"Detent" (or its equivalent, "detent mechanism") is just such a term. Dictionary definitions make clear that the noun "detent" denotes a type of device with a generally understood meaning in the mechanical arts, even though the definitions are expressed in functional terms. See Random House Unabridged Dictionary 541 (2d ed. 1993) ("a mechanism that temporarily keeps one part in a certain position relative to that of another, and can be released by applying force to one of the parts"); Webster's Third New International Dictionary 616 (1968) ("a part of a mechanism (as a catch, pawl, dog, or click) that locks or unlocks a movement"); G.H.F. Nayler, Dictionary of Mechanical Engineering (4th ed. 1996) ("A catch or checking device, the removal of which allows machinery to work such as the detent which regulates the striking of a clock."). It is true that the term "detent" does not call to mind a single well-defined structure, but the same could be said of other commonplace structural terms such as "clamp" or "container." What is important is not simply that a "detent" or "detent mechanism" is defined in terms of what it does, but that the term, as the name for structure, has a reasonably well understood meaning in the art.

Second, we do not agree with the district court that the term "detent mechanism" in the '501 patent should be treated as synonymous with the term "detent means" simply because the patent uses the term "detent means" in place of "detent mechanism" on two occasions in the "summary of the invention" portion of the specification. The drafter of the application that matured into the '501 patent appears to have been enamored of the word "means," as the word is used repeatedly in the summary of the invention. A close reading of the specification reveals, however, that the term is used in that portion of the patent simply as a shorthand way of referring to each of the key structural elements of the invention. Each of those elements is subsequently described in detail, without the use of the term "means," in the "description of the invention" portion of the
specification, and each is subsequently claimed, again without the use of the term "means," in claim 1 of the patent.

Finally, we disagree with the district court that the decision in Interspiro USA Inc. v. Figgie Int'l Inc., 815 F. Supp. 1488, 27 U.S.P.Q.2D (BNA) 1321 (D. Del. 1993), aff'd, 18 F.3d 927, 30 U.S.P.Q.2D (BNA) 1070 (Fed. Cir. 1994), is directly on point here. One of the elements in that case claimed "detent means . . . for moving and maintaining [the] movable member" in a breathing regulator for a fireman's mask. The district court in Interspiro characterized that element as containing means-plus-function language and therefore invoking section 112(6), see 815 F. Supp. at 1504, 27 U.S.P.Q.2D (BNA) at 1329, a characterization with which this court concurred on appeal, see 18 F.3d at 930-31, 30 U.S.P.Q.2D (BNA) at 1072.

While the language in the Interspiro case was in classic "means-plus-function" format, the language in Dr. Greenberg's patent was not. Section 112(6) provides that an element in a claim for a combination "may be expressed" as a means for performing a function, which indicates that the patentee is afforded the option of using the means-plus-function format. The question then is whether, in the selection of claim language, the patentee must be taken to have exercised that option.

In the Interspiro case, the patentee's choice of "means-plus-function" language made it clear that the patentee had elected to invoke section 112(6). In this case, by contrast, the element in question did not use conventional "means-plus-function" language, no other element of the claim was in means-plus-function form, and nothing cited to us from the prosecution history or elsewhere suggests that the patentee intended to claim in that fashion. There is therefore no reason to read the claim language in this case as reciting a means for performing a function, within the meaning of section 112(6).

We do not mean to suggest that section 112(6) is triggered only if the claim uses the word "means." The Patent and Trademark Office has rejected the argument that only the term "means" will invoke section 112(6), see 1162 O.G. 59 n.2 (May 17, 1994), and we agree, see Raytheon Co. v. Roper Corp., 724 F.2d 951, 957, 220 U.S.P.Q. (BNA) 592, 597 (Fed. Cir. 1983), cert. denied, 469 U.S. 835, 83 L. Ed. 2d 69, 105 S. Ct. 127 (1984) (construing functional language introduced by "so that" to be equivalent to "means for" claim language). Nonetheless, the use of the term "means" has come to be so closely associated with "means-plus-function" claiming that it is fair to say that the use of the term "means" (particularly as used in the phrase "means for") generally invokes section 112(6) and that the use of a different formulation generally does not. In this case, because we have found no reason to depart from that general principle, we conclude that the phrase "cooperating detent mechanism defining the conjoint rotation of said shafts in predetermined intervals" was not intended to invoke section 112(6) and should not be construed to do so.

Because we conclude that the district court erred by holding that the "detent mechanism" element of claim 1 of the '501 patent is governed by the rule of construction set forth in section 112(6), we vacate the district court's order granting summary judgment to Ethicon and remand the case for further proceedings.

Because we conclude that the district court erred by holding that the "detent mechanism" element of claim 1 of the '501 patent is governed by the rule of construction set forth in section 112(6), we vacate the district court's order granting summary judgment to Ethicon and remand the case for further proceedings.

1134

c. "detent plate structure defining a plurality of gear positions"

The term "detent plate structure defining a plurality of gear positions" means a structure of irregular notches positioned on a lower edge of the center flange for engagement by the shift lever that correspond to the PRNDL shift positions of an automatic transmission. The structure can be molded as part of the rear section of the center flange or a separate plate attached to the center flange.

1135

f. "Detented Position" (Claim 1)

88. In the '656 patent specification, the "detented" or engagement position is defined as the position where the spherical or curved surface detent ball 96 can project, extent or protrude outwardly of the solenoid housing. Col. 6, lines 16-19.

89. Thus, as used in the '656 patent claims, the "detented position" is the location that the detent extends, projects or

- 1572 -
protrudes to by the solenoid by entry of the combination so that the detent can be contacted by the detent engaging member on the cam.

1136
12. "[D]etent shoulder:" 12 "Part of a structure [support element or base body] that secures that structure to another." This construction is consistent with the specification. (col. 4:39-45; Figs. 3-5)

1137
18. "[D]etent tooth that protrudes from the longside of the support element:" 18 "A protrusion, one surface of which defines a detent shoulder." This construction is supported by the specification. While the specification describes the detent teeth of Figure 6 as having an angular structure (col 5:38-40), the court will not import the requirement that detent teeth have an angular structure based on one embodiment. See Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004).

1138
1. "determining and generating motion instructions that are adjusted to compensate for lead or taper errors" (claims 1 and 16)

Flow argues for the following construction: "Creating movement directives that compensate for lead and taper errors. Adjusting does not require readjusting after the motion control commands have been determined and generated (e.g. after the program is built and sent for execution)." Omax argues that it should be understood to mean: "the motion control commands are changed or altered after having been determined and generated."

The argument here stems from the meaning of the word adjusted. Flow argues that the determining and generating process "adjusts" the instructions so that, when that process is done, they are already "adjusted" to compensate for errors. Omax argues that adjusted means modified, and suggests that after the instructions are determined and generated, they are then adjusted to compensate. Contrary to Omax's argument, both uses of this word constitute "plain meaning": "adjusted adj 1 a: accommodated, altered or revised to suit a particular set of circumstances or requirements b: having achieved a harmonious relationship with the environment or with other individuals." Webster's Third New International Dictionary 27 (1981). Because both approaches are consonant with the word's plain meaning, the Court looks to the specification for guidance. Phillips, 415 F.3d at 1313 ("[T]he person of ordinary skill in the art is deemed to read the claim term not only in the context of the particular claim in which the disputed term appears, but in the context of the entire patent, including the specification.").

The specification supports Flow's approach, which construes "adjusted" as signifying that the motion instructions are already adjusted upon their determination and generation. According to the specification, after the "optimal values for the taper and lead angles at each endpoint of each drawing entity as a function of the speed of the cutting head at that point" are
generated, the Dynamic Waterjet Control System ("DWCS") then "builds the final motion program making adjustments to the motion program data structure as necessary for the particular jet controller in use." '452 Patent, col. 8, 11. 2-21. In figure 5 of the '452 patent, the building process occurs in step 507, and afterward instructions are sent to the controller for execution. Thus, there is no adjustment after the determination and generation of the instructions. The Court adopts Flow's proposed construction.

Home Diagnostics Inc. ("HDI") filed a declaratory relief action seeking a judgment that its blood glucose monitoring systems do not infringe United States Patent No. 5,843,692 owned by Lifescan. Claim 1, from which all of the asserted claims depend, reads:

A method for measuring a glucose concentration in a sample of whole blood using a reflectance-reading device, which comprises the steps of:

(a) providing a test strip for placement in the reflectance reading device, the test strip having a matrix pad with a sample receiving surface and a testing surface opposite the sample-receiving surface, which matrix pad further comprises a reagent for reacting with the glucose in the blood sample and creating a change in reflectance at the testing surface indicative of the glucose concentration in the sample;

(b) applying a sample of whole blood to the sample-receiving surface and allowing at least a portion of the sample to travel to the testing surface and react with the reagent;

(c) initiating a predetermined incubation period upon a change in reflectance at the testing surface sufficient to indicate that at least a portion of the sample has reached the testing surface;

(d) taking a reflectance measurement at the end of the predetermined incubation period, without having determined the time at which the sample was initially applied to the matrix pad; and

(e) determining the glucose concentration in the sample from the reflectance measurement.

U.S. Patent No. 5,843,692, col. 23, II. 1-27 (emphasis added). The district court construed the phrase "a predetermined incubation period" to mean "a time period determined in advance, which requires presetting the length of time of the incubation period, either directly or by reference criteria such as glucose concentration." The court later clarified that this requires knowledge of the duration of the incubation period prior to the test. Lifescan argues that the correct construction defines the incubation period by a set of events that define the beginning and the end of the period, in which the precise duration of the period is not necessarily known and set in advance. This proposed claim construction is unsupported by the intrinsic evidence. The specification only refers to the incubation period in terms of time, only discloses time-based measurements, and from the correspondence between the examiner and the applicant, it is clear that the claim was prosecuted based upon an understanding that incubation period meant time. *

* Alternatively Lifescan argues, based on the specification, that even if the patent is construed to refer to a time period, the length of the predetermined time period may depend on the glucose concentration that it encountered during the test (20 seconds for one concentration and 30 seconds for another), and that "predetermined incubation period" should be construed to include a choice of a time period that is affected by the results of the test while it is being conducted. Whether or not that is so, there is no contention here that the allegedly infringing product requires a choice to be made among predetermined time periods known in advance. Rather, the time period for the test in the allegedly infringing method is constantly variable, depending on the conditions encountered during the test.
amount of glucose contained per unit volume in the sample." It further determined that the phrase meant the actual concentration of the sample, not a premature or intermediate measurement. Lifescan argues that the open-ended article "a" is used to refer to "glucose concentration" in the preamble, and the specification discloses embodiments in which intermediate glucose determinations are made, a proper construction would not exclude intermediate or premature measurements. Lifescan's argument fails because such a claim construction would conflict with the plain meaning of the claim. The claim requires determining the glucose concentration of the blood sample; the blood sample can have only one glucose concentration. The intermediate measurements that Lifescan seeks to encompass within "glucose concentration" are not measurements of the glucose in the sample; they are measurements of the rate of reaction of the glucose in the sample with the chemicals found on the testing strip.

The Court concludes that because the preamble is not limiting in the context of this claim, "device" refers to "a device having the limitations called out by the body of the claim." The present claim construction dispute is not the first opportunity for this Court to construe the '760 patent. In a prior case, the Court was asked to construe the term "device" as a "sheet." Saffran v. Boston Scientific Corp., No. 2:05-CV-547 (TJW), 2008 U.S. Dist. LEXIS 52557, 2008 WL 2716318, at *6 (E.D. Tex. July 9, 2008). The Court refused then, and for the reasons below, the Court again refuses.

A. Parties' Construction Arguments

Defendants seek a construction of "device" as "a single sheet of material." Defendants argue the specification limits "device" to a single sheet of material and the prosecution history shows repeated disclaimers. Defendants note several places in the specification where the "device" is referred to as a "sheet." For example, Defendants point out that the specification in one place unequivocally states "the device, 1, is composed of a single sheet of material." 13:38-40. In addition, Defendants argue there are no embodiments other than a single sheet of material. Even though Plaintiff claims, for example, in Figure 6(a) the "device" is a "spray" and not a "sheet," Defendants argue that even the "spray" embodiment creates a "sheet"—the "sheet" is sprayed on. See Fig. 6(a). Regarding the prosecution history, Defendants point out that Plaintiff, when arguing around the prior art by Gaskill, stated his "device is a sheet rather than a pre-formed chamber." Applicant's 9/13/96 Response to Examiner's 6/12/96 Office Action, at 5, attached as Ex. 13 to Defendants' Amended Answering Brief, Dkt. No. 102. Defendants argue this is a disclaimer in prosecution.

Plaintiff argues that "device" should not be construed as a "single sheet of material" because there is no clear intention to limit the claim scope to a "sheet" in the specification. Instead, Plaintiff argues the specification shows that a "sheet" is merely a preferred embodiment of the "device." Plaintiff argues there are also other embodiments of the "device" disclosed in the specification such as "spray" or "coating" embodiments. See, e.g., 18:30-33 ("the invention can be applied to the site of injury as a spray"). Therefore, "device" cannot be limited to "sheet" because then it could not encompass the "spray" or "coating" embodiments discussed in the specification. Although there is language in the prosecution history potentially limiting "device" to "sheet," Plaintiff argues these citations are made merely to distinguish the prior art. For example, the patentee stated "[t]he device is a sheet rather than a pre-formed chamber (Gaskill)." Applicant's 9/13/96 Response to Examiner's 6/12/96 Office Action, at 5, attached as Ex. 13 to Defendants' Amended Answering Brief, Dkt. No. 102. Plaintiff argues these statements are not words of manifest exclusion or restriction to a "sheet"; instead, these statements exclude a preformed chamber like Gaskill's.

Plaintiff asks the Court to construe "device" as "at least the layer recited previously in the respective claims." Plaintiff argues that "device" should have its ordinary meaning and that "device" takes on its ordinary meaning by "simply pointing to the preferred embodiments disclosed in the specification." (Dkt. No. 97. at 21.) Plaintiff's rationale for its construction is not clear in its briefing, but at the hearing Plaintiff clarified that Plaintiff's proposed construction for "device" is related to the "comprising" language used in claim 1. Plaintiff argues that given the open-ended "comprising" language in claim 1, the inventor has claimed "at least" the layer recited in the claim language.
B. Analysis

The Court refuses to read in Defendants' "sheet" limitation for the term "device." The Court will first consider the intrinsic evidence. Defendants point out that the specification refers to the "device" as a "sheet" in multiple places. See, e.g., 12:21-22 ("single layered, flexible, minimally porous sheet having macromolecular restraint means"); 13:38-40 ("the device, 1, is composed of a single sheet of material"). Nevertheless, the Court agrees with Plaintiff that a "sheet" is merely a preferred embodiment of the "device." The specification states that the "sheet" is the "principal embodiment" or merely "one embodiment" of the "device." 7:57-60; 13:39-41. Defendants' references to the specification where it states, for example, that the device is composed of a single sheet of material are not enough to give rise to a "clear intention to limit the claim scope using 'words or expressions of manifest exclusion or restriction.'" Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004) (quoting Teleflex, 299 F.3d at 1327). The Federal Circuit has cautioned that "limitations appearing in the specification will not be read into claims, and . . . interpreting what is meant by a word in a claim is not to be confused with adding an extraneous limitation appearing in the specification, which is improper." In re Cruciferous Sprout Litigation, 301 F.3d 1343, 1348 (Fed. Cir. 2002) (citing Intervet Am., Inc. v. Kee-Vet Labs., Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989)) (internal quotes omitted). In Defendants' proposed claim construction, they seek to do what the Federal Circuit has cautioned against by adding the "sheet" limitation into the claim language. By reading in the "sheet" limitation proposed by Defendants, the Court would be ignoring the "spray" and "coating" embodiments disclosed by the patentee. "We normally do not interpret claim terms in a way that excludes disclosed examples in the specification." Verizon Servs. Corp. v. Vonage Holdings Corp., 503 F.3d 1295, 1305 (Fed. Cir. 2007). The specification gives several examples of other embodiments of the "device" besides a "sheet," such as a "coating" and a "spray." See, e.g., 6:49-50 ("The invention is to be provided as a flexible sheet, spray or tube . . . ."); 7:11-13 ([T]he present invention . . . can be applied as a spray film."); 12:64-65 ("Spray stream that forms the invention when the spray hits a solid surface."); 21:8-9 ("this invention being used to coat a stent"). Hence, the Court refuses to construe the "device" as a "sheet" because it would exclude the patentee's disclosure of other embodiments such as the spray, tube, or coating.

The Court also rejects Defendants' prosecution disclaimer argument. To be a disclaimer, the statement in prosecution history must be clear and unambiguous and constitute a clear disavowal of the scope. Verizon, 503 F.3d at 1306. In addition, the prosecution history is often less informative than the specification. Phillips, 415 F.3d at 1315. The patentee stated in prosecution, for example, that "[t]he device is a sheet rather than a pre-formed chamber (Gaskill)." Applicant's 9/13/96 Response to Examiner's 6/12/96 Office Action, at 5, attached as Ex. 13 to Defendants' Amended Answering Brief, Dkt. No. 102. While the patentee may have clearly disavowed a pre-formed chamber, the patentee did not clearly disavow every possible embodiment besides a sheet. The disclaimer must be unambiguous, and the only unambiguous disclaimer here was the pre-formed chamber. The specification as discussed above shows other embodiments besides a sheet, and the specification speaks with more clarity than the prosecution history in claim construction. Therefore, the Court rejects Defendants' prosecution disclaimer argument.

The Court additionally rejects Plaintiff's construction of "device" as "at least the layer recited previously in the respective claims." The Court is not persuaded by Plaintiff's argument that this language is necessary to reflect the "comprising" language in the claims. The term "comprising," as used in claim 1 and other independent claims in the patent-in-suit, is a transitional term in patent law that is inclusive or open-ended and does not exclude additional elements or steps. CollegeNet, Inc. v. ApplyYourself, Inc., 418 F.3d 1225, 1235 (Fed. Cir. 2005). Of course, as a patent law term of art, the "comprising" term will be given its customary meaning, but this Court need not construe "device" to reflect the open-ended nature of the "comprising" language because such a construction would be redundant and unnecessary given the "comprising" language already in the claim.

In all, the Court concludes that because the preamble is not limiting in the context of this claim, "device" refers to "a device having the limitations called out by the body of the claim." The term "device" is in the preamble of claim 1. See Claim 1, 22:29-31 ("1. A flexible fixation device . . . comprising: . . . ."). After the preamble, "device" is referenced on an antecedent basis in the body of claim 1; therefore, at all times in claim 1 the term "device" is referring to the "device" introduced in the preamble. See Claim 1, 22:29-43 ("1. A flexible fixation device . . . comprising: . . . the device being flexible in three dimensions by manipulation by human hands, the device being capable of substantially restricting the through passage of at least one type of macromolecule therethrough."). Further, in other claims, the term "device" is either referring to the "device" in claim 1 or a method for using such a device in claims 8 though 18.

There the court was reviewing a construction of the phrase "control apparatus" in the preamble of the patent-in-suit. Id. The particular claim, which was claim 1, read as "[a] programmable microcomputer control apparatus for controlling the relative motion between a tool and a workpiece comprising: . . . ." Id. at 1427. The court determined that the preamble was not a claim limitation and was irrelevant to the proper construction of the claim. Id. at 1434. The court stated that "[t]he phrase 'control apparatus' in the preamble merely gives a descriptive name to the set of limitations in the body of the claim that completely set forth the invention . . . [so] [t]he claim is infringed by any apparatus encompassing all of the limitations in the body of the claim." Id.

The reasoning from IMS Tech. applies here. As in IMS Tech., the phrase "device" used in the preamble merely gives a descriptive name to the set of limitations in the body of the claim that set forth the invention. Later references to "device" in claim 1 or other claims either refer to the "device" in the preamble on an antecedent basis or are referring to a method of using that device. To put it another way, in claim 1, which is a machine or apparatus claim, the inventor uses the label "device" to refer to the machine or apparatus that contains the set of limitations set forth in the body of the claim. Therefore, "device" refers to "a device having the limitations called out by the body of the claim."

C. "Device"

Claim 3 describes the invention, in pertinent part, as consisting of "a power unit supported on the chassis to supply power to the device and the display screen . . . wherein the device is a computing device." (the '178 patent, claim 3). The Plaintiff seeks to classify the "device" as a computer. The Defendant argues that the term "device" is indefinite in claim 1. The parties agree that the term in claim 3 is dependent upon the term in claim 1. Claim 1 does not describe "the device" in any way.

The Defendant relies on 35 U.S.C. § 112 for the proposition that a patent applicant must draft claims "particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention." Because claim 1 is indefinite, the Defendant argues, claim 3 must also be indefinite. However, such a cursory dismissal of the term would be counter to the presumption that each claim of a patent is presumed valid independent of other claims. 35 U.S.C. § 282. A claim is presumed valid "even though [the dependent claim is] dependent upon an invalid claim." Id. In fact, only clear and convincing evidence of indefiniteness can overcome this presumption. Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1348 (Fed. Cir. 2005). Even "a difficult issue of claim construction does not ipso facto result in a holding of indefiniteness." Id. at 1347. Thus, "the failure to provide explicit antecedent basis for terms does not always render a claim indefinite." Energizer Holdings, Inc. v. International Trade Com'n, 435 F.3d 1366, 1370 (Fed. Cir. 2006) (quoting The Manual of Patent Examining Procedure § 2173.05 (8th ed. 2004)). Further, a claim will not be invalid for lack of an antecedent basis if the meaning of the claim could reasonably be understood by persons of ordinary skill when read in light of the specification. Energizer Holdings, Inc., 435 F.3d at 1370. "Intrinsic evidence in the form of the patent specification and file history should guide a court toward an acceptable claim construction." Datamize, LLC, 417 F.3d at 1348.

The intrinsic evidence shows that the claim should not fail for indefiniteness. Throughout the patent, it is clear that the device refers to a computer. For instance, the horizontal tray could support "a computer terminal having a display screen." (the '178 patent, Col. 6, lines 2-3). The "horizontal tray [supports] the wireless computer terminal." (the '178 patent, Col. 6, lines 65-67). The specifications describe a workstation with a power unit and battery charger for a "wireless computer terminal." (the '178 patent, Col. 7, lines 20-23). The keyboard within the work station "communicates with the computer terminal through a conventional electrical connection so that the keyboard can be easily connected to the computer terminal whenever the wireless computer terminal is stored within the mobile workstation." (the '178 patent, Col. 7, lines 49-53).

Although indefinite on its face, the weight of intrinsic evidence that the device was meant to be a computer does not even make this "a difficult issue of claim construction." Datamize, LLC, 417 F.3d at 1348. The device should be defined as a computing device.
The first disputed term -- "device" -- appears in the preamble of claim 23. Defendant contends that in the context of the '344 patent, the term refers exclusively to collapsible flotation devices, and that claim 23 therefore does not describe objects like the HoverDisc that are not intended for flotation. Plaintiff, conversely, contends that the term "device" can be used to describe "almost anything," and thus that it does not limit the scope of claim 23. As an initial matter, neither party contends that the patentee of the '344 patent acted as his own lexicographer with respect to the term "device," or that the term has a specialized, technical meaning in the relevant fields of industrial art. Accordingly, the starting point in the claim construction inquiry is the ordinary and customary meaning of the term "device." Tex. Digital, 308 F.3d at 1201-02.

The dictionary definition of "device" is a "thing adapted for a purpose or designed for a particular function," or "something devised or contrived." THE CONCISE OXFORD DICTIONARY 262 (7th ed. 1983); MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY 317 (10th ed. 1999). The term "device," therefore, encompasses items and instruments of any function and purpose, not merely, as defendant claims, the specific purpose of aquatic flotation.

The principle of claim differentiation confirms that the term "device" should be construed in accordance with this ordinary and customary meaning. While claim 23 uses only the naked term "device" as a preamble, claim 2 of the '344 patent begins with the preamble "a collapsible floatation device," and claims 1, 9, and 18 begin with the preamble "a collapsible device." '344 patent, col. 4, l. 27 (claim 2); col. 4, l. 15 (claim 1); col. 4, l. 59 (claim 9); col. 5, l. 26 (claim 18). Thus, construing the term "device" to include the qualities of flotation and collapsibility would render portions of these other claims superfluous, and for that reason a broader construction of "device" is required. See Amgen Inc. v. Hoechst Marion Roussel, Inc., 314 F.3d 1313, 1326 (Fed. Cir. 2003) ("When a patent claim 'does not contain a certain limitation and another claim does, that limitation cannot be read into the former claim in determining either validity or infringement.'" (quoting SRI Int'l v. Matsushita Elec. Corp., 775 F.2d 1107, 1122 (Fed. Cir. 1985))).

The fact that the term "device" appears only in the preamble of claim 23 points to the same conclusion. As previously stated, a claim preamble is generally not construed as a limitation on claim scope. See Allen, 299 F.3d at 1346. Here, nothing about the phrase "a device" serves to "recite[] essential structure or steps" or "give life, meaning, and vitality" to claim 23 in a manner that would permit a limiting construction. See In re Cruciferous Sprout, 301 F.3d at 1347. A cursory comparison of the preamble of claim 23 with preambles held to limit claim scope will illustrate this point. In In re Cruciferous Sprout Litigation, for example, the Federal Circuit held that the preamble "a method of preparing a food product rich in glucosinolates" limited the scope of the claim at issue because it had helped distinguish the claimed invention from other food-preparation methods during prosecution. Id. Similarly, in Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d 1298, 1306 (Fed. Cir. 1999), the preamble "a method of producing on a photoreceptor an image of generated shapes made up of spots" was held to be "intimately meshed with the ensuing language in the [body of the] claim," such that it was necessary to construe the preamble and the body as "one unified and internally consistent recitation of the claimed invention." By contrast, the mere phrase "a device" provides no insight at all into the nature or purpose of the invention at issue here, and thus cannot serve to limit the scope of claim 23.

Seeking to avoid this result, defendant, invoking the principle that claims "must be read in view of the specification," Markman, 52 F.3d at 979, contends that the '344 patent specification contains "a plethora of globally defining references regarding the term 'device,'" that establish that the scope of claim 23 is narrower than the ordinary and customary meaning of "device" implies. Def.'s Reply Mem. at 7-8. In particular, defendant cites the facts that:

(i) the "Field of the Invention" states, "In particular, the present invention relates to inflatable flotation devices which are
defendant argues, limit the meaning of the term "device" because they "define the invention overall," rather than merely specific embodiments of it. Id. In support of this argument, defendant cites C.R. Bard, 388 F.3d at 858, in which the Federal Circuit held that language appearing in the "Summary of the Invention" and "Abstract" sections of the patent specification, while not constituting express lexicography or a disavowal of claim scope, id. at 863 n.3, nonetheless narrowed the meaning of the term "plug" to mean a plug with a pleated surface, id. at 866. The specific phrases at issue in C.R. Bard were:

(i) "the present invention is an implantable prosthesis…. the implant includes a pleated surface"; and

(ii) "implantable prosthesis including a conical mesh plug having a pleated surface ...."

Id. at 864. The Federal Circuit in C.R. Bard concluded that these phrases narrowed the meaning of "plug" based on the facts (i) that they appeared in sections of the specification that describe the invention as a whole, rather than merely preferred embodiments, id.; and (ii) that they "expressly defined the inventive plug as 'having' or 'including a pleated surface,'" id. at 865. The court went on to state that the prosecution history of the patent provided an independent ground for the same conclusion, holding that in the course of prosecution, the plaintiff "made a clear statement to the examiner that 'the surface of the inventive plug is pleated,'" in order to distinguish the invention from prior art. Id. at 869.

Here, defendant's reliance on C.R. Bard is misplaced for at least three reasons. First, of the statements in the '344 specification that defendant cites, only one, "A collapsible flotation device is described which includes a coilable spring and a flexible panel," comes from a specification section directed to the invention as a whole, i.e., "Summary of the Disclosure"; the others appear in sections directed to related art or specific embodiments and thus are unlikely to have been intended as "global" and limiting definitions. See C.R. Bard, 388 F.3d at 864. Second, the term "device" in the '344 patent is not analogous to the term "plug" in the patent at issue in C.R. Bard; "device" appears in only the preamble of claim 23, and serves merely to identify the claimed invention as a tangible object rather than a process or method; "plug," by contrast, appeared in the body of the claim at issue in C.R. Bard and described the very substance of the claimed invention in that case. Third, despite defendant's conclusory allegation to the contrary, nothing in the record suggests that the term "device" had to be construed as "collapsible flotation device" during prosecution to distinguish the '344 patent from prior art. 8 Unfortunately for defendant, C.R. Bard does not stand for the principle that the use of term in the claim preamble that defines a broad universe of objects and essentially serves only to identify the claim as a product rather than a process claim, must somehow be construed to apply to a small subset of that broad universe. Instead, the holding in C.R. Bard is a narrow one, arguably resting as much on the patent's prosecution history as on the specification. See id. at 870 (Prost, J., concurring) ("Because the inventors clearly disclaimed coverage of non-pleated plugs in the reexamination ... we may [resolve the dispute] on that basis alone; accordingly, I find it unnecessary to reach the remaining grounds for affirmance relied upon by the majority."). In sum, to accept defendant's argument regarding the proper construction of "device" would be to engage in the impermissible exercise of reading a limitation from the patent specification into the claims. See Tex. Digital, 308 F.3d at 1204-05. For that reason, defendant's argument that the term "device" should be construed to mean "collapsible flotation device" must fail.

- - - - - - - - - - - Footnotes - - - - - - - - - - -

7 '344 patent, col. 1, ll. 52-53.

8 Indeed, neither party has adduced evidence suggesting that the term "device" was relevant in any way in the prosecution
For the foregoing reasons, the term "device," as used in the preamble of claim 23, does not limit the scope of claim 23.

3. "Device Acting Between" for Lateral Constraining

261. Based on the claim language, the specification of the '904 patent, and the prosecution history, the "device acting between said stylus holder and said housing for constraining said stylus holder . . . the device including a seating and at least one constraining spring distinct from the biasing means . . . and providing lateral constraint from the axial biasing" of claim 2 of the '904 patent must be construed to mean (1) a separate mechanical device ("a device acting between") located between the stylus holder and housing, (2) the device having a "seating," and (3) the device having at least one constraining "spring" distinct from the bias spring to constrain the stylus holder against lateral movement. Tr 1369, 1389-90, See PP 84-87, 91, 93 supra.

262. During prosecution of the application that resulted in the '904 patent, Renishaw amended the claims to add the "device acting between" language in order to locate the device and thus overcome an objection by the Patent Examiner. PX 500, 501; DX 1150, p. 63-64, 78-79.

263. With reference to the specification of the '904 patent, the "device acting between . . . providing lateral constraint" and including a seating and at least one distinct constraining spring, corresponds in every embodiment to the Boys joint kinematic mount which includes a seating and a planar spring which constrains the movable member against lateral movement. These structures, together, constitute a separate mechanical device between the stylus holder and the housing and provide lateral constraint from axial biasing. Tr 928-29.

264. Accordingly, in view of the specification and prosecution history, the claimed "device acting between" cannot be construed to cover a touch probe which does not have a separate mechanical device located between the stylus holder and housing, or a touch probe that does not have a distinct laterally constraining spring as a part of the lateral constraint device. Tr 1390-93.

A. "A device for the amusement of pet animals free and untethered to the device"

As discussed in regard to the preamble of Claim 1, Plaintiff relied upon the preamble during prosecution to distinguish the claimed invention from the Postings and McMurry references, thereby requiring deviation from the general rule against construing preambles as limiting claim elements. See Catalina, 289 F.3d at 808-809. Statements of intended use may limit the claims in those instances where the patentee "clearly and unmistakably relied on those uses or benefits to distinguish prior art." Id. at 809.

In this instance, Plaintiff clearly relied on the "free and untethered" clause of the preamble to distinguish from the Postings and McMurry references when, in a response to the USPTO examiner's initial rejection, he stated:

"[W]ith [the Postings] exercising device the dog is tethered to the device and enticed with food or the like to run in a circle around the base. In contrast, no such incentive is provided in McMurry, where one or more dogs are tethered along arm 80 . . . [T]he device in both Postings and McMurry is clearly not for the free amusement of a pet unsecured to the device, but for the tethering and forced or encouraged exercising of a dog.

(Def's Ex. B at 35-37 (emphasis in original).) Thus, the Court will construe the preamble phrase "a device for the
amusement of pet animals free and untethered to the device" as "a device for the amusement of an animal kept for pleasure or companionship, rather than solely for utility, in which the animal is free and untethered to the device."

1. Whether the low and high liquid level responsive switching devices in Claim 1 can be incorporated into a single unit or device. Answer: Yes.

Plaintiff argues that the low and high liquid level responsive switching devices can be incorporated into a single unit or device. Plaintiff claims that Figure 4 is simply one preferred embodiment of the invention and that the claim construction should not be limited to the preferred embodiment. Plaintiff contends that the plural reference in Claim 1 to the "low and high liquid level responsive switching devices" merely reflects the notion that the device performs both on and off functions, not that it must be two physically separate devices. Specifically, Plaintiff points out that the written description expressly states that the liquid level sensing device used is old art, and that one invention of old art consists of a single liquid level sensing device with a single liquid level switching device.

Bunn-O-Matic proffers that the low and high liquid level responsive switching devices cannot be incorporated into a single unit or device because the language of the claim expressly calls for the plural form "devices." Furthermore, Defendant contends that Claim 1 is directed toward a preferred embodiment and that Claim 1 fails to encompass any other alternative embodiment, such as the single float actuated switching device. In addition, Defendant maintains that if the patentee wanted the patent to cover a single switching device, as opposed to two switching devices, the patentee should have included an alternative embodiment in the patent with only one switching device. Finally, Defendant asserts that, because the inventor amended the claim language from "low liquid level and high liquid level switching means" to "low and high liquid level responsive switching devices" in response to a rejection from the PTO, Claim 1 now requires two separate switching devices.

The Court holds that the low and high liquid level responsive switching devices in Claim 1 can be incorporated into a single unit or device.

a) Claim Language

The language of Claim 1 calls for "a liquid level sensing device carried by the housing and depending into the tank and including low and high liquid level responsive switching devices, a control circuit connected with an electric power source remote from the unit and with said motor, on and off valve and said high and low liquid level responsive switching devices." (Col. 14:64). The plain language of the claim calls for the plural "devices," indicating that there must be more than one switching device included in the single sensing device. The term "device" is a somewhat generic, non-specific term, thus, the Court looks to other intrinsic evidence for clarification.

b) Written Description

Rules of claim construction provide that limitations cannot be read into a claim from the written description, however, once a term is included in the claim, one may look to the written description to define the term and to provide context. Thus, the Court next turns to the patent specification to provide context and definitions for the liquid level sensing device and liquid level responsive switching devices included therein.

The claim description provides the following in pertinent part:

The liquid level sensing means L can be in the form of a float actuating switching device or, as shown, can be in the form of a resistive probe, with spaced apart pairs of electrodes which depend into the tank T. The lower ends of one pair of electrodes terminates at the lower liquid level in the tank and the lower end of at least one electrode of the other pair of electrodes terminate at the high liquid level in the tank. The beverage in the tank is a conductor and serves as a switching gate between the ends of the pairs of electrodes. With this form of liquid level sensing means, when the liquid level drops below the lower ends of the first or lower most set of electrodes, the circuit therebetween is open and when the liquid level rises in the tank to contact the lower ends of the upper set of electrodes, it closes the circuit therebetween. Accordingly, the
two pairs of electrodes cooperate with the liquid in the tank T to establish liquid level responsive normally closed and normally opened switches. The lowermost switch which is normally closed is a recycling or cycle starting switch and the other or upper normally open switch is a cycle stopping or stop switch.

In practice, one of the electrodes of each of the noted switches can be established by a common electrode with the result that three electrodes function to establish the noted pair of switches.

It is to be noted that the form of liquid level sensing means illustrated and described above is old in the art and is the full mechanical equivalent of those float actuated switching devices and means which have long been provided to effect control of electrical circuits in response to the level of liquids being worked upon and which are well known to all of those who are familiar with or skilled in the art to which my invention relates.

( '664 Patent Col.11:58 - Col.12:23)

This language expressly indicates that the patent encompasses more than one type of liquid level sensing device, such as a float device, a common electrode, or, as in the preferred embodiment, a probe with a pair of electrodes. It also indicates that the liquid level sensing device is not new art, and that the preferred embodiment performs the same function as the floating actuating switching device. This supports Plaintiff's argument that the patent as shown is only one embodiment, and that the invention encompasses other embodiments. Rules of claim construction mandate that the claims must not be limited to the preferred embodiment. Therefore, the various forms and combinations of sensing devices and switching devices set forth in prior art are within the purview of this invention and Claim 1. Accordingly, the liquid level sensing devices and the liquid level responsive switching devices that are included in a float actuating switching device, a resistive probe with a pair of electrodes, and a common electrode are within the boundaries of Claim 1. The Court considers the prior art of the float actuating switching device referred to in the patent to assist the Court in its understanding of the patent, but not to vary or contradict the terms of the claim. Markman, 52 F.3d at 980-1.

c) Prosecution History

Claim 1 of the original application to the PTO was denied by the Examiner due to prior art, specifically the inventions by Popinski, Greenfield, and Cartwright. In response, the inventor challenged the Examiner's rejection based on prior art, calling the rejection "not well-founded." The inventor explained that the present invention's "basic combination and relationship of parts is not anticipated or made obvious by the teachings of the prior art (independent from that which applicant teaches) and is clearly patentable." (Pl. Ex. 6 p.17). In short, the inventor conceded that many of the individual elements of his invention were found in prior art, including the liquid level sensing device and the liquid level responsive switching device. However, the novelty, and thus the patentability, of his invention lay in the overall combination of many elements into a single housing unit that sits atop a holding tank.

In support of this proposition, the inventor stated,

It is submitted that the broad aspects of applicant's invention might properly support and justify the allowance of a claim similar to Claim 1 in which the particular liquid level sensing device which is recited in Claim 1 is not recited. In accordance with the foregoing, the recitation of the high and low liquid level switching devices of the liquid level sensing means, which are recited to include sufficient structure and make the claim definite, should be afforded the broadest possible interpretation.

(Pl. Ex. 6 p. 17).

Therefore, the prosecution history makes it clear that the inventor envisioned that the invention could justify a claim similar to Claim 1 without the liquid level sensing device, and accordingly, the liquid level responsive switching device included therein should be broadly, not narrowly, construed.

Furthermore, the inventor stood his ground, successfully defended his application, and amended Claim 1 not because of the Examiner's rejection, but because he thought it loquacious. In addition to defending his position regarding the prior art, the inventor, believing Claims 1,2,10, and 11 to be wordy, took it upon himself to simplify the language and "carefully amended" the claims "to delete all language which was found to be redundant and/or otherwise unnecessary and/or which
could be deleted without rendering it structurally deficient." (Pl. Ex. 6 p. 9).

After considering the amended application along with the applicant's arguments, the Examiner was persuaded by the applicant's reasoning as to the prior art and approved the patent without substantial changes. The Examiner set forth the reasoning for his allowance: "The primary reason for the allowance of claims 1-18 was the combination of the supply tank and attachment unit, said attachment unit comprising a housing mounted atop said tank and enclosing dry powdered beverage concentrate and water discharge apparatus which operate in response to the level of beverage in the tank. The above was found in all the claims but not in the prior art." (Pl. Ex. 7 p. 2).

d) Prior Art, Technical Treatises and Dictionary Definition

Extrinsic evidence is to be considered to the extent necessary to assist in the Court's understanding of prior art and the patent at issue, not to contradict the terms of the claim.

As to the prior art, the invention must be read in light of the prior art to which it makes reference and to which the prosecution history makes reference. Specifically, United States Patent No. 3,643,835 by Leonard Popinski ("the Popinski patent") teaches a float actuating switching device in which a main float means, i.e. the liquid level sensing device, is comprised of a floating rod containing a single control switch, which may be a conventional mercury switch. (Popinski patent Col. 3: 43). The single switch has an on-position and an off-position. Id.

The Popinski patent liquid level sensing floating device, switching device, and the circuit work together in the following way to add beverage to the tank when the beverage lowers to a low level and to stop when the beverage reaches a high level:

When the rod portion 70 of the main float means 68 falls below a predetermined level, the main level switch 72 closes to its on-position and impresses 12 v. AC across the relay coil 92 causing the relay switch 91 to close; thereby connecting line 1 of the 115 v. AC to the pump means 34 and the electric water valve 42. With the power circuit closed, the pump means 34 operates and the water valve 42 opens, The pump means pumps the concentrate from tank 28 into the bowl 14 and the water simultaneously flows through valve 42 into the bowl 14 under the water pressure at output 57 originally set by the water pressure adjustment means 60 of the regulator. When the main float means 68 is buoyed upward with the addition of the concentrate and water and returns to the predetermined level, control switch 72 switches to its off-position, relay means 90 deenergizes, and relay switch 91 moves to its open-position and thereby disconnects the 115 v. AC from the pump means 34 and water valve 42 causing the proportioner device 20 to stop operating.

(Popinski patent Col. 4: 32).

Furthermore, a mercury switch "consist[s] of a glass tube containing mercury and two stationary contact members located in opposite ends of the tube." AMERICAN ELECTRICIAN'S HANDBOOK 4-4 (Terrell Croft & Wilford I. Summers eds., 12th ed. 1992)(emphasis added). "As the tube is tilted, the mercury moves until it bridges the electrodes and makes electrical contact." IAN R. SINCLAIR, SWITCHES 75 (1988). Thus, the mercury switch is a single unit, i.e. one glass tube, and can be in either the on or off position.

Therefore, the prior art included in the written description and the prosecution history of the '664 patent makes reference to a single liquid level sensing device with a single switching device, such as a mercury switch. The single switch has both an on function and an off function. Therefore, the liquid level sensing device in the patent at issue can include either a single switching device or multiple switching devices. Accordingly, the high and low liquid level responsive switching devices included in Claim 1 can be incorporated into a single unit or device. From the context of the written description and prosecution history, it is apparent that the "devices" cited in Claim 1 refer to the two off and on functions of high and low responsive switches, not two separate devices.

Defendant's arguments that the claim must be limited to the preferred embodiment and that the inventor should have included alternative embodiments if he had wanted the patent to encompass a float actuating device with a single switching device are without merit. There exists a wealth of case law in support of the notion that claims are not limited to the preferred embodiment. "The law does not require the impossible. Hence, it does not require that an applicant describe in his specification every conceivable and possible future embodiment of this invention. The law recognizes that patent
specifications are written for those skilled in the art, and requires only that the inventor describe the "best mode" known at the time to him of making and using the invention." SRI, 775 F.2d at 1121. As opposed to requiring the inventor to describe every possible embodiment, as Defendant would have the Court do, the law requires one considering the use of a device that might infringe on an existing patent to look into the prior art referred to in the written description and prosecution history before embarking on a course of action that would infringe on an existing patent. In this case, the inventor's reference in both the written description and prosecution history to the Popinski patent gives the public sufficient notice that the '664 patent includes as an element the prior art of the Popinski patent, specifically the single liquid level sensing device with a single switching device.

The dictionary definition of device tells us that device is broadly defined as "something constructed or devised for a particular purpose, esp. a machine used to perform one or more relatively simple tasks." WEBSTER'S II NEW RIVERSIDE DICTIONARY 370 (1994). This definition further supports Plaintiff's contention that a single switching device in Claim 1 can be used to perform both the high liquid level switching function and the low liquid level switching function.

2. Whether Claim 1 is limited to two physically separate liquid level responsive switching devices. Answer: No.

This issue is substantially similar to the first issue, with the parties offering substantially the same arguments. Plaintiff argues that nothing in the claim limits the responsive switching devices to two physically separate devices, while Defendant contends that the mere use of the plural "devices" supports the notion that the claim calls for two physically separate devices. The Court, for reasons set forth under the first issue regarding the liquid level responsive switching device or devices, holds that Claim 1 is not limited to two physically separate liquid level responsive switching devices.

A. "Devoid of Transverse Projections"

The '584 patent contains two independent claims. Independent claims 1 and 7 recite an in-line roller skate comprising, inter alia, two sidewalls that are (1) devoid of lateral projections, (2) formed of a different material than the heel and toe plates, (3) releasably detachable from the heel and toe plates, and (4) configured to directly attach to axles that carry skate wheels. The sidewalls extend down to create a cavity to receive the wheel axles. Representative claim 1 is set forth below:

1. An in-line roller skate comprising:
   a boot having a sole surface with toe and heel portions;
   a frame comprising:
   a toe plate having an upper, a lower, and a pair of lateral faces, said upper face being affixed to said sole surface toe portion;
   a heel plate having an upper, a lower, and a pair of lateral faces, said upper face being affixed to said sole surface heel portion;
   spaced-apart first and second downwardly extending sidewalls formed of a material different than said toe and heel plates, said sidewalls having inner and outer surfaces devoid of transverse projections; and
   fastening means for releasably attaching said first and second sidewalls to respective ones of said toe and heel plate lateral faces;
   a plurality of axles mounted to and between said first and second sidewalls; and
   a plurality of wheels, each of which is rotatably mounted between said spaced-apart sidewalls on a respective axle. (emphasis added.)
The '584 patent does not explicitly define the meaning of the term "devoid of transverse projections."

In its motion for summary judgment, Benetton argues that the term "devoid of transverse projections" should be construed to require sidewalls whose "major surfaces are completely flat." In support of its claim construction, Benetton observes that the '584 patent states that the "inward and outward directions comprise the 'transverse dimension,'" 3:47-49, and that the term "projection," is defined by Webster's Third New International Dictionary to mean "a part that projects or juts outs." From these two observations, Benetton concludes that the plain meaning of the term "devoid of transverse projections" requires sidewalls that are flat and lack any portion that projects out from its surface.

Benetton asserts that the '584 patent specification lends additional support for its claims construction of the term. Specifically, Benetton notes that the '584 patent specification states that the sidewalls are "devoid of lateral projections," which "greatly simplifies their manufacture [because] the sidewalls can be formed by simply cutting the appropriate shape from sheet metal or other material rather than requiring additional machining steps." 5:30-36. Moreover, according to Benetton, the '584 specification explains that flat sidewalls simplify replacement "because the sidewalls … are substantially structurally identical (which results from the absence of lateral projections thereon), skaters no longer need to carry with them both left and right side replacement sidewalls." 5:67-6:3. Benetton also claims that the prosecution history buttresses its proffered claim construction. Namely, Benetton notes that to distinguish the claimed configurations over the prior art, Wrike, the inventor, stated that difficult to form materials, such as titanium, have had very limited use in skate frames because they are "extremely difficult to machine and thereby form into nonplanar shapes." Polk Decl., Exh. 31 at 6.

V-Formation contends the claimed sidewalls must only be "essentially flat" and that strengthening/ decorative undulations or ridges do not affect the essentially planar nature of the sidewalls within the meaning of the '584 patent. V-Formation asserts that Benetton's reliance upon the dictionary is improper and unnecessary, and argues that the '584 patent specification confirms the meaning of the term proffered by V-Formation. V-Formation alleges that the '584 patent specification discusses prior art "that disclose non-planar sidewalls with large projections in the transverse (lateral) direction." and that the inward/ outward projections from prior art sidewalls destroy the generally planar configuration of the sidewalls. In response to Benetton's argument that the '584 patent's description of substantially structurally identical sidewalls provides further support for the view that the claimed sidewalls must be flat on both major surfaces, V-Formation points to the dependent claims of the '584 patent, which recite that the left and right sidewalls are "substantially structurally identical." Thus, according to V-Formation, under the doctrine of claim differentiation, claims 1 and 7 may not be construed so narrowly as to essentially make the dependent claims read like the independent claims.

Claim construction should begin with the ordinary meaning of the disputed term, which may be gleaned from dictionaries of the English language. CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002). Because none of the parties argue that the disputed term has an established specialized meaning in technical dictionaries, encyclopedias, or treatises of the relevant field of art, I find that a standard English dictionary is a proper starting point to understand the ordinary meaning of the disputed term. See, e.g., Inverness Medical Switzerland GmbH v. Princeton, 309 F.3d 1365, 2002 WL 31429033, at *4 (Fed. Cir. Oct. 31, 2002). Given the fact that the term "projection," is defined by Webster's Third New International Dictionary to mean "a part that projects or juts outs" and that the claimed sidewalls are "devoid" of transverse "part[s] that project or jut out," I find that, under the ordinary meaning of the disputed term, sidewalls having the disputed claim limitation is properly construed as: sidewalls that are flat.

I find the specification and prosecution history consistent with the construction of the disputed claim term. The patent examiner, during the prosecution of the application leading to the '584 patent, rejected some of the claims in the patent application for obviousness in view of French Patent No. 7,566,762 ("the Baladi patent"). In response to the rejection, Wrike wrote that "only when the present inventor conceived the recited configuration, in which the side walls are devoid of lateral projections, could titanium and other difficult to form materials be effectively employed in skate frames." Declaration of Louis F. Polk ("Polk Decl."), Exh. 31, p. 6. According to Wrike, titanium had very limited utility in skate frames because they could not be readily formed into nonplanar shapes. Id. The '584 patent specification provides examples of such nonplanar shaped sidewalls in the prior art by reference to United States Patent Nos. 4,418,929 ("the '929 patent"), 4,666,169 ("the '169 patent"), and 5,277,437 ("the '437 patent". 1:57-61). Figure 2 in each of the respective patents shows embodiments of sidewalls having lateral projections. Evidently, Wrike overcame the difficulty of using titanium in skates by avoiding the need to machine the material into such nonplanar shapes (i.e., sidewall shapes having "lateral projections"). Indeed, the '584 patent specification explains that because the sidewalls are "devoid of lateral projections," they may be manufactured by simply cutting the appropriate shape from sheet metal or other material, thereby avoiding additional
machining steps. 5:30-36. Thus, "as a result, lightweight, high durability materials ... can be employed, and machining that alters the thickness of the sheet material is not required in the forming process." Id., 5: 36-40. In view of the ordinary meaning of the disputed term, Wrike's argument highlighting an innovation of the claimed invention over the prior art and statements by the specification that the claimed sidewalls, as a consequence of being "devoid of lateral projections," avoid the need for additional machining steps that either change the planarity or thickness of the sidewalls, I am persuaded that the term "devoid of lateral projections" limits the sidewalls to embodiments whose major surfaces are flat. Seimed Life Systems, Inc. v. Advanced Cardiovascular Systems, 242 F.3d 1337, 1341 (Fed. Cir. 2001); Elkay, 192 F.3d at 979; Vitronics, 90 F.3d at 1582.

1147

c. Other Claim Limitations

In its claim construction ruling, the Court of Federal Claims held that the term "dial" in Claim 1 of the '068 patent must include divisions. Claim construction ruling Masco, 47 Fed. Cl. at 458. Masco argues that the term should not be limited to dials bearing divisions. It cites a general dictionary definition, which states that "dial" means "[a] movable control knob or other device on a radio or television receiver used to change the frequency." Masco also cites passages from the specification in which the dial is described simply as a part that is rotated, causing internal parts to move. Masco also refers to the testimony of Mas-Hamilton's director of engineering from Mas-Hamilton I, describing a knob without divisions as a "dial."

We discern no error in the court's construction. The court found that the plain language of the claim did not resolve the issue, but noted a general dictionary definition of "dial" as "a plate or disk with graduations or figures, as for the indication of pressure, number of revolutions, etc., as by the movements of a pointer." Claim construction ruling Masco, 47 Fed. Cl. at 458 (quoting The American College Dictionary 333 (1970)). In considering the intrinsic evidence, the court noted that the section of the specification describing related art states that "one class of lock is the electronic dial combination lock which uses a dial having divisions to enter a combination code . . . ." '068 patent, col. 1, ll. 21-24. The specification also distinguishes between the dial and the knob: "A dial 76 of well-known configuration is mounted to the external end of the shaft and includes a knurled knob 78 for both rotating and axially moving the dial." '068 patent, col. 5, ll. 7-10. The dial, which both the specification and a dictionary definition indicate has divisions, is thus distinguished from the knob, which does not. Accordingly, the term "dial" cannot be construed to cover knobs lacking divisions, and we affirm the court's construction of this limitation.

1148

G. Diameter

ICU defines "diameter" as a "straight line passing through the center of an object from side to side." RJCCPS at 4. Braun counters that it means "a straight line passing through the center of a circle and meeting the circumference or surface at each end." Id. The disagreement, then, concerns whether a "diameter" can pass through a non-circular object.

Once again, both parties begin their definition of the term with the dictionary, which defines "diameter" as:

1 . . . a. a straight line passing through the center of a circle or sphere and meeting the circumference or surface at each end. b. a straight line passing from side to side of any figure or body, through its center. 2. The length of such a line. 3. the width of a circular or cylindrical object.

Random House Unabridged Dictionary 547 (2d ed. 1987). The parties are consequently asking this Court to choose between two equally applicable dictionary definitions. In this context, the Federal Circuit has instructed that,

because words often have multiple dictionary definitions . . . the intrinsic record must always be consulted to identify which of the different possible dictionary meanings of the claim terms in issue is most consistent with the use of the words.
by the inventor. . . . If more than one dictionary definition is consistent with the use of the words in the intrinsic record, the
claim terms may be construed to encompass all such consistent meanings.

WL 2248109 (Fed. Cir. 2004). Under this rule, this Court finds that Braun's definition is "most consistent" with the use of
the word in the patent.

ICU points to two examples in the specification that it contends demonstrates the correctness of its interpretation. First, ICU
points to the statement in the context of the description of an embodiment that "during compression of the seal 36a, the
diameter of the ringed wall portions 94 expand outward in the radial direction." Col. 12:13-15. However the "ringed wall" is
circular and thus is consistent with Braun's definition. Second, ICU cites a preferred embodiment that "has a bell-shaped
skirt and an upper, preferably cylindrical, conduit." Col. 6:65-67. Apparently it is ICU's contention that the excerpts use of
the term "preferably" alludes to the possibility of non-circular shapes. The excerpt, however, doesn't even use the term
"diameter." Moreover, the shapes it does refer to are circular, in that a cross section of a "bell-shaped skirt" or a "cylindrical"
conduit would be a circle.

Each of the specification's uses of the term "diameter" correspond with circular objects. Col. 4:4-5 ("The O-ring elements
have increasing diameters, with the smallest diameter element begin [sic] adjacent the proximal end of the cavity."); Col.
7:12-24 (referring to the "outer diameter" of the "upper conduit" in Figs. 4, 5 and 19, which the diagrams depict as circular).

The term "diameter" shall thus be construed as proposed by Braun.

TFY disputes Cannon's charge that the district court improperly failed to apply the ordinary meaning in construing the claim
limitation "diaphragm disposed in the body." TFY basically repeats the analysis contained in the court's Markman decision,
which noted that the '850 patent specification uses the phrase "in the body" to describe an entirely-contained diaphragm and
uses the phrase "mounted thereon" to describe a partially-contained diaphragm. TFY also asserts that the prosecution history
supports the court's claim construction. According to TFY, in response to a § 112 rejection, the patentee amended the
language of the original claims from "mounting a [] diaphragm" to "diaphragm disposed in the body." Presumably viewing
the term "mounting" to encompass only a partially-contained diaphragm, TFY argues that Cannon should not be allowed to
recapture previously surrendered subject matter. TFY also downplays Cannon's reliance on a statement in the "Summary of
the Invention" as being too ambiguous to overcome the clear distinction in the way the specification describes entirely-
versus partially-contained diaphragms in the body.

We agree with Cannon that the district court improperly added the limitation "entirely" in its interpretation of the claim
limitation "diaphragm disposed in the body." As an initial matter, we note that the term "in" is a simple, non-technical term,
and that under its ordinary meaning, a "diaphragm disposed in the body" includes both diaphragms contained entirely and
partially in the body. See Brown v. 3M, 265 F.3d 1349, 1352 (Fed. Cir. 2001) (recognizing that claim terms may not be
technical terms of art, and do not require elaborate interpretation). For example, a trash bag is "in" a trashcan even though a
portion of it is hanging outside of the trashcan.
Moving on from the question of plain meaning, we next address whether there is any justification for deviating from it. As discussed in Phillips v. AWH Corp., 415 F.3d 1303, 1316-17 (Fed. Cir. 2005), we may depart from the plain meaning of a claim term when the patentee has acted as a lexicographer or when the patentee has clearly limited the scope of the invention through a disclaimer in the specification or prosecution history. We conclude that neither situation occurred here.

As the district court recognized, the patent uses the phrase "in the body" in one instance to describe a diaphragm that is contained entirely within the body of the pump, and the phrase "mounted thereon" in another instance to describe a diaphragm that is contained partially within the body of the pump. These two cited instances, however, do not clearly indicate that the patentee intended to assign a more narrow definition to the phrase "in the body" than it would otherwise possess. See, e.g., Elekta Instrument S.A. v. O.U.R. Scientific Intl, 214 F.3d 1302, 1307 (Fed. Cir. 2000) (for a patentee to act as its own lexicographer defining a claim term differently from its ordinary meaning, the specification must clearly indicate the patentee's intent to do so). Although the phrase "mounted thereon," which indicates that at least a portion of the diaphragm is on the outer surface of the body of the pump, may have a somewhat different meaning than the phrase "diaphragm disposed in the body," the two phrases are not mutually exclusive, viz., a diaphragm "mounted thereon" the body can also be a "diaphragm disposed in the body," as the second embodiment of the specification shows. Thus, the specification uses different words to highlight the different ways that a diaphragm may be placed in the body of the pump. Moreover, contrary to TFY's position, the specification unambiguously uses the phrase "in the body" in the "Summary of the Invention" section to refer to diaphragms that are contained both entirely and partially in the body of the pump. '850 patent, col. 2, ll. 16-24. And the fact that the specification contains figures of embodiments that are both entirely and partially in the body is a strong indication that the claims were intended to encompass both.

Our review of the prosecution history also does not clearly indicate that the patentee intended to disclaim coverage in the claims for diaphragms that are not contained entirely within the body of the pump. See Omega Eng'g v. Raytek Corp., 334 F.3d 1314, 1325-26 (Fed. Cir. 2003) (requiring a disclaimer of subject matter in the prosecution history to be "clear and unmistakable"). Although the patentee amended the claims, which originally recited "mounting a [] diaphragm," to a "diaphragm disposed in the body" in response to a § 112 indefiniteness rejection, that was not a clear disavowal of subject matter that was not completely in the body. In his correspondence, the patent examiner did not reject the originally-filed claims on the grounds that the claims containing the limitation "mounting a [] diaphragm" read on the prior art or was unsupported by the specification as filed. Rather, the examiner took issue with the apparatus claims being "narrative in form and replete with indefinite and functional or operational language." In making the amendment, the patentee merely replaced "operational" language, i.e., "mounting a [] diaphragm," with definite structural language, i.e., a "diaphragm disposed in the body." We are thus hard-pressed to conclude that there has been a surrender of subject matter when the patentee has merely amended the claims to replace an original phrase with a different, but not narrower, amended phrase. At a minimum, this was not a "clear and unmistakable" disclaimer.

1150

2. What is the Proper Construction of the Terms "barrel" and "die" in the '092 and '948 Patents?

Claim 1 of the '092 patent and claim 1 of the '948 patent contain the terms "extruder barrel" and "die." KXI and Culligan dispute where the "extruder barrel" ends and the "die" begins. KXI contends in both patents the "extruder barrel" and "die" are co-joined tubes, the "extruder barrel" the part that houses the extrusion screw, and the "die" the part that does not house the extrusion screw. Essentially, KXI's position is that the die begins where the helical flights of the extrusion screw end. Culligan contends in both patents the "die" is a distinct structure from the "barrel." Culligan contends the "die" is the structure that imparts shape and form to the feed mixture, and the "barrel" is the structure that houses the feed screw.

In support of its construction, KXI cites column 3, lines 2-5, 19-20, and 35-42 of the '092 patent, and column 3, lines 8-11, 25-26, and 41-48 of the '948 patent. Here, the specifications state:

The feed bin 10 feeds into an extruder barrel 12 which contains a feed screw 14. The feed screw 14 comprises a solid core 16 surrounded by conventional helical flights 18. . . . The output end of the extruder barrel 12 feeds the input end of a die assembly 24 . . . .
KXI argues this passage defines the term "extruder barrel" as the structure containing the feed screw.

In support of its construction, KXI cites a 1996 letter written by Joseph Jochman, Esq. to Plymouth. Jochman was Plymouth's outside patent counsel at the time. The letter concerned changes Plymouth contemplated making to its carbon block extruder. Plymouth had contemplated removing flights from the extrusion screw. Jochman stated "the removal of a few downstream flights from the extruder screw would result in a de facto extension in the upstream direction of the die cavity. In other words, the flightless part of the extruder barrel in effect becomes part of the die." KXI argues the Jochman letter is extrinsic evidence, and should be considered to show that Culligan, through its patent counsel, agrees with KXI's interpretation of the terms "extruder barrel" and "die."

In support of its construction, Culligan cites figures 1 and 3 accompanying the '948 and '092 patents, reproduced supra. These figures depict the extruder, including the extruder barrel, referred to as "12," and the die, referred to as "26." Culligan argues that the figures depict the extruder barrel (12), and the die (26), as two separate tubular structures. Culligan argues the separate structures are distinguished by the beginning and end of their respective tubes, and not by the ends of the extrusion screw's flights. Culligan argues the position of the "input end of the die" as depicted in the figures accompanying the '948 and '092 patents is downstream from the expansion flange (56) and well downstream from the points where the flights on the feed screw terminate in the barrel (12).

Culligan argues KXI's definitions of the terms "extruder barrel" and "die" are inconsistent with the '948 and '092 patents' specifications. According to Culligan, the patents describe the extruder barrel and die as two structures, and do not define either one by the extrusion screw. Culligan cites the '092 patent at column 3, line 2-5 and the '948 patent at column 3, lines 8-11, which state that the extruder barrel "contains a feed screw 14" and that the feed screw "comprises a solid core (16) surrounded by conventional helical flights 18." Culligan cites the '092 patent's specification at column 3, lines 25-26 and the '948 patent's specification at column 3, lines 31-32, which state that "the input end of the die 26 is provided with heating elements 28[.]"

Culligan argues that KXI's interpretation of the meaning of the terms "extruder barrel" and "die" is not supported by the prosecution history. During the prosecution of the '948 patent, the application was rejected over the prior art Zavasnik extruder, which does not contain a feed screw. Culligan points out that both the patentee and the examiner described the Zavasnik extruder as having an "extruder barrel (11)" and an "extruder die (26)." Culligan argues this description "directly undercut[s] current logic, which would define the entire Zavasnik extruder as a 'die' because no portion of the extruder tubes contains a screw."

