguistic or scientific rule mandates that "prisms" possess two flat planes rather than one flat plane with an affixed conical surface. The essence of a prism is simply that it alters or refracts the direction or path of incident light; like any other prism shape, conical prisms may perform this function, even if it does not do so in a manner identical to a polyhedral prism. Specification language makes clear that a lithographic exposure apparatus comprises a surfeit of prism forms: "Pyramid type prism[s]," "polyhedron prism[s]" (of convex and concave varieties), and "cone prism[s]" occupy various parts of the overall apparatus, see Patent '336 at 23:1-13; 32:24-28, and the claim itself identifies a "plurality of prisms," id. at 44:28-38, making unequivocal that the "prism" term is an incorporative one. The court thus includes conical prisms within the generic category of "prisms," construing "prism" to mean "an optical element, made up of two or more planar or conical surfaces, capable of changing the direction or path of light."
5. "Profile"

The parties offer different interpretations of the term "profile" as used in claim 1. Plaintiff argues that "profile" means "an outline of an object." (Plf. Brief at 16). Defendants suggest that the term "profile" is synonymous with "cross-sectional view." (Def. Brief at 11). This distinction is important because an outline of the gauge insert would not include voids in the filler, such as the pin cavity. However, the pin cavity would be included in a cross-sectional view of the insert.

In common usage, profile can mean either an outline or a cross-section. See WEBSTER'S II NEW COLLEGE DICTIONARY at 883 ("1 . . . b. A representation of an object or structure seen from the side. 2. An outline of an object."); MERRIAM WEBSTER'S COLLEGIATE DICTIONARY at 931 ("1: a representation of something in outline . . . 3: a side or sectional elevation . . ."). However, the claim is better understood as using the term synonymously with "cross-section." The specification refers to Figures 2 & 5, which show "cross-sectional views" of the gauge insert. (Plf. Brief, Exh. 1, col. 2, ln. 27 & 35; id., col. 5, ln. 42). The drawings themselves are not outlines, but show the entire structure of the insert, including the pin cavity. Therefore, the Court finds that "profile" means cross-section.

3109

e. "does not project laterally beyond the chassis"

The defendants request that the Court construe the term "does not project laterally beyond the chassis." The term appears twice in claim 1, once at the conclusion of the "tail articulation means" limitation and once at the conclusion of the "head articulation means" limitation. In each instance, the term describes the way the lateral conveyors fold when the plant is in transport mode. That is, the conveyor folds so that it "does not project laterally beyond the chassis."

The defendants propose that this term be interpreted to mean that "no elements of the lateral conveyor extend or protrude beyond the longitudinal beams." The plaintiffs object to the replacement of "chassis" with "longitudinal beams", and further urge the Court to construe "project" to mean "to jut out: extend beyond a given line."

As discussed above, the Court construes "chassis" to encompass more than just the longitudinal beams described by the defendants. The use of "chassis" in this part of the patent must conform to the Court's construction, and the Court therefore rejects the defendants' request that "chassis" be replaced with "longitudinal beams" in the construction of "does not project laterally beyond the chassis."

With respect to interpretation of the word "project", neither party argues that this term has a special technical meaning in this context. The Court finds that the entirety of the patent, including the drawings of the preferred embodiment, belie the defendants' argument that the term "project" would admit of elements that extend, even minimally, beyond the device's chassis. Thus, the Court finds the term "does not project laterally beyond the chassis" to mean "does not extend, in any amount, laterally beyond the chassis".

GO BACK

3110

19. Projecting

The Plaintiffs request construction of the term "projecting" as used in claims 1, 10, 27, and 31 of the '267 patent; in claims 39, 40, 41, 44, and 49 of the '410 patent; and, in claims 1, 21, 22, and 23 of the RE '439 patent. The Plaintiffs propose that the projecting be construed according to its ordinary meaning as "protruding." (Pls.' Open. Br. 35.) Pergo has not responded to the Plaintiffs' proposed definition.

Claim 39 of the '410 patent, in pertinent part, states: "with a locking strip at one long edge and at one short edge, each locking strip extending throughout substantially an entire length of the corresponding edge of the panel and being provided with a projecting locking element." ('410 patent, 14:22:26.) (Emphasis added). Project is defined as to "extend forward or out," and protrude is a synonym. Webster's II New Riverside University Dictionary 940. Therefore, the Court construes...
"projecting" as "protruding."

GO BACK

3111

z. "Projecting" (Claims 34, 43)

140. This claim term describes the operation of the movable element (Claim 34) and the movable projecting element (Claim 43). LaGard identifies these elements in the '656 patent lock with spherical detent ball 96 which is normally positioned below the upper surface of the solenoid housing. When the solenoid is activated, the detent ball projects, extends or protrudes outwardly of the solenoid housing to a detented position. Col. 6, lines 15-20. Thus, as described and illustrated in the '656 patent specification, "projecting" means to be pushed by the solenoid from a position within the solenoid housing to a position where the detent ball protrudes above the upper surface of the solenoid housing.

141. The meaning of the term as used in the '656 patent is consistent with the usual definition of "project". Generally, "project" means to cause to protrude. PX 8. "Protrude" means to thrust forward, to cause to project, or to jut out from the surrounding surface. Id.

142. Thus, as used in the '656 patent claims, "projecting" means that the separate detent is caused to move so as to protrude above the upper surface of the solenoid housing.

GO BACK

3112

D. "Said Housing Including a Plurality of Projections Projecting from Said Side Walls"

The parties agree that "said housing including a plurality of projections projecting from said side walls," as used in claim 16, requires two or more projections. The parties contest whether at least one projection must extend from each side wall or whether all projections may extend from a single side wall.

Switchcraft argues the phrase should be interpreted as "two or more projections where at least one projection extends from each side wall." In support of this argument, Switchcraft notes that claims 1 and 16 first describe:

An electrically grounded housing have a rear end, front end, a top wall, a bottom wall, and two side walls defining generally planar surfaces facing one another, wherein said front ends, and said top, bottom and side walls form an enclosed housing . . . .

'378 patent at 10:3-7, 16:27-31 (emphasis added). Claim 16 subsequently teaches the projections extend from "said side walls." Id. at 14:11. Switchcraft argues any interpretation that does not require the projections to extend from each side wall ignores the claim's use of "walls." Switchcraft gives significance to the description and illustration of the preferred embodiment showing at least one projection coming offeach side wall. See '378 patent at 8:45-48, FIGS. 21, 22.

Conversely, ADC contends the phrase should be construed to mean "two or more projections with each projection projecting from either of the side walls." ADC argues the claim refers consistently to "side walls" collectively as a single entity. Collective use of "side walls," ADC avers, does not require any particular distribution of projections on one or both side walls.

The Court finds claim 16 teaches that the plurality of projections may extend from either of the side walls. To eliminate any ambiguity, the Court interprets the phrase "said housing including a plurality of projections projecting from said side walls" to mean "two or more projections extending from one or both side walls." Adopting Switchcraft's interpretation would ignore the consistent collective use of "side walls" throughout the claim. In addition, the claim does not specify whether the projections must extend from one or both walls but merely teaches they extend into "previously empty spaces." '378 patent at 9:46-52. In the preferred embodiment, all projections extend from one side wall, with the exception of waveguide 210, which projects from the other side wall. Figures 21 and 22 show projection 210 necessarily extends from the cover sidewall.
because a lever arm occupies the space on the other side wall. However, the specification also describes an alternative embodiment that possesses only one forward port (rather than the two in the preferred embodiment). Id. at 9:32-35. Claim 16 also acknowledges the alternative embodiment through the language "said front end having at least a first jack port." Id. at 16:32 (emphasis added). The alternative embodiment omits forward port 34, which uses projection 210 for impedance matching purposes. In the absence of forward port 34, projection 210 would not be necessary and all of the remaining projections would extend from one side wall. For these reasons, the Court finds "two or more projections extending from one or both side walls" is the appropriate interpretation.

4. Claim 5 only

1. "at least one leg projecting laterally from each side of the center flange, each laterally projecting leg including an attachment flange defining an aperture for receiving a fastener for securing the support to a vehicle"

The term "at least one leg projecting laterally from each side of the center flange" means each side of the longitudinal length of the center flange must include at least one "laterally projecting leg," a term referring to a structure providing support for one side of the shifter support and having an attachment rim or rib projection extending outwardly from the side and fitted with a hole for receiving a fastener, such as a screw, to secure the support to the vehicle.

Second, the claims also describe a method for "projecting the corner edge portions of the duct section end portions beyond the corner section." For example, Claim 1 requires "projecting the corner edge of the duct section end portions beyond the corner pieces into the gasket member to deform a surface of said gasket member. . . ." (Emphasis added). The Court construes this language to require an assembler to take some action to cause the offset portion of the corner section to be moved relative to the corner piece front surface. 8
iv. "Projection"

180s' proposed construction for "projection" is "something that extends outward," and Gordini's is "a tooth-like extension protruding radially from a member surface."

I construe "projection" as "something that extends outward from a surface." The portion of this construction that reads "something that extends outward" is the widely accepted understanding of "projection." The entire construction, including the phrase "from a surface," is consistent with all the relevant language in the specification. (See, e.g., id., Ex. A at col. 7, ll. 47-49, Figs. 16 & 17.) Furthermore, although this Court need not consult extrinsic evidence because the intrinsic evidence is clear, Phillips, 415 F.3d at 1324, this construction closely tracks the dictionary definition. (Pls.' Mem., Ex. D ("projection" is "a thing that extends outward from something else").)

Defining "projection" as, in part, "tooth-like" would be vague and imprecise. In fact, as 180s points out, the "projections" shown in the patent figures do not particularly resemble teeth. Nor do claims 3 or 4 require that the "projections" protrude "radially" from the "member." Such a limitation simply does not exist in the claim language.

v. Projection

Plaintiffs interpret "projection" to mean "any portion of the auxiliary bridge which extends toward the primary bridge for the purpose of going over and engaging with the primary bridge." The Defendant agrees with this interpretation, but requests that the court specifically note that a "projection" is not limited to a single-component straight piece, but that it can also be a multi-component, bent or even U-shaped structure. Plaintiffs object to Defendant's request that the term be read to include "multi-component structures." 5

--- Footnotes ---

5 It is not entirely clear to the court whether Plaintiffs also object to Defendant's request insofar as it requests that the court note that the term also comprises bent and U-shaped structures. The court will presume that Plaintiffs do object.

--- End Footnotes ---

The court finds that the term "projection" means "any portion of the auxiliary bridge which extends toward the primary bridge for the purpose of going over and engaging with the primary bridge" and agrees with Defendant that a "projection" can also be a multi-component, bent or even U-shaped structure.

Nothing about the term "projection" indicates that a "projection" could not be a multi-component, bent or U-shaped structure, nor does the other claim language suggest that the term "projection" should be limited as Plaintiffs request. If an apparatus claim recites a general structure (e.g., a noun) without limiting that structure to a specific subset of structures (e.g., with an adjective), the Federal Circuit generally construes the claim to cover all known types of that structure that are supported by the patent disclosure. See Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998). Notably, the patentee need not "describe in the specification every conceivable and possible future embodiment of his invention." See Ccs Fitness v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002) (internal citations omitted).

--- Footnotes ---

6 This, of course, assumes that the term in question is not a means-plus-function claim limitation. See infra. In this case, neither Plaintiffs nor the Defendant, nor the court, would construe the term "projection" as a means-plus-function claim.
Here, the court finds no reason to limit the term projection to the kind of single-component structure described in the specification. See id. at 1364-65 (reversing the district court's decision to interpret the term "reciprocating member," in a patent involving fitness equipment, as not comprising a multi-component structure simply because the embodiments did not include such a structure). Therefore, the court construes "projection" to mean "any portion of the auxiliary bridge which extends toward the primary bridge for the purpose of going over and engaging with the primary bridge." The court adds that, all things being equal, 7 the term could comprise a multi-component, bent or U-shaped structure.

7 It, of course, goes without saying that the fact that a "projection" could be a multi-component, bent or U-shaped structure does not imply that every multi-component, bent or U-shaped structure necessarily constitutes a "projection."

The relevant background facts are set forth in the order deferring action on the partial summary judgment motions, 2005 DNH 138, slip op. at 2-5, and therefore will be repeated here only insofar as is necessary to explain the court's analysis. Claim 1 of the '243 patent claims:

An elongate member, comprising: a base portion, and a great multiplicity of resiliently flexible hook-like projections extending generally toward said base portion, with at least some adjacent ones of said projections, in a direction along the length of said member, extending in generally opposite directions; said base portion and integral projections being formed from an extrusion of molten plastic material by providing a first, cooled forming roller having a plurality of hook-forming cavities . . . ; providing a second pressure roller in position for coaction with said first forming roller; concurrently rotating said first and second rollers in opposite directions . . . ; directing said extrusion in between said first and second rollers at an interface thereof so that said plastic material fills said hook-forming cavities to form said base portion of said strip-like fastener member and with said hook-like projections extending integrally from one surface of the base portion, each said hook-like projection having a free end portion; cooling said fastener member . . . by carrying it on the periphery of said rotating cooled forming roller through a substantial portion of a revolution of said forming roller; and removing said strip-like fastener member from the first forming roller . . . so that said hook-like projections are withdrawn from said hook-forming cavities, after being sufficiently cooled so that unacceptable deformation of the hook-like projections is avoided . . . by drawing the free end portion of each hook-like projection through the throat portion of the respective one of said cavities, the free end portion of each said hook-like projection extending generally toward the base portion of said fastener member.

In its order deferring action on the summary judgment motions, the court construed the phrase "with at least some adjacent ones of said projections, in a direction along the length of said member, extending in generally opposite directions" to require that the projections which are adjacent along the length of the member extend in generally opposite directions. 2005 DNH 138, slip op. at 14-15.

Paiho manufactures molded plastic hook fasteners under the name "Easy Tape." First Rocha Decl. P 4, Exs. AA, BB. One of these products consists of rows of hooks extending along the length of the product where the hooks in one row all face in one direction and the hooks in the alternating row all face in the opposite direction. Id. P 8; see also id. P 4, Ex. AA. Another product consists of "double hooks," i.e., "hooks that contain two hook-like projections from each stem." Id. P 6; see also id. P 4, Ex. BB. Paiho has never produced plastic hook fasteners of any other design. Id. PP 8-9.
C. Discussion

Based on the foregoing facts, Paiho seeks summary judgment on the ground that its fasteners "have hooks in the same direction." Mem. Supp. First Mot. Part. Summ. J. at [2]. In Rocha's words, however, each "stem" on Paiho's double-hook fasteners contains "two hook-like projections" which appear to face away from each other. Rocha Decl. P 4, Ex. BB. Thus, resolving Paiho's first motion for partial summary judgment depends, at least in part, on whether the phrase "adjacent ones of said projections . . . extending in generally opposite directions" encompasses two hooks extending in generally opposite directions from a single projection. See 2005 DNH 138, slip op. at 15-16.

In response to the court's order for briefing on this claim construction issue, the parties have proffered similar constructions of the term "projections." Velcro argues that a "projection" is "material that projects from the base of the member and has a general hook shape, with a free end portion that extends toward the base of the member." Velcro Cl. Constr. Br. at 1. Paiho argues that "'projection' means the entire portion of the elongate member that extends from the base portion of the member up to and including any free end portions." Paiho Cl. Constr. Br. at 1. Thus, the parties differ on whether a single "projection" can have more than one "free end portion." Velcro says no, and that therefore a single double hook amounts to "two 'hook-like projections' that abut each other" and extend in generally opposite directions. Velcro Cl. Constr. Br. at 6. Paiho, however, contends that the term "projections" is not limited to projections with only one free end portion. Accordingly, Paiho characterizes a double hook as a single projection which has two free end portions extending in generally opposite directions, but which does not itself extend in a direction generally opposite from its adjacent projection.

The court set forth the methodology for claim construction in its prior claim construction order in this case:

In the absence of an express intent to impart a novel meaning to the claim terms, the words take on the full breadth of the ordinary and customary meanings attributed to them by those of ordinary skill in the art.

To ascertain this meaning, the court must first examine the intrinsic evidence, which includes the claims themselves, the specifications, and any prosecution history submitted by the litigants. The court starts with the actual language of the claim. If the claim language is clear on its face, then the consideration of the rest of the intrinsic evidence is restricted to determining if a deviation from the clear language of the claims is specified.

Although the court must therefore construe the claims in light of the specifications, it must take care not to read limitations from the specifications into the claims. If the meaning of the claim limitations is apparent from the totality of the intrinsic evidence, then the claim has been construed. If, and only if, a "genuine ambiguity" still persists, the court may turn to extrinsic evidence, such as expert testimony, to interpret the claim.

2005 DNH 38, 2005 WL 483400, at *1 (internal citations, quotation marks, and bracketing omitted).

Beginning with the language of the claim itself, Paiho points out that claim 1 uses the term "projections" ten times, not once stating that a projection can have only one free end portion. "A word or phrase used consistently throughout a claim should be interpreted consistently." Phonometrics, Inc. v. Northern Telecom Inc., 133 F.3d 1459, 1465 (Fed. Cir. 1998). Here, the claim specifically describes the projections as "including free end portions extending generally toward [the] base portion, with at least some adjacent ones of said projections . . . extending in generally opposite directions . . . ." '243 patent, col. 10, lines 12-16 (emphasis added). Velcro does not point to the usage of "projections" anywhere else in the claim to suggest that, despite the plural form of "portions" in the language at issue, the scope of "projections" is restricted to those with only one free end portion each. 2

--- Footnotes ---

2 Velcro itself cites the Federal Circuit's recent opinion in Free Motion Fitness, Inc. v. Cybex Int'l, Inc., 423 F.3d 1343, 2005 U.S. App. LEXIS 19886, 2005 WL 2241249 (Fed. Cir. 2005), for the proposition that the use of an indefinite article in a patent claim does not restrict the accompanying noun to its singular form. 423 F.3d 1343, 2005 U.S. App. LEXIS 19886, [WL] at *5. Thus, the claim's references to "a free end portion" do not limit the projections to just one. As Free Motion Fitness also explains, even the use of the definite article in connection with "free end portion" toward the end of the claim also does not limit "projection" in the manner Velcro suggests. 423 F.3d 1343, 2005 U.S. App. LEXIS 19886, [WL] at *5.
Instead, Velcro argues that the claim "does not limit the 'hook-like projections' in size or relative positioning, except for the . . . requirement that some of the hook-like projections be adjacent, and that these adjacent hook-like projections extend in generally opposite directions." Velcro Cl. Constr. Br. at 5. Velcro therefore suggests that "two back to back hook-like projections can even abut each other." Id. at 6. This reading, however, appears to ignore that the projections must be "adjacent," rather than "abutting," and Velcro does not explain why "adjacent" should be read to encompass "abutting" in the context of the claim. Cf. Int'l Rectifier Corp. v. IXYS Corp., 361 F.3d 1363, 1373-74 (Fed. Cir. 2004) (reversing construction of "adjoining" to mean "adjacent" given dictionary's notation that "as between adjacent and adjoining, adjoining may more strongly indicate the existence of common bounding lines or points of junction") (internal quotation marks and bracketing omitted). Indeed, as Paiho points out, the claim requires "hook-like projections extending integrally from one surface of the base portion . . . ." '243 patent, col. 10, lines 34-35; see also id., lines 10-11. Two projections that abut each other would not appear to extend integrally from the surface of the base portion, but from a common "stem" that itself extends from the base. Velcro's interpretation of "projections" to embrace extensions from the base portion which abut each other is therefore inconsistent with the language of the claim.

Velcro further suggests that construing "projection" to mean a structure with two or more free end portions "pointing in different directions" flouts the requirement that the projections be "hook-like." Velcro Reply Cl. Constr. Br. at 2. To paraphrase the court's reasoning in considering the term "strip-like" in the claim construction order in this case, 2005 DNH 38, 2005 WL 483400, at *3, the adjective "hook-like" conveys a mere suggestion of configuration, rather than a complete resemblance to what Velcro now considers the shape of a hook, i.e., a "J" shape. In any event, as the fact that both parties have been using the term "double hook" to describe the protuberances on Paiho's product attests, the common understanding of "hook" is not limited to those shaped like the letter J.

The court therefore concludes that, as Paiho argues, "projection" means the entire portion of the elongate member that extends from the base portion of the member up to and including any free end portions. This construction of "projection," in contrast to Paiho's more limited reading, gives the term the full breadth of its ordinary and customary meaning. Because the meaning of the term is clear from the language of the claim itself, "the court peruses the remaining intrinsic evidence for the sole purpose of determining if a deviation from the clear language . . . is specified." 2005 DNH 38, 2005 WL 483400, at *4 (internal quotation marks and footnote omitted).

Here, as Velcro acknowledges, the specification largely "mirrors the claim language" in relevant part. Velcro Cl. Constr. Br. at 6-7. Like the relevant passage from the claim, discussed supra, the specification notes that "the hook-like projections of the fastener member include free end portions," using that term in the plural. '243 patent, col. 2, lines 51-52. Furthermore, in describing the preferred embodiment, the specification states that "the hook-forming cavities are provided in the periphery of the forming roller such that adjacent ones of the cavities, in a direction circumferentially of the roller, extend or face in generally opposite directions." Id., col. 7, lines 24-28. Because each projection corresponds to a single cavity, id., lines 28-29, this description further undermines Velcro's contention that "adjacent" projections can abut each other. See also id., lines 20-21 ("many variations are possible with respect to the exact size, shape, and relative positioning of the cavities . . . .") (emphasis added). Neither Velcro's principal claim construction brief nor its reply persuasively demonstrates that any part of the specification is inconsistent with Paiho's proffered construction of "projection." Consistent with the court's order deferring action on the motions for partial summary judgment, neither party has submitted any prosecution history or other intrinsic, or extrinsic, evidence shedding light of the meaning of the term. 3 The court therefore adopts Paiho's proposed construction of "projection" to mean the entire portion of the elongate member that extends from the base portion of the member up to and including any free end portions.

--- Footnotes ---

3 In requesting the additional briefing, the court announced that it would "consider the parties' claim construction arguments in light of the principles of waiver discussed" in the order, 2005 DNH 138, slip op. at 16, which noted that Paiho had forfeited its ability to argue that the prosecution history supported its construction of the term "adjacent" in seeking summary judgment by failing to identify any dispute as to the meaning of that term during claim construction. Id. at 13-14.

--- End Footnotes ---
This term is used in Claim 19 the '328 Patent, which defines an end cap including pairs of projections extending inwardly opposing each other from said sidewall of the endcap. Pl's Markman Br. Ex. D. col. 16 ll. 10. Innovative argues that this term should be construed to mean "a part which projects or juts out from the sidewall of the end cap." Innovative bases this definition on the ordinary meaning of the term projection as a portion which projects or juts out and the specification for the patent and drawings that show pairs of spaced apart projections. The ordinary meaning is strong evidence of the proper claim construction. Phillips, 415 F.3d at 1313.

Defendants argue that the court should define projection as "a functional stop member" because this is the only meaning provided for in the specification for the projections. This language comes from an example in the specification. I agree with Innovative that the example is not a limitation. Further, it is problematic to define the term by its stopping function. The claim language selects a broader term, "projections," while the specification uses the more narrow terminology of "projections such as stops." Pl's Markman Br. Ex. D. col. 6 ll. 59. When the patentee uses a broader term in the claim language than the specification, it is improper to limit the claim term to an example in the specification. See Teleflex, Inc., 299 F.3d at 1326.

Based upon the ordinary meaning supported by the specification, I find that "projection" means "a part which projects or juts out from the sidewall of the end cap."

4. "projection means" -- Amesbury contends that the term "projection means" in Claim 8 is not a means-plus-function term. Rather, the term ought to be interpreted as though it just said "projection". In that respect, Amesbury argues that the term connotes "at least one projection or protrusion", with the word "projection" meaning "a part that juts out". By contrast, Caldwell argues that the term is a mean-plus-function claim and that the term should be construed more narrowly as "a means that projects from the mounting means and cooperates with the flanges of the channel, which is limited to the rectangular or elongated structure of a spine or rib. Furthermore, the spine or rib must fit snugly between the flanges." 4

At the hearing, Caldwell proposed the following definition on page 18 of its handout:

Function: projecting between the inwardly turned opposed flanges and cooperating with the flanges of the channel means (jamb). The corresponding structure is a spine or rib.

The Federal Circuit has observed that "if the word means' appears in a claim element in association with a function, this court presumes that § 112, P 6 applies. This presumption collapses, however, if the claim itself recites sufficient structure, material, or acts to perform the claimed function." Micro Chemical, 194 F.3d at 1257; accord Allen Engineering Corp. v. Bartel Industries, Inc., 299 F.3d 1336, 1347 (Fed. Cir. 2002); but see Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531 (Fed. Cir. 1997) ("Patent drafters conventionally [invoked the means-plus-function statute] by using only the words means for' followed by a recitation of the function performed. Merely because a named element of a patent claim is followed by the word means,' however, does not automatically make that element a means-plus-function' element under 35 U.S.C. § 112, P 6.").

In submissions following the Markman hearing, both parties cited to several more decisions of the Federal Circuit regarding the issue of whether a particular claimed term invokes the means-plus-function statute, and more particularly, whether a term that includes the word "means" recites sufficient structure or material for performing the claimed function to rebut the presumption. See e.g. Altiris, 318 F.3d at 1375-76 (finding that "means of booting" 5 is a means-plus-function even though "commands" represent structure and the claim states a location); Cole, 102 F.3d at 531 (finding that "perforation means" 6 is not a means-plus-function because the claim "describes the structure supporting the tearing function (i.e. perforations) . . . [and] also its location (extending from the leg band to the waist band) and extent (extending through the outer impermeable
layer)); Wenger, 239 F.3d at 1237 (finding that "means defining a plurality of separate product coating zones" is not a means-plus-function because, even assuming sufficient function, the "claim specifically recites structure including spray nozzles that are directed toward the sidewall of the reel, which" accomplish the function); Envirco Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 1365 (Fed. Cir. 2000) (finding that "second baffle means" is not a means-plus-function because the term baffle itself imparts structure and further, the "claims describe the particular structure of this particular baffle (having inner surfaces for directing airflow . . . radially outward . . . and thereafter . . . between said first baffle means and said air filter means") and the claims describe "details about the location and formational details"); TI Group Automotive Systems (North America) v. VDO North America, L.L.C., 375 F.3d 1126, 1135 (Fed. Cir. 2004) (finding that "pumping means" is not a means-plus-function because the claim recites "its structure (including a nozzle and a venturi tube in alignment with the nozzle), location (being located within the reservoir in the region of the opening), and operation (the passage of fuel out of the nozzle and through the venturi tube causing fuel to be entrained through the opening into the interior of the reservoir)").

5 The relevant claim stated: "means of booting including a first set of commands . . . resident on said storage device of said digital computer . . . , and a second set of commands resident on a storage device external to said digital computer . . . " Altiris, 318 F.3d at 1368.

6 The relevant claim stated: "perforation means extending from the leg band means to the waist band means through the outer impermeable layer means . . . " Cole, 102 F.3d at 526.

7 The relevant claim stated: "means defining a plurality of separate product coating zones . . . , each of said zones including at least one spray nozzle directed toward said sidewall . . . " Wenger, 239 F.3d at 1229.

8 The relevant claim stated: "second baffle means disposed radially outwardly of said centrifugal fan means . . . [and] having inner surfaces for directing the airflow from said centrifugal fan means inwardly of said primary housing and between said first baffle means and said filter means whereby air being introduced into said housing by said centrifugal fan means will be directed radially outwardly of said centrifugal fan means and guided by said first baffle means towards said second baffle means and thereafter by said second baffle means between said first baffle means and said air filter means." Envirco Corp., 209 F.3d at 1363.

9 The relevant claim stated: "pumping means for pumping fuel into the reservoir, said means being located within the reservoir in the region of the opening and including a nozzle and a venturi tube in alignment with the nozzle, the passage of fuel out of the nozzle and through the venturi tube causing fuel to be entrained through the opening into the interior of the reservoir;" TI Group, 375 F.3d at 1131.

Turning to the patent at issue, I find that this is not a case where the drafter of the patent was as "clearly enamored of the word means" as in Allen Engineering, 299 F.3d at 1348, where the Court ignored the word means’, which appeared 32 times in the relevant claim, in all but one of the twelve means’ limitations, or in Cole, 102 F.3d at 531, where the Court declined to construe any of the six elements that included the word means’, which occurred in the claim 14 times, as means-plus-function terms. The 368 Patent used the word "means" 13 times, but only with respect to four limitations: channel means, sash frame support means, mounting means/means for mounting, and projection means. And as discussed above, at least "mounting means" or "means for mounting" is a means-plus-function. The question, therefore, is whether Claim 8 recites sufficient structure or material associated with projection means' to rebut the means-plus-function presumption. Amesbury argues that the presumption is overcome in Claim 8 because the claim describes the structure carrying out the function of inhibiting the rotational movement of the mounting means (ie. a projection’ or a thing or part that extends outward beyond a prevailing line or surface’), its location ("positioned between said inwardly turned opposite flanges of the channel"), and its extent (sufficient to cooperate with the channel flanges). See Cole, 102 F.3d at 531; Amesbury's Post Markman Hearing Brief, p. 2.

Claim 8 does not articulate the extent of the "projection means", although the extent' suggested by Amesbury could be inferred. It is clear, however, that Claim 8 describes the location or position of the "projection means", namely "positioned between said inwardly turned opposite flanges of the channel." Location is a relevant factor and part of the structure according to the Federal Circuit. See Cole, 102 F.3d at 531; TI Group, 375 F.3d at 1135; and Envirco, 209 F.3d at 1365 (holding that "the claims recite sufficient structure, including details about the location and formational details"). However, as suggested by Caldwell, one could interpret Altiris, 318 F.3d at 1376, as implying that a location alone will not necessarily
provide sufficient structure. Consequently, I find that the crucial question is whether the term "projection" imports sufficient structure like the term "perforation" in Cole, or whether the term is, as Caldwell argues, "functional and inherently meaningless" as "any three-dimensional object will project from the surface to which it is attached." [Caldwell's Supplemental Submission, p. 1.] As to this issue, I agree with Amesbury; "projection" imports sufficient structure to overcome the presumption.

The ordinary meaning of "projection" as understood by a person of skill in the art is readily apparent. In Amesbury's initial submissions, they suggested the definition of "a part that juts out", and in the supplemental submission, Amesbury suggested the definition of a "thing or part that extends outward beyond a prevailing line or surface." I do not believe that it is necessary to adopt one or the other definition, because the debate seems to be whether or not "projection means" should be limited to the structures in the specification that correspond to and perform the function, namely the "raised spine" and the "locating rib", not over the definition of "projection". 10

10 In construing "raised spine", Caldwell argued that "spine is not broad enough to encompass any projection' or protrusion' such as a knob or a bump." [Caldwell's Brief, p. 7.] Thus, it appears that Caldwell shares Amesbury's understanding of the term.

Construction -- Projection(s).

**3120**

Projection Near A Terminal End

Claims 6-9, 16, 18, 20, and 23 call for a "projection near a terminal end" of a spring pin. Zettl argues that the term "near" includes the term "at" and, therefore, the projection can be located near or at the terminal end of the spring pin. Defendants disagree. But ordinary understandings of the term "near" clearly includes "at." See Webster's at 1510. Therefore, a "projection near the terminal end" refers to any part that juts out at or near a terminal end of the spring pin.

**3121**

3. "projection optical system"

During previous stages of this litigation, the parties did not dispute the meaning of the term "projection optical system"; indeed, they apparently stipulated before the ITC that the term should be construed as "a lens system or other component or components that project or expose a pattern onto an object." Before this court, ASML still favors this construction, but Nikon now proposes an alternative, asking the court to read the term to mean "a collection of optical components for forming an image of a pattern onto a photo resist layer on a substrate."

Neither party disputes that the "projection optical system" constitutes part of the larger lithographic exposure apparatus. See Patent '041 at 5:29-37. Nor does either party dispute that the role of the "projection optical system" is to project an image of a pattern onto a specific substrate. Id. But by comparison to this limited (and particularized) role, the parties' proposed constructions either overspecify or overgeneralize the operation of the relevant art. Cf. id.; see also id. at 3:17-37 & 11:60-12:45 (discussing the image formation process). Nonetheless, without resort to the parties' imprecise definitions, the court can construe the claim term by reference to the words' ordinary meaning and by reference to the intrinsic evidence. As the claim phrase itself suggests, a "projection optical system" is "a component or combination of components that project or transfer a mask pattern onto a substrate." The specification language, in turn, repeatedly refers to "projection optical system" as the mechanism by which mask patterns are translated to a substrate. See, e.g., id. at 12:55-13:62; 15:42-16:53. Consistent with plain meaning and the lessons of the specification language, the court construes the term "projection optical system" to mean "a component or combination of components that transfers or translates a mask pattern onto a substrate."
C. Orientation of the Projections

The '686 patent requires "outwardly convex projections." The '050, '023, '752, and '022 patents require "outwardly directed projections." The district court granted summary judgment for TCI because it found that TCI's products do not contain these elements. Order at 8.

The district court correctly held that the '686 patent requires that "the projections of the insert means have a width or diameter defined by a radius, meaning that [they] must be convex." Id. at 5.

With respect to the '050 and '023 patents, the district court held that TCI did not infringe because its products "have a space between the recesses which consists of a line segment. They do not have outwardly directed projections with a transverse cross-sectional configuration of a certain length." Id. at 8 (internal quotations omitted). Similarly, with respect to the '752 and '822 patents, the district court held that TCI did not infringe because its products "have spaces between the recesses which are line segments, not outwardly directed projections having a transverse cross-sectional configuration of a certain length." Id. (internal quotations omitted). In an attempt to address these portions of the district court's decision, the parties engage in extensive, and rather arcane, debate about the shape of the projections required by the patent claims. As the parties argue their positions, they hotly contest such details as the meaning of "transition points" and "radius end points," the definition of which is said to require that the length of the projections be measured in a particular way, whether or not the length of the projections and recesses must be measured with reference to a radius or a parameter equivalent to a radius, and what such an equivalent parameter might be. While the details of this debate may be interesting to the parties, we find the debate difficult to follow and irrelevant to settling the dispute before us. Indeed, at oral argument, counsel for the parties agreed that the issue of how to measure the length of the projections is not involved in this appeal. We believe the issue on appeal is what constitutes an "outwardly directed projection" and that this question should be addressed directly, rather than obliquely by referring to various measurement techniques for determining a length of the projections. At oral argument, counsel for TCI urged that the limitation "outwardly directed projections" implies that the peaks of the projections extend above the recesses and that the recesses should have been defined as extending above the lowest point of the depressions. We do not agree.

The claim language states that the surface of the insert means is "defined by a plurality of outwardly directed projections with recesses therebetween." '752 patent, col. 10, lines 31-33. Thus, the existence of "outwardly directed projections" necessarily requires the existence of "recesses" - the voids between the projections - and vice versa. Recesses and outwardly directed projections are complements of each other, and one cannot exist without the other. There is no requirement that these projections extend for any particular distance above the recesses. "Outwardly directed" is used to modify "projections" to distinguish the projections on the insert means from the "inwardly directed projections" on the surface of the inner hose, see '822 patent, claim 1, col. 10, lines 16-43, but does not have a special meaning or require that the projections have a particular shape. It simply clarifies that the insert means projections point towards the outside of the hose construction, so that they may engage with the recesses of the inner hose, while the projections of the inner hose point toward the inside of the hose construction, so that they may engage with the recesses of the insert means. In other words, "outwardly directed projections" means simply that bumps exist on the outer surface.

In each of the three claim constructions discussed above, the district court erroneously read a limitation into the claim language. Our cases make clear, however, that adding limitations to claims not required by the claim terms themselves, or unambiguously required by the specification or prosecution history, is impermissible. See Laitram Corp. v. NEC Corp., 163 F.3d 1342, 1347, 49 U.S.P.Q.2D (BNA) 1199, 1203 (Fed. Cir. 1998) ("a court may not import limitations from the written description into the claims"); SRI Int'l v. Matsushita Elec. Corp., 775 F.2d 1107, 1121, 227 U.S.P.Q. (BNA) 577, 585 (Fed Cir. 1985) (en banc).
d. Projection of the locking-member

Finally, with regard to the lock-up means, the parties dispute the meaning of the claim's requirement that "the second end of the locking member projects from the second chamber through the opening in the second end of the housing." Col. 7, lines 40-45. "Project" means to jut out or protrude and an "opening" is an open place or part, a hole, or a gap. See, e.g., Webster's New World Dictionary, 2d ed. (1970); The American Heritage Dictionary, New College Ed. (1976). There is nothing in the specification that suggests any intended meanings other than these ordinary ones. Thus, giving the claim language its ordinary meaning, the claim requires that the second end of the locking member protrude from the second chamber through an open place or gap in the second end of the housing.

III.

We ultimately conclude that it was proper to grant the motion for summary judgment of non-infringement albeit taking issue with some of the reasoning relied upon by the district court. Although the district court determined that it need not decide "whether the condenser is part of the process chamber or a separate unit," Semitool Order, 2005 U.S. Dist. LEXIS 4889 at *11, we find that summary judgment of non-infringement can only be properly granted if we determine that the condenser is inside the processing chamber.

The district court decided it did not have to reach that issue because "regardless of whether the condenser is merely an area within the process chamber or a separate unit, it does not 'supply a drying gas to the process chamber.'" Id. "The Tornado system is a closed system, meaning no external air enters or exits the machine during operation," and in the Tornado system "there is no introduction of 'drying gas'" into the process chamber. Id.

As stated above, the Claim Construction Order construed "supplying drying gas to the process chamber" to require that "supplying gas is introduced into the process chamber" and furthermore "once inside the process chamber, all that is required is that the "drying gas"...is capable of readily absorbing evaporated cleaning liquid from the carriers and removing said vapor(s) from the process chamber as it is evacuated therefrom." Id. The Claim Construction Order focuses on introduction of gas into the process chamber and evacuation of drying gas from the process chamber. Whether gases enter or are evacuated from the processing chamber, as required by the claims, is quite different from whether "air enters or exits the machine during operation" as described by the district court in its infringement determination. For example, depending on how the processing chamber is defined, air may not exit the machine but nonetheless could be introduced into the processing chamber and could remove vapors from the processing chamber. Specifically, as argued by Semitool, if the condenser were located outside the processing chamber and yet still within the machine then the condenser could potentially introduce drying gases into the processing chamber and could remove vapors when drying gases are evacuated from the processing chamber despite the fact that the apparatus as a whole is a closed system. Because of this, we find it is necessary to reach the question that the district court did not reach: Is the condenser inside the processing chamber or is it outside the processing chamber?

While the Claim Construction Order does not explicitly construe the term "processing chamber," the term appears throughout the Claim Construction Order. As a result, in order to resolve this dispute, we must turn to the standard tools of claim construction to determine what the Claim Construction Order meant when it used the term "processing chamber."

In order to properly understand how the district court was using this term in its Claim Construction Order, it is necessary to define the relationship between the processing chamber and the major structural limitation in the patent: the processing vessel. Semitool argues that the processing chamber encompasses only the area inside the processing vessel where wafer carriers are loaded, cleaned, and dried. In other words, the processing chamber is only the central region of the processing vessel; the other outlying regions of the processing vessel are not part of the processing chamber. In contrast, DMS argues
that the processing chamber encompasses the entire enclosed area bounded by the processing vessel's walls and that this interpretation is based on the specification from the '127 and '113 patents.

In resolving this issue, we begin with the claims. "Quite apart from the written description and the prosecution history, the claims themselves provide substantial guidance as to the meaning of particular claim terms." Phillips v. AWH Corp., 415 F.3d 1303, 1314 (Fed. Cir. 2005) (en banc). "First, we look to the words of the claims themselves, both asserted and nonasserted, to define the scope of the patented invention." Vitronics Corp. v. Conceptionic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996).

Asserted independent claims 1 and 39 of the '113 patent have the limitation that the apparatus contain "a processing vessel defining a process chamber therewithin." In fact, as described above, Semitool supports its interpretation by pointing to DMS's own admissions wherein DMS stated that "the central area of the DMS Model 300 contains a vessel defining a process chamber in which wafer carriers are loaded, cleaned, and dried." Semitool argues that this supports their interpretation of process chamber. We do not agree. In fact, according to the explicit language of the claims themselves, the process chamber is defined as the interior of the processing vessel. For these claims, there is no doubt that the processing chamber encompasses the entire interior of the processing vessel and this conclusion is consistent with DMS's interpretation of processing chamber.

Asserted claim 28, however, presents a more complex question. In contrast to the other asserted claims, independent claim 28 of the '127 patent does not itself contain the limitation of "a processing vessel defining a processing chamber therewithin." Rather, that claim only specifies "a processing chamber within the processing vessel." All that can be concluded from claim 28 itself is that the processing chamber must be within the processing vessel. In other words, according to claim 28, the processing chamber could constitute the entire interior of the process vessel or it could constitute some smaller space within the processing vessel. However, the clear definition of the process chamber language in the claims of the earlier '113 patent application suggests the same definition of the processing chamber in the continuation application which issued as the '127 patent. See, e.g., NTP, Inc. v. Research in Motion, Ltd., 418 F.3d 1282, 1293 (Fed. Cir. 2005); Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1350 (Fed. Cir. 2004).

In any event, the specification makes clear that the processing chamber is coextensive with the processing vessel. As we stated in Phillips, "the specification 'is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term.'" 415 F.3d at 1315 (quoting Vitronics, 90 F.3d at 1582).

DMS argues that the specification emphasizes that the processing chamber is meant to include the entire interior of the processing vessel. In other words, even regions of the processing vessel that are not areas where wafer carriers are loaded, cleaned, and dried are described by the patent as part of the processing chamber. In contrast, Semitool argues that the specification limits the process chamber because the specification describes a bottom baffle that separates the area where wafers are cleaned and dried from the rest of the processing vessel. Such a partition, according to Semitool, is quite relevant as the infringing device has a spray guard between the condenser and the area where the carriers are cleaned and dried.

The specification states that "the processing chamber 47 is also most preferably provided with a false bottom or bottom baffle 85." '127 patent, col. 5, ll. 57-60. The specification describes the baffle as a "false bottom" rather than an actual bottom. As argued by DMS, this suggests that the area below the baffle is still part of the processing chamber. The specification also further describes this region below the bottom baffle by stating that "the outer bottom wall piece 77 [of the processing vessel] has a processing chamber outflow opening or port formed therethrough adjacent to the outflow box." '127 patent, col. 7, ll. 26-30. Because this opening is specifically labeled as the "processing chamber outflow" rather than the "processing vessel outflow," the specification further reinforces the conclusion that the area below the false bottom baffle is still part of the processing chamber. Therefore, contrary to Semitool's contentions, the specification supports an interpretation of processing chamber as the entire interior of the processing vessel.

Furthermore, the specification treats the three terms processing bowl, processing chamber, and processing vessel synonymously thus further reinforcing the fact that processing chamber should be interpreted to encompass the entire interior of the processing vessel. First, the specification describes the processing vessel synonymously with the "bowl." The specification introduces these two terms together by discussing "a processing bowl or vessel 21." '127 patent, col. 2, l. 66. Similarly, the specification describes a "sidewall of processing vessel or bowl 21." '127 patent, col. 3, l. 20. From these passages, the specification makes it clear that the processing vessel and the processing bowl are one and the same structural
element.

But the specification also uses "bowl" in association with the processing chamber. The specification describes that "the processing chamber bowl and other conduits which supply gas or liquids are preferably made of stainless steel." '127 patent, col. 11, l. 44. This passage indicates that the processing chamber is associated with the "processing bowl" and in every other portion of the specification the processing bowl is used synonymously with the processing vessel. The specification makes no meaningful distinction between the vessel, the bowl, or the chamber and therefore the specification further reinforces that the entire interior of the processing vessel and the processing chamber should be interpreted to be coextensive.

Thus, for claims 1, 4, 9, 17, 19, 39, 55, 56, and 57 of the '113 patent, the claims themselves state that the "processing vessel defines a process chamber therewithin." Therefore, we agree with DMS that the processing chamber encompasses the entire interior of the processing vessel. Similarly, for claims 28-33 of the '127 patent, although the claims themselves leave room for argument, the specification makes clear that the processing chamber is coextensive with the entire interior of the processing vessel. Having interpreted processing chamber to be coextensive with the processing vessel, we now turn to the question of the alleged infringement of the asserted claims by DMS's Tornado wafer carrier cleaner.

5. "A product finishing station"

Many of the same concerns fueling the parties proposed constructions for "customer service station" are also present in their proposed constructions of "product finishing station." Foodie offers for its construction "any area(s) where product finishing is located," while Jamba Juice offers "a specific defined location, separate from the customer service station, where an employee stands and remains to operate blending units, access ice, dispense cups, rinse blenders and place them on a drain board. All the elements contained within the product finishing station are within reach of a stationary employee."

The Court's analysis of the parties' construction is the same as it was for "customer service station." There is insufficient support in the patent mandating that a customer service station and product finishing station must be separate. While items such as Fig. 2, which show separate stations, may show a preferred embodiment, this by itself does not limit the patent in such a manner. However, the Court does agree with Jamba Juice that the area is intended to be limited to a "station," encompassed by the items called for in the claims. See '448 patent col. 8 l. 16-19. Therefore, the Court's construction for "product finishing station" is: "a station including at least one blending unit, an ice bin, at least one cup dispenser and foot or hand activated rinse sink with integrated or detached drain board."

2. Progressive/Progressively

The terms progressive/progressively are found in Claims 1, 10(b), 14(b), 19, 28, 29, 30, 32, 35, 36 and 44 of the '461 patent; Claims 1 and 8 of the '108 patent; Claims 3, 4, 5, 9, 10, 12, 14, 17 and 18 of the '839 patent; Claims 1, 3, 4, 5, 7, 10, 13, 16 and 17 of the '625 patent; Claims 1 and 8 of the '744 patent; Claims 1, 4, 7 and 14 of the '389 patent; Claims 1, 4, 9 and 10 of the '711 patent; and Claims 1, 3, 5 and 10 of the '340 patent.

Vision Advancement asserts that the term "progressive/progressively" should be construed as "continuous change or continuously changing," while Vistakon submits "A controlled, gradual gradient designed to provide a certain vision correction power, without any abrupt changes or edges or breaks or transitions."

Turning first to the claims, claim 1 of the '461 patent states that "the correction power being caused to vary continuously and progressively." '461 patent, 7:50-51. Vision Advancement's definition would appear to make "progressively" superfluous because the claim language already requires that the power "vary continuously", which is the same as "continuously changing." See Merck & Co. v. Teva Pharms. USA, Inc., 395 F.3d 1364, 1372 (Fed. Cir. 2005) ("A claim construction that gives meaning to all the terms of the claim is preferred over one that does not do so."). Therefore, the claim language
supports a construction of "progressive" different than that urged by Vision Advancement.

The specification of the Portney Patents describes "progressive" when discussing the nature of the change in power in the lens of the invention. As the specification states, "This change is continuous (progressive), without any abrupt correction changes, or "edges." '461 patent, 2:44-45; see also 461 patent Abstract. Vision Advancement points to that language as showing that the '461 patent defines "progressive" as continuous. However, that would require the Court to ignore the rest of that sentence. Additionally, in the preceding sentence, the specification appears to define continuous when it states that the variation of the vision correction of the invention "is continuous, i.e., from near correction focal power to far correction focal power, then back to near, and again back to far, or vice versa." '461 patent, 2:40-44. The term "progressive" appears in the next sentence along with the requirement that the change or variation also be "without any abrupt correction changes, or edges."

Furthermore, the only embodiment disclosed in the Portney Patents to demonstrate how vision correction power was adjusted by the curvature of the lens surface, depicted a lens surface that gradually transitioned between high and low vision correction powers, through intermediate vision correction powers. See Col. 4:16-17; Col. 5:48-6:40. The fact that the Portney Patents disclose that "The undulating surface of the lens is preferably formed by a computer-controlled machining apparatus" underscores the gradual nature of the undulating surface. See Col. 5:48-6:40.

The statements and arguments made by the patentee to distinguish the prior art further support that the term "progressive" requires a gradual change or gradient of vision correction power without any abrupt correction changes or edges. In the Background section of the specification, the patentee distinguished U.S. Patent No. 4,162,122 ("Cohen") because the lens disclosed there had "disadvantages due to . . . abrupt curvature change of the lens surface from one zone to another." '261 patent, 2:3-13. Consistent with that statement, during prosecution of the '461 patent Portney distinguished the prior art Cohen and DeCarle bifocal lenses as lacking "any true progressive correction powers between the bifocal regions." Prosecution History, Def Br., Ex. P., VIST029127 (also noting "no suggestion that DeCarle's polishing is done to provide true progressive intermediate correction powers between the purely bifocal zones"). Portney further argued that his "progressive multifocal ophthalmic lens tends to reduce or eliminate this shadow image [of the prior art]" and "provides progressive intermediate imaging." Id.

Vistakon urges that the gradient of vision correction power should also be defined as "controlled" and that the vision correction power should be "certain". However, the Court finds no basis to add those terms to the definition of "progressive/progressively." Both of those terms appear to add ambiguity to the definition. For example, what does it mean to be "controlled" or "certain"? The specification of the '461 patent refers to the lens as preferably being formed by a "computer-controlled" apparatus, but it does not require it be so formed. '461 patent, 5:48-49. Therefore, the Court declines to add those terms to the definition of "progressive/progressively."

Accordingly, the Court construes the terms "progressive/progressively" to mean "A gradual gradient of vision correction power without any abrupt correction changes or edges."

Further, likelihood of success on the merits here turns on claim construction. Indeed, Engel admits that it inserts the plates in "one quick step." Thus, an interpretation of "progressively pressing" that defines only one step will necessarily result in a finding of literal infringement of that claim. However, if "progressively pressing" is construed to require two steps, as Engel argues, Engel clearly does not literally infringe claim 1 of the '880 patent. The district court construed "progressively" to mean "steady" and did not interpret that term as requiring two steps.

Engel argues that the depiction of the claimed process in the written description and the drawings discloses a method where a first portion of the angle plate is pressed at an angle into the flange, and then another portion of the plate is pressed to insert the entire angle plate completely into the flange (thus, involving a two-step process). Systemation argues that the two-step process of the interpretation advocated by Engel is merely the preferred embodiment of the claimed method. The word "progressively," according to Systemation, is broadly referring to the steady pressing on the plate to move it onto the flanges, without requiring any two-step method.
We agree with Engel that a portion of the written description does disclose a two-step process for inserting the angle plates into the flanges. See '880 pat., col. 4, ll. 17-24 ("In an initial step of pressing an angle plate 22 into the pair of channel flanges 24, the corner portion of the angle plate 22 is depressed within the notch 48 with the legs 38 being tilted upwardly and tightly engaged with the panels 26 of the duct 20. Thereafter, as is shown in Fig. 5, the angle plate 22 is then fully pressed into the channel flanges 24.") (emphasis added). However, there is nothing in the specification that suggests Systemation limited the scope of claim 1 to such a "two-step" method. There was no prosecution history or prior art cited that would render it reasonable to limit the claims in such a way because an automatic method of inserting angle plates was not known in the prior art. Further, other portions of the written description support the conclusion that the disclosure of a two-step process was merely a preferred embodiment, not the entire invention claimed by Systemation. See '880 pat., col. 1, ll. 57-60 ("An angle plate may be best positioned for pressing into the channel flanges with a corner thereof tilted into the notch.") (emphasis added); col. 9, ll. 21-26 ("Although only a preferred embodiment of the angle plate positioning machine has been specifically illustrated and described, it is to be understood that minor modifications may be made therein without departing from the spirit and scope of the invention as defined by the dependent claims.") (emphasis added).

Finally, the doctrine of claim differentiation also supports the conclusion that "progressively pressing" in claim 1 is not limited to the two-step pressing disclosed in a portion of the specification because a two-step method is expressly claimed in claim 5, which depends from claim 1:

5. The method of claim 1 wherein there is a notch between adjacent flanges at a corner of each duct, and in the pressing of an angle plate into said flanges, said angle plate is tilted with a corner of said angle plate tipping into said notch, and thereafter pressing said tilted angle plate fully into said flanges.

Id. at col. 10, ll. 4-9 (emphasis added). Claim 5 is directed to the two-step pressing method that Engel advocates as the legally correct interpretation of the final limitation of claim 1. However, claim 5, which depends from claim 1, is presumed to be narrower than claim 1. Further, under the doctrine of claim differentiation, absent clear and persuasive indications to the contrary, claim 1 is not limited to the two-step process, the limitation of the narrower dependent claim 5. See Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1551, 37 U.S.P.Q.2D (BNA) 1609, 1612 (Fed. Cir. 1996). Engel has not pointed to any such indications. Accordingly, we agree with the district court that "progressively pressing" does not require two-step pressing, but instead is correctly construed merely to require only steady pressing.

2. "Projection"

This term is also an element of claim 1 of the '053 patent. The pertinent phrase within the claim is "wherein the means for selecting comprises a projection extending therefrom and fitting into the slot of the holder." (Col. 8, lines 43-45.)

In this context, Rutherford proposes the construction, "portion of the mode selector that fits into a slot in the holder." Security Door, on the other hand, suggests "a pin moveable within a slot."

Rutherford contends that the definition urged by Security Door improperly limits construction of the term at issue to a single embodiment. Directing the Court's attention to column 5, lines 37-38 of the '053 patent, Rutherford rejoins that the specification describes a mode selector with a slotted head and a projection that fits into the slot in the holder. Security Door counters that the preferred embodiments refer to a pin moveable within the slot. In Security Door's view, they uniformly portray a pin fitting into a slot in the holder that serves to keep the mode selector in whichever position is selected. Harco and Vanguard take no position on this claim term.

While it would appear that each of the preferred embodiments included in the '053 patent refer to a pin moveable within the slot, neither the specifications nor the claims appear to include such a limitation. The United States Court of Appeals for the Federal Circuit has consistently counseled district courts against importing claim limitations from illustrative preferred embodiments unless the claim is drafted in a means-plus-function format. See Laitram Corp., 863 F.2d at 865; DSW, Inc. v. Shoe Pavilion, Inc., 537 F.3d 1342, 1348 (Fed. Cir. 2008).

The limitation proposed by Security Door, namely that the means for selecting comprises a "pin", is not supported by either
the claim language or specifications. The Court will therefore construe the term "projection" to mean "portion of the mode selector that fits into a slot in the holder."

1. A Proportional Positive Airway Pressure Apparatus

This phrase is found in the preamble of Claim 21 of the '575 Patent.

Phrase: A proportional positive airway pressure apparatus

Construction: The inclusion of the term "proportional" in the preamble of this claim is found to be in error and not to effect the claimed invention.

Reasoning: Plaintiffs contend that the term "proportional" appears in the preamble of Claim 21 by mistake. According to plaintiffs, the balance of Claim 21 discloses the predetermined pressure profile version of the invention, and not the proportional version. Defendant argues that because the '575 patent does claim an alternative proportional version of the invention, we cannot find that there is no reasonable debate that the word appears in this preamble by accident, and thus, cannot excise it. We disagree and find that upon consideration of the patent as a whole, it is clear that Claim 21 refers not to the proportional version of the invention, but to the predetermined version of it.

There is no question that the '575 patent includes a proportional version and a predetermined version of the invention. The proportional version is more complex and constantly monitors the patient in order to ensure that only the minimally sufficient pressure is applied at any time. The predetermined version monitors the patient only to determine when exhalation begins, and upon sensing it, applies a predetermined pressure profile. This latter version is described as more cost effective and able to be used in conjunction with existing CPAP devices. '575 Patent, cl. 20, Ins. 16-20, 66-67; cl. 21, Ins. 1-11. Claim 21 discloses this predetermined version of the invention, as evidenced by the fact that the pressure applied during exhalation is predetermined and by the fact that the claim does not require or mention a minimally sufficient pressure.

GO BACK

3130

The parties primarily dispute whether proportioning is permissible, rather than mandatory. They also dispute whether proportioning is "mixing in a measured amount" or "adjusting in relation to other [substances]." As previously explained, "allows" or "allowing" are not correct. What largely remains for the Court to decide is whether proportioning is adjusting or mixing.

The specification explains that proportioning foam concentrate and water can be accomplished by adjusting water pressure relative to foam concentrate. '336 patent, 7:59-65. It also explains that the foam concentrate and water can be pre-mixed in a container for small fires. '336 patent, 7:53-57. Claim 3 of the '965 patent recites specific pressures. The specification also explains that the foam concentrate are combined as ratios: "The foam concentrate ... is normally proportioned with water in percentages ranging from about 0.1% by volume foam concentrate to about 1% by volume foam concentrate." '336 patent, 7:44-51. See also '965 patent, 4:28-31 ("The foam concentrate is proportioned with water in percentages ranging from about 0.1% by volume to about 1% by volume depending on the hardness of the water."). Claim 6 of the '965 patent also recites specific percentages.

Looking to the claim language, the relevant limitations use "proportioning ... into" to produce a mixture. For example, Claims 1 and 9 of the '965 patent recite, "proportioning a foam concentrate into a stream of non-flammable liquid to form a stream of foam concentrate/liquid mixture." Defendants' verb of choice, "mixing," seems redundant considering the ultimate product is a "mixture." US Foam's verb choice of "adjusting" is inappropriate for the pre-mixed embodiment. The verb "measuring," however, is instructive and more accurately describes how the foam concentrate/liquid mixture is created for each of the embodiments. The embodiments described include "premix[ing] the foam concentrate and water in a suitable container," Venturi "line proportioning devices" that measure the flow rate of the foam and water, and "around the pump"
The Court construes "proportioning" to mean "measuring," "proportioned" to mean "measured," and "proportions" to mean "measures."

2. "protecting a portion of the interior of a structure from the force of the wind and objects carried thereby"

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Plaintiff's Proposed Construction</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>protecting a portion of the interior of a structure from the force of the wind and objects carried thereby.</td>
<td>A protective barrier device configured to be quickly deployed on or within a portion of a structure for protecting an interior of the structure from the force of the wind and objects carried thereby.</td>
<td>The protective element configured to be quickly deployed in or within a portion of a structure for protecting an interior of a building to protect a life.</td>
</tr>
</tbody>
</table>

The key dispute between the parties is whether claim 10 is meant to include only protective devices placed on the inside of a structure, or if it is meant to include devices placed inside or outside of a structure. Defendants contend that the phrase should be limited to a device configured to be quickly deployed only "in an interior of a building to protect a life." On the other hand, Plaintiff asserts that there is no structural feature described by this phrase, i.e. the phrase should not be narrowly interpreted to include only devices deployed on the interior of a structure. Plaintiff argues that this claim term, when read together with the specification, clearly encompasses a device that can be configured for quick deployment inside or outside of a structure.

For the reasons already noted in the previous section, the Court rejects the portion of Defendants' proffered construction limiting this claim term to protection of a life. As to the interior/exterior dispute, Defendants referred the Court to figures 2, 3, and 8 of Patent '085 at the hearing in support of their argument that this term should be construed to include only devices placed on the inside of a building. While it is true that these three figures show the placement of the device inside a structure, Defendants' selective and isolated reference to and reliance upon these figures alone is both misleading and misplaced. Indeed, figures 9 and 10 of Patent '085 clearly show the placement of the patented device on the outside of a structure, which offers support for a construction encompassing a device configured for placement on the inside or outside of a structure.

Defendants also rely heavily on a September 5, 2003 amendment by the patentee during the prosecution of Patent '852, a continuation-in-part of Patent '085. The Court has reviewed the relevant prosecution history related to this September 5, 2003 amendment. This prosecution history shows that during the prosecution of Patent '852, a PTO examiner rejected claim 1 of the originally filed Patent '852 application based on the judicially created doctrine of double patenting. Specifically, the examiner stated that the proposed claim, if allowed, "would improperly extend the 'right to exclude' already granted" by claim 10 of Patent '085. JCCS, 3 Exhibit D (DE 161-5), July 3, 2003 Official Action at 4. In response to this PTO examiner rejection, the applicant, through counsel, filed the September 5, 2003 amendment, which states:

"Claim 10 of [Patent '085] recites a kit for use in the interior of a building having a material with opposite edges which are connected to the building. The instant application is directed to a material for extended use and one edge is connected to the building and the opposing edge is connected to the ground. This is a fundamental difference between the patent claim and the application. There is no teaching in [Patent '852's] application to use [the invention set forth in Patent '852] in the interior of a building. Therefore, it is not evidence how any claim that may be allowed in this application would extend the life of claim 10 of the patent."
the device rather than a limitation on where the device is placed. A review of the claim and specification does not support

The Court concludes that the phrase "protecting a portion of the interior of the structure" is meant to be an intended use of and "on or within" a structure. Patent '085, col. 1, Ins. 14-16; col. 1, Ins. 61-62.

This Court finds additional support for this conclusion when considering that Patent '085's specification unambiguously coverage of Patent '085's claim 10 to placement of the patented device only in a structure's interior.

While the Court recognizes that explicit arguments made during a later prosecution to overcome prior art can lead to narrow claim interpretations, Seachange Int'l, Inc. v. C-COR, Inc., 413 F.3d 1361, 1372-73 (Fed. Cir. 2005) ("[w]here an applicant argues that a claim possesses a feature that the prior art does not possess in order to overcome a prior art rejection, the argument may serve to narrow the scope of otherwise broad claim language"), any such disclaimer must be clear and unambiguous. Id. at 1373; see also Purdue Pharma L.P. v. Endo Pharm., Inc., 438 F.3d 1123, 1136 (Fed. Cir. 2006) ("[u]nder the doctrine of prosecution disclaimer, a patentee may limit the meaning of a claim term by making a clear and unmistakable disavowal of scope during prosecution"). In determining whether the doctrine of prosecution disclaimer applies to disavow a claim's scope, the prosecution history must be considered in its entirety. Seachange, 413 F.3d at 1372.

Here, Defendants argue that the applicant's statement in the September 5, 2003 amendment that "Claim 10 … recites a kit for use in the interior of a building" narrows the scope of claim 10 to cover only devices used "in an interior of a building." Plaintiff counters that this statement does not amount to a clear and unambiguous disclaimer of claim scope. This Court agrees with Plaintiff. Viewing the prosecution history in its entirety shows that, in an effort to overcome the examiner's rejection, the applicant emphasized that claim 10 of Patent '085 discloses a device "having a material with "opposite edges which are connected to the building" while Patent '852's application "is directed to a material for external use and one edge is connected to the building and the opposing edge is connected to the ground." JCCS, Exhibit D (DE 161-5), September 5, 2003 Amendment at 3 (emphasis in original). A reasonable reading of the amendment in context is that the applicant attempted to distinguish claim 10 from Patent '852's application on the basis of whether the edges were connected to the building or not, rather than whether the device is deployed in the interior or exterior of a structure. Under these circumstances, the Court declines to find the later prosecution statement to be a clear, unequivocal disclaimer limiting the coverage of Patent '085's claim 10 to placement of the patented device only in a structure's interior.

This Court finds additional support for this conclusion when considering that Patent '085's specification unambiguously provides for the device to be placed inside or outside of a structure. See Elbex Video, Ltd. v. Sensormatic Elecs. Corp., 508 F.3d 1366, 1372 (Fed. Cir. 2007) (reaffirming that "because the prosecution history represents an ongoing negotiation between the PTO and the applicant … it often lacks the clarity of the specification and thus is less useful for claim construction purposes") (quoting Phillips, 415 F.3d at 1317). Specifically, Patent '085's Abstract states that the "flexible material may be included within the confines of a building in a free standing form or incorporating one or more interior walls of the building or structure" or "attached to the exterior of a structure to cover openings in the structure." Patent '085, Abstract. Further, the specification expressly contemplates use of the material "as an enclosure within the building or structure [which] could be free standing or incorporate one or more interior walls of the building or structure," while also expressly providing for the use of "material deployed on the outside of buildings to cover small openings such as windows and doors." Id. at col. 2, Ins. 5-11. The patent specification also refers to the patented device as being placed "on or inside" and "on or within" a structure. Patent '085, col. 1, Ins. 14-16; col. 1, Ins. 61-62.

The Court concludes that the phrase "protecting a portion of the interior of the structure" is meant to be an intended use of the device rather than a limitation on where the device is placed. A review of the claim and specification does not support
the narrowing construction proposed by Defendants. To the contrary, Plaintiff's proposed interpretation is consistent with the claim language and specification. Thus, the Court declines to construe this disputed phrase as being limited to a device deployed only in a structure's interior and hereby adopts Plaintiff's proposed construction, which accurately refers to a protective barrier device configured to be placed on the interior or exterior of a structure with the overall intended purpose of protecting the structure's interior.

The available intrinsic evidence relating to the '873 patent indicates that the phrase "protecting back panel" has a special meaning. It refers to a relatively stiff structure that protects the food tray compartments from indentation and damage. It specifically does not include flexible, pressure-sensitive labels which the patent specification consistently distinguishes from back panels. Plaintiff's assertion that the '873 patent uses the phrase "protecting back panel" to mean any back panel that enhances the structural integrity of the food tray runs counter to the available intrinsic evidence. Accordingly, it is rejected.

The Court's analysis begins with the presumption that Claim 2's back panel need not be relatively stiff. As noted, Claims 1 and 2 contain similar elements. Both claims refer to a back panel. However, whereas Claim 1 specifies "a back panel comprising a flat relatively stiff planar sheet," Claim 2 refers only to a "protecting back panel." The doctrine of claim differentiation directs courts to presume that claims that use different words or phrases have different meanings. Comark Communications, 156 F.3d at 1187. Accordingly, Claim 1's clear reference to a "relatively stiff" back panel gives rise to the presumption that Claim 2's "protecting back panel" need not be relatively stiff.

Nevertheless, the patent specification and prosecution history rebut this presumption. See Laitram Corp. v. Morehouse Industries, Inc., 143 F.3d 1456, 1463 (Fed. Cir. 1998) (presumption of claim differentiation is rebutted where differently-worded claims will bear only one interpretation). In discussing the patent's preferred embodiments, the inventors plainly declared that "any of the back panels would be constructed of a relatively stiff material such as paperboard or a relatively thick plastic material such as high density polyethylene." This statement recognizes no distinction between a Claim 1 back panel and a Claim 2 back panel; it declares that any back panel used in the patented invention is to be relatively stiff.

This declaration is consistent with Claim 2's prosecution history. As noted, an early version of Claim 2 (Claim 41) called for the "protecting back panel" to include an "end portion" that would allow the food tray to be displayed vertically. When the claims examiner rejected the inventors' attempt to describe this back panel as "non-bendable," he observed that "the present specification discloses this panel as being paperboard or HDPE" which could be described as "stiff" but not as "non-bendable." Accordingly, the patent examiner and the inventors understood the "protecting back panel" was relatively stiff even though this feature was not expressly claimed in the proposed patent but rather appeared only in the specification.

The inventors later amended Claim 41 to eliminate the claimed end portion. This amendment changed the shape of the back panel (it was not longer required to extend beyond the bottom edge of the package) but there is no indication that it changed the material from which it was to be constructed. Indeed, the above-cited declaration in the issued patent that "any of the back panels would be constructed of a relatively stiff material" including paperboard or HDPE confirms that the material from which Claim 2's protecting back panel was to be constructed was unaffected by the amendment to the claim.

The intrinsic evidence not only demonstrates that Claim 2's "protecting back panel" is to be relatively stiff, it also shows that a flexible, pressure-sensitive label is not a "protecting back panel." The specification recognizes that in some circumstances "it may be desirable to attach a conventional thin pressure sensitive label directly to the bottoms of the [tray] compartments." It then advises that "it is preferable that [these labels] not bridge gaps between compartments." By contrast, Claim 2 requires that a "protecting back panel" be "adhered immovably to [the] bottom walls of at least two of [the tray's] compartments." Accordingly, whereas labels should not bridge gaps between compartments, protecting back panels must. The '873 patent therefore teaches that conventional thin pressure sensitive labels are not "protecting back panels."

The requirement that Claim 2's "protecting back panel" be constructed of relatively rigid material is consistent with the panel's purpose which is to shield the bottom of the food tray from indentation and damage. This purpose is revealed in part
in the patent specification where the inventors list among the invention's objects "protecting the bottoms of the compartments of the tray against damage." This object is later linked specifically to Claim 2's "protecting back panel" when the patent specifies that if "a protective back panel" is not used, it may be necessary to alter the design of the tray so as "to protect the bottoms of the compartments against damage." Accordingly, the protection afforded by the "protecting back panel" is protection of the bottoms of the tray compartments against damage.

The prosecution history of the patent application reinforces this conclusion. During the prosecution of the patent application plaintiff's counsel noted that in some cases the proposed patent called for a back panel to cover the bottoms of all of the tray compartments. He observed that "this affords additional protection for those bottoms which are vulnerable to damage." When read with the patent specification, this intrinsic evidence strongly suggests that the function of a "protecting back panel" is to shield the bottom of the food tray from indentation and damage. The requirement that a "protecting back panel" be relatively stiff is consistent with this purpose.

Plaintiff disputes the purpose of the "protecting back panel." Plaintiff contends the "protecting back panel" is intended to enhance the structural integrity of the food tray. In support of this position plaintiff notes that Claim 2 requires the "protecting back panel" to adhere to more than one of the tray's compartments. The prosecution history shows that this requirement was added to ensure that the back panel would enhance the food tray's structural integrity. Prior art apparently did not disclose a back panel playing such a role. Accordingly, plaintiff argues defendant's labels are "protecting back panels" because they adhere to more than one tray compartment and thereby enhance the food tray's structural integrity.

Plaintiff's argument is contrary to the weight of the intrinsic evidence. The language of Claim 2 indicates that a "protecting back panel" is not synonymous with a "back panel that enhances the tray's structural integrity." If it were, then Claim 2 need only specify a "protecting back panel" or a "back panel adhered immovably to at least two of the tray's compartments." It does not. It requires both. Accordingly, these phrases must be interpreted to refer to different ideas or else some of the language of Claim 2 would be rendered superfluous. The Court's interpretation gives meaning to each of the words used in Claim 2 by interpreting the term "protecting" to refer to the back panel's role in shielding the bottom of the tray from damage. Such a back panel plays the additional role of enhancing the structural integrity of the tray only when it adheres to the bottom of more than one of the tray's compartments.

The prosecution history of the '873 patent also reveals that the inventors did not use the term "protecting" to refer to the back panel's role in enhancing the structural integrity of the food tray. To see this one need only consider the fact that the patent applicants referred to Claim 2's back panel as a "protecting back panel" well before the Patent Examiner "suggested" this role for the panel. Compare Prosecution History of '873 Patent at K 000163 to id. at K 000172. As the intrinsic evidence amply demonstrates, the protecting function the inventors ascribed to the "protecting back panel" was its role in shielding the bottom of the tray compartments from damage.

On July 13, 1998, Kraft sued ITC in the United States District Court for the Western District of Wisconsin, alleging that the packaging of ITC's lunch combination products infringed independent claim 2 of the '873 patent and its dependent claims. Claim 2 recites:

2. A food package comprising:

(a) a generally rectangular rigid plastic base tray having four side edges, a top, a bottom located in a bottom plane, and a plurality of compartments, said base tray having peripheral and internal flanges, said peripheral flanges defining said four side edges of said tray, each said compartment being defined by side walls extending from said flanges and a bottom wall located along the bottom plane, said flanges sized and adapted to form a hermetic seal with a film attached thereto,

(b) a film adapted to be affixed to said flanges so as to hermetically seal said compartments, said film adapted to receive and display information, and

(c) a protecting back panel adhered immovably to said bottom walls of at least two of said compartments of said tray, said back panel being planar and adapted to receive and display information.
In its January 14, 1998 claim construction and summary judgment opinion, the district court construed the term "protecting back panel" as having a "special meaning," i.e., a "relatively rigid structure[] that serves the function of protecting the food tray compartments from indentation and damage." 1 Kraft Foods, slip op. at 8. The court further stated that, "when adhered immovably to more than one compartment of the food tray [the "protecting back panels"] serve the additional function of enhancing the structural integrity of the tray." Id. The court declared the term "protecting back panel" to specifically exclude "flexible, pressure-sensitive labels which the patent specification consistently distinguishes from back panels." Id. at 10. Because the district court found that the labels on the bottom of ITC's trays were not relatively rigid, the court granted ITC's motion for summary judgment of no literal infringement. See id. at 15.

--- Footnotes ---

1 In its opinion, the district court used the terms "relatively stiff" and "relatively rigid" interchangeably.

--- End Footnotes ---

In addition, the district court construed Chiuminatta as precluding infringement under the doctrine of equivalents where the accused structure was "not new technology" arising after the time that the patent issued. See id. at 15-16. Stating that "[a] flexible, pressure sensitive label is not new technology," the district court held that ITC's use of labels on tray bottoms could not infringe limitation (c) of claim 2 under the doctrine of equivalents as a matter of law. See id. at 16.

DISCUSSION

I. Claim Construction

Claim construction is a question of law decided by the court. See id. at 979, 34 U.S.P.Q.2D (BNA) at 1329. "In interpreting an asserted claim, the court should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). Within this intrinsic evidence, "the appropriate starting point . . . is always the language of the asserted claim itself." Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186, 48 U.S.P.Q.2D (BNA) 1001, 1005 (Fed. Cir. 1998). A claim term should be given its ordinary meaning unless the specification or prosecution history provide a special, different meaning or definition. See Kegel Co. v. AMF Bowling, Inc., 127 F.3d 1420, 1427, 44 U.S.P.Q.2D (BNA) 1123, 1127 (Fed. Cir. 1997). There is a "heavy presumption in favor of the ordinary meaning of claim language." Johnson Worldwide Assoc's. v. Zebco Corp., 175 F.3d 985, 989, 50 U.S.P.Q.2D (BNA) 1607, 1610 (Fed. Cir. 1999); cf. Markman, 52 F.3d at 980, 34 U.S.P.Q.2D (BNA) at 1330 ("Any special definition given to a word must be clearly defined in the specification."). Although the written description may aid in the proper construction of a claim term, limitations, examples, or embodiments appearing only there may not be read into the claim. See Comark, 156 F.3d at 1186-87, 48 U.S.P.Q.2D (BNA) at 1005.

After the claims at issue have reasonably been construed, a district court may grant summary judgment "when it is shown that the infringement issue can be reasonably decided only in favor of the movant, when all reasonable factual inferences are drawn in favor of the non-movant." Voice Techs. Group, Inc. v. VMC Sys., Inc., 164 F.3d 605, 612, 49 U.S.P.Q.2D (BNA) 1333, 1337 (Fed. Cir. 1999); see Fed. R. Civ. P. 56(c). This court reviews both a district court's claim construction and its grant of summary judgment de novo. See Johns Hopkins Univ. v. Cellpro, Inc., 152 F.3d 1342, 1353, 47 U.S.P.Q.2D (BNA) 1705, 1713 (Fed. Cir. 1998).

A. Relatively Rigid

The district court began its claim construction by presuming that the "protecting back panel" of claim 2 did not need to be "relatively stiff." Under the doctrine of claim differentiation, two claims of a patent are presumptively of different scope. See Comark, 156 F.3d at 1187, 48 U.S.P.Q.2D (BNA) at 1005-06; Tandon Corp. v. U.S. Int'l Trade Comm'n, 831 F.2d 1017,
The district court noted that claim 1, which also recites a "back panel," expressly declares its back panel to be comprised of "a flat relatively stiff planar sheet." 2 Claim 2, by contrast, does not explicitly require that its "protecting back panel" be relatively stiff.

2 Claim 1 recites:

1. A food package comprising: . . .

    (c) a back panel comprising a flat relatively stiff planar sheet which is adhered immovably to the bottom walls of at least two of said compartments of the tray to preserve the structural integrity of the package and providing means to convey label information.

(Emphasis added).

The district court, however, viewed the written description and prosecution history as overcoming this presumption. The district court focused on the unequivocal declaration in the written description that "any of the back panels would be constructed of a relatively stiff material such as paperboard or a relatively thick plastic material such as high density polyethylene." '873 patent, col. 9, ll. 43-45 (emphasis added). The district court further recognized that, in prosecuting application claim 41 (the predecessor to issued claim 2), the inventors previously had required that the "protecting back panel" include an "end portion" to allow the food tray to be displayed vertically. Although the inventors later amended application claim 41 to eliminate this "end portion" of the "protecting back panel," they did not indicate that they were eliminating its relatively stiff attribute. The district court also noted that the inventors had amended application claim 41 to require that the "protecting back panel" be "non-bendable" in an attempt to overcome a prior art reference disclosing a bag supported by a hinged paperboard panel. In response to this amendment, the examiner had stated that the written description did not support a characterization of the back panel as "non-bendable," since it described the back panel as composed of paperboard or HDPE (high density polyethylene). The examiner acknowledged that the panel was "stiff," however. The applicants subsequently removed this "non-bendable" requirement.

Kraft offers a litany of arguments against the district court's requirement that the "protecting back panel" be "relatively rigid." First, Kraft reiterates the presumption arising from the doctrine of claim differentiation, arguing that the inventors plainly knew how to say "relatively stiff" when they so desired. Kraft also contends that "protecting back panel" must be given its plain and ordinary meaning of "a label or other structure adhered to the back of the food tray that protects the structural integrity of the claimed food package." Second, Kraft maintains that the written description does not support a special meaning of "protecting back panel" as being "relatively stiff," citing its express declaration that "the back panel may take many different forms." '873 patent, col. 3, l. 48. Kraft disputes the effect of the written description's statement that "any of the back panels would be constructed of a relatively stiff material such as paperboard or a relatively thick plastic material such as high density polyethylene," claiming that this declaration applies only to those embodiments that use the back panel to provide the stand-on-edge feature, as shown in Figures 10-15. See '873 patent, col. 8, l. 11 - col. 9, l. 41.

Finally, Kraft denies that the prosecution history is supportive of the "relatively stiff" nature of the "protecting back panel." Kraft emphasizes that the inventors amended application claim 41 to eliminate both the "non-bendable" and "end portion" limitations. Kraft notes that the stand-on-edge feature, which an "end portion" of the "protecting back panel" would have enabled, is claimed by a related Kraft patent issuing from the same parent application over two-and-a-half years before the '873 patent. See U.S. Patent No. 5,375,701 ("the '701 patent"). Each of the '701 patent's claims requires a "back panel comprising a flat relatively stiff sheet" so that the "package can stand upright." '701 patent, col. 14, l. 67 - col. 15, l. 8.

Notwithstanding Kraft's contentions, we agree with the district court that the written description and prosecution history overcome any presumption arising from the doctrine of claim differentiation, and thus approve the district court's construction of claim 2's "protecting back panel" as one that must be relatively stiff. Addressing each of Kraft's contentions in turn, we first note that claim differentiation only creates a presumption that each claim in a patent has a different scope; it is "not a hard and fast rule of construction." Comark, 156 F.3d at 1186, 48 U.S.P.Q.2D (BNA) at 1005. "Claim
Although Kraft had argued that "protecting" actually referred to protecting the structural integrity of the food package, the district court viewed the written description and prosecution history as supporting its interpretation of the "protecting" modifier as meaning protecting the back panel's immovable adherence to the bottom of the tray compartments either flat or indented. See id. Although the district court did not interpret "protecting" as also referring to the relatively stiff characteristic of the "protecting back panel." Similarly, the examiner's broadened the claim to the extent that the food package no longer needed to be capable of standing-on-edge, it did not alter the inherent "relatively stiff" characteristic required of the "protecting back panel." Similarly, the examiner's acknowledgment that the written description "certainly provides a description of this material [of the back panel] as being 'stiff,'" but not non-bendable, reveals that the inventors' subsequent removal of the non-bendable limitation did not change the back panel's relatively stiff characteristic.

B. Protecting

The prosecution history is similarly illustrative. The purpose of the former "end portion" limitation was to provide, in concert with the lowermost peripheral flange of the food tray, a stand-on-edge feature. As Kraft admits, the inventors eliminated this "end portion" limitation because it was already claimed by a related patent. Although this amendment broadened the claim to the extent that the food package no longer needed to be capable of standing-on-edge, it did not alter the inherent "relatively stiff" characteristic required of the "protecting back panel." Similarly, the examiner's acknowledgment that the written description "certainly provides a description of this material [of the back panel] as being 'stiff,'" but not non-bendable, reveals that the inventors' subsequent removal of the non-bendable limitation did not change the back panel's relatively stiff characteristic.

The district court construed the modifier "protecting" in "protecting back panel" as "protecting the food tray compartments from indentation and damage." Kraft Foods, slip op. at 8. Although the district court did not interpret "protecting" as also protecting the structural integrity of the food package, it viewed the back panel's immovable adherence to the bottom of more than one tray compartment as serving this additional role. See id.

The district court viewed the written description and prosecution history as supporting its interpretation of the "protecting" function. For example, the written description generally notes:

In the absence of a protective back panel, and depending on the particular material used to form the rigid base tray, it may be desirable to protect the bottoms of the compartments against damage by thermoforming the lower corners of the respective compartments either flat or indented.

'873 patent, col. 4, ll. 35-39 (emphasis added). Similarly, during the prosecution of the patent application, the inventors noted that some dependent claims of the proposed patent called for the back panel to cover the bottoms of all tray compartments. The inventors observed that such coverage "affords additional protection for those bottoms which are vulnerable to damage."

Although Kraft had argued that "protecting" actually referred to protecting the structural integrity of the food package, the
district court viewed claim 1 and the prosecution history as contradicting this interpretation. Claim 1 describes the back panel as "adhered immovably to the bottom walls of at least two of said compartments of the tray to preserve the structural integrity of the package." '873 patent, col. 14, ll. 15-16 (emphasis added). Although claim 2 also requires that the back panel be "adhered immovably to said bottom walls of at least two of said compartments," '873 patent, col. 14, ll. 32-33, it does not expressly associate such immovable adherence to preserving the structural integrity of the package. The district court reasoned that the "protecting" function of claim 2's back panel must serve a different purpose to avoid rendering claim 1's structural integrity language superfluous. The district court further emphasized that application claim 41 had always recited a "protecting back panel," and noted that it was the examiner who had suggested that the inventors amend the claim to require that the panel be "adhered immovably to said bottom walls of at least two of said compartments" to preserve the structural integrity of the package.

Kraft disputes the district court's conclusion that the "protecting" function concerns indentation and damage, instead interpreting "protecting" as protecting the food tray's structural integrity. Kraft contends that if, as the district court reasoned, the "adhered immovably" limitation inherently served the purpose of preserving the structural integrity of the food package, then claim 1's express recitation of this purpose would be redundant. Kraft thus concludes that the district court merely shifted the superfluity from claim 2 to claim 1.

We note that, with respect to back panels, the written description uses the term "protecting" in two different contexts: (1) "protecting the structural integrity of the tray," see, e.g., '873 patent, col. 3, ll. 33-35; and (2) "protecting the bottoms of the compartments against damage," see, e.g., '873 patent, col. 4, ll. 37-38. The district court apparently believed that it had to choose between these two different protecting functions in construing the "protecting" function, and did not consider the possibility that "protecting" included both. Similarly, though Kraft argues zealously that "protecting" must be limited to protecting the structural integrity of the food package, it offers no rational basis for preferring such protection over that against tray damage and indentation. Kraft further fails to present any sound argument clarifying or otherwise qualifying the written description's discussion of the back panel's role in protecting the tray compartment bottoms.

We thus agree with the district court's construction of the word "protecting," as used in the phrase "protecting back panel," to mean protecting both the structural integrity of the food package and the tray compartment bottoms against indentation and damage. This construction avoids the superfluity concerns voiced by the district court and Kraft, yet is consistent with the written description's repeated references to both forms of protection.
barrier device is "deployed to completely envelop the building structure." The written description further explains that "the roof is completely covered" by multiple panels joined together that provides "a continuous barrier surrounding the structure." Patent '852, col. 7, Ins. 2-15.

Defendants' essentially rely on a single embodiment theory; that is, that the Court's construction should reflect one single, preferred embodiment, which in this case, is the single barrier device structured to protect an entire structure, as illustrated in figure 1. Admittedly, figure 1's illustration and written description supports Defendants' proposal. However, the Federal Circuit specifically rejects single embodiment theories, stating that:

"[A]lthough the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments. In particular, we have expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment. That is not just because section 112 of the Patent Act requires that the claims themselves set forth the limits of the patent grant, but also because persons of ordinary skill in the art rarely would confine their definitions of terms to the exact representations depicted in the embodiments."

Phillips, 415 F.3d at 1323; see also Texas Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1204 (Fed. Cir. 2002). Accordingly, it is clear that the proper construction of "protective barrier device" should not be limited to any single preferred embodiment described in the specification, which includes figure 1.

Plaintiff proposes that "protective barrier device" means "a barrier against wind and windborne objects." This Court agrees. A review of the surrounding claim language of the first step recited in claim 1 shows that the phrase "protective barrier device" contemplates a device "arranged to prevent passage of wind-borne objects." The fourth step in this process claim states that "said protective barrier provides reduction of wind force."

In addition to the above surrounding claim terms, the specification specifically describes the invention as a "device for protection of property against high winds comprising a flexible material…utilized to protect the side of a structure including its windows and doors from the strong winds and debris impacts occurring during a hurricane." Patent '852, Abstract. The specification further states that the "invention relates to the protection of property against high winds and, in particular, to a flexible protective barrier device for securing property from damage from the wind itself and from the impact of foreign objects carried by the wind." Patent '852, Col 1., Ins. 13-17. Distinguishing prior art, the specification states that "what is lacking in the art is a flexible protective barrier constructed from a mesh material that can be easily stored and deployed for protecting the frangible portion of a structure from objects carried by the wind." Patent '852, Col. 2, Ins. 50-54. In light of the foregoing, this Court adopts a slightly modified version of Plaintiff's proposed construction and construes this claim term to mean "a protective barrier device in the form of one or more panels of a flexible textile material that acts as a barrier against wind and windborne objects."

</table>

GO BACK
IV. "protruding surface" 9

9 The term "protruding surface" is contained in claims 1, 9, and 12 of the '025 patent and claims 1, 17, and 27 of the '891 patent.

Plaintiff argues that the "protruding surface" is not limited to any shape, so long as the second socket surface "cooperates" with the opening of an engine workpiece. OPENING at 17-18. Defendant argues that this term is used interchangeably with the term "curved socket surface," and therefore, the "protruding surface" should be limited to being curved. RESPONSE at 10-11.

Claim 1 of the '891 patent discloses:

1. A process for manufacturing a valve operating assembly, comprising the steps of:
   a) cold forming, at least in part, a socket comprising the steps of:
      i) providing a first rod;
      ii) cold forming, at least in part, a first socket surface into the first rod so that the first socket surface includes a push rod cooperating surface;
      iii) cold forming, at least in part, a second socket surface into the first rod so that the second socket surface includes a protruding surface, a first flat surface, and a second flat surface, wherein the protruding surface is located between the first flat surface and the second flat surface;
   b) cold forming, at least in part, a leakdown plunger, comprising the steps of:
      i) providing a second rod;
      ii) cold forming, at least in part, a first plunger opening into the second rod so that the first plunger opening is provided with an annular plunger surface that defines a plunger hole shaped to accommodate a generally spherical member;
      iii) cold forming, at least in part, a second plunger opening into the second rod;
   c) cold forming, at least in part, a valve lifter body that is provided with a valve lifter axis, comprising the steps of:
      i) providing a third rod;
      ii) cold forming a first lifter cavity into the third rod so that the third rod is provided with a first inner lifter surface that includes a first wall, a second wall, a third wall, and a fourth wall that extend axially into the third rod with the fourth wall being located adjacent to a first curved surface, the third wall being located adjacent to a second curved surface, and the first and second curved surfaces are located adjacent to a lifter surface that is oriented to be generally orthogonal to the valve lifter axis of the valve lifter body; and
protrusion" when the absence of this feature would destroy the ability to make serpentine walls claimed as part of the protrusion and the insets. The court fails to see how the limitation of having a central narrow portion does not inhere in the narrowed portion were not present, binding would prevent the claimed relative rotation due to the interference between the drawn from this statement is that such curving is impossible without the central narrow portion of the protrusion. If the narrowed portion were not present, binding would prevent the claimed relative rotation due to the interference between the.

As the specification explicitly states, the central narrow protrusion allows for curving walls. The negative inference to be characteristic of having a central narrowed portion to the term "protrusion."

c. The Claim Term "Protrusion"

The specifications state, "the central narrow portion in the protrusion 26 (FIGS 1-6) allows for orientation of the blocks to provide inner curving and outer curving walls by the aligned seating and the relative rotation of the protrusion 26 within, and in relationship to, any block inset 22A or 22B." ('183 patent, col. 5, Ins. 9-13.) The court concludes that this attaches the characteristic of having a central narrowed portion to the term "protrusion."

As the specification explicitly states, the central narrow protrusion allows for curving walls. The negative inference to be drawn from this statement is that such curving is impossible without the central narrow portion of the protrusion. If the narrowed portion were not present, binding would prevent the claimed relative rotation due to the interference between the protrusion and the insets. The court fails to see how the limitation of having a central narrow portion does not inhere in the "protrusion" when the absence of this feature would destroy the ability to make serpentine walls claimed as part of the

3137
b. "Protrusion"

The claims of the '363 patent family require "a protrusion on one of said top or bottom surfaces" of the claimed block. See, e.g., '183 patent, col. 16, ll. 20-33 (emphasis added). The district court construed "protrusion" to include the limitation of having a "central narrow portion." This was error.

The ordinary meaning of the claim term "protrusion" is something that protrudes. See Webster's Third New International Dictionary 1826. The district court relied on the written description, which states that, "the central narrow portion in protrusion 26 (FIGS 1-6) allows for orientation of the blocks to provide inner curving and outer curving walls by the aligned seating and the relative rotation of the protrusion 26 within, and in relationship to, any block inset 22A or 22B," '183 patent, col. 5, ll. 9-13, to conclude that this statement attaches the characteristic of having a central narrow portion to the term "protrusion." Anchor, 252 F. Supp. 2d at 848. Contrary to the district court's claim construction, the written description does not describe "with reasonable clarity, deliberateness, and precision," In re Paulsen, 30 F.3d 1475, 1480 (Fed. Cir. 1994), that "protrusion" requires a "central narrow portion." Indeed, the many uses of the term in the written description are consistent with the ordinary meaning of "protrusion," one encompassing protrusions of any number of shapes. See, e.g., '363 patent, col. 4, ll. 55-56 ("While the protrusions may take any number of shapes, they preferably have a kidney or dogbone shape." (emphases added)). The general rule, of course, is that claims of a patent are not limited to a preferred embodiment, unless by their own language. See, e.g., Va. Panel Corp. v. Mac Panel Co., 133 F.3d 860, 866 (Fed. Cir. 1997) ("It is well settled that device claims are not limited to devices which operate precisely as the embodiments described in detail in the patent."). There is nothing in this case that warrants departing from the general rule.

Moreover, it is axiomatic that a claim construction that excludes a preferred embodiment such as the circular protrusions disclosed in Figure 3A "is rarely, if ever correct and would require highly persuasive evidentiary support." Vitronics, 90 F.3d at 1583; see, e.g., '363 patent, fig. 3A. Contrary to the district court's conclusion, varied use of a disputed term in the written description attests to the breadth of a term rather than providing a limiting definition. See, e.g., Enercon GmbH v. Int'l Trade Comm'n, 151 F.3d 1376, 1385 (Fed. Cir. 1998) (refusing to limit a term used "interchangeably" in the written description to only one of the uses of the term). That the term "protrusion" is used at various points in the written description to refer to "protrusions that may take any number of shapes" is simply not "a special and particular definition created by the patent applicant," Renishaw plc v. Marposs Societa' per Azioni, 158 F.3d 1243, 1249 (Fed. Cir. 1998), and is thus an insufficient reason to limit the scope of the claim. Furthermore, the parties point to nothing in the prosecution history compelling us to deviate from the ordinary meaning of "protrusion." Accordingly, we hold that the proper construction of "protrusion" is something that protrudes.

1) "Protrusion" and "Protruded"

The terms "protrusion" and "protruded" appear in the '296 patent. MKS contends that "protrusion" and "protruded" should be construed in accord with the ordinary meaning of the terms as "a portion that projects from a surface" and "having a portion that projects from a surface" respectively. Pursuant to its plain and ordinary meaning, the Court concludes that "protrusion" means "a projection" and "protruded" means "projecting."
connecting struts 400, as a result of which the protrusions 44 described in connection with FIG. 4 remain on each side of the support elements." The construction flows from the plain and ordinary meaning of protrude: "to thrust forward" or "to cause to project." Merriam-Webster Online Dictionary (2010). Defendant's proposal that the structure must project "outwardly," is unsupported by the intrinsic and extrinsic evidence of record.

15 '434 patent, claims 4 and 8.

GO BACK

3141

c. "provided in the engine body"

Claim 1 provides that "the first breather chamber, the first through passage, the second breather chamber, the second through passage and the communicating passage are provided in the engine body." ('215 Patent at 10:3-6.) Honda argues that the disputed term means "furnished with at least one component forming a structural framework for an engine," whereas Coast argues that the term should mean "contained within the combination of a crankcase, a cylinder barrel and a cylinder head." Although the parties proffer different meanings for the term "provided in," the focus of the dispute is over what constitutes an "engine body."

Honda argues that the term "engine body" needs no special construction and that it should be construed to mean "the structural framework for an engine." Honda also argues that Coast's proposed construction "may encompass crankcase portions that do not provide a structural framework for the engine and would not be considered by one of ordinary skill in the art to be part of an 'engine body.'" (See Shariati Decl., Ex. F (Declaration of Dr. Elliott L. Stern, PP 57-58.).) Notwithstanding Dr. Stern's opinion, the inventors acted as their own lexicographer and "set forth a definition of the disputed claim term in … the specification." CCS Fitness, 288 F.3d at 1366. Specifically, in the detailed description of the preferred embodiment, the inventors stated that "an engine body … has a crankcase 15, a cylinder barrel 17 and a cylinder head 20." ('215 Patent at 3:51-53.) Further, the use of the term "provided" in the claim language implies location.

Accordingly, the Court construes the term "provided in the engine body" to mean: "contained within the combination of a crankcase, a cylinder barrel and a cylinder head."

3142

VII. CONSTRUCTION OF THE '230 PATENT

Next, the parties ask the court to construe various portions of claims 1, 2, 3, 7 and 9 of the '230 Patent. The '230 Patent concludes with the following:

The embodiments of the invention in which an exclusive property are claimed are as follows:

1. A bin for containing material to be spread by a spreader vehicle having a floor-mounted conveyor positioned within the bin to extract such material, wherein the bin walls are provided with:

   (a) a curved portion that bends inwardly towards the conveyor, commencing from a first height that is above the level of the conveyor, and terminating at a second, lower height that is also above the level of the conveyor;

   (b) a terminal region extending to the edge of the conveyor, such terminal region being upwardly angled, proceeding outwardly from the conveyor, at an inclination that is sufficient to cause material to be spread when contained thereon to slide spontaneously to the conveyor, under the agitation arising from vehicular motion.
2. A bin as in claim 1 wherein the terminal portion is elevated at an inclined angle of between 7 to 30 degrees.

3. A bin as in claim 2 wherein the terminal portion is elevated at an inclined angle of 14 to 17 degrees.

4. A bin as in claims 1, 2 or 3 wherein the curved portion of the bin has a circular radius of 24 to 48 inches.

5. A bin as in claim 4 wherein the curved portion has a circular radius of 35 to 40 inches.

6. A bin as in claim 5 wherein the curved portion terminates virtually tangentially with a vertical upper bin wall portion.

7. A bin as in claim 1, wherein the curved portion terminates at a relatively flat terminal region having a width of from one to 20 inches.

8. A bin as in claim 1, wherein the curved portion terminates at a relatively flat terminal region having a width of from 4 to 6 inches.

9. In a spreader vehicle having a bin with a conveyor disposed along the bottom portion of the bin, a bin sidewall which is continuously curved from an outer, upper, near vertical portion of the sidewall to a lower, inner, near horizontal portion of the sidewall, the terminal boundary of the inner portion of the curved sidewall being inclined above the horizontal at an angle sufficient to induce sand contained therein to slide downwardly, in the presence of agitation arising from vehicle motion, into the conveyor.

'230 Patent, col.4, ll.19-63 (underlining added). Figures 3, 4 and 5 are instructive to visualize the claims:

GET DRAWING SHEET 3 OF 3

'230 Patent, figs.3-5. The specification discloses that, in these figures, 9 is a "conveyor platform," 10 is a "conveyor boundary," 13 is a "bin wall," 14 is an "upper vertical portion," 15 is a "curved portion" and 18 is a "terminal portion."

The court now discusses each of the disputed underlined clauses, in turn.

A. Claim 1

HECO proposes the following construction of the underlined portion of claim 1:

The "terminal portion" is an additional portion of each bin wall that is different from the curved portion and begins at the second, lower height where the curved portion terminates. The terminal region must be inclined to the point where the terminal region meets the curved portion is above the point where the terminal region meets the conveyor (with respect to the ground), and this upward inclination must be at least 7 degrees above horizontal.

JCCC at 19. Cives and Monroe do not believe that claim 1 requires construction. In the alternative, they propose the following construction:

Each "bin wall" has a terminal portion that extends to the conveyor. The terminal region is oriented at an upward angle away from the conveyor which enables material to slide to the conveyor by reason of irregular, rapid or violent action resulting from the movement of the vehicle.

Id.

The parties' proposed constructions and arguments to the court reveal two points of disagreement. First, Cives and Monroe object to the portion of HECO's construction that states that "the terminal region meets the curved portion." HECO construes claim 1 to require that the curved portion and terminal portion meet. Cives and Monroe contend that "there is nothing in the claim that requires the terminal region to begin at the second lower height at which the curved portion terminates" and imply that the inventor claimed that one or more other portions could fit in between the curved and terminal...
portions. Second, HECO contends that claim 1 is invalid for indefiniteness, unless the court Construes "at an inclination that is sufficient to cause material to be spread when contained thereon to slide spontaneously to the conveyor, under the agitation arising from vehicular motion" as requiring "at least 7 degrees above horizontal."

1. Other portions between the curved and terminal portions?

A critical starting point in determining whether claim 1 permits other portions between the terminal portion and the curved portion is the transitional phrase "provided with" at the outset of the claim. The question is whether "provided with" is an open- or closed-ended transitional phase.

Certain transitional language has customary meaning in patent law. For example, the word "comprising" means including the elements that follow in the body but not excluding additional, unrecited elements. Claims that use "comprising" are referred to as open claims . . . .

The transitional phase "consisting of" yields a claim of more limited scope. "Consisting of" basically means including only the elements that follow . . . and no more. Claims that use "consisting of" are referred to as closed claims . . . .

Herbert F. Schwartz, Patent Law & Practice 149-50 (5th ed. 2006) (footnotes omitted). Compare Genentech, Inc. v. Chiron Corp., 112 F.3d 495, 501 (Fed. Cir. 1997) ("'Comprising' is a term of art used in claim language which means that the named elements are essential, but other elements may be added and still form a construct within the scope of the claim.")., with Conoco, Inc. v. Energy & Envtl. Int'l, L.C., 460 F.3d 1349, 1360 (Fed. Cir. 2006) ("The phrase 'consisting of' signifies restriction and exclusion of unrecited steps or components."). 17

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

17 The transitional phrase "consisting essentially of" occupies a middle ground between "consisting of" and "comprising." "By using the term 'consisting essentially of,' the drafter signals that the invention necessarily includes the listed ingredients and is open to unlisted ingredients that do not materially affect the basic and novel properties of the invention." PPG Indus. v. Guardian Indus. Corp., 156 F.3d 1351, 1354 (Fed. Cir. 1998).

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Unfortunately, in this case the drafter of the patent chose the curious transitional phrase "provided with." The parties do not cite, and the court cannot find, any cases construing this transitional phrase as either open-ended or close-ended. The Federal Circuit Court of Appeals has, however, recognized that "comprising" is synonymous with "including," "containing" or "characterized by." Mars Inc. v. H.J. Heinz Co., L.P., 377 F.3d 1369, 1375-76 (Fed. Cir. 2004); see also Amgen v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1345 (equating "comprising" with "including"). At first blush, "provided with" strikes the court as similar to "including" or "containing." For example, a child's toy is "provided with" batteries when it includes or contains batteries. This does not mean, however, that the toy does not have other essential parts.

The structure of the claims also indicates that they should be construed as open-ended. Claim 6, a claim that is dependent on claim 1, claims "a bin as in claim 1, wherein the curved portion terminates virtually tangentially with a vertical upper bin wall portion." '230 Patent, col.4, ll.46-48. Ordinarily, an independent claim has a broader scope than a claim that depends from it. Free Motion Fitness, Inc. v. Cybex Int'l, Inc., 423 F.3d 1343, 1351 (Fed. Cir. 2005). Here, the specification makes clear that "a vertical upper bin wall portion is not a further description or a delimitation of the curved portion or the terminal portion, but rather adds a new element. See '230 Patent, col.2, ll. 18-31; see also id. col.3, ll.10-32 (discussing Figure 3 and remarking that "[upper vertical portions 14 of the sidewalls are optional: the bin sidewalls 13 may commence with inwardly curved portions 15"). Because dependent claim 6 adds an additional element to claim 1, it stands to reason that claim 1 is open ended.

The court must consult the specification, however, to determine whether one skilled in the art would read claim 1 as claiming a possible additional portion between the terminal and curved portions. See Lampi Corp. v. Am. Power Prods., Inc., 228 F.3d 1365, 1376 (Fed. Cir. 2000) (requiring the court to consult the specification to determine whether "having" was open-ended or close-ended). Here, the specification makes clear that, even if the phrase "provided with" construed to be an open-ended transitional phrase, the patent does not claim any additional portions between the terminal portion and the curved portion. In the specification, the patentee described the invention as follows:

- 3713 -
Each of the sidewalls is provided with a curved configuration that bends inwardly towards the conveyor, commencing from a height that is above the height of the conveyor. The curvature of this surface terminates at a second, lower height that is, as well, above the height of the conveyor. The bin surface then continues with a relatively flat, terminal region to the edge of the conveyor. This preferably flat terminal region is upwardly angled, proceeding outwardly from the conveyor, at an inclination that is sufficient to cause the material to be spread contained thereon to slide spontaneously to the conveyor, under the agitation arising from vehicular motion.

'230 Patent, col. 1, l.67, col.2, ll.1-11 (emphasis added). The specification clearly indicates that the terminal portion and the curved portion are together, because the entire surface "continues" from one to the other. Indeed, none of the figures, preferred embodiments or anything else in the specification contradicts such construction of the claim. 18

Accordingly, the court shall construe claim 1 to require that "the terminal region meets the curved portion," as HECO suggests.

2. "sufficient to cause"

HECO contends that claim 1 is invalid for indefiniteness, unless the court construes "an inclination that is sufficient to cause material to be spread when contained thereon to slide spontaneously to the conveyor, under the agitation arising from vehicular motion" as requiring "at least 7 degrees above horizontal." HECO asserts that the specification "teaches that inclination must be at least 7 degrees." Brief at 18 (citing '230 Patent, col.3, ll.21-28). Without any explanation, Cives and Monroe claim that the clause is clear and does not merit construction.

HECO has presented the court with insufficient reasons to construe the clause as requiring an inclination of at least 7 degrees. In support of its argument, HECO only cites to one preferred embodiment of the invention, in which the inventor stated that, under such embodiment, the angle should be "between 7 and 30 degrees, preferably substantially 16 degrees." Moreover, HECO does not explain or cite any legal authority to show why the clause is indefinite absent such construction. Because of the lack of argument and authority cited, the court declines to construe the clause at this time.

3. Conclusion

The court construes claim 1 as follows:

A terminal region extending to the edge of the conveyor, such terminal region being upwardly angled, proceeding outwardly from the conveyor, at an inclination that is sufficient to cause material to be spread when contained thereon to slide spontaneously to the conveyor, under the agitation arising from vehicular motion. The terminal region must be inclined to the point where the terminal region meets the curved portion is above the point where the terminal region meets the conveyor (with respect to the ground).

As should be clear, this is a hybrid of the parties' competing constructions.
Defendants' proposal for "providing" incorporates the remainder of the claim limitation into the definition of providing. Claim 1 of the '965 patent recites "providing at least one ingress point to said area of said mine shaft involved in fire." Defendants' proposal would make the trailing language superfluous. US Foam's use of "allowing" is equally impermissible. The parties also dispute whether an ingress point is "constructed" or "supplied." They offer little assistance to the Court on this point. The specification uses the word "constructing" with respect to the seals, which is where the ingress point is located in at least one embodiment. '336 patent, 4:46-47. In the first example, the specification explains that water pipes served as the ingress point and were "installed." '336 patent, 8:34-51. The definition of "provide" is "to supply for use." WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY OF THE ENGLISH LANGUAGE UNABRIDGED 1827 (1993). While constructing may be appropriate in some scenarios, constructing is narrower than supplying as it implies more planning and labor than supplying. The Court can envision supplying a hole in a mine without constructing it. The Court construes "providing" to mean "supplying."

2. "providing a flowpath"

Claim 1 of the '491 patent recites similar flowpath language but recites it in the form of "[a] method of cleaning hydrocarbons from a part in a parts washer . . . including the step [] of . . . providing a flowpath for the fluid between the basin and a tank." With respect to this instance of the "flowpath" term, Defendant argues the Court should construe the limitation as a step-plus-function limitation under 35 U.S.C. § 112, P 6. As a result, Defendant contends the phrase must be "limited to methods for providing a flowpath for the fluid between the basin and the tank, using the acts disclosed in the '491 patent, or equivalents thereof . . . ." (Def.'s Opening Brief at 21.)

Section 112, P 6 permits a patent applicant to claim his invention in "means-plus-function" or "step-plus-function" format:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

35 U.S.C. § 112, P 6. When the language of the claim uses the introduction "step of," instead of "step for," a presumption arises that the claim does not trigger step-plus-function treatment:

Method claims necessarily recite the steps of the method, and the preamble words that "the method comprises the steps of" do not automatically convert each ensuing step into the form of § 112 P 6. Nor does the preamble usage "steps of" create a presumption that each ensuing step is in step-plus-function form; to the contrary, the absence of the signal "step for" creates the contrary presumption.

Cardiac Pacemakers, Inc. v. St. Jude Medical, Inc., 381 F.3d 1371, 1382 (Fed. Cir. 2007). The Federal Circuit has cautioned district courts to tread carefully when invoking the step-plus-function doctrine:

Where the claim drafter has not signaled his intent to invoke § 112, paragraph 6 by using the "step[s] for" language, we are unwilling to resort to that provision to constrain the scope of coverage of a claim limitation without a showing that the limitation contains nothing that can be construed as an act.

Masco Corp. v. United States, 303 F.3d 1316, 1327 (Fed. Cir. 2002); see also id. ("[C]ourts must be cautious before adopting changes that disrupt the settled expectations of the inventing community.") (citing Festo Corp. v. Shoketsu Kinzoku Kabushiki Co., 535 U.S. 722, 739, 122 S. Ct. 1831, 1834, 152 L. Ed. 2d 944 (2002)).

Claim 1 of the '491 patent recites "[a] method of cleaning hydrocarbons from a part using a parts washer, the method including the step [] of . . . providing a flowpath for the fluid between the basin and a tank . . . ." Because the Applicant
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

signaled his intent not to invoke 35 U.S.C. § 112, P 6 by using "step of" instead of "step for," a presumption arises that the claim is not in step-plus-function format. Thus, the Court will not construe the claim as such unless "the limitation contains nothing that can be construed as an act." Masco, 303 F.3d at 1327.

The issue is thus whether "providing a flowpath" can be construed as an act. Judge Rader has noted "[t]he difficulty of distinguishing acts from functions in step-plus-function claim elements": "method claim elements often recite phrases susceptible to interpretation as either a function or as an act for performing a function. Both acts and functions are often stated using verbs ending in 'ing.'" Seal-Flex, Inc. v. Athletic Track and Court Constr., 172 F.3d 836, 848, 849 (Fed. Cir. 1999) (Rader, J., concurring). The Court is not without guidance, however, in distinguishing between acts and functions:

In general terms, the "underlying function" of a method claim element corresponds to what that element ultimately accomplishes in relationship to what the other elements of the claim and the claim as a whole accomplish. "Acts," on the other hand, correspond to how the function is accomplished. Therefore, claim interpretation focuses on what the claim limitation accomplishes, in relation to what is accomplished by the other limitations and the claim as a whole.

Id. at 849-50.

Claim 1 of the '491 patent is directed primarily to the biodegradation aspect of the parts washing patents. The claim recites, inter alia, the steps of "exposing" the part to the cleaning fluid in the basin, "providing a flowpath" between the basin and the tank, and "biodegrading" the grease and oil in the tank. The underlying function of the "providing a flowpath" limitation, in view of what the other steps of the claim accomplish, is the transportation of the oil and grease from the basin where it is washed off a part to the tank where biodegradation takes place. How that function is accomplished is "providing a flowpath between the basin and [the] tank."

Because "providing a flowpath" can be construed as an act, the claim element is not subject to § 112, P 6. Accordingly, the Court construes the phrase to mean "supplying a flowpath," or "supplying a path to be taken by the cleaning fluid from the basin to the tank."

II. Infringement of the '368 and '107 Patents

Claim 1 of the '368 patent contains the following first step:

1. In a method of stabilizing the below-grade foundation of an existing building structure having a predetermined weight and an assumed live load, the improved steps of:

   providing a foundation support for the foundation at a plurality of positions along the foundation . . .

Claim 1 of the '107 patent is the same.

In an opinion construing the claims of the '368 and '107 patents, the district court said that the "the term 'providing' [in claim 1] means that the support must be supplied or furnished at each location where stabilization is to occur." Because the "brackets are in existence and provided as required by the claims," the district court found that the Fasteel methods infringed
claims 1 through 4 and claims 6 through 8 of the '368 and '107 patents. Alternatively, the district court found that Chance proved infringement under the doctrine of equivalents. Neither party disputes the district court's claim construction.

Ruiz and Fasteel contend that the district court ered in finding that their method of underpinning infringed the '368 and '107 patents. Ruiz and Fasteel argue that in their method, the bracket does not have to be located near the stabilizing positions when the screw anchor is screwed into the ground. Instead, the bracket may be located elsewhere, such as in a nearby truck or near a supply pile on the ground of the job site.

In Fasteel's method, because metal brackets are in existence and available for use by the installer, they are "provided" within the meaning of claim 1. There is nothing in the claims or specification which indicates that the metal bracket had to be physically attached to or located next to the foundation before the other steps in the method could proceed. Thus, we find that the district court did not commit clear error in finding that the Fasteel method infringed claims 1 through 4 and claims 6 through 8 of the '368 and '107 patents.

ZMED's Proposed Construction:

Providing a third device (e.g., a linear accelerator) having its own coordinate system (e.g., relative to the isocenter) and determining the position of the third device relative to the position of the second image (and thus the organ) and moving the machine and patient relative to each other to place the third device in the desired position relative to the organ.

ZMED Opening Brief at 11.

NOMOS's Proposed Construction:

The "third device having a third coordinate system" of step (f) of claim 1 is defined in the specification of the '154 patent as being an imaging device such as a gamma-scintigraphy camera, a positron emission tomography (PET) apparatus, a magnetoencephalography (MEG) apparatus, or a synchrotron radiation apparatus. Accordingly, step (f) of claim 1 should be construed as the step of "providing a third imaging device having a third coordinate system."

NOMOS Opening Brief at 20-21 (citation omitted).

Construction:

Step (f) means "providing a third device (e.g., a radiation transmission apparatus or an imaging device) having its own coordinate system and determining the position of the third device relative to the position of the second rendering and therefore the first rendering (and thus the organ or lesion)."

Commentary:

The "third device" may be a "third imaging device" or may be another device, such as a linear accelerator. This construction is based on the text of the claim, which uses the terms "first imaging device" and "second imaging device," but not "third
imaging device." Logically, this difference suggests that "third device" is meant to be broader than simply a "third imaging device." Given the primacy of claim language in the patent construction process, that closes the inquiry. However, the specification provides additional support for this construction by listing several embodiments of the "third device," including a radiation transmission apparatus and an imaging device. See '154 Patent, col. 1, ll. 14-21.

A. Claim Construction

To construe claims, we first consider the ordinary and customary meaning of the claim language. Phillips v. AWH Corp., 415 F.3d 1303, 1312 (Fed. Cir. 2005) (en banc). The claim's "ordinary and customary meaning" is the reading a person of ordinary skill in the art would give the claim at the time of the invention. Id. at 1313. The person of ordinary skill in the art should read the claim term "not only in the context of the particular claim in which the disputed terms appears, but in the context of the entire patent, including the specification." Id. Claim 2 of the '653 patent reads as follows:

A method of treating an area of a body vessel, comprising the steps of:

[1] introducing a catheter with a collapsed inflatable balloon and a collapsed sleeve encircling the balloon on its end into the vessel at a point remote from the area to be treated;

[2] manipulating the catheter axially along the vessel to cause the balloon and sleeve to enter the area to be treated;

[3] inflating the balloon by introducing fluid under pressure into the balloon through a tube of the catheter in a manner wherein the sleeve surrounding the balloon is radially expanded towards the wall of the vessel;

[4] providing in the sleeve a material which increases in rigidity after expansion of said balloon;

[5] maintaining said balloon in an expanded condition in the vessel while said sleeve increases in rigidity; and

[6] thereafter removing the balloon and catheter from the vessel and allowing the sleeve to remain in the area to be treated (emphases added, bracketed numbers added)

AGR argues that the district court's claim construction was not justified and urges us to adopt a different claim construction. The district court defined "providing in the sleeve a material which increases in rigidity after expansion of said balloon" to mean "supplying in the sleeve a material that is separate and distinct from the sleeve itself." It rejected AGR's argued-for construction that this limitation somehow means that the sleeve has been pre-formed with a material that increases in rigidity after the balloon expansion. Rather, the district court held that the limitation requires the addition of a material to the stent after the balloon expansion. Rather, the district court held that the limitation requires the addition of a material to the stent at some point in the process.

When interpreting the claims, we must read them "in view of the specification, of which they are a part." Phillips, 415 F.3d at 1315 (quoting Markman v. Westview Instruments, Inc., 52 F.3d 967, 978 (Fed. Cir. 1995) (en banc)). In interpreting the '653 claim, the district court considered the intrinsic evidence contained in the patent specification to determine the meaning of the term "provided in." AGR's argument that the sleeve has been pre-formed with the material that increases in rigidity is without merit. The written description establishes that if the inventor intended to claim that the material was part of the invention, he would not have used the term "providing." In a description of one of the preferred embodiments, the specification speaks of the "sleeve unit ...including the ring balloons," which are intended to be filled with fluid, being "provided with sufficient radiopaque material ...." 653, col. 4, ll. 43-45 (emphasis added). Moreover, in another preferred embodiment, the specification speaks of the "sleeve space ...containing a fluid plastic material ...which is caused to become solidified ...." and "introduction into the sleeve space" of such material. Id, col. 6, ll. 22-26 (emphasis added). In short, the specification makes clear that in drafting his claims, when the patentee used the word "providing" - a word that like "introducing" or "supplying" denotes the addition of a separate substance into the stent - he did so deliberately, and not through an accident of quirky or idiomatic usage. This conclusion can be drawn from the fact that when he meant to convey the preexistence of a material in the sleeve he used an appropriate verb, such as "containing." Id.
Similarly, when Dr. Rockey wanted to convey the idea "formed of a material" he so stated specifically. In a description of one of the embodiments, the patent states that the "balloon …is formed of any suitable plastic or rubber material." Id., col. 6, ll. 7-9 (emphasis added). In another example, the specification teaches that an "outer sleeve wall …may be formed of Dacron" and an "inner wall …may be formed of Teflon." Id., col. 6, ll. 16-17 (emphasis added). Finally, the patent teaches that "the sleeve …is preferably formed of relatively inelastic material." Id., col. 5, ll. 52-53 (emphasis added). Thus, Rockey used the term "formed of" throughout the patent, yet specifically claimed the method of "providing in" for the claim involving the material. Considering this intrinsic evidence, we agree with the district court's construction of the fourth claim limitation.

This term is part of the claim limitation which reads:

. . . the shell further including proximal and distal lips retaining the viscoelastic hand/finger surface positioned in a central section of the tubular shell.