KXI responded that Culligan's argument is based on a mistake. The Zavasnik patent includes figures that depict the invention, reproduced supra. The different parts of the invention are numbered in the figures. According to KXI, during prosecution of the '948 patent, the examiner called the structure denoted as "11" the "barrel," and the patentee called it the "die." KXI argued that throughout the prosecution, the patentee's position was that "11" represented the "die." According to KXI, however, the patentee accidentally adopted the examiner's terminology and called "11" the "barrel" "once, maybe twice" during the prosecution.

Culligan argues that KXI defines the terms at issue contrary to the common meaning of "die." As support for its position, Culligan cites the McGraw Hill Dictionary of Scientific and Technical terms which defines "die" as "[a] tool or mold used to impart shapes to, or to form impressions on, materials such as metals and ceramics." McGraw-Hill Dictionary of Scientific and Technical Terms (4th ed. 1989).

The court finds there is no reason to define the term "extruder barrel" by where the extruder screw ends. The court gives the ordinary meaning to the terms. Accordingly, the court will construe "extruder barrel" and "die" as separate structures, the "extruder barrel" being the structure that houses the feed screw, and the "die" being the structure that imparts shape and form to the extrudate.
In construing the claims of a patent, "the inquiry into how a person of ordinary skill in the art understands a claim term provides an objective baseline from which to begin claim interpretation." Phillips v. AWH Corp., 415 F.3d 1303, 1313 (Fed. Cir. 2005) (en banc). "The person of ordinary skill in the art is deemed to read the claim term not only in the context of the particular claim in which the disputed term appears, but in the context of the entire patent, including the specification." Id.

During prosecution, a patent applicant may consistently and clearly use a term in a manner either more or less expansive than it is used in the relevant art, thereby expanding or limiting the scope of the term in the context of the patent claims. However, in order to disavow claim scope, a patent applicant must clearly and unambiguously express surrender of subject matter during prosecution. Middleton, Inc. v. Minn. Mining & Mfg. Co., 311 F.3d 1384, 1388 (Fed. Cir. 2002).

In construing patent claims, a court should consult the patent's prosecution history so that the court can exclude any interpretation that was disclaimed during prosecution. Phillips, 415 F.3d at 1317. Disclaimers based on disavowing actions or statements during prosecution, however, must be both clear and unmistakable. Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1326 (Fed. Cir. 2003). Moreover, "it is the applicant, not the examiner, who must give up or disclaim subject matter that would otherwise fall within the scope of the claims." Innova/Pure Water, Inc. v. Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1124 (Fed. Cir. 2004); see also Bell Atl. Network Servs., Inc. v. Covad Comm'n's Group, Inc., 262 F.3d 1258, 1273 (Fed. Cir. 2001) (Holding that, unlike the statement of an applicant, the statements of an examiner will not necessarily limit a claim.)

In this case, the language in claim 1(e) requires that the first and second materials have "different characteristics." The claim does not limit these differences to any particular sub-set of the broad term "characteristics." In other words, according to the claim language any difference in characteristics between the two injected materials would satisfy the claim language. Thus, a difference in color alone would satisfy the "different characteristics" limitation. The color would be the characteristic that differs.

In the context of the invention, the primary point of a sequential molding method would seem to call for some differences in the separately molded materials. Obviously a product made of a single uniform material could be produced in a single molding step. As long as the sequential materials differ in some respect, however, the patent does not specify any particular characteristic that must differ to satisfy the "different characteristics" limitation. The breadth of the claim language suggests that any difference in characteristics justifies the sequential molding process. As long as the characteristics differ, the patent does not specify further the nature of the difference.

To reinforce this interpretation of the claim language, the specification of the '184 patent states: "The first and second plastic materials may be either the same material or different materials." '184 patent, col. 9, ll. 17-18. This passage emphasizes that the material injected into the molds may be "the same." This reference suggests again that the first and second injection could use plastic with the same molecular structure. In that case, the "different characteristics" limitation would require some difference other than molecular structure, such as color.

In the specification the inventor also offers examples of a number of characteristic differences in materials that would justify separate molding steps. One of these is transparency. See '184 patent, col. 3, ll. 11-43. Differences in transparency, like differences in color, are differences that may or may not be associated with molecular structure. Thus, the inventor made clear in the examples as well that a difference characterizeable in terms other than molecular structure would satisfy the "different characteristics" limitation. However, the inventor does not limit the invention to these examples. In other words, the inventor does not disclaim, in the specification or claims, any particular difference in characteristics of the materials used in the sequential molding steps. In sum, the claim language and the specification show that color differences would suffice to satisfy the broad "different characteristics" limitation.

The prosecution history of the '184 patent similarly shows no disavowal of claim scope in relation to material characteristics. The inventor amended claim 1 a number of times in response to rejections for obviousness over prior art. In the original application, claim 1(b) specified "injecting a first plastic material into the first mold cavity," and claim 1(e) specified "injecting a second plastic material into the second mold cavity while the first plastic material component is contained therein." The examiner rejected claim 1 under 35 U.S.C. § 103 as obvious, citing U.S. Patent Nos. 4,422,995 (filed Dec. 7, 1981); 3,543,338 (filed Nov. 6, 1969); 3,832,110 (filed June 16, 1972); and 4,459,256 (filed March 22, 1982). To the examiner, these references would have made it obvious at the time of invention to use "the concept of a stabilizing region" in a multi-step molding process. In the rejection, the examiner noted that "the particular materials selected to be
molded area mere matter of choice depending on the product desired and are of no patentable consequence to the claimed process." This comment showed that the examiner based the obviousness rejection upon stabilization in a multi-step process, not on the characteristics of the materials used in the injections.

On January 11, 1989, the inventor attempted to overcome the obviousness rejection by amending claim 1 to specify that the final product would require laminated walls. The inventor also modified steps 1(b) and 1(c) to specify that the first or second plastic material would be injected until it reaches the parting line between the common mold part and the complementary mold part. On April 27, 1989, the examiner again rejected the amended claims for obviousness over the same prior art.

On July 11, 1989, the examiner had a telephone interview with the inventor concerning the amended (and rejected) claim 1. The examiner's record of this interview, in its entirety, is:

Discussed meaning of parting line and fact that two different materials with different properties are used. An amendment changing these limitations may not be entered.

Two weeks later the inventor filed a continuing application, amending claim 1 to include a requirement, in the preamble, that the molded product contain "a closed end and an open end terminating in a rim at the open end," and adding the phrase "having different characteristics than the first plastic material" to claim 1(e). 1 The inventor also amended the abstract with the addition: "A second plastic material having different characteristics than the first plastic material is injected until it reaches the portion of the second mold cavity that defines the rim of the product to form a laminated wall." The inventor explained these changes as:

better distinguishing the present invention over the art of record by defining a rim of the molded product, pointing out that both the injection of the first plastic material and the injection of the second plastic material reach the respective portions of the first and second mold cavities that define the rim of the product, and further pointing out that the first and second plastic materials have different characteristics.

The examiner then allowed the claims.

Footnotes

1 The inventor also changed claims 1(h) and 1(i) to point out that the first and second plastic materials reached the portion of the relevant mold cavity that defines the rim of the product.

This final exchange between the inventor and the examiner during prosecution appears to have misled the administrative judge. Nevertheless, the exchange in no way shows a clear and unambiguous disavowal of the broad scope of the claim language. In other words, the prosecution history does not disavow the broad scope of the claim language and specification that permit any difference in characteristics, including color. See Omega Eng'g, Inc., 334 F.3d at 1324. On this record, this court perceives no disavowal of scope. The claim thus excludes no specific differences in characteristics, and in particular differences in color, in the molded materials.

B. "Greater Than"

The '050 and '023 patent claims require that the insert means projections have a length that is "different from" the length of the inner hose recesses, and the '752 and '822 patents claim require that the insert means projections have a length that is "different than" the length of the insert means recesses. While the district court properly construed the claims of '050 and '023 patents to require that the length of the insert means projections be "different from" the length of the inner hose recesses, the court inexplicably construed the claims of the '752 and '822 patents to require that the length of the insert means recesses be "greater than" the length of the insert means projections. We believe the '752 and '822 patent claims
should have been construed similarly to the '050 and '023 patent claims to require that the length of the insert means recesses be different from or "not equal to," rather than "greater than," the length of the insert means projections. Since the structure and wording of the '752 and '822 patent claims is similar to the structure and wording of the '050 and '023 patent claims, we see no reason to construe the claims of the former two patents more narrowly than those of the latter two patents. Moreover, the structure and wording of the claims in these four patents is distinctly different from the language of the '686 patent claims, which requires that the recesses of the insert means be defined by a radius that is "longer than" a radius defining the length of the insert means projections. Thus, we construe the claims of the '752 and '822 patents to require that the insert means have projections and recesses, where the length of the projections is not equal to the length of the recesses.

3 The district court, however, mysteriously construed the term "predetermined length" in reference to the '050 and '023 patents, even though this term does not appear in any of the claims of those patents.

TCI argues that the district court's claim construction was correct in light of the patent specification's description of insert means recesses with a greater length than the insert means projections. We disagree, because although we construe claims in light of the teaching of the specification, we do not treat characteristics of a preferred embodiment as claim limitations.

GO BACK

1153

"Second Cleaning Step"

Unlike the first cleaning step, claim 1 does not limit how cleaning may occur in the second cleaning step, except that it must be different from the first cleaning step in the first location of the machine. Claim 1(e) provides a method for performing a second step of cleaning said coins, different from said first step of cleaning, while said coins are in said second location." Therefore, the only limitations upon the construction of this claim is that (1) separation of liquid or debris must take place while the coins are in the second location of the apparatus but before the coins reach the sorter; (2) separation must occur in a manner that will prevent damage to the machine; and (3) the method of cleaning must be different from the first step of cleaning.

7 CoinBank contends that the method of cleaning in the second location must not be performed by a restriction in the flow of coins, arguing that Coinstar expressly disclaimed this method of cleaning in overcoming the examiner's earlier rejection of the patent in suit based on prior art. CoinBank asserts that the De Meyer patent disclosed a mounting plate that restricted the flow of coins from a funnel to a storage hopper, similar to the blocking plate on the CBII and CBIII. In arguing to the examiner that the '546 patent was distinguishable from the De Meyer patent, Coinstar emphasized that the '546 patent had two different cleaning steps in two different locations of the machine. Since De Meyer had a cleaning step in the coin depository (a perforated bottom plate) and a mounting plate that restricted the flow of coins in the second location, CoinBank asserts that a restriction in the flow of coins cannot be claimed as a second cleaning step.

The problem with this contention is that the drawings in the De Meyer patent indicate that the mounting plate "flow restricter" is actually larger than the gap through which the coins slide from the coin depository to the internal funnel (and mounting plate) of the De Meyer device. If the gap through which the coins enter the machine from the coin depository is narrower than the mounting plate, then this restricted path flow could not have performed a "cleaning" function in the De Meyer patent.
4. "arms of different lengths," "arms have dissimilar lengths," and "the at least one and the second arm have dissimilar lengths"

Braun construes the phrases "arms of different lengths," "arms have dissimilar lengths," and "the at least one and the second arm have dissimilar lengths" to mean "arms which have different ending points on the axial dimension." (D.I. 74 at 19) Terumo instead believes these phrases should be given their ordinary and customary meaning and, therefore, has not provided any proposed construction. (D.I. 71 at 28) The issue is whether these "arms of different lengths" terms refer to ending points (Braun's view) or instead refer to a measurement of distance from one end of the arms to the other (Terumo's view). I believe they refer to ending points.

Braun relies on the specification to support its construction. (D.I. 99 at 15) For example, the patent states: "the end walls 130 overlap one another at a location distally in front of the needle tip, thereby to form a barrier that prevents inadvertent contact with, and distal movement of, the needle tip." (‘613 patent, col. 10 lines 6-9) Braun emphasizes that overlapping arm ends are necessary to block the needle tip, which is the essence of the invention. (See, e.g., Tr. at 82 ("[T]he needle guard has to fit into a small catheter hub and the overlapping arms permit a double protection mechanism from the tip escaping within the small space."); id. at 83 ("[I]f you didn't have overlapping arm ends, the arms wouldn't effectively block the needle tip."); id. at 84 ("The purpose, the whole purpose behind having the arms of different lengths is the overlapping end.").) As Braun further points out, "nowhere in the patent specification does the patent suggest measuring arm lengths or measuring lengths from Point A to Point B as the determination for meeting this claim term." (Tr. at 83)

It is true, as Terumo has explained, that one can accomplish different ending points with arms of the same length. (D.I. 97 at 22-23) ("[A]t least in some embodiments, it is possible to use arms of the same length to achieve arms with different end points in the axial dimension. For example, if the proximal wall was angled (rather than being perfectly vertical), then two arms of the same length extending from the proximal wall would have different ending points in the axial dimension.") Nothing about Braun's proposed construction neglects this reality nor excludes such an embodiment from the scope of the patent claim. Indeed, at the hearing, Braun's counsel conceded the basic geometric fact that arms having the same absolute length (i.e., distance from front to back) can still have different ending points and accomplish the purpose of the invention. (Tr. at 84) This demonstrates that the "arms of different lengths" terms in this patent are not being used in their ordinary meaning.

Therefore, I recommend that these terms be construed to mean "arms which have different ending points on the axial dimension."

"a plurality of different sets of elements"

Claim 5 of the '662 Patent and Claims 1, 11, and 18 of the '767 Patent contain the term "a plurality of different sets of elements." SHURflo contends that "a plurality of different sets of elements" means "at least two or more sets of elements, the sets different from one another in either the number of elements in each set or the kind of elements in each set." Defendants contend that the term means "at least two or more sets of elements lacking common elements whereby each set is uniquely tailored to a particular pump configuration." The parties disagree as to whether a set of elements can share common elements with another set of elements.

SHURflo asserts that its proposed construction is consistent with the ordinary meaning of the words, but presents no support for its narrowing of the claim language by inserting a limitation that the differences in each set be differences in number or kind of elements only. The claim language and specification allow for a situation where two different sets may have the same number and kind of elements, but are perhaps arranged differently to hold differently configured pumps to the housing. Thus, SHURflo's proposed construction is too narrow and improper.
Defendants assert that the specification and the prosecution history support their proposed construction. Specifically, the specification provides that "[e]ach set of elements or features preferably is exclusive in that element or elements in any given set do not cooperate with the element or elements of any other set in holding a pump to the housing." '662 Patent, col. 2:12-15. In addition, Defendants argue that the prosecution history supports their proposed construction because the patentee argued during prosecution that the different sets of elements were novel in order to overcome the Hoss prior art reference cited by the U.S. Patent and Trademark Office. Defendants focus on the following paragraph in the prosecution history:

With reference to FIG. 12 and to column 4, line 35 to 5, line 60 of Hoss, these sets 58, 60 of support elements are clearly designed for one specific type or "configuration" of engine and not for more than one engine having different configurations. Similarly, none of the other references cited by the Examiner employ different sets of elements adapted to hold or secure different types of pumps as claimed in each of claims 4, 5, 7, 34, and 41 of the present application. In each case, the sets of elements used are specifically adapted to hold one (and only one) type or "configuration" of device.

Defendants' Responsive Brief, Exhibit K, at 3. Defendants contend that the italicized phrase is referring to the claims of the '662 Patent, not the prior art references, and that the phrase represents the patentee's narrowing of the claim term during prosecution.

In response, SHURflo first argues that Defendants' proposed construction seeks to limit the claims to the preferred embodiment of the invention. A preferred embodiment disclosed in the specification is not a claim limitation, and the Court refuses to import the "exclusivity" limitation from the preferred embodiment into the claims. See Phillips, 415 F.3d at 1323. Second, SHURflo contends that Defendants' reliance on the prosecution history to support its "exclusivity" argument is misplaced. SHURflo argues that the italicized phrase is referring to the prior art references, not the claims of the '662 Patent, and nowhere does the patentee assert the absence of common elements in any of the plurality of "different sets of elements."

The prosecution history does not support Defendants' argument. In the quoted paragraph above, the patentee is merely arguing that each of the different sets of elements was adapted for differently configured pumps, not that the sets of elements could not share elements or that each set of elements could only fit one pump. Because the disclaimer of claim scope is not clear and unmistakable, the doctrine of prosecution disclaimer does not apply in this case. See Computer Docking Station Corp., 519 F.3d at 1374. Accordingly, the Court rejects both parties' proposed constructions and construes the term "a plurality of different sets of elements" to mean "two or more sets of elements where no two sets are the same."

IV. Different Size and Shape"

Claim 11 claims the kit of claim 1 wherein one of the stems "has a different size and shape" as another of the stems (9:8-10), claim 12 claims the kit of claim 1 wherein one of the bodies "has a different size and shape" of another of the bodies (9:11-13), and claim 13 claims the kit of claim 11 wherein one of the bodies "has a different size and shape", of another of the bodies (9:14-16). DePuy argues that the terms "size" and "shape" should simply be given their ordinary and/accustomed meanings. Zimmer, on the other hand, argues that "different shape" is indefinite under 35 U.S.C. § 112 P 2, rendering claims 11-13 invalid, and moves for summary judgment accordingly.

35 U.S.C. § 112 P 2 states that patent claims must "particularly point[] out and distinctly claim[] the subject matter which the applicant regards as his invention." The standard for determining whether a patent claim is sufficiently definite to satisfy this statutory requirement is whether "one skilled in the art would understand the bounds of the claim when read in light of the specification." Exxon Research & Eng'g Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001). In other words, the standard is "whether the claims at issue are sufficiently precise to permit a potential competitor to determine whether or not he is infringing." Id. (internal quotation omitted). Determination of claim indefiniteness is a question of law drawn from my duty as construer of patent claims. Id. at 1376.

While DePuy asks me to look at the terms "size" and "shape," and Zimmer asks me to examine the meaning of "different shape," the only way to proceed is to determine whether, in their entirety, the claims containing the "different size and shape" language can be construed. If a claim is insolubly ambiguous such that no narrowing construction can properly be
adopted, the claim is statutorily indefinite. Id. at 1375. If, however, the meaning of a claim is discernible, "even though the task may be formidable and the conclusion may be one over which reasonable persons will disagree," the claim is sufficiently clear to avoid invalidity on indefiniteness grounds. Id.

The phrase "different size and shape" is susceptible to two distinct meanings. The first reads "different size and shape" as meaning "different size and different shape," and thus objects that are the same shape but different sizes or objects that are the same size but different shapes are not of "different size and shape." The other way to read the phrase "different size and shape" is to read it as meaning "not the same size and shape," that is, as the opposite of "same size and shape." Under this reading, if two objects do not have both the same size and the same shape as one another, they are of "different size and shape." Reading the specification, it becomes clear that this second reading is the proper interpretation of the claim. The specification indicates that the purpose of a kit containing components of various shapes and sizes is to provide a wide variety of options in creating a prosthesis to fit an individual patient. (3:46-50.) This purpose is satisfied so long as each of the various types of components are not identical to one another. For example, a kit containing two heads of the same size and shape, two bodies of the same size and shape, and two stems of the same size and shape would not provide the flexibility described in the specification. It is immaterial, however, whether the two heads, two bodies, and two stems have only different sizes, only different shapes, or both. If the kit contained, for example, two different shaped bodies of roughly the same size, the described flexibility would still be present. Likewise, if the kit contained two bodies of the same shape in two different sizes, the described flexibility would be present. Thus, the specification points toward the proper interpretation of "different size and shape" as meaning "not the same size and shape." Further, because the proper meaning of "different size and shape" has thus been discerned, the claims are not invalid on indefiniteness grounds. See Exxon Research & Eng'g Co., 265 F.3d at 1375.

The next limitation in claim 31 provides:

and a second differential expansion portion adjacent said limited expansion portion expandable by said initial injected fluid with the limited expansion portion above the collapsed implantation position

The parties agree that the differential expansion portion is a second portion or part of the cover capable of expanding further than the limited expansion portion and that can expand with the limited expansion portion by the initial injected fluid above the collapsed position. The written description only describes the two cover portions as being "joined," col.2, lines 4-7, and all the figures show that limited expansion portion next to or connected to the differential expansion portion. It appears that for this particular term, the general usage of the word "adjacent" is what the inventor intended.

The court finds this limitation means "another portion of the cover, joined to the limited expansion portion either directly or through a tapered portion, capable of expanding differently from but expandable with the limited expansion portion by the initial injected fluid above the collapsed position."

As used in the claims, a diffuser is used to add the nitrogen to the foam concentrate (i.e., "introducing a gas comprising nitrogen under pressure to said stream of foam concentrate/liquid mixture by a diffuser/dispenser apparatus"). The specification explains that "[t]he foam is expanded and dispersed through a diffuser/dispenser apparatus that functions to introduce pressurized nitrogen into the water/foam concentrate stream to expand the foam and to dispense the expanded foam." '965, 4:62-65. The Court construes "diffuser" to mean "an apparatus that introduces pressurized nitrogen into the water/foam concentrate stream to expand the foam." The Court construes "diffuser/dispenser apparatus" to mean "an apparatus that introduces pressurized nitrogen into the water/foam concentrate stream to expand the foam and to discharge the expanded foam."
5. Diluting and Will Again Tumble

The construction of the phrase "diluting…and spinning…such that said fabric will again tumble" is in dispute. It appears in the following context: "after said first period of time, diluting said concentrated detergent solution to a lesser detergent concentration level, no less than 0.28 % by weight, and spinning said wash chamber to effect less than a one gravity centrifugal force on said fabric such that said fabric will again tumble" ('370 patent, claims 1, 8, 15.)

Whirlpool argues for the following construction: "This claim step means that after the first period of time, the detergent solution is diluted to a lower detergent concentration level of at least 0.28 % by weight. Also, after the first period of time, the wash chamber must again be spun at a speed effecting less than one gravity of centrifugal force on the fabric such that the fabric 'will again tumble' in the wash chamber. This diluting claim step occurs at some point following the first period of time; therefore this step must occur after the recirculating spray and the tumbling action have stopped (i.e., actions which characterize the first period of time)."

LG argues for the following construction: "After the first predetermined period of time (i.e., predetermined concentrated wash period), diluting the concentrated detergent solution to a fixed, lesser detergent concentration level, no less than 0.28 % by weight, and spinning the wash chamber…to cause the fabric to tumble in a wash chamber. Dilution of the concentrated detergent solution is initiated as the result of the completion of the predetermined concentrated wash period (i.e., not as a result of maintaining a predetermined liquid level in the wash chamber)."

The issue in dispute is whether the claim requires the tumbling action to stop between two steps. Whirlpool argues that the recirculating spray and tumbling action occurs in a first step, then stops during the dilution, and then resumes again in a second step. LG maintains that the claims permit the recirculating spray and tumbling action to continue uninterrupted, with no intermittent termination of wash chamber rotation. The Court can find nothing in the plain language of the claims requiring the tumbling to stop and start again. Whirlpool's dictionary definitions do not require the construction it seeks. The word "after" defined as "behind in place or order" or "at a later time than" contains no requirement for an interruption between two actions-it only requires that the one follow the other. See AMERICAN HERITAGE DICTIONARY. Likewise, "again" defined as "once more; a new" does not require an interruption. See AMERICAN HERITAGE DICTIONARY. The claim states that "after the first period of time," the fabric will "again tumble," which can be understood to mean that when the first period ends and the next step ensues, the fabric continues tumbling without having stopped. 1 Neither does the word "then" separating two steps necessarily require a break in an action; a first step can occur, and then another step following it, without the tumbling action ceasing and restarting. 2

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

1 Fabric can alternate between tumbling and not tumbling without a stop in the chamber's spinning. Fabric tumbles when the rotation is at less than 1 gravity, while it sticks to the outside of the chamber when rotating at more than 1 gravity due to centrifugal force.

2 Whirlpool illustrates its construction of the word "then" with the following example: "He stayed up late watching the movie, then went to bed." The person in Whirlpool's example watches a movie, stops, and then does something else. But the word "then" can readily be used in a context involving no stopping and starting, but rather an uninterrupted transition. For example, "He drove at 65 miles per hour, then drove at 55 miles per hour."

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

Whirlpool argues, and the Court agrees, that the prosecution history discloses a process involving distinct steps. In response to the examiner, Whirlpool characterized its invention as involving "two distinct spraying steps," first, "a concentrated spray and tumble step," and second, "a diluted spray and tumble step." (Response to Second Office Action at 3, Whirlpool Br. Ex. 12.) This description evinces that the difference between the two steps is that in the first step the spray is concentrated, where as in the second step the spray is diluted. Nothing in this description, however, suggests that the tumbling must stop and restart between the steps, even if the chamber spins at different speeds at various times.

Accordingly, the Court adopts LG's construction that "diluting and tumbling again after the first period of time" does not require the tumbling to stop between steps. The claim includes a scenario where clothes continuously tumble without
"Dimension" appears at various points throughout the '511 Patent, in the same context as the effective active region and the radiant energy detector previously discussed. Plaintiff argues that the term means the length or width of the interface between the detector and the incident x-ray beam, and Defendant has not proposed a definition. However, the Court does not find any language about length or width in the '511 claims. The Court finds neither the specification nor the patent prosecution history useful in defining this term. Since the intrinsic evidence does not provide much guidance as to the proper construction of the term, the Court finds it appropriate to consult the dictionary. "Merriam-Webster dictionary defines "dimension" as "measure in one direction, one of three coordinates determining a position in space." Accordingly, the Court FINDS that "dimension" as defined in the '511 Patent means a measure in one direction.

a. "dimensionally stable"

DuPont proposes this construction of the term "dimensionally stable": "a polymeric substrate that results in a flexographic printing plate having thermal distortion of less than 0.03% when developed at temperatures between 100 and 180[degree]sC, or [results in] an individual polymeric substrate having less than 0.07% distortion when heated to temperatures from 110 to 180[degree]sC". (DuPont Opening Br. at 21.) The first component of this proposed construction deals with the meaning of the term "dimensionally stable" as used in claim 1. ('758 Patent at col. 8, lines 18-25.) The second component addresses the use of this term in claim 19. (Id. at col. 10, lines 1-6.)

MacDermid proposes this construction, which it actually modified over the course of the claim construction proceedings:

A flexible polymeric substrate whose dimensional stability has been controlled through a special annealing process, namely an annealing process that: (1) is in addition and subsequent to the heat treating steps associated with manufacturing the polymeric film, (2) is not the process of bonding the photosensitive elastomer layer to the polymeric substrate, and (3) comprises: (i) heating the substrate to a temperature above its glass transition temperature but below its melting temperature and at or greater than the temperature to which the substrate is later subjected during thermal development, (ii) at tensions of less than 200 psi, and (iii) for a time greater than the time required to bring the film to the annealing temperature, such that a specially annealed substrate has less thermally induced distortion than a non-specially annealed substrate.

(MacDermid Supplemental Br. at 3-4.) The parties devoted much attention to this term in their briefing, with the supplemental briefing exclusively concerned with the proper construction of this term, and at the Markman hearing. They raise a range of complicated issues, but the heart of the dispute appears to be over whether the claim term at issue here should be construed as limited to a so-called "special annealing process."

DuPont argues that: (1) its own construction is supported by (a) the plain language of claim 1, which defines "dimensionally stable" by reference to the thermal distortion limit of 0.03%, and (b) the specification, which also indicates that the term should be defined by reference to the thermal distortion limit and otherwise states that "[t]he present invention is a flexographic printing plate having a very low degree of thermal distortion during development" ('758 Patent at col. 1, lines 51-53); (2) MacDermid's proposed construction improperly imports process limitations from the specification into a product claim and otherwise improperly limits the claim to a preferred embodiment; (3) the specification lacks the clear disavowal required to adopt MacDermid's proposed construction; (4) the term "special annealing process" is not used in the claims; (5) the specification only mentions the term "special annealing process" once, in the context of discussing a preferred embodiment using semicrystalline polymers; (6) such semicrystalline polymers are actually claimed in dependent claim 7, and, under the doctrine of claim differentiation, this embodiment should not be read into the broader claim 1; (7) because of the examiner's determination that the applicants had to choose between the product and the process claims, the applicants
responded to the examiner's 35 U.S.C. § 103 obviousness rejection by stating:

Indeed, in their August 1995 response, the applicants repeatedly emphasized the whole notion of annealing. Aspirations repeatedly relied upon the "special annealing process", and the Appeals Board cited their annealing arguments to reverse the examiner's rejections; (9) the prosecution history otherwise lacks any such disavowals; (10) MacDermid's requirement in subsection (1) of its proposed construction that the annealing process be in addition and subsequent to the heat treating steps associated with manufacturing the film is not found in the claims themselves; (11) MacDermid's additional requirements, found in subsections (2) and (3) of its proposed construction, also are not found in either the claims, the specification, or the prosecution history; and (12) these additional steps are actually covered in dependent claims 9 and 16 and therefore it would be inappropriate to read them into claim 1 given the claim differentiation doctrine. (DuPont Opening Br. at 17-20; DuPont Responsive Br. at 2-12; DuPont Supplemental Br. at 1-20; Tr. at 69-84, 186-94.)

MacDermid, in contrast, argues that: (1) DuPont's proposed construction ignores the requirement of a special, further, and important annealing step, which was used by the applicants to secure the issuance of the '758 patent; (2) DuPont's proposed construction collapses the term "dimensionally stable" into the term "thermal distortion", thereby effectively eliminating the "dimensionally stable" limitation from the claim itself; (3) DuPont's approach improperly grants it a right to exclude as to all thermally developed plates with favorable thermal distortion regardless of how this distortion result is achieved and even though the patent itself describes only one means to achieve this result; (4) the specification supports MacDermid's proposed construction because it: (a) describes the problem of thermal distortion, (b) states that a "special annealing process" solves this problem, (c) identifies the "special annealing process" as comprised of the three parameters of temperature, tension, and time, (d) discusses these three parameters in some detail, (e) notes that various annealing methods exist, such as air oven annealing, hot can annealing, or combinations of such methods, and (f) provides four examples wherein the annealed samples are compared to non-annealed samples; (5) the prosecution history further supports its proposed construction because -- to overcome the examiner's rejections, distinguish prior art, and prevail on appeal -- the applicants repeatedly relied upon the "special annealing process", and the Appeals Board cited their annealing arguments to reverse the examiner's rejections; (6) the extrinsic evidence, including the deposition testimony of an inventor, supports the "special annealing process" construction; and (7) as a matter of law, (a) the applicants intentionally and clearly disclaimed or disavowed the claim scope and otherwise disparaged non-annealed substrates and photosensitive plates made with non-annealed substrates, (b) the claims must be construed in light of the prosecution history, as the applicants successfully argued that their claims were enabled and distinguished from prior art due to the "special annealing process", (c) the extrinsic evidence, although less significant than the intrinsic evidence, should be viewed as supporting the proposed construction, (d) MacDermid's proposed construction does not improperly import limitations from a preferred embodiment, as it relies on the specification's identification of the "special annealing process" as the inventors' "discovery", and (e) the "special annealing process" should be treated as part of the product claims because the process steps form an essential part of the invention. (MacDermid Opening Br. at 8-20; MacDermid Responsive Br. at 15-25; MacDermid Reply Br. at 1-8; MacDermid Supplemental Br. at 1-29; Tr. at 92-142.)

Both parties have presented reasonable -- if complicated -- arguments for the Court to consider. But the Court agrees with MacDermid's proposed construction, in view of the specification and the prosecution history of the '758 patent itself.

As MacDermid explains, the patent specification repeatedly highlights the importance of annealing. The specification even states that "[t]he desirability of such semicrystalline polymers arises from the discovery that dimensional stability of these polymer substrates may be controlled through a special annealing process." (758 Patent at col. 2, lines 55-59.) In addition to mentioning different annealing methods, the specification explains this annealing process, focusing on temperature, tension, and time. (Id. at col. 2, lines 59-67, col. 3, lines 1-26.) The specification then provides four examples, in which the crucial distinguishing feature of the testing was whether the tested samples were in fact subjected to annealing. (Id. at col. 5, lines 26-66, col. 6, lines 1-67, col. 7, lines 1-67, col. 8, lines 1-16.) In turn, the applicants significantly found that the annealed samples showed less thermal distortion than their non-annealed counterparts. (Id.)

The prosecution history also supports MacDermid's proposed construction. In overcoming the examiner's rejections, the applicants repeatedly emphasized the whole notion of annealing. Indeed, in their August 1995 response, the applicants responded to the examiner's 35 U.S.C. § 103 obviousness rejection by stating:
The concept that all flexographic printing plates, including those disclosed in Martens and Prioleau, will have some "inherent" degree of thermal distortion, does not overcome Martens' and Prioleau's lack of teaching or suggestion as to the importance or desirability of dimensional stability. There is no basis for the inference that the inherent degree of distortion in Martens' and Prioleau's plates is in the range claimed. In fact, the Examples in the specification show that absent a critical annealing step, many polymeric films, including PEN and PET films, and plates made from such films do not meet the low distortion levels claimed in the present invention.

(Postruction History at 7-5 (emphasis added).) As to the 35 U.S.C. § 112 enablement rejection, the applicants argued "that Examples 3 and 4 additionally provide support and enablement for the invention as described in Claim 1." (Id. at 7-3.) In their subsequent January 1996 response, the applicants defended their claims against an anticipation rejection under 35 U.S.C. § 102 by asserting:

The rejection indicates that, nevertheless, Martens or Prioleau anticipate the present claims because they disclose substrate materials, e.g., polyethylene terephthalate, which the Examiner asserts "inherently have the characteristic of experiencing"low thermal distortion. There is no basis for the assertion that Martens' and Prioleau's plates or substrates inherently possess the degree of distortion in the range claimed. In fact, the Examples in the specification show that absent further treatment by annealing, many polymeric films, including polyethylene naphthalate and polyethylene terephthalate films, and plates made from such films do not meet the low distortion levels claimed in the present invention. Example 4, which discusses plates made with polyethylene terephthalate substrates, clearly demonstrates that not all polyethylene terephthalate films will yield plates having the claimed maximum distortion levels. The other examples show similar findings for polyethylene naphthalate films. Therefore, the specification clearly rebuts the assertion that polyethylene terephthalate films and plates made from such inherently have the characteristic of low thermal distortion as required by the claims. In view of the clear evidence set forth in the specification, Applicants respectfully assert that this rejection under 35 U.S.C. 102(b) is improper and should be withdrawn.

(Id. at 9-3 to 9-4 (emphasis added).) Responding to the obviousness rejection, the applicants again emphasized the importance of the annealing process:

The Martens patents and Prioleau are addressed to photosensitive plates and flexographic printing plates made therefrom having specific chemistry and construction. These patents do disclose that the plates can have polymeric substrates. The Examiner acknowledges that these references do not teach the important annealing step which enables one to achieve the very low degrees of distortion. Locey teaches a specific method of heat treating film to avoid draw lines which are out-of-plane distortions of biaxially oriented film. Lu teaches an alternate method of providing films that have thermal distortions less than 0.5%. However, Lu does not contain any specific showing that distortions of 0.07% or less can be obtained.

(Id. at 9-5 (emphasis added).)

The brief filed by the applicants with the Appeals Board contained even more pointed references to the "special annealing process." At the end of the "Summary of the Invention" section, the applicants stated:

Applicants have achieved such reduced levels of thermal distortion by subjecting the substrate of the plate to a special annealing process. This process is described at page 4, line 15 through page 6, line 190 of the specification.

(Id. at 12-6 (emphasis added).) They then reiterated many of the same arguments they had previously made to the examiner. Dealing with the anticipation rejection, the applicants stated that "the examples in the specification of the present invention show that absent further treatment by annealing, many polymeric films (including polyethylene naphthalate and polyethylene terephthalate films) and plates made from such films do not meet the low distortion levels claimed in the present invention." (Id. at 12-9 (emphasis added).) The applicants discussed the four examples, noting the different thermal distortion results obtained based on whether the samples had been annealed. (Id.) As to the issue of obviousness, the applicants emphasized that "[t]he Examiner acknowledges that these references do not teach the important annealing step which enables one to achieve the very low degrees of thermal distortion." (Id. at 12-11 (emphasis added).)

The applicants' contentions were successful, and the Appeals Board allowed the patent to be issued. The Appeals Board even relied on the annealing arguments in its June 29, 2000 decision, stating that:
Each of the § 102 rejections before us on this appeal is based upon the examiner's proposition that the respective plates of the applied references inherently possess limited distortion within the here claimed ranges because the prior art and here claimed plates may be manufactured from the same polymeric material, namely, polyethylene terephthalate. The appellants point out, however, that polyethylene terephthalate printing plates which are not annealed in accordance with their disclosed invention (i.e., the plates of Martens, Gibson or Worns) do not necessarily and inherently possess distortion values within the appealed claim ranges as evidenced by Example 4 including Table IV on pages 13 and 14 of the subject specification. Significantly, the examiner has not responded meaningfully to the appellants' point on this matter.

. . . . Under the circumstances recounted above, it is clear that the record before us on this appeal reflects that polyethylene terephthalate printing plates which have not been subjected to the annealing process disclosed by the appellants, that is, the plates of the references under consideration, do not necessarily and inherently possess the appellants' claimed distortion values.

(Id. at 18-3 to 18-4 (emphasis added).) The Appeals Board then "perceive[d] substantial merit in the appellants' arguments against the examiner's conclusion of obviousness." (Id. at 18-4.)

The Court thus construes the term "dimensionally stable" in light of the clear and unambiguous statements regarding the annealing process made in both the specification and over the course of the prosecution history. Cf., e.g., Novo Nordisk A/S v. Sanofi-Aventis U.S., No. 07-3206, 2009 U.S. Dist. LEXIS 62657, 2009 WL 2185905, at *8 (D.N.J. July 22, 2009) ("The Court concludes that the specification and the prosecution history do not include expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope, that demonstrate an intent to limit the invention to devices that have a gearbox and a non-rotatable piston rod" (citing Teleflex, 299 F.3d at 1327-28)). The Court therefore adopts the construction proposed by MacDermid.

1162

J. Claim 46

A device as in claim 31 wherein the wall means includes a dimensionally stable base.

The parties essentially agree that the wall means includes a part that is resistant to sudden change in width or length. The court finds this limitation means "a device as in claim 31 wherein the wall means includes a lower or bottom part that is resistant to sudden change in width or length."

1163

a. Preliminary Construction of Claim 1

The Court has received only excerpts of the '464 Patent's prosecution file history. The Court therefore will undertake only a preliminary construction of Claim 1 for the purposes of this preliminary injunction motion.

In construing claim terms, "the court should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification and, if in evidence, the prosecution history. Such intrinsic evidence is the most significant source of the legally operative meaning of disputed claim language." Vtronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996) (citation omitted). The Court should give the disputed claim terms "their ordinary and accustomed meaning as understood by one of ordinary skill in the art." Bell Atlantic, 262 F.3d at 1267; Phillips v. AWH Corp., 415 F.3d 1403, 1313 (Fed. Cir. 2005).

In addition to examining the intrinsic evidence, the Court may consider certain extrinsic evidence, "including expert and inventor testimony, dictionaries, and learned treatises." Markman v. Westview Instruments, Inc., 52 F.3d 967, 980 (Fed. Cir. 1995). While extrinsic evidence may be useful in "shed[ding] … light on the relevant art," it is "less significant than the intrinsic record in determining the 'legally operative meaning of disputed claim language.'" C.R. Bard, Inc. v. U.S. Surgical

For the purposes of this preliminary injunction motion, the parties agree that the only term in Claim 1 that requires construction at this time is the phrase "each said opening being dimensioned for the passage therethrough of a main body portion of a second identical tie down strap for the redirection of the second identical tie down strap when the elastic main body portion defining said opening is elongated."

Precision contends that the first part of this limitation, "each said opening being dimensioned for the passage therethrough of a main body portion of a second identical tie down strap" should be construed to mean that the openings along the main body portion of the strap must be large enough (i.e., "dimensioned") to allow the main body portion of a second identical tie down strap to pass through the opening. Precision contends that while this limitation implies a relative limit on the cross-sectional size of the main body portion, there are no limitations directed to the size of the main body portion found in the claim. Thus, it is Precision's position that the test for whether this claim limitation is satisfied is met is simply whether it is possible to pass the main body portion of another identical strap through the openings. [Doc. 38 at 16-17].

With respect to the second part of this limitation, "for the redirection of the second identical tie down strap when the elastic main body portion defining said opening is elongated," Precision contends that this phrase should be construed to refer to the impact of passing the second tie down strap through an opening in the main body portion of the first tie down strap. Precision argues that this limitation is best illustrated in Figure 10, which shows one of the straps (49) being forced to deviate from its straight-line path (44) by its placement through an opening in the crossing strap (38). [Doc. 38 at 18].

The Defendants contend, on the other hand, that the phrase "each said opening being dimensioned for the passage therethrough of a main body portion of a second identical tie down strap for the redirection of the second identical tie down strap when the elastic main body portion defining said opening is elongated" should be construed to mean that upon elongation of the first strap, the plurality of openings in the strap become dimensioned for the passage therethrough of a main body portion of a second identical tie down strap, thus permitting redirection of the second identical tie down strap. Specifically, the Defendants argue that the phrase "dimensioned for the passage therethrough" means that, upon elongation of the first strap, either:

(1) the width (X) of the openings of the first strap is greater than the depth (D) of the second strap and the length (Y) of the openings of the first strap is greater than the width (W) of the second strap; or

(2) the width (X) of the openings of the first strap is greater than the width (W) of the second strap and the length (Y) of the openings of the first strap is greater than the depth (D) of the second strap.

[Doc. 39 at 15].

Based on the record presented, the Court finds that the Plaintiff has failed to make a sufficiently strong showing that this claim should be construed to mean that the openings of the strap are large enough so that it is possible to pass a second strap therethrough. Plaintiff's proposed construction effectively reads out the "dimensioned for the passage therethrough" limitation required by the claim. The intrinsic evidence in the record makes clear that the strap becomes "dimensioned" for the passage therethrough of a second strap by the elongation of the first strap. See '464 Patent Abstract ("The openings . . . are dimensioned to receive therethrough a main body portion of another strap when the main body portion defining the opening is elongated"); Col. 2, lines 23-29 ("each opening being dimensioned for the passage therethrough of a main body portion of a tie down strap when the elastic main body portion defining the openings is stretched or otherwise elongated"); Col. 2, lines 54-55 ("each opening is stretchable to accommodate the passage therethrough by another strap"); Col. 5, lines 5-7 ("Hence, upon elongation of the strap 10, each opening 20 becomes dimensioned for receipt therethrough of a like but unstretched strap according to the present invention."); Col. 5, lines 12-14 ("the strap of the present invention features openings which are dimensioned upon elongation of the strap for receipt therethrough of another like strap"); Col. 5, lines 28-31 ("the elongated strap 10 through which a strap is twice extended"); Col. 5, lines 38-42 ("each one of the openings in the main body portion of each strap is dimensioned so that, upon elongation of its respective strap, a main body portion of another strap may pass therethrough").
This construction of "dimensioned" is also consistent with statements made by the Applicant during the prosecution of the '464 Patent in distinguishing the prior art. See Doc. 39-7 at 20 ("One of ordinary skill in the art at the time of the invention would be taught by Hartman the benefits and techniques for drastically limiting the degree to which a tie down strap can be stretched, i.e., to the point where the tie down strap is just stretchable enough for facilitating hooking and unhooking of S-shaped hooks through anchor holes in the strap, which is substantially less than the degree of stretching required for the main body portion of a strap to pass through an anchor hole.") (emphasis added).

The Defendants urge the Court to further construe this limitation as requiring that the openings be of particular relative dimensions (i.e., X>D and Y>D or X>W and Y>D). This construction, however, finds no support in the plain language of the claim. Rather, this proposed limitation is taken directly from the description of the preferred embodiment of the invention as set forth in the specification. The Federal Circuit has cautioned that a claim term should not be limited to its preferred embodiments. See C.R. Bard, 388 F.3d at 865. Moreover, the description of the preferred embodiment on which the Defendants rely itself states that the ratio of length to width or width to depth is merely "preferable." See '464 Patent, Col. 4, line 67 to Col. 5, line 4 ("the elongated dimension Y' of the opening in the lengthwise direction preferably becomes greater than the width W of an unstretched strap, and the contracted dimension X' of the opening 20 in the widthwise direction of the strap 10 preferably remains greater than the depth of the strap D") (emphasis added). Thus, this particular construction of the claim language must be rejected.

Based on the record presented, the Court concludes that the phrase "each said opening being dimensioned for the passage therethrough of a main body portion of a second identical tie down strap for the redirection of the second identical tie down strap when the elastic main body portion defining said opening is elongated" should be preliminarily construed to mean that upon elongation of the first tie down strap, the plurality of openings in the strap become dimensioned for the passage therethrough of a main body portion of a second identical tie down strap, thus permitting redirection of the second identical tie down strap.

BACKGROUND

Both the '717 patent and the '411 patent, as well as the accused products, are directed toward connecting sections of pipe together. Their primary application is in the oil well industry in which miles of pipe may need to be dropped into a hole. Such a pipe consists of a large number of sections, called joints, which are typically forty feet long and twenty inches wide and are connected together. The joints are commonly connected together in one of two ways. The first uses an integral connection in which the joints themselves have mating threads allowing the joints to be connected directly to each other. The second uses a coupling connection in which the joints still have threads, but are connected to a coupling which is disposed between two successive joints. The coupling has a much smaller length than the joint. The '717 and '411 patents disclose joints and couplings with increased sealing and strength characteristics to accommodate the large and varied forces to which oil well pipes are exposed.

Watts is the inventor of both the '717 patent and the '411 patent, which is a continuation-in-part of the '717 patent. This appeal concerns only claims 2 and 18 of the '717 patent and claim 1 of the '411 patent. Each of the three claims includes substantially the same two functional statements and these statements are the only limitations that the parties contest. The parties agree that claim 18 of the '717 patent is representative. Claim 18 reads as follows:

18. A high efficiency connection for joints of oilwell tubing or the like, comprising: at least two pipes joined together and forming joints of pipe, each joints of pipe having a first end with no increase in wall thickness relative to the average pipe wall thickness and formed with tapered internal threads; the joints each having a second end formed with tapered external threads dimensioned such that one such joint may be sealingly connected directly with another such joint; the threads being of sufficient length and taper such that the pipe wall strength of the first end in the area of the smallest diameter of thread engagement is at least three-fourths of the average pipe wall strength of the joints of pipe.
DISCUSSION

A. Standard of Review

We review a district court's grant of summary judgment de novo, reapplying the standard applicable at the district court. See Rodime PLC v. Seagate Tech., Inc., 174 F.3d 1294, 1301, 50 U.S.P.Q.2D (BNA) 1429, 1434 (Fed. Cir. 1999) (citing Conroy v. Reebok Int'l, Ltd., 14 F.3d 1570, 1575, 29 U.S.P.Q.2D (BNA) 1373, 1377 (Fed. Cir. 1994)). Summary judgment is only appropriate where "there is no genuine issue as to any material fact and ... the moving party is entitled to a judgment as a matter of law." Fed. R. Civ. P. 56(c). We draw all reasonable inferences in favor of the non-movant. See Anderson v. Liberty Lobby, Inc., 477 U.S. 242, 255, 91 L. Ed. 2d 202, 106 S. Ct. 2505 (1986). The determination of infringement is a two-step process. First, this court construes the claims and, second, we compare the properly construed claims to the accused device. See Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1454, 46 U.S.P.Q.2D (BNA) 1169, 1172 (Fed. Cir. 1998) (en banc).

B. Applicability of 35 U.S.C. § 112, paragraph 6

Section 112, paragraph 6 provides that "an element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof." 35 U.S.C. § 112, para. 6 (1994). In Personalized Media Communications, LLC v. Int'l Trade Comm'n, 161 F.3d 696, 48 U.S.P.Q.2D (BNA) 1880 (Fed. Cir. 1998), building upon a line of cases interpreting 35 U.S.C. § 112, paragraph 6, we stated that the failure to use the word "means" in a claim element created a rebuttable presumption that 35 U.S.C. § 112, paragraph 6 did not apply. See Personalized Media, 161 F.3d at 703-04, 48 U.S.P.Q.2D (BNA) at 1886-87. We also reiterated that in determining whether a presumption is rebutted, "the focus remains on whether the claim ... recites sufficiently definite structure." Id. at 704, 48 U.S.P.Q.2D (BNA) at 1887. We noted, however, that the claim limitation need not "connotate a precise physical structure." Id. at 705, 48 U.S.P.Q.2D (BNA) at 1888. The following year, we further clarified that the presumption that § 112, paragraph 6 did not apply could be rebutted by showing that the claim element recited a function without reciting sufficient structure for performing that function. See Rodime PLC v. Seagate Tech., Inc., 174 F.3d 1294, 1302, 50 U.S.P.Q.2D (BNA) 1429, 1434 (Fed. Cir. 1999) (explaining the converse rules for rebutting a presumption that § 112, paragraph 6 does apply). As an aid in determining whether sufficient structure is in fact recited by a term used in a claim limitation, this court has inquired into whether the "term, as the name for structure, has a reasonably well understood meaning in the art." Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580 at 1583, 39 U.S.P.Q.2D (BNA) 1783 at 1786 (1996). If § 112, paragraph 6 applies, then we follow the guidelines to claim construction specified in the statute: "such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof." 35 U.S.C. § 112, para. 6. If § 112, paragraph 6 does not apply, then our precedent for the construction of limitations that are not means-plus-function limitations is applied in the customary way.

Footnotes

In this case, in determining that the sealingly connected limitation 3 should be construed as a means-plus-function limitation, the district court stated that the limitation was "drafted as a function to be performed . . . rather than as a definite structure." Watts, slip op. at 4. Watts argues that the district court was wrong, contending first that because the sealingly connected limitation does not use the word "means," it is presumptively not a means-plus-function limitation. Next, Watts argues that the sealingly connected limitation is not purely functional because the claim describes a precise structure by reciting tapered internal and external threads. XL responds that the sealingly connected limitation is a means-plus-function limitation because it does not include structure capable of entirely performing the recited function. XL maintains that the tapered internal and external threads do not seal, but merely provide the location of the seal, and that the seal is created by misaligned taper angles. Finally, XL argues that public policy mandates that functional claims be restricted to the disclosed embodiments.

3 As will be shown, the first functional statement disposes of the case. Therefore we need not, and do not, address the second functional statement. See Carroll Touch, Inc. v. Electro Mech. Sys., Inc., 15 F.3d 1573, 1577 n.3, 27 U.S.P.Q.2D (BNA) 1836, 1839 n.3 (Fed. Cir. 1993).

**We hold that the sealingly connected limitation is not a means-plus-function limitation.** First, the presumption applies that because the limitation does not recite the word "means" it is not a means-plus-function limitation. Second, the presumption is not rebutted because the claim limitation recites or refers to terms that are reasonably well understood in the art as names for structure and which perform the recited function of sealing. Specifically, the claim limitation recites "a second end formed with tapered external threads" and refers to "a first end" with "tapered internal threads." These terms clearly have reasonably well understood meanings in the art as names for structure. Further, the specification makes it clear that the sealing function is performed with these interlocking threads. See '717 patent, col. 2, l. 48 - col. 3, l. 14; see also Unidynamics, 157 F.3d at 1319, 48 U.S.P.Q.2D (BNA) at 1104 (looking to the specification to determine the scope of "spring means").

XL's arguments are unavailing. The threads represent the sole structural configuration effecting the seal and clearly are not mere indicators of the location of the seal as XL has argued. Although the use of misaligned taper angles, as well as a variety of other mechanisms, may increase the strength of the seal, the claimed sealing function is accomplished by the claimed threads. See '717 patent, col. 2, l. 48 - col. 3, l. 66. Finally, because the limitations are not purely functional, XL's public policy argument is inapplicable.

The other two claims at issue include the same structural language, and the '411 specification includes the same discussion of how the seal is created and how its strength can be increased. Therefore, our holding that the sealingly connected limitation of claim 18 of the '717 patent is not a means-plus-function limitation also applies to claim 2 of the '717 patent and claim 4 of the '411 patent.

C. Construction of the Sealingly Connected Limitation

Having held that § 112, paragraph 6 is not applicable, we proceed to a standard claim construction. In construing a claim, a court principally consults the evidence intrinsic to the patent, including the claims, the written description, and the relevant prosecution history. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). While limitations contained in the specification are not ordinarily read into the claims, see Intervet Am., Inc. v. Kee-Vet Lab., Inc., 887 F.2d 1050, 1053, 12 U.S.P.Q.2D (BNA) 1474, 1476 (Fed. Cir. 1989), it is important to examine the specification. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 979, 34 U.S.P.Q.2D (BNA) 1321, 1329 (Fed. Cir. 1995) ("Claims must be read in view of the specification, of which they are a part."); aff'd, 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996). One purpose for examining the specification is to determine if the patentee has limited the scope of the claims. See O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1581, 42 U.S.P.Q.2D (BNA) 1777, 1781 (Fed. Cir. 1997) (limiting

- 1604 -
claims because the specification described only non-smooth or conical passages and distinguished over the prior art based on these characteristics); Wang Lab., Inc. v. America Online, Inc., 197 F.3d 1377, 1382-83, 53 U.S.P.Q.2D (BNA) 1161, 1164-65 (Fed. Cir. 1999) (limiting claims to the only embodiment described, a character-based protocol, and specifically not encompassing a bit-mapped protocol); Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1551, 37 U.S.P.Q.2D (BNA) 1609, 1612 (Fed. Cir. 1996) ("When the preferred embodiment is described in the specification as the invention itself, the claims are not necessarily entitled to a scope broader than that embodiment.").

The district court, in its alternative ruling, held that the sealingly connected limitation was expressly defined in the specification and prosecution history "as including only misaligned taper angles to effect a seal." Watts, slip op. at 4. According to the district court, the specification stated that the seal was created with misaligned taper angles and the prosecution history distinguished over the prior art with this sealing structure. See id.

Watts maintains, however, that the district court erred by reading in a limitation from the specification. Watts argues that the district court did not identify any term in need of a definition and it was therefore improper for the district court to import into the claims any definition from the specification. At oral argument before this court, Watts also argued that the specification was not, in fact, limiting, and that one of ordinary skill would be familiar with many ways of achieving a sealing connection. With regard to the prosecution history, Watts argues that it does not limit claim 18 because claim 18 was not pending at the time any amendments were made.

XL responds that both the specification and the prosecution history specifically limit the sealingly connected limitation to the disclosed embodiment, which utilizes misaligned taper angles. XL further responds that because the prosecution history distinguishes over the prior art by virtue of the misaligned taper angles, it is clearly applicable to claim 18, even though it was later added, and creates an estoppel.

We hold that the sealingly connected limitation is limited to structures utilizing misaligned taper angles. As explained below, we base our decision on the words of the limitation, the specific disclosure of the '717 patent, and the distinguishing remarks contained in both the specification and in the prosecution history of that patent.

The sealingly connected limitation includes the recitation that the "external threads [are] dimensioned such that one such joint may be sealingly connected directly with another such joint." '717 patent, col. 8, ll. 12-14. We hold that the claim language "dimensioned such that" is not clear on its face. Accordingly, we resort to the specification for clarification. We reject Watts' contention that we cannot consider the specification in this case. First, as just stated, the terms of the sealingly connected limitation are not clear on their face. Second, even if they were clear on their face, we must consult the specification to determine if the patentee redefined any of those terms. See Vitronics, 90 F.3d at 1582, 39 U.S.P.Q.2D (BNA) at 1576.

The specification only describes one method in which "tapered external threads [are] dimensioned" to achieve the sealing connection, as required in claim 18 of the '717 patent. That method is to misalign the taper angles of the internal and external threads. See '717 patent, col. 3, ll. 3-14. Moreover, the specification actually limits the invention to structures that utilize misaligned taper angles, stating that "the present invention utilizes [the varying taper angle] feature." '717 patent, col. 3, ll. 12-14.

We are not persuaded by Watts' two arguments, advanced at the oral hearing, that the specification was not limiting. First, Watts argued that one of ordinary skill would be aware of myriad ways to effect a sealing connection, such as by using o-rings. While this may be true, it does not overcome the fact that the specification specifies that the invention uses misaligned taper angles. See O.I., 115 F.3d at 1581, 42 U.S.P.Q.2D (BNA) at 1781; Wang, 197 F.3d at 1382-83, 53 U.S.P.Q.2D (BNA) at 1164-65; Modine, 75 F.3d at 1551, 37 U.S.P.Q.2D (BNA) at 1612.

Second, at the oral hearing Watts also argued that the description of the preferred embodiment uses permissive language in describing the use of misaligned taper angles. We assume that Watts is referring to the specification language stating that "so as to ensure a seal diameter for the connection of least diameter ... the taper of the external thread may be made slightly less than the taper of the internal thread." '717 patent, col. 4, ll. 64-67 (emphasis added). Examining the context of this statement and the entirety of the disclosure, we do not agree that this statement discloses an embodiment without misaligned taper angles. See Amhil Enters. Ltd. v. Wawa, Inc., 81 F.3d 1554, 1559, 38 U.S.P.Q.2D (BNA) 1471, 1474 (Fed. Cir. 1996) (stating that the court must "review the entire specification"). The specification does not explicitly discuss an embodiment
without misaligned taper angles and, as discussed earlier, actually limits the invention to embodiments with misaligned taper angles. See '717 patent, col. 3, ll. 3-14.

The invention is similarly limited in the prosecution history, in which Watts distinguished the primary reference based on the invention's misaligned taper angles. Watts stated that in the primary reference "no thread interference' is claimed which teaches away from the present invention." It is clear that the phrase "no thread interference" refers to the interference caused by the misaligned taper angles. Thus, Watts cannot now maintain that his invention does not require misaligned taper angles. See Biodex Corp. v. Loredan Biomedical, Inc., 946 F.2d 850, 862-63, 20 U.S.P.Q.2D (BNA) 1252, 1262 (Fed. Cir. 1991) (affirming the use of prosecution history to construe a claim, while also noting the clear distinction between such a use and the doctrine of prosecution history estoppel which estops later expansion of a claim's protection under the doctrine of equivalents).

We find Watts' argument that the prosecution history does not apply to the sealingly connected limitation of claim 18 to be baseless. It is irrelevant in this case whether Watts' prosecution history remarks were directed to claim 18 specifically because there is no clear indication that they were not. See Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579, 34 U.S.P.Q.2D (BNA) 1673, 1679 (Fed. Cir. 1995) ("Arguments made during prosecution regarding the meaning of a claim term are relevant to the interpretation of that term in every claim of the patent absent a clear indication to the contrary."). While Watts' remarks occur in a discussion of the rejection of claim 1, they are general in nature and apply to any claim that contains the sealingly connected limitation. This characterization is reinforced by the fact that Watts had already canceled claim 1. Moreover, the context of his remarks suggests that he was distinguishing the primary reference from the newly presented claims, including claim 16 (which later became claim 2). Further, Watts stated in a subsequent response to the U.S. Patent and Trademark Office that newly added claim 32 (which later became claim 18) was "another embodiment of allowed claim 16."

Our analysis applies to all three claims in suit. The '411 specification includes the same statement limiting the invention to structures utilizing misaligned taper angles. See '411 patent, col. 5, ll. 23-32. The context of the prosecution history reveals that the remark which distinguishes the primary reference applies equally to all of the claims of the '717 patent. See Southwall Techs., 54 F.3d at 1579, 34 U.S.P.Q.2D (BNA) at 1679. Further, the prosecution history of the '717 patent also applies to claim 1 of the '411 patent because: (1) the '411 patent is a continuation-in-part of the '717 patent; (2) claim 1 of the '411 patent also has a sealingly connected limitation; and (3) the prosecution history of the '411 patent contains nothing to the contrary. See Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 980, 52 U.S.P.Q.2D (BNA) 1109, 1114 (Fed. Cir. 1999) ("When multiple patents derive from the same initial application, the prosecution history regarding a claim limitation in any patent that has issued applies with equal force to subsequently issued patents that contain the same claim limitation."); Southwall Techs., 54 F.3d at 1579, 34 U.S.P.Q.2D (BNA) at 1679.

1165

As to the term "dipping," there is a dispute among the parties. Shen Wei argues that this term should carry its ordinary and customary meaning: "to plunge briefly into a liquid, usually in order to wet, coat, or saturate." See American Heritage Dictionary, at 399 (2nd Coll. ed. 1982). K-C submits that the term "dipping" should take its definition from the text of the '154 patent. K-C also argues that applying Shen Wei's proffered construction of the term "dipping" to the '154 patent would impermissibly add to the scope of the term "dipping" a means of applying aloe vera specifically surrendered by the patentee during the prosecution of the '154 patent to avoid prior art.

Claim construction is a matter of law. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 979 (Fed. Cir. 1995). Claim interpretation begins with an examination of the intrinsic evidence, the claims, the specification and, if in evidence, the prosecution history of the patent. CCS Fitness, 288 F.3d at 1366 (citations omitted). Courts may also use extrinsic evidence, expert testimony and treatises, to resolve the scope and meaning of a claim term. Id.

Generally speaking, there is a heavy presumption that a claim term carries its ordinary and customary meaning, see CCS Fitness, 288 F.3d at 1366 (citations omitted), and dictionary definitions may establish a claim term's ordinary meaning. Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1344 (Fed. Cir.2001) (using Random House Unabridged Dictionary to define the ordinary meaning of "portion" as encompassing both a one-piece and a two-piece structure); Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1584 n. 6 (Fed. Cir.1996) ("Although technical treatises and dictionaries fall within the
category of extrinsic evidence, as they do not form a part of an integrated patent document, they are worthy of special note. Judges are free to consult such resources at any time in order to better understand the underlying technology and may also rely on dictionary definitions when construing claim terms, so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents.

A court may, however, limit the ordinary meaning of a claim term when: (1) the patentee acted as his own lexicographer and clearly set forth a definition of the disputed claim term in either the specification or prosecution history, see e.g., Johnson Worldwide, 175 F.3d at 990; (2) the intrinsic evidence shows that the patentee distinguished the claim term from prior art on the basis of a particular embodiment, expressly disclaimed subject matter, or described a particular embodiment as important to the invention, see e.g., Spectrum Intern., Inc. v. Sterilite Corp., 164 F.3d 1372, 1378 (Fed. Cir. 1998) (narrowing a claim term's ordinary meaning based on statements in intrinsic evidence that distinguished claimed invention from prior art); Scimedi Life Sys., Inc. v. Adv. Cardiovascular Sys., Inc., 242 F.3d 1337, 1343-44 (Fed. Cir. 2001) (limiting claim term based in part on statements in the specification indicating that "all embodiments" of the claimed invention used a particular structure); (3) the term chosen by the patentee so deprives the claim of clarity as to require resort to the other intrinsic evidence for a definite meaning, see e.g., Johnson Worldwide, 175 F.3d at 990; or (4) the patentee phrased the claim in step- or means-plus-function format. 35 U.S.C. § 112 P 6; Watts v. XL Sys., Inc., 232 F.3d 877, 880-81 (Fed. Cir. 2000) (construing § 57 Or. 541, 112 P 6).