Kwitek proposes "the edges at or near each end of the shell and which go about the circumference of the shell." Pilot suggests "portions of the shell outwardly extending about the circumference of the shell at each end of the shell."

Now the party's positions about importing limitations from the specification are reversed. Pilot wants a single reference to outwardly extending lip and a diagram to be added to the claim. But Kwitek says no, that is merely an embodiment.

The parties agreed at the hearing that "proximal" and "distal" did not have to mean right at the very end of the tubular shell. Tr. pp. 68-69. Pilot noted that "at or near" was not as definite as "near" alone and might be confusing to the jury. Tr. pp. 68-69. Words are to be given their ordinary meaning as understood by one skilled in the art, in the context of the patent. However there is no indication from either party, the patent, nor the prosecution history that "proximal" or "distal" are specialized words of art in the field of writing implement grip design.

The field of art involves grips for writing implements. The claim and specification describes a writing implement with a "longitudinally extending, tubular shell." '190 patent, col. 8, l. 66; '190 patent, Figs. 1 & 4. Therefore, one skilled in the art would know the claim deals with objects in the shape of a common pen or pencil which has a longitudinal axis and two ends. One of these ends is toward the writing tip (the "proximal" end), and the other is toward the other end (the "distal end"). See '190 patent, col. 3, l. 41. This comports with common dictionary definitions. See THE MERRIAM-WEBSTER THIRD NEW INTERNATIONAL DICTIONARY, UNABRIDGED (2002)("proximal" means "next to or nearest the point of attachment or origin"); ("distal" means "remote from the point of attachment or origin"). Nothing in the claim itself, the specification, nor the prosecution history implies a further limitation of "at" or "right at" the very end of the shell. The court will not add such a limitation.

The next argument is whether the lip must be "outwardly extending" as urged by Pilot. The specification does use the term "outwardly extending" in reference to the lips. '190 patent, col. 1, ll. 53-55. But, as Pilot agreed, nothing in the claim or specification, prohibits lips from extending both inwardly and outwardly. Tr. p. 59, ll. 11-23. Further, nothing in the claim states the lips must extend outwardly.

This is not to say the lips are unimportant. The claim itself refers to lips "retaining the viscoelastic hand/finger surface positioned in a central section of the tubular shell." '190 patent, col. 9, ll 5-6. Initially the claim did not describe lips, and it was rejected by the PTO as anticipated by the McCall patent. See Office Action, 12/27/2001, p. 3, Ex. 2 to Defendants' Responsive Claim Construction Brief [Doc. # 61, Attachment # 3, p. 5 of 6].

The patentee responded by adding the term in dispute. See Kwitek's Amendment, 4/12/2002, p. 8, Ex. 4 to Defendants' Responsive Claim Construction Brief [Doc. # 61, Attachment # 5, p. 11 of 12]. The patentee argued to the PTO that McCall failed to disclose "a shell including proximal and distal lips retaining the viscoelastic hand/finger surface . . . ." Kwitek's
Amendment, 4/12/2002, p. 5, Ex. 4 to Defendants' Responsive Claim Construction Brief [Doc. # 61, Attachment # 5, p. 8 of 12]. The PTO stated "[t]he primary reason for allowance of the claims is the inclusion in claim 1 of the shell including proximal and distal lips that serve to retain the viscoelastic hand/finger surface positioned in a central section of the tubular shell. None of the art cited disclose [sic] this concept." Notice of Allowance, 4/12/2002, p. 2, Ex. 5 to Defendants' Responsive Claim Construction Brief [Doc. # 61, Attachment # 6, p. 4 of 4].

The claim itself limits the lips to those "retaining the viscoelastic hand/finger surface positioned in a central section of the tubular shell," so there is no need to repeat those words in the definition of "lips." Claims should be read broadly, and additional limitations should not be imported from the specification, and certainly not from description of the preferred embodiment. Additionally a claim construction hearing at which a party has no person skilled in the art to discuss the matter is not the place to determine, as a matter of fact, that such retention is only physically possible by lips pointing a certain direction. Pilot's arguments, and the "lips" limitation, may very well be dispositive of whether an accused device infringes. But that is a matter for another time. **The court will construe this term as follows:**

"Proximal and distal lips" means "portions of the shell which extend about the circumference at or near each end of the shell."

--- Footnotes ---

5 For each issue to be decided by the court, Plaintiff's proposed claim interpretation is listed as (1) and Defendants' proposed claim interpretation is listed as (2).

--- End Footnotes ---

Plaintiff proposes that the court construe the term to mean that the proximal end of the catheter has a cross-section defined by a fixed curved surface, or (2) the proximal end of the catheter is an elongated tube that has a proximal portion that is circular in cross section? 5

Answer: "proximal cylindrical portion" refers to a tube that is either circular or oval in cross section.

Both parties focus on the language "semicircular or 'D' shaped," but form opposite conclusions regarding the meaning of these terms. Plaintiff contends that the specification provides support for embodiments comprised of lumens either of a semicircular cross section or of an alternative D shaped cross section. Plaintiff's Reply to Defendants' Response Brief Re. Claim Construction, hereinafter "Pl.'s Reply" at 10.) Plaintiff recognizes that if the lumens were semicircular, the cylindrical portion would be circular, but argues that if the D shaped lumens are used, the cylindrical portion would therefore be oval in shape. (Markman Hearing Transcript, hereinafter "Tr." 100.) 6 Defendants counter that "D shaped" and "semicircular" are to be read as synonyms, and therefore only support a circular proximal cylindrical portion. (Tr. 111.) Alternatively, Defendants claim that the inside shape of the lumens does not necessarily define the outside shape of the cylindrical portion. (Id.) Therefore, in theory, the lumens could be something other than semicircles, but the outside cylinder would still be a circular tube.

--- Footnotes ---

6 The court interprets this to mean that the shape of the lumens dictates the shape of the cylindrical portion, which makes logical sense. However, Plaintiff conceded that this need not always be the case. (Tr. 117.) For example, the cylindrical
portion could be larger in diameter than the two lumens inside it, and thus a different shape than the one formed by the two lumens.

Even though the parties agree that the shape of the lumens does not necessarily define the shape of the outside cylindrical portion, the court notes that the specification, which describes the preferred embodiment of the patent, does suggest that the shape of the lumens determines the shape of the cylinder. The specification describes the "internal planar axial divider or septum" as "defining the return lumen and inlet lumen within the interior of the hollow tube." (‘155 patent, Ex. A to Second Amended Complaint, Col. 3, lines 21-25) (emphasis added.) The specification also states that the divider "bise[cr] the tube into the two lumens." (Id., Col. 3, lines 25-27.) While "tube" may not refer to the "cylindrical portion" (the tube could be inside of the cylindrical portion), the description of the patent's preferred embodiment, from which the language is quoted, does not refer to the cylindrical portion at all. This indicates that the term "tube" is used as a synonym for the cylindrical portion in the description, and suggests that although the lumens need not always define the shape of the cylinder, in the case of the preferred embodiment, they do. Therefore, assuming that D shaped means something other than semicircular, Defendants' interpretation is overly narrow.

Further evidence in favor of Plaintiff's interpretation comes from claim 7, which describes an alternate embodiment of the invention. Claim 7 depicts the septum inside the proximal cylindrical portion as "planar . . . and dividing the interior of said proximal cylindrical portion into first and second lumens." (Id., Col. 4, lines 67-68, Col. 5, lines 1-2.) Claim 8, which modifies claim 7, claims "the double lumen catheter as claimed in claim 7, wherein the first and second lumens and said distal end portion are each 'D' shaped in cross section." (Id., Col. 5, lines 23-25.) It is not disputed that the term "cylindrical" encompasses a circular tube. But if it truly encompassed only a circular tube, as Defendants contend, and if "D shaped" were equivalent to semicircular, then it would have been superfluous for claim 8 to specify D shaped lumens. The court concludes that claim 8 describes an alternative embodiment of the patent, one in which the lumens are D shaped but not necessarily semicircular. And this makes sense from a practical point of view: the letter "D" can be represented in various ways and does not obviously equate with a semicircle. For these reasons the court adopts Plaintiff's proposed claim interpretation; "proximal cylindrical portion" means that the proximal end of the catheter has a cross-section defined by a fixed curved surface, which can be either a circle or an oval shape.

3150

3. "proximal portion of a second length longer than the first length"

The plaintiff proposes "a proximal section of the guide wire tube that is longer and has a larger inner diameter than the distal portion." To support its proposed construction, the plaintiff makes a similar SciMed argument as for the previous phrase. The defendant, on the other hand, argues that this construction impermissibly adds limitations that are already specified elsewhere in the claim.

The Court agrees with the defendant that the plaintiff's proposed construction adds limitations that are already specified elsewhere in the claim. Therefore, no further construction is needed.

3151

2. "a proximal portion of a second length longer than the first length"

The plaintiffs propose "a proximal section of the guide wire tube that is longer and has a larger inner diameter than the distal portion." The defendants propose that this term carry its plain meaning.

As with the term "a distal portion of a first length," the plaintiffs rest on their arguments made in the Cordis case (which include a similar SciMed argument), and present no new arguments. The defendants do not present any arguments on this term in their briefing.
The court declined to construe this term in the Cordis case. See Cordis Order at 10-11. After carefully considering the arguments raised by the parties in this case, the court is not persuaded to alter its decision from the Cordis case. Accordingly, the Court concludes that this term does not require construction.

1. "proximal wall"

The parties first dispute the meaning of "proximal wall," a term which appears in all three independent claims (claims 1, 9, and 20), as well as in dependent claims. While Braun's proposed construction has evolved, Braun ultimately requested the construction "a wall on the proximal side of the needle guard." (Tr. at 11, 15) Terumo, by contrast, proposes that "proximal wall" be construed as "rear end wall closest to the user." (D.I. 71 at 7)

3 Braun earlier proposed that "proximal wall" be construed as "a structure on the proximal side of the needle guard that includes a proximally facing wall surface and a distally facing wall surface." (D.I. 74 at 10) In this earlier Braun construction, the "proximal wall" could have been a structure such as a "proximal vertical arm" or a "vertical arm" or a "proximal arm." (D.I. 74 at 12) At the hearing, Braun agreed that "proximal wall has to be a wall." (Tr. at 11; see also id. at 15 (Braun acknowledging it would be willing to drop from its proposal the language following "that includes").)

Both parties agree that the dispute is essentially whether the claimed "proximal wall" may be any wall on the proximal side of the invention -- that is, on the side closest to the medical practitioner who is inserting the IV -- or whether it must instead be the wall closest to the user. Braun proposes the former, as its construction would permit the "proximal wall" to be "a wall towards the back." (Tr. at 10) Terumo proposes the latter: "We say it's the rear wall." (Id. at 28) I recommend that the Court adopt Braun's construction. Thus, I recommend that "proximal wall" be construed as "a wall on the proximal side of the needle guard." The claim language in which the disputed term appears neither supports nor detracts from either side's proposed construction. That is, the claim language itself is consistent with the proximal wall being either a wall towards the back or being the rear wall. Claim 9, for instance, describes a proximal wall that has both a proximally facing and distally facing wall surface and two resilient arms extending distally of it. ('613 patent, col. 16 lines 9-13) These limitations could be satisfied by either a wall close to the user or the wall closest to the user.

Turning next to the specification, I find strong support for Braun's proposal. The specification repeatedly uses the term "proximal" as a relative term, to describe an area rather than a specific point within an area. For example, the specification refers to "a continuous, larger diameter proximal section 30." ('613 patent, col. 5 lines 27-28) Many other uses of "proximal" in the specification likewise relate to a direction or side. (See, e.g., id. col. 3 lines 44-45 ("further movement of the needle in the proximal direction"); id. col. 6 lines 1-2 ("guard . . . extends upward and proximally"); id. col. 6 lines 28-29 ("the needle moves proximally past the curved lip"); id. col. 6 lines 33-34 ("a result of needle 16 moving proximally past point C"); id. col. 6 lines 47-48 ("[if] desired, a slot 60 may be formed in the needle shaft slightly proximal to the needle tip"); id. col. 6 lines 52-53 ("move the needle further in a rearward or proximal direction"); id. col. 6 lines 63-64 ("move the protected needle . . . in the rearward or proximal direction"); id. col. 6 line 66 ("prevent further proximal movement of the needle"); id. col. 7 line 39 ("front wall 82 extends in the proximal direction"); id. col. 8 lines 29-30 ("section 102 extends from section 98 in the proximal direction"); id. col. 8 lines 51-52 ("at a location proximal to point B").) 4

4 Other uses of the word "proximal" in the specification are ambiguous as to whether they are referring to relative areas or specific points. See '613 patent, col. 3 lines 5-6 (describing a catheter "having a proximal end and a distal end"); id. col. 3 lines 8-9 ("catheter hub is attached to the proximal end of the catheter"); id. col. 5 line 22 ("proximal end of a needle"); id.
Terumo further argues that the specification uses "proximal wall" interchangeably with "rear wall" and "end wall," such that the patentee explicitly defined "proximal wall" to be the "rear wall of the needle guard." (D.I. 71 at 7-9) It is true that a patentee is free to be her own lexicographer and, when she is, her explicit definition will be adopted for purposes of claim construction. See Phillips, 415 F.3d at 1316. Here, however, I find no such express definition. The portions of the specification on which Terumo relies are, instead, descriptions of preferred embodiments of the invention depicted in the specification's Figures 10A and 10B. This section of the specification begins by describing "[t]he embodiment of the spring clip needle guard 120 disclosed in FIGS. 10A [and] 10B." (613 patent, col. 9 lines 28-29) One of the lines on which Terumo relies from a description of the embodiment depicted in FIG. 10A. (613 patent, col. 9 lines 40, 48-49 ("As shown in FIG. 10A ... [t]he proximal end of the needle 16 passes through the opening 134 in the rear wall 126.").) The other line on which Terumo relies is from a description of the embodiment depicted in FIG. 10B. (613 patent, col. 10 lines 12, 17-21 ("As also shown in FIG. 10B ... the crimp 138 on the needle shaft will come into contact with the end wall 126, and, since its width is greater than that of the opening 134, the end wall 126 will at this point prevent any further axial movement of the needle out of the needle guard."). It would be improper in the context of this patent to limit the broader claim language ("proximal wall") to the particular preferred embodiment ("rear wall") described in this portion of the specification, as nothing in either the claim language or specification calls for such a narrowing here. See, e.g., Phillips, 415 F.3d at 1323 ("Although the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments"); Liebel-Flarsheim, 358 F.3d at 908 (refusing to limit asserted claims to embodiments disclosed in the specification because the portions of the specification disclosing those embodiments "do not expressly or by clear implication restrict the scope of the invention").

Terumo points out, correctly, that the claim term being construed is "proximal wall," not "proximal." Yet this does not change the fact that in the numerous instances cited above the specification uses "proximal" to describe something in a relative manner. Terumo identifies no instances in which the specification uses "proximal" to describe something as the "rearmost of its kind."

The pertinent prosecution history is not inconsistent with these conclusions. During prosecution of the patent-in-suit, certain claims were rejected in light of U.S. Patent No. 5,135,504 (hereinafter "the McLees Patent"). (D.I. 74 at 14; D.I. 85 Ex. B (2/6/06 Office Action at 4 (BBM-TER0000336)); D.I. 85 Ex. B (11/23/05 Appellant's Brief at 5 (BBM-TER0000303))) The Patent Examiner viewed the McLees Patent as disclosing a proximal wall. But the patent applicant disagreed. (See, e.g., D.I. 85 Ex. B (6/12/06 Amendment at 15 (BBMTER0000359) (applicant stating: "[t]he issue of whether McLees discloses a proximal wall was also discussed. While consensus was not reached, [the examiner] agree[d] that McLees does not disclose a proximal wall comprising both a proximally facing wall surface and a distally facing wall surface.").) Subsequently, the applicant amended the claims to clarify that the claimed "proximal wall" in the patent-in-suit "comprises a proximally facing wall surface [and] a distally facing wall surface." (D.I. 74 at 14; D.I. 85 Ex. B (6/12/06 Amendment at 8-11 (BBMTER0000352-55))) Thereafter, the Examiner allowed the claims to issue. (D.I. 85 Ex. B (2/7/07 Notice of Allowability at 2-3 (BBM-TER0000517-18)) ("The subject matter not found was . . . the tip protector comprising a proximal wall having a proximally facing wall surface, a distally
In light of the claim language and the specification, there is nothing in this prosecution history that would justify construing "proximal wall" in the manner Terumo requests.

Terumo also cites to a great deal of extrinsic evidence but it, too, does not support Terumo's proposed construction. First, Terumo referred the Court to a dictionary definition of "proximal" (despite Terumo's point that the term in dispute is "proximal wall" and not just "proximal"). Specifically, Terumo cited Webster's Collegiate Dictionary, which defines "proximal" as "next to or nearest the point of attachment or origin." (See D.I. 72 Ex. G at p. 949; Tr. at 31-32 (Terumo's counsel discussing Terumo's slides 11 and 22).) However, this is the second (of three) definitions of "proximal" given at that same page of that same dictionary. The first definition given is "situated close to: proximate." (See D.I. 72 Ex. G at p.949.) Hence, the first-listed definition in the dictionary cited by Terumo appears to support Braun's proposal, not Terumo's.

Next, Terumo points to the 2001 deposition testimony of Mark Wynkoop, the '613 patent's primary inventor, given in other litigation. (D.I. 97 at 6) According to Terumo, in this earlier deposition Wynkoop described the proximal wall as the "back wall," the "[b]ackside of the clip," and the part of the clip that "has to be there to hold everything together." (D.I. 97 at 6) (quoting D.I. 98 Ex. 2 at p. 210) Then, in the instant case, in testimony given on December 30, 2009, Wynkoop again made clear -- in Terumo's estimation -- that he thinks of wall 126 as the "back wall," and that the back wall has to be there to "hold everything together." (D.I. 97 at 6) (quoting D.I. 98 Ex. 1 at pp. 141-42, 157-58) However, as Braun correctly notes, Wynkoop's testimony in the cited portions of these depositions addresses either Braun's Introcan Safety(R) product, an embodiment of the '613 patent (see D.I. 140 Ex. A at pp. 209-10 (Wynkoop's 2001 deposition, answering "the scissor clip on the Introcan Safety, what's its function?") (emphasis added)) or relates to an embodiment disclosed in the '613 patent specification (see D.I. 140 Ex. B at pp. 137-42, 157-58 (Wynkoop, in his 2009 deposition, reiterating his 2001 testimony and adding that he calls 126 in Figure 10A the "back wall," but not opining as to meaning of "proximal wall" in the claims)). In neither instance does Wynkoop's testimony address the distinct issue of the breadth of the claimed "proximal wall" of the '613 patent.

Finally, Terumo argues that if the Court adopts Braun's construction of "proximal wall," then the disclosed invention would not work. (Tr. at 30-31, 35) This is because Braun's construction would permit more than one proximal wall, but, Terumo asserts, "[n]one of these designs work with multiple proximal walls." (Tr. at 35) Braun responds with the observation that, even under its construction of "proximal wall," "[t]here are all these other elements there as well that are required to make this thing function." (Tr. at 42) Therefore, according to Braun, the disclosed invention would work even if multiple proximal walls are permitted. I have been unable to find anything in the record that would support either of these attorney arguments. Therefore, I find no evidence on this point that persuades me the conclusion I reach above is incorrect.

Thus, again, I recommend that the Court construe the term "proximal wall" to mean "a wall on the proximal side of the needle guard."
meaning of the term. If the claims intended a "near and within" meaning, they should have used that language. "Proximate" is widely understood as meaning "close to" or "near," but not necessarily "within." Furthermore, this construction makes sense in light of the specification and fits both uses of "disposed proximate" in claim 1: "the connector" is "located closely in space" to "the opening" and "the opening" is "located closely in space" to "the interior side." Finally, the dictionary supports this construction. The most relevant definition of "dispose" is "to put in place: set in readiness: arrange"; the most relevant definition of "proximate" is "very near: close." MERRIAM-WEBSTER ONLINE DICTIONARY, http://www.merriam-webster.com/dictionary/proximate; Merriam-Webster Online Dictionary, http://www.merriam-webster.com/dictionary/disposed.

GO BACK

3154

Claim 1 (c) refers to "the second end of said cylindrical body member engaging said tubular post proximate the second end thereof." According to the dictionary, "proximate" means "very near" or "immediately preceding or following." Merriam-Webster Dictionary online at http://www.m-w.com/cgi-bin/dictionary. "Immediately preceding or following" makes little sense as a definition when the referent is a tubular member encased by a cylinder for most of its length. As the drawings show, the second end of the cylindrical body member cannot engage the post at its very end because of the post's lip that projects slightly beyond the cylindrical body member. See Fig. 1, below.

[SEE FIG. 1 '194 PATENT IN ORIGINAL]

That the patent applicant intended the meaning to be "very near" is shown in Fig. 7, where the cylindrical body member is depicted as slightly farther from the very end of the tubular post than in Fig. 1, with an O-ring and a small portion of the nut separating it from the end of the post, as shown.

[SEE FIGURE IN ORIGINAL]

In both instances, the second end of the cylindrical body member is closer to the second end of the tubular post than to the first end or to the middle of the tubular post. From this, I am persuaded that the patent applicant used proximate to mean "very near" and used the term to identify the place along the tubular post at which the second end of the cylindrical body member engages the second end of the tubular post.

GO BACK

3155

B. Proximate

Claims 1(c) and 2(c) of the '194 patent require the second end of the cylindrical body member to engage the tubular post "proximate" to the second end of the tubular post. The ordinary meaning of "proximate" means "very near" or "immediately preceding or following." See July 25, 2003 Op. and Order, dkt. # 41 (citing Merriam-Webster Dictionary online at http://www.m-w.com/cgi-bin/dictionary). In the July 25 opinion and order, I concluded that a definition of "immediately preceding or following" would be inconsistent with the patent because, in the second preferred embodiment, there is an O-ring and a small portion of the nut separating the cylindrical body member from the very end of the tubular post. Using the specification to choose between multiple definitions is an accepted method of claim construction. See Texas Digital, 308 F.3d at 1203 ("Because words often have multiple dictionary definitions, some having no relationship to the claimed invention, the intrinsic record must always be consulted to identify which of the different possible dictionary meanings of the claim terms in issue is most consistent with the use of the words by the inventor."); Vitrionics Corp. v. Conceptoronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1995) ("an interpretation [excluding the preferred embodiment] is rarely, if ever, correct and would require highly persuasive evidentiary support").

Although I rejected defendant's position in the July 25 opinion and order, it continues to argue that the "ordinary meaning of proximate does not permit anything to come between one thing and another thing." Dft.'s Cl. Constr. Br., dkt. # 103, at 30. However, it fails to explain why a definition of "next to" is preferable to "very near." Further, defendant does not even attempt to reconcile its proposed construction with the second preferred embodiment. I adhere to my conclusion in the July
25 opinion and order that the term "proximate" means "very near."

3156
2. Claim 1, Element [b]: "proximate said slot engagement member."

The plaintiff argues that this limitation needs no construction. The defendants maintain that the court should define the term "proximate" and proposes a dictionary definition of the term to mean "next to or very close to." The court agrees with the defendants that the term "proximate" should be defined and adopts the definition of the term proposed by the defendants. The court notes that the plaintiff does not suggest that the defendants' proposed definition is inadequate or otherwise unnecessarily imposes limitations into the claim language. The limitation is defined as "next to or very close in space to said slot engagement member."

3157
2. "proximate the longitudinal ends of said panels" -- Claims 1 and 25

Amarr contends that this term should be construed as, "very near the right and left ends of the panels." Amarr's Opening Brief at 11. Wayne-Dalton declares that it requires no construction. See Transcript at 110.

With respect to the term "proximate," Amarr argues that "the jury won't understand that term to mean right at or very near or near, if the court doesn't give direction." Transcript at 111. Amarr therefore seeks the construction "very near" for that term. Wayne-Dalton, on the other hand, contends that it is entitled to all consistent meanings of the term "proximate." Wayne-Dalton is correct.

A court construing claim terms may not unduly limit its reading of those terms. TI Group Auto. Sys. (N. Am.), Inc., v. VDO N. Am., L.L.C., 375 F.3d 1126, 1136 (Fed. Cir. 2004). Rather, "a patentee is entitled to a definition that encompasses all consistent meanings" of the term. Id. "All consistent meanings" of the term "proximate" include more than "very near," or even "near." In the absence of an express statement in the 872 Patent that "proximate" bears the constricted meaning Amarr proposes, the requested limitation is not proper. The term "proximate" therefore does not require construction.

Amarr's effort to construe "longitudinal ends" to mean "the right and left ends of the panels" also must fail, as it seems more likely to add confusion than to remove it. Whether any given end is the right end or the left end depends on the viewer's position in relation to the door. The meaning of "longitudinal ends" is not similarly variable. Further, the parties do not dispute what is meant by "longitudinal ends." Once the first expert takes the stand, if there was any confusion to begin with (which this Court doubts), the jury will know what is meant by "longitudinal ends." The disputed language does not require construction.

3158
E. The Term "Proximity"

Again, we believe that the specification as delineated by the figures cited above renders the district court's construction--requiring that the needle be "flush with" the front of the guard when the flange activates--too narrow. In the embodiments designated by each figure, the blocking flange rests against the needle closely in front of, but not exactly at, the front of the guard body. As the needle moves, it will reach a point where it still protrudes from the front of the guard but is already clear of the blocking flange. The flange will therefore activate slightly but definitely before the needle submerges fully into the guard body and has its tip flush with the front; therefore, the district court's construction impermissibly excludes these embodiments. The proper construction of this term is "near."
IV. Pseudoelastic Shape Memory Alloy

In addition to the above terms BSC requests that the Court interpret pseudoelastic shape memory alloy. BSC's purpose for having the Court define this term is to add the language "without cooling" when discussing how stress-induced martensite is formed. As discussed previously, the Court does not find that such a limitation is warranted by the plain meaning of the term. Accordingly, the Court construes pseudoelastic shape memory alloy to mean an alloy, that when subjected to deforming stress in its austenitic state, first deforms elastically, and then, at a critical stress, deforms by the formation of stress-induced martensite.

4 There are additional claims that BSC asks the Court to construe. After reviewing BSC's proposed claim construction, however, it appears that the only substantive difference in BSC's proposed claim construction is its addition of the phrase "without cooling" to stress-induced martensite. The Court, therefore, will not address the claim constructions proposed by BSC.

3160

F. "Pulling"

Mitek construes the term "pulling" to mean pulling the flexible strand which extends outside of the femoral transverse tunnel. Mitek argues that in the Summary of the Invention, the method used for pulling the graft into the femoral socket is by "pulling evenly on the medial and lateral ends of the strand." (Doc. 140, Exh. 1, 3:3-4). Mitek also cites to the Detailed Description of the Preferred Embodiments which states that the graft is retracted through the femoral socket "by pulling evenly on the medial and lateral ends of the graft-passing wire." (Doc. 140, Exh. 1, 6:2-3). Mitek argues that the inventor only contemplated one method of graft-loading, and the claim should be limited to that method. Mitek also asserts that in the Summary of the Invention, the inventor claimed this technique of graft-loading eliminated sutures. (Doc. 140, Exh. 1, 2:33-34). Mitek argues that since Arthrex distinguished suture in-line graft-loading techniques (the prior art) from its transverse-wire technique, it cannot now assert that the claim broadly encompasses in-line graft-loading techniques.

Arthrex asserts that the patents disclose the preferred embodiment of how the graft is raised through the tibial tunnel. The preferred embodiment procedure is by pulling the ends of the flexible wire. However, the claim is not limited to the preferred embodiment. Arthrex argues that a person with ordinary skill in the art would know that the graft could be pulled through the tibial tunnel and into the femoral socket by the preferred method discussed in the Detailed Description of the Preferred Embodiments or any other method, including the method in prior patents known as the "in-line" technique of pulling the graft. Arthrex also argues that a "flexible strand" is a type of suture, which is used in the '477 patent to load the graft into the knee. Further, the '477 patent eliminates sutures as graft fixation devices not graft-loading devices.

The language in the claim is general in that it uses the term "pulling" in the following clause: "pulling the loop of the graft through the tibial tunnel and into the opening." (Doc. 140, Exh. 1, 6:53-54). This language is not limited to pulling the ends of the flexible strand that are protruding from the femur. The Summary of the Invention as well as the Detailed Description of the Preferred Embodiments does describe the method of pulling on the ends of the flexible strand that protrude from the femur to raise the graft into the knee. The issue is whether the outer limit of the claim is the method of pulling the flexible strand at both ends to raise the graft. It is impermissible to limit a claim to specification or the preferred embodiment, even if it is a single embodiment. Bell Atlantic Network Services, Inc. v. Covad Comm'n's Group, Inc., 262 F.3d at 1273, LizardTech, Inc. v. Earth Resource Mapping, Inc., 433 F.3d at 1377, Phillips v. AWH Corporation, 415 F.3d at 1323. The claim in this case is not limited by the specification nor by the preferred embodiment. A person of ordinary skill in the field would understand that the graft must be raised through the tibial tunnel and into the femur by some method, and the
preferred method is by pulling on the flexible strand that is protruding from the femur, however any method of raising the graft would comply with the claim. The argument by Mitek that the Summary of the Invention shows that the graft-pulling technique eliminates sutures is without merit. The method articulated eliminates sutures as graft-fixing devices, not graft-pulling devices. (Doc. 140, Exh. 1, 2:33-34).

Relying on the claim language itself, and the specification and preferred embodiment, the Court determines that "a person of ordinary skill in the art" would construe the "ordinary and customary meaning" of the term "pulling" to mean pulling the loop of the graft through the tibial tunnel and into the opening in the femur.

3161

"pulling the handle portion generally along the handle axis"

37. The third step of claim 1 requires "pulling the handle portion generally along the handle axis." Def. Munchkin Ex. A, Porter Patent, Col. 4, l. 3.

38. "Pulling" is a common, non-technical term that means "apply[ing] force to so as to cause or tend to cause motion toward the source of the force." Def. Munchkin Ex. MMM, American Heritage Dictionary 1002 (2d Coll. ed. 1991). This definition is consistent with the description of "pulling" in the Porter Patent's Summary of the Invention and Description of the Preferred Embodiment. Def. Munchkin Ex. A, Porter Patent, Col. 1, ll. 50-55; id., Col. 2, ll. 48-54. Both of these sections describe a user exerting force on the handle portion of the grooming tool to cause movement of the tool. In contrast, FURminator's proposed construction of "pulling" as meaning "the action of moving a comb or brush through hair" is not consistent with the ordinary and customary meaning of this term in the context of the Porter Patent, is not found in the patent, and is not referenced in the prosecution history.

39. With respect to the meaning of the phrase "the handle axis," the Porter Patent and prosecution history again make clear that the handle axis being described is the long axis of the elongate handle. See id., Col. 3, ll. 34-49; Def. Munchkin Ex. B, Porter Patent File History, at 447 ("If a user makes or otherwise acquires a grooming tool as described in Applicants' specification at pages 5-7 and uses the tool in the manner described on page 7, line 4-16 [Col. 3, ll. 34-49], loose hair will be removed from the furry pet without removing non-loose hair."). The referenced portion of the specification expressly discloses pulling the handle portion 22 of the grooming tool along the handle axis X. See Def. Munchkin Ex. A, Porter Patent, Col. 3, ll. 34-49; Def. Munchkin Ex. B, Porter Patent File History at 308.

40. FURminator's argument that "the handle axis" can be any one of an infinite number of axes that might be drawn from a handle of the grooming tool lacks merit, as previously discussed. Use of the definite article "the" with the term "handle axis" clearly refers back to the handle axis previously described (the elongate handle axis), not some new handle axis not previously disclosed or discussed. See Insituform, 99 F.3d at 1104-06 (construing "a cup" and "the cup" as singular because the claims, specification, and file history all supported that construction). Indeed, it is inconsistent with the arguments made to the Patent Office during the Porter Patent's prosecution for FURminator to argue that "the handle axis" referenced in this third step of the claim is anything other than the long axis X depicted in Figure 1. See Def. Munchkin Ex. B, Porter Patent File History at 447; Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 1578 (Fed. Cir. 1995) ("A patentee may not proffer an interpretation for the purposes of litigation that would alter the indisputable public record consisting of the claims, the specification and the prosecution history, and treat the claims as a 'nose of wax.'").

41. Contrary to FURminator's arguments, this construction does not contravene the claim differentiation doctrine. Claim differentiation is an aid to construction, is not a hard and fast rule, and applies only when a proposed construction would make "a claim superfluous." Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998) (emphasis added). Dependent claim 4 adds to claims 1 and 3 a limitation "wherein the blade portion is mounted on the handle portion in a manner so that the blade portion trails the handle portion as the handle portion is pulled generally along the handle axis while the pet engageable portion is in engagement with the pet." Def. Munchkin Ex. A, Porter Patent, Col. 4, ll. 14-18. Construing claim 1 to require that "a handle axis" or "the handle axis" is the longitudinal axis X of the handle does not render claim 4 superfluous, because claim 4 further requires the blade portion to trail the handle portion. Claim 1 says nothing about the longitudinal placement of the blade on the handle -- the blade could be at the front end (and thereby trail the handle when the handle is pulled along the long axis), in the middle, or on the back end (and thereby "lead" the handle.
during the pulling step).

42. Accordingly, this Court construes the disputed phrase "pulling the handle portion generally along the handle axis" as "applying force to the handle portion so as to cause or tend to cause motion toward the source of the force generally in the direction of the long axis of the handle."

43. Because it is not necessary to resolve for purposes of this preliminary injunction motion, the Court declines at this time to determine whether the third step of claim 1 of the Porter Patent is a step-plus-function claim pursuant to 35 U.S.C. § 112, P6, as asserted by Munchkin. See Wireless Agents, L.L.C. v. Sony Ericsson Mobile Communications AB, 390 F. Supp. 2d 532, 538 n.7 (N.D. Tex. 2005) (declining to construe multiple patent claim terms where the court only needed to construe one term to conclude that the plaintiff was not entitled to preliminary injunctive relief)."

44. FURminator has proposed other terms to be construed as part of this motion. However, because the Court's construction of the terms above is all that is needed to conclude that there is no likelihood of FURminator's success on the merits, the Court need not reach the construction of other claim terms requested by FURminator at this stage in the litigation.

GO BACK

2. "Pump Discharge Outlet"

The parties also disagree on the correct construction of the term "pump discharge outlet." Aqua seeks to have the claim construed as being "the point at which the pressurized water stream enters the housing for the remainder of the apparatus." (Pl. Claim Const. Stmt. at 19.) 3 It states that its construction is given support by the amendments it submitted after its Request for Continued Examination in response to the prior art it found after the Notice of Allowability, in which it stated that the volumetric flow of water made only one turn after exiting the pump discharge outlet. (Pl. Claim Const. Stmt. at 18.) Aqua reasons that the amendment would be nonsensical if the term "pump discharge outlet" were construed in a way other than its preferred construction. While Aqua's statements in prosecuting the amendment support its contention that it did not intentionally surrender external pumps, they do not support its argument that this Court should construe the claims to cover external pumps.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In contrast, Intex seeks to have the claim term "pump discharge outlet" construed "in accordance with its ordinary meaning." (Deft. Claim Const. Stmt. at 14.) 4 Using a dictionary, Intex defines each word in the term and arrives at the conclusion that the only possible construction of the term is that the discharge outlet is the point at which the water exits the pump. (Id.) This use of extrinsic evidence is acceptable here, as there is no use of the term "pump discharge outlet" anywhere in the patent specification or prosecution history. Intex contends that Aqua's construction argument contravenes the plain meaning of the words in the claim, thus violating the precept laid down in Phillips that without support from the specification the claim construction must be tethered to the claim language.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Intex also argues that Aqua's proposed construction conflicts with Figure 12, which demonstrates more than one right angle turn even using Aqua's construction. Figure 12, while illustrative of one possible embodiment of the invention, does not limit the entire scope of the patent's claims. The claims should not be confined by the embodiments disclosed in the specification. Phillips, 415 F.3d at 1323.
Intex's construction is correct. Aqua has presented no reason to go beyond the ordinary and customary meaning of the words in the term "pump discharge outlet." Because Aqua never defined the term "pump discharge outlet" either explicitly or implicitly in the specification, Aqua did not act as its own lexicographer in prosecuting the patent. Intex also correctly notes that in the case of an external pump, the Patent Office considered the pump discharge outlet an integral part of the pump apparatus, rather than inside the cleaning apparatus, because it described the external pump as being connected to a "housing adapter" rather than a "pump discharge outlet" in its December 19 Office Action. (Crisona Decl. Ex. 4 at 4.) A person of ordinary skill in the art of reading the '133 patent could not conclude that the PTO had considered the '133 patent to include external pumps, and while the PTO's understanding of the '133 patent is not binding upon this Court, it is nonetheless persuasive. Aqua's proposed construction is so far divorced from the meaning of the terms of the claim that without support from the specification it cannot stand, while Intex's construction simply applies the meaning of the words in the term as they would be understood by one skilled in the art. Both the prosecution history and the language of the claim point to the conclusion that the term "pump discharge outlet" should be construed to mean "the point at which water exits the pump."

2. Pumping Means

TI Group next argues that the district court erroneously construed the term "pumping means" as a means-plus-function limitation under 35 U.S.C. § 112, paragraph 6, resulting in a more narrow definition than called for by the written description. TI Group argues that the district court should not have analyzed the limitation under § 112, paragraph 6, because the limitation specified any necessary structure required. See Cole v. Kimberly-Clark Corp., 102 F.3d 524, 530-31 (Fed. Cir. 1996) (noting that, in order to invoke § 112, paragraph 6, "the alleged means-plus-function claim element must not recite a definite structure which performs the described function"). VDO argues that the phrase "pumping means" clearly gives rise to a presumption that § 112, paragraph 6 applies and that TI Group has not rebutted the presumption, because the structure recited does not perform the stated function.

The claim limitation at issue recites not only a pumping means, but its structure ("including a nozzle and a venturi tube in alignment with the nozzle"), location ("being located within the reservoir in the region of the opening"), and operation ("the passage of fuel out of the nozzle and through the venturi tube causing fuel to be entrained through the opening into the interior of the reservoir"). While the use of the word "means" gives rise to a presumption that § 112, paragraph 6 applies, the presumption is overcome by the recitation of the structure needed to perform the recited function. The written description informs and fully supports the structure recited in the claims: "Jet pump 30 includes nozzle 54 and venturi tube 58." '714 patent, col. 4, ll. 61-66.

The district court's construction, urged before this court by VDO, concludes that the pumping means must also include check valve 22, connecting tube 164, and jet block 144. Markman Order at 2. This construction, however, includes elements that are not necessary for performing the recited function. There is no indication in the patent that the function found by the district court, namely "to pump fuel into the reservoir," id. at 1, requires anything other than the structure recited in the claim. Therefore, the proper construction of the "pumping means" limitation in claim 2 is "a pump including a nozzle and a venturi tube in alignment with the nozzle."

In light of our conclusion that § 112, paragraph 6, is not invoked, we need not, and do not, address TI Group's alternative arguments about structure corresponding to "pumping means," including its arguments regarding check valve 22 and connecting tube 164.

IV. "Puncture Closure" as Used in the '004 Patent

Kensey submits that "puncture closure," as used in the claims, refers to any closure device that has a filament and that uses a
knot to hold the closure in place. Pls.’ Mem. at 53. Perclose submits that "puncture closure" means "a device for sealing a percutaneous incision or puncture in a vessel, duct or lumen comprised of a sealing member within the puncture tract, an anchor member within the vessel, duct or lumen, and a filament member connecting the anchor and sealing members in a pulley-like arrangement." Def.’s Mem. at 49, 5. Additionally, a "puncture closure" also has a "filament lock," which is a "combination of a knot in engagement with the sealing member and the system for exerting tension on the filament means, which includes a tag, a tamper means, and a torsion spring." Def.’s Mem. at 50.

As is evident in their favored definitions, Kensey and Perclose agree that "puncture closure" is a specific term but disagree about the precise meaning of the term. Neither party submits that the term would have a particular meaning to one of ordinary skill in the art, and therefore, the court is guided by the meaning of the term as it is understood in the patent and in the patent's prosecution history.

A. Claim Language

The '004 patent contains six independent claims. For the purpose of defining "puncture closure," Claims 1 and 10 contain language representative of the relevant language from all of the independent claims. The pertinent parts of Claim 1 read as follows:

A system for sealing a percutaneous puncture in the wall of a vessel, duct or lumen of a living being…

[a] said system comprising… a puncture closure,

[b] said closure comprising a first portion[,] 9 at least one extending filament portion and a filament lock . . .

[c] [with] said closure [deployed] in the puncture with said first portion of said closure within the interior of the vessel, duct or lumen and with said at least one extending filament portion extending from said first portion of said closure into the puncture tract,

[d] said closure being arranged to be disposed at an operative position in the puncture sealing the puncture,

[e] said filament lock comprising a knot locatable on said at least one filament portion within the puncture tract for cooperation with a portion of said closure[,] said knot, when in said puncture tract and when said first portion of said closure is within the interior of the vessel, duct or lumen, holding said closure at said operative position . . .

'004 Patent, 14:63-15:19. The language of Claim 10 that pertains to "closure device" is consistent with Claim 1 except in its description of the filament lock. The relevant portions of Claim 10 read as follows:

…said filament lock comprising a knot coupled to and movable with respect to said at least one filament portion within the puncture tract to a position holding said closure at said operative position…

Id., 16:38-42.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

9 Kensey's brief incorporates this comma without noting its absence in the text of the claim. See Pls.' Mem. at 53. I find no coherent way to understand the claim without this comma, and I assume that it was erroneously left out of the text of the patent.

- - - - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -
deployed within the puncture, the first portion sits within the interior of the vessel, the extending filament runs from the first portion into the puncture tract. Section e of Claim 1 and the quoted portion of Claim 10 specify that the filament lock is a knot and is either located on the extending filament or is coupled to the extending filament. "Puncture closure," based on the language in Claims 1 and 10, captures a class of devices smaller than the class suggested by Kensey but significantly larger than the class suggested by Perclose.

B. Specification

Kensey argues that Claims 1 and 10 adequately describe the term "filament lock" and that no special construction is required. See Pls.' Mem. at 53-56. Perclose, however, suggests a restricted definition of "filament lock" and argues that there is no support in the specification for the broad definition of "filament lock" contained in Claims 1 and 10. 10 See Def.'s Mem. at 51-55. Specifically, Perclose claims that, in the preferred embodiment of the '004 patent, neither of the two knots described--a knot tied around a plug member and a slip knot formed by the filament portions of the closure--can do all that Claims 1 and 10 require of the knot comprising the filament lock. See id. at 54-55; see also '004 Patent, 7:48-49 (describing knot 68 as the knot tied around the plug member securing the filament to the plug member); '004 Patent (Figure 2 - knot 68 tied around a plug member; and Figure 6 - knot 68 configured as a slip knot). Therefore, according to Perclose, "filament lock" must mean something more than just those knots. See Def.'s Mem. at 54-55. Kensey clarifies its position by admitting that the filament lock in the preferred embodiment of the invention is knot 68, but disagrees with Perclose's assertion that knot 68 cannot do all that Claims 1 and 10 require of the knot comprising the filament lock. See Pls.' Resp. at 20-22. Thus, the real issue before the court appears to be whether or not knot 68 can do what Claims 1 and 10 require of the knot comprising the filament lock.

--- Footnotes ---

10 Perclose also points out that during the application process, Kensey amended the claims of the '004 patent to use "filament lock" instead of "locking means," suggesting that the terms have different meanings. See Def.'s Mem. at 51. Any different meaning would be important because the "filament lock" claimed in Claims 1 and 10 appears to describe the locking means discussed in the specification of the '004 patent. See, e.g., '004 Patent, 2:49-57.

After reading the claims and the specification of the '004 patent, the interchangeability of "locking means" and "filament lock" is apparent. Furthermore, a perfectly acceptable reason for not using "locking means" in the claims is also apparent. As discussed with respect to "location detector" in the '689 patent, means-plus-function claim terms are construed in a very particular manner. If Kensey did not want to define the knot et al. in this fashion, then changing the claim language from "locking means" to "filament lock" makes sense.

--- End Footnotes ---

The knot described in Claim 1 must be locatable on the extending filament portion. See '004 Patent, 15:14-15. Knot 68 can do this. In the preferred embodiment, extending filament portion 34 passes through the plug member and out of the puncture tract. See id., 7:36-49. Thus, using the "pulley-like connection" the plug member can be positioned at a desired location on extending filament portion 34. Id., 7:36. Because knot 68 is tied around the plug member, knot 68 can also be positioned at a desired location on extending filament portion 34. Thus, knot 68 is locatable on the extending filament portion. Indeed, Perclose recognizes this. See Def.'s Mem. at 54.

Knot 68 must also be able to hold the closure in the operative position. See '004 Patent, 7:16-19. Perclose argues that in the preferred embodiment, the closure is not held in place by knot 68 but by the "combination of the pushing force exerted by the tamper on the sealing means, not on knot 68, and the pulley-like pulling force exerted on the filament." Def.'s Mem. at 54. In making this argument, however, Perclose points out exactly how knot 68 holds the closure in the operative position. The "pulley-like pulling force exerted on the filament" depends on knot 68. Without knot 68, the force exerted on extending filament portion 34 by the torsion spring would be unopposed, and the anchor member would not be held in the operative position. Although knot 68 does not hold the closure in the operative position by itself, in the preferred embodiment, knot 68 is essential to accomplishing this task. Thus, knot 68 satisfies the requirements imposed by Claim 1 on the knot comprising the filament lock.

Knot 68 can quickly be shown to satisfy two of Claim 10's three requirements. Claim 10 requires that the knot comprising
the filament lock be movable with respect to the extending filament portion. See '004 Patent, 16:38-39. In its brief, Perclose correctly acknowledges that knot 68 is, in at least some ways, movable with respect to extending filament portion 34. See Def.'s Mem. at 54. Moreover, it is already plain that, in cooperation with other elements of the preferred embodiment, knot 68 holds the closure in the operative position. See '004 Patent, 16:40-41.

The remaining requirement of Claim 10 is that the knot comprising the filament lock be coupled to the extending filament portion. See id., 16:38-39. Claim 10 also reveals, however, that between the filament lock and the extending filament portion lies that portion of the closure inside the vessel. See id., 16:32-36. In the preferred embodiment, the first portion would be made up of the anchor member and whatever filament from the pulley-like arrangement that remains inside the vessel. See id., 12:37-13:18. Assuming that there is some of this filament inside the vessel, knot 68 could satisfy this requirement of Claim 10. Taking the ordinary meaning of "coupled" to be connected, knot 68 is connected to the filament inside the vessel, and the filament inside the vessel is connected to extending filament portion 34. Thus, knot 68 is indirectly connected to extending filament portion 34, but connected nonetheless. For this reason, knot 68 satisfies the final requirement of Claim 10.

C. Prosecution History

Neither party analyzes the prosecution history of the '004 patent in detail. The '004 patent's application follows in the same line of continuation applications from which the '689 patent arose. The submission of the '004 patent's application immediately followed the submission of the '689 patent's application. The '004 application also arises from the same initial application, namely the '974 patent's application. It is clear the "puncture closure" is a particular type of "closure device" or "closure means." Hence, "puncture closure" refers to some subclass among the class of devices identified by "closure device" or "closure means." Hence, a puncture closure is some particular type of anchor, plug, and filament closure.

The '004 patent's prosecution history only further confirms that a puncture closure is a type of "closure device." In rejecting Kensey's initial application for the '004 patent, the examiner specifically stated that the application shared a "common subject matter" with the '974 patent and approval of the application would result in nonstatutory double patenting. PTO's June 30, 1998 Office Action at 2. 11 The common subject was "[a] system for sealing a percutaneous puncture comprising a deployment member or carrier means, a positioning means or anchoring means, a puncture closure or closure means, a filament, a locking means having a knot…." Id. at 3. As relevant here, both devices must include plugs or sealing members of some sort. Furthermore both closure assemblies must be positioned by the closures' anchors. Consequently, it is clear that the PTO examiner understood "puncture closure" to include both an anchor and a plug. In response, Kensey disclaimed, under 37 CFR 1.321, the subject matter of '974, and by so doing, Kensey gave up any extension of patent protection through the '974 patent that might have resulted from the approval of the '004 application. See August 21, 1998 Terminal Disclaimer. 12 This disclaimer, at a minimum, serves to indicate that Kensey did not dispute that "puncture closure" and "closure means" cover the same ground.

Footnotes: 11 In Dec. of Charles Cantine (Doc. 33) at Ex. 21.

12 In Cantine Dec. at Ex. 21.

In sum, "puncture closure" must be understood to have all the essential elements of "closure means" with the additional element of a "filament lock." "Puncture closure" must include, therefore, an anchor and plug. Furthermore, the plug can only be understood as being bound by the knot. Consequently, "puncture closure" as used in the '004 patent refers to the class of closure devices (1) that use an anchor, plug, and filament bound together in a pulley like arrangement whereby the filament draws the anchor and plug together so as to effectuate a seal and (2) that have a filament knot which holds the closure in place by holding the plug in place.
Kensey also appeals the construction of "puncture closure" as recited in the claims of the '004 patent. The district court held that "puncture closure" referred to

closure devices (1) that use an anchor, plug, and filament bound together in a pulley like arrangement whereby the filament draws the anchor and plug together so as to effectuate a seal and (2) that have a filament knot which holds the closure in place by holding the plug in place.

Thus, the court held that "puncture closure" is the same as "closure device" (i.e., an A-P-F device) but with an added element: a filament lock. The court based its construction on its belief that "puncture closure" refers to the same devices as identified for "closure device" in the '689 patent. The district court then added the filament lock requirement based on other language in the claims of the '004 patent. The '004 patent is a continuation of the '689 patent. Because a continuation cannot add new material, the usage of "puncture closure" must accord with the teachings of the '689 patent. Other than in the invention title, the term "puncture closure" appears only once in the specification of the '689 patent. That instance refers to a "hemostatic puncture closure device," indicating that the specification treats "puncture closure" and "closure device" as interchangeable terms. '689 patent, col. 14, l. 41. The '004 patent continues to refer to "closure device 22" throughout the specification in a manner that equates that term with "puncture closure." Similarly, in the '004 patent, the term "puncture closure" appears only in the claims, the summary of the invention, and in one reference to "hemostatic puncture closure device." '004 patent, col. 14, l. 48 (emphasis added). Hence, the district court correctly construed "puncture closure" as an A-P-F closure device with a filament lock.

B. Claims Construction in the '415 Patent

On September 19, 2003, the Court held a hearing in accordance with Markman v. Westview Instruments, Inc., 517 U.S. 370, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996), to construe the disputed terms and phrases of the asserted claims. The Court's October 7, 2003 Order Following Claims Construction Hearing construed the following disputed terms in the '415 patent which are relevant to the present findings on validity and invalidity:

"implant delivery assembly"  "an apparatus for delivery of occlusive devices, such as embolic coils that comprises three distinct components: a pusher, a coupling, and an implant"

"pusher"  "any device or structure intended to push another device or structure"

"selectively operable coupling"  "a connecting device that connects the implant to the pusher and that can be selectively operated by the user"

"coupling"  "a connecting device that connects the implant to the pusher and that can be selectively operated by the user"

"said coupling operable by fluid pressure so that when a sufficient amount of fluid pressure is applied to the coupling, the fluid pressure a user causes the occlusive implant to separate from the pusher"  "the coupling is a connecting device that can be operated by selectively applying fluid pressure to the coupling to separate the implant from the pusher, and the application of the fluid pressure by the user to the coupling causes the detachment of the implant at the coupling"
"delivering fluid pressure through the pusher such that the implant detaches from the pusher by the fluid pressure"

Plain and ordinary meaning applies, no specific construction by the Court

(The Markman Order at 22-29, Docket Item No. 177.)

I. "putter head" 1

--- Footnotes ---

1 The term "putter head" is contained in claims 1 and 2 of the '927 patent.

--- End Footnotes ---

Plaintiff's Proposed Construction

No construction required.

Defendant's Proposed Construction

The portion of the putter connected to the distal end of the shaft, small enough to enter the putting hole cup to retrieve a golf ball.

The instant claim construction dispute centers on two portions of the specification where the inventor describes (1) "The object of my invention is to provide a putter that is balanced, easy to line up, hit out of deep grass, easy to control, and can pick up a golf ball out of a putting cup," '927 patent at 1:20-23, and (2) "the putter head is small enough to enter the putting hole cup to retrieve a golf ball." Id. at 1:38-40. The parties dispute whether these descriptions suggest that the inventor and the Patent Examiner understood the claimed invention to necessarily be small enough to enter the putting hole cup to retrieve a golf ball.

Plaintiff contends that "putter head" is not limited in size as Defendant proposes. OPENING at 7. Plaintiff argues that the '927 patent's claim language properly claims a putter head that can be small enough to retrieve a golf ball from the putting hole cup, but is not limited to this embodiment. Id. Plaintiff contends that the claims should not be limited to the embodiment discussed in the Summary of the Invention section because those size limitations were not carried throughout the patent, or otherwise mentioned in the Description of the Preferred Embodiment or claim language. See id. At the Markman hearing and in the Opening brief, Plaintiff asserts that it is impermissible under Federal Circuit and Supreme Court precedent to read into a claim an element that is not present, even though it may be found in the description portion of the patent. OPENING at 8; Innova/Pure Water Inc, 381 F.3d 1111, 1117 (Fed. Cir. 2004) (citing White v. Dunbar, 119 U.S. 47, 51-52, 19 S. Ct. 72, 30 L. Ed. 303, 1886 Dec. Comm'r Pat. 494 (1886); Continental Paper Bag Co. v. E. Paper Bag Co., 210 U.S. 405, 419, 28 S. Ct. 748, 52 L. Ed. 1122, 1908 Dec. Comm'r Pat. 594 (1908)). Specifically, Plaintiff maintains that "even where a patent describes only a single embodiment, claims will not be read restrictively unless the patentee has demonstrated a clear intention to limit the claim using 'words or expressions of manifest exclusion or restriction.'" Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004) (quoting Teleflex, 299 F.3d at 1327). All in all, Plaintiff denies that the intrinsic record demonstrates the requisite intent to clearly limit the claim. OPENING at 8.

Defendant argues that Colucci has intentionally disavowed any embodiment that is too large to fit in the putting hole cup because the specification states that "[t]he putter head is small enough to enter the putting hole cup to retrieve the ball." '927 patent at 1:38-40; RESPONSE at 9. According to Defendant, by using affirmative language to set forth the object of his invention, Colucci is describing his invention as a whole and effectively limiting the embodiment to the invention itself--despite the abstract possibility that the claim could be read more broadly. See TRANSCRIPT at 22:2-7; see also (Doc. No. 61) ("Callaway Letter Brief"). Callaway contends that Colucci has provided "clear and express definitions" that amount to specification disclaimer. Id. at 10; TRANSCRIPT at 23:16-18 ("So we think that Mr. Colucci did disclaim anything other than a putter head that is larger- or that is larger than something that could fit inside of a cup."). In support of its position, Callaway cites Federal Circuit law governing specification disclaimer to conclude that the claims must be read to limit the invention to a putter head small enough to pick up a golf ball out of a putting cup. RESPONSE at 10 (relying on Netcraft
Examination of the Claim Language

The Court does not read the '927 patent to contain a clear disavowal of the full scope of the claim language. See Home Diagnostics, Inc. v. Lifescan, Inc., 381 F.3d 1352, 1358 (Fed. Cir. 2004) (holding that "[a]bsent a clear disavowal or contrary definition in the specification or the prosecution history, the patentee is entitled to the full scope of the claim language."). Importantly, the claim language does not mention the size of the putter head, and accordingly, Defendant does not support its contention with any reference to language from the claims. See Innova/Pure Water, 381 F.3d 1111, 1116 (Fed. Cir. 2004) (emphasizing that the claims are the measure of an invention). In common parlance, a "putter head" need not be small enough to fit within a putting hole cup. Therefore, the absence of claim language suggesting a restrictive reading of "putter head" weighs against Defendant's position.

Examination of the Specification

A review of the specification in its entirety also weighs against reading the claims restrictively because Defendant has not identified language that rises to the level of a "clear and unmistakable" disclaimer. Cordis, 561 F.3d at 1329. Defendant has the burden of overcoming the "heavy presumption" in favor of giving the claim terms their ordinary meaning, and the patentee's intention, as expressed in the specification, fails to confine the putter head to a single embodiment. Phillips, 415 F.3d at 1312-13, 1323; Liebel-Flarsheim, 358 F.3d at 913 (finding that claim terms must be given their ordinary meaning unless the claim language is overcome by statements of "clear disclaimer" expressly indicating "manifest exclusion or restriction"). 2 As noted above, the ordinary meaning of a "putter head" need not be restricted in size, and the disputed language in the specification supports a finding that embodiments of Colucci's invention may be small enough to fit within a putting cup, but the specification does not limit that embodiment to the exclusion of its broader effect. Innova/Pure Water, 381 F.3d at 1117 ("Accordingly, particular embodiments appearing within the written description will not be used to limit the claim language that has broader effect. And, even where a patent describes only a single embodiment, claims will not be read restrictively unless the patentee has demonstrated a clear intention to limit claim scope 'using words or expressions of manifest exclusion or restriction.'").

Footnotes

2 The Federal Circuit's holding in Liebel-Flarsheim provides a particularly relevant discussion of the "inherent tension" that exists in a situation where, as here, "the written description of the invention is narrow, but the claim language is sufficiently broad that it can be read to encompass features not described in the written description" (i.e. a putter head that is too large to fit within a putting hole cup). 358 F.3d at 904-05. Judge Bryson discusses in great detail two axioms often relied upon for contrary arguments: On the one hand, claims "must be read in view of the specification of which they are a part." Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995). On the other hand, it is improper to read a limitation from the specification into the claims. Arlington Indus., Inc. v. Bridgeport Fittings, Inc., 345 F.3d 1318, 1327 (Fed. Cir. 2003). Judge Bryson then comments that parties frequently cite to one or the other of these competing principles as if the axioms, standing alone, were sufficient to decide a claim construction dispute. Liebel-Flarsheim, 358 F.3d at 904.

End Footnotes
Embodiment section and the claims themselves, results in an inconsistent treatment of the claim term throughout the specification that cannot amount to an intentional disclaimer.

When the specification describes certain features as "preferable" or as examples, courts have found no disclaimer of claim scope. Fenner Investments, Inc. v. 3Com Corp., No. 6:08-cv-61, 2009 U.S. Dist. LEXIS 44842, 2009 WL 1505407, at *12 (E.D. Tex. May 26, 2009). Here, although the disputed language is not explicitly discussed as "preferable" or an example, the discrepancy between the specification and the claims, as well as the inconsistency within column 1 of the specification suggests that the patentee was considering embodiments that were not necessarily limited by the size of the putting hole cup. This is in contrast to circumstances where the patentee expressly contemplated "all embodiments of the present invention." 3 See SciMed, 242 F.3d at 1345.

3 Defendant argues that when a patentee discusses his invention with particular phrases such as "present invention" or "the object of my invention," the patentee's intention is unambiguous and courts should limit claim scope. RESPONSE AT 9; CALLAWAY LETTER BRIEF. Even if the Court were to find that "the object of my invention" is equivalent to the usage of "the present invention" in Verizon, the Court will not limit claim scope simply due to the use of that language. Fenner Investments, Inc. v. 3Com Corp., No. 6:08-cv-61, 2009 U.S. Dist. LEXIS 44842, 2009 WL 1505407, at *11-12 (E.D. Tex. May 26, 2009) (discussing Verizon, 503 F.3d at 1308) (noting in Fenner that the Court will not read a specification discussing "present invention" to be magic words that automatically triggers a narrowing of the claim language).

Examination of the Prosecution History

The prosecution history primarily focuses on the mechanics of the weight distribution means without further elaboration on the means for retrieving the golf ball. Claim 1 discusses only the broad situation where the putter head is comprised of a "means for retrieving a golf ball" and where a golf ball is retrieved "when the putter head is placed over a golf ball and pressure is applied downward." '927 patent at 2:53, 2:61-62. The claim language makes no attempt to distinguish this invention from prior art through limiting the size of the putter head, although it would have been straightforward for either the patentee or the Examiner to have done so. In the file history, neither the patentee nor the Examiner sought to impose such a limitation. (Doc. No. 51, EXHS. E, F, and H) ("Colucci File History") (the complete file history containing Colucci's patent application and all related papers prepared by the Patent Office and the applicant during the patent prosecution). Instead, the file history shows that Colucci originally filed four claims, none of which reference the putter head fitting in the putting hole cup, and after an initial rejection, Colucci amended his claims to more clearly define the weight distribution means behind the blade. See COLUCCI FILE HISTORY; TRANSCRIPT at 31-33. Absent any discussion in the file history as to the size of the retrieval means, the Court concludes that claim 1 is broad enough to cover a putter head that can be either small enough to fit within a putting hole cup or too large for the cup but still able to retrieve the ball somewhere else.

CONCLUSION

For the foregoing reasons, the Court is not persuaded that one skilled in the art would read the intrinsic evidence as containing explicit expressions of exclusion or restriction such that the size of the putter head was limited to an embodiment
that fits within a putting hole cup. Accordingly, the Court finds that the term "putter head" needs no construction. The term, when read in the context of claim 1, will be readily understood by a jury.

The prosecution history of the '055 patent is the next category of relevant intrinsic evidence. A patent's prosecution history also provides relevant information about the scope and meaning of claim terms. Markman, 52 F.3d at 980. Arguments and amendments made during the prosecution of the patent application, and other aspects of the prosecution history, are relevant in determining the meaning of terms in the claims. See Southwall Tech., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir. 1995). The definition for a disputed claim term might appear in the prosecution history. See Honeywell, Inc. v. Victor Co. of Japan, Ltd., 298 F.3d 1317, 1323 (Fed. Cir. 2002) (observing that it is well settled that an inventor may define a claim term in the prosecution history).

EZ Dock cites to a May 11, 1993 Amendment submitted to the PTO in support of its argument that the applicants defined "pylon" to mean "conical." The Amendment indicated that the applicants had "amended page 6 of the specification to state that the pylons formed by the docking members are generally frustoconically shaped." (Mitchell Aff. Ex. 10 at 3.) The Amendment also stated, "Webster's New Collegiate Dictionary, Copyright 1979 by G. & C. Merriam Co., defines a pylon as a structure that is 'conical.'" 8 (Id.) The Amendment concluded with the assertion that, therefore, the words "generally frustoconically shaped," added to page 6 of the specification "are equivalent to the word they are describing in the specification [i.e., pylon] . . . and do not represent new matter." The PTO allowed this amendment.

8 In point of fact, no such definition appears in that edition of Webster's New Collegiate Dictionary. The only definition for "pylon" in that edition which contains the word "conical" states that a "pylon" can mean "a conical marker used on a road (as for directing traffic)."

From the foregoing, the Court determines that the inventors defined the term "pylon" to mean "a structure that is 'conical.'" To construe the phrase at issue, therefore, it must determine what an individual who has completed high school would understand "a structure that is 'conical'" to be. The Defendants argue that a conical structure must be shaped like a right circular cone and must have a circular base. Placing it in the parlance of teenagers, the Defendants contend that the pylon in question must look like an ice cream cone. 9

9 The Defendants argue, with no supporting evidence, that a "typical high school educated person would not think of a shape with a noncircular base as a cone." Noting that a pyramid has a noncircular base, the Defendants go on to argue, again without a supporting factual basis, that "[a] typical high school educated person would not think of a pyramid as a cone." The Court rejects this line of argument as speculative.

When one compares that argument to the '055 patent, however, problems arise. The specification refers to a preferred embodiment having strips of pylons, and Figure 2 of the patent shows two parallel strips of openings on the bottom surface of a docking member. Each strip consists of a pattern of alternating rectangular openings and oblong openings. The drawings of a patent are relevant intrinsic evidence that the Court may consider in construing claims. See Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1324 (Fed. Cir. 2002). The Defendants offer no compelling explanation as to what those strips shown in Figure 2 represent if not the strips of pylons discussed in the specification, as seen from the bottom. Viewing the patent as a whole, it is evident that the '055 patent contemplates "pylons" which have something other than perfectly round bases.

"A claim construction that excludes from its scope a preferred embodiment 'is rarely, if ever, correct and would require
highly persuasive evidentiary support." Bowers v. Baystate Techs., Inc., 302 F.3d 1334, 1345 (Fed. Cir. 2002) (quoting Vitronics, 90 F.3d at 1583). The Defendants contend that EZ Dock's proposed construction of a "pylon" as a "conical" structure having a base in the shape of any closed plane (not just a circle) would encompass Heinrich's flange, found in the prior art in United States Patent No. 4,365,577. The Court has carefully reviewed the Heinrich patent and finds the Defendants' arguments to be unpersuasive. The Defendants have not presented the "highly persuasive evidentiary support" necessary to warrant their narrow proposed interpretation of the phrase at issue.

The Court concludes that, in the context of the '055 patent, a "pylon" is a conical structure; that is, it is a structure having a closed plane base and a surface formed by line segments joining every point of the boundary of the base to a common vertex. Having determined what a pylon is, the Court turns to the modifying adjective and adverbs, "generally frustoconically shaped."

Having determined what a pylon is, the Court turns to the modifying adjective and adverbs, "generally frustoconically shaped."

I.

The '895 patent originally issued on April 6, 1982. The patent, "Stabilized Athletic Shoe," claims a shoe that provides additional stability during running. According to the patent, the midsole design of prior-art shoes did not provide adequate stability. Fig. 2 of the patent illustrates a rear view of prior-art running shoes:

[SEE FIGURE 2 IN ORIGINAL]

The figure shows a shoe upper (12) mounted above a sole (14). The sole has a pyramid shaped midsole (16) with outwardly-flaring sides. In such a design, any supination or pronation by the runner compresses the sole as indicated by the arrows in Fig. 2. This compression results in a lack of stability and control for the runner's heel.

To solve this problem, the patent secures a support band (38) to the upper rim of the midsole (32) and the sides of the heel cup (26), as shown in the rear view of Fig. 6:

[SEE FIGURE 6 IN ORIGINAL]

According to the patent, this support band stabilizes the heel cup. If a runner's heel lands off center, the support band resists flexing to the side. The runner's foot, then, returns to a more stable position and better absorbs shock. The patent teaches that the support band can be formed "integral with the upper rim of the midsole" as shown in Fig. 6, or can be "a separate piece which is secured as by fusion to the sole during manufacture." Col. 3, ll. 14-25.

In 1991, HHI filed suit against Nike, Inc., Reebok International, Ltd., Hyde Athletic Industries, Inc., L.A. Gear, Inc., Brooks Shoe, Inc., and Kinney Shoe Corp. alleging infringement of the '895 patent. Reebok requested reexamination of the '895 patent in view of various prior art references. The United States Patent and Trademark Office (PTO) decided that the references raised a new issue of patentability and granted Reebok's request. During reexamination, HHI amended both the written description and the claims. In the written description, HHI added the following language describing the shoe structure:

The heel portion is pyramid shaped in lateral cross section with a lower rim having opposite side [sic] which flare outwardly. The lateral sides of the pyramid are not shown in the cross section of Fig. 6 because in the preferred embodiment they merge with the support band.

In a subsequent telephone interview with the examiner, HHI made similar statements summarized in a March 22, 1994 Telephone Interview Summary: "In Fig. 6 the pyramid is there, but one can only see the top and bottom sides. Patent Owner's attorney further stated that this is clear from the specification and drawings which show that the invention starts with the prior art pyramid-shaped midsole . . . ."

HHI amended claim 1 as follows:
1. An Athletic Shoe comprising a sole having a midsole [with a forefoot and heel portions] formed of a resilient force-absorbing material,

an outsole mounted below the midsole, said outsole being formed of a durable material for contact with a surface,

an upper mounted on the sole, the upper having a counter forming a heel cup having exterior sidewalls with lower edges,

a support band carried on the upper rim of the midsole and secured about the sidewalls of the heel cup,

said band extending upwardly and merging with the vertical midsapn of the heel cup for supporting and stabilizing the
heel cup relative to the sole during contact of the sole onto the surface when in use,

said midsole comprising a forefoot portion and heel portion means, said heel portion means being pyramid shaped in
lateral cross section with a lower rim having opposite sides which flare outwardly to locations which lie sufficiently laterally
beyond the lower edges of the heel cup for substantially stabilizing the shoe during initial contact on the surface along one
side of the sole,

the opposite sides of the lower rim of the heel portion means having a lateral width greater than the lateral width of the
heel cup midsapn, and the

midsole and support band having wall means which inclines upwardly from the lower rim of the heel portion means to
the heel cup midsapn for resisting flexing of the [side] sidewalls of the heel cup relative to the sole during said initial
contact on the surface along one side of the sole.

The PTO issued a reexamination certificate on August 8, 1995.

In 1996, HHI filed suit against Converse. The district court consolidated the suit with the original action against Nike and
the others. Converse moved for summary judgment of invalidity of all claims of the '895 patent for violation of 35 U.S.C. §
305 (1994). That section states: "No proposed amended or new claim enlarging the scope of a claim of the patent will be
permitted in a reexamination proceeding under this chapter." To illustrate the alleged violations of § 305, the parties referred
to two figures supplied to the district court by HHI during summary judgment briefing:

[SEE FIGURE A AND FIGURE B IN ORIGINAL]

These figures show two possible locations of the support band (38) in relation to the midsole (32). In Fig. A, the support
band rests atop the midsole, while in Fig. B, the support band surrounds the midsole.

Arguing that HHI had impermissibly broadened the claims, Converse emphasized the following amended limitation: "the
midsole and support band having wall means which inclines upwardly from the lower rim of the heel portion means to the
heel cup midsapn." The original claim, Converse noted, required that the support band incline upwardly "from" the lower
rim of the heel portion, meaning that the support band must "start from" the lower rim. Such a construction covers Fig. B
above, in which the support band (38) starts from the lower rim of the midsole (32), but not Fig. A. The amended claim,
Converse continued, requires only that the midsole and support band together form a wall means that inclines upwardly
from the lower rim. In other words, the amended claim allows the support band to start at some location other than the lower
rim of the heel portion so long as the wall means starts at the lower rim. Under that view, the amended claim covers both
Figs. A and B and is thus broader than the original claim.

HHI responded that the word "from" in the original claim does not mean "starting from" but rather "in a direction from." Thus,
the original claim did not require the support band to start at any particular location. It required only that the support
band incline "in a direction from" the lower rim of the heel portion to the heel cup midsapn. Under that interpretation, both
the original and amended claims cover both Figs. A and B. Thus, HHI argued, it did not broaden the claims.

The district court adopted Converse's proposed construction of "from" to mean "starting from." Thus, the district court held
that HHI impermissibly broadened its claim by dropping the requirement that the support band start from the lower rim of
the heel portion. HHI moved for reconsideration of the district court's decision, advancing a different claim construction
than the one it argued in opposition to Converse's motion. HHI argued that both the original and amended claims require the support band to be "carried on" the upper rim of the midsole. According to HHI, only Fig. A satisfies this requirement. Thus, HHI concluded, neither the original claim nor the amended claim covers Fig. B. The district court denied HHI's reconsideration motion.

On appeal, HHI advances a claim construction different from either of those advanced below. HHI now accepts that the original claim does not cover Fig. A because the support band in that figure does not start from the lower rim of the heel portion. HHI argues, however, that the amended claim also does not cover Fig. A because the midsole is not pyramid shaped as required by the amended claim. Thus, the claims have not been broadened. For its part, Converse advances the same arguments accepted by the district court, namely, that the reexamined claim is broader than the original claim because it only requires the wall means -- not the support band -- to start from the lower rim of the heel portion. Converse also contends that HHI waived its newest claim construction by not presenting it to the district court.

II.

Whether amendments made during reexamination enlarge the scope of a claim is a matter of claim construction. See In re Freeman, 30 F.3d 1459, 1464, 31 U.S.P.Q.2D (BNA) 1444, 1447 (Fed. Cir. 1994). Claim construction is a matter of law that this court reviews without deference to the trial court. See Cybor Corp. v. FAS Tech., Inc., 138 F.3d 1448, 1456, 46 U.S.P.Q.2D (BNA) 1169, 1174 (Fed. Cir. 1988) (en banc).

III.

In determining whether a patentee broadened a reexamined claim under 35 U.S.C. § 305, this court uses the same test as for reissue claims, see In re Freeman, 30 F.3d at 1464, namely:

A claim of a reissue application is broader in scope than the original claims if it contains within its scope any conceivable apparatus or process which would not have infringed the original patent. A reissue claim that is broader in any respect is considered to be broader than the original claims even though it may be narrower in other respects.

Tillotson Ltd. v. Walbro Corp., 831 F.2d 1033, 1037 n.2, 4 U.S.P.Q.2D (BNA) 1450, 1453 n.2 (Fed. Cir. 1987) (internal citations omitted). Stated another way, a "claim is enlarged if it includes within its scope any subject matter that would not have infringed the original patent." In re Freeman, 30 F.3d at 1464.

As a preliminary matter, this court decides that HHI has not waived the claim construction it advances on appeal. The recent case of Key Pharmaceuticals v. Hercon Laboratories Corp., 161 F.3d 709, 48 U.S.P.Q.2D (BNA) 1911 (Fed. Cir. 1998) presented a similar issue. In Key, Hercon challenged on appeal the very claim construction it convinced the trial court to adopt. Finding Hercon's position "highly questionable," this court noted: "Ordinarily, doctrines of estoppel, waiver, invited error, or the like would prohibit a party from asserting as 'error' a position that it had advocated at the trial." Id. at 715. However, because this court had not issued an opinion publicly condemning this behavior and because Key did not object, the Key court exercised an "abundance of fairness" and revisited the claim construction issue. See id. at 715-16.

The parties completed briefing in the case at bar on November 19, 1998, about a week before this court's November 25, 1998 decision in Key. Thus, the present parties, as in Key, did not have the benefit of an opinion of this court noting the impropriety of switching claim constructions on appeal. Accordingly, this court again exercises an abundance of fairness and reviews the correctness of the district court's claim construction.

As far as it goes, the district court's analysis is correct. The original claim required that the support band incline upwardly from the lower rim of the heel portion. This court accepts the district court's interpretation of "from" -- which neither party contests on appeal -- to mean "starting from." Under that interpretation, the original claim covers only Fig. B, 1 which depicts such a support band. The amended claim element, however, does not limit itself to a support band that starts from the lower rim. Rather, it allows the midsole and support band together to form a wall means that starts from the lower rim. Thus, that element, standing alone, would cover the configurations of both Figs. A and B.
Because the district court relied on Figs. A and B submitted by HHI during summary judgment briefing, and because on appeal both parties couch their arguments in terms of these figures, this court will also use them as a vehicle for analyzing the subject claims.

Proper claim construction, however, demands interpretation of the entire claim in context, not a single element in isolation. Therefore, this analysis cannot end without consideration of the rest of the amendments made during reexamination. In particular, HHI amended the claim to recite that the heel portion means is "pyramid shaped in lateral cross section with a lower rim having opposite sides which flare outwardly." This additional limitation constrains the amended claim to cover, like the original claim, only the Fig. B configuration.

Specifically, the written description describes the midsole of the prior art shoe configuration of Fig. 2 as pyramid shaped. See col. 2, ll. 50-52. Although "trapezoidal" or some other geometric term might better describe the shape of the Fig. 2 midsole, patentees may choose their own descriptive terms as long as those terms adequately divulge a reasonably clear meaning to one of skill in the art. See Digital Biometrics v. Identix, Inc., 149 F.3d 1335, 1344, 47 U.S.P.Q.2D (BNA) 1418, 1424 (Fed. Cir. 1998) ("The written description is considered, in particular to determine if the patentee acted as his own lexicographer, as our law permits, and ascribed a certain meaning to those claim terms."). In this case, HHI has assigned a clear meaning to the phrase "pyramid shaped," namely, the shape of the midsole in the prior art shoe of Fig. 2. By using the same phrase in the amended claim, HHI invoked the definition it assigned to that phrase in the written description.

Indeed, the claim language as a whole supports the meaning given to the term "pyramid shaped" by the written description. For instance, other language in the claim requires the lower rim of the heel portion to have opposite sides that "flare outwardly." The written description uses almost identical language to describe the midsole shape of Fig. 2: "The sole has a pyramid-shaped midsole 16 which is characterized in having an outwardly flared lower rim 15." Col. 2, ll. 50-52 (emphasis added). This parallel use of the "flare outwardly" language in both the claim and written description leaves no doubt about the shape HHI intended to invoke in the amended claims.

The prosecution history also supports this interpretation. During reexamination, HHI added language to the written description to note that the lateral sides of the pyramid do not appear in Fig. 6 because the preferred embodiment merges the midsole with the support band. Nonetheless, the written description explains, the heel portion is "pyramid shaped in lateral cross section." The prosecuting attorney further confirmed in a telephone interview that "the invention starts with the prior art pyramid-shaped midsole . . . ."

Under this interpretation, the amended claim does not cover Fig. A. Not only is the midsole (32) of Fig. A not "pyramid shaped" as the amended claim requires, but the lower rim does not "flare outwardly." Thus, although the "wall means" limitation would appear to cover the Fig. A shoe construction, the "pyramid shaped" limitation prevents such coverage. Moreover, Converse has not presented this court any other possible shoe configurations that would fall within the scope of the amended claim, but would not fall within the scope of the original claim. Nor can this court conceive of any. Viewing the claim amendments in conjunction, then, this court holds that the amended claim does not encompass any subject matter beyond that encompassed by the original claim.

That said, this court hastens to clarify a key point. From the above analysis, an observer might conclude that the reexamination broadened the claim in one respect (by amendment of the "midsole and support band having wall means" limitation) and narrowed it in another respect (by addition of the "said heel portion means being pyramid shaped" limitation). That situation, which would violate 35 U.S.C. § 305, did not occur in this case. These limitations do not exist independently, but rather operate together to define the same aspect of the claim. The "pyramid shaped" limitation constrains the scope of the "wall means" limitation, preventing the overall claim from covering a shoe structure such as that shown in Fig. A.

B. Quality Control
This term is in the preambles to claims one and thirteen. The parties agreed that the preambles are limiting. The Plaintiff argues that this term does not need construction, but offers "techniques used to sustain the quality of a product or service in order to satisfy given requirements" if the Court determines that a construction is necessary. The Defendants ask that the term be construed as "the activities performed by a contractor to make sure that a product or service meets established construction criteria such as material specifications."

The parties dispute whether the patent limits the performance of quality control to contractors. In support of its argument that it does, the Defendants cite to col. 1:49-57 and col. 7:5-14. These citations state (1) that many construction contracts contain pay incentives that are performance based and (2) that contractors can track quality control and acceptance results on a real-time basis in order to maximize bonus payments and reduce penalties for non-conforming materials. Although this citation shows that contractors can perform quality control, this section does not limit it to performance only by contractors.

The Defendants' next citation is a description of the process in FIG. 2 that states that results are given in a statistical comparison between "the contractors' quality control test results and the owners' quality acceptance results." Here again, this language indicates that contractors could have quality control test results, but it does not limit quality control to contractors.

Other instances of the disputed phrase occur in the patent. See col. 1:35-36; col. 3:61-63; col. 2:51-52; col. 7:15-16; col. 7:30-49. The patent does not specify that the quality control must be performed by a contractor, but it identifies a contractor as one person who would perform quality control. The non-specific identification of the quality control performer is reinforced by the patent's repeated description of the person performing the steps in the process as the "user."

Both the Plaintiff and Defendants provided extrinsic evidence to support their definitions in the form of reference materials. Both sides also offered experts to testify to the meaning of this term. The Plaintiff's expert testified that while quality control is a contractor's responsibility, it can be performed by third-parties, the contractor, or vendors. The Defendants' expert testified that quality control is performed by the contractor and quality assurance is performed by the owner. Both experts agreed that quality assurance is the province of the owner.

Taken as a whole, the evidence does not establish that there was a meaning of the term "quality control" to a person of ordinary skill in the art at the time of the invention that requires a contractor to perform quality control.

**Construction:** The activities performed to make sure that a product or service meets established criteria.

1. "quality of result" or "desired quality of result" (claims 9 and 23, respectively)

Omax proposes that the Court adopt the following construction:

Desired quality of result means and includes any characteristic(s) of a part or other work piece that a user desires to result from operation upon the work piece of a machine tool following a desired trajectory. These characteristics include surface finish and dimensional accuracy and precision, as well as uniformity of cut surface. More specific examples include: accuracy in cutting curves; accuracy as to the desired depth of a cut when cutting only partially through a workpiece; and avoidance of any of the following: undesirable marks or troughs, rounding of sharp corners, excessive kerf width; excessive taper, errors (beyond desired tolerance limits) caused by jet lag; deflection of the jet into areas not intended to be cut; and failure to cut portion intended to be cut.

Flow proposes the following construction: "The relative grade of cut surface finish of a work piece (specified by the user) that is cut at a speed just fast enough to cut through a work piece having a virtual thickness equal to or greater than the actual thickness of the material being cut, the grade of quality increasing as the virtual thickness of the material increases. Quality of result does not include dimensional tolerance or precision (e.g. error)." The first parenthetical is included where the construed phrase includes the term "desired."

This claim appears in the following context: "9. A method for determining tool motion control commands for operation of a machine tool on a desired trajectory to achieve a desired quality of result. . . ." 596 Patent, col. 17, 11. 14-16. The term
"quality of result" or "quality" appears throughout the specification, as well, including the following:

The resulting finish is assigned a quality of 1. The top half of a material that has just barely been cut through has a much better surface finish than the bottom half. If the speed is reduced so that the jet could just cut through a piece twice as thick, the surface finish is much better. This finish is assigned a quality of 2. Moving slowly enough to cut more than 5 times the material thickness does not significantly improve the finish. Therefore, quality 5 is regarded as the best finish possible.

's376 Patent, col. 14, ll. 58-67 (emphasis added). This explanation in the patent specification appears to suggest that the quality value (Q) relates exclusively to the resulting finish of the piece that is cut. Flow relies heavily on this passage to argue that "quality of result," as used in the claims, is either ambiguous or refers to a single feature of quality: surface finish. Flow argues that the Court should defer to the term as defined by the patentee in this passage. Johnson Worldwide Assocs. v. Zebco Corp., 175 F.3d 985, 990 (Fed. Cir. 1999) (requiring "the entry of a definition of a claim term other than its ordinary and accustomed meaning [when] the patentee has chosen to be his or her own lexicographer by clearly setting forth an explicit definition for a claim term").

Omax concedes that the above-quoted passage focuses exclusively on the finish of the cut, but argues that Flow relies on that passage to the exclusion of many passages that address other aspects of quality. For example, the claim terms frequently refer to the "uniformity of resulting cut surface." 's376 Patent, claim 10, 11. The claims also refer to a method for which the goal is to "limit lag error." 's376 Patent, claim 12. The specification frequently refers to both the surface finish and the "precision" of the cut. E.g., 's376 Patent, col. 7, l. 31. Other references to characteristics of quality include tapering, troughs, marks, and excessive kerfs, issues that arise in the context of the regularity of speed and the traversing of curves and corners. 's376 Patent, col. 14, ll. 30-53, col. 15, l. 40--col. 16, l. 10. These references make clear that the passage referring only to surface finish is only an exemplary, and not limiting, embodiment. See Phillips, 415 F.3d at 1323 (reiterating the requirement to "avoid the danger of reading limitations from the specification into the claim").

The Court finds that this claim term and its use in the patent do not support the narrow reading proposed by Flow. First, it is clear that contrary to Flow's argument, Dr. Olsen never "acted as his own lexicographer" in regards to "quality," nor defined it exclusively as surface finish. According to Flow's approach, if quality does not refer only to surface finish, then it is ambiguous beyond retrieval. This argument is unpersuasive. While the patent's construction of "quality" does not reach the exacting specificity proposed in Flow's construction, it is clear that quality or "cut quality" refers to a variety of characteristics that are recognizable by all experts of ordinary skill in the art. Flow's expert, Dr. Garris, does not deny that issues like lag are related to quality, but limited his argument largely to the notion that an individual of ordinary skill in the art would have read the passage quoted above and assumed that quality for the purpose of the patent focused only on surface finish. Finding this argument unavailing, the Court adopts the following construction: "Quality of result refers to any number of features or characteristics of a cut, including but not limited to surface finish, uniformity of cut surface, precision and dimensional accuracy. A user specifies his or her desired quality of result using an associated value."

The '181 Patent's "Summary of the Invention" describes the potential for tungsten evaporated from the electrodes to be deposited on the wall of the envelope (bulb), thereby causing blackening of the walls which would lead to higher wall temperatures and a shorter life of the lamp. It further describes how the presence of a small quantity of a halogen (chlorine, bromine or iodine) creates a cycle by which the evaporated tungsten is transported back to the electrodes, thereby lessening the blackening. (col. 2, ll. 30-34)

The parties dispute the interpretation of the phrase "that at least one of the halogens Cl, Br or I is present in a quantity between 10<–6> and 10<–4> [mu] mol/mm<3>." Neither party disputes that "Cl," "Br" and "I" are the abbreviations for the halogens chlorine, bromine and iodine. I construe "quantity" to mean a concentration--the amount per unit volume.

Philips reads the phrase "is present in a quantity" to mean only such of the halogen that is "participating, supporting and keeping in existence the tungsten transport cycle during lamp operation." (Philips Br. at 14-18; Philips Reply Br. at 4-5.) Philips relies upon the preamble language--"a halogen for maintaining a tungsten transport cycle during lamp operation"--
preceding the transitional phrase "characterized in that:"  I conclude that the phrase "a halogen for maintaining a tungsten transport cycle during lamp operation" identifies a filling material and describes the function of that material and nothing more. The phrase, fairly read, does not qualify or limit the halogen that "is present in a quantity".

1 As Philips urges me to do, I read the claim language as a whole and consider the preamble language to be relevant to claim interpretation. I note that a Jepson-type claim is one in which the existing art is described in a preamble followed by a transitional phrase such as the "improvement comprising" or "wherein the improvement comprises" after which the claimed elements are stated. See U.S. Pat. Off. Rule 75(e), 37 C.F.R. § 1.75(e). Ex Parte Jepson, 243 O.G. 525 (1917). Iwasaki asserts that the "characterized in that" language (common in certain European applications) should be given a similar construction, thereby rendering everything prior to the transitional phrase admitted prior art. I need not and do not decide the issue at this time. See generally Landis on Mechanics of Patent Claim Drafting at § 6:8 (R. C. Faber ed., PLI 2004).

Reading the claim as a whole, one of ordinary skill in the art would conclude that the quantity that is stated following the transitional phrase "characterized in that:" means the quantity of halogen in the bulb or envelope. It would be a strained construction to interpret the language to mean an amount of halogen less than the total quantity of halogen present in the envelope, i.e. only such of the quantity of halogen that is necessary "for participating, supporting and keeping in existence the tungsten transport cycle during lamp operation." 2 I also have considered the extrinsic evidence and do not find it persuasive in Philips' favor.

2 "I would say that the quantity being added, when we look to measure this quantity, it is this quantity has to be there that is for the tungsten transport cycle. Any quantities that are there that are not used for the tungsten transport cycle are irrelevant. We're only claiming the quantities in the bulb for maintaining a tungsten transport cycle." (Counsel for Philips, Nov. 22 Hr'g at 38)

I have examined other uses of scientific notation in the specification. There are references to quantities of methyl bromine in quantities of "5.10^{-6}". (col. 3, l. 53) Elsewhere there is a reference to "5.10^{-4} to 5.10^{-2} g atoms of at least one of the halogens per cubic millimeter are fed into the envelope." (col. 1, l. 22.) While the use of a numerical multiplier is of some significance, it is also true that a numerical multiplier is not universally used when the multiplier is 1. 3 For example, to one skilled in the art, 10^{-5} means 100,000 and it may also be expressed as 1 x 10^{-5}. But, depending upon how it is used, it could also mean an order of magnitude of 10^{-5}, i.e. any numerical value in the hundreds of thousands. The specific context becomes critical to understanding. Here, I conclude that the use of two numbers in the phrase "a quantity between ___ and ___" implies a specific range, as argued by Iwasaki. It does not imply a range between two values which are themselves ranges.
3 I have considered the reference to "10^{-5} \text{ [} \mu \text{ mol of Br/} \text{mm}^3\text{]" (col. 3, l. 54) and conclude it to be ambiguous for the reasons discussed at the hearing. (Nov. 22 H'g, compare 25-27 with 56-59.)

Philips disclaims inexactitude in its interpretation. (Nov. 22 H'g at 78) To bring precision, Philips urges that, utilizing rounding principles, "10^{-6} and 10^{-4} \text{ [} \mu \text{ mol/} \text{mm}^3\text{]" represent a specific numerical range and that the concentration of the halogen "could be as low as 5 \times 10^{-7} \text{ [} \mu \text{ mol/} \text{mm}^3\text{] and as high as 5 \times 10^{-4} \text{ [} \mu \text{ mol/} \text{mm}^3\text{]." (Expert Report of Dr. David R. Lide at 9) I am reluctant to read more into the claim language than is written. A more natural interpretation is that the phrase "between 10^{-6} and 10^{-4} \text{ [} \mu \text{ mol/} \text{mm}^3\text{]" means a quantity between 1 \times 10^{-6} and 1 \times 10^{-4} \text{ [} \mu \text{ mol/} \text{mm}^3\text{]. If the claim language were intended to refer to orders of magnitude, it likely would have used a modifier or qualifier and not have expressed the quantity in the seemingly absolute terms implied by the form "present in a quantity between ___ and ____." 6

4 Another of Philips experts states as follows: "in my opinion, one skilled in the art would interpret the lower limit of halogen concentration in the '181 Patent Claims as extending downwards to 10^{-5.6} and the upper limit extends upwards to 10^{-3.5} \text{ [} \mu \text{ mol/} \text{mm}^3\text{]." (Expert Report of Dr. Robin Devonshire at 15)

5 Philips relies upon Holmes, et al. (U.S. Patent No. 3,382,396). In that patent in this field of art, quantities of iodine are displayed in a one single table in the form "1 \times 10^{-5}\text{" and also in the form } "10^{-4}\text{". For the reasons discussed at the November 22 hearing, these references are ambiguous.

6 I note that Claim 5 employees the language "that the mercury vapor pressure is about 400 bar." (emphasis added).

I conclude that the phrase "a quantity between 10^{-6} and 10^{-4} \text{ [} \mu \text{ mol/} \text{mm}^3\text{]" means that the halogen is present in the envelope or bulb in a quantity between 1 divided by 1,000,000 and 1 divided by 10,000 micromoles per cubic millimeter.

3174

1. "rack"

This term appears in the '366 patent claims 1, 4, 6, 18, 23, 29, 30, 32, 35, 37, 41, 42, 46, and 47. Rackable contends that "rack" means "frame or cabinet for holding multiple computer chassis that can be removed and are accessible after installation, such as a standard industry server rack" Supermicro proposes that "rack" means "a frame or cabinet that contains mounting arrangements for holding electronic devices in a stacked manner."

The essence of the parties' dispute concerns whether "rack" should be construed to mean a particular type of frame or cabinet used in the server storage industry, or whether it should be construed as a more general purpose rack capable of holding all types of electronic devices; and whether the device enables the mounting or the removal of the computers or electronic devices.

Rackable argues that "rack" refers to a particular type of electronic device -- computer chassis -- and enables removal. In support of its construction, Rackable contends that the patent itself targets the computer server industry, and notes that the specification example, figure 4, is of a type of rack used for holding computers in the high-density computer industry. It also argues that figure 4 of the patent demonstrates that the rack is a type that enables the removal of the computers after installation. Rackable further asserts that its construction, referring to the "standard industry server rack," is consistent with the patent itself, which describes a rack whose dimensions are those of a "standard industry server rack."
Supermicro contends that "racks" store electronic devices generally, and enable the mounting of the devices. Supermicro responds that figure 4 to the '366 patent supports its construction. It also relies in part on the expert declaration of Sam Wood. In support of its mounting argument, Supermicro also cites to language in the patent for the proposition that "[i]n a typical setup, the rack will have holes and the electronic devices will contain 'ears' that are screwed into the holes, thus connecting the electronic devices to the rack." It further argues that the specification discloses that the rack can hold items other than computers. Finally, Supermicro asserts that its construction is supported by technical dictionary definitions.

Because the patent is not ambiguous, the court declines to consider extrinsic evidence as to this term. It also declines to adopt either party's construction in full. First, the court finds that the intrinsic evidence supports Rackable's construction that the "rack" holds computers, as opposed to Supermicro's more general construction, which encompasses all "electronic devices." The '366 specification's field, background, and summary of the invention clarifies that the patent concerns the storage of computers, as opposed to simply "electronic devices." There is absolutely no suggestion anywhere in the patent that the rack is utilized for holding other types of electronic devices. See, e.g., Phillips, 415 F.3d at 1313 (person of ordinary skill is "deemed to read the claim term not only in the context of the particular claim . . . but in the context of the entire patent, including the specification").

The court also rejects both of the parties' injection of the mounting and removability limitations on the computers held by the racks. Those are limitations that are not properly read into this court's construction of the claims. The law is clear that it is error to import a limitation from the specification into the claim. Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 904 (Fed. Cir. 2004). The "fact that a patent asserts that an invention achieves several objectives does not require that each of the claims be construed as limited to structures that are capable of achieving all of the objectives." Id. at 908. Nor should an embodiment disclosed in the specification limit the claims. Id. at 906.

In conclusion, the court adopts a modified version of Rackable's construction of the term "rack" as a frame or cabinet for holding multiple computer chassis.

3175

Claim 4 of the '419 Patent

Claim 4 can be framed in terms of three elements:

A dish racking system according to claim 3 and

1. further including a second rack spaced above said basic rack and

2. rack mounting structure supporting said second rack for movement into and out of said washing chamber,

3. said second rack having bottom support means and front, rear and side walls with said bottom support means upwardly stepping above said one higher side wall of said basic rack.

Element 1 is not at issue, but the parties differ as to elements 2 and 3.

Element 2

First, the parties dispute whether element 2 is governed by Section 112 P6. Because the words "means" is not used, there is a presumption that the element is not in means-plus-function form. But W. Mem. 25 contends that the element is purely functional, with the words "rack mounting" and "structure" failing to connote sufficient structure.

M. Mem. 28 attempts to counter with the completely conclusory assertion that "the term 'mounting structure' has a meaning that is understood in the field," but it offers zero support for that conclusion. Thus having failed to establish a term of art that connotes basic structure, Maytag lacks the necessary predicate to urge that a precise structure is not needed to escape the application of Section 112 P6. Indeed, the very authority sought to be invoked by M. Mem. 29, Personalized Media
Communications, 161 F.3d at 704-05, teaches that "precise physical structure" is not required only if the claim sets forth a term "connotative of structure" to those of skill in the art. **Whirlpool wins on this issue.**

**3176**

c. "Radial"

Finally, with regard to the term "radial," the difference in the parties' positions on the proper construction is somewhat unclear. Formula contends that the term describes something that is "characterized by a protrusion or divergence from a center." SRAM asserts that the term indicates something that is "arranged like rays or straight lines or radiating from or converging to a common center." As an adjective, the word "radial" must describe a characteristic of the noun or noun phrase that it modifies, i.e., the portion of the exterior or exterior surface of the master cylinder. If each of these constructions is interpreted as including a requirement that the action at issue, be it protrusion, divergence, radiation, or convergence, comes from or goes to a center point, there is no practical difference between the two constructions.

If, however, the first phrase of each definition is interpreted as not being tied to a center point, the difference is clear. Under Formula's definition, any protrusion of the exterior surface would be radial; under SRAM's definition, any arrangements of rays or straight lines that do not originate from or terminate in a common point would be radial. These positions, particularly when grounded in the context of the larger patent document, are nonsensical. Though the radial portion of the cylinder exterior can certainly protrude into other things, such as the reservoir, that is not the characteristic that makes that portion of the exterior "radial" in nature. Conversely, it is easy to imagine arrangements of straight lines or rays that would not be radial, such as lines that run parallel to each other.

Accordingly, we construe the term "radial" to describe the quality of radiating to or from, diverging from, or converging to a common point.

**3177**

The disputed language contained in claims 9 and 11 of the '954 is similar, and thus, can be analyzed together. In regards to claim 9 of the '954 patent, the language at issue is "may be inserted therein in a radial direction with respect to said groove. . . ." (Am. Compl., Exh. A, col. 6, 11. 50-51). With respect to claim 11 of the '954 patent, the language at issue is "allowing insertion of said pin or rods in a radial direction with respect to said passageway." (Am. Compl., Exh. A, col. 7, 11. 6-7). The word "radial" is defined as "relating to, placed like, or moving along a radius." Webster's Collegiate Dictionary, 971 (9th ed. 1985). The word "radius" is defined as "a line segment extending from the center of a circle or sphere to the circumference or bounding surface." Id. at 972. Plaintiffs propose that the language of claims 9 and 11 means that the structure be capable of allowing the bar, pin or rod to be inserted into the passageway solely in a radial direction. The Court finds that the use of the words "radial direction" can be reasonably interpreted to mean that a radial direction solely with respect to the insertion of the bar, pin or rod, was not contemplated. As Defendant correctly observes, the unequivocal language of the claims states nothing concerning the bars, rods or pins being inserted in a perpendicular or radial direction alone.

Clearly, it is settled law that a patentee may be his own lexicographer and grammarian. Feed Serv. Corp. v. Kent Feeds, Inc., 528 F.2d 756, 762 (7th Cir. 1976), cert. denied, 429 U.S. 870, 97 S. Ct. 182, 50 L. Ed. 2d 150 (1976); Harrington Mfg. Co., Inc. v. White, 475 F.2d 788, 796-98 (5th Cir. 1973). However, in order to do so, a lexicographer "must set out his uncommon definition in some manner within the patent disclosure." In re Paulson, 30 F.3d at 1480 (quoting Intellicall, 952 F.2d at 1387). Here, however, there is no contention that Plaintiffs have set forth a definition for "perpendicular" to mean solely perpendicular or perpendicular alone. Likewise, there has been no such definition provided with respect to the word "radial."

Defendant maintains that the intrinsic record, in particular the specifications and the prosecution history of the '954 patent further supports its construction of the claim language. The specifications of the '954 patent supply the 'essence' of
substance of the invention. It provides:

[T]he great advantage of the articulation element 200 of the present invention is that it can at all times be arranged on the pins or the bars which can be engaged by a lateral snapping action with the intermediate jaws moving freely against the spring 70. This spring is sufficiently powerful to hold the pins or the bars when snapped in position during reduction and before the practitioner has clamped the shaft 50 by turning head 51 to compress the assembly, which makes it possible to lock the pins or bars as well as the angular position of the intermediate jaws in a single operation.

(Am. Compl., Exh. A. Col. 4, 11. 52-62). The specifications language does refer to a lateral motion, but there is no apparent indication or requirement for an action solely in a lateral direction. The Court is persuaded that this language supports Defendant's claim construction.

The prosecution history also provides some guidance in interpreting the claim language before the Court. Specifically, during the prosecution, the applicants stated:

Applicant has clearly claimed that the rod, pin, or bar of his design is inserted in his bore in a radial direction, not axially as shown in Fig. 9 of Englehardt or Fig. 2 of Radwell. Fig. 2 of Radwell suggests that the rod is inserted axially since the gap between the edges 4 and 10 of each clamp is too small to allow the insertion of a rod in the radial direction.

(Chin Decl., Exh. J, p. 6). The applicants further stated:

[The prior art reference has] no external opening along the transverse direction allowing the bar, pin or rod to be placed in the passage by pressure in a direction perpendicular to both the shaft axis and the transverse direction. . . . Rather, rod 50 [of the prior art reference] is slid in the bore . . . in the axial direction of the rod 50.

(Chin Decl., Exh. K, p. 6). This language is important in aiding this Court in claim interpretation, as it clearly demonstrates that Plaintiffs distinguished their claims on the basis of lateral insertion versus axial insertion. There is no indication or mention that Plaintiffs distinguished their claims with respect to prior art on the basis that the clamps provide for insertion in a perpendicular or radial direction alone.

Additionally, the Court is persuaded by the testimony of Raymond W. Augustin, Esq., the attorney who prosecuted the '954 patent. He was specifically questioned concerning the meaning of the language "perpendicular to both said access and said transverse direction." Mr. Augustin testified as follows:

Q: You added the language perpendicular to both said access and said transverse direction. . . . ?

A: Yes, I see that.

Q: Why did you add that?

A: To make clear which direction the rod had to be inserted.

Q: When you made this amendment what did you understand this language to mean?

A: That it would go in laterally.

Q: Exactly perpendicular to the shaft?

A: Just that it could be inserted. . . . laterally.

Q: So if came down at an angle and snapped in, that would still be perpendicular to the shaft?

A: I would consider that to be the case, yes.

(Chin Decl., Exh. H, p. 85, 1. 15 - p. 86, 1. 9) (emphasis added). The foregoing testimony of the attorney who prosecuted
that patent at issue further supports Defendant's proposed interpretation that the claim language merely required at least some movement or pressure in the perpendicular or radial direction, and not pressure or movement in said directions alone.

Additionally, during the Markman hearing, both parties offered the testimony of experts whom they claimed possessed ordinary skill in the art. "[I]t is permissible, and often necessary, to receive expert evidence to ascertain the meaning of a technical or scientific term or term of art so that the court may be aided in understanding … what [the instruments] actually say." Markman, 52 F.3d at 981 (quoting U. S. Industrial Chemicals, Inc. v. Carbide & Carbon Chemicals Corp., 315 U.S. 668, 678, 62 S. Ct. 839, 86 L. Ed. 1105 (1942)). "The purpose of expert testimony is to provide assistance to the court in understanding, when the claims are technologically complex or linguistically obscure, how a technician in the field, reading the patent, would understand the claims." Advanced Cardiovascular Sys., Inc. v. Scimed Life Sys., Inc., 887 F.2d 1070, 1076 (Fed. Cir. 1989) (Newman, J., dissenting); Snellman v. Ricoh Co., Ltd., 862 F.2d 283, 287 (Fed. Cir. 1988) ("[E]xpert testimony is admissible to explain the meaning of technical terms in the claims. . . ."). Here, Plaintiffs' expert, Dr. Albert H. Burnstein, Ph.D., an orthopedic surgeon in the field of biomechanical engineering, testified concerning the structure of the device described in the '954 patent. Dr. Burnstein specifically noted: "[i]n order to practice the patent, in other words if you want to make the device the patent talks about, then if you take the rod and push on the perpendicular direction, it must go in, so that is a requirement that you must have if you want to make this device." (Trans. of Markman hearing, p. 46, 11. 15-19). Plaintiffs utilize this testimony to support their contention that given the described structure of the patent, the '954 patent was a device or product claim, and not a method claim.

Defendant's expert, Dr. James P. Stannard, M.D., an orthopedic trauma surgeon, also testified concerning the use of the external fixator device. Dr. Stannard testified that the direction in which the rod could be engaged with the clamp are not exclusively perpendicular or exclusively lateral. Dr. Stannard made reference to a drawing included with his expert report to demonstrate the different possible lateral approaches. (Def.'s Markman, Exh. 9). He specifically noted:

Q: What is this drawing, Dr. Stannard?

A: It's a drawing from the patent that has had additional lines added to it.

Q: And what does that demonstrate with regard to the lateral approaches that you were just demonstrating from the physical exhibit?

A: Just demonstrating that the line marked "A" is a purely perpendicular or straight lateral approach. However the lines marked "B" and "C," you could draw a number of significant other lines. All are coming in from the lateral side, but they are not exclusively lateral or exclusively perpendicular.

Q: Are all of those directions A, B, C examples of lateral?

A: Yes.

(Trans. of Markman hearing, p.84, 1.12 to p.85, 1.11). Dr. Stannard concluded that all of the directions set forth in the diagram were examples of lateral entry.

In sum, it is clear that the plain and ordinary meaning governs the claim construction before the Court. Here, the Court concludes that the plain and ordinary meaning of the disputed language in claim 1 of the '954 patent does not mean purely or solely perpendicular; but rather, indicates that the bar or pin is to be placed in the structure of the clamp in a generally perpendicular direction. Further, this Court finds that the plain and ordinary meaning of claims 9 and 11 can be interpreted to mean that a solely radial direction with respect to the insertion of the bar, pin or rod was not contemplated. These interpretations are further buttressed by the intrinsic record, as contained in the specifications language and the prosecution history of the '954 patent.
Brandon's independent claim 1 provides in relevant part:

a radial positioning means comprising a compressed spring means biased against said ring segments to forcibly cause said segments to move to said large clearance position, while working fluid which is freely admitted to the annular space between said casing and said ring segments will urge said segments toward said small clearance position, whereby at low speed and small turbine loads the spring forces will predominate, while at high flows and high working fluid pressure the pressure forces will predominate.

Because the term "radial positioning means" uses the word "means," it is presumptively subject to section 112, paragraph 6. Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1427, 44 U.S.P.Q.2D (BNA) 1103, 1109 (Fed. Cir. 1997). However, the claim recites sufficient structure to overcome that presumption.

The claim states that the function of the "radial positioning means" is to position the ring segments "whereby at low speed and small turbine loads the spring forces will predominate, while at high flows and high working fluid pressure the pressure forces will predominate." The claim recites two structures for achieving that function: (1) a compressed spring means and (2) working fluid. The claim also describes how those structures act to achieve the claimed function--the compressed spring means is biased against the ring segment while the working fluid is freely admitted to the space between the casing and the ring segment. As the court explained in the Sage Products case, "where a claim recites a function, but then goes on to elaborate sufficient structure, material, or acts within the claim itself to perform entirely the recited function, the claim is not in means-plus-function format." 126 F.3d at 1427-28, 44 U.S.P.Q.2D (BNA) at 1109.

While it is true that the "compressed spring means," which is one of the elements of the "radial positioning means" also uses the term "means," we conclude that it, too, does not invoke section 112, paragraph 6. The claim states that the function of the compressed spring means is "to forcibly cause said segments to move to said large clearance position." The claim then recites structure to achieve that function--a compressed spring biased against the seal ring segment. Although the term "spring" has a functional connotation, a "compressed spring" denotes a type of device with a generally understood meaning in the mechanical arts. See Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583, 39 U.S.P.Q.2D (BNA) 1783, 1786 (Fed. Cir. 1996) (construing the term "detent mechanism" as not invoking section 112, paragraph 6, because it is generally understood in the mechanical arts to describe structure). There is nothing in the specification or the prosecution history suggesting that the patentee used the term "compressed spring means" generally to refer to any structure that can perform a biasing function; on the contrary, both the specification and the prosecution history disclose only a type of device denoted as a "spring" or a "compressed spring." In these circumstances, the term "compressed spring means" is not subject to section 112, paragraph 6.

Our decision in Unidynamics v. Automatic Products International, Ltd., 157 F.3d 1311, 48 U.S.P.Q.2D (BNA) 1099 (Fed. Cir. 1998), is consistent with the conclusion we reach in this case. In Unidynamics, we concluded that the claim language "spring means tending to keep the door closed" was in means-plus-function form and therefore governed by section 112, paragraph 6. The specification in Unidynamics stated that a "spring" was only one example of a "spring means," which indicated that the claim term "spring means" was broader than the meaning of the term "spring" generally recognized in the mechanical arts. Thus, we concluded that the patentee in Unidynamics defined spring means functionally as anything that performs a springing or biasing function.

In this case, by contrast, the claim recites a particular kind of spring--a "compressed spring"--and the specification makes clear that the claim term "compressed spring means" was used to denote structure, not function. The preferred embodiment uses S-shaped compressed springs. The specification adds that other types of springs can be employed, but there is no suggestion that the claim was meant to include biasing mechanisms other than springs. Accordingly, we conclude that the patentee in this case has defined "compressed spring" to refer to a particular type of device. Because neither the term "radial positioning means" nor the term "compressed spring means" is subject to section 112, paragraph 6, those limitations are not restricted by the corresponding structures disclosed in the specification and their equivalents.

GE concedes that a flat spring is a type of compressed spring, as that term is generally understood. Nonetheless, GE asserts that Brandon disclaimed the use of flat springs in the course of the prosecution and that flat springs are therefore not covered by the claims.

During prosecution, the examiner rejected Brandon's claims as anticipated by a British patent issued to Warth. Warth's
patent specifically disclosed the use of flat (or leaf) springs interposed between the casing shoulder and the inner surface of an outer ring portion of the seal segment. In distinguishing Warth, Brandon stated:

In summary, Applicant's invention is essentially a two-position packing ring system. That is, at low speeds and low loads it is fixed at a large clearance position. When a low, predetermined load, and pressure condition is reached, the ring moves swiftly to its small clearance position. This is a significant distinction over Warth's system that employs leaf springs with nearly frictionless ring segments that gradually allow the ring clearance to lessen as load is increased.

GE argues that this statement disclaims all embodiments employing flat (or leaf) springs.

GE reads too much into the prosecution history. The clear thrust of Brandon's argument was that his invention is a two-position packing ring system, while Warth's invention is a multiple-position packing ring system. Brandon described Warth's invention as including an equalizing passage through the seal segment, which was designed to reduce the axial fluid pressure and allow the space at the top of the seal segment to communicate with the annular space on the low pressure side of the seal segment. According to Brandon, the equalizing passage enabled the Warth seal to assume a medium clearance position as well as a small and large clearance position, which had certain disadvantages that were cured by his two-position seal. Whether or not Warth employed flat springs was irrelevant to that distinction. In fact, in the same response, Brandon added a claim specifically directed to flat springs. The addition of that claim further indicates that Brandon was not disclaiming all embodiments employing flat springs. Instead, it appears that Brandon was simply noting that while Warth's invention used flat springs, it was otherwise distinguishable from the claimed invention. We therefore conclude that the term "compressed spring means" should be construed to include flat (or leaf) springs, because such springs are within the generally understood meaning of that term and because Brandon did not disclaim such springs or otherwise indicate that a special meaning should be given to the term "compressed spring means."

Finally, GE argues that the "compressed spring means" limitation includes a stricture on the location of the spring. However, there is no such limitation in claim 1. On the contrary, dependent claims 2 and 4 add such a limitation, providing that the springs must either be interposed between the casing shoulders and an inner surface of the outer ring portion of the ring segment, or be interposed between the ends of the ring segments.

The "radial positioning means" limitation of claim 1 also recites the use of "working fluid which is freely admitted to the annular space between said casing and said ring segments." In construing that term, it is appropriate to consider the "for example" language that was added to the specification during prosecution of the '311 patent. Although the district court concluded that the amendment added new matter, the amendment actually added no more than the concept, originally disclosed, that "various other modifications of the invention may occur to those skilled" in the art. '311 patent, col. 5, ll. 17-18.

With respect to the "working fluid" limitation, GE argues that Brandon disclaimed certain steam pathway configurations when he distinguished the Warth prior art reference. In distinguishing Warth, Brandon stated that "drilled holes above the ring, as used in Warth, are unnecessary since this space already communicates to the upstream pressure by way of slots [cutouts] in the ring and holder." According to GE, that statement disclaims all embodiments that do not employ cutouts in the casing shoulder for steam passage.

Brandon made several arguments to distinguish Warth, including the argument that his invention did not require "drilled holes above the ring." Brandon thus represented to the public in clear and definite terms that his invention did not require any such holes. See Watts v. XL Sys., Inc., 232 F.3d 877, 883, 56 U.S.P.Q.2D (BNA) 1836, 1840 (Fed. Cir. 2000) (holding that the patentee limited his invention by arguments made to distinguish the primary reference cited by the examiner). TurboCare cannot now retreat from that position in asserting the Brandon patent against GE. However, Brandon's statement about Warth should not be construed unduly broadly. Brandon characterized his invention as not employing drilled holes above the ring, but he did not characterize it as lacking drilled holes altogether or as requiring local cutouts in the high pressure side of the casing shoulder. Claim 1 requires that steam or working fluid be freely admitted to the annular space between the casing and the ring segments. In accordance with Brandon's characterization of his invention in the course of the prosecution, the "working fluid" limitation should be construed to exclude devices in which steam is admitted to the space between the casing and ring segments through a drilled hole above the ring. But that limitation should not be interpreted to exclude any device in which steam is admitted through a drilled hole, regardless of where the drilled hole is located.
1. "and which is radially compressible upon insertion into the defect from a first configuration which is larger than the defect into a second configuration which approximates the shape of the defect"

The parties dispute the meaning of the claim limitation "and which is radially compressible upon insertion into the defect from a first configuration which is larger than the defect into a second configuration which approximates the shape of the defect."

Plaintiffs, adhering to the plain meaning of the claim language, propose that this limitation be construed to mean "and which can be radially compressed upon insertion into the hole from a configuration that is larger than the defect or hole into a second configuration that approximates the shape of the hole."

U.S. Surgical contends that the term "radially compressible," as used in the above claim limitation, means the capability of being compressible in a radial direction without "kinking or buckling."

U.S. Surgical bases its proposed construction of this claim limitation on a statement made by Bard to the examiner in its May 1, 1995 Request for Reexamination. As noted above, Bard attempted to distinguish its claimed invention from the reexamination references by noting that the prior art did not disclose a plug that is radially compressible without kinking or buckling. Bard stated that "this feature is an element of each claim, except method claim 21." U.S. Surgical argues that this statement demonstrates that the phrase "radially compressible" should be not construed to cover a hernia plug that kinks and buckles when it is compressed. U.S. Surgical contends that Bard's statement to the examiner is consistent with the language of the specification, which states that the pleated surface of the implant allows the device to "conform to irregularities in the shape of the hernia without kinking." The specification, moreover, distinguishes the claimed invention from the prior art by stating that the prior art "may be susceptible to kinking and buckling during placement." U.S. Surgical contends that the specification and prosecution history dictate an interpretation of the term "radially compressible" in claim 20 as meaning compressible in a radial direction without kinking or buckling.

Bard notes that only eleven of the twenty-six claims of the '432 patent, as reexamined, expressly recite compression without kinking and buckling. Plaintiffs assert that the statement made by the prosecuting attorney in the Request for Reexamination was an erroneous remark about the number of claims containing the kinking and buckling limitation. Plaintiffs argue that the language of the claims, and not the statement of the attorney, should control. See Intervet, 887 F.2d at 1050 ("When it comes to the question of which should control, an erroneous remark by an attorney in the course of prosecution of an application or the claims of the patent . . . we think the law allows for no choice. The claims themselves control."). Moreover, plaintiffs note, the attorney's comment was made as part of his initial request to the PTO to commence a reexamination proceeding, rather than in response to an office action. Plaintiffs contend that the comment should not be construed as an interpretative remark intended to import the kinking and buckling limitation into claim 20.

Only eleven of the twenty-six claims of the patent recite the kinking and buckling limitation. As such, the court finds that the remark by the prosecuting attorney that the kinking buckling limitation "is an element of each claim, except method claim 21" was an error. Because the erroneous statement was made in the context of an initial request for reexamination, rather than as a response to objections raised by the examiner, the court does not find that the claims, as allowed, should be construed in light of the attorney's statement. The court will adopt the existing language of this claim limitation.

B. Radially Extending Member

The Court construed "radially extending member" to mean "[a] member extending in the direction of the radius, which is perpendicular to the longitudinal axis of the tubular body."
The Court finds that defendant's device does not literally infringe because the inflation arm extends from the main body of the catheter at a 40-45 degree angle. Under the plain language of the Court's construction, the radially extending member extends in the direction of the radius, and the radius is positioned perpendicularly to the longitudinal axis. Therefore, the radially extending member extends in a direction that is perpendicular to the longitudinal axis. Merriam-Webster's Dictionary defines "perpendicular" as "being at right angles to a given line or plane." The dictionary likewise defines "right angle" as "an angle of 90[degrees]". Because the radially extending member extends at a 90[degrees] angle, the Court rejects Venetec's argument that the inflation arm literally infringes by extending radially and laterally.

The Court rejects Venetec's argument that any portion of the inflation arm extends in a direction perpendicular to the longitudinal axis. Venetec identifies a section of the inflation arm, 1/16 to 1/8 of an inch in length, which purportedly extends perpendicular to the longitudinal axis. (See the section labeled "A" in Opp., App. B.) Although this section appears in plaintiff's diagrams of its device, the Court has reviewed the actual Foley catheter and finds that no such perpendicular section exists. Plaintiff's expert testified that section "A" is perpendicular only if the catheter is visualized with certain pieces missing. (See Layton Depo., at 155:3-4 ("If I remove the spur out of there, then it's perpendicular"); 170:20-21 ("And you have that portion that you take out of there"); and 170:25-171:1 ("When I remove the fill at the round, the fill-in, they're both perpendicular").

Even if a medical professional temporarily extended the inflation arm at a 90-degree angle when inserting the Foley catheter into defendant's device, the Court finds no literal infringement because the claims describe the radially extending member as "positioned" within the lateral slot. (See, e.g., 230 patent, claim 1, at 22:12-13.)

The Court declines to apply the doctrine of equivalents because no reasonable jury would conclude that a 40-45 degree inflation arm is equivalent to a 90-degree radially extending member. Warner-Jenkinson Co. v. Hilton Davis Chem. Co., 520 U.S. 17, 39, 117 S. Ct. 1040, 137 L. Ed. 2d 146 (1997). Venetec's argument that the precise angle is irrelevant "would vitiate a claim limitation," i.e., the requirement that the member extend "radially," where the radius is perpendicular to the longitudinal axis. See Tronzo v. Biomet, Inc., 156 F.3d 1154, 1160 (Fed. Cir. 1998).

Therefore, summary judgment is appropriate wherever a radially extending member is claimed, including claims 4 and 5 of the 230 patent and all asserted claims of the 676 patent. However, plaintiff asserts that claims 1 and 19 of the 230 patent and all contested claims of the 892 patent reference, but do not require, the radially extending member. Plaintiff's argument contradicts the deposition of its expert, who testified that "radially extending member" is a limitation of all the asserted claims in the 230 and 892 patents. (Layton Depo., at 117:3-118:25.) Plaintiff's argument is also inconsistent with its Final Infringement Contentions, which claim the radially extending member as a limitation of all asserted claims in all patents. (See Def. Exhibit 64.) By failing to seek the Court's Order to modify its final infringement contentions, plaintiff violated Patent Local Rule 3.7. 2 See O2 Micro Int'l Ltd. v. Monolithic Power Sys., Inc., 467 F.3d 1355, 1366-68 (Fed. Cir. 2006) (affirming district court's enforcement of local rule under abuse-of-discretion standard). This violation warrants summary judgment for defendant on all claims in the 230 and 892 patents that reference the "radially extending member".

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

2 Patent Local Rule 3.7 reads: "Amendment or modification of the Preliminary or Final Infringement Contentions . . . may be made only by order of the court, which will be entered only upon a showing of good cause." In O2 Micro, the district court enforced a similarly worded local rule and denied plaintiff's motion to amend its final infringement contentions because plaintiff failed to show "good cause."

467 F.3d at 1361. Limiting plaintiff to the theory set forth in its unamended infringement contentions, the court granted the defendant's motion for summary judgment of non-infringement. Id. at 1362. Reviewing for an abuse of discretion, the Federal Circuit affirmed the district court's enforcement of the local rule. Id. at 1366-68. Applying de novo review, the Federal Circuit also affirmed the grant of summary judgment. Id. at 1369. The Federal Circuit relied on the exclusion (under the local rule) of the untimely infringement theory and arguments that plaintiff submitted in opposition to the defendant's motion for summary judgment. Id. Therefore, O2 Micro is authority for the proposition that this Court may grant summary judgment of non-infringement where plaintiff fails to comply with the local rule on amending final non-infringement contentions and submits arguments in opposition to summary judgment that are inconsistent with those contentions.

- - - - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -
In addition, with respect to the 230 patent, the Court rejects plaintiff's argument as incorrect on the merits. Applying the Pitney Bowes rule, the Court finds that "radially extending member" recites limitations of claims 1 and 19 of the 230 patent and "is necessary to give life, meaning, and vitality" to those claims. In these claims, the patent claims a retainer in an anchoring system which includes a lateral slot with a longitudinal length "so dimensioned to substantially equal the thickness of the radially extending member." (230 patent, at 22:6-8.) The claim preamble explains that the radially extending member "projects from the tubular body." The claim's description of the lateral slot's dimensions makes sense only in the context of the preamble's description of the radially extending member as a projection from the tubular body. Therefore, summary judgment for defendant on claims 1 and 19 of the 230 patent is appropriate on both procedural and substantive grounds.

Radially Intermediate the First and Second Regions

Baker Hughes contends "radially intermediate the first and second regions" means "located radially (from the longitudinal axis of the drill bit body) between the first and second regions." ReedHycalog argues this term does not require construction. The Court agrees with ReedHycalog. The term does not require construction. A lay jury will be able to understand the drill bit location of a "third region, radially intermediate the first and second regions."[14]

--- Footnotes ---

14 Ref. No. 13 of Appendix B contains the disputed term "radially intermediate the first and second regions" and its construction.

--- End Footnotes ---

radially spaced from an axis of rotation of the roll core (claim 8)

Fargo positioned at a known distance from the axis of rotation of the roll core

Iris the pins are spaced an equal distance apart from the axis of rotation as well as from each other

As with the earlier phrase concerning supports "spaced annularly . . . at known intervals," Iris contends that this phrase indicates that the pins to which it refers must be spaced at equal distances from each other. Iris contends that "radial" means "developing symmetrically around a central point." A review of the dictionary entry Iris submitted, however, demonstrates that Iris’s proposed definition is only one of the definitions. The first three definitions do not require symmetry. Iris also relies on the specification, but nowhere in the specification does it state that the pins must be at an equal distance from each other. While the drawings do not refute Iris's definition, neither do they clearly support or require it. The Court thus adopts Fargo's proposed definition.

"Radiant Energy." Used in Claims 1, 3, 4, 12, and 24-30.

Flashmark suggests "the forms of energy described in [dependent] Claims 3 and 4, or any form of heat or range of light wavelengths." GTECH proposes "energy transferred by electromagnetic waves, rather than by conduction or convection." The main dispute here is whether "radiant energy" is limited to electromagnetic energy, or can include heat transferred by contact with a hot object (conduction) and heat transferred by hot liquid or gas moving past an object (convection).
A common example may help illustrate the difference. A microwave oven uses the part of the electromagnetic spectrum known as microwaves to heat food. A microwave safe plate will not feel hot after being placed in an operating microwave oven. However, the microwave will heat food on that plate. When the food heats, the plate can become hot from the transfer of heat from the food through conduction.

Flashmark maintains that the patentee acted as his own lexicographer in defining "radiant energy" as both electromagnetic energy, such as visible light and infrared light, and as "heat," of a type which is not electromagnetic energy. Flashmark points to language in the specification such as "a particular form of radiant energy, whether it be heat or light . . . ." '153 Patent Col. 1,11.65-66. Several other similar references are made in the specification, and the claims themselves use phrases such as:

"3. The article of claim 1 wherein said particular form of radiant energy comprises heat." Col. 7, 11. 30-31;

"4. The article of claim 1 wherein said particular form of radiant energy comprises a range of light wavelengths." Col. 7, 11. 32-34; and

"5. The article of claim 4 wherein said range of light wavelengths covers from about 750 nanometers to about 950 nanometers." Col. 7, 11. 35-37.

Flashmark invokes the doctrine of claim differentiation to assert that "heat" must therefore surely be different than "light." They are different, but that does not answer the question of whether one of ordinary skill would understand "radiant energy comprises heat" to refer to some form of energy outside of the electromagnetic spectrum. As discussed below, "light" and "heat" are commonly used to describe different bands of wavelengths in that spectrum.

In spite of Flashmark's impassioned arguments, the patentee provided no special definition of "radiant energy." On the other hand, the task is not made easy by a clear intentional disclaimer. The court is faced with the familiar problem of the "twin axioms," which require reading claims in view of the specification but forbid importing limitations from the specification into the claims Liebel-Flarsheim Co. v. Medrad, 358 F.3d 898, 904 (Fed. Cir. 2004). Resort to dueling canons of construction is not going to resolve this dilemma.

No single statement in the patent nor in the prosecution history is sufficient by itself to determine the meaning of "radiant energy." Rather the court must examine the claim, the specification, the prosecution history, and relevant scientific principles to determine how one of ordinary skill trying to use, or design around, the invention would have understood the term.

Scientific Principles Relevant to the Art

A court may not attempt to define claim terms from extrinsic evidence. However, the "customary meaning" of a term "refers to the 'customary meaning in [the] art field.'" Phillips, 415 F.3d at 1313 (citation omitted). A review of basic, uncontroversial scientific principles provides "an objective baseline from which to begin claim interpretation." Id. The words of the claims are viewed from the point of view of one of ordinary skill in the art - in this case, someone with a knowledge of science, including the properties of energy.

The parties agreed that "light," in its everyday meaning, and as used in this patent, is a form of electromagnetic energy that travels at specified wavelengths. The parties also agreed that the electromagnetic spectrum can be divided into ranges, shown generally on the chart, attached as Appendix A, and discussed at the hearing as Court Exhibit 1.

The ranges are marked on the chart in micrometers or one thousandth of a millimeter, denoted by the symbol "[mu] m." The patent uses the unit of measurement known as the "nanometer," 31 which is one thousandth of a micrometer. So Claim 5's description of light wavelengths "from about 750 nanometers to about 950 nanometers" would be shown on the chart from about .750 [mu] m to about .950 [mu] m. As shown on the chart, this would range from about the bottom end of the visible red light spectrum into what is called the "near infrared" area on the chart. Longer wavelengths, from about 5.5 [mu] m to about 1000 [mu] m fall into what is sometimes denoted as "thermal infrared." 31 This is generally the range of electromagnetic radiation felt as heat and used in cooking.
Language in the Claim and Specification

Given a basic understanding of the electromagnetic spectrum, it would not be unusual for one skilled in the art to understand "heat" as referring to energy at a particular wavelength. With this interpretation, Claims 3, 4, and 5 are simply dependent claims, each of which limits the broad scope of "radiant energy" of Claim 1 to a smaller portion of the electromagnetic spectrum. This does no violence to the presumption that flows from claim differentiation. See Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380 (Fed. Cir. 2006). Of course, this does not by itself dispose of Flashmark's claim that "heat" may be something other than radiant energy.

Claim 1, upon which each of these claims is dependent, limits "radiant energy" to "a particular form . . . not normally present in ambient light . . . ." Col. 7, 11. 21-23. This phrase is important, because, as discussed in more detail below, it was added by the patentee to overcome a rejection by the PTO. Flashmark admits that "light" refers to a portion of the electromagnetic spectrum, but insists that "heat" does not. If "heat" as used in this patent is not in the form of electromagnetic waves, it is not going to be "in," i.e., a component of, ambient light. 3 Flashmark has shown no basis to ignore this limitation of the independent claim.

--- Footnotes ---

3 Claim construction can not rest the sophistical argument that anything placed in a room can be "in" the room's ambient light, but since the non-electromagnetic heat source is not normally "in" a room it meets the limitation of Claim 1.

--- End Footnotes ---

Independent Claim 24 teaches a device that invalidates the voidable articles and documents of Claims 1 - 23. It describes "a radiant energy source which exposes at least a portion of said article to a dose of radiant energy . . . ." Col. 8, 11. 34-35. Again, the dependent claims describe a variety of forms of "radiant energy" including "heat." But all are dependent upon Claim 24, in which the patentee carefully chose "dose" to describe the application of radiant energy. It would be unusual to describe the application of a heated scanner head to an article as a "dose." However the use of "dose" is consistent with radiation in the form of wavelengths of the electromagnetic spectrum. The dependent claims 25, 26, 27, 28, 29, and 30 would then each describe the "dose of radiant energy" of Claim 24 as occurring in different bands of the spectrum.

The use of "dose," by itself, is not enough for the court to construe the term in dispute. It must be taken in conjunction with the other references discussed. However, it is illuminating that in describing the device that voided his voidable articles, the patentee made no attempt to formulate a claim, nor to describe in the specification, any application of "heat" by contact with heated metal, ceramic, or other material (conduction), nor through exposure to moving heated gas or liquid (convection).

One of ordinary skill in the art would know of the different types of energy transfer. A voidable article could be touched with a hot material (conduction) or placed in a blast of hot air (convection). But nearly every use of the word "energy" in this patent is preceded by the word "radiant." Except in the discussion of prior art, there is no hint in the specification, nor in the prosecution history, of an article or document placed in direct contact with a hot surface or exposed to heated air or other gas. Accordingly, the claims and specification support a construction of "radiant energy" as part of the electromagnetic spectrum.

Prosecution History

Another indication of the way in which claim language was interpreted at the time of the application is seen in the "Supplemental Information Disclosure Statement." See Supplemental Information Disclosure Statement, 1.28/1991, FLASH 0000061-63 in GTECH's Ex. E [Doc. #107, Attach. # 11, p. 1-3 of 76]. As required by law, the patentee was disclosing relevant prior art. Distinctions drawn between the patented invention and prior art may be useful "since they indicate in the inventor's own words what the invention is not." MBO Labs., Inc. v. Becton, Dickinson, & Co., 474 F.3d 1323, 1330 (Fed. Cir. 2007).
prosecution history at the time of the invention.

In this case the patentee disclosed European Patent Application No: 0 305 211 ("Herbert"), with the explanation: "Herbert discloses a mail item treated with heat sensitive material. Heating causes the material to turn color." Supplemental Information Disclosure Statement, 1/28/1991, FLASH 0000063 in GTECH's Ex. E [Doc. # 107, attachment # 11, p. 3 of 76]. The Herbert Application describes applying a thermal print head to items treated with a heat sensitive material that changes color when heat is applied. See European Patent Application No: 0 305 211, pp. 2-3 in GTECH's Ex. J [Doc. # 107, Attach. # 16, pp.3-4 of 8].

In other words, Herbert discloses a heated surface (the thermal print head), applied to "a material peculiarly responsive to" the heat from that heated surface, causing the item to change color. Unless one is to assume that the patentee in the present case intended to inform the PTO of invalidating prior art, the "heat" and "heat sensitive materials" of Herbert are not what was claimed in the '153 patent by "radiant energy" and "material peculiarly responsive to a particular form of radiant energy."

Finally, the correspondence between the patentee and the Examiner indicate that both understood "radiant energy" to refer to energy of particular wavelengths. The Examiner initially rejected claims 1-23 as unpatentable over earlier patents that had disclosed materials that changed colors upon exposure to light. "It would have been obvious to have made the Jenkins tickets respond to non-visible wavelengths of energy as taught by Parrotta in order to obtain energy levels . . . ." Office Action, 3/26/1991, FLASH 0000065 in GTECH's Ex. E [Doc. # 107, attachment # 11, p. 5 or 76](emphasis added).

The patentee did not respond that his invention claimed a form of "heat" that was not part of the electromagnetic spectrum at all, and thus was not affected by these prior references. That would have run afoul of the Herbert patent. Rather, the patentee amended Claim 1 by adding "not normally present in ambient light in amounts sufficient to cause said material to discolor." Response to Office Action, 6/28/1991, FLASH 0000078 in GTECH's Ex. E [Doc. # 107, Attachment # 11, p. 18 of 76]. As discussed above, the added language indicates that the "radiant energy" of Claim 1 can be defined by wavelengths, as can "ambient light." Otherwise, the amendment means nothing, and was used only as a subterfuge to confuse the Examiner.

This understanding is confirmed by the Examiner's Reasons For Allowance, which substitutes "radiation" for "radiant energy."

Claims 1-23 and 36 are considered allowable over the prior art because the art of record does not disclose or teach voidable machine-readable articles or documents utilizing a material responsive to radiation which is not normally present in sufficient amounts in ambient light.

Notice of Allowability, p. 2, 9/10/1991, FLASH 0000085 in GTECH's Exhibit E [Doc. # 107, Attach. # 11, p. 25 of 76] (emphasis added). It strains credulity to argue that either the patentee or the Examiner even imagined that the language of the claims referred to energy that was not part of the electromagnetic spectrum and thus would not be part of the waves that make up ambient light.

Flashmark argues that the Examiner could have been referring only to Claim 14, which describes documents (not articles) exposed not to "radiant energy," but to "a sufficient intensity of non-visible wavelength light . . . ." Col. 7,11.62-63. But Claim 14 simply limits the kinds of articles to documents, and the range of wavelengths to those in the non-visible range. Only a very strained interpretation of the referenced dialogue in the prosecution history would support a conclusion by one skilled in the art that "radiant energy" refers to anything other than energy in the form of specified wavelengths of the electromagnetic spectrum.

In the end, the court must determine what the patentee invented and, more importantly, described. This description can not be read from the point of view of the present patent holder years after the patent was issued, nor of a lawyer, nor even from that of the uneducated inventor operating in a field of art strange to him. The description in the patent is addressed, "as section 112 says, to those skilled in the art to which the invention pertains or with which it is most connected." Phillips, 415 F.3d at 1313 (citation omitted). Accordingly, the court must reject Flashmark's argument that Mr. Johnson had only a high
The issue here reduces to whether the substance and scope of claims 2 and 13 were changed by amendments made during the reexamination process. If the amendments amount to a substantive change, there can be no infringement because the accused activity occurred prior to March 22, 1994. If, however, the amendments function only to clarify, then infringement may exist. This determination is to be made by analyzing the original language of the claim and the amendment language to ascertain whether the claims are "identical."

The determination of whether a claim is identical to the original claim is a question of law. Westvaco Corp. v. International Paper Co., 991 F.2d 735, 741 (Fed.Cir. 1993). Generally, "identical" does not mean verbatim. Laitram Corp. v. NEC Corp., 952 F.2d 1357, 1361 (Fed.Cir. 1991). "Identical' means, at most 'without substantive change.}' Seattle Box, 731 F.2d at 828. Moreover, "it is the scope of the claim that must be identical not that the identical words must be used." Slimfold Mfg. Co. v. Kinkead Industries, Inc., 810 F.2d 1113, 1115 (Fed.Cir. 1987). There is no per se rule to determine whether a claim change is substantive when the claim is amended during a reexamination following a rejection based on prior art. Instead, it is necessary to analyze the claims of the original and the reexamined patents in light of the individual circumstances, the prosecution history, the prior art, and other pertinent information. Laitram, 952 F.2d at 1363.

Reissuance of a patent where the amendments clarify the original language are not considered a substantive change in scope and will rise to the level of identical for purposes of the statute. Kaufman, 807 F.2d at 977. Similarly, where a claim is made more definite by the addition of a term without a change in scope, there is no substantive change and the claims are "legally identical." Tennant Co. v. Hako Minuteman, Inc., 878 F.2d 1413, 1417 (Fed.Cir. 1989). For example, in Kaufman the court reasoned that the amendment in the reissuance was "unnecessary and redundant with the language already in the claims" and found the reissuance to be legally identical within the meaning of § 252. In contrast, where the reissue claims changed the "precise placement of the material layers within the structure," the claim was not a clarification but rather was a change in scope. Seattle Box, 731 F.2d at 828.

In the instant case, plaintiff argues that claims 2 and 13 are identical to the claims in the original patent and were changed only to the extent of clarifying the original claims. Plaintiff argues that the addition of words such as "communicating with a radiant tube extending into and exiting from a furnace," "radiant tube," and "separate from the combustion" do not constitute substantive changes in the original patent but rather function only to clarify the original claims. In opposition, defendant stresses that the changes are substantive and were made only after the examiner rejected the claims as obvious and anticipated by G.B. '585. Defendant argues that the changes were made so that claims 2 and 13 could define over prior art and without a substantive change, patentability could not have been achieved.

Bloom's first amendment to claim 2 involved the addition of the phrase "communicating with a radiant tube extending into the furnace." This amendment does not rise to the level of a substantive change. This language clearly is intended to explain or clarify the claim. Furthermore, the amendment does not differ from what is displayed in the drawings and specification. An amendment which explains the technical application of what a claim already reveals cannot be a substantive change. Compare Kaufman, 807 F.2d at 970 ("so that the downstream roller means rotates faster than the upstream roller means" was found to be clarifying because it was a technical clarification of what already was present in the specification). The language of the amendment to claim 2 in this case did not signify anything new but instead detailed what already was covered by the original claim.

Similarly, by amendment to claim 13, Bloom added an additional explanation of the apparatus. The amendment consisted of "a radiant tube extending into the furnace interior and communicating with each of the first and second burners." This language clearly explains or clarifies what is presented by the specification and drawings. Furthermore, one skilled in the art would recognize this aspect of the apparatus by viewing the drawings and specification and such language may even be considered redundant. See, e.g., Kaufman, 807 F.2d at 977 (explanatory language added to claim was considered redundant.
Bloom's second and third amendments to claim 2, however, yield a different result. Bloom made a change to the claim which was substantive. In its second amendment, Bloom substituted "radiant tube" for "furnace" in two separate places. On its face "radiant tube" implies that it is a different mechanism from a furnace. Although not dispositive, terms of a claim are given their ordinary meaning unless it is clear that the inventor used them differently. Schneider AG, 852 F. Supp. at 851. The use of "radiant tube" in place of "furnace" narrows the claim significantly. The use of "furnace" leaves open a broad interpretation. A furnace is a very large apparatus. In comparison, "radiant tube" is a much smaller part and limits or narrows the claim to one particular component of the furnace.

In General Elec. Co. v. Hoechst Celanese Corp., 698 F. Supp. 1181, 1185 (D.Del. 1988), a change of "comprising" to "consisting essentially of" was found to be a substantive change because it narrowed the claim in order to avoid the prior art. See also Fortel Corp., 825 F.2d at 1580-81 (claim which is narrowed by imposing a specific limitation is not identical). Similarly, in Bloom's third amendment, the addition of the phrase "separate from the combustion air stream" to both claims 2 and 13 indicate a change in what the claims originally defined. In Seattle Box, 731 F.2d at 828, a change made during the reexamination process from "greater than the diameter of the pipe" to "substantially equal to or greater than the thickness of the tier of the pipe length" was held to be a substantive change rather than a clarification.

Because Bloom made substantive changes to the scope of the original claims, it cannot be said that the changes were clarifications or the equivalent of "identical" as defined by case law. Accordingly, Bloom is not entitled to continuous patent protection for the invention because the original claims were surrendered and Bloom's rights are effective only from the date of the reissuance.

3. Radiation-Cured Adhesive Material

The parties agree that a radiation cured adhesive material is an adhesive cured by radiation, especially ultraviolet radiation. The only difference in the two proposed definitions is Whitlam's attempt to define this material as transparent. The plain meaning of the term, which the Court is required to adopt, is an adhesive cured by radiation. Nothing from that phrase can be used to infer whether this layer is transparent or opaque. The plain meaning of this term, which the Court adopts is: "An adhesive cured by radiation such as ultraviolet radiation."

"Radiation source"

Cytyc's proposed construction (no construction required) Xoft's proposed construction radionuclide

The patent provides a clear definition of "brachytherapy": "The term 'brachytherapy,' as used herein, refers to radiation therapy delivered by a spatially confined radioactive material inserted into the body at or near a tumor or other proliferative tissue disease site." All asserted independent claims of the '204 patent contain the phrase "interstitial brachytherapy," which the court has construed as "radiation therapy delivered by a spatially-confined radioactive material inserted into the body at or near a tumor or other proliferative tissue disease site." Cytyc's argument that "radiation source" should not be constructed to exclude any radiation sources must be rejected; the claims clearly do not contemplate a radiation source other than "radioactive material."

There is still, however, the question of whether "radioactive material" means the same thing as Xoft's proposed construction of "radionuclide." 12 In describing the preferred embodiment, the patent says: "[t]he inner volume 30 is then filled with a material containing a predetermined radionuclide, for example, I-125, I-131, Yb-169 or other source of radiation, such as radionuclides that emit photons, beta particles, gamma radiation, or other therapeutic rays." '204 patent, col. 4, ll. 9-13
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

(emphasis added). Since all the examples of sources of radiation given in the specification are radionuclides, the patentee appears to have intended to define "radioactive material" as "radionuclides." Cytyc argued at the Markman hearing that "or other therapeutic rays" could refer to other sources such as x-rays. The words "or other therapeutic rays," however, clearly refers to types of radionuclides. Cytyc's construction would require the patentee to have inserted the word "or" before "gamma radiation," indicating the end of the list of types of radionuclides. 13

12 The parties have agreed that "radionuclide" means "an isotope that undergoes radioactive decay."

13 Cytyc also stated that this was an "Oxford comma" issue. Tr. at 137-38. However, in the sentence at issue, the Oxford comma is the one after "gamma radiation." Whether it is present does not alter the meaning of the sentence. Cytyc also argued that "we're in the land of eats, shoots and leaves." If Cytyc was referring to a book of such title, the court does not see how that would support Cytyc's argument; the theme of Eats, Shoots & Leaves is that punctuation should be used correctly. See Lynne Truss, Eats, Shoots & Leaves: The Zero Tolerance Approach to Punctuation (2004).

Radial Location of Superabrasive Cutters and Depth of Cut Control Features

Claims in the '930 Patent discuss the radial location of the superabrasive cutters and depth of cut control features. The parties dispute whether the claims require the superabrasive cutters and depth of cut control features to be centered. At a Radius

Claims in the '930 Patent require at least one superabrasive cutter to be secured to the bit body "at a radius from the centerline of the bit body" or "positioned at a radius from the centerline." Baker Hughes and ReedHycalog dispute whether this claim term includes a "centered" limitation wherein the superabrasive cutter is centered at a distance from the radius. The "centered" limitation is not present in the claim language of the '930 Patent, nor is it supported by the specification. Thus, these terms mean "at a distance perpendicular (at a ninety degree angle) from the centerline of the drill bit body (the radius)." 18

16. a radiused portion extending from said seaming panel ('875 patent, claim 32)

Crown's proposed construction is "a portion formed on an arc extending from the seaming panel." 73 Rexam's proposed construction is "[a] curved portion that is different from the radius of the seaming panel (i.e., the radiused portion of the upper portion of the wall is a part of the cover hook)." 74

The court adopts Crown's proposed construction.

Claim 32 of the '875 patent recites a "first wall portion extending from said seaming panel to a first location on said wall and comprising a radiused portion extending from said seaming panel." The parties agree that the "first wall portion extending from said seaming panel" refers to "the first wall portion extending from the end of the seaming panel." 75

Rexam's proposed construction presupposes that the court accepted its proposed construction of "peripheral cover hook" and "seaming panel" which were rejected in 2 and 3, above. Here, Rexam's proposal that the radiused portion of the can wall is "a curved portion that is different from the radius of the seaming panel" is inconsistent with the court's determination that the seaming panel is not limited to a single radius, but rather $r[2]$ ("seaming panel radius") and $r[1]$ ("seaming panel/chuck wall radius"). Also, the parenthetical of Rexam's definition, "(i.e., the radiused portion of the upper portion of the wall is a part of the cover hook)," adds undue confusion. That language begins with "the radiused portion of the upper portion of the wall," seemingly acknowledging that the wall has a radiused portion, but ends by defining that radiused portion as "a part of the cover hook."

The court, therefore, adopts Crown's proposed construction: "a portion formed on an arc extending from the seaming panel."

3) "rail"

Plaintiff proposes that "rail" be defined as "a bar or relief that serves to direct the planar motion of an interfacing component substantially along the axis of the rail." Defendant proposes the definition, "a bar with at least two substantially perpendicular surfaces that is fixed to one structure extending longitudinally upon which another structure is slidable and which serves to direct the motion of that structure along the axis of the bar." I construe "rail" to mean a bar that serves to direct substantially the motion of another component along the axis of the rail.

The specification does not define the term "rail." Although the written description states that the disclosed invention "also includes at least one rail interconnected with the crankcase housing such that the counterbalance weight is slidable along the rail," nothing in the claim language itself requires that the component guided by the rail must "slide" along, or otherwise
maintain constant contact with the rail at all times as the weight reciprocates. '166 patent, col. 1, Ins. 55-57. Neither the claim nor the written description indicates that the rails must direct the motion of the counterbalance weight completely, rather than "substantially" or generally along the axis of the rail. Also, however, neither the claim language nor the written description limits rails to guiding only the planar motion of the counterbalance weight.

Figure 4 of the 166 patent shows rails (34, 40 & 42) along which the counterbalance weight slides. Because all the rails shown in Figure 4 are bars with at least two substantially perpendicular surfaces, defendant contends that the term rail should be construed to require a bar with two substantially perpendicular surfaces. "Although the specification may well indicate that certain embodiments are preferred, particular embodiments appearing in the specification will not be read into the claims when the claim language is broader than such embodiments." Tate Access Floors, Inc. v. Maxcess Technologies, Inc., 222 F.3d 958, 966 (Fed. Cir. 2000); Kemco Sales, Inc. v. Control Papers Co., 208 F.3d 1352, 1362 (Fed. Cir. 2000). The claim language does not include any limitation requiring two "substantially perpendicular" surfaces. Therefore, I will construe "rail" to mean a bar that serves to direct substantially the motion of a component that slides along the axis of the rail.

A. Defendant's Motion to Reconsider Revised Claim Construction

When construing a claim term, the court must not limit or broaden the claims, but rather must define, as a matter of law, the invention that has been patented. Netword, LLC v. Centraal Corp., 242 F.3d 1347, 1352 (Fed. Cir. 2001). The court must be careful not to restrict the scope of a patent by importing limitations not contained in the patent claims. Phillips v. AWH Corp., 415 F.3d 1303, 1323 (Fed. Cir. 2005). At the same time, the court must not permit a claim term to be read in a way that enlarges the patent beyond the scope of the invention itself. Netword, LLC, 242 F.3d at 1352. Simple though it may sound, striking a balance between an overly restrictive and an overly broad construction can be as treacherous as navigating between Scylla and Charybdis, as this case has demonstrated.

As a remedy for the overly broad construction adopted in the November 3 summary judgment order, the parties have proposed several alternative constructions which they contend capture more closely the meaning of the term "rail" as it would be understood by those skilled in the art of mechanical engineering. Plaintiff has proposed two definitions:

1. A bar that serves to direct substantially the planar motion of a component that slides along the axis of the rail. Plt.'s Br. in Resp. to Dft.'s M. for Reconsideration, dkt. # 165, at 2.
2. A bar supported along its length that serves to direct substantially the motion of a component that slides along the axis of the rail. Id.

Defendant offers a third alternative:

A bar that is interconnected to a component that supports the rail along its length, and which fits into the recess or slot of an interfacing component and acts to direct the linear motion of either component along the axis of the bar. Def.'s Supp. Br. on Claim Constr., dkt. # 203, at 8.

At the November 25, 2005 hearing, I heard oral argument concerning plaintiff's proposed definitions. At the time, I indicated a preference for plaintiff's first proposal because it resembled more closely the construction adopted on summary judgment. However, having heard the parties arguments and having studied the briefs, I conclude that adopting the "planar motion" description would create more problems than it would solve, given the parties' starkly different interpretations of the meaning of "planar." Therefore, I will focus on plaintiff's second proposed construction and defendant's alternative construction, neither of which contains the phrase "planar motion."

From the parties' proposed definitions, it appears that they agree upon several key elements of the term "rail" as it is used in the '166 patent. First, a rail is a bar supported along its length. 2 Second, a rail directs substantially the motion of another component along the rail's axis. Plaintiff would add the requirement that the moving component "slide" along the axis of the bar, while defendant would add that (1) the rail directs the linear motion of the moving component and (2) the rail and
moving component are interconnected by means of a slot or recess.

Footnotes

2 At the November 25, 2005 hearing, defendant objected to plaintiff's suggestion that a rail was supported along its length. Hearing Transcript, dkt. # 199, at 10:6-17. However, because defendant proposes in its most recent filing a definition that requires a rail to be supported along its length, Def.'s Supp. Br. on Claim Constr., dkt. # 203, at 8, I will assume that defendant concedes the point.

End Footnotes

Plaintiff suggests that a rail directs the motion of a component by permitting it to slide along the rail's axis. I understand "sliding" to mean movement along the length of the rail during which the moving component contacts the rail to some extent as it moves. I do not understand "sliding" to require perfect or constant contact with the surface of the rail. Although defendant has not included the word "slide" in its proposed construction, it does not dispute that a rail directs the motion of a component that slides along the rail's axis. Because this description is not a limitation, but rather a characterization of how one skilled in the art would understand a rail to function, it is a reasonable addition to the claim construction.

Defendant proposes that a rail directs the linear motion of the moving component. This limitation is a transparent attempt to re-litigate the question of linear motion addressed at length in the November 3, 2005 summary judgment order. As stated in that order, the '166 patent does not require a counterbalance weight to move in a straight line, but only "in a linear manner." Order dated Nov. 3, 2005, dkt. # 110, at 71-72. It follows that a rail need not direct purely linear motion. Defendant's attempt to import this limitation is unavailing.

Defendant's second suggested addition to the construction of rail merits greater attention. Defendant contends that a rail must be interconnected to the moving component whose motion it directs by means of a slot or recess. In support of this contention, defendant focuses on Figures 4 and 9 of the '166 patent, which show two embodiments of the patent's rails and guides. The figure below (Figure 4 of the '166 patent), shows a rail (34) interconnected with a counterbalance weight (26) by means of a slot (32).

Two guides (40 and 42) support the weight but do not direct the weight's motion along their axes. Similarly, the figure shown below (Figure 9 of the '166 patent) shows a rail (50) interconnected with a counterbalance weight (46) by means of a slot (58).

Defendant asserts that the distinguishing difference between a rail and a guide is that a rail connects to the counterbalance weight by means of a slot or recess. Without such an interconnection, defendant contends, there is no meaningful difference between rails and guides. Although it is true that the "single rail" embodiments shown in Figures 4 and 9 of the '166 patent feature a slot or recess that guides the motion of the counterbalance weight along the axis of the rail, other embodiments do not necessitate such an interconnection. The patent envisions "multiple rail" embodiments in which the need for a slot or recess becomes optional. The patent specification states:

'166 patent, col. 1, Ins. 55-59 (emphasis added). Simply put, the patent does not mandate interconnection of a rail with the counterbalance weight by means of a slot or recess.

As defendant asserts, the difference between a guide and a rail cannot be found in the shape of the object itself. Neither can
it be found in an "interconnection" between a rail and the component whose motion it directs. Rather, the difference between guides and rails is purely functional. A rail directs substantially the motion of a component along its axis. A guide does not direct motion along its axis. As long as a bar (or combination of bars) directs the motion of a component along its axis, the bar need not interconnect with the moving component in order to constitute a rail.

For the foregoing reasons, I find that plaintiff's second proposed definition best captures the meaning of the term rail as it is used in the '166 patent and as it would be understood by those skilled in the relevant art. Therefore, I will construe a "rail" to be a bar supported along its length that serves to direct substantially the motion of a component that slides along the axis of the bar.

4. "Rail end"

Claim 11 of the '662 patent describes "a cantilevered leg extending from the rail side of said main body, said leg having a rail end, a bottom side extending from the rail end to said main body, and a top side extending from the rail end to said main body." (Plf. Brief, Exh. 1, col. 8, ln. 1-4). The specification provides that "[a] rail end 342 of the leg 340 contacts the rail web 144 of the rail 140." (I., Exh. 1, col. 4, ln. 12). Defendants maintain that "rail end" must be construed to mean an end in contact with, or abutting, the rail web. (Def. Brief at 17). Plaintiff suggests a broader definition that allows contact at any point on the rail. (Plf. Reply at 15-16).

The Court agrees with defendants. The specification and patent drawings clearly illustrate that the rail end abuts the web of the rail. Plaintiff argues that the Court should draw a distinction between claim 1, which specifically refers to the web of the rail, and claim 11, which does not. This is known as the doctrine of claim differentiation. See Tandon Corp. v. United States International Trade Commission, 831 F.2d 1017, 1023 (Fed. Cir. 1987) (when applicant uses different words or phrases in different claims, it is presumed that the claims have different meanings). However, this presumption is merely "a guide, not a rigid rule." ATD Corp. v. Lydall, Inc., 159 F.3d 534, 541 (Fed. Cir. 1998), quoting Autogiro Co. of America v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 404 (Ct. Cl. 1967). More importantly, it cannot expand the scope of a claim beyond that which is supported by the specification. The Court therefore construes the term "rail end" to mean the end of the cantilevered leg that contacts the web of the rail.

B Rail portion

Independent claims 1 and 4 of patent 351 and independent claims 1, 5, and 6 of patent 980 claim the structure of the rail portion as generally semi-circular. Independent claim 5 of patent 351 claims the structure of the rail portion as rounded. The parties agree that the term rail portion means the portion extending across the channel formed by the two arms.

Ameritex argues that the patents do not require that the rail portion is the top portion of the header. The specification describes the rail portion as "a semi-circular rounded rail portion extending between the two sides, and which is slightly offset outwardly with respect to each side." 351 patent, col. 2, ll. 40-44. If the rail portion were not the top of the header it could not offset outwardly from the two sides of the header.

In addition, figure 1 is a cross sectional illustration of the header. The top of the header is labeled 20. The specification does not identify the structure designated 20 in figure 1, but 20 is semi-circular and offsets outwardly from the sides of the header, which corresponds to the specification's description of the rail portion. Therefore, the Court holds that one of ordinary skill in the art would understand that 20 identifies the rail portion and that the rail portion is the top of the header.

Ameritex also argues that the rail portion is limited to a structure with no flat surfaces. Taylor contends that generally semi-circular and rounded claim a rail portion that includes flat sections. The claims do not provide a more detailed description of the shape of the rail portion other than describing it as rounded and generally semi-circular. The specification states that the
header has a curved upper surface with means for supporting a boat canopy. 351 patent, col. 2, ll. 40-41. The rail portion labeled 20 and found on figure 1 appears semi-circular and has a curved upper surface.

The term generally allows for a slight deviation from the mathematical boundaries presented by the term circular. Anchor Wall Systems, Inc. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1310-1311 (Fed. Cir. 2003). The claims and specification indicate that generally semi-circular and rounded are used to claim a rail portion that is a semi-circle or that is similar to a semi-circle. The specification requires a rail portion with a curved upper surface. Consequently, generally semi-circular and rounded do not claim a rail portion that has a top surface that is entirely flat, but neither the claims nor the specification provide additional limitations.

Ameritex submits several headers that existed prior to the filing of patent 351. This prior art has top portions with a flat top and bottom surface. Ameritex contends that the Court must impose limitations on the rail portion claimed in patents 351 and 980 that will avoid reading on this prior art. However, the Court may only alter the ordinary meaning of a claim term to avoid anticipation when it can reasonably infer that the examiner would not have issued an invalid patent. Phillips, 415 F.3d at 1327. Ameritex has not offered any evidence relating to the prosecution of the 351 patent and fails to demonstrate that the examiner even considered this issue during the patent's prosecution. Consequently, the Court denies Ameritex's request that it impose a limitation that patents 351 and 980 claim only rail portions completely void of flat sections.

8 The Court notes that the parties provided documents regarding the prosecution of divisional patent 980, which was filed after patent 351. This prosecution history indicates that the patentee used the terms generally semi-circular and rounded to avoid reading on prior art that had flat or D-shaped top portions. However, Ameritex did not present similar evidence concerning the prosecution of patent 351, and the Court will not use the evidence regarding the prosecution of 980 to speculate as to what took place during the prosecution of patent 351.

3 The Court concludes that Baden has provided the more accurate construction.

3 The numbers refer to the identifying numbers in Fig. 3 of Baden's '835 patent.
The Court looks first to the ordinary meaning of the claim terms and then reads those terms in the context of the other claims in the patent. The '835 patent claims, in part, "a plurality of raised seams, defined by strips of a seam material, wherein the sponge layer underlies the raised seams, and further, the inner carcass portion, the cellular sponge layer and raised seams together define a ball carcass.' (Claim 1). Considered in isolation, the words "raised seams" suggest seams that are heightened in relation to something else. Thus, considered in light of the ordinary meaning of the words, Molten's construction does not make sense. Molten suggests comparing the height of the seam to the exterior skin panels. But under Molten's construction, the seam is not heightened in relation to the exterior skin panels, but "flush with the upper surfaces of the adjacent skin panels." (Emphasis added.) Molten's construction would therefore eliminate the ordinary meaning of the word "raised."

Baden's proposed construction is consistent with the '835 patent claims. As explained in claims 1 and 3, the "inner carcass portion, the cellular sponge layer and raised seams together define the ball carcass." Thus, before the skin panels are attached, the ball carcass is composed of an inner carcass, encircled by a cellular sponge layer, with seams extending upwards from and on top of the cellular sponge layer. This phraseology suggests that the seams are "raised" regardless of the height or positioning of the exterior skin panels; they are "raised" in relation to the underlying sponge layer.

Molten points to other claim language to support its construction of the term. Specifically, Molten points, to that portion of Claim 1, which states, "wherein . . . each strip of seam material comprises: a raised portion positioned between spaced, outer edges of the skin panels on opposite sides of the raised portion." And Molten points to Claim 5, which states, "the raised seams defining the boundaries of skin panel placement areas . . . each strip of seam material includes a raised portion." But this claim language describes the horizontal position of the seams in relation to the exterior panels, not the vertical position. This language explains that the raised portion of the seams are exposed between and touch the exterior panels. It does not describe the height of the seam vis-a-vis the adjacent exterior skin panels.

In addition, Molten points to language in the specification of Baden's '835 patent that refers to the raised seams "exposed between the edges of exterior skin panels" (col. 1, 11. 11-12); "the boundaries of the exterior skin panels [being] defined by the raised seams" (col. 2, 11. 29-31); and the "raised central portion 22 of the seam material 20 fill[ing] the space between the outer edges 24, 26 of two adjacent skin panels 28, 30" (col. 3, 11. 32-34). Like the claim language, these specifications do not describe the height of the seam compared to the adjacent exterior skin panels, but rather, the horizontal position of the seam in relation to the skin panels.

Finally, Molten points to prior art mentioned in the prosecution of the '835 patent. But Molten has not cited to where this prosecution history is in the record. And even if the Court considered the relevance of this prior art (the Anderson patent, U.S. Patent No. 3,863,923), which itself refers to the Henderson patent (U.S. Patent No. 3,508,750), the Court is not persuaded that Anderson or Henderson affect the meaning of "raised seams" in Baden's '835 patent. As explained by Molten, Anderson, in describing the Henderson patent, discloses that the diameter of the exterior skin panels constitute the diameter of the ball, as defined by the elevated raised seam. Not only is this evidence attenuated, it does not explain that the Henderson seam must be "raised" in relation to the exterior panel; it only explains that in the Henderson design, that seam was designed to be the same height as the highest portion of the exterior skin panel. This prior art thus provides little guidance in understanding the meaning of "raised seams" in Baden's '835 patent.

The ordinary meaning of the term and the claim language support Baden's construction of "raised seams." Baden's construction is also supported by Figures 1, 3, and 5 of the '835 patent, which all indicate a seam with a raised portion at a height above the underlying sponge layer. And finally, the patent specifications support Baden's construction. The specifications describe how the ball is molded: In the mold, the carcass is cured under heat, the heat causes the foaming agent to expand the foambale sections into a single, uniform cellular sponge layer, and "[t]he seam strips are molded at the same time, thereby creating the raised seams familiar to conventional basketballs." (Col. 4, 11. 25-34). This specification suggests that the seams are "raised" regardless of the height of the exterior skin panels; rather, their raised characteristic explains the seams' height in relation to the underlying foam section.

Because the ordinary meaning of the words, the claim language, and the patent specifications are all consistent with Baden's proposed construction, the Court adopts Baden's proposed construction of the term "raised seams."
In conclusion, in an attempt to deconstruct the metaphor of "raised spine" I will not limit its meaning with descriptors not component. A shape that corresponds and cooperates with the jagged flanges, which is at bottom the defining characteristic of this flanges, for instance, a rectangular shape would not fit. Rather, the raised spine of the mounting element would have to have inwardly turned opposed flanges had straight edges. If for some reason a window jamb channel were designed with jagged the crest of a ridge is not normally rectangular. Furthermore, a rectangular shape would only fit snugly in the channel if the flanges with the requisite width thereby inhibiting rotation. A rectangular shape is not necessarily required, and I note that be designed to have at least some of the edges positioned between and in the same plane as the inwardly turned opposed projections sculpted into it. The Claim encompasses variously shaped raised formations that could imports such a characteristic. Furthermore, the raised formation in Figures 9, 10 and 11 is not even a true rectangle because require the raised formation to be elongated as it is depicted in Figures 9, 10 and 11 except to the degree that the term spine' is to be operatively received. "[638 Patent, col. 5, 11. 8-11.] Neither the Claim nor the description in the specification is a snug fit between open lip portions . . . of a channel section sash frame member . . . within which the mounting element is to be operatively received." [638 Patent, col. 5, 11. 8-11.] Therefore, the raised formation in Figures 9, 10 and 11 is not even a true rectangle because of the inter-engagement projections sculpted into it. The Claim encompasses variously shaped raised formations that could be designed to have at least some of the edges positioned between and in the same plane as the inwardly turned opposed flanges with the requisite width thereby inhibiting rotation. A rectangular shape is not necessarily required, and I note that the crest of a ridge is not normally rectangular. Furthermore, a rectangular shape would only fit snugly in the channel if the inwardly turned opposed flanges had straight edges. If for some reason a window jamb channel were designed with jagged flanges, for instance, a rectangular shape would not fit. Rather, the raised spine of the mounting element would have to have a shape that corresponds and cooperates with the jagged flanges, which is at bottom the defining characteristic of this component.

Here Caldwell argues for the inclusion of the adjectives elongated and rectangular because in Claim 1 the "raised spine" is supposed to be "positioned between and in the same plane as the inwardly turned opposed flanges of said channel means whereby rotational motion of said mounting means is inhibited." [638 Patent, col. 6, 11. 12-15.] Similarly, an embodiment corresponding to this description is depicted in Figures 9, 10 and 11 and described as having a width "arranged such that it is a snug fit between open lip portions . . . of a channel section sash frame member . . . within which the mounting element is to be operated." [638 Patent, col. 5, 11. 8-11.] Here again, I feel confident that the ordinary meaning of "raised spine" as understood by a person of skill in the art is readily apparent. This is not the case where the term has a "particular meaning in [the relevant] field of art", nor does it appear that the term is being used "idiosyncratically". Phillips, 415 F.3d at 1315. Thus, I will construe the term according to the "widely accepted meaning" of this metaphor. Id. at 1314.

It is unclear how Amesbury determined that "a raised projection or protrusion" is the plain and ordinary meaning of "raised spine". Caldwell, on the other hand, points me again to the American Heritage Dictionary (3d ed 1992), which includes the following definition for spine" -- "Something that resembles or suggests a backbone, as: a. The hinged back of a book. b. The crest of a ridge." I find that this definition more accurately describes the ordinary meaning of this term as used in the context of Claim 1 and I agree with Caldwell that the words "raised projection or protrusion" do not sufficiently capture the concept of "raised spine" intended by the patentee's choice of that term in both Claim 1 and the specification. Rather, the ordinary meaning of the term "spine" is more specific than the broader terms "projection" or "protrusion", which may encompass simple knobs, bumps, or even a "poorly-hammered nail". The Federal Circuit gave some guidance in International Rectifier Corp. v. IXYS Corp., a pre-Phillips case, where it disapproved of the district court's adoption of a synonym of the claim term as the definition because it "disregard[ed] entirely the distinction between the two terms set forth in the usage note." The court observed that "had the inventor meant [the synonym], he could have used that word. However, we must consider the word that the inventor actually chose and use the definitions of that term that are consistent with the written description." International Rectifier Corp. v. IXYS Corp., 361 F.3d 1363, 1374 (Fed. Cir. 2004).

Having recognized the importance of fully capturing the proposed usage, I must disagree with Caldwell that the disputed term is necessarily limited to the elongated and rectangular shapes depicted in the patent drawings. To do so "would be to impermissibly read a limitation into the claims from the written description", Anchor Wall Systems, Inc. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1308 (Fed. Cir. 2003) citing Comark, 156 F.3d at 1186, and "the patent drawings depict[ing] a particular embodiment". Id. at 1306-07. See also Phillips, 415 F.3d at 1323. 3

3 Amesbury points to the Federal Circuit's reversal on the meaning of "protrusion" in Anchor Wall for the proposition that shape-based limitations should not be included in the definition unless expressly set forth in the patent. However, I find the general principle re-affirmed in Phillips that claims should not be confined to the specific embodiments in the specification more compelling for purposes of construing the patent before me.

Here Caldwell argues for the inclusion of the adjectives elongated and rectangular because in Claim 1 the "raised spine" is supposed to be "positioned between and in the same plane as the inwardly turned opposed flanges of said channel means whereby rotational motion of said mounting means is inhibited." [638 Patent, col. 6, 11. 12-15.] Similarly, an embodiment corresponding to this description is depicted in Figures 9, 10 and 11 and described as having a width "arranged such that it is a snug fit between open lip portions . . . of a channel section sash frame member . . . within which the mounting element is to be operatively received." [638 Patent, col. 5, 11. 8-11.] Neither the Claim nor the description in the specification require the raised formation to be elongated' as it is depicted in Figures 9, 10 and 11 except to the degree that the term spine' imports such a characteristic. Furthermore, the raised formation in Figures 9, 10 and 11 is not even a true rectangle because of the inter-engagement projections sculpted into it. The Claim encompasses variously shaped raised formations that could be designed to have at least some of the edges positioned between and in the same plane as the inwardly turned opposed flanges with the requisite width thereby inhibiting rotation. A rectangular shape is not necessarily required, and I note that the crest of a ridge is not normally rectangular. Furthermore, a rectangular shape would only fit snugly in the channel if the inwardly turned opposed flanges had straight edges. If for some reason a window jamb channel were designed with jagged flanges, for instance, a rectangular shape would not fit. Rather, the raised spine of the mounting element would have to have a shape that corresponds and cooperates with the jagged flanges, which is at bottom the defining characteristic of this component.

In conclusion, in an attempt to deconstruct the metaphor of "raised spine" I will not limit its meaning with descriptors not
included in either the Claims or the specification. However, simply analogizing "raised spine" with "raised projection or protrusion" loses the ordinary meaning implicit in this common usage of spine. To the extent that Caldwell is suggesting that the meaning of the term "raised spine" ought to embody the qualifier that it be "positioned between and in the same plane as [the] inwardly turned opposed flanges of [the] channel . . . whereby rotational motion of [the] mounting means is inhibited", I decline the invitation. To do so would make the remainder of the Claim just quoted redundant and unnecessary.

Construction -- A raised portion of the mounting element that resembles or suggests the spine of the mounting element, shaped to cooperate with the window jamb flanges to inhibit the rotational motion of the mounting means.

7. "ramp"

Floe contends that the term "ramp" should be construed as "a structure that includes a flat sloping surface and an upper portion and a lower portion, where the structure provides ease of sliding objects onto a trailer deck." Newmans, on the other hand, contends that the term "ramp" should be construed as "uniformly sloping." Floe alleges that its construction is consistent with the specification, which describes a "ramp" as a structure that has a sloped surface and assists in loading vehicles or other objects onto a trailer. Floe also contends that its construction is consistent with standard and technical dictionary definitions. In particular, Floe cites the definition in the McGraw-Hill Dictionary of Engineering (1984), which defines "ramp" as a "uniformly sloping platform, walkway, or driveway." See id. at 470. Newmans also asserts that technical dictionary definitions support its construction and cites the same definition as Floe from the McGraw Hill Dictionary of Engineering.

Consistent with the specification and the technical dictionary definitions of "ramp," the Court construes "ramp" as "a uniformly sloping platform that provides ease of sliding objects onto a trailer deck."

1. "ramp means"

The parties disagree over whether this phrase is a means-plus-function limitation. Floe contends that "ramp means" is a means-plus-function limitation and thus subject to 35 U.S.C. § 112, ¶ 6. Specifically, Floe supports its contention by pointing out that the claim is in means-plus-function format, that the prosecution history reveals that the patentee believed that the claim was a means-plus-function claim, and that Newmans, until recently, and Newmans' expert believed that the claim was a means-plus-function limitation. Floe originally asserted that the phrase "ramp means" should be construed as "the corresponding structure for carrying out the ramp means function is a ramp such as that shown by structure 74 in figure 10. The corresponding structure includes structures that are equivalent to structure 74." But at the Markman hearing, Floe suggested that the Court adopt Newmans' proposed construction, which avers that the corresponding structure is illustrated in figures 3 and 10 and described in c. 5, ll: 20-40 of the patent. Specifically, Newmans contends that this phrase should be construed as follows:

If "ramp means" in claim 11 is truly a "means-plus-function" claim element, then the corresponding structure is illustrated in figure 3 and figure 10 of the '379 patent, and is described in c. 5, ll: 20-40. It is Newmans' position that given the structure described in the "ramp means" claim element of claim 11, "ramp means" must be construed in light of the construction of its structural components as set forth herein.

Newmans refutes that the use of the phrase "ramp means" is a means-plus-function limitation. Newmans acknowledges that the use of the word "means" presumes that the patentee intended to invoke the statutory mandates for means-plus-function clauses. Additionally, the parties agree that the claimed function is "for assisting in loading the vehicles when the frame structure is positioned for loading." (379 Patent, c. 8, ll: 26-32.) Newmans, however, refutes that "ramp means" is a means-plus-function limitation, alleging that the claim language recites sufficient structure or material for performing that function. Specifically, Newmans points to the claim language that states, "wherein said ramp means has a lower surface and a ramp surface disposed between said lower surface and said upper edge at a first predetermined angle to said trailer bed support.
The Court disagrees. Here, Claim 11 requires, "ramp means formed with said edge protection means for assisting in loading the vehicles when the frame structure is positioned for loading, wherein said ramp means has a lower surface and a ramp surface disposed between said lower surface and said upper edge at a first predetermined angle to said trailer bed support means[]."

Although the claim language describes some structure, the claim does not recite sufficient structure to perform the undisputed function of assisting with the loading. Thus, the Court finds that this language does not overcome the presumption that this is a means-plus-function limitation.

Next, the Court addresses the parties' arguments regarding the corresponding structure disclosed in the specification for carrying out the function. Originally, Floe contended that structure 74, shown in figures 3 and 10, of the specification, was the disclosed structure but agreed at the Markman hearing to use Newmans' proposed construction, which asserts that the corresponding structure is illustrated in figures 3 and 10 and described in c. 5, ll: 20-40. Floe, however, added that it was important to emphasize to the jury that in c. 5, ll: 20-40, the ramp means is formed with the edge protection means. The preferred embodiment is described as follows in c. 5, ll: 20-40:

"ramp means" is a means-plus-function claim element, and consistent with the parties' agreement, the Court finds that the corresponding structure is illustrated in figures 3 and 10 and described in c. 5, ll: 20-40.

1. "ramp member"

Newmans contends that the phrase "ramp member" should be construed as:

a structure that is joined to said deck support member in a cooperative relation that has a length substantially equal to said predetermined length, and consists of three structural components: (1) a deck edge protecting surface extending upwardly from said deck support surface and having an upper edge, (2) a lower portion having a longitudinal edge, and (3) a ramp surface disposed between said upper edge and said longitudinal edge at a predetermined angle less than ninety degrees to said deck support surface and arranged to protect an edge of a deck to be supported by said deck support surface[]."

At the Markman hearing, Floe withdrew its proposed claim construction and requested that the Court either not interpret "ramp member," or use Newmans' proposed construction but substitute "includes" for "consists of."

Floe contends that the phrase "ramp member" means a structure that includes, but is not limited to, the structure set forth in the ramp-member limitation. In support of this contention, Floe points to the definition of "ramp member" in Claim 1, which states:

said ramp member having a length substantially equal to said predetermined length, a deck edge protecting surface extending upwardly from said deck support surface and having an upper edge, a lower portion having a longitudinal edge, and having a ramp surface disposed between said upper edge and said longitudinal edge at a predetermined angle less than ninety degrees to said deck support surface and arranged to protect an edge of a deck to be supported by said deck support surface.
Specifically, Floe contends that the intrinsic evidence indicates that "having" is an open-ended term. Additionally, Floe alleges that Newmans' proposed construction would limit "ramp member" to the structure disclosed in the preferred embodiment. Newmans, on the other hand, contends that the term "having" does not carry the presumption of open-ended interpretation. Newmans further asserts that here, the patentee did not indicate that "having" is non-limiting. Newmans also contends that the "ramp member" element absolutely requires three structural components and urges the Court to reject any attempts by Floe to disregard any one of the three required limitations of "ramp member."

The Court finds that it must first construe "having" before it can construe "ramp member." The transitional word "having" indicates that a claim may be open or closed. Crystal Semiconductor Corp. v. TriTech Microelectronics Int'l Inc., 246 F.3d 1336, 1348 (Fed. Cir. 2001). After examining the intrinsic evidence, the Court finds that "having" is an open-ended term. "Having" is used multiple times in Claim 1 in an open-ended context. For example, "a lower portion having a longitudinal edge" does not suggest that the lower portion only has a longitudinal edge. Instead, "having" indicates that the lower portion has at least a longitudinal edge. And "deck edge protecting surface extending upwardly from said deck support surface and having an upper edge" does not mean that the deck edge protecting surface only has an upper edge. Likewise, "having" indicates that the deck edge protecting surface has at least an upper edge, but is not limited to only having an upper edge. Further, Newmans' proposed construction would limit ramp member to the structure disclosed in the preferred embodiment.

After concluding that "said ramp member having" is an open-ended construction, the Court construes "ramp member" using Newmans' proposed construction, but substitutes "includes" for "consists of." Thus, "ramp member" is construed as:

- a structure that is joined to said deck support member in a cooperative relation that has a length substantially equal to said predetermined length, and includes three structural components: (1) a deck edge protecting surface extending upwardly from said deck support surface and having an upper edge, (2) a lower portion having a longitudinal edge, and (3) a ramp surface disposed between said upper edge and said longitudinal edge at a predetermined angle less than ninety degrees to said deck support surface and arranged to protect an edge of a deck to be supported by said deck support surface.

8. "ramp surface"

Floe asserts that this phrase should be construed as "a surface of a ramp." Newmans, on the other hand, contends that this phrase should be construed as "uniformly sloping surface." Floe contends that its proposed construction is consistent with the plain meaning of "ramp surface." As stated above, Newmans contends that because the word "ramp" means "uniformly sloping," a "ramp surface" means a "uniformly sloping surface." The parties appear to agree that "surface" does not need to be separately construed. Here, the Court finds that the ordinary meaning of "ramp surface" is "a surface of a ramp," and therefore construes the phrase as such.

(a) "Random Faded Effect"

Lee argues in its reply memorandum that the look of garments processed by the various stonewashing methods is irrelevant, especially as it pertains to garments finished with commercial processes. 29 Lee is correct that comparisons between commercial products have no meaning in discussing interpretation of patent claims. 30 See Jackson Jordan, Inc. v. Plasser American Corp., 747 F.2d 1567, 1578 (Fed. Cir. 1984) (claims, not embodiments, are the focus of the obviousness inquiry). Markman v. Westview Instruments, Inc., 52 F.3d 967 (Fed. Cir. 1995). However, the look of the garments processed by allegedly anticipatory processes 31 is not totally irrelevant because as Lee has acknowledged the random faded effect of the garments or fabrics using one of the processes claimed in the '213 patent is an element of the inventions.
29 This argument is in response to Golden Trade's assertions that Lee's allegedly anticipatory "sponge-bleach process" (see infra Section IV-D.) produced garments that were "distinctively different" in appearance from those finished with Lee's Frost process, the process that Golden Trade asserts infringes the '213 patent, and therefore the sponge-bleach process cannot anticipate the '213 patent because the appearances are different. The sponge-bleach process and the Frost process are not the same. Because this is a motion for invalidity, not infringement, Golden Trade's invocation of the Frost process borders on the irrelevant, tends to mislead the Court, and is not looked upon favorably.

It is worth noting that just because results of different processes are different does not mean that one result is more correct than the other, as long as both processes meet the limitations of the claim. Thus, all of Lee's commercially produced garments that Golden Trade attempts to compare may actually fall within, and anticipate, the claim limitations of the '213 patent. This inquiry is considered below in Section IV-D.

30 Lee is also correct that Golden Trade mischaracterizes these comparisons when the processes (the Frost process and Ricci's commercial process) use pumice stones to create appearances on jeans. Lee has specifically not moved to invalidate claims 2 and 10 using its sponge-bleach process because those claims limit the processes in claims 1 and 6, respectively, to "granules" which are pumice. Thus, Golden Trade's statement that Lee "concedes" lack of identity between Lee's sponge-bleach process and "Mr. Ricci's invention" is totally out of place. (Pltf.'s § 102 Op. Mem. at 92.) One embodiment of "Mr. Ricci's invention" uses stones (Ricci's commercial process), but Ricci chose to patent a much broader process using "granules." By not contesting claims 2 and 10, Lee has conceded lack of identity between the sponge-bleach process and a process that uses stones, but not one that uses "granules" for which "Mr. Ricci's invention" calls. That is perfectly appropriate.

Similarly, Golden Trade mischaracterizes testimony of one of Lee's witnesses by using the words "bleach-impregnated granules" when the testimony only referred to "stones." (Id. at 52 (emphasis added).) This mischaracterization is improper because "granules" and "stones" are not equivalent terms within the patent claims.

Further, Golden Trade's invocation of claim 10 for infringement purposes in this memorandum directed to validity issues misleads the court. (See id. at 92; cf. supra note 27.) But what is worse is that even its attempt to mislead is wrong. In a footnote, Golden Trade states that because Lee does not address claim 10, even if its motion for invalidity on the other claims were to be granted, infringement on that claim would still have to be tried against Lee and the other defendants. (Id. at 92 n.271.) Golden Trade fails to realize that a claim only has to be invalidated once, so if Levi's motion for invalidity on all the claims were to be granted, claim 10 would be invalid and an infringement trial would then be a waste of time. See Blonder-Tongue Labs., Inc. v. University of Ill. Foundation, 402 U.S. 313, 28 L. Ed. 2d 788, 91 S. Ct. 1434 (1971) (patentee estopped from litigating patent declared invalid in prior action).

31 This includes its sponge-bleach process and Consolidated's dry process.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - -

The effect is included in the preambles to both claims 1 and 6 which recite "method of producing a random faded effect." 32 Regarding when a preamble may also be a limitation, the Federal Circuit has said:

No litmus test can be given with respect to when the introductory words of a claim, the preamble, constitute a statement of purpose for a device or are, in themselves, additional structural limitations of a claim.

Corning Glass Works v. Sumitomo Elec. U.S.A., Inc., 868 F.2d 1251, 1257 (Fed. Cir. 1989); In re Paulsen, 30 F.3d 1475, 1479 (Fed. Cir. 1994). Thus, a term appearing in the preamble is a "necessary limitation" where it "breathes life and meaning into the claims." Loctite Corp. v. Ultrasel Ltd., 781 F.2d 861, 866 (Fed. Cir. 1985). "The effect preamble language should be given can be resolved only on review of the entirety of the patent to gain an understanding of what the inventors actually invented and intended to encompass by the claim." Corning, 868 F.2d at 1257. Corning held that the words "optical waveguide" (a subset of optical fibers) in the preamble of a patent for optical fibers did not "merely state[] a purpose or intended use" for the fibers, id. at 1256, but was an element because the specification made clear that the inventors were working on a specific problem in optical communications systems not on general improvements to conventional optical fibers. To read the specification to include all types of optical fibers in that claim rather than limit it to optical waveguides would be "divorced from reality." Id. at 1257.
Because the specification and prosecution history make clear that the intent of Ricci's process was to produce a random faded effect, a subset of faded effects, that phrase is needed to "breathe[] life and meaning" into the claims. Thus, a "random faded effect" is a necessary element in both claims 1 and 6.

The prosecution history leads to the same conclusion. Ricci added claims 6-14 in his first amendment and claims 15-20 in his second and third amendments. Although the effect of claim 1's process is further limited in claims 4 and 5, none of the claims depending from claim 6 further limit that claim's effect. Thus, claims 14 ("faded made-up garment") and 20 ("faded cloth fabric") are product-by-process claims "produced by the method of claim 6." Because claims for uniformly faded products would not have been allowed by the Examiner, (see Notice of Allowability of Dec. 30, 1987 at 2, in Pros. Hist., Tab O (comparative showing distinguished claimed products from prior art ones)), claims 14 and 20 must be directed to randomly faded fabrics in order to retain their validity. 33 As these are merely the products of claim 6 with no further description of the faded effect, the effect as listed in claim 6 must be an element.

Defining "random faded effect" is harder. Claim 1 merely says that dry-tumbling must "produce a random faded effect." Claim 4 limits the effect to "irregular patches or areas of dissimilar color shading distributed at random over the entire expanse of the treated cloth or garment," and claim 5 limits it to "non-uniform, irregular patches or areas of dissimilar color shading." Thus there are two aspects to the randomness: intensity and placement (distribution).

The specification says that a random faded effect includes "a 'used' look characterized by the contrast between light and dark areas." ('213 patent, col. 1, l. 40-41.) Then it distinguishes the prior art which included this effect only on the seams of a made-up garment, the color of the rest of the garment remaining "substantially uniform." (Id., col. 1, l. 44.) The "essential feature" of the effect is "the appearance of a plurality of irregular patches that vary in intensity of color shading and are distributed in a non-uniform manner over the entire expanse of the cloth, or garment." (Id., col. 1, l. 54-58.) Because this "essential feature" is the same as the limitation in claim 4, it must not be as broad as the effect claimed in claim 1. Whereas a fabric with a prior art "uniform faded effect" is at least a little faded all over, one with a "random faded effect" may have areas where no fading occurs. (See '213 patent, col. 3, l. 46-49 (specification says that differences in color shading appear where random contact by stones on clothes occurs); see also claim 4 (calling for random shading over "the entire expanse of the" fabric).)

Therefore, a "random faded effect" is an element of the '213 patent and includes fading on fabric or a made-up garment where (a) some areas are more faded than others, (b) some areas may not be faded at all, and (c) the placement of the faded areas is not uniform. This effect is the same in claim 1 and claim 6.

3200

(a) "Random Faded Effect"

Lee argues in its reply memorandum that the look of garments processed by the various stonewashing methods is irrelevant, especially as it pertains to garments finished with commercial processes. 29 Lee is correct that comparisons between
commercial products have no meaning in discussing interpretation of patent claims. See Jackson Jordan, Inc. v. Plasser American Corp., 747 F.2d 1567, 1578 (Fed. Cir. 1984) (claims, not embodiments, are the focus of the obviousness inquiry). Markman v. Westview Instruments, Inc., 52 F.3d 967 (Fed. Cir. 1995). However, the look of the garments processed by allegedly anticipatory processes is not totally irrelevant because as Lee has acknowledged the random faded effect of the garments or fabrics using one of the processes claimed in the '213 patent is an element of the inventions.

--- Footnotes ---

29 This argument is in response to Golden Trade's assertions that Lee's allegedly anticipatory "sponge-bleach process" (see infra Section IV-D.) produced garments that were "distinctively different" in appearance from those finished with Lee's Frost process, the process that Golden Trade asserts infringes the '213 patent, and therefore the sponge-bleach process cannot anticipate the '213 patent because the appearances are different. The sponge-bleach process and the Frost process are not the same. Because this is a motion for invalidity, not infringement, Golden Trade's invocation of the Frost process borders on the irrelevant, tends to mislead the Court, and is not looked upon favorably.

It is worth noting that just because results of different processes are different does not mean that one result is more correct than the other, as long as both processes meet the limitations of the claim. Thus, all of Lee's commercially produced garments that Golden Trade attempts to compare may actually fall within, and anticipate, the claim limitations of the '213 patent. This inquiry is considered below in Section IV-D.

30 Lee is also correct that Golden Trade mischaracterizes these comparisons when the processes (the Frost process and Ricci's commercial process) use pumice stones to create appearances on jeans. Lee has specifically not moved to invalidate claims 2 and 10 using its sponge-bleach process because those claims limit the processes in claims 1 and 6, respectively, to "granules" which are pumice. Thus, Golden Trade's statement that Lee "concedes" lack of identity between Lee's sponge-bleach process and "Mr. Ricci's invention" is totally out of place. (Pltf.'s § 102 Op. Mem. at 92.) One embodiment of "Mr. Ricci's invention" uses stones (Ricci's commercial process), but Ricci chose to patent a much broader process using "granules." By not contesting claims 2 and 10, Lee has conceded lack of identity between the sponge-bleach process and a process that uses stones, but not one that uses "granules" for which "Mr. Ricci's invention" calls. That is perfectly appropriate.

Similarly, Golden Trade mischaracterizes testimony of one of Lee's witnesses by using the words "bleach-impregnated granules" when the testimony only referred to "stones." (Id. at 52 (emphasis added).) This mischaracterization is improper because "granules" and "stones" are not equivalent terms within the patent claims.

Further, Golden Trade's invocation of claim 10 for infringement purposes in this memorandum directed to validity issues misleads the court. (See id. at 92; cf. supra note 27.) But what is worse is that even its attempt to mislead is wrong. In a footnote, Golden Trade states that because Lee does not address claim 10, even if its motion for invalidity on the other claims were to be granted, infringement on that claim would still have to be tried against Lee and the other defendants. (Id. at 92 n.271.) Golden Trade fails to realize that a claim only has to be invalidated once, so if Levi's motion for invalidity on all the claims were to be granted, claim 10 would be invalid and an infringement trial would then be a waste of time. See Blonder-Tongue Labs., Inc. v. University of Ill. Foundation, 402 U.S. 313, 28 L. Ed. 2d 788, 91 S. Ct. 1434 (1971) (patentee estopped from litigating patent declared invalid in prior action).

31 This includes its sponge-bleach process and Consolidated's dry process.

--- End Footnotes ---

The effect is included in the preambles to both claims 1 and 6 which recite "method of producing a random faded effect." Regarding when a preamble may also be a limitation, the Federal Circuit has said:

No litmus test can be given with respect to when the introductory words of a claim, the preamble, constitute a statement of purpose for a device or are, in themselves, additional structural limitations of a claim.

Corning Glass Works v. Sumitomo Elec. U.S.A., Inc., 868 F.2d 1251, 1257 (Fed. Cir. 1989); In re Paulsen, 30 F.3d 1475, 1479 (Fed. Cir. 1994). Thus, a term appearing in the preamble is a "necessary limitation" where it "breathes life and
meaning into the claims." Loctite Corp. v. Ultraseal Ltd., 781 F.2d 861, 866 (Fed. Cir. 1985). "The effect preamble language should be given can be resolved only on review of the entirety of the patent to gain an understanding of what the inventors actually invented and intended to encompass by the claim." Corning, 868 F.2d at 1257. Corning held that the words "optical waveguide" (a subset of optical fibers) in the preamble of a patent for optical fibers did not "merely state[] a purpose or intended use" for the fibers, id. at 1256, but was an element because the specification made clear that the inventors were working on a specific problem in optical communications systems not on general improvements to conventional optical fibers. To read the specification to include all types of optical fibers in that claim rather than limit it to optical waveguides would be "divorced from reality." Id. at 1257.

32 Lee in fact cites the preamble wording in its element-by-element comparison in its opening memorandum. (Lee's § 102 Mem. at 28, 30.)

Because the specification and prosecution history make clear that the intent of Ricci's process was to produce a random faded effect, a subset of faded effects, that phrase is needed to "breathe[] life and meaning" into the claims. Thus, a "random faded effect" is a necessary element in both claims 1 and 6.

The prosecution history leads to the same conclusion. Ricci added claims 6-14 in his first amendment and claims 15-20 in his second and third amendments. Although the effect of claim 1's process is further limited in claims 4 and 5, none of the claims depending from claim 6 further limit that claim's effect. Thus, claims 14 ("faded made-up garment") and 20 ("faded cloth fabric") are product-by-process claims "produced by the method of claim 6." Because claims for uniformly faded products would not have been allowed by the Examiner, (see Notice of Allowability of Dec. 30, 1987 at 2, in Pros. Hist., Tab O (comparative showing distinguished claimed products from prior art ones)), claims 14 and 20 must be directed to randomly faded fabrics in order to retain their validity. 33 As these are merely the products of claim 6 with no further description of the faded effect, the effect as listed in claim 6 must be an element.

33 Even though these claims are invalidated in this opinion, see supra Section IV-A, they can still be used to construe the other valid claims because all claims were valid at the time the patent issued.

Defining "random faded effect" is harder. Claim 1 merely says that dry-tumbling must "produce a random faded effect." Claim 4 limits the effect to "irregular patches or areas of dissimilar color shading distributed at random over the entire expanse of the treated cloth or garment," and claim 5 limits it to "non-uniform, irregular patches or areas of dissimilar color shading." Thus there are two aspects to the randomness: intensity and placement (distribution).

The specification says that a random faded effect includes "a 'used' look characterized by the contrast between light and dark areas." ( '213 patent, col. 1, l. 40-41.) Then it distinguishes the prior art which included this effect only on the seams of a made-up garment, the color of the rest of the garment remaining "substantially uniform." (Id., col. 1, l. 44.) The "essential feature" of the effect is "the appearance of a plurality of irregular patches that vary in intensity of color shading and are distributed in a non-uniform manner over the entire expanse of the cloth, or garment." (Id., col. 1, l. 54-58.) Because this "essential feature" is the same as the limitation in claim 4, it must not be as broad as the effect claimed in claim 1. Whereas a fabric with a prior art "uniform faded effect" is at least a little faded all over, one with a "random faded effect" may have areas where no fading occurs. (See '213 patent, col. 3, l. 46-49 (specification says that differences in color shading appear where random contact by stones on clothes occurs); see also claim 4 (calling for random shading over "the entire expanse of the" fabric).)

Therefore, a "random faded effect" is an element of the '213 patent and includes fading on fabric or a made-up garment where (a) some areas are more faded than others, (b) some areas may not be faded at all, and (c) the placement of the faded areas is not uniform. This effect is the same in claim 1 and claim 6.
B. The Court will not Reconsider its construction of the term "random orientation" of the bamboo segments.

Teragren asks the Court to Reconsider its ruling that the term "random orientation" in the '197 patent requires that the "bamboo segments have random, not uniform lengths, and are staggered or lapped along the length of the beam." [Markman Claims Construction Ruling, Dkt. # 59, at 9].

Specifically, the Court ruled:

The randomness feature of Plaehn's invention specifically included the notion that the bamboo segments would be of random lengths, and placed into the beam in a generally parallel fashion, but randomly with respect to their vertical, horizontal, and rotational orientation, and furthermore that they would be randomly staggered and lapped along the length of the beam. For these reasons, the Court concludes that the term "random" or "randomly oriented" as used in claims 1, 5, and 7 means that the bamboo segments and stocks used to construct the bamboo beam are not placed in an orderly or uniform fashion; they do not have a top or a bottom, or a front or a back. Instead, they are placed at random. As used in the '197 patent, the term also requires that the generally parallel bamboo segments have random, not uniform, lengths, and are staggered or lapped along the length of the beam.

Plaintiff Teragren argues that the requirement of "random lengths" and "staggered or lapped" placement along the length of the beam are both in error.

It focuses on the language of the claims themselves which describe segments having a random vertical and horizontal orientation with respect to each other (see claim 5), and about the length and width of each of said segments (see claim 1) and with respect to each other about the width and height of the bamboo beam (see claim 7).

Teragren argues that none of these claims requires that the bamboo segments have random (or not uniform) lengths, or that they be staggered or lapped along the length of the beam. Indeed, they argue, the lengths of the segments are specified in claim 5 -- the segments are to be, in substantial number, between 5 and 20 feet long, with shorter or longer segments permissible in small quantities.

Teragren argues that the '197 patent describes a beam that contains bamboo segments randomly oriented vertically, horizontally, and rotationally, but that are not necessarily lapped or staggered, and are not necessarily of random (or non-uniform) lengths. Teragren effectively argues that the beams described in the patent could be like a box of uncooked spaghetti; the individual segments are randomly placed, but are of uniform length and are not staggered.

Defendant argues that Teragren itself argued in its opening Brief [Dkt. # 41] (as Plaehn had argued to the Examiner) that the staggered bamboo segments eliminated the inherent limitation in using bamboo as a structural wood substitute. That inherent limitation -- the distance between the annual rings (weak points) in a given bamboo segment -- was overcome in the Plaehn invention, because the staggering allowed the manufacture of beams that were longer than that distance.

Teragren wrote:

In addition, the parallel stacking used in prior art beams limited the length of bamboo beams. The beams could only be as long as the distance between the annular rings in the bamboo stock. In contrast, the random stacking of the patented invention eliminated this limitation because the staggering of the bamboo segments allowed the length of the beam to exceed the length of the individual bamboo segments. This staggering also created a stronger and more consistent product. As the inventor explained:

[T]he only mention in [the prior art] of a beam refers to using longitudinal layers exclusively. The "longitudinal bamboo strips (1) are bamboo strips cut lengthwise uniformly," and [the prior art] recognizes the limitations created by the "presence of annular rings in the bamboo trunk." citation omitted Therefore, the length of the longitudinal strips, which are uniform in length, are limited by the distance between the annular rings in the bamboo stock. (The presence of an annular
ring in a bamboo strip may present a weak point and discontinuity, greatly reducing the strength and uniformity of the bamboo strip.) This limitation greatly limits the possible lengths of the bamboo beams in [the prior art].

In the present invention, however, such limitations in beams [sic] length are not present. The bamboo strips do not have to be uniform lengthwise and may include the annular ring portions of the bamboo segment. Furthermore, though the strips are parallel in direction, they are random in horizontal and vertical orientation and length. The advantage is that the randomness of this process assures a uniform and length-wise staggered stacking of the bamboo segments, allowing the length of the beams to exceed the length of the bamboo segments themselves and negating any weaknesses of the discontinuity of the annular rings. This randomness not only ensures consistency in the physical characteristics of the bamboo beams, it also provides a product which is cheaper to manufacture because less work is required due to the random parameters.

[Dkt. # 41 at 4, 5].

Teragren acknowledges that it recited this claims history, but strenuously denies that it ever asserted that the issued claims should be interpreted so as to require random lengths or staggering. [See Dkt. # 70 at 2]. Teragren's opening Brief did not attempt to distinguish or explain away this prosecution history, though it also did not specifically reference it when articulating its own meanings for the claims' terms.

In any event, it is clear that Plaehn, and then his counsel, consistently sought a patent by emphasizing the primary benefit of his invention: the beams created could be longer than the distance between the annual rings because the segments were staggered. He repeatedly emphasized this feature in distinguishing the Chu patent. [See Seyedali Dec.; Dkt. # 39, at: Ex. A, Original Application, p.4; Ex. D, First Amendment, at p, 5; Ex. G January 1996 Amendment, at pp.7-8]. Each iteration of Plaehn's submissions to the Examiner, and the '197 patent itself, touted the invention's object as providing "a beam which can be manufactured to virtually any dimension." [ See '197 Patent, Seyedali Dec., Ex. H at 3]. As Plaehn consistently argued, this feature was the direct result of the randomness (as opposed to Chu's orderliness) of the bamboo strands, including their random lengths (generally within a range of 5 to 20 feet), and their random placement -- or staggering -- along the beam's length.

It is true that the issued '197 patent's claims do not specifically reference this feature. However, it is also clear that the Examiner, who repeatedly rejected Plaehn's applications before ultimately accepting his final Amendment, was not at any point concerned that the "randomness" described by Plaehn over time was an impediment to the issuance of the patent. Instead, the Examiner (and Plaehn) focused on whether or not his invention was sufficiently distinguished from the Chu patent's orderly stacking.

Based on this claim prosecution history, the Court concluded, and does conclude, that the meaning of the term "random orientation" as used in the '197 patent, means bamboo segments which have random, not uniform lengths, and which are staggered or lapped along the length of the beam.

The Plaintiff's Motion for Reconsideration on this point [Dkt.# 60] is therefore DENIED.

GO BACK

3202

"in rapid succession"

Claim 17 of the '387 patent contains the term "in rapid succession." The term is used to define the "burst state" of the camera. The Court has previously construed the term "burst state" as meaning "the camera takes a pre-determined number of pictures in rapid succession in response to one or more signals from a motion detector." Good Sportsman Mktg, 440 F. Supp. 2d at 576. There, the Court specifically found that the patent's specification did not define the term "in rapid succession" more precisely and that "it is a phrase potential jurors [would] be familiar with . . . ." Id. at 577. For those reasons, the Court declined to provide an additional definition the term. Id.

Nevertheless, Defendants essentially argue that the term "rapid" is insolubly indefinite because it fails to define, with mathematical precision, the amount of pictures that must be taken per unit of time in order to meet the limitation.
Defendants' assertion suggests that "rapid" is entirely subjective. However, they do concede that the specification provides guidance to the meaning of "rapid" by contrasting a "burst state" with the camera's "pause state." For instance, with respect to the "pause state" the specification provides that "[i]n one embodiment, the controller is programmable by a user so that the time of the pause between possible exposures is set optionally between 1 to 60 minutes." See '387 patent at 4:41-44. In contrast, the specification describes that the "burst state," in one embodiment, allows the user to "provide anywhere between 1 and 9 exposures per triggering event." See id. at 4:33-35. Inherent in the patent's description of the user's ability to select the number of exposures taken in the "burst state" is the understanding that a user does not control the rate that those exposures are taken. This fact is further bolstered by the specification's description of the "pause state" where, as quoted above, a user does control the rate that the camera takes exposures.

Defendants produce various declarations by their experts concluding that one skilled in the art could not determine the meaning of "in rapid succession" because it is not defined within the patent with mathematical precision and has no mathematically precise meaning within the art. See Stoneburner Decl., Docket No. 109-8 at P 23; Laws Decl., Docket No. 109-13 at PP 7-9. These extrinsic statements misapply the law. A claim term is not indefinite simply because it does not describe or define the invention with mathematical precision. BJ Servs. Co. v. Halliburton Energy Servs., Inc., 338 F.3d 1368, 1372 (Fed. Cir. 2003). In fact, terms of degree are often used in patent claims for the specific purpose of avoiding having to define a claim with precise mathematical precision. Ecolab, Inc. v. Envirochem, Inc., 264 F.3d 1358, 1367 (Fed. Cir. 2001) (explaining that the term "substantially" was used in claim terms to avoid mathematical precision). Furthermore, a term does not have to be specifically explained in the specification to be understood by one skilled in the art. Med. Instrumentation & Diagnostics Corp. v. Elekta AB, 344 F.3d 1205, 1217 (Fed. Cir. 2003) (finding that the term "computer" was commonly recognized by those skilled in the art without the necessity of further description in the specification). Thus, Defendants' experts' assertions that their understanding of "rapid" requires mathematical precision is irrelevant to the issue of indefiniteness.

"Rapid" is commonly understood to mean "moving, acting, or occurring with great speed." See The American Heritage College Dictionary 1032 (3d ed. 1997). The parties agree that neither the specification nor the prior art attach a specialized meaning to the term. Within the context of the patent and the general field of photography, the "great speed" at which exposures can be taken is inherently limited by the physical capabilities of a camera. The term "rapid" is further limited by the claims themselves because of the contrast between a "burst state" (where there is no control over the speed of exposures) and a "pause state." Thus, the term "in rapid succession" within the context of the claims would be commonly understood to mean "one after another without any intentional delay or pause such as in the pause state." However, given that the term "rapid" is commonly understood and the contrast between "burst" and "pause" states is inherent within the claims themselves, it is not necessary to further limit or clarify the term. Therefore, while "in rapid succession" is not insolubly ambiguous, it does not need further construction beyond its plain and ordinary meaning. Accordingly, Defendants' motion is denied with respect to claim 17 of the '387 patent. To the extent that this claim term arises at trial, the Court instructs the parties to tailor their trial arguments to accord with this Order.

Unlike the above terms, "rapidly" is not amenable to construction. The term is entirely subjective and is judged purely from the consumer's standpoint. See Datamize, 417 F.3d at 1347 (Fed. Cir. 2005) (finding indefinite a term that was "completely dependent on a person's subjective opinion."). Although Crane suggests that it may be possible to measure the average time of vending machines and then determine a competitively advantageous time, the patent does not disclose any such method. Absent a comparison method or a quantifiable method for measuring rate of time, the court is not persuaded that "rapidly" is amenable to construction.

7. What is the Proper Construction for the Phrase "rapidly cooling" in the '311 Patent?
Claim 1 and claim 94 of the '311 patent contain the phrase "substantially immediately after formation of said continuous binder structure, rapidly cooling said mixture to below the softening point of the binder material to retain said converter binder material in its continuous webbing structure condition to produce the composite material." KXI contends "rapidly cooling" requires cooling the mixture to below the softening temperature of the binder material in a sufficiently short enough time to prevent wetting of the carbon by the binder and deterioration of the bonds. Culligan contends "rapidly cooling" means cooling as rapidly as practicable to retain the composite material's structure. Culligan contends "rapidly cooling" includes cooling by ordinary methods to a temperature below the softening temperature of the binder, including by allowing the part to cool naturally in ambient air.

The term "wetting" never appears in the '311 patent. KXI contends wetting means the softened binder particles penetrate the primary particles or completely surround the primary particles. KXI alleges that wetting of carbon particles by softened binder particles can cause the bonds between carbon and a binder to break down, causing deterioration of the bonds.

KXI argues the inventors recognized that wetting is a problem, and that it may be solved by rapid cooling. KXI relies on column 14, lines 8-16 of the '311 patent's specification, which reads in relevant part:

"It has been shown that, if the product of the [continuous web matrix] or [forced point-bonding] processes is held for an extended period at the elevated temperature, there is a rapid deterioration of the product and loss of the continuous web or binding points. Therefore, following the formation of continuous binder resin structure in the [continuous web matrix] product or bonding points in the [forced point-bonding] product, the material should be cooled rapidly, preferably as rapidly as possible.

KXI contends the inventors developed "rapid cooling" to solve the wetting problem. KXI argues, "rapidly cooling" requires cooling the mixture to below the binder's softening temperature in a sufficiently short enough time to prevent wetting of carbon by binder. KXI therefore construes "rapidly" to mean sufficiently quickly to prevent wetting or deterioration of the bonds.

Culligan argues its interpretation is supported by the '311 patent's specification. Culligan cites column 13, lines 4-8. This reads in relevant part: "the resulting immobilized material is relatively quickly cooled to a temperature below the melting point of the binder to 'freeze' the unstable structure once it is formed." Culligan cites column 14, lines 22-23. This states that "water sprays or air blasts may be used to hasten cooling." Culligan also cites example 1, at column 26, lines 34-35, which discloses utilizing air cooling to cool pellets that were made in a 0.5 inch diameter cylindrical compression molding die.

KXI responds that Culligan's construction of the phrase containing "rapidly cooling" would allow air cooling in any situation. According to KXI, air cooling may not be appropriate in certain circumstances to "rapidly cool" the product. KXI argues that:

"because the type of cooling depends on many factors, including the temperature and size of the article and the thermal mass of the mold surrounding the article, it would be improper to define 'rapidly cooling' as allowing any type of cooling. . . . Instead . . . the cooling must be sufficiently fast to prevent wetting of the carbon and deterioration of the bonds."

The court finds that preventing "wetting" never appears in the '311 patent, and is not required by the claim. Otherwise, the court agrees with KXI's interpretation. The court construes "rapidly cooling" to mean cooling the mixture to below the softening temperature of the binder material in a sufficiently short enough time to prevent deterioration of the bonds.

3205

c. "reaches"

The term "reaches" appears in several claims of the '987 Patent. ev3 argues that the term should be construed as "is within or beyond." Boston Scientific argues that the term is easily understood and need not be construed. The Court construes "reaches" as "is within or beyond." 8
2. "directly facing at least one radiator element"

The Court construes the term "directly facing at least one radiator element" as meaning that at least one outlet opening must be pointing squarely toward at least one radiator element. The term "face" means "to stand or sit opposite to: occupy a position with the face toward (he stood facing the window)." Webster's Third New Int'l Dictionary at 811. Another source similarly defines facing as "positioned with the front toward a certain direction; opposite: a book with Italian and English lyrics printed on facing pages." The New Oxford American Dictionary at 606. This understanding of "facing" is consistent with the context in which the term is used in the claims and with the specification, which indicates that the cooling air passes "directly over the radiator elements." '766 patent, col. 3, lines 44-48.

The claim uses the term "directly" in reference to direction or location. Used in that sense, the ordinary meaning of the term is "squarely" or "exactly." See Webster's Third New Int'l Dictionary at 641 ("without any intervening space or time: next in order: squarely, exactly <<directly opposite the city hall>> <<directly in the center of the room>> <<during the decade directly before his birth>>); The New Oxford American Dictionary at 483 ("exactly in a specified position: the ceiling directly above the door, the houses directly opposite").

The parties propose to define "directly" as denoting the absence of any obstruction (Alcon) or any significant obstruction (Brembo), but neither the ordinary meaning of the term nor its usage in the claim or specification involve the presence or absence of obstructions. By way of example, two house can be "directly opposite" each other yet still have objects between them, such as trees. None of the dictionaries consulted by the Court contained a reference to obstruction in the definition of "directly." Nor does the specification include any reference to the presence or absence of obstructions between the outlet opening and radiator element.

Alcon argues that for the air to pass from the duct to the radiator element, no obstructions can exist between the two. To support its position, Alcon relies on the fact that the dictionary says that "directly" means, among other things, "without any intervening space," which, it says, requires the term to be construed as meaning "without obstruction." This argument fails, for two reasons. First, even were "without intervening space" a relevant definition in context, the absence of space is not the same as the absence of obstruction. Second, the diagrams included in the specification depict that there is, in fact, space between the duct and the radiator elements. See, e.g., '766 patent, figure 2.

Defining "directly" as meaning squarely or exactly is more consistent with the use of the term in context of the claim language. See Texas Digital, 308 F.3d at 1203 (court must determine which of possible alternative meanings of a term is most consistent with the use of the word in the patent). Substituting the words squarely or exactly for "directly" in the examples provided by Webster's Dictionary make this clear -- exactly opposite the city hall; squarely in the center of the room.

In sum, the phrase "reaching into the immediate vicinity and directly facing at least one radiator element" means that at least one outlet opening must extend into the proximate area of, and must point squarely toward, at least one radiator element.
1. "reaction frame"

In its "summary" section, the '500 patent specifications describe the relevant invention as a "precision motion stage mechanism including the stage itself . . . surrounded by a 'window frame' guide structure." See '500 Patent at 1:55-58. The parties agree that "reaction frame" has no generally accepted meaning in the art, and however obvious the meaning of "reaction" and "frame" may be when disaggregated, the conjoined "reaction frame" term has no plain meaning, either. The court must look to the intrinsic record accordingly.

In pertinent part, the specifications discuss a "frame" separate and distinct from that supporting the various precision photolithographic components. The abstract to the '500 patent discusses "a mechanical support for the stage independent of the support for its window frame guide," see Patent '500 at Abstract, and "reaction force" is understood as being "transmitted independently directly to the earth's surface by an independent supporting structure." See id. at 2:36-40. According to the intrinsic record, moreover, the reticle stage mechanism is placed "apart [] and [is] independently supported from the other elements of the photolithography machine." Id. at 2:49-52; see also id. at 5:23-28 (discussing an "independent support structure"); id. at 2:35-40 ("An additional aspect . . . is that the reaction force of the stage and window frame drive is not transmitted to the support frame . . . but is transmitted independently directly to the earth's surface by an independent supporting structure."). The specification language for the incorporated '118 patent is largely in accord, as is the '118 patent's prosecution history. See, e.g., Patent '118 at 4:5-9 & 7:17-19; Appendix to ASML's Memorandum, Exh. 21, Patent '118 file history (noting that Nikon, in prosecuting the '118 patent, emphasized an "independently supported reaction frame [that] has its own supporting pillars resting on [a] foundation . . . without any mechanical coupling to the XY stage 30 or to the optical elements").

But not all of the specification language suggests that the reaction frame must go separately and independently to the ground. Both the '500 patent specifications and the correlative '118 patent text discuss a structural support that "underlies"--i.e., buttresses from below, perhaps through a stacked-frame structure--the mechanism's frames. See Patent '500 at 5:15-17; 5:23-52; Patent '118 at 4:11-19; 6:66-7:4. Nothing in the intrinsic (or extrinsic) record demands that the reaction frame itself run independently to the ground in every case, rather than to a separate component of the larger device which itself contacts "the earth's surface." '500 Patent at 2:36-40. Only by limiting the claim to a particular embodiment does such a limit emerge, and the court is unwilling to impose such a limit here. See, e.g., Intervet Am., Inc. v. Kee-Vet Lab., Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989) (noting that attempts to impose such limits rarely, if ever, succeed). A "cardinal sin of claim construction," the Federal Circuit has observed, is to import limitations into claims where claim language permits a construction broader than the embodiments. Teleflex, Inc. v. Ficosa North Am. Corp., 299 F.3d 1313, 1324 (Fed. Cir. 2002). It is equally problematic, of course, to construe a claim to exclude a preferred embodiment, see Vitronics, 90 F.3d at 1583-84 (noting that a construction that excludes the preferred embodiment is "rarely, if ever, correct"), but construing "reaction frame" to include a stacked-frame configuration suffers neither of these flaws. For one, the claim language is broader than the relevant embodiment and the specification text; nothing in the claim language excludes a stacked-frame configuration, and nothing in the claim language requires separate and independent attachment to the ground. Indeed, embodiments in the incorporated '118 patent depict precisely the contrary. See Exh. 14 at 1:40-64; Fig. 1B. For another, a construction of the term "reaction frame" that includes a stacked configuration does not exclude the preferred embodiment; it simply acknowledges that the reaction frame need not extend separately and independently to the ground.

The court thus construes "reaction frame" to mean "a physical structure, separate and distinct from the structure supporting the precision components, that transfers reaction forces, caused by the movement of a stage drive, away from the precision components."
Here, the parties agree that "reaction space" is expressly defined in the specification, but argue over how much of that definition actually is necessary to define the term. The specification provides:

According to the invention, the term "reaction space" includes both the space in which the substrate is located and in which the vapor-phase reactants are allowed to react with the substrate in order to grow thin films, namely, the reaction chamber, as well as the gas inflow/outflow channels communicating immediately with the reaction chamber, said channels serving for admitting the reactants into the reaction chamber, inflow channels, or removing the gaseous reaction products of the thin-film growth process and excess reactants from the reaction chamber, outflow channels …. According to the invention, the reaction space is the entire volume to be evacuated between two successive vapor-phase pulses.

( '590 patent 4:29-43.) ASM argues that "reaction space" should not be construed to include the last sentence of this definition, on the ground that it would be confusing, tautological, subjective, and unhelpful.

It appears that ASM's concern is that the reaction space should be described in terms of a physical description of its boundaries, rather than by describing it by volume of space to be evacuated. The specification clearly defines the term both ways, however, and for good reason. Without the last line of the definition, it is not clear whether there is any limitation on the amount of the inflow and outflow channels that are included in the reaction space. With the last line included, it becomes clear that only the portions of the inflow and outflow channels that are evacuated of reactants between pulses are included in the reaction space.

The specification provides that the different reactant gases are not permitted to mix in the inflow channels or in the reaction space. ( '590 patent 5:10-15.) In order to prevent this, there must be some sort of valves or baffles on the inflow channels that control the flow of reactant gases into the reaction space. (See, e.g., '590 patent 6:19-22.) The location of those valves or baffles defines the limit of the reaction space on the input end. The limit of the reaction space on the output end must be either the vacuum pump itself, or any exhaust valve or baffle through which the vacuum pump draws the reactant gases out of the reaction space.

Accordingly, the Court agrees with Genus that the last sentence of the specification's definition of "reaction space" must be included in order to clearly define the limits of the reaction space. Thus, the reaction space includes the reaction chamber as well as the gas inflow/outflow channels communicating immediately with the reaction chamber, and includes the entire volume to be evacuated between two successive vapor-phase pulses.
Def. Supp. Mem. at 3. PSN does not provide a proposed construction.

The '530 Patent summary describes performing touch-ups, smoothing, and if desired, adding a glaze after the veneer has been removed from the statue. See col. 2, 11. 52-60. But the preferred embodiment section describes finishing treatments performed while the veneer is still attached to the statue, and the example section describes glazing the veneer and then re-firing the veneer prior to removing the veneer from the statue. See col. 4, 11. 40-47; col. 5 11. 65 - col. 6 11. 2. Tellingly, the preferred embodiment specifically states that "the support provided by the statue with the casing still mounted while such treatment is conducted is a feature of this invention." Col. 4, 11. 44-47.

While two parts of the patent specification may be internally inconsistent, the plain meaning of "ready for" and the specific affirmation of the statue's presence during finishing as "a feature of this invention" support Ivoclar's proposed construction. Reading the claimed term "ready for mounting" to include finishing steps after the statue has been removed effectively reads the disputed phrase out of the claim. See, e.g. Texas Instruments, Inc. v. U.S. Int'l Trade Comm., 988 F.2d 1165, 1171 (Fed. Cir. 1993) (rejecting a proposed claim construction because it would "render the disputed claim language mere surplusage").

PSN also argues that the specification's references to cleaning, sterilization, etching, and adding cement to the veneer support PSN's position that the patent contemplates additional steps between removing the statue and mounting the veneer on the tooth. But these steps described by PSN are steps associated with mounting rather than finishing. See col. 2, 11. 57-60 (describing cleaning, etching and adding a cement coating "to permit the veneer to be mounted and fixed in place"). Therefore, "ready for mounting" means "leaving the veneer restoration ready to be fitted to and cemented on a patient's tooth for which it was custom-made."

Discussion

In the Opinion, the Court construed the phrase "ready for mounting" in Claim 1 of the '530 Patent to mean, as proposed by Ivoclar, "leaving the veneer restoration ready to be fitted to and cemented on a patient's tooth for which it was custom-made." Opinion at 10. On the basis of the construction of the phrase "ready for mounting," the Court granted summary judgment for Ivoclar after finding that no reasonable jury could conclude that Ivoclar's manufacturing process left the tooth veneer ready for mounting after the investment material had been removed.

As part of the claim construction portion of the Opinion, the Court noted that PSN did not provide a proposed construction counter to that provided by Ivoclar. PSN brings to the Court's attention that PSN provided the Court with a proposed construction as part of its Local Rule 56.1 Additional Statement of Material Facts. PSN does not dispute that it did not discuss or argue its proposed construction in its Opposition to the Motion for Summary Judgment, although it added a citation to the statement of fact that contained the construction. PSN also briefly referenced its proposed construction in its Response to Ivoclar's Short Supplement to its Motion for Summary Judgment. PSN's proposed construction for "ready for mounting" is: "the statue has been eroded from the veneer and is substantially fabricated other than finishing and fitting operations required for its placement on the tooth."

While the Court admits that it overlooked PSN's proposed construction and will address that proposed construction on its merits as part of this opinion, it bears mention that PSN is not entirely blameless for the error. 2 Claim construction is a matter of law; proposed claim constructions are not material facts and are inappropriate for placement in a Local Rule 56.1 statement. See Kenall Mfg. Co. v. Genlyte Thomas Group LLC, 439 F. Supp. 2d 854 (N.D. Ill. 2006) (legal conclusions regarding infringement and claim construction arguments do not comply with Local Rule 56.1). This Court is obligated under Local Rule 56.1 not to consider legal arguments and conclusions of law that parties place in their statements of undisputed facts. In both the Opposition and Response to Supplement briefs, PSN made the strategic decision to focus its argument on the reasons that Ivoclar's proposed construction should not be used rather than providing support for its own proposed construction.

2 Ivoclar also apparently missed the proposed construction in PSN's 56.1 Statement of Additional Facts. Ivoclar stated in its
Reply to the Motion for Summary Judgment that PSN had not provided a proposed construction. Reply Mem. in Support of Summary Judgment at 8 (Docket No. 248).

Because the Court overlooked the presence of a proposed construction, however improperly stated, the Court will re-address the claim construction on the merits. In the Opinion, the Court adopted Ivoclar's revised construction of "ready for mounting":

Leaving the veneer restoration ready to be fitted to and cemented on a patient's tooth for which it was custom-made.

PSN's proposed construction for "ready for mounting" is:

the statue has been eroded from the veneer and is substantially fabricated other than finishing and fitting operations required for its placement on the tooth.

The major difference in the two proposed constructions is the presence of the term "finishing" as a separate step from "fitting" that should be included in the construction of "ready for mounting." While the Opinion did not have the benefit of PSN's proposed language, the Opinion did analyze and conclude on the basis of the specification in the '530 Patent that "ready for mounting" did not include finishing steps. The Opinion specifically addressed the types of activities that PSN raises in its Motion for Reconsideration as "finishing" steps, including beveling, shaping, and glazing. Therefore, although PSN argues that it has been prejudiced by the Court's failure to consider PSN's proposed construction, the Court did discuss the finish steps and determine that the claim construction should not include them - the key difference in construction language that PSN proposed.

The Opinion also explained the reasoning behind the Court's decision that "finishing" could not be included in the phrase "ready for mounting." While PSN chose to phrase its arguments on summary judgment as arguments against Ivoclar's construction (rather than in favor of its own construction), PSN made the same legal arguments in briefing that it now makes on reconsideration; the Opinion addressed those arguments and ruled against PSN. For the sake of completeness, those arguments are addressed again in brief.

First, PSN argues that a claim construction that does not cover the description in the summary of the invention is "rarely, if ever, correct." But PSN draws this quote from a case discussing the preferred embodiment, not the summary of the invention. That case, Globetrotter Software, Inc. v. Elan Computer Group, Inc., 362 F.3d 1367, 1381 (Fed. Cir. 2004), states that "a claim interpretation that excludes a preferred embodiment from the scope of the claim 'is rarely, if ever, correct.'" The preferred embodiment in the '530 Patent would be excluded if PSN's proposed construction were to be adopted, the position that these exact cases counsel to be an incorrect result. PSN's proposed construction states that finishing will take place after the statue is removed, while the preferred embodiment states that "the support provided by the statue with the casing still mounted while such treatment is conducted is a feature of this invention." '530 Patent, Col. 4, ll. 43-46.

Ivoclar's proposed construction is consistent with the preferred embodiment, but PSN's proposed construction would exclude, or at very least ignore, the inventor's statement in the preferred embodiment that the support provided during finishing treatment has significance in the invented process because it provides a structure during the finishing steps. The inventor's statement is not an expression of an option, or a suggestion of one method among many. The sentence describes a "feature" of the inventor's process. A description in the specification that specifically notes a feature of the invention can inform the Court of the proper construction of a claimed term. See Boss Control, Inc. v. Bombardier, Inc., 410 F.3d 1372 (Fed. Cir. 2005) (where the specification limited a term to a process involving two steps in order, claim would not be construed broadly to allow for any step); Inpro II Licensing, S.A.R.L. v. T-Mobile USA, Inc., 450 F.3d 1350, 1355 (Fed. Cir. 2006) (limiting a claim for an interface to a specific type of interface because the preferred embodiment specified it was an "important feature" and explained the purpose behind that feature). To construe the phrase "ready for mounting" to allow finishing after the investment material has been removed would be to ignore an aspect of the invention that the inventor himself felt important enough to highlight as one of the invention's features. This statement may be present in the preferred embodiment, but that alone does not allow the Court to ignore its implications.

Contrary to PSN's position, construing the claim "ready for mounting" to exclude finishing steps does not necessarily result
in a complete exclusion of the summary of the invention. The Summary of the Invention describes single or double baking the veneer on the statue, allowing the statue to cool, and then removing the statue from the veneer. See '530 Patent, Col. 2, ll. 40-53. In the next paragraph, the summary describes touching up, smoothing, and possibly glazing the veneer casing "produced by either the single or double bake process. Col. 2., ll. 54-56. The description of these steps follows the description of removing the investment material in the summary description, but do not dictate that the touching up necessarily follows the removal. The Summary is not clear on the sequence of removing the statue vis-a-vis finishing, but the preferred embodiment, as discussed above, is clear that the sequence of events is significant. Additionally, the prosecution history of the '530 Patent supports the statement in the Preferred Embodiment, and the Opinion's finding, that "ready for mounting" allows for fitting and cementing steps, but not for the finishing steps such as smoothing and glazing. In its brief appealing the results of a reexamination of the '530 Patent, Yukiyo (then the assignee of the '530 Patent) argued that the patented process smoothed and glazed the veneers prior to erosion of the investment material, consistent with the description in the preferred embodiment. See Def. Ex. 26 at 8-9.

Second, PSN argues that the Court should have recognized the ambiguity in the '530 Patent and relied upon the extrinsic evidence provided in the form of affidavits from experts Dr. Gerald McLaughlin (the inventor of the '530 Patent) and David Andrus, and that PSN suffered prejudice from the Court's failure to consider these expert affidavits. As explained above, the Court overlooked the single statement of material fact that contained PSN's proposed construction. But the Court reviewed the statement of material facts and the exhibits attached to the statement of fact, including the often-referenced affidavits of McLaughlin and Andrus. Contrary to PSN's assertions, PSN was not deprived of review of the testimony of those of "ordinary skill in the art." This testimony is part of the record and was reviewed prior to publication of the Opinion. The Court did not choose to rely on the extrinsic evidence of expert testimony because the claims could be construed on the basis of the intrinsic evidence found in the language of the claims themselves and in the patent specification. See Phillips v. AWH Corp., 415 F.3d 1303, 1317 (Fed. Cir. 2005) (in construing claims, expert testimony is "less significant than the intrinsic record in determining the legally operative meaning of claim language") (internal citations omitted). Extrinsic opinions from experts can help clarify the meaning of terms and can educate a court on the technology at issue in the case, but its use in construing claims is within the sound discretion of the court. See Inpro II, 450 F.3d at 1357.

Based on the intrinsic evidence alone, reading the phrase "ready for mounting" to include finishing steps would have the effect of reading out a feature of the preferred embodiment - a situation which case precedent counsels to be an inappropriate outcome. Therefore, the construction of the phrase "ready for mounting" in Claim 1 of the '530 Patent remains, as it was in the Opinion, "leaving the veneer restoration ready to be fitted to and cemented on a patient's tooth for which it was custom-made."

3211

Readily disengaged

The term "readily disengaged" appears in both the '823 and '302 patents. Litepanels contends that the term's plain meaning should apply. Gekko proposes "readily disengaged" should be construed as "capable of being disengaged from a lighting frame by manually applying pressure to release locking tabs and twisting in an opposite direction from that originally used to bring it into a locking position." Although the claim language does not reference limitations such as "locking tabs," "manually applying pressure," or "twisting" in certain directions, Gekko's construction tracks one of the preferred embodiments. See '823 patent, Col. 10:56-62; '302 patent, Col. 10:56-62. It argues that this embodiment is the only reference made to "readily disengaged" in the specifications and, thus, must be used to construe the phrase.

"Although the specification may aid the court in interpreting the meaning of disputed claim language, particular embodiments and examples appearing in the specification will not generally be read into the claims." Comark Commc'n's, Inc, 156 F.3d at 1187. In both patents, the specification also references other methods for affixing the camera mounting assembly. The specifications state, "the mounting assembly receptor may comprise any suitable mechanism." '823 patent, Col. 10:30-32; '302 patent, Col. 10:30-32. They teach that "a variety of other means may alternatively be used to affix a camera mounting assembly." '823 patent, Cols. 11:1-2, 12:36-37; '302 patent, Cols. 11:1-2, 12:36-37. The specifications also state that the camera mounting assembly figures are "merely examples" and other assemblies may be used. '823 patent, Col. 13:40-44; '302 patent, Col. 13:40-44. Adopting Gekko's construction would limit the claim to a preferred embodiment. See Phillips, 415 F.3d at 1323 (warning against confining claims to a particular embodiment).
Neither the specification nor claim language gives "readily disengaged" a special meaning. In fact, the specification states a "variety" of methods for attachment exist, which indicates a variety of methods for detachment exist. When reading the phrase in the context of the claim language, no ambiguity exists. A lay juror will have no difficulty in understanding what "readily disengaged" means. See Phillips, 415 F.3d at 1314. It is difficult to conceive of a more clear way to convey the meaning of this phrase; accordingly, the Court does not construe "readily disengaged."

A. The '920 Patent

Hearing Components argues that the district court erred in finding claims 1 and 2 of the '920 patent indefinite. According to Hearing Components, the phrase "readily installed and replaced by a user" is not ambiguous, as a person of ordinary skill in the art would know that it means "simple to install, without tools or specialized skills." Hearing Components contends that the specification disparages the prior art that required a tool and touts that the invention requires no tools. According to Hearing Components, the specification does not suggest that a person must have a certain level of physical disability to be the claimed "user," and although the '920 patent describes that the invention benefits older persons, the patent does not distinguish the prior art on that basis.

Hearing Components also argues that the "readily installed" phrase is not a claim limitation that required construction at all, as it is in the preamble and is not an essential component of the invention. According to Hearing Components, the phrase is duplicative of other language in the claim, and the prosecution history does not clearly distinguish the invention on the basis of the preamble language.

Shure responds that the "readily installed" phrase is indefinite, as nothing in the specification or prosecution history of the '920 patent clarifies the claim scope. According to Shure, the use of subjective terms such as "readily" renders a claim indefinite. Shure asserts that it presented unrebutted testimony that the art has no commonly understood definition of the word "readily." Shure also argues that the "readily installed" term is a claim limitation at least because Hearing Components relied on it to distinguish prior art during prosecution and in the specification.

Finally, Shure asserts that Hearing Components never presented the claim construction to the district court that it now proposes on appeal, as it previously argued for the definition "easily placed on and taken off the tube." According to Shure, Hearing Components also first suggested that the limitation was part of the preamble in a footnote to its claim construction reply brief. Hearing Components replies that there was no waiver, as its proposed construction is similar to the one presented to the district court. Hearing Components also replies that the court specifically considered whether the phrase was a limitation or part of the preamble.

We agree with Hearing Components that the claim limitation "readily installed and replaced by a user" is not indefinite. "A determination that a patent claim is invalid for failing to meet the definiteness requirement in 35 U.S.C. § 112, [paragraph] 2 is a legal question reviewed de novo." Young v. Lumenis, Inc., 492 F.3d 1336, 1344 (Fed. Cir. 2007). A patent is presumed to be valid, so Shure faces an evidentiary burden of clear and convincing evidence to show facts supporting a conclusion of invalidity. Id. at 1345.

As an initial matter, the "readily installed" phrase is a claim limitation, as Shure argues. A preamble to a claim may or may not be limiting, depending on the circumstances. "In considering whether a preamble limits a claim, the preamble is analyzed to ascertain whether it states a necessary and defining aspect of the invention, or is simply an introduction to the general field of the claim." Computer Docking Station Corp. v. Dell, Inc., 519 F.3d 1366, 1375 (Fed. Cir. 2008) (quotation marks omitted). A term is often limiting when the patentee has relied on it during prosecution to distinguish prior art, as such reliance demonstrates that the feature disclosed in the preamble is necessary to the patentability of the claim. See id.; Jansen v. Rexall Sundown, Inc., 342 F.3d 1329, 1333 (Fed. Cir. 2003). In this case, Hearing Components clearly relied on the "readily installed" phrase during prosecution to distinguish prior art. See J.A. 5768 ("The Moser et al device clearly lacks (1) a 'disposable wax guard' that is (2) 'readily installed and replaced by a user' . . . as expressly called for in applicant's claim 1."); J.A. 5769 (The membrane in the Siemens device "is not 'readily installed and replaced'; indeed, it apparently remains in place, where it is cleaned ultrasonically."); J.A. 5770 (In the Oliveira device, "the sleeve is certainly
not intended to be 'readily installed and replaced,' . . . as specifically called for by applicant's claim 1."). We do not consider the "readily installed" phrase to be duplicative of other language in the claim. Although the claim recites a membrane "that permits a user to position [a] guard over [an] outlet port," the "readily installed" phrase refers to the entire wax guard and therefore is more limiting. We thus conclude that the "readily installed" phrase is a claim limitation.

However, Hearing Components correctly asserts that the limitation is not indefinite. Under 35 U.S.C. § 112, second paragraph, the "specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention," which is known as the definiteness requirement. "Claims are considered indefinite when they are not amenable to construction or are insolubly ambiguous. Thus, the definiteness of claim terms depends on whether those terms can be given any reasonable meaning. Indefiniteness requires a determination whether those skilled in the art would understand what is claimed." Young, 492 F.3d at 1346 (internal citations and quotations marks omitted). The purpose of the definiteness requirement is to ensure that "the claims, as interpreted in view of the written description, adequately perform their function of notifying the public of the scope of the patentee's right to exclude." Honeywell In'لو, Inc. v. Int'l Trade Comm'n, 341 F.3d 1332, 1339 (Fed. Cir. 2003) (quotation marks omitted).

Here, the district court noted that the patentee has used a word of degree, "readily." "[A] patentee need not define his invention with mathematical precision in order to comply with the definiteness requirement." Invitrogen Corp. v. Biocrest Mfg., L.P., 424 F.3d 1374, 1384 (Fed. Cir. 2005) (quotation marks omitted). Not all terms of degree are indefinite. However, the specification must "provide[ ] some standard for measuring that degree." Datamize, LLC v. Pluritree Software, Inc., 417 F.3d 1342, 1351 (Fed. Cir. 2005) (quotation marks omitted). Although "readily" does not refer to a mathematical measure of degree, in Datamize, we addressed the "purely subjective" claim term "aesthetically pleasing" and stated that, as with terms of degree, "a court must determine whether the patent's specification supplies some standard for measuring the scope of the phrase. Thus, we next consult the written description." Id.

As the district court correctly noted, the written description of the '920 patent states that one of the advantages of the wax guard is that it "requires no tools for installation or removal." '920 patent col.2 ll.6-9. Indeed, that statement appears in the context of the following two sentences: "It is simple to install, easy to remove, and convenient to replace, even for older persons. The guard is inexpensive and requires no tools for installation or removal." Id. Assuming the patentee intended the second sentence to elaborate on the first sentence, a wax guard that is "inexpensive and requires no tools for installation or removal" will be "simple to install, easy to remove, and convenient to replace, even for older persons." Id. That assumption is supported by the repetition of variations on the words "install" and "remove" in both sentences. Furthermore, given that the words "readily," "simpl[y]," "eas[ily]," and "convenient[ly]" are all synonyms, the language of those two sentences in the specification closely tracks the language of the disputed claim term, "readily installed and replaced by a user." Thus, the written description gives a clear example of a wax guard that is "readily installed and replaced by a user": one that "is inexpensive and requires no tools for installation or removal."

The district court was also correct in noting that the specification discusses the phrase "readily installed and replaced by a user" in the context of prior art. The specification disparages prior art guards that were not "readily installed and replaced." It states that some prior art inventions "have mechanically mounted screens or other filters beyond the sound delivery tube opening, but removal and replacement has been difficult, especially since persons wearing hearing aids are often advanced in years and unable either to see clearly enough or to perform fine physical actions well enough to replace the filters." '920 patent col.1 ll.62-68. By negative implication, the patent thus explains that a filter that must be mounted beyond the sound delivery tube opening is not "readily installed and replaced."

Those two examples are the only examples or discussion provided by the specification of the "readily installed" phrase. Although the court cited parts of the written description discussing "prior products [that] needed a tool or solvent to remove wax buildup," Claim Construction Opinion, slip op. at 12 (citing '920 patent col.1 ll.59-60), that discussion is irrelevant to the wax guard because the tools and solvents that removed wax buildup were not used for "install[ing]" or "replac[ing]" a wax guard on the prior art products; they were simply used to clean parts of the products. See '920 patent col.1 ll.43-44 (discussing "a hearing aid through which solvent may be pumped to remove wax buildup"); id. at col.1 ll.51-62 (discussing prior art patents that discussed previous prior art, but not giving a reason for "the apparent difficulty in replacing [previous prior art wax filters] after they are soiled" and describing only a reusable wax guard in which "ear wax is removed by pushing a tool through [a] cross passage").

The district court found the "readily installed" phrase indefinite because the written description did not address the level of
Accordingly, the container and dunnage is readily reused"

Bradford proposes that "the container and dunnage is readily reused" means "easily used again." Defendants propose that "the container and dunnage is readily reused" means "the container and the 'dunnage structure' are capable of moving back into the erected position for receiving product without any manipulation of the container beyond erecting the two opposing and moveable 'side structures' into an upright position." In support of their construction of this term, Defendants draw on the prosecution history of the '096 Patent and the specification of the '119 Patent.