In this case, upon analyzing the ordinary meaning of the term "dipping" to the '154 patent, this court finds that the term "dipping" must be limited from its ordinary meaning because: (1) the ordinary meaning of the non-technical term "dipping" is sufficiently broad and amorphous such that the scope of the term "dipping" can only be construed with recourse to the written description; and (2) the patentee distinguished the term "dipping" from prior art during the prosecution of the '154 patent.

In looking at the specification of the '154 patent, the first suggestion as to the appropriate scope of the term "dipping" can be found within the summary of the '154 patent which teaches: "After drying, the gloves are turned inside out and dipped into a prepared Aloe Vera solution to saturate the outer surface." ( '154 patent, Shen Wei's In Camera Response In Opposition to Kimberly-Clark's Motion For Summary Judgment of Non-Infringement, attached Exhibit D, KC 001984: Col. 2, 30-33). From this statement, notwithstanding the ordinary meaning of the term "dipping," the invention claimed by the '154 patent includes a process by which the gloves must be "dipped" until saturated.

Next within one preferred embodiment of the '154 patent, the '154 patent teaches: "To associate Aloe Vera with the surface of the glove [turned inside out], Aloe Vera solution can be sprayed onto the surface of the glove. Alternatively, the glove can be immersed into the Aloe Vera solution." (Id. at KC 001985: Col. 3, 57-60). From this statement, this court is left to infer that "dipping" as claimed in the '154 patent is either association by spraying until saturated or association by immersion until saturated. The '154 patent also states: "The latter method [association by immersion] is preferred because it creates a complete and even distribution of the Aloe Vera solution," (Id. at KC 001985: Col. 3, 60-62), and continues: "In one preferred embodiment, the dipping process is accomplished by grouping a number of gloves in a batch … The gloves are immersed in the solution [of Aloe Vera] for at least 10 minutes to allow adequate absorbency." (Id. at KC 001985: Col. 3, 63-67). As such, since association by immersion will create a complete and even distribution of the Aloe Vera solution, which is specifically claimed by the '154 patent, see (id. at KC 001985: Claim 5, Col. 4, 48-49), the only logical conclusion is that the term "dipping" is equivalent to association by immersion until saturated.

--- Footnotes ---

2 Based on the language of the '154 patent, the court must also infer that the term "saturated" must mean "adequate absorbency."

--- End Footnotes ---

In looking at the prosecution history of the '154 patent, in a December 6, 2000, Patent Office action, the Patent Examiner rejected the '154 patent in part based on prior art stating: "Buchanan reads on a disposable medical glove comprising rubber latex and a moisturizing composition containing aloe vera (via powder or spray coating) to the interior of the glove." (Shen Wei's In Camera Response In Opposition to Kimberly-Clark's Motion For Summary Judgment of Non-Infringement, attached Exhibit D, Prosecution History at KC 002048)(emphasis added). In order to avoid prior art, the Examiner stated: "Claim 1 [of the '154 patent] would be allowable if the following limitations were added to the claim to clearly recite how the aloe vera is applied to the glove: "wherein the aloe vera is attached to the flexible material by dipping the glove into a
solution of comprising aloe vera …" (Id. at KC 002049-KC002050). Based on upon this limitation added to Claim 1 by the patentee, it is clear that the term "dipping" is not equivalent to association by spraying until saturated, leaving association by immersion as the only alternative.

Accordingly, upon review of the intrinsic evidence of the '154 patent, the patentee has defined the term "dipping" by implication through his consistent use of the term "dipping" throughout the '154 patent. See e.g., Bell Atlantic Network Services, Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1273 (Fed. Cir. 2001)("the patentees defined the term "mode" by implication, through the term's consistent use throughout the 786 patent specification)(citing Vitronics, 90 F.3d at 1582). As such, this court construes the claim term "dipping," as used in the '154 patent, to mean association by immersion until saturated. This court also finds that the term "saturated" is defined within the '154 patent, also by implication, to mean adequately absorbed, and that the term "immersion," as used within the '154 patent, carries its ordinary meaning: "to cover completely in a liquid; submerge". See American Heritage Dictionary, at 643 (2nd Coll. ed. 1982).

Shen Wei's proffered definition of the term "dipping" cannot be correct because Shen Wei's construction of the term "dipping" would include association by spraying. 3 As discussed previously within this section, the term "dipping" cannot include association by spraying because: (1) the Patent Office specifically rejected the patentability of the '154 patent claiming association by spraying causing the patentee to surrender association by spraying during the prosecution of the '154 patent, (Prosecution History at KC 002048-KC002050); and (2) the '154 patent specifically distinguishes the term "dipping" from association by spraying and equates "dipping" to association by immersion. ('154 Patent, KC 001985: Col. 3, 57-67).

Moreover, Shen Wei's proffered construction of the term "dipping" reads out express limitations as to the scope of the term "dipping" found in the prosecution history of the '154 patent, and therefore must be rejected. See, e.g., Texas Instruments v. U.S. Intern. Trade Com'n, 988 F.2d 1165, 1171 (Fed. Cir. 1993)("Relying on the claim language, the specification, prosecution history, and the testimony of the inventors and experts all support the conclusion that the fluid insulating material is injected through a gate on the other, or opposite side, of the electrical conductors. Indeed, to construe the claims in the manner suggested by TI [Texas Instruments Inc.] would read an express limitation out of the claims."). Where Shen Wei's current methodology is a process that immerses a glove into a solution comprising aloe vera until the aloe vera is adequately absorbed onto the surface of the glove and is evenly distributed onto the insides of the glove to a thickness of about 0.01 mm. See ('154 Patent, KC 001985: Claims 4-6, Col. 4, 45-53), Shen Wei's proffered construction of the term "dipping" is so broad, the proffered construction disregards whether the aloe vera is evenly distributed throughout the interior of the glove and also disregards whether the aloe vera is at a thickness of 0.01 mm.

In summary, while the ordinary meaning of the term "dipping" supports a broader meaning than the construction articulated today by this court, Shen Wei proffered construction of the term "dipping" would alleviate the need to include the term "dipping" within the '154 patent and therefore is incorrect.

2. Step 3

Step 3 of the '458 patent requires a "direct shift" from neutral into an appropriate rolling start gear ratio. Defendants maintain that this step is taught by the Dobson reference, which in at least the embodiment plaintiff focuses on, teaches shifting from neutral to a preset gear. Plaintiff argues that Dobson teaches delaying the shift until the engine speed slows down to the appropriate RPM for the preselected gear, and that such a delay is by definition not a "direct shift".

--- Footnotes ---

3 Shen Wei explains that spraying is typically done in an on-line process where gloves pass through multiple spray nozzles that project aloe vera onto the surfaces of the gloves. Based on this explanation, it is clear that a typical spraying operation would cause the gloves to be plunged briefly into a liquid in order to wet, coat, or saturate their inner surfaces with aloe vera.

--- End Footnotes ---
The term "direct" was not identified as a disputed term during claim construction. Because claim construction is a legal issue, not a factual one, the Court must determine what the term "direct" means in the '458 patent. The dictionary defines the term "direct" as "straight; undeviating < a direct line >." Black's Law Dictionary, 7th ed. (1999). This definition does not include a time element, but rather describes a movement from point A to point B without any intervening stops along the way.

The '458 patent uses the term "directly" a second time, in the description of the preferred embodiment, as follows:

If, in sixth gear as shown, the operator moves the lever forward three times in quick succession, then allowing its return to rest, he will skip two gears in effect, and achieve a skip shift directly into ninth speed (i.e., seventh and eighth speed will not be engaged) almost instantaneously.

(458, col. 6, ll. 18-23) (emphasis added). This use of the term "directly" suggests the absence of an intervening point, as it points out in the parenthetical that the intervening gears are not engaged. The abbreviation "i.e." means "that is", Black's Law Dictionary, 7th ed. (1999), so in the parenthetical the patent explains what it means when it uses the term "directly". The patent language does go on to state that the shift is almost instantaneous, but that is an additional feature of the shift, and not a definition or an elaboration of the word "directly".

"Direct" is not a technical term, and its meaning in the context of the patent claim is "without engaging any intervening gears" as follows: when the transmission is in neutral and the vehicle speed exceeds a minimum reference value, a single movement of the shift lever in the upshift direction will be interpreted as a shift from neutral to an appropriate rolling start gear determined as a function of current vehicle speed without engaging any intervening gears.

Crown's proposed construction is "[m]eans clause Subject to [35 U.S.C.] § 112, P 6: A second score groove that is near the end of the primary score and the hinge segment and that performs the function of directing the fracture of metal of the hinge segment in a direction away from the end of the primary score. The structure for performing this function described in the specification is an anti-fracture score in which the tail portion 25 has a score residual differential less than that of the remaining portions of the anti-fracture score." 141 Rexam argues this is not a means-plus-function limitation under 35 U.S.C. § 112 P 6 and its proposed construction is "[t]he second score is near the second end of the primary score and near the hinge segment to provide a path for a fracture of the hinge segment along the second score." 142

Crown's proposed construction is "[m]eans clause Subject to [35 U.S.C.] § 112, P 6: A second score groove that is near the end of the primary score and the hinge segment and that performs the function of directing the fracture of metal of the hinge segment in a direction away from the end of the primary score. The structure for performing this function described in the specification is an anti-fracture score in which the tail portion 25 has a score residual differential less than that of the remaining portions of the anti-fracture score." 141 Rexam argues this is not a means-plus-function limitation under 35 U.S.C. § 112 P 6 and its proposed construction is "[t]he second score is near the second end of the primary score and near the hinge segment to provide a path for a fracture of the hinge segment along the second score." 142

Crown's proposed construction is "[m]eans clause Subject to [35 U.S.C.] § 112, P 6: A second score groove that is near the end of the primary score and the hinge segment and that performs the function of directing the fracture of metal of the hinge segment in a direction away from the end of the primary score. The structure for performing this function described in the specification is an anti-fracture score in which the tail portion 25 has a score residual differential less than that of the remaining portions of the anti-fracture score." 141 Rexam argues this is not a means-plus-function limitation under 35 U.S.C. § 112 P 6 and its proposed construction is "[t]he second score is near the second end of the primary score and near the hinge segment to provide a path for a fracture of the hinge segment along the second score." 142

Crown's proposed construction is "[m]eans clause Subject to [35 U.S.C.] § 112, P 6: A second score groove that is near the end of the primary score and the hinge segment and that performs the function of directing the fracture of metal of the hinge segment in a direction away from the end of the primary score. The structure for performing this function described in the specification is an anti-fracture score in which the tail portion 25 has a score residual differential less than that of the remaining portions of the anti-fracture score." 141 Rexam argues this is not a means-plus-function limitation under 35 U.S.C. § 112 P 6 and its proposed construction is "[t]he second score is near the second end of the primary score and near the hinge segment to provide a path for a fracture of the hinge segment along the second score." 142
The parties agree that this claim term contains a functional limitation, they dispute whether it should be construed as a means-plus-function limitation under 35 U.S.C. § 112, P 6. "A claim limitation that actually uses the word 'means' will invoke a rebuttable presumption that § 112 P 6 applies. By contrast, a claim term that does not use 'means' will trigger the rebuttable presumption that § 112 P 6 does not apply." 144 Here, the claim limitation does not use the word "means," therefore, there is a presumption that § 112, P 6 does not apply. That presumption can be rebutted if it is demonstrated "that the claim term fails to 'recite sufficiently definite structure' or else recites a 'function without reciting sufficient structure for performing that function.'" 145 The court determines that Crown has failed to rebut that presumption.

Crown acknowledges that a claim does not have "to recite a precise physical structure to avoid the applicability of 35 U.S.C. § 112, P 6" but argues that "the mere recitation of a 'second score groove' does not provide sufficiently definite structure to perform the fracture-directing function." 146

The court agrees with Rexam that the claim recites both a structure ("a second score groove") and the location of that structure ("adjacent to the second end of said primary score and adjacent to said hinge segment"). If there is a second score line in the central panel, it necessarily has some depth and is, therefore, not as thick as the non-scored metal of the hinge segment. 147 The structural location of the second groove, between the hinge segment that may fracture and the second end of the primary score groove, functions to divert a fracture from the primary groove. The court agrees with Rexam that "a person of ordinary skill in the art would understand the recited structure to be sufficient to accomplish the directing away function," i.e., that "the fracturing metal will follow the path of least resistance" along the second score. 148

The court, therefore, determines that the disputed claim term is not subject to 35 U.S.C. § 112, P 6 and adopts Rexam's proposed construction: "the second score is near the second end of the primary score and near the hinge segment to provide a path for a fracture of the hinge segment along the second score."
2. Construction of "directional flow"

The parties next seek construction of the term "directional flow", which is found in Claim 11 of the '890 patent as follows:

11. An electrode strip... comprising: an elongated electrode support defining a sample transfer path for directional flow of the sample from an application point along said electrode support ...

Plaintiffs urge the Court to interpret "directional flow" as "substantially linear movement of a fluid" and whereas Defendant proposes "flow of a sample in a uniform manner in the sample transfer path mesh layer." Defendant contends that the term "directional flow" necessarily implies the presence of a mesh layer since that is the only method disclosed in the specification for creating a directional flow. The Court is not persuaded by this argument. Defendant points to nothing in the intrinsic evidence indicating that the inventor intended that the structure guiding the sample through the electrode support to be limited to "mesh layers." The plain language of Claim 11 indicates no such limitation. For reasons similar to those articulated above, Defendant's interpretation is undermined by the fact that subsequent dependent claims explicitly add a mesh layer limitation. See, '890 Patent, Claims 13-21. This implies that Claim 11, from which the dependent claims are derived, contains no such limitation. Id. Defendant's proposed construction would effectively require the Court to read in an additional limitation from the specification, which the Court declines to do. See Electro Medical Systems, S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994)("Claims are not to be interpreted by adding limitations appearing only in the specification.")

The specification does shed some light on the intended meaning of the term "directional flow." The specification states, "the preferred embodiments are those where the reference electrode... lies downstream (in the direction of sample flow) of the working electrode... and a remote application point at an aperture... for the sample is provided upstream of the reference electrode ..." ('890 Patent, 4:44-48). The use of the terms "downstream" and "upstream" indicate that transfer path is intended to orient and guide the sample in a particular direction, as in the described embodiment, where the path is structured to have the sample flow from the aperture opening to the reference electrode. There is further support for this interpretation of "directional" flow as a guided orientation of the sample. The claim language immediately following the disputed term indicates that the intended orientation of the sample is "from an application point" "along" the electrode support, indicating that the claimed structure is designed to guide the sample along a specific path. Accordingly, the Court construes "directional flow", in light of the specification, as "the orientation and guidance in a particular direction."

1169
d. The "directly" limitation

Claim 1 requires the first reflector be "directly" above the first LED. 12 Defendants submit that the ordinary and customary meaning of "directly" has several definitions. One of these definitions is "in a direct line, way or manner; straight." 13 Terlep agrees that the ordinary and customary meaning of "directly" is "in a direct line or manner; straight." 14 However, Terlep goes on to argue the Court should adopt a definition for directly of "placed in axial alignment." Terlep's proposed definition is not from a dictionary. Also, Terlep does not use "directly" in a way inconsistent with "in a direct line or manner; straight." Therefore, the Court construes "directly" to mean "in a direct line or manner; straight."

12 Doc. 29, Ex. 1 (The '433 patent), column 6, lines 26-27.

The parties are in agreement that the first reflector and the first LED must be close together. Terlep submits another customary and ordinary meaning of "directly" is "without intervening space." 15 Defendants then argue the Court should
adopt a definition of "directly" to include, "in immediate proximity." If more than one definition is consistent with the use of
the words in the intrinsic record, the claim terms may be construed to encompass all such meanings. Texas Digital Systems,
308 F.3d at 1203. The Court believes this definition is consistent with an ordinary and customary meaning of "directly" and
with the intrinsic evidence. Therefore, the Court construes "directly" to also mean "in immediate proximity." Therefore, the
first reflector must be "in a direct line or straight" above and "in immediate proximity" to the first LED.

C. Interpreting "means located on said beam for attaching said S-cam bearing directly to said beam" and "means for directly
attaching said brake chamber to said beam."

As earlier described, claim 16 of the '237 patent, provides, in part:

In an axle bearing suspension system . . . an S-cam assembly comprising an S-cam bearing, . . . the improvement
comprising: means located on said beam for attaching said S-cam bearing directly to said beam, and means for directly
attaching said brake chamber to said beam.

Claim 17 of the '237 patent describes the same means for attaching the S-cam bearing and the brake chamber as claim 16 of
the '237 patent. The specifications of the '237 patent do not suggest any different structure for Claim 17 from that suggested
for Claim 16.

Regarding construction of "means for directly attaching said brake chamber to said beam," Defendant Neway Anchorlok
says this Court must construe this phrase as requiring "nuts and bolts that cause the brake components to abut the beam
without any intervening parts."

After reviewing the intrinsic evidence of the '237 patent, the Court finds that "means for directly attaching" should be
construed to require a direct attachment of the brake components to the beam (element 59 of the '237 patent) and not to the
axle. In claim 16 of the '237 patent, its inventor says that attachment of the brake components on the beam distinguished the
invention from the prior art which had attached the brake chamber and S-cam bearing to the axle. Accordingly, the "means
for directly attaching" the brake components to the beam does not allow attachment to the axle.

Interpreting "directly attaching," the Court finds this term should be given its regular meaning. Giving such an
interpretation, the Court finds "directly" requires that the brake chamber and the S-cam bearing be attached "without any
intervening space." Webster's Third New International Dictionary, at 641. The Court finds that "attaching" requires the brake
actuating mechanism to "fasten firmly," "to make fast or join" to the beam. See id. at 140.

The Court therefore construes "means located on said beam for attaching said S-cam bearing directly to said beam," and
"means for directly attaching said brake chamber to said beam" discloses a function of fastening firmly without any
intervening space the air brake chamber and S-cam bearing to the beam. The Court finds that the structure used to
accomplish this is an S-cam bearing and brake chamber brackets or appendage to the beam to which the S-cam bearing and
brake chamber are attached through a combination of nuts and bolts, or its equivalent thereto.

Sandt also argues that the district court erred in construing the term "directly behind" in claim 1 so as not to require that the
second plate actually touch the first plate. The Resco cover, Sandt argues, is "spaced" from the opening in the first plate,
thus permitting access to the housing.

The district court noted the amount of space between the first and second plate in terms of depth or distance between the plates is "marginally larger" in the Resco cover than in the Bodyguard. However, nothing in the claims or the specification of the '057 patent requires that the second plate be in a contacting or an abutting relationship with the rear end of the front plate. The specification states only that the second plate is "mounted between the outer plate . . . and the upper housing." '057 patent, col. 5, ll. 18-19 (emphasis added). The Resco plate clearly has a second plate that is mounted behind the first plate, in a position that is directly behind the opening in the first plate. Thus, it contains this limitation of claim 1.

### 1172

3. "Directly"

"Directly" means, "In immediate physical contact."

Plaintiff states that "directly" appears in each claim in the following context, "positioning said at least one electronic element in the absence of a non-electronic carrier directly between said first and second plastic core sheets." (Pl. Br. at 21; Cohen Decl., Exh. L.) Defendant refers to the same language in claims 1 and 16 of the '207 patent. (Def. Br. at 25.) Both parties cite to Webster's for the definition of "directly" as meaning "in immediate physical contact." (Pl. Br. at 21; Def. Br. at 25.) Plaintiff rests on this. Defendant urges additional language, however, defining "directly" to mean that "there is nothing between the 'electronic element' and the first plastic core sheet and nothing between the 'electronic element' and the second plastic core sheet." (Def. Br. at 25.) That just says the same thing in more words that add nothing to the definition. I therefore elect to go with Plaintiff's sparer and more elegant version.

### 1173

The '158 patent presents a more difficult issue. The '158 patent describes a projector that conducts air from outside the projector directly through the power unit in order to cool it more effectively. Seiko Epson asserted infringement of two independent claims. Claim 1 recites a projector comprising:

- a power unit including a ventilating path provided inside the power unit for circulating cooling air;
- an outer case that stores the optical unit and the power unit;
- a first cooling air intake port located on the outer case that provides cooling air from outside of the outer case to the optical unit; and
- a second cooling air intake port located on the outer case that directly conducts cooling air from the outside of the outer case to the ventilating path, said second cooling air intake port comprising:
  - an air inlet provided on the power unit, and a duct connecting said second cooling air intake port and the air inlet.

Similarly, claim 5 recites a projector comprising:

- a power unit including an air inlet and an air outlet;
- an outer case that stores the optical unit and the power unit;
- a first cooling air intake port located on the outer case that provides cooling air from outside of the outer case to the optical unit;
a second cooling air intake port located on the outer case that directly conducts cooling air from the outside of the outer case to the air inlet; and

an exhaust vent provided on the outer case that directly conducts air exhausted from the air outlet to the outside of the outer case.

At the claim construction hearing, Seiko Epson proposed that the phrase "directly conducts cooling air" be construed to mean "transmits cooling air without substantial contamination by internal sources of heat." The district court agreed in essence with Seiko Epson's proposed construction, but modified it to "transmits cooling air without [increasing] its temperature to that of the air inside the outer casing of the projector." The court explained that the change was necessary because Seiko Epson's proposed construction was "not limited to the air's temperature." The court also noted that the modified construction was consistent with how the patent distinguished the prior art, which was described as being less efficient because the air used to cool the power unit "had already been heated by many other elements located in the outer case."

We hold that the district court erred in its construction of "directly conducts cooling air," and we adopt Seiko Epson's narrower construction. Claims 1 and 5 recite that the second air intake port directly conducts not just "cooling air," but "cooling air from the outside of the outer case." The inclusion of that additional phrase indicates that air from outside of the case must be conducted directly to the power unit without substantial contamination by the air inside the case. Moreover, it reveals that the modifying term "cooling" is merely descriptive rather than definitional, since all air from outside of the case is presumed to be cooler than the air inside the case.

That interpretation is further supported by the specification, which clarifies that the term "cooling" is used in the patent solely in reference to "fresh" air from outside of the case. For instance, the abstract of the patent states that the second air intake port "directly conduct[s] fresh air into the ventilating path. Because the interior of the power unit is cooled by fresh air which is cooler than the air inside the outer case, cooling efficiency is enhanced." The Summary of the Invention section of the specification reiterates that the invention "directly conduct[s] fresh air from outside the outer case from the cooling air intake port to the inlet of the ventilating path. Because the cooling air conducting means directly conducts fresh air to the ventilating path, and because fresh air is cooler than the air in the outer case, the interior of the power unit can be cooled with high efficiency."

The patent also notes that the duct recited in claim 1, which connects the second air intake port and the air inlet of the power unit, "only introduces fresh air from the cooling air intake port to the ventilating path . . . [and] prevents the air from the outer case, which is hotter than the fresh air, from entering into the ventilating path." Id., col. 3, ll. 18-21. Those statements demonstrate that the thrust of the invention is not simply to pass any form of cooler air through the power unit, but rather to inject "fresh" air from outside the case directly into the ventilating path.

Because we are satisfied that "cooling air from the outside of the outer case" has a more limited meaning than "cooling air," and that directly conducting such air to the power unit requires a narrower construction than the one provided by the district court, we vacate the district court's grant of summary judgment as to the '158 patent. On motion for summary judgment, the district court held that the asserted claims of the '158 patent were invalid in light of Japanese Patent Application No. 4-271334 ("Nakamura"). The Nakamura reference, however, plainly fails to satisfy our construction of "directly conducts cooling air from the outside of the case." Although Nakamura teaches a second air intake port located in the vicinity of the power unit, it does not provide an uninterrupted path from that port to the power unit. Instead, the figures in the Nakamura reference indicate that the fresh air entering through the second air intake port mixes with ambient air from inside the case before reaching the power unit. Consequently, the fresh air entering through the second air intake port is not directly conducted to the power unit as required by the '158 patent.

D. "a toy object secured to the opposite end of said connecting line for suspension directly downwardly from the free end of said elongate member"
Defendants suggest construing this term to mean "directly beneath the free end of the elongate member." The Court, however, finds that the phrase is readily understood. Thus, the term shall not be construed.

The parties first dispute the construction of the term "disc" as found in claims 1 and 15 of the 183 Patent as found in the "disc-shaped element" and "mounting disc". Specifically, the parties dispute the meaning of "disc".

Claim 1 of the 183 Patent includes, in pertinent part, "said attaching means comprising a disc-shaped element … one of the disc-shaped element surfaces facing in a first direction … the one disc-shaped element surface being generally perpendicular…." Claim 15 of 183 Patent states, in pertinent part, "said second attachment means comprising a mounting disc…." 

The terms, including "disc", are not explicitly defined in the specification. A 183 Patent drawing depicts the "disc-shaped element" as a flat circular plate.

Plaintiff seeks to define disc as "a relatively thin object with opposite facing surface…." Plaintiff arrives at this definition by looking to synonyms of disc, including "sheet", "panel", "pane", or "slab". Plaintiff does not cite any authority where a term was construed based on a synonym of that term. Plaintiff also seeks the Court take judicial notice of a conventional computer disc, which Plaintiff alleges is a thin, plate shape with a square peripheral shape.

Defendant argues that the term "disc" should be given its plain meaning.

"Disc' ["Disk"] is defined as a "thin circular object". Webster's Third International Dictionary 651 (3d ed 1986). A review of the Patent description and drawings do not evince that Plaintiff set forth a definition different in scope than that of its plain meaning. Instead, the Patent drawing supports the plain meaning. Furthermore, contrary to Plaintiff's argument, a conventional computer disc, while encased in a square, is actually circular.

Based on the above, the term "disc" is defined as a "thin circular object".

3. "Discharge Conduit"

The term "discharge conduit" appears in Claim 2. Claim 2 recites:

2. The apparatus of claim 1 in which the discharge conduit has at least two longitudinal discharge openings, each of which discharge openings is located at opposite ends of the discharge conduit and which create a longitudinal force vector in the water jet discharged from said openings.

'133 patent, col. 24, lines 27-31. Intex conceded that it agreed with Aqua's construction of the term "discharge conduit" except insofar as it relied on Aqua's proposed construction of the term "pump discharge outlet." (Tr. at 52.) Because "pump discharge outlet" has been construed as "the point where water exits the pump" there is no dispute between the parties with respect to "discharge conduit." Accordingly, the term will be construed to mean "the conduit through which water is discharged from the cleaner."
Claims 1 and 16 of the '829 Patent describe the precipitate as being located in "discrete region(s)." '829 Patent, col. 11, II. 53, 57, 59, & 61; col. 12, II. 59, 60, & 66-67. Despite offering different constructions of the term "discrete region(s)," both Eppendorf and Nanosphere argued that the term describes areas that are unconnected and contained (Pls.' Opening 13, Docket No. 60; Def.'s Opening 18, Docket No. 63), and conceded that their proposed constructions are "similar" (Pls.' Resp. 5, Docket No. 74; see also Def.'s Resp. 24, Docket No. 73 (noting that the parties are "for the most part," "in agreement").

The Court has concluded that the simplest and most appropriate construction of "discrete region(s)" is "finite areas that do not overlap." This definition is supported by the specification, which describes the discrete areas as being unconnected: "These locations or spots have preferably a diameter comprised between 10 and 500 μm and are separated by distance of similar order of magnitude . . . ." '829 Patent, col. 3, II. 36-39 (emphasis added). The words "finite" and "do not overlap," which appear in Eppendorf's proposed construction, are marginally more effective at conveying the unconnected nature of the regions in question, than the words "separate and distinct." which Nanosphere has proposed. Moreover, the remaining portion of Eppendorf's proposed construction relating to the content of the discrete areas, namely "capture molecules," is unnecessary and redundant, because both of the claims in which the term "discrete region(s)" appears already describe such contents: Claim 1 reads "each of said discrete regions being fixed with one species of capture molecule," id. col. 11, II. 53-54, and Claim 16 reads, "each of said discrete regions being fixed with one species of capture molecule which recognizes a target compound," id. col. 12, II. 60-61.

D. Discrete Sites

Plaintiff's Proposed Construction: sites that are sufficiently distinct to permit individual detection

Defendant's Proposed Construction: sites that are non-contiguous with other sites

The parties dispute whether the word "discrete" means non-contiguous, that is, whether each site must not touch another site. In its briefs, defendant relied on several lay dictionary definitions, but, at the claim construction hearing, defendant conceded that some of those definitions support a view that "discrete" can be defined to mean "distinct," as plaintiff suggests. In addition, plaintiff gave a number of examples of things that are touching, such as the squares on a chess board, but are still "discrete" because they are individually identifiable.

The question is whether the patent has chosen a more specific meaning for the word "discrete." Unlike the other two terms, the specification does not include an explicit definition of this term. The figures in the patent seem to support defendant's proposed construction because all of the "discrete sites" depicted in the figures are spaced apart, but that is not necessarily dispositive because the figures represent embodiments rather than the invention as a whole. E.g., Lighting World, Inc. v. Birchwood Lighting, Inc., 382 F.3d 1354, 1365 (Fed Cir. 2004).

The most substantial discussion of the term appears in column 8 of the patent:

'The sites may be a pattern, i.e. a regular design or configuration, or randomly distributed. A preferred embodiment utilizes a regular pattern of sites such that the sites may be addressed in the X-Y coordinate plane. "Pattern" in this sense includes a repeating unit cell, preferably one that allows a high density of beads on the substrate. However, it should be noted that these sites may not be discrete sites. That is, it is possible to use a uniform surface of adhesive or chemical functionalities, for example, that allows the attachment of beads at any position. That is, the surface of the substrate is modified to allow attachment of the microspheres at individual sites, whether or not those sites are contiguous or non-contiguous with other sites. Thus, the surface of the substrate may be modified such that discrete sites are formed that can only have a single associated bead, or alternatively, the surface of the substrate is modified and beads may go down anywhere, but they end up at discrete sites.

'841 pat., col. 8, Ins. 42-53.

Both parties rely heavily on this paragraph, but each focuses on a different portion. Defendant cites the following passage:
"it should be noted that these sites may not be discrete sites. . . . That is, the surface of the substrate is modified to allow attachment of the microspheres at individual sites, whether or not those sites are contiguous or non-contiguous with other sites." I agree with defendant that the passage is as close as the specification comes to defining what the inventor means by "discrete." By stating that the sites "may not be discrete sites" and then following that with the explanatory phrase "[t]hat is, . . . those sites [may be] contiguous or non-contiguous with other sites," the specification seems to be equating the word "discrete" with the word "non-contiguous." If the phrase is not a definition, plaintiff fails to identify another purpose for the phrase. In fact, plaintiff ignores the phrase entirely in its argument.

Plaintiff does not argue that the passage is not controlling because it is a discussion of an embodiment. Further, plaintiff does not point to any portion of the passage or any other part of the specification that uses its proposed construction. Instead, plaintiff's argument is devoted to showing that defendant is reading the passage incorrectly. Plaintiff focuses on the last two clauses in the paragraph: "beads may go down anywhere, but they end up at discrete sites." Plaintiff interprets this to mean that there is no limitation on where one site is in relation to another, but one problem with this interpretation is that it conflates the site with the bead sitting on the site. The specification does not state that the sites may be "anywhere," only that the beads "may go down anywhere." The use of the phrase "end up at discrete sites" suggests that the beads may not "end up" where they started. That is, one interpretation is that the beads discussed in the last sentence must "end up" at non-contiguous sites regardless where they "go down."

Although the last sentence of the passage could favor plaintiff's or defendant's proposed construction, plaintiff's proposal becomes more problematic when viewed with the rest of the paragraph. The passage makes it clear that, in some instances, sites "may not be discrete sites" and, in other instances sites are discrete. Under defendant's view of the passage, this simply means that the sites may be contiguous in some instances and non-contiguous in other instances. Plaintiff's view is more complicated. According to plaintiff, even if sites do not start out as discrete sites, they all "end up" that way once the beads go down. However, plaintiff does not explain how a site may be transformed from "non-discrete" to "discrete" with the introduction of a bead. In particular, plaintiff points to nothing in the specification suggesting that a bead changes the character of the site. To the extent plaintiff means to argue that the site can be detected individually because a bead has been placed on it, this seems to be another example of conflating the bead and the site.

To be sure, the meaning of the passage is not immediately transparent. On one hand, the inventor seems to be saying that sites "may not be discrete sites" if they "allo[w] the attachment of beads at any position"; on the other hand, the inventor says in the same paragraph that beads "end up at discrete sites" even if "beads may go down anywhere." However, defendant's understanding of the passage is more internally consistent than plaintiff's. Further, I agree with defendant that, to the extent ambiguity exists, the notice function of the patent is best served by choosing the narrower construction. Athletic Alternatives, Inc. v. Prince Manufacturing, Inc., 73 F.3d 1573, 1581 (Fed. Cir. 1996).

Plaintiff advances two other arguments, but neither is persuasive. First, plaintiff relies on the specification's use of the word "discrete" in another passage:

In a preferred embodiment, the second substrate is an optical fiber bundle or array, as is generally described in U.S. Ser. Nos. 08/944,850 and 08/519,062, PCT US98/05025, and PCT US98/09163, all of which are expressly incorporated herein by reference. Preferred embodiments utilize preformed unitary fiber optic arrays. By "preformed unitary fiber optic array" herein is meant an array of discrete individual fiber optic strands that are co-axially disposed and joined along their lengths. The fiber strands are generally individually clad. However, one thing that distinguished a preformed unitary array from other fiber optic formats is that the fibers are not individually physically manipulatable; that is, one strand generally cannot be physically separated at any point along its length from another fiber strand.

841 patent, col. 8, Ins. 3-16. Plaintiff argues that "discrete" cannot mean non-contiguous because the passage uses the word "discrete" to describe fiber optic strands that are joined together.

This passage does not provide guidance for two reasons. First, it uses the word "discrete" in a very different context. Although plaintiff argues that the passage shows that defendant's proposed construction is wrong, plaintiff overlooks the fact that its own proposed construction could not apply in the context of this passage. It would make little sense to define a strand in this context as "sufficiently distinct to permit individual detection" because the strand is not being "detected" by anything. Thus, regardless what the inventor meant by "discrete" in the context of fiber optic strands, that understanding of "discrete" may be different from the one in the context of sites on a projection.
Even if I assume that the inventor meant "discrete" to mean the same thing everywhere in the patent, this passage does not necessarily contradict defendant's proposed construction. One could read "an array of discrete individual fiber optic strands that are co-axially disposed and joined along their lengths" to include an element of time. That is, the clause could mean that, initially, the strands are "discrete" and then they are "joined along their lengths." Plaintiff is correct that the passage does not require such a reading, but it does not forecast that reading either.

Finally, plaintiff cites dependent claim 7, in which the array locations contain up to "2,000,000,000 bioactive agents per square centimeter." Although plaintiff argues that such a densely packed location shows that some sites will be contiguous, plaintiff cites no evidence showing that it would be impossible to have that number of bioactive agents in that amount of space unless the sites were contiguous.

Accordingly, I agree with defendant that the term "discrete sites" is defined in the specification to mean "sites that are noncontiguous." Because the parties agree that "noncontiguous" means that the sites do not touch another site, I will adopt that as the construction for this term.

**Court's construction:** sites that do not touch another site

---

1. "Discrete." Used in Claims 9 and 42.

Nike proposed "individually distinct." Adidas suggests "each support element must be completely separate and distinct from other support elements." Both parties include "distinct" in their definitions. Since the parties have agreed that "plurality" means more than one, we know we are dealing with two or more different items. Claims 9 and 42 describe "said support elements extending between upper and lower portions of said cavity to provide support for the foot in said heel portion…" This establishes that the support elements are all located together in the same cavity of the sole of the shoe. Every embodiment described, including the preferred embodiment, and every diagram, has the support elements resting on, attached to, formed with, or embedded in the bottom of the cavity.

Adidas' proposal of "completely separate and distinct from other support elements" implies no contact between the elements, as if only one of the support elements can be in the shoe, with the others located perhaps in the pocket or hand of the wearer. This goes too far, as adidas seems to recognize by stressing in its brief that its definition would not exclude columns joined at the top and bottom. But that is not the import of adidas' proposal, as written.

A claim should be interpreted, if practicable, so as to give it effect rather than to have it fail. Nazomi Communications Inc. v. Arm Holdings, PLC, 403 F.3d 1364, 1368 (Fed. Cir. 2005). An interpretation that strains to exclude all described embodiments, including the preferred embodiment is not likely to be correct. See Pfizer, Inc. v. Teva Pharmaceuticals, USA, Inc., 429 F.3d 1364, 1374 (Fed. Cir. 2005).

Adidas also seems concerned with the possibility that a columnar support may touch one of the walls or sides of the cavity. Nothing in the claim language or specification prevents that, and Figures 5, 8, and 12 seem to show such an embodiment. But the supports are still distinct and separated from each other.

The diagrams illustrate, and the specification describes, support elements that are distinct, and separated from each other, although they may be connected at the top and bottom. See '796 patent, Figs. 3, 4, 6, & 7; '796 patent, col. 6, 11. 54-55; '796 patent, col. 6, 1. 66 - col. 7, 1. 3. Construction of "discrete" as "individually distinct" and "separated" would be appropriate in the context of the rest of the claim language, be in line with the specification, and would comport with the common definition of the term. See THE MERRIAM-WEBSTER THIRD NEW INTERNATIONAL DICTIONARY, UNABRIDGED (2002) ("discrete" means "consisting of distinct, unconnected, or unrelated parts."). Therefore, this term is construed as follows:

"Discrete" support elements means: support elements that are "individually distinct, and which are separated from each other, though they may be connected at the top, the bottom, or both."
The parties do not appear to dispute the term "plurality." The term "plurality" simply means "more than one." The specification confirms that this term is to be given its ordinary and plain meaning, stating that "in the embodiment described, the number of switches included in the P Terminal 12 is 45, with five switches being included in each of the nine line displays . . . . naturally, this number could be varied to suit particular applications." '845 patent, col. 5, ll. 42-46; see also '845 patent, Fig. 7.

The parties, however, vigorously dispute the proper construction of the term "discrete switches." NCR proposes that the court construe discrete switches to mean "transparent switches on the panel each having an individually distinct identity such that a specific area identified on the panel causes a distinct action when that area is actuated." Handspring and Palm propose that the court construe discrete switches more narrowly to mean an array of distinct and separate physical devices that can be individually actuated, manually or mechanically, to make, break, or change the connections in an electrical circuit.

The differences between the parties' proposed constructions for this claim term are significant. According to NCR, a "switch" exists when there is "a specific area identified on the panel [that] causes a distinct action when that area is actuated." NCR's construction of a switch is broad enough to cover the continuous resistive touch screen digitizer employed to enable data entry in the accused devices, which when combined with software renders the appearance of separate physical areas on the screen without including actual physical switches. In contrast, Palm and Handspring's construction would not cover such technology, because under their definition the claim limitation requires a plurality of separate and distinct physical structures.

**a. Palm and Handspring's Position**

In support of their proposed construction, defendants first point out that the definition of the term "switch" is well-accepted. According to the McGraw-Hill Dictionary of Scientific and Technical Terms, Fifth Edition, a "switch" is "a manual or mechanically actuated device for making, breaking, or changing the connections in an electric circuit." Defendants further contend that their definition comports both with the claim language, "switches for entering data when actuated," and the description of the structure and operation of such "switches" in the specification, which states:

> when a user wishes to actuate one of the plurality of switches 30, as for example that one associated with key area 28-9 in Fig. 4, the user simply depresses that area 28-9 causing the conductor 52-5 in Fig. 7 to pass through the hole 60-9 and thereby contact the conductor.

'845 patent, col. 6, ll. 58-63.

Defendants also argue that the term "discrete" should be construed as "separate," "individually distinct," and "opposed to continuous," as so defined by the American Heritage Dictionary for the English Language, Fourth Edition and the Oxford English Dictionary. This construction is supported by the specification, which describes using forty-five separate and distinct physical switches, made up of five top conductors and nine bottom conductors, in order to enable users to enter data on the P Terminal device. See '845 patent, col. 5, ll. 42-45; Fig. 7. Furthermore, Palm and Handspring point out that the specification makes clear that the claimed plurality of discrete switches are actual physical structures that are always present and that are distinct from the display areas. See id., col. 5, ll. 50-54 ("While the actual (physical) switches in the plurality of switches 30 are always present on the top panel 24, they are outlined or highlighted only when they become necessary for a particular function or instruction being executed by the P Terminal 12."). Defendants thus conclude that "discrete switches" refers to the actual (physical) switches in the plurality of switches 30, id., col. 5, ll. 50-52, formed by the contact of two conductive elements with each other. See Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1303 (Fed. Cir. 1997) (finding that "examples disclosed in the preferred embodiment may aid in the proper interpretation of a claim term").

**b. NCR's Position**
In response, NCR contends that Palm and Handspring's construction impermissibly limits the claim to cover only the preferred embodiment in the patent. Phonometrics, 133 F.3d 1459 (noting that "claims are not necessarily restricted in scope to what is shown in the preferred embodiment."). It argues that the disclosure of the patent specification supports its broader construction. See Rexnord Corp. v. Laitram Corp., 274 F.3d 1336 (Fed. Cir. 2001). To support this position, it points to the following language from the specification:

Although the fabrication of switches 30 has been described in a specific manner, it is not intended to exclude other alternative methodologies to fabricate "transparent" switches such as homogeneous or discrete capacitive-film switches and electrostatic-sensitive switches, for example.

'845 patent, col. 7, II. 5-10. Based on this portion of the specification, NCR contends that "discrete switches" must be construed to include "other 'transparent' switches [besides the 'micromotion' type switches detailed in the preferred embodiment] such as homogeneous or discrete capacitive-film switches and electrostatic-sensitive switches."

NCR contends that of the two potential dictionary definitions for discrete -- (i) composed of separate and distinct parts; and (ii) having an individually distinct identity -- the meaning used in the claims must be the latter. The court notes that NCR does not dispute the defendants' proposed construction of the terms "plurality" or "switch." Nonetheless, NCR contends that the term "discrete switches" should be construed to mean that the transparent switches on the panel each have an individually distinct identity in that a specific area identified on the panel causes a distinct action when that area is actuated.

c. The Court's Construction

The court begins the task of construing this term by turning the claim language itself. The court also turns to the specification for guidance as to the proper scope of the claims, because it details the claimed invention. Markman, 52 F.3d at 979 ("Claims must be read in view of the specification, of which they are a part"). While NCR is correct that, as a matter of law, it is improper to import limitations from the preferred embodiments into the claim, neither should a court should give a claim term a broader construction than is supported by the specification and claim language. See Netword LLC v. Centraal Corp., 242 F.3d 1347, 1352 (Fed. Cir. 2001) ("Although . . . the claims are not limited to the preferred embodiment of the invention, . . . neither do the claims enlarge what is patented beyond what the inventor has described as the invention."); Wang Labs. Inc. v. America Online, Inc., 197 F.3d 1377 (Fed. Cir. 1999) (holding that because "the only embodiment described in the '669 patent specification is the character-based protocol, . . . the claims were correctly interpreted as limited thereto").

The language of the claim, stating that one element of the claimed data handling device is "a plurality of discrete switches for entering data when actuated," provides some help in choosing between the proposed constructions offered by the parties. First, the court notes that the specific use of the terms "plurality" and "discrete," before the term "switches" in the claim language does give some indication that the claim element is referring to an array of separate switches. The claim language also specifies that these "discrete switches" are "positioned in overlapping relationship with the display elements relative to the panel of the claimed device "to enable said switches to be actuated from said panel," and requires in addition that the display elements can be selectively energized "so as to present on said panel the key information . . . which are associated with those of said discrete switches . . . " This demonstrates that the "switches" are distinct elements from the display elements or areas on the display.

The specification explains the claimed relationship between the discrete switches and the key information presented by the display elements in the following passages:

The top panel 24 has a plurality of switches 30 positioned relative to the top panel 24 as shown in Fig. 7. When a particular switch of the plurality of switches 30 is to be involved in one of the choices which is to be made available to the user, the associated switch area on the top panel 24 will be visually outlined by the display 26 to make this choice apparent to the user . . . .

The labels or designations are provided by the display 26 which lies below the plurality of switches 30. While the actual (physical) switches in the plurality of switches 30 are always present in the top panel 24, they are outlined or highlighted only when they become necessary for a particular function or instruction being executed by the P Terminal 12 . . . .
The switch areas 28-1 through 28-9, alluded to with regard to the discussion of Fig. 4, area aligned, respectively, with holes 60-1 through 60-9 shown in Fig. 7. When a user wishes to actuate one of the plurality of switches 30, as for example that one associated with key area 28-9 causing the conductor 52-5 in Fig. 7 to pass through the hole 60-9 and thereby contact the conductor 56-9.

Col. 4, II. 46-54; col. 5, II. 48-54; col. 6, II. 55-63 (emphasis added).

From the above language, it is clear that the claim term "discrete" means "distinct and separate," as each switch is individually distinct and separate from any other switch in the claimed plurality of switches. Being distinct and separate from one another, each switch is associated with a particular key area or switch area that can be outlined or highlighted by the display screen so that the user can selectively actuate that particular switch from among the plurality of switches. When a particular distinct switch is actuated, it closes the circuit in a specific area, such that the device can determine what corresponding display area on the screen was touched.

It is also clear that the specification defines the claimed invention as requiring "actual (physical) switches" in the claimed plurality of switches, that are distinct from the "areas" on the display with which they are associated. The specification makes clear that the switches are actual physical structures that are "always present," regardless of what is being displayed or what function or instruction is being executed. It describes in detail how the switches are to be arrayed in rows and columns. Further, it draws a distinction between the "actual (physical) switches," which are always there, and "switch areas," which are areas on the panel outlined by the display. The "switch" is the actual physical structure that is actuated to enter data, while the corresponding "areas" merely show the user where to press. This distinction between "switches" and images created by the display is also drawn in the claims themselves, in that each is recited as a separate claim element.

Both the common definition of switch and the specifications of the patents-in-suit belie NCR's assertion that a "switch" exists when there is "a specific area identified on the panel [that] causes a distinct action when that area is actuated." First, the ordinary meaning of a "switch" is a "manual or mechanically actuated device for making, breaking, or changing the connections in an electric circuit." This meaning should apply here, as there is no evidence that the inventors intended to impart a novel meaning to that term.

York Prods., Inc. v. Cent. Tractor Farm & Family Ctr., 99 F.3d 1568, 1572 (Fed. Cir. 1996) ("Without an express intent to impart a novel meaning to claim terms, an inventors' claim terms take on their ordinary meaning"). Second, the patent clearly distinguishes between the actual (physical) switches and their associated display areas. Thus, a switch cannot be defined simply as a "specific area identified on the panel." The claims and specification make clear that in the invention of the patents-in-suit, an array of switches lies under the specific areas on the panel; the switches are separate claim elements.

NCR argues, however, that in construing the claims, the court must look at other embodiments mentioned in the specification. The phrase in the specification that NCR relies upon to demonstrate that a broader construction is proper, states that "although the fabrication of switches 30 has been described in a specific manner, it is not intended to exclude other alternative methodologies to fabricate 'transparent' switches such as homogeneous or discrete capacitive film switches and electrostatic-sensitive switches, for example."'845 patent, col. 7, II. 5-10. NCR argues that this portion of the specification requires that definition of "discrete switches" to be broad enough to encompass homogeneous capacitive film switches.

The court does not agree with NCR's reading of this phrase. First, if indeed homogeneous modifies "switches" and not "capacitive film," the reference to "homogenous" switches in the specification cannot act to expand the definition of the claim term "discrete switches" to include "homogeneous switches" or "continuous switches." The claims do not claim "switches" generally, and certainly do not claim "homogeneous switches." Rather, only "discrete switches" are claimed. As a result, the claim term "a plurality of discrete switches" does not cover "homogeneous capacitive-film switches." See Novo Nordisk of No. Am., Inc. v. Genentech, Inc., 77 F.3d 1364, 1369 (Fed. Cir. 1996) ("The claims, . . . not the specification, measure the protected patent right to exclude others."); see also Johnson & Johnston Associates Inc. v. R.E. Service Co., Inc., 285 F.3d 1046, 1052 (Fed. Cir. 2002) (noting that "the claims, not the specification, provide the measure of the patentee's right to exclude" and that "when a patent drafter discloses but declines to claim subject matter . . . this action dedicats that unclaimed subject matter to the public"). If the court construed discrete switches to include homogeneous or continuous switches, it would impart no meaning to the claim term "discrete." Thus, because of the claim language requiring "discrete switches," homogeneous switches," which the patent specification makes clear are distinct from...
"discrete switches," are outside the scope of the claims. Second, and similarly, a fair reading of the phrase relied upon by NCR, indicates only that the specification teaches that "homogeneous or discrete capacitive-film switches and electrostatic-sensitive switches," whatever their actual structures may be, are contemplated by the inventors to be examples of other methods of fabricating "the plurality of discrete switches." Such potential embodiments do not affect of the plain meaning of "plurality of discrete switches." Any of the referenced methodologies must still result in the fabrication of two of more manually or mechanically actuated devices that make, break, or change connections in an electric circuit, which are individually distinct and separate from one another.

--- Footnotes ---

5 Palm's expert, Louis E. Tannas, Jr., points out in his declaration that "a more natural reading of the reference in the patent is that the term 'homogeneous' modifies the term 'capacitive-film' (the dielectric) rather than 'capacitive-film switches.' In other words, it is the capacitive film (the dielectric) that is homogeneous rather than the conductors. Moreover, [the use of the term] 'switches' would indicate that the conductors were partitioned to make multiple switches." Tannas Decl. P14. Tannas also notes that the Hale patents do not disclose the A/D converter and software needed to implement a capacitive touch screen. Id. at P15.

--- End Footnotes ---

Finally, the court notes that, contrary to NCR's assertion, this is not a case of limiting a construction to a preferred embodiment. 6 Rather, it is a case of construing the claims in line with the disclosed invention. The specification of the '845 and '478 patents describes only one embodiment of the claimed "plurality of switches." A construction that construes the invention as broader than what was disclosed and claimed is not supportable.

--- Footnotes ---

6 Neither is it, as NCR argues, a case where the court's construction of the term "discrete" as "individually distinct or separate from each other" would read out the preferred embodiment. NCR asserts that the switches disclosed in its patents are not "discrete" in that sense. The patents confirm that NCR is incorrect. They show forty-five different and distinct switches in the array of switches that are formed by forty-five holes at the intersections of the top and bottom conductors. See, e.g., Fig. 7. These switches are actuated by pressing a particular top conductor through a particular one of the forty-five holes to contact a particular bottom conductor. That each switch itself is not made of separate or distinct parts is of no moment. Each switch is distinct from each other in that each may make, break, or change its connection in an electric circuit. Accordingly, the defendants definition of a "plurality of discrete switches" does, in fact, read directly on the preferred embodiment.

--- End Footnotes ---

Here, NCR argues that the keys and buttons display generated by the software application fall within the claimed "plurality of discrete switches" of the invention. But nothing in the specification or claims teaches that the claimed "plurality of switches" may be generated by software. This contention that the display and software create a "plurality of discrete switches" runs counter to the display and software create a "plurality of discrete switches" runs counter to the claims' and specifications' distinction between switches and images. It also runs counter to the ordinary and undisputed meaning of a switch as a device, i.e., a physical structure. If anything, the specification teaches only that the switches are "fabricated" in some manner, implying that they are constructed out of various hardware components, rather than rendered functional by a software component. Moreover, the specification teaches that "the actual (physical) switches in the plurality of switches 30 are always present on the top panel 24." By contrast, software generated "switches" would disappear from the panel once the rendering application quits running.

For the above stated reasons, the court construes the claim term "plurality of discrete switches" as two or more distinct and separate manual or mechanically actuated devices for making, breaking, or changing the connections in an electric circuit. This definition, proposed by the defendants, best comports with the ordinary meaning of the claim terms as read in light of the claim language and the specification. See Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1250 (Fed. Cir. 1998) ("The construction that stays true to the claim language and most naturally aligns with the patent's description of the invention, will be, in the end, the correct construction").
The Court next addresses "dislodge" as used in Claim 22 of the 011 Patent. Both RTI and NMT agree that the ordinary meaning of "dislodge" is "to be moved from a settled position" or "to cause to shift from a fixed position." Nevertheless, NMT would interpret "dislodge" to mean "to slide the stopper relative to the plunger until it is free from the opening in the plunger." According to NMT's briefing, it offers such a construction because the specification does not permit something to be "dislodged" by breaking off.

In short, the Court does not find any intrinsic evidence which limits the ordinary meaning of "dislodge" as used in Claim 22 of the 011 Patent. First, the claim language does not limit "dislodge" in any way from its ordinary meaning. Second, the Court does not find manifest intent to limit the definition of "dislodge" from statements in the 077 Patent describing a preferred embodiment. NMT argues that the Court should limit Claim 22 to a preferred embodiment because "the only embodiment disclosed in the patent specification is a plug slidingly mounted in the opening of the plunger that slides relative to the plunger until it is free of the plunger opening." However, as the Federal Circuit has mandated, "an accused infringer cannot overcome the 'heavy presumption' that a claim term takes on its ordinary meaning simply by pointing to the preferred embodiment or other structures or steps disclosed in the specification or prosecution history," Teleflex, Inc., 299 F.3d at 1327. The Court does not find evidence sufficient to overcome the heavy presumption that "dislodge" carries its ordinary meaning in the language NMT cites from either the 011 or 077 Patents. Thus, "dislodge" means "to be moved from a settled position."

DISCUSSION

The sole issue on appeal is the proper construction of the claim term "dispensing" in asserted claims 1, 2, 3, 5, 6, and 8 of the '861 patent. Of the asserted claims, claims 1 and 5 are independent. Both cover "[a] method of dispensing reagents onto a slide." Claim 1 reads:

1. A method of dispensing reagents onto a slide, the method comprising the steps of:

   providing at least one reagent container;

   providing at least one slide on a slide support;

   automatically identifying the reagent container using a computer;

   automatically determining whether reagent in the reagent container should be dispensed onto the slide; and

   dispensing the reagent in the reagent container onto the slide based on the determination of whether the reagent in the reagent container should be dispensed onto the slide,

   wherein the step of automatically determining whether reagent in the reagent container should be dispensed onto the slide includes the steps of:

   providing a bar code reader;

   reading a slide bar code placed on the slide using the bar code reader thereby acquiring slide information, the slide information indicating reagents to be applied to the slide; and
sending the slide information to the computer.

'861 patent, col. 24, l. 53 - col. 25 l. 6 (emphases added). And claim 5 reads:

5. A method of dispensing reagents onto a slide, the method comprising the steps of:

providing a plurality of reagent containers in a reagent support, each of the reagent containers having a reagent barcode;

providing at least one slide on a slide support, the slide having a bar code;

providing a bar code reader;

reading the bar codes on the reagent containers;

determining reagents in the reagent containers based upon the reading of the bar codes on the reagent containers;

reading the slide bar code on the at least one slide;

determining a sequence of reagents to be applied on the at least one slide based upon the reading of the slide bar code on the slide; and

dispensing the reagents in the reagent containers based upon the sequence of reagents to be applied.

The district court construed the "dispensing" claim limitation to require "direct dispensing," meaning that "the reagent is dispensed directly from the reagent container" onto the slide, rather than utilizing an intermediate transport mechanism to transfer reagent from the reagent container to the slide. Claim Construction Order, slip op. at 5-7. The district court held that the context in which the "dispensing" term is used in the claim "necessitates 'direct dispensing' by stating that the reagent in the reagent container is dispensed onto the slide, meaning the reagent is dispensed directly from the reagent container." Id., slip op. at 6. The district court also noted that the written description and figures supported a narrow construction of "dispensing" because all of the disclosed embodiments dispense reagent directly from the bottom of the reagent container without using any intermediate transfer device. Id., slip op. at 7.

After construing the term "dispensing" to mean "direct dispensing," the district court held that the inventors disclaimed a particular type of dispensing, "sip and spit" dispensing, during the prosecution of an ancestor application. In "sip and spit" dispensing, an intermediate transport mechanism such as a pipette uses suction to "sip" the reagent from the reagent container and then releases or "spits" the reagent onto the slide. The '861 patent issued from a continuation of a continuation of a division of a continuation of U.S. Patent Application No. 07/924,052 (the "'052 application"), which originally presented 93 claims. 1 Independent claim 1 of the '052 application provided:

1. A biological reaction apparatus for dispensing a selected reagent directly to a sample, said biological reaction apparatus having:

   a reagent carousel having a plurality of reagent container supports thereon;

   homing and indexing means, operatively coupled to the reagent carousel, for identifying the position of each reagent container support with reference to a home position; and

   drive means, engaging the reagent carousel and operatively coupled to said homing and indexing means, for rotating the reagent carousel and positioning a preselected reagent container support in a reagent supply zone wherein said reagent supply zone is oriented so that a reagent in a container in said preselected reagent container support is dispensable directly to a sample.
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

(emphases added). The examiner rejected independent claim 1 and dependent claims 2-3 and 5-6 of the '052 application under 35 U.S.C. § 103 as being unpatentable over two prior art references, Wakatake et al. and Assmannet al. In response, the inventors argued that neither the Wakatake nor the Assmann reference disclosed the capability to dispense reagent "directly to a sample":

"Even in the unlikely event that Wakatake and Assmann were successfully combined into one system, the resulting system would still lack the present invention's novel capability to dispense reagent "directly to a sample" as set forth in Applicants' Claim 1, at line 16.

....

.... [T]he recited apparatus provides for direct dispensing of reagent from a reagent container to a sample. .... The present invention uses the "drive means to rotate the "reagent carousel." The reagent carousel holds the reagent containers. As can be seen in the Figures, the Reagent carousel is positioned above the samples and the reagent containers are oriented within the carousel with their outlet nozzles pointing down such that they are ready to dispense reagent directly to the sample below. ....

In contrast, Wakatake et al teaches reagent tables positioned side by side with a reaction table. (Wakatake et al, Figure 2). This side by side configuration precludes dispensing of the reagent "directly to a sample" or the incorporation of a "reagent delivery zone" as set forth in Claim 1 of the present invention. The Wakatake side by side configuration requires an additional device, a reagent pipetting device, to transfer the reagent between tables and mediate the dispensing of reagent to the sample. The reagent pipetting device is used to suck up an aliquot of reagent from a reagent container on one of at least two reagent tables, pivot so that the pipetting tube of the device is held just above a selected reaction vessel on a separate reaction table, and dispense the aliquot of reagent to the vessel (Wakatake at column 4, line 42 to column 5, line 10). Such devices are referred to in the trade as "sip and spit" devices.

The district court held that these statements during prosecution amounted to a "clear and unmistakable" disclaimer of "sip and spit" dispensing from claim 1 of the '052 application. Claim Construction Order, slip op. at 11. The district court further held that this disclaimer attached to claims 1 and 5 of the '861 patent

because there is a common claim limitation to which the disclaimer is directed: "direct dispensing." The court has already construed the claim term "dispensing" in the '861 patent to mean "direct dispensing" and thus, the '052 application and '861 patent have the same claim limitation. The "sip and spit" disclaimer may properly attach to the '861 patent (direct) dispensing limitation.

II

This court reviews claim construction de novo. Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1456 (Fed. Cir. 1998) (en banc). On appeal, Ventana argues that the district court improperly limited the scope of the term "dispensing" to cover only those methods of dispensing in which the reagent container is also the reagent dispenser (i.e., "direct dispensing"). Accordingly, Ventana asks this court to reverse the district court's claim construction and construe the phrase "dispensing" to mean "to apply reagent to the slide." We agree that the district court improperly imported limitations from the specification when it construed the term "dispensing" to require "direct dispensing."

Claim terms "are generally given their ordinary and customary meaning." Phillips v. AWH Corp., 415 F.3d 1303, 1312 (Fed. Cir. 2005) (en banc) (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996)). And "the ordinary and customary meaning of a claim term is the meaning that the term would have to a person of ordinary skill in the
art." Id. at 1313. In this case, Ventana argues that there is nothing in the record to suggest that a person of ordinary skill in
the art would interpret the disclosure and claims of the '861 patent to mean that the term "dispensing" is limited to "direct
dispensing." We agree.

To start with, claims 1 and 5 do not contain any language that could be read to limit the term "dispensing" to require "direct
dispensing." Although "direct dispensing" is one type of dispensing, BioGenex does not appear to dispute that other types of
dispensing, such as "sip and spit" dispensing, also fall within the ordinary meaning of "dispensing." Though the district
court held that the word "onto" in the language of the claim necessitated "direct dispensing" because the claims require that
reagent in the reagent container be dispensed "onto" the slide, BioGenex agreed at oral argument that the word "onto" does
not by itself exclude the "sip and spit" method of dispensing from the ordinary meaning of "dispensing."

Instead, BioGenex argues that the patent's specification compels a narrow construction of "dispensing." BioGenex first
points to the "BACKGROUND ART" section of the patent, which discusses a number of prior art automated staining
devices, including a device that BioGenex alleges employs the "sip and spit" method of dispensing. '861 patent, col. 2, ll. 6-
16. BioGenex argues that because the patent goes onto state that "[t]he previously known devices are limited in their
performance and unable to satisfy the needs for automated, high precision immunohistology" and that it was an object of the
invention to "provide a device which provides more rapid, reliable and more reproducible results than standard methods," id.
at col. 2, ll. 26-31, the patent makes clear that the invention does not practice the "sip and spit" method of dispensing.

We decline to interpret these general statements by the inventors to effect a complete surrender from the claims of the '861
patent of all types of dispensing except "direct dispensing." For one thing, the "BACKGROUND ART" section includes
discussion of a number of different prior art devices that employ a number of different dispensing techniques, including a
device that employs a "direct dispensing" technique. Id. at col. 1, l. 65 - col. 2, l. 5 ("Stark, E. et al, J.Immunol.Methods.
107:89-92 (1988) describes a microprocessor controlled system including a revolving table or carousel supporting radially
positioned slides. A stepper motor rotates the table, placing each slide under one of the stationary syringes positioned above
the slides. A predetermined volume of liquid, determined by a dial, is delivered to a slide from each syringe."). Thus, if
BioGenex's argument were correct, the inventors have also disavowed coverage of "direct dispensing," which is the type of
dispensing employed by the patent's preferred embodiment. For this reason, BioGenex's argument cannot be correct.