The Court does not believe that the prosecution history supports Defendant's construction of "readily reused". In contesting the Examiner's rejection of the claimed invention over the reference of Rader, Bradford argued that "[t]here is absolutely no teaching or suggestion in Rader to operably couple the hanging files to the side structures so that they simultaneously move between erected and collapsed positions along with the moveable side structures." Doc. No. 48-3, at 5. Bradford also stated, "Furthermore, [in Rader] hanging files are not operably coupled to the side structures as taught in the present invention, for moving to an erected position when the side structures are erected, and moving to a collapsed position when the side structures are collapsed." Id. As the Court reads these excerpts of the prosecution history, the point of distinguishing Rader was not that the dunnage in the claimed invention was readily reusable and Rader's was not. Rather, the main point of distinction was that the dunnage in the claimed invention was coupled to the side structures of the container whereas in Rader the hanging files had to be removed from the container before it could be collapsed. See id. at 4-5. Bradford did state that the hanging files in Rader would likely not be reusable if they remained in the container while it was collapsed. Id. at 5. Nevertheless, there is no indication that the hanging files in Rader could not be reused if they were removed from the container before it was collapsed. In other words, the distinction Bradford was making was that the claimed invention teaches a system wherein the dunnage is operably coupled to the container and Rader does not.

Defendants' contention that the specification of the '119 Patent demonstrates that its construction of "readily reused" is correct has more appeal. For instance, the "Summary of the Invention" states: "To reuse the dunnage structures, the container is simply erected for another shipment and the dunnage structures will again move into the engagement position." '119 Patent, col. 3, ll. 26-28. Nevertheless, the Court rejects this argument. As Bradford persuasively argues, Defendants' construction is overly restrictive in that it would seem to preclude the performance of additional operations needed to erect the container, such as locking and securing sides.

Accordingly, the Court holds that "readily reused" means "easily used again."
a. Scope of the '468 Patent Claims

The parties dispute whether the '468 patent claims only the testing strips, and thus is a "product" patent, or whether it is a "method" patent or "combination" patent of the strip and meter. This is an issue of law to be determined by interpreting the claims of the patent.

The claims of the '486 patent are quoted below, as they appear in the patent itself.

What is claimed is:

1. A reagent test strip for use in an apparatus for determining the blood glucose concentration of a sample of whole blood, said apparatus comprising optical means for detecting intensity of light at wavelengths of about 635 nm and about 700 nm reflected from at least a portion of said strip by reading the reflectance of at least a portion of said strip;

   said strip having a porous portion disposed near a distal end of said strip such that the porous portion generally registers with the optical means of the apparatus when the strip is retained by the apparatus during determination of said blood glucose concentration, said porous portion having a sample receiving surface for receiving a sample of whole blood and a testing surface, said porous portion further comprising reagent means for indicating the concentration of blood glucose in said whole blood sample in the presence of optically visible hemoglobin by creating a change in reflectance at said testing surface indicative of the concentration of glucose present in said sample, said reagent means comprising chemical reagents selected to produce said change dependent upon the glucose concentration wherein said chemical reagents comprise a dye precursor forming a chromophore indicative of the concentration of glucose present in said sample, said chromophore absorbing light at about 635 nm but not to any significant extent at about 700 nm.

2. The strip of claim 1 wherein said dye precursor comprises 3-methyl-2-benzothiazoline hydrazone hydrochloride and 3-dimethylaminobenzoic acid.

3. The strip of claim 2 wherein the chemical reagents are at a pH of 3.8 to 5.

Claims 1-3, '468 Patent.

Most persuasive to the court on the issue of claim interpretation is the language of the three claims themselves. Claim 1 begins with the words "[a] reagent test strip" while Claims 2 and 3 refer to "the strip of claim 1." It is clear that each claim constitutes a description of the claimed strip, not a claimed method. Each claim provides a detailed description of the makeup and qualities of the claimed strip, not of the method employed in testing blood glucose levels. Claim 1 repeatedly refers to the strip and its characteristics. Mention of the meter in which the strip is used serves to describe certain strip features, not to describe a combination of strip and meter. The mention of the meter apparatus in the first sentence of claim 1 serves to identify the environment in which the strip will be used, not to create a claim to the method of determining glucose levels in blood or to the combination of strip and meter. See e.g., Smith Corona Corp. v. Pelikan, Inc., 784 F. Supp. 452, 463 (M.D. Tenn. 1992), aff'd, 1 F.3d 1252 (Fed. Cir. 1993); see also In re Stencel, 828 F.2d 751, 754-55 (Fed. Cir. 1987).

In addition to the language of the claims, i.e. the repeated references to the strips described in claims 1 through 3, the court finds that the prosecution history favors a finding that the '468 patent is directed solely to the strips themselves. The '468 patent arose out of a continuation application which was amended to contain new claims directed to a "reagent strip." In June, 1993, these amended claims were amended again, but still directed to a "reagent test strip." Although this amendment, given the number Claim 55, described the apparatus in which it was to be used, the dependent claims added along with Claim 55 each begins with the phrase "the reagent test strip of claim 55 ..." After considering the amendments of claims 55 through 59, the patent examiner stated that it was "the examiner's position that the claims are directed to a test strip." Additionally, the examiner referred twice more in that communication to "the claimed test strip." Thereafter, LifeScan submitted an amendment canceling prior claims and adding Claim 60 incorporating the limitations of Claim 55. During and after the submission of Claim 60, LifeScan did not dispute the examiner's interpretation of Claim 55 as referring to the strip itself. In addition, Claim 60 added a feature relating to the nature of the chemicals in the strip.
After an initial rejection by the patent examiner, LifeScan conducted an interview with the examiner, during which drafts of new claims 61 and 62 were discussed. The first of the new claims, which later became claim 1 of the '468 patent, was directed to "a reagent test strip for use in an apparatus for determining the blood glucose concentration in a sample of whole blood." The second new claim, which became claim 2 of the '468 patent, was directed to "the strip of" the first claim. Following the interview, LifeScan also submitted a new claim 63, later claim 3 of the '468 patent, which also was directed to "the strip" of the preceding claim. Claim 61, which was later allowed, contains fewer references to the nature of the apparatus in which the strip is to be used. The references to the apparatus, i.e. the meter, which do exist are merely descriptive of the environment of the intended use of the strip. See e.g. In re Stencel, 828 F.2d at 754-55; see also Smith Corona, 784 F. Supp. at 463-65. Based on the court's review of the language of the claims and the patent history, the court has determined that, as a matter of law, the '468 patent claims the testing strip and therefore a product, not a method or combination of method and product.

In addition, this court is not persuaded by Polymer's argument that the '468 patent claims are limited to the reagent strip when in place in the meter with a whole blood sample present thereon. This interpretation is simply not supported by the claim language or the claim prosecution.

The court also finds unpersuasive Polymer's arguments concerning the interpretation of claim 3 of the '468 patent, which reads as follows: "The strip of claim 2 wherein the chemical reagents are at a pH of 3.8 to 5." Based on the claim language and the prosecution history, the court finds that the claim language refers to the pH of the chemical reactants in the dry strip, rather than the "pH of all of the chemicals in the strip when it is placed in the meter and a sample of whole blood is applied thereto" as is argued by Polymer.

Finally, based upon the language of the claims and the claim prosecution, the court finds that the language in claim 1 requiring that the porous portion of the strip

comprise reagent means for indicating the concentration of blood glucose in said whole blood sample in the presence of optically visible hemoglobin by creating a change in reflectance at said testing surface indicative of the concentration of glucose present in said sample, . . .

does not limit the claim to a strip in which the only hemoglobin that can be optically sensed by the apparatus is that which is "in the red blood cells filtered out and held at the surface of the test strip."

Polymer argues that its strip does not meet the elements of claim 1 because hemoglobin not "in the red blood cells filtered out and held at the surface of the test strip" is optically visible. However, the court disagrees with Polymer's interpretation of the claim language. First, the court finds that there is no indication that the '468 patent claim 1 is limited to a strip in which the only optically visible hemoglobin is that which is in the red blood cells. On this point, the court notes that the patent expressly refers to "blood being analyzed [flowing] through the pores of the matrix" and to "blood . . . wetting the polyamide matrix without having an excess liquid penetrate the porous matrix to interfere with the reflectance reading on the opposite side of the matrix." This language indicates that the claim is not limited to hemoglobin inside red blood cells, but rather also encompasses "free" hemoglobin released into the remainder of the sample. Second, even if the claim were limited in the manner alleged by Polymer, Polymer has not asserted that the hemoglobin presence in red blood cells applied to First Choice strips is not "optically visible" to at least some extent by the LifeScan home-use blood glucose meter.

Therefore, after reviewing the claim language, the patent specification, the prosecution history, the expert deposition testimony submitted, and the prior art, the court has determined that the proper meaning or interpretation of the '468 patent is that it is directed to the test strips per se, rather than to a method or combination of strip and meter. Additionally, the '468 patent claims refer to the strips themselves and are not limited to the strips when in the apparatus, with whole blood upon them. Finally, the phrase "in the present of optically visible hemoglobin" does not limit claim 1 to a strip in which the only hemoglobin optically visible is that which is in red blood cells filtered out and held at the surface of the test strip.

1. Term 1: "rear cavity"
The principal claim construction dispute between the parties relates to the "rear cavity" limitation of claim 1. Lightspeed contends that the rear cavity is an enclosure within and separate from the enclosure of the earcup that is attached to the rear of the baffle and encloses the driver. Lightspeed's Opening Claim Construction Br. at 3 [Doc. No. 42]. Bose contends that the rear cavity is the cavity within the earcup that is farther from the user. Bose's Opening Claim Construction Br. at 14 [Doc. No. 43]. More specifically, Lightspeed argues that the area behind the baffle is a cavity separate from the claimed "rear cavity" while Bose maintains that there is no second such cavity and the area behind the baffle and the "rear cavity" is a solid structure. See Bose's Claim Construction Reply Br. at 3-4 [Doc. No. 45]; Lightspeed's Sur-Reply to Bose's Reply Br. at 1 [Doc. No. 47]. The '252 patent includes figures illustrating the claimed invention. The parties seem to agree that 11R of Figure 2 of the '252 patent is the rear cavity; the parties' disagreement as to the construction of the term "rear cavity" seems to fall on what constitutes the earcup wall. Lightspeed interprets the earcup wall as the outer lining of the headphone structure, resulting in a broad definition of "rear cavity." In contrast, Bose interprets the earcup wall as the whole area behind the baffle and rear cavity, with a smaller area designated as the "rear cavity." See Bose's Claim Construction Reply Br. at 3.

--- Footnotes ---

1 Claim 1 of the '252 patent is as follows:

A headset comprising:

at least one earcup having a front cavity and rear cavity with front cavity and rear cavity compliances respectively,

a baffle separating the front and rear cavities,

a high compliance driver with a driver compliance that is greater than said rear cavity compliance having a diaphragm joined to a voice coil normally residing in a gap mounted on the baffle, and

an active noise reduction system coupled to said driver.

--- End Footnotes ---

Looking at the language of the claims first, claim 1 states that the headset has "at least one earcup having a front cavity and rear cavity." The '252 patent at 5:10-14. This language does not include any reference to more than two cavities - the front cavity and the rear cavity. Id. Lightspeed's construction requires that there be three cavities in total - one front cavity, one rear cavity, and another cavity between the rear cavity and the earcup wall - an interpretation not supported by the language of the claim.

In addition to the words of claim 1, the '252 patent specifications seem to support the idea that there are only two cavities within the earcup. The specifications provide that active noise-reducing headphones are known to "use a headphone having front (inside) and rear (outside) cavities separated by a baffle carrying a small driver." The '252 patent at 1:18-20. The patent specifications further state that ",[i]n the invention includes a baffle that separates a front or inside cavity from a rear or outside cavity . . . ." Id. at 1:53-55. Also, "[b]affle 11 separates front or inside cavity from rear or outside cavity . . . ." Id. at 2:11-12. Additionally, the patent specifications state that ",[i]t is convenient to refer to the cavity nearer the user and encompassing his ear with headphones properly positioned as the front or inside cavity and the cavity further from the user as the rear or outside cavity." Id. at 2:17-21. The patent specifications indicate that there are two cavities contained within the earcup, a front and a rear cavity, and there is no mention of an additional cavity, contrary to Lightspeed's assertion.

The prosecution history confirms this interpretation. The United States Patent and Trademark Office ("PTO") objected to Figure 2 of Bose's original application in an Office Action dated March 1, 1991, because the original illustration did not show the front cavity, rear cavity, and the high compliance driver of claim 1. Lightspeed's Opening Claim Construction Br. at 7. Bose amended Figure 2 on June 6, 1991, to overcome the PTO's objection by adding a new paragraph that stated, in part, ",[r]eferring to FIG. 2, there is shown a diagrammatic sectional view . . . with headphone cup structure added to better illustrate the relationship among the front cavity, rear cavity, high compliance driver and raised portions on the basket surface." Id. at 8.
Lightspeed proposes that in the prosecution history, Bose distinguished between the claimed "rear cavity" and the earcup enclosure, as Lightspeed calls it, demonstrating that the "rear cavity" is something different from the earcup enclosure, and thus Bose's proffered construction cannot stand. Id. at 7-8. Bose's construction is not that the rear cavity and earcup enclosure are the same, but rather that there is only one rear cavity within the earcup. The prosecution history does not support Lightspeed's contention that there are two separate rear cavities.

Moreover, the extrinsic evidence teaches against Lightspeed's construction. To support its argument that there is a solid structure behind the rear cavity, Bose points to parts of Figure 2 of the '252 patent that include "cross-hatching" or "section lining," and offers extrinsic evidence such as the PTO's Manual of Patent Examining Procedure and several engineering textbooks to prove that solid-line cross-hatching is used to denote solid materials, and not empty spaces or cavities in drawings. Bose's Claim Construction Reply Br. at 7.

Lightspeed counters that "in the acoustics industry, dashed lines are often used in patent drawings to identify cavities within headsets" and points to the original '252 patent drawing which contained such dash lines. Lightspeed's Sur-Reply to Bose's Reply Br. at 2. Lightspeed, however, does not cite to extrinsic sources to support this assertion. Id. Instead, Lightspeed offers one example of a patent drawing using dashed lines to denote a sound-absorbing material, but this material is expressly discussed in that patent's specifications, which is not the case with the '252 patent. 2 Id.

2 Moreover, Lightspeed does not acknowledge that Figure 2 in the final '252 patent differs from the original Figure 2 drawing with the dashed lines because Figure 2 in the final '252 patent contains solid lines throughout the contested region. See '252 patent, Figure 2. The driver in the original Figure 2 drawing Lightspeed provides also looks different than the driver in Figure 2 of the final '252 patent. Id. Figure 2 in the final '252 patent contains solid lines which does not seem to indicate an open space in light of the extrinsic evidence.

The intrinsic and extrinsic evidence of the '252 patent, weighed appropriately in terms of importance, indicate there are only two cavities - a front and rear cavity - within the headphone cup structure. This Court construes the term "rear cavity" as "the cavity within the headphone cup structure that is farther from the user and attached to the rear of the baffle."
intersection of two plane faces (as of a pyramid) or of two planes." Merriam-Webster's Colledge Dictionary available at
http://www.m-w.com. Defendants offer no real argument in support of their position, and I conclude that their construction
is unconvincing.

Plaintiff asks this Court to adopt the construction given by the United States District Court for the Central District of
California in a related action: 29 "having a margin of intersection between the top and bottom surfaces of the blade in which
at least some part of the surface boundary defined by that margin is at the rearmost point of the blade. There is no limitation
on the shape of the surface boundary defined by the margin of intersection." (Pl.'s Reply Br. at 50 (citing Bausch and Lomb,
Inc. v. Oasis Med., Inc., CV 00-11298 (C.D. Cal. July 18, 2001) (slip op.); Pl.'s Ex. 8.)) The Court in Oasis Medical, upon
rejecting both proposed definitions, noted first that the blade includes three types of edges: the rear edge, the cutting edge,
and the side edge. The Court further noted that the term "rear edge" has dual meaning in that the term is physical because it
describes a location (within the rear, trailing portion), and it is relational because, as explained in the preferred embodiment,
it is "generally parallel to the forward cutting edge." Oasis Med. at 4 (quoting Col. 11, Ins. 26-28). The Court determined
that the relational description would be meaningless unless the patentee intended to describe "the two dimensional
relationship between the front and rear surface borders." Id. (emphasis omitted). The Court further observed that the rear
edge had no shape restriction. See id. I am persuaded by the thorough logic of the Court in Oasis Medical and adopt it here.

30 In summary, the term "rear edge" is construed as: having a margin of intersection between the top and bottom surfaces of
the blade in which at least some part of the surface boundary defined by that margin is at the rearmost point of the blade;
there is no limitation on the shape of the surface boundary defined by the margin of intersection.

3218

B. Claim Construction

Claim construction begins with the language of the claims. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed.
Cir. 1996). The words of a claim are generally to be accorded their "ordinary and customary meaning," id. at 1582, which is
"the meaning that term would have to a person of ordinary skill in the art in question at the time of invention," Phillips v.
It is presumed that the person of ordinary skill in the art read the claim in the context of the entire patent, including the
specification, not confining his understanding to the claim at issue. Id. at *24; see also V-Formation, Inc. v. Benetton Group
SpA, 401 F.3d 1307, 1310 (Fed. Cir. 2005) (noting that the intrinsic record "usually provides the technological and temporal
context to enable the court to ascertain the meaning of the claim to one of ordinary skill in the art at the time of the
invention"). Further, claim terms are presumed to be used consistently throughout the patent, such that the usage of a term in
one claim can often illuminate the meaning of the same term in other claims. Phillips, 2005 U.S. App. LEXIS 13954, at *28;
see also Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001).

As the court summarized in Renishaw,

ultimately, the interpretation to be given a term can only be determined and confirmed with a full understanding of what
the inventors actually invented and intended to envelop with the claim. The construction that stays true to the claim
language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction.

Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998) (citations omitted). In furtherance of
this full understanding, an invention must be construed "with reference to the file wrapper of prosecution history in the
LEXIS 13954, at *35. "The purpose of consulting the prosecution history in construing a claim is to 'exclude any interpretation that was disclaimed during' prosecution. Rhodia Chimie, 402 F.3d at 1384 (quoting ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1580 (Fed. Cir. 1988)). Thus, the prosecution history can reveal instances where the inventor limited the invention in the course of prosecution and thus narrowed the scope of the claim. Phillips, 2005 U.S. App. LEXIS 13954, at *36.

The district court defined the claim term "rear end" as referring to the "outermost edge of the tube." Claim Construction Order, slip op. 12. Although the district court properly construed the term "rear end" to mean the point forming the edge of the tube body rather than merely the rearward portion of the tube, it erred to the extent that it treated the chamfer angle as being inside the rear end of the tube. Properly construed, the claim term "rear end" refers to the entire rear edge of the tube, including the point at the rear end on the inside of the tube, the point on the rear end at the outside of the tube, and the area in between. Specifically, the "rear end" does not just refer to the point on the outside of the rear end of the tube. The district court erred by selecting the outer edge as the end point of the tube, thereby impermissibly limiting the scope of the claim. Both the inside and the outside edges are part of the rear end of the tube.

The language of the claims supports this construction. Claim 10 of the '433 patent uses the term twice. It claims "[a] hollow tube body being generally cylindrical and extending from a rear end to a nozzle end," '433 patent, col. 4, ll. 41-42 (emphasis added), and "ribs extending to said rear end of said hollow tube body," id., col. 4, ll. 52-53 (emphasis added). In the context of the claim, "rear end" clearly refers to a point defined by the rear edge, such that the tube body extends between two points: the rear end and the nozzle end. Research argues that the claim term "rear end" should be construed as the rear portion of the tube. However, it would be illogical to describe a tube that extends to two regions in the manner that Research suggests, since this would leave the extension of the tube ill-defined. Claim 10 also describes the ribs as "extending to said rear end," which clearly indicates that the rear end is conceived of as a point capable of being attained, and not as a region.

Claim 1 of the '433 patent uses the term "rear end" in the same manner as claim 10. It claims "[a] tube body being elongated and extending from a rear end to a forward nozzle end." '433 patent, col. 3, ll. 66-67 (emphasis added). Claim 1 describes the positioning of air spaces "adjacent said rear end of said tube body by air space defining members extending to said rear end." '433 patent, col. 4, ll. 7-9 (emphases added).

The written description further supports construing "rear end" as referring to the rear edge of the tube. The written description uses the term "rear end" in a manner consistent with its usage in the claim terms. It discusses prior art tubes as being "generally cylindrical and extending from a rear end to a front nozzle." '433 patent, col. 1, ll. 11-12. Research contends that the written description's statement that the "plunger is received within the rear end" precludes defining the rear end as a point. '433 patent, col. 1, l. 12. However, this argument is not persuasive. It is not incongruous to treat the use of "rear end" in this portion of the written description as meaning a point on the tube, particularly in light of the designation of the "rear end" as the end point of the tube in the preferred embodiment. Figure 2, shown below, depicts the preferred embodiment. The written description specifies that the rear edge, labeled 33, is the "rear end" of the tube.

GET DRAWING SHEET 1 OF 1.

The prosecution history also provides substantial support for construing the claim term "rear end" as the point defined by the rear edge of the tube. During prosecution, the '433 patent was rejected as anticipated by the Ennis patent. The Ennis patent claimed a tube with channels or ribs located at the nozzle end of the tube. In overcoming the examiner's rejection, Research distinguished Ennis by claiming ribs that "extend to the rear end of the tube." In thus amending its claim, Research affirmatively disclaimed, at a minimum, tubes with channels immediately adjacent to the nozzle. However, Research further stated to the patent examiner that the amendments made to overcome the rejection over Ennis limited the claims to cover tubes in which "the air spaces are provided adjacent the rear end of the tube such that the air spaces are provided when the tube is full." If the term "rear end" was construed as an undefined area, and the ribs were positioned adjacent to this area, further inside the tube, air spaces would not be provided when the tube was full. Rather, spaces would only be provided when the tube was partially full. Such a construction would not avoid the prior art that Research distinguished. Positioning ribs of unlimited length adjacent to a rear region could feasibly entail placing the ribs in the forward portion of the tube, near the nozzle. Such a construction would negate the clear disclaimer of claim scope made during the prosecution of the '433 patent. See Phillips, 2005 U.S. App. LEXIS 13954, at *36; Rhodia Chimie, 402 F.3d at 1384. Consequently, Research's amendment must be seen as an affirmative disclaimer of ribs not extending to the rear edge of the tube.
For the foregoing reasons, we construe the claim term "rear end" to mean "a reference point defined by the rear edge of the tube."

2. Rear Mountable

a. The Parties' Constructions

LPL asserts that the term "rear mountable" means "capable of being substantially supported with the rear housing via a fastening part(s) located on the rear surface of the first frame and positioned on or inside the border of the flat display panel." LPL Opening Brief (D.I. 370) at 8 (emphasis supplied).

Defendants argue "rear mountable" excludes front and side mounting and that the term is not limited to a specific location of the fastening parts with respect to the flat display panel.

b. The Special Master's Construction

As discussed above, by amending the claims to include "rear mountable" and distinguishing the prior-art mountings both in the common specification and the prosecution history, front and side mounting were expressly disclaimed. Thus, front and side mounting are excluded from "rear mountable."

LPL urges that "rear mountable" means the fastening elements cannot be just anywhere on the rear surface of the device, but must be "on or inside the border of the flat display panel." LPL identifies Figures 4C and 10 of the patents-in-suit as supporting that construction.

Neither of the referenced figures -- indeed none of the figures -- depict fastening elements that are located "on or inside the border of the flat display panel." Moreover, in discussing Figures 4C and 10, the patents are completely silent about the location of the fastening elements relative to the flat display panel. '641 patent, 4:12-41, 6:16-52. LPL relies on the broken line in Figure 4C (above) as proof that the fastening elements 15 must be positioned on or inside the border of the flat display panel 12. It is the Special Master's view that the broken line simply indicates that the displayed components are sandwiched together as a single device, as the patents state, and not that the fastening elements are on or inside the border of the flat panel display. Additionally, although the broken line appears to align with one corner of the panel 12, that apparent alignment does not necessarily mean the fastening elements 15 fall on or inside the border of the panel 12. In fact, at least two of the other three corners of the panel 12 do not align with the corners of the frame 14g having the fastening elements 15:

[SEE FIGURE IN ORIGINAL]

Figure 4C is therefore, at best, unclear regarding the location of the panel 12 relative to the frame 14g and its fasteners 15. Finally, nothing in the language of the patents helps to explain Figure 4C in this regard.

Figure 10 utterly fails to provide further clarity. Notably, Figure 10 identifies no fastening elements, such as by reference numeral:

The common specification, likewise, is silent as to any fastening elements with respect to Figure 10. LPL's reliance on what
is, at best, an ambiguous artifact in Figure 10 does not further their argument. Indeed, one skilled in the art considering Figure 10 and its accompanying description in the common specification could only speculate as to the location of the fasteners with respect to the panel.

Given the context of the invention and that the phrase "on or inside the border of the flat display panel" is not found in the intrinsic evidence, the Special Master concludes that one skilled in the art would understand "rear mountable" excludes front and side mounting, rather than defining the location of the fasteners with respect to the border of the panel. 15

--- Footnotes ---

15 The term "rear mountable" connotes the capability of being rear mounted, and therefore the term "rear mounted" does not need to be construed. Similarly, the phrase "flat display panel that is rear mounted" does not require construction.

--- End Footnotes ---

Accordingly, the Special Master's construction is as follows:

<table>
<thead>
<tr>
<th>CLAIM TERM</th>
<th>SPECIAL MASTER CONSTRUCTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>rear mountable</td>
<td>A flat-panel display device that is capable of being mounted to a housing solely from the back of the first frame and that has no front or side mounting fastening elements</td>
</tr>
</tbody>
</table>

A review of the specification compels the conclusion that the disputed terms "rearward area" and "end area," also used interchangeably throughout the '445 patent claims and specification, are correctly defined as "the area facing away from the brake disk." See '445 Patent Specification, Column 1, lines 54-57 (providing that "a direct transmission of the braking forces into the caliper is permitted since the rearward area, which faces away from the brake disk, of the caliper receiving the application unit is essentially closed...") (emphasis added). The specification also teaches that the last disputed term, "application unit," is properly defined as "a mechanical mechanism that multiplies an input force using a lever to provide a greater output force that presses the brake shoes against the brake disk."

---

5. "receptacle" or "receptacles"

<table>
<thead>
<tr>
<th>Plaintiff's Construction</th>
<th>Defendants' Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>A physical structure that can receive, contain, or hold something</td>
<td>Formations in the raised periphery surrounding the game board, not on the playing surface, used for mounting batteries, wires, and/or laser devices, and not used for holding playing pieces</td>
</tr>
</tbody>
</table>

a. Innoventions' Proposed Construction

Innovention agrees with the defendants that the ordinary-meaning of "receptacle" connotes that it is a structure that receives or holds something. However, Innovention asserts that, even though "space" and "receptacle" are distinct concepts, the '242 patent does not preclude that a "receptacle" could be located at a "space" on the game board. In support of this assertion, Innovention points to claim 26, which teaches that "each space provides a recess that is receptive of a game piece."

Innovention contends that "[t]here is strong linguistic and structural relationship between a 'receptacle' and a 'recess that is receptive' of some other item (such as a 'game piece'), which still exists if the 'recess' (i.e., a 'receptacle') happens to be
located at a 'space' on the 'game board.'" 13

13 Thus, Innovention contends that, because the claims contemplate that a space may be recessed, that a recessed space may receive or be receptive of a game piece, and that a game piece may include electronic components, it follows that a "recess" existing at a "space" must be capable of "holding electronic components."

b. Defendants' Proposed Construction

The defendants assert that even Innovention's proposed constructions of "space" and "receptacle" do not strongly support the view that a "space" could be a "receptacle", unless the Court adopts the strained and unnatural reading that requires a space on the game board to "receive, hold, or contain" the game piece, which (say defendants) is an interpretation that is contrary to the specification. The defendants also point out that the terms "spaces" and "receptacle" are used in close proximity, which creates an inference that they have different meanings.

c. The Court's Construction

Claim 15 teaches that the invention is:

A game comprising:

a game board having a playing surface and one or more receptacles for holding electronic components.

Based on the scarce claim language (and clarified by the specification, and the drawings that illustrate the point), it is clear that the patentee differentiates between "spaces" and "receptacle" (while "receptacle" and "cavity" are similar in their ordinary meanings and as claimed). Accordingly, as it did with "cavity", the Court adopts a slightly modified version of the defendants' proposed construction of "receptacles": "Formations in the raised periphery surrounding the playing surface that contain batteries and wires."

3. "Received"

The parties dispute the meaning of the term "received" as used to refer to a fastener being received in a recess. 3 Part of the dispute involves whether a recess must be pre-formed to "receive" a fastener, as discussed above. In addition, Defendants claim that the term "received" means that the fastener's head resides "below the inward surface of the panel." Plaintiff argues that there is no such limitation. The Court agrees. The claims at issue recite that the "head portion" of the fastener is "received" in the recess. (See, e.g., claim 16 of '493 Patent.) There is no language in the claims suggesting that the fastener head must reside below the inward surface of the liner panel. Furthermore, the specification states that the fastener heads "may extend out from [the] surface [of the liner panel] but could also be countersunk into recesses . . . so that the heads are at or below the panel surfaces." (493 Patent, col. 8:33-37.) Accordingly, the Court finds that the limitation Defendants propose is not supported by the claims or the specification, and the Court concludes that the term "received" is straightforward and does not call for any construction.

3 The parties dispute the meaning of the word "received" as used in the following related phrases: "received in said recess" (claims 16, 17, and 23 of '493 Patent) and "is received in said recess and abuts said facer" (claim 17 of '493 Patent).

3223

A. "Completely Received"

The claims of all the patents require that the projections of the insert means be "respectively received in said recesses of said inner hose . . . whereby the interior of said tubular hose is substantially sealed to the interior of said coupling." 2 '752 patent, col. 10, lines 34-38. The district court construed the claim language "respectively received in" to require that the projections be "completely received" in the recesses of the inner hose, "resulting in an alignment of the projections with the recesses." Order at 4. As TCI conceded at oral argument, the claim language does not explicitly require that the projections be completely received in the recesses. TCI nevertheless argues that the specification of the patents teaches that the invention requires complete reception. We disagree. We find the teaching of the specification at most ambiguous regarding the degree of reception required to form a seal. The specification states only that the projections of the insert means are initially "partially received" in the recesses of the inner hose, "752 patent, col. 7, lines 37-38, and then, when the inner sleeve is radially expanded, that the projections "more firmly move into the recesses" to create the seal. Id. at col. 7, line 66. We cannot conclude from the foregoing that the patentees unambiguously limited the scope of the claimed invention to require complete reception. For us to do so here would be to impermissibly read an unclaimed (and arguably undisclosed) limitation into the claims. As we said in Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186, 48 U.S.P.Q.2D (BNA) 1001, 1005 (Fed. Cir. 1998), "while . . . claims are to be interpreted in light of the specification and with a view to ascertaining the invention, it does not follow that limitations from the specification may be read into the claims," quoting Sjolund v. Musland, 847 F.2d 1573, 1581, 6 U.S.P.Q.2D (BNA) 2020, 2027 (Fed. Cir. 1988). Here, the claims only require that the insert means projections be received in the hose recesses such that a substantial fluid seal is formed between the interior of the hose and the interior of the coupling. Complete reception is neither explicitly nor implicitly required.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

2 Because the '822 patent claims a "coupling for a hose construction," '822 patent, col. 10, line 16, rather than a "hose construction," its analogous claim language requires that the "interior of said tubular hose is adapted to be substantially sealed to the interior of said coupling." Id. at col. 10, lines 36-38 (emphasis added).

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Similarly, alignment of the projections and recesses is not required by the claim language. Nor does the specification limit the claim coverage to projections aligned with recesses. Indeed, the specification describes an embodiment of the invention in which the spacing between adjacent insert means projections differs from the spacing between adjacent inner hose recesses, see '752 patent, col. 8, lines 54-57 and col. 5, lines 40-42, such that only one projection may be exactly aligned with a recess. Thus, alignment is not required by the claims.

GO BACK

3224

3. "receiving an indication of a speed" (claim 1)

Flow proposes that this phrase should be construed as: "To acquire a value related to speed, such as supplied by a computer system." Omax agrees generally, but argues that "related to speed" changes the meaning of the claim term and, moreover, is equally ambiguous. Omax proposes instead that the term "speed" be specifically construed as "distance per unit time."

Omax's expert endorses this approach, but fails to note that in the claim term, the word "speed" is preceded by the words "an indication of." These words support the use of the more general construction proposed by Flow. Their inclusion would signal to someone of ordinary skill in the art that the value acquired by the computer system might not be an actual velocity, in distance per time, but something more generally related to speed. Omax is correct, however, that "related to" opens up the realm of possibilities too far, at the risk of the inclusion of every aspect of the cutting process, such as the "nozzle orifice diameter." Instead of introducing a new term to the claim construction, the Court finds the term "indicating" to be adequately understandable by a lay jury. See Phillips, 415 F.3d at 1314. As such, the Court will construe the claim term as:
"To acquire a value indicating speed, such as supplied by a computer system."

3225

(3) insert-receiving area

Plaintiff proposes that this term be construed to mean "a region of the eccentric weight portion that is capable of receiving an insert." Joint Disputed Claim Terms Chart, Dkt. # 29-2, p. 7. Defendants' proposed construction is "the area in the portion of the counterweight that projects from the gear portion that is shaped to receive an insert." Id.

The dispute regarding construction of this term is generated by a dispute over the location of the eccentric gear portion and the cylindrical gear portion. Defendant contends that the insert-receiving area is in the portion of the counterweight that extends forward from the front face of the cylindrical gear portion. Defendants' Opening Claims Construction Brief, Dkt. # 31, p. 21. Defendants' argument is based on their contention that the eccentric gear portion and the cylindrical portion are separate and discrete areas of the counterweight. Plaintiff, on the other hand, directs the Court's attention to the preferred embodiment described in the specifications, and the accompanying drawings which show the bores which constitute the inset-receiving area as extending fully through the cylindrical gear portion. '964 patent, Fig. 3B and col 5, lines 61-65.

This dispute has been resolved by the Court's construction of the term "eccentric weight portion," which declined to adopt defendants' proposal to assign a specific location to the eccentric gear portion, as well as the construction of the term "integral" as meaning a one-piece unit. Considering the term as it is used in the claims and the specifications, together with the Court's construction of the other terms, the Court declines to adopt defendants' proposed construction which would limit the location of the inset-receiving area. Plaintiff's proposed construction, however, is vague in that it does not clarify that the "inset-receiving area" is a bore through the counterweight. The Court therefore adopts the following construction for this term: "a bore formed in the eccentric weight portion of the counterweight that is capable of receiving an insert."

3226

3. pin-receiving plate (claims 1, 17); pin-receiving plate secured to said sleeve (claims 1, 17)

Fargo pin-receiving plate: a surface that receives pins
pin-receiving plate secured to said sleeve: a surface that receives pins and is attached to or formed integral with the sleeve

Iris pin-receiving plate: a flat thin piece of material for receiving the pins
pin-receiving plate secured to said sleeve: the two parts are attached in some fashion to each other while still retaining their identity

Iris objects to Fargo's use of the word "surface," because that term indicates that the plate exists in only two dimensions. Fargo argues that because the plate may be formed integral with the sleeve, Iris's proposed definition is too constricting. The Court agrees with Iris that the word "surface" is at odds with the ordinary meaning of the word "plate," and also recognizes the validity of Fargo's argument that the claims permit the plate to be formed integral with the sleeve. Accordingly, the Court will adopt Iris's definition of "pin-receiving plate" and the following definition of "pin-receiving plate secured to said sleeve." "A plate that receives pins and is attached to or formed integral with the sleeve."

3227

2. "Receiving Portion"
Plaintiff's proposed construction of the term "receiving portion" is "a part of the structural connection device that holds or supports an end portion of an elongate member." (Pl.'s Br. at 8.) Defendant's proposed construction is "that portion of the bracket ('structural interconnection device') that receives the end portion of the vertical post ('elongate member') as construed above. The 'receiving portion' includes a bore sized to receive the 'end of the elongate member,' as construed above, and includes walls of sufficient thickness around the bore to have threaded openings for grub screws forming the 'locking means' as construed below." (Def.'s Br. at 13.)

The heart of the parties' dispute over the term "receiving portion" is whether the '230 patent requires that the end portion of the elongate member be inserted into the receiving portion itself, or whether the receiving portion must merely support or hold the end portion of the elongate member. There appears to be no disagreement between the parties that the receiving portion must support the end portion of the elongate member, and the claims consistently refer to the end of the elongate member being "secured to" the receiving portion. (230 patent, col. 4, l. 48.) The question raised by the parties' competing approaches to construing the term is thus whether, in addition to holding/supporting the end portion of the elongate member, the receiving portion must, as Defendant argues, be able to take in or contain (as a receptacle) the end portion of the elongate member. The ordinary meaning of the word "receive" can be read to support either construction. See Webster's New Int'l Dictionary 1894 (3d ed. 1993) (defining "receive" alternatively as "to take in: act as a receptacle or container for," or "to support the weight or pressure of: bear"). 10

10 Reliance on the dictionary definition for the construction of these terms is appropriate here, where there is no suggestion from the remainder of the intrinsic evidence that the words were used "idiosyncratically," Phillips, 415 F.3d at 1314, and where "the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents." Vitronics, 90 F.3d at 1584 n.6.

Plaintiff argues that the only bases for Defendant's assertions that the receiving portion must be able to take in or contain the end portion of the elongate member are the descriptions of preferred embodiments of the structural interconnection device in the specification and the deposition testimony of the inventors as to their intentions in utilizing the term. Plaintiff is correct that neither of these sources is sufficient, in itself, to confine the scope of the claims. While it is true that the preferred embodiment of the receiving portion set forth in the specification describes "a tubular shaped formation into which the end portion of the elongate member may be received." (230 patent, col. 2, l. 1-3), it is well-settled that the "general rule . . . is that the claims of a patent are not limited to the preferred embodiment" of the invention described in the specification. Karlin Tech. Inc., 177 F.3d at 973. Additionally, Defendant's reliance upon the inventors' deposition testimony to derive their intent in using particular claim terms is misplaced, because the "subjective intent of the inventor when he used a particular term is . . . irrelevant to the issue of claim construction." Howmedica, 540 F.3d at 1346-47 (internal quotations and citations omitted). 11 If the specification's preferred embodiment and the inventors' testimony were the only sources of support for Defendant's proposed construction of the term "receiving portion," then such a construction would be unsupportable.

11 While inventor testimony "may be pertinent as a form of expert testimony, for example, as to understanding the established meaning of particular terms in the relevant art," Howmedica, 540 F.3d at 1347 n.5, there is no suggestion from the cited testimony that the inventors were speaking about such "established meaning . . . in the relevant art," as opposed to their own subjective intent in using the terms. Id. In the absence of a stronger indication that the inventors were addressing the established meaning of these terms in the relevant art, the Court will heed the caution prescribed by the Court of Appeals for the Federal Circuit, and will not rely upon the inventors' testimony in construing the disputed claim terms.

As the Court now explains, however, the requirement that the receiving portion be able to take in or contain the end portion of the elongate member finds support in "the words of the claims themselves," Phillips, 415 F.3d at 1312, and the specification's "written description of the invention." Vitronics, 90 F.3d at 1582. Specifically, the use of the word "receive"
in the unasserted claims of the '230 patent, as well as in the specification, leaves little doubt that the term, as it is used in the patent as a whole, encompasses taking in as well as holding/supporting. See Phillips, 415 F.3d at 1314 ("Because claim terms are normally used consistently throughout the patent, the usage of a term in one claim can often illuminate the meaning of the same term in other claims"); Cf. Chamberlain Group, Inc. v. Lear Corp., 516 F.3d 1331, 1337 (Fed. Cir. 2008) ("the 544 patent's term 'trinary code' is relevant to construing 'binary code' because the term 'code' presumptively should carry the same meaning throughout the patent") (citation omitted). The '230 patent repeatedly refers to an object being received into the receiving portion. In claim 3, for example, which is not asserted in this lawsuit, see Phillips, 415 F.3d at 1314 ("[o]ther claims of the patent in question, both asserted and unasserted, can . . . be valuable sources of enlightenment as to the meaning of a claim term"); the patent describes a limitation in which the "receiving portion comprises a tubular shaped formation into which the end portion of an elongate portion may be received." (230 patent, col. 5, l. 2-4) (emphasis added). Likewise, in the specification's description of the locking means, the patent states that the locking means comprises "at least one screw threaded aperture formed in a wall portion of the receiving portion and into which a grub screw or like member may be received and rotated to bear at an inner end against the surface of an end portion of an elongate member." (Id. at col. 2, l. 9-13) (emphasis added).

The word "received" in this context necessarily designates the act of taking in an inserted object through an opening. That is, if the '230 patent's use of the term "receiving" were intended solely to signify the act of supporting, then in describing the act of placing screws or elongate members into holes in the receiving portion, the patent could easily have used the word "inserted" - i.e., "an aperture into which a grub screw or like member may be inserted." In view of the presumption that "claim terms are normally used consistently throughout the patent," Phillips, 415 F.3d at 1314, the '230 patent's repeated use of the word "receive" to signify the act of taking in an inserted item provides strong support for a construction of the term "receiving portion" which requires that the portion be able to take in or contain the end portion of the elongate member. Because the term "receive" "presumptively should carry the same meaning throughout the patent," Chamberlain, 516 F.3d at 1337, the use of the term to signify taking in an inserted object in claim 3 and in the specification indicates that the term "receiving portion" must be construed to permit the portion to take in or contain the end portion of the elongate member through an opening in the receiving portion.

Plaintiff's argument to the contrary is not persuasive. Plaintiff draws the Court's attention to claim 3, which is dependent upon claim 1, and which, as noted above, asserts an additional limitation in which "the receiving portion comprises a tubular shaped formation into which the end portion of an elongate portion may be received." (230 patent, col. 5, l. 2-4.) Plaintiff, relying on the principle of claim differentiation, 12 suggests that claim 3 would be rendered redundant if the receiving portion were, by definition, required to take in or contain the end portion of the elongate member.

12 See Phillips, 415 F.3d at 1314-15 ("the presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim").

Plaintiff's reliance on the doctrine of claim differentiation is misplaced. The limitation added by claim 3 is that the opening into which the elongate member is received is "a tubular shaped formation." (230 patent, col. 5, l. 2-3.) This limitation is to be contrasted with other variations in the shape of the space in the receiving portion into which the elongate member is received, which is described in separate claims, as summarized in the specification:

The receiving portion may comprise a tubular shaped formation into which the end portion of an elongate member may be received. Said receiving portion may comprise a bore of circular or, for example square cross-section. The bore may be of uniform dimension along its length, or it may be formed with axially spaced ribs that extend inwards and provide bearing surface regions for contact by the end portion of the elongate member.

(Id. at col. 2, l. 1-8.) The limitation added by claim 3 - the specified "tubular shaped formation" - is not rendered redundant by a construction that requires the receiving portion to take in or contain the end portion of the elongate member; claim 3 adds specificity to the "formation" into which the elongate member is inserted (i.e., that it is "tubular shaped").

While the Court will therefore construe the term "receiving portion" to require a structure which can take in or contain the
end portion of the elongate member, Plaintiff is correct that Defendant's proposed construction improperly incorporates criteria for the locking means into the definition of the receiving portion. Claim 1 explains that the interconnection device includes "a receiving portion comprising [a] locking means . . ." ('230 patent, col. 4, l. 41-42.) "In the patent claim context the term 'comprising' is well understood to mean 'including but not limited to.'” CIAS, Inc. v. Alliance Gaming Corp., 504 F.3d 1356, 1360 (Fed. Cir. 2007) (citation omitted). While the receiving portion in this patent thus includes (but is not limited to) a locking means, if the definition of "receiving portion" inherently encompassed a locking means, then the "comprising locking means" language in claim 1 would be redundant. See Phillips, 415 F.3d at 1314 ("the claim in this case refers to 'steel baffles,' which strongly implies that the term 'baffles' does not inherently mean objects made of steel").

Based on the above considerations, the Court will adopt the following construction of the term "receiving portion": "the part of the structural interconnection device which takes in the inserted end portion of an elongate member, and which holds or supports the end portion of the elongate member."

GO BACK

3228

a. "Receiving floating pulley units"

Claim 26 requires first and second floating pulley units, and "a first cable receiving said floating pulley units." According to Vectra, the meaning of the term "a first cable receiving said floating pulley units" is functionally defined in the remainder of the claim as meaning that the first cable and the floating pulley units are associated such that "a force exerted on either one of said floating pulley units or on said first exercise unit responsively tensions said first cable and is resisted by said load."

'572 patent 12:3-6. Vectra contends that "receiving" means "associated" and does not, as defendants contend, require the first cable to have direct physical contact with the two floating pulley units. According to defendants, "first cable receiving said pulley units" requires that the cable pass over, under, around or part way around at least one pulley of each of the pulley units.

Once again, defendants' strained interpretation -- in this instance, of the term "receiving" -- is unsupported by the language in the claim. Elsewhere in claim 26, more restrictive terms are used to characterize the relationship between cables and pulleys. For example, claim 26 recites "a second cable carried by said first floating pulley unit" and also "a third cable carried by said second floating pulley unit." '572 patent 12:7-10. Clearly, then, more restrictive terms are used when intended to express a particular physical relationship between a cable and a pulley. Cf., e.g., '572 patent at 7:10, 7:68-8:1, 12:54:61 (using the terms "passing over, "passing under," "passing party way around" or "looping party-way around" to express the relationship between the cable and the pulley).

Thus, the term "first cable receiving said floating pulley units" does not require that both floating pulley units be in direct physical contact with the first cable. Instead, if a force exerted on either one of the floating pulley units responsively tensions the first cable and is resisted by the load, then the floating pulley units are "received" by the cable as recited in claim 26.

GO BACK

3230
2. "Recess" or "Area Depressed"

The parties dispute the meaning of the terms "area depressed" and "recess," which refer to an area of the liner panel at or around the head of a fastener that allows the fastener which attaches the liner panel to the vertical post to be countersunk so that it is flush with the inner surface of the trailer. The parties agree that a "recess" or "area depressed" is an indentation, but they dispute whether the "recess" or "area depressed" is formed before the facer and backer are fastened to the vertical post. Plaintiff contends that the claims simply require a "recess" or "area depressed" to be present, regardless of when and how it was created, while Defendants argue that a "recess" or "area depressed" must be pre-formed.

Footnotes

2 The specific disputed terms and phrases are: "area depressed" (claims 16, 17, and 25 of '493 Patent); "deflects into said area [depressed]" (claims 16, 17, and 25 of '493 Patent); "define a recess" (claims 16, 17, and 23 of '493 Patent); "define said recess" (claim 25 of '493 Patent); "backer defines an area depressed from said inward side of said backer" (claim 16 of '493 Patent); "facer deflects into said area so that said facer and said backer define a recess" (claim 16 of '493 Patent); "defines an area depressed from said inward side of said backer" (claim 17 of '493 Patent); "define a recess at said inner surface" (claim 17 of '493 Patent); "define a recess" (claim 24 of '493 Patent); "depressed from said inward side of said backer" (claim 25 of '493 Patent); "received in said recess" (claims 16, 17, and 23 of '493 Patent); and "is received in said recess and abuts said facer" (claim 17 of '493 Patent).

End Footnotes

In the claims, the facer and backer "define a recess" and the head of the fastener "is received" in the recess. (Claims 16, 17, and 23 of '493 Patent.) Defendants argue that if the recess were not to be pre-formed, then the fastener-and not the backer and facer-would define the recess in the backer and facer. Defendants also assert that a recess cannot "receive" the head of the fastener if it were formed by the head of the fastener; rather, the recess must exist before the fastener is placed there. Plaintiff contends, however, that the recess can be formed by forcing the fastener head at the time the liner panel is attached to the post. Plaintiff further argues that the method restrictions proposed by Defendants are inappropriate.

Where the patent claims a novel product, methods of manufacture cited in the patent do not limit the product claims. See Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361, 1375 (Fed. Cir. 2007). "However, process steps can be treated as part of a product claim if the patentee has made clear that the process steps are an essential part of the claimed invention." Id. Here, the claims do not specify that the recesses must be pre-formed. The specification states that the recesses may be formed by a variety of methods, including "crushing, cutting, milling, drilling or sanding" the backer or backer and facer together so that the liner's thickness at the recess is reduced. ('493 Patent, col. 8:37-46.) The Court agrees with Plaintiff that at least one proposed method-crushing-does not require the recess or area depressed to be pre-formed; the fastener itself could create a recess during the fastening process. The Court further concludes that the patent does not require a specific method, essential to the claimed invention, of creating the recess. Accordingly, the Court construes the terms "recess" and "area depressed" to mean "indentation."

Unilin asserts that Alloc is proposing a construction that would limit the scope of the term "recess" to only that part of the
recess that "performs a locking function" and has incorrectly transposed the structural requirements of the "recess" and the "locking element." (Unilin Reply Claim Constr. Br. ("Unilin Reply Br." ) 7.) Alloc counters that Unilin seems to suggest that the italicized phrase in claim 10 of the '836 patent modifies the term "lip" rather than the term "recess"; that is, "wherein said locking elements comprise a recess located in a lower lip extending at least to a side edge and defining at least in part a lower side of said groove and a protrusion provided at a lower side of said tongue." (Alloc Reply Mem. 7-8.) But, Alloc states that it is clear from the claim language that the italicized language describes the recess, not the lip. Id.

The parties' arguments focus, in part, on the language of claim 10 of the '836 patent which states "wherein said locking elements comprise a recess located in a lower lip extending at least to a side edge and defining at least in part a lower side of said groove." (836 patent, 17:42-44)(emphasis added.) Claims containing the transitional phrase "comprising" or "comprises" create an open-ended claim. 10 See Scanner Techs. Corp. v. ICOS Vision Systems Corp., N. V., 365 F.3d 1299, 1304 (Fed. Cir. 2004)(construction of "comprises an illumination apparatus"). Claim 10 indicates that a "recess" is part of the locking element. Thus, there is no need to include reference to the locking element in the definition of recess. See Scanner Techs. Corp. v. ICOS Vision Systems Corp., N.V., 365 F.3d 1299, 1304 (Fed. Cir. 2004)(construction of "comprises an illumination apparatus"). Claim 10 indicates that a "recess" is part of the locking element. Thus, there is no need to include reference to the locking element in the definition of recess.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

10 An example of an open-ended claim is found in Gillette Co. v. Energizer Holdings, Inc., 405 F.3d 1367, 1371 (Fed. Cir. 2005)(holding that a claim directed to a razor "comprising . . . a group of first, second, and third blades" did not exclude a razor having four blades, noting that the "word 'comprising' transitioning from the preamble to the body signals that the entire claim is presumptively open-ended. . . . The addition of elements not recited in the claim cannot defeat infringement").

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The term "recess" is used in claims of the '486 patent and '836 patent claims other than claim 10. Claim terms are normally used consistently throughout a patent. See Phillips, 415 F.3d at 1314. As with claim 10, the other words of the specific claims give further context to the term "recess." See id.

The specification states: "As represented in Figs. 5 to 7, the locking element 33 preferably consists of a protrusion of the lower side 35 of the tongue 31 which can be located in a recess 36 in a lower lip 43 extending distally from the lower wall 37 of the groove. The locking element 34 is formed by the upward directed part or protrusion which defines the distally outer end of the recess 36." ('486 patent, 6:54-56.) The specification shows that as long as a portion of an indentation or hollow is part of the locking element or performs a locking function, then the entire indentation or hollow is within the scope of the claim term "recess."

Unilin's suggested definition of "recess" is consistent with its ordinary definition. (Jt. App. Ex. 6 (American Heritage Dictionary (4th ed. 2000)) 1459.) Moreover, it is in agreement with the use of "recess" throughout the patent claims. Therefore, the Court interprets "recess" as meaning "an indentation or small hollow." Therefore, the Court interprets "recess" as meaning "an indentation or small hollow."

3232

E. "THE HANDLE PORTION HAVING A RECESS"

Another term in claim 1 that is at issue is "the handle portion having a recess," although the real dispute with this claim term is only with respect to the term "recess." Plaintiff argues that "the handle portion having a recess" should be construed to mean "the handle portion having an indentation." Plaintiff asserts that its proposed construction is based on the ordinary meaning of the claim term, in conjunction with the drawings included in the patent specification. Defendants argue that the claim term should be construed to mean "the handle portion having a space." They also argue that their proposed construction is based on the ordinary meaning of the claim term, and that it is consistent with inventor testimony.

Both Parties have given the term "recess" what they assert is its "ordinary and customary meaning." Phillips, 415 F.3d at
1312 (internal quotations omitted). The Court agrees that this is a term that has a readily apparent meaning and, therefore, that further examination of intrinsic and extrinsic evidence is not necessary. While either definition would be appropriate, the Court has concluded that Plaintiff's proposed construction is more helpful than Defendants' proposal. Accordingly, the Court will construe "the handle portion having a recess" to mean "the handle portion having an indentation."

B. "Locking Recess"

"Locking recess" is the next disputed term in claim 1. This term appears in the first element of claim 1 as follows: "said tie wings having a locking recess in their labial faces." See '715 patent, Col. 16, ll. 57-58 (emphasis added). Plaintiff proposes that the term be construed as follows: "an indentation or small hollow that permits engagement by the locking body." Pl.'s Ex. 3 at 5. Defendants' proposed construction of this term is:

A definite and pronounced structure, consisting of an indentation or depression whose purpose is to complete locking the structure in place in a corresponding structure when in the closed position. The indentation that comprises the locking recess must be a structure separate and independent from the archwire slot.

Id. at 6.

Claim Construction of "Locking Recess"

The term "locking recess" is discussed in the prosecution history and the prior art cited by the Patent Examiner during prosecution of the patent. The Examiner identified U.S. Patent No. 4,492,573 to Hanson (Pl.'s Ex. 7) as including locking recesses in the labial faces of the tie wings and rejected certain proposed prosecution claims based on Hanson. See Pl.'s Ex. 8 at 3, Office Action dated Feb. 2, 1994. The features of the Hanson reference identified by the Patent Examiner are two small indentations in the labial face of the bracket (items 60 and 64) in Figs. 1 and 2 of Hanson. Id. Figures 1 and 2 of the Hanson patent show how the free end (item 58) of the retainer member (item 48) comes together with and fits into (engages) one of the locking recesses (item 60) when in closed position. See Ex. 7, Col. 3, l. 64 - Col. 4, l. 57.

OrthoArm's proposed construction is also supported by the common dictionary definition of the word "recess," which is "an indentation or small hollow" or a "receding part or space." See Pl.'s Ex. 4 at 1033, American Heritage Dictionary; Pl.'s Ex. 5 at 1102, Random House College Dictionary. Persons of ordinary skill in the art understand the term "locking recess" to mean a recess -- i.e., an indentation or small hollow -- that permits engagement by the locking body. See Voudouris Decl. at PP 13-14; Jerrold Decl. at PP 17-20.

Defendants ask the Court to construe the term "locking recess" as "a definite and pronounced structure, consisting of an indentation or depression whose purpose is to complete locking the structure in place in a corresponding structure when in the closed position. The indentation that comprises the locking recess must be a structure separate and independent from the archwire slot." See Pl.'s Ex. 3 at 7. The Court cannot accept this proposal.

As defined in the dictionary cited by Defendants, a "recess" is "any small depression or indentation." See id. at 7 (emphasis added). Yet, Defendants propose that the term be defined (contrary to its own dictionary definition) to require a "definite and pronounced" depression or indentation, rather than "any" depression or indentation. Defendants also attempt to add the limitation that the locking recess is a "structure separate and independent from the archwire slot." This creates a redundancy in the claim language because it is clear from the claim itself that locking recess and slot are different features. The additional limitations inserted by Defendants unnecessarily complicate the plain and ordinary meaning of the term "locking recess."

As support for this construction, at page 19 of their Memorandum, Defendants refer to one specific example of a "locking recess" disclosed in the specification, wherein a "combination of opposing notches 44 on each set of occlusal and gingival tie wings defines a locking recess 48, as best illustrated in Fig. 7. Each notch 44 on each of the four tie wings includes an upstanding wall 50 and a shoulder 52." Col. 5, ll. 31-34. This exemplar structure, however, is specifically claimed in dependent claim 2, which provides: "The edgewise orthodontic bracket defined in claim 1, wherein said locking recess
consists of opposing notches in the occlusal and gingival tie wings, each said notch having an upstanding portion and a shoulder portion." Col. 17, ll. 9-12. Construing claim 1 as limited to the structure described in connection with this embodiment would violate the claim differentiation doctrine.

Footnotes

1 Under the claim differentiation doctrine, each claim in a patent is presumptively different in scope. See SunRace, 336 F.3d at 1302-03. "This presumption is especially strong where there is a dispute over whether a limitation found in a dependent claim should be read into an independent claim, and that limitation is the only meaningful difference between the two claims." Ecolab, Inc. v. Paraclipse, Inc., 285 F.3d 1362, 1375 (Fed. Cir. 2002) (internal quotation omitted).

Defendants' proposal does not comport with the plain and ordinary meaning of the disputed term, nor does it comply with the principles of claim construction. Defendants' attempt to limit the scope of the claim language to the structures disclosed in the specification is at odds with the case law cited by both Plaintiff and Defendants. In particular, the Court notes that Dayco Products, Inc. v. Total Containment, Inc., 258 F.3d 1317 (Fed. Cir. 2001), cited at pages 5-6 of Defendants' Memo, involved a case where an accused infringer offered claim constructions that were unduly limiting and inconsistent with the plain meaning of the terms and phases of the patent and the prosecution history. The District Court adopted those constructions and granted the accused infringer's motion for summary judgment of noninfringement. Id. at 1324-25. The Federal Circuit reversed that judgment because the District Court's claim constructions "erroneously read an additional limitation into the claim language," and construed the disputed terms "contrary to the plain meaning of the limitation." Id. at 1325. In defense of the District Court's proposed construction, the accused infringer invited the Federal Circuit to "embark on a speculative and convoluted reading of the claim language, the specification, and the prosecution history." Id. at 1324. The Federal Circuit declined to do so. Id. at 1325. This Court must follow the Federal Circuit's lead and decline Defendants' invitation to adopt a construction of the disputed terms and phrases that is unduly limiting and at odds with the plain and ordinary meaning of the claim language, the specification, the prosecution history, and the extrinsic evidence of record.

Accordingly, for all the foregoing reasons, the Court construes the term "locking recess" as "an indentation or small hollow that permits engagement by the locking body."
cutting edge surface.

We are not, however, prepared to give Izumi the broad interpretation that it currently seeks. The specification states that an objective of the disclosed invention is "to provide an electric razor which assures that the shaving debris and other substances do not easily adhere to the cutter blades of the inner cutter." '749 patent, col. 2, ll. 25-28. The invention accomplishes this objective by cutting out the rear portion of the cutting edge surface. Id., col. 2, ll. 40-44. The specification further teaches that inner cutter blades having a recess with a cutout angle \( \theta \) of greater than 90 degrees between the rear side surface of the inner cutter blade surface and the cutting edge surface, as seen in the prior art electric rotary razors, will not prevent shaving debris adhesion. Id., col. 5, ll. 9-13. In disclosing that the cutout angle \( \theta \) must be 90 degrees or less, the specification is not describing an embodiment of the disclosed invention, but rather defining a critical aspect of the invention itself. We therefore construe the claim term "recess," as used in both claims 1 and 3, to be a cutout having an angle \( \theta \) of 90 degrees or less between the rear side surface of the inner cutter blade and the cutting edge surface.

Furthermore, we reject Izumi's attempt to construe the limitation "recess formed below," as used in claim 3, more broadly than the limitation "recess … formed immediately beneath," as used in claim 1. As we construe it, the claim term "recess" has a cutout angle \( \theta \) between the rear side surface of the inner cutter blade and the cutting edge surface. But there can be no cutout angle \( \theta \) if the "recess" is not immediately below the cutting edge surface. Indeed, an intervening section of the inner cutter blade would preclude the existence of an angle between the rear side surface portion of the cutout and the cutting edge surface. Thus, the "recess," as that term is used in claim 3, must be immediately below the cutting edge surface. Moreover, Izumi's proposed construction of "recess formed below" would be contrary to a stated objective of the invention, viz., to minimize the contact pressure between the surfaces of the inner and outer cutter blades by reducing the thickness of the cutting edge surface of the inner cutter blade. Id., col. 2, ll. 19-24. Under Izumi's construction, the cutting edge surface of the inner cutter blade would not necessarily have a reduced thickness.

Next, we address the district court's construction requiring the recess to be "orientated in a horizontal direction, parallel to the cutting edge surface." We agree with Izumi that the patent specification does not support this claim construction. As we have construed them here, the claims require only a recess having a cutout angle \( \theta \) of 90 degrees or less. A semi-cylindrical recess having a cutout angle \( \theta \) of 90 degrees or less would not be "orientated in a horizontal direction, parallel to the cutting edge surface." We agree with Izumi that the patent specification does not support this claim construction. As we have construed them here, the claims require only a recess having a cutout angle \( \theta \) of 90 degrees or less. A semi-cylindrical recess having a cutout angle \( \theta \) of 90 degrees or less would not be "orientated in a horizontal direction, parallel to the cutting edge surface." But would otherwise appear to fall within the scope of the claim term "recess," as we have defined it. Thus, we conclude that the district court erred in requiring the recess to be "orientated in a horizontal direction, parallel to the cutting edge surface."

18. A Recess Located in a Lower Lip Extending to a Side Edge and Defining At Least in Part a Lower Side of Said Groove

The parties disagree on the meaning of "a recess located in a lower lip extending to a side edge and defining at least in part a lower side of said groove" in claim 10 of the '836 patent. Alloc states that "a recess located in a lower lip extending to a side edge and defining at least in part a lower side of said groove" means that "the recess must extend at least to a side edge and must define a part of the lower side of the groove." (Alloc Resp. Mem. 17-18.) Unilin maintains that "a recess located in a lower lip extending to a side edge and defining at least in part a lower side of said groove" means "it is the lower lip that must extend to a side edge and define at least in part a lower side of the groove." (Unilin Reply Br. 7-8.)

Claim 10 of the '836 patent reads:

[W]herein said locking elements comprise a recess located in a lower lip extending at least to a side edge and defining at least in part a lower side of said groove; and a protrusion provided at a lower side of said tongue;

wherein the-[sic]panels at the side edge comprising the groove, of at least one of the side edge of both pairs of the side edges, include an upper lip above the groove, said upper lip defining at least in part an upper side of said groove, and said upper lip terminating at a distal outer end, wherein said lower lip extends distally beyond the distal outer end of the upper lip, and further wherein the recess is located in the lower lip in an area of the lower lip that is located at least partly beyond the distal outer end of the upper lip.
While Alloc suggests that the language in bold type modifies the term "recess," the language "extending at least to a side edge and defining at least in part a lower side of said groove" is more properly read as modifying the more proximate term "lip." Such construction is consistent with the remainder of the claim which recites analogously that the upper lip above the groove "defines at least in part an upper side of said groove." ('836 patent, 17:48-50.) This construction is reinforced by reference to the final phrase of claim 10, which states "and further wherein the recess is located in the lower lip in an area of the lower lip that is located at least partly beyond the distal outer end of the upper lip." ('836 patent 17:52-55.)

Specification figures 22 through 25 of the '836 patent also support the Court's construction of the phrase. Those figures (see infra at 70-71) demonstrate that the lower lip 43 extends at least to a side edge. Therefore, "a recess located in a lower lip extending to a side edge and defining at least in part a lower side of said groove" means "it is the lower lip that must extend to a side edge and define at least in part a lower side of the groove."

4. "recessed underportion"

This claim term appears in the '068 patent in claim 15 (it does not appear in the '726 patent). The portion of claim 15 describing the burner body states:

the lower portion of the burner body having a substantially flat undersurface portion extending away from the spacer generally parallel to the base of the burner pan, the lower portion having a recessed underportion spaced apart from the burner pan's base and recessed from the burner body's flat undersurface portion, the recessed underportion defining a portion of the gas distribution chamber . . . .

(The '068 patent, 12:51-59 (emphasis added)).

Travis proposes that the term be construed to mean "a portion of the underside of the burner body that is recessed." Hearth proposes that it be construed to mean "a channel in the lower portion of the burner body's flat undersurface portion that receives a spacer." As these two proposals reflect, the parties dispute centers on whether "recessed underportion" refers to the gas distribution chamber formed by a hollowed out area on the underside of the burner body (Travis' position), or the channels that are on the perimeter of the gas distribution chamber and that are recessed into the undersurface than the burner body, which the spacers fit into (Hearth's position). Based on the intrinsic evidence, the Court agrees with Travis and construes "recessed underportion" to mean "a portion of the underside of the burner body that is recessed."

The ordinary and plain meaning of this claim term supports the Court's construction. "Recess" is defined as "an indentation or small hollow." (Rossman Decl., Ex. D (The American Heritage Dictionary, 3d ed. 2000)).

The term "recessed underportion" does not appear anywhere in the specification. In some of the figures (see figures 6, 15, and 16), there is an H-shaped hollowed out area on the underside of the burner body. This area is described as an "interior chamber." (See the '068 patent, 4:9-11; 4:39-40; 7:1-3). In other figures (see figures 18 and 20), the burner pan has a perimeter fence near the edges of the burner pan, as well as internal fences dividing the area into various sub-areas. The burner body has "channels," sometimes called "shallow channels" or "fence channels," into which these fences are inserted when the burner body is placed on top of the burner pan. (See Id., 9:19-35; 10:3-28; 10:37-39; 10:48-50). Hearth maintains that "recessed underportion" is only these channels and does not include the H-shaped hollowed-out area. In contrast, Travis maintains that "recessed underportion" can be either the H-shaped hollowed-out area or the channels into which the spacers fit.

While the specification language describing the H-shaped hollowed area in figures 6, 15, and 16 does not use the term recessed underportion to describe it, likewise, the specification language describing the channel into which the spacer or fence fits in figures 18 and 20 does not use the term recessed underportion to describe it. Therefore, it is illogical to argue that, based on the specification language alone, this term can apply to only one but not the other.
The prosecution history does not compel a contrary construction. During prosecution of the '068 patent, Travis added the term "recessed underportion" to claim 15 after the provisional application was rejected as anticipated by prior art, including the Shimek '743 patent. (Ex. 4 at 102). The Shimek '743 patent included a figure representing an "H-shaped area recessed into the ceramic fiber top," which is similar to the burner body in Travis' invention, and which "provides . . . [a] hollow manifold [an area enclosed by the bottom and top to hold the gas-air mixture]." (Ex. K, figure 9, 4:61-64; see also 2:59-61). The remarks accompanying Travis' amended claim 15 stated that:

Shimek '743 does not teach each and every feature of claim 16 [later changed to 15] as amended. . . . Shimek '743 is also silent in connection with a lower portion of a burner body having a substantially flat undersurface portion substantially parallel to the base of the burner pan and having a recessed underportion spaced apart from the burner pan's base and recessed from the burner body's flat undersurface portion to define a portion of a gas distribution chamber.

(Ex. 4 at 98 (emphasis added)). In this remark, Travis did not state that Shimek '743 lacked a recessed underportion; rather, Travis remarked that Shimek lacked the combination of a substantially flat surface with a recessed underportion.

2) "reciprocating"

Plaintiff proposes that "reciprocating" be defined as "to and fro movement." Defendant proposes the definition "back and forth motion in a straight line."

Defendant argues that when "reciprocating" is construed in the context of the entire patent specification, it is limited to purely linear motion. The '166 patent abstract states "an engine counterbalancing system [with] a counterbalance weight that reciprocates in a linear manner in opposition to piston movement." (Emphasis added) Moreover, the written description reads:

An engine balancing system is disclosed in which the counterbalance weight moves in a linear manner in opposition to the reciprocating piston . . . An advantage of this present invention is that the counterbalance weight moves in a linear manner in opposition to the linear motion of the reciprocating piston, for improved balancing.

'166 patent, col. 1, Ins. 43-45 (emphasis added).

Plaintiff contends that its construction best captures the meaning that "one skilled in the art" would attribute to "reciprocating." In support of its broader reading of the term, plaintiff cites Virginia Panel Corp. v. Mac Panel Co., 133 F.3d 860 (Fed. Cir. 1997), in which the court construed the meaning of "reciprocating" in the context of a mechanism for engaging a test adapter and receiver. In that case, the defendant argued that the term "reciprocating" should be limited to linear motion because (1) the "reciprocating" slide plates shown in the preferred embodiments moved only in a line and (2) because the patent's written description referred twice to the motion of the slide plates as linear. Id. at 866. The court held:

Without an express intent to impart a novel meaning to claim terms, an inventor's claim terms take on their ordinary meaning. That ordinary meaning was established at trial; the uncontroverted evidence, including a recognized treatise, indicated that those skilled in the mechanical arts would have understood "reciprocating" to mean motion in which "a point traverses the same path and reverses its motion at the ends of such a path."

Id.

The role of claim construction in infringement analysis is not to limit or to broaden patent claims, but rather to define the
invention that has been patented. Netword, LLC v. Centraal Corp., 242 F.3d 1347, 1352 (Fed. Cir. 2001). Claims are always construed in light of the specifications of which they are a part. Id. However, where a specification does not require a limitation, that limitation should not be read from the specification into the claims. Specialty Composites v. Cabot Corp., 845 F.2d 981 (Fed. Cir. 1988). In this case, the patent specification describes the motion of the counterbalance weight as movement "in a linear manner." The description distinguishes the motion of the 166 counterbalance weight from prior "rotating" counterbalance weights but it does not require that the counterbalance weight move in a perfectly straight line in all possible embodiments. The phrase "in a linear manner" (instead of "in a straight line") leaves room for the possibility of a counterbalance weight that reciprocates along a less than a perfectly straight path.

Moreover, plaintiff argues that the term "reciprocating," cannot be limited to purely linear reciprocation as used in independent claim 1 because if it did dependent claim 12 would be rendered meaningless. (Claim 12 claims "the system of claim 1, wherein said counterbalance weight moves linearly in opposition to piston reciprocation." (Emphasis added)). Under the doctrine of claim differentiation, it is presumed that different claim will have different scopes. E.g., Phillips, 415 F.3d at 1315 ("the presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim"). The presumption is especially strong when the limitation in dispute is the only meaningful difference between an independent and dependent claim and one party is urging that the limitation in the dependent claim should be read into the independent claim, as defendant does here. Sunrace Roots Enterprise Co., Ltd. v. SRAM Corp., 336 F.3d 1298, 1303 (Fed. Cir. 2003).

Defendant suggests that the claims can be distinguished on the ground that claim 12 requires the counterbalance weight to move "in opposition to piston reciprocation," whereas claim 1 requires merely that the counterbalance weight reciprocate "in response to the rotation of the crankshaft." The suggestion is unpersuasive because it depends upon a presumption that the limitations "moves linearly" and "reciprocating" have the same meaning. Such a presumption is unwarranted when the patentee has chosen to use different claim terms, raising the presumption that the terms are intended to reflect differences in the scope of the claims. Forest Labs, Inc. v. Abbott Labs, 239 F.3d 1305, 1310 (Fed. Cir. 2001). Because the plain language of the claim is consistent with the meaning plaintiff proposes and because defendant has not provided evidence sufficient to overcome the presumption in favor of differentiating between the meaning of claim 1 and claim 12, I will construe reciprocating to mean back and forth motion.

2. Means adapted for reciprocating the substrate carrier past the work stations a plurality of times

AVL contends that "reciprocating" means to move back and forth and that because the substrate carrier in the ARx10 rotates in a circle it does not infringe the '095 patent. AVL points to language in the specification that describes coating a substrate by moving it past the processing stations and from there "it is returned in the opposite direction . . . . The forward and reverse transport cycle is repeated until the desired oxide thickness of metal has been built up on the substrate." '095 Patent at col. 17, lines 4-5, 10-12.

OCLI protests that this description is taken from one particular embodiment of the invention and should not be read to limit the claim, nor can the dependent claim describing that embodiment be used to limit the independent claim at issue.

OCLI is quite right that the language AVL relies on is a description of an "in-line transitional system" that is distinguished from the rotary system depicted in the rest of the specification. In the rotary system, the workpiece carrier is cylindrical and moves "rotatably." Claim 25, '095 Patent at col. 24, lines 62-64. The in-line system, in contrast, utilizes a flat workpiece carrier whose movement is linear. Claim 26, '095 Patent at col. 25, lines 1-3. Both the rotary system and the in-line system--described in the specification and disclosed in dependent claims 25 and 26 respectively--are particular embodiments of the system disclosed in claim 24. Such limitations, as they exist in the specification, should not be read into claims. Sjolund v. Musland, 845 F.2d 1573, 1582 (Fed. Cir. 1988). Nor should explicit limitations in one claim be introduced into another. Caterpillar Tractor Co. v. Berco, S.P.A., 714 F.2d 1110, 1116 (Fed. Cir. 1983). Accordingly, as "reciprocating" can mean either moving back and forth or just simply returning, and as the embodiments described in the specification and claims contemplate both linear and rotary workpiece carriers, this court construes the term to be broad enough to include carriers that move in a circular rotation.
Applying these principles, we hold that the claim term "reciprocating member," as used in the asserted patents, encompasses the multi-component, curved structure used by the accused exercise machines. The parties agreed before the district court that "reciprocating" simply means to move back and forth, and we accept that definition on appeal. More important, "member," as defined by common and technical dictionaries, refers to a "structural unit such as a . . . beam or tie, or a combination of these," see McGraw-Hill Dictionary of Scientific and Technical Terms 1237 (5th ed. 1994), or to a "distinct part of a whole," see American Heritage Dictionary 849 (3d ed. 1996). Based on these definitions, we agree with CCS Fitness that the term "member" denotes a beam-like structure that is "a single unit in a larger whole." It is not limited to a straight-bar structure comprising a single component only.

In addition, Life Fitness has not shown that anything in the specification or prosecution history overcomes the "heavy presumption" that "member" carries its ordinary meaning. The specification never requires a certain number of components or certain shape; nor does it limit the "member" in either regard. Contrary to the district court's analysis, moreover, the specifications did not need to include a drawing of a multi-component, curved member for the claimed invention to cover that particular embodiment. The drawings merely illustrated a particular embodiment of the claimed member and the specifications did not clearly assign a unique definition to "member," distinguish "member" based on the prior art, disclaim subject matter or describe a single-component, straight-bar "member" as important to the invention.

Nor does the prosecution history contain any clear statements that would narrow the ordinary meaning of the claimed "member." Indeed, Life Fitness itself characterizes the statements in the prosecution history as posing a mere "inconsistency" with the ordinary meaning of "member," not as assertions that, e.g., clearly disclaimed subject matter. In any event, having reviewed the statements identified by Life Fitness, we see nothing that bears on the shape or the number of components comprised by the term "member." We see only a terse mention of the "angle" that a "foot platform" takes "relative to a reciprocating member" and the members' wheels and attachment to the crankshaft.

Life Fitness also relies on expert testimony, but this testimony does not establish the assertion that "member" lacks clear meaning. First, we can resolve the ordinary meaning of the claimed "member" by resort to the intrinsic evidence and dictionary definitions only. Thus, we do not need to examine expert testimony. Even doing so, however, we do not view this expert testimony as particularly helpful, since the inventor himself, presumably also an artisan of ordinary skill in the art, offered testimony that essentially contradicts the expert's assertion that "member" lacks an ordinary meaning. In other words, the battle between Life Fitness' expert testimony and CCS Fitness' inventor testimony is inconclusive. Unsurprisingly, the district court's infringement analysis did not rely on the testimony of either the expert witness or the inventor in reaching its claims construction conclusions. Neither do we.

Scimed Life Systems does not compel a different conclusion. See 242 F.3d at 1342-44, 58 USPQ2d at 1064-65. In that case, we determined that the claim term "lumen," as used in three patents covering a type of catheter, meant a "coaxial lumen" only. 242 F.3d at 1342, 58 USPQ2d at 1064. The specification distinguished the claimed invention from the prior art based on that art's use of "dual lumens" and pointed out the advantages of coaxial lumens. 242 F.3d at 1343, 58 USPQ2d at 1064. It also described "the present invention" as using a coaxial lumen, and it stated that "all embodiments of the present invention" use coaxial lumens. 242 F.3d at 1343-44, 58 USPQ2d at 1064-65. We therefore determined that a catheter employing coaxial lumens was the invention. 242 F.3d at 1345, 58 USPQ2d at 1066.

Here, on the other hand, nothing in the specifications distinguishes the claimed "member" from prior art based on its shape or number of components. And the specifications do not even imply that "all embodiments" of the claimed exercise machine must use a single-component, straight-bar member or else tout the advantages of using that particular structure. In short, Life Fitness cannot use the intrinsic evidence's silence to narrow the ordinary meaning of an unambiguous claim term. See, e.g., Johnson Worldwide, 175 F.3d at 992, 50 USPQ2d at 1612 ("Mere inferences drawn from the description of an embodiment of the invention cannot serve to limit claim terms."); Kegel, 127 F.3d at 1427, 44 USPQ2d at 1127 ("Without an express intent to impart a novel meaning to a claim term, the term takes on its ordinary meaning."); see also Wang Labs, 197 F.3d at 1384, 53 USPQ2d at 1165-66 (limiting term "frame" to the character-based system in the specification when (among other things) the prosecution history distinguished the claimed invention from prior art based on that system).
In Toro Company, also relied on by Life Fitness, we limited a claim term -- "said cover including means for increasing pressure" -- to the structure shown in the patent's specifications and drawings. 199 F.3d at 1300-01, 53 USPQ2d at 1069. We did so because dictionary definitions of "cover" and "including" did not "shed dispositive light" on the scope of that claim limitation, 199 F.3d at 1300, 53 USPQ2d at 1069, and the specification described the particular structure at issue, a ring physically attached to the cover, as "important to the invention." 199 F.3d at 1301, 53 USPQ2d at 1069. But this precedent does not rescue Life Fitness' argument, for unlike the intrinsic evidence in Toro, nothing in the intrinsic evidence here describes a single-component, straight-bar "member" as important to the invention. See id.; see also Watts, 232 F.3d at 882-83, 56 USPQ2d at 1840-41 (limiting claim term "sealingly connected" to the "misaligned taper angles" disclosed in the specification when the claim term was "not clear on its face" and the prosecution history showed that the patentee had distinguished the claimed invention from prior art based on the "misaligned taper angles"); Ethicon Endo-Surgery, Inc. v. U.S. Surgical Corp., 93 F.3d 1572, 1579, 1581, 40 USPQ2d 1019, 1024, 1026 (Fed. Cir. 1996) (limiting term "pusher assembly" to the structures stated in the claims themselves and shown in the drawings when the claim term itself did not define the makeup of the "assembly" and the specification provided only "minimal guidance" about the term's scope).

Life Fitness' mild attempt to make the claimed "reciprocating member" a means-plus-function clause fares no better. A claim using that format will cover only the corresponding step or structure disclosed in the written description, as well as that step or structure's equivalents. 35 U.S.C. § 112 P 6; Watts, 232 F.3d at 881, 56 USPQ2d at 1838; Personalized Media Communications, LLC v. Int'l Trade Comm'n, 161 F.3d 696, 703, 48 USPQ2d 1880, 1886 (Fed. Cir. 1998). A claim limitation that actually uses the word "means" will invoke a rebuttable presumption that § 112 P 6 applies. Personalized Media Communications, 161 F.3d at 703-04, 48 USPQ2d at 1887. By contrast, a claim term that does not use "means" will trigger the rebuttable presumption that § 112 P 6 does not apply. 161 F.3d at 704, 48 USPQ2d at 1887; Watts, 232 F.3d at 880, 56 USPQ2d at 1838. In this case, the claims at issue do not phrase the "reciprocating member" limitation in means-plus-function language, thereby triggering the rebuttable presumption that § 112 P 6 does not govern.

Still, Life Fitness can rebut this presumption if it demonstrates that the claim term fails to "recite sufficiently definite structure" or else recites a "function without reciting sufficient structure for performing that function." Watts, 232 F.3d at 880, 56 USPQ2d at 1838. To help determine whether a claim term recites sufficient structure, we examine whether it has an understood meaning in the art. 232 F.3d at 880-81, 56 USPQ2d at 1838.

Here, we conclude that Life Fitness cannot rebut the presumption that "reciprocating member" is not restricted by § 112 P 6 and thus covers more than the single-component, straight-bar structures (and their equivalents) shown in the patents' drawings. For one thing, Life Fitness itself has offered nearly no analysis in this regard, i.e., has done nothing to try to overcome the presumption. Moreover, as set forth above, the dictionary definitions of "member" show that an artisan of ordinary skill would understand this term to have an ordinary meaning and to connote beam-like structures. See Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583, 39 USPQ2d 1783, 1786 (Fed. Cir. 1996) ("'Detent' . . . is just such a term. Dictionary definitions make clear that the noun 'detent' denotes a type of device with a generally understood meaning in the mechanical arts, even though the definitions are expressed in functional terms."); Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531, 41 USPQ2d 1001, 1006 (Fed. Cir. 1996) (using dictionary definition of "perforation" to discern whether one of ordinary skill would understand this term to connote structure).

Further, in addition to the structure suggested by these dictionary definitions (e.g., a "structural unit such as a . . . beam or tie, or a combination of these"), the claims themselves describe the "member" as having a "rear support and a front end" with one end of this structure circulating around a crankshaft and the other having wheels so that it can "rollably engage the base portion" of the claimed invention. This suffices for purposes of § 112 P 6 and the presumption thereto, since a term need not connote a precise physical structure in order to avoid the ambit of that provision. E.g., Personalized Media Communications, 161 F.3d at 705, 48 USPQ2d at 1888.

Because the claim term "reciprocating member" encompasses a multi-component, curved structure, and because the parties do not dispute the structure of the accused device, we must reverse the district court's summary judgment determinations of no literal infringement and no infringement by equivalents.

- 3812 -
E. "reciprocating path of travel"

Precor argues that this claim should be construed exactly as the patentee defined it in the patent: "any back and forth path of travel which is repetitively traversed by the end of the foot link and includes a generally linear path of travel as is provided by the flat track 28, 32 of the Figure 1 embodiment as well as curved paths provided by other embodiments shown here in." Col. 3, lines 20-26. Fitness Quest argues for a more straightforward version: "Any back and forth path of travel which is repetitively traversed." Fitness Quest here is in the unusual position of arguing that the longer version might be misinterpreted by the jury as limiting. Precor argues against Fitness Quest's version because it fails to make explicit that the reciprocating path could be straight or curved. Because the Court has included reference to curved or straight paths in the previous claim construction, the longer, more explicit version proposed by Precor is unnecessary. Fitness Quest's shorter, clearer proposed construction will be used.

Contrary to MAC's arguments, the claims of the '005 patent do not indicate that the "slide plates" must move linearly. Rather, the claim phrases "adjacent to the fixed hanger plates" and "spaced profiled cam slots including entrance portions parallel to straight slots" refer only to the stationary position of the slide plates relative to the hanger plates, not to the paths traversed by the slide plates. Also, while the claim phrase "in unison relative to the fixed hanger plates" refers to the slide plates' motion, it does so without specifying whether that motion is linear or along a curved path.

Similarly, the other intrinsic evidence relied on by MAC does not indicate that the claimed "slide plates" must move linearly. The portions of the specification on which MAC relies, col. 3, lines 29-32, and col. 1, lines 44-46, do not even include the word "reciprocating." These passages only state that the dry lube bearings and their pads are useful in reducing friction when and if the slide plates move linearly; they do not require the slide plates to move linearly. MAC's reliance on the absence of a drawing describing the non-linear motion of a slide plate is similarly unsound, for it is well-settled that device claims are not limited to devices which operate precisely as the embodiments described in detail in the patent. See SRI Int'l v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1121, 227 U.S.P.Q. (BNA) 577, 585 (Fed. Cir. 1985). Additionally, we note that MAC does not rely on any language in the prosecution history to support its argument that the "reciprocating" motion of the slide plates must be purely linear.

Thus, the intrinsic evidence does not require that the word "reciprocating" be interpreted differently from its ordinary meaning. See York Prods., Inc. v. Central Tractor Farm & Family Cent., 99 F.3d 1568, 1572, 40 U.S.P.Q.2D (BNA) 1619, 1622 (Fed. Cir. 1996) ("Without an express intent to impart a novel meaning to claim terms, an inventor's claim terms take on their ordinary meaning."). That ordinary meaning was established at trial; the uncontested evidence, including a recognized treatise, indicated that those skilled in the mechanical arts would have understood "reciprocating" to mean motion in which "a point traverses the same path and reverses its motion at the ends of such a path." Accordingly, because neither the '005 patent nor its prosecution history uses or implies a special definition for "reciprocating," the language "reciprocating slide plates" is not limited to plates that exhibit only linear motion, as opposed to the broader, ordinary meaning of that phrase. Thus, the disputed term literally encompasses rotating motion, such as that exhibited by the MAC mechanism.
Since the jury necessarily adopted the correct meaning of this claim language, we will not disturb the judgment of infringement. We thus affirm the judgment that the '005 patent was infringed.

2. "recirculation pipe"

The main point of contention between the parties on the construction of "recirculation pipe" is whether one end of the pipe must be submerged under wastewater effluent. Cecil's argues that it must be (Dkt. No. 22 at 38-45), while Chaffin posits that this is too narrow a reading, and puts forth a construction whereby the recirculation pipe is merely somewhere within the storage mixing tank. Dkt. No. 21 at 7-8.

This argument turns on the distinction between reading the claims of the patent in light of the specification, which the Court must do, and limiting the claims to the specification, which the Court must not do. See Phillips, 415 F.3d at 1317, 1323. In light of the admonition that it is the words of the claim that must be construed, the Court believes that Cecil's' construction is too narrow, importing limitations that do not belong to the claim. While the device may well be less efficient if the pipe is not submerged because the recirculation will not create the level of turbulence desired, this only means that the preferred embodiment contains a submerged recirculation pipe. The claims themselves betray no hint that the recirculation pipe must be submerged.

The construction put forth by Cecil's does, however, contain an element of specificity that the Court finds necessary. While Chaffin proposes the construction "a tubular fluid pathway for returning a fluid to a starting point," the Court believes that a variation of Cecil's proposed phrase, "having at least a section downstream from the venturi," is required for a proper construction of the term.

Thus, the Court construes "recirculation pipe" as follows: "a tubular fluid pathway for returning a fluid to a starting point, with at least a portion of that pathway being downstream from the venturi."

2. Rectangular

Plaintiff proposes defining "rectangular" as "having parallel, opposing edges disposed at right angles to one another." Tr. at 10. Defendants propose, in one document, that a "rectangle" be defined as "a four sided figure with opposite sides parallel and adjoining sides intersecting at right angles, the area of which equals the product of its length times its width." Def. Proposed Order on Claim Construction (DE # 47-2). In another document, Defendants suggest the proper construction to be "shaped like a rectangle, a parallelogram, a quadrilateral with opposite sides parallel," Def. Claim Construction Chart (DE # 38). There was no significant debate on this term during the Markman hearing.

This Court will construe the term "rectangular" to mean having four sides, with opposite sides parallel, and four right angles.
Both plaintiff and defendants have submitted briefs requesting that this court, pursuant to Markman v. Westview Inc., 52 F.3d 967, 979 (Fed. Cir. 1995), determine the meaning of the term "recyclable adhesive" as used in certain claims of U.S. Patent No. 5,205,473 ("the '473 patent").

The patent, in simple terms, is for an external wrap of corrugated paper that is placed over a standard paper cup so that, if the cup contains hot beverages or food items, it can comfortably be held despite the hot contents.

Claim 10, for purposes of the present Markman hearing, is the only one that the parties agree, the court need construe.

Claim 10 claims the invention of:

An insulating beverage container, comprising a cellulosil corrugated tubular member consisting essentially of recyclable material, said container including a first opening and an internal cavity for containing a hot or cold medium, said container including fluting means adhesively attached with a recyclable adhesive to a liner for containing insulated air.

Plaintiff contends that the term "recyclable adhesive" means an adhesive that does not interfere with recycling paper.

Defendants contend that the term "recyclable adhesive" means an adhesive that, after use, can be recovered, processed and reused in some form as an adhesive.

Defendants list four reasons why its definition should be adopted by the court:

First, the term "recycle" has a commonly understood meaning, supported by definitions contained in ordinary dictionaries, trade literature and statute law, which requires both collection and reuse of the product at issue.

Second, nothing in the '473 patent claims, specification or prosecution history indicates that the patentee, in using the term "recyclable," intended to give some unique or novel meaning to the term "recyclable adhesive." To the contrary, the limited evidence in the prosecution history demonstrates that DBÜ was embracing the ordinary meaning, rather than some novel meaning.

Third, both the inventor and the prosecuting attorney testified that they did not have (or could not recall) any novel definition of "recyclable adhesive" in mind when they filed and prosecuted the patent application.

Fourth, as DBÜ's professed expert himself has admitted, the proffered evidence with respect to the definition a paper recycler might give to the term "recyclable adhesive" is wholly irrelevant to a patent in the field of paper cup manufacturing. The expert has admitted his lack of any pertinent expertise and, even in his narrow area of non-pertinent expertise, has admitted that his proffered definition is an inaccurate one.

Plaintiff makes four arguments as to why the court should accept its definition. They are:

First, extrinsic evidence must be used to interpret "recyclable adhesive" because the term is not defined by the claims, specification or prosecution history.

Second, the Dictionary of Paper supports the ordinary meaning of "recyclable adhesive" understood by one skilled in the art that the adhesive does not interfere with recycling paper.

Third, the parties' respective experts agree that in the paper recycling industry, a "recyclable adhesive" is one that does not interfere with recycling paper.

Fourth, plaintiff's definition of "recyclable adhesive" upholds the validity of the claims of the '473 patent and claims should be construed to sustain their validity.

Because, on balance, I feel that plaintiff's arguments are more persuasive both legally and logically, I find that "recyclable adhesive" means an adhesive that does not interfere with recycling paper.
adhesive” as used in the claims of the ’473 patent means an adhesive that does not interfere with recycling paper. To find otherwise is to suggest that the adhesive would likely be recovered, collected, processed or reused by a recycler, a result that defendants' own witness decries. See Declaration of James A. Gatcomb.

Moreover, while defendants argue that the word "recycle" has a commonly understood meaning, those meanings do not necessarily attach to the word "recyclable", the connotation of which certainly includes a product or substance that does not impede the recyclability of another product to which it may be attached or applied.

In this case, the adhesive material is applied between the fluting material and the liner board. The adhesive is not stripped from the corrugated paper product prior to the recycling because it does not interfere with recycling the paper product.

As to defendants' second reason, plaintiff agrees that the '473 patent and file history does not impart a novel or special definition to the term in issue. In fact, the term "recyclable adhesive" is not defined anywhere. In brief, the file history, in my judgment, is of arguable help to both sides regarding the definition of the term. It certainly is not conclusive as to either position.

As to defendants' third reason, it seems that neither the inventor nor the prosecuting attorney had, what I would characterize as, a fixed definition of the term in question. That is, both sides can point to deposition testimony favoring its position. Thus, I find defendants' argument in this regard to be unpersuasive.

Most important to my analysis, I do not believe that plaintiff's proffered expert is irrelevant. Dr. Ling testified as an expert in paper recycling and his testimony, referred to in plaintiff's brief, is:

...when we say adhesive is recyclable, basically the adhesive has to be repulpable or dispersable during pulping.

In the context of what this patent is all about, the external wrap over a paper cup, the definition plaintiff urges upon us is the one with which I agree.

5. "Applying glue to abutting wooden surfaces to...reduce air infiltration to less than 0.7/0.5 air changes per hour"

Claim 11 states in relevant part as follows: "A method for reducing air infiltration to less than about 0.7 air changes per hour in a residence having a frame comprising wooden components, the method comprising applying glue to abutting wooden surfaces to provide a seal between such surfaces to block air flow between such surfaces and reduce air infiltration to less than about 0.7 air changes per hour." 4 ('088 Patent, Ex Parte Reexamination Certificate, P. 12, Col. 2, ll. 36-42). Staples requests the following construction of the disputed phrase: "Lower the number of air changes per hour to a value lower than approximately 0.7 [or 0.5]." (Joint Claim Construction Statement, P. 2). Defendants construe the phrase as follows: "Application of the glue to abutting wooden surfaces alone causes the air changes per hour to drop from a value above 0.7 [or 0.5] to below 0.7 [or 0.5]." (Id.). The differences in the parties' construction thus hinge on whether the air changes per hour must be greater than 0.7/0.5 before the glue is applied, and whether there must be a nexus between the application of the glue and the reduction of air infiltration to the specified levels. 5

-------- Footnotes --------

4 The language in Claim 12 is identical to that in Claim 11, except that it requires a reduction of air infiltration to "less than about 0.5 air changes per hour." ('088 Patent, Ex Parte Reexamination Certificate, P. 12, Col. 2, ll. 45-51).

5 In their claim construction brief, Defendants further maintain the intrinsic evidence, "makes clear that air changes per hour is not an estimate or predicted value, but is a value that is actually demonstrated, such as through a blower door test." (Doc. No. 61, P. 19). Upon consideration, the Court finds it need not decide this issue, as such a requirement is found nowhere in Defendants' proposed construction of the phrase at issue.

-------- End Footnotes --------
Upon consideration, the Court will adopt Defendants' proposed construction. Specifically, the Court finds the claim language itself requires that air infiltration be reduced to a level less than about 0.7/0.5 air changes per hour. Implicit within that language is the requirement that the level be greater than 0.7/0.5 air changes per hour before the application of glue. Furthermore, the claims language, the specification, and the prosecution history all support the notion that a nexus must exist between the application of the glue and the reduction of air infiltration. Defendants' proposed construction thus more accurately reflects the teachings of the patent, and will be adopted here.

BACKGROUND

Baldwin initially filed the instant action against Siebert based on its belief that Siebert calendered its fabric, a process by which air is reduced in the fabric by pressing it between two heated rollers. After discovery, Baldwin learned that Siebert's accused fabric was in fact not calendered, nor was its air reduced by any other mechanical process prior to being wound on the roll. At the Markman hearing on June 16, 2005, Baldwin argued that the claim term, "reduced air content cleaning fabric," did not exclude fabric whose air content was reduced by the process of winding or rewinding on a roll. Siebert argued that the patent, the prosecution history, and Baldwin's initial basis for infringement, precluded such a construction, and that calendering was the only method of air content reduction envisioned by the patent. We disagreed, noting that claim construction is an analysis wholly independent from plaintiffs theory of infringement and is not influenced by such. Baldwin, 2005 U.S. Dist. LEXIS 15527, 2005 WL 1838451. We further found that the patent, while mentioning only the method of calendering for reducing air content, specifically stated that calendering was "not the exclusive method" of reducing air content. Id.

Siebert moved for reconsideration of that decision on September 1, 2005, on grounds that we gave too much weight to extrinsic evidence, namely the report of John McPhee, plaintiffs expert. We denied Siebert's motion, finding that we did not principally rely on McPhee's report, but relied mainly on the claim language and other intrinsic evidence. Baldwin, 2005 U.S. Dist. LEXIS 42051, 2005 WL 4034698.

In its current motion, Siebert devotes most of its attention to its contentions that the patent is invalid based on anticipation, obviousness and indefiniteness. There may well be merit to one or more of its contentions. The specification does not suggest reducing air content by winding on a core, and neither do the claims (with the possible exception of claim 26) - winding on a core may well result incidentally in some reduction of air content, and that procedure has been around for a very long time. A person with ordinary skill in the art would have a difficult time trying to determine what level of tension might trigger patent infringement. We do not, however, determine whether any of those contentions justifies summary judgment Rather, we revisit claim construction.

Alternatively, Siebert puts forth a new theory that it contends requires us to reconsider our construction of the claim term. Siebert argues that it is clear from the language of the patent, its claims and specification, and the prosecution history, that the term "reduced air content cleaning fabric" indicates a fabric whose air content is reduced by some means prior to winding on a core to form a roll. Siebert goes on to argue that in light of this construction, and since there is no genuine issue of material fact that Siebert's fabric does not go through any mechanical process before being wound on the roll, it is entitled to summary judgment on grounds of non-infringement. Upon close consideration of parties' arguments, the patent, and the prosecution history, we agree with Siebert's proposed claim construction and grant its motion to revise our construction of the claim term "reduced air content cleaning fabric." We further grant its motion for summary judgment based on non-infringement. 1
I Additionally, we grant Siebert's motion to file an over-length brief in support of its motion for summary judgment. Furthermore, we find moot Baldwin's argument that we should disregard Siebert's exhibits 28B and 28C (as they were not disclosed during discovery) because, as will be evident below, we do not rely on them in our analysis (Baldwin's response to motion for summary judgment at 10). We also find moot Siebert's motion to strike certain paragraphs in Baldwin's statement of material facts for the same reason.

ANALYSIS

Generally motions for reconsideration are only appropriate to correct manifest errors of law, or to present newly discovered evidence. Oto v. Metropolitan Life Ins. Co., 224 F.3d 601, 606 (7th Cir. 2000); United Mun. Leasing Corp. v. Lexington Corporate Props., 1997 U.S. Dist. LEXIS 14428 (N.D.Ill 1997). Such motions are valuable where the court misunderstands a party, makes a decision outside of the adversarial issues presented by the parties, or makes an error of apprehension. Bank of Waunakee v. Rochester Cheese Sales. Inc., 906 F.2d 1185, 1191 (7th Cir. 1990). Baldwin argues that Siebert's theory that any reduction in air content must occur prior to the fabric being wound on the roll is not new, but merely a rehashing of his prior theory that calendering is the only process envisioned by the '976 patent to reduce air content. We do not agree. Siebert's earlier argument was that calendering was the only method of reducing air content. We disagreed with that argument because, among other reasons, the patent specifically stated that calendering was not the exclusive method of reducing air content. Here, Siebert is not arguing that there is only one method of reducing air content. Rather, it appears to concede that there may be many methods. What Siebert argues here is that regardless of the method used to reduce air content, the reduction of air content as envisioned by the patent occurs prior to winding the fabric on the roll. Because Siebert suggests that we made an error of law with respect to our construction of the claim term, and because we find this new theory to be different from the one it posited earlier in this litigation, its motion to reconsider is appropriate. See Chamberlain Group, Inc., v. Lear Corp., 2007 U.S. Dist. LEXIS 12004, *5 (N.D. Ill. 2007).

Claim Construction

In order to determine the proper construction for a claim term, we first look at the term as used in the claims themselves. Phillips v. AWH Corp., 415 F.3d 1303, 1312 (Fed. Cir.2005). The two independent claims, claims 1 and 14, standing alone, do not aid much in our construction analysis, for while both recite the term, "reduced air content cleaning fabric," both claims are very broad and vague, neither teaching the winding of the fabric on a core. At first glance, these claims appear to envision an invention that does not require a core. But given that every manifestation of Baldwin's invention throughout the specification and prosecution history includes a fabric roll on a core, and given that the patent was an improvement on an earlier pre-soaked fabric roll wound on a core, we decline to read these claims as being so much broader than what the invention as a whole teaches. See Phillips, 415 F.3d at 1316 (citing Markman v. Westview Instruments Inc., 517 U.S. 370, 389, 116 S. Ct. 1384, 134 L. Ed. 2d 577 (1996)("[A claim] term can be defined only in a way that comports with the instrument as a whole."). Yet, because of the lack of specificity in the independent claims, we must look to the other claims to determine the construction of the disputed term. Forest Laboratories, Inc. v. Abbott Laboratories, 239 F.3d 1305, 1310 (Fed. Cir. 2001) ("We … construe independent claims consistently with the claims that depend from them.").

Once outside claims 1 and 14, our analysis is complicated by the fact that the term "reduced air content cleaning fabric" does not appear in any of the other claims. Instead, the dependent claims use a variety of ambiguous terms, including "cleaning fabric," "fabric," "strip," "strip of cleaning fabric," and in one instance, "strip of cloth." These terms are ambiguous because they are often used to indicate both a "reduced air content cleaning fabric" and a fabric whose air content has not yet been reduced. In order to determine the meaning of the disputed term, we must first discern which instances of the word "fabric," and its equivalents, translate to "reduced air content cleaning fabric." To do so, we resort to the rules of construction.

To interpret the meaning of the word "fabric," and its equivalents, we will first look at the word in the context of the dependent claim we are looking at, in light of the independent claim upon which that claim relies. Gart v. Logitech, Inc., 254 F.3d 1334, 1341 (Fed. Cir. 2001). Where possible, we give claim terms their ordinary and plain meanings, so as to be understood by a person of ordinary skill in the art. Smithkline Diagnostics, Inc. v. Helena Laboratories Corp., 859 F.2d 878, 882 (Fed. Cir. 1988). Additionally, under a principle of consistency, it is presumed that "the same terms appearing in
different portions of the claims should be given the same meaning unless it is clear from the specification and prosecution history that the terms have different meanings at different portions of the claims." Fin Control Systems Pty, Ltd. v. OAM. Inc., 265 F.3d 1311, 1318 (Fed. Cir. 2001). We understand that consistency is especially important when discussing multiple instances of a claim term within any one claim, Digital Biometrics v. IdentiXML, Inc., 149 F.3d 1335, 1345 (Fed. Cir. 1998) ("[T]he same word appearing in the same claim should be interpreted consistently."). We also read the term in light of the specification and the prosecution history, as "the person of ordinary skill in the art is deemed to read the claim term not only in the context of the particular claim in which the disputed term appears, but in the context of the entire patent, including the specification." Phillips, 415 F.3d at 1313; Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342-43 (Fed. Cir. 2001).

We will begin our analysis with the two claims that appear to be the most appurtenant to the issue at hand, claims 18 and 26. However, in order to interpret these claims we first must set out and interpret the independent claim upon which they both depend, claim 14. That claim reads:

14. A method for making a cleaning system comprising: reducing air content of a strip of cleaning fabric by 1 to 50 percent to form a strip of reduced air cleaning fabric; and contacting said strip of reduced air content cleaning fabric with a low volatility, organic compound solvent which does not evaporate readily at ambient temperature and pressure and pre-soaking and saturating said reduced air content cleaning fabric with said solvent.

Reading the terms of claim 14 in context, we find that the patentee used two different terms to mean two different things. "Where claims use different terms, those differences are presumed to reflect a difference in the scope of the claims." Forest Laboratories, 239 F.3d at 1310. The first term, "strip of cleaning fabric," refers to a cleaning fabric whose air content has not yet been reduced. We find this to be so because that term, a noun, is being modified by the verb "reducing." Thereafter in the claim, the term used is "reduced air content cleaning fabric," because the reducing of the air content has already occurred. The strip of fabric which comes into contact with the solvent, then, is already reduced in air content.

Additionally, while claim terms should generally be read consistently throughout a claim, here there is a clear manifestation that these two terms be read differently. First, the terms themselves are different, one being merely "cleaning fabric," while the other is "reduced air content cleaning fabric," Second, as stated above, reading the first term in context with a modifier such as "reducing," indicates that the patentee intended that term to mean a non-reduced air content cleaning fabric.

This reading is not only clear from the claim itself, but is supported by both the specification and the prosecution history. The specification states that "the reduced air content provides for an absorptive solvent amount and a reduced displacement of solvent during storage and thus less shift or no shift in the fabric roll's center of gravity and allows for better and more even distribution of the solvent within the fabric roll" ("976 patent, col. 7, In. 20-25, Bald. App. 4). During prosecution of the patent, Baldwin made clear that the air content of the fabric is reduced prior to soaking it in the solvent. In response to an objection by the examiner, Baldwin asserted that "[b]y reducing the air content of the cleaning fabric prior to saturation, the present invention improves the wettability of the fabric and improves the distribution of the solvent in the fabric" ("976 patent prosecution history, FH 0764-65, FH 0783-84, Bald. App. 19). Baldwin also made clear that saturation itself is not a method for reducing the air content of the fabric as taught by the invention ("976 patent prosecution history, FH 0665-6, FH 0764-65, Bald. App. 19). Therefore, while steps in a method need not necessarily be performed in the order they are listed in a patent, here it is clear that the step of reducing air content of a fabric necessarily must occur prior to saturation. See Loral Fairchild Corp. v. Sony Corp., 181 F.3d 1313, 1332.

We turn to claim 18, which reads:

18. The method as defined in claim 14 including providing an elongated core wherein said strip of cleaning fabric is wrapped about said elongated core prior to contacting said strip of cleaning fabric with said solvent.

Here we find that in both instances in claim 18, the term "strip of cleaning fabric" refers to "reduced air content cleaning fabric." It is clear that in the second instance, the term "strip of cleaning fabric," means "reduced air content cleaning fabric." This is because, as discussed above, the invention requires that the air content in the fabric be reduced prior to coming in contact with the solvent. Reading the term as indicating a non-reduced air content cleaning fabric would go against the principles of the invention, as it would be reading the claim to involve contacting non-reduced air content cleaning fabric with solvent. Secondly, we must attempt to construe all like terms alike, unless it is clear from the patent that they are to be construed differently. Unlike the distinction made between terms in claim 14, here there is no modifying verb.
used in conjunction with the first use of the term, "strip of cleaning fabric," which would make clear the manifest intent that the term denote a non-reduced air content cleaning fabric. Without that manifest intent, we must construe these claims to mean the same thing, and thus we construe them both to mean "reduced air content cleaning fabric."

We then turn to claim 26, which states:

26. The method as defined in claim 14 wherein said step of reducing air content of said strip of cleaning fabric further comprises the step of increasing the length of said cleaning fabric by at least about 25% without substantially effecting \[\text{sic}\] the diameter of said fabric roll after the cleaning fabric has been wound about a core.

This claim is also dependent on claim 14, which delineates the general method for the invention. Claim 26 permits an additional step to the method—that of increasing the length of the cleaning fabric. We find that although generally we are required to construe like terms consistently, here, as in claim 14, it is clear from the context that these two terms refer to different states of the fabric. The terms "strip of cleaning fabric" and "cleaning fabric," when mentioned in the first clause of the claim, refer to non-reduced air content cleaning fabric, because in both instances the terms are being modified by a word signifying an element of an air reduction process, i.e. "reducing" or "step of increasing". Because "increasing" is an additional step in the air-reduction process, it necessarily implies the fabric at issue has not already bad its air content reduced. However, the term "cleaning fabric," in the second clause of the claim, refers to "reduced air content cleaning fabric" because it is no longer being used in conjunction with the process of reducing air content (of which increasing length is a step), but with the result of the air content reduction—that the diameter of the roll after the cleaning fabric is wound is not substantially affected.

Just as in claim 14, we have claim terms that are defined differently within the claim. While here, unlike in claim 14, the claim terms themselves are not different, there is the presence of the modifiers, "reducing" and "step of increasing," which demonstrate a manifestation of the intent that those terms, as used with those modifiers, relate to non-reduced air content cleaning fabric. Yet, it would be illogical to construe the last term as also meaning non-reduced air content cleaning fabric, as construing the term in that way would read, "without substantially effecting \[\text{sic}\] the diameter of said fabric roll after the non-reduced air content cleaning fabric has been wound about a core." This reading makes no sense because only the action of reducing the air content would increase the length of the fabric without increasing the diameter of the fabric roll. Winding non-reduced air cleaning fabric onto a roll would either not increase the length of the fabric, or it would increase the diameter of the roll. Nor do we see how the step of reducing air content could be achieved after the fabric is wound on the roll. If one of the advantages of reducing air content is increasing the length of the fabric, that is not an advantage that can be wrought from a process that reduces air content after the fabric is already wound. Thus, we find that the only logical meaning of the term "cleaning fabric" in the context of the last clause of claim 26, is "reduced air content cleaning fabric."

There is a possibility that the clause as a whole could support an argument that claim 26 envisions reduction in air content through winding the fabric on the roll. We find this possibility unlikely, however, as we find it would require more specificity than is present with regards to the method of winding. As Baldwin's expert John McPhee conceded, not every winding of fabric onto a roll has the effect of reducing air content (expert rebuttal report of John McPhee, at 20, Siebert App. 25). We find that to interpret this claim to cover air content reduction through winding or rewinding would require additional language that is not present here, and thus the claim should not be so construed. 2

--- Footnotes ---

2 Even if this claim were construed in a way as to support an argument of air reduction through winding or rewinding, we find that the construction of this claim in this way cannot be imported to the other claims in the patent, which we find clearly do not envision air reduction through winding or rewinding. Furthermore, claim 26 covers an increase in the length of the fabric (through air reduction) of at least about 25%. There has been no evidence that Siebert's fabric's length has been increased by this amount, and Baldwin has not even asserted that Siebert infringed claim 26. Thus, even if we were to construe this claim alone to cover reduction in air content through winding or rewinding, there has been no allegation of infringement, nor has there been any evidence of the same, and thus Siebert would be entitled to summary judgment on that point.

--- End Footnotes ---
Having parsed the term "fabric," and its equivalents, in the relevant claims 18 and 26, into the more precise terms of "reduced air content cleaning fabric" and non-reduced air content cleaning fabric, we can then determine whether or not the term "reduced air content cleaning fabric" should be construed as requiring that the air content of the fabric be reduced prior to being wound on the core to form a roll. It is clear from the discussion above that claims 18 and 26, dependent on claim 14, envision that the air content of the fabric is reduced prior to it being wound on the roll. Claim 18, as construed, teaches the wrapping of the reduced air content fabric about an elongated core prior to its contact with the solvent. This implies the air content is reduced prior to the wrapping because, as the claim reads, what is wrapped around the core is reduced air content cleaning fabric. Claim 26 teaches that the step of increasing the length of the non-reduced air content fabric can be achieved without affecting the diameter of the fabric roll after the subsequently reduced air content fabric is wrapped around the core, again implying reduction in air content prior to wrapping.

By performing this same analysis throughout the claims, we are able to distinguish the patentee's intent to refer to non-reduced air content cleaning fabric, from its intent to refer to "reduced air content cleaning fabric," in almost all the claims. The only claims where, even after our analysis, the term could still mean either substance, is in claims 8 and 10, which talk about the composition of the fabric in general. However, the use of either term in these two claims has no effect on the question of whether or not "reduced air content cleaning fabric" means a fabric whose air content is reduced prior to winding it on a core to form a roll.

Our position that the claim term does require a reduction in air content prior to winding is further supported by the patent specification. The abstract states; "The system includes a cleaning fabric treated to reduce the amount of air volume the cleaning fabric contains. The cleaning fabric is saturated to functional equilibrium with a low volatility organic compound solvent. The cleaning fabric is wrapped around an elongate core to form a fabric roll" (976 patent, col. 2, In. 34-39, Bald. App. 4).

Here, like in claim 14, the term "cleaning fabric" is modified by its treatment to reduce air content. Thereafter in the abstract, the term "cleaning fabric" necessarily refers to "reduced air content cleaning fabric," which necessitates the reduction in air content prior to the fabric being wound on the roll.

The summary of the invention states this even more clearly when it states that "[a] cleaning fabric with a reduced air content is wrapped around the core to form a fabric roll" (976 patent, col. 3, In. 65-66, Bald. App. 4). The use of the word "with" implies that the fabric being wound on the roll has already had its air content reduced prior to winding. Later, in the broad recitation of the method, the patent states that "[t]he saturated cleaning fabric is wrapped around a core to form a pre-soaked fabric roll" (976 patent, col. 4, In. 32-33, Bald. App. 4). Because, as discussed above, the air content of the fabric must be reduced prior to saturation, it follows that here the air content is reduced prior to winding.

The preferred embodiment, in conjunction with the relevant claims, teaches that the invention covers not only saturation of the fabric prior to winding, but saturation after winding as well, or both saturating before and after winding. In one section it states: "The fabric is pre-soaked and saturated with a low volatility organic compound solvent, as described in more detail herein below, before or after it is wrapped around the core to form roll in any convenient manner" (976 patent, col. 5, In. 58-61, Bald. App. 4). It is clear that the term, "fabric," means "reduced air content cleaning fabric," because just as in claim 18, it is being used in conjunction with contacting the solvent, which can only be done with fabric whose air content is already reduced, according to the invention. The subsequent pronoun, "it," then necessarily refers to the same term, and thus means "reduced air content cleaning fabric." By reading this sentence as such, the patent clearly envisioned the reduction in air content taking place prior to winding on the roll, because the soaking of the reduced air content cleaning fabric can occur either before or after the reduced air content cleaning fabric is wrapped around the core, which can be done "in any convenient manner."

The preferred embodiment further states:

In one variation of the method, the fabric is preferably wrapped around the core prior to contacting the same with the solvent. In yet another embodiment, the fabric is wrapped around the core after being saturated with the cleaning solvent. It is also within the invention to saturate the fabric with solvent both prior to and after forming the fabric roll. The wrapping of the fabric can be done in any convenient manner and requires no special apparatus, a wide variety of roll making equipment being readily available for accomplishing the same. (976 patent col. 9, In. 1-10, Bald. App. 4.)
Here, again, the term, "fabric," indicates "reduced air content cleaning fabric." The term is used both in the context of saturating prior to winding (which requires the fabric to have its air content already reduced), and then, without any modification of the term, in the context of winding on a roll prior to saturation. Because no modification of the term has occurred, we should construe it consistently, which requires us to construe it as "reduced air content cleaning fabric."

Additionally, if we were to construe this term to include non-reduced air content cleaning fabric, it would not follow that the wrapping could be done in any convenient manner, but would have to be done in such a way as to reduce the air content of the fabric. Thus, construing "fabric" here to mean "reduced air content cleaning fabric," is the only logical construction in light of the context in which the term is used. We find similar examples throughout the specification, thus solidifying our determination that the term "reduced air content cleaning fabric" must be construed as a fabric whose air content in reduced prior to its being wound on a core to form a roll.

The fact that Baldwin's patent states that descriptions in the summary and the preferred embodiment should not be construed as to limit the variations and advantages of the invention to those disclosed, does not alter our determination. (See '976 patent, col. 4, In. 49-54, col. 11, In. 49-55, Bald. App. 4). We are not importing a limitation from the specification into the claims. See SciMed Life Systems, Inc. v. Advanced Cardiovascular Systems, Inc., 242 F.3d 1337, 1340 (Fed. Cir. 2001)("... one of the cardinal sins of patent law-reading a limitation from the written description into the claims"). Rather, we are interpreting the claim terms first in light of their context and logical construction, and referring to the specification and prosecution history to ensure that our construction is the proper one. The one limitation that we draw from the prosecution history, that reduction in air content must occur prior to saturation, is not a "limitation" at all, but part of what makes the invention patentable over prior art. 3 Hence, our construction of the claim term is not importing a limitation from the specification, but construing the claim in the context of the necessary limitations in the patent itself. We are not limiting the various ways that the reduction in air content can be achieved, rather, we construe the term to indicate that any reduction in air occurs prior to winding the fabric on the roll. We therefore reconsider our prior construction of the term, "reduced air content cleaning fabric," and construe that term to mean "a fabric whose air content has been reduced by some method prior to being wound on a roll."

3 In fact, the possibility that the air content could be reduced by saturation, or after saturation, was a major sticking point for the patent examiner. The examiner indicated in its rejections that reduction in air content after saturation rendered the invention obvious in light of the Meisen patent (U.S. Patent No. 4,712,472, FH 0623, Bald. App. 19), and reduction in air content by saturation rendered the invention unpatentable over Baldwin's earlier 157 patent, which taught a pre-soaked fabric roll. Baldwin distinguished its invention by making clear that reduction in air content had to occur prior to saturation.

6 D.I. 151, ex. E at 1016 (defining "ring" as "a circular band for holding, connecting, hanging, pulling, packing, or sealing"). Plaintiff proffered its own ordinary meaning of "ring." D.I. 148, ex. 6 at 990 (defining "ring" as "a circular line, figure, or object"). As defendant points out, the dictionary plaintiff cites for its ordinary meaning gives "smoke ring" as an example for the definition. This example is not consistent with the subject of the '264 patent. When multiple dictionary definitions are given, courts should adopt the definition most consistent with the inventor's use of the words. Tex. Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1203 (Fed. Cir. 2002). Consequently, the court adopts defendant's ordinary meaning.

7 264 patent, col. 2, ll. 34-38, 42-52; col. 3, ll. 1-5, 47-55; col. 4, ll. 14-18; col. 5, ll. 30-31; figs. 1, 3, 9, 10.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -
2. "A reduced diameter cylindrical central portion." Consistent with the claim language and its ordinary meaning, 25 and the specification, 26 the court construes "a reduced diameter cylindrical central portion" to mean "the portion of the tubular body that includes the middle point has a smaller diameter than adjacent portions of the tube."

25 D.I. 148, ex. 6 at 179 (defining "central" as "situated at, in, or near the center"); D.I. 151, ex. E at 221 (defining "central" as "containing or constituting the center"); see also Random House Dictionary of the English Language 335 (2d ed. 1987) (defining "center" as "the middle point").

26 '476 patent, col. 2, ll. 48-57; col. 3, ll. 49-55; figs. 1, 9, 10. Another embodiment of the specification describes a "telescoping configuration." '476 patent, col. 4, l. 44 - col. 5, l. 65. In this configuration, the tubular body consists of two halves, one of which is deformed to have a reduced diameter central portion. '476 patent, col. 5, ll. 5-10. The body is then formed by sliding the undeformed half over the reduced diameter central portion and welding the two halves together. '476 patent, col. 5, ll. 11-18. Because this embodiment does not join enlarged diameter cylindrical end portions, it does not affect construction of "a reduced diameter cylindrical central portion" in claim 1 of the '476 patent. See claim 1, '476 patent, col. 6, ll. 29-33.

2. "reference" (claims 5, 8, 15, 16, and 17)

At a basic level, the parties agree that "reference" denotes a "position." ASML suggests that "reference" denotes "a position or item (other than the object) relative to which displacement can be measured"; Nikon, by contrast, reads "reference" to mean a "position defined in a coordinate space, from which the object/substrate is displaced and positioned relative thereto." The court cannot accept either definition as offered, and it finds that a person of ordinary skill in the art would understand "reference," as it is used in this context, to denote a basis of comparison. The specifications are not to the contrary. In various places, the patent uses "reference" to describe four positions: the initial position determined by global alignment, the position of the projection lens system, the position of the mask, and the position of location-related stationary mirrors. See, e.g., '832 Patent at 3:23-27; 18:9-13. Throughout the patent, usage of "reference" is invariably comparative and positional, assessing one thing relative to another and pegging the location of one item with respect to a second item. Id. Nothing in the intrinsic evidence supports Nikon's attempt to limit "reference" to positional definition in "a coordinate plane," and nothing in the claim language suggests the court need read in claim terms (viz., "object"); found elsewhere in the relevant claims. Consistent with plain meaning and the specification, the court construes "reference" to mean "a position or item relative to which displacement, location, or both can be measured."

C. "Reflective inner coating"

Consistent with the Claim itself, the prosecution history and the ordinary meaning of the Claim terms, Yanova contends that "reflective inner coating" must be construed as:

[A] coating applied to the inside of a light transmission element that reflects light interiorly from a light device to prevent or minimize light dissipation as the light travels along the light transmission element to the edible confection.
Yanova Memo at 15. However, according to Defendants, the ordinary meaning of the claim language and intrinsic evidence when viewed as a whole requires that "reflective inner coating" be construed as:

[A] coating may be a texture or appearance of a surface, or may be a layer of a substance that is spread over a surface.

Def's Memo at 16-18.

"Reflective inner coating" consists of three parts: (i) reflective, (ii) inner, and (iii) coating. First, as defined by American Heritage Dictionary, Fourth Edition (2000), "reflective" means "of, pertaining to, produced by, or resulting from reflection." As a verb, "reflective" means, "to throw or bend back (light for example) from a surface." The form, direction, method, purpose, or style of reflection is never delineated and never limited.

Second, Claim 1 states that the "light transmission element" include a "reflective inner coating." ('816 Patent, Claim 1, col. 5, 24-26). Therefore, contained within the "light transmission element" is the "reflective inner coating."

Third, the term, "coating," as defined by the American Heritage Dictionary, Fourth Edition (2000), means "a layer of material covering something else." Analogous to the term "reflective coating," "mirror coating," as defined by McGraw-Hill Dictionary of Scientific and Technical Terms, Sixth Edition (2003), means "a thin film of highly reflective material spread over a correctly shaped glass surface to produce a mirror . . . also known as reflective coating."

Consistent with its plain meaning, the term "reflective inner coating" in the asserted claims of the patents-at-issue is construed to mean:

[A] thin film of highly reflective material spread over a correctly shaped glass surface to produce a mirror contained within the light transmission element.

"INTERNAL REFLECTING SURFACE"

Black Matte

The reflective surface inside the housing, as described in the Ecolab patents, receives light from a source within the housing and reflects that light upward and onto the wall above the trap. Ecolab contends that the term "internal reflecting surface" means any surface of any color which is positioned inside the housing to reflect any degree of light onto the wall where the trap is mounted, i.e., onto the vertical mounting surface. Paraclipse contends that the term "internal reflecting surface" means a shiny metallic reflective surface and does not include a black matte surface.

Each of the independent claims of the Ecolab patent includes, as an element, a "reflecting" "layer" or "surface" inside the housing. The specifications of the '690 and '017 patents expressly define "reflective layer" as follows:

The interior of the housing contains a reflective layer, and it is at least partially reflective. Such reflective layers can be made from shiny metallic surfaces such as aluminum foil, metallized polyester bright-white reflective panels, silver glass mirrors and other related reflective surfaces.

See, e.g., '690 patent, Column 3, lines 5-10 (Emphasis added.)

Column 7, at lines 48-64, of the '690 patent, describes experiments conducted to "compare the effect of the installation of the shiny metallized polyester (Mylar) reflective surface within the housing with the effect of a non-reflecting surface." The results of the experiment are shown in Table 5. The "non-reflecting surface" mentioned in the patent is a black surface. Table 5 compares the effectiveness of the trap with an interior housing surface of metallized Mylar, as opposed to covering the Mylar with a "non-reflective black surface." Id. The Note beneath Table 5 states:

Our experimentation shown in Table 5 demonstrates a substantial increase in capture rates when a shiny reflective surface is installed within the housing. The metallized Mylar surface we have used shows a substantial increase (by 26% in capture
rates when compared to a black non-reflective surface).

(Emphasis added.)

The court concludes that the term "internal reflecting surface" used in the claims of the Ecolab patents does not include a black matte surface on the inner wall of the housing. Direct light, as described in the patents, means light radiated directly from the source of light onto the wall above the unit. The term "reflected light" as used in the patent claims means the light from the source which bounces off, i.e., is reflected off, the reflecting layer on the inside wall of the housing cover. The "non-reflecting" surface mentioned in the patent at Table 5 is a black surface.

In addition, the court cannot accept Ecolab's assertion that the patent does not exclude a black matte internal surface because all surfaces are partially reflective. The "Detailed Description of the Invention" in Column 2 of the '690 patent at lines 60-63 states: "The light source is substantially enclosed within a housing having an internal surface at least partially covered with a reflecting layer." If the patent includes any internal surface of any kind, such an interpretation would render the word "reflecting" superfluous.

Therefore, if, as Ecolab argues in the context of the disputed claims, all surfaces reflect and no surface is excluded, a critical element of the patent, namely, the term "internal reflecting surface" or "interior reflective layer" becomes meaningless. Neither Ecolab nor any witness at the Markman hearing has explained the meaning of, or provided an example of, a non-reflecting surface. Thus, the court is left to speculate why the terms "reflecting" and "reflective" appear in the patent at all. Consequently, for the foregoing reasons, which are not exclusive, the court determines that a person of ordinary skill in the art would conclude that, for the purposes of the Ecolab patents, a black matte layer or surface inside the housing does not constitute a "internal reflective surface" or an "internal reflecting surface" within the meaning of the Ecolab patent claims.

--- Footnotes ---

2 Paraclipse offers excerpts from the prosecution history which reinforce the conclusion that the terms "reflecting surface" and "reflective layer" exclude a black matte surface. See Paraclipse's Proposed Findings of Fact and Conclusions of Law at PP 8 & 11 (as modified by this court): In the prosecution history of the '690 original application, the patent examiner initially rejected all 25 claims, some for obviousness in view of two prior art references, including a Phillips patent. Ecolab responded: "The prior art is replete with inventions directed toward insect traps…. Applicant's invention is also based on the discovery that insect attractancy can be increased through the use of a combination of diffused and reflected light." (Emphasis added.)

Ecolab distinguished Phillips on the basis of Ecolab's "reflective surface." Ecolab's attorney argued: "The examiner concedes that Phillips does not disclose the use of a pheromone, a shiny metallic surface, or a lethal electrified surface." Following Ecolab's argument that its patent distinguished over Phillips by including a "shiny metallic surface," the Examiner withdrew his rejection of the claims.

Also, during the reexamination proceeding, the examiner rejected certain claims as anticipated by White, a prior art patent. Ecolab submitted the declaration of inventor-Thomas D. Nelson which stated that the commercial White trap contains a black matte finish and horizontal white adhesive board which reflects light into the room when the top of the White trap is open.

Nelson stated in pertinent part: "A critical distinction between White and the claimed invention is that this reflected light does not form a part of the light pattern on the wall. Light . . . is reflected off the reflective glue board. . . and onto the inside black matte surface of the enclosure. . . of the White trap. Similarly this reflected light does not contribute to the light pattern on the wall. The black matte surface of the commercial White trap is further evidence that White did not consider the housing to participate in the reflection of light, relying instead on the reflective glue board. . . . Even if the top is removed from the trap when installed on a wall, no important amount of reflected light is used in the light pattern on the wall either above or below the trap. The light pattern from the White trap is composed entirely of directly radiated light." (Emphasis in original.) The foregoing provides additional evidence that a person of ordinary skill in the art would conclude that black is not a reflective surface within the meaning of the Ecolab patents.
3253

1. Black matte surface

The section of Instruction No. 11 excluding a black matte surface from the scope of the term "internal reflecting surface" was based on the district court's Markman ruling that "a black matte layer or surface inside the housing does not constitute a [sic] 'interior reflective surface' or an 'internal reflecting surface' within the meaning of the Ecolab patent claims." Markman Order at 21.

Ecolab argues that any surface of any color positioned inside the housing to reflect any degree of light onto the wall qualifies as an "internal reflecting surface." But Table 5 of the '690 patent makes it clear that not every black surface is an "internal reflecting surface." Table 5 outlines the results of an experiment "comparing the effect of the installation of the shiny metallized polyester (Mylar) reflective surface within the housing with the effect of a non-reflecting surface." '690 patent, col. 7, ll. 48-64. The "non-reflecting surface" used in the experiment was black. Ecolab has not distinguished the black matte surface from the non-reflecting surface of Table 5. Moreover, if "a surface that does reflect light from the source, even if only a small amount," is "reflective" within the meaning of claims 1 and 16, then no surfaces would be excluded and the term "reflective" would be meaningless. The district court concluded, and we agree, that because the term "internal reflecting surface" requires a surface having at least some small amount of reflectivity, the black matte surface on the inner wall of the housing cover (which is only minimally reflective) does not qualify. Markman Order at 11.

We therefore find that the section of Instruction No. 11 excluding the black matte surface as an "internal reflecting surface" was not erroneous.

3.3 Interpretation of the "Reflector Means" Claim Limitation

Genlyte argues that the "reflector means" claim limitation limits the scope of that claim element to a one hundred percent reflectivity reflector as opposed to a partially reflective reflector or a partially transmissive reflector. Genlyte further contends that the "reflector means" claim limitation excludes from its scope a reflector which provides uplighting or upwardly directed light rays.

Before addressing the intrinsic evidence relevant to the interpretation of this claim term, it is important to note that Federal Circuit precedent states that an interpretation of a claim limitation in a way that would exclude an inventor's preferred embodiment disclosed in a patent represents an "... interpretation [which] is rarely, if ever correct, and would require highly persuasive evidentiary support." Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996). See also, Modine Mfg. Co. v. Int'l Trade Comm'n, 75 F.3d 1545, 1550 (Fed. Cir. 1996).

The Tickner '414 patent discloses three distinct preferred embodiments. Tickner's first preferred embodiment is illustrated in Figs. 2-8 of the '414 patent where the reflector is identified by Reference Nos. 14A and 14B. Tickner's second preferred embodiment is disclosed in Figs. 9-15 where the reflector is designated by Reference No. 100. Tickner's third embodiment
is illustrated in Fig. 16 where the reflector is designated by Reference No. 200.

The written description of the Tickner '414 patent recites a detailed explanation of design features implemented to provide for the circulation of cooling air through various openings in the second and third embodiments. At Column 8, lines 28-48, Tickner describes open spaces 112, central aperture 130 and smaller apertures 136 which provide openings designed to circulate cooling air -- and inherently the radiation of light through those holes -- literally through the reflector itself. At Column 9, lines 15-22, Tickner further describes how his structural ribs 121 cooperate with openings 130 and 136 to provide air circulation -- and necessarily for radiation of light through the reflector itself.

At Column 9, lines 56-61, Tickner describes his Fig. 16 third reflector embodiment which includes a plurality of elongated vertically oriented slots designated by Reference No. 215. Those slots similarly provide for both the circulation of cooling air through the reflector as well as the radiation of light through the reflector.

This intrinsic evidence in the form of Tickner's patent drawings and the written description clearly teaches the incorporation of numerous apertures, or open spaces and slots all representing holes in the reflector in two of his three preferred embodiments to provide cooling flow air; and inherently for the escape compact fluorescent light radiation through the reflector itself. The light passing through these numerous holes in the reflectors radiates both laterally to the side as well as vertically upwardly.

With Genlyte's proposed claim interpretation requiring total containment of all compact fluorescent light radiation within the reflector with one hundred percent reflectivity, two of Tickner's three embodiments would be excluded from the scope of the "reflector means" claim limitation. In view of Vitronics and the intrinsic evidence, however, the Special Master interprets the "reflector means" limitation as encompassing either a totally reflective reflector, a partially reflective reflector, as well as a partially light transmissive reflector, with or without apertures or openings in the reflector itself, where the reflector is capable of radiating light through or out of the reflector in all directions, including both laterally and upwardly.

This interpretation expressly encompasses a reflector providing uplighting. This interpretation is consistent with and is, in fact, required by the claim interpretation guidelines stated in the Vitronics case which requires that a claim limitation be interpreted to encompass the preferred embodiments disclosed in the intrinsic evidence. In the present case, the intrinsic evidence does not stand in the way of such a broad interpretation. To the contrary, it requires it.

This interpretation is consistent with a lighting industry publication which was jointly submitted to the Court by the parties which defines the term "reflection" as the process by which a part of the light falling on a medium leaves that medium from the incident side. Lighting Handbook Reference & Application (8th ed. 1993) (Illuminating Engineering Society of North America). That definition is consistent with the Special Master's interpretation of the "reflector means" claim limitation.

The Special Master, in construing the "reflector means" limitation "recommends that it be construed:

as encompassing either a totally reflective reflector, a partially reflective reflector, as well as a partially light transmissive reflector, with or without apertures or openings in the reflector itself, where the reflector is capable of radiating light through or out of the reflector in all directions, including both laterally and upwardly.

(Report and Recommendation, p.5).

Defendants object to this construction because the Special Master's proposal erroneously permits the transmission of light through the reflectors due to the existence of "apertures or openings" within the reflector itself. According to the Defendants, "the Special Master errs by not recognizing that light passing through such apertures is irrelevant to defining what the 'reflector' itself must be." (Defendants' Objections, p.13) (Emphasis original).

However, the Defendants' argument is not well taken as it appears to import an additional limitation that is not contemplated in the '414 Patent claims or specification; that is, a reflector that is completely reflective despite the existence of "apertures
or openings" that undoubtedly allow for the transmission of light through the reflector. Notably, Claim One of the '414 Patent does not expressly or impliedly separate the existence of the "apertures or openings" from the scope of the reflector. Rather, the plain language of the claim simply contemplates a reflector which encompass all of its characteristics and aspects such as "apertures and openings." In other words, the relevant reflectors with their openings are not somehow separated out so as to exclude the "apertures or openings" from the reflector's scope. To accept Defendants' position would appear to require this Court to exclude two of the three preferred embodiments disclosed in the '414 Patent. For instance, as noted by the Special Master, the specification of the '414 Patent, when describing the second embodiment disclosed in Figure 9 discusses the existence of open spaces "to permit the passage of air into the interior of the fixture" and "to permit the passage of heated air outwardly from the fixture." ('414 Patent, Col.8, 11.30-44). In addition, the specification, when describing Figure 16 of the third embodiment states that the reflector possesses "slots to permit the passage of heated air outwardly from the reflector." ('414 Patent, Col.9, 11.53-59). Thus, it is clear that the preferred embodiments and specification of the '414 Patent contemplate the existence of holes within the reflectors themselves that would allow for the transmission of light along with the passage of air. To accept Defendants' proposed construction of "reflector means" the Court would simply have to ignore the relevant "apertures or openings" within the reflectors. However, to do so would run contrary to what is already contemplated within the relevant embodiments and thus would potentially exclude such embodiments as well as add an additional limitation requiring the reflectors to be completely reflective despite the existence of holes that permit the passage of light. Such a construction is contrary to Federal Circuit authority. See Primos, Inc. v. Hunter's Specialties, Inc., 451 F.3d 841, 848 (Fed.Cir. 2006) ("[W]e also should not normally interpret a claim term to exclude a preferred embodiment."). In addition to the support of the Special Master's construction of "reflector means" within the preferred embodiments and specification of the '414 Patent, it appears that the extrinsic record would support the determination that the reflector may allow the transmission of light through the reflectors themselves. Notably, the Lighting Handbook from the Illumination Engineering Society of North America, which both Parties placed heavy reliance on, contemplates the possibility that a "reflection" provides for the possibility of the transmission of light through the reflecting material. (Defendants' Markman Hearing Exhibits, Exhibit 39, p.17). While this extrinsic evidence is by no means controlling it is consistent with the Special Master's interpretation and the intrinsic record of the '414 Patent. Accordingly, the Court will adopt the Special Masters' construction of "reflector means."

21. The method according to claim 33, wherein during said seaming operation at least a portion of said can end wall first portion is reformed by bending upward by an angle of at least about 26 [degree] ('875 patent, claim 34)

Crown's proposed construction is "[t]he can end wall first portion is formed again by turning upward by an angle of at least about 26 [degree]." 89 Rexam's proposed construction is "[a] portion of the upper wall (chuck wall), which is about the first location, is bent upwards, when looking at a cross section drawing, around the first location by 26 degrees (less 1 degree or plus 1 degree or more)." 90

89 Id.

90 Id.

The court adopts Crown's construction for the same reasons set forth in 18, above: "the can end wall first portion is formed again by turning upward by an angle of at least about 26 [degree]."

- 3828 -
1. "At Least Three Layers Reformed Into"

a. Construction

This claim limitation is present in all four patents at issue. While the patents' wording varies slightly, the parties agree that this limitation should be construed the same in all four claims. The parties dispute the meaning of this limitation.

Hallmark contends that this limitation incorporates the limitation that the paperboard is folded and turned back upon itself to form three thicknesses of paperboard laid one over the other. It bases this argument on the prosecution history. In that history, James River changed the phrase "folded areas in which the paperboard has been turned over and sealed on itself" (PX-9) to "densified region…including fiber from at least three thicknesses of said blank" (PX-8, Preliminary Amendment) and then to folds or pleats "including at least three layers of paperboard." (PX-8, Amendment at 2).

James River contends that the limitation refers to the three layers that are necessary to form any pleat. It argues that Hallmark's error is in construing the claim limitation to refer to the pleats as containing three layers after formation, not to the origin of the pleats as being formed from three layers before being pressed.

It is not the densified regions, but the pleats from which they are formed, that contain at least three layers of paperboard. This is clear from the language of the claims. The '496 claim reads: "densified regions being formed from pleats including at least three layers of said paperboard reformed…." PX-003 at 11, lines 17-19 (emphasis added). The '140 claim speaks of: "a plurality of circumferentially-spaced densified regions radially extending through annular portions of said rim, said densified regions including at least three layers of paperboard reformed into substantially integrated fibrous structures…." PX-001 at 14, lines 12-14. The '500 claim describes a process in which: "during said shaping step, forming a plurality of radially-extending, circumferentially-spaced pleats in said rim, each said pleat including at least three layers of fibrous substrate….." and "applying heat and pressure to said rim sufficient to … transform each said pleat into a substantially integrated fibrous structure." PX-002 at 13, lines 62-68, at 14, line 1. Finally, the '499 claim refers to "pressing said blank to form said container including pleats of at least three layers of said paperboard" and "applying sufficient heat and pressure … to reform each said pleat into a substantially integrated fibrous structure…. PX-004 at 11, lines 6-16. Each patent claim is clear from its own language, given its ordinary meaning, and together, they reinforce each other. Pleats are formed in the shaping step, and the application of heat and pressure alters the pleats to form the densified regions. In understanding how this limitation fits into the claims as a whole, it is clear that the three layers retain separate identity only in the pleat before reformation; the densified regions cannot have three layers after reformation if the layers no longer have separate identities. Thus, it is the pleats, before reformation by heat and pressure, not the densified regions, that must contain at least three layers of paperboard.

3258

1. "Refrigerated source liquid"

The parties agree that "refrigerated source liquid" means "juice, yogurt, etc. which serves as base level ingredients in the preparation of pulverized, slush-like consistency consumer beverages." See '448 patent col. 1 l. 10. The parties disagree, however, over whether "at least one" needs to be included in the construction of "refrigerated source liquid." The issue of whether "at least one" needs to be included in both the terms to be construed and the definition runs throughout a number of the terms. Foodie argues that if the term itself includes "at least one," then the definition should include it also. The Court agrees with that proposition, but also agrees with Jamba Juice that "at least one" should not actually be included in any of the terms at issue. 3 The meaning of "refrigerated source liquid" is what is at issue, and "at least one" is not relevant to the construction of the actual term (or any of the other terms including "at least one"). Moreover, "at least one" is obvious to the jury and need not be construed, and it would be cumbersome and redundant to include the extra phrase in both the terms to be construed and in the definitions. Accordingly, because the Court finds that "at least one" should not be included in any of the terms to be construed, the Court adopts the parties' agreed construction as stated above for "refrigerated source liquid" as the construction of the Court.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -
We believe that the district court erred in the first instance by applying the recapture rule to rewrite the claims, essentially claim. Id. at 1470. If it does, the recapture rule bars the "whether the broader aspects of the reissue claims relate to the surrendered subject matter." Id. at 1468-69. This is broader than the patent claims." Id. at 1468. First, the original and reissued claims are construed to ascertain "whether and in what aspect the reissue claims are pertinent to the subject matter surrendered during prosecution are impermissible." Hester Indus., Inc. v. Stein, Inc., 142 F.3d 1472, 1480 (Fed. Cir. 1998). We described in depth the required analysis in a recapture case in In re Clement, 131 F.3d at 1468-70. First, the original and reissued claims are construed to ascertain "whether and in what aspect the reissue claims are broader than the patent claims." Id. at 1468. If the reissue claims are broader in some way, the court must determine "whether the broader aspects of the reissue claims relate to the surrendered subject matter." Id. at 1468-69. This is accomplished by reviewing the prosecution history to determine what has been surrendered and determining whether the additional coverage of the reissue claim reads on the surrendered matter. Id. at 1469-70. If it does, the recapture rule bars the claim. Id. at 1470.

We believe that the district court erred in the first instance by applying the recapture rule to rewrite the claims, essentially
unmaking the change that the PTO had permitted. Claim construction should not, of course, be blind to validity issues: "claims should be so construed, if possible, as to sustain their validity." Rhine v. Casio, Inc., 183 F.3d 1342, 1345 (Fed. Cir. 1999). A claim that is interpreted too broadly will run into validity issues, providing motivation for the construing court to choose a narrower interpretation if possible. However, validity construction should be used as a last resort, not a first principle: "we have limited the maxim [that claims are to be construed to preserve validity] to cases in which the court concludes, after applying all the available tools of claim construction, that the claim is still ambiguous." Phillips, 415 F.3d at 1327 (quotation marks omitted). Construction of the claims here is not so difficult a problem as to require resort to the validity maxim.

MBO clearly sought in reissue to broaden the scope of its patent coverage by rewriting its claims to cover all relative movement, not just retraction. That broadening was the explicitly stated purpose of the reissue application. Application for Reissue of U.S. Patent No. 5,755,699, Reissue Declaration of Blecher et al. at 2 (July 1, 1999) (original claims "claim less than we had a right to claim in that they fail to claim clearly that any relative movement . . . will achieve the desired result of preventing needlestick hazard, whether or not the needle moves toward the body and connected safety device"). In light of these clear statements in the prosecution history of the RE '885 patent, we are compelled to give effect to MBO's stated intent to broaden the coverage of its claims. Whether those broadened claims are invalidated by the recapture rule is an issue separate from construction. In the narrowly limited appellate posture of this case, only the question of infringement, not validity, is before us. 3

3 This is not to say that the recapture rule may never properly factor into claim construction. In a case where the available techniques of construction yield two possible interpretations of a reissue claim, only one of which includes previously surrendered matter, it would be correct to resolve the ambiguity by selecting the interpretation not barred by the recapture rule.

All of the disputed method claims, both original and reissued, refer to "providing a body slidably receiving the needle." The district court construed that phrase as referring to "a stationary body into which the movable needle retracts." We disagree with that construction. In our view, the term refers to the physical relationship between the guard body and the needle, such that the guard body is capable of sliding relative to the needle. That construction of "slidably receiving" is dictated in part by the embodiment depicted in Figures 3 and 4 of the RE '885 patent; those figures show the needle extending forward, not retracting backwards, relative to the guard body. See RE '885 patent col.6 ll.25-32. Therefore, we find that the terms "relatively moved," "slidably receiving," and their cognates permit the needle and guard to slide in any manner.

2. "a relatively smaller patch of web material"

First Quality argues that "a relatively smaller patch of web material" found in Claim 1 of the Ungpiyakul Patent should be construed to mean "a piece of material that is smaller than the absorbent pad, topsheet layer, and backsheet layer." KC offers that the phrase means "a piece of material that is at least somewhat smaller than the backsheet layer."

After review, we find that the intrinsic evidence supports KC's proposed construction. The specification provides, in relevant part:

The article generally includes a backsheet layer 236, and a substantially liquid permeable topsheet layer 239 which is disposed in an adjacent facing relation with the backsheet layer. An absorbent pad 54 is sandwiched between the topsheet and backsheet layers...Accordingly, marginal portions of the topsheet and backsheet extend beyond the periphery of the absorbent pad to form front and rear waistband edges and lateral side edges. A relatively smaller patch of web material 228 is secured to an inward or outward facing surface of the backsheet layer.

U.S. Patent No. 5,286,543 at col.6, ll. 10-23 (emphasis added). Likewise, Claim 1 specifies that "[a]n article comprising: a
backsheet layer; a substantially liquid permeable topsheet layer...An absorbent pad sandwiched between said topsheet and backsheet layers; and a relatively smaller patch of web material secured to an inward or outward facing surface of the said backsheet." U.S. Patent No. 5,286,543, Claim 1. Each of these pieces of evidence indicate that a small patch of web material must be attached to the inward or outward facing surfaces of the backsheet. It follows that in order to be attached to the backsheet the web material must be smaller than said backsheet. Furthermore, the only term appearing in the same clause as a "relatively smaller patch of web material" is the word "backsheet." This indicates that the web material must be relatively smaller than the backsheet in order to be attached to said backsheet. Contrary to First Quality's argument, KC's construction does not impermissibly expand nor limit the scope of the patent. Instead, KC's construction is supported by the claim and specification language. Therefore, we conclude that "a relatively smaller patch of web material" means "a piece of material that is at least somewhat smaller than the backsheet layer."

3261

The court heard oral argument on the issue of claim construction in order to better understand the extent of the parties' disagreement about the construction of the claims. During oral argument, both parties focused primarily on the '273 patent. Since neither party has distinguished the facestock claims of the '273 patent from the facestocks claimed as part of the process patents, the court's reasoning in this opinion regarding construction of the '273 patent should be considered applicable to the '532 and '669 patents.

When considering the claims, the "terms of a claim will be given their ordinary meaning, unless it appears that the inventor used them differently." ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1579 (Fed. Cir. 1988) (citation omitted). Claim 19 of the '273 patent provides:

19. A multilayer facestock for use in pressure-sensitive label, tape or sign applications comprising a coextrudate of cojoined layers comprising a relatively thick core or base layer of polymeric film material of a stiffness of between 10 and 100 Gurley and which contributes the majority of the dimensional stability and stiffness of labels or signs cut or formed from the facestock, and at least one relatively thin skin layer, said skin layer being on the face side of the coextrudate and having an ink-printable surface, and a pressure-sensitive adhesive layer combined at the side of said coextrudate opposite said face side.

Claims 20 and 21 are dependant on claim 19 and necessarily incorporate by reference all the elements of claim 19. Claims 19-21 cover a plastic multilayer facestock or film. Claim 1 of the '532 patent provides:

1. A method of economically manufacturing die-cut labels or signs using roll or sheet facestock, comprising the steps of providing a plurality of at least two charges of film-forming resin, coextruding said charges to thereby form a construction in the form of a multilayer extrudate comprising a relatively thick core layer and at least one relatively thin skin layer, the former layer providing the majority of the dimensional stability and stiffness of the construction, preselecting the charge for said core layer, as by selection of density or flex modulus, to provide a degree of stiffness suitable for the label or sign application, preselecting the charge for said skin layer to provide a skin adapted to the intended decorating process, such as printability, or surface performance characteristics, such as weatherability of the facestock, and combining said extrudate with a pressure-sensitive adhesive layer to form label or sign facestock, combining said facestock with a liner, die-cutting said facestock to form a label or sign releasably adhered to said liner and surrounded by a matrix of excess facestock material to utilize non-tearing self-supporting properties of said material to pull said matrix away from the die-cut label or sign.

Claims 3 and 8 are dependent on claim 1 and claim 9 is dependent on claim 8. Claim 14 of the '532 patent provides:

14. A method of economically manufacturing die-cut labels or signs using roll or sheet facestock, comprising the steps of providing a plurality of at least two charges of film-forming resin, coextruding said charges to thereby form a construction in the form of a multilayer extrudate having a face side and a back side, said multilayer extrudate including stiffening layer means which contributes the majority of the stiffness of the construction, preselecting at least one of the charges, as by selection of density or flex modulus, to provide said stiffening layers means with a degree of stiffness suitable for the label or sign application, and combining said multilayer extrudate with a pressure-sensitive adhesive layer and release liner to form linered label or sign facestock, die-cutting said facestock to form a label or sign releasably adhered to said liner and
surrounded by a matrix of excess facestock material, and stripping said matrix of excess facestock material to utilize non-tearing self-supporting properties of said material to pull said matrix away from the die-cut label or sign.

Claim 16 is dependent on claim 14. Claim 1 of the ’669 patent provides:

1. A method of economically manufacturing die-cut labels using roll or sheet facestock, comprising the steps of providing a plurality of at least two charges of film-forming resin, coextruding said charges to thereby form a construction in the form of a multilayer extrudate comprising a relatively thick core layer and at least one relatively thin skin layer, preselecting the charge for said core layer, as by selection of density or flex modulus, to provide said facestock with a degree of stiffness suitable for the label application, preselecting the charge for said skin layer to provide a skin adapted to the intended decorating process, or surface performance characteristics, of the facestock and combining said extrudate with a pressure-sensitive adhesive layer to form label facestock, combining said facestock with a liner, die-cutting said facestock to form a label releasably adhered to said liner and surrounded by a matrix of excess facestock material, and stripping said matrix of excess facestock material to utilize non-tearing self-supporting properties of said material to pull said matrix away from the die-cut label.

Claims 2, 3, 7, 8 and 9 are dependent on claim 1. Claim 11 of the ’669 patent provides:

11. A method of economically manufacturing die-cut labels using roll or sheet facestock, comprising the steps of providing a plurality of at least two charges of film-forming resin, coextruding said charges to thereby form a construction in the form of a multilayer extrudate comprising a relatively thick core layer and at least one relatively thin skin layer, preselecting the charge for said core layer, as by selection of density or flex modulus, to provide said facestock with a suitable degree of stiffness and sufficient body and strength for the label application, preselecting the charge for said skin layer to provide a skin adapted to the intended decorating process, or surface performance characteristics, of the facestock, hot-stretching and combining said extrudate with a pressure-sensitive adhesive layer to form label facestock, combining said facestock with a liner, die-cutting said facestock to form a label releasably adhered to said liner and surrounded by a matrix of excess facestock material, and stripping said matrix of excess facestock material to utilize non-tearing self-supporting properties of said material to pull said matrix away from the die-cut label.

The construction of the facestock claims’ terms and phrases desired by the parties, especially "coextrudate of cojoined layers" and "comprising a relatively thick core or base layer," require the court to look beyond the language of the claims. To aid in construction of the claims, the court must look at the patent specifications. "The specification acts as a dictionary when it defines terms used in the claims or when it defines terms by implication." Vitronics at 1582. The patent inventor is his or her own "lexicographer." ZMI at 1580. Therefore, "the specification aids in ascertaining the scope and meaning of the language employed in the claims inasmuch as words must be used in the same way in both the claims and the specification." Id. (citation omitted).

The patent specifications for the ’273 patent offer several illuminating claim descriptions. The specifications for the facestock offer two prototypical examples in Figures 5 and 6. The coextrudates in these examples "comprise polymeric film materials, are formed by simultaneous extrusion from a suitable know type of coextrusion die, and are adhered to each other in a permanently combined state to provide a unitary coextrudate." Patent ’273, Column 9, Lines 21-26. The elements of the facestock, as described in the specifications, are as follows: "a relatively thick core layer of polymeric film material . . . having a cojoined, relatively thin, ink-printable skin layer at least at the face side of the construction, and having a pressure-sensitive adhesive layer combined at the sides of the construction opposite the face side." Patent ’273, Column 10, Lines 59-66. The facestock is produced "by coextruding a plurality of at least two charges of film-forming resin to form a coextrudate having a relatively thick core layer and at least one relatively thin skin layer . . . and combining the coextrudate with a pressure-sensitive adhesive layer." Patent ’273, Column 10, Lines 67-68; Column 11, Lines 1-8.

The prosecution history of the patents provides similarly helpful evidence for this court. A patent's "prosecution history (or file wrapper) limits the interpretation of claims so as to exclude any interpretation that may have been disclaimed or disavowed during prosecution in order to obtain claim allowance." Standard Oil Co. v. American Cyanamid Co., 774 F.2d 448, 452 (Fed. Cir. 1985). The prosecution history reveals that in the application for the ’273 patent, Serial No. 06/853,772, the inventor, Melvin S. Freedman, distinguished his facestock from a product which is "formed by adhering preformed layers." The patent examiner issued a restriction requirement on October 17, 1986 stating: "the product as claimed can be made by a materially different process such as by adhering pre-formed layers." Def's Resp. Ex. W. In an amendment filed
October 27, 1986, Freedman responded: "The process pointed out by the Examiner, namely adhering preformed layers, cannot be used to form the claimed coextrudate, since if the layers were preformed they would not have been coextruded and would not constitute a coextrudate as called for in [the] independent product claims." Def's Resp. Ex. X.

Based upon a review of the entirety of the patent, including the claim language, specifications and prosecution history, the court concludes that claims 19-21 of the '273 patent should be plainly construed to cover a coextrudate which is a facestock, or plastic film, formed solely by simultaneous, or joint, extrusion of several materials through a die. The immediate result of this simultaneous extrusion, or coextrusion, is a multilayer film wherein the layers are firmly adhered to one another in a permanently combined state, i.e., the patented coextrudate. A facestock formed by adhering preformed layers is not within the scope of claims 19-21 of the '273 patent. Further, in claim 19, the coextruded product must have (1) a thick core or base layer (with a stiffness of between 10 and 100 Gurley); (2) at least one thin ink-printable skin layer on the face side of the product; and (3) a pressure-sensitive adhesive layer on the side opposite the face side. In claim 20, the product is the same as in claim 19 with the addition of a second skin layer between the core or base layer and the adhesive layer. In claim 21, the product is the same as in claim 19 with the addition of a releasable liner on the adhesive.

The parties, especially UCB Films, have also devoted substantial time to arguing that the phrase "core or base layer" in the claims must mean "core layer or base layer" (meaning the core must be made up of only one layer) and not, as Avery argues, "core" (which could have one or more layers) or "base layer." However, the court finds that the patent specifications, on which UCB Films primarily relies, use both the term "core" (e.g. '273 Patent; Column 10, Line 46) and the phrase "core layer" (e.g. '273 Patent, Column 10, Line 60). This court is thus unwilling to apply UCB Films' reading to the claims and cannot find on the basis of this argument that the claims are limited to a core composed of a single layer.

As stated previously in this opinion, the court's construction of the claims of the '273 patent is largely applicable to the facestock portions of the process patents. In light of the above claim construction, this court finds that there are disputed issues of material fact as to whether UCB Films infringed the patents and that infringement remains a question of fact to be submitted to a jury. The motions for summary judgment [154-1, 250-1] are therefore denied.

3262

SurgiLance's primary claim construction argument is that the district court erred in construing the phrase "spring means acting between the lance and the body so that in a relaxed condition of the spring means the lance is in a first retracted position within the body" from claim 1 of the '249 patent. '249 patent, col. 4, ll. 25-27. SurgiLance contends that the term "relaxed condition" refers to a state "free of tension" or "non-energized."

In the 2002 order, the district court held, and the parties continue to agree, that this phrase is styled in means-plus-function format. The district court identified two functions for this means-plus-function limitation, which are that the structure "(1) acts between the lance and the body, and (2) retains the lance in a first retracted position within the body." As to the term "relaxed condition," which is contained within the phrase in question, the district court concluded that neither the intrinsic record nor the prosecution history provided guidance in c on struing the term "relaxed condition. " The district court instead referred to a general usage dictionary definition, stating that "the dictionary definition of the verb 'relax' indicates that the term embodies some relativism: 'to make less tense or rigid, 'to lessen the tension or pressure, 'and 'to abate in intensity. ' See WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 1917 (3rd Ed. 1986)." Based on this definition, the district court construed the term "relaxed condition" as requiring only a relatively "less energized" state. "The 'springs mean' [sic] limitation is, therefore, interpreted to cover a spring, whether zig-zag or coiled, that regains its original shape after being compressed or extended, that functions between the body and the lance that is in an initial state less energized than a second, extended state of the spring, as well as its equivalents under section 112."

In its 2003 order, the district court again addressed its construction of the term "relaxed condition," but found "no good cause to disturb its prior construction of 'spring means'" related to the relaxed condition limitation.

We hold that the intrinsic record demonstrates that the term "relaxed condition" refers to a condition in which the spring has no potential energy. The claim term "relaxed condition" itself suggests an absolute state of no potential energy because it is
not written in a relative fashion, such as "more relaxed" or "less relaxed." Moreover, the specification refers to the condition of the spring depicted in Figure 1, which is not in tension because the end to which the needle is attached is free to move, as "the relaxed state of the spring." '249 patent, col. 2, ll. 25-26. Thus, the specification equates a "relaxed condition" with a condition in which the spring is free from tension, i.e., has no potential energy.

At oral argument, Owen Mumford attempted to counter this evidence from the intrinsic record. Owen Mumford first cited to column 3 lines 7 to 21 of the specification of the '249 patent, which describes the process of energization as the cap slides onto the body. Owen Mumford's counsel emphasize d that the spring becomes more energized as the cap is slid further onto the body. This fact, however, tends to prove only that the term "energizing" has a relativistic component. It proves nothing about the term "relaxed condition," which relates to the initial state before the cap is slid onto the body. Owen Mumford contended that the function of the spring of the '249 patent as a whole is to "impart[,] the necessary energy to spring the lance forward" and that "it is not critical to that function that the spring in its first condition be totally relaxed or partly energized." At most, this argument demonstrates that the function of the device is consistent with an interpretation of "relaxed condition" as either without potential energy or less energized. Accordingly, Owen Mumford's two arguments provide no reason based on the intrinsic record for adopting an interpretation of "relaxed condition" as "less energized."

Nor does the general usage dictionary definition cited by the district court suggest that "relaxed condition" should be interpreted as "less energized." To begin, the district court focused on the "relativism" of the definition of the verb "relax" but did not consider the lack of relativism of the definition of the adjective "relaxed" in the same dictionary. See Webster's Third New International Dictionary 1917 (3d ed. 1986) (defining "relaxed" as, inter alia, "set at rest or at ease"). A further dictionary definition of the adjective "relaxed" in the appellate record that also lacks relativism is "being free from or relieved from tension or anxiety." Random House Dictionary of the English Language 1627 (2d ed. 1987). Other things being equal, the relativistic dictionary definition of the verb "relax" chosen by the district court would appear to be less appropriate than the non-relativistic definition of the adjective "relaxed" because the claim term at issue uses the adjective "relaxed."

Finally, we note that expert testimony from both sides confirms our construction based on the intrinsic record that a "relaxed condition" is a state in which the spring has no potential energy, not merely a state of relatively less energy. Owen Mumford's own expert Robert Mann testified in his deposition that a "relaxed condition of a spring" is "one in which there's no energy." By affidavit, SurgiLance's expert Stephen Lisak testified that "when a spring is in a relaxed condition, it has zero potential energy."

Accordingly, we hold that the term "relaxed condition" as used in the '249 patent refers to a state in which the spring has no potential energy, i.e., is free from tension.

3263

a. "release layer"

DuPont asks the Court to construe the term "release layer" as meaning "[a] transparent or substantially transparent layer to actinic radiation," or, as corrected for grammar, "a layer that is transparent or substantially transparent to actinic radiation." (DuPont Responsive Br. at 37.) But MacDermid proposes this construction: "A layer used for ease in placing and removing an image bearing transparency onto and from the photopolymerizable surface after exposure to a vacuum frame by providing a substantially non-tacky surface to the typically tacky surface of the photopolymerizable layer." (MacDermid Opening Br. at 43.)

Both parties cite the '859 patent specification as support for their respective positions. (DuPont Opening Br. at 37; MacDermid Opening Br. at 43; Tr. at 53-58, 62-65, 171-75, 179.) According to DuPont, MacDermid's proposed construction incorrectly limits the use of a release layer to analog imaging and ignores that, as recognized by both the specification and the Court, such a layer could be used in digital imaging. (Tr. at 53-58, 62-65, 179.) It further contends that MacDermid's proposed construction improperly restricts the term to a preferred embodiment and reads functional limitations into a structural claim element. (DuPont Opening Br. at 37; Tr. at 53-58, 62-65, 179.) MacDermid attacks DuPont's proposed construction as overly broad and inconsistent with the explicit patent language, and adds that a release layer would serve little if any real function in the digital imaging context. (Tr. at 171-75.)
The Court turns to the specification -- which provides a lengthy discussion of "release layer" -- to construe this term:

The primary purposes of a release layer are for ease in placing and removing an image-bearing transparency onto and from the photopolymerizable surface after exposure in a vacuum frame. (An image-bearing transparency may also be referred to herein as a mask, target, silver halide target, and phototool.) The release layer provides a substantially non-tacky surface to the typically tacky surface of the photopolymerizable layer. The release layer can also protect the surface of the photopolymerizable layer from being damaged during removal of an optional temporary coversheet and can ensure that the photopolymerizable layer does not stick to the coversheet. When the thermally removable layer is functioning as a release layer, the layer is transparent or substantially transparent, i.e., insensitive or substantially insensitive, to actinic radiation. ('859 Patent at col. 10, lines 1-15.)

DuPont's proposed construction comes from the final sentence above, but Dupont fails to take into account the remainder of the specification's "release layer" discussion. The proposed construction also is inconsistent with the actual language of claim 21 itself, which refers to an additional layer selected from the group consisting of a "release layer, adhesion-modifying layer, barrier layer, and surface modifying layer, wherein the at least one more additional layer is transparent to actinic radiation." (Id. at col. 45, lines 17-21 (emphasis added).)

But MacDermid recommends an unduly narrow construction of this term, overlooking language in the specification regarding the presence of a release layer in digital imaging. The Court, in the Preliminary Injunction Opinion, addressed the term in the context of tentatively construing the term "thermally removable layer". (Prelim. Inj. Op. at 33-36.) Quoting the specification, the Court noted that "[a] release layer can also be used with digital imaging." (Id. at 35 (citing '859 Patent at col. 40, lines 1-17).) Specifically, the specification describes an example of digital imaging where the plate structure includes a release layer. (Id.)

The Court therefore rejects each proposed construction. Returning to the specification passage quoted above, it appears that the patent essentially characterizes a "release layer" as a "substantially non-tacky surface". ('859 Patent at col. 10, lines 6-7.)

The Court construes the term "release layer" as referring to "a substantially non-tacky surface."
piece needle holder to retract. Id. at 14-15 (citing '733, 11:49-52).

b. Court's Construction

For the reasons stated above, this Court finds that the invention operates through the use of a clamping or fictional force. This Court, however, is not persuaded that the claimed release must be accomplished in the same manner as the installation. The patent teaches alternative methods for providing release of the holding force. Specifically, the patent allows the holding force to be released by spreading the barrel apart slightly, thus releasing the retraction mechanism. See '733, 11:49-52 ("The barrel is flexible and is spread outwardly a slight amount to the position of FIG. 6 just prior to retraction. Here the mating surfaces are separated an amount which reduces the clamping force on the needle holder."). Therefore, although the holding force is created by sliding engagement in this claim, the Patent contemplates another method of its release.

Accordingly, the Court finds that the term "releaseably installed by sliding engagement of said retainer member and said inwardly facing surface" means "installed by sliding the retainer member along the inwardly facing surface to engage it with the wall of the syringe, which creates a clamping or frictional force that can be released at a later time."

The terms "a first region" and "a second region" appear in claim 2 of the '717 patent:

(2) An apparatus according to claim 1 wherein the video display includes a first region for displaying the video game menu options and a second region for displaying the video game menu choices.

Because it refers back to claim 1, claim 2 is considered "dependent" on claim 1. In addition to its own limitations, its also includes all of the limitations of claim 1. 35 U.S.C. § 112, P 4. Accordingly, the "video display" of claim 2 is the same "video display" claimed in limitation (b) of claim 1.

"a first region" and "a second region"

Again relying on Figure 2 of the '717 patent and the constructions it propounded for claim 1, JVL argues that "a first region" and "a second region" are "separate and distinct areas. The first region displays all video game menu choices and the second region simultaneously and separately displays all video game menu options." Def.'s '717 Presentation at 35. Merit proffers an alternative construction of claim 2: "The apparatus of claim 1, wherein: The video screen includes a first area for showing images relating to all of the selectable game menu items. And a second area for showing images relating to the chosen game menu items." Pl.'s '717 Presentation, Ex. 3 at 4.

The primary dispute concerns JVL's use of the additional words "separate and distinct" and "simultaneously and separately." Merit argues nothing in the specification or prosecution history supports the insertion of these words. It specifically takes issue with JVL's reliance on the '717 patent's description of the preferred embodiment. JVL argues that the "detailed description of preferred embodiments" teaches that Figure 2 is a game menu screen "divided into first, second and third regions." '717 patent at 3:48-50. This justification for the "separate and distinct" construction is improper because Figure 2 is a preferred embodiment of the '717 patent that should not limit construction of the claims. Phillips, 415 F.3d at 1323. ("Although the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments."); Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998) (cautioning against limiting claimed invention to preferred or specific embodiments). More importantly, the specification expressly notes that the invention is "not limited" to preferred embodiments depicted in the drawings. '717 patent at 2:65 - 3:2.

Nonetheless, there can be no doubt that "a first" and "a second" region are distinct regions. Anyone, including one of ordinary skill in the art, would understand these terms to refer to two different regions. The specification advises "[t]he present invention is an apparatus for providing menu choices of video games on a video screen having first and second regions." '717 patent at 2:20-22. As JVL points out, Merit stated during the reexamination that "menu options from a region are placed into specific locations in another region" when addressing the construction of claim 8, 3 which also includes the terms "a first region" and "a second region." Def.'s Suppl. Br., Ex. E at 8 (emphasis added).
Claim 8 reads as follows:

(8) An apparatus for programming video game menu choices on a display from a group of video game menu options, the apparatus comprising:

(a) a video screen having

(i) a first region for displaying video game menu choices;

(ii) a second region for displaying video game menu options, the video game menu choices and video game menu options being simultaneously displayed; and

(b) a display controller for causing video game menu options selected from the second region to be displayed in the first region as a video game menu choice.

Relying on the fact that claim 2 depends on claim 1, JVL argues that the first and second regions "simultaneously and separately" display options and choices. The basis for JVL's current interpretation is its earlier construction of "displaying … options and choices" as requiring simultaneous and separate display. Because that construction was rejected, it does not support JVL's current construction of "a first region" and "a second region."

There is no clearer way to interpret "a first region" and "a second region" than the language of the claim itself. The clear and unambiguous meaning is that they are two different regions. No further construction is necessary.

b. "region of interest"

ev3 seeks a construction that would limit the term "region of interest" to "the lesion or stenotic portion of the vessel that is being treated--i.e., the portion of a vessel that has been narrowed by disease." Boston Scientific, on the other hand, argues that the term should be construed as the "area within the patient's vessel where a medical treatment procedure is to be performed." Neither party disputes that the term "region of interest" refers to a fixed location.

The term "region of interest" appears in several claims of the '520 Patent. There is no indication in the intrinsic evidence that the term "region of interest" should be limited strictly to the lesion or stenotic portion of the vessel being treated. Instead, the Court construes "region of interest" as the "location of a percutaneous procedure to be performed within a patient's vessel." 2

2 This construction also applies to the term "region of interest" in the '987 and '505 Patents.

f. "first and second regions"
The phrase "first and second regions" appears in claim 1 of the '366 Patent. The term "regions" is used to describe the outer surface of the bottom end cap that seals against the inside wall of a housing. Specifically, claim 1(c)(ii) reads: "said second end cap sealing portion including at least first and second regions of different diameters." 19

Donaldson asserts that this phrase should be construed as "areas of a structure's surface" or "areas of an end cap's surface." Baldwin asserts that the phrase should be construed as "two parallel offset sealing surfaces." In support, Baldwin argues that the patent specification describes a single embodiment of the regions on the second end cap outer annular surface, which "in the broadest sense are parallel and offset." In particular, Baldwin argues that FIG. 6 of the patent includes a set of parallel offset sealing surfaces. In addition, Baldwin argues that the specification uses the term "region" interchangeably with the term "step" in describing the annular sealing portion surface, and that such "steps" are parallel and offset.

The patent specification uses the term "region" to describe the surface of both the top end cap and the bottom end cap that seals against a housing. With respect to the top end cap, the specification provides:

Thus, when inlet tube 14 is inserted through aperture 28, end cap material in region 40 will be compressed. In this manner a seal is formed at region 41.

'366 Patent, col. 6, ll. 37-40; '009 Patent, col. 6, ll. 41-43. The specification goes on to describe the "region" of the upper end cap as a ribbed, stepped, or tapered funnel:

For the particular arrangement shown in FIGS. 1-7, material at region 40 is compressed between and against both inlet tube 14 and inner support 26; that is, inner support 26 is set sufficiently deeply into end cap 23 that a portion of it is positioned behind compressible region 40, to provide support. Thus, a good seal is effected. The shape of aperture 28 in region 41 will preferably be as a ribbed or stepped funnel (or tapered), to facilitate engagement."

'366 Patent, col. 6, ll. 50-58; '009 Patent, col. 6, ll. 54-61. The description of the term "region" with respect to the top end cap is relevant to the Court's construction of "regions" in claim 1(c)(ii), as it is used to describe the outer surface of the bottom end cap. See Phillips, 415 F.3d at 1314 ("Because claim terms are normally used consistently throughout the patent, the usage of a term in one claim can often illuminate the meaning of the same term in other claims.").

The specification also describes the outer surface of the bottom end cap that seals against the filter housing. See '366 Patent, col. 9, ll. 26-48; '009 Patent, col. 9, ll. 30-53. While that portion of the specification describes a "preferred configuration for surface 75" that "includes steps 101, 102 and 103, with extensions 105 and 106 therebetween," the patent also describes different shapes for the bottom end cap. In particular, FIG. 13 of the '366 Patent illustrates a mold used to make a second end cap with a different configuration than the "stepped" configuration pictured in FIG. 6. Even though the specification does not discuss in detail the end cap that would result from using the mold in FIG. 13, it discloses a generally tapered configuration to one skilled in the art.

Accordingly, the Court determines that Baldwin's proposed definition of regions requiring two parallel offset sealing surfaces would improperly limit the claim to the "stepped" configuration of an embodiment. Consistent with the claim language and the specification, the Court construes "regions" as "areas of an end cap's surface."
There is no dispute that the term "support member" means that it holds up or serves as a foundation or prop for the connector and/or a portion of the connector. The parties hotly debate, however, the meaning of the modifier "reinforcement." Amphenol argues, and Maxconn disputes, that it indicates that the member must be removable. In particular, Amphenol argues that the prosecution history demonstrates that the term "reinforcement support member" indicates a component that reinforces and supports the contact in such a manner that it can be removed to allow access to the interior of the connector for inspection and/or repair of the contacts without destroying the integrity of the connector so that the connector is reusable.

a. Claim language

The Court agrees with Maxconn that the language of the claim itself does not support Amphenol's position that the word "reinforcement" somehow implies "removable." Indeed, at oral argument, Amphenol concurred that the ordinary meaning of the term "reinforcement" does not require that the member be removable.

b. Specification

At oral argument, the parties took the position that the specification provides no useful guidance on whether the support member must be removable.

c. Prosecution History

The entire debate over the meaning of this term centers on the prosecution history. Maxconn points out that the examiner had rejected all claims of the '017 patent as being anticipated by a patent issued to Evans, which describes a connector body with contact receiving cavities. In Evans, the contacts are not independent of the supporting member; rather, the supporting apparatus and the contacts are molded into one piece. Amphenol argues that Maxconn gave a special meaning to "reinforcement" in the course of prosecution in order to emphasize that the member was removable to prevent damage to the contacts.

i. The Original Application

The original application contained three independent claims: Claims 1, 7, and 14. Application Claim 1 was ultimately cancelled. Application Claim 7 ultimately became Claim 1 and Application Claim 14 ultimately became Claim 6 of the Maxconn '017 patent. Accordingly, the Court will focus its discussion on the prosecution history of Application Claims 7 and 14.

Neither of these claims initially included the word "reinforcement." Application Claim 7 claimed "a locking support member having a mating means for selectively engaging said connector body at said open-ended rear surface . . . ." Application dated April 24, 1987, at 9. Application Claim 14 claimed "[a] support device for portions of angulate contact elements within an interior of a multiple contact connector having a front mating surface and an open-ended rear surface, comprising, a locking support member slidably fit within an open-ended rear surface of a multiple contact connector . . . ." Application dated April 24, 1987, at 11. Initially, the applicant explained that the "locking support member" "permits repair of individual contact elements" in that it "may be removed from the connector," Application dated April 24, 1987, p. 7, and that "[the member] may be detached from the connector to facilitate connector repair." Application dated April 24, 1987, p. 3.

ii. Rejection of Original Claims

The patent examiner found Application Claim 7 unpatentable as anticipated by Evans in view of Reuss or Silbernagel. The examiner also found Application Claim 14 to be anticipated by Evans.

iii. Applicant's First Amendment

The applicant thereafter filed a Substitute Amendment, 3 amending the original claim for a "locking support member" with "locking reinforcement support member." Substitute Amendment mailed December 30, 1987 (emphasis added). The Substitute Amendment pointed out the differences between the present invention and the Evans patent. Among other things,
the applicant argued that Application Claim 14 was distinguishable from Evans in that the "contacts are independent of the supporting member and remain so when the supporting member is removed, such as for visual inspection of the interior of the connector." Substitute Amendment mailed December 30, 1987, p. 6.

3 On December 1, 1987, the applicant filed the first amendment, but the Examiner refused to enter it for failure to comply with a rule concerning renumbering of claims.

As to Application Claim 7, the applicant distinguished the prior art by saying that "the locking support member is removable to allow access to the interior of the connector for inspection and/or repair." Substitute Amendment mailed December 30, 1987, p. 9. He further explained that the removability element was nonobvious: "If the support wafer assembly was removed from the Evans connector, the wire array would be eliminated. . . . Therefore, it teaches away from a removable support connector and would not be obvious to do such." Substitute Amendment mailed December 30, 1987, p. 9.

"Applicant is claiming a connector with a support member . . . [which] when removed does not destroy the integrity of the connector." Substitute Amendment mailed December 30, 1987, p. 9.

Discussing the applicable level of skill in the art, the applicant stated that "the present invention is a connector with a support member that when inserted or removed does not destroy the integrity of the connector . . . . The prior art does not anticipate, teach or suggest the present invention of a removable locking support member in an electrical connector." Substitute Amendment mailed December 30, 1987, p. 10.

iv. Rejection of First Amendment

On July 21, 1988, the examiner rejected the claims, explaining that Application Claim 7 was anticipated by McHugh and that Application Claim 14 was anticipated by Silbernagel.

v. Second Amendment

The applicant then filed an Amendment After Final Rejection. As to Application Claim 7, the applicant amended the claim to incorporate features the examiner had deemed to be patentable (and unrelated to removability). Amendment mailed September 13, 1988, pp. 5-6. As to Application Claim 14, the applicant stated that the invention is an improvement over Silbernagel because the reinforcement support member "is removable to allow access to the interior of the connector for inspection and/or repair." Amendment mailed September 13, 1988, p. 6.

This review of the patent prosecution reveals that the applicant repeatedly argued to the examiner that the point of novelty of the '017 patent was that, unlike previous incarnations of connectors featuring contact wires inextricably encased in supporting material, this new type of support device could be removed from the connector body so as to leave the connector wires intact and to facilitate inspection or repair of the wires.

Maxconn seeks to avoid the effects of the prosecution history by arguing that the statements concerning removability related only to the cancelled Application Claim 1. This argument has no merit. As demonstrated above, the applicant made many representations concerning removability directed to all application claims in general and to claims that became patent Claims 1 and 6. Patent claims may not be interpreted one way in order to obtain their allowance and a different way against accused infringers. See Southwall Technologies, 54 F.3d at 1576.

d. Extrinsic evidence

Reliance on expert testimony is unnecessary since the meaning of the disputed terms can be ascertained from a reading of the prosecution history.

e. Construction
The "reinforcement support member" is a member that can be removed from the connector body without destroying the integrity of the connector in general or the contact wires in particular so as to facilitate inspection or repair of the contacts.

1. Language in Dispute: "A relative concentration of material."

4 Does "a relative concentration of material" mean (1) the presence of some material relative to the hollow lumens or (2) sufficient material to stiffen the tip relative to the remainder of the catheter body?

--- Footnotes ---

4 For each issue to be decided by the Court, Plaintiffs' proposed claim interpretation is listed as (1) and Defendant's proposed claim interpretation is listed as (2).

--- End Footnotes ---

Answer: "A relative concentration of material" means sufficient material to stiffen the tip relative to the remainder of the catheter body.

a). Claim Language

The Court must interpret the term "relative concentration of material." The term "relative" is a comparative term and requires a determination of what is being compared. The claim does not explain to what the relative concentration of material should be compared. Plaintiffs argue it should be compared to the hollow lumen. Arrow argues that when looking at the claim language in the patent, the meaning of "relative concentration of material" cannot be determined because it does not say to what it is relative. The Court agrees. Therefore, the Court must look to the specification and written descriptions for guidance.

b). Written Description

The specification of the '968 patent supports Arrow's construction of the claim. The specification clearly demonstrates that the term "relative" relates to a comparison of the stiffness or rigidity between the catheter tube, the body, and the tip. Each time the words "relative concentration of material" appear in the specification, they appear as a relative concentration to stiffen the tip. This is true in the Abstract, the Summary of the Invention, and also in the Preferred Embodiment.

The abstract explains: "to provide improved dilator characteristics, preferably the tip includes a relative concentration of material for rigidity." (Abstract). Similarly, the summary of the invention describes the conical tapered tip: "[it] comprises a relative concentration of material to impart relative rigidity so that the tip functions as an effective dilator for soft tissue and veins." ( '968 patent, col. 2, lines 38-41). In the preferred embodiment, the specification describes figure 7 as showing a conical tip formed with "a relative concentration of material 23 to stiffen the tip 20. This stiffening aids penetration of the tip 20 into the body cavity (not shown) and also aids the dilation of soft tissue such as veins." ( '968 patent, col. 4, lines 16-21).

c). Prosecution History

The prosecution history is also consistent with Arrow's claim construction. Dr. Mahurkar described the purpose of the relative concentration of material in his prosecution of the '968 patent: "This relative concentration of material further prevents kinking of the catheter tip during insertion." (Def. Ex. 2 at NSHN 128717). Thus, it is the relative concentration of material that stiffens the tip relative to the catheter body, which prevents it from kinking.

d). Prior Litigation

Judge Easterbrook in his opinion In re Mahurkar, 831 F. Supp. 1354, 1359 (N.D. Ill. 1993) discussed figure 7 of the '968 patent.
patent. He explained that figure 7 "shows that the intake lumen of the Mahurkar catheter is sealed off below the intake ports and replaced with a plug of plastic, which the claims of the patent call a 'relative concentration of material.' (This both stiffens the tip and eliminates space in which blood may pool and clot.)" In re Mahurkar, 831 F. Supp. at 1359.

Relative Movement

Konami argues that "relative movement" should be construed as "continuous movement of one thing with reference to another." Defendants Roxor and Redoctane contend that the term requires no construction, and Defendant MadCatz proposes that if the Court decides to construe the term, it should mean "movement of one thing with reference to another." In addition to whether "relative movement" should be construed at all, the parties disagree about the propriety of Konami's requirement that the movement be "continuous." The Court finds that the term requires no construction because the patentee used the term in accordance with its ordinary accustomed meaning, and additionally finds that Konami's "continuous" limitation lacks support as applied to "relative movement." n10

"Relative movement" is generally found in the following context: n11

a guidance unit effecting display of relative movement between said first and second display parts;

said guidance unit including a control section for controlling said relative movement to display a matching relationship between said first and second display parts in timed relationship with said rhythmic piece to thereby direct the player to actuate said actuateable parts (emphasis added).

This claim language suggests that the patentee used the term "relative movement" in accordance with its normal and accustomed meaning, which encompasses all types of movement including "continuous" and "non-continuous" movement. Rexnord Corp., 274 F.3d at 1342. However, Konami argues that the specification teaches that the display parts are, in fact, a series of discrete stationary images rapidly displayed to create the illusion of continuous movement. In support, Konami points to a part of the preferred embodiment describing the allocation of memory that loads the display parts "without interruption." See 8:26-29. The Court finds this excerpt is insufficient to overcome the presumption that "relative movement" should carry a broader meaning, which is in accord with its ordinary and accustomed meaning. CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d at 1366.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n10 The Court finds that "movement of one thing with reference to another" is not helpful because it merely confirms the ordinary meaning of "relative movement." Thus, the Court will focus on Konami's "continuous" limitation, and on whether "relative movement" should be construed at all.

n11 "Relative movement" appears in claims 11, 22, 28, 36, 42, 46, 48, 49, and 50, but once again, the Court will use claim 11 as an exemplar.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - -
display surface 31 of the monitor 3 in scroll display is written. The scroll display control section 110 causes a stepping position indication marks from the mark memory 111 to be written as scroll images into a display memory 3a in such a manner that the reading addresses are shifted sequentially at predetermined time intervals. In this manner, in addition to dance images which are not scrolled, stepping indication marks which are scrolled are also transferred in sequence to the display memory 3a, and furthermore, the contents of the display memory 3a are repeatedly read and displayed in known display scanning means at a cycle, such as 1/60 seconds, and on the display surface 31, the stepping position indication mark is scrolled and displayed on the display surface 31 and the dance image is displayed in a moving-picture manner as a background image (emphasis added). 8:19-44.

The emphasis on "scrolling," which appears in dependent claim 32 as a particular sub-category of "relative movement," indicates that this excerpt describes a preferred embodiment including "scrolling" but the more general concept of "relative movement" is not implicated.

As noted above, the patentee used "relative movement" in its normal and accustomed meaning, which includes both "continuous" and "non-continuous" movement. The claims do not suggest that any particular type of movement was contemplated, and although Konami argues that the specification teaches a particular type of movement, that guidance is not particularly strong or clear as to "relative movement" and seems to read more directly on "scrolling." Therefore, the Court finds that this term's ordinary and accustomed meaning controls, and no construction is necessary.

Relative Position

The '754 patent teaches:

a programmable microcomputer control apparatus for controlling the relative motion between a tool and a workpiece comprising … indicator means for providing at an output digital signals indicative of the relative position between the tool and the workpiece.

Def. Ex. A (Pat.) at col. 14, ll. 41-46. Defendants argue that this is a means-plus-function element. Defendants are correct; the element discloses a function (providing output signals indicative of relative position) and does not describe the structure used to accomplish that function. See Cole v. Kimberly-Clark, 102 F.3d 524, 531 (Fed. Cir. 1996) ( means-plus-function elements "must not recite a definite structure which performs the described function."). In such cases, the Court must adopt the structures set forth in the specification as a limit on the element.

Defendant also argues that this element must be limited to an indicator which directly measures the relative distance between the tool and the workpiece rather than indirectly calculating this distance by measuring the absolute distances of the tool and the workpiece from some fixed reference point. Plaintiff argues that the indicator successfully indicates the "relative distance" between the tool and the workpiece regardless of whether it directly measures the distance between the tool and the workpiece, or indirectly determines their relative distance from each other by reference to some fixed point. Plaintiff therefore argues that the language of this element does not support such a distinction. To the contrary, plaintiff argues that the patent specification mandates against it.

Defendants contend that plaintiff relied on a distinction between direct and indirect calculation of the distance between the tool and the workpiece by distinguishing between devices that measure "relative" and "absolute" position in the prosecution history. For example, Hurco distinguished the Kokai patent by stating: "Kokai discloses current position register 7 storing absolute position, but no apparent indication of relative position," See Def. Ex. D at HA022961, while simultaneously claiming that the '754 patent "requires the indication of the relative position of the tool and the workpiece."

In response, plaintiff notes that although the '754 patent uses the phrase "relative position," the patent's specification itself describes the position of the workpiece as being determined by reference to an absolute, fixed point on the machine tool table. In particular, the specification states:

When the program is in data block zero the table zero may be established over the full range of table travel by pushing
Def. Ex. A (Pat.) col 6, ll. 30-34. Plaintiff therefore argues that the phrase "indicative of the relative position between the tool and the workpiece" must be construed to include systems that measure the location of the workpiece from some fixed point on the machine tool table. Although plaintiff cannot explain the prosecution history excerpt defendant cites regarding "absolute position," the exact meaning of this excerpt is unclear, and plaintiff's interpretation seems to accord better with the language of the specification itself. The Court therefore rejects defendants' proposed limitation.

H. "Relative Sliding Movement Between the Auxiliary Device and Weapon Causes the Inclined Surface to Cause the Latching Mechanism to Overcome the Biasing Force of the Spring-Biased Mechanism"

The quoted phrase is used only in claim 27. Insight proposes a construction for the phrase, while Glock and SureFire contend that no construction is required. Insight states that the phrase means "that the spring-biased mechanism includes an inclined surface, such as depicted in the patent's Figure 6, [] that is configured so that when the auxiliary device slides onto the weapon, the sliding motion of the weapon causes the sloped surface to be pushed against the biasing force of the spring that biases the spring-biased mechanism." Neither Glock nor SureFire have responded to Insight's proposed construction.

Claim 27 is dependent on claim 24, which claims the auxiliary device of claim 1 in the circumstance when the "spring-biased mechanism comprises a latching mechanism." Claim 27 provides a specific form of latching mechanism, using an inclined surface as part of the spring-biased mechanism. The distinction appears to be that the inclined surface of the spring-biased mechanism "facilitates the installation of the auxiliary device on the weapon." 8:21-22. In other words, the inclined surface causes an "automatic retraction as the auxiliary device is slid onto the weapon [that] simplifies installation, as it eliminates the need to manually retract the transverse bar as the auxiliary device is being installed." 8:34-38. Therefore, the specification provides sufficient additional description of the invention claimed in claim 27 so that additional construction is not necessary.

b. Court's Construction

Plaintiff contends this term should be given its commonly understood meaning, and no construction is necessary. Alternatively, if some construction is required, Plaintiff asserts the term describes an orientation whereby one item is positioned apart from another, forming a gap in between and that there is no requirement that the spaced relationship be "parallel." (’631 Patent at 7:6-11).

In one of the embodiments, the fin structures have been oriented "in parallel spaced apart relation" to one another. (’631 Patent at 3:19-20.)
Patent at 4:30-31). The specification explains that, in this particular embodiment, "the cover plate is provided with an elongated inlet which is generally aligned with [the] gap." (631 Patent at 4:32-33). That is, the parallel positioning of the fin structures in that embodiment is tied to the corresponding shape of the air flow inlet.

According to Plaintiff, while a parallel arrangement may be a sufficient structure, it is not necessary. Plaintiff argues there is no reason why another embodiment using a differently-shaped air inlet would not be allowed to use a differently-shaped gap. Plaintiff relies on the fact that the claim language only requires a "relative spaced relation" instead of a "parallel spaced relation" like the embodiment discussed at Col. 4, Lines 30-31. Again, Plaintiff assert the specification warns that the claims do not require any particular shape or design for the gap, including any shape or design described in the preferred embodiments. (631 Patent at 7:6-11).

Defendants suggest that unless "relative" is defined to mean "parallel," it would be meaningless. The Court agrees. If construed as Plaintiff proposes, the term "relative spaced relation" would encompass any spatial positioning of the fin structures so long as a gap is formed therebetween. As urged by Defendants, such a construction is inappropriate because it encompasses a seemingly infinite number of spatial orientations of the fin structures. Positioning the fin structures at any position other than parallel to each other would hinder the stated goal of the '631 Patent, namely to provide a split-feed, transverse air flow such that air flow is divided into two portions and passed through the fin structures.

The specification of the '631 Patent discloses, in all shown embodiments, that the fin structures are positioned in a parallel relationship. Each figure depicting the heat sink assembly in the '631 Patent shows the fin structures positioned parallel to each other with an unoccupied space extending from the second surface. This "spaced relationship" is described in the specification as nothing but "parallel." (631 Patent at 4:27-30 ("It will be seen further in FIG. 1 that first fin structure 16 and second fin structure 18 are affixed to the top plate 12 on the surface opposite mounting surface 13 in parallel spaced apart relation")). The Court notes that the '631 Patent describes the invention as a whole. Thus, this description of parallel spaced relation limits the scope of the invention. See Tivo, Inc. v. Echostar Comm. Corp., 516 F.3d 1290, 1300 (Fed. Cir. 2008) (Noting the specification referred to the separation aspect of the "invention" and not merely one embodiment of a broader invention, the Federal Circuit held that "[w]hen a patent thus describes the features of the 'present invention' as a whole, this description limits the scope of the invention."). This construction is further supported by the fact that the cover plate of the '631 Patent, which encloses the fin structures, is specifically designed to fit with fin structures that are positioned in a parallel relationship.

The "cautionary language" in the '631 Patent that Plaintiff relies upon, which states that "various modifications" can be made and "alternative materials, shapes and dimensions may be utilized," does not compel the construction Plaintiff advances. Such boilerplate language is given no weight here. Fromson v. Anitaec Printing Plates, 132 F.3d 1437, 1447 (Fed. Cir. 1997) (rejecting boilerplate statement that other "suitable liquids" could be used as insufficiently specific); Honeywell Intl', Inc. v. ITT Indus., 452 F.3d 1312, 1318-19 (Fed. Cir. 2006) (stating, in the context of patentee's statement during prosecution, that "such a broad and vague statement cannot contradict the clear statements in the specification describing the invention more narrowly"); Aspex Eyewear, Inc. v. Altair Eyewear, Inc., 386 F. Supp. 2d 526, 535 (S.D. N.Y. 2005) (In the absence of any specific statement in the specification, "[g]eneralized disclaimers provide no guidance in defining which variations are within the scope of the claim language and which are not.").

Although the Court agrees the fin structures must be positioned apart in a paralleled relationship, the Court is not convinced, as urged by Defendants, that the unoccupied space extends from the second surface. Therefore, the Court construes "being in relative spaced relation" to mean "positioned apart from and parallel to each other such that an unoccupied space is formed between the fin structures."

Similarly, the district court also properly construed the term "relative to" ("identification of a position . . . relative to the positional coordinates and other items of interest . . . ") to denote that the "information transmitted to a user of the system displays the items of interest only relative to the positional coordinates" in an internal grid system, as opposed to absolutely, such as by reference to that item of interest's latitude and longitude. CIVIX slip op. at 40. The prosecution history, together with the claims language, require this construction. CIVIX amended independent claims 1, 17 and 26 by adding the limitation "relative to" in order to overcome an examiner's rejection for indefiniteness, which stated that "the position of
CIVIX argues this construction renders the GPS embodiment unworkable, because the system would have to store nearly an infinite number of positional coordinates for each item of interest to allow for continuous redefinition, and because, by referring to a GPS system, the specification implicitly references the use of a system such as latitude and longitude to define a position. However, as the district court's opinion thoroughly discussed, the prosecution history, the overall structure of the specification and the appended source code (which only provides for the user to select a pre-defined area of interest, and not define the positional coordinates himself), as well as the extrinsic evidence, all lead to the conclusion that the claims identify the position of the item of interest in relation to an arbitrary reference point, not by its "absolute" location in a generally accepted coordinate system. There is no indication in the record that the GPS embodiment stores or transmits location using latitude and longitude. Even if there were, the GPS embodiment was described prior to the claim amendment, and remained in the specification without modification. If the GPS embodiment uses absolute positioning, it falls outside the amended claims and is dedicated to the public. Moreover, as further discussed below, even if CIVIX' claims encompassed the use of latitude and longitude as positional coordinates, defendants' systems still would not infringe because they do not locate each item of interest through "positional coordinates" of a reference point other than that of the item of interest searched by the user, and they do not locate their geographic vicinities by reference to such positional coordinates.

The only disputed claim term is "relatively resilient end edge portion which temporarily deflects and subsequently rebounds to snap-secure." '573 patent col.8 ll.61-62. The district court construed this term to mean that "the end edge portion is sufficiently resilient that it can temporarily deflect and subsequently rebound when glass is being inserted into the frame." S.J. Op. at 3 (emphasis added). Saint-Gobain argues that the term should have been construed to mean that "the end edge portion is sufficiently flexible to permit the glass in the finished product to be pushed out of the frame and pushed back into the frame." Br. for Defendant-Appellant Saint-Gobain Corp. at 25 (emphasis added). More particularly, Saint-Gobain argues that "relatively resilient" should not mean "temporarily resilient immediately after cooking in an oven and before any opportunity to cool." Id. at 26. Gemtron argues that the district court's construction was correct. The parties do not dispute that the "relatively resilient" limitation requires that the frame be flexible at some point in time. The dispute is about precisely when the frame must be flexible to satisfy the "relatively resilient" limitation.

Because neither party has identified any portion of the prosecution history or any extrinsic evidence bearing on the claim construction issues before us, we confine our analysis to the claim language and the specification. Looking first to the claim language, we note that claim 23 has no express temporal or temperature limitation requiring that the end edge portion be relatively resilient "always," or "at all temperatures," or "when in use in a refrigerator," or "when in use in a refrigerator." Additionally, the claim does not merely claim a frame with an end edge portion that is "relatively resilient." The full expression recited in the claim calls for a frame with a "relatively resilient end edge portion which temporarily deflects and subsequently rebounds to snap-secure" one of [the] glass piece front and rear edges in the glass piece edge-receiving channel." '573 patent col.8 ll.61-64 (emphasis added). The use of the phrase "temporarily deflects and subsequently rebounds to snap-secure" suggests that the claimed resilience of the frame need only be exhibited during assembly. The "snap-secure" interaction of the frame and glass piece, facilitated by the "relatively resilient end edge portion," is a characteristic of the shelf that is maintained even after assembly in the claimed shelf. While the claim language ties the "relatively resilient" characteristic of the frame's edge portion to its function in the assembly of the shelf, that characteristic is nonetheless a structural attribute possessed by the claimed frame and is not a process limitation. See, e.g., In re Garnero, 412 F.2d 276, 279, 56 C.C.P.A. 1289 (CCPA 1969) (listing similar examples of claim terms "held capable of construction as structural, rather than process, limitations").

Like the claims, the specification focuses on the characteristics of the frame that enable snap-secure assembly of the claimed shelf. In the "Background of the Invention" section, the specification describes the structure of prior art shelves by reference to the way in which the shelves are assembled. See, e.g., '573 patent col.1 ll.21-27 (describing assembly of prior art shelf as "[t]he glass [panel] is basically 'dropped-in' from above, not snapped-in from below"); id. col.1 ll.28-36 (describing other prior art shelves as "the same type shelf structure" but assembled using different methods, in which "a sheet of glass … is slid into opposite channels of a frame and then is locked into position" or "a panel . . . is dropped-in from above and rests upon a flange"). The specification characterizes all of the prior art as disclosing a shelf assembled by "adhesively bonding a peripheral edge of a sheet of glass to [the] frame." Id. col.1 ll.43-45. The specification goes on to criticize this type of shelf
structure, because of the additional cost of the adhesive and the "additional steps [that] are required during the assembly process." Id. col.1 ll.46-55. Likewise, in the "Brief Summary of the Invention" section, in discussing the advantages of the disclosed shelf over this prior art, the specification stresses the advantages that the claimed structure has in the manufacturing and assembly process:

In this manner, a sliding shelf is manufactured at a relatively low cost from only two pieces of material (a frame and a glass panel) in the absence of the added costly manufacturing step of applying adhesive and removing excess adhesive, while at the same time increasing conductivity because the fingers cover but minor lower surface areas of the glass panel side, front and rear edges.

Id. col.2 ll.58-65. In fact, every time the structure of the "relatively resilient" edge portions is mentioned in the specification, it is in the context of a discussion of how that structure functions while the shelf is assembled. See id. col.2 ll.42-47 (describing "relatively resilient" ends of fingers "such that the glass panel can be snap-secured"); id. col.5 ll.57-60 ("Due to this relative dimensioning and the relatively flexible nature of the fingers 90 and the finger terminal edge portions 91 thereof, the latter are free to temporarily flex and deform as the glass panel 35 is inserted upwardly . . . ."). There is no discussion in the specification of any purpose for or value of the 'relatively resilient' structural characteristic of the end edge portions of the frame, other than to facilitate assembly of the shelf. This indicates that the end edge portions of the frame have the claimed structural characteristic--"relatively resilient"--if they are able to deflect at the time the shelf is assembled, to "snap-secure" the glass panel within the frame.

For these reasons, we affirm the district court's construction of "relatively resilient end edge portion which temporarily deflects and subsequently rebounds to snap-secure" as used in claim 23 to mean that the end edge portion must be sufficiently resilient that it can temporarily deflect and subsequently rebound when glass is being inserted into the frame.

Saint-Gobain argues that a construction requiring only that the frame deflect at the time that glass is being inserted into the frame during assembly transforms the "relatively resilient" limitation of claim 23 into a product-by-process limitation. We disagree. The limitation requires that the glass panel be "snap-secure[d]" in the frame. "Snap-secure[d]" describes the structural relationship between the glass panel and the frame, which is possessed by the claimed shelf because of the structural characteristics of the individual components. See, e.g., 3M Innovative Props. Co. v. Avery Dennison Corp., 350 F.3d 1365, 1371 (Fed. Cir. 2003) ("[E]ven words of limitation that can connote with equal force a structural characteristic of the product or a process of manufacture are commonly and by default interpreted in their structural sense . . . ."); Hazani v. U.S. Int'l Trade Comm'n, 126 F.3d 1473, 1479 (Fed. Cir. 1997) (holding that claim is not product-by-process claim if it "describes the product more by its structure than by the process used to obtain it"); see also Garnero, 412 F.2d at 279 (noting that past-tense verbs such as "'intermixed,' 'ground in place,' 'press fitted,' 'etched,' and 'welded,' all . . . at one time or another have been separately held capable of construction as structural, rather than process, limitations."); Eric P. Mirabel, Product-By-Process Claims: A Practical Perspective, 68 J. Pat. & Trademark Off. Soc'y 3, 4-7 (1986). Defining a structural component by its functional as well as its physical characteristics is different from defining a structure solely by the process by which it is made. Our construction therefore does not transform the "relatively resilient" limitation of claim 23 into a product-by-process limitation.

E. "relatively rigid system"

As noted above, "system" means just that, and not "fork" as Fox would construe the term. The parties here differ on the meaning of "relatively rigid." "Rigid" itself requires no further construction; SRAM's proposed definition of "stiff" is unnecessary for understanding the claim. SRAM also proposes that "relatively" be construed as "comparatively." Although Fox argues for a further clarification, none is necessary.

GO BACK

3277

2. "Relatively short length"

- 3848 -
SBM seeks to construe the phrase "relatively short length" in Claim 1, as follows:

. . . said mooring arm having a relatively short length such that when/if in an essentially upright position from the buoyant body toward sea level, it extends/would extend no further than to just below or just above sea level

APL, however, argues for the following construction:

. . . said mooring arm having enough length to exert significant turning forces on the turntable, and such that when in an essentially upright position from the buoyant body toward sea level, the mooring arm extends no further than to just below or just above sea level,

Although neither party disputes that Claim 1 contains a maximum length limitation on its face (i.e., "a relatively short length such that when in an essentially upright position from the buoyant body toward sea level, the mooring arm extends no further than just below or just above sea level"), APL's construction proposes that a minimum length limitation be read into Claim 1. The minimum length limitation does not appear on the face of Claim 1. APL argues, however, that the prosecution history of the '183 Patent supports the reading of the limitation into Claim 1.

In distinguishing the SBM device from the Urdshals et al. 5,288,253 reference (the "Urdshals patent"), SBM argued to the Patent and Trademark Office ("PTO"):

By contrast, the relatively short arm 6 of the present invention, to which the vessel is connected via an anchor chain or rope, as can clearly be seen from Figure 1, will, upon weatherwaving of the vessel around the buoy, transmit a rotational torque onto turntable 5. The rigid arm 6 is relatively short and can exert a rotational torque on the turntable which is significantly larger than if the mooring hawser 14 in Figure 1 of the present invention were to be directly connected to the turntable 5 as is the case in the URDSHALS et al. reference.

Amendment, Document No. 55 ex. B, at SBM 00294-00295. In this passage, SBM is distinguishing from the Urdshals patent the specific ability of the '183 Patent's "relatively short arm" to exert a significantly larger rotational torque on the turntable than if the mooring hawser were directly connected to the turntable. See CCS Fitness, 288 F.3d at 1366-67 (noting that prosecution disclaimer may operate to limit claim scope where "the patentee distinguished [a] term from prior art on the basis of a particular embodiment."). This language from the prosecution history is sufficient to meet the "clear and unmistakable" standard set forth in Omega Engineering to support a finding of prosecution disclaimer. Thus, prosecution disclaimer applies and a minimum limitation is read into Claim 1 such that the "rigid mooring arm" be long enough to exert a significantly larger rotational torque on the turntable than if the mooring hawser were directly connected to the turntable.

Based on the foregoing, the claim phrase "relatively short length" as used in Claim 1 is construed to mean "said mooring arm having a minimum length long enough to exert a significantly larger rotational torque on the turntable than if the mooring hawser were directly connected to the turntable and having a maximum length such that when in an essentially upright position from the buoyant body toward sea level, the mooring arm extends no further than to just below or just above sea level."
Claim 9. A condenser for a refrigerant in a cooling system comprising:

[1] a pair of spaced, generally parallel, elongated cylindrical tubes defining headers;

[2] a vapor inlet in one of said tubes;

[3] a condensate outlet from one of said tubes;

[4] said header tubes each having a series of elongated generally parallel slots with the slots in the series on one header tube aligned with and facing the slots in the series on the other header tube;

[5] a tube row defined by a plurality of straight, tubes of flat cross-section and with flat side walls and having opposed ends extending in parallel between said header tubes, the ends of said flat cross-section tubes being disposed in corresponding aligned ones of said slots and in fluid communication with the interior of said header tubes, at least some of said tubes being in hydraulic parallel with each other;

[6] web means within said flat cross-section tubes and extending between and joined to the flat side walls at spaced intervals to (a) define a plurality of discrete, hydraulically parallel flow paths within each flat cross-section tube that extend between said header tubes; to (b) absorb forces resulting from internal pressure within said condenser and tending to expand the flat cross-section tubes; and to (c) conduct heat between both said flat sides and fluid in said flow paths;

[7] said flow paths being of relatively small hydraulic diameter which is defined as the cross-sectional area of the corresponding flow path multiplied by four (4) and divided by the wetted perimeter of the corresponding flow path;

[8] serpentine fins incapable of supporting said flat cross-section tubes against substantial internal pressure extending between facing flat side walls of adjacent flat cross-section tubes;

[9] each of said flow paths including at least one elongated crevice extending generally along the length of the associated flow path.

Claim 10. The condenser of claim 9 wherein each flow path has a plurality of said crevices.

It is not disputed that all of the elements of the claimed invention have counterparts in the accused condensers, and that infringement turns on the meaning and scope of the terms "flat side walls" and "relatively small hydraulic diameter."

Modine challenges the correctness of the Commission's claim interpretation and the ensuing finding of non-infringement.

II

INFRINGEMENT

As we have recently held, "because claim construction is a matter of law, the construction given the claims is reviewed de novo on appeal." Markman v. Westview Instruments, Inc., 52 F.3d 967, 979, 34 U.S.P.Q.2D (BNA) 1321, 1329 (Fed. Cir.) (en banc), cert. granted, 116 S. Ct. 40 (1995). Disputes as to the meaning and scope of terms as used in the claims are determined as a matter of law, based on the patent specification and the prosecution history if it is in evidence. Id. at 979-80, 34 U.S.P.Q.2D (BNA) at 1329-30. As stated in Markman, "when legal 'experts' offer their conflicting views of how the patent should be construed, or where the legal expert's view of how the patent should be construed conflicts with the patent document itself, such conflict does not create a question of fact nor can the expert opinion bind the court or relieve the court of its obligation to construe the claims according to the tenor of the patent. This opinion testimony also does not change or affect the de novo appellate review standard for ascertaining the meaning of the claim language." Id. at 983, 34 U.S.P.Q.2D at 1333.

*   *   *

B. RELATIVELY SMALL HYDRAULIC DIAMETER
The Commission held that the claim term "relatively small hydraulic diameter" is a limitation to hydraulic diameters no larger than exactly 0.040 inch. Since the hydraulic diameters of the Showa condensers are all larger than 0.040 inch, the Commission held that the claims are not infringed, literally or under the doctrine of equivalents.

Hydraulic diameter is an engineering designation that measures the flow path within the condenser. It is defined as the cross-sectional area of the corresponding flow path multiplied by four and divided by the wetted perimeter of the corresponding flow path; this definition is included in claim clause [7]. Claims 9 and 10, the claims in suit, describe the hydraulic diameter as "relatively small." Claims not in suit describe the hydraulic diameter as "about 0.015 to 0.040 inches" (claims 1-3), "in the range of 0.015 to 0.040 inches" (claims 4-5), and "sufficiently small . . . so that surface tension and capillary forces acting upon condensate within said flow paths improve heat transfer efficiency" (claims 6-8). The Commission held that "relatively small" in claims 9 and 10 has an upper limit of 0.040 inch.

Ordinarily a claim element that is claimed in general descriptive words, when a numerical range appears in the specification and in other claims, is not limited to the numbers in the specification or the other claims. See Specialty Composites v. Cabot Corp., 845 F.2d 981, 987, 6 U.S.P.Q.2D (BNA) 1601, 1604 (Fed. Cir. 1988) ("Particular embodiments appearing in the specification will not generally be read into the claims . . . What is patented is not restricted to the examples, but is defined by the words in the claims.") It is usually incorrect to read numerical precision into a claim from which it is absent, particularly when other claims contain the numerical limitation. In D.M.I., Inc. v. Deere & Co., 755 F.2d 1570, 1574, 225 U.S.P.Q. (BNA) 236, 239 (Fed. Cir. 1985), the court stated:

Where, as here, the limitation sought to be "read into" a claim already appears in another claim, the rule is far more than "general." It is fixed. It is long and well established. It enjoys an immutable and universally applicable status comparatively rare among rules of law. Without it, the entire statutory and regulatory structure governing the drafting, submission, examination, allowance, and enforceability of claims would crumble.

When a limitation is included in several claims but is stated in terms of apparently different scope, there is a presumption that a difference in scope is intended and is real. Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1023, 4 U.S.P.Q.2D (BNA) 1283, 1288 (Fed. Cir. 1987). Such a presumption can be overcome, but the evidence must be clear and persuasive. Conversely, it is incorrect to construe a claim as encompassing the scope that was relinquished in order to obtain allowance of another claim, despite a difference in the words used. See Builders Concrete, Inc. v. Bremerton Concrete Prods. Co., 757 F.2d 255, 260, 225 U.S.P.Q. (BNA) 240, 243 (Fed. Cir. 1985).

All rules of construction must be understood in terms of the factual situations that produced them, and applied in fidelity to their origins. Thus, although Modine stresses the rule that the description of the preferred embodiment in the specification does not limit the claims to that embodiment, when the preferred embodiment is described in the specification as the invention itself, the claims are not necessarily entitled to a scope broader than that embodiment. See Autogiro Co. of America v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 398, 155 U.S.P.Q. (BNA) 697, 703 (Ct. Cl. 1967) ("where the patentee describes an embodiment as being the invention itself and not only one way of utilizing it," this description guides understanding the scope of the claims).

Modine accurately states that the '580 specification describes "about 0.015-0.040 inch" as the "preferred embodiment." However, it is the only embodiment remaining for, as we shall discuss, the broader range of 0.015-0.070 inch was removed from the specification on refiling of the patent application. Modine thus limited the invention of the '580 patent to hydraulic diameters in the range of about 0.015-0.040 inch. Although Modine states that it neither abandoned, nor intended to abandon, the broader range of hydraulic diameters, and is prosecuting in another application claims that include hydraulic diameters up to 0.07 inch, that does not control the construction of the claims of the '580 patent.

Thus we agree with the Commission that "relatively small" in claims 9 and 10, interpreted in light of the '580 specification and the prosecution history, is not entitled to the range of up to 0.070 inch as sought by Modine. However, the Commission erred in literally restricting the hydraulic diameter range to an upper limit of exactly 0.040 inch, and in barring access to the doctrine of equivalents. See Hilton Davis Chem. Co. v. Warner-Jenkinson Co., 62 F.3d 1512, 1522, 35 U.S.P.Q.2D (BNA) 1641, 1648 (Fed. Cir. 1995) (en banc) ("The trial judge does not have discretion to choose whether to apply the doctrine of equivalents when the record shows no literal infringement.")

1. The Specification and the Prosecution History
The ’580 patent evolved from two continuation-in-part applications. The first-filed application, called the "grandparent," described condenser tubes with flow paths having hydraulic diameters in the range of "about 0.015-0.070" inch. The specification stated that "heat transfer is increased in the range of hydraulic diameters of about 0.015 inches to about 0.070 inches through the use of the invention with some variance depending upon air flow." The specification also stated that the preferred range was "about 0.015-0.040" inch. The specification included a graph of heat transfer as a function of hydraulic diameter, and described the graph as showing improved performance at hydraulic diameters up to about 0.070 inch.

In the second-filed application, called the "parent," the hydraulic diameter upper limit of "about 0.070" inch in the grandparent was replaced, at every occurrence in the text, with "about 0.040" inch. The graph showing improved performance at hydraulic diameters up to 0.070 inch was retained in the application, but the explanatory text now described the graph as showing that

heat transfer is advantageously and substantially increased in the range of hydraulic diameters of about 0.015 inches to about 0.040 inches through the use of the invention with some variance depending upon air flow.

In the ensuing prosecution, when the examiner objected that the specification did not show "criticality" of the 0.015-0.040 inch range, Modine argued that this was the peak range "and it is this peak heat range that is sought to be covered by the applicant." During prosecution of the parent application Modine told the patent examiner of the "Cat-Folded Front" condenser that was made by Modine for the Caterpillar Company for use in tractors, and sold more than a year before the filing date of the grandparent application. The Cat condenser had several structural differences from the condenser described in these applications: it had an overall hydraulic diameter of 0.0496 inch (or 0.04822, the record shows both figures); it did not have a web joined to the tube walls; and it did not have a plurality of elongated crevices in the flow paths. The Cat condenser was treated as prior art, along with several cited references.

Modine again refiled the patent application (the "child" application), without further change in the description of the hydraulic diameter. Although Modine points out that hydraulic diameters up to 0.070 inch continued to be shown in the graph that appeared in all three applications, the replacement of 0.070 with 0.040 in the text requires the conclusion that the applicant limited the invention described in the refiled applications to hydraulic diameters of up to about 0.040 inch.

Modine argues that the limitation in the parent/child specifications to hydraulic diameters of about 0.015-0.040 inch was not required by the prior art, pointing out that it is appropriate to consider not only the changes made during prosecution but also the reason for the changes. See Insta-Foam Prods., Inc. v. Universal Foam Sys., Inc., 906 F.2d 698, 703, 15 U.S.P.Q.2D (BNA) 1295, 1298 (Fed. Cir. 1990) ("A close examination must be made as to not only what was surrendered, but also the reason for such a surrender.") Although Modine may be correct that it was not necessary to reduce 0.070 to 0.040, this change was conspicuous and unambiguous. It was made in the context of the cited references and the Cat condenser, and the interested public is entitled to rely on it in interpreting the claim term "relatively small" as used in the ’580 patent.

2. The Incorporation by Reference

The '580 specification incorporates by reference a patent entitled "Method of Making a Heat Exchanger," U.S. Patent No. 4,688,311 (the ’311 patent). The ’580 specification states that the ’311 patent describes a "highly preferred means by which the tubes 20 with accompanying spacers 40 may be formed." Modine places great weight on this incorporation to support its position that "relatively small" is correctly construed to mean hydraulic diameters up to 0.07 inch, for the ’311 patent states:

The invention may be used with particular efficacy where the flow passages are to be of relatively small hydraulic diameter as, for example, 0.07 inches or less. When such dimension is selected, particularly where the hydraulic diameter is 0.040 inches or less, the structure is ideal for utilization in a high efficiency condenser.

Modine stresses that the ’311 patent defines "relatively small" as "0.07 inch or less," and that incorporation by reference has the same effect as if the host patent had set forth the entire text of the incorporated document. See In re Lund, 54 C.C.P.A. 1361, 376 F.2d 982, 989, 153 U.S.P.Q. (BNA) 625, 631 (CCPA 1967).

However, incorporation by reference does not convert the invention of the incorporated patent into the invention of the host patent. The use of "relatively small" to describe the condenser flow paths to which the ’311 manufacturing method is applicable did not reinstate into the parent and the child applications the hydraulic diameter range that was deleted from the
grandparent. The words "relatively small" appear only once in the '580 specification, and do not change the presentation of the invention as defined by the hydraulic diameter numerical range stated throughout the specification:

In addition to the utilization of a relatively small hydraulic diameter for the flow paths as mentioned previously, as another facet of the invention, it is contemplated that each of the flow paths have at least one crevice preferably extending along the entire length of the flow path, . . .

"Relatively small" does not appear to have an independent meaning in this art that would distinguish between 0.040 and 0.070 inch. In view of the replacement of the "relatively small" parameter of about 0.070 in the grandparent application with the "relatively small" parameter of about 0.040 in the parent and child applications, it does not appear to be correct to read the scope of "relatively small" in the '311 patent as overriding that replacement.

3. The Prosecution of Claims 9 and 10 (Application Claims 27 and 28)

The claims in suit were added near the end of the prosecution of the child application, and contain the only usage of "relatively small" in the claims. During prosecution Modine cancelled allowed claim 10 and added application claims 25-28. Modine points out that when application claims 25-28 were added Modine told the examiner that the claims were broader than allowed application claim 10 in some respects and narrower in others:

New Claim 25 is somewhat like original Claim 10 although it is broader in some respects and narrower in others.

. . .

As regards new Claims 25-28, independent Claim 25 is basically directed to the improved strength characteristic of the invention. See page 7 of the application as filed. Should the Examiner believe it to be dispositive, or otherwise helpful in determining the patentability of these claims, counsel notes that when the hoop strength containment feature of the Cat folded front type tubes is removed by removing the plate fins at the rounds of the flattened tubes, that is, at the radius of the flattened tubes, deformation and/or bursts occur at about 1,800 PSI; whereas the tubes of the present invention remained intact at pressures at least as high as 2,000 PSI. These sort of results are believed to commend the patentability of independent Claim 25.

Thus in presenting this group of claims Modine focused on the additional strength assertedly provided by the web means, not that these claims broadened the scope of the hydraulic diameter. Independent claim 25 used the words "relatively small hydraulic diameter." Showa argues, and we agree, that the examiner viewed all the claims as referring to the hydraulic diameter range of 0.015 to 0.04, for the examiner stated at one point during the prosecution of this claim:

Therefore, to achieve increased heat transfer and to save on material consumption it would have been obvious to one of ordinary skill in the art of heat exchange to reduce the hydraulic diameter of flow passages to within the claimed range of 0.015 to 0.04 as taught by Asselman et al.

The examiner persisted in the rejection of application claims 25 and 26, but held that claims 27 and 28 were allowable. In view of the prosecution history, we conclude that "relatively small" in application claims 27 and 28 (patent claims 9 and 10) did not enlarge the range of hydraulic diameters beyond that described in the specification as the invention.

The specification and prosecution history of the '580 patent do not permit a construction of "relatively small" to include the 0.070 inch range that was described in the grandparent application, when that range was reduced in the parent and child to about 0.040 inch. However, neither are the claims correctly construed as limited to exactly 0.040 inch. Although the Commission correctly held that "relatively small" in claims 9 and 10 is limited by the description of the invention in the specification, the Commission incorrectly limited the hydraulic diameter to exactly 0.040 inch, for that is not the description in the specification and is not required by the prosecution history.

The specification uses the qualifier "about," and also states that the optimum hydraulic diameter varies with the conditions. Such broadening usages as "about" must be given reasonable scope; they must be viewed by the decisionmaker as they would be understood by persons experienced in the field of the invention. Andrew Corp. v. Gabriel Electronics, Inc., 847 F.2d 819, 821-22, 6 U.S.P.Q.2D (BNA) 2010, 2013 (Fed. Cir.), cert. denied, 488 U.S. 927, 102 L. Ed. 2d 330, 109 S. Ct. 312
(1988). Although it is rarely feasible to attach a precise limit to "about," the usage can usually be understood in light of the technology embodied in the invention. When the claims are applied to an accused device, it is a question of technologic fact whether the accused device meets a reasonable meaning of "about" in the particular circumstances. Thus we turn to the factual aspects of the infringement determination.

C. LITERAL INFRINGEMENT

The record shows hydraulic diameter ranges of the nine Showa models before the Commission as follows: 0.0484-0.0519 inch; 0.0453-0.0520 inch; 0.0477-0.0577 inch; 0.0577-0.0606 inch; 0.0482-0.0497 inch; 0.061-0.065 inch; 0.0445-0.0682 inch; 0.0424-0.0573 inch; and 0.0513-0.0547 inch. The ALJ also referred to a model having a range of 0.0453-0.0477 inch. The Commission, incorrectly limiting "relatively small" to precisely 0.040 inch, did not consider variability based on the nature of the coolant, as stated in the specification, and did not determine whether any of the Showa models were within a reasonable literal scope of "relatively small" interpreted as meaning "about 0.015-0.040" inch.

Precedent illustrates the fact-dependency of determinations of the technologic scope of "about" and similar terms, depending on their contexts and the precision or significance of the measurements used. See, e.g., Quantum Corp. v. Rodime, PLC, 65 F.3d 1577, 36 U.S.P.Q.2D (BNA) 1162 (Fed. Cir. 1995) (the addition of "approximately" during reexamination was a significant broadening of the claims); Hybritech, Inc. v. Abbott Labs., 849 F.2d 1446, 1455, 7 U.S.P.Q.2D (BNA) 1191, 1199 (Fed. Cir. 1988) ("at least about 108 liters/mole" is literally satisfied by 4.8 x 107 liters/mole and 7.1 to 7.5 x 107 liters/mole); W.L. Gore & Assoc., Inc. v. Garlock, Inc., 842 F.2d 1275, 1280, 6 U.S.P.Q.2D (BNA) 1277, 1282 (Fed. Cir. 1988) (an "imprecise limitation, such as the phrase 'about 100% per second'" is to be considered in determination of infringement); Rosemount, Inc. v. Beckman Instruments, Inc., 727 F.2d 1540, 1546-47, 221 U.S.P.Q. (BNA) 1, 7 (Fed. Cir. 1984) ("close proximity" is as precise as the subject matter permits).

The Commission's determination of literal infringement was based on a hydraulic diameter limit of exactly 0.040 inch, with no consideration of the scope of "about" and no determination of the effect of relevant factors such as the nature of the coolant and the precision of measurement. The finding of non-infringement was based on an incorrect claim construction, leading to an inadequate application of the claims to the accused devices. The finding is vacated. On remand the Commission shall determine whether any of the accused condenser models literally infringes the claims, upon construction of the claim term "relatively small" as meaning a hydraulic diameter in the range of about 0.015-0.040 inch, and upon applying the claims to the various accused Showa models.

D. INFRINGEMENT BY EQUIVALENCY

The Commission held that the doctrine of equivalents did not apply because Showa did not "unscrupulously" copy the Modine condenser. This ruling was based on an incorrect view of the law. As was explained in Hilton Davis, 62 F.3d at 1522, 35 U.S.P.Q.2D (BNA) at 1648, there is no equitable threshold for determination of the factual question of infringement by equivalency. Although the ALJ received evidence on the facts relevant to equivalency, the findings were made in the context of an incorrect view of prosecution history estoppel, the ALJ holding that Modine's claims were limited to hydraulic diameters no larger than exactly 0.040 inch. The ALJ's determination of estoppel was based on the same factors that led to the incorrect claim interpretation.

Modine argued to the Commission that the teachings in the specification, including the graph showing superior coolant activity up to a hydraulic diameter of 0.070 inch, support a range of equivalents up to 0.070 inch. Modine alternatively argued that even if the Commission found that Modine was not entitled to this range of equivalents, it is entitled to establish equivalency up to the overall hydraulic diameter of the prior art Cat condenser, i.e. about 0.48-0.49 inch.

Discussing the imported accused condensers, the ALJ found as fact that their function and result are the same as those of the claimed invention, but that the imported condensers do not meet the "same way" test because of the presence of internal fins in some of the Showa models. However, Modine's evidence was substantially unrebutted that the presence of inner fins did not substantially change the way the condensers function, by surface tension and capillary forces. Although the intervenors argue that their condensers with larger hydraulic diameters are less efficient, equal performance is not required to establish equivalency. Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 859, 9 U.S.P.Q.2D (BNA) 1289, 1294 (Fed. Cir. 1988), cert. denied, 490 U.S. 1068, 104 L. Ed. 2d 634, 109 S. Ct. 2069 (1989). The ALJ's finding is against the heavy weight of the evidence. There was not substantial evidence supporting the finding of non-equivalence.
However, the ALJ correctly recognized that prosecution history estoppel limits the application of the doctrine of equivalents, even when the function/way/result or other test of equivalency is met by the accused devices. Prosecution history estoppel implements the principle that a patentee cannot obtain, in an infringement suit, protection of subject matter that was relinquished in order to obtain allowance of other subject matter during prosecution of the patent application. Mannesmann Demag Corp. v. Engineered Metal Prods. Co., 793 F.2d 1279, 1285, 230 U.S.P.Q. (BNA) 45, 48 (Fed. Cir. 1986) (the relinquished subject matter must be material to the issuance of the patent). The standard for determining whether particular subject matter was relinquished and was material is an objective one which we determine as a matter of law, LaBounty Mfg., Inc. v. United States Int'l Trade Comm'n, 867 F.2d 1572, 1576, 9 U.S.P.Q.2D (BNA) 1995, 1998 (Fed. Cir. 1989), and is based on the reasonable reading, by a person of skill in the field of the invention, of the entire prosecution history.

We have discussed the prosecution history ante, and concluded that in connection with the patent application that led to the '580 patent, Modine relinquished the range of hydraulic diameters that extended to 0.070 inch, based in substantial part on the hydraulic diameter of the prior art Cat-Folded Front condenser. Although Modine points out that the '580 invention differs in several respects from the Cat condenser, the prosecution history shows that the hydraulic diameter of the Cat condenser was a factor in limitation of the '580 claims. The change in the description of the hydraulic diameter in the specification from grandparent to parent/child application, and the arguments to the patent examiner, highlighted the applicant's action in distinguishing the '580 claims from the Cat condenser.

Thus we conclude that the available range of equivalency is limited, by estoppel, to the hydraulic diameter of the Cat condenser. Within this boundary, however, the prosecution history and the prior art do not eliminate equivalents if substantial identity is shown. The controlling criterion, as reaffirmed in Hilton Davis, 62 F.3d at 1518, 35 U.S.P.Q.2D (BNA) at 1645, is whether the accused device is substantially the same as the claimed invention. See Graver Tank & Mfg. Co. v. Linde Air Prods. Co., 339 U.S. 605, 607, 94 L. Ed. 1097, 70 S. Ct. 854 (1950) (insubstantial changes do not avoid the application of the doctrine of equivalents).

The ALJ incorrectly held that Modine was estopped to assert equivalency against any condenser with a hydraulic diameter larger than exactly 0.040 inch. The holding is vacated, and the case is remanded to the Commission for findings in accordance with the doctrine of equivalents.

3279

C. Indefiniteness claim pursuant to 35 U.S.C. § 112

Defendant also claims that the 998 patent is invalid because the language "a relatively small incision" is too vague. The pertinent language of 35 U.S.C. § 112 reads:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same, and shall set forth the best mode contemplated by the inventor of carrying out his invention.

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

While defendant does cite some case law to support the proposition that the use of the term "relatively" in a patent's claim can render the patent invalid under § 112, see Long Manufacturing Co. v. Lilliston Implement Co., 328 F. Supp. 268 (E.D. N.Car. 1971), aff'd 457 F.2d 1317 (4th Cir. 1972), cert. denied 409 U.S. 874, 34 L. Ed. 2d 126, 93 S. Ct. 119 (1972); Ex Parte Oetiker, 23 U.S.P.Q.2D (BNA) 1651 (Bd. Pat. App. & Int'l 1991), aff'd 951 F.2d 1267 (Fed. Cir. 1991), defendant also admits that the term "relatively small" is not per se indefinite. Modine Mfg. Co. v. U.S. Intern. Trade Comm., 75 F.3d 1545 (Fed. Cir. 1996), cert. denied 116 S. Ct. 2523 (1996). The Modine court held that "when claims are amenable to more than one construction, they should when reasonably possible be interpreted so as to preserve their validity." Id. Defendant also cites the declaration of its expert Doctor Leo D. Bores, who testified that even he, despite all of his experience in the field,
finds the term "relatively small" to be indefinite.

Plaintiffs counter by arguing that the term "relatively small" is clear to doctors in the field, who know whether they are preforming "small incision" (foldable) or "large incision" surgery. Plaintiffs also point out that an exemplary "relatively small incision" is illustrated in figure 1 of the patent. Although the court finds that this indefiniteness argument is not a frivolous one, it concludes that defendant has not met its burden of showing that it will likely succeed on the merits of this claim at trial, and as such declines at this time to invalidate the 998 patent on the grounds of indefiniteness.

1) The meaning of the "relatively thick layer" of absorbent material.

With regard to the term "relatively thick," the '381 patent's specification addresses this question.

In the present application, any reference to "relatively thick" or "relatively thin" are with respect to each other. The entire disposable menstrual panty of this invention is really very thin and lightweight. The thickness of the mesh-like covering of the top portion is very thin, about the thickness of the leg portion of a conventional pair of nylon pantyhose, a hairnet, a silk scarf, or the like. The thickness of the inside layer lining the bottom portion is between substantially less than one eighth of an inch to approximately seven-eighths of an inch, depending on the particular end use of the panty, and a range of between one-sixteenth of an inch and one inch is possible for particular applications.

(Def. App. II Ex. E at KC 017.) (diagram reference numbers omitted) K-C reads this specification as requiring the "relatively thick layer" lining the bottom portion of the panty to be "no less than 1/16th of an inch to no more than 1 inch thick." (Motion at 3.) Plaintiff vociferously disagrees.

First, plaintiff argues that when read as a whole the '381 patent makes clear that the thickness of the "relatively thick" portion is just that, relative. In other words, plaintiff argues that the specification quoted above merely "describes a layer that is thick relative to another layer of material in the panty. While stating in a number of places that all dimensions of the panty are variable, the Specification provides, by way of example, two possible ranges for the thickness of the 'relatively thick' layer." (Resp. at 10-11.) (footnote omitted)

2 At the outset plaintiff argues that the Patent Examiner's rejection of this argument ought be dispositive. However, for the reasons stated previously, that simply is not so.

In support, plaintiff notes that the specification, by stating that references to "relatively thick or relatively thin are with respect to each other," incorporates the standard dictionary definition of the term "relatively." She also cites to various other points within the patent in which it is made clear that "the relative thickness of the absorbent layer can be varied." (Def. App. II Ex. E at KC 021.) 3 Plaintiff argues that these statements, coupled with the larger block quote above, demonstrate that the "relatively thick" layer is not tied to a strict numerical range of between 1/16th of an inch and one inch in thickness. The court disagrees.

3 These citations include: "the thickness of the various portions of the panty and liner may be varied, as desired" (Def. App. II Ex. E at KC 015-016); "the entire disposable menstrual panty of this invention is really very thin and lightweight" (Id. at KC 017); and "modifications can be made without departing from the spirit and scope of the present invention which is limited only by the appended claims" (Id. at KC 022).
The above block quote makes clear that a numerical range for the "relatively thick" layer was contemplated by the applicant. Having recited that range in her patent, plaintiff is bound by that recitation. Moreover, this is the only fair reading of the specification. To adopt plaintiff's interpretation would essentially read out the very language that she chose to describe the relatively thick layer. This the court declines to do. Finally, the court notes that plaintiff's interpretation would ultimately give no meaning to the term "relatively thick layer." Stating that the relatively thick layer is thick relative to the relatively thin layer is simply insufficient, for such a statement says nothing. Indeed, it can be safely surmised that plaintiff recognized this fact and chose to give meaning to the term "relatively thick layer" by defining it against something more concrete than the relatively thin layer—namely, a numerical range of thickness.

Plaintiff also argues that this interpretation is flawed because "references to a preferred embodiment, such as those often present in a specification, are not claim limitations." Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988). However, as defendant correctly notes, the numerical limitation does not relate to a particular preferred embodiment. This section is clearly definitional. As noted above, absent this numerical range the terms "relatively thick" and "relatively thin" have no empirical meaning.

Plaintiff next contends that even if the relatively thick portion of the panty is tied to a numerical definition, it is not the 1/16th to one inch range claimed by defendant. Rather, plaintiff argues that the relatively thick portion of her panty can be as thin as "substantially less than one eighth of an inch." (Def. App. II Ex. E at KC 017.) However, as noted by defendant, such an interpretation "makes the specification nonsensical." (Reply at 4 n.2.) The only way to harmonize the two ranges specified by the patent is to read the second range as setting the outer boundaries for the relatively thick layer. In other words, the only logical interpretation is that, although the relatively thick layer can be "substantially less than one eighth of an inch" and still be the relatively thick layer, it ceases to be so if it falls below 1/16th of an inch.

**B. The "Relatively Thick" Limitation**

Solomon also challenges the district court's interpretation of the claim limitation "relatively thick." Solomon asserts that no particular thickness is required by the claims and that the term "relatively" implies that the thick material is thick only in relation to other material. Specifically, Solomon argues that the "relatively thick" layer need only be more thick than the "relatively thin" layer and repeatedly cites the statement in the specification, quoted below, that the thick and thin portions "are relative to each other." Solomon also directs our attention to the statement in the specification that the "thickness . . . may be varied as desired" and notes that a thickness range is not specified for the "relatively thin" layer. Solomon asserts that the district court impermissibly read the preferred embodiment into the claims when defining "relatively thick." We disagree.

The district court properly turned to the written description and drawings in order to determine the meaning of the term "relatively thick." In the section entitled "Detailed Description of the Preferred Embodiment," the patent specification describes the preferred embodiment and certain variations encompassing a number of different styles and structures of the disposable panty. Before describing further alternative embodiments, the specification states:

In the present application, any reference to "relatively thick" or "relatively thin" are with respect to each other. The entire disposable menstrual panty 21 of this invention is really very thin and lightweight. The thickness of the mesh-like covering of the top portion is very thin, about the thickness of the leg portion of a conventional pair of nylon pantyhose, a hairnet, a silk scarf, or the like. The thickness of the inside layer 51 lining the bottom portion 27 is substantially less than one eighth of an inch to approximately seven-eighths of an inch, depending on the particular end use of the panty 21, and a range of between one-sixteenth of an inch and one inch is possible for particular applications.

This paragraph is clearly definitional. It provides two ranges of thickness, indicating its general applicability to varied situations. It does not purport to be exemplary, but rather states that it applies to any reference to "relatively thick" in the present application. Solomon's attempt to limit the applicability of this paragraph solely to the preferred embodiment is clearly belied by the text itself. It is equally clear that the "inside layer 51" refers to the "relatively thick" layer as used
throughout the application. Numerous alternative embodiments refer explicitly to the "relatively thick layer of absorbent material 51" or the "inner lining 51 of relatively thick absorbent material."

The public is entitled to rely on the sole unequivocal statement by the patentee regarding the meaning of "relatively thick" used throughout the specification. The passage cited by Solomon does not contradict this interpretation. Rather, while the specification elsewhere makes clear that the thickness of the "relatively thick" layer may be "varied . . . as desired," it may only vary within the enumerated range. Thus, the two passages are consistent with one another. Having expressly defined the term "relatively thick" in the specification, Solomon cannot now succeed in her argument that an undefined "ordinary and accustomed meaning" should govern. See Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1277, 35 U.S.P.Q.2D (BNA) 1035, 1040 (Fed. Cir. 1995).

GO BACK

3282

Turning now to the relaying step, claim 14 reads as follows:

14. A method for automatically regulating the release of the drill string of a drilling rig drill, comprising the steps of:

   relaying said selected signal or signals to a drill string controller which regulates the release said drill string in response to said selected signal or signals.

'142 patent, col. 28, ll. 34-38 (emphasis added).

As outlined above, nothing in the claim language requires or even suggests the use of pneumatically operated valves in performing the relaying step. Rather, the only discussion of pneumatically operated valves in the intrinsic record comes from the specification: "In the preferred embodiment, valves 236-239 are pneumatic valves that operate as relays to supply compressed air to air motor 204." '142 patent, col. 7, ll. 35-37. This disclosure and corresponding Figures do not limit the invention as a whole to the use of pneumatically operated valves; rather they merely list such valves as but one example of relays operable in the present invention. See C.R. Bard, Inc. v. U.S. Surgical Corp., 388 F.3d 858, 864 (Fed. Cir. 2004) ("Statements that describe the invention as a whole, rather than statements that describe only preferred embodiments, are more likely to support a limiting definition of a claim term.") (citing Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1347 (Fed. Cir. 1998)); SanDisk Corp. v. Memorex Prods., Inc., 415 F.3d 1278, 1286 (Fed. Cir. 2005) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations.") (quoting Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988)); Gillette, 405 F.3d at 1374 ("This court has cautioned against limiting the claimed invention to preferred embodiments or specific examples in the specification.") (quoting Texas Instruments, Inc. v. U.S. Int'l Trade Comm'n, 805 F.2d 1558, 1563 (Fed. Cir. 1986)); Gart v. Logitech, Inc., 254 F.3d 1334, 1342 (Fed. Cir. 2001) (noting that "drawings [depicting the preferred embodiment] are not meant to represent 'the' invention or to limit the scope of coverage defined by the words used in the claims themselves."); see also '142 patent, col. 24, ll. 27-35 (stating the present invention is not limited to the preferred embodiment).