Moreover, this is not a case in which the inventor's distinguishing the invention over the prior art in the specification results
in a disavowal of coverage by the inventor of features in the prior art. In Phillips, we recognized that in certain cases, "the
specification may reveal an intentional disclaimer, or disavowal, of claim scope by the inventor." Phillips, 415 F.3d at 1316.
In such cases, this court interprets the claim more narrowly than it otherwise would to give effect to the inventor's intent to
disavow a broader claim scope. Id.; Honeywell Int'l, Inc. v. ITT Indus., Inc., 452 F.3d 1312, 1319-20 (Fed. Cir. 2006);
SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1342-44 (Fed. Cir. 2001). Here, however,
BioGenex points to only general statements by the inventors indicating that the invention is intended to improve upon prior
art automated staining methods: "The previously known devices are limited in their performance and unable to satisfy the
needs for automated, high precision immunohistology. It is an object of this invention to provide a device which provides
more rapid, reliable and more reproducible results than standard methods..." 861 patent, col. 2, ll. 26-31. Such general
statements, without more, will not be interpreted to disclaim every feature of every prior art device discussed in the
"BACKGROUND ART" section of the patent.

Next, BioGenex points out that all of the '861 patent's disclosed embodiments employ a "direct dispensing" method of
dispensing. BioGenex submits that when the specification is read in its entirety, one of skill in the art would come to the
"inescapable conclusion that the novelty of Ventana's invention is the birthday cake or over/under carousel arrangement for
direct dispensing." As a result, BioGenex argues, the specification has implicitly defined the term "dispensing" to mean "direct dispensing."

There are, however, several problems with this argument. "It is a 'bedrock principle' of patent law that 'the claims of a patent
define the invention to which the patentee is entitled the right to exclude.'" Phillips, 415 F.3d at 1312 (quoting Innova/Pure
Water, Inc. v. Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1115 (Fed. Cir. 2004)). "[A]lthough the specification often
describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those
embodiments." Id. at 1323. While the fact that the disclosed embodiments are limited can assist in interpreting claim
language, the mere fact that the '861 patent discloses embodiments in which the reagent container is also the reagent
dispenser does not in and of itself mean that the method claims at issue are limited to the disclosed embodiments.
The second problem with BioGenex's argument is that each claim does not necessarily cover every feature disclosed in the specification. When the claim addresses only some of the features disclosed in the specification, it is improper to limit the claim to other, unclaimed features. Id. at 1327; see also Golight, Inc. v. Wal-Mart Stores, Inc., 355 F.3d 1327, 1331 (Fed. Cir. 2004) ("[P]atentees [are] not required to include within each of their claims all of [the] advantages or features described as significant or important in the written description."); E-Pass Techs., Inc. v. 3COM Corp., 343 F.3d 1364, 1370 (Fed. Cir. 2003) ("An invention may possess a number of advantages or purposes, and there is no requirement that every claim directed to that invention be limited to encompass all of them."). Here, the claims of the '861 patent are directed toward automated methods of dispensing that use bar codes to determine which reagents should be dispensed onto which slides. Although the preferred embodiments also contain a "direct dispensing" feature, the inventors were not required to claim this feature in the '861 patent and, indeed, did not do so.

III

Ventana also argues that the district court erred in holding that the inventors of the '861 patent disclaimed coverage of "sip and spit" dispensing during prosecution of the '052 application, an ancestor of the '861 patent. BioGenex responds that the inventors disclaimed "sip and spit" dispensing when they distinguished the prior art "sip and spit" devices because of those devices' inability to dispense reagent "directly to a sample," as required claim 1 of the '052 application.

BioGenex thus raises the doctrine of prosecution disclaimer. "[T]he prosecution history can often inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution, making the claim scope narrower than it would otherwise be." Phillips, 415 F.3d at 1317. Accordingly, we examine the patent's prosecution history, when placed in evidence, to determine whether the inventor disclaimed a particular interpretation of a claim term during the prosecution of the patent in suit or during the prosecution of an ancestor application. Id.; Advanced Cardiovascular Sys. v. Medtronic, Inc., 265 F.3d 1294, 1305-06 (Fed. Cir. 2001). But the doctrine of prosecution disclaimer generally does not apply when the claim term in the descendant patent uses different language. Invitrogen Corp. v. Clontech Labs., Inc., 429 F.3d 1052, 1078 (Fed. Cir. 2005) ("[T]he prosecution of one claim term in a parent application will generally not limit different claim language in a continuation application."); ResQNet.com, Inc. v. Lansa, Inc., 346 F.3d 1374, 1383 (Fed. Cir. 2003) ("Although a parent patent's prosecution history may inform the claim construction of its descendant, the [parent] patent's prosecution history is irrelevant to the meaning of this limitation because the two patents do not share the same claim language."); Advanced Cardiovascular Sys., 265 F.3d at 1305-06.

In this case, the allegedly disclaiming statements were made with respect to claim language that expressly required reagent in the reagent container to be "dispensable directly to a sample." Indeed, in distinguishing the prior art, the inventors stated that the prior art "sip and spit" devices lacked "the present invention's novel capability to dispense reagent 'directly to a sample' as set forth in Applicants' Claim 1, at line 16" (emphasis added). Because claims 1 and 5 of the '861 patent use different claim language -- that is, they do not require that reagent be "dispensable directly to a sample" -- the alleged disclaimer of "sip and spit" dispensing during the prosecution of the '052 application does not apply to the asserted claims of the '861 patent.

2 BioGenex makes a number of arguments in response to a perceived argument by Ventana that a disclaimer made during prosecution of the '052 application does not apply to the claims of the '861 patent because the '861 patent resulted from a divisional application as opposed to a continuation application. We do not understand Ventana to be making this argument, however, so we need not address BioGenex's responses to it. Regardless of whether the '861 patent resulted from a divisional application or a continuation application, the alleged disclaimer of "sip and spit" dispensing does not apply to the asserted claims of the '861 patent because claim 1 of the '052 application and the asserted claims of the '861 patent do not share a common claim term in dispute.

Indeed, we agree with Ventana that the prosecution history of the '861 patent supports a broad construction of "dispensing." For example, during the prosecution of the application that led to the '861 patent, the examiner issued a restriction requirement. With respect to the application claims that eventually resulted in claims 1 and 5 of the '861 patent, the
examiner observed that "the process as claimed can be practiced by another materially different apparatus or by hand, such as a manual pipette means." This statement shows that the patent examiner did not consider the "dispensing" claim term to be limited to the "direct dispensing" embodiment disclosed in the specification. Moreover, the inventors did not rely on "direct dispensing" as a distinction between the claims at issue in this case and the prior art. Instead, in response to rejections over the prior art, the inventors limited their arguments to the ability of the claimed inventions to address the shortcomings of manual reagent identification and manual determination of reagent dispensing protocols.

IV

BioGenex next argues that the inventors disclaimed "sip and spit" dispensing from claims 1 and 5 of the '861 patent during the prosecution of two later-issued patents, the '901 patent and the '029 patent. The district court did not address the relevance, if any, of the prosecution histories of the '901 and the '029 patents in its claim construction opinion. Nevertheless, for the reasons described below, we agree with Ventana that the prosecution histories of these later patents do not inform the proper construction of "dispensing" in claims 1 and 5 of the '861 patent.

The '861 patent issued from U.S. Patent Application No. 09/452,309 (the "'309 application"). Each of the later-issued patents resulted from continuations of the '309 application. 3 Independent claim 72 of the '169 application (which issued as claim 1 of the '901 patent) provided, in part:

72. A biological reaction apparatus for dispensing a selected reagent to a slide containing a sample, said biological reaction apparatus comprising:

   a reagent carousel having a plurality of reagent container supports thereon;

   a homing and indexing device, operatively coupled to the reagent carousel, for identifying the position of each reagent container support with reference to a home position;

   [and] a motor engaging the reagent carousel and operatively coupled to said homing and indexing device, for rotating the reagent carousel and positioning a preselected reagent container support in a reagent supply zone, wherein said reagent supply zone is oriented so that reagent in a container in said preselected reagent container support is dispensable to a slide and wherein each of the reagent container supports is arranged to accommodate a reagent container such that it is positioned above a slide when in the reagent supply zone whereby the reagent is dispensable from a lower end of said container onto the slide . . . .

( emphases added).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 The '901 patent issued from U.S. Patent Application No. 10/137,169 (the "'169 application"), which was a continuation of a continuation of the '309 application. The '029 patent issued from U.S. Patent Application No. 10/054,535 (the "'535 application"), which was a continuation of the '309 application.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In responding to a obviousness rejection of application claim 72 and its corresponding dependent claims, the inventors distinguished a prior art "sip and spit" reference because it transferred reagents "by pipettes into cuvettes 106 held in sample analysis carousels 102 that are adjacent to and not below the reagent carousel" as required by the claims. In distinguishing another prior art reference, the inventors stated that

the invention of claim 72 et al. includes a sample carousel arranged beneath a reagent carousel [and] the reagent is dispensed onto a slides

[sic] position below the reagent carousel. . . .
Locating the carousel including samples containing slides below the reagent carousel is an important feature of the claimed invention because it allows the reagent to be applied directly to the samples on the slides.

BioGenex asserts that these statements amount to a disclaimer of "sip and spit dispensing" that should be applied to the claims of the '861 patent.

We have held that statements made by the inventor during continued prosecution of a related patent application can, in some circumstances, be relevant to claim construction. See Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1349 (Fed. Cir. 2004) (recognizing that "the prosecution history of one patent is relevant to an understanding of the scope of a common term in a second patent stemming from the same parent application"). As with statements made by the inventor during the prosecution of an ancestor application, statements made during the continued prosecution of a sibling application may "inform the meaning of the claim language by demonstrating how the inventor understood the invention." Phillips, 415 F.3d at 1317.

But here, once again, BioGenex points to statements made with respect to claim language that expressly required the reagent to be "dispensable from a lower end of [the] container onto the slide." Because claims 1 and 5 of the '861 patent do not contain this claim language, these statements are not relevant to the construction of "dispensing" in claims 1 and 5 the '861 patent.

Similarly unpersuasive is BioGenex's assertion that the inventors disclaimed "sip and spit" dispensing during prosecution of the '029 patent. Independent claim 92 of the '535 application (which issued as claim 17 of the '029 patent) called for "a method of dispensing reagents onto a slide" where the reagent container and the slide support are moved" relative to one another to position the reagent container over the slide." In response to an obviousness rejection, the inventors distinguished a prior art "sip and spit" device because it positioned the reagent containers adjacent to the receptacles into which the reagents were dispensed. Thus, the prior art device did not position the reagent container "over the slide," as required by the claim. Claims 1 and 5 of the '861 patent, however, do not contain this language. Consequently, the statements pointed to by BioGenex are not relevant to the construction of "dispensing" in claims 1 and 5 the '861 patent.

4 BioGenex also points out that the patent examiner issued an obviousness-type double patenting rejection of all of the claims of the '535 application over the claims of the '861 patent. The inventors responded to the obviousness-type double patenting rejection by filing a terminal disclaimer. BioGenex argues that the filing of the terminal disclaimer represents an admission by the inventors "equating all claims of the '535 application to all claims of the '861 Patent." As a result of the terminal disclaimer, BioGenex argues, any prosecution disclaimer of "sip and spit" dispensing in the '535 application applies to the claims of the '861 patent. We disagree. For one thing, "the filing of a terminal disclaimer simply serves the statutory function of removing the rejection of double patenting, and raises neither presumption nor estoppel on the merits of the rejection." Quad Envtl. Techs. Corp. v. Union Sanitary Dist., 946 F.2d 870, 874 (Fed. Cir. 1991). Moreover, the inventors' filing of a terminal disclaimer does not change the fact that the asserted claims of the '861 patent do not contain the "over the slide" limitation present in claim 92 of the '535 application. As a result, arguments made during prosecution of the '535 application with respect to whether the prior art "sip and spit" devices positioned the reagent container "over the slide" are irrelevant to the construction of "dispensing" in claims 1 and 5 the '861 patent.

I respectfully dissent from the majority's decision to vacate and remand based upon its construction of the term "dispensing." I believe that the district court correctly construed the disputed term in light of the specification and, for that reason, I would affirm.
"[T]he person of ordinary skill in the art is deemed to read the claim term not only in the context of the particular claim in which the disputed term appears, but in the context of the entire patent, including the specification." Phillips v. AWH Corp., 415 F.3d 1303, 1313 (Fed. Cir. 2005) (en banc). The specification "is always highly relevant to the claim construction analysis. Usually it is dispositive; it is the single best guide to the meaning of a disputed term." Id. at 1315 (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996)). When read in the context of the specification, the claim term "dispensing" clearly means "direct dispensing."

The '861 patent is part of a family of six other patents sharing a common specification, although only claim 15 of the '707 patent expressly recites "direct dispensing." Claim 1 of application 07/924,052, which eventually was abandoned, was amended to include the word "direct dispensing" in order to overcome prior art. Claim 1 of the '861 patent is broader and makes no reference to dispensing directly. Nonetheless, the claims must be construed in light of the specification, which is the same for all seven patents and which repeatedly describes dispensing reagent directly from a reagent container onto a slide.

The Summary of the Invention describes "positioning a preselected reagent container support and associated reagent container in a reagent supply zone. The apparatus has a reagent delivery actuator means positioned for engaging a reagent container positioned on a container support in the reagent supply zone and initiating reagent delivery from the reagent container to a slide supported on a slide support in the reagent receiving zone." '861 patent, col. 2, ll. 53-59. The Summary further describes using a "volumetric pump means, and a reagent delivery actuator means positioned for activating the volumetric pump means, thereby effecting delivery of reagent from a reagent container by the volumetric pump to the reagent delivery zone." '861 patent, col. 3, ll. 53-56. Those statements of delivery from a reagent container to a slide describe direct dispensing. They describe the essence of the invention and clearly show that the reagent is dispensed directly from a reagent container positioned in a support onto a slide.

Such statements are repeated throughout the rest of the specification. For example, in the Detailed Description of the Invention, the specification describes that "[t]he carousel 10 is rotated by the stepper motor 14 drive belt 16 to a position placing a selected reagent bottle 12 in the reagent delivery position under the air cylinder reagent delivery actuator 18 over a slide to be treated with reagent." '861 patent, col. 6, ll. 54-57. The specification further indicates that the "reagent delivery actuator 18, supported by support arm 216, contacts reagent bottle 218, directly over slide 214." '861 patent, col. 9, ll. 24-26 (emphasis added). The text accompanying Figure 15 describes the dispensing: "Delivery of pressurized air to the cylinder 18 causes rod 304 and its attached foot 306 to move downward against a reagent container 12 positioned in the reagent delivery zone. Downward movement of reagent container 12 causes emission of a precise volume of reagent liquid 310." '861 patent, col. 11, ll. 40-45. Finally, Figures 1, 2, 3, 4, 11, 15 depict the apparatus that employs direct dispensing. The figures depict reagent containers in a carousel placed directly over a slide to dispense the reagent from the container onto the slide.

Statements describing dispensing reagent directly from a reagent container onto a slide are thus found in the abstract, the summary of the invention, the detailed disclosure of the invention, and the figures. Those statements do not merely describe a preferred embodiment of the invention; they broadly disclose the overall invention of all seven patents. The majority points out that, because the preferred embodiment discloses direct dispensing, we should not limit the claims to only that which is the disclosed embodiment. However, this is not a case of limiting the claims by looking at a preferred embodiment. Direct dispensing is the essence of the invention, and the specification supports that conclusion. The specification, shared by all seven patents, leads to the "inescapable conclusion" that the invention of the '861 patent consists of "direct dispensing." Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1348 (Fed. Cir. 2004) (citing SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1342 (Fed. Cir. 2001)). Moreover, nowhere does the specification suggest that the invention includes the alternative "siphon and spit" dispensing method, involving dispensing reagent from an upright container by means of a pipette. Accordingly, I believe that the district court correctly construed the claims to require "direct dispensing."

An examination of the prosecution history confirms that Ventana viewed its inventions as limited to direct dispensing. In a related grandparent application, in order to overcome an examiner's rejection, Ventana argued that the prior art lacked the "present invention's novel capability to dispense reagent 'directly to a sample'" and that the "apparatus of the present invention" uses a reagent carousel and reagent container supports, "which minimize the time required to apply a given reagent, and the time between the application of multiple reagents, by dispensing reagent 'directly to a sample.'" Ventana
further stated: "As can be seen in the Figures, the reagent carousel is positioned above the samples and the reagent containers are oriented within the carousel with their outlet nozzles pointing down such that they are ready to dispense reagent directly to the sample below." Those statements made in the prosecution of the related patent application, having the same specification, reflect that Ventana understood its own invention to be limited to direct dispensing. We cannot construe the claims to cover subject matter broader than that which the patentee described in its specification, regarded as comprising its invention, and represented to the Patent and Trademark Office.

Even though those statements from the prosecution were made in a grandparent patent application, they relate to the common specification and reflect Ventana's own understanding of its invention. I believe, therefore, that the statement in the prosecution of the '052 application is indicative of the proper interpretation of the same claim term in the later-issued '861 patent.

In sum, the district court appropriately considered the specification and related prosecution history and determined the ordinary meaning of "dispensing" in light of all the intrinsic evidence. I see no error in the court's approach or result. Accordingly, I would affirm the district court's claim construction.
Although Smiths argues that MiniMed has offered a "myriad" of conflicting definitions for the term "dispensing protocol," the definition appears straightforward. The PDR Medical Dictionary lists only one definition for "protocol": "a precise and detailed plan for the study of a biomedical problem or for a regimen of therapy." PDR Medical Dictionary, 1446 (1st ed. 1995). Further, Merriam-Webster's Dictionary lists only one definition of protocol applicable to the medical field; "a detailed plan of … treatment, or procedure." Merriam-Webster's Collegiate Dictionary, 936 (10th ed. 2002). The ordinary meaning of "dispensing protocol" in this context is a "a plan or regimen for the delivery of medication."

Smiths' argument that the intrinsic evidence supports its more narrow construction is unconvincing. Nowhere in the specification has the patentee "demonstrated a clear intention to limit the claim scope." Liebel-Flarsheim, 358 F.3d at 906. Smiths relies on a statement in the specification, that "the medication dosage and frequency are, of course, developed according to a dispensing protocol to meet the needs of each patient" to show that the patentee narrowed the scope of "dispensing protocol" to "dosage rate." (D.I. 190 at 16 (citing '065 patent, col. 1:54-56, col. 2:14-20, col. 5:1-14).) Frequency and dosage are apparently two of the factors considered when creating a dispensing protocol. Therefore, such language is consistent with the plain meaning of "dispensing protocol."

With respect to the prosecution history, the one excerpt on which Smiths relies is taken out of context and is inconsequential. In the office action in question, the patentee distinguished the prior art by noting that it did not recommend a dosage rate. (D.I. 192, Ex 26, at 6.) As a "dispensing protocol" is made up of a series of "dosage rates" and could presumably be just one "dosage rate," in some instances, it is axiomatic that if the prior art did not suggest a "dosage rate" it also could not suggest a "dispensing protocol" because "dispensing protocol" encompasses "dosage rate." Therefore, the patentee was not limiting the definition of "dispensing protocol."

As to Smiths' last argument, that MiniMed's own expert supported Smiths' construction of the term in question, the quote relied on again appears to be taken out of context. During a deposition, the expert was asked the question "what did the algorithms recommend? Did they recommend a pattern?" (D. I. 193, Ex. 44 at 44.) In response, he answered "No. They recommend a rate." (Id.) It appears, however, that the expert was addressing one embodiment of the invention where the invention is continually changing the dosage rate throughout the day in response to blood glucose readings and not the meaning of "dispensing protocol" as used in Claim 1. (Id. at 44-45, 54-55.)

**H. "dispersed in all directions"**

This term describes in which directions light hitting the coating is reflected. Defendants propose that the word "all" be given its ordinary meaning because there is no basis to depart from the standard presumption in favor of the ordinary meaning. The Court disagrees. In this case, the inventor has not used the word "all" in its ordinary sense, but instead has imparted a special meaning. This special meaning is apparent in the specification, as well as in the words of the claim at issue.

First, from the claim itself it can be seen that the term "dispersed in all directions" does not stand alone, but is part of a clause that works as a unit to describe where and how the glitter particles are positioned within the coating. The first part of the clause--"whereby substantially all light incident on said body is reflected"--indicates that the glitter particles are evenly distributed throughout the coating and in such close proximity to each other that all but an insignificant amount of light is reflected. The second part of the clause--the one at issue--describes how the flat glitter particles are oriented within the coating. The term states that the glitter is oriented so that light incident on the coating is reflected in "all directions."

There is an infinite number of directions. If light is to be reflected in "all" of them, then the ordinary meaning of the word "all" would require a finite number of glitter particles to be oriented upon an infinite number of planes. This peculiar implication of the ordinary meaning renders unclear the meaning of the term "in all directions" in the context of an invention defined as having only a finite number of glitter particles. Thus, it is appropriate to refer to the specification to ascertain its meaning. See Johnson Worldwide Assoc., Inc. v. Zebo Corp., 175 F.3d 985, 990 (Fed. Cir. 1999) (disputed term invites reference to the specification when term chosen by patentee deprives claim of meaning).
Furthermore, it appears that the patentee did not use the term "all" in its ordinary sense, requiring light to be dispersed in an infinite number of directions, but rather has set forth a different definition. The specification states that light is reflected "in a very large plurality of directions." ( '160 Patent, col. 2, line 12.) Although this term itself is somewhat ambiguous, fortunately the patentee defines exactly what is meant by "a very large plurality of directions" later in the specification: light is reflected from the coating at "as many different angles . . . as there are [glitter] particles." ( '160 Patent, col. 3 line 5.) The Court is convinced that this interpretation is the one mandated by in view of the claim language and the specification.

1186

a. "Displaceable" and "Linearly Displaceable"

The term "displaceable" appears in independent Claim 1 and the term "linearly displaceable" in dependant Claim 2 of the '477 Patent. See '477 Patent col. 8 ll. 48-50 ("the elongate members being displaceable between 'open' and 'closed' positions such that fluid can flow.") (Claim 1); id. col. 8 ll. 61-63 ("each of said elongate members are linearly displaceable within one of said shafts between said 'open' and 'closed' positions.") (Claim 2). Millipore initially argued that the term "displaceable" should be given its ordinary meaning, namely "physically movable out of a position." Additionally, Millipore contended that the term "linearly displaceable" contained in Claim 2 should be given the same meaning, except that it should be limited to a linear movement as distinct from a rotational movement.

The first issue is therefore to determine whether the limitation contained in Claim 2 can be read into Claim 1, thereby excluding rotational movement. Under the doctrine of claim differentiation in patent law, "the presence of a dependent claim that adds a particular limitation gives rise to a presumption that the limitation in question is not present in the independent claim." Phillips, 415 F.3d at 1315. Consequently, I conclude that the limitation found in Claim 2 should not be read in Claim 1. This conclusion is further supported by the prosecution history, which suggests that there is a difference between linear and rotational movement. For instance, in prosecuting the patent, Millipore characterized the elongate member of the sampling device as being "capable of linear and rotation [sic] movement to be selectively moved from a closed to open position." '477 Patent, Prosecution History Record, p. 60. Additionally, articulated the broad scope of the term "displaced" to mean that "claim 1 [as filed] is not limited to either movement [linear or rotational] and that the claims as filed have always covered both movements." Id. at 107.

This treatment of the term "displaceable" is consistent with ordinary usage as reflected in dictionaries. As noted in Phillips, a court may rely on dictionary definitions, "so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents." 415 F.3d at 1322-23 (quoting Vitronics, 90 F.3d at 1584 n.6). Because I find that the dictionary definitions provided for the term "displaceable" are not contradicted by the specification or any other patent documents, I construe this term, as Millipore now concedes, to mean "that can be displaced," i.e. "that can be put out of place." See Webster's Third New International Dictionary at 654 (2002). Accordingly, I construe the term "linearly displaceable" in the same fashion with the exception that the movement be limited to linear and not rotational.

1187

11. Displacing, Displacement, and Displaceable

This section of the decision addresses the related terms displacing, displacement, and displaceable. "Displacing" appears in claims 1(d), 10(d), 19(c), 23(c), 27(d), 31(d), 35(c), and 39(c) of the '267 patent. "Displacement" appears in claims 39, 49, and 50 of the '410 patent; and, in claims 1, 21, and 22 of the RE '439 patent. "Displaceable" appears in claims 1, 3, 5, 7, 12, 13, and 14 of the '907 patent.

Relying on the ordinary meaning of the terms, the Plaintiffs assert that displacing means "putting something in a different place;" displacement is the "process of being put into a different place;" and, "displaceable" means "the capability of being put in a different place." (Pls. Open. Br. 36-37.) The Plaintiffs also contend that displaceable is not restricted to "no appreciable force." (Id.)
Pergo maintains that "displacing" in the context of the '267 patent claims means "easily sliding joined panels relative to one another along their joined edges, because a play exists between the joined edges," and "displaceable" means "the joined panels can easily slide relative to one another along their joined edges because a play exists between the locking groove and the locking element." (Unilin's Open. Br. 27-31.) Pergo also states that "displacement" should be defined with respect to RE '439 patent claims 1, 21, and 22 as "the joined panels can easily slide relative to one another along their joined edges because a play exists between the locking groove and the locking element," (Unilin's Open. Br. 32.), and with respect to claims 29, 49, and 50 of the '410 patent as "so constructed to allow the mutual displacement of the panels in the direction of the long edges." (Pergo's Reply Br. Ex. F 1.)

The Court notes that "unless compelled otherwise, a court will give a claim term the full range of its ordinary meaning as understood by persons skilled in the relevant art." Gemstar-TV Guide Int'l, Inc. v. Int'l Trade Comm'n, 383 F.3d 1352, 1364 (Fed. Cir. 2004). The ordinary and customary meaning of a claim term may be determined by reviewing a variety of sources, which may include the claims themselves; dictionaries and treatises; and, the written description, the drawings, and the prosecution history. Id. The construction of claims is simply a way of elaborating the normally terse claim language in order to understand and explain, but not to change, the scope of the claims." Embrex, Inc., v. Serv. Eng'g Corp., 216 F.3d 1343, 1347 (Fed. Cir. 2000) (internal quotations and citation omitted).

Claim 39 of the '410 patent includes the terms "displacement" and "displacing" as follows:

A flooring system comprising a plurality of rectangular floor panels which are mechanically connectable to each other in parallel rows along adjacent long edges and short edges, respectively, of the panels, said floor panels being provided with means for mechanically locking together their long edges as well as their short edges in a first direction at right angles to a principal plane of the panels, thereby forming first mechanical connections between the panels, each panel, at a rear side thereof, being provided: (i) with a locking strip at one long edge and at one short edge, each locking strip extending throughout substantially an entire length of the corresponding edge of the panel and being provided with a projecting locking element, and (ii) with a locking groove at an opposite long edge and at an opposite short edge, each locking groove extending parallel to and spaced from the corresponding edge and being open at the rear side of the panel, said locking strips and locking grooves forming second mechanical connections locking the panels to each other in a second direction parallel to the principal plane and at right angles to the joint edges such that a locking strip of a first one of two joined panels projects on the rear side of the second panel with its locking element received in the locking groove of the second panel, the first and the second mechanical connections are so constructed as to allow mutual displacement of the panels in the direction of the long edges, the second mechanical connection along the long edges is so constructed as to allow the locking element to leave the locking groove if the panel associated with the locking groove is turned about its long edge angularly away from the strip, and each locking strip at the short edges is flexible and resilient such that two of the floor panels, having already been mechanically joined to a common long edge of a third of the floor panels, can be mechanically joined together at their adjacent short edges by displacing said two panels horizontally towards each other, while resiliently urging the flexible strip at one of said short edges downwards, until said adjacent short edges of the two panels have been brought into complete engagement with each other horizontally and the locking element at said one short edge thereby snaps into the locking groove at the adjacent short edge.

('410 patent, 14:14-59.) (Emphasis added).

The Plaintiffs' definitions of the displacement terms are vague. Moreover, their definitions are not presented within the context of the specification or the patent claims.

Pergo's proposed definitions relate to the patent claims and specification. Each of Pergo's proposed definitions of the terms include some form of the word "slide." In discussing the role of "play" in the invention, Alloc, 342 F.3d at 1369, states that the specification teaches that play permits displacement between the components of the locking joint; i.e., allows the panels to "slide" relative to one another. The court also noted that the prosecution history for the '621 parent patent indicated that representations distinguishing the invention from the prior art were based on the invention's ability to displace panels ("slide movably") and to release adjacent panels by rotation about the joint. Id. at 1371.

The term "slide" means "to move over a surface while maintaining a smooth, continuous contact." Webster's II New Riverside University Dictionary, 1094. Some ease of movement is inherent in the term slide. Pergo has not shown that the modifier "easily" is supported by the patent claims or specification. "Play" permits displacement. However, there is no basis
for including "play" in the definition of the displacement terms. Although Pergo has suggested rather elaborate proposed definitions, it also succinctly states that "displacement refers to the ability of two panels to slide alongside of each other along their joined edge." (Unilin's Open. Br. 28.) (Emphasis added). Based on the claims, the specification, and Alloc, the Court construes the noun "displacement" as "the act of sliding movably." The verb "displacing" is construed as "sliding movably." The Court further construes "displaceable" as "having the capability of sliding movably."

To dispose of this appeal, we need only address one aspect of the Commission's claim construction and infringement analysis. Because we uphold the Commission's construction of step (c) of claims 1 and 8 of the '464 patent, and because we agree that under that construction there was no proof of infringement by the DSS products, we sustain the Commission's ruling that Innovatron failed to prove a violation of section 337.

Step (c) of the claimed method requires:

- displacing said corresponding contact surfaces relatively, in a direction tangential to said corresponding contact surfaces if said testing determines non-alignment and non-existence of correct electrical contact, and stopping the relative displacement of corresponding contact surfaces when said testing determines said alignment and existence of correct electrical contact.

The Commission held that the act of "displacing . . . in a direction tangential" includes only relative movement of the corresponding contact surfaces while those surfaces are in contact and that the act of "stopping the relative displacement of corresponding contact surfaces" results from a positive test for correct alignment and electrical contact and occurs nearly instantaneously after a successful test.

We agree with the Commission that "displacing . . . in a direction tangential" includes only relative movement of the corresponding contact surfaces when those surfaces are in contact. That construction is consistent with the plain language of step (c). Moreover, contrary to Innovatron's arguments, it is fully supported by the written description, which explains that step (c) requires

- displacing in an oscillatory or alternating and relative fashion the two contact surfaces, around a median point, in a direction tangential to their surface, at least as long as these surfaces are in contact. This oscillatory movement can be carried out while the two contact surfaces are constantly in contact and it may equally be carried out by successive passes, i.e. by a repetition of the contacting process.

The phrase "at least as long as these surfaces are in contact" means that the displacement, i.e., the oscillatory or alternating movement about a median point, must take place while the corresponding contact surfaces are in contact. That the process may be "carried out by successive passes" does not mean that displacement can take place while the surfaces are out of contact; it suggests, rather, that displacement can be halted and restarted when contact is broken and reestablished. Accordingly, we construe "displacing . . . in a direction tangential" to require relative movement of the corresponding contact surfaces while those surfaces are in contact. The displacement can be interrupted either by stopping the relative movement or by breaking contact, but the periods of interruption are not themselves part of the displacement.

Innovatron makes two arguments against that construction. First, it argues that construing "displacing . . . in a direction tangential" to require the corresponding contact surfaces to be in contact would prevent claims 1 and 8 from reading on the preferred embodiment. The preferred embodiment operates as follows: (1) contact is established; (2) there is continuous displacement consisting of, at most, a single oscillation about a median point (i.e., the card is moved fully forward and back); (3) if there is no successful test before the oscillation is complete, contact is broken; (4) if there has been no successful test, the process is repeated. Contrary to Innovatron's contention, the preferred embodiment does "displace . . . in a direction tangential," because, although the periods of displacement may be interrupted while contact is broken, there is relative movement of the corresponding contact surfaces while those surfaces are in contact.
Innovatron's second argument against this construction is that it does not read on one of the embodiments that is disclosed as an alternative to the preferred embodiment. In the section entitled "Description of Preferred Embodiments," the written description discloses the following:

The translationally movable drawer may be replaced by a jointed shutter which is rotationally and translationally movable (in the same fashion as introduction mechanisms for magnetic cassettes in tape readers).

According to Innovatron, in a system with a jointed shutter rather than a drawer, there is no displacement while the corresponding contact surfaces are in contact. The exact operation of the jointed shutter mechanism is not apparent from the disclosure, but it is clear that the jointed shutter shares a critical characteristic with the preferred drawer mechanism; namely, both the drawer and the jointed shutter are "translationally movable." In the detailed description of the preferred embodiment, it is clear that it is the translational movement of the drawer that gives rise to the "displacement . . . in a direction tangential." Whatever the properties of a jointed shutter card insertion system, it is apparent from the plain text of the disclosure that such a system, like the preferred drawer system, must be "translationally movable." Our construction of "displacing . . . in a direction tangential" does not, therefore, cause the disclosed jointed shutter card insertion mechanism to fall outside the scope of claims 1 and 8.

B

We also agree with the Commission that "stopping the relative displacement" requires two things: the stopping must (1) result from a positive test for correct alignment and electrical contact and (2) occur nearly instantaneously after a successful test. Contrary to Innovatron's arguments, the stopping required by step (c) is not satisfied by any mechanism that does not restart after a successful test. Our construction of "displacement . . . in a direction tangential" dictates the proper construction of "stopping the relative displacement." The "displacement" to be stopped is the relative movement of the corresponding contact surfaces, not the overall process of seeking satisfactory contact and alignment. The movement is stopped because of and immediately after a successful test. Otherwise, a primary objective of the invention--to identify quickly and with minimum contact wear a relative position in which there is satisfactory contact and alignment--would likely be thwarted.

When the DSS products are used in the accused manner, i.e., when they are inserted and, following an unsuccessful test, removed and reinserted, the displacement of the CAM cards occurs while the cards are being inserted and stops when the cards are fully inserted and before the testing begins. Consequently, the displacement is not stopped as a result of a successful test, and users of the DSS products do not infringe claim 8 of the '464 patent when using those products in the accused manner. Because Thomson's products do not infringe claim 8 of the '464 patent, their importation does not violate section 337. We affirm the Commission's decision on that ground.

In view of the parties' arguments, one final comment is appropriate. Innovatron suggests that if CAM cards are "jiggled" when they are inserted, rather than removed and reinserted, there may be infringement. Given the proper construction of claim 8, a user who infringes in this manner must "jiggle" the CAM card so that there is testing during the resulting relative movement of the corresponding contact surfaces (i.e., the movement does not cause the sensor at the back of the card slot to indicate that no card is present) and the movement must be stopped immediately after, and as a result of, a successful test. The Commission found, however, that Innovatron failed to prove that users had "jiggled" CAM cards in the precise manner that would be necessary to infringe claim 8. Innovatron has not demonstrated that the Commission's finding was unsupported by substantial evidence. The "jiggling" argument therefore does not affect our disposition of this case

3. Housing; Display Case/Case

a. The Parties' Constructions

LPL argues that "housing" should be given its ordinary and customary meaning. Defendants assert that "housing" should be limited to a case and body of a portable computer. Defendants argue that the inventors became their own lexicographers, when in response to an objection by the examiner, they stated a definition of housing as a display case or case and body. 16
b. The Special Master's Constructions

Unless a patentee becomes his own lexicographer by using terms in a manner other than their ordinary meaning by clearly stating the special definition in the specification or prosecution history, words in a claim are given their ordinary meaning. Vitronics, 90 F.3d at 1582. The Special Master is of the view that no such clear statement of a special definition exists. In fact, the intrinsic evidence contains no explicit definition connecting "housing" to a portable computer.

Addressing the Defendants' argument that housing was defined in response to the examiner's objection, the Special Master is mindful that a patent examiner's objection is distinct from a rejection. In this regard, an objection does not relate to the patentability of the claims. According to M.P.E.P. § 706.01: "[t]he refusal to grant claims because the subject matter as claimed is considered unpatentable is called a 'rejection.' The term 'rejection' must be applied to such claims in the examiner's action. If the form of the claim (as distinguished from its substance) is improper, an 'objection' is made." The amendments made by the inventors addressed a formality raised by the examiner's rejection, i.e., antecedent basis, and were therefore non-substantive and, to coin a phrase, "merely cosmetic." Cf. AK Steel Corp. v. Sollac & Ugine, 344 F.3d 1234, 1242 (Fed. Cir. 2003) ("There was no indication that the amendment was made to relinquish claim scope; rather it was made in response to the examiner's request to replace language that he found vague with language that he felt 'more specifically defined' the same material. Under those circumstances, the amendment clarified the claims without changing their scope."). Moreover, "an inventor may choose to be his own lexicographer if he defines the specific terms used to describe the invention 'with reasonable clarity, deliberateness, and precision.'" Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1325 (Fed. Cir. 2002) (quoting In re Paulsen, 30 F.3d 1475, 1480 (Fed. Cir. 1994)) (emphasis supplied). Further, the Special Master finds it noteworthy that the amendment resulted in housing being expressed two different ways, one somewhat more specific than the other, but in no event in the Special Master's view, in a way clearly stated. 17 Because "housing" was not defined with reasonable clarity, deliberateness, and precision, the Special Master concludes that "housing" should be accorded its ordinary meaning.

CLAIM TERM | SPECIAL MASTER CONSTRUCTION
--- | ---
Housing | An outer casing or enclosure
display case | The portion of the housing onto which the flat-panel display device is arranged and attached

Accordingly, the Special Master's constructions are as follows:

17 "Together, the case and body may be referred to as a housing …" '641 patent, 4:48-49. "… the body (first portion) and the display case (second portion) (collectively referred to as a housing) …" '641 patent, 6:6-8.

See '641 and '718 patents, 4:54-56 and 6:12-15.
1190

A. The Parties' Proposed Construction

Plaintiff proposes the following terms construction:

1. Spaced relation to the uppermost portion of the first quantity of explosive material: There is an air-gap in the borehole between the top of the lower-most explosive material and the bag-like device above it.

2. First relatively large quantity of explosive material: The larger quantity of explosive material placed within the borehole.

3. Second relatively small quantity of explosive material: The smaller quantity of explosive material placed in the borehole.

4. Disposed or disposing: Placed, placing, or causing to be placed.

5. Bag-like device: An item similar to, or characteristic of, an inflatable body of flexible material that is made, or adapted, to perform a function. 4

---Footnotes---

4 See plaintiff's memorandum, footnote 2. Plaintiff proposed this definition anticipating that the court would decline to separately define the term "bag."

---End Footnotes---

In contrast, defendants propose the following:

1. Spaced relation to the uppermost portion of the first quantity of explosive material: The bag-like device is sufficiently spaced within a borehole above the top of the explosive material to form an air gap in the borehole between the bag-like device and the explosive material, with the air gap being approximately 8% to 16.7% of the borehole.

2. First relatively large quantity of explosive material: The major charge or quantity of total explosive material within the borehole.

3. Second relatively small quantity of explosive material: The minor charge or quantity of explosive material within the borehole, with the major charge being 3-5 times the quantity of the minor charge.

4. Disposed or disposing: The bag-like device while in a flat and uninflated state is placed in a particular order or place to accomplish the special effect or purpose of the device.

5. Bag-like device: A device comprised of multiple polymeric sheets sealed along the edges thereof and capable of being closed at one end which lies flat when uninflated. 5

---Footnotes---

5 Defendants modified their proposed definition at the Markman hearing on July 29, 2005, after the release of Phillips by the Federal Circuit. Defendants' initial proposed construction was "a flexible device capable of being closed at one end comprised of at least one polymeric sheet sealed along the edges thereof which lies flat when uninflated, of disc-like, square, tubular, or doughnut conformation."

---End Footnotes---
C. "Disposed" or "disposing"

Defendants suggest that "the parties['] proposed definitions are similar, except that [plaintiff's] proposed definition departs from the context of his '233 [p]atent because it does not include the important teaching that the inflatable device is uninflated and flat while being disposed within the borehole . . ." (Def. Mem. at 17.) In support, defendants argue that the patent claims "recite separate steps for 'disposing' and 'inflating.'" (Def. Resp. at 13.) Indeed, according to the patent, the "inflatable devices of the invention are positioned within boreholes in a deflated condition and are inflated at the desired location. . ." ('233 patent, "Summary of the Invention," Column 2, Lines 25-27.)

It is noted, however, that neither the claims nor the specification appear to limit disposition to inflatable materials. Various claims, for example, refer to disposing "explosive material" or "stemming material" or "material," none of which would constitute the disposition of an inflatable device. These articles almost certainly do not inflate, and likely do not lie flat. Thus, defendants' proposed requirement that disposition occurs only while an article is in a "flat and uninflated state" is unrealistic inasmuch as it imposes undue limitations on the general use of that term throughout the '233 patent. Moreover, while the patent may teach that certain articles are disposed in an uninflated position, defendants have offered no support for their contention that the articles must lie "flat" prior to disposing.

The court adopts the construction given by plaintiff to the terms "disposed" or "disposing" and set forth in numbered item 4 at page 6, supra, except that the court declines to adopt the phrase "causing to be placed", inasmuch as it appears that "placed" or placing" adequately defines the terms "disposed" or "disposing" in the '233 patent.

1191

(10) "Said first and said second ends disposed a variable longitudinal distance from each other." The flexible compensating member or flexible link is positioned so that, upon expansion of the stent, the distance between its two ends changes along the stent's longitudinal axis.

1192

As to the '001 patent, "disposed about" means that one substance completely surrounds and encircles a second substance. The resulting configuration being one where there are no gaps or discontinuity found in the circumference or the axial direction of the first substance said to be "disposed about" the second substance. See Figures 1, 6, Column 2, lines 20-23.

1193

C. Claim Construction of "Window Disposed Adjacent to the Hole"

Claim 1 refers to a rotatable platen "having a hole formed therethrough" and an endpoint detector compromising "a window disposed adjacent to the hole formed through the platen, the window rotating with the platen and intermittently providing a pathway for the light beam to impinge on the wafer." ('454 Patent, Col. 16, lines 26-28, 35-38). Plaintiff argues that the claim only requires that the window rotate with the polishing pad. Specifically, Plaintiff points to the three (3) figures that are a part of the patent specification. Figures 3A-3C represent simplified cross-sectional views of respective embodiments of the windows. Figure 3A shows a window as an insert made of light transmissive material which is mounted securely in a hole in the platen.

[SEE FIG. 3A IN ORIGINAL]

Figure 3B represents an embodiment that allows the pad itself to be used as a window. The light is transmitted through the hole in the platen and through a light-transmissive portion of the polishing pad surface, thereby allowing light to transmit
through the pad.

[SEE FIG. 3B IN ORIGINAL]

Figure 3C - the window is essentially a plug that is inserted into the pad.

[SEE FIG. 3C IN ORIGINAL]

Defendants argue that Figure 3A does not conform with the specification because the claim requires that the window be a part of the pad. Defendants focus on the limitation that the "window moves with the polishing pad." Defendants' interpretation would require that when the pad is removed from the machine, the window must still be attached.

The Court does not interpret the claim the same. Looking at the claim language, it is clear that Plaintiff intended to incorporate all three figures as part of the patent. Dependent Claim 2 states "wherein the window compromises an insert mounted within the hole in the platen, the insert being transmissive to the light beam" and is depicted as Figure 3A. Dependent Claim 6 describes the window as comprising "a portion of the polishing pad, the portion being at least partially transmissive to the light beam" as depicted in Figures 3B and 3C. (454 Patent, Co. 16, lines 57-59). Several other dependent claims also refer to both embodiments of the window:

. Dependent Claim 14: "wherein the window comprises a light-transmitting insert mounted in a hole through the platen." (454 Patent, Col. 17, lines 23-25).

. Dependent Claim 18: "wherein the window comprises a light-transmitting portion of the polishing pad." (454 Patent, Col. 17, lines 39-40).

. Dependent Claim 25: "wherein the polishing pad support comprises a metal portion and the window comprises a hole through the metal portion of the polishing pad support." (454 Patent, Col. 18, lines 17-20).

. Dependent Claim 26: "wherein the window comprises a light-transmitting portion of the polishing pad." (454 Patent, Col. 18, lines 22-24).

Defendants' construction is inconsistent with the claim language and seeks to limit the claim language only to the embodiment in dependent Claim 6.

Additionally, the specification clearly describes Figures 3A-3C as part of the preferred embodiments of the apparatus. The specification goes into great detail to explain the difference in the figures and how to achieve the results as tested in the embodiment. (454 Patent, Cols. 6-7). There is no additional evidence provided by the prosecution history.

The plain and ordinary meaning, which is not contradicted by the intrinsic evidence, would leave a person to conclude that the window must move with the polishing pad while the machine is in motion. Accordingly, the Court FINDS that the "window disposed adjacent to the hole formed through the platen" encompasses windows that are both in and near the hole of the platen.

GO BACK
element to mean "placed beside or on a line parallel to the lengthwise centerline of the housing." (Id.; D.I. 138 at 31.) Later, AMO accepted Alcon's suggestion that the full plain and ordinary meaning of the term "along," means "to be placed through, on, over, or continuously beside or on a line or course parallel and close to." (D.I. 192 at 7.) Alcon, however, does not propose that I accept what even it has offered as the "plain and ordinary meaning" of "along," but rather that I construe "along" to mean "on." (D.I. 164 at 2.) In support of its narrow construction, Alcon refers to Figures 2 and 3 in the specification, as shown below, depicting the only embodiment disclosing the outlet's position in relation to the lengthwise centerline of the housing, in which the outlet is depicted directly on the lengthwise centerline of the housing. 5 (D.I. 171 at 16.)

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

5 Figures 1, 2, and 3 are reproduced below. Figures 2 and 3 depict the housing, including the longitudinal axis (34) and the aspiration fluid outlet (42) and chamber (36).

GET DRAWING SHEET 1 OF 3

Alcon thus proposes that I construe "disposed along" to mean "placed on," such that the claim element means "placed on the lengthwise centerline of the housing." (D.I. 164 at 2; D.I. 171 at 15.)

AMO asserts that Alcon's limited construction for the term "along" is too narrow because it unnecessarily limits what Alcon has admitted to be the plain and ordinary meaning of the term "along" to only part of that meaning based on the disclosure in the specification. (See D.I. 192 at 6-8.) Thus, AMO argues that Alcon's proposed construction "would impermissibly import a narrowing limitation from the specification to the claims." (Id. at 7 (internal quotation and citations omitted).)

Alcon asserts that a person of ordinary skill in the art would look to the specification as a source to determine the meaning of the term. (D.I. 171 at 15 (citing Toro Co. v. White Consol. Indus., Inc., 199 F.3d 1295, 1299, 1301 (Fed. Cir. 1999)).) Alcon correctly notes that the only embodiment disclosed in the patent is shown in Figures 2 and 3 and illustrates that the outlet (42) is placed directly on the longitudinal axis (34), which the parties agree is "the lengthwise centerline of the housing." (Id. at 16.) Alcon also asserts that if I were to accept AMO's initially proposed construction for "along," "arranged or placed beside or on a line parallel to the lengthwise centerline of the housing," the construction would improperly exclude the only embodiment disclosed in the specification because AMO's proposed construction did not include that "along" could mean "on." (D.I. 192 at 25-27.) In addition, Alcon argues that if I were to accept AMO's later proposal, to construe "along" to mean "continuously beside or on a line or course parallel and close to," the term would be indefinite because there would be no limit to the allowable distance that would be considered "close to" the lengthwise centerline of the housing. (Id. at 26.)

In response, AMO asserts that Alcon's indefiniteness argument is not supported in the case law, 6 that "one of ordinary skill in the art would understand that if the chamber outlet is 'along' the axis it must be in proximity to the axis," and that the chamber and its outlet must be placed in the housing and connected to the aspiration pump, which provide "a specific limit to how far away from the housing longitudinal axis it could be." (D.I. 192 at 8.) AMO relies on the Federal Circuit's opinion in TI Group Auto. Sys. (N. Am.), Inc. v. VDO N. Am., L.L.C., 375 F.3d 1126 (Fed. Cir. 2004), for its legal argument that the "presumption that the ordinary meaning of a term applies may not be rebutted simply by pointing to the preferred embodiment disclosed in the patent." (D.I. 192 at 6 (citing TI Group, 375 F.3d at 1136).) Alcon attempts to distinguish TI Group, by pointing to the Federal Circuit's observation that the patentee was "entitled to the full breadth of claim scope supported by the words of the claims and the written description," 375 F.3d at 1138, and arguing that "the written description [in that case] provided independent support for the meaning asserted." (D.I. 187 at 28.) Alcon further argues that "unlike the TI Group case, in this case, nothing in the written description supports a construction that would permit the outlet be placed anywhere other than on the lengthwise centerline of the housing." (Id.)

6 AMO relies on Verve LLC v. Crane Cams, Inc., 311 F.3d 1116, 1119-1120 (Fed. Cir. 2002) and Andrew Corp. v. Gabriel Elecs., Inc., 847 F.2d 819, 821-22 (Fed. Cir. 1988) to support its position. (D.I. 192 at 8.)
ii. The Court's Construction

There is a heavy presumption that the patent inventors intended the ordinary meaning of a term to apply. See Teleflex, 299 F.3d at 1325. Alcon admits that the ordinary meaning of "disposed along" is "to be placed through, on, over, or continuously beside or on a line or course parallel and close to." (D.I. 171 at 16.) AMO agrees that the term "along," "implies some degree of proximity or closeness" and accepts Alcon's version of the plain and ordinary meaning of the term, even though AMO repeats the definition without explicitly including the "close to" language. (D.I. 192 at 7.) AMO, however, apparently accepts that portion of the construction of "along," because the construction it initially proposed, included the words "close to." (See D.I. 164 at 2 (AMO proposed that the term "along" be construed to mean "continuously beside or on a line or course parallel and close to.").) Thus, both parties apparently accept that the full plain and ordinary meaning of the term "along" is "to be placed through, on, over, or continuously beside or on a line or course parallel and close to." (See D.I. 171 at 16; D.I. 164 at 2; D.I. 192 at 7.)

The Federal Circuit in TI Group was presented with a similar issue. See, 375 F.3d at 1135-36. The plaintiff in that case argued for a broader construction of the term "within" while the defendant proposed a narrower construction for that term. Id. The defendant asserted that the structures illustrated in the drawings of the written description supported the narrower construction and that no structure supported the broader definition proposed by the plaintiff. Id. at 1136. In response, the Federal Circuit reiterated the rule that "the mere fact that the patent drawings depict a particular embodiment of the patent does not operate to limit the claims to that specific configuration." Id. (quoting Anchor Wall Sys. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1306-07 (Fed. Cir. 2003) (citing Hockerson-Halberstadt, Inc. v. Avia Group Int'l, Inc., 222 F.3d 951, 956 (Fed. Cir. 2000))). The court continued, "the drawings, without more, are insufficient to cabin the scope of the ordinary and customary meaning of the term … in this case." Id. Thus, that the figures in the written description depict only one embodiment showing the outlet placed on the housing longitudinal axis, does not, in and of itself, narrow the scope of the ordinary and customary meaning of the term.

Alcon also cites to the Federal Circuit's construction of another claim term in that same case to argue that the written description there affirmatively supported a broader construction of the disputed claim term, whereas the specification in this case does not. (D.I. 187 at 28.) A full reading of the Federal Circuit's opinion, however, reveals that the court placed the burden on the defendant to find evidence in the written description that the claim term should be limited to a more narrow construction than its plain and ordinary meaning would suggest. TI Group, 375 F.3d at 1138 (the plaintiff "is entitled to the full breadth of claim scope supported by the words of the claims and the written description. [Defendant's] argument again focuses on a single, narrow dictionary definition, when many equally apt, and broader, definitions are also provided. The written description does not restrict the ordinary and customary meaning of [the claim term] in any respect. Therefore, we conclude that the [claim term] is not restricted [to the narrow construction argued by the defendant]."). Since, in this case, Alcon has not pointed to any such evidence, I construe "along" to mean "to be placed through, on, over, or continuously beside or on a line or course parallel and close to." Thus, the claim element "disposed along the housing longitudinal axis" means "to be placed through, on, over, or continuously beside or on a line or course parallel and close to the lengthwise centerline of the housing." I do not, however, pass judgment on Alcon's argument that the construction I have adopted renders the claim indefinite, except to note that there is a factual dispute regarding this issue that is not pertinent to the construction of this claim term.

1195

(2) "Disposed and adapted to cooperate so that upon expansion of said stent said first loops and said second loops change shape to compensate for the tendency of said stent to foreshorten when said stent is expanded." The two sets of loops must be oriented in different directions, one a generally vertical direction and one a generally horizontal or longitudinal direction. This limitation encompasses growth of one of the sets of loops in the longitudinal direction that is caused by expansion of the stent by a balloon or other mechanical means.
9. "disposed between"

Floe proposes that this phrase be construed as "arranged or placed in the space that separates two structures or points." Newmans, however, contends that this phrase should be construed as "with one edge connected to the upper edge of the deck protective surface and the opposite edge connected to the longitudinal edge of the lower portion." Floe asserts that its proposed construction is consistent with the plain meaning of the phrase "disposed between." Floe also contends that dictionary definitions of "dispose" and "between" are consistent with its proposed construction. For example, Merriam-Webster's Collegiate Dictionary 109 (10th ed. 2001), defines "between" as "in the time, space, or interval that separates: in intermediate relation to[.]", and "dispose" as "to put in place: set in readiness: ARRANGE[.]". Floe also points out that the Federal Circuit has defined "between" to mean "in or through the space that separates (two things)." See Elekta Instrument S.A. v. O.U.R. Sci. Int'l, Inc., 214 F.3d 1302, 1307 (Fed. Cir. 2000). Additionally, Floe contends that its proposed construction is consistent with the specification.

Newmans, on the other hand, does not disagree that Floe's construction is consistent with the plain meaning of the phrase "disposed between." Instead, Newmans asserts that the prosecution history contains a clear disclaimer of scope. Newmans first asserts that various choices by the patentee in drafting various claims of U.S. Patent 5,421,612 (the '612 Patent"), to which the '379 Patent claims priority, support its proposed construction. But aside from being a different patent from the one at issue here, Newmans' arguments regarding the '612 Patent are based on ambiguous and speculative inferences. These inferences do not constitute a clear disclaimer of the plain meaning of the phrase "disposed between." Additionally, Newmans asserts that the patentee disclaimed the plain meaning of "disposed between" when, after his claims were rejected, the patentee amended the claims to read "disposed between" instead of "disposed." (See Decl. of Douglas J. Frederick in Support of Newmans' Claim Constructions ("Frederick Decl." at P 3, Ex. B at FL000175-77.) Further, Newmans asserts that in amending the claims, the patentee distinguished Pittman on the ground that the "ramp surface" in Pittman "is joined at only one edge" to the deck protective surface "and has one edge unconnected." Thus, according to Newmans, the "ramp surface" of Pittman is not "disposed between" anything because it "has one edge unconnected."

The Court, however, disagrees with Newmans that the patentee's response to the Examiner's rejection unequivocally disclaimed a construction that would "encompass a ramp surface connected at one edge to the upper edge of the edge protecting surface and having the opposite edge of the ramp surface left as an unconnected edge." (Defendant's Opening Markman Brief at 24.) The Court finds that the patentee made the relevant amendments to clarify that, unlike Pittman, Claims 1 and 6 require an inclined ramp surface. Here, the patentee never clearly indicated that "disposed between" should be defined as Newmans asserts. Thus, consistent with the plain meaning of the phrase "disposed between," the Court construes the phrase as "arranged or placed in the space that separates two structures or points."
592 (defining "insert" as "to put or thrust in" and "to put or introduce into the body of something"); D.I. 151, ex. E at 221 (defining "central" as "containing or constituting a center" and "situated at, in, or near the center"); 625 (defining "insert" as "to put or thrust in" and "to put or introduce into the body of something"); see also Random House Dictionary of the English Language 335 (2d ed. 1987) (defining "center" as "the middle point").

13 The '264 patent specification does not alter the plain ordinary meaning of inserting. Compare '264 patent, col. 1, ll. 52-54; col. 2, l. 67 - col. 3, l. 1; col. 4, ll. 66-68; col. 5, ll. 24-27; fig. 5 with '264 patent, col. 2, ll. 31-34; col. 3, ll. 25-27; col. 4, ll. 63-66.

The '264 patent specification also shows that the preassembly is positioned to include the middle point of the length of the tubular body. '264 patent, col. 2, l. 66 - col. 3, l. 1; col. 3, ll. 27-29; figs. 1, 4, 5-10.

B. Disposed Circumferentially

The second disputed term -- "disposed circumferentially" -- appears in the body of claim 23 and describes the placement of the inflatable bladder component of the invention. Defendant contends that "disposed circumferentially" describes a bladder placed along the perimeter of an object or space such that it encircles and defines an interior area. Plaintiff, however, argues that the phrase reads on any bladder occupying the perimeter of a defined area, even if it also occupies the interior of that area. Plaintiff claims, in other words, that a bladder "disposed circumferentially" can fill, rather than simply surround, an interior space, provided that "its edge extends along the circumference or perimeter area within the interior area." Pl.'s Mem. of Opp. at 11. As with the term "device," neither party contends that the inventor acted as his own lexicographer with respect to the phrase "disposed circumferentially," or that the phrase has a specialized, technical meaning in the relevant fields of industrial art. Accordingly, analysis of the intrinsic evidence must begin with the ordinary and customary meaning of the plain language of claim 23. Tex. Digital, 308 F.3d at 1201-02.

Conveniently and appropriately, the parties are largely in agreement with respect to the plain meaning of the language at issue. First, the parties agree that the word "circumferentially" refers to the perimeter of a generally circular object or area. Second, the parties also agree that the phrase "disposed circumferentially" describes the placement of the bladder in the overall invention, not the shape of the bladder. By mutual agreement, therefore, the phrase "an inflatable bladder coupled to [a] spring and … disposed circumferentially within [an] interior area" describes a bladder placed along the perimeter of an interior area defined by a surrounding spring. This agreed ordinary and customary meaning, however, does not answer the question whether a bladder thus described necessarily encircles a second interior space, i.e., is annular in shape.

Comparing the language of claim 23 to that of other claims in the '344 patent, however, provides some support for a construction of "disposed circumferentially" that requires encirclement. Claim 24, for example, describes "the device of claim 23, said inflatable bladder defining a second interior area, further comprising a panel coupled within said second interior area." The phrase beginning, "said inflatable bladder," serves to clarify that the referenced bladder -- claim 23's bladder -- encircles a second interior area. Contrary to plaintiff's contention that the phrase actually highlights a difference between claims 23 and 24, the difference between the claims is plainly set forth through the use of the phrase "further comprising," which goes on to differentiate claim 24 from claim 23 by requiring that a panel be placed in the interior area defined by the bladder. Thus, the plain language of claim 24 supports the argument that "disposed circumferentially" should construed to require encirclement of an interior area.

Opposing this conclusion, plaintiff offers a different comparison of claim terms from the '344 patent. As plaintiff points out, claim 2 describes an inflatable bladder "disposed circumferentially about" an interior panel. Seizing on claim 2's substitution of the word "about" for "within," plaintiff contends that claim 2 necessarily describes an encircling bladder, and, conversely, that the bladder of claim 23 should not be construed necessarily to encircle. The weakness in this argument is that while it clearly distinguishes the meanings of the terms "about" and "within," it offers no instruction as to the inherent contextual meaning of "disposed circumferentially." Thus, while the principle of claim differentiation makes clear that the bladder described in claim 2 is located outside an interior panel, and that the bladder described in claim 23 in located inside an
exterior spring, it does not establish whether claim 23's bladder must encircle an interior area or may converge to the center of the interior space.

The '344 patent specification provides further guidance on the question whether, in context, a bladder "disposed circumferentially" necessarily encircles an interior area. The "Summary of the Disclosure" section, which describes the invention as a whole rather than merely the preferred embodiments, states that the invention "includes a coilable spring and a flexible panel," and that "along the outer edge of the flexible panel is a perimeter pocket into which the coilable spring and at least one inflatable chamber are placed." This description is consistent with a reading of "disposed circumferentially" that requires encirclement. The fact that the Summary goes on to state that "in addition to or instead of the perimeter pockets, the central portion of the flexible panel may include pockets into which inflatable chambers may be placed," does not alter this conclusion, as it highlights the contrast between "central" and "perimeter," i.e., circumferential, placement.

--- Footnotes ---

9 See C.R. Bard, 388 F.3d at 864 (stating that sections describing the invention as a whole are more likely to support "a limiting definition of a claim term").

10 '344 patent, col. 1, ll. 52-56.

11 '344 patent, col. 2, ll. 3-6. Additionally, although not part of the claim construction analysis, it is nonetheless worth noting that the specification drawings and descriptions all depict bladders that encircle a flexible panel on which a person might lie. In the one suggested alternative configuration that includes bladders in the central portion of the flexible panel, the central bladders merely cross the panel rather than fill the central space and thus are not "disposed circumferentially" under either party's definition. See '344 patent, fig. 4. Accordingly, the specification draws a clear distinction between centrally-located bladders and bladders "disposed circumferentially."

--- End Footnotes ---

The prosecution history of the '344 patent also supports a construction of "disposed circumferentially" that requires encirclement. Among other things, it reflects that the phrase "disposed circumferentially" was added after the predecessor of claim 23 was rejected by the patent examiner in January 2002 as anticipated by U.S. Patent No. 6,171,100 ("the '100 patent"), which described a device composed of a closed-loop spring surrounding a circular bladder. See Exhibit 2. The written summary of the rejection states that the inventor and examiner discussed "circumferential disposal of the spring and/or bladder" as potential claim language to distinguish claim 23 from the '100 patent. Because the prior art sought to be avoided by the use of a bladder "disposed circumferentially" included a circular, centrally-located bladder, the phrase "disposed circumferentially" cannot be reasonably be construed to read on a bladder occupying the center of an interior area. While plaintiff correctly notes that the drawings in the '100 patent do not depict the bladder extending all the way to the perimeter defined by the spring -- and thus do not depict a bladder "disposed circumferentially" under its proposed construction of that phrase -- it is difficult to discern a patentable distinction between a circular, centrally-located bladder that occupies the entire area defined by a closed loop spring and a circular, centrally-located bladder that occupies less than all of that area. Accordingly, construing "disposed circumferentially" to require encirclement rather than mere occupation of a perimeter creates a clearer distinction between the '344 patent and the '100 patent. Additionally, the prosecution history reflects that the examiner described several pieces of prior art as having a bladder "disposed circumferentially," and that in each case the bladder so described encircled rather than filled an interior space. As with the specification, therefore, the prosecution history of the '344 patent makes clear that as used in claim 23, the phrase "disposed circumferentially" describes an encircling object.