Moreover, the specification's disclosure of valves that "operate as relays" implicitly suggests that "relay" has a broader meaning than simply the preferred pneumatically operated valves. To illustrate, the applicant could have used terminology such as "relays are pneumatically operated valves" that expressly disavows alternative structures. As written, however, the specification contemplates that other structures may "operate as relays" in addition to the preferred pneumatically operated valves. Hence, the intrinsic record does not support the district court's interpretation of the relaying step.

Finally, the extrinsic evidence in this case confirms that the relaying step is not limited to pneumatically operated valves. For example, Pason's expert, presumably one of ordinary skill in the art, testified that "relaying" in claim 14 was not limited to the use of pneumatically operated valves:

Court: It's not your opinion, is it, that claims 11 and 14 are limited to a pneumatic control system -

Expert: No. Well -- no. It's not limited to a pneumatic control system as the way they're written, that's true.

In addition, Pason's counsel at oral argument similarly conceded that relaying in claim 14 should not be limited to
pneumatically operated valves. Hence, there is no support, either in the intrinsic or extrinsic record, for the district court's interpretation of the relaying step. Thus, as with the selecting step, the district court's interpretation of the relaying step is unduly narrow.

3283

5. "Relaxed Diameter"

Next, Bridgeport argues that the fact that its designs indicate an adaptor with a relaxed diameter greater than the outer diameter of the connector compels summary judgment in its favor on claims 1, 2, 3, 4, 5, 8, and 9 of Patent '164, which provide, in pertinent part, as follows:

[A] circular spring metal adaptor surrounding said leading end of said electrical connector which also has a leading end, a trailing end, and an intermediate body, said circular spring metal adaptor being less than a complete circle when on the electrical connector and when separated from said electrical connector has a relaxed diameter, less than the diameter of the portion of the connector which it surrounds 15 ....

(Doc. 83, Exs. A, B (emphasis added)). Again resorting first to reference materials, Webster's Third New International Dictionary defines "relaxed" as "set at rest" and "relax" as to "lessen the tension or pressure of." WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 1917. Thus, the "relaxed diameter" of a circle is the diameter 16 as measured when any outside force or pressure has been removed. See also id. (defining "relaxation" as "the adjustment of a system to a state of equilibrium following the abrupt removal of some influence"). This construction is apparently conceded by both parties (Doc. 115 PP 28, 30-34), and, indeed, the claims themselves identify the adaptor as "relaxed" when it is removed from the larger-diameter connector. The court will construe "relaxed diameter" to mean the diameter of the adaptor when it is removed from the connector.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

15 In contrast, claim 1 of Patent '050 requires that the relaxed diameter be "less than the diameter of the hole into which it is to be inserted." (Doc. 83, Ex. B).

16 "Diameter" is "the length of a straight line through the center of an object."WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 623. Neither party disputes the meaning of this term. See Vivid Techs., Inc. v. Am. Sci. & Eng'g, Inc., 200 F.3d 795, 803 (Fed. Cir. 1999) ("Only those terms need be construed that are in controversy, and only to the extent necessary to resolve the controversy.").

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

At this stage in the proceedings, considering the evidence in the light most favorable to Arlington, the court cannot say that Bridgeport's products do not, as a matter of law, infringe on the claims at issue. Bridgeport may establish at trial that the inner diameter of its adaptors exceeds the outer diameter of its connectors, but Arlington has presented evidence, in the form of expert reports and deposition testimony, that some of Bridgeport's designs include "dimples" that lessen the inner diameter of the adaptor and that Bridgeport's manufacturing processes have produced units in which the connector has a greater diameter than that of the relaxed adaptor. (Doc. 119, Ex. 38 PP 3-9, 13, 15, 17; Doc. 199, Ex. 41 at 4-5). Because clear factual issues remain to be decided, summary judgment on these claims is inappropriate.

3284

1. "a plurality of releasable fasteners for attachment of said protective barrier to said structure"

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Plaintiff's Proposed Construction</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Plaintiff asserts in its rebuttal statement that Defendants' proposal disregards the well settled rule that construction must begin and remain centered on the claim language. Plaintiff argues that Defendants "ignore the unambiguous claim language" in an improper "attempt to rewrite the claim." According to Plaintiff, Defendants "also violate the principles that limitations not be imported from the specification into the claim and that claims are not to be confined to those embodiments described in the specification." Defendants counter that someone of ordinary skill in the art would construe "releasable fasteners" to mean readily easy to separate like velcro or latches. Defendants maintain that Patent '852 does not disclose any releasable fastener attached to the structure. Instead, Defendants assert that Patent '852 discloses embodiments illustrating the "attachment of the protective barrier to the structure via fasteners anchored to the ground."

Claim 8 discloses the process of claim 1 plus an additional step of providing a plurality of releasable fasteners for attachment of the barrier device to the structure. Defendants would have this Court construe claim 8 as meaning a number of fasteners to secure adjacent panels to each other in order to form a single protective barrier device. Plaintiff contends that claim 8 plainly means what the language itself says, that a plurality of fasteners connect the barrier device to the structure and not to each other. This Court agrees with Plaintiff. In so agreeing, the Court follows Federal Circuit precedent establishing that "[i]n construing claims, the analytical focus must begin and remain centered on the language of the claims themselves, for it is that language that the patentee chose to use to 'particularly point[ ] out and distinctly claim[ ] the subject matter which the patentee regards as his invention.'" Texas Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1201-02 (Fed. Cir. 2002) (citing 35 U.S.C. § 112; Interactive Gift Express, Inc. v. CompuServe, Inc., 256 F.3d 1323, 1331 (Fed. Cir. 2001)). Federal Circuit precedent further holds that "terms used in the claims bear a 'heavy presumption' that they mean what they say and have the ordinary meaning that would be attributed to those words by persons skilled in the relevant art," and "unless compelled otherwise, a court will give a claim term the full range of its ordinary meaning as understood by persons skilled in the relevant art." Id. at 1202 (citations omitted). Such is the case here. Specifically, the Court concludes that Defendants' proposal is unsupported by the claim language. Further, the Court declines to rewrite the claim language, which would effectively import limitations from the specification. The Court finds the ordinary and customary meaning of this claim language to be readily apparent such that additional construction is unwarranted.

4. "wherein the continuous retainer member is releasable from the inner head"

a. Parties' Positions

The parties offer the following constructions for the term "wherein the continuous retainer member is releasable from the inner head," which appears in claim 43. Dkt. No. 114.

<table>
<thead>
<tr>
<th>RTI</th>
<th>BD</th>
</tr>
</thead>
<tbody>
<tr>
<td>The plunger releases the continuous retainer member from the inner head as the plunger is further depressed in</td>
<td>The plunger releases the continuous retainer member from the inner head by pushing the continuous retainer</td>
</tr>
</tbody>
</table>
the barrel member off of the inner head as the plunger is depressed in the barrel to reduce the frictional force with the wall of the syringe.

The parties' arguments in connection with this term closely mirror those proffered in connection with the term "releaseably installed by sliding engagement of said retainer member and said inwardly facing surface" construed above. See Dkt. Nos. 111 at 19-20 & 112 at 26-27.

b. Court's Construction

For the reasons stated above, this Court finds that the invention operates through the use of a clamping or fictional force. However, since the clamping or frictional forces are already part of this Court's construction of "continuous retainer member," this Court finds that it would be unnecessarily confusing and duplicative to include a reference to those forces in this term's construction. As also discussed above, this Court finds that that the holding force may be released by some other manner than that with which it was installed.

Accordingly, the Court finds that the term "wherein the continuous retainer member is releasable from the inner head" means "the plunger releases the continuous retainer member from the inner head as the plunger is further depressed in the barrel."

3286

Releasable Stopper

The parties next ask the Court to construe "releasable stopper" in Claim 22 of the 011 Patent. The parties do not dispute that the term "stopper" ordinarily means "something inserted to close an opening" and that the term "releasable" ordinarily means "capable of being freed." Thus, the ordinary meaning of "releasable stopper" is "something inserted to close an opening which is capable of being freed." RTI proposes that "releasable stopper" simply means "a member that seals or closes one end of the plunger and can be freed such that it no longer seals or closes." In contrast, NMT proposes that "releasable stopper" means "a plug capable of being freed from its position where it is fitted in the opening of the plunger which slides relative to the plunger opening after the injection is complete and before retraction of the needle." Because the relevant portion of Claim 22 discusses a plunger, RTI properly limits its definition to a stopper which closes the plunger. However, the Court must determine whether the claim language and other intrinsic evidence require the restrictions in NMT's proposed construction.

--- Footnotes ---

6 NMT also asks the Court to construe the term "stopper" separately from "releasable stopper." Claim 22 provides in relevant part: "the head of the plunger having an opening into said cavity, sized to receive the retractable parts and a releasable stopper extending from said opening, the stopper sealing the interior of the plunger ...." NMT does not explain, and the Court cannot imagine, how the second "stopper" could refer to anything other than "releasable stopper." This is a prime example of the many instances where NMT has attempted to unnecessarily multiply and complicate the issues in this claim construction. The Court will not indulge NMT's request for duplicative analysis and disregards NMT's "stopper" arguments.

--- End Footnotes ---

The Court rejects NMT's proposed construction. NMT's proposed construction apparently comes from Claim 6 of the 011 Patent. Claim 6 claims:

The tamperproof retractable syringe of claim 5 wherein the plunger head has a tip with an opening sealingly closed by a dislodgeable held stopper which slides relative to the plunger in response to dislodging force applied by depression of the plunger at the end of the injection cycle before retraction occurs.

- 3861 -

PUBPAT
It is apparent that Claim 6 is dependent on Claim 5 and thus that its restrictions are directly aimed at Claim 5. NMT has provided no briefing on its proposed construction, so the Court is somewhat at a loss to understand why it should apply Claim 6's restrictions to Claim 22 when those claims are wholly separate. Because the drafter intended for Claim 6 to limit Claim 5 and because Claim 22 is unrelated to either Claims 5 or 6, the Court finds that a person of skill in the art would not read Claim 6 as a limitation on Claim 22. Therefore, the Court rejects NMT's proposed construction and adopts RTI's statement of "releasable stopper's" ordinary meaning as used in Claim 22: "a member that seals or closes one end of the plunger and can be freed such that it no longer seals or closes."

--- Footnotes ---

7 The Court takes NMT's proposed construction from the Amended Consolidated Claim Interpretation Chart ("Chart") jointly submitted by the parties. To facilitate the claim construction process, the Court requires parties in patent cases to submit a claim interpretation chart as a matter of course. The Chart lists disputed terms along with proposed constructions. In this case, the parties submitted the Chart after briefing. Moreover, NMT chose to change its proposed construction in the Chart from that proposed in briefing. Because the Chart is the parties' most recent statement of their positions to the Court, the Court examines the Chart's proposed construction even though NMT submitted no supporting argument.

--- End Footnotes ---

3287

B. "Releasably Attached" and "Releasably Attaching"

Independent claims 1, 9, and 17 of the '466 patent and independent claims 1 and 7 of the '584 patent each recite either fasteners or fastening means that "releasably attach" the sidewalls to the mating portions of the toe and heel plates or sidewalls that are releasably attached. Representative claim 1 of the '466 patent reads as follows:

1. An in-line roller skate, comprising:
   a boot having a sole surface with toe and heel portions;
   a frame, comprising:
      a toe plate having an upper face and a lower face, said upper face being affixed to said sole surface toe portion, and two pair of spaced apart flanges extending downwardly from said toe plate lower face, each of said flange pairs defining a cavity therebetween;
      a heel plate having an upper face and a lower face, said upper face being affixed to said sole surface heel portion, and two pair of spaced apart flanges extending downwardly from said heel plate lower face, each of said flange pairs defining a cavity therebetween;
   first and second downwardly extending sidewalls having front and rear upper portions, wherein said first sidewall is configured such that said rear upper portion is received into a corresponding one of said heel plate cavities and said front upper portion is received into a corresponding one of said toe plate cavities, and wherein said second sidewall is received into the other opposing said toe and heel plate cavities;
   a plurality of fasteners for releasably attaching said first and second sidewalls to respective ones of said toe and heel plate flange pairs; and
   a plurality of wheels rotatably mounted between said first and second sidewalls.

 Neither the '466 patent nor the '584 patent define explicitly the scope of the term "releasably attaching" or its variant, "releasably attached."
Benetton asserts that the terms should be construed to mean that the sidewalls can be separated from the flanges without destroying any part of the skate, including the means of attachment. Salomon suggests that the disputed limitations should be construed to mean that the fasteners can be conveniently removed and reused without special tools or skills to permit easy removal of a sidewall. V-Formation essentially argues that any attachment method that allows the sidewalls to be released should be construed to the terms, releasably attaching and releasably attached.

In support of its claim construction, Benetton cites to Webster's Third New International Dictionary (1993), which defines "releasable" to mean "capable of being released." While Benetton concedes that any fastened together structure is in a sense "releasable," it argues that the ordinary connotation of that term is narrower, referring to attachment mechanisms that permit easy and repeated detachment of the fastened structures. Benetton further argues that its construction of the term is consistent with the way the term is used in the Wrike patents. In particular, Benetton observes that the Wrike patents describe the use of bolts as an example of releasable fastening means, but then discusses the use of rivets or high-strength adhesives to secure the wheel frame to the sole surface of the boot. Benetton suggests that this alone indicates that Wrike did not consider rivets and high strength adhesives to be releasable fasteners. Benetton argues that the preferred embodiment described by the '466 and the '143 patents provides additional evidence for its claim construction. Specifically, the '466 patent (and the '143 patent, which is a continuation of the '466 patent and therefore contains a virtually identical disclosure to the '466 patent) states:

> It is preferred that the fasteners be releasably attached to the frame flanges 32a, 32b, 32a', 32b' and sidewalls 50a, 50b so that if one of the sidewalls needs to be replaced, it can easily be removed conveniently without special tools or skills.

Benetton further notes that Wrike, during prosecution of the '584 patent, stated that the sidewalls of his invention "can easily be removed and replaced," thus allowing the skaters to change the wheels on the skate "quickly and easily."

Salomon makes arguments similar to Benetton, alleging that the '466 patent specification repeatedly uses the words "easily" and "without special tools or skills," to describe the releasability of the sidewalls. In particular, Salomon alleges that the '466 patent clearly distinguishes between fasteners that can be easily removed and reused without their destruction, such as threaded bolts, and fasteners that are difficult, if not impossible to remove, such as rivets or high-strength adhesives. Salomon adds that, as a matter of common sense, the scope of the term "releasably attaching" cannot be construed to reach any and all types of attachments. To further support its claim construction, Salomon cites which discusses the scope of the term "permanently affixed" for a patent assigned to K-2 Corp. v. Salomon, S.A., 191 F.3d 1356 (Fed. Cir. 1999). In K-2, the Court of Appeals for the Federal Circuit stated that, "the ordinary and accustomed meaning of "permanently affixed" [in the context of the K-2 patent] requires that the fastening be unremovable." Id. at 1363.

According to V-Formation's expert, rivets should be considered releasable because they can be removed by detaching either of the heads that hold the rivet in place. Addendum to Steven R. Thomas Declaration in Support of V-Formation's Opposition to Benetton's Motion for Summary Judgment ("Thomas Addendum"), pp. 28-29. V-Formation asserts that the '466 patent claims do not require that the "releasably attached" element be removable without destroying or damaging any part of the skate, and contends that nothing in the '466 patent specification places any limitation on the destruction of the fasteners in the course of releasing the sidewalls. Furthermore, V-Formation avers that nothing in the '466 patent claims requires the attachment be "quick and easy" or "easily removed and replaced." Even if the fastening element were limited to attachments that could be easily removed, V-Formation submits that, like screws, rivets may be easily replaced in a matter of seconds.

V-Formation further argues that the defendants' claim construction arguments based on the prosecution history of the '584 patent cannot succeed because the "releasably attached" limitation in the initial application was introduced in the original claims and were never amended during prosecution. In addition, V-Formation, citing Abbott Labs. v. Dey, L.P., 287 F.3d 1097, 1104 (Fed. Cir. 2002), contends that the defendants improperly argue that limitations from prior art, which was cited by the patent examiner during prosecution of the patent application that eventually lead to the issuance of the '584 patent, should be read into the disputed claim term.

I find V-Formation's arguments for its claim construction, on the whole, unpersuasive. While I agree with V-Formation's view that many of the arguments advanced by its opponents, which are grounded on the intrinsic evidence fail to unambiguously demonstrate the meaning of the term "releasably attached," I believe that the patent specification and
prosecution history of the Wrike patents provides sufficient guidance to resolve the ambiguity of the disputed term. Upon consideration of the claims, I find no evidence that the claims, on their face, require that the sidewalls be removable without destroying the means of attachment, as Benetton suggests, or that the fasteners must be capable of being removed and reused without special tools or skills, as Salmon suggests. Benetton and Salomon suggest that the Wrike patent specifications identify rivets and high strength adhesives to be non-releasable. The passage cited by them, however, says nothing about the perceived releasability of these types of fasteners. Although '466 and '143 patents describe a preferred embodiment in which the sidewalls can be removed without special tools or skills, I find nothing in the specifications of these two patents to support the view that the patentee has so limited the scope of the claims to exclude fastening means that requires special tools or skills. Scimil Life Systems, 242 F.3d at 1341. It is a cardinal sin of patent law for a court to "read into a claim a limitation from a preferred embodiment, if that limitation is not present in the claim itself." Bayer AG v. Biovail Corp., 279 F.3d 1340, 1348 (Fed. Cir. 2002); see also Benetton Sportswear USA, Inc. v. First Team Sports, Inc., 38 Fed. Appx. 599, No. 02-1004, 2002 WL 1312678, at *6 (Fed. Cir. June 14, 2002) (stating that it would be improper to conclude that merely because the preferred embodiment has a certain requirement that the claim language itself must then contain a similar requirement). Thus, I cannot adopt Salomon's construction, which requires that the claimed inventions must include sidewalls that can only be removed without special tools or skills.

On the basis of the file history and patent specification of the '584 and '466 patents, I am convinced that the term "releasably attached" means that the fasteners claimed in the Wrike patents must permit the sidewalls to be easily removed and replaced. The intrinsic evidence for each patent repeatedly emphasizes the ease with which the sidewalls can be removed and replaced. In the '584 patent specification, for instance, it states that "it is an object of the present invention to provide an in-line roller skate having a frame that includes sidewalls that can be easily and inexpensively replaced when damaged." (emphasis added). Elsewhere, the '584 patent indicates that the invention "allows users to replace one or both sidewalls without replacing the other components of the wheel frame. As a result, the user can inexpensively replace damaged sidewalls, easily reconfigure the skate to carry wheels of a different diameter, and use sidewalls with anodic coatings of different colors." 2:57-62. (emphasis added). During prosecution of the '584 patent, Wrike characterized the claimed inventions to have sidewalls that can be "easily removed and replaced," which thus allows quick and easy change of the wheels on the skate. Polk Ex. 31, August 13, 1996 Amendment, p. 6 (emphasis added).

The criticality of the ease with which the fastener may be removed to permit replacement of the sidewalls is also repeated by the '466 patent. For instance, the '466 patent states that "if one of the sidewalls [in the invention] needs to be removed from the skate frame to be replaced, it can easily be removed without special tools or skills." 7:25-27 (emphasis added). In view of this requirement, the '466 specification states that "another aspect of the invention is a repair kit for allowing for faster or more convenient sidewall replacement." 3:34-36. In view of the object sought by the '466 and '584 patents to provide a frame that include sidewalls that can be easily separated and singularly replaced ('466 patent, 2:39-44, 3:3-6; '584 patent, 2:57-60), I am convinced that the term "releasably attached" means that the fastening element claimed in the Wrike patents must be easily removed and replaced.

V-Formation disputes, however, whether rivets may be properly considered easily removed and replaced. To begin, the claims of a term must be construed to have the meaning that would be given by persons of ordinary skill in the relevant art, unless it is apparent from the patent and prosecution history that the inventor used the term with a different meaning. Dow Chemical, 257 F.3d at 1372; Vitronics, 90 F.3d at 1582. The prior art cited by the patent examiner during the prosecution of the '584 patent provides evidence of what one skilled in the art would consider "releasably attached." In a misguided effort, V-Formation argues, on the basis of Abbott Laboratories, that it is improper to rely on prior art cited by the examiner because it constitutes extrinsic evidence. V-Formation is incorrect. The passage referenced by V-Formation in Abbott Laboratories pertains to determining the scope of permissible equivalents under a doctrine of equivalents analysis, which is not relevant to claim construction. See 287 F.3d at 1104; cf. Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579 (Fed. Cir. 1995). Prior art cited in the prosecution history falls within the category of intrinsic evidence and may be initially considered in construing a patent claim. Tate Access Floors, Inc. v. Interface Architectural Resources, Inc., 279 F.3d 1357, 1372, n.4 (Fed. Cir. 2002).

In the second office action to the priority patent application that lead to the eventual issuance of the '584 patent, the patent examiner rejected the submitted claims as being anticipated by United States Patent No. 5,549,310 ("the Meibock patent"). According to the Meibock patent, the toe and heel plates are described as "being permanently attached to the [boot sole] through the use of rivets or releasably attached through the use of fasteners such as screws or bolts." 4:53-56; see also 5:22-29. Furthermore, according to the Meibock patent, the frame sidewalls are "shown in the preferred embodiment [of the
Meibock patent] as [being attached to the heel and toe plates by] a screw and retainer . . . [although] any suitable releasable fastening device could be used. In alternate embodiments a more permanent fastener such as a rivet could also be used. The Meibock patent provides evidence that rivets are considered by persons of ordinary skill to be permanent fasteners.

I find it notable that the Meibock patent describes the in-line skate construction in strikingly similar language to that used in the Wrike patents. The Meibock patent states that "the frame and the base of the boot are generally integrally molded as a single piece or are permanently fastened together by riveting or bonding." 1:36-40. By comparison, the Wrike patents state that the wheel frame may be secured to the base of the boot by rivets or high-strength adhesives e.g., bonding. '466 patent, 5:13-16; '584 patent, 4:4-6; '143 patent, 5:16-19. According to the Meibock patent, the permanence of the structure created by riveting or bonding "prevents a user from adjusting the location of the frame with respect to the boot or from removing and exchanging one set of frames for another set of frames of a different configuration." (1:36-43). In view of the distinction drawn by prior art, which was discussed and cited during prosecution of the '584 patent prosecution, between rivets and other fastening means, I am persuaded that those skilled in the art would not consider rivets (or high strength adhesives) to fall within the category of releasable fasteners. 1 See Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998) ("The construction that stays true to the claim language and most naturally aligns with the patent's description of the invention will be, in the end, the correct construction."). 2

--- Footnotes ---

1 Although the K-2 case, which Salomon cites, is by no means controlling in the instant case, the K-2 case appears to affirm my understanding of the nature of rivets, which I derived from the intrinsic evidence reviewed herein. 191 F.3d at 1365 ("Screws, unlike rivets and laminates, are meant to be unscrewed, that is, to be removed. A rivet or a laminate, to the contrary, is meant to remain permanent, unremovable unless one is bent on breaking the permanent structure apart.").

2 Although claim 1 of the '584 patent recites a "fastening means for releasably attaching" the sidewalls, which would ordinarily require a thorough analysis of the "corresponding structure" disclosed in the '584 specification and its equivalent, this analysis is unnecessary given the difference in function performed by rivets and releasable fasteners, such as screws and bolts. See Micro Chem., Inc. v. Great Plains Chem. Co., Inc., 194 F.3d 1250, 1257 (Fed. Cir.1999) ("§ 112, P 6] does not permit limitation of a means-plus-function claim by adopting a function different from that explicitly recited in the claim.").

3288

CLAIM CONSTRUCTION

This court must address the meaning of the claim term "releasably attaching" in claims 1 and 9 of the '466 patent. Claims 1 and 9 state: "a plurality of fasteners for releasably attaching said first and second sidewalls to respective ones of said toe and heel plate flange pairs." '466 patent, col. 9, ll. 25-27; col. 10, ll. 16-18 (emphasis added). The district court construed the term "releasably attaching" to mean that the fasteners "must permit the sidewalls to be easily removed and replaced." V-Formation, Inc., 2002 U.S. Dist. LEXIS 22394, at *24. The district court also determined that "those skilled in the art would not consider rivets . . . to fall within the category of releasable fasteners." Id. at *29.

The intrinsic record in a patent case is the primary tool to supply the context for interpretation of disputed claim terms. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). This tool usually provides the technological and temporal context to enable the court to ascertain the meaning of the claim to one of ordinary skill in the art at the time of invention. Metabolite Labs., Inc. v. Lab. Corp. of Am. Holdings, 370 F.3d 1354, 1360 (Fed. Cir. 2004); Moba v. Diamond Automation, Inc., 325 F.3d 1306, 1315 (Fed. Cir. 2003) ("Moreover, as this court has repeatedly counseled, the best indicator of claim meaning is its usage in context as understood by one of skill in the art at the time of invention."); Ferguson Beauregard v. Mega Sys., LLC, 350 F.3d 1327, 1338 (Fed. Cir. 2003) ("The words used in the claims must be considered in context and are examined through the viewing glass of a person skilled in the art."); Interactive Gift Express, Inc. v. Compuserve Inc., 256 F.3d 1323, 1332 (Fed. Cir. 2001) ("It is important to bear in mind that the viewing glass through which the claims are construed is that of a person skilled in the art."); Markman, 52 F.3d at 986 ("The focus is on the objective test of what one of ordinary skill in the art at the time of the invention would have understood the term to
mean.").

In most cases, the best source for discerning this proper context is the patent specification wherein the patent applicant describes the invention. Metabolite, 370 F.3d at 1360. In this case, the '466 patent's specification informs this court that the sidewalls must be "easily" removed and replaced. The specification repeatedly emphasizes the ease of sidewall removal and replacement. For instance, the '466 patent states: "If one of the sidewalls [in the invention] needs to be removed from the skate frame to be replaced, it can easily be removed without special tools or skills." '466 patent, col. 7, ll. 25-27 (emphasis added). In view of this requirement for easy replacement, the '466 patent specification further states: "Another aspect of the invention is a repair kit for allowing for faster or more convenient sidewall replacement." Id. at col. 3, ll. 34-36 (emphasis added). In fact, the specification lists as one of the invention's objects that it provides an in-line skate frame with sidewalls that can be separated and singularly replaced. Id. at col. 2, ll. 39-42. Thus, the specification supports the district court's claim interpretation.

The district court properly considered other intrinsic evidence to aid its construction. For instance, the district court considered U.S. Patent No. 5,549,310 (the Meibock patent). The Meibock patent is prior art that was listed as a reference on the face of the '466 patent and in an Information Disclosure Statement. This prior art reference to Meibock is not extrinsic evidence. This court has established that "prior art cited in a patent or cited in the prosecution history of the patent constitutes intrinsic evidence." Kumar v. Ovonic Battery Co., 351 F.3d 1364, 1368 (Fed. Cir. 2003); Tate Access Floors, Inc. v. Interface Architectural Res., Inc., 279 F.3d 1357, 1371-72 n. 4 (Fed. Cir. 2002); Vitronics, 90 F.3d at 1582 (Fed. Cir. 1996); Markman, 52 F.3d at 979-80. For example, in Arthur A. Collins, Inc. v. Northern Telecom Ltd., 216 F.3d 1042 (Fed. Cir. 2000), this court rejected the district court's claim construction, which "declined to consider the teachings of [prior art referenced in the patent] to ascertain the meaning" of the claim term "time-space-time (TST) switch." Id. at 1044. Instead, this court interpreted the term based on its usage in the prior art that was cited in the patent, explaining that "when prior art that sheds light on the meaning of a term is cited by the patentee, it can have particular value as a guide to the proper construction of the term, because it may indicate not only the meaning of the term to persons skilled in the art, but also that the patentee intended to adopt that meaning." Id. at 1045.

The district court properly used the Meibock patent to set the context for its claim construction. The Meibock patent explains that the toe and heel plates are "permanently attached . . . through the use of rivets or releasably attached through the use of fasteners such as screws or bolts." Meibock patent, col. 4, ll. 53-56 (emphases added); see also col. 5, ll. 22-25. The Meibock patent further explains: "Each fastener is shown in the preferred embodiment as a screw and retainer; however, any suitable releasable fastening device could be used. In alternative embodiments, a more permanent fastener such as a rivet could also be used." Id. at col. 5, ll. 54-58. Thus, the district court correctly concluded: "[The] Meibock patent provides evidence that rivets are considered by persons of ordinary skill to be permanent fasteners." V-Formation, Inc., 2002 U.S. Dist. LEXIS 22394, at *28.

As the district court noted, the Meibock patent uses "strikingly similar language" to the '466 and '143 patents to describe its in-line skate construction. Id. For instance, the Meibock patent recites: "The frame and the base of the boot are generally integrally molded as a single piece or are permanently fastened together by riveting or bonding." Col. 1, ll. 36-40. In addition, the Meibock patent explains that the permanent rivet or bonding structures "prevent[] a user from adjusting the location of the frame with respect to the boot or from removing and exchanging one set of frames for another set of frames of a different configuration." Id. at col. 1, ll. 38-42. By comparison, the '466 and '143 patents state that rivets or high-strength adhesives may secure the wheel frame to the base of the boot. '466 patent, col. 5, ll. 13-16; '143 patent, col. 5, ll. 16-19. Consequently, this court agrees with the district court's conclusion that one skilled in the art would not consider rivets within the category of releasable fasteners.

Finally, the district court properly weighed this court's opinion in K-2 Corp. v. Salomon, S.A., 191 F.3d 1356 (Fed. Cir. 1999), when considering the available intrinsic evidence. The district court quoted the following portion of K-2 Corp. in footnote 1 of its opinion: "Screws, unlike rivets and laminates, are meant to be unscrewed, that is, to be removed. A rivet or a laminate, to the contrary, is meant to remain permanent, unremovable unless one is bent on breaking the permanent structure apart." V-Formation, Inc., 2002 U.S. Dist. LEXIS 22394, at *29 (quoting K-2 Corp., 191 F.3d at 1365). The district court put this reference in its proper context by explaining that "although the K-2 case . . . is by no means controlling in the instant case, the K-2 case appears to affirm my understanding of the nature of rivets, which I derived from the intrinsic evidence . . . ." Id. Thus, the district court properly used K-2 Corp. to merely further confirm the correctness of its independent claim construction and not as controlling authority for its decision. Likewise, this court does not rely on K-2.
Corp. in reaching its conclusion regarding the trial court's claim construction. The district court properly referred to a related, non-binding judicial opinion to support its independent conclusion in this case.

In sum, this court affirms the district court's claim construction defining "releasably attaching" in claims 1 and 9 of the '466 patent to mean that the fasteners "must permit the sidewalls to be easily removed and replaced" and determining that "those skilled in the art would not consider rivets . . . to fall within the category of releasable fasteners."

C. "Releasably Attached"

The claim term "releasably attached" appears in Claims 3 and 5. In Claim 3, "the diaphragm has a connector extending upwardly therefrom and the actuating means are releasably attached thereto." In Claim 5, "the connector is a separate member releasably attached to the diaphragm." The parties agree that a releasably attached structure is one designed for repeated assembly and disassembly.

Cannon contends that the term "releasably attached" requires that the components be "capable of being readily attached to and separated from [each other] by ordinary manual force and without the use of specialized tools." Cannon argues that the purpose of the invention compels this construction -- the breast pump is to be assembled and disassembled by a mother in the home environment, not by engineers in a laboratory.

TFY argues that the term requires that the components must be "capable of being readily attached to and separated from" each other in a non-destructive way. The Court agrees with TFY. The specification teaches that "an advantage of the illustrated breast pump is the ease by which it may be assembled and disassembled to enable it to be properly sterilized before use." '850 patent, col. 7, Ins. 58-60. The summary of the invention teaches that "it is an object of the present invention to provide an improved pump which is easier and more convenient to use and simpler to strip down for cleaning and reassembly." '850 patent, col. 1, Ins. 46-48.

The definition of "releasably" is: "capable of being released." Webster's Third New Int'l Dict. at 1917. "Release" is defined as: "to set free from restraint, confinement, or servitude; the act of liberating or freeing: discharge from restraint." Webster's Third New Int'l Dict. at 1917. The definition of "attach" is: "to make fast or join (as by string or glue); bind, fasten, tie; to fix or fasten itself, adhere." Id. at 140.

Although Cannon's definition is consistent with the purpose of the patent, nothing requires the construction of "releasably attached" to require the limitation of ordinary manual force. Indeed, nothing in the specification specifies the degree of difficulty with which the components can be attached and separated.

TFY's proposed construction is consistent with the ordinary meaning and with the specification and summary of invention. Accordingly, the Court defines "releasably attached" as "capable of being non-destructively attached to and separated from."
counter-profiles on each plate member. I agree with CPT because the specification precisely describes the manner in which the connection between the plate members and the opposing surfaces is achieved. For example, the specification states: "The connection of the plate members with the side members is structurally very easily accomplished, as . . . described in . . . connection with several exemplary embodiments," which are represented by Figures 2 and 6. Id. at col.2 l.8-11. In both of these figures, and from the accompanying descriptions in the specification, it is evident the connection between the plate members and the opposing surfaces is accomplished solely via the cooperating profiles and counter-profiles. Although IKN argues the specification describes a connection between the flanges and the upper edges of the side members, this phrase reveals only a contact relationship between these parts and, as such, is insufficient to satisfy the limitation. Thus, I will construe the "releasably connectable" limitation as requiring each individual plate member to be "connected directly to the opposing surfaces of the two side members in such a manner that it is capable of being freed from the opposing surfaces of the two side members." 13

--- Footnotes ---

12 This argument also assumes the proper construction of the term "opposing surfaces" includes the upper edges - a position I have previously rejected.

13 The modifier "releasably" simply refers to the various references in the specification to the ease with which the plate members can be inserted and removed from the frame when the invention is disassembled for the purpose of removing and replacing worn plates.

--- End Footnotes ---

2. Claims 2 and 4

The parties have asked the Court to construe the term "releasably secured" which appears in dependent claims 2 and 4. Claim 2 claims an "apparatus as claimed in claim 1 wherein the nozzle is releasably secured to the tubular housing." ('886 patent, col. 4, ll. 18-19.) Claim 4 claims an "apparatus as claimed in claim 1 wherein the mouthpiece is releasably secured to the tubular housing." ('886 patent, col. 4, ll. 22-23.) Since the same term is used in both claims, it should be construed in the same way in both claims. Georgia-Pacific Corp. v. U.S. Gypsum Co., 195 F.3d 1322, 1331 (Fed. Cir. 1999) ("Unless the patent otherwise provides, a claim term cannot be given different meaning in the various claims of the same patent.").

P&M construes "releasably secured" as "connected, but detachable." (Pls. Opening Mem. at 21.) Rose Art construes the term as having "a control mechanism that provides the ability to easily free the nozzle portion [or the mouthpiece in claim 4] from the fastened position and secure the nozzle [or mouthpiece] to the tubular housing in a fastened position." (Def. Pre-Markman Hr'g. Br. at 28-29.) There is nothing in the claim language or the specification which would require the term to include "a control mechanism" for freeing and securing either the nozzle or the mouthpiece relative to the housing. Rose Art relies on extraneous evidence in the form of dictionary definitions, the "Plasto-Vertrieb" patent and expert testimony to support its definition of this term. The Court finds that the term "releasably secured" is not ambiguous and, therefore, it is not necessary to consider extrinsic evidence to construe the disputed claim language. Consequently, the Court construes the term "releasably secured" as "connected, but detachable."

aa. "Releasable Means" (Claim 3)

143. LaGard concedes that the releasable means of Claim 3 is a means-plus-function element subject to § 112 P6. LaGard's Reply Re Summary Judgment Motion on Infringement (DE # 127), p. 11; LaGard's Supplemental Reply to Mas-Hamilton's Opposition to LaGard's Summary Judgment Motion (DE # 142), p. 8. LaGard asserts, however, that the word "releasable" is unimportant for claim interpretation. However, no claim term is to be ignored in interpreting a claim; each element is to be

144. In describing the "releasable means", the '656 patent specification states that the cantilever arm (an integral part of the lever) and detent on the lever (the spring-biased pin at the lower end of the cantilever) releasably maintains the lever in a position disengaged from the cam wheel. See '656 patent Abstract. These parts are also described in the specification to releasably maintain the pivotable lever in a position disengaged from the cam wheel. Col. 2, lines 24-26. As shown by the description and drawings of the '656 patent, when the solenoid housing translates linearly, the detent pin is released from the recess on the upper surface of the solenoid housing. Once the lower end of the cantilever arm is released, there is no mechanical connection between the upper surface of the solenoid housing and the lower end of the cantilever arm. Thus, as used in the '656 patent, "release" has the usual meaning of a mechanical arrangement of parts for holding or freeing a device or mechanism as required, or a setting free from restraint. PX 187, PX 188.

145. As described in the '656 patent specification, the "releasable means" identifies a lever which is held up out of contact with the dial cam by a cantilever arm including at its lower end a movable spring-loaded detent pin within a bore which normally engages a recess in the solenoid housing which retains the detent pin in place. The detent pin, as well as the lower end of the cantilever arm, are releasable from the recess when the solenoid housing moves linearly to cause the lever to engage the dial cam. That is, as the solenoid housing moves linearly, there is no mechanical connection between the lever and the solenoid housing -- the lever is set free from the solenoid housing.

146. The function of the releasable means is to maintain, through the operation just described, the lever in a stationary position disengaged from the cam wheel and independent of rotational movement of the cam wheel, yet release the lever at the appropriate time during operation of the lock.

bb. "Release" (Claims 34, 43)

147. In Claims 34 and 43, "release" is used to describe the interaction between the movable link member and the lever, i.e., that the movable link member is moved so as to "release" the lever. This term is to be defined in the same way as described in connection with the releasable means. When the mechanical mechanism operates, the movable link member (the solenoid housing) is moved to free the lever so that there is no longer any mechanical interconnection between the movable link member and the lever.

c. "Releasing" (Claims 34, 43)

148. This claim term is used to describe the action of the movable link member after the combination has been entered. This term has the same meaning in these claims as "release", i.e., setting free the lever from the solenoid housing.

GO BACK

3293

1. Release Coating and Release Coated 14

Plaintiff's Proposed Construction: A "release coating" is a covering that permits the easy and complete removal of pressure sensitive adhesive labels.

Defendants' Proposed Construction: A "release coating" is a material such as silicone or lacquer applied to a substrate by a liquid coating operation, which allows pressure sensitive labels to release. The term does not encompass an uncoated film or the films of Rigggsbee (U.S. Patent No. 4,767,654) or Du Katz (U.S. Patent No. 5,248,536) which Plaintiff told the Patent Examiner were not coated materials in order to induce the Patent Examiner to grant the patents-in-suit nor does it include a laminate that is made by bonding two or more films together.

The Court's Claim Construction: A "release coating" is a covering that permits the easy and complete removal of pressure sensitive adhesive labels. "Release coated" means a material having a "release coating."

14 Defendants have asked the Court to define "release coated" as "a material having a 'release coating' which allows pressure sensitive labels to release." MPT does not dispute this definition. Because release coated is defined by reference to
the definition of release coating, both terms will be addressed in this section.

The parties do not dispute the function of a release coated surface. They have not argued that MPT's proposed construction which "permits the easy and complete removal of pressure sensitive adhesive labels" differs in any appreciable manner from Defendants' proposed construction which "allows pressure sensitive labels to release." Instead, the parties disagree over the materials that may perform this function. Defendants are involved in the sale of a product that incorporates a Teflon(R) film to allow for the removal of pressure sensitive labels. Defendants argue that under their proposed definition, a Teflon(R) film could not literally infringe the patents because it is a film that is bonded to a second film, rather than a silicone or a lacquer applied to a substrate by a liquid coating operation. MPT believes that any material that performs the release function and covers another material is release coated.

The release coating of the claims is on the release coated surface (or face) of the placard and allows for the placement and removal of adhesive coated labels. For example, in Claim 1 of the '790 patent the "placard [has] a release coated face . . . ." The method involves "placing a pressure-sensitive adhesive coated label on the release coating of the placard[,] . . . removing said label from the placard" and "replacing said label with another adhesive coated label . . . ." The claims do not attempt to further define the release coating by its structure. This claim language supports MPT's definition. There is nothing in the claims to limit a release coating to a particular material or manufacturing process. Instead, the focus is on the ability to permit the easy and complete removal of pressure sensitive adhesive labels.

Defendants counter that release coating has a special meaning in the art, and further, that the inventor meant to incorporate that meaning by his alternative use of "release layer" to describe the liner release surface in Claim 5 of the '790 patent and Claim 10 of the '164 patent. By using different terminology for the "release layer" of the liner and the "release coating" of the placard, Defendants believe the inventor was providing public notice that a placard with a release layer does not infringe. Defendants then posit that a laminated film such as Teflon(R) is a release layer.

However, the claims do not disclose any structural difference between a "coating" and a "layer." In fact, in the '164 patent the same liner release surface is described as both a "release coated" surface (Claims 3, 5 and 8) and a "release layer" (Claim 10). MPT points out that Claim 1 and Claim 4 of the '790 patent describe the same adhesive face of the placard as "an adhesive coated face" and "a pressure sensitive placard adhesive layer," respectively. Also, later in Claim 4 the adhesive surface of the label is described as "a pressure sensitive adhesive coating." Thus, it appears from the claims that "coating" and "layer" are used interchangeably.

Both parties argue that the specification supports their position. 15 Defendants argue that the specification always describes the liner release surface as a "release layer" while the placard release surface only has a "release coating." MPT counters in a number of ways. First, Defendants are incorrect that the release surface of the liner is always referred to as a "release layer." The "release layer 20" of the liner is referred to as a "a release coating 20" at one point in the specification. ("790 patent, col. 2, ln. 20) (emphasis added). Second, the "release coating" of the placard is referred to as a "layer" on a number of occasions. For example, the specification describes the entire lamination, including the release coating of the placard, as "a multi-layer lamination 10." ("790 patent, col. 2, ln. 8-12) (emphasis added). The patent drawings do not depict the placard release coating (element 24) in a different manner than the liner release layer (element 20). Third, in the preferred embodiment both release surfaces are made of the same material: "The liner is provided with a silicone release layer 20" and the placard release surface has "a silicone release coating 24." ("790 patent, col. 2, ln. 14-15, ln. 29-30).

15 The specifications for the '790 patent and the '164 patent are essentially the same. For that reason, the Court will reference the '790 patent specification only.

Defendants explain the interchangeable use of "layer" and "coating" as follows: "The release layer may be either a 'release coating' [i.e., a lacquer or silicone applied by a liquid coating process] or it may be a film that has inherent release properties such as Teflon(R) film." The Court disagrees. Nothing in the claims or specification supports Defendants' position. There is no indication that "coatings" are not "films" or even that "coating" is a subset of "layer." Instead, the specification contemplates that a "layer" can be "laminated" to a "film" such that it "coats" the film. Although the specification does not address the manufacturing process for the placard release coating, 16 it does give an example of how the full lamination can be constructed from a commercially available liner and film. In short, the paper liner 18 has a "layer of white modified acrylic adhesive 26 laminated to one side." ('790 patent, col. 2, ln. 32-33) (emphasis added). The film and liner are combined by "laminating" the "non-release coated side of the film" to the adhesive side of the liner, after
which the adhesive surface initially referred to as a "layer" is referred to as providing an "adhesive coated surface." 17 ('790 patent, col. 2, ln. 34-37 (emphasis added); see also '790 patent, col. 2, ln. 18-19 (describing an "opposite face [of the film] with a coating of adhesive 26"). This supports MPT's argument that a release coated surface may also be formed by the lamination of layers or films.

16 MPT argues that "the placard acquires its 'release coated surface' through a process of laminating two solid webs together . . . ." This is not correct. The specification never describes how the release coated surface is applied to the film, beyond noting that a film already having a release coated surface is available from the Mobil Chemical Corporation. ('790 patent, col. 2, ln. 28-31).

17 Defendants cite to Satas to explain the lamination process of the adhesive: "The adhesive is usually transfer coated. That is, the adhesive is applied to the silicone coated sheet and transferred to the label stock in the final laminating step." Satas at p. 398. However, this reference merely confirms that a coating can be applied by a lamination process.

Moreover, assuming arguendo that "release coating" is a subset of "release layer," this does not mean that a release coating is "a material such as silicone or lacquer applied to a substrate by a liquid coating operation . . . [not] including a laminate that is made by bonding two or more films together." What is noticeably absent from the claims or specification is any indication that the terms "layer" and "coating" were intended to refer to materials produced by a particular manufacturing process. Those terms simply describe the relationship between components of the full "multi-layer lamination 10" used to perform the method. For example, the "release coating 24" is the outside "layer" of the lamination ('790 patent, col. 2, ln. 8-12), even though it is a "release coating 24" for the placard film 22. ('790 patent, fig. 2; col. 2, ln. 23-24). Similarly, the "release layer 20" of the liner may generally be described as a layer located near the center of the lamination. ('790 patent, fig. 2). However, it is specifically referred to as "a release coating 20" with respect to the "liner 18" that it coats.

Defendants also focus on the fact that the release coating 24 coats a film 22. ('790 patent, col. 2, ln. 17-18, 29-30). The film 22 has a "non-release coated side." ('790 patent, col. 2, ln. 34-35). Starting from the premise that the film 22 is not a release coating, Defendants conclude that no film can be used as a release coating. This results in Defendant's proposed definition that a release coating cannot include "a laminate that is made by bonding two or more films together." However, Defendants' logic is flawed. A person of ordinary skill in the art would understand that the film 22 needs a release coating 24 not because it is a film, but because it is a film without release properties.

Defendants also point to the specification's specific reference to silicone as the release coating. However, the claims never limit the release coating to silicone. 18 Courts are not permitted to import the preferred embodiment into the claims unless it is justified by the claim language. Specialty Composites v. Cabot Corp., 845 F.2d 981, 987 (Fed. Cir. 1988). The error would be particularly egregious here, since the patents' only references to a silicone release coating are in the description of the preferred embodiment. In re Am. Acad. of Sci. Tech Ctr., 367 F.3d 1359, 1369 (Fed. Cir. 2004). The claims and the remainder of the specification recite a generic release coating. By leaving silicone out of the claims, the inventor chose not to limit his invention to a silicone release coating. See SRI Int'l v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1121 n.14 (Fed. Cir. 1985) (explaining that "there is nothing in the asserted claims themselves about" the preferred embodiment).

18 Indeed, defendant Marathon Labels, Inc. responded to an interrogatory that "release coating" had a broad meaning that included materials other than silicone, but that "the silicone release coating is the only enabling disclosure for the claimed feature." (Marathon's Resp. to PI's 1st Req., Interr. # 8).

These conclusions are confirmed by reading the patent specification in light of its purpose to "teach and enable those of skill in the art to make and use the invention and to provide a best mode for doing so." Phillips, 415 F.3d at 1323. As is demonstrated by the extrinsic evidence discussed below, although numerous materials have release properties, the most common material for this application at the time of the invention was silicone. It makes sense that the inventor would use silicone in the "Description of the Preferred Embodiment" section of the patent to teach and enable others to perform the inventive method. Moreover, the inventor risks invalidity if he fails to "set forth the best mode contemplated by the inventor of carrying out his invention." 35 U.S.C. § 112. It certainly appears that the inventor's contemplated best mode included a silicone release coating.

It is also important to consider exactly what the specification would teach a person of ordinary skill in the art. As is confirmed by the technical references discussed below, silicone is immediately recognizable as a material that permits the easy and complete removal of pressure sensitive adhesive labels. There is no indication anywhere in the specification that
silicone is being used to explain the manufacturing process or original physical state of the release coating. Instead, the specification assumes that materials with appropriate release properties are commercially available from others. In sum, it is clear that the references to silicone were intended to teach and disclose the best mode for the invention rather than to limit the scope of the claims. Phillips, 415 F.3d at 1323.

The Court turns next to the prosecution history. The parties focus on two patents that were discussed during prosecution, Riggsbee and Du Katz. Riggsbee discloses an improved detachable coupon label. Prior to Riggsbee's invention, it was widely believed "that an effective detachable coupon label had to employ an adhesive to ensure that the coupon or label did not prematurely detach from the carton or container." (Riggsbee, col. 2, ln. 31-34). Other label structures required "a release polymer" to allow for the easy removal of labels. (Riggsbee, col. 2, ln. 38-41).

Riggsbee recognized a need for "a coupon label that will securely adhere to packaging without the use of an undesirable tacky adhesive and which can be readily removed without the use of a release substance." (Riggsbee, col. 2, ln. 42-45) (emphasis added). Riggsbee accomplished this goal by applying a resin film to the label base sheet to form a composite web. (Riggsbee, col. 4, ln. 15-19). This process created the necessary London or dispersion force between the resin film and the base sheet such that the label would separate from the film only upon the application of a desired release force. (Riggsbee, col. 4, ln. 15-19). London or dispersion force is a force of attraction between two materials that does not require an adhesive. (Riggsbee, col. 4, ln. 20-25). Riggsbee goes on to describe in detail some examples of materials and the manufacturing process used to produce labels with the necessary London or dispersion force.

The examiner initially rejected the claims of the original '119 application in light of Riggsbee. The prosecuting attorney responded with two arguments, the first addressed the method of relabeling and the second the film material. First, "Riggsbee is designed for one-time use" and "no relabeling with a different label is disclosed." ('119 file, p. 40) (emphasis in original). Second, "once the coupon [i.e., the label of Riggsbee] is removed [from the film of Riggsbee], there is no release-coated face exposed for receiving another label. The coupon itself has no adhesive coating on it so it cannot be adhered to the film." ('119 file, p. 40).

It is not entirely clear why the examiner eventually rescinded the rejection under Riggsbee. 19 ('119 file, p. 67). In any event, the '119 application was abandoned in favor of the '882 continuation-in-part application, which added the following material to the specification:

A label is applied to the placard outer face such that a pressure sensitive adhesive backing of the label is releasably attached to the release coated surface even if the label has a so called permanent adhesive backing.  

* * *  
Moreover, because of the release coating 24 any commercially available label can be used including those with inexpensive permanent pressure sensitive adhesive coatings rather than more expensive removable coatings.

(Compare '882 file, p. 6, with '119 file, pp. 9-10)

19 Following the applicant's filing of an appeal brief, and before an appeal, the examiner ended the Riggsbee line of rejections with the following terse statement: "The Final rejection dated November 10, 1993 has been rescinded[.]") ('119 file, p. 67). This provides some anecdotal support to the Federal Circuit's warnings about the lack of clarity often present in patent prosecution histories. Phillips, 415 F.3d at 1317.

Among other rejections, the '882 claims were rejected under 35 U.S.C. § 102(e) as anticipated by Du Katz and 35 U.S.C. § 103 as obvious under Du Katz in light of Riggsbee. Regarding Riggsbee, a declaration of Michael Kennedy stated as follows:

I have reviewed Riggsbee Patent 4,767,654 and failed to see where it in any way suggests the use of a release coating to enable a user to utilize labels with either permanent or reusable adhesive and be able to remove such a label without damage to the substrate. Indeed, this patent teaches the use of a casting substrate to avoid "an undesirable tacky residue" when a coupon is removed.

('882 file, p. 8). 20

20 This declaration was also submitted with the '202 application. ('202 file, p. 68).
Du Katz describes an apparatus for displaying removable indicia in a setting such as a fast food restaurant. (Du Katz, col. 4, ln. 21-27). A base sheet is manufactured of ABS or other commercially available materials. (Du Katz, col. 4, ln. 47-66). The base sheet displays information such as combo meals with predetermined non-printed zones. (Du Katz, col. 4, ln. 67 - col. 5, ln. 20). The non-printed zones of the base sheet receive removable indicia which include information such as the price of the combo meal and can be changed without replacing the entire display. (Du Katz, col. 5, ln. 21-67). The removable indicia (i.e., the Du Katz component which is similar to a label) "may have a removable adhesive deposited thereon, such as, for example, the water-base adhesive KIWO(R)" for attachment to the base sheet. (Du Katz, col. 5, ln. 35-37). A substantially transparent cover sheet "is conformably dimensioned to mate with the base sheet 20, and is operable to selectively locate and substantially seal the removably interchangeable indicia 30 within the apparatus 10 for view by the consumer." (Du Katz, col. 7, ln. 20-24).

The declaration of Michael Kennedy was submitted in response to this rejection. ('882 file, p. 48). He referred the patent examiner to definitions for permanent adhesive and removable adhesive provided by the Fasson company:

Permanent: An adhesive designed to stick to a substrate without edge lifting that cannot be removed without damaging either the label or the substrate.

Removable: An adhesive designed to stick to a substrate without edge lifting that can be removed without damage to either the label or the substrate.

('882 file, p. 51).

He then argued that the surface of Du Katz could release only removable adhesive labels, and thus did not have a release coating:

The ABS "base sheet" 20 of [Du Katz] is printed on its outer surface and does not have a release coating. The removable labels 30 must necessarily have a removable adhesive. Otherwise the outer surface of the "base sheet" 20 could be damaged when the "indicia" 30 are removed and replaced. Any printing that might underlie the labels could be stripped away.

('882 file, p. 48). 21

21 These statements are repeated elsewhere in the '882 application and also in the '202 application. ('882 file, p. 8; '202 file, p. 68).

Kennedy also submitted evidence that the invention enjoyed commercial success. The examiner ultimately found this latter basis persuasive, relying on "the weight of evidence relating to long felt need and commercial success . . . to overcome the prima facie case for obviousness that had existed against the claims in this case." 22 ('882 file, p. 92). That application then issued as the '790 patent.

22 A prima facie case of obviousness is a procedural tool used by the PTO. In re Oetiker, 977 F.2d 1443, 1445 (Fed. Cir. 1992). The patent examiner has the initial burden of setting forth a prima facie case of obviousness. Id. This may be overcome by objective evidence of nonobviousness such as commercial success and long felt need. Graham v. John Deere Co., 383 U.S. 1, 17-18, 86 S. Ct. 684, 15 L. Ed. 2d 545 (1966); Rouffet, 149 F.3d at 1355.

The '882 application was also continued as the '202 application. The '202 application was initially rejected as obvious under Du Katz and two other patents. 23 ('202 file, p. 36). The arguments made above were largely repeated during prosecution of the '202 application. (E.g., '202 file, p. 68). The claims were eventually allowed on the basis that the "prior art fails to teach a placard having a release coating." ('202 file, p. 79). The '202 application issued as a patent and was reissued as the '164 patent.

23 Riggsbee was not cited in the initial rejection of the '202 application. ('202 file, p. 42).

Defendants essentially repeat their film/release coating argument with respect to the prosecution history. The argument goes as follows: 1) Riggsbee and Du Katz are films (or layers); 2) Riggsbee and Du Katz are not release coatings; and 3) therefore, no film can be a release coating. Defendants' argument is flawed. The prosecution history clearly indicates that, to the extent Riggsbee and Du Katz were distinguished based on their materials, the critical distinction was the materials' lack of release...
properties to accommodate both permanent and removable pressure sensitive adhesive labels. Rigsbee teaches away from using any release substance or adhesive labels, while Du Katz only allows for the use of removable adhesive labels. That the materials of Rigsbee and Du Katz might have been referred to as films was wholly irrelevant. 24

24 Indeed, Rigsbee describes a prior art patent where a "film is . . . coated onto the release polymer."

(Riggsbee, col. 2, ln. 12-13) (emphasis added). Du Katz was not concerned with the nature of the base sheet as a film. The base sheet or main body may be made of numerous materials which might not be characterized as a film, such as "styrene, vinyl, paper, polyester, foam stock or polycarbonate, to name a few." (Du Katz, col. 4, ln. 64-66). ABS itself is not necessarily a film. (See Lantz).

Defendants also wish the Court to include in the definition of release coating the following statement: "The term does not encompass . . . the films of Rigsbee (U.S. Patent No. 4,767,654) or Du Katz (U.S. Patent No. 5,248,536) which Plaintiff told the Patent Examiner were not coated materials in order to induce the Patent Examiner to grant the patents-in-suit . . . ." Their request is denied for a number of reasons. First, Defendants' statement focuses on the incorrect "films are not coatings" argument. The applicant certainly made limiting statements with respect to Rigsbee and Du Katz, but again, those statements were focused on the function of the release coating as permitting the easy and complete removal of pressure sensitive adhesive labels, something that the Court has already included in its claim definition. Second, Defendants' definition is unwieldy and inappropriate for presentation before a jury. The Court can define release coating in a concise and understandable manner that does not require reference to other patents and create the potential for a backdoor around this Markman ruling. Third, if Defendants are seeking to make a prosecution history estoppel argument, that limitation on the doctrine of equivalents is more appropriately addressed to the Court after the claim term has been defined. The prosecution history instead confirms the Court's reading of the claims and specification. As was discussed above, there is no indication in the prosecution history that a film cannot be a release coating. Nor is there any indication in the cited passages that the release coating is limited to "a material such as silicone or lacquer applied to a substrate by a liquid coating operation." Similar to the specification and claims, the prosecution history focuses on the functionality of the release coating. Specification language was added stating that labels with "permanent pressure sensitive adhesive coatings" could be released from the release coating and both Du Katz and Rigsbee were distinguished on this basis. Finally, the extrinsic evidence also supports the Court's conclusion. The following industry definitions were provided by Defendant:

. "RELEASE COAT The release liner treatment material that allows pressure sensitive labels to release from the release liner. Usually made from silicone." (TLM p. 49).
. "Release Coat (release lacquer, lacquer, silicone coat) Material coated on the liner which allows [pressure sensitive] labels to release." (Fasson p. 35).
. "Release coating -- The release liner treatment material -- usually silicone -- that is coated onto the backing paper or film and which enables pressure-sensitive face materials or labels to be readily removed from the protective release liner prior to application. See silicone release coatings." (Fairley p. 167).
. "Release layer. A thin layer of chemicals, usually silicones, which 'release' the adhesive from the liner. This layer is sometimes referred to as the silicone or lacquer layer." (Avery § 4 p.1).

Despite Defendants' arguments to the contrary, these industry definitions are consistent with the Court's reading of the intrinsic record. All four define the release coat or release layer by reference to its function of allowing for the release of adhesive surfaces. As is indicated by the qualifying language that the release coat is "usually" made from silicone or lacquer, the examples are not intended to exclude other materials with the same properties. In fact, the citation of silicone as an exemplary material supports the Court's conclusion that the patent specification's recitation of a "silicone release coating" in the preferred embodiment would be recognized by a person of ordinary skill in the art as describing release properties rather than a manufacturing process.

These definitions provide no support for limiting a coating to a material "applied to a substrate by a liquid coating operation" as Defendants suggest. The definitions say nothing about a liquid coating operation. Nonetheless, Defendants' argue as follows: 1) a release coating must be silicon or lacquer; 2) silicone and lacquer are applied by a liquid coating operation; and 3) therefore, a release coating must be applied by a liquid coating operation. Defendants are wrong on all three counts. As was stated above, silicone and lacquer are merely provided as examples of a release coating. Moreover, Defendants have not pointed the Court to any evidence that silicone or lacquer must be applied by a liquid coating operation. Thus, the technical definitions provide no support for Defendants' proposed limitation. 25
25 Defendants also provide the following definition:

COATING In printing, an emulsion, varnish or lacquer applied in-line or off-line, often over a printed surface to give it added protection.

(TLM p. 12). This does not support limitation of a coating to a liquid coating process. First, the definition requires the same logical leap as every other definition proffered by defendants; namely, the Court must assume that the enumerated substances may only be applied as a liquid. Second, this definition is explicitly limited to printing. A brief review of a few pages of the TLM glossary indicates that there are many types of coatings, such as "clear coat," "clay coat," "barrier coat," "sealer coat" and "anchor coat." None of these coatings appear to be limited to a liquid coating process, and if one had been, the Court assumes that Defendants would have pointed this out.

Defendants next point to a definition of a "laminate" as "[a] web material formed by bonding two or more materials together as in a pressure sensitive construction. To apply one layer of material over another." (TLM p. 32). Defendants apparently believe that the inclusion of this definition in the same glossary necessarily means that "coating and lamination are two different processes." However, the TLM glossary defines a release coating by its properties, not by a manufacturing process. A laminate, by contrast, is defined by its method of manufacture. It is entirely consistent for a product produced as a laminate to have the properties of a release coating. 26

26 The only definition relating to a "coating" process, provided by MPT, confirms this conclusion:

Coating - A thin polymeric layer applied to the surface of a film to provide enhanced surface characteristics.

(Ampef p. 1). Although this definition is not entitled to great weight since it postdates the patent application by a number of years, it is notable in that it is the only generic technical definition of coating provided by either party. MPT also notes that it manufactured a placard from a material called Tefzel, which it believes is similar to Teflon. (See Tefzel). Although the inventor testified that "he didn't consider [the Tefzel lamination] any different from our regular one" (Petrou Dep. pp. 46-50), MPT has provided no evidence for its assertion that "the Kennedy Group placed notification of the '790 patent on the Tefzel-coated placard."

Defendants also note a definition of "release liner" as "the component of the pressure sensitive label stock which functions as a carrier for the pressure sensitive label. Prior to application, it protects the adhesive, and readily separates from the label immediately before the label is applied to product." (TLM p. 50). Defendants posit, without explanation, that this means that a release coating is merely a subset of materials with release properties. A careful review of the definitions reveals the opposite. The TLM release liner definition refers to a unitary component of the label stock that is made up of both the release coating and the material it coats. (See TLM p. 49 (defining a release coating as a release liner treatment material)). The release coating is what allows the release liner to release. Defendants other arguments are similarly flawed. 27 The extrinsic evidence only supports the definition dictated by the intrinsic record.

27 Defendants' argument that MPT's definition would not be enabled is an invalidity argument. Defendants' reference to a later Kennedy application is similarly irrelevant. First, the application was filed well after the original application and has little bearing on how a person of ordinary skill in the art would understand that application at the time the application was filed. Second, the application states that "the release surface 23 may be a coating applied to the protective layer 22 or may be a property of the material from which the protective layer is made." This passage merely recognizes that some materials may operate as both a "protective layer" and as a "release surface." There is nothing to indicate that a protective layer with release properties could not be used as a release coating in another application.

The final issue is the use of the term "covering" in the Court's definition. The claims, specification, prosecution history and technical definitions all define release coating by reference to its release function rather than the fact that it is a coating. Throughout these materials, the term coating was used according to its plain meaning as a material that covers another material. Although Defendants are correct that lay dictionary definitions cannot trump an art-specific meaning from the claims, specification, prosecution history or technical literature, all of those sources use the term coating in a manner consistent with the dictionary definition as a covering. (E.g., Websters p. 433) (defining "coating" as "a layer of any substance used as cover, protection, decoration or finish").
Accordingly, the Court construes "release coating" as "a covering that permits the easy and complete removal of pressure sensitive adhesive labels." "Release coated" is construed as "a material having a 'release coating.'" 28

28 In light of the Court's definition of "release coating." Defendants proposed definition of release coated as "a material having a 'release coating' which allows pressure sensitive labels to release is redundant.

3294

Release Element and Retainer Member

The Court addresses the terms "release element" 11 and "retainer member" 12 together because NMT argues that the two are inextricably intertwined. Indeed, NMT argues that one cannot define "retainer member" without using the term "release element." Thus, NMT proposes that "retainer member" mean "a release element that surrounds the needle holding member." Furthermore, NMT argues that a person of ordinary skill in the art would read the two-word term "release element" as "a separable member that frictionally engages the needle holding member along the sliding interface and itself holds the needle holding member against the retraction force provided by the biasing element until it moves axially thereby reducing the area of the sliding interface until the retraction force exceeds the remaining friction force." Moreover, all of the limitations from NMT's definition of "release element" would also apply to "retainer member" because NMT's "retainer member" construction incorporates "release element."

11 Used in Claims 1 and 23.

12 Used in Claims 23 and 24.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -

First, the Court finds that a "release element" is simply a "part that holds and later frees the needle holding member." The plain and ordinary meaning of "release element" is a "part that has to do with releasing or freeing." Furthermore, neither party disputes that the 551 Patent clearly envisions the "release element" as something which is initially involved in holding the needle holding member. The Court further notes that while Claim 1 does not restrict the scope of "release element," Claim 23 clearly defines exactly what a release element is for that claim. 13 The patentee expressed no intent to incorporate Claim 23's "release element" definition into Claim 1, and so the Court finds that a person of ordinary skill in the art would not do so either. The Court's construction of "release element" when inserted into the 551 patent will give Claim 1 its proper scope and will be limited by the clear and express definition found in Claim 23.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

13 Claim 23 states in relevant part: "the release element is a retainer member surrounding the needle holder and serving to hold the needle holder against the biasing influence of said biasing element acting on the needle holder with the needle extended from the syringe for use." 551 Patent, Col. 18, Ins. 35-39.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -

Moreover, the Court rejects NMT's proposed definition as overly complicated, redundant, and an improper attempt to incorporate limitations from the specification into claim terms. The Court does not give a full written analysis of NMT's numerous arguments but rather notes a passage from RTI's construction brief which aptly sums up NMT's proposed construction: "NMT's construction tries to fold the entirety of both claims-along with extraneous limitations not found in the claims-into the one term 'release element.' Construction should not import limitations nor be an exercise in redundancy." Pls. Retractable Technologies, Inc. And Thomas J. Shaw's Markman Brief on U.S. Patent No. 5,385,551, p. 26. Although RTI's passage is perhaps overly broad as a general rule, it is correct in this case. A person of ordinary skill in the art simply would not roll all of the limitations NMT proposes into the two words "release element."
Second, the Court finds that a "retainer member" is a "separable part that holds the needle holding member." The ordinary meaning of the term "retainer member" is a "part that holds something." Moreover, neither party disputes that the "retainer member" holds the "needle holding member" and neither party disputes that the retainer member in the 551 patent is a "separable part."

Defendants propose that the term be defined as follows:

[A] rigid bar that pivots about one point and that is used to move an object at a second point by a force applied at a third. The rigid bar attaches to and is retained by the leaves of the ring binder and does not rock about a pin or incorporate or rely on any additional mechanisms or fasteners to provide for operation of the lever.

At the claim construction hearing, all parties agreed that "release lever" is one of the two most significant terms in the patent for purposes of this claim construction litigation.

Defendants arrived at the first part of their definition from a dictionary defining the term lever. The second part of Defendants' definition is extracted from the prosecution history.

According to the specifications in the '729 patent, the release lever is made up of a "thumb or finger plate" and a "lever arm" beneath the plate. ('729 patent, col. 3, ll. 36-38.) The "release levers" are mounted on opposite ends of the ring metal and move the hinged leaves to open and close the binders. (Id. at col. 3, ll. 31-34.) The specifications further provide that "[e]ach release lever extends longitudinally of and co-planar with [the] cover of the ring metal." (Id. at col. 13, ll. 34-36.) "Each release lever includes a thumb or finger plate and a lever arm." (Id. at col. 13, ll. 36-37.) The claim language provides that the release lever is located at one end of the shield and includes "a finger plate sized to receive a finger of the user" to move the levers to open and close the binder. (Id. at col. 4, ll. 66-col. 5, ll. 4.) The patent abstract advises that "both release levers extend substantially co-planar to the cover" and "generally correspond[] to the length" of the paper stored, thereby allowing the size of the binder to be smaller. (Id. at 1.) The background section claims an advantage of the patent is that it provides for a ring binder with ring metal shorter than conventional binders for the same size of paper. (Id. at col. 2, ll. 20-23.)

In response to an Office Action of December 18, 1997, the patentee provided a distinction between the '729 patent and the Trussell patent. (Plf. Ex. A at 58.) This response concentrated, at least partially, on the lever arm and advises the Patent and Trademark Office that the Trussell patent teaches away from the claim release lever. A careful reading of that excerpt, however, makes it clear that the response is addressing the function of the lever arm.

The Court finds that the claim term "a release lever" can be defined using the language, teachings, and limitations set out in the patent specifications and claim language. Accordingly, the Court construes the term "a release lever" as follows:

A rigid bar mounted at opposite ends of the cover or shield extending longitudinally of and coplanar with cover or shield sized to fit the finger of user and operable by user of ring binder to move leaves to open and close the binder. Each release lever includes a thumb or finger plate and a lever arm.

Venus argues "remain at the specific size" should be construed in the same manner as "durably assumes a smaller size."
size"/"durably assumes a reduced size" and "durably assume a diameter at least as small as the reduced diameter achieved in the step of pre-shaping." specifically, "assumption and retention of compressed diameter after treatment smaller than pre-treatment." Defendants argue "remain at the specific size" should be construed as "until the hollow anatomical structure will maintain the predetermined smaller but non-zero diameter, accommodating ordinary levels of fluid (e.g., blood) flow for a lasting (i.e., non-temporary) period without external compression."

The Court, for the reasons stated by defendants, finds "remain at the specific size" is properly construed as "maintain the predetermined smaller but non-zero diameter for a lasting (i.e., non-temporary) period without external compression."

6 The Court has not adopted defendants' proposed additional language, specifically, the phrases "accommodating ordinary levels of fluid (e.g., blood) flow" and "until the hollow anatomical structure will." Defendants have failed to show the patent requires accommodation of "ordinary" flow, and the claim already includes the phrase "such that the hollow structure will." See '273 Patent, col. 19, line 18.

B. "remote home base"

Claim 1 of the '490 patent contains the term "remote home base": "said modem adapted to link said memory to a remote home base to establish a communication link between said remote home base and said plurality of various job sites at which said retractable and self-contained mobile repair unit is working." The term appears several times in the specification, e.g., "[a] monitor senses the load on the derrick and conveys that information to a remote home base where the time of critical events is identified," ('490 patent, 2:13-15), and "[m]onitor 48 converts signal 94 to a digital value, stores it in a memory 96, associates it with a real time stamp, and eventually communicates the data to a remote home base 100 by way of a modem 98," ('490 patent, 3:52-55) (emphasis added). According to Key, no construction of "remote home base" is necessary. Alternatively, Key proposes "a location remote from the work site where the repair unit is operating." The defendants' proposed construction is "the location where the operator of the mobile repair unit receives data related to the repair unit, and such location is removed from the work site at which the repair unit is operating."

Forbes and Petron contend that the following sentence from the specification supports their proposed construction: "An operator at a home base 100 remote from the work site at which repair unit 20 is operating accesses the data stored in circuit 124 by way of a PC-based modem 98 and a cellular phone 136." ('490 patent, 4:28-31). But Key argues that the operator requirement unnecessarily imports a limitation from the preferred embodiment. Furthermore, Key contends that the "operator at a home base" may be the well operator, not just the service rig operator.

The court is persuaded by the plaintiff's argument. Nothing in the patent requires "remote home base" to be limited to the preferred embodiment. Thus the court construes this term to mean "a location remote from the work site where the repair unit is operating."

2. Meaning of "Remote Location"

Following the rules laid out above, we now construe the proper meaning of "remote location beyond a range of direct manual contact," as used in the 003 patent. In this regard, it is the task of this Court to determine the meaning of "remote location" at the time Wilk filed the application that led to the 003 patent, not in hindsight. Schering Corp. v. Amgen Inc., 222 F.3d 1347, 1352 (Fed. Cir. 2000).
The crux of the dispute between the parties is whether a "remote location beyond a range of direct manual contact" includes a location in the very same operating room as the patient being operated upon. While Brookhill maintains that this phrase does indeed include such a location, Intuitive strenuously disagrees. For the reasons that follow, we find that Intuitive has the better of the argument. Moreover, as shown below, our interpretation of this language is dispositive on the question of literal infringement.

a. Claims

First, we look to the language of the claims themselves. The only independent claims of the 003 patent, and, thus, the only ones relevant to this inquiry, are claims 1, 10, and 17. Each of these independent claims include the following language: "transmitting [a video signal to a surgeon in] a remote location beyond a range of direct manual contact with [the] patient's body." 003 patent, col. 4, lines 17-21, col. 5, lines 5-9, col. 6, lines 16-21 (emphasis supplied).

In considering the "ordinary and customary" meaning of this language, see K-2, 191 F.3d at 1362, we note that Webster's defines "remote" as "separated by intervals greater than usual; far apart . . . far removed; not near; far; distant." Webster's Third New Int'l Dictionary 1921 (Merriam-Webster 1993). Furthermore, this comports with the popular use of the word "remote." For example, "remote sensing" is a technique for collecting scientific data that is defined as "reconnaissance from a distance," and Remote, Oregon is a city from which "there are many lonely miles in every direction." What is Remote Sensing?, at http://www.geog.nau.edu/RemoteSensing (last modified Apr. 8, 1998); Remote Oregon - City Guide, at http://www.scod.com/cities/remote (last modified June 25, 2001). On the other hand, however, Brookhill points out that "remote," as used in a "remote control" of a television or toy vehicle, means only control "without directly touching" the object being controlled. Pl.'s Opp. at 8.

We find, as a matter of law, that the ordinary and customary meaning of "remote" is "far away" rather than "not directly touching." This lends support to Intuitive's view that a "remote location" is one that is at least as far away from the patient so as to not be in the same room as her. The 003 patent does not, however, use the single word "remote," but rather the more specific phrase, "remote location beyond a range of direct manual contact." Because a patentee is free to "be his own lexicographer," Vitronics, 90 F.3d at 1582, the relevant construction is not simply the meaning of "remote," but rather the meaning of this phrase as a whole.

Brookhill asserts that "remote location beyond a range of direct manual contact" "means what it says." Pl.'s Opp. at 6. From Brookhill's point of view, this includes all locations "beyond arm's reach of the patient," including most of the operating room. See Pl.'s Opp. at 7, 9. This interpretation emphasizes the "direct manual contact" language. On the other side, Intuitive stresses the "range" language. Intuitive asserts that the plain meaning of this phrase is that within the "range" it defines, the surgeon has the ability to go near and touch the patient with her own hands, while outside of this "range, " such "manual contact" is impossible. See Defendant's Reply to Plaintiff's Opposition to Motion for Summary Adjudication or Summary Judgment ("Def's Reply") at 5. Such a reading would exclude a location within the operating room. Id.

Both of these definitions have arguable merit. Thus, we find the meaning of this phrase is not free from ambiguity when read in isolation, so we proceed to the next stage of the analysis, and examine the specification of the 003 patent. See Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 621 (Fed. Cir. 1995) (because "it is legal error to construe a claim by considering it in isolation," a "claim must be read in view of the specification of which it is a part").

b. Specification

Intuitive argues that the key to understanding what is meant by "remote location" in the 003 patent is to consider its purpose, as described in the specification. Specifically, Intuitive asserts that the "single described advantage [of the 003 patent] over the prior art [is] getting the surgeon out of the operating room so that leading surgeons can operate anywhere in the world without having to physically travel to the patient's location, thereby decreasing the cost and time required for surgery." Def.'s Mem. at 7. Therefore, Intuitive continues, the 003 patent accomplishes its purpose only if "remote location" is construed to mean a location outside the operating room. Id.

Brookhill disputes this point on two fronts. First, Brookhill maintains that the 003 patent has three stated objectives, rather than just one. These are: "1) performing surgery at reduced surgical costs; 2) further providing for surgery with endoscopic
and/or laparoscopic equipment; and 3) facilitating the performance of operations by surgeons from all over the world."

As to the first of Brookhill's responses, we find that the only real and actual advantage of the 003 patent over the prior art is the facilitation of endoscopic and laparoscopic surgery by surgeons not physically present in the operating room, and possibly located hundreds or thousands of miles away. The other two claimed objects or advantages of the 003 patent are not, in fact, advantages over the prior art in any way. As to the first claimed advantage, namely the reduction of surgical costs, the 003 patent merely takes the existing art of endoscopic and laparoscopic surgery and adds several components, such as a "transmitter," two "computers," and a "joy stick." 003 patent, col. 3, lines 13-22. This addition of hardware would not appear cost reductive. Rather, the only reduction in "surgical costs" effected by the 003 patent is the elimination of the costs of patients and surgeons traveling to each other. Id., col. 1, line 41. This savings is, however, encompassed by the advantage acknowledged by Intuitive.

Furthermore, Brookhill's second claimed "object" of the 003 patent merely restates the nature of the system and apparatus, namely, that it is "a method and apparatus usable with endoscopic and/or laparoscopic surgery." 003 patent, col. 1, lines 43-44. That is not a purpose or object of the 003 patent, but merely a description thereof. Thus, we are left with the only actual advantage of the 003 patent being the facilitation of remote surgery by leading surgeons at a considerable distance from their patients.

We must, however, grapple with Brookhill's second, more substantial, objection to Intuitive's use of the purpose of the system enumerated in the specification to define the 003 patent. Brookhill calls attention to, inter alia, Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182 (Fed. Cir. 1998) to support its argument that while "the specification may aid the court in interpreting the meaning of disputed claim language, particular embodiments and examples appearing in the specification will not generally be read into the claims." Id. at 1187 (internal citation and quotation marks omitted); see also, e.g., TurboCare Div. of Demag Delaval Turbomachinery Corp. v. General Elec. Co., 264 F.3d 1111, 1123 (Fed. Cir. 2001) (citing Laitram); Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations.").

On this issue, Brookhill is correct, but only to a point. Recent Federal Circuit opinions on this issue make clear that while the general proposition that a description of a preferred embodiment should not be read into the claims is still good law, it is not the end of the discussion. See, e.g., Bell Atl. Network Servs., Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1270 (Fed. Cir. 2001) (while "mindful of the fact that limitations from the specification may not be read into the claims," holding that a preferred embodiment may be used to construe the claims); Wang, 197 F.3d at 1383. This is due to the fact that a patentee has at least two distinct obligations to the public under the patent statutes. The first is to describe "the invention," and the second is to "set forth the best mode contemplated by the inventor of carrying out his invention." 35 U.S.C. § 112, P 1.

There are times, and Intuitive argues that this is one of them, when an enumerated "best mode" or "preferred embodiment" of an invention is, in fact, nothing more than the invention itself. Wang, 197 F.3d at 1383 (citing Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1551 (Fed. Cir. 1996) and General Am. Trans. Corp. v. Cryo-Trans, Inc, 93 F.3d 766, 770, 772 (Fed. Cir. 1996)). When this occurs, it is because the patentee has, permissibly, collapsed these two independent requirements into one. Moreover, in such a case, it is proper for a construing court to read the claims as being constrained by the singular embodiment of the invention. See, e.g., Wang, 197 F.3d at 1383 (because the "only embodiment described in the '669 patent specification is the character-based protocol, the claims were correctly interpreted as limited thereto"); General Am. Trans., 93 F.3d at 770 (where the teaching in the specification was "not just the preferred embodiment of the invention [but, rather,] the only one described," the district court erred by interpreting the claims as encompassing matter beyond this sole embodiment).

We find, as a matter of claim construction, that Wilk was granted the 003 patent for a method of endoscopic or laparoscopic surgery by which the operating surgeon is located at some significant distance from the patient. This is not merely one example of a broadly useful invention, but, rather, is the only reasonable way to interpret Wilk's system, as he described it in the specification.
The specification has a consistent theme: location. For example, the 003 patent describes the then-current state of laparoscopic and endoscopic surgery. The specification notes that under traditional laparoscopic and endoscopic surgery, visual images captured by the laparoscope or endoscope may only be transmitted to "other rooms in the hospital or other institutional clinical setting." 003 patent, col. 1, lines 27-28. The 003 patent clearly contrasts this situation with the possibilities available to one using the system therein described, whereby the visual images are transmitted "to a remote location beyond a range of direct manual contact with the patient's body." Id., col. 2, lines 9-10. This contrast shows that "remote location" means a location that is farther away from the patient than other rooms within the hospital would be.

Moreover, the specification notes that in traditional laparoscopic and endoscopic surgery, "the surgeon is always present in the operating room to manipulate the surgical instruments." Id., col. 1, lines 30-31. In contrast, the 003 patent "enables operations to be performed by ... surgeons who are not present in the operating room." Id., col. 2, lines 18-19. This is further support for interpreting "remote location" to mean a location outside the operating room.

Finally, and perhaps most forcefully, the 003 patent states: "It is to be understood, of course, that surgeons and other personnel are present in the operating room at the time of surgery to oversee and supervise the proper operation of the equipment. These personnel may communicate with the remote surgeon via [a] telecommunications link." Id., col. 3, lines 41-46 (emphasis supplied). This language clearly distinguishes between the local surgeons located within the operating room on one hand, and the "remote surgeon" located outside the operating room on the other hand, thus lending further support for an interpretation of "remote location" that excludes the operating room where the patient is located.

Thus, considering only the four corners of the 003 patent, we find that "remote location" is being used in its customary sense to mean "far away," and that Brookhill has not overcome the presumption that this ordinary meaning is the correct one. See K-2, 191 F.3d at 1363. At this stage, then, after considering the claims themselves and the specification of which they are a part, we would construe "remote location beyond a range of direct manual contact" to mean a location necessarily outside the operating room. We shall, nevertheless, complete or review of the intrinsic evidence by considering the prosecution history of the 003 patent.

c. Prosecution History

As originally filed, the application for the 003 patent repeatedly used the phrase "remote location beyond a range of direct visual contact." Declaration of John B. Pegram in Support of Defendant's Motion for Summary Adjudication or Summary Judgment ("Pegram Decl.") Ex. 10, passim (emphasis supplied). The patent examiner found this phrase to be "indefinite" because "the range of direct visual contact may be different for certain operators of the system and this cannot be given weight in the claims." Id., Ex. 11, at 4.

In order to overcome this indefiniteness objection, Wilk replaced this phrase with the language in dispute here, namely, "remote location beyond a range of direct manual contact." Id., Ex. 11, at 5. Wilk's explanation of this change was that "it means that the remote location is beyond the arm's reach of the patient. Inasmuch as an arm's length is a well understood distance, it is believed that the remote location is sufficiently defined for purposes of the Patent Statute." Id. Brookhill points to this as evidence that being in a "remote location beyond a range of direct visual contact" with the patient is consistent with a surgeon being in the same room as the patient, and, therefore, that the 003 patent includes within its teaching a surgical system whereby the surgeon and patient are in the same operating room. Pl.'s Opp. at 10-11. Brookhill further asserts that, under the teaching of the 003 patent, a surgeon in the same room as the patient must "look at the monitor," and, thus, at that moment cannot, "be in direct visual contact with the patient." Pl.'s Opp. at 10. This argument does not withstand analysis.

First, as Intuitive points out, "if the key phrase were to require merely that the surgeon observe a monitor instead of the patient when operating, the prior art surgeon [using traditional endoscopic or laparoscopic surgery] would also be 'beyond the range of direct visual contact with the patient.'" Def.'s Reply at 2. Such an interpretation of Wilk's "invention" would render the 003 patent invalid for lack of novelty, because it would be no different than the prior art of endoscopic or laparoscopic surgery. See 35 U.S.C. § 101 (requiring that an invention be "new" to be eligible for a patent). As the 003 patent, like all patents, is presumed to be valid, 35 U.S.C. § 282, this interpretation cannot be correct.

Furthermore, the application for the 003 patent did not say that it covered the situation where the surgeon is "beyond direct visual contact" with the patient, but rather "beyond a range of direct visual contact" with the patient. Pegram Decl., Ex. 10,
passim. It is obvious that a surgeon in the same room as a patient, even at the moment that she is looking at something apart from the patient, such as a monitor, medical chart, or another surgeon, remains within the "range" of direct visual contact with the patient. The surgeon in the same room as the patient is within this range because she need only shift her gaze in order to achieve "direct visual contact" with the patient.

It is equally clear that a surgeon located in another part of the world from the patient, however, is truly "beyond a range of direct visual contact" with her. In other words, she is out of "range." In order to make "direct visual contact" with the patient, such a surgeon would have to leave her location, travel to the operating room, and look at the patient. Thus, the 003 patent only encompasses the scenario where the surgeon must travel to the patient to see her directly, and not the circumstance where the surgeon need only shift her gaze to do so.

We note that Brookhill asserts that this change in language from "direct visual contact" to "direct manual contact" did not impermissibly add "new matter" to the application because these two phrases are consistent. Pl.'s Opp. at 19-24. See also 35 U.S.C. § 132. While Intuitive contests this assertion, see Def.'s Mem. at 13-19, for purposes of this summary judgment motion, we accept Brookhill's contention as true. We are thus operating under the assumption that this change in language worked no change in the matter claimed by the 003 patent. As we have found that the language "location beyond a range of direct visual contact" is properly construed to mean a location outside the operating room, we find that "location beyond a range of direct manual contact" has the same meaning.

Thus, this final piece of intrinsic evidence, the prosecution history, confirms our construction of the language in question. To reiterate, a "location beyond a range of direct manual contact," as used in the 003 patent, necessarily means a location outside of the operating room where the patient is located.

C. Extrinsic Evidence

Because our analysis of the intrinsic evidence alone resolves all ambiguity in the disputed claim term, it is improper to, and we do not, consider extrinsic evidence. Covad, 262 F.3d at 1268-69.

D. Comparison of '003 Patent and the da Vinci System

It is undisputed that, when using the da Vinci system, both the surgeon and the patient are, at all times, in the same operating room. Wagner Decl. at P 7; Pl.'s Opp. at 12. As we have found that the 003 patent is limited to surgery where the surgeon is located outside the operating room, see Part II.B, supra, we find that the da Vinci system does not read on any claims of the 003 patent.

III. CONCLUSION

We grant Intuitive's motion for summary adjudication of the meaning of claim limitation "remote location." As used in the 003 patent, this term means "a location outside the operating room where the patient undergoing surgery is located." Furthermore, there is no dispute that a surgeon using the da Vinci system is located in the same operating room as her patient, and, thus, the da Vinci system does not read on the 003 patent. It follows, then, that Intuitive did not infringe that patent.

3299

B. Analysis

As noted above, the district court interpreted the limitation "remote location" as meaning "a location outside the operating room where the patient undergoing surgery is located." 178 F. Supp. 2d at 358. Brookhill challenges this interpretation, stating that the plain meaning of the claim term, the patent's written description, the prosecution history, and extrinsic evidence all support a broader reading that does not restrict the surgeon to a location outside of the operating room. Intuitive, on the other hand, argues that the written description and prosecution history foreclose Brookhill's broad interpretation and instead limit the interpretation of "remote location" to a location outside of the operating room. We agree
We begin our claim construction analysis with the words of the claim. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 USPQ2d 1573, 1576 (Fed. Cir. 1996). "In construing claims, the analytical focus must begin and remain centered on the language of the claims themselves, for it is that language that the patentee chose to use to 'particularly point[] out and distinctly claim[] the subject matter which the patentee regards as his invention.' 35 U.S.C. § 112, P 2." Interactive Gift Express, Inc. v. Compuserve, Inc., 256 F.3d 1323, 1331, 59 USPQ2d 1401, 1406 (Fed. Cir. 2001). The words used in the claims are examined through the viewing glass of a person skilled in the art. Tegal Corp. v. Tokyo Electron Am., Inc., 257 F.3d 1331, 1342, 59 USPQ2d 1385, 1393 (Fed. Cir. 2001). In the absence of an express intent to impart a novel meaning to the claim terms, the words are presumed to take on the ordinary and customary meanings attributed to them by those of ordinary skill in the art. See, e.g., Teleflex, 299 F.3d at 1325, 63 USPQ2d at 1380. The ordinary and customary meaning of a claim term may be determined by reviewing a variety of sources. Some of these sources include the claims themselves, see Process Control Corp. v. HydReclaim Corp., 190 F.3d 1350, 1357, 52 USPQ2d 1029, 1033 (Fed. Cir. 1999); dictionaries and treatises, Texas Digital Systems, Inc. v. Telegenix, Inc., 308 F.3d 1193, 1202, 64 USPQ2d 1812, 1818 (Fed. Cir. 2002); and the written description, the drawings, and the prosecution history, see, e.g., DeMarini Sports, Inc. v. Worth, Inc., 239 F.3d 1314, 1324, 57 USPQ2d 1889, 1894 (Fed. Cir. 2001).

The written description must be examined in every case, because it is relevant not only to aid in the claim construction analysis, but also to determine if the presumption of ordinary and customary meaning is rebutted. See Renishaw PLC v. Marposs Societa per Azioni, 158 F.3d 1243, 1250, 48 USPQ2d 1117, 1122 (Fed. Cir. 1998). The presumption will be over come where the patentee, acting as his or her own lexicographer, has clearly set forth a definition of the term different from its ordinary and customary meaning. See In re Paulsen, 30 F.3d 1475, 1480, 31 USPQ2d 1671, 1674 (Fed. Cir. 1994); Intelicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1387-88, 21 USPQ2d 1383, 1386 (Fed. Cir. 1992). The presumption also will be rebutted if the inventor has disavowed or disclaimed scope of coverage, by using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope. See Teleflex, 299 F.3d at 1324, 63 USPQ2d at 1380.

II

At the outset, we note that although the disputed claim language is characterized by both the parties and the district court as "remote location," these words find context in the surrounding phrase "remote location beyond a range of direct manual contact." While certain terms may be at the center of the claim construction debate, the context of the surrounding words of the claim also must be considered in determining the ordinary and customary meaning of those terms. See Hockerson-Halberstadt, Inc. v. Converse Inc., 183 F.3d 1369, 1374, 51 USPQ2d 1518, 1522 (Fed. Cir. 1999).

Brookhill argues that the ordinary and customary meaning of the expression "remote location" can be clearly understood from the language of the claims themselves. Brookhill contends that "a remote location beyond a range of direct manual contact" means any location beyond the arm's length of a human. Brookhill further asserts that the written description is consistent with the construction that a remote location simply means beyond arm's reach. Brookhill also argues that the district court, in reaching a narrower construction, erroneously imported limitations from the written description into the claims, both by reading in limitations from the recited advantages and by misapplying this court's precedents with respect to preferred embodiments. Finally, Brookhill asserts that the district court misapplied the prosecution history as limiting the scope of the claims.

Intuitive contends that the district court's analysis was correct and that the written description and prosecution history of the '003 patent require that the construction of the term "remote location" be limited to "a location outside the operating room where the patient undergoing surgery is located."

III

In considering the ordinary and customary meaning of the disputed terms, the district court consulted a contemporaneous dictionary, which defined "remote" as "separated by intervals greater than usual; far apart . . . far removed; not near; far; distant." Webster's Third New International Dictionary 1921 (Merriam-Webster 1993) ("Webster's"). The district court also
consulted a number of unrelated and non-contemporaneous authorities, such as "What is Remote Sensing" at http://www.geog.nau.edu/RemoteSensing (last modified Apr. 8, 1998) and Remote Oregon - City Guide at http://www.scod.com/cities/remote (last modified June 25, 2001). These references are dated well after the '003 patent, which was filed in March 1991 and issued in June 1993. They are not contemporaneous with the patent, do not reflect the meanings that would have been attributed to the words in dispute by persons of ordinary skill in the art as of the grant of the '003 patent, and for those reasons are not considered in our de novo claim construction analysis.

The dictionary entry for "remote," cited by the district court and argued before us by the parties, has several definitions that all have facial relevance to the claimed invention. Webster's at 1921. Brookhill relies on the first definition--"separated by intervals greater than usual." It argues that a surgeon located at any distance beyond arm's length is at an "interval greater than usual," because surgery is traditionally performed by direct manual contact with the patient. Intuitive, on the other hand, relies on the remaining cited definitions--"far apart . . . far removed; not near; far; distant." Intuitive argues that these definitions connote long distances, well beyond the arm's length separation asserted by Brookhill. Intuitive thus argues that a "remote" location is at least as far as to be outside of the operating room.

Both Brookhill's and Intuitive's proposed constructions are in some measure supported by the various definitions provided. While dictionaries and treatises are useful resources in determining the ordinary and customary meaning or meanings of disputed claim terms, the correct meaning of a word or phrase is informed only by considering the surrounding text. This is why consulting dictionary definitions is simply a first step in the claim construction analysis and is another reason why resort must always be made to the surrounding text of the claims in question, the other claims, the written description, and the prosecution history. Our precedent referencing the use of dictionaries should not be read to suggest that abstract dictionary definitions are alone determinative. In construing claim terms, the general meanings gleaned from reference sources, such as dictionaries, must always be compared against the use of the terms in context, and the intrinsic record must always be consulted to identify which of the different possible dictionary meanings is most consistent with the use of the words by the inventor. "Where there are several common meanings for a claim term, the patent disclosure serves to point away from the improper meanings and toward the proper meanings." Renishaw PLC, 158 F.3d at 1250, 48 USPQ2d at 1122; see also Tex. Digital, 308 F.3d at 1203, 64 USPQ2d at 1819. If more than one dictionary definition is consistent with the use of the words in the intrinsic record, the claim terms may be construed to encompass all consistent meanings. Tex. Digital, 308 F.3d at 1203, 64 USPQ2d at 1819. Because multiple, potentially consistent, dictionary definitions exist for the claim terms in question, we turn now to the rest of the intrinsic record for further context and guidance.

IV

The written description explains that in accordance with the invention an endoscopic instrument and a surgical instrument may each be placed within hollow tubes fed through a small incision in the abdominal wall of a patient to the surgical site. '003 patent, col. 2, ll. 37-47. The endoscope transmits a video image to a transmitter that transmits the image over a telecommunications link to a remote receiver. The receiver relays the image to another computer that generates an image of the internal body tissues of the patient on a monitor. Id. at col. 3, ll. 7-18. The surgeon then remotely controls the surgical instrument and the endoscope. Id. at col. 3, ll. 25-34. The written description sets forth no specific parameters as to the distance between the surgeon and patient, but teaches generally that a surgeon using the disclosed assembly may operate without directly touching the patient, the surgical instruments, or the endoscope--regardless of the extent of the physical separation between the surgeon and the patient.

Intuitive argues that the scope of the claims is limited based on statements made in the Objects of the Invention and Background sections of the patent, and on the single embodiment disclosed. The Objects of the Invention section of the written description describes the invention as "reducing surgical costs" and "facilitating the performance of operations by surgeons from all over the world." Id. at col. 1, ll. 39-48. The Background section states that in traditional settings, "the surgeon is always present in the operating room to manipulate the surgical instruments." Id. at col. 1, ll. 29-32. The patent, however, does not disavow the use of the invention within an operating room, nor does it specify that the invention is useful only where the surgeon is located at a great distance from the operating room.

The patent certainly contemplates that a principal use of the invention is to allow a surgeon to operate at some distance, possibly across the world, from the operating room in which the patient is located. The written description states the advantage of the invention in this context, and the description of the preferred embodiment contemplates a surgeon located outside of the operating room:
It is to be understood, of course, that surgeons and other personnel are present in the operating room at the time of surgery to oversee and supervise the proper operation of the equipment. These personnel may communicate with the remote surgeon via computers and telecommunications links and/or through other telecommunications or electromagnetic signaling linkages such as the telephone network.

Id. at col. 3, ll. 41-48 (internal references omitted). No statement in the written description, however, constitutes a limitation on the scope of the invention. The objective described is merely one of several objectives that can be achieved through the use of the invention; the written description does not suggest that the invention must be used only in a manner to attain that objective. "Advantages described in the body of the specification, if not included in the claims, are not per se limitations to the claimed invention." Vehicular Techs. Corp. v. Titan Wheel Int'l, Inc., 141 F.3d 1084, 1096, 46 USPQ2d 1257, 1266 (Fed. Cir. 1998) (Newman, J., dissenting) (citing Applied Materials, Inc. v. Advanced Semiconductor Materials Am., Inc., 98 F.3d 1563, 1574, 40 USPQ2d 1481, 1489 (Fed. Cir. 1996); E.I. DuPont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1432-34, 7 USPQ2d 1129, 1131-32 (Fed. Cir. 1988)). The Background merely states the apparent--that traditional surgery is performed by direct manipulation of surgical instruments on patients within the operating room. Stating that the surgeon would always be in the operating room when performing traditional surgery does not foreclose the presence of the surgeon within the operating room when performing remote surgery. The statements from the description of the preferred embodiment are simply that--descriptions of a preferred embodiment that permits surgeons to operate from across the world. Those statements do not indicate that the invention can only be used in such a manner. Absent a clear disclaimer of particular subject matter, the fact that the inventor anticipated that the invention may be used in a particular manner does not limit the scope to that narrow context. See, e.g., Teleflex, 299 F.3d at 1328, 63 USPQ2d at 1382-83; Catalina Mkttg. Int'l, Inc. v. Coolsavings.com, Inc., 289 F.3d 801, 809, 62 USPQ2d 1781, 1785 (Fed. Cir. 2002). Where, as here, the written description and prosecution history fail to express a manifest exclusion or restriction limiting the claim term, and where the written description otherwise supports the broader interpretation, "we are constrained to follow the language of the claims," Teleflex, 299 F.3d at 1328, 63 USPQ2d at 1382-83, and to give the claim term its full breadth of ordinary meaning as understood by persons skilled in the relevant art. See Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342, 60 USPQ2d 1851, 1854 (Fed. Cir. 2001). As such, we construe the term "remote location" to encompass not just locations that are "far apart" or "distant," but also those locations that are merely "separated by intervals greater than usual." Webster's at 1921. These locations need not be outside the operating room.

V

The prosecution history also supports our construction. Nothing in the prosecution history attributes patentability to the location of the surgeon outside of the operating room.

To the extent Intuitive relies on the amendment during prosecution in which Brookhill changed the phrase "remote location beyond a range of direct visual contact" to "remote location beyond a range of direct manual contact," and argues that this amendment somehow requires us to construe the claims narrowly to preserve their validity, we reject that argument for the following reasons.

As originally filed, the application for the '003 patent used the phrase "remote location beyond a range of direct visual contact." The patent examiner found this phrase to be indefinite because "the range of direct visual contact may be different for certain operators of the system and this cannot be given weight in the claims." To overcome the indefiniteness rejection, Brookhill replaced the word "visual" with the word "manual," resulting in the issued claims. In support of this change, Brookhill stated that the amended text "means that the remote location is beyond the arm's reach of the patient. Inasmuch as an arm's length is a well understood difference, it is believed that the remote location is sufficiently defined for purposes of the Patent Statute." Brookhill further stated that "this amendment clarifies that a remote operator who is generating actuator control signals... is so far from the patient and the endoscopic instrument as to be unable to manipulate the instrument at the patient's side." The examiner subsequently allowed the claims and the patent issued following an examiner's amendment in which references to the "range of direct visual contact" in the specification were revised to recite "range of direct manual contact."

Intuitive asserts that because the original claim scope required that the surgeon be "beyond a range of direct visual contact," the only appropriate scope for the claim is for the surgeon to be outside of the operating room. Intuitive argues that if the surgeon is in the operating room, the surgeon can shift his gaze to see the patient and, thus, would be within the range of
Intuitive's argument is not persuasive. As discussed above, there is nothing in the written description or original claims that limits the location of the surgeon to a position outside the operating room. In giving the originally filed claims their full breadth, as we must, the location of the surgeon within or outside the operating room is not relevant. Because the scope of the originally filed claims is not as narrow as Intuitive argues, the argument that the scope of the claims as issued should somehow be limited by those claims to exclude locating the surgeon within the operating room is of no avail.

Intuitive also argues that to adopt Brookhill's construction--that the term "remote location" simply places the surgeon beyond an arm's length from the patient--impermissibly broadens the scope of claim coverage beyond the scope of the originally filed application, citing Schering Corp. v. Amgen, 222 F.3d 1347, 55 USPQ2d 1650 (Fed. Cir. 2000). The district court declined to address this argument, accepting for purposes of summary judgment Brookhill's contention that the amendment did not add new matter.

Intuitive's reliance on the Schering case is misplaced. In Schering, the patent application as originally filed included a claim limitation "leukocyte interferon." During the pendency of the patent, the scientific community coined the phrase "IFN-alpha" to refer to a class of compounds encompassing both leukocyte interferons and other compounds. The specific compound identified in the original application--the leukocyte interferon--was designated by those skilled in the art as "IFN-alpha-1." During prosecution, the patentee amended the claims and specification to replace the term "leukocyte interferon" with "IFN-alpha." Id. at 1352, 55 USPQ2d at 1654. The patent subsequently issued and was asserted against an infringer. The accused infringer argued that the claim term "IFN-alpha" could not be construed to cover all compounds of this type, but rather, only the "leukocyte interferon"/"IFN-alpha-1" compound disclosed in the originally filed application. The district court concluded that the change of text in the specification constituted new matter in violation of 35 U.S.C. § 132. Id. at 1352, 55 USPQ2d at 1653.

This court agreed that the patentee was not entitled to assert broad claim coverage of all types of IFN-alpha. But rather than finding a new matter violation, we construed the scope of claim coverage to be consistent with the scope of the term originally used:

"This court does not discern a new matter violation in the substitution of the term "IFN-alpha" for "leukocyte interferon." This court interprets the claim term "IFN-alpha" in light of the patent's written description . . . [which] clarifies that [the inventor] may not attempt to broaden his invention to cover polypeptides not discovered at the time of his patent application . . . . The written description accompanying his new claim language specifies that the amendment merely renames his invention--whatever its scope may have been at the time of application . . . . The amendment merely substitutes terminology. . . . As already noted, this court interprets the claim at issue to cover no more than what the specification supported at the time of filing."

Id. at 1352-53, 55 USPQ2d at 1654.

Unlike Schering, Brookhill was not attempting to capture, by amendment, something that was not supported by the original specification. Instead, Brookhill was merely clarifying, at the examiner's insistence, a supported limitation of the claim. The issue in Schering, therefore, is not present in this case. Brookhill, in changing the claim language from beyond visual contact to beyond manual contact provided a definition for the term "remote location" that applied to both contexts--"it means that the remote location is beyond the arm's reach of the patient." This definition, provided outside the context of litigation, and supported by the written description and original claims, is entirely consistent with the construction now
urged by Brookhill.

As discussed above, the written description sets forth no specific parameters as to the distance between the surgeon and patient, but teaches generally that a surgeon using the disclosed assembly may operate without directly touching the patient, the surgical instruments, or the endoscope—regardless of the extent of the physical separation between the surgeon and the patient. The term "remote location" thus must be given the full breadth of its ordinary and customary meaning, and includes all locations that are "far apart," "distant," or "greater than usual." The overall limitation "remote location beyond a range of direct manual contact" as used in the claims must be construed to encompass all locations where the surgeon is beyond direct physical contact with a patient, including locations within the operating room. The expression "beyond a range of direct manual contact" is no broader than and adds little more than emphasis to the fully supported term "remote location." The court thus "interprets the claim at issue to cover no more than what the specification supported at the time of filing." Id. This does not present a new matter issue for consideration on remand.

VI

The plain language of the claims themselves, the written description, and the prosecution history fully support the determined meaning of "a remote location beyond a range of direct manual contact." Accordingly, we need not and do not consider the extrinsic evidence present in the record. See Vitronics, 90 F.3d at 1582, 39 USPQ2d at 1577 ("[I]f an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term . . . it is improper to rely on extrinsic evidence.").

CONCLUSION

Because the district court's construction of "remote location" was erroneous and because the district court's grant of summary judgment in favor of Intuitive was predicated entirely on this erroneous construction, we reverse the judgment and remand the case to the district court for further proceedings consistent with this opinion.

b. "Remotely controllable surgical device"

Claims 1, 13, 18, 23, and 27 disclose a "remotely controllable surgical device." See generally '539 Pat. cols.9-13. The Parties dispute both what a "surgical device" is, and the location from which such devices are controlled. KSEA contends that this term should be construed as "a device for use during a surgical procedure that can be controlled from a remote location." (Proposed Constructions Chart 9.) S&N urges the Court to construe the term as "a device for operating on a patient that can be controlled from a sterile field of an operating room using a touchscreen." (Id.)

The Court rejects S&N's proposed construction as to both disputed aspects of this term. With regard to "surgical devices," KSEA's expert explained that there are devices, such as image capture devices, that are commonly used in endoscopic surgery but that are not understood as directly operating on the patient. (See KSEA Opening Claim Construction Br. Ex. G (Gunday Decl.) 101.) S&N has not disputed that one skilled in the art would read "surgical devices" in this manner, and S&N is incorrect to read aspects of the preferred embodiment as limiting the claim language. Courts may not "import limitations into the claims from the specification . . . unless the patentee has demonstrated a clear intention to limit the claim scope using words or expressions of manifest execution or restriction." Trading Techs. Int'l, Inc. v. eSpeed, Inc., 595 F.3d 1340, 1352 (Fed. Cir. 2010) (citations and internal quotation marks omitted).

With regard to the location from which the "surgical devices" are controlled, S&N's proposed construction again reads limitations from the specification into the claims. The claims teach that the surgical devices are controllable using the touchscreen. See, e.g., '539 Pat. col.10 ll.4-5; id. at col.11 ll.4-10. The specification describes the touchscreen as being located in the sterile field, but neither the specification nor the claims "manifest[ly]" require that the touchscreen be located there. Trading Techs. Int'l, 595 F.3d at 1352; see also Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 905 (Fed. Cir. 2004) (explaining that courts must be particularly cautious about importing limitations from the specification where the "written description of the invention is narrow, but the claim language is" broad).
The Court construes a "remotely controllable surgical device" as a "device for use during a surgical procedure that can be controlled from a remote location."

3301

3. "A remotely located refrigeration unit"

Foodie contends this term should be construed to mean "a structure, for storing at least one source liquid below room temperature, which is located outside of the customer service station and connected to it through at least one refrigerated source liquid conduit line," while Jamba Juice offers as their proposed construction "a structure for storing substances at temperatures below room temperature displaced from the customer service station." The dispute here is identical to the parties' dispute regarding "refrigerated source liquid conduit line," namely whether or not the patent mandates that the "remotely located refrigeration unit" must be connected to the customer service station via a "refrigerated source liquid conduit line." The parties agree on the remainder of the construction.

The Court's analysis on this issue is identical to its analysis in construing "refrigerated source liquid conduit line." While the specification does discuss pumping refrigerated source liquids via the conduit lines from the remotely located refrigeration unit, that is not what the patent claims, and there is no clear support in the specification for Foodie's attempt to construe the claim in such a manner. Accordingly, the Court adopts Jamba Juice's proposal as the construction of the Court: "a structure for storing substances at temperatures below room temperature displaced from the customer service station."

3302

5. removable (claims 1, 8); removably mounted (claim 5); removing and replacing (claim 4); replaceable (claims 1, 2)

Fargo
- removable: capable of being removed
- removably mounted: mounted so as to be capable of being removed
- removing and replacing: taking away from a position and placing into a position
- replaceable: capable of being replaced

Iris
- these terms are not amenable to construction and therefore render the claims indefinite

These terms refer to the metal pins placed in the apertures in the hub of the printer roll core. According to the prosecution history and the specification, the pins are removable so that they can be positioned to obtain the desired code for identifying the type of ribbon.

Iris argues that the word "removable" is insolubly ambiguous and renders the claims in which it appears invalid as indefinite under 35 U.S.C. § 112, P 2. Iris argues that a quantitative measurement is necessary to render these terms amenable to construction, but nothing in the intrinsic evidence helps define the terms precisely. Rather, according to Iris, the prosecution history renders the terms more ambiguous, because it refers to the ease of removing and replacing the pins. Given enough force, Iris argues, anything is removable, and thus this term lacks any determinate meaning.

In the recent case of Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342 (Fed. Cir. 2005), the Federal Circuit set forth the standards for determining whether a claim is indefinite. Only when a claim term cannot be given any reasonable meaning can it be considered insolubly ambiguous or not amenable to construction. Id. at 1347. If the meaning is discernable, the term will not be found indefinite, even though the task of construction may be difficult and the conclusion may be one over which reasonable persons will disagree. Id. In light of these principles, the Court simply cannot agree with Iris that the term "removable" renders indefinite any claim in which it appears. While it is true that the specification and the prosecution history do not enable the Court to assign a precise measurement of the amount of force needed to remove the...
pins, the Court does not agree that this lack of a quantitative measurement renders the terms indefinite. Id. ("The definiteness requirement, however, does not compel absolute clarity.").

Unfortunately, Fargo's proposed definition for this term does not overcome Iris's complaints, because it relies on the same root word, "remove." Because the use of this term throughout the patent indicates that the structure in which the pins are mounted is still usable after the pins are removed, it is clear in the context that to be removable within the meaning of the claims, the act of removing must not cause any damage to that structure. Accordingly, the Court will adopt the following construction: "capable of being taken away from a position without damaging the surrounding structure."

The parties do not dispute that "removable" and like terms have the same meaning throughout the patent. Accordingly, the Court will adopt Fargo's proposed definitions of "removably mounted," "removing and replacing," and "replaceable," n4 with the understanding that the root word "remove" carries the meaning of "taking away from a position without damaging the surrounding structure."

--- Footnotes ---

n4 Because Iris focuses specifically on the meaning of the word "removable," the Court believes that its construction of that word renders it unnecessary to construct the term "replaceable."

--- End Footnotes ---

5. removable collar

3M   (a) no definition necessary
(b) a removable ring-like device

ITW   a removable ring-shaped device used to hold the removable lid to the periphery of the reservoir opening

3M contends that its definition more accurately encompasses the definition of removable collar as that term is used in the patent and that the latter half of the definition proposed by ITW is unnecessary in any event because it merely restates the next line in the claim. ITW argues that 3M's proposed definition is vague and inaccurately defines removable collar.

The first claim in the patent describes a "removable collar which secures the lid to the reservoir at the periphery of the opening." Based on this claim language, the Court agrees with 3M that the latter half of ITW's definition is unnecessary and confusing. 3M's proposal to use the term "ring-like" is troubling, however, because that term itself is ambiguous and capable of various meanings. The Court therefore finds that the "ring-shaped" portion of the definition proposed by ITW more accurately describes the collar, but the Court also incorporates into the definition the word removable to clarify the description. The Court, then, adopts the following definition of removable collar: a removable ring-shaped device.

2. Removable Pressure-Sensitive Adhesive Material

The parties agree that a removable pressure-sensitive adhesive material must be able to stick to a layer but also be removable. Avery succinctly defines this material as: "An adhesive that can stick to a layer, yet is removable." Whitlam would define this material as: "An adhesive that can stick to an underlying layer and be removed without damaging the underlying or a carrier sheet upon which the adhesive is adhered." Claims must be interpreted according to their ordinary meaning. Viewed in this light, a removable-pressure sensitive adhesive must be just that, an adhesive that is also removable, but the definition doesn't extend to any effect that adhesive might have on appurtenant surfaces. For this reason, the Court
adopts the following definition of removable pressure-sensitive adhesive layer: "An adhesive that can stick to a layer, yet is removable."

3305

The critical issue presented by this motion is the meaning of the word "removably" as it is used in describing the Allure hamper's supporting rods and how those rods function. The term "removably" is used as follows in the disputed claims: (1) "removably secured" (claims 1, 6, 7, and 17); (2) "removably securing" (claims 6, 7, and 17); and (3) "removably fitting" (claim 14). As noted, four of the five claims use the term "removably" twice within the claim.

LaMont contends that the term is clear and unambiguous and, consistent with other language in the patents, the term refers to rods that are completely detachable from the hamper. Although neither party suggests that the inventor attributed any special meaning to the term "removably secured" or "removably fitting," Allure argues that the term is ambiguous and that therefore extrinsic evidence should be considered.

Allure contends that interpreting "removably" to mean detachable or completely removable from the hamper is not consistent with the inventor's intent and understanding of his invention. (Pl. Opp. at 8). In addition, Allure maintains that the term "removably" refers to "the ability to remove the supporting rods from their cavities, thereby removing the secured rods from their vertical position, rendering a fully collapsible hamper." (Id.). Allure argues that the plain dictionary meaning of the word "removable" means "capable of changing location" and thus supports its claim that "removably" does not mean what LaMont claims it does. (See Pl. Letter dated 5/29/98 & Ex. B to Letter).

After carefully considering plaintiff's arguments, I hold that the term "removably" as it repeatedly appears in the contested claims is unambiguous. Moreover, to the extent the term is arguably ambiguous, other intrinsic evidence in the patents dispels any doubt. As used in the claims in issue, "removably" means detachable, i.e., detachable from the hamper. I reach this conclusion for four reasons.

First, "removably" plainly means detachable. If the inventor had intended to claim a device that used rods that were movable but permanently attached on one end, he would have used words like "hingeably attached," "movably attached," "removable at one end," or words of similar import. The inventor did not describe the rods in such a manner. Not only did the inventor fail to say that the rods could or should be attached to the apparatus, he consistently and repeatedly chose to describe the rods with the term "removably."

Second, other language in the claims at issue demonstrates that "removably" means detachable. The claims describe side walls or other hamper components that are "secured" to the apparatus as well as a lid that is "hingeably" or "movably" fixed to it. (See Pl. Opp. Exs. 5 & 6, claim 6 (lid "hingably [sic] fixed"); claim 17 (lid "moveably [sic] fixed"); claim 1 ("secured" top and bottom); claim 7 (hamper components that are "secured"); and claim 14 (hamper "assembled" and hamper "not assembled", rods that "matingly" and "removably" fit into certain cavities -- meaning they can be fitted in and pulled out)). This language speaks for itself.

Third, the figures included in both patents show that the rods are completely removed and placed underneath the hamper when the hamper is in its collapsed state.

Finally, other language in the patents outside the disputed claims demonstrates that "removably" means detachable. For instance, the abstracts of both patents describe a hamper that has "removably secured" supporting rods that "define a three dimensional internal storage space . . . that is attractive to the eye when said hamper is assembled for use and which can be easily disassembled and collapsed for convenient storage."

Accordingly, I find as a matter of law that the term "removably" as it is used in each of the five disputed claims means detachable from the apparatus and not simply "capable of changing location" as Allure urges.
Upon granting Graco's motion for summary judgment of noninfringement, Summary Judgment at 1, the district court first interpreted the terms "removably attached" and "removably secured," id. at 5-6. Neither party argued that a specialized meaning of the terms existed in the art of juvenile car seat design. The district court thus attributed to the terms their ordinary meaning and concluded that they require that the seat and base in the claimed invention "will be detached or unsecured on some occasion during the lifetime of the product." Id. at 5. In other words, the district court determined that the claimed product is designed to come apart. The district court concluded, however, that the claim language does not require that the seat and base come apart during normal usage. Ease of separation is not a limitation on claim scope, as the district court opined, because the claim language does not recite "easily" removable or removable "relatively easily." Id. at 6. Indeed, the district court expressly and emphatically rejected any notion that the claims require "ease of separation" of the seat from the base. "Removably attached" and "removably secured" mean only that the seat and base "are designed at some time or another to come apart." Id. at 5.

The district court further opined that the claim terms "removably attached" and "removably secured" "carry with them an implication that the detach mentor unsecuring process not do violence to the seat." Id. The seat must therefore be usable as a seat upon separation from the base. In sum, the district court held that the claims cover a structure that includes a seat and base "affixed together in a manner that contemplates that the seat may be removed from the base such that the seat remains functional." Id. at 6.

Turning next to the claim term "base" and to the surrounding claim language, the district court determined that the base is "the structure that props up the seat." Id. Finally, the district court interpreted the claim term "seat" as "the structure intended to be sat in or on," id., a structure the district court thought necessarily to be separate from the base.

The district court applied this construction to the accused Graco products and found no literal infringement because the accused products were found not to have a seat separate from the base, as claimed in the asserted patents, and because the two parts of the accused products were found to be an integrated unit. Id. at 7. In short, the district court held that Graco's two-part structure is integral, meaning that it lacks a seat and base as separate, stand-alone structures.

We review issues of claim interpretation independently, Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456 (Fed. Cir. 1998) (en banc), and test the scope of claim language with primary reference to the specification, of which the claims are a part, Phillips v. AWH Corp., 415 F.3d 1303, 1315-17 (Fed. Cir. 2005) (en banc).

The district court correctly interpreted "removably attached" and "removably secured." The specifications of the patents in suit are mainly directed to the claimed cupholder feature of the inventions, and there is little reference to the concept of the removability of the seat from the base. See '862 patent, Abstract ("A juvenile vehicle seat is provided including a cup holder. The cup holder is movable between a retracted position adjacent the seat and an extended position spaced from the seat."); '649 patent, Abstract (same). The specifications speak of "means for coupling" the seat bottom to the base, but expressly state that such means are not shown in the drawings. '862 patent, col. 2, ll. 52-53; '649 patent, col. 2, ll. 55-56. Further, the "seat base is configured to releasably couple to the seat bottom." '862 patent, col. 1, ll. 27-29; '649 patent, col. 1, ll. 31-33.

To impart "ease of separation" to the claims would require adding the words "easily" or "relatively easily" to the "removable" limitations, as the district court noted. Nothing in the patent's specification suggests "ease of separation." If anything, the specification teaches the meaning given to the "removable" limitations by the district court. This is so, because the only reference to what might be placed in the patented cup holder is shown in Figure 4 as a "COLA." Given the configuration of the cup holder and the seat's base, spilled cola would surely invade the bottom portion, where it could attract bees, hornets and other unwelcome insects. The occasional need to unscrew the top portion from the bottom portion to clean away spilled cola, or other matter that could find its way from the cup holder into the bottom portion, comports with the district court's holding that the seat and base merely be capable of separation.
As the district court was no doubt aware, "ease of separation" is a common trait of many iterations of modern infant car seats. Simple observation on the public streets of parents removing children from cars reveals two-part infant car seats, whereby the base portion remains in the car while the seat portion is removed with the child still strapped in. This seat portion can then be easily secured into an infant stroller and later removed from the stroller to be reattached to the base portion that had remained in the car. While this may be the preferable two-part car seat for use with infants, the patents in suit do not require that the seat be "easily removable" from the base. There simply is no reference whatsoever in the specifications to "ease of release" or "ease of separation," no indication that the patent is directed to a product comprising a base that, during everyday usage, remains in the automobile while the user removes the seat and the child.

In short, the "removable" limitations, as understood through the plain meaning of the claim language and as tested by information in the specification, per Phillips, are just as the district court held. The seat and base can be separated "in a manner that contemplates that the seat may be removed from the base such that the seat remains functional." Summary Judgment at 6.

The district court also correctly construed the terms "seat" and "base" to require two separate structures- "the structure intended to be sat in or on" and "the structure that props up the seat," respectively. Id. The drawings in the patents certainly confirm the district court's understanding that the seat and the base are two separate structures held together by some means. See '862 patent, Figs. 1-4; '649 patent, Figs. 1-4. We thus discern no error in the district court's interpretation of the key claim terms.

3307

DISSENT BY: NEWMAN

DISSENT

NEWMAN, Circuit Judge, dissenting.

I respectfully dissent. The district court correctly construed the term "removably attached/secured" to mean "removably," not its opposite, as the panel majority holds. The Graco carseat is a permanent assembly whose molded parts are permanently screwed together with six "one-way" screws. Upon unscrewing and disassembly, the Graco seat becomes a collection of loose parts, the cup holder incapable of its function of supporting a cup. The Graco carseat is clearly not a base and seat assembly as in the Dorel patents, whereby the seat can be reversibly slipped from its mooring to carry its infant passenger. Removal of the top part of the Graco carseat (for example, to carry the infant into grandma's house), would require removing the upholstery, upending the carseat (requiring removal of the entire assembly from its crash-proof installation), and removing the six unremovable screws with the special tool needed for removing unremovable screws -- and then repeating the operation in reverse upon returning to the car with the top part and its infant cargo. The panel majority's redefinition of the patented invention to cover such a carseat is devoid of support.

The Dorel patents include drawings of the patented carseat, showing the separate base carrying the cup holders:

The specifications show that the seat and base are distinct structures that are designed to be manually released and reattached, as the district court found. The seat 12, which includes a "seat bottom" and a "seat back," is described as "releasably coupled" to the base 16, which includes a "front," a "rear," a "pair of side walls," and a "cupholder receptor 38." The term "releasably" is also used to describe the manually adjustable cupholder 18, as "releasably held" and "releasably locked" by tabs 22.

In striking contrast, the Graco carseat is a unitary structure without a removable seat portion:

The panel majority has misperceived the Dorel structure, perhaps because the seat of the Turbo Booster is molded in two segments, whose engineering drawings are shown in the record as follows:

"Seat Top" "Seat Bottom"
These molded parts are not "removably attached"; they are permanently assembled, using six permanent screws set in recessed indentations. Graco's "one-way" screws can be unscrewed only with a special tool called the "Un-Do-It" tool. Although the majority states that the tool "can be purchased in hardware stores," that is not the general experience, and Dorel's expert testified that he could locate such a tool only after searching the internet for the term "one-way screw."

The panel majority errs in construing the Dorel claims to a removably attached seat and base, to encompass a unitary structure that does not have a separable and separable seat and base. The Dorel prosecution history itself negates such a construction. The original claims, broadly referring to any "juvenile vehicle seat" with a retractable cup holder, were rejected as anticipated by O'Brien U.S. Patent No. 3,637,184, which describes a unitary seat with a retractable cup holder. In response, the claims were amended to "further comprise" a "seat" that is "removably secured" or "removably attached" to a "base." The district court correctly construed the claims as requiring a removable seat and separate base. See Phillips v. AWH Corp., 415 F.3d 1303, 1317 (Fed. Cir. 2005) (en banc) ("the prosecution history can [make] the claim scope narrower than it would otherwise be"). Indeed, Dorel in its motion for summary judgment observed that the O'Brien patent "discloses a single, indistinct piece, in which no seat could be identified separately from a base, much less a seat removably attached or removable secured to a base." Neither Dorel nor the panel majority can recapture what Dorel surrendered during prosecution: a single indistinct piece without an identifiable, removable seat portion.

The district court, referring to the prior art, correctly rejected "the one piece, stand alone base/seat" that is adopted by the panel majority as covered by the Dorel claims. The district court construed "base" to mean a structure that not only "props up the seat" and "upon which the seat sits," but also is "separate from the seat." The district court correctly construed "seat" to mean not only a structure "intended to be sat in or on, "but also used "in conjunction with but not as part of the base." The district court further construed "removably attached/secured" to require that the base and seat be "designed at some time or another to come apart." On these definitions and the undisputed structure of Graco's carseat, the district court correctly recognized that no reasonable jury could find that the Graco seat device has a seat that is removably attached to a separate base. As the district court observed, the bottom piece of the Graco assembly "is an integral part of the seat," not removably attached or secured to the seat.

The panel majority ignores this central issue and remands for findings on a non-issue: whether "the top structure is capable of functioning as a 'seat' upon being removed from the bottom structure." Maj. op. at 7. That aspect is irrelevant. The question is not whether the top structure is "capable" of being sat upon; the question is whether there is a seat removably attached to a separate and distinct base.

The panel majority also holds as a matter of law that the "removably attached" and "removably secured" limitations are met, based on its construction requiring only that the seat and base "be capable of separation." Maj. op. at 5. That is not the description of the invention. Of course even "one-way" screws can be laboriously removed and the structure disassembled; indeed, it is difficult to imagine any assembly not capable of being disassembled. The district court correctly required that the seat and base be "affixed in a manner that contemplates" removal; that is, the parts must be "designed at some time or another to come apart." Summary Judgment at 6-7. The record contains no suggestion that Graco's carseat is designed to come apart. The user manual for Graco's product negates disassembly, admonishing the user not to modify the seat or use the seat without all of its parts, warning that failure to properly use the seat "increases the risk of serious injury or death." Even on the panel majority's speculation that the Graco structure might be disassembled for cleaning, the "removably attached/secured" requirement of the Dorel claims is not met. The specification describes the base as being "releasably coupled" to the seat; this is not compatible with the need to purchase and use a special tool to unscrew one-way screws covered by upholstery.

The panel majority complains that the patent does not discuss the advantage of separating the Dorel seat from its base, stating that "there is no indication that the patent is directed to a product comprising a base that, during everyday usage, remains in the automobile while the user removes the seat and the child." Maj. op. at 5-6. However, such separable carseats were in the prior art at the time the Dorel applications were filed; the patents are directed primarily to the cup holders, not the seat and base structure. See '862 patent, col. 1, ll. 9-10 (describing the invention as a retractable cup holder in a "conventional juvenile vehicle seat" that is "generally known" and in "widespread use"); see also Figures 1 and 2 of Dorel's patents, supra. The record contains other patents by the inventor of the Dorel patents, such as U.S. Patent No. 6,554,358, which is directed to a seat removably attached to a base, and which cites eleven references to seat and base combinations that are manually separable. In addition, Graco points to Department of Transportation regulations, with which all carseats must conform, that describe carseat components that "can only be removed by use of a tool" as "permanently attached."
C.F.R. §§ 571.213 S5.9 , 571.225 S15.1.2.1(f). The panel majority's interpretation of "removably attached" and "removably secured" as requiring only that the structure be "capable" of disassembly, however laborious the mechanics, is contrary to the prior art, contrary to usage in the field, and contrary to federal regulation.

The majority's approach to claim construction strains this court's attempts to restore consistency of analysis to patent claims by placing the claims in the context of the specification. See Phillips, 415 F.3d at 1321 ("The risk of systematic over breadth is greatly reduced if the court instead focuses at the outset on how the patentee used the claim term in the claims, specification, and prosecution history, rather than starting with a broad definition and whittling it down"). The panel majority construes the Dorel claims as encompassing a different invention from that described and prosecuted. From this incorrect claim construction, leading the court to an incorrect decision, I must, respectfully, dissent.

The first term in dispute are the phrases "removably attached" and "removably secured." The construction is to be made without reference to the accused product. The construction begins with an examination of the terms used and a recognition that "the terms used in the claim bear a heavy presumption' that they mean what they say and have the ordinary meaning that would be attributed to those words by persons skilled in the relevant art." Texas Digital Sys., Inc., v. Telegenix. Inc., 308 F.3d 1193, 1202 (Fed. Cir. 2002).

Neither party suggests to the Court the identity of the person skilled in the relevant art in this case. This omission can more than likely be explained by the rather obvious inference that the person skilled in the relevant art is a person who designs juvenile car seats and by the lack of an assertion by either side that these words have a specialized meaning understood only by such a person. Thus the analysis begins with an attempt to determine the ordinary meaning of these phrases.

The phrases "removably attached" and "removably secured" carry with them the inference that whatever is to be removably attached or removably secured will be detached or unsecured on occasion during the lifetime of the product. In other words the product is designed to come apart. Whether it comes apart in normal usage or not would be dictated by other language. By themselves the words imply only that the items "removably attached" or "removably secured" are designed at some time or another to come apart.

The terms also carry with them an implication that the detachment or unsecuring process not do violence to the seat. This conclusion is bolstered by the remaining language in the claim. The base, by the language of the claim, is to support the seat arranged as a base. Without the base there still exists a seat. In other words the base is not a part of the seat. Thus, the removal of the base from the seat, or the coming apart of the seat and base, will not render the seat unusable as a seat.

The parties discuss the notion that ease of separation is inherent in the terms "removably attached" or "removably secured." The Court finds no comfort in this concept because adding the ease of separation into the construction of "removably attached" would add the word "easily" or the words "relatively easily" where they do not exist.

Having looked just at the plain meaning of the words to be construed, as a first step in the Markman claim construction process, this Court concludes that as used in the claims at issue "removably attached" or "removably secured" means affixed together in a manner that contemplates that the seat may be removed from the base such that the seat remains functional.
First, Zyliss counters by arguing that the Zyliss spinner does not literally infringe the '883 patent as it does not have a cover that is "removably connected" to the bowl. With regards to the meaning of the phrase "removably connected," we are not convinced that the phrase means something that "essentially rests on the top edge of the bowl and covers the opening of the bowl," as OXO contends.

While OXO points out that the Federal Circuit recently interpreted the meaning of the phrase "operatively connected" in Innova/Pure Water, Inc. v. Safari Water Filtration Systems, Inc., 381 F.3d 1111, 1117-18 (Fed. Cir. 2004), this does not aid in our determination of the meaning of the phrase "removably connected," as the two phrases are inherently different. In Innova/Pure Water, Inc., the patent in question, involving a water bottle filter assembly, required that the tube be "operatively connected" to the cap. Id. at 1119-21. The court construed this phrase to mean that only that the cap and the tube had to be arranged in a manner capable of performing the filtering function, thus comporting with the meaning of the term "operative." Id. The components did not need "to be affixed in type of tenacious physical engagement shown in the preferred embodiment." Id. However, the ordinary meaning of the phrase "operatively connected" can substantially differ from "removably connected." The use of the term "removably" before the term "connected" implies a more permanent connection than a cover that simply rests on a bowl and is removable as is the case with the Zyliss spinner. Use of the term "removably" also implies a more permanent connection than one arranged in a manner capable of performing the product's function, as in the Innova/Pure Water, Inc. decision. The ordinary meaning of the term "connected" is "joined or linked together." See e.g., WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 480 (1993). OXO, through its expert Mr. Olson, attempts to equate the term "connected" with different unclaimed terms such as "engages," "surrounds," and "nests." (Olson Dep. pp. 129, 132 (Zyliss Exhibit 28)). The '883 patent makes a clear distinction between the terms "engaged" and "connected." It appears that the word "engaged" in the '883 patent is used to mean mere contact. OXO could have used the term "engaged" in the claim embodiment rather than the word "connected," if OXO intended that the cover solely to make contact with the bowl. By using the term "connected" however, some type of contact more than that of mere contact seems inferred, particularly when predicated by the term "removable."

Analysis of the intrinsic evidence further confirms the conclusion that the ordinary meaning of "removably connected" requires a tighter interface than simply laying one thing on top of another. The specification expressly discloses a "friction fit" between the cover and the bowl of the preferred embodiment, or, put another way, a connection between the cover and the bowl. There is no "friction fit" between the cover and the bowl of the Zyliss spinner. OXO makes mention of the fact that a frication fit or a tight fit is not present in the OXO spinner, but this is irrelevant to our analysis. Our analysis must focus upon the comparison between elements of the patent claim and corresponding elements of the allegedly infringing device. Thus, the Zyliss spinner does not have a cover that is "removably connected" to the bowl.

7. Claim 17 ("removably fastened") Claim 17 of the '286 Patent provides for "an ultrasonic instrument according to claim 7, wherein the clamp member includes a tissue contact surface removably fastened to the clamp member." '286 Patent, Claim 17 (emphasis added). Plaintiff would construct "removably fastened" as "designed so as to be capable of being held secure to something else and designed so as also to be capable of being unsecured and taken away from." Defendant proposes, "designed so as to be capable of being held secure to something else and also adapted to be unsecured and taken away from." The dispute between the parties as to this claim term is whether to use the phrase "and designed so as also to be capable . . . " (plaintiff's construction), or "and also adapted to be . . . " (defendant's construction). At the Markman hearing, plaintiff argued that use of the word "adapted" suggests that "a user might have reason to, or could, if he or she so wished, remove that tissue contact surface, but that doesn't happen. It's designed such that if you wish to pull it out you could, but it wouldn't actually ever be pulled out in actual use." Markman Tr. at 36. In contrast, defendant argued that "it's designed so [it] can [be] taken on and off, and what they disclose in the patent for these tissue contact surfaces is a simple tongue-and-groove mechanism so that the tissue contact surface can be applied to the clamp member and then removed again." Id. at 130. n12

n12 In fact, the specifications provide that the "tongue and groove fastening assembly" is the preferred method, "although other fastening assemblies are envisioned." '544 Patent, 4.2-6.

While the Court is dubious about the distinction drawn between "designed" and "adapted" as having a meaningful
difference, the Court nonetheless sees no basis in the claim language or specification for the differentiation defendant proposes. The patent simply provides no indication that the term "removably" should be construed using the word "adapted" while the term "fastened" is construed using the word "designed." Additionally, the words "capable of being" more closely track the dictionary definition, than does defendant's "adapted" language. See Webster's Third New Int'l Dictionary (plaintiff's Ex. G) at 1921 ("Capable of being removed, displaced, transferred, dismissed, or eradicated."). Accordingly, the Court will construe the term "removably fastened," as "designed so as to be capable of being held secure to something else and designed so as also to be capable of being unsecured and taken away from."

3312

c. "removably securing"

Toro argues that both the air inlet cover component and the "baffle" component of the White cover have attachment means for "removably securing" the air inlet cover to the housing as claimed in element v of claim 16. Toro contends that these facts were admitted by David Haupt, an engineer employed by White. See (Beattie Aff. Ex. D, Haupt Dep. at 233-34, 244-45). White argues that although the air inlet "baffle" is removably secured from the housing, the outer lid portion of the air inlet cover is not removably secured because it is attached to the housing by a hinge. See (Def. Mem. at 25); (Mattson Decl. at PP 15-19); (Haupt Decl. at P 20). White further asserts that Toro claimed an air inlet cover that is completely detachable from the vacuum-blower housing. (Def. Mem. at 24).

6 It is well established Eighth Circuit law that a statement in a declaration contradicting earlier sworn deposition testimony cannot create a fact issue. As such, the court will rely on Haupt's deposition testimony. White also argues that the reasoning of another court on this same issue is compelling. See The Toro Company v. McCulloch Corp., 1994 U.S. Dist. LEXIS 20904, Civil No. 3-94-664 (D. Minn., Oct. 21, 1994) ("McCulloch"). That decision does not relieve this court of its obligation to make findings of fact and conclusions of law in this matter, however.

The adjective "removable" is defined as: "capable of being removed, displaced, transferred, dismissed or eradicated." Webster's Third New Int'l Dictionary, 1921 (1981). "Secure" is defined as "4b: to make fast: tie down: SEAL." Id. at 2053. Another dictionary defines secure as "12. to make firm or fast: as by attaching." The Random House College Dictionary 1190 (Revised ed. 1980).

Claim 16 does not state that the cover is removable or secured; claim 16 states that the cover is removably secured. Removably is an adverb which modifies the verb securing. Thus, a cover which is not removably secured to the housing will either be attached to the housing and therefore not removable, or not secured at all. According to the common meaning of its terms, a removable secured cover as described by the '528 patent could take many forms, including hinged covers, tethered covers, covers rotated about a pivot and covers that are completely detachable from the blower housing such as the Toro model.

White bases its entire argument concerning the definition of "removably securing" on the McCulloch case. In that case, the pressure ring was attached to the cover lid. See (Sipiora Supplemental Decl. Ex. C at 5). Thus, although the one-piece cover in McCulloch was the same as the design at issue in Toro I, it is not the same design as the two-piece cover at issue in this case. Because the facts in this case are different from those in McCulloch, the McCulloch court's legal conclusions have limited applicability to the instant matter.

The court's prior definition of the term "cover" aids its interpretation of the terms "removably securing." There is no dispute that the "baffle" piece of the White cover is removable from the air inlet and the housing. White contends that the outer lid piece of the cover is not removably secured, however, because it is attached to the housing by a hinge. This argument fails for two reasons. First, Haupt, White's own witness, testified in his deposition that the outer lid was removably secured. See (Beattie Aff. Ex. D., Haupt Dep. at 233-34). Second, the '528 patent claims both one-piece and two-piece air inlet covers, not simply cover components. See supra p.17. White's "cover" is comprised of the air inlet lid and the "baffle." Although
White concedes that the "baffle" is removably secured from the housing, both cover components must be removed from the air inlet for vacuuming operation. White cannot avoid literal infringement by arguing that its two-piece "cover" does not literally infringe element v of claim 16 because something less than the "cover", the outer lid component, is not removably secured to the housing.

Additionally, the specifications of the '528 patent provide that a hinged cover is removable. Column 1, line 18 states:

During use as a vacuum, the apparatus is converted by removing the apertured cover and placing a vacuum nozzle in communication with the air inlet, and substituting a debris bag for the blower nozzle at the air outlet. U.S. Pat. No. 4,325,163 issued on Apr. 20, 1982 to Mattson et al is one such prior art apparatus.

The Mattson patent shows a hinged cover. See (Beattie Aff. Ex. I). Thus, the '528 patent provides a cover lid that is "removably secured" must be capable of moving away from the air inlet to permit insertion of the vacuum tubes, but does not necessarily need to be completely detachable from the blower housing.

The court has considered the meaning of the language used in the '528 patent and compared this language to the accused device. After making this analysis, the court concludes that White's cover on its latest vacuum-blowers literally infringes the '528 patent because every limitation in claim 16 is present in the accused device. Based this finding, the court does not reach the issue of infringement under the doctrine of equivalents.

Footnotes:

7 Without deciding the issue, the court notes that, based on the record before it, Toro also has a reasonable likelihood of success on the merits at trial on the issue of infringement under the doctrine of equivalents.

GO BACK

In the main, the parties do not dispute the meaning of the term "removably supported." Both parties agree that the court should construe "removably supported" to mean "supported by and being removable from". Compare Defendant's Motion at 6 with Plaintiff's Response and Brief in Opposition to Defendant's Motion for Summary Judgment at 12 [hereinafter cited as "Plaintiff's Response"]. Where the parties diverge is defendant's contention that "removably supported" necessarily excludes all permanent means of attachment, including the use of rivets. Plaintiff counters that the claims of the '326 patent do not specify the type of fasteners to be used and, in any event, rivets are not permanent fasteners because they can be removed. In support of its contention that rivets are removable, plaintiff offers the affidavit of its Vice President of Engineering, Lawrence J. Cammuso. Mr. Cammuso asserts that "rivets may be removed by using a drill with a drill bit, a rivet removal tool and other tools" and that the rivets used in the accused device "could readily be removed and replaced both during manufacturing and in the field." Exhibit 2 to Plaintiff's Response at P 19. Once removed, however, the rivets are not reusable; the pump assembly must therefore be reattached using new rivets or bolts and nuts. Id. at P 21.

Like the Court in K-2 Corp. v. Salomon S.A., 191 F.3d 1356 (Fed. Cir. 1999), this court need not confront the existential question of whether any fastener can truly be considered permanent. As the Court noted, and the parties in this case agree, a "rivet-made permanent connection is of course not 'infinitely' permanent, because a rivet can be broken." Id. at 1365. The common, ordinary meaning of removable or removably, however, does not include breaking what is meant to be a permanent connection. The court's understanding that rivets are considered permanent connections is reinforced by the extrinsic evidence. See Exhibit 2(A) to Defendant's Motion at 318 ("rivets are permanent shear fasteners"); Exhibit 2(B) to Defendant's Motion at 824 ("The most common method of permanent or semipermanent mechanical joining is by riveting.") (emphasis in original). The intrinsic difference between removable fasteners, such as screws and nuts and bolt assemblies, and rivets, which are meant to form a permanent bond, was likewise recognized by the Court in K-2 Corp.

Screws, unlike rivets and laminates, are meant to be unscrewed, that is, to be removed. A rivet or laminate, to the contrary, is meant to remain permanent, unremovable unless one is bent on breaking the permanent structure apart.
K-2 Corp., 191 F.3d at 1365. A component cannot be "removably supported" if it is attached using fasteners that are meant to be permanent and not removed. As the accused pump is attached to its support plate by rivets, it cannot meet the "removably supported" claim limitation. Thus, as a matter of law, defendant's pump assembly does not literally infringe the '326 patent.

(d) "Removing" In general usage, to "remove" means "to move by lifting, pushing aside, or taking away or off," Merriam-Webster's Collegiate Dictionary 990 (10th ed. 1993), or "to move or shift from a place or position," Webster's College Dictionary 1139 (Random House 1992). "Removing" an object thus means the purposeful application of motive force to change the location of the object, under circumstances where, without the application of such motive force, the object would tend to stay in its original place.

1. "Removing"

The parties disagree as to the meaning of the term "removing contaminate vapors from contaminated underground areas" as used in paragraph 1 of the '407 Patent. Plaintiff argues the term means an operation or use of the claimed process for an extended period of time for the purpose of eliminating all or substantially all the contaminants from a contaminated site. Defendants, on the other hand, argue that the term means the removal of any amount of contaminant vapors rather than all or substantially all of such vapors.

The Court begins its analysis with the ordinary meaning of the word "remove." When a general descriptive term is used in a claim, the dictionary definition generally constitutes the ordinary and accustomed meaning of the term. Casler v. U.S., 15 Cl. Ct. 717, 9 U.S.P.Q.2D (BNA) 1753, 1772 (Cl. Ct. 1988). The dictionary definition of "remove" is: ". . . 1: to change or shift the location, position, station, or residence of . . . 4: to get rid of as though by moving . . . " WEBSTER'S THIRD NEW INTERNATIONAL UNABRIDGED DICTIONARY ((c) 1961, 1993) at 1921. This definition does not modify the word "remove" with terms like "completely" or "substantially all." Accordingly, the Court concludes that as soon as the process disclosed in the '407 Patent is commenced, one is engaged in practicing the invention. It is not necessary to complete the process before one is said to be practicing the invention.

In addition, the specification does not support Plaintiff's interpretation of "removal". For the Court to read a limitation from the written description into the claim, the inventor must indicate clearly in the specification that the limitation must be imported into the claim to give meaning to the disputed term. Renishaw PLC v. Marposs Societa' Per Azioni, 158 F.3d 1243, 1249 (Fed. Cir. 1998). Plaintiff does not indicate clearly in the specification that he would like to add the limitations "completely" or "substantially all" while interpreting the term "removing." Further, Plaintiff has not provided an explicit definition for the term.

6. ev3's Patents

The phrase "removing restraint on balloon filter" appears in both the '019 and '375 Patents. Boston Scientific argues that the phrase should be construed as "moving the restraining element so as to uncover the filter at the desired location." ev3 suggests that the phrase need not be construed, but to the extent it is to be construed, it should mean nothing more "than that the filter element be outside the lumen of the sheath and permitted to expand to its expanded configuration." The Court declines to construe "removing restraint on filter element" because the phrase is easily understood.
5. "Repeating said injecting process until all of the plurality of openings have been filled" ('682 Patent, Claims 18 and 20) (Claim Element 5)

a. The Parties' Positions

ATI proposes that the plain meaning of this claim element be adopted. Dkt. No. 81 at 13. Specifically, ATI proposes the following construction: "Repeating said injecting process until all of the plurality of openings have been filled." Id. However, Defendants propose the following construction: "Using a nozzle or other point source injecting mechanism to force light influencing material influencing material into each hole in the opaque material is repeated until all holes in the substantially opaque material are filled." 11

11 Sharp provides no briefing on this issue. Dkt. No. 83. Instead, in the Chart, Sharp states that it "agrees with DNP." Dkt. No. 113 at 3.

b. Construction

The differences between ATI and Defendants' proposed constructions are as follows: (1) whether to include the "use of a nozzle or other point source injecting mechanism to force" and (2) whether "each hole" must be included. Both of these issues have been addressed previously in this claim construction. See Discussion, supra. Accordingly, these issues will not be addressed again. As noted above, this Court will not adopt either of Defendants' two proposed changes to the plain meaning of these terms. Therefore, the Court's construction for Claim Element 5 is as follows: "Repeating said injecting process until all of the plurality of openings have been filled."

2. "Replaceable"

Claim 1 of the '909 patent provides for an under-eye light absorbing device comprising a "replaceable pliable sheet material patch." The parties agree that "replaceable" in this context means repositionable but debate whether there is an implied time limitation. (At the preliminary injunction hearing, I rejected plaintiff's argument that the replaceable limitation is satisfied simply because a user can remove and dispose of defendant's product and then put on a new one. Such an interpretation would render the term meaningless; anything of a generic quality can be "replaced" with a second item. Plaintiff does not revive this argument at summary judgment.) Defendant presumes that there is no specific time limitation and relies on its president's demonstration at the preliminary injunction hearing. Plaintiff also relies on its demonstration at the preliminary injunction hearing but argues that claim 1 should be construed to require only that the product be repositionable during initial application.

According to plaintiff, initial application is the only time an athlete would reposition an eye black; thus, this limitation is implied as a matter of logic. In support of this markedly narrow limitation, plaintiff cites the affidavits of two athletic trainers, whom plaintiff characterizes as experts. In their affidavits, the trainers state that the only time they are aware of athletes repositioning eye blacks is during initial application. Plaintiff's argument is unavailing for a number of reasons. First, it reads in a narrow limitation not from the claim language, patent specification or prosecution history but from extrinsic evidence. Extrinsic evidence is an interpretive resource of last resort. Vitriconics, 90 F.3d at 1583. It may not be used to impose limitations that are in no way found in the intrinsic record. Dow Chemical Co. v. Sumitomo Chemical Co., Ltd., 257 F.3d 1364, 1373 (Fed. Cir. 2001) ("extrinsic evidence may be used only to assist in the proper understanding of the disputed limitation; it may not be used to vary, contradict, expand, or limit the claim language from how it is defined, even
Second, these two trainers do not qualify as experts or persons skilled in the act of eye black repositioning. Defendant's product is a mass market consumer good sold to athletes at all levels of competition; when a consumer might reposition the product is not a matter of scientific, technical or otherwise specialized knowledge. Fed. R. Evid. 702. Even more problematic than simply not qualifying as "experts" of eye black repositioning, neither trainer explained why he would have known whether an athlete had repositioned an eye black at some time after initial application. Without such a showing, very little can be drawn from the fact that the trainers were not aware of any post-application repositioning.

Nothing in the claim language, specification or portions of the prosecution history suggests an implied limitation that the patch need be replaceable only during initial application. To the contrary, the prefix "re" indicates that the patch must be placed somewhere before it can be "replaced." Merriam Webster's Collegiate Dictionary 971 (10th ed. 1997) (defining "re" as "again [or] anew"). Ordinarily, "placed" means put in a particular position or set. Id. at 888. Thus, the claim language indicates that the product must be moveable at some point after it has been set in a particular position. Further, the claim specification anticipates that the patches are to be used in connection with "athletic activity such as football, baseball, basketball, tennis, golf and the like." '909 Pat., col. 3, Ins. 17-19. Without any indication to the contrary, a natural reading of this passage would suggest that the qualities attributed to the product would endure at least as long as it would ordinarily take an athlete to participate in one of these listed sports.

As for plaintiff's suggestion that initial application is the only time that an athlete would reposition an eye black, there are any number of reasons to think that a person would be equally if not more likely to reposition an eye patch at some later point. An athlete might apply an eye black patch indoor under artificial light and not notice that the patch is not in the best place to block reflection until going outside in full sunlight. Further, a person might readjust the product's position if the angle at which light is hitting his face changes; this might occur as the sun changes position over time or when teams trade sides of the field or court. Finally, skin irritations might prompt an athlete to readjust the position of an eye black patch during the course of an athletic event. Absent any indication in the intrinsic record suggesting a more limited time frame, I conclude that the claim requires that the product be repositionable for the duration of an average game of football, baseball, basketball, tennis or golf.

II. Claim 4: "replacing said specific link"

Claim 4 of the '423 Patent provides:

selecting a specific link of a sequence of links to be formed into a loop of saw chain . . . [and] providing a replacement link that is different in appearance from the appearance of the selected link . . . .

(disputed term emphasized).

Defendants construe "a replacement link that is different in appearance from the appearance of the selected link" to mean "permanent coloration or shape of the replacement link differs from all remaining links in the chain performing the same function." Thus, in effect, Defendant proposes the same definition for this term as it did for the term in Claim 1 for almost identical reasons. Plaintiffs, however, contend the disputed language is clear on its face and, therefore, can be understood by its ordinary meaning. Again, the Court agrees.

The "replacement link" need only be "different in appearance" from the "selected link," and the specification and other claims make clear that the patentee contemplated more than mere color or shape as the means by which to differentiate the replacement link. Accordingly, the term "a replacement link that is different in appearance from the appearance of the selected link" does not require further construction and is understood by its ordinary meaning alone.
A. Valve Disc Replica

Our claim construction opinion interpreted "valve disc replica" as "a close copy of the valve disc." Claim Construction Order, July 12, 2004 at 8-9. Nothing in Phillips changes that conclusion. NIBCO seeks to have the Court define the term almost purely based on the function that it plays in the 347 patent. NIBCO wants a valve disc replica to be construed as "a structure or assembly of structures that create [sic] a circular disc with an outer periphery shaped to form the valve seat during molding and having aligned valve stem receiving openings on one of its faces." 1 NIBCO's Motion for Reconsideration at 8. But the functions inherent in this definition, and the functions described in the specification, are consistent with a valve disc replica being "a close copy of the valve disc."

--- Footnotes ---

1 As we mentioned in our claim construction order, NIBCO first suggested that we construe the phrase "valve disc replica" to mean "a structure or combination of structures that shapes the central portion or valve seat during the molding process and thus simulates the finished fluid passageway within which the valve disc will be mounted when the valve is assembled." In its Supplemental Brief, NIBCO changed its position of the meaning of "valve disc replica" to the proposed definition quoted above. Claim Construction Order at 8.

--- End Footnotes ---

Although we did refer to a dictionary in arriving at our claim construction for valve disc replica, nothing in Phillips prevents us from doing so. As mentioned above, the Phillips court noted that "in some cases, the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and claims construction in such cases involves little more than the application of the widely accepted meaning of commonly understood words. . . . In such circumstances, general purpose dictionaries may be helpful." Phillips, 415 F.3d at 1314. The Court believes that to be the case here. It is for this reason that we stated in our claim construction order that "referencing dictionaries is probably not even necessary in this instance, since common usage of the term" valve disc replica is plain on its face. See Claim Construction Order at 9.

We continue to believe that the ordinary and customary meaning of the term "replica" as understood by someone skilled in the art would be a "close copy," and therefore a "valve disc replica" is a "close copy of a valve disc." NIBCO has presented us with no evidence that someone of skill in the art of making valves would view this term differently. NIBCO instead argues that it never said or suggested in the specifications that the valve disc replica "looks like" or is a "close copy" of the actual valve disc. NIBCO's Motion for Reconsideration at 7-8. But this argument ignores the obvious point that by repeatedly using the term "replica" in the claims, nothing more needed to be said because a replica is a close copy.

Moreover, the intrinsic record supports the construction given by the Court. The figures depicting the valve disc replica show an object that is very similar in appearance to the valve disc, although it is not an exact copy of the valve disc. Compare Figs. 1 and 3 with Figs. 11 and 12. For example, both the valve disc and the valve disc replica are thin circular plates. Id. In addition, both the disc and the disc replica contain holes through which the valve stem (or valve stem replica, respectively) is inserted. Id. Although there are some variations between the valve disc replica and the valve disc -- for example, the replica has inclined walls making it recessed on one of its faces so it can be held in place during the molding process, see 347 Patent, col. 4 lines 10-13 -- this merely confirms the point that the disc replica is a close copy of the disc, not an exact copy of the disc.

The prosecution history of the 347 patent further supports the construction that a "valve disc replica" is a close copy, not an exact copy, of a valve disc. During the prosecution of the 347 patent, the applicants stated that the valve disc replica would not be an exact copy of the valve disc because there would be "dimensional variations" between the two to optimize the configuration of the final valve. As the applicants stated: "the replica valve disc and the replica valve stem are not exact duplicates of the corresponding finished valve disc and valve stem. Their dimensional variations permit the formation of a channel 46 and thickened bosses 59 and 59a." Tyco's Summary Judgment Exhibit B-15 at 2. The prosecution history thus supports the construction that, although the disc replica is not an exact copy of the valve disc, it is a close copy of it.
Furthermore, nothing in the specifications indicates that NIBCO acted as its own lexicographer as to the term "replica," or that it used the term idiosyncratically. See Phillips, 415 F.3d at 1316. NIBCO draws the Court's attention to lines 7-14 of column 4 of the 347 patent, which reads as follows:

The central or valve seating portion of the seat is shaped by a disc replica 43 which is seated in the fluid passageway and is clamped between the mold halves 40a and 40b (FIG. 10). The disc replica 43 is recessed in one face (FIG. 16) creating a cavity 44 into which a mating boss 45 on mold half 40b seats to hold the valve replica properly located within the valve body 11 (FIGS. 10 and 12). The cavity and boss have inclined walls to accurately center the replica.

See NIBCO's Motion for Reconsideration at 7. This part of the specification, which indicates that the function of the valve disc replica is to shape the valve seat and to simulate the valve disc replica, is compatible with the ordinary meaning of the term "valve disc replica," that is, "a close copy of a valve disc." In the Court's view, nothing in this passage suggests that the patentee intended to define the term "valve disc replica" as "a structure or assembly of structures that create [sic] a circular disc with an outer periphery shaped to form the valve seat during molding and having aligned valve stem receiving openings on one of its face" -- the definition NIBCO now asks the Court to adopt. NIBCO's Motion for Reconsideration at 8.

In sum, the Court found that the term "valve disc replica" means "a close copy of the valve disc" and it did so with full awareness of its functions. While the dictionary played a modest role in our conclusion, for the reasons stated above, we are of the firm belief that rather than undermining our earlier ruling, Phillips actually supports it.

1. Valve Stem Replica

In the patent at issue in this case, the fourth step of Claims 1, 4 and 11 involves "inserting a valve stem replica through the stem openings in the valve disc replica and both bushings and into the socket." Claim 6 requires "inserting a valve stem replica through both bushings and the valve disc replica." In our claim construction order, we held that a "valve stem replica" means "a close copy of a valve stem." As we will discuss below, because Tyco's method does not use "a close copy" of the finished valve stem, it does not infringe Claims 1, 4, 6 and 11.

3. Reset Portion

Leviton argues, citing Dr. De La Ere's declaration, that the term "reset portion" is clear on its face to one of ordinary skill in the art. See Leviton's Memo at 20; De La Ere Declaration P 24, at 12-13. Leviton also contends that "reset portion" is a structural limitation and not a means-plus-function clause subject to § 112, P 6. See id. In support of its position, Leviton cites Col. 3, ll. 5-8 of the '766 patent, which states: "A reset portion is disposed at least partially within the housing and is configured to reestablish electrical continuity in the open conductive paths." The '766 Patent at Col. 3, ll. 5-8; Leviton's Memo at 20. Leviton, in maintaining its position, also asserts that the "reset portion" claim element does not use the word "means." See Leviton's Memo at 20-21. In further support of its position that the "reset portion" claim element is clear on its face and not subject to § 112, P 6, Leviton states that "reset portion" has, over the years, acquired a reasonably well understood meaning in the art that is reasonably associated with a particular structure. See id.

The Court does not agree with Leviton's position that "reset portion" is clear on its face to one of ordinary skill in the art and that it is not a means-plus-function clause. While "means" is not used in the "reset portion" claim element, the presumption that a claim element not containing the word "means" is not subject to § 112, P 6 can be overcome. See Cole v. Kimberly-Clark Corp., 102 F.3d at 531 ("Merely because an element does not include the word 'means' does not automatically prevent that element from being construed as a means-plus-function element."); Personalized Media Comm'n's, LLC v. Int'l Trade Comm'n, 161 F.3d at 704. The Court, agreeing with the Defendants, believes that presumption is overcome here; the relevant claim element does not provide sufficient structure. See Defendants' Memo at 34-35; Defendants' Response at 15-
The Defendants, citing Massachusetts Institute of Technology and Electronics for Imaging, Inc. v. Abacus Software, 462 F.3d 1344 (2006), contend that the presumption that a claim element lacking the word "means" is not a means-plus-function element is overcome here, because the claim does not contain sufficient structure and the words "reset" and "portion," when assessed either independently or in conjunction, do not connote sufficient structure. See id. at 1353 ("[A] limitation lacking the term 'means' may overcome the presumption against means-plus-function treatment if it is shown that 'the claim term fails to 'recite sufficiently definite structure' or else recites 'function without reciting sufficient structure for performing that function.'"). The Defendants note that pertinent dictionaries either do not define those terms or do not define them in a manner that connotes structure. See Transcript at 58:14-60:13 (Fry); Defendants' Markman Hearing Presentation at tabs 31-34, 36-40. The Defendants also point out that Dr. De La Ere testified that "reset portion" did not refer to any specific structure. See Transcript at 60:21-62:17 (Fry); Defendants' Response at 16-17 (citing August 31 De La Ere Deposition at 78:17-79:5). Further, the Defendants note that the Court previously, in its construction of the '558 patent's claims, determined that the "reset means" claim element was subject to § 112, P 6, and that, in the '558 patent, Leviton uses the terms "reset means" and "reset portion" interchangeably. See Transcript at 59:12-21 (Fry); Defendants' Memo at 34-45.

The Court finds the Defendants' position concerning "reset portion" persuasive. The Court believes that the language of the "reset portion" claim element cannot be said to impart sufficient structure. See The '766 Patent, Claim 1. The Court also believes that it is noteworthy that the Defendants' search did not reveal, nor did Leviton present, evidence that the term "reset portion" or the individual terms "reset" and "portion" impart sufficient structure within the art. See Mass. Inst. of Tech. & Elec. for Imaging, Inc. v. Abacus Software, 462 F.3d at 1354 (analyzing disputed claim element terms together and independently, and finding that § 112, P 6 applied where those terms did not impart sufficient structure and none was otherwise included within the claim). The Court, moreover, acknowledges that Dr. De La Ere conceded that the term "reset portion" does not connote any specific structure, see August 31 De La Ere Deposition at 78:17-79:5, and that Leviton does appear to use "reset means" and "reset portion" interchangeably in Claims 3 and 4 of the '558 patent, see The '558 Patent, Claims 3 & 4, Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d at 1334 ("We presume, unless otherwise compelled, that the same claim term in the same patent or related patents carries the same construed meaning."). Considering the foregoing, the Court concludes that the Defendants have overcome the presumption that § 112, P 6 is not applicable, and that the "reset portion" claim element is a means-plus-function element.

Citing Ventana Med. Sys. v. Biogenix Labs, Inc., Leviton contends that the "reset" language used in Claim 1 of the '766 patent and Claim 3 of the '558 patent is different, and that, therefore the Court's construction of Claim 3 of the '558 patent is irrelevant and the Court should not find that "reset portion" is a means-plus-function element. See Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d at 1334 (stating that, while a parent patent's prosecution history may inform the claim construction of its descendant, the parent patent's prosecution history is irrelevant to the meaning of a descendant's limitation if the two patents do not share the same claim language); Transcript at 14:10-15:17 (Magidoff). The Court notes, however, that the "reset portion" claim element's lack of accompanying structure, and not its language's similarity to that of Claim 3 of the '558 patent, drives the Court's conclusion here.

Because the Court concludes that "reset portion" is a means-plus-function element, it must determine its function. See Linear Tech. Corp. v. Impala Linear Corp., 379 F.3d at 1322. The Court concurs with the function that the Defendants put forth. The language of the "reset portion" claim element is largely identical to that of the "circuit interrupting portion" claim element, for which the Court adopts the Defendants' proposed construction. See The '766 Patent, Claim 1. Moreover, the word "said" indicates that the term "predetermined condition," as used in the "reset portion" claim element, should be construed as it was with respect to the "circuit interrupting portion" element. Phillips v. AWH Corp., 415 F.3d at 1316-17 (stating that use of the term "said" indicates that the term in question has previously been used within the claim and that the earlier understood meaning should be maintained). Given the use of "said," given that the Court adopts the Defendants' construction of the "circuit interrupting portion" construing identical language, given that it is presumed that the same claim term in the same patent or related patents carries the same construed meaning, see Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d at 1334, and given that, while Leviton states that the Defendants' proposed § 112, P 6 function is incorrect, Leviton
does not present the Court with an alternative, see Leviton's Response at 15-17, the Court will adopt the Defendants' proposed construction of the "reset portion" claim element. The Defendants' proposed construction provides:

This claim element is a means-plus-function element in accordance with 35 U.S.C. § 112, P 6. The function to be performed by the "reset portion" is reestablishing electrical continuity between the first and second electrical conductors and between the first and third electrical conductors after the occurrence of a current imbalance (in this case an artificially induced electrical fault) that activates the circuit interrupting portion.

Defendants' Presentation at 88.

Because the Court concludes that "reset portion" is a means-plus-function element, it must also identify the structure that corresponds to the function. See Linear Tech. Corp. v. Impala Linear Corp., 379 F.3d at 1322. The Court finds that the pertinent specification language contained within the '766 patent for completing the function assigned to the "reset portion" is the same structural language contained within the '558 patent for completing the function that was assigned there to "reset means." See The '766 Patent, Col. 8, ll 25-56; The '558 Patent, Col. 8, ll 25-56. Given that the language the Court used to describe the function of the "reset means" in the '558 patent is nearly identical to the language it adopts to describe the function of the "reset portion" of the '766 patent, and given that the relevant specification language is the same in both the '558 and '766 patents, the Court will apply its finding with regard to the structure of "reset means" from the '558 patent to the "reset portion" claim element appearing in the '766 patent. Thus, the necessary structures corresponding to the function ascribed to the "reset portion" are: return spring 120; latch number 100; latching finger 102; movable contract arms 50 and 70; reset contacts 104, 106, 52, 62, 56, 66, 72, 82, 76, and 86; coil assembly 90, plunger 92, banger 94, banger dogs 96 and 98; operable ends 116 and 118; and a circuit that senses the "predetermined condition" and causes coil assembly 90 to actuate plunger 92. See The '766 Patent at Col. 8, ll 25-56.

At the February hearing in this case, I construed "resile," a term appearing solely in claim two, as follows: “Resile" means to return to or tend to return to a prior or original position in a manner that contributes, at least in part, to the lodging of the member in the hole. Completely returning to a prior or original position, though included, is not required. Though occurring after Judge Hubel's claim construction, my construction necessarily relates to his. Thus, the issue concerns the proper relationship or relative meanings of "resile" and "resilient."

Given the context, "resile" as used in claim two clearly refers to the act of resiling or a device resiling in use. Judge Hubel's intended meaning of "resilience" is less clear, but it appears there are two possible meanings. First, it is used as a synonym for "resile," requiring that the device actually perform in a resilient manner in order to meet the definition of "member." This is a resilient-in-use interpretation. The second possibility is that Judge Hubel meant that the device must simply have the capacity to resile, not that it actually resile in use. Both options are supported by the common definition of "resilient." See Merriam-Webster's Collegiate Dictionary (11th 3d. 2005) 1060 (defining "resilience" as "capable of withstanding shock without permanent deformation or rupture" and "tending to recover from or adjust easily to . . . change").

Claim two reads in relevant part, "[a] method for anchoring in bone a member and attached suture, comprising the steps of: . . . deforming the member in a manner such that the member resiles against the portion of the bone that defines the hole. Legaard Decl. in Supp. Pl.'s Markman & Summ. J. Br., Ex. 1 at 10 (emphasis added).

Though Judge Hubel did not explain what he meant, his opinion indicates that he intended the resilience-in-use interpretation. Referencing the patent specification, he stated "the [invention] would be inoperable as described if it was not formed of a resilient material." See Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1378 (Fed. Cir. 2006)
("the specification is the single best guide to the meaning of a claim term"). Logically, if resilient material is required for the device to operate as described, then that material must actually perform its distinct function--resiling. It is inconceivable that the capacity for resilience alone is the difference between an effective and ineffective device as described in the patent.

There is also support for the resilience-in-use interpretation in the Federal Circuit's Ethicon opinion. Upon review of the district court's various rulings, the Circuit concluded the '557 patent "is directed to an anchor with resilient legs that open and resile after the anchor is pushed into the cancellous bone, lodging the anchor against the cortical layer." Smith & Nephew, Inc. v. Ethicon, Inc., 276 F.3d 1304, 1312 (Fed. Cir. 2001). The Circuit also referenced a statement made by Dr. Hayhurst during the prosecution of '557 where he distinguished his invention from prior art on the basis that '557 encompasses devices that attach to bone through resilience. Id. at 1309.

Though framed differently, in its briefing Smith & Nephew raises the doctrine of claim differentiation in opposition to a resilient-in-use interpretation. As between independent claims, the doctrine of claim differentiation acts as a "presumption that each claim in a patent has a different scope." Curtiss-Wright Flow Control Corp., 438 F.3d at 1380 (quoting Versa Corp. v. Ag-Bag Int'l Ltd., 392 F.3d 1325, 1330. In this context, it is a "guide, not a rigid rule." Id. at 1381 (internal quotation marks and citation omitted). As a general matter, this doctrine is relevant where a proposed construction renders "additional, or different, language in another independent claim superfluous." Id. (internal quotation marks and citation omitted). However, it cannot be used to "broaden claims beyond their correct scope." Id. (internal quotation marks and citation omitted).

Smith & Nephew argues the doctrine of claim differentiation is triggered here because interpreting "member" as an anchor that is resilient-in-use renders claim two's specific reference to resiling and claim six and seven's reference to a "deformable member" superfluous. I disagree. As the Federal Circuit explained in Curtiss-Wright, "a patentee may define the same subject matter with claims having different terminology." Id. at 1381. Thus, even though the resilient-in-use interpretation may diminish the differences between the claims, that fact does not mean the interpretation is wrong.

Further, I find that the words used in the latter set of claims are not rendered completely superfluous because, when read as a whole, those claims more specifically define the manner in which the resiling must occur than do the more general claims, like claim one. For example, unlike any other claim, claim two specifies "the member [must] resile[] against the portion of the bone that defines the hole." Interpreting "member" as a device that "return[s] to or tend[s] to return to a prior or original position in a manner that contributes, at least in part, to the lodging of the member in the hole" does not render claim two's specific method of resiling meaningless. Likewise, when read as a whole, claims six and seven describe a unique method for accomplishing resiling. And to the extent there is some overlap between "deformable member" and "member" defined as a device that is resilient in use, I conclude this is necessitated by the patentee's formulation of his claims.

Additionally, as Judge Hubel said, it is clear from the patent specification that the distinguishing characteristic of Dr. Hayhurst's invention is that it is a device that resiles in bone. Thus, Smith & Nephew's argument that "member" includes both resilient and non-resilient devices based on the different language used in the various claims would inappropriately broaden the scope of the invention as contemplated by the specification. Whatever Dr. Hayhurst's motivation in including the term "deformable member" in claims six and seven, the claim language cannot be read in a manner that is inconsistent with the overall purpose and function of the invention. See id. at 1381 (vacating district court's construction that was inconsistent with "the overall context of th[e] invention and th[e] field of art as described in the specification"). Thus, to conclude, I find the proper interpretation of "resilience," as that term was incorporated into the definition of "member" by Judge Hubel, is that the device must resile in use.

3324

In Smith & Nephew v. Ethicon, No. CV 98-76-MA, (D. Or. June 11, 1999), 2 Magistrate Judge Hubel construed "member" as "the anchor itself." He further held this term requires "that the entire member is resilient." As set out in an earlier opinion, Judge Hubel's construction applies here under principles of claim preclusion. Judge Hubel did not, however, define "resilient," and the parties now dispute the import of this term.
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

2 Hereafter, Judge Hubel's opinion in Ethicon is referred to as "Hubel's Am. F&R."

At the February hearing in this case, I construed "resile," a term appearing solely in claim two, as follows: "'Resile' means to return to or tend to return to a prior or original position in a manner that contributes, at least in part, to the lodging of the member in the hole. Completely returning to a prior or original position, though included, is not required." Though occurring after Judge Hubel's claim construction, my construction necessarily relates to his. Thus, the issue concerns the proper relationship or relative meanings of "resile" and "resilient."

Given the context, "resile" as used in claim two clearly refers to the act of resiling or a device resiling in use. 3 Judge Hubel's intended meaning of "resilience" is less clear, but it appears there are two possible meanings. First, it is used as a synonym for "resile," requiring that the device actually perform in a resilient manner in order to meet the definition of "member." This is a resilient-in-use interpretation. The second possibility is that Judge Hubel meant that the device must simply have the capacity to resile, not that it actually resile in use. Both options are supported by the common definition of "resilient." See Merriam-Webster's Collegiate Dictionary (11th ed. 2005) 1060 (defining "resilience" as "capable of withstanding shock without permanent deformation or rupture" and "tending to recover from or adjust easily to . . . change").

Claim two reads in relevant part, "[a] method for anchoring in bone a member and attached suture, comprising the steps of: . . . deforming the member in a manner such that the member resiles against the portion of the bone that defines the hole. Legaard Decl. in Supp. Pl.'s Markman & Summ. J. Br., Ex. 1 at 10 (emphasis added).

Though Judge Hubel did not explain what he meant, his opinion indicates that he intended the resilience-in-use interpretation. Referencing the patent specification, he stated "the [invention] would be inoperable as described if it was not formed of a resilient material." See Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1378 (Fed. Cir. 2006) ("the specification is the single best guide to the meaning of a claim term"). Logically, if resilient material is required for the device to operate as described, then that material must actually perform its distinct function--resiling. It is inconceivable that the capacity for resilience alone is the difference between an effective and ineffective device as described in the patent.

There is also support for the resilience-in-use interpretation in the Federal Circuit's Ethicon opinion. Upon review of the district court's various rulings, the Circuit concluded the '557 patent "is directed to an anchor with resilient legs that open and resile after the anchor is pushed into the cancellous bone, lodging the anchor against the cortical layer." Smith & Nephew, Inc. v. Ethicon, Inc., 276 F.3d 1304, 1312 (Fed. Cir. 2001). The Circuit also referenced a statement made by Dr. Hayhurst during the prosecution of '557 where he distinguished his invention from prior art on the basis that '557 encompasses devices that attach to bone through resilience. Id. at 1309.

Though framed differently, in its briefing Smith & Nephew raises the doctrine of claim differentiation in opposition to a resilient-in-use interpretation. As between independent claims, the doctrine of claim differentiation acts as a "presumption that each claim in a patent has a different scope." Curtiss-Wright Flow Control Corp., 438 F.3d at 1380 (quoting Versa Corp. v. Ag-Bag Int'l Ltd., 392 F.3d 1325, 1330. In this context, it is a "guide, not a rigid rule." Id. at 1381 (internal quotation marks and citation omitted). As a general matter, this doctrine is relevant where a proposed construction renders "additional, or different, language in another independent claim superfluous." Id. (internal quotation marks and citation omitted). However, it cannot be used to "broaden claims beyond their correct scope." Id. (internal quotation marks and citation omitted).

Smith & Nephew argues the doctrine of claim differentiation is triggered here because interpreting "member" as an anchor that is resilient-in-use renders claim two's specific reference to resiling and claim six and seven's reference to a "deformable
member" superfluous. I disagree. As the Federal Circuit explained in Curtiss-Wright, "a patentee may define the same subject matter with claims having different terminology." Id. at 1381. Thus, even though the resilient-in-use interpretation may diminish the differences between the claims, that fact does not mean the interpretation is wrong.

Further, I find that the words used in the latter set of claims are not rendered completely superfluous because, when read as a whole, those claims more specifically define the manner in which the resiling must occur than do the more general claims, like claim one. For example, unlike any other claim, claim two specifies "the member [must] resile[] against the portion of the bone that defines the hole." Interpreting "member" as a device that "return[s] to or tend[s] to return to a prior or original position in a manner that contributes, at least in part, to the lodging of the member in the hole" does not render claim two's specific method of resiling meaningless. Likewise, when read as a whole, claims six and seven describe a unique method for accomplishing resiling. And to the extent there is some overlap between "deformable member" and "member" defined as a device that is resilient in use, I conclude this is necessitated by the patentee's formulation of his claims.

Additionally, as Judge Hubel said, it is clear from the patent specification that the distinguishing characteristic of Dr. Hayhurst's invention is that it is a device that resiles in bone. Thus, Smith & Nephew's argument that "member" includes both resilient and non-resilient devices based on the different language used in the various claims would inappropriately broaden the scope of the invention as contemplated by the specification. Whatever Dr. Hayhurst's motivation in including the term "deformable member" in claims six and seven, the claim language cannot be read in a manner that is inconsistent with the overall purpose and function of the invention. See id. at 1381 (vacating district court's construction that was inconsistent with "the overall context of the invention and the field of art as described in the specification"). Thus, to conclude, I find the proper interpretation of "resilience," as that term was incorporated into the definition of "member" by Judge Hubel, is that the device must resile in use.

3325

2) the word "resilient" means that "the information tab is made of material which recoils back to its original shape;"

GO BACK

3326

7. "Resilient and compressible material." Used in Claim 9 and 42.

Nike proposes "material for the support element that can be reduced in height when a force is applied by the foot (compressible), but substantially returns to the original height when the force is removed (resilient)." In their brief, Adidas proposes only a slight modification to the definition of "resilient"? "substantially returns to the original shape when the force is removed." 6 As to the term "compressible," adidas suggests "materials that can be squeezed under the loads typically experienced in use of footwear to occupy substantially less volume to provide cushioning."

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

6 Nike argues that adidas has waived the right to propose any construction for the term "resilient" because they failed to comply with P.R. 4-1 and P.R. 4-2. These rules require each party to list the claim terms, phrases, or clauses which that party contends should be construed by the court and to exchange a preliminary proposed construction of each claim term, phrase, or clause identified with the opposing party. See P.R. 4-1 and P.R. 4-2. Adidas denies that it has not complied with the rules. There is no evidence before the court to suggest that either party has not complied with the patent rules. A defendant is not required to guess what claim terms may be in dispute, and may respond to a proposal from a plaintiff. This does not mean that a defendant would have an absolute right to propose, after the deadline, terms not identified by the plaintiff.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - -

The parties admit, and the court agrees, that there is little difference between "returns to the original shape" and "returns to the original height." Other language in the claim already indicates the support elements are "vertically-projecting" between the sole and upper. The force of the foot is directed downward, toward the sole, so the other claim language already denotes
the direction of the change during compression. Accordingly, the court will use "substantially returns to the original shape."

Nike asserts that "compressible" means the material can be reduced in height. Adidas argues that it must mean the material can be substantially reduced in volume. The ’796 patent incorporates U.S. Patent No. 5,343,639 ("Kilgore"). See 796 patent, col. 2, 11. 37-40. The Kilgore patent discusses the use of compressible materials, such as foams, and compressible structures, such as a gas or fluid filled bladder. See 639 patent, col. 4, 11. 53-68; ’639 patent, col. 11, 11. 45-57. But "resilient and compressible" in Claims 9 and 42 of the ’796 patent modify "material." There is no indication in either claim or in the specification that the term refers to a compressible structure, made up of material which itself would not be compressed by the force applied by a foot (such as a spring made of steel). On the other hand, there is no indication that the volume of the material must be substantially decreased.

Adidas points to passages in the specification indicating a preference for foam type materials which are reduced in volume under compression. But a preference for one material over another in a specification is not necessarily a limit to a claim. When some materials are compressed by a force along one axis (in this case reduced along the vertical axis from the upper to the sole by pressure of the foot) they expand on other axes (for example in this case toward the medial and lateral sides of the shoe) without much reduction in total volume. There is no indication in the patent or the file that compression, as used in this patent, refers only to total volume compression. Therefore this term is defined as follows:

"Resilient and compressible material" means "a material that will change shape as force is applied by a foot, and which will return to substantially the same shape when the force is removed."

2. "Resilient"

Plaintiff argues that a "cantilevered resilient arm" is one that "is elastic enough to be pressed without being force fit downward toward the rail web and under the rail head during installation, and has a tendency to spring back to its original shape after being pressed into position." (Plf. Brief at 10). Defendants generally agree with this definition. However, they object to the proposed limitation of "without being force fit." (Def. Reply at 5). The Court agrees that this limitation should not be part of the claim.

Resilience is a physical property or characteristic. See WEBSTER'S II NEW COLLEGE DICTIONARY at 943 (defining "resilience" to mean "the property of a material that enables it to regain its original shape or position after being bent, stretched, or compressed"). It has nothing to do with any particular method of installation. The claim is silent as to how the flangeway filler device is to be installed. Indeed, there is a separate patent covering the installation process.

Plaintiff also contends that the cantilevered leg is less resilient than the cantilevered arm and is rigid enough to support the gauge insert. (Plf. Proposed Claim Constructions at 1-2). This argument is based on the fact that the claim uses the term "resilient" to describe the arm but not the leg. Of course, the entire insert is made out of resilient material. (Plf. Brief, Exh. 1, col. 1, ln. 43). The leg must therefore have some resiliency. On the other hand, the claim cannot be construed to mean that the leg is just as resilient as the arm. This would render the limitation meaningless. See Exxon Chemical Patents, Inc., 64 F.3d at 1557. It is not logical to suggest that the arm might be resilient in a different manner than the leg, since both components are made of the same material. Nor is there any basis to imply that the leg might be more resilient than the arm. This leads to only one possible conclusion—the arm is more resilient than the leg. The Court therefore construes the term "cantilevered resilient arm" to mean that the arm is elastic enough to be pressed beneath the rail head and regain its original shape and is more elastic than the cantilevered leg.

However, the Court is not convinced that the leg must be rigid enough to support the insert. The construction advocated by plaintiff is belied by the specification:

"... the leg 540 also includes a lobe 545 extending below the leg 540. It is preferred that the lobe 545 extend below the leg 540 with sufficient length to rest on the rail base 142 of the rail 140, or abut against the rail anchor 150, or both. In this manner, the leg 545 will support the gauge insert 500, or prevent the gauge insert 500 rotating, or both."

(Id., Exh. 1, col. 5, ln. 52-58). The "cantilevered leg" and the "lobe" are two different components of the gauge insert. It is
clear from the specification that the "lobe" supports the insert, not the "cantilevered leg." 3 The Court declines to incorporate this limitation into the claim construction statement.

3 Although the quoted portion of the specification states that "the leg 545 will support the gauge insert," this structure is not the "cantilevered leg" at issue in this case. The "cantilevered leg" is labeled as 540 in Figure 5 of the '662 Patent. The "lobe" is labeled as 545. (Plf. Brief, Exh. 1, Fig. 5).

BACKGROUND

Transclean is the assignee of the '080 patent, which is directed to an automatic transmission fluid changing apparatus. The fluid circulates from an automobile's automatic transmission case to a radiator and back via circulation lines. '080 patent at col. 1, ll. 6-12. The invention of the patent is designed to tap into a fluid circulation line and become part of the circulation system for the duration of the fluid changing procedure. Id. at col. 3, ll. 8-19. In that configuration, the invention collects used fluid as it circulates around and into the machine, while supplying new fluid into the circulation system. Id. Prior to the invention, such machines were not capable of matching the supply rate of new fluid to the outflow rate of used fluid. Id. at col. 2, ll. 56-68. As a result, one of two problems was likely to occur. First, if the supply rate was less than the outflow rate, the transmission could become starved of fluid, which could lead to excessive heating and damage to the transmission. Id. Second, if the supply rate exceeded the outflow rate, a buildup of internal fluid pressure could stress and damage seals in the transmission. Id. The invention aimed to solve these problems by balancing the supply rate to the outflow rate. Id. at col. 3, ll. 8-19. Claim 1, the only independent claim, reads as follows:

1. In a fluid replacing apparatus for an automatic transmission an improvement having fluid circulation inlet and outlet ports comprising:
   a fluid receiver adapted to be connected to the fluid circulation output port on said automatic transmission;
   a source of fresh transmission fluid adapted to be connected to the fluid circulation inlet port on said automatic transmission so that fluid circulates therethrough; and
   means connected to said fluid receiver and said source of fresh fluid, for equalizing the fluid flow into said fluid receiver and out of said source of fluid.

Id. at col. 8, ll. 10-23 (emphases added).

As can be seen, the claims recite a "means . . . for equalizing the fluid flow" in the manner authorized by 35 U.S.C. § 112, P 6. The specification discloses several structures corresponding to the claimed "means." According to one structure, the fluid receiver and source of fresh transmission fluid are segregated portions of the same tank, and the means for equalizing is a flexible diaphragm that defines the boundary dividing the tank into two segregated portions. Id. at figure 3. A structure with those characteristics is the subject of claim 13, which reads as follows:

13. The apparatus of claim 1 in which the means for equalizing the flow is comprised of means disposed intermediate the fluid receiver and source, said means exhibiting resilient characteristics for exerting a force, related to the pressure existing in the fluid circulation circuit of said transmission and said receiver, upon the fluid in said source.

Id. at col. 8, ll. 55-61 (emphasis added). Another structure corresponding to the means for equalizing in claim 1 is a pair of tanks, one for used fluid and one for fresh fluid charged by pressurized air. Id. at figs. 4, 6.

* * *
As for the second alleged abuse of discretion, denial of Bridgewood's motion for summary judgment of noninfringement of claim 13, Bridgewood argues that the court misconstrued the phrase "exhibiting resilient characteristics" to mean "returning to an original shape after being deformed" or "returning to its original position after being compressed." Summary Judgment Opinion 77 F. Supp. at 1087. Bridgewood contends that initial deformation of shape is inherent in the meaning of the expression and cites technical dictionary definitions in support of that contention. Under the correct construction of that expression, according to Bridgewood, the free-floating piston in its device does not "exhibit[] resilient characteristics." Moreover, Bridgewood contends that prosecution history estoppel and the all-limitations rule bar Transclean from asserting infringement under the doctrine of equivalents for that claim limitation because claim 13, in which it appears, was added during prosecution, whereas the originally submitted claims did not contain that limitation, and because vitiation of the "exhibiting resilient characteristics" limitation would result. Transclean responds that claim 13 requires only that "said means exhibit[] resilient characteristics," not that the means itself be "resilient." Transclean also cites common dictionary definitions and expert testimony in support of its view that the term "resilient" does not require initial deformation. Moreover, Transclean contends that claim 13 itself was never narrowed during prosecution and that Bridgewood's prosecution history estoppel argument was not raised in the district court and has therefore been waived.

Because we affirm the judgment of infringement of claims 1-4 and 12, we need not review the court's ultimate conclusion regarding infringement of claim 13. Bridgewood has already been held to be an infringer, and infringement of another claim does not increase its liability. See Pall Corp. v. Micron Separations, Inc., 66 F.3d 1211, 1220, 36 USPQ2d 1225, 1231 (Fed. Cir. 1995). However, to put to rest any doubts regarding the proper construction of claim 13, because the patent has not been shown to be invalid and the issue has been fully ventilated by the parties, we will address that issue. We agree with Bridgewood that the court misconstrued the term "resilient." Dictionaries, both general and technical, define the adjective "resilient" or its noun form "resilience" as encompassing that which returns to its original shape following a deformation in shape. See, e.g., McGraw-Hill Dictionary of Scientific and Technical Terms 1693 (5th ed. 1994) (defining the term "resilience" as the "ability of a strained body, by virtue of high yield strength and low elastic modulus, to recover its size and form following deformation"); American Heritage Dictionary 1535 (3rd ed. 1992) (defining the term "resilient" as "returning to an original shape or position, as after having been compressed"). The dissent, as did the district court, focuses on the word "or" in the preceding definition to support its view that the term "resilient" encompasses the returning to a position alone, without any shape deformation. We do not think that the use of the word "or" in that definition can overcome the meaning attributed to the term "resilient" by the patent's disclosure of only a flexible diaphragm dividing a tank into two chambers. See '080 patent; fig. 3; col. 4, ll. 54-55 (depicting and describing "a flexible rubber-like diaphragm").

Furthermore, to the extent there is a difference between the common and technical meanings of the terms, the term "resilient" is used in the '080 patent in a technical context to describe a component of a mechanical apparatus, and a technical dictionary is therefore a better source to inform the meaning of the term to a skilled artisan in this case. Moreover, we do not share the dissent's view that the phrase "exhibiting resilient characteristics" describes a function in a means-plus-function limitation. On the contrary, the means-plus-function limitation further defined in claim 13 is the "means for equalizing the flow" previously set forth in claim 1. Id. at col. 8, ll. 20-23, ll. 55-61. According to the claim language, the only function performed by that "means" is "equalizing the flow." The phrase "exhibiting resilient characteristics" is not a second function performed by that "means"; rather, the phrase further defines characteristics of that "means." It is therefore, appropriate, indeed mandatory under 35 U.S.C. § 112, P 6, to look to the corresponding structure in the specification to ascertain the meaning of the phrase. As already noted, that corresponding structure, "a flexible rubber-like diaphragm," '080 patent, col. 4, ll. 54-55, is "resilient" in the sense that it tends to return to its original shape, not just its original position. We therefore conclude that the phrase "exhibiting resilient characteristics" in the '080 patent requires initial shape deformation. Because the jury's finding of infringement of claim 13 was premised on a construction of that phrase at odds with ours, we vacate the judgment of infringement of claim 13.
I agree with the majority's resolution of the validity, damages, and attorney fees issues as well as its determination that the district court did not abuse its discretion in precluding Bridgewood from asserting noninfringement of claims 1-4 and 12 as a sanction for various discovery abuses. Furthermore, I agree with the majority that the district court properly granted summary judgment to Bridgewood on Transclean's trademark infringement claim. However, in my view the majority's construction of the term "resilient" in claim 13 is unduly narrow and departs from the term's ordinary meaning. Therefore, I respectfully dissent from that portion of the majority's opinion vacating the district court's claim construction and the jury's finding of infringement as to that claim.

This case asks us to decide the meaning of the word "resilient." That word is not defined in the specification. Indeed, "resilient" appears in the patent exactly once—in claim 13:

The apparatus of claim 1 in which the means for equalizing the flow is comprised of means disposed intermediate the fluid receiver and source, said means exhibiting resilient characteristics for exerting a force, related to the pressure existing in the fluid circulation circuit of said transmission and said receiver, upon the fluid in said source.

U.S. Patent No. 5,318,080, col. 8, lines 55-61 (emphasis added). Because the patentee has not chosen to be his own lexicographer in this instance, "resilient" should carry its ordinary meaning in the art. Transclean asserts that "resilient" encompasses the ability to return to an original shape or position after being compressed, while Bridgewood argues that a resilient means must be capable of returning to an original shape and position after being compressed—in other words, that it must be inherently elastic.

To help us divine the meaning of "resilient," Transclean has provided dictionary definitions of "resilient" as well as expert testimony regarding what one of skill in the art would understand the term to mean. In contrast, Bridgewood proffers definitions of "resilience" from technical dictionaries. The district court properly rejected Bridgwood's definitions of "resilience" and adopted instead the ordinary meaning of the actual claim term, resilient. The majority, based on the supposed superiority of technical dictionaries over ordinary dictionaries, prefers Bridgwood's definition.

The district court gave the word "resilient" its ordinary dictionary meaning, possessing "the capability of returning to an original shape or position, as after having been compressed." Transclean Corp. v. Bridgewood Services, Inc., 77 F. Supp. 2d 1045, 1087 (D. Minn. 1999) (quoting American Heritage Dictionary 1535 (3d ed. 1992) (emphasis added)). In other words, the broad term "resilient characteristics" can include a variety of different properties such as the ability to return to an original position after being exposed to a force, or the ability to return to an original shape after having been deformed. This meaning is in accord with the definition found in other common dictionaries. See, e.g., Websters Third New International Dictionary (unabridged) 1932 (defining resilient as "returning freely to a previous position, shape or condition: as a: moving swiftly back...b: capable of withstanding shock without permanent deformation or rupture...c: SPRINGY...") (first emphasis added); Oxford English Dictionary 714 (2d Ed. 1989) (defining resilient as "1. Returning to the original position; springing back, recoiling, etc." and "2. Resuming the original shape or position after being bent, compressed, or stretched"); Random House Webster's Unabridged Dictionary 1638 (2d ed. 1993) (defining resilient as "1. springing back; rebounding" and "2. returning to the original form or position after being bent, compressed, or stretched") (emphasis added). This meaning is in accord with the expert testimony proffered by Transclean, which explained that the patent uses the term resilient to mean "returning to the, some earlier position...or shape."

To support its proposed definition, Bridgewood cites various technical dictionaries that, supposedly, define "'resilient' or 'resilience.'" A closer examination of these sources reveals, however, that the technical definitions provided by Bridgewood in fact relate the definition of "resilience" and not "resilient." And, unlike "resilient," "resilience" generally refers to the stored energy of a strained—and typically elastic—material. For example, Van Nostrand's Scientific Encyclopedia 2673 (8th ed. 1995) defines resilience as follows: "resilience of a body measures the extent to which energy may be stored in it by elastic deformation." The Dictionary of Mechanical Engineering 314 (4th ed. 1996) defines resilience as "the stored energy of a strained or elastic material, such as in a compressed spring or in rubber dampers, which have inherent damping properties." See also Chambers Dictionary of Science and Technology 980 (1999) (defining resilience as the "stored energy of a strained material, or the work done per unit volume of an elastic material by a bending moment, force, torque or shear force, in producing strain").

The majority chooses to rely upon Bridgewood's proffered definitions of "resilience" rather than the ordinary meaning of the actual claim term, "resilient," for two reasons. First, the majority finds that technical dictionaries are generally superior to
common dictionaries. While dicta in Bell Atlantic Network Services, Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1267, 59 USPQ2d 1865, 1870 (Fed. Cir. 2001), states the view that technical dictionaries are preferred to common dictionaries, neither that case nor the case upon which it relied, Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 45 USPQ2d 1429 (Fed. Cir. 1998), involved a conflict between a common dictionary definition and that found in a scientific treatise—and neither does this case. The technical definitions are simply inapt because they define the wrong word—resilience instead of resilient. Indeed, the "common dictionaries" rejected by the majority are the only sources before the court that define both resilient and resilience, and notably, they define resilience in the same way as the supposedly superior technical dictionaries. For example, Webster's Third New International Dictionary 1932 (1993) defines resilience as follows:

1a: an act of springing back: REBOUND, RECOIL, ELASTICITY b: capability of a strained body to recover its size and shape after deformation, esp. when the strain is caused by compressive stresses--called also elastic resilience

2: the recoverable potential energy of an elastic solid body or structure due to its having been subjected to stress not exceeding the elastic limit.

(Second emphasis added.) While it may often be preferable to look to a technical dictionary or treatise to provide the technical definition of a term as understood by practitioners of a particular art, I think that preference must fade when the technical dictionary does not provide a definition of the precise term used in the claim language. Therefore, I would hold that the trial court properly adopted the common dictionary definition of "resilient" as proffered by Transclean.

The majority shores up its view of the correct meaning for "resilient" by holding that the phrase "exhibiting resilient characteristics for exerting a force" does not describe part of the function of the "means for equalizing the flow" limitation. I disagree with that holding, for it is clear to me that the "exhibiting resilient characteristics" phrase does define function. If I am correct on this point, then of course it is impermissible to define the function by reference to structure disclosed in the written description. Function must be defined by reference to ordinary principles of claim interpretation, before proceeding to determine corresponding structure. See Kemco Sales, Inc. v. Control Papers Co., 208 F.3d 1352, 1361, 54 USPQ2d 1308, 1313 (Fed. Cir. 2000). The majority does not disagree with me on this point: if the phrase in question defines function, then resort to the specification to find structure to define the function is simply wrong, and ordinary tools of claim interpretation apply.

Instead, the majority holds that the phrase in question is actually part of the means for equalizing the flow, and that resort to the specification is required to find the structure corresponding to the means limitation. Thus, from the specification the majority fetches the flexible rubber-like diaphragm, and thereupon concludes that "exhibiting resilient characteristics" must require initial shape deformation because that is the characteristic of the diaphragm.

The majority's rationale is self-destructive. If the diaphragm is indeed the structure that corresponds to the "means for equalizing the flow" limitation--as both parties and all the judges on the case agree--then the majority must come to grips with the stark fact that the jury found that the piston structure in Bridgewood's device is structurally equivalent, for § 112 f infringement purposes, to the diaphragm disclosed in Figure 3. Indeed, the case was submitted to the jury precisely to resolve disputed issues of fact on the structural equivalence of the accused piston and the diaphragm structure. No question has been raised that substantial evidence does not support the jury's verdict. Consequently, if, as the majority holds, "exhibiting resilient characteristics for exerting a force" must be understood as merely "further defining the structure of [the] means," ante at 16, there is no possible basis for disturbing the jury's verdict of infringement.

In short, the majority is wrong on any interpretation of the disputed phrase. If the phrase describes function, it must be interpreted by ordinary interpretative canons, as did the district court. If the phrase is to be interpreted as part of the means limitation, as the majority holds, then the jury verdict of infringement must stand. Either way, the jury verdict of infringement cannot properly be upset, and I respectfully dissent from the majority on this point.

G. Resilient Member

The parties do not seem to disagree as to the meaning of the words "resilient member" in Claim 4. Even if they do disagree,
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

the issue is not a difficult one. Quite obviously, the term "resilient member" means a member that is resilient. The word "resilient" should be defined as capable of returning to its original shape when deformed. The controller holders disclosed in the patent are examples of resilient members.

It may be that Plaintiff seeks to have the foregoing definition of the term "resilient member" somehow eliminate the remaining limitation in the claim. Of course, that position -- if that is what Plaintiff is arguing -- is rejected. **Claim 4 is construed to require that the accessory of Claim 1 include a "resilient member" (that is, a member capable of returning to its original shape when deformed) that is "forceable to a position which allows said receiving means to receive a video game controller, upon release of pressure on said resilient member resiliently returning to lock the video game controller in place."**

1. What Does "Resilient" Mean?

ICU contends that their construction is closely tied to the language of the patent, and is consistent with the ordinary meaning of the term "resilient." (D.I. 118, at 15.) RyMed contends their construction is supported by the Common Specification, and asserts that ICU's construction improperly allows the seal to be considered "resilient" if, "outside of its use in the invention, it could be bent or stretched and return to its original form." (D.I. 116, at 24-25.)

In the Court's view, RyMed's proposed construction is more persuasive because it mirrors the language used in the Common Specification. In contrast, ICU's proposed construction adds terms, such as "bent" or "stretched," which do not appear anywhere in the intrinsic record of the patents-in-suit. Further, ICU proposes the construction of the Braun court, which relied on the dictionary meaning of "resilient." See Braun, 344 F. Supp. at 668. Currently, dictionary definitions are not favored as a source of ordinary meaning. See Phillips, 415 F.3d 1303, 1320-23 (discussing problems with approach of Texas Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193 (Fed. Cir. 2002)). Rather, the ordinary meaning of claim terms is to be determined by reference to the context provided by the intrinsic record. Id. at 1313.

When read in the context of the intrinsic record, the Court concludes RyMed's construction is fully supported. The Common Specification states, "[u]pon removal of the syringe from spike. . . the seal 36 is free to return to its original shape," and "[t]he ability of the seal 36 to return to its original shape is determined by the resiliency of the material used to prepare the seal." ('866 Patent, col. 9:14-18.) Therefore, if a seal is made of resilient material, it is able to return to its original shape. The seal is free to return to its original shape when the syringe is removed, or in other words, when the source of compression is removed.

2. Does the Claim Language Indicate the Limitation of a "Single Sealing Structure"?

ICU contends that RyMed's proposed limitation of a "single sealing structure" is neither inherent in the claim language, nor supported by the intrinsic record. (D.I. 118, at 16.) ICU asserts that RyMed's emphasis on the article "a" in the claim language is ineffective, and that the Common Specification contemplates multi-component sealing structures. (D.I. 172, at 14.) RyMed contends there is no disclosure in the patents that two or more seals can be used to perform the specifically claimed functions, and accordingly, a single resilient seal must perform the functions. (D.I. 116, at 24.) Further, RyMed contends that this single sealing structure is disclosed as "the invention" in the preferred embodiment, and that the claims cannot have a broader scope than the embodiment. (Id. at 23.)

The Court concludes that ICU’s construction is more appropriate for two reasons. First, the claim language and Common Specification appear to contemplate multi-component sealing structures. In general, the indefinite article "a" or "an" in a patent claim means "one or more." Baldwin Graphic Sys., Inc. v. Siebert, 512 F.3d 1338, 1342-43 (Fed. Cir. 2008). "[T]his is particularly true when those words are used in combination with the open-ended antecedent 'comprising.'" TiVo, Inc. v. Echostar Commc'n Corp., 516 F.3d 1290, 1303 (Fed. Cir. 2008). When the articles "the" and "said" refer back to the same claim terms, the general non-singular meaning still applies. Baldwin, 512 F.3d at 1342. However "a" or "an" can mean "only one" when the context dictates a singular meaning. Id. at 1342-43. RyMed notes that neither the patent claims nor the Common Specification discloses more than one sealing structure. This reading is accurate, but RyMed fails to cite any context from the claims or Common Specification that supports deviating from the general meaning of the article "a." Additionally, the claim language "a resilient seal" is preceded by the open-ended term "comprising" in the '866, '862 and '592 Patent claims, thus providing further support to use the general meaning of the article "a."

Second, the contention that a "single sealing element" is the invention itself is not convincing. "Where the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent." SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1341 (Fed. Cir. 2001). As discussed above, the Common Specification does not make clear that the invention does not include multi-component...
sealing structures, and accordingly, a multi-component sealing structure should not be deemed to be a feature outside the reach of the claims. Thus, the Court concludes that "resilient seal" means "wherein, upon compression, the structure changes shape and, upon removal of the compression, the structure returns to its original shape." The Court concludes that "resilient seal element" means "a sealing structure wherein, upon compression, the structure changes shape and, upon removal of the compression, the structure returns to its original shape."

At issue in plaintiff's '648 patent is the meaning of particular phrases in a number of claims, including 16, 17, 18, 22, 29, 31, 36 and 37. The first phrase for the court to construe is found in Claim 16, as well as dependent Claims 17, 18 and 22, and reads as follows: "resilient sealing means, carried by said housing overlying said channel, for sealing said first end…" While it is clear that this is a means-plus-function claim, with the function being sealing said first end, an interpretation of "resilient sealing means" is required.

Aided by the testimony of Sheehan and Vaillancourt, the court has concluded, based upon the language in this claim and the specification (the prosecution history sheds no light on this issue), that the resilient sealing means is the septum under enough radial compression to reseal the slit therein. Support for this conclusion is as follows: First, a means-plus-function claim can only be interpreted in light of the function. The claim states that the function of the resilient sealing means is to reseal the first end of the housing. The specification teaches that radially directed forces acting upon the septum are what cause the slit to reseal. For example, column 2, lines 27-30 read as follows: "The sealing member is subjected to radially directed forces by a tapered interior surface of the first end of the housing. These forces tend to reseal the opening in the sealing member." (See also Column 1, lines 50-62). The septum by itself would not reseal the slit, or, therefore, seal the first end. Thus, the resilient sealing means must be the septum under radial compression.

This is further illustrated by Vaillancourt's testimony. Vaillancourt interpreted the phrase "resilient sealing means" as referring to the septum only. However, in later testimony, when discussing Claim 18 (a dependent claim of Claim 16), Vaillancourt interpreted the phrase "cylindrically shaped resilient member" as referring to a round septum. Taking both of Vaillancourt's definitions, Claim 18, which reads "An injection site as in Claim 16 with said sealing means including a cylindrically shaped resilient member" would mean: An injection site as in Claim 16 with said septum including a round septum. Under this interpretation of the separate phrases, Claim 18 would not make sense.

However, in interpreting the resilient sealing means to mean a septum under radial compression, Claim 18 would make sense: An injection site as in Claim 16 with said septum under radial compression including a round septum."

Plaintiff uses the phrase "resilient sealing means" inconsistently throughout the '648 patent, and it is often not clear what is actually meant by "resilient sealing means." For example, Sheehan pointed to other claims in the patent, not in dispute in this litigation, which use this phrase in a similar vein to Claim 16. Claim 1 uses "resilient sealing means," and includes the language "said sealing means including a generally cylindrical sealing member positioned in said first end…" Again, interpreting the disputed phrase as comprising the septum only would render this sentence nonsensical.

On the other hand, Claim 29 uses the phrase in a way that indicates it refers to the septum by itself. Claim 29 details the position of the sealing means, stating "means for retaining said sealing means adjacent said lip including force-applying means for urging said resealable opening to a sealed condition…" If sealing means in this claim were to indicate a septum under radial resealing compression, the sentence mentioned above would be redundant, i.e., a means for retaining the septum which is under radial compression adjacent said lip including force-applying means for resealing the slit.

Therefore, the court has looked only to the specification and specific use of the phrase in Claim 16 and its dependent claims. For the reasons stated above, "resilient sealing means" in this claim is construed to mean the septum under radial resealing compression.

GO BACK
Claims 3 and 4 refer to "resilient support members (which) support said deck member on said frame structure so as to permit at least a portion of said deck to move downwardly with respect to said frame in response to the impact force of the user's feet on said exercise surface thereby resulting in lower impact loads on the user's feet." Precor argues that this claim element is supported only by the treadmill embodiment 630 of figures 21-23. Precor argues in support of its proposed construction that the meaning of the disputed claim element "is unclear and it cannot be determined whether the claim language is supported in the specification" as required by 35 U.S.C. § 112, P 1. The Court declines to address compliance with 35 U.S.C. § 112, P 1 in the context of a Markman hearing. Life Fitness' Motion to Strike Precor's proposed construction of this disputed claim element is GRANTED.

Life Fitness in turn asks the Court to construe the phrase "resilient support members" as having its ordinary meaning. Specifically, the ordinary meaning proposed by Life Fitness is as follows: "a partly elastic and rubber-like substance that returns freely to its previous position, shape or condition, and where the elastic rubber-like portion has the characteristic of a variable change in load per unit deflection." Life Fitness' Opening Claim Construction Memorandum, p. 20.

The Court adopts Life Fitness' proposed construction, and finds that the intrinsic and extrinsic evidence is consistent with this construction. The specification of the '951 patent makes clear that the "resilient support members" at issue can be composed of a variety of materials and can appear in a variety of forms. '951 patent at col 9, line 52 - col. 10, line 3. Moreover, dictionaries and treatises available at the time of the filing date of the '951 patent provide definitions consistent with those proposed by Life Fitness. See Rodriguez Dec., Exs. S, T, U.

Regarding the resiliently biased spring means, claim 1 provides in pertinent part:

"first and second resiliently biased spring means carried on said coupling and disposed within said first and second pockets, respectively, and directed to urge an element wall against a wall of said coupling upon insertion of said element wall between said outer and inner walls ...."

The '243 patent, claim 1.

The use of the word "means" creates the presumption that § 112, P 6 applies once again. The language "directed to urge an element wall against a wall of said coupling upon insertion of said element wall between said outer and inner walls" recites the function of the spring means. The remainder of the claim does not describe a structure, but explains the relationship between the spring means and other claim elements. The language in claim 1 recites insufficient structure to rebut the presumption that § 112, P 6 applies. See Unidynamics, 157 F.3d at 1319.

The language of claim 1 requires that the spring means be "resiliently biased." The phrase "resiliently biased spring" indicates that a spring is being held in a stressed state, as distinct from a relaxed state. The claim also states that the spring is "directed to urge" the trough wall against the wall of the coupling, indicating that the spring is already under stress. ADC argues that the term should be construed as "a flexibly slanted spring." ADC's proposed interpretation renders the words "resiliently biased" meaningless and removes the qualification from the claim. The proper construction of "resiliently biased spring" is a spring that is under stress even before the trough wall is inserted into the coupler.

This construction is supported by the figures and specifications of the '243 patent. The specification describes springs "biased toward the internal walls" of the coupler. The '243 patent, at col. 3: 66. Upon insertion of the trough end into the coupling, the trough walls "force the springs away from" the internal walls. Id. at col. 4: 1-3. Figures 5-7 illustrate a leaf spring that is in contact with the opposite wall of the coupler prior to insertion of the trough wall. A sufficient amount of spring bias is required to provide adequate clamping strength to hold the trough wall.
a. "resiliently deformable sealing caps removably attached to said tubes"

"Resilient" is defined as "bouncing or springing back into shape, position, etc. after being stretched, bent, or, esp., compressed," Webster's New World Dictionary of the American Language 1210 (2d college ed. 1984), and "deformable" as "[capable of being acted on so as] to change the shape of by pressure or stress," id. at 371. Thus, centering on the language of the claim in the first instance, the ordinary meaning is a sealing cap that can be compressed by pressure or stress and still bounce or spring back into shape after the pressure is removed. Further, nothing in the specification demonstrates that the patentee acted as his or her own lexicographer so as to alter the ordinary meaning of the phrase. To the contrary, the specification's description of the "resiliently deformable sealing caps" is consistent with the phrase's ordinary meaning. See '610 Patent, col. 6, ll. 55-56, col. 34, ll. 47-63, col. 36, ll. 58-67.

Defendants' proposal to import precise numerical limitations from the preferred embodiments of the claimed invention is inappropriate. Reading numerical precision into imprecise claim terms is usually incorrect. See Modine Mfg. Co. v. U.S. Int'l Trade Comm'n, 75 F.3d 1545, 1551-54 (Fed. Cir. 1996)(importing precise numerical range from written specification into claim term "relatively small" only where patentee removed a greater range in successive patent applications and in the process explicitly informed the examiner that the smaller range represented the invention's peak range). Here, defendants' citations to the prosecution history demonstrate merely that the patentee distinguished prior art on the basis of the existence of resiliently deformable sealing caps in the claimed invention, see Defs. Markman Vol. 3 [Doc. # 645] Ex. 29 at 20, not on the basis of the precise deformable characteristics of the preferred embodiments. See Kopykake Enters., Inc. v. Lucks Co., 264 F.3d 1377, 1382 (Fed. Cir. 2001)(distinguishing prior art on the basis that it did not disclose "screen printing" demonstrated no disclaimer of claim scope with respect to any particular construction of the term "screen printing").

C. "A Resiliently Lined Yoke"

Claim 1 contains the claim term "a resiliently lined yoke." The yoke is a clamp that connects the leg support to the shoe platform. The Court construes the term "resiliently lined yoke" to mean "a yoke or clamp lined with a material that is capable of being elastically or reversibly deformed." The term requires a lining that is distinct from the yoke itself, but does not require that the lining and the yoke be of different materials.

1. The term "resiliency lined yoke"

The Court construes this term to mean:

A yoke or clamp lined with a material that is capable of being elastically or reversibly deformed. The lining must be distinct from the yoke or clamp itself, but need not be made of a different material.

This construction is essentially identical to the construction adopted in Forest Group, 2007 U.S. Dist. LEXIS 10487, at *10-11 ("The Court construes the term 'resiliency lined yoke' to mean 'a yoke or clamp lined with a material that is capable of being elastically or reversibly deformed.' The term requires a lining that is distinct from the yoke itself, but does not require that the lining and the yoke be of different materials.").

Based on the parties' briefs, it appeared to the Court that they agreed on the meaning of "resiliency." Def. Reply Br. at 10 ("There . . . is no real dispute as to the definition or meaning of 'resiliency.'"). At the Markman hearing, however, Warner asked the Court to distinguish between three types of resiliency -- resiliency with respect to stretching, bending, and compression -- and to construe the patent to cover only resiliency with respect to compression. The Court sees no reason to
limit the term "resiliency" in this way. The claim language is not so limited, and while compressible foam rubber is the only material identified specifically in the patent, '515 Pat. col. 3:16, that is not sufficient reason to construe "resiliency" narrowly.

The key dispute as to this term is over the word "lined." Forest argues that "resiliently lined" should be broadly construed to cover any yoke with an interior surface that is resilient when compared to the support member clamped within the yoke. The patent could have been drafted this way. It could have said, for instance, "a yoke that is resilient in comparison to the leg-support member." Instead, the patent describes the yoke as "resiliently lined," and nowhere in the patent is the word "lined" given the unusual meaning that Forest advocates.

In short, the patentee did not act as his own lexicographer by defining "lined" either explicitly or implicitly. See Phillips, 415 F.3d at 1316 (observing that if the specification "reveal[s] a special definition given to a claim term by the patentee . . . the inventor's lexicography governs"). The Court therefore interprets the word "lined" in light of its ordinary meaning, which is the only meaning supported by the patent's specification. In particular, the written description says that the yoke's inner surfaces "are lined with a resilient padding material 70, such as foam rubber." '515 Pat. col. 3:14-15. Moreover, Figure 4 identifies the yoke's lining as a material (item number 70 in Figure 4) separate from the body of the yoke itself.

The Court is conscious of its duty to avoid "one of the cardinal sins of patent law -- reading a limitation from the written description into the claims." SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1340 (Fed. Cir. 2001). Accordingly, the Court does not construe "resiliently lined" to mean "lined with foam rubber." But a "lining" is ordinarily distinct from the thing lined; one would hardly call the interior (or exterior) surface of a t-shirt its "lining." In adopting its construction of "resiliently lined," the Court believes that it has stayed on the correct side of the "fine line between reading a claim in light of the specification, and reading a limitation into the claim from the specification." Comark Communs. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998).

B. "resin coating"

Two aspects of this term are in dispute. The disputes require the Court to resolve the following issues: (1) whether claim 1, read in light of the specification and prosecution history, should be construed as requiring the coating to be any particular thickness and; (2) whether the resin coating must be a two-part mixture.

1. Coating Thickness

Defendants argue that this term should be construed to include a limitation requiring the thickness of the coating to be at least three times the maximum glitter particle dimension (the "3x thickness"). They acknowledge that no such limitation is included in the language of the claim. However, they contend that Nichols surrendered coatings less than the 3x thickness during prosecution and, therefore, Nichols should not now be allowed to reclaim those smaller thicknesses in order to pursue infringement claims.

Nichols presents three arguments in response. First, it argues that it is improper for the Court to read limitations from the specification and prosecution history into the claims. Second, it argues that the doctrine of claim differentiation creates a presumption against reading claim 1 so as to render it identical to claim 2. Third, it argues that the Defendants have taken the prosecution history out of context and that any thickness limitation derived from the prosecution history does not apply to claim 1.

Before addressing Nichols' arguments, the Court will first review the specification and the prosecution history. The purpose of the invention is to produce a fishing lure whose surface has a three-dimensional appearance, which is believed to make the lure more attractive to fish. ( '160 Patent, col. 2, lines 14-20.) As conceded in the patent, the application of glitter to fishing lures is not a new idea. ( '160 Patent, col. 1, lines 46-55.) Previous patents taught that glitter could be applied by dusting, sprinkling, or spraying the glitter onto the surface of a lure which had been covered with wet glue. ( '160 Patent, col. 1, lines 46-55.) According to the ‘160 patent, the problem with previously known methods of applying glitter is that the glitter particles all lay on the surface and were easily scratched off. ( '160 Patent, col. 1, lines 56-59.) Furthermore, most of
the glitter applied by this method lay flat on the surface thereby reflecting light only outwardly from the surface of the lure. ('160 Patent, col. 1, lines 59-64.)

The '160 patent purports an improvement over the prior art with its method for dispersing small glitter particles throughout a resin coating which is then applied to the lure. This method is claimed to be superior to the prior art for many reasons, but primarily because it creates the three-dimensional appearance that was lacking in previous lures.

The three-dimensional appearance is achieved by applying to the surface of the lure a resin coating that contains glitter particles which face--and thus reflect light--in many different directions. This feature is what distinguishes the '160 patent from the prior art. In other words, a lure with a coating applied in accordance with the '160 patent will not have its glitter particles facing--and thus reflecting light--primarily outward; instead, the glitter particles will face--and thus reflect light--"in a very large plurality of directions" thus imparting a three-dimensional appearance to the surface. ('160 Patent, col. 2, line 13.)

The specification further states, in the preferred embodiment, that the coating should be applied to a thickness that is at least three times the size of the glitter particles. ('160 Patent, col. 4, lines 44-46.) The specification explains why the coating must be three times the size of the glitter particles:

By the thickness of the coating being three times the maximum size of the glitter particles, the glitter particles can be oriented in all directions within the coating. Since the glitter particles are literally flat flakes, if the thickness is not three times the size of the glitter particles, the glitter particles will tend to lay flat. If the glitter particles lay flat, then the reflective effect would be two dimensional rather than three dimensional and, again, it would not give the appearance of live bait. ('160 Patent, col. 4, lines 46-54.)

What is clear from this language is that the 3x thickness is not merely an optional feature of the preferred embodiment, but a requirement crucial to achieving the object of the invention--a three-dimensional appearance. Therefore, in order to be consistent with the specification and the preferred embodiment, the term "resin coating" must be construed to mean that the coating thickness has to be at least three times the maximum glitter particle dimension. As the specification states, if the thickness is less than the 3x thickness, then the primary innovation of the invention will not be achieved.

That this construction is the correct one is also clear from the prosecution history. The language of claims 1-4 as presented in Nichols' original application is identical in all relevant aspects to the language in the final patent, including dependent claims 2 and 4 which specify that the coating thickness must be at least three times the glitter size. However, claims 1-4 were initially rejected in their entirety by the patent examiner who determined that any innovation as to coating thickness and glitter particle size was obvious from the prior art. (Examiner's Action, Jan. 17, 1992, at Strike King's Br. filed July 17, 2000 App. p. 60.) In response to the patent examiner's objection, Nichols inserted into the specification the passage quoted above to explain why the 3x thickness is not merely an obvious design choice, but is instead a patentable improvement upon the prior art:

With the [above] amendment to the specification...the particular problem being solved and the stated purpose is now clearly spelled out in the specification. If the metallic flakes are too large, they will migrate to one end of the lure body upon rotation of the lure body. Further, the thickness of the coating must be approximately three times the size of the reflective particles or otherwise the particles, which are basically flat flakes of material will have a tendency to lay flat. If the reflective particles lay flat, they do not have the three dimensional effect and will not appear as live bait.

(First Amendment, Mar. 23, 1992, at Strike King's Br. filed July 17, 2000 App. p. 68.)

Nichols points out that this response to the patent examiner's objection addresses two elements: glitter particle size and coating thickness. It argues that the glitter particle size discussion is directed at the allowance of claim 1 and the thickness discussion is directed at allowance of claim 2; therefore, the 3x thickness is applicable only to claim 2 and should not be construed as a limitation on claim 1.

The Court finds this an unconvincing attempt to parse the language of the amendment. Nichols' characterization of the prosecution history avoids the very construction that was offered in order to overcome the examiner's objections. The word "further" linking the two elements is used in the conjunctive sense and not, as Nichols suggests, in the disjunctive sense.
Thus, the language of the amendment makes clear that the 3x thickness, in combination with glitter size, is necessary to achieve a three-dimensional appearance. This point is emphasized again later in the amendment:

"Because the proposed small size of the glitter particles] solves a particular problem that exists in present lures that do not reflect and disperse light in all directions, it is submitted that claims 1-6 now patently distinguish over [the prior art]. Further, none of the [prior art] references suggest the thickness of the coating would be three times the maximum dimension of the glitter particles. Again, a thickness of three times is necessary so that the glitter particles will be oriented in all directions to give a three-dimensional effect. (First Amendment, Mar. 23, 1992, at Strike King's Br. filed July 17, 2000 App. p. 69.)"

The Court concludes that the specification and prosecution history indicate that Nichols relinquished coverage of thicknesses less than the 3x thickness in response to the patent examiner's objections. The patent cannot now be construed to recapture this subject matter.

Nichols argues that imposing the 3x thickness limitation improperly reads limitations from the specifications and prosecution into the claim. This argument conflicts with established case law and the basic principles of claim construction which indicate that the specification is "always highly relevant" and that the court must reject interpretations that were disclaimed during prosecution. See, e.g., Vitronics, 90 F.3d at 1582-83; Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir. 1995). The cases cited by Nichols do not support its position. None of them stand for the proposition, as Nichols' argument implies, that the Court should ignore the clear meaning of the specification. Indeed, they all indicate that proper analysis of a disputed term includes a review of the specification. For example, in both Burke, Inc. v. Bruno Indep. Living Aids, Inc. and Johnson Worldwide Associates, Inc. v. Zebo Corp., the court did not limit the claim language because it determined, after thorough review of the specification, that the specification did not support a limited construction. See Burke, Inc. v. Bruno Indep. Living Aids, Inc., 183 F.3d 1334, 1340-41 (Fed. Cir. 1999); Johnson Worldwide Associates, Inc. v. Zebo Corp., 175 F.3d 985, 990-91 (Fed. Cir. 1999). In this case, the Court is not reading an extraneous limitation from the specification into the language of the claim; to the contrary, the Court is construing claim 1 consistently with the essential purpose of the invention and with what the patentee has unambiguously represented to the public is the proper scope of the patent.

Finally, Nichols argues that under the doctrine of claim differentiation, it is improper to read into a broader claim limitations that are present in a narrower claim. In this case, dependent claim 2 expressly includes the 3x thickness limitation, and as such, is narrower than claim 1. Thus, Nichols argues, the doctrine of claim differentiation prevents the Court from reading the same limitation into claim 1.

However, "the doctrine of claim differentiation cannot broaden claims beyond their correct scope, determined in light of the specification and the prosecution history." Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1480 (Fed. Cir. 1998). Accepting Nichols' argument would require the Court to ignore the unambiguous implication of the specification and prosecution history: that coating thicknesses less than the 3x thickness are not covered by the patent. Nothing in the cases cited by Nichols supporting the doctrine of claim differentiation permits any other conclusion. In Modine Mfg. Co. v. United States Int'l Trade Comm'n, cited by Nichols, the court in fact read into a broader claim a numerical limitation from a narrower claim, the doctrine of claim differentiation notwithstanding, because any other construction would have been inconsistent with the specification and prosecution history. See Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1551-54 (Fed. Cir. 1996). And in D.M.I., Inc. v. Deere & Co., the court, while acknowledging the importance of claim differentiation nevertheless confirmed that a patentee may not recapture ground relinquished during prosecution. See D.M.I., Inc. v. Deere & Co., 755 F.2d 1570, 1574 (Fed. Cir. 1985).

In sum, the term "resin coating" is construed to mean that the coating thickness must be at least three times the maximum glitter particle dimension.

2. Two-Part Mixture

Defendants argue that "resin coating" should include the additional limitation that the resin consists of a "two-part mixture." In support of their argument, Defendants point to several places in the specification where the resin coating is described as a two-part mixture of a liquid resin and a hardener. Plaintiffs do not address this argument except to summarily state that the limitation is not permissible because it is not present in the claim language.
The Court concludes that the resin coating claimed by the patent must be a two-part mixture. The Abstract, which is a succinct description introducing the invention, states that the glitter particles are inserted in a liquid mixture of 1) a resin and 2) a hardener. The Summary of the Invention also indicates that the resin coating is "produced by mixing a liquid resin with a hardener." ('160 Patent, col. 2, line 33.) Furthermore, the mixture apparently serves a distinct purpose important to achieving the object of the invention: the combination of the two ingredients initially produces a highly viscous liquid which facilitates the uniform distribution of the glitter particles. ('160 Patent, col. 2, lines 50-53.) After the resin coating containing the glitter particles is applied to the surface of the lure, by brushing or dipping, it eventually hardens into a solid. ('160 Patent, col. 2, lines 53-61.) The lure must be rotated during the drying period so that the glitter particles maintain their even distribution and do not migrate to one side of the lure under the force of gravity. ('160 Patent, col. 2, lines 61-65.)

The preferred embodiment describes how the coating is produced:

To produce such coating, a liquid epoxy resin and a hardener for such resin are mixed to produce a chemical reaction resulting in converting the liquid mixture into a solid by passing through a highly viscous liquid stage. ('160 Patent, col. 4, lines 5-10.)

The preferred embodiment goes so far as to suggest specific commercially-available liquid resins and hardeners.

The Court recognizes that a patent is not necessarily limited to the preferred embodiment. However, "whether an invention is fairly claimed more broadly than the 'preferred embodiment' in the specification is a question specific to the content of the specification [and] the context in which the embodiment is described." Wang Laboratories, Inc. v. America Online, Inc., 197 F.3d 1377, 1383 (Fed. Cir. 1999). In this case, the preferred embodiment describes the invention itself, at least with respect to the composition of the coating. Accordingly, Nichols is not entitled to a broader interpretation than is described in the preferred embodiment. The Court concludes that the term "resin coating" is properly interpreted as meaning a two-part mixture.

---

2. resistance assembly

Free Motion broadly defines the "resistance assembly" as "a set of parts put together to make a completed product that tends to oppose or retard motion." (Pl. Reply I at 14.) Cybex, on the other hand, narrowly defines the resistance assembly as just the weight stack and nothing else, that when assembled is capable of providing selected degrees of beneficial resistance. (Cybex Brief at xiii.) Nautilus argues that the "resistance assembly" is properly defined in specification as "a support frame 34 with vertical support members 36 aligned to support the stack of weight plates 32." (Nautilus Reply at 6 (quoting '061 Patent, col. 3, lines 31-33; and citing Bell Atlantic Network Services, Inc., v. Covad Communications Group, Inc., 262 F.3d 1258, 1269-70 (Fed. Cir. 2001) (specification properly consulted when ordinary meaning is too broad to determine scope of claim)).) 2

---

2 Nautilus argues that "resistance assembly" cannot be properly construed in light of subsequent dependent claims 6 and 7, but that if claims 6 and 7 are ignored, then alternatively, the specification definition is how the term should be defined. See (Transcript of Hearing, dated November 19, 2003, at 32, lines 17-24.)
a stack of weight plates;

one or more upright supports that align the weight plates for vertical movement;

a system of cables and pulleys, wherein engagement of the first end and/or second end of the cable, which links the first and second extension arms to the weight stack, by a user results in vertical movement of the weight plates.

('061 Patent, col. 8, lines 38-49.) Free Motion argues that under the doctrine of claim differentiation, each claim in a patent is presumptively different in scope and because Claim 6 is a dependent claim, that Claim 6 is narrower than Claim 1. (Pl. Reply II, at 4 (citing RF Delaware, Inc. v. Pac. Keystone Techs., Inc., 326 F.3d 1255, 1263 (Fed. Cir. 2003); and Slater Elec., Inc. v. Thyssen-Bornemisza, Inc. 650 F. Supp. 444, 456 (S.D.N.Y. 1986)).) The Court agrees that it is settled rule of law that narrower, dependent claims cannot be read into broader, independent claims so as to limit the scope of the latter. See DMI Inc. v. Deere & Co. 755 F.2d 1570, 1574 (Fed. Cir. 1985).

Therefore, to avoid using dependent claims to define independent Claim One, the court properly consults the specification in the brief description of the preferred embodiment of the '061 Patent to define the resistance assembly as the assembly of parts that make up the weight stack:

[A] support frame 34 with vertical support members 36 aligned to support the stack of weight plates 32.

('061 Patent, col. 3, lines 25-31.)

--- Footnotes ---

3 Referring to Figure 2 of the '061 Patent.

--- End Footnotes ---

The Court further notes that during argument, Free Motion appeared to agree with consulting the specification: "They (Nautilus) say the resistance assembly is properly construed as the weight stack meaning weight stack 124 or weight stack 12 defined in the specification as support frame 34 with vertical support members 36 aligned to support the weight stack plates, so it looks like we've basically come into agreement with respect to resistance assembly interpretation." (Transcript of Hearing, dated November 19, 2003, at 9, lines 1-6.)

8. "said protective barrier device is resistant to ultra violet, biological, and chemical degradation"

<table>
<thead>
<tr>
<th>Claim Term</th>
<th>Plaintiff's Proposed Construction</th>
<th>Defendants' Proposed Construction</th>
</tr>
</thead>
<tbody>
<tr>
<td>said protective barrier device is resistant to ultra violet, biological, and chemical degradation</td>
<td>No construction necessary -- ordinary meaning.</td>
<td>The protective barrier device comprises at least a modicum of resistance to ultraviolet, biological, and chemical degradation.</td>
</tr>
</tbody>
</table>

In support of their proposed construction, Defendants stated in their rebuttal statement and again at the hearing that the term "resistant" is unclear and requires definition as to the degree or amount of resistance. In this Court's view, to insert the phrase "at least a modicum of resistance" would be contrary to the way the instant claim term is used in the patent and inconsistent with the manner in which a person of ordinary skill in the art would understand the term. Indeed, nothing in the claims themselves or in the specification supports Defendants' proffered construction. The claim very plainly states that the
protective barrier device "is resistant to ultra violet, biological, and chemical degradation." The specification explains that "the material of the fabric preferably would be resistant to the ultra violet radiation, and to biological, and chemical degradation such as are ordinarily found outdoors" and that "[t]his invention contemplates either coating the material or utilizing material with inherent resistance to withstand these elements." Id. col. 3, Ins. 56-61. The specification goes on to set forth specific types of materials "found to be acceptable" and "sufficiently resistant." Patent '852, col. 3, Ins. 61 - col. 4, In. 3.

Were this Court to adopt Defendants' proposal, it would be impermissibly rewriting the claim by adding a term that extends beyond the words of the claims and the specification. This Court's role is to interpret, not to rewrite or redraft, the claim. Chef America, 358 F.3d at 1374. This Court concludes that a person of ordinary skill in the art would understand "said protective barrier device is resistant to ultra violet, biological, and chemical degradation." The words themselves are clear and any additional construction by the Court is unnecessary and unsupported by intrinsic evidence.

### 3343

(4) "operating in said washing tub to cause a resonance phenomena in said multi-phase washing medium"

The parties also dispute the term "operating in said washing tub to cause a resonance phenomena in said multi-phase washing medium." LG proposes construing the term to mean "operating [the vibrating disc] to cause a resonance phenomena [i.e., an increase in amplitude of oscillation due to low frequency vibration of the vibrating disc] in a multi-phase washing medium." (Chart at 16.) Whirlpool proposes instead that the term be construed to mean "vibrating a disc at a characteristic frequency to cause an observable wave pattern in the multiphase washing medium." (Id.) The Court notes, as an initial matter, that the parties agree that the term "operating" refers to the vibrating disc.

The summary of the patent states that "a low frequency vibration type washing machine in accordance with an embodiment of the present invention comprises . . . a vibrating disc placed in the washing tub for causing resonance phenomena in the multi-phase washing medium . . . ." (886 Patent, col. 2, ll. 1-6.) The background of the patent states that "[i]n order to wash clothes in a conventional automatic washing machine using low frequency vibration, a low frequency vibrating disc placed in a washing tub generates a specified low frequency vibration which causes resonance phenomena in a multi-phase washing medium in the washing tub." (Id., col. 1, ll. 16-21.) "The level of low frequency is specified in accordance with the shape of the washing tub, the shape of the vibrating disc and the mixing ratio of the multi-phase washing medium." (Id., col. 1, ll. 23-25.)

Whirlpool argues that the prosecution history supports its construction of the term "resonance phenomena" to mean "characteristic frequency" that causes "an observable wave pattern." (Def.'s Br. at 32-33.) According to Whirlpool, "the Examiner found that the German patent anticipated claim 1," and that "[t]he German patent discloses an 'oscillating element . . . which strongly vibrates the washing liquid' resulting in 'standing waves in the washing liquid.'" (Id. at 34.) LG, meanwhile, fails to identify any intrinsic evidence supporting its proposed construction of the term "resonance phenomena." The Court will therefore construe the term "operating in said washing tub to cause a resonance phenomena in said multi-phase washing medium" to mean "operating the vibrating disc at a characteristic frequency to cause an observable wave pattern in the multi-phase washing medium."

### 3344

1. '776 Patent

In the '776 patent, the last element of each of claims 1, 3, and 24 is construed to be a step or means that energizes, or turns on, a compressor in response to an increase capacity signal and deenergizes, or turns off, a compressor in response to a decrease capacity signal. The claims do not allow for energizing a compressor in response to a decrease capacity signal or deenergizing a compressor in response to an increase capacity signal.

The word "respective" in the context of the claim means "in the order given." The order given in the claim is to energize and
deenergize in response to increase capacity signals and decrease capacity signals. "Respective" links the energizing steps to the increase capacity signals and links the deenergizing steps to the decrease capacity signals. The Court adopts Dr. Rhyne's testimony that a person of ordinary skill in the art would give this interpretation to the word "respective."

In the specification, where "respective" is used many times, it also means "in the order given." See, e.g., Column 4, line 66 through Column 5, line 4. The prosecution history further supports this interpretation. See JX-776, Response, Bates Nos. 144-45, example showing that a compressor was energized only in response to an increase capacity signal and that a compressor was deenergized only in response to a decrease capacity signal.

The language in claim 1 is exemplary and states that the last step comprises "selectively energizing and deenergizing compressors in response to respective increase capacity signals and the decrease capacity signals." To understand why "compressors" and "signals" are plural, the Court examined other portions of the claims, the specification, and the prosecution history. The next to last element in each of claims 1, 3, and 24 indicates that a single increase capacity signal is generated when more compressor capacity is needed and that a single decrease capacity signal is generated when lesser compressor capacity is needed. The use of the plural "signals" in the last element of claims 1, 3, and 24 reflects a history of operation, i.e., a result of controller operation over a time interval. The Court accepts and adopts Dr. Rhyne's testimony that a person of ordinary skill at the relevant time would have so understood and interpreted the use of plural "signals" and "compressors" in the claims. Because there is no indication from other portions of claims 1, 3, and 24 whether the use of the plural in "compressors" is also a result of the same time interval or history of operation, the Court looked to the specification and discovered that the specification and disclosure indicate that a single compressor is turned on in response to an increase capacity signal and a single compressor is turned off in response to a decrease capacity signal. See, e.g., Column 4, line 66 to Column 5, line 4 states that "one of the multiple compressors" is energized in response to an increase capacity signal. The prosecution history at pp. 28-29, JX-776, Response, Bates Nos. 144-45, reflects that only one compressor is turned on in response to an increase capacity signal and one compressor is turned off in response to a decrease capacity signal. On page 30 of the same Response, JX-776, Bates No. 146, the applicant argued,

It is the independent control of each compressor of the present invention without regard to the energized or deenergized state of the other compressors in the system which makes the number of combinations of compressors available greater than the number of available compressors.

Thus the last element of claims 1, 3, and 24 of the '776 patent recites a step or means for energizing a single compressor in response to an increase capacity signal and deenergizing a single compressor in response to a decrease capacity signal.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

23 The specific languages is

providing an increase capacity signal when said operating suction pressure exceeds said upper limit and a decrease capacity signal when said operation suction pressure is below said lower limit.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

Furthermore, this last element of claims 1, 3, and 24 of the '776 patent is construed to be a step or means for energizing or deenergizing a single compressor at a time and in such a manner that compressors are turned on and off in sequence until the appropriate compressor combination to meet the load demand is eventually achieved. Thus this last element of claims 1, 3, and 24 is not so broad as to cover the situation where a specific capacity signal is generated, the controller analyzes the signal, and in response turns on the specific combination of compressors that matches the load demand without cycling through a sequence of compressors.

The claim further needs interpretation in light of the collective limitations of the words and phrases, "selectively," "in respective response," and "to provide a greater combination of compressors." In combination with other limitations of "respectively" and "to provide a combination of compressors . . .," "selectively" means energizing or deenergizing compressors according to some particular logic or criteria. Thus the claim element takes on the construction indicated supra. Support is found in the specification, Column 7, 11. 45-51, DX-119:
As described above, it will be evidence that controller circuit 10 will "cut-in" or "cut-out" the next compressor or compressor stage as above described until the combination of stages has an operating capacity closest to matching the system load, i.e., causing the system suction pressure to return to the previously established . . . range as hereinabove described and shown in FIG. 4 [emphasis added].

Similarly, the prosecution history also supports this construction. On page 30, Response, JX-776, Bates Nos. 146), the applicant was commenting upon the example provided on the prior pages which compared the operation of "the invention" to the prior art (in which the example clearly cycled through compressors until the correct capacity match was made) and explained

Successive reiterations of the FIFO strategy enables [sic] the present invention to more efficiently match the system load with the expanded set of compressor combinations available than previous systems, such as in Golber, having only a limited number of combinations available [emphasis added].

The Court accepts and adopts Dr. Rhyne's testimony that a person of ordinary skill in the art at the time would have understood and interpreted the use of "selectively" and "respective" in the claims in the '776 patent as limited with respect to choosing the optimal combination without the cycling through individual compressors until the proper combination for the needed capacity was achieved.

Aspex argues that "magnetic members respectively secured in the free ends of said arms" means "each magnetic member is connected directly or indirectly within the unattached end of an auxiliary frame arm, in a manner such that the connection is not likely to fail or give way." Ps. Br. 17. E'Lite construes this limitation to mean "magnets horizontally secured in the respective end portions of the arms." D. Br. 23.

The court's discussion of the previous claim limitations is adequate to resolve the construction of this limitation. First, for the reasons already explained, see supra at § III (D)(1), the court refrains from construing "magnetic member." For the reasons stated supra at § IV(C), the court adopts Aspex's definition of "secure," with the exception of the phrase "directly or indirectly." Also, based on the rationale of the previous section, the court construes "free end" to mean "end portion."

Last, the parties disagree over whether this disputed limitation limits the orientation of the magnetic members. As with claim 18, E'Lite contends that claim 23 requires the magnetic members to possess horizontal orientation when they are engaged. Aspex argues that limiting the magnetic members' orientation in claim 23 is improper. The parties rely on their arguments proffered with respect to the disputed limitation "first magnetic member secure thereto" of claim 18. While the court could resolve this construction dispute on the basis of its reasoning in § III(D)(4), it need not do so. In § III(D)(4) the court construes the magnetic members of claim 18 to have horizontal orientation, even though the claim language does not support this construction. The court relies on intrinsic evidence to overcome the presumption created by the doctrine of claim differentiation. Regarding claim 23, however, the doctrine of claim differentiation is inapposite. The last phrase of claim 23 states: "so that said pair of magnetic members can vertically engage corresponding magnetic members on a primary spectacle frame." D. App. 10. As discussed above, a requirement that the magnetic members engage vertically (along a vertical axis) means that the magnetic members are horizontally oriented (i.e., their surfaces form a horizontal plane when engaged). Thus in construing this limitation of claim 23 as limiting the orientation of the magnetic members to a horizontal plane, the court need not refer to other intrinsic evidence, because the language of claim 23 itself calls for this construction.