For the foregoing reasons, the phrase "disposed circumferentially" does not describe an object that entirely fills the interior of a defined area even if it also occupies the perimeter portion.

---

3. "disposed exteriorly about at least a portion of the perimeter of the bottom portion"
Claim 1 teaches that the bolster must be "disposed exteriorly about at least a portion of the perimeter of the bottom portion." 502 patent at col. 3, l. 44. The issue here is whether this language represents a means-plus-function claim that invokes 35 U.S.C. § 112, P 6. Defendants contend that § 112, P 6 applies, and the function of "disposing" the bolster should be construed to cover fasteners, straps, or equivalents secured to the interior of the outer covering. Flexi-Mat argues that this claim falls outside § 112, P 6.

Section 112, P 6 allows for an element in a claim to be expressed "as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof." 35 U.S.C. § 112, P 6. Such limitations are generally known as "means-plus-function" claims. Apex, Inc. v. Raritan Computer, Inc., 325 F.3d 1364, 1371 (Fed. Cir. 2003). Means-plus-function claims allow a patent applicant to claim a functional element without reciting specific structures for performing those functions. Id. When § 112 applies, claim construction consists of two steps: (1) identifying the function and (2) identifying the structure described in the specification that performs that function. ACTV, Inc. v. Walt Disney Co., 346 F.3d 1082, 1087 (Fed. Cir. 2003).

The Federal Circuit has established a framework for determining whether a claim invokes § 112, P 6. Micro Chemical, Inc., v. Great Plains Chemical Co., Inc., 194 F.3d 1250, 1257 (Fed. Cir. 1999). If the word "means" appears in association with a function, § 112, P 6 is presumed to apply. Id. This presumption may be rebutted if the "claim itself recites sufficient structure, material, or acts to perform the claimed function." Id. If the word "means" does not appear in the claim language, "a claim element is presumed to fall outside means-plus-function strictures." Id. This presumption collapses "when an element lacking the term means' nonetheless relies on functional terms rather than structure or material to describe performance of the claimed function." Id.

Because claim 1 does not use the word "means," it is presumed that § 112, P 6 does not apply. The analysis then turns on whether claim 1, "as understood by one of ordinary skill in the art, . . . fails to recite sufficiently definite structure or else recites a function without reciting sufficient structure for performing that function." Apex, 325 F.3d at 1373.

The relevant portion of claim 1 provides:

a bolster removably disposed within the interior of the outer covering and substantially all of said bolster disposed exteriorly about at least a portion of the perimeter of the bottom portion without being secured to the removable cushion

502 patent at col. 3, ll. 42-46. This language describes the bolster as "disposed exteriorly." These are non-technical words whose meanings to one skilled in the art are readily apparent: "disposed" means "to put in place," and "exteriorly" means external or situated at the outer surface. See Webster's Third New International Dictionary (1986). Thus, the term "disposed exteriorly" explains that the bolster is positioned alongside the surface of the outer edge of the bottom cushion. "Disposed exteriorly" is not a specific function; rather, it is a description of the location of a structure -- the bolster -- relative to other structures.

The construction of "disposed exteriorly" as structural rather than functional makes sense in light of the specification. The specification repeatedly describes, and the figures each depict, the bolster as "disposed about at least a portion of the perimeter of the bottom portion." 502 patent at col. 2, ll. 2-5, 52-53. In describing the advantages of securing the bolster to the interior of the cover, the patentee explains that "holding the bolster in the bolster pocket keeps the bolster relatively fixed in position with respect to the perimeter of the bottom portion of the pet bed." Id. at col. 3, ll. 4-7. This language suggests that the invention consisted of a bolster that was located in a certain position relative to the bottom cushion. The term "exteriorly" makes clear that the position is along the outer edge of the base.

Defendants contend that claim 1 includes the function of "disposing" the bolster exteriorly about at least a portion of the perimeter of the bottom portion." Docket No. 79 at 16. They argue that the structures for performing this function are the fasteners or straps mentioned not in claim 1, but in claims 4, 5, 6, 9, 10, 11 and in the specification at col. 2, ll. 11-12, 61-68 and col. 3, ll. 1-7.

This interpretation distorts, and consequently misconstrues, the claim terms. "Disposing the bolster" could be construed as functional language claiming the function of positioning the bolster in place. But this is not the language that the patentee used. Claim 1 clearly states that the bolster is "disposed exteriorly," not that some later-claimed structure is "disposing the
bolster." The fact that the patentee also claimed structures -- fasteners or straps -- for holding the bolster in place does not convert his description of the bolster in claim 1 into a means-plus-function claim.

Thus, the claim language and specification indicate that the presumption against applying § 112, P 6 stands, and the strictures of that provision do not limit the construction of "disposed exteriorly about at least a portion of the perimeter of the bottom portion."

"Disposed generally opposite." The first and second loops, defined as horizontally-facing structural elements, are positioned across from each other and approximately aligned with each other along the longitudinal axis of the stent.

A Thumb-Associable Cluster of Input Keys Disposed Generally Over Three Mutually Intersecting Surfaces

Microsoft argues that this phrase should be construed to mean that the thumb keys must be disposed over three distinct surfaces, with each surface sharing an intersection with the other two surfaces, and that "the keys of the thumb cluster cannot be in a uni-planar array," i.e., on one planar surface. Microsoft's Memorandum in Support of Non-Infringement of '477 Patent, p. 11. Plaintiff does not contest Microsoft's proposed construction or offer an alternative construction for this phrase.

I agree that the claim language does not refer to a device with the thumb keys located on one generally planar surface; rather, the three surfaces must "mutually intersect." "Mutual" means "shared in common." See Goff Decl., Ex 8 (Wester's Ninth New Collegiate Dictionary, p. 783). Further, the patent specification describes the surfaces of the clusters as forming a "keyboard sub-amphitheater" as depicted in Figure 1; this corner formation is distinct from a "uni-planar" surface. See '477 Patent, Col. 4:19-23 and Figures 1, 2, 6.

Notably, during prosecution of the M47 patent, the PTO rejected certain claims of the '477 patent as indefinite. Goff Decl., Ex. 3, pp. 2-3. 1 Specifically, the PTO found that the term "three mutually intersecting surfaces" was indefinite, because it was "recited in an inferential manner, there being no positive recitation of three surfaces and the manner in which they intersect." Id. at Ex. 3, p. 2. In response, Gambaro emphasized "that claims are read in light of the specification, including any drawings" and argued that "it is abundantly clear what is meant by three mutually intersecting surfaces by brief reference to Fig. 1 and the description of surfaces 34a, 34b, 34c of thumb key sub-amphitheater 34." Id. at Ex. 4, p. 9. As noted above, the patent specification and drawings describe and depict a corner formation housing the thumb key clusters.

Plaintiff contends that prosecution estoppel applies only when the applicant offers an amendment to the patent claims, but not when an applicant provides an explanation or clarification to the PTO. Plaintiff is incorrect. "Just as prosecution history estoppel may act to estop an equivalence argument under the doctrine of equivalents, positions taken before the PTO may bar an inconsistent position on claim construction under § 112, P 6." Alpex Computer Corp. v. Nintendo Corp. Ltd., 102 F.3d 1214, 1221 (Fed. Cir. 1996); see also Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 979 (Fed. Cir. 1999) ("Arguments made during the prosecution of a patent application are given the same weight as a claim amendment .... [It] is irrelevant whether [the patentee] relinquished [a] potential claim construction in an amendment to the claim or in an argument to overcome or distinguish a reference"). Therefore I find that Gambaro's representations to the PTO narrow the scope of the claim language.
Finally, the PTO also found that the '477 claims were not patentable over the prior art Malt keyboard, United States Patent No. 4,244,659. In response, Gambaro distinguished the Malt keyboard as having thumb keys placed in a "uni-planar array," rather than "disposed over three mutually intersecting surfaces" as recited in Claim 1 of the '477 patent. Goff Decl., Ex. 4, p. 15. "[A] concession made or position taken to establish patentability in view of prior art on which the examiner has relied, is a substantive position on the technology for which a patent is sought, and will generally generate an estoppel." Pall Corp. v. Micron Separations, Inc., 66 F.3d 1211, 1220 (Fed. Cir. 1995).

Accordingly, I construe this claim to mean that the thumb key clusters must be spread over three distinct and separate surfaces, with each surface sharing an intersection with the other two surfaces.

The second disputed element requires a "smoking pipe means removably disposed in said first cavity." Defendant cites the Court to various definitions of the word "in" to indicate that the pipe must be disposed "entirely within" the first cavity. This is far too narrow a definition. A person can be standing "in" a pool of water; that does not mean that he must be submerged over his head. The more sensible reading of the second element is that some part of the smoking pipe must be disposed within the first cavity so as to hold it in place there. The fact that the smoking pipe in the particular embodiment described in the '658 patent is contained entirely within the first cavity cannot be used to limit the claim itself. Laitram, 863 F.2d at 865; Specialty Composites, 845 F.2d at 987; Du Pont, 849 F.2d at 1433; SRI Int'l, 775 F.2d at 1121.

2. "disposed in a known geometric orientation"

NOMOS contends that the phrase "disposed in a known geometric orientation" used in paragraph (c) of Claim 6 of the '026 Patent means "that the orientation of the ultrasound probe must be known with respect to the frame of reference of the radiation therapy device." (D.I. 80 at 16). NOMOS further contends that the Court should specify in its claim construction order that "the ultrasound probe is disposed [i.e. arranged] in a known geometric position under circumstances where the position of the ultrasound probe with respect to the radiation therapy device is indicated." (D.I. 80 at 16).

BrainLAB contends that "disposed in a known geometric orientation" means "placed or arranged to move with respect to the frame of reference of the linear accelerator." (D.I. 82 at 26). BrainLAB relies both on the language of the specification and on the prosecution history for its construction.

In response to BrainLAB's argument, NOMOS contends that the phrase "to move" is not found in the specification, and thus, BrainLAB's construction improperly limits the claim language to the preferred embodiment. (D.I. 84 at 21). BrainLAB has agreed to change its definition to "place or arrange with respect to the frame of reference of the linear accelerator," in order to eliminate the parties' dispute over the phrase "to move." (D.I. 84 at 34).

After reviewing the claim language in light of the specification and the prosecution history, the Court concludes, as BrainLAB contends, that "disposed in a known geometric orientation" means "arranged with respect to the frame of reference of the linear accelerator." The term "disposed" has previously been construed to mean "arranged," and the parties apparently agree with this construction. The parties' dispute centers on the phrase "known geometric orientation." In discussing the concept of a "known geometric orientation," the specification states:

- Preferably, the known geometric orientation is the orientation of the ultrasound probe 422 with respect to the coordinate system, or frame of reference of the linear accelerator 401, which is along the longitudinal axis of the treatment table 404 . . .

( '026 Patent, col. 7, 11. 60-65). However, during the prosecution history of the '026 Patent, NOMOS clarified that the phrase "known geometric orientation" must relate to the linear accelerator, and that such relation to the linear accelerator was not merely "preferable," but necessary to the invention. To this effect NOMOS stated:
It is necessary that the ultrasound probe 422 be disposed in a known geometric orientation with respect to the frame reference of the linear accelerator 401.

(D.I. 82, Ex. B at 5) (emphasis added). Accordingly, the Court's construction of this phrase is consistent with the specification of the '026 Patent as clarified by the patentee during the prosecution history.

8. Claim 6: Step (c)

Text:

(c) generating at least one two-dimensional ultrasound image of the lesion in the patient's body, with the ultrasound image generating means being disposed in a known geometric orientation for each ultrasound image generated;

'026 Patent, col. 12, ll. 47-51.

NOMOS's Proposed Construction:

The ultrasound probe is disposed (i.e. arranged) in a known geometric position under circumstances where the position of the ultrasound probe with respect to the radiation therapy device is indicated.

NOMOS Opening Brief at 15.

ZMED's Proposed Construction:

This step requires using the ultrasound probe to generate a two dimensional ultrasound image (which is the direct 2D output of the ultrasound probe) for use in identifying the position of the lesion and knowing the orientation and position of the probe at the time the image is made.

ZMED Opening Brief at 27.

Construction:

This step means "placing a conventional, commercially available ultrasound probe that generates a two-dimensional ultrasound image in a known geometric orientation when each ultrasound image is generated of the lesion in the patient's body."

Commentary:

The plain language of step (c) compels this reading, once the meaning of "disposing" is established.

"Filter Means" in Claim 1

Footnotes

Both parties agree that the discussion that follows in the text also covers two other claim elements:

1. Claim 10 in the '433 Patent (W. Mem. 20, M. Mem. 22 n. 13):
filter means in said soil container for filtering said soil-laden water of non-settling soil particles, maintaining said non-floating and non-settling particles with said soil container chamber, and emitting cleansed liquid.

2. Claim 16 in the '433 Patent (W. Mem. 23, M. Mem. 24 n. 15):

filter means disposed in said soil container for filtering non-settling soils from said soil laden portions, and providing a cleansed liquid.

Next the parties dispute the meaning of this highlighted phrase in claim 1:

filter means disposed in said third wall for filtering soil particles from said soil-laden portion of said wash liquid.

That language is in means-plus-function form and relates to this language in the specification (col. 5, ll. 58-60):

Fine mesh filter segments 32 in cover 30 permit flow of cleansed wash liquid to return to dishwasher space 14 for recirculation.

That last-quoted sentence identifies the "filter means" as the combination of the filter segments and the cover. Hence the "filter means" is "disposed in said third wall" by way of the filter-segments-plus-cover combination. Though it must be said that this reading involves an awkward and unusual use of the phraseology "disposed in" (something that would ordinarily be expected to refer to physical placement "in" or "within" the third wall), this Court cannot punish Whirlpool's patent writer for poor drafting by disregarding what is actually disclosed. Instead it reads the language (strained though this may seem) as calling for the filter means "disposed" (that is, positioned) in the third wall only in the sense that the cover is "disposed over and secured to" the third wall (col. 4, ll. 5-6) as discussed in the preceding section. Maytag loses this argument.

The parties also dispute the term "disposed in the gap." LG proposes construing the term to mean "placed in the gap." (Chart at 22.) Whirlpool proposes instead that the term be construed to mean "placed in a space between the lower side of the
vibrating disc and the inner surface of the bottom wall of the washing tub." (Id.)

The Court notes that the parties agree that the term "disposed" should be construed to mean "placed." Claim 1 describes "[a] low frequency vibration type washing machine comprising . . . a rigid vibrating disc having a lower side . . . , the lower side of the vibrating disc disposed in uniformly spaced relation to the inner surface to create a gap . . . ." (‘886 Patent, col. 3, l. 34 to col. 4, l. 9.) The machine also comprises "shrinkable shielding means disposed in the gap to prevent clothes from becoming jammed in the gap during a clothes washing operation." (Id., col. 4, ll. 10-12.) Moreover, in construing the above terms, the Court has already noted that it is the space between the lower side of the vibrating disc and the inner surface of the bottom wall that creates the relevant gap.

The Court therefore agrees with Whirlpool that "disposed in the gap" should be construed to mean "placed in the space between the lower side of the vibrating disc and the inner surface of the bottom wall of the washing tub."

The parties also dispute the term "the lower side of the vibrating disc disposed in uniformly spaced relation to the inner surface to create a gap." LG proposes construing the term to mean "the lower side of the vibrating disc disposed in uniformly spaced relationship to the inner surface [i.e., consistent degree of spacing between the lower side of the vibrating disc and the inner surface of the bottom portion of the washing tub] to create a gap." (Chart at 17-18.) Whirlpool proposes instead that the term be construed to mean "all points on the lower side of the vibrating disc have the same spacing relative to the inner surface of the bottom wall of the washing tub during vibration." (Id.)

Claim 1 describes "[a] low frequency vibration type washing machine comprising . . . a rigid vibrating disc having a lower side . . . , the lower side of the vibrating disc disposed in uniformly spaced relation to the inner surface to create a gap . . . ." (‘886 Patent, col. 3, l. 33 to col. 4, l. 9.) The summary of the patent states that an object of the invention is "to provide a low frequency vibration type washing machine having shrinkable shielding means . . . whose shielding means totally or partially shields the gap between the low frequency vibrating disc and the tub bottom from the outside." (Id., col. 1, ll. 60-67.)

Figures 2, 3, and 4 are embodiments of the claimed invention. Each one depicts the gap as the one between the lower side of the vibrating disc and the inner surface of the bottom wall. The written description for Figure 2 states that "[i]n this first embodiment, the shrinkable shielding means for prevention of clothes jamming comprises a shrinkable shielder 4 which is annularly placed in the gap between a low frequency vibrating disc 2 and the inner bottom of a washing tub 1 at the lower edge of the disc 2." (Id., col. 2, ll. 37-41.) The written description for Figure 3 refers to the gap as "between the inner bottom of the tub 1 and the vibrating disc 2." (Id., col. 3, ll. 11-12.) The written description for Figure 4 also refers to the gap as "between the inner bottom of the washing tub 1 and the disc 2 at the lower edge of the disc 2 . . . ." (Id., col. 3, ll. 23-25.) The Court therefore agrees with Whirlpool that the "inner surface" refers to the inner surface of the bottom wall.

With respect to the rest of Whirlpool's proposed construction, however, it has identified no intrinsic evidence in support of its construction. The Court will therefore reject the other aspects of Whirlpool's proposed construction of the term.

For these reasons, the Court construes the term "the lower side of the vibrating disc disposed in uniformly spaced relation to the inner surface to create a gap" to mean "the lower side of the vibrating disc disposed in uniformly spaced relation to the surface of the bottom wall to create a gap."

FieldTurf's Proposed Construction: "Located between"
SCG's Proposed Construction: "Placed into unoccupied spaces"

The Court's Claim Construction: "Located between"

It is the infill layer that is "disposed interstitially" between ribbons in the claims. FieldTurf points to the specification, which describes a "unique infill layer of two graded courses of particulate material disposed interstitially between the upstanding ribbons" and "[d]isposed interstitially between the upstanding ribbons 2 upon the upper surface 1 is an infill layer 3 of particulate matter." '689 patent, 5:10-21; 9:48-56. FieldTurf argues that these passages support its claim construction of "disposed interstitially" as requiring a structural relationship (i.e, relative location) as opposed to the active meaning proposed by SCG.

The only portion of the specification cited by SCG to support its claim construction, '689 patent, 9:48-50, does not say anything that would equate "disposed interstitially" with actively placing the infill layer into unoccupied spaces. Indeed, where the FieldTurf patent describes the active steps in manufacturing the turf it did so explicitly. See '689 patent, 10:33-34 ("After the mixed lower infill layer is laid a substantially pure rubber particulate material is placed as a resilient top layer). FieldTurf chose to write its claims as product claims, and those claims define the invention by its structure. Hazani v. ITC, 126 F.3d 1473, (Fed. Cir. 1997) (explaining that a claim is properly characterized as a product claim where the "limitation, read in context, describes the product more by its structure than by the process used to obtain it"). Accordingly, unless there is something in the claim language that quite clearly demonstrates that method steps are claimed, courts decline to read method steps into the claims. Vanguard Prods. Corp. v. Parker Hannifin Corp., 234 F.3d 1370, 1372 (Fed. Cir. 2000) (explaining that "[t]he method of manufacture, even when cited as advantageous, does not itself convert product claims into claims limited to a particular process"). Similarly, there is nothing to indicate that these claims at issue are product-by-process claims, 10 wherein a product (here the synthetic grass assembly) is claimed by the process used to manufacture that product (i.e., placing a first course between ribbons, placing a second course between ribbons). The claim is easily defined and understood through structural language. SmithKline Beecham Corp. v. Apotex Corp., 439 F.3d 1312, 1315 (Fed. Cir. 2006) (explaining that "[t]he purpose of product-by-process claims is to allow inventors to claim an otherwise patentable product that resists definition by other than the process by which it is made").

----------------- Footnotes ----------------

10 "A product-by-process claim is 'one in which the product is defined at least in part in terms of the method or process by which it is made.'" SmithKline Beecham Corp. v. Apotex Corp., 439 F.3d 1312, 1315 (Fed. Cir. 2006) (quoting Bonito Boats, Inc. v. Thunder Craft Boats, Inc., 489 U.S. 141, 158, 109 S. Ct. 971, 103 L. Ed. 2d 118 n. (1989)).

----------------- End Footnotes ----------------

What is really at issue with this claim term, and a number of claim terms that follow, is a premature attempt by SCG to have the court decide certain infringement issues. As the Court noted above, the ultimate conclusion of infringement or noninfringement is a two-step process. The only part of that process at issue here is claim construction. Nonetheless, SCG is seeking a construction which requires the layer or courses of the claims to be placed or installed at a particular time. The reason is apparent from the following arguments which are repeated a number of times:

FieldTurf further admits that the invention is limited to artificial turfs having "resistance to particle displacement." Column 7, lines 42-47. In other words, where the resilient granules or the hard granules migrate and are not resistant to particle displacement, the artificial turf does not and cannot infringe the patent. Migrating or displaced granules are not "placed" by SCG. Migrating or displaced granules are placed by whatever forces (e.g. weather, gravity, wear) cause the granules to migrate or become displaced. Displaced granules are not, and cannot be, placed granules.

Doc. 59, p. 27.

Simply put, the claims themselves do not support a claim construction as method claims, in which placing of layers or courses could be required elements. The manner or order of construction of artificial turf is not the issue for a product claim--the physical relationship of the structural components is the issue. The Court acknowledges that this issue is likely to come up in a future infringement analysis if an SCG artificial turf is demonstrated to infringe the claimed structure and if
that infringing structure is the result of a change over time--i.e., the SCG structure would not infringe as installed. But as
SCG's brief acknowledges, that is an infringement issue. 11 Doc. 59, p. 27 ("Though SCG denies infringement in the case at
bar, defendants are never responsible for infringement as a result of changes that occur over time."). The Court declines to
opine on infringement issues at this time.

11 That this is an infringement issue is also supported by the cases cited by SCG. For example, Elyria Nat'l Rubber Heel
Co. v. I.T.S. Rubber Co. explained that "normally, the monopoly is to be judged at the time of the sale." 263 F. 979, 981 (6th
Cir. 1920); see also Stash, Inc. v. Palmgard Int'l, Inc., 937 F. Supp. 531, 537 (D. Md. 1996) (explaining that "where the
alleged infringement . . . occurs, if at all, only over a period of some time, such action does not constitute infringement").

a. "disposed on opposite sides of said chamber"

i. The Parties' Proposed Constructions

AMO initially proposed that I construe "disposed on opposite sides of said chamber" to mean that the "the chamber inlet
and outlet [are] to be arranged facing each other with the chamber, the intervening space, between them." (D.I. 138 at 34
(emphasis added).) AMO later proposed that I construe the term to mean "the chamber inlet and outlet are arranged with
the chamber, the intervening space, between them." (D.I. 164 at 3-4.) Alcon proposes that I construe "disposed on opposite
sides of said chamber" to mean "placed across from one another on the outer portion of the chamber." (D.I. 164 at 3; D.I.
171 at 22.)

AMO argues that Alcon is "impermissibly attempting to 'read in' a limitation from the specification that does not exist"
because "the claim language makes no reference to the 'outer portion' of the chamber." (D.I. 138 at 34.) Additionally, AMO
asserts that because claim 3, which is dependent upon claim 2, claims a chamber with the chamber inlet along the chamber
perimeter, the doctrine of claim differentiation creates a strong presumption that claim 2 should not be interpreted to require
that the chamber inlet and outlet be placed on the "outer portion" of the chamber. 8 (Id. at 34-35.)

8 The same arguments apply to claim 8, which also includes the element "disposed on opposite sides of said chamber," and
claim 9, which depends from claim 8 in the same manner in which claim 3 depends from claim 2.

ii. The Court's Construction

I construe "disposed on opposite sides of said chamber" to mean "placed across the chamber from one another on the outer
portion of the chamber." First, the parties do not disagree that the term "disposed" means "placed or arranged." (D.I. 164 at
3.) Second, the plain and ordinary meaning of "opposite," when used to describe how two objects are positioned in relation
to each other, is "across an intervening space from and usually facing or on the same level with." Webster's Third New
International Dictionary 1583 (1996). The intervening space in claim 2 is clearly the chamber. Third, the plain and ordinary
meaning of "side" is "a boundary line of a geometrical figure," in this case the circular or toroidal chamber. Id. at 2111. The
boundary line of the chamber is clearly its outer portion. Thus, I do not believe that Alcon has impermissibly "read in" limitations from the specification, but rather proposed a construction that is entirely consistent with the claim element's plain and ordinary meaning. AMO's construction, on the other hand, does not attribute any meaning to the term "side" as used in the claim element.

Additionally, the doctrine of claim differentiation does not prevent the term "side" from being construed to mean the outer portion because claim 3 contains an additional limitation not included in claim 2, and, as such, is not rendered superfluous. 9 See Telemac Cellular Corp. v. Topp Telecom, Inc., 247 F.3d 1316, 1325-26 (Fed. Cir. 2001). Therefore, I construe "disposed on opposite sides of said chamber" to mean "placed across the chamber from one another on the outer portion of the chamber."

9 Claim 3 contains the additional limitation of "means, orienting said chamber inlet along the chamber perimeter, for causing circulation of the introduced fluid within said chamber in order to inhibit settling of particulate material, in the introduced fluid, in said chamber." ('765 patent, col. 5, ll. 16-19.) Thus, this additional limitation further narrows the scope of claim 3 to a way in which the inlet is oriented.

2. "disposed on the base layer"

Claim 1 of the '102 Patent describes a first electrode with a gel layer "disposed on the base layer." Philips renews its disclaimer arguments as to this term, as set forth in Section II.D.1, above, and further asserts that this term should be construed as "spread directly on the surface of the base layer (i.e., without any conductive contact layer, such as a homogeneous, thinly deposited metallic layer, a conductive ink material, or a flexible metal mesh, between the gel layer and the base layer)." Cardiac Science contends that "disposed on" means "placed on."

Similar to the Court's construction of the term "overlaying the base layer" in the '919 Patent, the Court finds that the '102 Patent does not state that the gel layer is directly disposed on the base layer, as Philips contends. The '102 Patent specification offers no further support, other than the illustrations at Figures 13 and 14, which are merely embodiments of the patent. The dictionary defines "dispose" as "to put in place." Merriam-Webster's Collegiate Dictionary, supra, at 361. Consistent with the dictionary definition of the term, the Court construes the term "disposed on the base layer" as "placed on the base layer."

The '483 Patent

Claim 1 of the '483 patent recites three main elements: (1) a substrate, (2) a sub-circuit, and (3) a capacitor with three sandwiched layers -- each "disposed over a portion" of the underlying layer. The tri-layered structure has a first conductive layer of a material such as polysilicon. This layer lies over the semiconductor substrate. A second conductive layer of a material, such as a metal, lies over the first layer surrounded by a guarding capacitor structure. A third layer of a material, such as a metal, lies over the second layer. An insulating layer separates each of these three layers from one another. Thus the invention describes a sandwiched structure as depicted in Figure 2 of the '483 patent (the first, second, and third layers labeled as 34, 36, and 38 respectively).

The disputed portion of claim 1 recites:
a capacitor having first and second plates formed on the first face of said semiconductor substrate, said capacitor having:

a first conductive layer disposed over a portion of the first face of said semiconductor substrate and separated therefrom by a first insulating layer,

a second and shielded conductive layer disposed over a portion of said first conductive layer and separated therefrom by a second insulating layer,

a third conductive layer disposed over a portion of said second and conductive layer and separated therefrom by a third insulating layer,

... a fourth conductive layer disposed in substantially the same plane as said second shielded conductive layer and disposed a predetermined distance therefrom and a third connecting device for connecting said fourth conductive layer to a predetermined voltage.

(emphasis added). The trial court construed "disposed over a portion" to require an "area of coincidence between the two layers greater than zero." Thus, the court interpreted claim 1 to encompass capacitor structures with layers covering anywhere from a small area to the entire area of the underlying surface.

Claim language itself sets the claim scope. Vitronics Corp v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1577 (Fed. Cir. 1996). This court has consistently emphasized that the indefinite articles "a" or "an," when used in a patent claim, mean "one or more" in claims containing open-ended transitional phrases such as "comprising." KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356, 55 U.S.P.Q.2D (BNA) 1835, 1839 (Fed. Cir. 2000); see Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 977, 52 U.S.P.Q.2D (BNA) 1109, 1112 (Fed. Cir. 1999); AbTox, Inc. v. Exitron Corp., 122 F.3d 1019, 1023, 43 U.S.P.Q.2D (BNA) 1545, 1548 (Fed. Cir. 1997). "Under this conventional rule, the claim limitation 'a,' without more, requires at least one." KCJ at 1356 (emphasis added).

Based on this conventional rule, because claim 1 is open-ended, the limitation "disposed over a portion" means "disposed over at least one portion." This claim construction comports completely with the district court's claim construction. Thus, claim 1's proper construction does not limit "disposed over a portion" to only a portion of the layer beneath. In other words, claim 1 includes within its scope a capacitor structure with layers disposed over the entirety of the underlying surface. Claim 1 does not require a capacitor structure shaped like a three-tiered wedding cake, with the first layer being largest in surface area and the third layer being smallest, or stacked like staggered, partly overlapping layers.

When a patent claim uses the word "comprising" as its transitional phrase, the use of "comprising" creates a presumption that the body of the claim is open. In the parlance of patent law, the transition "comprising" creates a presumption that the recited elements are only a part of the device, that the claim does not exclude additional, unrecited elements. See KCJ, 223 F.3d at 1356.

The transition "having" can also make a claim open. Regents of the Univ. of Cal. v. Eli Lilly & Co., 119 F.3d 1559, 1573, 43 U.S.P.Q.2D (BNA) 1398, 1410 (Fed. Cir. 1997). However, the term "having" does not convey the open-ended meaning as strongly as "comprising." "Having," for instance, does not create a presumption that the body of the claim is open. Therefore, this court examines the claim in its full context to determine whether Crystal's use of "having" limits claim 1 to its recited elements.

The language of claim 1 itself does not limit the term "having" to a closed meaning. The '483 patent discloses a capacitor structure that shields the sensitive plate of the capacitor from stray noise. The "Background of the Invention" describes typical prior art capacitors with a two-plate structure. Col. 1, ll. 58-68. The top plate served as a "sensitive 'virtual ground' capacitor plate" while the bottom "shielded the sensitive node from substrate noise." Id. These two-plate capacitors were "still susceptible to noise coupling onto the sensitive top plate through passivation and packaging dielectrics." Id. at 66-68. The claimed tri-layered structure improves noise shielding. The first and third layers are connected together and operate "to shield... the second conductive layer, from noise resulting from external sources or from the semiconductor substrate."
Col. 2, ll. 19-24; col. 4, ll. 8-11 ("The upper metal plate 38 is operable to shield the shielded plate 36 from noise resulting from signals that are disposed above the plate 38.").

Figure 6 illustrates that the preferred embodiment of the claimed '483 invention shields against noise by entirely covering the middle layer (36):

[SEE FIGURE 6 IN ORIGINAL]

According to the written description, the fourth conductive layer (also called the conductive ring 82) "is disposed between the contacts 84 and 85, and the shielded plate 36 to substantially eliminate stray capacitance between plate 34 and sensitive plate 36." Col. 5, ll. 10-15. Contacts 84 connect the upper conductive layer to the intermediate interconnection strip 83 as depicted in Figure 6. Col. 5, ll. 42-50. Contacts 85 connect the lower conductive layer to the same interconnection strip to link the upper and lower layers. Because the conductive ring "is disposed between plate 34 and contacts 84 and 85," a capacitor structure with such a conductive ring must have a middle layer that is smaller in surface area than the upper and lower layers. In other words, because claim 1 recites this fourth conductive layer, the written description requires claim 1 to encompass a capacitor structure wherein the third layer covers the entirety of the second layer.

The written description thus shows the intent to make claim 1 at least partially open to permit the limitation "disposed over a portion" to mean "disposed over at least one portion." Any assertion that "disposed over a portion" means "disposed over only one portion" would contradict the clear purpose of the invention as described in the written description, depicted in Figure 6, and recited in claim 1. Such an assertion would also impermissibly read the preferred embodiment out of claim 1. Vitronics, 90 F.3d at 1583.

The accused Model 931 device has first and third layers of approximately equal size and a smaller second, or middle, layer. Because each layer overlies a portion of the underlying layer, the Model 931 literally infringes claim 1 of the '483 patent. Therefore, this court detects no error in the district court's reading of the "over a portion" limitation and its application of that claim language to the accused device.

b) The Patent Claim at Issue Here

16. Claims 1 and 14 are the independent claims of the ’306 Patent, with claims numbered 2 through 13 dependent, directly or indirectly, upon Claim 1, and claims numbered 15 through 33 dependent, directly or indirectly, upon Claim 14. (LX-16,Cols. 9 through 12.)

17. Laminations has asserted infringement of independent Claim 14. Claim 14 reads as follows:

14. A reservoir container assembly for growing plants comprising

[1] first container means for holding a liquid and having a wall,

[2] second container means for holding a plant growing medium,

[3] conduit means extending from the interior of said first container means through said wall into the interior of said second container means,

[4] said conduit means having means for assisting the transfer of liquid from said first to said second container means,

[5] said second container means having a surface portion that, in use, faces substantially vertically upwardly and a first opening in said surface portion for allowing plant growth therethrough,

[6] said second container means also having a second opening disposed remote from said first opening and for allowing evaporation of liquid therethrough.
18. In short, Claim 14 describes a "reservoir container assembly for growing plants."

b) The Second Opening Disposed Remote from the First Opening

The inventor of the '306 Patent used the term "opening" in relation to a surface portion of the second container facing substantially vertically upwardly to describe the area where evaporation through the surface portion of the second container was to occur, and employed the phrase "disposed remote" to describe the location of the second opening in the surface portion. There is no evidence that the inventor intended these terms to have anything but their ordinary and customary meaning.

An "opening" is ordinarily understood as a gap, a passage, or an open space. (See LX-23 ("opening" defined as an "open space serving as a passage or gap").) The meaning of opening, therefore, is straightforward. Laminations, however, has injected ambiguity into the construction of this element by implying that the open space need not be completely bounded. Whether the second opening means a bounded or unbounded open space can be resolved by an examination of the claim language and the specification.

The term "opening" appears twice in Claim 14 -- the first "opening" and the second "opening." "Claim terms are presumed to be used consistently throughout the patent, such that the usage of a term in one claim can often illuminate the meaning of the same term in other claims." Research Plastics, Inc. v. Fed. Packaging Corp., 421 F.3d 1290, 1295 (Fed. Cir. 2005). This presumption logically takes on greater force where, as here, the identical terms are used in the same claim. In this regard, Mr. Whisenant described the "first opening" in the surface portion of the second container in connection with the second embodiment as follows: "By using a flexible rim for opening 120, the edge of the opening is maintained in intimate contact with the stem growing therethrough." (LX-16, Col. 7, Lines 51 through 53.) The natural inference from this description is that the first opening must be bounded on all sides, an inference supported by Figures 1, 5, and 7 of the '306 Patent. Therefore, the opening, as that term is used in relation to the "second opening," must be an open space bounded on all sides.

The phrase "disposed remote" is also defined by its ordinary and customary meaning. The term "disposed" means "to assign to a particular place or position." Webster's Third International Dictionary 654 (unabridged ed. 1993). The term "remote" is understood as "far removed" from a particular point. (See Defs.' Proposed Findings of Fact, Dkt. Entry 35, P 72.) Thus, as used in Claim 14, the second opening is "disposed remote" from the first opening when it is located at a point "far removed"
from the first opening.

How "far removed" the second opening must be from the first opening can be ascertained by considering the objective of the '306 Patent, as well the written specification. One of the disadvantages of the prior art noted by Mr. Whisenant was the accumulation of salt and minerals caused by localized evaporation around the plant growth, the consequence of which was "stunted plant growth or death of the plant." (Id., Col. 1, Lines 31 through 34.) The '306 Patent purports to eliminate this disadvantage with an opening disposed remote from the plant growth. This, in turn, will facilitate evaporation, and the "salt and minerals [that] build up at the site of evaporation are kept away from the roots of developing plants." (Id., Col. 4, Lines 30 through 36; see also id., Col. 7, Lines 1 through 4; Col. 8, Lines 10 through 13.) This objective, however, can be achieved only if the opening surrounding the plant growth is "spaced a suitable distance from . . . the evaporation opening." (Id., Col. 7, Lines 62 through 63.) Therefore, the second opening is "disposed remote" from the first opening when it is located a suitable distance away from the first opening ensuring that evaporation and the accumulation of salt and minerals does not occur anywhere near the growing plant.

In summary, after considering the relevant language of Claim 14, the ordinary and customary meanings of "opening," "disposed," and "remote," and the written specification of the '306 Patent, the Court construes the sixth element of Claim 14 as: a second open space in the surface portion of the second container, bounded on all sides, that is located a sufficient distance away from the first opening to ensure that evaporation and the accumulation of salt and minerals do not occur adjacent to the growing plant.

Disposed Substantially at the Radius

The '930 Patent claims also require exterior structures, features, or bearing segments "disposed substantially at the radius" of their associated superabrasive cutters. Baker Hughes and ReedHycalog dispute whether these terms require the exterior structures, features, or bearing segments to be centered at the same radius as their associated superabrasive cutters. ReedHycalog contends the patents require the abovementioned centered placement of these structures; Baker Hughes argues the patents are not so limited.

The '930 Patent claims do not contain a "centered" limitation. Despite this claim language, ReedHycalog points to Figs. 1, 2, and 2A of the '930 Patent and the accompanying description to support its construction.

However, the '930 Patent figures do not delineate the centers of the superabrasive cutters or the exterior structures, features, or bearing segments. The figures do not indicate that the centers of the exterior structures, features, or bearing segments lie along the same radius as the centers of the associated superabrasive cutters. The supporting text in the specification also does not describe or impose any requirement that the exterior structures, features, or bearing segments be centered at the same radius as the center of their associated superabrasive cutters.

ReedHycalog further contends Baker Hughes, to overcome a 35 U.S.C. § 102(b) rejection by the Examiner, narrowed its claim language to require the exterior structures, features, or bearing segments to be "centered" at the same radius as the center of their associated superabrasive cutters. During prosecution of the '930 Patent, the Examiner rejected the claim that contained the "disposed substantially at the radius" language under 35 U.S.C. § 102(b) in light of U.S. Pat. No. 4,554,986 (the "Jones Patent"). As Baker Hughes argued when it amended the claims, the Jones Patent discloses bearing structures that extend from center outward and not structures placed at substantially the same radius as an associated superabrasive cutter. Nowhere in the claim amendment did Baker Hughes mention a centered limitation, nor is one necessarily implied to distinguish the claims in the '930 Patent from the Jones Patent. Thus, the prosecution history of the '930 Patent does not support ReedHycalog's contention that the exterior structures, features, or bearing segments must be centered at the same radius as their associated superabrasive cutters.

For the abovementioned reasons, the claim term does not include a "centered" limitation. Therefore, "disposed substantially at the radius" means "located close to the radius." 19
Disposed upon is essentially the same as disposed interstitially, and as such, the Court adopts the same analysis as above, wherein disposed refers to a location, not a method of placing something. With respect to SCG's various arguments, the Court recognizes that the patents-in-suit disclose a method of manufacturing the artificial turf. However, they also disclose a structure and it is that structure (or product) that is claimed. SCG's various arguments for reading the method elements into the claim because they are disclosed in the specification again fail, because there is nothing to indicate that the preferred method of manufacture must be read in the claim or has been defined as the claim as a whole. Once again, the Court also recognizes SCG's noninfringement argument that an artificial turf constructed without the claimed structure may not infringe the patents-in-suit. But that is an infringement issue that may require significant factual details regarding the accused products.

Bradley argues that when it distinguished the '960 Patent over the prior art U.S. Patent No. 2,282,152 (the "Babbin Patent"), the Court required the multiple response thermostat of the '960 Patent invention to be fully exposed in the mixing chamber. Defs.' Opp'n to Claim Constr. at 11-14. Therefore, disposed within means fully exposed in. Id. at 14. In contrast, Lawler argues that for a multiple response thermostat to be disposed within the mixing chamber, only the functional portions of the thermostat that contribute to the response rate must be exposed to the fluid in the mixing chamber. Pl.'s Reply to Claim Constr. at 15-17.

The Court primarily agrees with Lawler. Reading the claims in light of the specification, the Court finds that the phrase a multiple response thermostat disposed within the mixing chamber means that the temperature sensing portions of the thermostat are immersed in the fluid contained in the mixing chamber. Starting with the plain language of claim 1, it appears that, at a minimum, the first and second thermostat portions of the multiple response thermostat must come in contact with the fluid in the mixing chamber between the valve assembly outlet and the flow control valve means. '960 Patent, col. 9, ll. 35-42. Those are the parts of the thermostat that are delineated by claim 1 as being part of the multiple response thermostat that is disposed within the mixing chamber. The purpose of the thermostat is to sense the temperature of the mixed fluid as it mixes in and is let out of the mixing chamber. Therefore, the temperature sensing thermostat portions must come in contact with the fluid mixture in the mixing chamber to perform as required.

The specification reveals that "in order to reliably react to a change in the temperature of the fluid mixture, the thermostat must be immersed in the mixture." Id. col. 4, ll. 53-55. Similarly, another part of the specification teaches that the importance of immersing the thermostat in mixed fluid is "to assure that the thermostat receives a proper indication of the temperature of the exiting fluid." Id. col. 5, ll. 18-20. Clearly, the important part of the thermostat is the temperature sensing portions rather than either the rod that acts in response to changes in those temperature sensing portions, or any support
The Court finds that the phrase disposed within means that the temperature sensing portions of the multiple response thermostat are immersed in the mixed fluid contained in the mixing chamber.

E. Disposed Within a Void of a Main Panel of Said Brim

The next term appears in claim 3, which states: "The illumination headgear of claim 1, wherein said array of light emitting diodes is disposed within a void of a main panel of said brim." The parties agree that "void" means "cut-out, groove, or other opening" and that "disposed" means "located." They dispute whether the claim should be construed to refer to a single void or to several possible voids. Plaintiff relies on the general rule of patent construction that a noun following the article "a" or "an" indicates both the singular and plural form of the noun. See Baldwin Graphic Sys., Inc. v. Siebert, Inc., 512 F.3d 1338, 1343 (Fed. Cir. 2008). As demonstrated by the court's discussion of "contiguous beam," however, the general rule alone does not end the inquiry. The court must still look at the context of the term to determine whether the specific usage is more naturally understood to refer to one particular object. Tivo Inc., 516 F.3d at 1303; Norian Corp. v. Stryker Corp., 432 F.3d 1356, 1359 (Fed. Cir. 2005). Here, the context of the term "a void" does not warrant departure from the general rule.

The patent specification clearly contemplates the possibility of multiple "voids." "Alternatively, the light source and the electrical conducting path are mounted to a preexisting main panel within voids such as cutouts, grooves, or the like (not shown) and secured with stitching, adhesive, or the like." ('831 patent, Col. 5, ll. 24-27)(emphasis added.) The use of the plural in the specification supports Plaintiffs' construction. Further, there is nothing in the context of the claim itself to suggest that "a void" could not also encompass multiple, proximate voids. Use of the singular form of the noun "array" in the claim does not preclude the possibility of multiple voids because an "array" is an arrangement comprised of several lesser components. An "array" of LEDs could easily be situated in multiple, proximate voids, and yet still be configured to produce what appears to be a "contiguous beam" of light.

As nothing in the claims, specification, or prosecution history necessitates a departure from the general rule, the court finds that claim 3's reference to "a void" may mean one or more voids. Accordingly, the court adopts Plaintiffs' construction of "disposed within a void of a main panel of said brim" as: "located within a cut-out, groove, or other opening of the main panel of the brim."

6. "Disposing a light influencing material in said at least one opening" ('682 Patent, claims 22, 25, and 26; '711 Patent, claim 4) (Claim Element 6)

a. The Parties' Positions
ATI proposes that essentially the plain meaning of this claim element be adopted. Dkt. No. 81 at 13-14. Specifically, ATI proposes that the following construction be adopted: "Placing a light influencing material in said at least one opening." Id. The only difference between ATI's proposed construction and the plain meaning is that ATI suggests that the term "disposing" be replaced with the term "placing." Id. Defendants, however, propose the following construction: "Placing light influencing material in at least one hole in the substantially opaque material, in the proper order or arranged as by injection." 12 Dkt. No. 84 at 24-25. In support of this proposed construction, DNP uses The American College Dictionary to define the word "dispose." Id. DNP claims this definition supports a construction that this light influencing material "must be disposed in a particular arrangement or manner." Id.

--- Footnotes ---

12 Sharp provides no briefing on this issue. Dkt. No. 83. Instead, in the Chart, Sharp states that it "agrees with DNP." Dkt. No. 113 at 3.

--- End Footnotes ---

In response, ATI argues that Defendants' proposed construction includes two additional and potentially erroneous limitations: (1) that the disposing is conducted in a special order and (2) that the disposing is achieved by injection. Dkt. No. 81, Pages 13-15. ATI also argues that if the "disposing" need only be in one opening, it is unclear what "order" would be used. Id.

b. Construction

As an initial matter, this Court has not adopted Defendants' proposed construction that the term "opening" be replaced with the term "hole." Therefore, this issue will not be addressed again. Additionally, Defendants' proposed construction that this process must be completed "in the proper order or arrangement as by injection" cannot be adopted for several reasons. First, the plain language of the claims themselves merely require that the "disposing" be in "at least one opening." If only one opening is required, it is unclear how the disposing could be done in any "proper order or arrangement." Accordingly, Defendants' proposed construction of this claim element contradicts this claim element's plain language.

Second, DNP's only support for this proposed construction is a non-technical dictionary that does not necessarily establish the "ordinary and customary meaning" for someone skilled in the art, and, accordingly, this Court is not required to adopt this proposed construction. Phillips, 415 F.3d at 1313. Third, these claims do not require that this step be completed by "injection." DNP argues that the specification supports such a construction that injection is required. See, e.g., Col. 3, Lines 52-57. DNP is correct that one preferred embodiment provides for injection. Id. However, this restriction from one preferred embodiment should not be imported to the claim terms. Phillips, 415 at 1323. Accordingly, this Court rejects Defendants' proposed construction and adopts the following construction for Claim Element 6: "Placing a light influencing material in at least one opening."

GO BACK

1219

1. "disposing on the treatment table a means for generating an ultrasound image"

In construing the term "disposing on," NOMOS breaks the term into its components, "disposing" and "on." NOMOS contends that these words should be construed in accordance with their normal dictionary meaning. Specifically, NOMOS contends that "disposed" should be construed to mean "arranged," and "on" should be construed to "indicate a position . . . near a specified part of something." (D.I. 80 at 12-13). Taken together, NOMOS contends that the phrase "disposing on" should be construed to mean "arranging the position of [the patient or ultrasound probe] near the treatment table." (D.I. 80 at 13).

In response, BrainLAB contends that "disposing on the treatment table" means "arranging the 'means for generating an ultrasound image' in physical contact with and supported by the treatment table." (D.I. 82 at 22). BrainLAB agrees with NOMOS that the term "dispose" can be construed as "arrange," but BrainLAB disagrees with NOMOS insofar as the construction of the term "on" is concerned. BrainLAB contends that the term "on" is more accurately defined using the
alternate definition provided by the dictionary, i.e. "in a position above, but in contact with and supported by; upon." (D.I. 82 at 24) (citing Webster's New Word Dictionary, p. 993, Prentice Hall Press (Second College Edition 1986)).

In its claim construction, NOMOS contends that "on" cannot be construed in accordance with this alternate dictionary definition. Using the preferred embodiment as an illustration, NOMOS contends:

While the patient is in 'contact' with the treatment table (i.e. that which supports from beneath), the ultrasound probe, even in the preferred embodiment of the invention of the '026 Patent, is not in contact with the treatment table. Rather in the preferred embodiment of the '026 Patent, the ultrasound probe is attached to a bracket which is above the treatment table and the bracket is only preferably fixedly attached to the treatment table.

(D.I. 80 at 13) (emphasis in original).

After reviewing the claim language in light of the specification, the Court concludes, as BrainLAB contends, that "disposing on the treatment table a means for generating an ultrasound image" means "arranging the means for generating an ultrasound image in physical contact with and supported by the treatment table." In the Court's view, this construction is supported by both the specification and the manner in which the phrase "disposing on" is used in the claim language. The specification of the '026 Patent uses the phrase "disposing on" to denote a physical connection or contact. For example, the specification provides:

Ultrasound probe 422 is disposed upon and mounted to, treatment table 404 as by a bracket 423 which is preferably fixedly secured to treatment table 404. Ultrasound probe 422, by means of any suitable conventional connection 423, is mounted so that it can be moved upwardly and downwardly with respect to bracket 423.

('026 Patent, col. 7, 11. 14-20). Further, the drawings in the specification all depict the ultrasound probe as being in contact with or connected to the treatment table, albeit by virtue of the bracket or other fixation device.

In the Court's view, this definition is also consistent with the claim language. That the term "disposing on" denotes a physical connection is apparent in the manner in which the phrase is used elsewhere in the claim. For example, the term "disposing on" is used in paragraph (a) of Claim 6 which provides "disposing the patient on a treatment table of a radiation therapy device." ('026 Patent, col. 12, 11. 43-44). When used in this sense, it is evident that the term "on" denotes a physical contact between the patient and the treatment table, and not merely that the patient is "near" the treatment table as NOMOS's definition suggests.

NOMOS contends that BrainLAB's definition of the term "on" improperly limits the invention to the preferred embodiment. However, in this case, the preferred embodiment is the only embodiment described by the specification. In the Court's view, its construction of this term is consistent with the specification. That this construction happens to be consistent with the preferred embodiment, as well, is the result of the patentee's use of the preferred embodiment in the specification and not the result of the Court improperly limiting the invention to the preferred embodiment.

NOMOS also contends that BrainLAB's construction of the phrase "disposing on" runs afoul of the doctrine of claim differentiation. According to NOMOS, claim 20 of the '026 Patent indirectly depends on claim 6, and claim 20 specifies that the ultrasound probe is disposed on the treatment table by mounting the ultrasound probe perpendicular to the treatment table. NOMOS contends that it is error for the limitation of Claim 20 to be read into Claim 6. In support of its contention, NOMOS directs the Court to the Federal Circuit's decision in Environmental Designs, Ltd. v. Union Oil Co. of California, 713 F.2d 693, 699 (Fed. Cir. 1983), cert. denied, 464 U.S. 1043, 79 L. Ed. 2d 173, 104 S. Ct. 709 (1984), for the proposition that "it is improper for courts to read into an independent claim a limitation explicitly set forth in another claim." Id.

The Court is not persuaded that its claim construction runs afoul of the doctrine of claim differentiation. Under the doctrine of claim differentiation, claims should be presumed to cover different inventions. Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1538 (Fed. Cir. 1991). Stated another way, a claim should not be construed in a manner that would make it read like another claim. Id. However, the doctrine of claim differentiation is merely a construction guideline, and not a rigid rule. Id. Thus, "if a claim will bear only one interpretation, the similarity [between the two claims] will have to be tolerated." Id.

In pertinent part, Claim 20 of the '026 Patent reads:
The method of claim 17, wherein the ultrasound image generating means is disposed on the treatment table by mounting the ultrasound image generating means perpendicular to the treatment table.

(‘026 Patent, col. 14, ll. 21-24). Claim 20 is dependent on Claim 17, which is in turn dependent on Claim 6. Claim 20, however, adds the limitations of Claim 17, and thus, Claim 20 does not have the same scope as Claim 6. Further, the Court's construction of the image generating means (as construed in the context of Claim 1) includes an ultrasound probe and a bracket which maintains the ultrasound probe perpendicular to the treatment table and equivalents of that structure. Where, as here, a dependent claim recites a structure corresponding to an independent means-plus-function claim, the Federal Circuit has concluded that claim differentiation is maintained. IMS Technology Inc. v. Haas Automation Inc., 206 F.3d 1422, 1431 (Fed. Cir. 2000) (claim differentiation is maintained when the disclosed structure corresponding to an independent P6 claim is recited in a dependent claim) (citing Laitram Corp., 939 F.2d at 1538). Accordingly, the Court concludes that its construction of the paragraph "disposing on" is not inconsistent with claim differentiation principles.

6. Claim 6: Step (a)

Text:

(a) disposing the patient on a treatment table of a radiation therapy device;

‘026 Patent, col. 12, ll. 43-44.

NOMOS's Proposed Construction:

Arranging the position of the patient in relation to or near the treatment table . . . (i.e. positioned in relation to the treatment table, and in fact in contact with it).

NOMOS Opening Brief at 14-15.

ZMED's Proposed Construction:

This step requires placing the patient on a treatment table of a radiation therapy device.

ZMED Opening Brief at 25.

Construction:

Step (a) means "placing the patient on (in contact with and supported by) a treatment table of a radiation therapy device."

Commentary:

This dispute centers on the construction of the words "disposing" and "on." A term should be given its ordinary meaning unless the patent owner chooses to be his or her own lexicographer. Monroe Eng'g Prods., Inc. v. J.W. Winco, Inc., 915 F. Supp. 901, 905 (E.D. Mich. 1996), aff'd in part, rev'd in part, Monroe Eng'g Prods., Inc. v. J.W. Winco, Inc., 121 F.3d 728 (Fed. Cir. 1997). Here, the term "disposing" is not defined in the patent, but is used repeatedly. See, e.g., ’026 Patent, col. 5, In 32; col. 6, l. 16; col. 7, ll. 8, 14, and 56; and col. 8, ll. 32, 34. By comparing the various places in which the term is used, I conclude that, in context, "dispose" means "to place." Meaning is least strained by this definition across Steps (a)-(c) of claim 6.

The word "on," of course, has a range of meanings. Here, the most reasonable construction of the word, and the one which reflects its ordinary and common use, Envirotech Corp. v. Al George, Inc., 730 F.2d 753, 759 (Fed. Cir. 1984), is "in contact with and supported by."
5. "Dissection" refers to the act of rupturing or breaking connected tissue.

15. "Distal End" and "Proximal End."

The court shall apply the ordinary definition of the terms "distal" and "proximal." The term "distal end" shall be construed to mean "the end situated away from the point of origin or attachment." The term "proximal end" shall be construed to mean "the end situated toward the point of origin or attachment."

3. A "distal end portion" is the farthest point from the proximal end portion, and may include a bladder inflatable from a contracted condition to an expandable condition.

G. "said arm links having a first portion coupled to a corresponding foot link and a second distal portion coupled to said frame"

This term arises in claim 17, which reads in full: "17. The exercise device according to claim 7, wherein said guide comprises arm links, said arm links having a first portion coupled to a corresponding foot link and a second distal portion coupled to said frame." The parties disagree on the meaning of the word "distal" in the context of the proper construction of the phrase "a second distal portion." Precor argues that "distal" simply means "at a distance" or, in other words, "at some distance away." The extent of that distance relative to any other of the arm link is not established by this construction. Fitness Quest argues that "distal" should be construed as "beyond the mid-point." In other words, the second portion of the arm link would be shorter than the first portion.

Finding no guidance from the specification or extrinsic evidence, the Court concludes that the words of the claim itself imply that "distal" simply means "further away from." In other words, the second portion of the arm link is further away from the foot link than the first portion. The Court is unpersuaded by Dr. Brienza's conclusory assertion that someone of ordinary skill in the art would interpret "distal" as meaning at a point beyond the mid point of the arm link. To the contrary, nowhere in the claims is there any implication about the lengths of the first and second portions of the arm link. Based on the proposed embodiments in the figures that include arm links, the Court concludes that "distal" means only that the second portion is further away than the first portion from the foot links that are described in the same claim. Thus, the construction of claim 17 is as follows: "17. The exercise device according to claim 7, wherein said guide comprises arm links, said arm links having a first portion coupled to a corresponding foot link and a second portion, which is further away from said foot links, coupled to said frame."
2. "distal portion of a first length"

The plaintiff proposes "the distal extremity of the guide wire tube in which the inner diameter is decreased in size for a short distance" whereas the defendant contends that no construction is needed. There are two main disputes - 1) whether to include an inner diameter limitation and 2) whether the phrase should be limited to the "distal extremity" covering a "short distance."

The plaintiff argues that its proposed construction meets the four criteria established in SciMed Life Systems, Inc v. Advanced Cardiovascular Systems, Inc., 242 F.3d 1337 (Fed. Cir. 2001), for construing claims by reference to the single embodiment disclosed in the specification. First, the abstract states that the guide wire tube must have a decreased inner diameter at the distal extremity. Second, the decreased diameter in the distal extremity distinguishes the invention over prior art because it combines several benefits inherent in the invention, e.g., reduced blood in the guide wire lumen, free movement of the catheter relative to the guide wire, etc. Third, the specification states that "the invention" includes a distal extremity of the guide wire tube decreased in size for a short distance. '358 patent, 2:48-49, 6:11-13. Fourth, the patent discloses this feature as the single embodiment because the specification states that it is applicable to all balloon catheters with guide wire lumens. '358 patent, 1:54-56, 2:42-45, 6:22-25.

The defendant argues that this phrase does not mention the inner diameter, and that the inner diameter is actually discussed in later claim language. According to the defendant, adding the inner diameter limitation would result in an impermissible reading of a limitation into claim terms.

The defendant also argues that adding the "short distance" limitation is incorrect for four reasons. First, the defendant contends that the claim already defines the relative length of the distal portion - "a distal portion of a first length and a proximal portion of a second length longer than the first length." According to the defendant, this does not mean that the distal portion extends only for a "short distance," but only that the proximal portion is longer than the distal portion.

Second, the defendant contends that the specification does not compel a "shortness" limitation. The defendant argues that this aspect is just one embodiment and the limiting language ("all embodiments of the present invention") in the SciMed case is not present in the specifications of the patents. The defendant also contends that SciMed does not apply because the specifications do not provide a way to determine what constitutes a "short distance," and, therefore, it cannot be a limitation necessary to distinguish prior art.

Third, the defendant contends that the prosecution history counsels against adding a "shortness" limitation. The defendant points out that when the examiner rejected the original claims because they did not specify the length of the guide wire lumen's distal portion, the applicants amended their claims to state that the proximal portion was longer than the distal portion. According to the defendant, if the applicants wanted to limit the length of the distal portion to a "short distance," then they would have done it in their amended claims.

Fourth, the defendant contends that "short" is an ambiguous word and would not aid in construing the meaning of the term.

The Court agrees with the defendant that the inner diameter size and the "short distance" limitation should not be included in the construction of this phrase. The inner diameter size is already discussed in a subsequent part of the claim. The language in Claim 1 states that the inner surface of the guide wire lumen has "a first diameter for the distal portion of the guide wire tube and a second diameter larger than the first diameter for the proximal portion of the guide wire tube." '358 patent, 7:18-22.

In addition, "short distance" is an ambiguous term. Subsequent claim language specifies the limitations for selecting the length of the distal portion (e.g., it must substantially prevent blood from entering the proximal portion, etc.). See '358 patent, 7:28-38. The Court rejects the plaintiff's argument that, in this case, SciMed requires a construction limited to the specification. In SciMed and the other cases cited by the plaintiff, the court limited the scope of the asserted claims to the structures described as distinguishing, or improving upon, prior art. See SciMed, 242 F.3d at 1342-43; Honeywell Int'l, Inc.
v. ITT Industries, Inc., 452 F.3d 1312, 1318 (Fed. Cir. 2006); On Demand Machine Corp. v. Ingram Industries, Inc., 442 F.3d 1331, 1340 (Fed. Cir. 2006); Inpro II Licensing, S.A.R.L. v. T-Mobile USA, Inc., 450 F.3d 1350, 1356 (Fed. Cir. 2006). Here, the patents-in-suit do not distinguish the prior art solely on the basis of having an inner diameter decreased for a "short distance." The Court also notes that the abstract does not identify the inner diameter of the distal portion of the guide wire as being decreased for a "short distance." Cf. SciMed, 242 F.3d at 1342 (stating that the limitation was identified from the outset of the specification, in the abstract section). Accordingly, the Court concludes that this term requires no further construction.

1. "a distal portion of a first length"

The plaintiffs propose "the distal extremity of the guide wire tube in which the inner diameter is decreased in size for a short distance." The defendants propose that this term carry its plain meaning.

The plaintiffs propose the same construction as they advanced in Medtronic AVE Inv., et al. v. Cordis Corp., 2:03-cv-212, ("the Cordis case"), and reassert that their proposed construction of this term is proper in light of SciMed Life Sys., Inc. v. Cardiovascular Systems, Inc., 242 F.3d 1337 (Fed. Cir. 2001). The defendants do not present any arguments on this term in their briefing.

The court previously addressed this term in its Claim Construction Order issued on April 23, 2007 (Dkt # 229 in the Cordis case) ("the Cordis Order"). After carefully considering the arguments raised by the parties in this case, the court is not persuaded to alter its construction from the Cordis Order at 8-10. Accordingly, the Court concludes that this term does not requires construction.

A. "Distal Section"

As described above, in the course of construing claim one of the Sirhan patent, the Court found that the term "distal section," when read in light of the specification, was sufficiently clear to enable a person skilled in the art to identify the distal section of ACS' balloon dilatation catheter. The Court noted that the specification teaches that the distal section is between ten and forty centimeters long and is contiguous to the balloon. Furthermore, the Court stated, certain criteria known to persons skilled in the art, such as the flexibility and profile of the catheter and the type of procedure for which the catheter was designed, would, when coupled with the description in the specification, allow a person skilled in the art to identify with adequate precision the distal section of the Sirhan '275 patent catheter. In reaching these conclusions, the Court rejected SciMed's arguments that the term "distal section" was fatally indefinite because the specification stated only that the distal section is preferably between ten and forty centimeters in length and ACS' expert conceded that there was no clear-cut definition in the industry for distal.