The court construes "magnetic members respectively secured in the free ends of said arms" to mean "horizontally oriented magnetic members connected in the respective end portions of the auxiliary arms, in a manner such that the connection is not likely to fail or give way." 18

--- Footnotes ---

18 For the reasons set forth supra at note 12, the court does not adopt E'Lite's proposed language of "horizontally secured" but instead employs the phrase "horizontally oriented."
In five independent claims in the '346 patent (Claims 1, 2, 6, 11 and 13), the key phrase that the parties' dispute is the scope of the term "responsive to exhaust pressure." 3 The Court starts its analysis with a review of dictionary definitions publicly available at the time the patent was issued. Intellectual Property Development, Inc. v. UA-Columbia Cablevision of Westchester, Inc., 336 F.3d 1308, 1315 (Fed.Cir. 2003); Anchor Wall Systems, Inc. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 2003 WL 21920278, *5-*6 (Fed. Cir. 2003); E-Pass Techs., Inc. v. 3COM Corp., 343 F.3d 1364, 2003 WL 21976381, *3 (Fed.Cir. 2003). The dictionary definition of "responsive" gives no indication that something that is responsive to exhaust pressure must be exclusively responsive to exhaust pressure. Rather, "responsive" is defined as "giving response," "answering," "quick to respond or react appropriately" and "sensitive." See Merriam-Webster's Collegiate Dictionary 998 (10th ed. 1996). "Response" is defined as "the activity or inhibition of previous activity of an organism or any of its parts resulting from stimulation" or "the output of a transducer or detecting device resulting from a given input." Id.

3 The phrase is used in different forms in the five independent claims: "responsive to the absence of said exhaust pressure" (Claims 1 and 13); "in response to said exhaust pressure" (Claims 2 and 11); and "responsive to said predetermined exhaust pressure" (Claim 6). See '346 patent at col. 6-8.

Defendants argue that the '346 patent was initially rejected by the PTO. They point out that the patent was subsequently approved only after the phrases "responsive to exhaust pressure" and its variants were added to the claims. As a result, Defendants contend that the claims of the '346 patent must read to include "only" as a limitation to "responsive to exhaust pressure." See Exhibit D to Defendant's Brief at pages ATT014813-14. Defendants also argue that the Peters patent (the prior art which Plaintiff had to overcome to obtain the '346 patent) used intake pressure to shut down the braking mechanism. Therefore, Defendants argue that Plaintiff has disclaimed the use of intake pressure to initiate the braking mechanism. The '346 patent, in Defendants' view, must be limited to braking mechanisms that are "only responsive to exhaust pressure." Plaintiff disagrees with this interpretation, and urges the Court to reject adding the limitation "only" before the relevant "responsive to exhaust pressure" phrases used in its patent.

The Federal Circuit Court of Appeals has recently explained the standard to be applied to Defendant's prosecution disclaimer argument. In Omega Engineering, Inc. v. Raytek Corp., 334 F.3d 1314, 1325 (Fed.Cir. 2003), the Court stated: "we have required the alleged disavowing statements to be both so clear as to show reasonable clarity and deliberateness… and so unmistakable as to be unambiguous evidence of disclaimer." The Federal Circuit reversed the district court in Omega Engineering for including a "novel negative limitation" in its claim construction. The patent at issue in that case involved laser beams used to measure infrared temperature. The patent referred to beams which Plaintiff had to overcome to obtain the '346 patent) used intake pressure to shut down the braking mechanism. Therefore, Defendants argue that Plaintiff has disclaimed the use of intake pressure to initiate the braking mechanism. The '346 patent, in Defendants' view, must be limited to braking mechanisms that are "only responsive to exhaust pressure." Plaintiff disagrees with this interpretation, and urges the Court to reject adding the limitation "only" before the relevant "responsive to exhaust pressure" phrases used in its patent.

The Federal Circuit Court of Appeals has recently explained the standard to be applied to Defendant's prosecution disclaimer argument. In Omega Engineering, Inc. v. Raytek Corp., 334 F.3d 1314, 1325 (Fed.Cir. 2003), the Court stated: "we have required the alleged disavowing statements to be both so clear as to show reasonable clarity and deliberateness… and so unmistakable as to be unambiguous evidence of disclaimer." The Federal Circuit reversed the district court in Omega Engineering for including a "novel negative limitation" in its claim construction. The patent at issue in that case involved laser beams used to measure infrared temperature. The patent referred to beams which Plaintiff had to overcome to obtain the '346 patent) used intake pressure to shut down the braking mechanism. Therefore, Defendants argue that Plaintiff has disclaimed the use of intake pressure to initiate the braking mechanism. The '346 patent, in Defendants' view, must be limited to braking mechanisms that are "only responsive to exhaust pressure." Plaintiff disagrees with this interpretation, and urges the Court to reject adding the limitation "only" before the relevant "responsive to exhaust pressure" phrases used in its patent.

The Court concludes that the plain words of the patent control. A device that has a braking mechanism responsive to exhaust pressure falls within the '346 patent, whether or not such braking mechanism is responsive to something else at the same
As mentioned above, the parties also dispute the construction of two other phrases used in element (c) of Claim 1. First, Defendants argue that the phrase "responsive to the motion of said mass" is limited by the corresponding structure for initiating the OPA. Under Defendants' view, the only corresponding structure for initiating an OPA is a bi-state mechanical switch. As such, they assert that the phrase "responsive to the motion of said mass" means "that the means for initiating operates in direct response to the movement of the mass to the position required for initiation." (Joint Mem. at 1.) As discussed above, the court is not persuaded that the claim construction of the means for initiating the OPA is limited to a bi-state mechanical switch. Therefore, Defendants' proposed construction of "initiating in direct response to the movement of the mass" is not required. Using such language would contradict the ordinary meaning of the claimed language by limiting the means for initiation to only those means of initiation that respond "in direct response" to the movement of the mass. The court finds no reason for such a limitation on the language. The ordinary meaning of "responsive" is not equivalent to "in direct response."

Second, Defendants' proposed construction of the phrase "in excess of a predetermined threshold value" stems from its argument that Claim 1 is limited to bi-state electro-mechanical sensors only. (Defs.' Br. at 18.) Defendants' proposed construction would limit the phrase to mean "a predetermined amount of acceleration [that] is needed to overcome biasing force applied to the mass." (Joint Mem. at 1.) This narrow construction is not required. The ordinary meaning, as understood by a person having ordinary skill in the art, of the phrase "in excess of a predetermined threshold value" is not limited as Defendants suggest.

The second term in dispute is "rest position." The '079 Patent teaches that the proper configuration in which to determine whether the distal ends are substantially parallel to the longitudinal axis of the catheter is "in at least one rest position of the catheter." (Col. 3, lines 19-20.) Defendants argue that the term "rest position" should be construed as "a position where the catheter is motionless." (Def. Mem. at 18) Defendants go on, however, to argue that this elusive "rest position" can "only occur when the catheter is outside of the patient's body," and is limited to the time period prior to insertion because after it is removed, "the catheter has no medical significance and it is discarded." (Def. Mem. at 18, 21.) Plaintiffs argue that the proper construction of "rest position" is "a position assumed by the catheter when it is not being used to circulate fluids." (Pl. Mem. at 18.) Both proposed constructions are flawed.

The plain meaning of "rest," as defined in the dictionary, is the "freedom from, cessation of, or absence of labour, exertion, or activity … Absence, loss, or cessation of motion." Shorter Oxford English Dictionary 2552 (5th ed. 2002); accord The American Heritage Dictionary 1486 (4th ed. 2000) (defining "rest" as the "cessation of work, exertion, or activity …. Termination or absence of motion"). Again, upon a cursory review defendants' proposed construction -- absent the proposed requirement that the catheter be outside a patient's body prior to insertion -- more closely tracks the plain meaning of the term "rest."

Once again, plaintiffs' proposed construction improperly attempts to import limitations from the specification into the claim. See Ecolab, 264 F.3d at 1367; Transmatic, 53 F.3d at 1277-78. Plaintiffs' argument that the catheter is in a rest position at all times other than when it is "being used to circulate fluids" attempts to import from the specification the explanation that the "invention … [is] used for the circulation of at least one fluid between a cavity of a patient's body and a means for circulating this fluid such as a fluid perfusing and/or extracting means." (Col. 1, lines 7-10.) This and similar language found elsewhere in the specification is not found in the claim with respect to the "rest position" of the catheter. In fact, the claim speaks about the catheter's proximal end being "adapted to be connected to a means (9) for circulating fluid" (Col. 3,
However, it is proper to impose the limitation that rest position must be determined prior to the time the device is removed from the body (not represented)" (emphasis added).

For example, at Col. 1, lines 19-20, it states that the catheter is "intended to be placed in a cavity of a patient's body outside the body, prior to insertion." (Tr. at 47.) The Court has no evidence to dispute this contention, and therefore there is no reason to impose an additional limitation on "rest position" at this time.

Further, even when read in light of the specification, plaintiffs' proposed construction is improper. The specification of the '079 Patent teaches that the distal ends of the catheter move "like a sail parallel to the wind" when "placed on the axis of fluid flow" (Col. 2, line 48), and that the "agitation and flexion of these end portions considerably reduces the risk of clogging substances being deposited on the surfaces of the perfusing and/or extracting channels with which these end portions are equipped." (Col. 2, lines 52-55.) Plaintiffs admit that this "agitation and flexion" is the "essential function that makes [the catheter] inventive, that's important about it and solves the problems of the prior art … it is the essence of the invention" (Tr. at 34), and it is this constant "agitation and flexion" when placed on the axis of fluid flow that is antithetical to the plain meaning of the word "rest" as the absence of motion or labor.

Plaintiffs argue that the "agitation and flexion" of the distal ends caused by fluid flow is simply "passive" movement, and therefore not labor or work. (Pl. Mem. at 3-4.) Since the plain meaning of "rest" encompasses both the absence of motion and the absence of work, plaintiffs argue, their proposed construction is not contrary to the plain meaning of "rest." See Texas Digital, 308 F.3d at 1203 ("If more than one dictionary definition is consistent with the use of the words in the intrinsic record, the claim terms may be construed to encompass all such consistent meanings."); see also Brookhill-Wilk, 2003 U.S. App. LEXIS 6960, 2003 WL 1868650, at *5 (same). Plaintiffs' argument, however, is premised on too narrow a view of "work."

Reading the claim in light of the specification, it is clear that the catheter protected by the '079 Patent is not only working when it is actively exchanging fluid, but is also working to prevent obstruction when it undergoes the "agitation and flexion" that is the self-proclaimed "essence of the invention." (Tr. at 34-37.) See Webster's Third New International Dictionary Of The English Language 2634 (Unabr. 1993) (defining "work" as "sustained physical or mental effort valued as it overcomes obstacles and achieves an objective or result"). In this case, the sustained effort is the "agitation and flexion" of the distal ends, the obstacle is the "risk of clogging substances being deposited on the surfaces of the perfusing and/or extracting channels," and the objective or result is that the catheter is "practically not subject to obstruction." (Col. 2, lines 57-55; see also Col. 1, lines 29-31 ("One object of the invention is to obtain a catheter having a risk of obstruction by clogging that is substantially reduced relative to the known catheters."); Tr. at 31 ("The object of the invention … is to make sure that this catheter doesn't clog up.").) Plaintiffs' artificial distinction between self-locomotion and "passive" movement is not supported in the claim or the specification. Moreover, it is inconsistent with plaintiffs' own proposed construction, as any "work" done by the catheter when it is "circulating fluid" is caused by an external force, i.e. "a means for circulating this fluid such as a fluid perfusing and/or extracting means." (Col. 1, lines 8-9.) Therefore, in this case, "work" and "motion" are synonymous, and plaintiffs' proposed construction of "rest position" as limited to those times when the catheter is "being used to circulate fluids" is improper.

Defendants' proposed construction is also mistaken when it seeks to limit the catheter's rest position to one where the catheter is "outside of the patient's body" and prior to insertion. While there appears to be some evidence in the specification that "rest position" should be construed as a position outside of the body, there are no temporal or functional limitations expressed in the claim itself. See Ecolab, 264 F.3d at 1367; Transmatic, 53 F.3d at 1277-78. At the Markman hearing, plaintiffs claimed that "there is no factual basis to assume that the [catheter] is never motionless for a particular moment in the body." (Tr. at 47.) The Court has no evidence to dispute this contention, and therefore there is no reason to impose an additional limitation on "rest position" at this time.

--- Footnotes ---

7 For example, at Col. 1, lines 19-20, it states that the catheter is "intended to be placed in a cavity of a patient's body" (emphasis added), and at Col. 1, lines 66-67 it states that the catheter is "intended to be placed inside a cavity of a patient's body (not represented)" (emphasis added).

--- End Footnotes ---

However, it is proper to impose the limitation that rest position must be determined prior to the time the device is removed.
from a patient. The claim itself states that the invention is a "multilumen catheter." (Col. 2, line 65.) Once the catheter is removed from a patient's body, it is no longer a "multilumen catheter," or any other viable medical device. Rather, it is medical waste, as the following colloquy at the Markman hearing demonstrates:

Court: Isn't it essentially medical waste and useless after it's taken out of the body?

Plaintiffs: Well, no, I don't think so.

Court: Could you reuse it?

Plaintiffs: Well, you can reuse almost any medical device, your Honor. I don't think that any of the companies would sell them for that purpose ….

(Tr. at 48-49.) Therefore, this Court construes "rest position" as "a position in which the catheter is motionless prior to being removed from a patient."
to indicate position in close proximity with," and "used as a function word to indicate a source of attachment or support," and do not require the "in contact with" language on which Defendants rely. Id. (emphasis added).

The plain language of the claim states that the burner must be "resting on" the base, not "in contact" with the base, as Defendant suggests. Further, each embodiment of the invention disclosed in the '061 patent includes a burner (Fig. 2) held in a support (Fig. 3). The support and the burner are placed within the base (Fig. 4) of a flask. The patent discloses that the burner is resting on the base because it is supported by the base. To require a construction that the burner be in contact with the base is unsupported and inconsistent with the disclosure of the patent.

3351

3. "Peripheral portions of the plate being restrained from movement relative to an interior portion of the plate in a direction substantially perpendicular to a major axis of the shoe"

This claim term has been referred to as "relative restraint," and it causes the deflection feature discussed below. Both parties agree that the first part of this claim term is properly defined according to its plain and ordinary-meaning. Akeva proposes a construction for "restrained from movement relative to an interior portion of the plate" as "a plate portion is restrained from movement as compared to a portion that is closer to the center of the plate." (Akeva's Markman Br. at 13.) adidas proposes separate constructions of various components of this phrase: (1) "restrained" should mean "prevented from doing something"; (2) "movement" should mean "change of place or position"; and (3) movement "relative to" should mean movement "of one body or point with respect to another body or point that is regarded as fixed." (adidas' Markman Br. at 14.) There is no substantive difference between the parties' definitions thus far. The parties also agree that "a major axis of the shoe" is the heel-to-toe axis.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

6 The restraint and deflection terms are connected by the phrase "so that" and should be understood together to mean that the restraint feature functions in a certain manner "so that" the deflection can occur in a certain manner.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

The dispute centers on the phrase "in a direction substantially perpendicular." The crux of the disagreement is whether this includes the vertical direction. Akeva argues that this should be construed as "either the horizontal (medial-to-lateral) or vertical directions," while adidas argues it should be construed as only the "medial-to-lateral direction." 7 adidas contends that the term should be limited by the prosecution history because the patent examiner defined the term as the lateral-to-medial direction to distinguish it from a prior art reference and allow the claims.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

7 In summary, Akeva proposes that this term, in its entirety, be construed to mean "a plate portion is restrained from movement as compared to a portion that is close to the center of the plate in either the horizontal (medial-to-lateral) or vertical directions." adidas proposes that the term mean "the peripheral portions of the flexible plate are prevented from changing their place or position in the medial to lateral direction with respect to an interior portion of the plate."

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

The court must begin its construction with the plain and ordinary meaning. The dictionary definition of "perpendicular" used as an adjective in this context of a physical direction 8 is "being or set at right angles to a given line or plane." Webster's Third New Int'l Dictionary 1684 (1986). adidas points out that the '300 Patent's specification discusses relative restraint only twice. The first statement teaches that "housing 580 acts as a reinforcement for limiting or eliminating lateral movement of the flexible member 560 during use." '300 Patent, col. 11, 11. 20-23. The second statement teaches that "each of the above-described flexible members may be made integral with the rear sole support, which . . . limits the lateral displacement of the periphery of the flexible member upon deflection." Id., col. 12, 11. 47-52. These statements reference only lateral movement, but they do not redefine the restraint term nor do they disclaim or disavow any coverage of other
types of movement of the flexible member. Thus, the specification contains no evidence to show the plain and ordinary meaning should be rebutted.

8 The dictionary contains an additional definition of a physical direction related to the horizon and outdoor observation. This definition is inappropriate in the context of a patent over an athletic shoe where a given line is explicitly referenced.

The only portion of the prosecution history before the court is the examiner's Notice of Allowability. In this notice, the examiner stated:

This language has been interpreted as the restrained direction being the direction perpendicular to the major axis, i.e., the major axis is that axis which runs from the toe of the shoe to the heel of the shoe and the direction perpendicular to such is the direction medial to lateral direction and allows the interior portion of the plate to deflect relative to the peripheral portions in the perpendicular/vertical directions, i.e., a direction perpendicular to the major axis.

(adidas' Markman Br. Ex. G. at 2 (emphasis added).) She continued that a prior art reference by Tong did not include this feature, and, in fact, the Tong shoe did not include any restraint of the peripheral portions in the medial-to-lateral direction. (Id. at 2-3.) Also, it provided "no guidance as to how the interior of the plate reacted in reference to the periphery of the plate." (Id.) The examiner concluded that the Tong reference must feature a plate that moved as a single element, functioned as "a supporting element, not a flexible deflective member," and did not feature any concave or convex sections on its upper surface. (Id. at 3.). She also described the Tong reference as having a wave shape that "allowed the plate to expand horizontally/in a direction along the major axis of the shoe, instead of vertically, i.e., in a direction substantially perpendicular to a major axis of the shoe' as claimed [in the '300 Patent]." (Id.) For these reasons, the '300 Patent overcame the Tong reference.

The doctrine of prosecution history estoppel may limit a claim term where the prosecution history (or "file wrapper") shows the patentee made "express representations . . . to the examiner to induce a patent grant." Standard Oil Co. v. American Cyanamid Co., 774 F.2d 448, 452 (Fed. Cir. 1985). "Such representations include amendments to the claims and arguments made to convince the examiner that the claimed invention meets the statutory requirements of novelty, utility, and nonobviousness." Id. Statements like this would exclude from the definition of claim terms any subject matter that was "disclaimed or disavowed during prosecution in order to obtain claim allowance." Id. Estoppel also results when "arguments made during prosecution . . . show a clear and unmistakable surrender of subject matter." Bayer AG v. Elan Pharm. Research Corp., 212 F.3d 1241, 1251 (Fed. Cir. 2000) (internal quotations omitted). However, not all changes will result in estoppel. Changes are often made during a patent's prosecution, and "[a] non-substantive change or a change that did not in fact determine patentability does not create an estoppel." Pall Corp. v. Micron Separations. Inc., 66 F.3d 1211, 1219 (Fed. Cir. 1995). If the examiner relies on a concession or argument to establish patentability over prior art, this "is a substantive position on the technology for which a patent is sought, and will generally generate an estoppel." Id. at 1220. On the other hand, "when claim changes or arguments are made in order to more particularly point out the applicant's invention, the purpose is to impart precision, not to overcome prior art." Id. In the latter case, no estoppel is presumed and the issue must be examined on its facts. Id.

In this case, it does not appear that estoppel is warranted because the examiner was clarifying an aspect of the invention without intending to limit it. She merely describes the features of the Akeva patent that distinguish it from the Tong reference. Whether or not the examiner was relying on an argument made by the patentee to overcome this prior art reference, there is no indication that she amended the claims to conform to a limited interpretation of the direction of relative restraint. Also, there was no need to limit the direction of relative restraint to only the medial-to-lateral direction in order to establish patentability. If the Tong reference discloses an interior plate that does not feature any relative restraint, as the Notice of Allowability concludes, then the '300 Patent could disclose a plate wherein the periphery and interior moved separately in any direction, so long as separate movement was claimed. This would be enough to overcome the Tong reference. Moreover, if the examiner had excluded the vertical direction in regard to relative, restraint, this would create a problem for one of the allowed claims of the '300 Patent. Claim 192 includes a relative restraint feature wherein the plate portion is "restrained from movement in a substantially vertical direction. " '300 Patent, col. 28, 11. 45-47 (emphasis added).
Excluding the vertical direction would render this claim invalid.

Finally, the language of this notice is not clear enough to effect an estoppel. The first reference to the perpendicular direction discusses relative restraint and states "the direction perpendicular to such is the . . . medial to lateral direction." (adidas' Markman Br. Ex. G. at 2.) When the examiner discusses the deflection feature, however, she talks about the vertical direction. For instance, she concludes that the Tong reference's shape "allowed the plate to expand horizontally . . ., instead of vertically, i.e. [. ]' in a direction substantially perpendicular to a major axis of the shoe." (Id. at 3 (emphasis added).)

Akeva argued at the Markman hearing that "a. major axis of the shoe" is used in regard to the direction of relative restraint, while "the major axis of the shoe" is used in regard to the direction of deflection. This would mean that the latter comment about the vertical direction is made in reference to relative restraint, even though it appears to discuss deflection. Whether or not Akeva is correct about the examiner's reference, the court is unwilling to find estoppel based on this language.

Prosecution history estoppel is generally only found based on express statements or an unmistakable surrender of subject matter. Without a more direct statement by the examiner or the patentee regarding the meaning of this perpendicular direction, the court cannot find the scope of the term "perpendicular" in reference to the relative restraint term to be limited to the medial-to-lateral direction.

Thus, the term "peripheral portions of the plate being restrained from movement relative to an interior portion of the plate in a direction substantially perpendicular to a major axis of the shoe" should be construed as "the peripheral portions of the flexible plate are prevented from changing their place or position as compared to a portion that is close to the center of the plate in any direction that is substantially at a right angle to a heel-to-toe axis of the shoe, including the medial-to-lateral and vertical directions." 9

--- Footnotes ---

9 This definition does not include restraint in a direction along a heel-to-toe axis of the shoe, or parallel to such axis.

--- End Footnotes ---

3352

3. "Restraining means" "Restraining member" and "Restraint"

With respect to these terms, the parties dispute (1) whether they should be construed to include the location at which the restraining means is positioned, and (2) whether the construction should include an isothermal limitation. For the reasons previously set forth, the Court rejects Gore's proposed construction to the extent it includes the isothermal limitation.

With respect to the position of the restraining means, the asserted claims generally are silent on this point. (See, e.g., '957 Patent, claims 1-3, 5-7.) In other claims, Jervis expressly provides for a specific position. Furthermore, as Medtronic notes, one such claim expressly contradicts Gore's proposed construction. (Compare '957 Patent, claim 10 (memory alloy element is within restraining member) with '957 Patent, claim 14 (restraining means is within hollow memory alloy element).) Similarly, where Jervis required that the temperature be above the austenite start temperature, he expressly included such a requirement in the claims. (See, e.g., '957 Patent, claims 10, 18.) Medtronic thus argues that the presumption of claim differentiation should apply to these claims.

In general, the doctrine of claim differentiation recognizes "that different words or phrases used in separate claims are presumed to indicate that the claims have different meanings and scope." Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361, 1369 (Fed. Cir. 2007) (quoting Karlin Tech. Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971-72 (Fed. Cir. 1999)). Thus, there is a presumption that "[t]o the extent the absence of such difference in meaning and scope would make a claim superfluous, … the difference between claims is significant." Id. (quoting Tandon Corp. v. U.S. Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed. Cir. 1987)). That presumption may be overcome, however, by the written description of the patent or its prosecution history. Id. Here, Gore has offered no argument in opposition to Medtronic's claim differentiation argument. Furthermore, although the position of the restraining means and the austenite start temperature are not the only differences in the claims, the Court has examined the claims in light of the specification, and finds no reason why the presumption of claim differentiation should not apply.
The Court also has reconsidered its tentative construction of these terms, as they are used in the '141 Patent, and concludes that Medtronic's proposed construction should be adopted as to all patents in which the terms are used.

Accordingly, the Court construes the terms "restraining means," "restraining member," and "restraint" to mean: "a device that prevents the transformation of the shape memory alloy element back into its original shape."

The court adopts CVE's construction. First, GK's construction, which is not offered as the "ordinary meaning" given to this term, reads out the word "resultant" and does not account adequately for the word "vibratory." (R.56, Ex. A, DeEuilius Reb. Decl. P6.) See Innova/Pure Water, Inc. v. Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1119 (Fed. Cir. 2004) ("all claim terms are presumed to have meaning in a claim.") Rather, as DiEuliis testified, a person of ordinary skill in the art would understand GK's proposed language--"force having direction and magnitude"--to define a vector force, and nothing more. (R.67, Ex. 2, Markman Tr. 32.) CVE's construction, on the other hand, accounts for those direction and magnitude components by using the term "vector force," while also giving meaning to the words "resultant" and "vibratory." See Merck & Co. v. Teva Pharms. USA, Inc., 395 F.3d 1364, 1372 (Fed. Cir. 2005) ("A claim construction that gives meaning to all the terms of the claim is preferred over one that does not do so.") And its inclusion of the object upon which the force acts--the vibratory trough of a conveyor--is consistent with claim 5 itself, which recites that the "resultant vibratory force [is] supplied to said conveyor trough." ('763 patent col. 7 lin. 57-58.) Indeed, even the portion of the specification that GK cites to support its definition refers to "the resultant force acting on the conveyor." ('763 patent col. 3 lin. 67-col.4 lin 2.) Finally, DiEuliis's testimony, which is entitled to some weight, supports CVE's construction based on how a person of ordinary skill in the art would understand the term.

At the Markman hearing, GK's only challenge to CVE's construction was its use of the phrase "in three dimensional space." (Markman Tr. 46-51.) Relying on the drawings in the specification, GK contended that the forces acted only in two dimensions. But DiEuiliis clarified that in an actual machine some residual forces would apply to the trough in all three dimensions, (id. at 69), and GK does not challenge that contention in its post-hearing brief. Accordingly, because CVE's construction is derived from and consistent with the claim language and the specification, and because it reflects DiEuiliis's understanding of the term, the court adopts CVE's construction.

The court adopts CVE's construction. First, GK's construction, which is not offered as the "ordinary meaning" given to this term, reads out the word "resultant" and does not account adequately for the word "vibratory." (R.56, Ex. A, DeEuilius Reb. Decl. P6.) See Innova/Pure Water, Inc. v. Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1119 (Fed. Cir. 2004) ("all claim terms are presumed to have meaning in a claim.") Rather, as DiEuiliis testified, a person of ordinary skill in the art would understand GK's proposed language--"force having direction and magnitude"--to define a vector force, and nothing more. (R.67, Ex. 2, Markman Tr. 32.) CVE's construction, on the other hand, accounts for those direction and magnitude components by using the term "vector force," while also giving meaning to the words "resultant" and "vibratory." See Merck & Co. v. Teva Pharms. USA, Inc., 395 F.3d 1364, 1372 (Fed. Cir. 2005) ("A claim construction that gives meaning to all the terms of the claim is preferred over one that does not do so.") And its inclusion of the object upon which the force acts--the vibratory trough of a conveyor--is consistent with claim 5 itself, which recites that the "resultant vibratory force [is] supplied to said conveyor trough." ('763 patent col. 7 lin. 57-58.) Indeed, even the portion of the specification that GK cites to support its definition refers to "the resultant force acting on the conveyor." Accordingly, because CVE's construction is derived from and consistent with the claim language and the specification, and because it reflects DiEuiliis's understanding of the term, the court adopts CVE's construction.

- 3933 -
A. Relevant Claim Language

The final portion of Claim 1 consists of the following language: "retain at least 2.0% and no more than 3.0% phosphorous by weight of fabric." ('545 Patent, col. 8, Ins. 42-44).

B. Parties' Positions

Defendants argue that element (c)(ii) means: "after uniform treatment, the fabrics have at least 2.0% and no more than 3.0% phosphorous by weight of fabric and continue to have at least 2.0% and no more than 3.0% phosphorous by weight of fabric after exposure to the 5 Wash/24 Hour Boil." (Defs.' Construction at 27). Defendants support this argument by explaining that the ordinary meaning of "retain" is to "keep" or "hold," which therefore must mean that the fabric "keeps" or "holds" the relevant level of phosphorous "both before and after the 5 Wash/24 Hour Boil procedure." (Defs.' Construction at 28-29). Notably, in order to explain their construction, Defendants needed to use the phrase "both before and after," whereas the language in the claim only uses the word "after." Defendants go on to argue that the specification emphasizes the need for the fabric to be comfortable and flexible, and that a user's concern would be how the garment feels throughout its useful life, not just at the end of its useful life. (Defs.' Construction at 29-30). However, broader ideas such as a customer's primary concerns need not be considered when the claim language is clear. In the claim language itself as well as in the specification, the 2.0% to 3.0% quantity of phosphorous is always described as existing "after" the wash and boil process.

Plaintiffs object to Defendants' insertion of the word "before" when the inventors "specifically elected to use only the term 'after' in the claim." (Pls.' Rebuttal at 19). According to Plaintiffs, this portion of the claim means: "whatever the level of phosphorous is before the wash and boil procedure, at least 2.0% and no more than 3.0% phosphorous by weight must be in the fabric after the wash and boil procedure." (Pls.' Rebuttal at 24).

C. Court's Construction

Plaintiffs concluded in their rebuttal, "The claim language cannot be any clearer that the only relevant phosphorous level is that after the wash and boil procedure." (Pl.'s Rebuttal at 20). We agree. The requirement that the fabric retain a certain amount of phosphorous refers solely to the state of the fabric after the wash and boil procedure, without any reference to the level of phosphorous existing before the procedure.

6. "retainably removing"

In construing this term, the defendants suggest that the claims at issue, claims 35 and 145 of the '930 patent and claims 20 and 26 of the '180 patent, use "retainably removing" to disclose only the "robotic arm" embodiment. Accordingly, they argue that the court should define the term in accordance with the "robotic arm" discussion in the specification. '930 Patent, col. 14, 1. 33. Crane asserts that this is not the case, and that imposing such a limitation would unduly read out the "cup embodiment."

The court agrees with Crane. Although each claim is not required to claim every embodiment, the structure of claims 35 and 57 in the '930 patent suggests that the claims are broader than the defendants contend. Claim 35 is an independent claim and requires "retainably removing." Claim 57, which depends from claim 35 (and therefore requires "retainably removing" as well), reads as follows:

57. The vending machine of claim 35, including release means cooperatively connected with said container holding means and activatable by said beverage container capture means for releasing by gravity a selected container from said container holding means to said beverage container capture means. (emphasis added).

The language of claim 57 requires "releasing by gravity," an action whose compatibility with "grasping and lifting" is not
apparent. Accordingly, the court is unwilling to construe the term in the limiting manner proposed by the defendants..

The court, however, does not find Crane's construction helpful. Crane's construction simply rearranges the terms. As suggested by Crane's recent statements made during reexamination of the '930 patent, "retainably removing" involves a level of control not disclosed by the prior art reference to the '930 patent. See Ex. 4 to SVA's Resp. at 77.

For these reasons, the court defines "retainably removing" as "removing the container from the container holder into the carriage frame assembly in a controlled manner."

2. retained within

P&M construes "retained within" to mean "holding at least a portion of." (Pls. Opening Mem. at 14-15.) Rose Art maintains that this term should be construed to describe "a reservoir pen formed with a nib of absorbent material being held in place or position inside of the 'housing' (i.e., the cylindrical structure that covers the pen)." (Def. Pre-Markman Hr'g Br. at 18.) Rose Art contends that "retained within" should not be construed so as not to require that the entire pen is encased by the tubular housing. (Def. Pre-Markman Hr'g Br. at 19.)

As discussed in detail above, the claim language of the '886 patent cannot be construed to exclude the fig. 8 embodiment. Accordingly, the Court cannot adopt a construction of "retained within" which requires that the reservoir pen be entirely encased within the housing. Vitronics, 90 F.3d at 1583-84. That being said, there is nothing particularly ambiguous about the term "retained within." An examination of the clear language of the claim makes it readily apparent that the term "retained within" describes a reservoir pen which is at least partially held inside of the housing. There is nothing in the specification which would require the Court to deviate from that construction. Consequently, the term "retained within" is construed to mean "holding at least a portion of." Since the entirety of the intrinsic evidence with regard to this term is not ambiguous, the Court did not consider the extrinsic evidence submitted by the parties with respect to this term.

1. Construction of "Retainer"

The parties dispute the meaning of the term "retainer". Plaintiff Lisle seeks to construe "retainer" to mean "any of various devices used for holding something." Defendant A.J.'s proposed construction is much narrower: "a collar or ring rotatably affixed over the surface of the hollow tube for locking the tabs of the c-shaped wrench disc into position." (Pl. Ex. D) Lisle's proposed construction comes from Webster's Ninth New Collegiate Dictionary; A.J.'s proposed construction is derived from the drawings and references in the patent, specification, and prosecution history. Plaintiff's proposed construction benefits from a "heavy presumption" in that claim terms carry their ordinary meaning to a person of ordinary skill in the relevant art.

The critical distinction between the two parties' positions is whether the retainer described in the claim must be separate from the tube. Under Lisle's construction, the claim would permit the retainer to be either a separate piece or a permanent fixture. A.J.'s construction of the claim would limit the patent to devices that contain a separate piece as a retainer.

The claim itself does not specify whether the retainer must be separate, although the preferred embodiment of the claim does demonstrate a separate retainer. The Federal Circuit consistently warns that "claim terms are [not] limited to the embodiment disclosed." Teleflex, 299 F.3d at 1326. In some cases, though, "the preferred embodiment is … the invention itself." See Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1551 (Fed. Cir. 1996). For a variety of reasons, this is not such a case.

In the '776 patent, the preferred embodiment contains a separate retainer that is invariably referred to as a "retainer ring", "retainer collar", or just "ring" throughout the description of the invention. From a review of the specification and the
prosecution history, though, it is apparent that the invention covers both a separate retaining ring and a permanent retainer built into the tool.

From the manifest language of the claim, it is clear that the invention consists of at least two component parts: (1) a C-shaped insert with outwardly projecting tabs; and (2) a hollow tube with a retainer for engaging the C-shaped insert at one end and "means for cooperation with tube rotation means at the opposite end." (Pl. Ex. A at col. 4, lines 16-28). In prosecution of the patent, the application was rejected twice on the grounds of obviousness in light of two French patents. One of these, the Gross patent, combined inserts with both hexagonal and tubular wrenches to make the wrench have broader applicability. The other, the Koralek patent, revealed a wrench with a single tab to hold the insert in place. To overcome these patents, Lisle represented to the Patent and Trademark Office (PTO) that it was the retaining structure, not merely the insert or the tabs, that differentiated the '776 patent invention from the prior art.

Defendant A.J. asserts that Lisle's representation that "one cannot simply combine a C-shaped insert with a tubular wrench" (Pl. Ex. F at LIS 000870) must mean that their invention requires a retainer to be separate from the C-shaped insert and the tubular wrench. A.J. removes this language from the context of the prosecution history, however. In the paragraph containing the above quoted language, Lisle continues "It takes structure to make it work … The teaching of Gross does not disclose or suggest structure that enables use of a C-shaped inserts with a tubular wrench." (Pl. Ex. F at LIS 000870). From this language, it is clearly not the separateness of the retaining structure that differentiates the '776 patent from the prior art. Rather it is a retaining structure that accommodates a C-shaped insert with a tubular wrench that differentiates it from the prior art. This is the clearest statement in the prosecution history regarding the differentiation of the '776 patent from the prior art that the PTO believed was most relevant to the present claim, and it does not specify the separateness of the retaining structure.

Although A.J. insists it is not trying to limit the '776 patent to the preferred embodiment, that would be the precise result of adopting their proposed construction. A.J.'s proposed construction of the term "retainer" is much too narrow. A.J. asserts that the consistent reference to "retainer collar" or "retainer ring" must mean that the retainer is a collar or ring separate from the hollow tube. There is no reason to so limit the claim language. A collar or a ring could either be separate or permanently affixed. Indeed, men's shirt collars were once always separate and now they are nearly always affixed. A.J.'s proposed construction would needlessly cabin the '776 patent into a three separate piece invention consisting of a tube, a C-shaped disc, and a retainer.

The Court finds that Lisle's proposed construction of the term "retainer" is consistent with the language, specification, and prosecution history of the '776 patent. The term "retainer" in the '776 patent is construed to mean: any of various devices used for holding something.

According to A.J., the district court erred by giving the term "retainer" its ordinary and accustomed meaning, arguing that the '776 patent specification repeatedly refers to a "retainer" as a rotatably-affixed collar or ring, and thus limits the scope of that claim term. A.J. asserts that the term "retainer" should have been construed to mean a "collar or ring rotatably affixed over the surface of the hollow tube." On the other hand, A.J. contends that the district court erred by not applying the ordinary and accustomed meaning to the limitation "said retainer being detachably cooperative with the tabs to rotate the disk and a tie rod engaged therewith." For that limitation, A.J. proposes the alternative construction that the "retainer and tabs work together to disengage to rotate the disc and a tie rod interlocked therewith," which it believes more accurately reflects the grammatical structure of the claim language.

We affirm the district court's construction of the term "retainer." There is no basis for limiting the scope of the term "retainer" to the rotatably-affixed retainer ring shown in figure 7 of the '776 patent, as advocated by A.J. An object of the patented invention is to provide a single tool that can be used on many different tie rod configurations, '776 patent, col. 1, ll. 56-68, and it is clear from the context of the patent that the retainer facilitates that objective by permitting the body of the tool to engage and disengage wrench discs, e.g., id. at col. 3, l. 39-col. 4, l. 6. Tellingly, the patent does not place any significance on using a separately-affixed rotating-retainer component as shown in figure 7, but, instead, broadly states that the retainer's configuration and shape may be varied. E.g., id. at col. 4, ll. 8-9. Thus, we will not give the term "retainer" the narrower claim construction that A.J. proposes.
{a. "Retainer Assembly"

Claims 31-32 and 37-41 require a "retainer assembly having a retainer mechanism configured to overlap each of said holes and slots and retain said bone engaging fastener[s] extending through said holes and slots." Claim 86 requires "a retainer assembly for retaining said heads of said number of bone engaging fasteners within said at least one first opening and said at least one second opening."

The parties dispute whether "retainer assembly" has an ordinary meaning understood by persons skilled in the art. A general dictionary defines "assembly" as the parts to be fitted together to make a whole. Webster's New World Dictionary Third College Edition 82 (1988). "Retainer" is defined as a device that keeps an object in a fixed state or condition. Id. at 1145. "Retainer assembly" is not defined, but combining the two definitions yields "parts to be fitted together to make a whole device that keeps an object in a fixed state or condition."

--- Footnotes ---

1 The Court finds it appropriate to consult a general dictionary because expert testimony cited by Plaintiff does not show experts in the field would attach a specialized meaning to the term "retainer assembly," or that they would attach "no meaning at all" to the term. Irdeto Access, Inc. v. Echostar Satellite Corp., 383 F.3d 1295, 1300 (Fed. Cir. 2004). The testimony shows experts believe the term is generic and is not commonly understood, but they attach some meaning to it.

Federal Circuit precedent is unclear whether it is appropriate to consider expert testimony, which is extrinsic evidence, at this stage. The court has often repeated the principle that extrinsic evidence may not be used to alter a claim construction dictated by intrinsic evidence. See, e.g., On-Line Techs., Inc. v. Bodenseewerk Perkin-Elmer GmbH, 386 F.3d 1133, 1139 (Fed. Cir. 2004). However, Irdeto Access apparently permits extrinsic evidence to determine if a term has an "accepted meaning in the art." 383 F.3d at 1300.

The Court does not rely on extrinsic evidence here, but considers only the claim language, the specification, and a general dictionary. "A dictionary is not prohibited extrinsic evidence, and is an available resource of claim construction." Vanguard Prods. Corp. v. Parker Hannifin Corp., 234 F.3d 1370, 1372 (Fed. Cir. 2000).

--- End Footnotes ---

The specification reveals "retainer assembly" is intended to encompass an elongated washer extending along the length of the plate. The specification states, "[t]he retainer assembly includes a washer having at least one tapered aperture." (Litovsky Decl. Ex. A at col. 3 Ins. 48-49 (emphasis added).) Also, the specification shows the retainer assembly is "for an elongated plate." (Litovsky Decl. Ex. A at col. 3 ln. 47.) Finally, the specification describes "a retainer assembly 33 positioned along axis L." (Litovsky Decl. Ex. A at col. 6 Ins. 36-37 (emphasis added).) The number "33" corresponds to figure 1 of the 786 Patent, which shows item 33 is a washer extending lengthwise from one end of the plate to the other.

To limit the definition of "retainer assembly" only to a washer, however, would conflict with the ordinary meaning of "assembly," which requires more than one part. Reading the claim language in light of the specification, "retainer assembly" refers to (1) a device that retains all of the bone engaging fasteners and (2) a separate device that attaches the retaining device to the plate.

In the specification, the retaining assembly is embodied as (1) a washer with apertures and (2) locking screws extending through the apertures to attach the washer to the plate. This embodiment is consistent with the Court's definition, but it would be improper to read the aperture and locking screw limitations into the claim language. See Liebel-Flarsheim, 358 F.3d at 904.

GO BACK}
C. "and retainer means comprising at least one protrusion molded into the surface of the central portion of the lid opposite said access strip"

Claim 1 of the '015 patent recites a "retainer means comprising at least one protrusion molded into the surface of the central portion of the lid opposite said access strip." The parties have raised the issue of whether this element should be construed as a means-plus-function element under 35 U.S.C. § 112 P 6. The Federal Circuit has examined § 112 P 6 in several cases and has established guidelines for determining its applicability. In deciding whether a claim limitation is a means-plus-function limitation, the "use of the word 'means' creates a presumption that § 112, P 6 applies." Personalized Media, 161 F.3d at 703. However, a limitation that uses the word "means," but does not recite a function that corresponds to the means, does not invoke § 112, P 6. See Rodime PLC, 174 F.3d at 1302. Likewise, even when a limitation does recite a function, if it also recites sufficiently definite structure for performing that function, then § 112, P 6 does not apply. See id.

Here, the "retainer means" limitation uses the word "means" and therefore is presumed to invoke § 112, P 6. Moreover, the claim language recites the corresponding function of "being shaped and located to capture and releasably maintain said access strip in the open position." However, the claim does recite some structure for performing the claimed function. Claim 1 states that the "retainer means" comprises "at least one protrusion molded into the surface of the central portion of the lid opposite said access strip." The magistrate judge concluded that one skilled in the art would understand the term "at least one protrusion molded into the surface of the central portion of the lid opposite said access strip" to connote sufficiently definite structure to rebut the presumption that § 112, P 6 applies. See Bailey I, 980 F. Supp. at 572-73. The question now raised is whether my acceptance and adoption of the magistrate judge's decision to depart from the presumption that § 112, P 6 applies was clearly erroneous.

I look to the case law for guidance. In Cole v. Kimberly-Clark Corp., the Federal Circuit interpreted the following claim phrase involving removable training pants for toilet training toddlers: "perforation means extending from the leg band means to the waist band means through the outer impermeable layer means for tearing the outer impermeable layer means for removing the training brief in case of an accident by the user." 102 F.3d 524, 531 (Fed. Cir. 1996). The Federal Circuit held that the quoted clause failed to satisfy § 112, P 6 because it described the structure supporting the tearing function (i.e. perforations) and because it describes the location (extending from the leg band to the waist band) and extent (extending through the outer impermeable layer) of the structure Id. The Federal Circuit concluded that "an element with such a detailed recitation of its structure, as opposed to its function, cannot meet the requirements of the statute." Id. Similarly, in Rodime PLC, the court held that the claim element "positioning means for moving said transducer means between the concentrically adjacent tracks on said micro hard-disk" fell outside of the means-plus-function format because the claim went on to provided a detailed description of the structure, its location and its interconnection with the structural sub-elements. 174 F.3d at 1303-04. Likewise, in Enviro Corp. v. Clestra Cleanroom, Inc., the Federal Circuit held that because the term "baffle" in the "baffle means" element connotes some degree of structure and the claim provided additional details as to the location and formation of the structure, the § 112, P 6 presumption was overcome. 209 F.3d 1360, 1365 (Fed. Cir. 2000). See also AMP, Inc. v. Fujitsu Microelectronics, Inc., 853 F. Supp. 808, 820 (M.D. Pa. 1994) (interpreting "bus solder tail means" to fall outside means-plus-function format because the words "bus solder tail" described a specific structure).

Not every recitation of structure, however, removes the claim element from the means-plus-function format. For example, the Federal Circuit held that the claim phrase "spring means tending to keep the door closed" is insufficient structural language to take the limitation out of the ambit of the construction dictate of § 112, P 6. See Unidynamics Corp. v. Automatic Products International, Ltd., 157 F.3d 1311, 1319 (Fed. Cir. 1998). The court held that the word "spring" was the only recitation of structure in the claim and alone could not rebut the presumption created by the word "means." See also Nilssen v. Motorola, Inc., 80 F. Supp. 2d 921, 928 (N.D. Ill. 2000) (term "source means having AC terminals and being operative to provide AC voltage thereat" did not recite sufficient structure to remove claim from the presumed ambit of § 112, P 6); Loral Fairchild Corp. v. Victor Company of Japan, Ltd., 906 F. Supp. 798, 808 (E.D.N.Y. 1995) (holding the term "sink charge means" and additional claim language identifying the location of the sink charge means do not provide sufficient structure to overcome the presumption). Moreover, when the recited structure sets forth only what the recited means does, rather than what it is structurally, the claim is properly interpreted under § 112, P 6. See Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1536 (Fed. Cir. 1991) ("The recitation of some structure in a means plus function element does not preclude the applicability of section 112(6) [when it] merely serves to further specify the function of that means").
Upon consideration of the case law, I determine that "retainer means" element recites sufficient structure to overcome the presumption that § 112, P 6 applies. The words of the claim, "comprising at least one protrusion molded into the surface of the central portion of the lid opposite said access strip," state with sufficient specificity the structure (at least one protrusion molded into the surface) as well as the location of the structure (central portion of the lid opposite said access strip). Based on the Federal Circuit's decisions in Cole and Enviro Corp., I conclude "an element with such a detailed recitation of its structure, as opposed to its function, cannot meet the requirements of the statute." Cole, 102 F.3d at 531.

Because the "retainer means" element does not qualify for § 112, P 6 treatment, it is not limited to the structure corresponding to the claimed function as "described in the specification and equivalents thereof." 35 U.S.C. § 112, P 6. Instead, I will construe the claims pursuant to standard claim construction rules.

The thrust of the dispute between the parties is the construction of the claim element "at least one protrusion." Bailey contends that "at least one protrusion," to one skilled in the art, simply means what it says, specifically one or more structures that protrude. Dart, on the other hand, contends that the term "at least one protrusion," when properly construed, means at least one protrusion, excluding a vent cap, and some other structure.

At first blush, the term "at least one protrusion" would appear to have a plain and straightforward meaning. "The common and ordinary meaning of the word protrusion to one skilled in the art . . . is something which protrudes. The verb protrude means to project or 'to jut out from the surrounding surface. Furthermore, the common and ordinary meaning of the words 'at least one' includes a retainer means comprised of only one protrusion." Bailey I, 980 F. Supp. at 575. The magistrate judge found no indication that Bailey intended to accord any special meaning to the claim element. After reviewing the matter again, I withdraw my previous acceptance of the magistrate judge's conclusion on this point.

The claims and specifications of the patent indicate that the term "protrusion" has a more narrow meaning than the meaning assigned to it by the magistrate judge. See Vitronics, 90 F.3d at 1582 ("It is always necessary to review the specification to determine whether the inventor has used any terms in a manner inconsistent with their ordinary meaning"). The magistrate judge determined that the term "protrusion" includes all structures that "jut out from the surrounding surface." Bailey I, 980 F. Supp. at 575. Such a definition would also include "vent caps." However, the use of the word "protrusion" throughout the patent claims and specifications demonstrates that a "protrusion" is a distinct structure from a "vent cap."

First, the word "protrusion" is used in contradistinction to the term "vent cap" in the claims of the '015 patent. It is axiomatic that "[a] word or phrase used consistently throughout a patent claim should be interpreted consistently." See CAE Screenplates Inc., 224 F.3d at 1317 (quoting Phonometrics, Inc. v. Northern Telecom, Inc., 133 F.3d 1459, 1465 (Fed. Cir.1998)). In addition to claim 1, the word "protrusion" appears in dependent claims 9 and 10. Claim 9 states:

The container lid of claim 1 wherein said retainer means comprises a pair of spaced apart protrusions molded into the surface of the central portion of the lid opposite said access strip; said protrusions being spaced and shaped to capture and releasably maintain said access strip in the open position therebetween.

'015 patent, col. 6 (emphasis added). Claim 10 states:

The container lid of claim 1 wherein said retainer means comprises the combination of a vent cap and at least one protrusion molded into the surface of the central portion of the lid, each said protrusion being spaced from the said vent cap to define a trough therebetween, each said trough being located and being of a size and shape to capture and releasably maintain said access strip in the open position.

'015 patent, col. 6 (emphasis added). While claim 9 does not mention the term "vent cap," claim 10 does. The latter describes a retainer means comprising "at least one protrusion" and a "vent cap." Here, in context, it seems plain that a "protrusion" is a distinct structure from a "vent cap." If a "vent cap" were merely a structure included in the more generic category of "protrusions," then such a relationship would be best expressed by denoting a "vent cap" and "at least one other protrusion." Put simply, the interpretation of "protrusion" advanced by Bailey in claim 1, in which a "vent cap" is a type of "protrusion," when applied to claim 10 would render that claim superfluous with respect to claim 9. See Mycogen Plant Science v. Monsanto Co., 243 F.3d 1316, 1329 (Fed. Cir. 2001) ("To the extent that the absence of [a] difference in meaning and scope would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference
between claims is significant") (quoting Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed. Cir.1987)).

Similarly, the specifications consistently distinguish between a "protrusion" and a "vent cap." The first embodiment of the retainer means is disclosed in figures 1 and 2 of the '015 patent. The specification recites that in those embodiments the "retainer means (30) comprises the combination of molded-in vent cap (33) and a protrusion (32), each rising above the surface of the central portion (12)." '015 patent, col. 4, l. 13-16. While this confirms the distinction between the structures "molded-in vent cap (33)" and "protrusion (32)," it also emphasizes that "each rises above the surface of the central portion" (emphasis added). In other words, the '015 patent recognizes that not all structures that rise above the central portion are "protrusions." Thus, one skilled in the art would construe the '015 patent to create two distinct structures, namely a "vent cap" and a "protrusion," even if they share the feature of rising above the surface of the container lid.

Having determined that "at least one protrusion" does not include a "vent cap," I next turn to the question of whether the term "at least one" means that Bailey has claimed a retainer means comprising only one protrusion, or whether the retainer means element, in fact, requires "at least one protrusion" and some other structure in addition. Again, the term standing alone suggests that a retainer means consisting of only one protrusion is claimed by the '015 patent. See Bailey I, 980 F. Supp. at 575 ("The common and ordinary meaning of the words 'at least one' includes a retainer means comprised of only one protrusion"). However, at the hearing on this matter the parties presented experts who offered vastly different opinions concerning the manner in which this element would be interpreted by one skilled in the art. Interestingly, however, both experts relied on much of the same prosecution history in reaching their opposite conclusions. After re-examining the matter, including a more probing examination of the prosecution history of the '015 patent, I conclude that one skilled in the art would understand the retainer means of claim 1 to require "at least one protrusion," and some additional structure.

--- Footnotes ---

7 Claim 1 of the '535 application mentions a "vent hold." After reviewing all the evidence presented, I conclude that one of the ordinary skill in the art would understand the word "hold" to be a typographical error, and that the intended term was "vent hole." The specification of the '535 application discuss a "vent hole," and the figures depict the "hole."

--- End Footnotes ---

On January 7, 1976, Bailey filed the '212 application, which was a continuation-in-part application of the '535 application. Exhibit 5, p. D1. The purpose of a continuation-in-part is to permit an applicant to add new information and data to his/her application, while retaining the benefit of the earlier filing date for what was in the original application. See Waldemar Link, GmbH & Co. v. Osteonics Corp., 32 F.3d 556, 558 (Fed. Cir.1994) ("A [continuation-in-part] application can be entitled to different priority dates for different claims. Claims containing any matter introduced in the [continuation-in-part] are accorded the filing date of the [continuation-in-part] application. However, matter disclosed in the parent application is entitled to the benefit of the filing date of the parent application"). See also Manual of Patent Examining Procedure § 201.08 (6th Ed., Rev. 3, 1997) ("A continuation-in-part is an application filed during the lifetime of an earlier nonprovisional application by the same applicant, repeating some substantial portion or all of the earlier nonprovisional application and adding matter not disclosed in the said earlier nonprovisional application") (emphasis in the original). Comparison of the '535 application with the '212 application reveals the new matter that Bailey added in the '212 application consisted of descriptions and drawings of a retainer means. Claims 9 through 12 related to the new retainer means disclosure of the '212 application. Exhibit 5, p. D17-D18. Those claims state:

9. The container lid of Claim 1 including retainer means to capture and releasably maintain said tear strip in the open position.

10. The container lid of Claim 9 wherein said retainer means in integral therewith.
11. The container lid of Claim 9 wherein said retainer means comprises a pair of spaced apart protrusions molded into the surface of the central portion of the lid opposite aid tear strip; said protrusions being spaced and shaped to capture and releasably maintain said tear strip in the open position therebetween.

12. The container lid of Claim 9 wherein said retainer means comprises the combination of a vent cap and at least one protrusion molded into the surface of the central portion of the lid, each said protrusion being spaced from said vent cap to define a trough therebetween, each said trough being located and being of a size and shape to capture and releasably maintain said tear strip in the open position.

Id. Claim 9 recites a generic retainer means in means-plus-function format. Claim 10 adds that the retainer means is "integral therewith." Claim 11 recites a retainer means with a "pair of spaced apart protrusions." Claim 12 discloses a retainer means comprising a "vent cap and at least one protrusion." The '212 application does not disclose a retainer means comprising only one protrusion. The patent examiner rejected claims 1 through 10 for lack of novelty. Exhibit 5, p. D31. The only claims not rejected by the examiner were claims 11 and 12. Although the examiner did not reject claims 11 and 12, he did not allow them as stated either. Rather, the examiner objected to claims 11 and 12 and explained that they "would be allowed if rewritten in independent form containing all the limitations of the parent claims." Exhibit 5, p. D31. In other words, claims 11 and 12, which recited retainer means comprising at least one protrusion and either another protrusion or a vent cap, were allowable if written as independent claims and not dependent from rejected claim 9. On or about August 10, 1977, Bailey filed an amendment to the '212 application following its final rejection. Exhibit 5, p. D50. He amended claims 1 and 7 (neither pertain to a retainer means), although he argued that all of claims of the '212 were valid. On September 9, 1977, the patent examiner rejected Bailey's amended application. Exhibit 5, p. D60.

On October 5, 1977, Bailey filed his '445 application, which was a continuation of the '212 application. Exhibit 6, p. E1. Although there may be some variation in the scope of the claimed subject matter, a continuation application is based solely on the disclosure of a parent application. See Manual of Patent Examining Procedure § 201.07 (6th Ed., Rev. 3, 1997) ("The disclosure presented in the continuation must be the same as that of the original application; i.e., the continuation should not include anything which would constitute new matter if inserted in the original application"). By definition, a continuation application adds no new matter. More specifically, the '445 application did not recite any additional retainer means element. Indeed, comparison of the '212 application to the '445 application reveals that Bailey did not add any material to the '445 application. On August 9, 1978, the examiner rejected all the claims in the '445 application, except claims 11 and 12, the same retainer means claims to which the examiner objected in the '212 application. Exhibit 6, p. E49-E50. Again, neither claim 11 nor 12 recited a retainer means with only one protrusion. On or about September 15, 1978, Bailey appealed the final rejection of the '445 application to the Patent Board of Appeals (the "Board"). Exhibit 6, p. E52. The Board, however, sustained the examiner's position. Exhibit 6, p. E87. With respect to the rejected claims 9 and 10, which recited a retainer means in means-plus-function format, the Board wrote:

Claims 9 and 10 recite broadly retainer means to capture and releasably maintain the closure in open position. The examiner has relied on the Nicholson disclosure for its protrusion 50 as a teaching of such expedient. As broadly claimed, we see no error in such position.

Exhibit 6, p E89. On October 9, 1981, in response to the decision of the Board, Bailey filed an amendment to his '445 application. Exhibit 6, p. E92. In his amendment, Bailey cancelled claims 13, 9, and 10 of the '445 application. In their stead, Bailey wrote a new claim 15, which eventually became claim 1 of the '015 patent. It is of particular significance that, in remarks to the Patent and Trademark Office, Bailey described claim 15 of the '445 application as follows:

Claim 15, presented herein, represents a careful compositing of the subject matter of Claims 13, 9, 11 and 12 in such manner as to, at once: (1) avoid new matter; (2) provide a single independent claim which is generic to allowable dependent Claims 11 and 12; and (3) teach that subject matter of Claims 11 and 12 which the Examiner has previously held to patentably define over the prior art. Specifically, allowable dependent Claims 11 and 12 teach the retainer means as comprising at least one molded protrusion located on the central portion of the lid opposite the access strip. Each of the foregoing features and associations is explicitly recited in new independent Claim 15. Accordingly, Claims 11 and 12 have also been retained as species claims depending from said Claim 15.

Exhibit 6, E94 (emphasis in the original). On March 30, 1982, the '015 patent issued based on the amended '435 application.
Bailey now asserts that the new claim 15 in his amendment to the '445 application claims a retainer means with only one protrusion. For support, he relies upon the language of the claim, which allows for a retainer means comprising "at least one protrusion." In light of the prosecution history, however, Bailey's position is wholly unsupported. First, Bailey represented to the Patent and Trademark Office that in compositing claims 13, 9, 11 and 12 of the '445 application, he "avoided new matter." See also 35 U.S.C. § 132 ("No amendment shall introduce new matter into the disclosure of the invention"). "New matter" is matter that is a departure from or an addition to the original disclosure. See Manual of Patent Examining Procedure § 706.00(o) (6th Ed., Rev. 3, 1997); Stearn v. Superior Distributing Co., 674 F.2d 539, 544 (6th Cir. 1982). As noted several times above, none of the claims composited in claim 15 (claims 13, 9, 11 and 12) disclose a retainer means with only one protrusion. Claim 13 recites no retainer means element at all. Claim 9 recites a generic retainer means in means-plus-function format (i.e. no structure recited). Claim 11 recites a retainer means with a "pair of spaced apart protrusions." Claim 12 discloses a retainer means comprising a "vent cap and at least one protrusion." Indeed, Bailey never disclosed a retainer means with only one protrusion in any of his patent applications leading up to the issuance of the '015 patent. Therefore, a retainer means element consisting of only one protrusion would be new matter in the disclosure of the '445 application. Because Bailey represented to the examiner that he was avoiding new matter, Bailey's claim 15 could not have included a retainer means with only one protrusion. So what did Bailey mean when he wrote "at least one protrusion" if he did not mean "one or more protrusions?" For the answer, I venture further into the thicket.

Bailey also asserted to the examiner that claim 15 was "generic" to claims 11 and 12. It is well-established that a claim may be broadened by generalizing the description of structure. See Manual of Patent Examining Procedure § 806.04(d) (6th ed., Rev. 3, 1997). While a generic claim bears some resemblance to a means-plus-function claim, in that they both allow a patentee to assert broad claims, the two are not equivalent. See Enercon GmbH v. International Trade Comm'n, 151 F.3d 1376, 1384-85 (Fed. Cir. 1998) (generic claim terms should not be limited to the example disclosed in the specification absent clear redefinition of the claim term by patentee). Instead, generic claims allow all claims of species that meet the limitations of the generic claim. See Manual of Patent Examining Procedure § 806.04(d) (6th ed., Rev. 3, 1997). One common way of expressing a generic claim is to identify an element common to the several species claims. See id. ("[Generic claim] may define only an element . . . common to the several species"). Here, when Bailey represented that claim 15 was "generic" to claims 11 and 12, he was attempting to find a way of expressing those claims in a form common to both. The sole feature common to both claims 11 and 12 is one protrusion. The feature that claim 11 and 12 do not share is the structure used in combination with one protrusion to form a retainer means. Claim 11 uses another protrusion, while claim 12 uses a vent cap. However, neither of the species claims contain only one protrusion. A generic claim, therefore, cannot recite a retainer means consisting of only one protrusion. Thus, the only possible conclusion is that Bailey did not claim only one protrusion, but instead generically claimed retainer means comprising "at least one protrusion" and some other structure. 8 By asserting that his claim 15 was generic to claims for retainer means comprising at least two structures, Bailey cannot now disavow that "at least one protrusion" means a retainer means with "at least one protrusion" and some additional structure. See Southwall Techs., 54 F.3d at 1576 ("The prosecution history limits the interpretation of claim terms so as to exclude any interpretation of claim terms that was disclaimed during prosecution").

8 Moreover, Bailey represented to the Patent and Trademark Office that claim 15 teaches the subject matter of claims 11 and 12. Again, claim 15 teaches the subject matter of claims 11 and 12 only if the claim is construed to exclude a single protrusion retainer means.

3361

D. Retainer Means and Structure Described Thereafter

Dart initially assumes, without explanation, that the language "retainer means" in claim 1 of the '015 patent is expressed in a means plus function format and therefore subject to the confines of the sixth paragraph of 35 U.S.C. § 112 ("section 112, P 6"). Dart also argues that the term "at least one protrusion [emphasis added]," when properly construed, does not include a vent cap and, in particular, does not cover the vent caps in Dart's lids. In addition, Dart submits that the words "opposite [emphasis added] said access strip" ( '015 patent, col. 5, l. 32) which describe one or more protrusions, when properly
construed, do not describe or extend to cover centrally located vent caps which lie adjacent to the access strip. (Docket Entry # 46).

In reply, Bailey similarly fails to address in detail the issue of the applicability of section 112, P 6 to the claimed retainer means. Instead, Bailey generally assumes that section 112, P 6 does not apply to the retainer means language and therefore discusses the construction of the words in a manner different from Dart's construction. 15 (Docket Entry # # 49 & 78).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - 

15 It is, of course, to Bailey's advantage to forego application of section 112, P 6 to the retainer means language. Because a section 112, P 6 construction operates to limit the words in a claim to the stated and equivalent structures disclosed in the specification which perform the identical function, see In re Bond, 910 F.2d 831, 833 (Fed.Cir. 1990) ("'section 112 P 6 operates to cut back on the types of means which could literally satisfy the claim language"), Bailey's construction achieves a broader reach for the retainer means language.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - 

1. Applicability of Section 112, P 6

The last subparagraph of claim 1 of the '015 patent claims the following:

retainer means comprising at least one protrusion molded into the surface of the central portion of the lid opposite said access strip, said retainer means being shaped and located to capture and releasably maintain said access strip in the open position.

Section 112, P 6 allows an inventor to express an element in a claim as a means for performing a function without reciting the structure of the claimed element in the claim. 16 The doctrine operates as a kind of reverse doctrine of equivalents inasmuch as the structures or equivalent structures disclosed in the specification will be read into the claimed means. See Johnston v. IVAC Corporation, 885 F.2d 1574, 1580 (Fed.Cir. 1989). In order for infringement to exist when a claim contains means plus function language, "an accused device must (1) perform the identical function recited in the means limitation and (2) perform that function using the structure disclosed in the specification or an equivalent structure." Carroll Touch, Inc. v. Electro Mechanical Systems, Inc., 15 F.3d 1573, 1578 (Fed.Cir. 1993); accord King Instruments Corporation v. Perego, 65 F.3d 941, 945-946 (Fed.Cir. 1995) (setting forth similar analysis and citing Valmont Industries, Inc. v. Reinke Manufacturing Company, 983 F.2d at 1042), petition for cert. filed, 64 U.S.L.W. 3625 (U.S. March 4, 1996) (No. 95-1418).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - 

16 The statute reads as follows:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - - 

The recitation of a function together with the word "means" in a claim does not necessarily require the application of section

In the case at bar, the structural language following the words retainer means is in and of itself structural in nature. The words "protrusion [emphasis added] molded into the surface of the central portion of the lid" ( '015 patent, col. 5, l. 30-33) exist independently and apart from the described function of the retainer means. Cf. Fairchild Semiconductor Corporation v. Nintendo Company, Ltd., 1994 U.S. Dist. LEXIS 3853, 1994 WL 560607 at *4 (W.D.Wash. Feb. 14, 1994) (finding means plus function language with the term "connector means," in part, because "the structure is not known without understanding its function"). The aforementioned words do not merely "further specify the function of [the] means," Laitram Corporation v. Rexnord, Inc., 939 F.2d at 1536, which in this instance is "to capture and releasably maintain said access strip." ( '015 patent, col. 5, l. 33-35). Instead, they describe a structure, i.e., a protrusion and its location opposite said access strip. See, e.g., ZMI Corporation v. Cardiac Resuscitator Corporation, 844 F.2d 1576, 1581 (Fed.Cir. 1988).

To the extent there is any doubt, the prosecution history confirms that one skilled in the art would interpret the claims in this manner notwithstanding the language in the specification intimating the application of section 112, P 6. ( '015 patent, col. 4, l. 4-20). 17 In October 1977 Bailey filed a continuation in part application which eventually issued as the '015 patent. The original application recited four application claims involving a retainer means, application claims 9 through 12. 18 Application claims 9 and 10 incorporated prior claims and simply included added language describing a retainer means albeit without the insertion of structural language. 19 Application claims 11 and 12, however, included a more specific and more structural description of the retainer means. 20

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

17 The referenced language describes alternative means to capture and releasably maintain the access strip in its open position.

18 The original language in the specification remained essentially unchanged throughout the application process with respect to the description of the retainer means except for the substitution of "access strip" for the words "tear strip."

19 Application claim 9 claimed, "The container lid of Claim 1 including retainer means to capture and releasably maintain said tear strip in the open position."

Application claim 10 recited, "The container lid of Claim 9 wherein said retainer means is integral therewith." (Docket Entry # 60, Ex. 8).

20 Application claim 11 claimed, "The container lid of Claim 9 wherein said retainer means comprises a pair of spaced apart protrusions molded into the surface of the central portion of the lid opposite said tear strip: said protrusions being spaced apart and shaped to capture and releasably (sic) maintain said tear strip in the open position therebetween."

Application claim 12 recited, "The container lid of Claim 9 wherein said retainer means comprises the combination of a vent cap and at least one protrusion molded into the surface of the central portion of the lid, each said protrusion being spaced from said vent cap to define a trough therebetween, each said trough being located and being of a size and shape to capture and releasably (sic) maintain said tear strip in the open position." (Docket Entry # 60, Ex. 8).

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

The examiner rejected application claims 9 and 10 because it would have been obvious to employ the retainer teachings shown in a 1969 patent issued to John B. Nicholson ("Nicholson") (Docket Entry # 48, Ex. E) in the coffee cup lid claimed in a 1974 patent issued to James J. Serritella ("Serritella") (Docket Entry # 48, Ex. C) as modified by a 1968 patent issued to Henry M. Chang ("Chang") (Docket Entry # 48, Ex. D). The examiner did not, however, reject application claims 11 and 12 which, as previously noted, included the more specific, structural language describing the retainer means. Rather, the examiner objected to these application claims because they depended on previously rejected claims. He further stated that application claims 11 and 12 would be allowable if rewritten in independent form with the limitations of the parent claims.
In lieu of following the examiner's suggestion to rewrite application claims 11 and 12 in independent form, Bailey submitted a response. With respect to the issue of the retainer means, Bailey argued that Nicholson disclosed a retainer means for can tops with metallic tear strips which was inoperable in Bailey's resilient thin polymeric wares. Thereafter, however, the examiner reaffirmed his earlier decision to reject application claims 9 and 10 as unpatentable. 21

21 This court has considered that, in issuing a final rejection of application claims 13, 3 and 5, the examiner also explained that, "It would be obvious to employ the non-converging or non-intersecting tearing of Chang with the impressions of Serritella . . . The score lines of Serritella are 'substantially through' the sheet." (Docket Entry # 60, Ex. 8).

Bailey appealed the rejection and, with respect to the retainer means language, repeated his argument that Nicholson only disclosed a retainer means operable for metallic tear strips. The examiner's answer asserted, in part, that the teaching of the Nicholson retainer applied to plastic as well as to metal. The Board of Appeals of the United States Patent and Trademark Office affirmed the examiner's rejection of application claims 9 and 10. In so doing, the board noted the following:

Claims 9 and 10 recite broadly means to capture and releasably maintain the closure in open position. The examiner has relied on the Nicholson disclosure for its protrusion 50 as a teaching of such expedient. As broadly claimed [emphasis added], we see no error in such position.

(Docket Entry # 60, Ex. 8).

After losing the appeal, Bailey canceled application claims 9 and 10 and added a new, independent claim denominated as application claim 15. In addition to claiming other matter, the retainer means described in application claim 15 read as follows:

retainer means comprising at least one protrusion molded into the surface of the central portion of the lid opposite said access strip, said retainer means being shaped and located to capture and releasably maintain said access strip in the open position.

(Docket Entry # 60, Ex. 8). Application claims 11 and 12 containing the more specific, structural description of the retainer means, were made to depend from new application claim 15. 22

22 Application claims 15, 11 and 12 eventually issued respectively as claims 1, 9 and 10 in the '015 patent.

It is significant that in remarks to the United States Patent and Trademark Office ("PTO"), Bailey described application claim 15 as a generic claim which avoided new matter but nevertheless taught the subject matter of application claims 11 and 12. Bailey's remarks read, in part, as follows:

Claim 15, presented herein, represents a careful compositing of the subject matter of Claims 13, 9, 11 and 12 in such manner as to, at once: (1) avoid new matter; (2) provide a single independent claim which is generic to allowable dependent Claims 11 and 12 [emphasis added]; and (3) teach that the subject matter of Claims 11 and 12 which the Examiner has previously held to patently define over the prior art. Specifically, allowable dependent Claims 11 and 12 teach the retainer means as comprising at least one molded [emphasis in original] protrusion located on the central [emphasis in original] portion of the lid opposite [emphasis in original] the access strip. Each of the foregoing features and associations is explicitly recited in new independent Claim 15. Accordingly, Claims 11 and 12 have also been retained as species [emphasis added] claims depending from said Claim 15.
In other words, Bailey again decided not to limit the new claims to independent versions of application claims 11 and 12, as earlier suggested by the examiner. Instead, Bailey decided to add a new claim, application claim 15, which he described as "generic" to application claims 11 and 12. He also characterized application claims 11 and 12 as "species claims" depending from application claim 15.

In patent nomenclature, a generic claim and claims restricted to species are terms of art:

Claims may be restricted to a single disclosed embodiment (i.e., a single species, and thus be designated a specific species claim), or a claim may include two or more of the disclosed embodiments within the breadth and scope of definition (and thus be designated a generic or genus claim) . . . In general, a generic claim should include no material element additional to those recited in the species claims, and must comprehend within its confines the organization covered in each of the species.

Manual of Patent Examining Procedure, §§ 806.04(d) & 806.04(e) (5th ed., Rev. 15, 1994); see also In re Kroekel, 803 F.2d 705, 707 (Fed.Cir. 1986) (in separate patents, one patent may have "a broad or 'generic' claim which 'reads on' an invention defined by a narrower or more specific claim in another patent").

Consequently, in light of the rejection of the retainer means application claims which lacked the structural language (application claims 9 and 10) "as broadly claimed," Bailey framed an independent generic claim. In so doing, he imported three features from the nonobjectionable, retainer means application claims which had included structural language (application claims 11 and 12) and underlined the imported features for emphasis, to wit, "at least one molded protrusion located on the central portion of the lid opposite the access strip." Bailey then characterized application claims 11 and 12 as species claims emanating from new application claim 15. By emphasizing the structural components of the retainer means and the location of the retainer means opposite the access strip in the newly formed independent, generic claim, Bailey removed any doubt that the retainer means element in claim 1 of the '015 patent is not a means plus function clause.

The PTO issued a notice of allowance with respect to the applications claims as amended after appeal. Thereafter, on March 30, 1982, the '015 patent issued.

As previously noted, Dart argues that the term "at least one protrusion [emphasis added]," when properly construed, does not include a vent cap. The common and ordinary meaning of the word protrusion to one skilled in the art, however, is something which protrudes. The verb protrude means to project or "to jut out from the surrounding surface." (Docket Entry # 60, Ex. 13). Furthermore, the common and ordinary meaning of the words "at least one" includes a retainer means comprised of only one protrusion. One skilled in the art would also understand that the term protrusion conceivably includes a structure which juts out from the surface of the container lid including the structure identified as a vent cap in Dart's lids.

The specification fails to demonstrate any special definition accorded the term protrusion. In other words, there is no indication in the specification that Bailey intended to attach an uncommon meaning to the term protrusion. See Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1388 (Fed.Cir. 1992) (when "inventor chooses to be his own lexicographer and to give terms uncommon meanings, he must set out his uncommon definition in some manner in the patent disclosure"). The specification language cited by Dart ( '015 patent, col. 4, l. 15-16) does not explicitly define the term protrusion to exclude a vent cap. Rather, the sentence simply describes one of several embodiments of the retainer means wherein the retainer means is comprised of "the combination of molded-in vent cap (33) and a protrusion (32), each rising above the surface of central portion (12)." Claim 10 claims this more specific version of the retainer means. 23 Accordingly, Dart's construction of the terms "at least one protrusion" does not mandate partial summary judgment.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

23 The fact that claim 10 separates the term vent cap from the term protrusion does not, absent more specific language in the patent, inevitably require that a protrusion can never constitute a vent cap. Furthermore, the fact that Dart's lids may not infringe the retainer means in claim 10 does not lead to a conclusion that Dart's lids do not infringe the retainer means in claim 1.
Dart also asserts that the words "opposite [emphasis added] said access strip" ( '015 patent, col. 5, l. 32) do not describe or extend to cover centrally located vent caps which lie adjacent to the access strip. Claim 1 uses the words "opposite said access strip" to refer to the location of the one or more protrusions on the container lid which operate to releasably maintain the access strip in its open position. The more complete phrase claims "at least one protrusion molded into the central [emphasis added] portion of the lid opposite said access strip." The claimed protrusion is therefore located in the central portion of the container lid which lies opposite the access strip. Given the described location of Dart's vent cap as opposite the access strip by Bailey's expert (Docket Entry # 59, PP 24 & 69) and as adjacent to the access strip by Dart's expert (Docket Entry # 49, P 9), there is a material issue of fact as to whether the so called vent cap in Dart's lids literally infringes the limitation in claim 1 that the centrally located protrusion[s] be "opposite said access strip." 24

24 For purposes of resolving the motion for partial summary judgment, therefore, this court need not further interpret the language "opposite said access strip" at this time. As noted in Markman, the court is obligated to pronounce the meaning of disputed language within a claim. However, "This ordinarily can be accomplished by the court in framing its charge to the jury." Markman v. Westview Instruments, Inc., 52 F.3d at 981.

Dart also contends that because Bailey acquiesced to the rejection of application claim 9, he cannot now assert a broad scope to the retainer means disclosed in claim 1. The prosecution history, however, reflects that although Bailey canceled application claim 9, he also applied for a new claim, application claim 15, which he described as a composite of the subject matter taught in application claim 9 as well as three other application claims. Moreover, Bailey is not attempting to define the term retainer means as broadly as the language used in application claim 9.

Due to the different descriptions of the location of the vent cap and the way in which Dart's lids maintain the access strip in an open position, partial summary judgment is also improper with respect to whether the differences between Dart's lids and the retainer means in claim 1 are substantial. 25

25 In making this finding this court has considered Dart's arguments about the prior art, its construction of Bailey's statements to the examiner describing new application claim 15 and the reasons for Bailey's insertion of the words "opposite said access strip" into application claim 15. (Docket Entry # 46).
RTI contends that BD's construction would not only limit the patent to a preferred embodiment, but would also limit the patent to RTI's particular commercial product, the VanishPoint(R)-syringe. Dkt. No. 111 at 8-10. The construction proposed by BD would read a frictional holding force limitation into the term. RTI believes this improper because some claims do not require any engagement or holding force, much less some kind of frictional force. Id. at 10 (citing '224, 20:46-54 (claim 43)). Moreover, RTI contends that the patentee explicitly stated in some claims that frictional forces were required, raising the implication that claims without such explicit statements are not limited to friction. Id. (comparing '733, 14:32-37 (claim 1) with 17:18-21 (claim 24) and 18:38-41 (claim 36)). RTI also contends that the specification expressly contemplates embodiments that operate using something other than friction to hold the retainer member in place. Id. at 11-13. Specifically, the patents teach that the holding force used in the invention, while preferably frictional, may instead rely on tack welding, sonic welding, adhesive, or clamping forces. Id. at 12-13 (citing '733, 9:50-53, 10:4-8, 6:47-55, and 11:49-52).

RTI also believes that BD's proposed construction is improper in another regard, it requires that the retainer member and needle holder be separate parts. Id. at 16-18. While one preferred embodiment teaches that the two components are separate parts, RTI argues that there is nothing in either the claims or the specification that requires such. Id. To the contrary, an alternative embodiment suggests that the two are welded together to form a single structure. Id. at 17 (citing '733, 9:7-27). Therefore, RTI contends that--despite being two components--the patents contemplate that the retainer member and needle holder may be formed into a single structure. Id.

In response, BD contends that the specification repeatedly describes the invention as a retracting syringe in which the needle holder is engaged and released by sliding surfaces, and therefore, friction. Dkt. No. 112 at 17. BD identifies numerous points in the specification where the holding force used in the invention is identified as a frictional force. Id. at 17-18 (citing '733, 2:67-3:6, 3:11-13, and 3:61). BD also contends that the specification uses the terms 'holding force' and 'frictional holding force' interchangeably, thus demonstrating that they are intended to have the same meaning. Id. (citing Tate Access Floors, Inc. v. Maxcess Techs., Inc., 222 F.3d 958, 968 (Fed. Cir. 2000)). Moreover, BD argues that the specification criticizes syringes in the prior art that operate without friction and rely instead on flexing, breaking, or penetration. Id. at 18 (citing '733, 1:48-54, 2:18-35). Specifically, BD contends the specification asserts that the invention was new and different because it "relies entirely on clamping force or friction . . . ." Id. (quoting '733, 2:20-21).

In connection with the second issue regarding this term, that is whether the needle holder and retainer member must be separate parts, BD argues that the '733 claims suggest that the two components are inherently separate parts. Id. at 25. BD argues that a single, unitary structure cannot couple with itself or surround itself. Id. In addition, BD contends that the patent specification, specifically the Summary of the Invention, explains that the retraction mechanism has a "two part head." Id. (citing '733, 3:25-26). Finally, BD argues that melting or tacking two parts together do not make them a single part; instead, such coupling is further evidence that they are indeed two separate parts. Id. at 25-26.

b. Court's Construction

First, this Court finds that nothing in the specification requires the needle holder and retainer member be two separate parts. The specification states that in "one embodiment, the head of the holder is a two part head comprising an inner head surrounded by a separable retainer . . . ." '733, 3:19-22 (emphasis added). This statement is explicitly limited to a single, preferred embodiment, thus suggesting that other embodiments of the invention may utilize a unitary structure. Such a structure is contemplated in an alternative embodiment in which the two components are initially welded together and later "ruptured or separated." Id. at 9:7-13.

Second, this Court finds that the invention operates through the use of a frictional or clamping force, and that the retainer member must utilize these forces. Although the claims by themselves may seem broad enough to encompass other methods of operation, the patent as a whole disavows such methods and limits itself to frictional or clamping forces. The Federal Circuit has stated that where "the general summary or description of the invention describes a feature of the invention . . . and criticizes other products . . . that lack the same feature, this operates as a clear disavowal of these other products . . . ." Astrazeneca AB v. Mutual Pharm. Co., 384 F.3d 1333, 1340 (Fed. Cir. 2004), see also SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1341 (Fed. Cir. 2001) ("Where the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims . . . even though the language of the claims, read without reference to the specification, might be considered broad enough to encompass the
RTI is correct in asserting that some claims of the '733 Patent are explicitly limited to a frictional force while others do not. Claim differentiation would ordinarily require that all claims not be so limited. The specification, however, makes clear that the invention does not include the use flexing, breaking, or penetration as methods of operation. It does so by expressly criticizing other methods used in retractable syringes:

Other problems with the prior art are dependence on flexing or breaking of internal parts by the plunger in order to release the retraction mechanism and use of a diaphragm at the end of the plunger which must be penetrated by a needle holding member and spring. These structures present serious quality control and assembly problems.

'733, 1:48-54. In contrast to these less preferable methods, the specification asserts that the present invention is superior because it relies entirely on clamping or frictional forces: "The prior art has not recognized a retraction mechanism with separable parts that relies entirely on clamping force or friction . . . ." '733, 2:18-20. By distinguishing itself from the prior art in such absolute terms, the patent has limited itself to a certain type of holding force--clamping or friction.

Finally, the varied embodiments in the invention demonstrate that this holding force may be utilized in different manners within the syringe. In one embodiment, a pair of frictional holding forces function to retain the needle in the projecting position: a frictional force between the wall of the syringe and the retainer member, and another between the retainer member and the needle holder. See '733, 6:56-67, 3:8-24. In another embodiment, the needle holder and retainer member are welded or tack molded together as discussed above. See '733, 9:50-53, 10:4-8, and 11:49-52. Although this weld or tack mold holds the needle holder and retainer member together, there is still a clamping or frictional force between the wall of the syringe and the retainer member. Without this force between the wall of the syringe and the retainer member, the syringe would be inoperable--it would be unable to retain the needle in a projecting position. Thus, the retainer member can only function through the use of a frictional or clamping force.

Accordingly, this Court finds that the term "retainer member" means "a non-retractable part of the retraction mechanism that uses some clamping or frictional force to keep the needle in the projecting position until released."

The parties agree that this limitation requires one portion to keep in a particular position and further moves or pushes a second part of the cover against a portion of the separated tissue that lies over it. The disagreement comes with respect to the interpretation of "retaining."

The parties agree that "retain" means to keep in a particular position. Defendants claim, however, that this term should be construed so that it precludes any further expansion of the limited expansion portion. In this vein, defendants again seize on the word "only" at the end of the limitation ("retaining a first portion of the cover in the expanded position and further forcing a second portion of the cover against the overlying portion of the separated tissue layer to further expand such overlying portion only"). The structure of the sentence, however, is even more clear in its indication that the word "only" applies only to the overlying tissue portion. Plaintiff, asserts that the "retaining" language is meant to convey the idea that the limited expansion portion must be kept in an expanded condition. Read in context of the specification, this language again is relative, and not absolute. Therefore, the proper construction is that the limited expansion portion must be retained in the expanded condition.

The court finds this limitation to mean "keeping the first portion of the cover in the expanded position and further pushing a second portion of the cover against the portion of the separated tissue that lies over it to further expand only such overlying tissue."

- 3949 -
"Retaining Assembly Including a Cross Brace Member"

The parties' proposed definitions of "retaining assembly including a cross brace member" are set forth in Table 2.

Table 2 - Parties' Claim Constructions for Claim 92 of the '092 Patent

<table>
<thead>
<tr>
<th>Term, Patent, and Ind. Claim</th>
<th>Pl.'s Interp.</th>
<th>Def.'s Interp.</th>
</tr>
</thead>
<tbody>
<tr>
<td>retaining assembly including a cross brace member 6 member</td>
<td>Lifetime's interpretation: a &quot;retaining assembly including a cross brace member&quot; can be comprised of just a cross brace member, without more. (Lifetime's Cons. Rep. in Supp. (30) at 5.)</td>
<td>Correll's interpretation: &quot;a retaining assembly exists which has as part of its make up the cross brace member but the cross brace member by itself does not constitute the retaining assembly.&quot; (Correll's Mem. in Opp. (22) at 16-17.)</td>
</tr>
</tbody>
</table>

The only disagreement in the above proposed constructions is whether a cross brace member by itself meets this term or whether use of the words "assembly" and "including" require that the retaining assembly have other parts with the cross brace member.

The ordinary meaning of "assembly" is "a group of machine parts, especially one forming a self-contained, independently mounted unit." Webster's at 125. "Include" means "to contain, as a whole does parts or any part or element" and "to contain as a subordinate element; involve as a factor." Id. at 967.

The specification teaches that for the preferred embodiment, the retaining assembly is the cross brace member:

In one presently preferred embodiment, each of the retaining assemblies 36a, 36b comprise a cross-brace member having opposing ends and an intermediate body portion formed there between.”

(Sears Decl., Ex. A, '092 Patent at col. 13, Ins. 29-32.) This suggests that the retaining assembly can be the cross brace member alone, with nothing more.

Correll argues that allowing the preferred embodiment to apply to claim 92 is contrary to the claim language. Correll points out that the claim language uses the word "including" while, as noted above, the specification uses the word "comprise." According to Correll, because Lifetime used the word "including" and not "comprising" in the claim, the term must be construed to include structure other than the cross brace member.

A recent Federal Circuit decision is instructive on the parties' arguments because that court addressed the meaning of the terms including and comprising:

Comprising is a term of art used in claim language which means that the named elements are essential, but other elements may be added and still form a construct within the scope of the claim. The word include means the same thing. Thus, a claim reciting "a widget comprising A and B," for example, would be infringed by any widget containing A and B, no matter
that C, D, or E might be present.

Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1344-45 (Fed. Cir. 2003) (internal quotations and citations omitted) (emphasis added). This view of the meanings of including and comprising is also held by the United States Patent and Trademark Office. Manual of Patent Examining Procedure § 2111.03 (8th Ed. 2003) ("including" and "comprising" are synonyms that do not exclude additional unrecited elements, but do not require them, while "consisting of" has a different meaning that excludes additional unrecited elements.)

In the present case, using the above-underlined language from Amgen--the "widget comprising A"--the "widget" is a retaining assembly and "A" is a cross brace member. Again, following Amgen, a product need only have "A" to infringe. This leads to the conclusion that the term including is synonymous with comprising, and specifies what the element must contain, at a minimum, to read on the patent. Contrary to Correll's assertion, the claim language retaining assembly including a cross brace member means that components other than the cross brace member may be added, but are not required. Id.; see also Hewlett-Packard Co. v. Repeat-O-Type Stencil Mfg. Corp., Inc., 123 F.3d 1445, 1451 (Fed. Cir. 1997) ("including' is synonymous with 'comprising,' and other "unnamed components" are "permitted" but not required).

The specification, as discussed above, supports this conclusion. When the inventor defined the preferred embodiment of the retaining assembly as a cross brace member, the inventor was emphasizing that nothing more was needed.

Correll also argues that the prosecution history of this claim element demonstrates that, contrary to the specification and Amgen, the retaining assembly including a cross brace member must include more than just the cross brace member. Correll's view of the prosecution history, however, is mistaken. Correll is correct that the Examiner rejected this element as originally claimed--retention member--in original claim 1 because it was anticipated by a 1959 Australian Patent to Sebels. After the applicant submitted new claims, the examiner also rejected the applicant's new term for this element--retaining member--in original claims 92 and 103. Significantly, original claims 1, 92, and 103 did not contain a requirement that the table be made of blow molded plastic.

When the applicant again submitted new claims in response to the rejection, the applicant added limitations requiring: (1) a blow molded table top; and (2) that the retaining assembly include a cross brace member. The claims were subsequently allowed, and as a result, Lifetime argues the addition of the blow molded plastic element was the reason for allowance.

The treatment of another claim in the prosecution history confirm's Lifetime's argument. Original claim 72 (allowed claim 58) contains all the same elements as original claim 92, but also contains the broader term retaining assembly without requiring a cross brace member. Original claim 72 also required that the table top be made of blow molded plastic. Although original claim 72 contained the same, or broader, retaining assembly that was present in original claims 1, 92, and 103 (which did not have the blow molded plastic requirement), the examiner did not reject claim 72. This leads to the conclusion that the requirement that the table top be made of blow molded plastic was the reason for allowance for original claim 72.

Accordingly, the court concludes that the addition of cross brace member to the retaining assembly element of claim 92 was not the reason for allowance.

Based on the above, the court's construction of retaining assembly including a cross brace member is: A machine part (or parts) that acts as a whole to retain the table legs, and that may consist of only a cross brace member, or there may be other parts in addition to the cross brace member.

5. Retainer Device

As an initial matter, Aqua-Lung maintains that the term "retainer device" invokes means-plus-function analysis. 35 U.S.C. § 112(6). To determine whether a term should be so construed, the first step is to determine if the word "means" is used as its presence creates a presumption that 35 U.S.C. § 112(6) applies. Mass. Inst. of Tech. v. Abacus Software, 462 F.3d 1344, 1353 (Fed. Cir. 2006). When a claim does not use the term "means," as is the case here, treatment as a means-plus-function claim element generally is not appropriate. Id. Means-plus-function claims only go to purely functional limitations that do
not provide the underlying structure performing the function. Phillips, 415 F.3d at 1311. For example, in Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996), the court construed "detent mechanism" to refer to particular structure, even though the term had functional connotations.

That said, "a limitation lacking the term 'means' may overcome the presumption against means-plus-function treatment if it is shown that the claim term fails to recite sufficiently definite structure or else recites function without reciting sufficient structure for performing that function." Mass. Inst. of Tech., 462 F.3d at 1353 (quotation omitted). Generic terms such as "mechanism," "means," "element," and "device," typically do not connote sufficiently definite structure. Id. at 1354. In Personalized Media Commc'n's, LLC v. Int'l Trade Comm'n, 161 F.3d 696, 704 (Fed. Cir. 1998), for instance, the Federal Circuit contrasted the term "digital detector" as a whole, which recited sufficient structure to avoid 35 U.S.C. § 112(6) with "detector" by itself and other generic structural terms such as "means," "element," and "device," which did not.

Under this framework, Aqua-Lung submits that the use of the term "device" in "retainer device" is generic and invokes mean-plus-function analysis. Two Forty contends that adding the term "retainer" recites adequate structure and thereby does not implicate 35 U.S.C. § 112(6). While the term "device" standing alone connotes no more structure than the term "means," the addition of "retainer" takes this claim outside the means-plus-function realm because claim language that further defines a generic term like "device" can add sufficient structure to avoid Section 112(6). Mass. Inst. of Tech., 462 F.3d at 1354.

Use of the term in the '130 application and the '609 patent characterizes "retainer device" as something that secures the filter within the housing, thereby importing sufficient structure. See '130 application claim 12 at 37 ("said filter element is disposed between said bias exerting mechanism and said retainer device proximate said outlet opening"); '609 patent claim 15 at 20:65-67 ("a retainer device disposed within said passageway and configured to removably secure said filter within said passageway"); see also '130 application claim 1 at 35, claim 13 at 38, claim 21 at 40. The specifications likewise make clear that the term "retainer" refers to a particular device (a c-clip) and is not simply a general description of any structure that will perform a particular function. See id. at 26 ("A c-clip 86 is utilized to maintain the position of all the aforementioned components within the bore 210."); '609 patent at 7:42 ("A C-clip 44 is utilized to hold the filter 42 in the opening 38.").

Lest there by any doubt that 35 U.S.C. § 112(6) does not apply, the Federal Circuit has presented numerous examples that are similar to the term "retainer device" where claim language further defining a generic term added sufficient structure to avoid the confines of Section 112(6). Compare Greenberg, 91 F.3d at 1583 (holding that Section 112(6) did not apply to the term "detent mechanism" because "detent" denoted a type of device with sufficient structure), with Mass. Inst. of Tech., 462 F.3d at 1354 (determining that the term "colorant selection" modifying "mechanism" did not connote sufficient structure as it was not defined in the specification). "Retainer device," therefore is outside the purview of the means-plus-function analysis, and will be construed in accordance with the standard rules of claim construction noted in Phillips above.

The term "retainer device" appears in three claims of the '130 application, two claims of the '609 patent, one claim of the '958 patent, and four claims of the '674 patent. See '130 application claim 1 at 35 ("a retainer device for removably securing said filter element within said passageway"); '609 patent claim 15 at 20:65-67 ("a retainer device disposed within said passageway and configured to removably secure said filter within said passageway"); '958 patent claim 1 at 18:17-21 ("a retainer device disposed within said passageway and configured to removably secure said filter within said passageway, and said filter is disposed between said bias exerting mechanism and said retainer device proximate said outlet opening"); '674 patent claim 9 at 27:11-13 ("the retainer device securing the filter within the passageway is located between the filter and the exit opening"); see also '130 application claim 12 at 37, claim 29 at 43; '609 patent claim 27 at 22:43-45; '674 patent claim 1 at 26:53, claim 13 at 27:38-39, 28:3-4, claim 14 at 28:5-8.

Aqua-Lung proposes that a "retainer device" be defined as: "a c-clip mounted in an annular internal groove provided within the tubular duct proximate the lower or bottom end portion of the housing and sized to mount a removable c-clip therein, the c-clip being sized, shaped and positioned so that the spring provides sufficient bias force to close the gas inlet aperture with the gas flow control element, and so that the c-clip holds all of the internal components of the valve in place within the tubular duct." Two Forty proposes that it be construed as "a mechanism for holding one or more parts in place."

Aqua-Lung's proposed definition operates from the assumption that 35 U.S.C. § 112(6) applies. As a result, Aqua-Lung maintains that the term "retainer device" should be limited to the c-clip disclosed in the embodiments. See, e.g., '130 application at 21 ("the c-clip 86 holding all the internal components of the valve 132 in place within the bore 78"); see also id. at 18, 26, 28-29, 31. The patents-in-suit similarly use "c-clip" in their specifications to describe a "retainer device."
The Federal Circuit expressly has rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment. Phillips, 415 F.3d at 1323 (citing Gemstar-TV Guide Int'l, Inc. v. Int'l Trade Comm'n, 383 F.3d 1352, 1366 (Fed. Cir. 2004)). This is because persons of ordinary skill in the art rarely would confine their definitions of terms to the exact representations depicted in the embodiments. Id. One of the best ways to teach a person of ordinary skill in the art how to make and use the invention is to provide an example of how to practice the invention in a particular case. Id. Here, therefore, the fact that the specifications disclose only a single c-clip embodiment as a "retainer device" does not, by itself, compel limiting claim scope to a c-clip embodiment.

That said, the fact that only a single embodiment is shown is a fact that, when taken into consideration with the patentee's description of the invention, may show that the inventor only intended to claim a particular feature as his invention. Honeywell Int'l, v. ITT Indus., Inc., 452 F.3d 1312, 1318 (Fed. Cir. 2006). To do so, there must be additional evidence beyond the disclosure of a single embodiment to justify narrowing a construction to that embodiment. Agfa Corp. v. Creo Prods. Inc., 451 F.3d 1366, 1376-77 (Fed. Cir. 2006) ("Without any indication beyond the necessary depiction to suggest limiting the invention to this single embodiment, the broader language of the claims cannot carry that unexpressed and unintended (at the time of patent drafting) limitation.").

In Honeywell, for example, the court limited the scope of "fuel injection system component" to a "fuel filter" for two overriding reasons. 452 F.3d at 1318. First, because the specification repeatedly described the fuel filter as "this invention" and "the present invention," the "public was entitled to take the patentee at his word and the word was that the invention [was] a fuel filter." Id. Second, the written description's detailed discussion of the problem with the prior art that the patented invention addressed supported the conclusion that the fuel filter used in the specification was not a preferred embodiment, but the only embodiment. Id. Similarly, in Inpro II Licensing, S.A.R.L. v. T-Mobile USA, Inc., 450 F.3d 1350, 1354-55 (Fed. Cir. 2006), the court affirmed the narrow construction of "host interface" as "direct parallel bus interface" because the only embodiment disclosed was a direct parallel bus interface with the specification emphasizing the importance of a parallel connection in solving the problems identified.

The specifications here, by contrast, neither repeatedly used a c-clip as "this invention" nor indicated any particular importance of using a c-clip as a retainer device in solving the problem of keeping water out of a scuba regulator when the diver forgets to replace the dust cap after use. In any event, in the end, the manner in which the patentee uses a term within the specification and claims will demonstrate whether the example is limiting or to be read just as an example of the invention. Phillips, 415 F.3d at 1323. A review of the entire intrinsic record reveals that while certain embodiments may disclose the particular structure of a c-clip for the retainer device, there is no limitation restricting the claims to such a structure. The patentee knew the term "c-clip" and had he intended to limit the patent to such an embodiment, he could have done so in the claims. Instead, the abstracts, the summaries, and the claims in the '130 application and all three patents-insuit use the broader term "retainer device." See, e.g., '609 patent summary at 4:12-14 ("a retainer device is positioned for removably securing the filter element within the passageway"). Only when describing the representative non-binding embodiments did the patentee use the term "c-clip."

Aqua-Lung's preferred construction reads numerous limitations from the embodiments into its proposed definition. In contrast, Two Forty's proposed construction ignores the intrinsic record; that is, it does not take into the account the actual claim language and other parts of the intrinsic record outlined above. The Court, therefore, construes "retaining device" as "a mechanism configured removably to secure the filter and other parts within the passageway."

GO BACK

3366

dd. "Retaining Element" (Claim 31)

149. This element is described in terms of its function: "for holding the lever out of engagement with said cam during rotation of said dial until after said combination has been entered". This claim limitation is distinguishable from the first element of Claim 1 only because the phrase "a retaining element for" has been substituted for "lever retaining means for". Further, the word "element" is the equivalent of the word "means", as described earlier. For the reasons previously described, this claim language is to be construed as a means-plus-function element and subject to § 112 P6. The "element" is described solely by what it does: holding the lever out of engagement with the cam during rotation of the dial -- rather than
what it is.

150. There is no evidence that a "retaining element" has any commonly understood meaning in this art. Cf., Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996) ("detent mechanism" had well-understood meaning in the field).

151. The phrase "retaining element" is neither defined nor used in the description of the '656 patent specification. This terminology appears for the first time in Claim 31 where it is expressly defined in terms of functional terms, rather than its mechanical structure. The term "retaining" modifying "element" further reflects an intent to claim the limitation functionally -- that is, that the "element" retains or holds the lever out of engagement. Thus, the claim limitation is essentially devoid of mechanical structure, but is defined principally in terms of its functional characteristics.

152. The phrases "retaining means" and "retaining element" are also used interchangeably in other claims, also manifesting an intent for "element" and "means" to be equivalent. See Claims 1, 17, 19, 28 ("retaining means"); Claim 31 ("retaining element"). Other claims of the patent may be used to determine the scope of the claim at issue. McGill, Inc. v. John Zink Co., 736 F.2d 666, 674 (Fed. Cir. 1984). These are all the same mechanical structure, described in equivalent functional language, and therefore should be interpreted the same.

153. In the '656 patent specification, for the part identified as the "retaining element", the lever is held up out of contact with the dial cam by a cantilever arm which is an integral part of the lever and which includes a movable spring-loaded pin contained within a bore which operates to create a force when released rotating the lever about its pivot axis to bring the lock lever out of engagement with the dial cam.

ii. Retaining mechanisms

Plaintiffs argue that the term "retaining mechanisms" should be construed as any structure that keeps the lenses in a fixed place or position, whether rims, pins, screws or other mechanisms securing the lenses. The Defendant contends that the term should be restricted to the structure disclosed in the patent's specification--rims--and their equivalents that perform the identical function of "supporting" and "defining." 10

10 To the extent Plaintiffs dispute that the structure disclosed in the specification includes rims, the court disagrees. The court finds, based on its reading of the specification and every figure or drawing contained therein, that the retaining mechanisms disclosed in the specification clearly includes rims.

Under U.S. Patent law, "means-plus-function" claims must be construed in a way that is consistent with the structure disclosed in the patent's specification, see 35 U.S.C. § 112, P6, and, in this case, the specifications for each of the Patents-in-Suit depict the retaining mechanisms in the form of rims. 11 Defendant argues that "retaining mechanism" is a means-plus-function claim limitation because there is no common meaning of the phrase in the industry, and because the claim limitation is described only in terms of its function and not its mechanical structure (i.e. supporting lenses and defining a plane). See Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1215 (Fed. Cir. 1998) (construing a term as a "means-plus-function" claim limitation in light of "subsequent functional language"). Plaintiffs disagree that "retaining mechanism" is a means-plus-function claim limitation for the purposes of § 112 P6.

11 As well as to any equivalents, but the issue of equivalents is not before the court at this time.
As Plaintiffs correctly point out, there is presumption against construing "retaining mechanism" as a means-plus-function claim, because the relevant term at issue here does not include the word "means." See Phillips, 415 F.3d at 1311 (citing Personalized Media Communns., LLC v. ITC, 161 F.3d 696, 703-04 (Fed. Cir. 1998)). That said, the presumption is rebuttable, see Phillips, 415 F.3d at 1311, and this court finds that the presumption has been rebutted in this case.

Means-plus-function claiming applies only to purely functional limitations that do not provide the structure that performs the recited function. See Watts v. XL Sys., Inc., 232 F.3d 877, 880-81 (Fed. Cir. 2000). In this case, the term "retaining mechanism" is a purely functional limitation that provides no indication as to the nature of its structure, if any. Rather, the relevant claim language refers to "two retaining mechanisms for supporting a pair of lenses, and defining a frontal plane"—language which describes only what the retaining mechanisms do, namely supporting a pair of lenses and defining a frontal plane. As such, "retaining mechanism" is a means-plus-function claim within the meaning of § 112 P6.

Plaintiffs argue that the Federal Circuit's analysis in Phillips compels a contrary result but, in fact, Phillips is consistent with this court's decision. In Phillips, the Federal Circuit considered whether the term "baffles" 12 was a means-plus-function claim, and ultimately found that it was "not a purely functional placeholder in which structure is filled in by the specification" and, thus, not within the parameters of § 112 P6. See 415 F.3d at 1311. The court based its conclusion on the fact that the claim characterized the baffles as made up of "steel" and "extending inwardly" from the steel shell walls, "which plainly implied that the baffles are structures." Id. In this case, in contrast, the relevant claim language contains no language analogous to "extending inwardly" that in any way describes the retaining mechanism's physical structure. As such, the claim language in this case compels a different result than that at issue in Phillips. 13

12 The relevant claim language in Phillips at issue was as follows:

"Building modules adapted to fit together for construction of fire, sound and impact resistant security barriers and rooms for use in securing records and persons, comprising in combination, an outer shell . . ., sealant means . . . and further means disposed inside the shell for increasing its load bearing capacity comprising internal steel baffles extending inwardly from the steel shell walls."

13 Once again, the parties relied in part on the testimony of outside experts and other sources in support of their interpretations of "retaining mechanism." Plaintiffs cited testimony from Richard Chao and Defendant pointed to the testimony of Mr. Leck. The court finds that this evidence is no more helpful in construing "retaining mechanism" than it is in construing "frame" and, as such, declines to reach any motions to exclude any and all of this evidence.

Therefore, the court finds that "retaining mechanism" means "a structure that keeps the lenses in place using rims."
Essentially Freedman argues the retaining member must be two pieces while ASC says that the retaining member need not be a separate structure, and can be part of the overall structure of the female fastener. As explained below, Freedman has the better of the argument when the teachings of the specification are examined together with the claim language and in light of the file history.

2. Evidence from the Patent

a.

The specification requires access to both sides of the seat shell in order to engage the legs of the female fastener, col. 9, ll 19-30:

Also, although reference has been made throughout the text to the "insert" being fastened to the "seat shell," it is to be understood that the fastener of the present invention is not limited to use in any one particular application, but rather is truly a general purpose type fastener and, accordingly can be used, for example, for fastening a decorative panel to a wall divider frame (as shown in FIG. 11), a seat cushion to seat a frame (as shown in FIG. 12) or in any other application where a first member must be fastened to a second member, wherein the second member is accessible from both sides.

The specification requires the fastener to accommodate varying thicknesses of a seat shell, col. 1, ll 48-52:

It is also desirable, in some applications, to have a fastener which possesses a plurality of locking positions. Such a fastener may be used in applications where the thickness of material located between the two fastener halves is uncertain or subject to wide variation.

The specification calls for separate fastening components to avoid the need to remove the entire fastener and discard it before a new one is installed, col. 1, ll 53-61:

[I]t is often desirable to have a fastener with replaceable parts, especially those parts which tend to wear quickly. In such a case, if the wear prone parts are field replaceable, they can be serviced in the field. In cases where the fastener is not constructed with serviceable parts, the entire fastener, or perhaps the fastener and associated members, must be removed and discarded and new ones installed.

In other words, the fastener must have field replaceable components, col. 2, ll 1-3:

It is yet an additional object of this invention to provide a fastener which has field replaceable components, especially those components which are prone to wear.

The specification states that the retaining member gives the female fastener realignment capability, col. 3, ll 42-54:

the retaining member allowing the female fastener to move along the first axis, whereby when the seat insert is placed adjacent the seat shell and the stud fastener is passed through the female fastener aperture and between the resilient legs, and whereby any substantial imbalance along the first axis between the resilient forces of the legs against the stud body will cause the female fastener to move along the first axis in the direction which substantially balances the resilient forces exerted by the legs on the stud body, thereby aligning the female fastener with the male fastener, and whereby the engagement of the legs and the stud body acts to fasten the seat insert to the seat shell.

Claim 6 also states this, col. 11, ll 30-31:

said retaining member allowing said female fastener to move along said first axis.

Only a retaining structure separate from the structure of the female fastener including its legs can meet all of the above requirements.

b.
Additionally, the functioning of the retaining member calls for a separate structure. The retaining member when it engages (or comes into contact) with the legs keeps the female fastener in place, col. 2, ll 39-45, by preventing it from being pulled out:

the retaining washer engaging end of each leg passes completely through the retaining washer aperture thereby being released from their compressed position and causing the retaining washer engaging end of each leg to engage the second side of the retaining washer thereby retaining the female fastener in the aperture of the second member…

while at the same time allowing for some movement, col. 3, ll 34-42:

such that the female fastener is permitted to move within the seat shell aperture along a first axis parallel to the engaging surface of the seat shell, a retaining member adapted to reside in the inner portion of the seat shell and engage the legs of the female fastener thereby preventing the female fastener from being pulled out of the seat shell aperture…

and col. 7, ll 47-59:

While retaining female portion 46 in this position, aperture 51 of retaining clip 50 is placed around resilient legs 76, 78 and pushed thereon. This pushing force compresses legs 76, 78 towards one another until aperture 51 of retaining clips 50 passes over spurs 54 wherein the legs 76, 78 resiliently spring outwardly assuming their normal position and spurs 84 engage outer surface 90 of retaining clip 50 thereby preventing female fastener 46 from pulling out 88 of shell apertures 38. While washer 50 is retained by spurs 84, it can be seen that female fastener 46 will remain within shell aperture 38. The final step is to insert studs 26 over apertures 102 of their respective female fasteners 46.

c.

There are additional reasons from a reading of the specifications for construing a retaining member to call for a structure separate from the female fastener including the legs. This is made clear by the manner in which the ‘582 patent uses the phrases retaining member, retaining washer and retaining clip interchangeably.

The Abstract describes "a clip on the opposite side of the panel for retaining the female fastener in the aperture.*

The Summary of the Invention describes "a stud engaging end and a retaining washer engaging end, col. 2, ll 21-22 and "a retaining washer having first and second sides, col. 2, ll 25-26 and retaining washer, col. 2, ll 23-36.

The Summary of the Invention describes the invention "provid[ing] a self-insert fastening system," col. 3, 17-8. The phrase retaining member is described as the structure which allows movement of the female fastener in the aperture as well as prevents the female fastener from being pulled out of the shell aperture, see col. 3, ll 38-41. This is clearly the same structure as the referenced washer earlier described.

In the Detailed Description of the Preferred Embodiment, we find the phrases "retaining clips (or washers) 48, 50," col. 5, ll 11-12; "washer 50 (or retainer)," col. 6, l 29; "retaining clip 50," col. 7, ll 48, 51, 54; "washer (or retainer) which has previously been described," col. 8, ll 39-40, used interchangeably.

Clearly, this variable use calls for the washer as a separate structure; and therefore the retainer, which is a synonymous structure, must also be a separate structure.

d.

Lastly, it is clear from a reading of Claim 6 and in light of Claim 1 that a two piece structure is called:

Claim 1 which describes the invention of the ‘582 patent as a

  self-aligning fastener system for attaching a first member to a second member

 calls for a "retaining washer" throughout.
Claim 6 which describes the invention in a more limited way

a seat insert fastening system, for fastening an insert to a seating portion of a seat shell
calls for a "retaining member."

The two structures have identical functions. Claim 6 is more narrowly directed than Claim 1. The structure of the retaining member of Claim 6 is no broader or different than the retaining member of Claim 1.

Arguing claim differential is of no moment. Two claims with different terminologies can (and here do) define the same subject matter. Hormone Research Found. v. Genentech, Inc., 904 F.2d 1558, 1567, n.15 (Fed. Cir. 1990).

2. Evidence from the File History

Up to now in construing the phrase retaining element, the Court has considered only the language from the patent, with particular emphasis on the specification. Consideration of the file history of the '582 patent is in order because it was the applicant's response to the examiner's rejection which conclusively establishes a finding that the applicant expressly disclaimed coverage of the retaining member being an integral part of the female fastener.

In the Office Action of January 7, 1992, Claim 6 in its present form was rejected with the examiner stating in part:

It would have been obvious at the time the invention was made to a person having ordinary skill in the art to have substituted a resilient retaining washer for the work piece b of Tinnerman '148 as taught by Carr to allow some flexing between the attached members a and c.

The applicant responded in part as follows:

. . . The Examiner further states that it would have been obvious at the time the invention was made to a person having ordinary skill in the art to have substituted a resilient retaining washer for the work piece b of Tinnerman '148 as taught by Carr to allow some flexing between the attachment members a and c.

Two purposes are served by use of washer 9 in the Carr reference. First, it is used to hold nut member 3 in assembly with Metzel part 1 (page 1, lines 23-66) and secondly it is used to grip the walls surrounding the aperture 2 within supporting part 1 (lines 79-83). However, both of the above-referenced functions of washer 9 are served by retaining elements 16 in Tinnerman. Retaining elements 16 function to maintain work pieces a, b in proper assembled relation while also locking the clip in its position prior to attachment (see page 2, lines 7-17). Thus, there would be no motivation to add the washer of Carr '367 to the fastener of Tinnerman '148 in that it merely duplicates a function which is already present in the fastener. In the present invention, washer 90 serves the purpose of allowing female fastener portion 46 to float within aperture 38 thereby giving the fastener of the present invention its self-aligning attributes. Accordingly, there is no motivation to combine the washer as taught by Carr with the fastener as taught by Tinnerman. Carr does not teach the use of a washer in a way which allows the fastener to float within an aperture. There is no motivation to combine the washer of Carr to the fastener of Tinnerman to produce a self-aligning fastener inasmuch as neither Carr nor Tinnerman teaches the advantages of a self-aligning fastener.

Tinnerman, U.S. Patent No. 2,303,148, describes a nut fastened installation. It calls for a unitary restraining structure integral with a female fastener. All of this is described in col. 2, ll 34-57 which need not be recited here because all this is shown in Fig. 1 and particularly Fig. 4 of Tinnerman.

Carr, U.S. Patent No. 1,646,367, covers a nut and screw fastener and shows a dish-shaped washer 9 which is "snapped over the head of the nut to hold it in the assembly," col. 2, ll 56-58.

To combine Tinnerman with Carr as suggested by the examiner would result in non-integrated two pieces functioning to retain the fastener and integrated legs in place.
The applicant argued against the two pieces retainer resulting from a combination of Tinnerman and Carr because these were all really the two pieces called for by Claim 6. This is what was meant by the statement in the response:

Thus, there would be no motivation to add the washer of Carr '367 to the fastener of Tinnerman '148 in that it merely duplicates a function which is already present in the fastener.

ASC cannot reclaim subject matter which was disclaimed. See Rhodia Chimie v. PPG Ind., Inc., 402 F.3d 1371, 1384 (Fed. Cir. 2005). As stated in Freedman Seating's Revised Responsive Claim Construction Brief at p. 25:

Clearly, ASC argued during prosecution that the structure taught by the prior art Tinnerman patent -- namely, a one-piece female fastener having an integral structure which first "locks" the fastener into position within an aperture from one, not two sides of access, by "gripping" the walls surrounding the aperture, and which secondly carried its own, integrated, stud-receiver (a threaded nut) -- was patentably distinct fro the two-piece structure claimed by ASC, including claim 6, which requires a separate "retaining washer" to maintain the fastener in position within the aperture. Simply put, ASC argued that its invention did not encompass a female fastener that was maintained within an aperture without the use of a separate "retaining member."

3. Construction

The phrase "retaining member" is construed as follows:

A structural element separate and distinct from the female fastener adapted to come into physical contact with the legs of the female fastener to restrain the position of the head portion on the outer portion of the seat shell.

L. Claim 25

The method of claim 24 including the steps of retaining one edge of the tissue flap connected to surrounding tissue, moving the flap away from the edge so that it overlies an adjacent recipient area and applying the flap to such area.

The court finds this limitation to mean "keeping in position one line of intersection between the tissue flap and tissue that extends on all sides of and joins to the tissue flap, moving the flap in a direction other than towards the intact border so that it covers a receiving area near to the differentially expanded tissue flap and applying the flap to such area."

1(b) "Retaining said stand portions in face-to-face engagement with the underside of said platform and permitting limited displacement of said bearing members in a horizontal direction" as used in claim 1,

and

"Retaining said bearing means in sliding engagement with the underside of said platform and permitting limited displacement of said bearing members in a horizontal plane" as used in claim 8

Plaintiff's proposed construction:

Linking the stand portions to the underside of the platform and allowing limited horizontal movement of the bearing member." (claim 1)

and
Slots on the stand portions and tabs on the underside of the platform and equivalents (i.e. the tabs can come from the bearing and it can be inserted into the platform via slots and bent over, the slots being substantially larger than the tabs)" (claim 8)

Defendant's proposed construction:

Holding the bearing members against the underside of the platform so as to permit horizontal movement of the bearing members, but prevent non-horizontal movement.

Court's construction:

These terms do not contain a limitation that the bearing member cannot move in a non-horizontal direction.

In its claims construction brief, defendant identifies "retaining said stand portions in face-to-face engagement with the underside of said platform and permitting limited displacement of said bearing members in a horizontal direction" (claim 1) and "retaining said bearing means in sliding engagement with the underside of said platform and permitting limited displacement of said bearing members in a horizontal plane" (claim 8) as functions of the "assembly means."

As discussed above, these are not functions of the "assembly means" but the effect of how the bearing member or stand portion are connected to the platform. Nonetheless, the parties dispute whether these two phrases contain a limitation that disclaims any non-horizontal movement between the bearing member and the platform. Because neither the language of claims 1 and 8 nor the specification specifically disclaim non-horizontal movement, I conclude that the non-horizontal limitation should not be read in to these claims terms.

Defendant argues that because both claims 1 and 8 discusses limits on the bearing member's horizontal movement in relation to the platform, these claims specifically disclaim non-horizontal movement. In addition, the specification of the '420 patent also state that there should be "sufficient clearance so that the bearings may move horizontally with respect to the platform." '420 Pat., col 4., lns. 30-39. Despite defendant's contention that these lines constitute an express disavowal of non-horizontal movement, there is no language that expressly denies non-horizontal movement. Also because the invention transfers vertical force through the bearing members, it would appear that a certain amount of vertical movement would occur between the bearing member and the platform. However, it is the patent's total silence on whether the bearings could move in a limited vertical manner that leads me to conclude that neither claim term requires a limitation of "non-horizontal movement." Finally, as plaintiff observes, for the claimed horizontal movement to occur, there has to be some vertical movement, however minuscule; the scale would not work at all if it completely disclaimed vertical movement.

4. Reticle Image or Pattern