SciMed raises no new arguments in opposition to ACS' motion for reconsideration. Patner, it continues to rely on the testimony of ACS' expert, Mr. Corso, that there is no industry-wide definition for distal, and that different factors might be considered in determining where the distal section begins in a catheter, including the type of procedure for which the catheter is designed, the change in flexibility along the catheter shaft, and the patient upon whom the catheter is being used. See Flannery Dec., Ex. 17 at 32:6-7, 45:17-23, 474:20-475:10. As the Court previously concluded, this testimony does not demonstrate that the term "distal section" is indefinite.

The specification of the Sirhan '275 patent states that in the preferred embodiment, the distal section is between ten and forty centimeters long and is situated contiguous to the balloon. See Hansen Dec., Ex. 1 at 7:62-67. In addition, it identifies the distal section as that section that enters the patient's coronary anatomy during intravascular procedures and that has decreased dimensions and improved flexibility. See id. at 2:29-39, 3:6-21, 7:64-67. Mr. Corso states that the term "distal" is "among the most common terms of reference in the art of intravascular catheters." Id., Ex. 31 at 2. This conclusion is
supported by SciMed's use of the term "distal shaft" in its product literature, see id., Ex. 30, and the repeated use of the term "distal section" in the opinion letter SciMed obtained from outside counsel. See id., Ex. 32.

The fact that "distal section" is not defined more precisely is insufficient to overcome these factors. Mr. Corso and Dr. Drasler testified that the portion of the catheter that is designed to extend into the coronary arteries of a patient varies by procedure. See id., Ex. 14 at 178:11-19 (the portion of the catheter that is inserted in the coronary artery ranges from ten to fifteen centimeters); id., Ex. 31 at 4 (the catheter is designed to extend approximately ten centimeters into the patient's coronary arteries, and from twenty to twenty-five centimeters in more extreme circumstances). Likewise, the arched portion of the guide catheter, through which the distal section must also extend, varies in length. See id., Ex. 3 at 3-4 ("In PTCA catheters . . . the distal section is the portion of the catheter that navigates through the curved portion of the guide catheter (around the aortic arch) and into and through the coronary arteries. . . . The catheter should be designed with a portion that can readily flex about the arched portion of the guide catheter, which may typically be about 10-15 cm long."). Thus, the patent specification's description that the distal section is between ten and forty centimeters long is as precise as the subject matter permits. The Court concludes that this estimate, when considered in conjunction with the other criteria used to identify the distal section, including its location immediately adjacent to the balloon, its flexibility, and its decreased dimensions, renders the term "distal section" in claim one sufficiently definite that those skilled in the art would understand what is claimed when the claim is read in light of the specification.

GO BACK

1228

6. "The Distance Between the Two Adjacent Disks" and "The Distance Between Each Adjacent Disk"

The next issue in Claim 1, element 1(n), is the meaning of the italicized portion of the following language: "[T]he surface of the spacer has a linear measure greater than the distance between the two adjacent disks." Because Claim 12, element 12(k), is nearly identical--it refers to "the distance between each adjacent disk"--the Court will presently consider both. 11 Fellowes argues that "the distance between the two adjacent disks" in Claim 1 means "the linear distance of the space between the two cutting disks measured parallel to the shaft." Michilin proposes that it means "the linear distance of the space having the width that is constant circumferentially and between each set of adjacent cutting disks measured parallel to the longitudinal axis of the shaft." Intek's construction is identical to Michilin's except without the word "circumferentially."

11 Fellowes' definition of Claim 12, element 12(k), is identical to its definition of Claim 1, element 1(n) except that it swaps the words "the two" with the word "adjacent" in element 12(k) as follows: "the linear distance of the space between adjacent cutting disks measured parallel to the shaft." Michilin and Intek, by contrast, both define elements 1(n) and 12(k) to be identical. Finding the word "adjacent" to make no material difference in this context, the Court will construe 1(n) and 12(k) identically.

The only material difference between the parties' constructions of elements 1(n) and 12(k) is that the defendants use the term "constant" or "constant circumferentially" to describe the distance between the "cutting disks," while the plaintiff imposes no such limiting language. The defendants' construction is simply another effort to get the Court to construe the "cutting disks" as "flat" and lying in "parallel planes." Although the diagrams in the '780 Patent depict "spacers" whose widths appear to be "constant," Claim 1 does not limit the width of the "spacers" as such. Having already rejected the defendants' arguments on this point, and concluding that Fellowes' construction gives the phrase "the distance between the two adjacent disks" its plain and ordinary meaning, the Court FINDS that "the distance between the two adjacent disks" in Claim 1, and "the distance between each adjacent disk" in Claim 12, both mean "the linear distance of the space between the two cutting disks measured parallel to the shaft." The Court sees no need to add defendants' proposal that the "cutting disks" are "measured parallel to the longitudinal axis of the shaft," as the word "longitudinal" is missing in the patent and including it would seem to be redundant.

GO BACK
Moore contends that the district court erroneously construed the "distance sufficient" limitation of claim 1 of the '798 patent as constrained by the particular specifications of the IBM 3800 printer. Moore emphasizes that claim 1 recites "a printer used to process the mailer during pausing of the printer," and not "an IBM 3800 printer." Moore argues that the district court, by requiring that the "distance sufficient" be "more than one quarter inch," improperly imported a limitation from the written description into the claim in contravention of multiple decisions of this court, including SRI International v. Matsushita Electric Corp., 775 F.2d 1107, 227 U.S.P.Q. (BNA) 577 (Fed. Cir. 1985) (en banc). The district court's reliance on the title of the '798 patent, "Pressure Seal Adhesive Pattern for IBM 3800 Printers," Moore maintains, was also unjustified, because there is no case in which the title of a patent was used to read a term into the claims.

Moore argues that, contrary to the district court's belief, nothing in the prosecution history requires reading the particular specifications of the IBM 3800 printer into the claims. According to Moore, the prosecution history in fact overwhelmingly militates against such a construction. During the prosecution of the '798 patent, the applicant responded to the examiner's indefiniteness rejection with respect to the "distance sufficient" limitation by declaring:

It is respectfully pointed out that regardless of the fact that different printers have different spacings, the invention is entitled to a scope that covers all printers. The fact that a claim is broad does not mean that it is vague or incomplete.

(emphasis added). In response to the examiner's continued rejection that claim 1 was indefinite "because it is impossible to determine the distance claimed in the last paragraph," the applicant again responded:

[The "distance sufficient" limitation] is a functional description, providing a complete, definite and accurate statement of what the spacing should be. The fact that the spacing is not in numerical terms is irrelevant since a functional term such as this, so long as it is itself definite, is entirely appropriate. This is exactly what In re Hammack [57 C.C.P.A. 1225, 427 F.2d 1378, 166 U.S.P.Q. (BNA) 204 (C.C.P.A. 1970)] holds. In Halleck, the exact numerical amount of chemical added to the animal feed was not critical or specified, but rather the functional term "an effective amount for growth stimulation". That is the same situation here. The exact numerical spacing is not critical, and will vary from printer to printer, just as the effective amount of growth hormone in Halleck varied from animal to animal. . . .

. . .

It is impossible for the applicant to anticipate printers with pauses that come out on the market in the future, and measure the exact distance that is necessary for such printers with pauses in the future, but that does not mean that applicant should be denied the rights to his invention. Anyone can determine whether or not they infringe by comparing their product with the functional recitation of claim 1, which is entirely definite. . . .

. . .

Claim 1 is not indefinite, merely broad enough to protect the applicant's real invention.

Moore maintains that these excerpts from the prosecution history, coupled with the examiner's subsequent allowance of the claims, clearly reveal the applicant's intent and the examiner's understanding that "distance sufficient" is not limited to the particular specifications of the IBM 3800 printer.

Notably, SRC does not dispute that the "distance sufficient" limitation is not limited to the IBM 3800 printer for claim construction purposes (though it contends otherwise for infringement purposes). In fact, SRC goes so far as to suggest that the district court did not "assume that the only printer that the limitations of the claims could relate to is an IBM 3800 printer," as Moore maintains. SRC concedes that:

it is obviously possible that, in the future, some other company will put out a printer that functions in the same way as the IBM 3800 printer or that IBM will put out another printer that functions in that same way. If that occurs, and if SRC were to
put out a form designed for use with that printer in the fashion specified by the claims in the '798 patent, then those forms
would infringe.

We agree with the parties that the "distance sufficient" limitation is not limited to the particular specifications of the IBM
3800 printer. We first note that the plain language of claim 1 recites a "printer" generally, and nowhere mentions the IBM
3800 printer. The preamble, for example, refers to "a printer having rollers, and operated to occasionally pause." '798 patent,
col. 6, ll. 50-51.

While the written description refers repeatedly to the IBM 3800 printer, it clarifies that a form for use on an IBM 3800
printer is only the preferred embodiment. See '798 patent, col. 1, ll. 40-41 (discussing the "present invention" and referring
generally to a "printer used to process the mailers"); id., col. 1, ll. 52-56 (discussing "one aspect of the present invention"
and referring to the use of an "IBM 3800 printer having fuser and backup rollers"). Such "references to [the] preferred
embodiment . . . are not claim limitations." See Laitram, 863 F.2d at 865, 9 U.S.P.Q.2D (BNA) at 1299. That the title also
refers to an IBM 3800 printer does not change our analysis, since the bar on importing limitations from the written
description into the claims applies no less forcefully to a title. See Pitney Bowes, Inc. v. Hewlett-Packard Co., 182 F.3d
1298, 1312, 51 U.S.P.Q.2D (BNA) 1161, 1171 (Fed. Cir. 1999) ("If we do not read limitations into the claims from the
specification that are not found in the claims themselves, then we certainly will not read limitations into the claims from the
patent title.").

The prosecution history further informs our analysis. The examiner's indefiniteness rejection with respect to the "distance
sufficient" limitation reveals the examiner's belief that the limitation was not restricted to any particular printer. The
applicant's responses to these rejections clearly demonstrate a similar understanding on his part. That the examiner yielded
to the applicant's arguments by allowing the claims does not, as the district court suggested, establish that the "distance
sufficient" limitation must be limited to the particular specifications of the IBM 3800 printer. On the contrary, the
examiner's acquiescence indicates his acceptance of the "distance sufficient" limitation as functionally claimed and as
properly definite under 35 U.S.C. § 112, P 2. We note that there is nothing wrong with defining the dimensions of a device
in terms of the environment in which it is to be used. See Orthokinetics, Inc. v. Safety Travel Chairs, Inc., 806 F.2d 1565,
1575-76, 1 U.S.P.Q.2D (BNA) 1081, 1087-88 (Fed. Cir. 1986) (holding that the limitation that the claimed wheelchair have
a "front leg portion . . . so dimensioned as to be insertable through the space between the doorframe of an automobile and
one of the seats thereof" was not indefinite).

While SRC implies that the district court's claim construction is consistent with the preceding discussion, we cannot agree.
The district court plainly concluded that "the 'distance sufficient' limitation in claim 1 is in reference to the IBM 3800
printer." Moore I, slip op. at 8; see also id. at 6 ("In other words, the 'distance sufficient' limitation, according to plaintiff,
would be a variable that depends on the type of printer used. The court disagrees."). Despite SRC's attempt to disavow this
statement, we agree with Moore that the district court must have meant what it said, and consequently erred. As we explain
below, however, this error was entirely harmless.

6. distensibility

The plaintiffs propose "the percent radial expansion of a balloon calculated using the equation [shown in the '364 patent at
4:15]." The defendants propose "a value calculated according to the definition provided at 4:12-18 of the '364 patent…all
measurements take place at about 37 degrees C."
Both parties agree that the correct equation for the "wall tensile strength" is:

\[
\frac{\text{Diameter of balloon at 10 bars}}{\text{Nominal balloon diameter} - 1} \times 100\%
\]

The arguments for this term are identical to the "wall tensile strength." Accordingly, the term "distensibility" means "a value calculated according to the equation [shown in the ’364 patent at 4:15] where measurements are taken at or about normal human body temperature."

### 1232

**a. Distributed manufacturing plant**

ITI suggests that the phrase "distributed manufacturing plant" appears in the preamble and appears to argue that the language does not constitute a claim limitation. A preamble is considered a claim limitation only if, when read in the context of the claim as a whole, it recites essential structure or steps or is "necessary to give life, meaning, and vitality" to the claim. Eaton Corp. v. Rockwell Intern. Corp., 323 F.3d 1332, 1339 (Fed. Cir. 2003) (quoting Catalina Mktg. Int'l, Inc. v. Coolsavings.com, Inc., 289 F.3d 801, 808 (Fed. Cir. 2002)). If, therefore, the limitations in the body of the claim "rely upon and derive antecedent basis from the preamble," then the preamble acts as a necessary component of the claimed invention and constitutes a limitation. Id. Several limitations within claim 18 derive antecedent basis from the "distributed manufacturing plant" language in the preamble. Specifically, the claim mentions "the plant," six times, which clearly refers to the "distributed manufacturing plant" language in the preamble. Accordingly, the phrase constitutes a claim limitation and must be construed.

ITI contends that the limitation refers to a plant which makes a variety of products using different machines. Defendants counter that the phrase means a manufacturing plant consisting of unconnected machines that are spread out over the manufacturing plant. Defendants claim that the patent supports its inclusion of "unconnected" in the definition. They cite a sentence under the section "Description of the Prior Art" that states, "Most manufacturing plants or factories are distributed in that they consist of heterogeneous, unconnected workstations." U.S. Patent No. 4,796,194, col. 1, lines 21-23. Because this sentence appears within a discussion describing prior art and the term does not appear elsewhere in the patent, the Court is hesitant to conclude that the claim phrase denotes a manufacturing plant with unconnected workstations. When defining terms, courts are directed to give words their broadest reasonable construction that is consistent with the use of the term in the patent. See In re Am. Acad. of Sci. Tech Ctr., 367 F.3d 1359, 1364 (Fed. Cir. 2004). In short, the Court sees no reason to limit distributed manufacturing plants to those with unconnected workstations.

Later in the section describing prior technology, the specification states in general terms that "[a] distributed manufacturing plant is capable of fabricating a variety of products through ordered-process sequences of process steps. Each process step can be performed by at least one workstation in the factory." U.S. Patent No. 4,796,194, col. 1, lines 27-30. The Court concludes that "distributed manufacturing plant" should be construed as a factory that makes a variety of products using machines in workstations throughout the plant.

### 1233

1. "Whereby an air flow into said inlet between said two fin structures is divided, with a respective portion of said air flow being directed through each of said two fin structures."

**a. Parties' Positions**

The parties propose the following constructions for this term which is present in claim 2 of the ’631 Patent. The main disputes are whether this term includes an "exclusive entry" requirement; a "perpendicular entry" requirement; and an "exclusive exit" requirement as urged by Defendants.
b. Court's Construction

Defendants assert the claims of the '631 Patent must be construed to require "the 'essential' [split feed transverse] air flow configuration called out by the patent." (Plaintiff's brief at 7); see also MBO Labs., Inc. v. Becton, Dickinson & Co., 474 F.3d 1323, 1330 (Fed. Cir. 2007) (construing claims to "ensure that they" require an "essential feature" described in the specification and the prosecution history). The '631 specification provides a basic description of the split feed transverse flow configuration as follows:

[T]he novel structure of the present invention utilizes a split feed transverse flow heat sink configuration where air flow enters the structure through a slot and is then divided into two flow paths, one flowing through each of two separate fin structures.

('631 Patent at 2:23-28). According to Defendants, the claims of the '631 Patent must be construed to require a structure that provides for three essential elements of air flow:

(1) Air enters the heat sink through a slot.

(2) All of the air is then divided (i.e., split) into two flow paths.

(3) Each flow path flows transversely through one of two separate fin structures.

Defendants further assert Figure 1 of the '631 Patent, which the specification refers to twice as the "heat sink assembly of the present invention" (4:12-13; 4:40), provides a helpful illustration of a basic heat sink assembly having these three elements of the split feed transverse flow configuration.

Defendants contend the language of the specification teaches that the '631 heat sink has a single air inlet. (See, e.g., 2:4-8 (Statement of the Invention) ("[T]he air flow path between inlet and outlet should be minimized."); 6:58-60 ("The split feed transverse flow configuration reduces the thermal path between inlet and outlet . . . .") (emphasis added)). Therefore, Defendants' proposed construction requires that the inlet be the exclusive entry point of forced air into the heat sink, not simply one among many entry points.

Defendants' proposed construction also requires the configuration to split the forced air after the air enters the inlet and that all of the split air flows through the fin structures. Relying on claim 2, which states that the respective portions of air flow divided by the slot are "directed through the fin structures," Defendants argue the split feed transverse flow configuration requires that each of the two flow paths flows through a fin structure. ('631 Patent at 2:23-29)("[T]he novel structure of the present invention utilizes a split feed transverse flow heat sink configuration where air flow enters the structure through a slot and is then divided into two flow paths, one flowing through each of two separate fin structures."); ('631 Patent at 3:29-32)(the '631 invention "utilizes a novel split feed transverse flow configuration where the structure automatically divides the air flow with half flowing through each of two separated fin structures" (i.e., with all air flowing collectively through both of the two fin structures)) (emphasis added).

While both sides agree that the '631 Patent calls for a novel, "split feed transverse flow" configuration, Defendants seek to incorporate several additional details that are not essential elements of the configuration. Specifically, they assert that a split feed transverse flow configuration not only permits, but actually requires that air flow must enter the fin structures exclusively from the "gap" and that all air flow which enters the gap must then flow exclusively into the fin structures. These additional elements of air flow are not essential elements of the "split feed transverse flow" configuration as urged by
Defendants.

Neither claim imposes any requirement to employ any more specific configuration of the gap or the air flow, including any configuration described in the preferred embodiments. (’631 Patent at 7:6-11). Nor is there any requirement that the fin structures must capture the entirety of the air flow. (’631 Patent, Fig. 1; 2:3-4, and 3:10-16). Although the split feed transverse flow configuration calls for air to flow into a gap created between fin structures and then to be split before respective portions flow transversely through the fin structures, the Court finds persuasive Plaintiff’s argument that

Defendants’ exacting standard is inconsistent with basic principles of air flow physics and, as a result, with how persons skilled in the relevant arts would understand the claim language. Importantly, the ’631 Patent never purports to define the “air source.” Thus, any definition of split feed transverse flow must be flexible enough to deal with different “air source” configurations. Claim 2, unlike claim 3, calls for a cover plate that would at least partially shield the fin structures from below. An accurate depiction of what is “essential” to a split feed transverse flow configuration must be consistent with both claims, not just claim 2.

There is no requirement that air must enter the fin structures only through the gap. Rather, the only requirement is that some air must enter the gap. Claim 2 says that there must be a path created between two fin structures and then describes what happens to air which enters that path. Claim 2 does not say that all air generated by the air source must find its way into the path created between the fin structures, nor does it purport to describe what happens to such stray air. Claim 3 likewise says only that the gap must be "configured for receiving air," not "all air."

As urged by Plaintiff, Defendants’ assertion that all of the air which enters the gap between the fin structures must then proceed through the fin structures is also inconsistent with principles of air flow. The claim language avoids saying that all air will flow through the fin structures. Claim 2 only requires that a "respective portion" of "an air flow" should flow through each fin structure. 3 Claim 3 similarly says that "air" flowing towards the second surface (not "all of the air" or even "the air") will be divided into two portions, and the "portions" will be directed to the two separate fin structures. This phrasing allows for the possibility that some parts of the air flow will not be effectively captured, a point which is consistent with how persons skilled in the relevant arts would view the claim language. (Rippel Dec. P 6).

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 Defendants claim that because no other destination is specified, it follows that all air must go through the fin structures. However, Defendants give no reason why the claims would have been expected to specify where any "stray" air would have gone.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Given the fluid and dynamic nature of air flow, one skilled in the relevant art would not necessarily assume that all air which enters the gap would inevitably flow exclusively through the fin structures. Even considering Fig. 1, there is nothing to prevent some air from "spilling out" over the walls. Embodiments which lack Fig. 1’s shielding would expect even more "stray" air. Figs. 6-8 provide another embodiment in which the "ends" of the gap are not sealed by a side wall as in Fig. 1. Rather, the "walls" are cut in the shape of a "V," as reflected in Fig. 8. Plaintiff asserts this embodiment would permit the sort of "spill out" that should not be possible if Defendants’ interpretation of this term were adopted by the Court.

Finally, the Court agrees with Plaintiff that there is no requirement that air must flow into the gap at a strictly "perpendicular" angle. There is no reason why, for instance, an air source cannot direct a "cone" of air towards the top plate, the vast bulk of which would follow an "angled" path. (Rippel Dec. P 7).

In light of the foregoing, the Court construes "whereby an air flow into said inlet between said two fin structures is divided, with a respective portion of said air flow being directed through each of said two fin structures" to mean "whereby an air flow into said inlet is divided, such that respective portions of the air flow are directed through separate fin structures."
CLAIM 15

The parties have requested construction of essentially all of the language of the claim, other than the "engine," as follows:

15. A fuel delivery system for removing undesired components from fuel delivered from a fuel tank to an engine comprising, in combination: [issue # 1]

an engine;

initial fuel filter means for removing water from fuel received from the fuel tank; and [issue # 2]

secondary fuel filter means including vessel walls defining an interior chamber having an outlet in fluidic communication with said engine, an inlet in fluidic communication with said initial fuel filter means for receiving fuel containing an undesired gas from said initial fuel filter means, and a return line opening; [issue # 3]

a filter element dividing said chamber into an inlet side and an outlet side, and providing means for preventing substantially all undesired gas in said fuel from passing through said outlet, said preventing means including said filter element separating said inlet side from said outlet side and having substantially no openings having a greater dimension than about 25 microns passing from said inlet side to said outlet side, said return line opening communicating with said chamber on said inlet side to receive air and fuel therefrom; and [issue # 4]

a fuel return line communicating with said return line opening and said fuel tank for delivery of air and fuel to said fuel tank. [issue # 5]

* * *

Claim 15; Issue 4 - The Filter Element

The parties appear to be in agreement that the language pertaining to the filter element is not ambiguous, but offer differing constructions of the language. Defendants again offer a proposed construction that a "filter element" is a "filter which allows fuel to pass but not air," and in their argument assert that a filter element is an "air filter, as opposed to a water filter or particulate filter, which allows fuel to pass but not undesired gas." As set forth above, the Court can perceive no reason either to define the air filter in terms of what it is not or to expressly distinguish it from other types of filters that it does not purport to be. The Court also again rejects Defendants' limitation that the filter "allows fuel to pass by not air." The claim language itself states that the filter element prevents "substantially" all undesired gas from passing through to said outlet, and references a filter having openings of 25 microns or less. Moreover, as set forth more fully in the discussion of earlier claims, the specification consistently references the separation of entrained and entrapped air or air bubbles. See, e.g., col. 2, lines 22-35; col. 4, lines 40-45; col. 5, lines 21-49.

The filter element also includes a "providing means for preventing substantially all undesired gas in said fuel from passing through said outlet." Although drafted as a means-plus-function claim, the Court agrees with Plaintiffs that the claim itself provides sufficient structure such that § 112, P6 does not apply. See Sage Prods., 126 F.3d at 1427-28. The claim language specifies that the filter element separates the inlet side from the outlet side, and is composed of a filter with openings no greater than 25 microns to prevent substantially all air from passing from the inlet side to the outlet side, and that the fuel return opening communicates with the inlet side to receive fuel and air from the inlet side.

Defendants suggest the word "communicate" be construed as a connection, while Plaintiffs assert no further definition is necessary. While not the picture of proper English grammar, the Court finds that the term "said fuel return line communicating with said chamber on the inlet side" is not ambiguous as used in the claim. Nor is it defined in the specification in a manner inconsistent with its ordinary meaning. Similar to this Court's prior determinations, the term "communicating" as used herein is defined to mean that it permits transfer.

Defendants further assert that the filter element must be submerged below the surface of the fuel. Such a requirement is in fact consistent with the preferred embodiment, but it is not contained within the language of this particular claim. The submersion limitation is expressly referenced in other claims, such as claim 8, but is not contained in this claim, which
purports to describe a more general "fuel delivery system." As such, it is fair to assume the absence was intended. Modine Mfg. Co. v. U.S. Intern. Trade Com'n, 75 F.3d 1545, 1551 (Fed. Cir. 1996) ("Ordinarily a claim element that is claimed in general descriptive words, when a numerical range appears in the specification and in other claims, is not limited to the numbers in the specification or the other claims.").

Moreover, one can easily envision an embodiment of this claim in which the filter element presents vertically within the entire length of the vessel, to create an inlet side on one side, and an outlet side on the other, which would not necessarily require submersion of the entire filter element.

Based on the claim language and the specification, the Court finds that one skilled in the art would understand the filter element to mean the following:

"A filter element divides the chamber into an inlet side and an outlet side, and provides a means for preventing substantially all undesired gas in the fuel from passing through the outlet. The filter element which separates the inlet side from the outlet side has substantially no openings greater than 25 microns. A return line opening is in communication with the chamber in the inlet side to receive air and fuel therefrom. "Communication" means that the air and fuel can transfer from the inlet side to the return line opening."

The critical claim construction issue is whether the phrase "dome-shaped region" as used in claims 1, 5 and 15 should be construed to require concavity to the inside of the cup or alternatively, to require the flow of liquid from the concave to the convex side of the region. Plaintiff contends that the language of the asserted claims do not literally include such limitations. Defendants argue that the claim language, when viewed in light of the specification necessarily requires the additional limitations. The competing positions require the Court to discern the "fine line between reading a claim in light of the specification, and reading a limitation into the claim from the specification." Commark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1186-87 (Fed. Cir. 1998). The Federal Circuit recently offered this advice to aid in performing the task:

However, the line between construing terms and importing limitations can be discerned with reasonable certainty and predictability if the court's focus remains on understanding how a person of ordinary skill in the art would understand the claim terms. For instance, although the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments.... That is not just because section 112 of the Patent Act requires the claims themselves set forth the limits of the patent grant, but also because persons of ordinary skill in the art rarely would confine their definitions of terms to the exact representations depicted in the embodiments.

Phillips v. AWH Corp., 415 F.3d 1303, 1323 (Fed. Cir. 2005). Careful examination of the claims language and specification leads to the inescapable conclusion that one of ordinary skill in the art would not believe that the term "dome-shaped region" includes a directional limitation. To find a directional limitation in the term would plainly be an impermissible importation of a limitation from the preferred embodiment. See Callicrate v. Wadsworth Manufacturing, Inc., 427 F.3d 1361, 1368 (Fed. Cir. 2005).

The disputed language of the asserted claims, "dome-shaped region," does not include any technical terms. The ordinary meaning of the phrase is "readily apparent, even to lay judges." Phillips, 415 F.3d at 1314. The ordinary meaning does not carry any particular directional component. There is no real dispute that the valves of the accused devices include dome-shaped regions in the ordinary sense of that term. The direction of the dome, either in reference to the interior of the cup or the direction of flow, is an additional limitation which would typically be described separately and is not inherent in the phrase dome-shaped region in any ordinary sense.

Furthermore, there is nothing in the surrounding language of the asserted claims themselves or in other claims in the patent which would suggest a directional meaning was intended. Id. at 1314-15. Indeed, dependent claims 8 and 10 include limitations that there be two dome-shaped regions which are concave in opposite directions, making it entirely clear that directional orientation is irrelevant to the meaning of the term "dome-shaped region".

- 1674 -
Defendants rely primarily on the preferred embodiments of the specification in support of their claim construction position. In each instance where the specification describes a valve in a dome-shaped region the flow of liquid or air is from the concave to the convex side of the dome-shape. See, e.g., col. 2, ln. 27; col. 2, ln. 57-8; col. 4, ln. 27; Figs. 1, 2, 4 and 7. The specification never suggests flow in the opposite direction (from convex to concave). However, preferred embodiments ordinarily do not limit claims because those of skill in the art would rarely confine their definition of terms to the representations in the embodiments. Phillips 415 F.3d at 1323.

Much of the time, upon reading the specification [in context as enabling and teaching a best mode] it will become clear whether the patentee is setting out specific examples of the invention to accomplish those goals, or whether the patentee instead intends the claims and the embodiments in the specification to be strictly coextensive.

Id.

The '245 specification leaves no doubt the patentee was providing best mode examples and not intending the claims and embodiments to be coextensive. The specification includes several examples of how to practice the invention, some of which include dome-shaped regions and others which do not. Apart from the paragraphs generally describing the inventions at col. In 59-col. 2 ln. 13 (which include no reference to valve shape), the embodiments are prefaced by statements that the "valves may comprise" dome-shaped regions which are concave toward the interior of the cup. The specification expressly provides that "other valve formations are feasible." The preface to the discussion of the drawings expressly provides that they are "by way of example only."

The specification language also reveals that the patentee did not intend the phrase "dome-shaped region" to inherently include a direction either in relation to the cup or flow. The inventor consistently modifies the term with language specifying the direction. col. 2, ln. 20-24; ln. 39-41; ln. 57-60. It is therefore very unlikely that the inventor intended to implicitly include such a limitation when using the same term in the claims. In fact, the absence of the same type of modifying language in the claims strongly suggests that the limitation was intentionally excluded and the claim was intentionally left broad.

This conclusion is supported by the prosecution history. The claims of the original application included as a limitation "a dome-shaped region concave towards the interior of the cup-shaped container and having a slit to allow flow from concave to convex side but not in the opposite direction" thus expressly including the limitation which defendants now seek to read into the claims. The elimination of this language from the redrawn claims evidences the intent of the patentee to broaden the claims so as not to include the limitation.

It is also telling that in distinguishing the invention of the '245 patent from Brown, the patentee made no mention of the directional difference in the dome-shaped region of the valve. Brown could have been readily distinguished by the valve shape if that had been a limitation of the patent claims. Instead it was distinguished on the basis that it taught to open the valve by increasing internal pressure rather than by the reduction of external pressure through suction.

The patentee's mention of the dome-shaped region in distinguishing her claims from Coy did not rely on the direction of the dome-shape, but on the fact that the Coy valve region was not dome-shaped at all. Furthermore, the primary basis for distinguishing Coy was the exclusive use of suction, rather than lip pressure, to activate the valve. Considered as a whole it is apparent that the patentee intentionally left the claims as broad as possible, eliminating the earlier directional limitation since it was not necessary to distinguish the invention from the prior art. The claims language, the specification and the prosecution history consistently support an interpretation which does not impose a directional limitation on the dome-shaped region.

Defendants place considerable emphasis on plaintiff's assertion during the prosecution of the '457 patent that the prior art (including the British predecessor to the '245 patent) did not teach to use a dome-shaped region convex to the direction of flow. Defendants argue that this proves that the '245 claims are limited to dome shapes concave to the direction of the flow. This argument is logically flawed because it is built on the false premise that a patent must teach everything that falls within its claims. "The scope of a patent's claims determines what infringes the patent, it is no measure of what it discloses." In re Benno, 768 F.2d 1340, 1346 (Fed. Cir. 1985). Hence, the original 1840 telegraph patent may be broad enough to read on a modern telex, though the latter would not have been conceived of at the time of the original patent. Id.
A relatively broader patent does not estop a later improvement patent, nor does the failure of the broader patent's prosecution history to mention the specific improvement suggest that the original patent does not encompass it. Integra Lifesciences I, Ltd. v. Merck KGAA, 331 F.3d 860, 869 (Fed. Cir. 2003). In this case the '245 claims read on, but the patent specification does not disclose, valves comprising a dome-shaped region convex to the direction of flow.

III. DISCUSSION

The parties dispute the proper construction of portions of Claims 1 and 20 of the '689 patent. Claim 1 in pertinent part states:

> the control bars are supported such that the confined shape does not change as the control bars are moved and stopped closer to or farther from each other in their respective planes to vary the area of the confined shape at each of the plurality of different positions, whereby the movement of the control bars toward and away from each other changes the opening in the bag evenly from all sides and minimizes tearing stresses.

Plaintiff contends that proper construction "in view of the patent specification … means that:

> When the control bars are contacting the bag opening, the confined shape defined by the bars does not substantially change so that the control bars gather the bag opening evenly from all sides and minimizes tearing stresses on the bag."

"Plaintiff's Motion For Claim Construction" (Document No. 62 at 2) (emphasis added).

Defendant's interpretation of the proper construction of claim 1 would require that:

> The first control bar and the second control bar define an opening between them. The opening has a predetermined shape (or spatial contour that is decided beforehand). The neck of a bag to be constricted is placed in this opening. The control bars are supported such that the confined shape (or spatial contour) does not change or become different when the control bars are moved closer to or farther from each other. The confined shape (or spatial contour) changes only in area as the control bars move in their respective planes to each of several different positions.

"Defendant's Memorandum In Support Of Its Motion…" (Document No. 77 at 4) (emphasis in original).

A. Claim 1

After careful review of the '689 patent in its entirety, the undersigned finds Defendant's interpretation of claim 1 to be most consistent with the language of the patent and thus reaches a similar construction of the disputed term. Plaintiff has forcefully argued that the Court should construe the patent with a focus on the intrinsic evidence, and the Court has done so. Nevertheless, the undersigned still finds that Defendant's narrower interpretation of the '689 patent is proper and consistent with an "ordinary and customary meaning" of the key terms. While the undersigned has not totally disregarded extrinsic evidence, the use of the disputed terms within the four corners of the '689 patent has been the focus of the undersigned's analysis.

First, claim 1 describes the opening between the control bars as a "predetermined confined shape … such that the confined shape does not change as the control bars are moved." (Patent P. 6, L. 36-39). The undersigned construes both "predetermined confined shape" and a confined shape that "does not change" as descriptions of a shape or contour that is preset by the apparatus and is not altered by the functioning of the apparatus. The patent's summary of the invention specifically states that "the confined shape does not change, but varies in area…." (P. 2, L. 51-52). The language of that sentence, juxtaposing "shape does not change" with "but varies in area" reinforces that the shape remains the same, whereas the area varies, or changes. The patent's author could have easily stated that the shape also varies, or that it does not change much, or does not change substantially or significantly, but there is no such clarification. The language of the patent simply states, "shape does not change."
"Plaintiff's Supplemental Brief In Support Of Its Motion For Claim Construction" (Document No. 78) cites a 2005 decision by the Federal Circuit to bolster its position that it is necessary to consider the claim terms in the context of the entire patent, and specifically noting that a "claim construction that excludes a preferred embodiment…is rarely, if ever, correct." Pfizer, Inc. v. Teva Pharmaceuticals USA, Inc., 429 F.3d 1364, 1374 (Fed. Cir. 2005). In the instant case, the undersigned has carefully considered the preferred embodiment which describes in one pertinent part: "[a]s can be seen in FIG. 3, the predetermined shape of the opening 20 is maintained at all times, and it changes only in size as the control bars 12, 16 are moved toward or away from each other." (Patent P.4, L.15-17).

[SEE Fig. 3 IN ORIGINAL]

Here the language of the preferred embodiment further defines "not change" as "maintained at all times" - emphasizing a change "only" in size. The patent's author could have left the description at "maintained" but instead added "at all times" or could have written "changes in size" but instead wrote "changes only in size." (Emphasis added). This additional modifying language leaves the interpretation of "shape does not change" in the context of this patent as unambiguously opposed to any change of shape.

The next paragraph of the preferred embodiment begins "[b]ecause the opening 20 changes only in size, the stresses that are placed on the neck of the bag are much more evenly distributed…." (P. 4, L. 26-29) (See also Fig. 4 below). Again, the patent describes a change only in size, and excludes any mention of any change in shape.

Defendant's proposed construction is more consistent with the language of the patent itself than is Plaintiff's. Plaintiff construes "not change" in claim 1 as "not change substantially" while the patent itself equates "not change" with "maintained at all times" and "changes only in size." Reading the patent as a whole and in a manner that is internally consistent as insisted upon by the Plaintiff, and required by Pfizer, leaves no doubt that the predetermined shape of the apparatus' opening should not change at all. See Pfizer, 429 F.3d at 1373-74.

[SEE Fig. 4 IN ORIGINAL]

In fact, claim 7 of the '689 patent identifies the apparatus of claim 1 as "a rectangle" and claim 8 goes on to describe in greater detail that

[[t]he apparatus of claim 1, wherein the angled relationships are such that, when the first control bar and the second control bar are moved in relation to one another, the overlapping of the angled relationship of the first control bar with the angled relationship of the second control bar at all times forms a rectangle….

(Patent P. 7, L. 12-19) (Emphasis added). The definition of rectangle has not been argued thus far in these proceedings; nevertheless, Merriam Webster's Collegiate Dictionary, Tenth Edition, unequivocally confirms the Court's understanding that a "rectangle" is "a parallelogram all of whose angles are right angles."

Furthermore, claim 1 describes the movement of the control bars toward and away from each other as changing the opening in the bag evenly from all sides. The undersigned construes even changes in this context as synonymous with equal changes. If an opening is changed evenly from all sides, then that opening would keep, or maintain its shape. As discussed above, under the '689 patent, that would mean the "predetermined confined shape" stays the same, or constant. If that shape is a rectangle, and the sides of that rectangle move evenly toward or away from each other, then the shape of that rectangle will remain the same and only the area of the rectangle will change.

The last sentence of the '689 patent's abstract reinforces this interpretation; "the predetermined confined shape changes only in area and evenly exerts force upon all sides of the neck of the bag, thus minimizing stresses." Apparently, it is critical to this invention that the force of the closing apparatus be even on all sides to minimize tearing stress. This objective is re-stated in the summary of the invention: "[i]t is a further object of the present invention to adjustably vary the opening in a bag by exerting evenly displaced stresses upon the neck of the bag to minimize the possibility of tearing the bag." (Patent P.2, L.2-5).

If the sides move evenly toward and away from each other, then the shape will not change. Put another way, if the shape...
changes, the sides must not be moving evenly and therefore there would be an increased risk of tearing the bag. Plaintiffs cannot argue that an object of their patent - even force on all sides to minimize tearing - should be interpreted to mean something different than what it describes. The Court interprets the purpose of the '689 patent as to protect a device that keeps its predetermined shape, while it alters the area of the opening, so that the forces exerted are evenly dispersed on all sides of the neck of a bag.

The two Haney patents relate to a stationary sander for sanding a surface of a work piece, such as a piece of wood. The sander operates in such a way as to eliminate undesirable cross-grain scratching that can occur during sanding. Claim 20 of the '794 patent reads as follows:

20. An orbiting sander comprising:
   a frame;
   a platen;
   a double-drive mechanism interposed between and connecting the platen and frame, where the double-drive mechanism imparts at least one translational orbital movement super imposed on another movement to the platen relative to the frame; and
   an abrasive held in operative position on the platen.

The three asserted independent claims of the '342 patent -- claims 2, 3, and 17 -- read as follows:

2. A method of sanding products comprising:
   placing a product on a conveyor that moves the product through an abrading area; and
   abrading the product in the abrading area by a sander having a platen, an abrasive sheet, a securing device for holding the abrasive sheet on the platen, a frame, a subframe, a first drive mechanism interconnecting the platen and the subframe for moving the platen in a first motion and a second drive mechanism interconnecting the subframe and the frame for moving the subframe and the platen in a second motion, where the first and second drive mechanisms superimpose the first and second motions on the platen while they move the platen, and where the abrasive sheet's motion is solely dependent on and controlled by the platen's motion.

3. A sander comprising:
   a frame,
   a subframe,
   a platen,
   an abrasive sheet,
   a securing device for holding the abrasive sheet on the platen,
   a first drive mechanism interconnecting the platen and the subframe for moving the platen in a first motion, and
   a second drive mechanism interconnecting the subframe and the frame for moving the subframe and platen in a second motion,
where the first and second drive mechanisms superimpose the first and second motions on the platen while they move the platen, and

where the abrasive sheet's motion is solely dependent on and controlled by the platen's motion.

17. A sander comprising:

a frame,

a subframe,

a platen,

an abrasive sheet,

a securing device for holding the abrasive sheet on the platen,

a first drive mechanism interconnecting the platen and the subframe for moving the platen in a first motion at a first speed, where the first drive mechanism includes at least two power-driven shafts connecting the platen and the subframe at spaced locations on the platen thus to stabilize the platen, and

a second drive mechanism interconnecting the subframe and the frame for moving the subframe and platen in a second motion at a second speed less than the first speed,

where the first and second drive mechanisms superimpose the first and second motions on the platen while they move the platen, and

wherein the abrasive sheet's motion is solely dependent on and controlled by the platen's motion.

Timesavers manufactures and sells a line of sanders known as the "Series O/B Orbital Brush Sanders." The accused device, which is from this line, includes a first motor that moves a platen in a circular orbit and a second motor that moves the platen in a reciprocal linear motion. The reciprocal linear motion is superimposed on the circular motion to produce a combined motion of the platen. The result of the motion of the platen in the accused device is also to prevent undesirable cross-grain scratching of the work piece.

Determining whether a patent claim is infringed requires a two step inquiry: "First, the claim must be properly construed to determine its scope and meaning. Second, the claim as properly construed must be compared to the accused device." Carroll Touch, Inc. v. Electro Mechanical Sys., 15 F.3d 1573, 1576, 27 USPQ2d 1836, 1839 (Fed. Cir. 1993). The decision of the district court turned on claim construction, and in particular on construction of the drive mechanism limitations of the asserted claims. As far as the '794 patent was concerned, the court concluded that the double-drive mechanism limitation in claim 20 is primarily a functional claim limitation because it defines the claimed element in terms of its function rather than its structure. Consequently, the court viewed the double-drive mechanism limitation as subject to paragraph 6 of 35 U.S.C. § 112 (1988). It therefore limited the scope of the claim to the structure disclosed in the specification of the '794 patent for performing the function of producing the combined motion, and equivalents thereof. Based upon this claim construction, the court determined that there were no genuine issues of material fact and held that the accused device did not infringe claim 20 because the accused device did not meet the double-drive mechanism limitation of that claim, either literally or under the doctrine of equivalents.

Turning to the '342 patent, the district court determined that "the interpretation of claims 2, 3 and 17 . . . is limited by 35 U.S.C. § 112, para. 6 because the 'first and second drive mechanisms' of claims 2, 3 and 17 are defined in terms of function." Accordingly, the court limited the scope of these claims in the same way that it had limited the scope of claim 20 of the '794 patent. Based on its construction of the independent claims of the patent, the court found no genuine issues of material fact and held that the accused device also did not infringe the asserted claims of the '342 patent because they did not meet the drive mechanism limitations of those claims, either literally or under the doctrine of equivalents.
The district court erred as a matter of law in its construction of the foregoing claims. Turning to the '794 patent, we do not view the double-drive mechanism limitation of claim 20 as subject to § 112, paragraph 6. The clause "a double-drive mechanism interposed between and connecting the platen and frame" recites structure. This recitation of structure in concert with accompanying function -- "where the double-drive mechanism imparts at least one translational orbital movement superimposed on another movement to the platen relative to the frame" -- removes the claim from the purview of § 112, paragraph 6. In ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 6 USPQ2d 1557 (Fed. Cir. 1988), the issue was the correct construction of the limitation "a pair of electrodes having nonmetallic skin-contacting members that provide low current density to reduce stimulation of local sensory nerves and resulting pain." Id. at 1578, 6 USPQ2d at 1559. This court did not apply 35 U.S.C. § 112, paragraph 6 to the limitation. Rather, we stated, "The reduction of pain through the transmission of a low current density to the skin is intended to be a functional limitation on the nonmetallic members, or the electrodes." Id. at 1581, 6 USPQ2d at 1561. Accordingly, we concluded that the claims at issue, as properly construed, were limited to an electrode "which functions to lower the current density . . . applied to the patient's skin . . . ." Id. In much the same way, claim 20 is limited to a double-drive mechanism which functions to impart the two described motions "to the platen relative to the frame," and is not limited to the structures described in the specification and equivalents thereof under § 112, paragraph 6. For the same reasons, claims 2, 3, and 17 of the '342 patent, which recite additional structure, also are not limited by § 112, paragraph 6 to the structures described in the '342 patent and equivalents thereof.

In sum, none of the claims at issue in this case is subject to 35 U.S.C. § 112, paragraph 6. Therefore, the claims are not limited to the structure disclosed in the '794 and '342 patents, and equivalents thereof. When the claims are properly construed, disputed issues of material fact exist relative to the issue of infringement. Thus, the district court's grant of summary judgment in favor of Timesavers was improper. Lemelson v. United States, 752 F.2d 1538, 1552, 224 USPQ 526, 534 (Fed. Cir. 1985) (trial court's erroneous construction of a claim, which was sole basis for finding of non-infringement, renders that finding clearly erroneous). Accordingly, as indicated above, the judgment of the district court is vacated and the case is remanded for further proceedings consistent with this opinion.

1. Interpretation of "Double Walled Construction"

Claim 1 of the '277 patent and Claim 3 of the '843 patent require the element of "a lower wall portion adjacent and integral with the floor, wherein said lower wall portion is of double-walled construction and includes an interior lower wall portion and an exterior lower wall portion connected by a top surface."

Norseman asserts that the phrase requires an exterior and interior wall connected at the top. Rehrig contends that asserted Claims 12-15 of the '843 patent and Claims 1 and 2 of the '277 patent do not include the "connected at the top" language. Rehrig therefore argues that proper construction of the Claim elements is "a structure that includes an interior lower wall portion and an exterior lower wall portion, [connected to each other by a top surface]" where the bracketed language applies to those Claims 1-5 of the '843 patent and 3-5 of the '277 patent.

The Court construes the term "doubled walled construction" to limit these Claims to wall structures comprising two distinct and continuous walls and requiring a top surface connecting the two walls for Claims 1-5 of the '843 patent and 3-5 of the '277 patent.

C. "Disposed at downward angle with respect to [another object]"/
"Formed at a downward angle with respect to [another object]"

The parties also dispute the meaning of the phrases "disposed at/formed at a downward angle with respect to [another object]." 15
15 The parties each propose identical definitions for the two phrases, and therefore appear to interpret "disposed at" and "formed at" in the context of the claim terms in pari materia. The Court follows the parties' approach.

The claim language details that the upper surface of the second rail extrusion is "disposed at a downward angle with respect to" the upper surface of the first rail extrusion. 16 The Forecast patents' drawings show (see Figure 4 attached) that: first, the position of the upper surface [47] of the second rail extrusion [42] as vertically lower and to the right of the upper surface [41] of the first extrusion [40], and second, that the upper surface [47] of second rail extrusion [42] is itself inclined at a downward angle with respect to (that is, sloping downward from) the upper surface [41] of the first rail extrusion [40] (which is represented as a flat surface). (712 patent; Fig. 4 (attached)).

TBC proposes a definition of the downward angle limitation that, although difficult to interpret, appears to be directed mainly at the latter concept (an inclined surface), and Forecast proposes a definition that is stated in the alternative to encompass either concept (a positional relationship or an inclined surface). 18

By stating the definition in the alternative, Forecast proposes a construction that would substantially broaden the scope of its claims to include a device that maintained either feature. As set forth below, the Court rejects Forecast's construction because the disputed phrase, the Court concludes, speaks at least in part to an "inclined" orientation of the object.

The disputed claim term is not a model of clarity, but the Court concludes that the best construction is one that, as set out below, encompasses both concepts: that the upper surface of the second rail extrusion is inclined with respect to surface of the first rail extrusion, and that it is in a position vertically lower than the first.

The claim language here offers little in the way of elaboration. But the specification's description of the invention is helpful in providing the necessary context for the Court's construction. It states in relevant part:

"Preferably, the top of the steel frame is inclined so that the upper surface of the second rail extrusion is disposed at a downward angle with respect to the upper surface of the first rail extrusion when both are mounted to the steel frames. Thus, when mounted to the second rail extrusion, the console box will be oriented at a slight downward angle with respect to the desktop for ergonomic purposes."

(712 patent; col. 6, lines 64-67; and col. 7, lines 1-4 (emphasis added.).) The use of the phrase "downward angle with respect to" in this part of the specification lends support to a definition that refers in part to an angle of incline. First, as provided in this preferred embodiment, when the second rail extrusion is mounted atop an inclined steel frame, the upper surface of the second rail extrusion will be both inclined, and below and to the right of, the upper surface of the first extrusion. Second, Forecast concedes in its memorandum that the "downward angle" limitation in the patents' description of
the console box above refers at least in part to its inclined orientation. Such an orientation is "thus" assured if the surface of
the second rail extrusion is also oriented at an incline.

The Court notes that the relative angle of incline of the second rail extrusion (and in this case the console box supported
thereon) is not an insignificant detail in the specification, but instead, plays a substantial part in the invention: if the console
box were not oriented at an incline (as in the attached Figure 3) then the user of the workstation could not, at the same time,
see a screen that was simply below (and behind) the desktop unit. ('712 patent; Fig. 3 (attached).) It is, in other words, the
relative angle of incline that permits the workstation's ergonomic set up.

Finally, the prosecution history also supports the Court's construction. As noted above, the Forecast patents were re-
examined at the request of TBC. In its submissions, Forecast explicitly relied on the "downward angle" limitation as
distinguishing the prior art. Forecast's invocation of the exact claim language sheds little light on its meaning. However, the
Court notes that the Statement of the Examiner also referred to the second extrusion as itself having "angled surfaces."
(Defs. Reply, Ex. C.) The examiner understood that not only the position of the surface was at some relative angle, but that
the surface itself was also angled or inclined. 19

--- Footnotes ---

19 The Court notes that Claim 9 of the '088 patent, in describing an alternative structure for the rail extrusion, refers to a
second "inclined surface," that is "disposed at a downward angle" with respect to a first surface. Forecast thus argues that
"downward angle" must mean something other than "inclined," because that term is already used to describe the orientation
of the surface. The Court concludes, however, that the reference to "inclined" in the claim language is best understood as
a case of duplicative draftsmanship, rather than a true case of the claim term's differentiation. It should not, in any case, trump
what is, in the context of the entire patent record, the better fitting construction.

--- End Footnotes ---

Thus, the Court construes the phrases "[disposed/formed] at a downward angle with respect to [another object]" as:
"Disposed in location below and to the left or right of the other object and having a greater angle of incline than the other
object."

A. "Dragged" and "drag forces"

Whirlpool contends that the term "dragged" should be construed to mean "pulled with friction." Defendants contend that
"dragged" should be defined as "to move by force."

The Oxford English Dictionary Online defines drag as:

To draw or pull (that which is heavy or resists motion); to haul; hence to draw with force, violence, or roughness; to draw
slowly and with difficulty; to trail (anything) along the ground or other surface, where there is friction or resistance.

Webster's Third New International Dictionary, Unabridged defines "drag" as "to pull along by main force: draw slowly or
heavily." The American Heritage Dictionary of the English Language (4th ed.) defines "drag" as "To pull along with
difficulty or effort."

Whirlpool contends that friction is part of the defining characteristic of drag. The '722 Patent specification supports
Whirlpool's construction:

However, when the impeller 40 oscillates, the frictional engagement between the impeller 40 and the cloth items in the
lower transfer zone LTz adjacent the impeller 40 creates forces on the cloth items in the lower transfer zone LTz such that
cloth items in the transfer zone LTz are dragged along with the impeller 40.
However, if wash liquid is introduced to a degree that the cloth items are allowed to float in the wash basket 42, the impeller 40 will not sufficiently frictionally engage the cloth items to drag the cloth items along an arc-like path.

According to Defendants, Whirlpool is attempting to narrowly interpret the term "drag" to require frictional engagement to avoid invalidity over prior art, even though this narrow concept was specifically included in certain dependent claims, and intentionally excluded from most of its claims. The term "frictional engagement" is found in dependent claims 4, 6, 9, 10, 19, 27, and 29. Defendants contend that if the concept of friction was already part of the understanding of "drag" in independent claims 1, 8, 17, 25, and 28, then the introduction of the term "frictional engagement" in the dependent claims would be rendered redundant and superfluous. See 35 U.S.C. § 112 P 4 ("a claim in dependent form shall contain a reference to a claim previously set forth and then specify a further limitation of the subject matter claimed").

It would be improper to interpret claims in a manner rendering recitations in other claims (the dependent claims) redundant or superfluous. See AK Steel Corp. v. Sollac, 344 F.3d 1234, 1242 (Fed. Cir. 2003) ("Under the doctrine of claim differentiation, dependent claims are presumed to be of narrower scope than the independent claims from which they depend."). However, the Court does not agree with Defendants' contention that Whirlpool's incorporation of "friction" into the definition of "dragged" would render any of the dependent claims redundant or superfluous.

The dependent claims have other limitations over the independent claims besides the insertion of the concept of "frictional engagement." Claim 1 recites that "cloth items above the impeller are dragged in an oscillatory manner along with the impeller." '722 Patent, Claim 1 (emphasis added). Where the term "frictional engagement" is used in Claims 4, 6, 9, 10, 19, 27, and 29, it is not used as an alternative way of describing how the clothes are moved. Instead, the dependent claims describe controlling the water level such that the clothes will not "lose" frictional engagement with the impeller. For example, Claim 4 recites "supplying a quantity of wash liquid into the wash chamber sufficient to wet the cloth items but insufficient to cause the impeller to lose frictional engagement with the cloth items." '722 Patent, claim 4 (emphasis added). This stated desire to prevent loss of "frictional engagement" between the impeller and the clothes implies that such frictional engagement already existed in the independent claims. Accordingly, the use of the term "frictional engagement" in the dependent claims supports Whirlpool's position that the term dragged means "pulled with friction."

The abstract for the '722 Patent also supports Whirlpool's proposed construction of the term:

The method includes loading cloth items into the wash chamber and then supplying a quantity of wash liquid into the wash chamber sufficient to moisten the cloth items but insufficient to cause the cloth items to lose frictional engagement with the impeller as the impeller oscillates.

Defendants also object to Whirlpool's definition of drag because they contend Whirlpool is referring to friction that causes something to move, when in fact the dictionary definition of drag uses the term friction to describe a force that resists movement.

Whirlpool denies that it is employing friction to refer to the force that causes movement. The '722 Patent recites that the cloth items are dragged in an oscillatory manner along with the impeller, i.e., they are pulled with friction in an oscillatory manner by the impeller, in contrast to movement by liquid force or fluid force which would not involve friction or dragging.

Defendants' suggested definition of "to move by force" does not include the resistance or difficulty that is implied in the term drag and it is inconsistent with the premise in the patent specification that there is some frictional engagement that would be lost when too much wash liquid is added. Accordingly, the Court will construe "dragged" as "pulled with friction" and "drag forces" as "forces that pull with friction."
4. The term "drain opening" (claim 9, claim 12) 

The Court agrees with WIMCO that this term does not need to be construed. The words "drain opening" are ordinary words, used in their ordinary sense, and any further definition or paraphrasing would serve no useful purpose.

Lange argues that "drain opening" means "bottom of standpipe." JCCS at 3; Def. Claim Constr. Br. at 36-37. Lange's argument relies primarily on the fact that the '207 patent specification discloses only one type of drain, a hole at the bottom of the standpipe. This is true, but it is not a sufficient reason to limit the broad term "drain opening" to cover only a single embodiment. In so limiting the term, the Court would be wrongly importing a limitation from the specification into the claims.

Claim fifteen is the only independent claim at issue in the '255 patent. This claim contains the following claim limitation: "a drainage device including a mechanism for removing said plug from said opening to provide communication with said chamber and thereby drain the contents of said chamber." This limitation describes the function of the drainage device: removing the plug and draining the chamber. The "drainage device" claim limitation is written in means-plus-function format subject to 35 U.S.C. § 112, P 6, as the limitation describes a function to be performed rather than a definite structure. Therefore, the structure which removes the plug and drains the contents of the chamber must be taken from drawings and descriptions in the specifications. See 35 U.S.C. § 112, P 6. Figures ten and eleven most closely resemble the accused Dornoch product. The description of the third alternative embodiment specifies that the plug is pushed "up into the container so that fluid flows out of the container through the openings . . . ."

The drainage device in the '255 patent does have the same function as the drainage device in the Dornoch product. The two drainage devices also achieve the same result, drainage of the chamber. However, no reasonable jury could find that the drainage device described in the '255 patent's specifications operates in the same or in a substantially equivalent way as the Dornoch drainage device. A conduit in the '255 patent pushes a plug in the bottom of the chamber up and into the chamber. Gravity then causes the chamber to drain through the bottom hole, preferably assisted by a vacuum suction. 13 The Dornoch product, however, does not rely on a vacuum suction or on the force of gravity alone. Instead, a flush jet pushes a plunger rod downward, which is attached to a stopper, thereby pushing the stopper out of the drain opening. Spray from the flush jet
then enters the chamber, which, together with the plunger rod, creates a swirling action to assist in drainage. The inclusion and reliance on the flush jet spray and the plunger rod in Dornoch's drainage device indicates that the drainage device does not operate in a substantially equivalent way as the Bemis drainage device.

The independent claim at issue in the '476 patent is claim eight. Similar to claim fifteen in the '255 patent, claim eight has a "drainage device" claim limitation. This claim is written in means-plus-function format, as it describes a function to be performed, rather than the specifications for accomplishing that function. The drainage device is designed to automatically open the drain and drain the contents of the container. However, the claim limitation provides no guidance on how the device operates. Therefore, the scope of the claim limitation is found in the specifications. As in claim fifteen of the '255 patent, figures ten and eleven along with the description for the third alternative embodiment most closely resemble Dornoch's drainage device. For the reasons discussed above, the 'way' the '476 patent's drainage device operates is not a substantial equivalent to Dornoch's drainage device's method of operation.

With respect to the "drawing out" phrase, the Court has construed all of the constituent terms except the phrase "drawing out at least a portion of the ambient atmosphere." The parties agree that "to draw out" means "to remove." The parties appear to dispute whether "ambient atmosphere" means "air." US Foam did not offer a definition for "ambient atmosphere" while Defendants propose "air." The specification explains that the conventional method of fighting a coal mine fire includes the step of "drawing out as much air as possible from the involved areas." '336 patent, 4:49-50. Later, it explains that "it is preferred that the atmosphere in the sealed area is drawn out so as to reduce as much as possible the oxygen in the sealed area to limit or slow the progress of the fire." '336 patent, 5:4-8. The remainder of Claim 10 of the '965 patent further explains that the purpose of the "drawing out" is to "thereby . . . reduce the amount of oxygen and gaseous fuel available to the fire." '965 patent, claim 10. Although conventionally the method would draw out air, the patentee chose not to so limit his invention to a single type of gaseous fuel. The Court construes "drawing out at least a portion of the ambient atmosphere" to mean "removing at least some of the ambient atmosphere, such as air, from said area involved in fire after it has been sealed."
The Magistrate Judge considered both the specification and the prosecution history of the patent when he made his recommendation. Specifically, the Magistrate Judge noted after reviewing the specification that it "supports the broader interpretation of 'drill list data corresponding to positions on workpieces where holes should be drilled' that does not require the data to identify specific positions." The Magistrate Judge also noted the prosecution history of the patent did not narrow the scope of the phrase "drill list data corresponding to positions on workpieces where holes should be drilled" because the patentees did not narrow the meaning of the phrase during the prosecution by a "clear and unmistakable disavowal of scope."

In rejecting Defendant's proposed construction of the phrase "drill list data corresponding to positions on workpieces where holes should be drilled," the Magistrate Judge reasoned:

[T]he prosecution history should not restrict the scope of the term "drill list data corresponding to positions on workpieces where holes should be drilled." Thus, the term "drill list data corresponding to positions on workpieces where holes should be drilled" should be given its plain and ordinary meaning as supported by the specification. The specification supports a broader interpretation of the term that does not limit it to identifying specific positions. However, the data still must "correspond to positions," so it cannot merely be "data corresponding to the formation of a hole," which conceivably could include no positional data whatsoever. While the specification clearly states that "drill list data" alone can include data other than positions, such as the depth or angle of the hole, the claims only recite "drill list data corresponding to locations on workpieces where holes should be drilled." Thus, the data must contain some information with which the system can ascertain the location where the hole(s) should be drilled. The definition that Precision proposes in its supplemental brief, that "drill list data corresponding to positions on workpieces where holes should be drilled" should be construed as "data relating to the formation of holes in desired positions on a workpiece," captures the idea that the data must relate in some fashion to a position on the workpiece.

Findings and Recommendation at 17-18.

The Court has reviewed the pertinent portions of the record de novo and does not find any error in the Magistrate Judge's Findings and Recommendation as to the construction of the phrase "drill list data corresponding to positions on workpieces where holes should be drilled."

A. Motion for Reconsideration of Claim Construction

In an Order dated May 14, 1998, this court construed the claims of the '100 Patent as follows: 1). "Boring, when turned, a hole in bone mass" was defined as "making a cylindrical hole by the removal of material with a rotary tool." The court further held that "[a] drill means does not include a screw or a pin or a nail or a trocar tip or any other object that does not have cutting edges and flutes." (Slip Op. at 5-6). "Thread means that includes a plurality of thread flights formed in the anchor distal from said drill means end to turn into the bone mass following the drill means" was defined to include "thread means that overlap the drill means so long as a greater number of thread means are distal from the drill means." 3). "Means for securing a suture to said anchor to extend therefrom after said anchor is seated in the bone mass" was defined as "a structure having a suture permanently attached to a retention disk positioned internally within the anchor." In construing the claim this court relied on the claim itself, the specification and the prior art as revealed in the prosecution history. The court did not rely on extrinsic evidence except for a general understanding of the patent.

Mitek's Motion for Reconsideration of Claim Construction argues that the court committed errors in its construction of the terms "drill means" and "means for securing". Mitek does not request modifications of the court's definition of "thread means". Mitek argues that the question of whether or not a drill means includes a screw, a pin, a nail or a trocar tip is a question for the jury and not a question of law for the court. This court disagrees. Mitek argued and presented evidence at length to support its contention that a drill means includes a trocar tip, a pin, a nail or a screw and requested that this court construe the term "drill means" to include these devices. Only when this court disagreed with Mitek's definition did it argue that this was an issue for the jury. The conclusion that a drill means does not include objects that do not have cutting edges and flutes is fully supported by the intrinsic evidence. Further, the Federal Circuit has affirmed claim construction rulings that define functions or structures that are excluded from the coverage of a claim. See, e.g. The Gentry Gallery, Inc., v. The
Berkline Corp., 134 F.3d 1473, 1477 (Fed. Cir. 1998) (term "console" construed to exclude tray unit) and General American Transp. Corp. v. Cryo-Trans, Inc. 93 F.3d 766, 770 (Fed. Cir. 1996) (opening "adjacent" to a side was construed to exclude opening adjacent to an "end wall").

Mitek further argues that the court committed error in defining "means for securing" to exclude a freely sliding suture. As stated above, this court may properly define functions or structures that are excluded from the coverage of a claim. Mitek also argues that the court may not use the prior art to limit the range of structures that may be equivalent to the structure disclosed in a specification for performing an identified function. Once again, this court disagrees. It is well established that the prior art as cited by the applicant is part of the intrinsic evidence upon which the court must rely to construe the claims. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996). The prior art relied upon by the applicant "gives clues as to what the claims do not cover." Autogiro Co. of America v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 399 (Ct Cl. 1967). The holding that the structure of the means for securing cannot include an eyelet is full supported by the intrinsic evidence. Therefore, Mitek's Motion to Reconsider Claim Construction is denied.

Drill Means

Mitek argues that the court erred by limiting the claim to cover only anchors with one or more cutting edges and flutes due to the "drill means" limitation, thus excluding disclosed embodiments and all equivalents. However, the court correctly limited this means element as required by 35 U.S.C. § 112 P 6. A means element in a claim covers only the structure disclosed in the specification and its equivalents. See Fonar Corp. v. Gen. Elec. Co., 107 F.3d 1543, 1551, 41 U.S.P.Q.2D (BNA) 1801, 1807 (Fed. Cir. 1997). In this case, every reference to the drill means in the specification refers to the structure of the drill means as containing flutes, i.e., "the one anchor end includes a fluted drill …." U.S. Patent No. 4,632,100, col. 5, l. 6. Mitek's argument that references in the specification to devices in the prior art are adequate to disclose a structure with a trocar or conical tip is unpersuasive because those devices can be used with a variety of drill bits.

In addition, the specification may describe specific means outside the coverage of the means-plus-function claim to delineate the boundary of the claim's scope. See Sofamor Danek Group, Inc. v. DePuy-Motech, Inc., 74 F.3d 1216, 1220, 37 U.S.P.Q.2D (BNA) 1529, 1531 (Fed. Cir. 1996). In discussing the structure of a flat drill, which by definition has no flutes, the patent specification teaches away from its use for boring by stating "a drill portion … preferably consisting of two flutes, which … makes possible a use of a lesser diameter drill than would be possible with other drill shapes such as … a flat drill." U.S. Patent No. 4,632,100, col. 9, lines 17-24. Thus, the specification expressly excluded the use of a flat drill from the meaning of "drill means" and mentions the flat drill as part of the prior art that is being improved upon.

B. "Drilling"

"Drilling" is used in the patent to describe the process by which a passageway through the tip is formed. (Doc. 29, Ex. A). Dentsply argues that drilling means "bor[ing] or driv[ing] a hole in." (Docs. 34, 55). Hu-Friedy contends that the term should be construed as "using a drill to mechanically cut [sic] a hole by rotating abrasion. " (Docs. 42, 46). Hu-Friedy asserts that "drilling" must be differentiated from "electric discharge machining," known as "EDM," a process by which an electric pulse is used to bore a hole through metal. (Docs. 42, 46, 55).

The language of the claims and specifications supports a broader interpretation of "drilling," to include any type of boring. Although the claims differentiate between drilling and EDM, they suggest that the latter is a subset of the former. The first claim of the patent, with the broadest coverage, provides for the "drilling" of a passageway through the tip. A subsequent claim provides for a more limited version of the invention in which the passageway is formed through EDM. (Doc. 29, Ex. A). That EDM is used for the same purpose as drilling and appears in a more limited version of the claim strongly suggests that EDM is merely one type of drilling.
This conclusion is buttressed by language in the specifications. The specifications state that the fluid passageway may be formed by "a number of techniques[,] including drilling and boring." Although listed separately, "drilling" and "boring" are later used interchangeably. The section describes the use of a lathe as alternatively a "boring" and a "drilling" process. (Doc. 29, Ex. A). Other language similarly equates the two terms. Thus, by identifying EDM as "a preferred boring method," the specifications also identify EDM as "a preferred [drilling] method."

The broad construction of "drilling" is confirmed by reference sources. Dictionaries define "to drill" as "to make a hole with" and a "drill" as "[a]n implement . . . for boring holes in hard materials." E.g., AMERICAN HERITAGE COLLEGE DICTIONARY 429 (4th ed. 2002). The interpretation proposed by Dentsply is supported by intrinsic and extrinsic evidence. Accordingly, the court will construe "drilling" as "bor[ing] or driv[ing] a hole in."

1. Drilling a Stepped Endosseous Orifice

The parties' proposed constructions are as follows:

<table>
<thead>
<tr>
<th>Plaintiffs</th>
<th>Defendant</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creating a hole with at least one sudden, marked change in the slope of the wall along its length, thus forming a step.</td>
<td>Drilling a hole in a patient's bone which has the appearance of stair-steps when viewed in cross-section.</td>
</tr>
</tbody>
</table>

The parties' dispute over this term revolves around the meaning of "stepped." (Plf's Opening Brief 6; Plf's Reply Brief 1; Def's Opening Brief 18.) The standard dictionary definition of "stepped" is "having a step or series of steps: arranged or constructed in steps . . ." (7/24/09 Transcript 16; Plf's Ex. 12 (Webster's) at 2237.) The dictionary definition of "step" includes "something to put the foot on in ascending or descending" and "a steplike shoulder or bench on an otherwise smoothly rising hillside or slope: one of a series of terraces rising vertically from a valley floor." (Plf's Ex. 12 (Webster's) at 2236.)

The language of the claim does not define "stepped" nor does it specifically describe the shape of the steps created in the orifice. (Swaroop Decl. Ex. 1, col. 6, ll. 25-50.) It merely refers to "drilling a stepped endosseous orifice" in a patient's jawbone into which a dentist inserts a tapered implant. (Id.) The claim also explains that the orifice is "step drilled" so that the steps line up with the shape of the implant so as to laterally compress the cancellous tissue. (Id.) The portion of the claim that describes the tapered implant likewise fails to precisely define the contours of the implant in a way that would necessarily shed light on the shape of the steps that are drilled in the orifice. (Id.)

According to the specification, the purpose of drilling a stepped orifice in which the dentist inserts the implant is to create a greater initial strength between the implant and the porous, spongy cancellous bone tissue. (Swaroop Decl. Ex. 1, col. 1-4.) To that end, the '160 patent seeks to achieve this purpose by step-drilling the orifice and laterally compressing the cancellous bone tissue to create an orifice that is the size or slightly smaller than the implant, so that when the dentist installs the implant, the cancellous tissue is compressed laterally and puts less pressure on the bottom of the implant. (Swaroop Decl. Ex. 1, col. 2, ll. 49-56, col. 4, ll. 56-61.)

- 1688 -
Nonetheless mean that the orifice must contain such ledges. Has not explained why removing from the final patent the portion of the drawing depicting the horizontal ledges would drawings. Moreover, to the extent that Plaintiffs altered the drawing in Figure 4 to remove the horizontal ledges, Defendant courts generally do not rely on schematic drawings to limit the scope of a patent to the embodiment depicted in such drawings. See Anchor Wall, 340 F.3d 1298, 1306-7 (Fed. Cir. 2003) (explaining that "the mere fact that the patent drawings depict a particular embodiment of the patent does not operate to limit the claims to that specific configuration").

Nonetheless, Defendant contends that Figure 8 shows that the drill used to create the stepped orifice has horizontal ledges, which would create steps that resemble stair-steps. The Court, however, declines to use this drawing to limit the scope of the patent to a stepped orifice created using the stepped osteotome depicted in Figure 8. First, courts generally do not rely on schematic drawings to limit the scope of a patent to the embodiment depicted in such drawings. See Anchor Wall, 340 F.3d at 1306. Second, the specification explains that Figure 8 is an example of a stepped osteotome that "can be used to form a stepped orifice." (Swaroop Decl. Ex. 1, col. 3, ll. 26-28.)(emphasis added). According to the specification, a dentist may use a stepped drill or osteotome or a plurality of drills or osteotomes. (Swaroop Decl. Ex. 1, col. 4, ll. 27-30.) The specification does not require a dentist to use the type of osteotome depicted in Figure 8. Third, the specification states the cutting edges of the osteotome are not depicted in Figure 8. Fourth, even if the Court limited this term to steps created by the type of osteotome depicted in Figure 8, the Court still would not adopt Defendant's proposed construction because the osteotome in Figure 8 contains some "steps" that lack horizontal ledges and do not resemble stair-steps. Thus, by adopting Defendant's proposed construction, the Court would be improperly excluding the preferred embodiment. See Vitrionics, 90 F.3d at 1583. Finally, the specification specifically states that "[v]ariations in both the implant and the method are within the scope of the invention." (Swaroop Decl. Ex. 1., col. 3, ll. 34-36.)

Footnotes

8 Presumably, if the inventors believed that the method for drilling the stepped orifice required the dentist use the type of osteotome depicted in Figure 8, they could have simply said so. They did not. Likewise, if the inventors believed that the steps must resemble stair-steps in order to properly compress the cancellous tissue, they could have simply said so. They did not.
Defendant also relies on prior art, the Schulte patent, to support its contention that the steps must resemble stair-steps. Defendant, however, has not explained why this prior art necessarily means that the stepped orifice or step drill described in the '160 patent must necessarily contain horizontal ledges and resemble stair-steps. While it is true that the Schulte patent appears to use the term "stepped" to refer to steps that resemble stair-steps and that the '160 patent refers to that patent as illustrating an implant in a stepped orifice, nothing in the '160 patent suggests that the inventors limited the term "stepped" to include only steps that resemble stair-steps, like the Schulte patent. (Def.'s Exs. 1, 10.)

Moreover, at the hearing, counsel for Defendant conceded that steps need not contain precisely horizontal ledges. (7/24/09 Transcript 70.) Specifically, Mr. Hurey stated "[w]e are not saying the steps have to be precisely 90 degrees, precisely vertical, precisely horizontal." (Id.) Defendant's expert also conceded this point. (Plf's Ex. 43 at 112.)

As to extrinsic evidence, Plaintiffs have presented evidence supporting their contention that the steps need not contain horizontal ledges. Specifically, in addition to the dictionary definitions described above, Plaintiffs rely on an article in the International Journal of Oral and Maxillofacial Implants that depicts a "stepped" drill that creates a "stepped" orifice that has sloped, not horizontal, steps. (Plfs' Dem. Ex. Bahat Article.)

The Court, however, declines to adopt Plaintiffs' proposed construction as currently drafted because it is slightly inaccurate. Specifically, Plaintiffs' proposed construction refers to creating a hole with at least one marked change in slope, but Plaintiffs' expert conceded that in order to create one step, there needs to be two, not one, marked changed in slope. (Brunski Depo. 65-66.) As a result, adopting Plaintiffs' proposed construction would not be consistent with creating a "stepped" orifice because it could include an orifice that has only one marked change in slope and thus does not contain even one step.

In light of the foregoing, the Court adopts the following construction: Creating a hole in the bone with at least two sudden, marked changes in the slope of the wall along its length, thus forming at least one step.

F. "Drilling the Passageway Through" and "Forming in Said Tip Body"

These phrases appear in several claims of the patent related to the method of producing the fluid passageway within the tip body. (Doc. 29, Ex. A). Dentsply argues that neither phrase requires a directional limitation. (Docs. 34, 55). Hu-Friedy asserts that both contemplate the drilling or forming of the passageway "in the direction from the fluid inlet end to the bend of the tip." (Docs. 49, 55).

Dentsply's proposed construction is supported by the claims and specifications. The claims themselves provide only that the passageway is to be "drilled" or "formed," without indicating from which direction the process should begin. The specifications state that the passageway could be formed by drilling from the fluid inlet end, but do not connote an intention to exclude other methods of drilling. Indeed, one of the claims instructs that the tip should be bent "to form . . . a location for an opening of a passageway," suggesting that the drilling process may start at the bend of the tip, where the discharge orifice is located. (Doc. 29, Ex. A (emphasis added)).

Hu-Friedy's attempt to interpose a directional limitation in the claims is contrary to law. Specifications may be read to limit otherwise broad claim terms only when the patentee clearly demonstrates such an intent. E-Pass Techs., Inc. v. 3COM Corp., 343 F.3d 1364, 1367-69 (Fed. Cir. 2003). The specifications cited by Hu-Friedy contain no such indication. They all describe only one embodiment of the device, without suggesting that the description should serve as a limitation. To the contrary, the patent clearly states that the specifications are not intended to limit the "scope [of the invention] as set forth in the . . . claims." (Doc. 29, Ex. A). The court will construe the phrases "drilling the passageway through" and "forming in said tip body" as incorporating no directional limitation.
B. "Drinking Cap"

The Defendants' proposed construction of "drinking cap" is "a removable cover that completely covers a beverage container or drinking container, and allows a user to drink a beverage through said removable cover by means other than a hole." Sunbeam's proposed construction is "a removable structure adapted to mount to the end of a container to facilitate drinking." Again, the parties dispute the extent to which the "drinking cap" must cover the beverage container, while also disagreeing as to whether the cap "facilitates" drinking or "allows" drinking.

1. Words of the Claim

Claim 3 of the ‘592 patent describes "[a] method of mixing ingredients in a drinking container, comprising:

- placing ingredients in a drinking container;
- attaching a blade base to the drinking container;
- inverting the blade base and drinking container;
- attaching the blade base to a motorized blender base and operating the blender base to mix the ingredients in the drinking container;
- removing the blade base and drinking container from the blender base;
- inverting the blade base and drinking container;
- removing the blade base from the drinking container; and
- attaching a drinking cap to the top of the drinking container."

‘592 Patent at 20:35-49 (emphasis added). A "drinking cap" is also mentioned in Claim 1 of the ‘659 patent, "an independent apparatus claim," which is listed as "[a] blender assembly comprising:

- a blender base;
- a collar removably mountable on said blender base and having a first interface;
- a blender jar removably mountable to said collar and having a second interface configured to mate with said first interface;
- a beverage container removably mountable to said collar and having a third interface configured to mate with said first interface; and
- a drinking cap removably mountable to said beverage container and having a fourth interface configured to mate with said third interface."

3 The original text of the patent reads "a drinking can," which, in context, is an obvious typographical error.
"The term 'drinking cap' is not used in the common specification of either the '592 or '659 Patents." Def. Memo, at 15. Nor is any aspect of the term illuminated by the prosecution history.

3. Extrinsic Evidence

In addition to the lay dictionary definition of "cap" discussed earlier, the Defendants proffer a dictionary definition of "facilitate" to oppose Sunbeam's proposed construction that the drinking cap with the drinking hole "facilitate[s] drinking." The Defendants cite a definition of "facilitate" as "to make easy or easier," Merriam-Webster.com, and contend that a drinking cap having a drinking hole does not make drinking easier, but rather that it makes drinking possible. Def. Memo, at 13. Sunbeam counters, "[o]ne could obviously drink from a container that does not have a drinking cap, but the drinking cap simply facilitates the act." Reply at 11.

4. Proper Construction of "Drinking Cap"

As differentiated from the term "cap," the term "drinking cap" is necessarily narrower; it is a subset of "cap" that is not intended to be used purely for purposes of storing the vessel's contents, but rather one that is intended to be used for drinking. As differentiated from the narrower disputed claim term "drinking cap having a drinking hole" (which is necessarily a subset of "drinking cap") discussed infra, a "drinking cap" includes not just a cap with a hole through which a person may drink. It also includes a cap with a notch or other portion cut out so that the cap itself does not have a hole, but that the user has an opening through which to drink when the cap is affixed. Thus, with such a "holeless" drinking cap, drinking from the vessel is possible while the cap is in place despite the absence of a hole in the cap itself. See Sunbeam Oral Argument Slide 26. This explains the distinction between Claim 4 of the '592 Patent, 20:51-63 (describing a cap "selectively covering [the] open top portion of the container") and Claim 9, 21:6-7 (stating that "[t]he assembly of claim 4, wherein said cap has a drinking hole formed therein"), which implies that there is a type of drinking cap that does not have a drinking hole. In comparing the terms "drinking cap" and "drinking cap having a drinking hole," it is evident that the limitation "having a drinking hole" is not present in the claim term "drinking cap."

Additionally, the language of the claim specification respecting "cap" makes clear that any sort of cap — including a "drinking cap" and a "drinking cap containing a drinking hole" — contains an interface by which the cap screws onto the container. x 592 Patent at 11:55-59 (describing the process by which "the agitator collar is screwed off" and "[t]he cap may then be screwed on["].

The record shows that the claim language, liberally interpreted, does not produce any lack of clarity or inconsistency when the term "drinking cap" is defined in terms of its plain and ordinary meaning. Although, as the Defendants argue, the "holeless drinking cap" to which Sunbeam points as evidence to show the distinction between the claim terms may be shown not to be practicable in the context of a screw-on interface, or may be shown not to have been embodied in a product, it shows how the plain language of the terms does not produce any confusion as to the scope of any claim term.

Thus, the term "drinking cap" is construed as "a cap which, when screwed onto the beverage container, allows a person to drink the contents of the beverage container." Although the cap may indeed facilitate drinking, the crucial distinction to be drawn between "cap" and "drinking cap" is that the latter necessarily enables drinking while the cap is affixed.

C. "Drinking Cap Having a Drinking Hole"

The Defendants' proposed construction of "drinking cap having a drinking hole" is "a removable cover that completely covers a beverage container or drinking container, said removable cover having a hole therein that is substantially smaller than the circumference of the beverage container cover or drinking container cover, and through which a user can drink a beverage." Sunbeam's proposed construction is "a removable structure adapted to mount to the end of a container to facilitate drinking having an opening of any size through which a user can drink." Thus, the parties disagree as to whether the claims contain any inherent limitation on the size of the drinking hole in relation to the size of the opening of the beverage container.
1. Words of the Claims

The language of Claim 1 of the '592 patent states:

- a drinking container having a first interface at its top;
- a blade base removably mountable on and off a blender and having a blade unit thereon and a second interface thereon, the second interface configured to mate with the first interface, the blade base and the drinking container forming a sealed container; and
- a drinking cap having a drinking hole and a third interface, the third interface configured to mate with the first interface.

'592 Patent at 20:22-34 (emphasis added).

2. Specification and Prosecution History

The parties identify the same specification language as raised with respect to the term "cap." As noted above, the '592 Patent specification, at 11:39-59, notes that "[t]he removable cap 198 may include a drinking hole, and/or may include a closure tab to avoid spillage." The specification further notes that "[t]he cap 198 may then be screwed onto the single serving beverage container 38, and the single serving beverage container is ready for use." This would evidently apply whether or not the cap has a drinking hole.

The prosecution history does nothing to clarify the term. See Def. Memo, at 12 (finding no history relevant to the term "drinking cap having a drinking hole").

3. Extrinsic Evidence

Other than dictionary definitions of "cap" and "facilitate," discussed above in reference to the term "drinking cap," there is no extrinsic evidence presented that relates to the proper construction of "drinking cap with a drinking hole."

4. Proper Construction of "Drinking Cap Having a Drinking Hole"

For the reasons described above with respect to the proper construction of the term "drinking cap," a "drinking cap having a drinking hole" is simply a subset of the term "drinking cap." In practice, it is likely that most drinking caps have a hole through which the person drinks, but not all drinking caps necessarily have such a hole. Thus, the plain language of the claims distinguishes the terms, and there is little for the court to construe.

The term "drinking cap having a drinking hole" is thus construed as "a cap which, when screwed onto the beverage container, allows a person to drink the contents of the beverage container through a hole in the cap."

8. "A drip pan"

For "a drip pan," Foodie offers "a pan for collecting drippings," while Jamba Juice offers "an open, shallow bin for droppings located in the product finishing station." The Court has already elaborated on its reasoning for not including the modifiers "open" and "shallow" in the term, and the specification provides no more support for reading these modifiers into "a drip pan" than they did for "a cold pan." See supra discussion pp. 13-14. At the Markman hearing, Jamba Juice indicated they would be amenable to taking out the "located in the product finishing station" language in the definition, and the Court agrees that it need not be included. There appears to be no substantial difference between "drippings" or "droppings," though the patent itself uses "drip," and in the interest of consistency, the Court will also adopt drippings as a derivation of the word drip. Therefore, the Court construes the term "a drip pan" to mean "a pan for collecting drippings."
The Court of Federal Claims interpreted the term "to drive" as meaning "to push." Masco challenges this interpretation, stating that the word "drive" is broader than the word "push" and that the court improperly read in limitations from the preferred embodiment. **We affirm the court's construction of this limitation.**

We begin, as did the Court of Federal Claims, with the words of the claim itself. The court cited a general dictionary definition defining "to drive," in part, as "to push, propel, or press onward forcibly." Claim construction ruling Masco, 47 Fed. Cl. at 457 (quoting The American Heritage Dictionary of the English Language 563-64 (3d ed. 1996)). However, the court found that the plain language of the claim did not resolve the question of the scope of "to drive." Masco, 47 Fed. Cl. at 456. Although the definition cited suggests that the force moves away from the actor, other definitions do not indicate this. For example, a definition of "drive" taken from the field of mechanical engineering defines the term simply as "the means by which a machine is given motion or power . . . or by which power is transferred from one part of a machine to another." McGraw-Hill Dictionary of Scientific and Technical Terms 616 (Sybil P. Parker et al. eds., 5th ed. 1994). Because the plain meaning did not resolve the construction of the term, the court properly turned for guidance to the intrinsic record, consisting not only of the claims themselves, but also the specification and the prosecution history that was in evidence. See Teleflex, Inc. v. Ficosa N. Am. Corp., 2002 U.S. App. LEXIS 12361, 299 F.3d 1313, 63 U.S.P.Q.2D (BNA) 1374, 1380 (Fed. Cir. 2002); Vtronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996) (holding such intrinsic evidence to be "the most significant source of the legally operative meaning of disputed claim language"). The court found that the specification implicitly equates "to drive" with "to push":

When the proper combination has been entered, all parts of the lock are linked. The critical point is the junction between the camshaft wheel, which has a "boss," and the solenoid housing, which has a "detent." The specification states that "the solenoid cam surface includes a small sloped protrusion or boss 92 . . . for engaging and pushing an extended detent in the solenoid housing 62 upon rotation of the cam wheel." Col. 5, lines 49-54. Correspondingly, "the solenoid housing 62 is a rigid body or element, . . . for positively operating, driving or moving the lever from its disengaged position to a position for engaging the nose part 48." Col. 5, lines 59-63.

The cam surface and the solenoid housing operate together. The cam surface "pushes" the solenoid housing and the solenoid housing "drives" the lever. Therefore, there is a clear, if implicit, equalization between "to drive" and "to push" in the specification.

Claim construction ruling Masco, 47 Fed. Cl. at 456.

The Court of Federal Claims also made reference to the prosecution history of the parent '656 patent, which was properly in evidence, and which the parties "agreed . . . was intrinsic evidence to be used in construing the '068 patent and the '711 patent." Id. The prosecution history of a parent application may be considered in construing claim terms. Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 980, 52 U.S.P.Q.2D (BNA) 1109, 1114 (Fed. Cir. 1999) ("When multiple patents derive from the same initial application, the prosecution history regarding a claim limitation in any patent that has issued applies with equal force to subsequently issued patents that contain the same claim limitation."); Jonsson v. The Stanley Works, 903 F.2d 812, 818, 14 U.S.P.Q.2D (BNA) 1863, 1869 (Fed. Cir. 1990); see also Mark I Marketing Corp. v. R.R. Donnelley & Sons Co., 66 F.3d 285, 291, 36 U.S.P.Q.2D (BNA) 1095, 1100 (Fed. Cir. 1995) (holding that, for estoppel purposes, the relevant prosecution history included not only the application upon which the patent issued but also the parent and grandparent applications). The court determined that the prosecution history of the '656 patent showed that "the applicants thought of the 'driving' force as a 'pushing.'" Claim construction ruling Masco, 47 Fed. Cl. at 457. The court found support for this in the following passage from a proposed Amendment After Final Rejection that was submitted on August 20, 1993:

Consider briefly Applicant's invention. One aspect of Applicant's invention is directed to a combination lock having improved tamper resistance. The present invention also provides more predictable operation of the lock by positively engaging the fence lever with the cam wheel when the nose part on the fence lever and the slot in the cam wheel are properly aligned. The tamper resistance and improved operation features of the lock in one aspect of the invention are provided, in part, by either (1) holding the lever out of engagement with the cam wheel, (2) providing a positive driving
mechanism for pushing the lever into engagement with the cam wheel, and/or (3) providing a means by which the cam
wheel can push a link mechanism such as a shaft or rod to push the lever into engagement with the cam wheel when a
portion of the cam wheel is properly aligned with a portion on the shaft so as to allow the cam to push the shaft after entry
of a proper combination.

Masco, 47 Fed. Cl. at 456-57.

The term "to drive" was inserted into Claim 1 of the issued '068 patent in an amendment submitted on May 2, 1994. This
amendment was made in response to a rejection of the claim as anticipated by a German patent, number 3,817,696. In the
lock described in the German patent, a tension spring pulls the lever into engagement with the cam wheel surface after an
electromagnetic blocking element has been moved. The pertinent part of the amendment reads as follows:

transmitting a force applied to [rotating] the dial to the lever after the lever and the dial have been operably connected to
drive [move] the lever to a position where the protrusion can contact the surface of the cam wheel in such a manner that the
lever will be pulled by the cam wheel during rotation of the cam wheel.

Masco argues that "drive" is a part of the description of the action in which the force that moves the lever is transmitted
from the dial, not supplied from some other source such as the spring in the German patent. Masco relies on the explanatory
argument in the same amendment, which distinguished the German reference:

the force generated by the spring is not applied to the dial. Nor is it transmitted from the dial to the lever. Thus, in contrast
to the present invention, the German reference fails to teach or suggest a combination of method steps including the step of
"transmitting a force applied to the dial to the lever . . . to drive the lever."

Masco points out that it did not argue that "drive" distinguished prior art that pulled or explicitly define "drive" to mean
"push." Because of this, Masco argues, the amendment did not distinguish pushing and pulling, nor did it limit the direction
of force.

We do not agree. The addition of "transmitting a force applied to the dial to the lever" to the claim by itself made clear that
the force that moves the lever is transmitted from the dial, not from some other source. As the Court of Federal Claims
found, the patentee's use of the term "drive" in the specification equated driving with pushing. The amendment
distinguished the pushing action of the claimed invention from the pulling action disclosed in the German patent by
inserting the word "drive," denoted in the specification as a pushing action, in place of the word "move," which had no
directional connotations. Masco's proposed definition of "drive" to encompass pulling actions is inconsistent with the
specification of the '068 patent and with the prosecution history of the '068 patent and its parent patent. See Litton Sys., Inc.
broad construction of a claim limitation as "inconsistent with the prosecution history"). Because the amendment
distinguished the pulling action found in the German patent, Masco cannot now maintain that the proper scope of the "to
drive" term is broad enough to encompass that pulling action.

The phrase "drive assembly" means "an assemblage of two or more parts that act together to impart motion to the flexible
cover sections and substantially parallel supporting bows from an unspecified source."

B. "Drive Bay Slot"

Comaper suggests that this term means "the relatively narrow opening in the housing of a computer that leads to the drive
bay." (Pl.'s Constr. Mem. at 4.) Comaper arrives at this definition by interpreting the individual meaning of the words within
the term. A "slot", Comaper contends, is a well-known term for an opening or passage; a "drive bay" is a common term for
the particular space inside a computer that is dedicated to accommodate a drive. Id. Comaper further argues that there is no special meaning ascribed to the term "slot" in the intrinsic record, and therefore the plain and ordinary meaning should prevail in its interpretation. Id. at 5.

Antec interprets the term "drive bay slot" to mean "the area inside a computer enclosure having an independent opening capable of housing a drive." (Defs.' Constr. Mem. at 10.) Antec contends that Comaper's construction contradicts its use of the term in Claim 1 which recites "a case configured to mount within said drive bay slot of said computer such that said case occupies substantially the entire drive bay slot." Id. According to Antec, a case would be "far larger" than the narrow slot leading to the drive bay. Id. Antec also reasons that the term "slot" cannot mean opening because opening was used during the application process, and yet the Examiner still insisted on inserting the term opening. (Defs.' Reply Mem. at 11.) Using Antec's construction would result in "drive bay slot" and "drive bay" meaning the same thing. This was not the intent of the patentee.

The Court concludes that the term "drive bay slot" means "the relatively narrow opening in the housing of the computer that leads to the drive bay." The prosecution history supports this construction. As stated above, courts are free to consider the prosecution history, the record of correspondence and communications between the inventor and the PTO, which is kept on file at the PTO and made available for public inspection. "Although the prosecution history can and should be used to understand the language used in the claims, it too cannot 'enlarge, diminish, or vary' the limitations in the claims." Markman, 52 F.3d at 980 (citation omitted). "If a patentee takes a position before the PTO, such that a 'competitor would reasonably believe that the applicant had surrendered the relevant subject matter,' the patentee may be barred from asserting an inconsistent position on claim construction." Katz v. AT&T Corp., 63 F. Supp. 2d 583, 591 (E.D. Pa. 1999) (citing Cybor Corp. v. FAS Technologies, Inc., 138 F.3d 1448, 1457 (Fed. Cir. 1998)); see also Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531 (Fed. Cir. 1996).

The parties agree that the term "slot" was added during prosecution at the Examiner's insistence. (See Pl.'s Constr. Mem. at 4;Defs.' Reply Mem. at 11.) Furthermore, Comaper concedes that the term was added as a way to distinguish the '955 Patent from the device in Pollard. (Pl.'s Constr. Mem. at 4.) It is also clear that the term "opening" existed elsewhere in the patent language and the use of the term "slot" was to convey a different meaning than a mere opening.

The district court construed the term "drive bay slot" to mean "the relatively narrow opening in the housing of the computer that leads to the drive bay." Claim Construction Order, 2006 U.S. Dist. LEXIS 67363, 2006 WL 2709382, at *6. Antec argues that the drive bay slot is not the opening in the computer housing but rather the area inside the computer behind the opening where a drive may be installed. Antec essentially asks us to equate the terms "drive bay" and "drive bay slot," despite their separate use in the '955 patent. There is an inference, however, that two different terms used in a patent have different meanings. Ethicon Endo-Surgery, Inc. v. U.S. Surgical Corp., 93 F.3d 1572, 1579 (Fed. Cir. 1996). While this inference is not conclusive, Bancorp Servs., L.L.C. v. Hartford Life Ins. Co., 359 F.3d 1367, 1373 (Fed. Cir. 2004), the intrinsic evidence supports the district court's construction that "drive bay" and "drive bay slot" have different meanings.

The meaning of the term "drive bay slot" was made clear during prosecution. During the prosecution of the '955 patent, the application was repeatedly rejected as anticipated by and obvious in light of U.S. Patent No. 5,171,183 ("Pollard"). Pollard disclosed a case module for installing a 3.5-inch form-factor removable-media disk drive into a 5.25-inch drive bay. The module included a cooling unit that would draw in ambient air to cool the drive. Once installed, both the front of the disk drive and the vent for the cooling unit could be seen on the front of the module, such that the drive and vent would together occupy the opening in the computer housing leading to the drive bay in which the module was installed. In order to distinguish the application of the '955 patent from Pollard, the inventors and the examiner agreed that a limitation would be added to the claims wherein the "case occupies substantially the entire drive bay slot"--i.e., unlike Pollard, the cooling unit itself would occupy substantially the entire drive bay slot. Because the phrase "case occupies substantially the entire drive bay slot" was added to distinguish Pollard, the use of the term "slot" in Pollard is significant. Pollard clearly describes a "slot" as the two-dimensional opening in the computer housing: "A common PC enclosure has 5.25 inch form factor slots (5.75 inches wide by 3.25 inches high) in the face of the enclosure . . . ." Pollard col.1 ll.18-20 (emphasis added). Therefore,
it is appropriate for the term "drive bay slot" in the '955 patent to have a similar meaning, and we conclude that the district court correctly construed "drive bay slot" to mean "the relatively narrow opening in the housing of the computer that leads to the drive bay."

--- Footnotes ---

3 The examiner's stated reason for allowing the '955 patent was that "the case for the cooling device mounted in the drive slot does not provide housing a disk drive which is different from the Pollard et al reference wherein the case houses both the cooling device and the disk drive." J.A. 212.

--- End Footnotes ---

--- 1257 ---

5. "a drive circuit for the motor" (claims 1, 14, 22)

Omax proposes that this phrase should be construed as the "portion of a machine tool that receives motor commands and electronically controls motor functions. It may or may not include one or more controllers that interpret and adjust motor commands." Flow's interpretation uses the same first sentence, and then continues: "The drive circuit may contain a force command interpreter, a position command differentiator, or a position command interpreter, as defined in the patent. The drive circuit does not include add-in cards or intermediate command interpreting controllers."

This Court already has concluded that "the specification as a whole does not suggest 'that the very character of the invention requires the [direct connection] limitation [suggested by defendant] to be part of every embodiment.'" Order, Dkt. # 52 at 6 (quoting Alloc, Inc. v. Int'l Trade Comm'n, 342 F.3d 1361, 1370 (Fed. Cir. 2003)). Flow has attempted to account for this conclusion by suggesting that the claim be construed as allowing certain intermediate connectors, but not the add-in card or other controllers that are the hallmark of the Flow device. The Court continues to hold that the character of the invention does not require the absence of the intermediate steps that Flow attempts to preclude through its proposed construction. The Court therefore adopts Omax's proposed construction.

--- 1258 ---

Clause (b) recites "a drive mechanism connected to [the machine's] frame for moving [the machine] in a given direction, and at a controlled speed, over the turf to be treated." (Patent '744, Col. 13, Lines 31-33.) The court concludes that this is not a means-plus-function clause. This clause does not lack sufficient structure to warrant construction under a means-plus-function analysis, nor is there language signaling that § 112, P 6 should apply. An ordinary interpretation and construction of this claim therefore must include two components: (1) a drive mechanism, i.e., some form of mechanized propulsion; 6 that is (2) connected to the machine's frame for providing this propulsion. The common understanding of the word "connected" suggests: "joined, linked or incapable of being separated." See, e.g., Merriam Webster's Collegiate Dictionary 244-245 (10th ed. 1998).

6 Such as an engine system comprised, in part, of a hydraulic drive motor as disclosed in the patent specification. (See Patent '744, Col. 5, Lines 58-60; and Col. 6, Lines 50-53.)

--- End Footnotes ---

--- 1259 ---

A. Element 1: "Drive Motor Means"
Element 1 contains the term "drive motor means." The use of the word "means" creates a presumption that section 112, P6 applies. Personalized Media Communications, LLC v. Int'l Trade Comm'n, 161 F.3d 696, 702 (Fed. Cir. 1998). Sunon contends that section 112, P6 applies to Element 1, and that the recited "function" of the "drive motor means" is to "drive the blades of the fan." (R. 96-1, Defs.' Claim Constr. Br. at 11.) Papst argues that section 112, P6 does not apply because the claim does not recite a function that corresponds to the means. The Court agrees with Papst.

The claim language does not state a function. Rather, the claim term "drive motor means" recites a definite structure, i.e., the drive motor. See Cole, 102 F.3d at 531; see also Pirelli Cable Corp. v. Ciena Corp., 988 F. Supp. 424, 434 (D. Del. 1997) (holding that the term "optical coupling means" recites a definite structure, "the optical coupler"). Sunon fails to identify any language within Claim 29--or anywhere else in the patent--that suggests that the term "drive motor means" has a corresponding function, and that the corresponding function is "to drive the blades of the fan." Because there is no corresponding function for the "means," section 112, P6 does not apply to the "drive motor means" term. Rodime PLC v. Seagate Tech., Inc., 174 F.3d 1294, 1302 (Fed. Cir. 1999); Sage Prods., 126 F.3d at 1427; York Prods., 99 F.3d at 1574.

Papst argues that the Court should define the term "drive motor means" to mean any type of electric motor that is used to drive a fan. The parties do not dispute the meaning of the word "motor," and the specification indicates that the "drive motor" is simply an electric motor that drives the fan. See '015 patent, col. 5, ll. 51-53. Papst contends that the Court should further construe the term "drive motor means" to specifically include both types of motors that are typically used to drive fans--AC motors and DC motors. Papst argues that Figure 2 of the '015 patent depicts a squirrel cage motor, which one skilled in the art would recognize as an AC motor. Nothing in the claim language or the specification, however, expressly includes or excludes any particular type of electric motor from the scope of the claim. Accordingly, the Court interprets Element 1 to mean any type of electric motor that is used to drive a fan.
1. Means-Plus-Function Analysis

Under 35 U.S.C. § 112, P6 9, "an applicant can describe a limitation of his invention by the result accomplished or the function served, rather than describing the item or limitation to be used . . . " Warner-Jenkinson v. Hilton Davis Chemical Co., 520 U.S. 17, 117 S. Ct. 1040, 1048, 137 L. Ed. 2d 146 (1997). The use of the word "means" triggers a presumption that the inventor used the term advisedly to invoke the statutory mandates for means-plus-function clauses. York, 99 F.3d at 1574. However, this presumption is not conclusive. See Sage Products, Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1427 (Fed.Cir. 1997). Where a claim uses the word "means," but specifies no corresponding function for the "means," § 112, P6 is not implicated. See id. (quoting York, 99 F.3d at 1574). Similarly, if a claim has sufficient structure within the claim itself which can entirely perform the recited function, the language of the claim is not in means-plus-function format. See 126 F.3d at 1427-28 (quoting Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531 (Fed.Cir. 1996), cert. denied, 139 L. Ed. 2d 20, 118 S. Ct. 56 (1997)).

--- Footnotes ---

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claims shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

--- End Footnotes ---

In the '959 Patent, the "drive system assembly means" of both claim 1 and claim 7 employ the word "means," and thereby presumptively implicate § 112, P6. See York, 99 F.3d at 1574. Claim 1 states in relevant part:

... (d) drive system assembly means mounted on said plate in order to sum reciprocating motion into continuous and fluid rotary motion, said drive system assembly means having a right pedal sprocket, a left pedal sprocket and a drive sprocket, wherein said drive sprocket is driven by either said right sprocket or said left sprocket in one direction only and said right and left sprocket are free to overrun in the opposite direction...

Col. 7, line 64 through Col. 8, line 4 (emphasis added). Similarly, claim 7 states in relevant part:

... (c) drive system assembly means for summing motion into continuous and fluid rotary motion, said drive system assembly means having a right pedal sprocket, a left pedal sprocket and a drive means, wherein said drive means is driven by either said right sprocket or said left sprocket in one direction only and said right and left sprocket are free to overrun in the opposite direction...

Col. 9, lines 18-25 (emphasis added).

StairMaster believes the "drive system assembly means" of both of these claims recites only structure, with no function advanced. Procycle disagrees that no function is recited and states none of the functions to be performed by the "drive system assembly means" can be accomplished by the structure recited in the claim. Because the parties' dispute centers around how much structure is sufficient to bring into play the means-plus-function analysis, the Court briefly turns its attention to this question.

The Federal Circuit Court of Appeals has in numerous instances discussed the amount of structure necessary to be recited in claim language before the means-plus-function section of the patent statute, 35 U.S.C. § 112, P6, is applicable. Recently, the Federal Circuit stated: "Where a claim recites function, but then goes on to elaborate sufficient structure, materials, acts within the claim itself to perform entirely the recited function, the claim is not in means-plus-function format." Sage Products, 126 F.3d at 1427-28 (citations omitted) (emphasis added). It follows the structure recited in claims 1 and 7 is sufficient to avoid analysis under § 112, P6 if the recited structure is capable of performing entirely the recited function. As the York case makes evident, in most cases this will mean the claim language must recite predominantly structure; however, York also makes clear that recitation of some structure is not necessarily sufficient to take a claim out of the means-plus-function rubric. See York, 99 F.3d at 1574-75 (quoting Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1536 (Fed.Cir. 1991))
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

("Mere incantation of the word 'means' in a clause reciting predominantly structure cannot evoke section 112, P 6 . . . .
[However,] the recitation of some structure in a means plus function element does not preclude the applicability of section
112(6).")

10 Federal Circuit of Appeals precedent soundly rejects StairMaster's thesis that any reference to structure removes a claim
from interpretation under the means-plus-function statute. Clearly, the recitation of "some structure" does not preclude
applicability of § 112, P6 in all cases. See York, 99 F.3d at 1574.

Applying this analysis, both the "drive system assembly means" of claim 1 and 7 function by summing reciprocating motion
of the pedals into continuous and fluid rotary motion. Turning to the structure of these devices, the "drive system assembly
means" of claim 1 includes a "right pedal sprocket," a "left pedal sprocket," and a "drive sprocket." 11 The structure of the
"drive system assembly means" of claim 7 includes a "right pedal sprocket," a "left pedal sprocket," and a "drive means."
Because the Court finds the "right pedal sprocket", the "left pedal sprocket," and the "drive sprocket" or "drive means" is a
clause reciting predominantly structure and capable of performing entirely the recited function of summing reciprocating
motion into continuous and fluid rotary motion, application of the means-plus-function analysis is inappropriate for the
"drive system assembly means" of claim 1 and claim 7.

11 Additionally, claim 1 also refers to the "drive system assembly means" being mounted on a plate. However, this plate
does not play any consequential role in the recited function of the claim language.

12 Although the drive shaft is also an essential structure which allows the "drive system assembly means" to sum
reciprocating motion into rotary motion, as will be discussed more fully below, the Court construes the "drive sprocket" and
"drive means" as requiring a "drive sprocket" linked to a "drive shaft."

As a predicate matter, the court finds Nikon's reliance on claim differentiation doctrine logically puzzling. The doctrine of
claim differentiation requires this appendix because claim 19--a dependent claim of claim 1--states "wherein the drive includes a
mask drive to move the mask stage and an object drive to move the object stage."

Though it risks making the claim construction process an inherently circular enterprise, the parties appear to agree that the
proper construction of "a drive to move the mask stage and the object stage" should include the words of the term itself. The
parties disagree, however, regarding whether the court should append the phrase "which may include a mask drive to move
the mask stage and an object drive to move the object stage" to its construction. According to Nikon, the doctrine of claim
differentiation requires this appendix because claim 19--a dependent claim of claim 1--states "wherein the drive includes a
mask drive to move the mask stage and an object drive to move the object stage."

As a predicate matter, the court finds Nikon's reliance on claim differentiation doctrine logically puzzling. The doctrine of
claim differentiation requires that terms in independent claims--like this one--be read more broadly than comparable (and
narrower) terms in dependent claims--like claim 19. See Transmatic, Inc. v. Gulton Industries, Inc., 53 F.3d 1270, 1277-
1278 (Fed. Cir. 1995) ("Consistent with the claim differentiation doctrine, the term 'light housing' in claim 1 is broader in
scope than in claim 3 and the other dependent claims."); United States v. Teletronics, Inc., 857 F.2d 778, 783-84 (Fed. Cir.
1574 (Fed. Cir. 1985) ("Where some claims are broad and others narrow, the narrow claim limitations cannot be read into
the broad."). The foundation of this doctrine is that reading a dependent claim more broadly than its governing independent
claim would make the two claims concomitantly inconsistent and inverted. Id. There is no risk of violating the rule in
eschewing Nikon's limitation. In fact, to assert, as Nikon has, that claim differentiation doctrine requires the court to import
a limitation from a dependent claim gets claim differentiation doctrine precisely backwards. The limitation in claim 19 does
not compel the court to append a limitation to the plain-meaning construction of the claim 1 term; indeed, the claim 19 limitation unavoidably, if indirectly, suggests that the court should construe claim 1's terms to be "broader in scope" than the identical terms in claim 19. Id.

Nor can the court agree with Nikon that construing claim 1 absent claim 19's limitation would render claim 19 meaningless. As the court understands the relevant claims, the converse is true; if the court were to exclude claim 19's limitation from its construction of claim 1, the two claims would avoid redundancy and retain independent, if interrelated, meaning. If, by contrast, the court were to read claim 19's limitation into claim 1, claim 19 would become superfluous, repeating what claim 1 already says. Neither claim differentiation doctrine nor common sense require the court to read dependent claims into nugatoriness. Specification language for the '500 patent contemplates separate drives moving each stage. See '500 Patent at 4:24-56; figs. 1, 2, & 5. Consistent with this specification language, and consistent with the plain meaning of the claim term, the court construes the phrase "a drive to move the mask stage and the object stage" term to mean "components used to move the mask stage and to move the object stage."

1262

1. Claims 1-7, 9

With respect to claims 1-7 and 9, the parties have only one minor dispute involving the term "drive units", specifically the "first drive units" and the "second drive units". The parties agree that they refer to an "assemblage of components responsible for rotation" at a rate of one ω and two ω, respectively. The dispute is whether the proper construction of the "drive units" includes (or does not include) the tubing and vessel which are rotated. Plaintiff Haemonetics contends that the tubing and vessel are part of their respective drive units while the defendants argue that the assemblage is exclusive of both.

Claim 1, upon which the other referenced claims are dependent, reads:

A centrifugal device for liquids containing suspended particles, such as blood, comprising:

- a centrifugal unit with a center and a rotation axis;
- a peripheral separation chamber;
- a plurality of channels connecting the center of the centrifugal unit to said separation chamber, each channel having a central extremity;
- a plurality of tubes having first and second extremities, the central extremities of the respective channels attached to the first extremities of the tubes and the second extremities of the tubes being angularly stationary and coaxially located with respect to the rotating axis;
- first drive units to turn the tubes around said rotating axis at an angular speed ω; and
- second drive units to turn the centrifugal unit around said rotating axis at an angular speed 2ω wherein the centrifugal unit has a radius between 25 and 50 mm and a height between 75 and 125% of the radius.

(emphasis added).

The defendants assert that the drive units were clearly intended to exclude the components that are rotated. In support, they cite to the language in Claim 1 (excerpted above) which delineates the six components comprising a centrifugal device. The vessel, tubing, first drive units and second drive units are all separate items on that list. Furthermore, defendant Fenwal contends that because the patent drawings themselves assign a different reference number to the vessel, tubing and drive units, the intent was to treat the drive units as separate from the vessel and tubing. Accordingly, the defendants contend that the natural interpretation is that the drive units are not inclusive of the vessel and tubing.

Haemonetics argues that the defendants are improperly attempting to read limitations into the claims from the specification.
It contends that "drive units" is simply a reference to the drive mechanism and that there is no basis for limiting the particular construction based on its particular application to the tubing and centrifugal vessel.

Although the plaintiff is correct that a written description should not be taken as unduly limiting claims without evidence of an intent to do so, the Court finds that argument misapplied in this case. According to the Court's reading of the Claim and specifications, the construction of the subject term is not about reading limitations into the claim but rather about whether the tubing and vessel, two separate structures, should be included within the term "drive units". It seems clear from the plain language of the claim itself that the structures are distinct claim elements. They are enumerated separately from the drive units, themselves. Moreover, the specifications and the drawings accompanying the patent underscore the delineation between the vessel, the tubing and the two drive units by assigning separate reference numbers to each component.

Having concluded that the drive units are separate components from the tube and the vessel that they rotate, the question is whether a drive unit should be construed in such a way as to be inclusive of those separate structures. The Court concludes that there is nothing to indicate that the term should be so construed. As in the case of Bradshaw v. Igloo Products Corp., 1996 U.S. App. LEXIS 29761, 1996 WL 663310 (Fed. Cir. Nov. 15, 1996), in which the Federal Circuit rejected an attempt to define "handle" in a manner which would be inclusive of both "lifting handle" and "pulling handle", the Court here rejects the plaintiff's attempt to define "drive unit" in such a broad manner. In Bradshaw, the Federal Circuit noted that the patent "consistently speaks of the lifting handles and the pulling handle as distinct elements" and that "the drawings so indicate". Id. 1996 U.S. App. LEXIS 29761, [WL] at *2. Likewise, in this case, both the language and the drawings in the patent clearly treat the drive units as separate from the objects which they rotate.

Accordingly, "first drive units" will be construed as: "the assemblage of components responsible for rotating the tubes around the designating axis at an angular speed \( \omega \). The assemblage does not include the tubes or vessel." And, "second drive units" will be construed as "the assemblage of components responsible for rotating the centrifugal vessel (or centrifugal unit) around the designated axis at an angular speed 2\( \omega \)."

C. "driving the elongate member to rotate and move the toy object in a path around the base member"

Defendants cite to various passages of the specification for the proposition that this step of Claim 12 should be construed as meaning "to drag the object on the ground in a path around the base." However, reading such a limitation into the claim language would mean committing "one of the cardinal sins of patent law" -- reading specific limitations in a specification's disclosed embodiment into the broader claim. Cardiac Pacemakers, Inc. v. St. Jude Medical, Inc., 418 F. Supp. 2d 1021, 1029 (S.D. Ind. 2006) (citing Phillips, 415 F.3d at 1320, 1323). It is clear that in the preferred embodiment of the device, and the accompanying method, the object would be dragged along the ground. (See, e.g., '448 Patent Abstract ("object ... is preferably arranged to be dragged along the ground"); Summary of Invention at Column 1, Line 36 ("object may be directly secured to the free end of the wire but is preferably secured to it by a length of string so that it is dragged along on the ground"); Description of Preferred Embodiment at Column 2, Line 38 ("[t]he cord or wire is of sufficient length to enable object 22 to be dragged along the ground") and Column 3, Line 45 ("In order to operate the toy device, the motor is actuated and the wire 20 will then be rotated, dragging object 22 on the ground in a path around housing 12.") (emphasis added.)

However, it is equally clear that the "claim language, specification, and prosecution history do not disclaim" all other embodiments of the device, or methods, in which the object is not dragged along the ground. Cardiac Pacemakers, 418 F. Supp. 2d at 1029; see also Phillips, 415 F. 3d at 1323 ("[W]e have expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment.") The use of the phrase "preferably" would be rendered superfluous if other possible arrangements (in which the object was not dragged on the ground) were not included within the claimed invention. As such, the Court declines to construe this element as requiring the object to be dragged on the ground.

a. "Drivingly Engages" in Claim 1
As before, the Court first starts with the language of the claim itself. "Drivingly engages" as used in claim 1, Col. 8, lines 10 and 14, refers to an engagement between a right or left pedal means and a left or right pedal sprocket. See Col. 8, lines 5-15. Because a claim is circumscribed by its structural limitations, see York, 99 F.3d at 1574, and this claim requires the engagement of two sprockets, this claim language requires a chain engagement. The specification language supports this construction: "The chain 72 is made to pass over and drivingly engage the teeth of a right sprocket 76 . . . ." Col. 5, lines 32-34 (emphasis added). Similar language is found for a left chain 90 drivingly engaging a left sprocket. See Col. 5, lines 58-60. The Court is not importing language from the specification into the claims. Rather, it is simply looking to the specification to understand what might "drivingly engage" a sprocket. The claim language itself requires a sprocket and chain engagement, and there is nothing in the prosecution history 20 that refutes this interpretation. The Court therefore finds that "drivingly engages" of Claim 1, Col. 8, lines 10 and 14 refers to a chain and sprocket mechanical engagement.

b. "Drivingly Engages" in Claim 7 and 11

Next, the Court considers the claim language "drivingly engages" in claim 7, Col. 9, lines 32 and 37, and claim 11, Col. 11, lines 30 and 35. The relevant claim language states that a left or right pedal means "drivingly engages" either a right or left pedal sprocket (claim 7) or a right or left one way clutch (claim 11). See Col. 9, lines 26-38; Col. 11, lines 24-36. Unlike claim 1, however, this claim language gives no hint as to how the left or right pedal means engages the pedal sprockets or the one way clutches. Accordingly, the Court turns to the specification. The specification states in pertinent part:

The left and right sprockets operate in conjunction with clutch bearings 110 and 112, respectively. As viewed in FIGS. 3 and 4, when the right sprocket turns counterclockwise, the sprocket and clutch bearing positively lock with the shaft to turn the shaft counterclockwise . . . . Thus, when the shaft 106 is rotated counterclockwise, the drive sprocket 108 will clockwise be rotated counterclockwise.

Col. 6, lines 6-15; see also Col. 3, lines 51-57 (same). It therefore appears in the specification the pedal sprockets and one way clutch bearings drivingly engages a drive shaft which has a drive sprocket linked to it. However, as this preferred embodiment is not required by the language of the specification, it is improper to import this language into the claim where the claim language appears to be broader. See Specialty Composites v. Cabot Corp., 845 F.2d 981 at 987; Electro Medical, 34 F.3d at 1054; see also CVI/Beta Ventures, 112 F.3d at 1158. Therefore, "drivingly engage" in claim 7 and 11 can cover engagement of any of a number of mechanical connections. Nor does the specification require any special definition for this claim language. Accordingly, the claim should be interpreted according to its ordinary and customary meaning. See Vitronics, 90 F.3d at 1582.

Consulting the dictionary, "engage," as used in this context, means "to come into contact or interlock with, mesh." See Webster's Third New Int'l Dictionary at 751. "Drivingly" is defined in the following manner: "with driving force or energy." See id. at 692. Consequently, the customary meaning of "drivingly engages" is to come into contact, interlock, or mesh with driving force or energy. There being nothing to the contrary which limits this claim language to any narrower definition, the Court construes "drivingly engages" to cover any mechanical connection which comes into contact, interlocks, or meshes with driving force or energy. The Court therefore finds that the language "drivingly engages" of claim 7, Col. 9, lines 32 and 37, and claim 11, Col. 11, lines 30 and 35, refers to any type of mechanical engagement between a pedal means and a pedal sprocket or one way clutch that is capable of coming into contact, interlocking, or meshing with driving force or energy.
VII. Drop member

<table>

</tr>
</tbody>
</table>

The '336 patent describes two different embodiments for releasing the inner tubular. In the "drop embodiment," the tool is sent to the appropriate depth in the wellbore, and then a drop member is pumped from the surface down the wellbore towards the tool. '336 patent 7:47-48. Fluid is continually pumped down the wellbore until the drop member reaches the drop member receptacle and restricts the flow of fluid through the inner tubular. This restriction causes fluid pressure to build up in the wellbore and break the mounting member, thus releasing the inner tubular. '336 patent 8:61-66. In the "cage embodiment," the drop member is mounted to a cage-like catcher/seat above the drop member receptacle, and sent down the wellbore with the tool. Fluid pressure is used to break the cage and then push the drop member into the drop member receptacle to restrict the flow of fluid through the inner tubular. '336 patent 7:56-64. As with the drop embodiment, this restriction causes the inner tubular to be released. Weatherford argues that the term "drop member" refers exclusively to the drop embodiment, and that an "activation ball" is used in the cage embodiment. Davis-Lynch argues that the terms "drop member" and "activation ball" are interchangeable.

The Court must begin its analysis by consulting the claim language itself. Phillips, 415 F.3d at 1312. The claim at issue in this case, claim 34, is broadly written to cover both the drop embodiment and the cage embodiment. Therefore, unless the patentee has explicitly or implicitly limited the term "drop member" to only refer to the drop embodiment, the Court will construe claim 34 to encompass both embodiments. See Aloft Media, LLC v. Microsoft Corp., No. 6:07-cv-50, 2009 U.S. Dist. LEXIS 24124, 2009 WL 803133 at *3 (E.D. Tex. Mar. 24, 2009) ("Although consistent usage may define a term, particular embodiments and examples appearing in the specification should not be read into the claims.").

Weatherford argues that the patentee implicitly limited the scope of the term "drop member" by consistently using it to describe the drop embodiment. See Bell Atl. Network Servs., Inc., 262 F.3d at 1271 ("when a patentee uses a claim term throughout the entire patent specification, in a manner consistent with only a single meaning, he has defined that term 'by implication'"). In every figure depicting the claimed invention, the object which lands in the drop member receptacle is labeled as element 23. Figures 2, 3, 4, and 5 contain a catcher/seat (element 23A), thus depicting the cage embodiment. See '336 patent 7:46-66, 8:54-66. Figures 6, 7, 8, and 9 do not contain a catcher/seat, thus depicting the drop embodiment. See '336 patent 9:32-58. When discussing figures 2, 3, 4, and 5, element 23 is referred to as a "ball," "activation ball," or "operation ball." '336 patent at 7:46-47, 7:58-66, 8:62-64. When discussing figures 6, 7, 8, and 9, element 23 is referred to as a "ball," "drop ball," "drop element," or "drop member." '336 patent at 9:39, 9:49, 10:15-16, 10:59, 11:36-37.

This sort of consistent usage could lead one of ordinary skill in the art to conclude that the terms "activation ball" and "drop member" refer to two different embodiments. See Bell Atl. Network Servs., Inc., 262 F.3d at 1271. However, the only term used to describe an element that employs fluid pressure to convert the inner tubular in any of the 54 claims of the '336 patent is "drop member." In particular, Claims 12, 17, 18, and 54 claim "a drop member mounted adjacent to said inner tubular." 11 This language parallels cage embodiment language in the specification which describes an activation ball as "mounted adjacent" to the tool. '336 patent 7:49-51. Furthermore, Claim 18 describes using a first fluid pressure to cause the drop member to break a release member, and a second fluid pressure to cause the drop member to engage the inner tubular. Thus, claims 12, 17, 18, and 54 use the term "drop member" to describe the cage embodiment, and show that the terms "drop member" and "activation ball" must be interchangeable. See Phillips, 415 F.3d at 1314 ("Other claims of the patent in question, both asserted and unasserted, can also be valuable sources of enlightenment as to the meaning of a claim term.").

--- Footnotes ---

11 Claim 12 recites "a drop member mounted adjacent to said moveable member."
The Court finds that the patentee has not implicitly limited the term "drop member" to refer exclusively to the drop embodiment. Therefore, the Court will not impose a narrow restriction on the broad claim language of claim 34 as Weatherford proposes. The Court adopts Davis-Lynch's proposed construction as consistent with the way drop member/activation ball is described in the patent. See '336 patent at 7:57-60.

5. "dropping"

* * *

Claim 20 of the '930 patent is exemplary of the usage of the disputed term:

c. removing a bottled beverage from said one of said ordered queues by means of a robotic assembly, in response to said customer selection input; and

d. smoothly moving said bottled beverage by said robotic assembly in a generally vertical X-Y plane within a vend selection space of the vending machine, to a delivery port of the machine; wherein said removing and moving steps are performed without dropping or subjecting the bottled beverage to sharp impact forces. (emphasis added).

The claim language requires the removing and vending steps to be performed "without dropping" the beverage. The question for the court is whether the patent's use of the phrase "without dropping," distinguishes a "free fall" from other events, such as sliding or rolling.

After hearing the arguments, the court concludes that Crane's argument is persuasive. One of the stated purposes of the patents is to "address[] the described deficiencies of prior vending machines . . . ." '930 Patent, col. 3, ll. 5-6. One of the deficiencies is the vertical drop vending process. In describing the vertical drop vending process, the patents delineate between "vertically drop[ping] the beverage container from the front end of the shelf on which it is stored, to a lower chute" and "redirect[ing] the container to a delivery area . . . ." '930 Patent, col. 2, ll. 17-20; see also id. at col. 2, ll. ("virtually all vending machines that operate on the principle of dropping and delivering the vended product by gravity"). Furthermore, a preferred embodiment of the patent contemplates "enable[ing] beverage containers carried thereby to slide by gravity toward the open front . . . ." '930 Patent, col. 10, ll. 33-34; see also id. at col. 14, ll. 30-34 (describing the "robotic arm" embodiment). Thus, the term "dropping" refers to "an unconstrained free-fall, with no guidance."

1267

I. Construction of "Drum"

Ramsey contends that the term "drum" should be construed as "a one-piece cylindrical part on which a cable is mounted."

Ramsey argues that to differentiate "drum" from "drum assembly," the "drum" cannot be a collection of parts but must be a single part. If "drum" were construed to allow an additional part that rotated with the drum but was not integral to it, Ramsey continues, "drum" would mean essentially the same thing as "drum assembly." Ramsey notes that the preferred embodiment shows the drum as a single piece 10, seen most easily in Figure 3. Ramsey argues that gaps between multiple parts would diminish the efficiency of the heat dissipation from the stator to the drum's outer surface and on to the atmosphere.

Ramsey notes that the specification considers the stator separate from the drum, even though the two are closely connected:
a cylindrical stator which is fixed within the drum … and is in tight surface-to-surface fixed contact with the inner surface of the drum. The stator is in effect an extension of the drum in that heat generated … is conducted through the stator material to the drums outer surface.

Warn contends that the term "drum" should be construed as "the hollow, open-ended cylinder that surrounds the brake mechanism."

Warn cites Free Motion Fitness, Inc. v. Cybex Intern., Inc., 423 F.3d 1343 (Fed. Cir. 2005), for its holding:

"[A]" or "an" in patent parlance carries the meaning of "one or more" in open-ended claims containing the transitional phrase "comprising." This convention is overcome only when the claim is specific as to the number of elements or when the patentee evinces a clear intent to … limit the article.

Id. at 1350 ("a cable linking" means "one or more cables linking") (internal quotation and citation omitted); see also KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356 (Fed. Cir. 2000) ("a . . . continuous . . . chamber" covers one or more continuous chambers, and reads on the accused device air mattress's separate inflatable chambers for the head, body, and legs of the patient). Warn argues that under this law, any mention in the '255 patent of "a drum" or "the drum" cannot support the argument that the drum, or the heat conductive cylinder from my previous ruling, must be a single piece.

The cited cases discuss a different issue than Warn addresses. Free Motion and KCJ discuss situations in which there are multiple instances of the item, namely multiple cables and multiple chambers. Warn is arguing for multiple pieces making up one instance of the item. The two cases do not directly apply.

Warn contends that nothing in the claim, specification, or prosecution history shows a clear intention to limit the "drum" to one piece. Warn states that the specification only recognizes three features of the "drum": (1) the central portion that surrounds the brake assembly and on which the cable is wound; (2) the ends that engage the housing; and (3) the flanges that define the area of the drum width on which the cable can be wound. Warn argues that the "drum" can differ from the "drum assembly" without the "drum" being required to be a single piece. Warn further contends that it is common for a drum to contain a liner or an outer sleeve to change the diameter for a particular application.

Ramsey also submits extrinsic evidence to support the argument that one of ordinary skill in the art would understand the term "drum" to mean a single-piece cylindrical part. The evidence consists of parts manuals for eight winches from multiple manufacturers which all label a drawing of a single-piece cylindrical part as the drum. Warn contends that it cannot be determined from the parts manuals if the drums are actually a single piece or made from multiple pieces. I do not think there is a need to rely on extrinsic evidence here.

From the specification:

Basically the winch includes a cable drum 10 that is supported in the winch housing at its ends by bushings 13 for axial rotation relative to the stationary housing 9. A cable 16 wound on the drum 10 (and confined by drum flanges 15) is either wound onto or off of the drum with winding or unwinding rotation of the drum. Housing end 12 houses a motor that turns a shaft assembly 18 that extends through the center of the drum 10 and engages a planetary gear assembly 20 contained in housing end 14. The planetary gear assembly 20 is engaged with the cable drum 10. Thus the motor rotatively drives the shaft assembly 18 which rotatively drives the planetary gear assembly 20. The function of the planetary gear assembly is to reduce the rate of rotation so that the drum 10 is rotated by the planetary gear assembly at a rate that is a fraction of the rotation of the shaft assembly 18. Such gear reduction multiplies the torque produced by the motor as transmitted to the drums.

A brake mechanism 22 is mounted to the shaft assembly 18. The brake mechanism 22 functions to lock the shaft assembly 18 to the drum 10. The planetary gear assembly 20 is thus unable to generate the rotational difference between the shaft assembly 18 and the drum 10. The drum, the shaft and the winch housing are thus interlocked and rotation of the shaft and the winch is thereby stopped or braked.
'255 patent, 2:45-3:1

The drum's purpose in the claim is to have the cable wound on and off the drum. The drum is also connected to the brake mechanism and to the shaft assembly in such a way that torque allows easier winding and unwinding of the cable and the cable can be completely braked.

Warn's proposed construction says nothing about the cable. Ramsey's proposed construction adds the requirement that the drum cylinder be a single piece. Certainly this would be the most common, as shown by the parts manuals, and is drawn in the preferred embodiment, but I see no requirement in the claim or even the specification that this be the case. Thus, I again choose a construction that differs from what the parties propose.

I conclude the term "drum" is defined to be "the cylindrical part on which a cable is mounted."

II. Construction of "Drum Assembly"

The term "drum assembly" is not mentioned in the specification.

Ramsey contends that the term "drum assembly" should be construed as "a collection of parts, including a drum, that rotate together with respect to the housing."

Ramsey contends that the drum assembly includes the drum, which provides the cylindrical surface, and an additional part defined in the claim as "a brake surface on said cable drum assembly." '255 patent, 5:5. Ramsey notes part of Claim 1:

a brake surface on said cable drum assembly, a movable braking member provided on said brake shaft and rotatable therein and moveable between engaged and disengaged frictional braking engagement with said braking surface of the drum assembly

'255 patent, 5:5-9. Based on this language from the claim, Ramsey argues that the movable braking member that rotates with the brake shaft is not part of the drum assembly. It contends that the braking members, also called brake pads in the specification, are claimed as separate structures that rotate with the brake shaft and come into frictional contact with the brake surfaces on the stator contained within the drum assembly.

Ramsey relies on the specification's discussion of the brake surfaces to support its argument that the stator is part of the drum assembly:

A cylindrical stator 72 is fixedly secured to the inner wall of the drum 10. . .The stator has a center bore 78 that allows passage therethrough of the shaft assembly. Spring 58 and retaining ring 64 are also located in the center bore 78. Cylindrical faces 80, 82 at each end provide braking surfaces.

'255 patent, 3:62-4:3.

Warn contends that the term "drum assembly" should be construed as "the drum, and the brake mechanism (comprising at least the stator and movable braking member) disposed within the drum which is adapted to lock the shaft assembly to the drum."

Both Warn and Ramsey agree that the "drum assembly" includes the drum and the stator. Warn, however, argues that it also includes the movable braking member that is adapted to lock the shaft assembly to the drum.

Warn relies on part of the specification:

A brake mechanism 22 is mounted to the shaft assembly 18. The brake mechanism 22 functions to lock the shaft assembly 18 to the drum 10.
Warn contends that Figure 1 generally includes both the stator and the brake members in brake mechanism 22. Thus, Warn contends that "drum assembly" is used to refer to the drum and the brake mechanism. The proper construction is delineated in the claim language. The parties agree that the stator is part of the drum assembly because the stator provides the brake surfaces. I agree with Ramsey, however, that the movable braking member is called out as a separate part that engages, or not, with the braking surface of the drum assembly that is found on the stator end face. Consequently, I will use Ramsey's proposed construction with a slight twist. Since the construction calls out the drum as one component, I think it should also expressly call out the stator. I conclude the term "drum assembly" is defined as "a collection of parts, including a drum and a stator, that rotate together with respect to the housing."

As noted, in the '304 patent, claims 1, 9 and 15 each require a "plurality of annular shell rings" each ring being "non-jointed along its circumference" and "connected to form a generally cylindrical drum shell."

In construing the elements in plaintiff's independent claims, the words must be given "their ordinary and accustomed meaning, unless it appears from the specification or the file history that they were used differently." Carroll Touch, 15 F.3d at 1577. Reference to a dictionary to determine the ordinary and accustomed meaning of a word is appropriate. Miles Labs, Inc. v. Shandon, Inc., 997 F.2d 870, 876 (Fed. Cir. 1993), cert. denied, 510 U.S. 1100, 127 L. Ed. 2d 232, 114 S. Ct. 943 (1994). Webster's Dictionary defines plurality as "the state of being plural," or "the state of being numerous," or "a large number or quantity," or a "multitude." Webster's Third New International Dictionary 1745 (1986). Webster's defines "connected" as "joined" or "linked together." Id. at 480.

Nothing in the '304 patent's specification points to a definition of "plurality" different from Webster's. Indeed, the specification always refers in the plural to the rings which comprise the drum shell. For example, in defining the sounding ring, the specification states that "one or more of such rings function as sounding rings which have a greater outer radius than the other shell rings." (Lovelett Aff., Ex. A, col. 3, lines 21-23) (emphasis added). Therefore, each of plaintiff's independent claims -- 1, 9 and 15 -- requires a "multitude of" or "numerous" annular shell rings. The '304 patent does, however, define "connected." "Pins are positioned axially into adjacent rings to precisely position the rings relative to one another," and "pins . . . are embedded into adjacent rings to radially align and maintain the relative ring positions." (Lovelett Aff., Ex. A, col. 3, lines 17-19; col. 4, lines 19-22) Accordingly, "connected" in the '304 patent means linked together with the use of pins embedded in the rings. Finally, the term "drum shell," as used in the '304 patent, includes both the stacking and the sounding rings. (Id. col. 3, Line 62 - col. 4, Line 6)

The '806 patent, inventor Dr. Charles B. Hilton, is directed to a method of reducing iodide contamination in organic medium, particularly acetic acid. When the acetic acid is catalytically converted to vinyl acetate, the presence of iodide in more than about one part per billion poisons the catalyst. Such iodide contamination was known to be removable by contacting the acetic acid with silver-charged gel ion exchange resins, but the process was slow and impractical in large commercial volume. In seeking to improve the Celanese commercial process, Dr. Hilton discovered that by using a macroreticulated (sometimes described as macroporous) silver-charged cation exchange resin having specified characteristics, he obtained effective, rapid, large-volume removal of minute traces of iodine, to a degree of effectiveness, practicality, and utility not previously available.
When BP encountered iodide contamination in the commercial production of acetic acid BP sought other methods of removal before adopting the method, using a macroreticulated silver-charged cation exchange resin, that is charged with infringement. Celanese brought suit, asserting that the BP method infringed claims 2 and 6 of the '806 patent. Claim 2 is shown, with claim 1 from which it depends:

1. A method for removing iodide compounds from a non-aqueous organic medium comprising contacting the medium containing said iodide compounds with an ion exchange resin characterized in that the resin is a macroreticulated strong-acid cation exchange resin which is stable in the organic medium and has at least one percent of its active sites converted to the silver or mercury form.

2. The method of claim 1 wherein the non-aqueous organic medium is acetic acid and from about 25 to about 75 percent of the active sites are in the silver form.

The question of infringement turns on the meaning of the word "stable" in the claims. It is no longer disputed that all of the other claim elements and limitations are present in the BP method.

B. Review Procedure

Trial was to a jury, lasting for seven days. The jury found that the '806 patent was infringed and that the infringement was willful. The district court, denying duly made motions for a new trial and for judgment as a matter of law, entered judgment on the jury verdict. In its opinion the court identified the evidence in support of the jury verdict, identified the evidence supporting each party's theory of the meaning of certain disputed terms in the patent, and stated its own view of the meaning of these terms. In following this procedure the court relied on Read Corp. v. Portec, Inc., 970 F.2d 816, 822 n.3, 23 U.S.P.Q.2D (BNA) 1426, 1432 n.3 (Fed. Cir. 1992), as requiring or advising that a judicial statement be made of the meaning of disputed claim terms.

BP points out that Read v. Portec has been superseded by the decision in Markman v. Westview Instruments, Inc., 52 F.3d 967, 34 U.S.P.Q.2D (BNA) 1321 (Fed. Cir.) (en banc), cert. granted, 116 S. Ct. 40 (1995), and that Markman requires the Federal Circuit to decide de novo disputed questions of claim interpretation without deference to the trier of fact. BP points out that the disputed question of the meaning of the claim term "stable" is dispositive of the issue of infringement, and therefore that no deference need be given to the jury's finding of infringement. We agree that Markman so requires, and that the issue of infringement is decided by the meaning of "stable" as used in the claims. See Markman, 52 F.3d at 999, 34 U.S.P.Q.2D (BNA) at 1346 (Newman, J., dissenting) (pointing out that the disputed meaning of technical terms often decides the fact of infringement).

"Stable" is defined in the body of the specification as turning on the meaning of "dimension." Although "dimension" appears in the specification, not in the claims, implementation of the Markman decision appears to require that the meaning of "dimension" be given the same de novo determination by the Federal Circuit as the meaning of "stable" in the claims, lest we add further complexities to the trial of patent cases.

C. Construction of the Terms "Stable" and "Dimension"

A technical term used in a patent document is interpreted as having the meaning that it would be given by persons experienced in the field of the invention, unless it is apparent from the patent and the prosecution history that the inventor used the term with a different meaning. ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1579, 6 U.S.P.Q.2D (BNA) 1557, 1560 (Fed. Cir. 1988); Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1387, 21 U.S.P.Q.2D (BNA) 1383, 1386 (Fed. Cir. 1992).

The meaning of "stable" as used in the claims is defined in the specification, col. 4, lines 31-35, as follows:

By the term "stable," it is meant that the resin will not chemically decompose, or change more than about 50 percent of its dry physical dimension upon being exposed to the organic medium containing the iodide compounds.

Thus the meaning of "stable" depends on the meaning of "dry physical dimension." On the BP position that "dry physical dimension" refers to volume, the BP process does not infringe; but on the Celanese position that "dimension" is a linear
measure, there is literal infringement. Celanese states that linear dimension is the plain meaning of "dimension" as understood by persons of skill in this field and as used by the inventor. The BP position is that the term "stable" refers to volume as the physical dimension being measured, pointing out that the resin is in the shape of spherical beads and that the inventor in his research measured volume change. BP states that since its resin changes by more than 50% in volume when exposed to acetic acid, there can not be infringement.

The parties have provided us with photographs and experimental data, the testimony of the scientists who produced the data and interpreted it, and the testimony of experts in the field. Markman limits appellate reliance on extrinsic evidence to evidence in explanation of the technology and technical terms:

Through this process of construing claims by, among other things, using certain extrinsic evidence that the court finds helpful and rejecting other evidence as unhelpful, and resolving disputes en route to pronouncing the meaning of claim language as a matter of law based on the patent documents themselves, the court is not crediting certain evidence over other evidence or making factual evidentiary findings. Rather, the court is looking to the extrinsic evidence to assist in its construction of the written document, a task it is required to perform.

52 F.3d at 981, 34 U.S.P.Q.2D (BNA) at 1331. However, we have found it necessary to rely on the evidence presented at the trial and credit certain evidence over other evidence, for we are not personally qualified to know the scientific meanings of "stable" and "dimension" as applied to macroreticulated cation-exchange resins in organic medium.

The evidence was sharply in conflict. The technical expert presented by Celanese testified as follows:

Q. The second part of this has to do with its dimension. What does that mean?

A. For the case of a spherical resin, it typically means its diameter.

Q. The word "dimension," does it mean volume dimension?

A. There is no such thing as volume dimension.

In turn, the BP expert testified that "dimension" meant volume dimension, stating that volume is what one skilled in the art would understand the term to mean:

Q. Okay. Is that all the reasons [why you believe the term "stable" refers to volume]?

A. There are at least two, perhaps three, additional very important reasons. One is that really it is the common practice of measuring changes that a resin experiences as it swells in a solvent in terms of volume percentage swelling. That is very amply documented in the literature. It is the easiest thing to do. Conversely, it is rather difficult to pick a single bead, measure the change in diameter of that bead, for example, because not every one bead in a sample of resin is identical to the rest of the beads. . . .

The other rather important reason is that it is clearly the objective of this patent to distinguish between a resin that works because it has a porosity independent of swelling, such as Amberlyst 15, and another type of resin which has a porosity that depends upon swelling. That would be the gel type resin in the language used by the patent.

Both sides cite dictionary definitions that support their respective positions. Webster's Ninth New Collegiate Dictionary at 355 (1988) defines "dimension" as:

measure in one direction; specif. one of three coordinates determining a position in space or four coordinates determining a position in space and time.

In partial contrast, the Concise Oxford Dictionary of Current English at 327 (8th ed. 1990) defines "dimension" as:
a measurable extent of any kind, as length, breadth, depth, area, and volume.

This court has occasionally relied on general and technical dictionaries to determine the meaning of technical and other terms. In this case the dictionaries do not distinguish in a dispositive manner between the contested technical meanings. Further, a general dictionary definition is secondary to the specific meaning of a technical term as it is used and understood in a particular technical field. See Hormone Research Found., Inc. v. Genentech, Inc., 904 F.2d 1558, 1563, 15 U.S.P.Q.2D (BNA) 1039, 1043-44 (Fed. Cir. 1990), cert. dismissed, 499 U.S. 955 (1991). Thus we return to the testimony at trial.

Dr. Hilton, the inventor, testified under direct examination as follows:

Q. What is meant by that sentence? In other words, how much swelling does that definition of stable accommodate?

A. A 50 percent change in dimension. The dimension is a distance. A dimension is not volume. Okay? It's the distance between my hands, or it's the distance across my chest. It's the radius of a sphere. A dimensional change in a spherical particle of 50 percent would lead to a swelling or a volume increase of 337 percent.

Dr. Hilton was challenged as to his assertion that "dimension" means distance or linear dimension, for he had measured the swelling volume of these resins during his research. The following exchange occurred on cross-examination:

Q. When did you first form a view that dimension means something other than volume dimension, dimension in this definition of stable?

A. I have never thought of volume as being a dimension. Dimension is not -- volume is not a dimension. Volume of a sphere formula, four thirds pi, distance cubed, radius cubed, distance times distance times distance. Dimension is a distance.

Q. You've never heard the term "volume" used as a dimension?

A. No.

Q. Yet you consider the volume expansion in order to design a guard bed, do you not?

A. Yes, you do.

Q. How many dimensions does volume have?

A. Volume has three dimensions.

The district court called Dr. Hilton's testimony "highly credible." Although we are at a disadvantage in attempting to make credibility determinations, the inventor's testimony reads as that of an expert in the field. See Palumbo v. Don-Joy Co., 762 F.2d 969, 976, 226 U.S.P.Q. (BNA) 5, 9 (Fed. Cir. 1985) (concluding that particular inventor's declaration as to claim meaning was by a "knowledgeable declarant"), overruled on other grounds, Markman, 52 F.3d at 979, 34 U.S.P.Q.2D (BNA) at 1329. Markman requires us to give no deference to the testimony of the inventor about the meaning of the claims. Id. at 983, 34 U.S.P.Q.2D (BNA) at 1332. However, we have treated Dr. Hilton's testimony as cumulative to the other evidence, and as enlarging our understanding of the technology and the usage of the disputed terms.

In addition, the specification of the '806 patent shows the resin characteristic of mesh size of the dry resin, a linear measure based on diameter. The specification also contains swelling data stated to be from the Technical Bulletin for Amberlyst (R) 15 and which, according to the inventor's testimony, is the percentage of swelling by volume. A videotaped "swelling test" that was presented to the jury is stated to have shown that Celanese's preferred Amberlyst (R) 15 resin expanded slightly more than 50% by volume in acetic acid, while BP's Purolite (R) resin of the same chemical composition (polystyrene cross-linked with divinylbenzene) expanded 103% by volume but less than 50% in linear dimension upon exposure to acetic acid.

The district court observed that BP's interpretation of "stable" as meaning dimension by volume would exclude from the claims the Celanese preferred embodiment that is described in the specification. However, if stable is measured by linear
dimension, the claims include the resin that Celanese specifies in its invention. We share the district court's view that it is unlikely that an inventor would define the invention in a way that excluded the preferred embodiment, or that persons of skill in this field would read the specification in such a way. See Modine Mfg. Co. v. United States Int'l Trade Comm'n, 75 F.3d 1545, 1550, 37 U.S.P.Q.2D (BNA) 1609, 1612 (Fed. Cir. 1996) (claim interpretation that would exclude the inventor's device is rarely the correct interpretation).

We find that the more reasonable explanation is that volume has three dimensions, and we give weight to the argument that on the BP definition the Celanese preferred embodiment would not be within the claims of the Celanese patent. Thus we conclude that "dry physical dimension" as used in the specification means linear dimension. On this definition of dimension, and defining "stable" accordingly, the claims read literally on the BP process.

With regard to literal infringement, the only ground we detect for disturbing the judgment is the claim clause "replacing said rinsing fluid with said drying vapor," which appears in each of the asserted claims. After holding a Markman hearing prior to trial, the district court construed the claim term "drying vapor" as "a vapor that facilitates the removal of liquid from a surface," wherein a "vapor" is "the gaseous state of a substance that, under ordinary circumstances, is usually a liquid or solid." CFMT, Inc. v. Steag Microtech, Inc., No. 95-442-RRM, slip op. at 11 (D. Del. Nov. 25, 1997) (unpublished memorandum opinion). Additionally, the court construed the claim term "replacing" as "taking the place of." Id. at 12. We have considered Steag's arguments that the district court's construction of "drying vapor" is wrong; however, we are not persuaded. Rather, we agree with these aspects of the district court's claim construction.

"Duct" appears at least forty five times in the claims of the '130 application, thirty-one times in the claims of the '609 patent, and six times in the claims of the '958 patent. See '130 application claim 21 at 40 ("a housing defining a central duct with gas inlet and outlet openings defined at opposite ends thereof"); '609 patent claim 37 at 23:34-35 ("a valve housing defining a tubular interior duct having gas inlet and gas outlet apertures at opposite ends thereof"); '958 patent claim 8 at 18:50-51 ("a housing defining a duct with gas inlet and gas outlet openings defined at opposite ends of said duct"); see also '130 application claim 38 at 45; '609 patent claim 1 at 17:55-56, 17:60-67, 18:5-9, claim 18 at 21:15-16, 21:21-27, 21:27-30, claim 37 at 23:36-45, 23:54-56; '958 patent claim 8 at 18:57-59; 18:63-64. The term does not appear in the claims of the '674 patents.

Aqua-Lung seeks to have "duct" defined as "a conduit formed in the housing that leads gas through the housing and which is filled with pressurized gas when the housing is connected to a source of gas." This is the same definition it proposed for "passageway." Two Forty proposes that "duct" be defined as "a passage or channel." Aqua-Lung argues that "duct" is the same as "passageway." The hearing helped shed some light on the scope of "duct" compared to "passageway" and "bore." Two Forty acknowledged that "bore" was the broadest of the three terms because it connoted a hole, while passageway was more of a path. For "duct," however, Two Forty contended that it was similar to "passageway." Comparing the claims presented above with the claims for "passageway" reveals that the two terms are similar in that "duct" does appear to stand in the stead of "passageway" in certain claims. Interestingly, the term "duct" does not appear in the specification of the '130 application or any of the patents-in-suit outside of the claims. Nonetheless, looking at the embodiments and seeing how "passageway" was used in the specification leads to the conclusion that "duct" and "passageway" refer to the same disclosed structure. A person skilled in the art would look at the embodiments and interpret "duct" in no other way. While the patentee selected different names to refer to the same structure, the coverage of the patents cannot be expanded on that basis alone. Doing so would expand the coverage beyond what the patentee invented. Based on the intrinsic record, the Court will adopt the same definition for "duct" that it did for "passageway," and therefore construes the term to mean "a conduit formed in the housing that allows gas to pass through it."
b. "a duct for the passage of cooling air"

The parties dispute whether the term "duct" in the claim phrase "a duct for the passage of cooling air" requires the duct to be enclosed. Alcon contends that a duct must be enclosed, arguing that the term means "an enclosed channel or conduit with at least one inlet and one outlet." Brembo construes the term as simply denoting "a passage or a conduit" without reference to whether it is an enclosed passage.

Brembo's proposed definition is consistent with the ordinary meaning of the term. Webster's Third New Int'l Dictionary at 699. Alcon argues that the term must be limited to an enclosed passageway, because persons skilled in the relevant technology would understand that to control the flow of air, a duct through which air is conveyed must be enclosed. In this regard, Alcon relies in part on the affidavit submitted by its expert. Def. Ex. B, Declaration of Terry L. Satchell P 67. It is appropriate for a court to rely upon expert testimony to understand the underlying technology of a device. Playtex Prods. v. P&G, 400 F.3d 901, 908 n.1 (Fed. Cir. 2005). A court may not, however, use expert testimony to construe a claim in a way that is at odds with the intrinsic evidence. Id. There is nothing in the ordinary meaning of "duct" or its usage in the patent claims or specification that requires the duct to be entirely enclosed except for openings at either end. Ducts often have multiple openings. Consider, for example, a heating duct in a home.

For these reasons, the Court construes "a duct for the passage of cooling air" to denote a passage or conduit through which cooling air may pass.

B. "Dumping Assembly"

As noted, "dumping assembly" is included in the "assembly extendable to the curb side of the vehicle." See 245 Patent, col. 8, lines 1-5. Plaintiff argues that "dumping assembly" should be construed as "the structure that inverts and dumps the contents of the curb side container, including a hydraulic cylinder or other motor." (See Pl's Proposed Order at 2:5-7.) Defendant argues that "dumping assembly" should be construed as "an assembled collection of parts used for letting the contents of a curbside refuse container fall in a heap or mass into the intermediate container, which collection of parts include the motor powered means to empty as interpreted below." (See Def.'s Proposed Order at 2:9-11.)

Both parties' proposed constructions focus on the function of the claimed "dumping assembly." Although the parties offer differing language, each has proposed a construction that is, essentially, in accord with the specification's teaching as to the function of the "dumping assembly," specifically, that it causes the contents of a curb side refuse container to be emptied, i.e., "dumped," into the intermediate container. See 245 Patent, col. 7, lines 32-34; Figs. 4, 7.

Accordingly, "dumping assembly" is construed as "the structure that dumps the contents of a curb side refuse container."

4. Claim 1 - "dunnage structure"

Bradford proposes that "dunnage structure" means "a number of flexible parts held or put together in a particular way for separating and protecting the products shipped in the container." Defendants propose that "dunnage structure" means "partitions or elements for keeping products apart from each other or otherwise protecting products during shipping." The essential difference between the parties' definitions is Bradford's addition of the "flexible" limitation to the term.

In support of its definition, Bradford points out that throughout the specification, "dunnage" is variously referred to as being
"pliable" or "collapsible". Bradford also points out that the specification states that the dunnage "does not affect the operation and collapsibility of the container." '119 Patent, col. 3, ll. 35-37. Bradford observes that rigid dunnage would affect the collapsibility of the container. Thus, Bradford argues, the specification contemplates dunnage materials that are flexible instead of nonflexible.

Conversely, Defendants argue that "dunnage structure" does not require flexible elements. In support of its definition, Defendants first point to col. 2, ll. 12-15 of the '119 patent, which state: "For example, it may be necessary to utilize dunnage elements, such as partitions or separating structures, in the container during shipment for separating and protecting the products shipped in the container." Defendants contend that this sentence indicates that the "dunnage structure" need not be flexible. This sentence, however, does not support Defendants' argument. In context, this sentence, which is from the "Background of the Invention" section, is describing drawbacks to existing collapsible and reusable containers. This sentence is not describing the claimed invention. Therefore, it does not support Defendants' construction of "dunnage structure".

More significantly, Defendants observe that Claim 1 does not contain any limitation regarding pliability or flexibility of the dunnage structure. They point out further that the "pliable" limitation is not introduced until dependent claims 12 and 13. Under the claim differentiation doctrine, the "pliable" limitation would be presumed not to be present in Claim 1. Defendants also point out that Bradford's website indicates that dunnage can be rigid and that rigid dunnage can be collapsible simply by folding it.

While the Court appreciates Defendants' claim differentiation argument, this appears to be a situation where it would be appropriate to read a limitation from the specification into the claim. As Bradford correctly argues, throughout the specification the dunnage is described in terms that are synonymous with flexible. Additionally, as indicated, the "Background of the Invention" describes the problems and drawbacks of rigid dunnage elements - they must be handled separately from the container and the manufacturer often has to buy or construct new dunnage elements when the container is returned for reuse. '119 Patent col. 2, ll. 10-35. Thus, manufacturers using prior art containers have higher shipping costs. Therefore, it would be contrary to one or more of the basic objectives of the claimed invention, i.e., to reduce shipping costs and the time and labor associated with handling the container, id. col.2, ll. 44-64, if the definition of "dunnage structure" were not limited to flexible elements. See, e.g., Minnesota Mining & Mfg. Co. v. Johnson & Johnson Orthopaedics, Inc., 976 F.2d 1559, 1566-67 (Fed. Cir. 1992) (relying on the specification's description of the drawbacks with the prior art to define "lubricant" and "pre-lubricated resin coated sheet"). The specification also states that the dunnage structures are ready for reuse simply by erecting the container. '119 Patent, col. 3, ll. 25-29. There is no need to separately handle the dunnage structures. Id. ll. 32-37. Defendants' definition eliminating the "flexible" limitation reimplies the disadvantages of the prior art the claimed invention seeks to avoid. Therefore, Defendants' definition of "dunnage structure" is rejected.

Accordingly, the Court holds that "dunnage structure" means "a number of flexible parts held or put together in a particular way for separating and protecting the products shipped in the container."

1276

5. Durably Assume A Diameter At Least As Small As The Reduced Diameter Achieved In The Step Of Pre-shaping" (Claim 1, '433 Patent)

Vnus argues "durably assume a diameter at least as small as the reduced diameter achieved in the step of pre-shaping" should be construed in the same manner as "durably assumes a smaller size"/"durably assumes a reduced size," specifically, "assumption and retention of compressed diameter after treatment smaller than pre-treatment." Defendants argue "durably assume a diameter at least as small as the reduced diameter achieved in the step of pre-shaping" should be construed in the same manner as "durably assumes a smaller size"/"durably assumes a reduced size," specifically, "the [hollow structure/vein] must maintain this smaller but non-zero diameter with a reduced but continued fluid flow for a lasting (i.e. non-temporary) period. The [hollow structure/vein] must maintain this smaller but non-zero diameter with a reduced but continued fluid flow for a lasting (i.e. non-temporary) period."

The Court, for the reasons stated by Vnus, finds "durably assume a diameter at least as small as the reduced diameter achieved in the step of pre-shaping" is properly construed as "assumes and retains a compressed diameter after treatment.
4. Durably Assumes A Smaller Size (Claim 1, '084 Patent)/Durably Assumes A Reduced Size (Claim 1, '803 Patent)

Vnus argues the term "durably assumes a smaller size"/"durably assumes a reduced size" should be construed as "assumption and retention of compressed diameter after treatment smaller than pre-treatment." Defendants argue the term "durably assumes a smaller size"/"durably assumes a reduced size" should be construed as "the [hollow structure/vein] must maintain this smaller but non-zero diameter with a reduced but continued fluid flow for a lasting (i.e. non-temporary) period. The [hollow structure/vein] must maintain this smaller but non-zero diameter with a reduced but continued fluid flow for a lasting (i.e. non-temporary) period."

The Court, for the reasons stated by Vnus, finds "durably assumes a smaller size"/"durably assumes a reduced size" is properly construed as "assumes and retains a compressed diameter after treatment smaller than pre-treatment."

During optimization

The Court also finds that the term "during optimization" in Claim 1 means "during any process for optimizing the roller cone bit." The plain language of "during optimization" means "during a process for making better." The Court finds no support for Smith's assertion 11 that "during optimization" means "during the sequence of steps recited in the claim." Neither the claim, nor any other intrinsic evidence limits "optimization" to the steps recited in Claim 1. Moreover, the 262 Patent's specification provides that the 225 Patent's methods and optimizations "can be used . . . in synergistic combination with the methods described in the present application." Col. 5, Ins. 64-67. Thus, the specification contemplates other "optimization" steps than those included in the 262 Patent claims.

11 Smith's argument on this point in particular is unclear. In its response to Haliburton's claim construction brief, Smith argued that "during optimization" meant "during the sequence of steps recited in the claim." However, Smith changed its argument for presentation at the Markman hearing and in the supplemental Construction of Agreed and Disputed Terms document. Smith offers no briefing or explanation in support of its new construction, and, Smith's oral argument is unenlightening. See footnote 6 supra. In fact, the Court can only guess at how Smith's new construction ("during the process for optimizing the roller cone bit design") differs from Haliburton's proposed construction ("during a process for optimizing the roller cone bit"). Although Smith has arguably abandoned its prior position, the Court will consider Smith's briefed arguments in the interest of fairness.
The parties dispute the meaning of the phrase "the gripping member having a different durometer characteristic than the resilient grip body." This phrase shall be construed to mean "the gripping member has a different hardness than the resilient grip body." 1

1 Ranir's construction invites the court to import a limitation from a dependent claim into Claim 1, which is contrary to Federal Circuit precedent. See Comark Communics. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998) ("'[w]hile . . . claims are to be interpreted in light of the specification and with a view to ascertaining the invention, it does not follow that limitations from the specification may be read into the claims.'") (internal citation omitted). Further, "[n]or may [the court], in the broader situation, add a narrowing modifier before an otherwise general term that stands unmodified in a claim." Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1249 (Fed. Cir. 1998).

2. "dynamically" (claim 1)

Flow proposes that this claim term means a "potentially changing activity or item, such as changing under variable process conditions, as contrasted with static." Omax largely agrees with this construction, but argues that this definition must not include "Omax's static processes, where all calculations are done in advance then the fully determined motion commands are exported to the controller for actual machining." The Court again finds that the parties do not manifest a meaningful dispute on this issue, and adopts Flow's construction. The jury will determine the question of infringement.

2. "dynamically isolated"

Like "reaction frame," the term "dynamically isolated" lacks established technical meaning. The specification language for the '500 patent refers to "physical[] isolation" of a stage to "prevent[] [] reaction forces from vibrating the projection lens," '336 Patent at 2:44-47, and it discusses how the mechanism should avoid "coupling" of the reaction force into the base structure, id. at 5:15-17, but nowhere is the ungainly "dynamically isolated" phrase specifically defined in the specification language. Still, a pair of points are clear: First, "dynamic isolation" does not demand "complete isolation." Neither party suggests--and nothing in the patent implies--that a reaction frame will reduce vibration to zero, no matter how effective or firmly fastened to the ground. All that "dynamically isolated" connotes, and all that is physically possible in the context of the photolithographic machine, is that vibration--i.e., the relevant reaction forces--transmitted from one frame to the next be minimized sufficiently to permit the projection apparatus to function accurately. See, e.g., '500 Patent at 2:40-47 (discussing reduction of undesirable movement such that the projection lens can operate accurately); see also In the Matter of Certain Microlithographic Machines and Components Thereof, Investigation No. 337-TA-468 at 41-45.

Second, nothing in the claim or in the specification language compels the conclusion that this vibration-minimization occurs through motorized means. Indeed, as ASML noted during the court's Markman hearing, Nikon expressly disclaimed use of active motors when securing a patent (viz., the '128 patent) directly germane to the '500 patent claims. Cf. Georgia-Pacific Corp. v. U.S. Gypsum Co., 195 F.3d 1322 (Fed. Cir. 1999); see also Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 2004 U.S. App. LEXIS 1595, *26-28 (Fed. Cir. 2004) ("Any statement of the patentee in the prosecution of a related application as to the scope of the invention would be relevant to claim construction, . . . not only to [patents issued after the predicate patent], but also to [] earlier issued [] patent[s].") (emphasis added). The court has located nothing in the intrinsic record suggesting that the patent contemplates motorized means of vibration-minimization, and recognizing that the claim term is inherently ungainly, the court construes "dynamically isolated" to mean that "the two frames are sufficiently free of transferred vibrations and reaction forces that the photolithographic machine can perform accurately."
This construction is not inconsistent with the gloss recently placed on "dynamically isolated" by the Board of Appeals and Patent Interferences of the PTO. See Decision on Prelim. Motions and Judgment, Interference No. 104,813 (defining "dynamically isolated" as the state in which "reaction forces, e.g., dynamics of the one frame, are not transmitted to the other frame"); see also Decision on Preliminary Motions, Interference No. 104,814 (noting that two frames are not "dynamically isolated" if "some vibrations or reaction forces [are] transferred between the two frames"). The court does not read these recent statements to suggest that no vibration could ever possibly be transferred between the two frames, as that kind of segregation would not be physically possible given the construct of the relevant art; rather, the court assumes, consistent with the construction the court offers, that the vibrations are reduced / not transferred such that the invention can operate effectively.

"dynamically modifiable library of code" (claim 20)

Flow argues that this phrase should be construed as a "potentially changeable code in a collection of code." Omax argues that this phrase appears "to indicate a group of source code that is modifiable on the fly in real time by the user." The Court construes the term "dynamically" consistent with its prior definition of the term, and therefore adopts Flow's proposed construction.

Each

Genlyte asks the Court to construe the term "each" as meaning "any or all." Lutron, however, argues that the proper interpretation of "each" is "every" when the word is used as an adjective, and "every one" when the word is used as a pronoun. The parties agree that "each" applies to every control in the mimic mode, and seem to agree that "each" is either irrelevant or does not apply to the master/slave mode. Indeed, Genlyte argues that in master/slave mode, 'each' is not manifest in (i.e., is irrelevant to) the system or product," and Lutron argues that "there is no plausible interpretation of ‘each' that is consistent with [the master/slave] mode." Therefore, the Court will only concern itself with the meaning of "each" in the mimic mode.

The parties' disagreement is one of semantics. Genlyte and Lutron agree that "each" only applies to the mimic mode of the invention. The parties also agree that "any" or "every one" of the individual light controls or "all" or "every" individual light control operates in the same manner while in the mimic mode. Only because Lutron's proposed construction offers more consistency, by stating which term is used according to how the word "each" is used, the Court adopts its construction. Nevertheless, the terms which both parties seek to use could be interchangeable. For example, Lutron offers that in claim 1, where it says "A multi-room controller for controlling a plurality of individual light controls, each light control adapted to control directly," the claim should be construed to read "A multi-room controller for controlling a plurality of individual light controls, every light control adapted to control directly." Similarly, Genlyte would have claim 1 read "A multi-room controller for controlling a plurality of individual light controls, all light controls adapted to control directly." Therefore, the Court adopts Lutron's construction of "each," which is "‘each’ is ‘every’ when the word is used as an adjective, and ‘each’ is ‘every one’ when the word is used as a pronoun." Nevertheless, the Court believes Genlyte's proposed construction accomplishes the same purpose.
ii. "Immediately After"

Medtronic asserts that "immediately after" means "without any events between the application of cardioverting energy to the atria and the enabling of the atrial pacing." Medtronic argues that, according to its dictionary, "immediately" means "without intermediary." American Heritage Dictionary 643 (2d college ed. 1982). Medtronic argues that the Parties agree that the ordinary meaning of the term "immediately" prohibits an intermediary or intervening event, such as a ventricular pacing pulse supplied by the device, between shock and the initiation of atrial pacing.

Guidant argues that within the context of pacing the atria, "immediately" means pacing as soon as it would be effective within the first heart cycle after the cardioversion shock is applied. Guidant asserts that this definition is appropriate because one of ordinary skill in the art would know that events take place in both the heart and the device between applying the shock and enabling the pacing, such as restoration of normal atrial activity and repolarization. For support, Guidant cites language in the '569 Patent itself:

"After applying the cardioverting electrical energy to the atria, the microprocessor 60, through the disable stage 63, enables the pacer 92 which has been preprogrammed . . . . This begins the post-cardioversion atrial pacing of the heart. The pacing of the heart continues, preferably at a rate greater than a bradycardia pacing rate, for a finite time until the occurrence of a predetermined event."

'569 Patent at 6:11-18.

Guidant asserts that the reason for pacing "immediately after" the cardioverting shock is to eliminate the time required to confirm whether the shock was successful in restoring normal cardiac activity. However, the Court cannot limit its claim construction based on the perceived purpose of the invention. See E-Pass Techs., Inc. v. 3COM Corp., 343 F.3d 1364, 1370 (Fed. Cir. 2003).

The Court agrees with Medtronic. The cited language says nothing about waiting to determine the results of cardioversion. In addition, the specification states that the pacing begins "immediately after each cardioversion attempt," '569 Patent at 6:22-23, not immediately after each successful cardioversion attempt. Moreover, the claim itself says nothing about waiting to determine the success of the cardioversion.

Medtronic also asserts that the claimed atrial pacing must be performed after every application of cardioverting energy. The ordinary meaning of the word "each" is "every one of two or more considered individually or one by one." The Random House College Dictionary 414 (rev. ed. 1982). The specification and claim language do not change this ordinary meaning. Therefore, the Court will include the word "every" in its interpretation of this claim.
An array is alternatively defined as "a rectangular arrangement of quantities arranged in rows and columns, as in a matrix," "an orderly, often imposing arrangement," or "an impressively large number, as of persons or objects." THE AMERICAN HERITAGE DICTIONARY 102 (3d Ed. 1996). When this language is reviewed in light of the figures attached to the specification of the patent, it becomes clear that the intended definition of an array in this context is the first definition. See Fig. 2. Given that the prosecution history provides no contrary argument, the Court finds that the term "array" as used in patent '911 refers to "a rectangular arrangement of quantities arranged in rows and columns."

Next, the Court confronts the term "cowl." Again, looking initially to the plain meaning of the term, the Court finds that, generally speaking, a cowl refers to a hood or cover some sort. 3 Reference to the specification and the remaining claims in this case does not provide a more specific definition of the term. Indeed, such review reveals that a cowl may refer to hoods of different shapes. For instance, figure 6 presents "another embodiment of the cowl" as do claims 2, 3, 7 and 8. 4 In addition, the prosecution history indicates that the shape of the cowl has no impact on the patentability and, thus, the scope of the claim. The Court, therefore, finds that a cowl as used in these claims refers to a hood of any shape.

Having defined the terms "array" and "cowl," one limitation remains to be defined.

As noted above, Plaintiff argues that the phrase "each cowl for shielding one of the holes" does not require that each hole have a separate cowl. However, upon reference to the specification, the Court finds that that is precisely the meaning of that phrase. At page 4, the specification indicates that: "Each of the holes is shielded by deflecting means comprising a separate scoop or cowl. . . ." In addition, reference to the prosecution history provides further support for this reading of the claim. Indeed, the first amendment Talbot made to the claim after initial rejection was to change the language of this element from referring generally to "shielding the holes" to the present language "each cowl for shielding one of the holes." Moreover, in combining the first and second claims of the original application as part of the first amendment, Plaintiff included the phrase "each cowl for shielding one of the holes" to replace of the phrase "an individual cowl for shielding each hole." Thus, the plain meaning of the language, the specification and the prosecution history all require the Court to find that for a device to literally infringe on this patent, it must have one separate cowl for each hole.
require a one-to-one correspondence between the number of cowls and the number of holes. Dr. Shrink contends, however, that such a one-to-one correspondence is exactly what is required by the claim language. Dr. Shrink also argues that the claim language cannot be construed to include a louver covering a number of holes, which is how Dr. Shrink describes the accused device.

Claim construction is an issue of law reviewed de novo and requires consideration of the claim language, the written description and, if relevant, the prosecution history. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996).

The claim language in this case is clear on its face. That is, for each cowl in an array of cowls one corresponding hole is covered. The specification also supports this construction: "Each of the holes is shielded by deflecting means comprising a separate scoop or cowl," with "each [cowl] partially covering one of the holes." '911 patent, col. 4, lines 12-13; col. 5, lines 27-29. The prosecution history further supports this construction. During prosecution, the claim language was modified to narrow the scope of the claims to include this one-to-one limitation ("each cowl for shielding [the] one of the holes"). Therefore it does not appear that the district court erred by requiring a one-to-one correspondence between cowls and holes.

Mr. Bickerstaff cites to the following language in the specification to support his argument: "Cowls [can be] of different shapes which protect two or more holes without departing from the spirit of the present invention." '911 patent, col. 4, lines 35-37. Mr. Bickerstaff disclosed the foregoing, but he did not claim it. The claim language here is clear; Mr. Bickerstaff claimed a one-to-one correspondence between cowls and holes. He cannot now discard that limitation.

The district court concluded that not only must there be a one-to-one ratio of cowls to holes, but each cowl must be "separate." The record does not bear out this interpretation. Nothing in the claim language or prosecution history requires that the cowls cannot be adjacent or abutting. The preferred embodiment shown in figure 2 of the '911 patent shows the cowls being separated from each other by portions of the surface of the central portion of the vent. The specification describes each of this preferred embodiment's holes as being covered by "a separate scoop or cowl." '911 patent, col. 4, lines 12-15. However, the word "separate," which is being used to describe a preferred embodiment, did not find its way into the claims. A preferred embodiment and the specification's description of it do not necessarily limit the claims. See Texas Instruments, Inc. v. United States Int'l Trade Comm'n, 805 F.2d 1558, 1563, 231 U.S.P.Q. (BNA) 833, 835 (Fed. Cir. 1986) ("This court has cautioned against limiting the claimed invention to preferred embodiments or specific examples in the specification."). The district court erred by inserting this "separate" limitation where it is not required by the claim language, specification, or prosecution history.

6. "[W]herein each crosspiece disposed at the end sections of the two spring strips is provided with a covering cap:" 6 "Crosspieces must be located at the terminal portions of the spring strips." The construction is consistent with the specification of the '512 patent, which does not disclose an embodiment having crosspieces located other than at the terminal portions of the spring strips. It is likewise consistent with the prosecution history, in which the examiner rejected the claims of the '512 patent as anticipated by several prior art wiper blades having crosspieces disposed at the ends of the spring strips. (D.I. 165 at JA01077) The applicant did not traverse this rejection by noting that the crosspieces of the '512 patent could be disposed elsewhere along the spring strips. (Id. at JA01106) Nor can plaintiff convincingly invoke the doctrine of claim differentiation in its argument that dependent claim 4, which requires "at least one crosspiece . . . disposed at each end section[,]" mandates a broader interpretation of independent claim 1. See Kraft Foods, Inc. v. Int'l Trading Co., 203 F.3d 1362, 1367-68 (Fed. Cir. 2000) (written description and prosecution history rebut any presumption arising from the doctrine of claim differentiation).

6 '512 patent, claim 1 (and dependent claims).

End Footnotes
1. "each extension including a rear end having a first flange extended downward"  

Defendant objects to the magistrate judge's recommended construction of "each extension including a rear end having a first flange extended downward." To review, the magistrate judge recommended that this disputed element be construed as: "each extension includes a rear end, a portion of which reaches in a downward direction relative to the remaining portions of the extension and facilitates attachment of the auxiliary frame to the primary frame." See Report and Recommendation at 20. In recommending this claim construction, the magistrate judge rejected Defendant's argument that "the claim terms are clear enough and need no real construction, especially if it adds extra claim requirements." Id. at 11 (quoting Def. Resp. at 6). The magistrate judge essentially adopted the Plaintiffs' proposed construction of the term with the deletion of what she described as "extraneous language." Id. at 12. 3

3 Plaintiffs recommended the following definition: "each extension including a rear end having a first flange extended downward" as "each extension includes a rear end having a portion of the extension which protrudes from the rear end thereof and facilitates attachment of the auxiliary frame to the primary frame and where such portion of the extension reaches in a downward direction relative to the remaining portions of the extension." See Def. Open. Br. at 10.

In response to Defendant's objections, Plaintiffs contend that the term "portion" used by the magistrate judge in her recommended claim construction "significantly" broadens the "specific structural shape" of flange 23 illustrated in Figure 3 of the patent, because she recommends the use of the word "portion." See Def. Obj. at 16. According to Defendant, "redefining 'flange' under the guise of claim construction to mean a 'portion' having any shape which reaches in a downward direction relative to the remaining portions of the extension and facilitates attachment impermissibly broadens Claim 12." Def. Reply to Pl. Resp. at 9-10. Defendant further objects to the magistrate judge's incorporation of functional language, namely, "facilitates attachment of the auxiliary frame to the primary frame," in her construction. Defendant argues that such use of the functional language is inconsistent with the claim language, since Claim 12 requires the flanges to be located behind the studs "to further secure the auxiliary frame to the primary frame," and such a requirement is different from merely "facilitating attachment" of the frames. Def. Obj. at 16. Based on these arguments, Defendant proposes the following definition: "each extension includes a rear end having a flange which extends in a downward direction relative to the remaining portions of the extension to further secure attachment of the auxiliary frame to the primary frame as required by other elements of the claim." Id. Defendant further states that its preference is to omit the "further secure" language. Id.

As to Defendant's objection that the magistrate judge incorporated functional language, namely, "facilitates attachment of the auxiliary frame to the primary frame," Plaintiffs argue that Defendant's "position exalts form over substance," since the words "secure" and "attach" both mean essentially the same thing in this context. Plaintiffs also argue that the magistrate judge's proposed definition of "'flange" to include a so-called "functional element" is consistent with its ordinary meaning, a part used "to strengthen an object, hold it in place, or attach it to another object." Id.
Having considered the magistrate judge's findings and conclusions, the parties' legal briefing and applicable law, the court overrules Defendant's objections. The court rejects Defendant's selective argument that "portion" impermissibly broadens the scope of "flange." Defendant is relying on one possible embodiment of the claim. The Federal Circuit has cautioned against this approach to claim construction, "even when a specification describes very specific embodiments of the invention or even describes only a single embodiment, unless the specification makes clear that 'the patentee . . . intends for the claims and the embodiments in the specification to be strictly coextensive.'" J.V.W. Enterprises, Inc. v. Interact Accessories, Inc., 424 F.3d 1324, 1335 (Fed. Cir. 2005) (citing Phillips, 415 F.3d at 1323); SRI Int'l v. Matsushita Electric Corp. of America, 775 F.2d 1107, 1121 n.14 (Fed. Cir. 1985) (en banc) ("Specifications teach. Claims claim. . . . That a specification describes only one embodiment does not require that each claim be limited to that one embodiment."). In any event, the term "portion" used by the magistrate judge in her recommended claim construction tracks Figure 3 very closely. As shown in Figure 3, the flange 23 is the portion of the extension 22 located at its rear end; it extends downward relative to the rest of the extension; and it facilitates attachment of the auxiliary frame to the primary frame.

As to Defendant's objection that the magistrate judge's use of the terms "facilitates attachment of the auxiliary frame to the primary frame," the court agrees with Plaintiffs that Defendant's position exalts form over substance. In the context of the patent, the court can conceive no difference between the words "secure" and "attach." Moreover, the functional language is consistent with the claim language itself, which provides that "the flanges are located behind the studs to further secure the auxiliary frame." '747 Patent, Col. 6 lines 15-16. The court agrees with the magistrate judge that in such a situation, the construction recommended by the court properly "gives meaning to all the terms of the claim[.]" Report and Recommendation at 12 (citing Terlep v. Brinkmann Corp., 418 F.3d 1379, 1384 (Fed. Cir. 2005) (finding that district court's construction of term "clear" as "transparent or having the property of transmitting light without appreciable scattering so that bodies lying beyond are seen clearly" did not impermissibly import a functional limitation, but reflected an appropriate assignment of meaning to the disputed term); see also Hill-Rom Co., Inc. v. Kinetic Concepts, Inc., 209 F.3d 1337, 1341 (Fed. Cir. 2000) (finding that district court's construction of the term "cushion" as "a structure that provides basic support and comfort" did not impermissibly import extraneous functional limitations into claim, because the construction was consistent with the ordinary meaning of the term and the abstract and description of the patent, noting that the objective of the cushion was to provide support).

Microsoft argues that this phrase should be construed to mean that for each cluster of finger keys, "the angles between the adjacent keys [must] alternate between an obtuse angle (between 90 and 180 degrees) and a reflex angle (greater than 180 degrees)," and that for each finger there must be at least two alternating angles between three keys. Microsoft's Memorandum in Support of Non-Infringement of '477 patent, p. 18. Plaintiff offers no alternative construction for this phrase and does not contest Microsoft's proposed construction. The ordinary meaning of the claim terms require that the planes of each key intersect one another in a "mixed" pattern of obtuse and reflex angles. This pattern would include one reflex angle and one obtuse angle, with two angles between three keys. Microsoft's construction is further supported by the specification drawings. See '477 Patent, Figures 3-8. Therefore, I adopt Microsoft's construction as set forth above.

3. Each Key in Which is Arranged Facialy to Confront, in Close Proximity and in Parallel Planar Relationship, One of Various Different, Underside, Finger-Expanse Portions of an Associated, Adjacent Finger

Microsoft argues that this phrase should be construed to mean that "each key of each non-thumb finger cluster must be positioned to face in close proximity and be parallel to the tip or the underside of the adjacent finger of a user." Microsoft's Memorandum in Support of Non-Infringement of '477 patent, p. 15. In other words, Microsoft argues that "[t]he cluster cannot be disposed along a uniform curved convex surface." Id.
Microsoft maintains that the ordinary meaning of the term "confront" requires that each key face and be parallel to the "finger expanse portions," i.e., the underside, of the corresponding finger. Goff Decl., Ex. 7 (American Heritage Dictionary of the English Language, 4th Ed., p. 387). Microsoft further contends that the key clusters cannot be arranged along a uniform convex surface, because the underside of each finger must "alternate[] between various angles" to correspond with the keys. See '477 Patent, Figure 8.

Plaintiff disputes Microsoft's construction and argues that "[d]evices embodying the invention may or may not have a uniformly curved convex surface, but must have the keys oriented to confront, in parallel planar relationships, two or more portions of the underside of the fingers." Plaintiff's Opposition to Defendants' Motions for Summary Judgment, p. 30. Put simply, plaintiff contends that the claim language encompasses keys placed on a uniform, convex surface so long as the keys correspond with the underside of the associated finger.

It is true that plaintiff is entitled to all reasonable constructions of the claim language; however, the construction must be consistent with the claim language and the description of the invention in the specification. Here, the claim language requires that keyboard be designed to correspond with the "underside architecture of the hand." Id. Col. 4:26-27. Further, the specification describes the keyboard portion as "a sort of curvilinear keyboard amphitheater," depicted in the specification drawings. See '477 Patent, Col. 3:47-48, Figures 1-4. Notably, the specification drawings shown in Figures 1, 3, 4, 7, and 8 show a concave corner housing with keys placed in varying angles to conform to the underside and tip of the corresponding finger. See also '477 Patent, Col. 3:13-18 (Figures 7 and 8 illustrate "the nominal position of a user's finger with respect to this structure" and the "different gesture motions used by a finger").

Additionally, the specification explains that along the length of a key cluster, the planar surfaces supporting the keys "intersect one another" as detailed in Figure 3. '477 Patent, Col. 5:8-12, Figure 3. "[T]he keys mentioned above in cluster 26 may be thought of as having actuation axes, respectively, which intersect normally the respective underlying support planed provided for the keys." Id. Col. 5:36-39. Thus, the claim language and specification describes a corner sub-amphitheater housing keys placed in intersecting planes and excludes a uniform, convex surface.

Finally, plaintiff's construction extending to a convex surface is contrary to Gambaro's representations to the PTO. As established by defendants' submissions, Gambaro unambiguously disavowed that a uniform convex curved surface was claimed by the '477 patent. Specifically, Gambaro distinguished several prior art keyboard references containing key clusters that were "uniformly curvilinearly convex in two orthogonal axes" and not "arranged in a cluster to confront in close proximity and in parallel planar relationship an associated finger-expanse portion." Goff Decl., Ex. 4, pp. 13-14. Gambaro stated: "Nothing could be further from what applicant claims as his invention" and directed the PTO to Figures 7 and 8 for clarification. Id. Ex. 4, p. 14.

Plaintiff argues that Gambaro merely explained to the PTO that the Malt keyboard did not include the claimed element of keys arranged to confront the underside of the finger as opposed to the tip, but that Gambaro's clarifications cannot invoke prosecution estoppel. Plaintiff is incorrect. Gambaro did not merely clarify the elements of his invention; he specifically distinguished prior art in order to secure issuance of the patent. Southwall Techs., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1583 (Fed.Cir.1995) ("Clear assertions made during prosecution in support of patentability, whether or not actually required to secure allowance of the claim, may also create an estoppel."). For example, Gambaro explained that the importance of the cluster limitation was to correspond with the underside of the finger, "an important distinction over prior art keyboards, the structure of which enable only the traditional fingertip keystroking . . . " Goff Decl., Ex. 4, p. 14 (emphasis added). Prosecution estoppel thus precludes plaintiff from claiming that the claim language encompasses devices with a uniformly convex surface. See Wang Lab., Inc., 103 F.3d at 1578 (arguments distinguishing prior art made during prosecution of patent "presumably give rise to prosecution history estoppel").

Accordingly, I construe the phrase to mean that each key of each finger cluster must be positioned parallel and in close proximity to the tip and the underside of the adjacent finger, and that the clusters be disposed along a concave surface.

1291

(6) "Each of said flexible links including a plurality of portions with neighboring portions having an area of inflection there
between." The flexible links are loops.

Defendant's only apparent point of departure from Plaintiffs' construction is the additional requirement that the first flange "extends downward to hook over and contact the rear portion of an extension on the primary frame." JS, Exh. C at 107 (emphasis added). Claim 12 has no such limitation. Instead, Claim 12 simply require that the magnetic materials of the primary frame "magnetically engage . . . in a lateral manner" the magnetic materials of the auxiliary frame." Koo Decl., Exh. C at 22, Col. 6, 11. 6-8. The section of the patent describing the summary of the invention is also consistent with this interpretation. See Koo Decl., Exh. C at 20, Col. 1, 11. 41-44; Col. 2, 11. 3-5.

Therefore, the Court declines to adopt Defendant's limitation requiring that the flange hook over and contact the rear portion of the extension of the primary frame. Instead, the Court construes the instant phrase to mean that each side having an extension and each extension including a rear end having a portion of the extension which protrudes from the rear end thereof and facilitates attachment of the auxiliary frame to the primary frame and where such portion of the extension reaches in a downward direction relative to the remaining portions of the extension.

Defendant objects to the magistrate judge's recommended construction of: "each stud is extended over by one of the extensions, and can support that extension to prevent the auxiliary frame from moving downward relative to the primary frame."

The magistrate judge noted that the parties' primary dispute concerned whether the court should adopt a construction requiring the primary frame studs to physically contact the extensions in order to provide support for the auxiliary frame. Essentially adopting the Plaintiffs' proposed claim construction, the magistrate judge recommended that this disputed claim element be construed to mean: "at least some portion of each of the extensions reaches above and across the corresponding stud, and is capable, with or without direct contact, of maintaining the corresponding extension in position so as to keep it from falling, sinking or slipping and thus prevent the auxiliary frame from moving downward relative to the primary frame." Report and Recommendation at 20 (emphasis added).

Defendant argues that the magistrate judge's recommended construction is incorrect because: (1) the patent discloses an embodiment in which the extensions directly contact the studs; (2) reading the claim to cover configurations in which the extensions do not directly contact the top surfaces of the studs requires magnetic attraction not disclosed in the patent; and (3) the patent says that engaging contact between the extensions and studs is part of the invention. Def. Obj. at 4-10.

The court overrules Defendant's objections. While the parties appear to agree that the stud can directly contact the extension to provide the claimed support, the dispute concerns whether the claim requirement can be provided by a magnetic support without direct contact between the extension and stud. As argued by Plaintiffs, Patent '747, column 3 lines 4 through 9 of the patent specification discloses that magnetic attraction alone may be used to "solidly secure[]" the auxiliary frame to the primary frame. The patent does not state that physical contact between the extension and the upper side of the stud is required for the invention. Moreover, in support of its objection, Defendant points once again to the embodiment of the invention shown in the patent's drawing in the specification, which does show contact. As already stated, the Federal Circuit has cautioned against this approach to claim construction, "even when a specification describes very specific embodiments
of the invention or even describes only a single embodiment, unless the specification makes clear that 'the patentee . . . intends for the claims and the embodiments in the specification to be strictly coextensive.'" JVW Enterprises, 424 F.3d at 1324 (citing Phillips, 415 F.3d at 1323). Moreover, as the magistrate judge correctly noted, "while Defendant points to a drawing that shows contact, Defendant points to nothing else in the specification, or in Claim 12, indicating that contact between the stud and extension is required." Report and Recommendation at 12.

In addition, as Plaintiffs correctly point out, the patent Abstract, a condensed summary of the invention, provides:

An eyeglass combination includes a primary frame having a bridge and two side studs. An auxiliary frame includes a bridge and two side extensions each having a rear flange for engaging with the stud and for allowing the auxiliary frame to be secured to a typical primary frame. The rear flanges each includes a magnet for engaging with another magnet engaged in the studs or for engaging with the studs of magnetic material.

See Ex. 1 to Pl. Resp (cited in Pl. Resp. at 11-12) (Plaintiffs' emphasis). 4 Thus, Defendant's contention that the patent discloses only direct contact is incorrect.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

4 The court rejects Defendant's argument that the magistrate judge relied only on the oral argument of Plaintiffs' counsel at the claim construction hearing to find that physical contact between the extension and the studs was not required. While the magistrate judge did make note in her Report and Recommendation that she found "compelling" Plaintiffs' arguments to support their assertion that the stud and extension need not have contact (see Report and Recommendation at 16), her Report and Recommendation makes clear that she considered the parties' written submission, including the patent, joint claim construction statement and parties' briefs. See id. at 1, 17.

II. "each tapered side diagonally approaching one of said second parallel sides"

Ethicon's proposed construction of this claim term is: "Each tapered side has a generally diagonal orientation and extends toward the second set of parallel sides. The term 'approaching' does not require connection of the tapered sides to the second parallel sides." U.S. Surgical proposes the following: "Diagonally approaching' means the tapered side constitutes a straight line displaced angularly between, and connecting, a first and second parallel side."

Thus, the first dispute is whether the term "approaching" as used in Claim 1 includes "connecting." Ethicon argues that the plain meaning of approaching is "to come nearer to," and that it does not require nor connote a "connection." Ethicon also relies on the doctrine of claim differentiation, a presumption that different patent claims have a different scope. See, e.g., Kraft Foods, Inc. v. Int'l Trading, 203 F.3d 1362, 1368 (Fed. Cir. 2000). Independent and unasserted Claim 5 describes the tapered sides as "connected" to both sets of parallel sides, not "approaching" the second parallel sides as phrased in Claim 1. (While Claim 1 addresses a "stapler" and Claim 5 addresses a "staple cartridge," the parties do not address this possible difference in scope nor ascribe any distinction that might be relevant to the use of the words "approach" vs. "connect.") Ethicon also notes that the Summary of the Invention states the tapered side "culminates" at the second parallel side. This, says Ethicon, demonstrates that the drafter made deliberate, different choices in describing the connection of the two sides, with no intent to equate all of these terms. Ethicon admits that most specification references and the embodiments include connections between the tapered and second set of parallel sides. Indeed, other than the Summary's use of "culminates" and "approaching" used in Claim 1, the patent uniformly describes the tapered sides as connected to the second parallel sides. But Ethicon relies on the well-established rule that, absent explicit limiting language, claims are not limited to the specific embodiments, even if the patent describes only a single embodiment. See, e.g., Altiris, Inc. v. Symantec Corp., 318 F.3d 1363, 1371 (Fed. Cir. 2003). Ethicon asserts that nothing in the specification explicitly limits "approaching" to "connecting" nor limits the claimed invention to the preferred embodiment.

U.S. Surgical argues that the repeated references in the specification to the "connection" between the tapered and parallel
The parties also dispute whether the tapered sides (described as "diagonally approaching" the second set of parallel sides) synonymous with "connecting." Whether the specification adequately supports this construction, or whether the claim may be construed to construe "approach" to have a meaning different from "connect." The drafter apparently intentionally used the word "approaching" to mean "connecting." While there is room for doubt, the Court is here, U.S. Surgical contends that the specification's consistent description of the "connecting" sides supports a conclusion that the claim term "within the vessel" to mean that the chamber was co-extensive with the vessel.

Usually, it is dispositive; it is the single best guide to the meaning of a disputed term." Id. at 1346-1347. The Court limited its opinion in Phillips, the Court again noted that the specification "is always highly relevant to the claim construction analysis. The dispute was whether the claims were limited to communications over a "telephone line" or could also include communications over a "packet-switched network" (e.g., the Internet). While a few of the claims explicitly used the term "telephone line," some were much broader, making no reference to a telephone line and, standing alone, did not exclude communications over a packet-switched network. The Court observed: "Nonetheless, the claims must be interpreted in light of the specification, which is identical for all three patents and which repeatedly and consistently describes the local and remote systems of the claimed inventions as communicating directly over a telephone line." Id. at 1347-1348. However, the Court also noted and relied on the extensive prosecution history of the patents, which explicitly supported the construction of the claims as limited to a telephone line. In this case, the claims were approved almost exactly as submitted by the applicant. (See Doc. 52, Exhibit 2, File Wrapper for the '823 patent, at pp. 19-20, which discloses only one Examiner's Amendment to Claim 5. Authorization for this amendment, adding the words "in a staple cartridge" to the claim, was given in an unrecorded telephone interview with the applicant's counsel.) Hence there is no prosecution history here that could assist in resolving this question.

More recently, in Semitool, Inc. v. Dynamic Micro Systems, 444 F.3d 1337 (Fed. Cir. 2006), the Federal Circuit construed a claim term and affirmed a judgment of noninfringement based on the Circuit's own construction. The dispute concerned whether a condenser in a semiconductor cleaning machine was inside or outside of the machine's "processing chamber." The answer depended on whether the "chamber" was defined as the entire interior space of the "processing vessel," or some smaller portion of that interior. The disputed claim simply described the chamber as "within" the vessel. The Court turned to the specification, which the Court concluded clearly defined the chamber as coextensive with the vessel. Quoting from its opinion in Phillips, the Court again noted that the specification "is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term." Id. at 1346-1347. The Court limited the claim term "within the vessel" to mean that the chamber was co-extensive with the vessel.

Here, U.S. Surgical contends that the specification's consistent description of the "connecting" sides supports a conclusion that the claim term "approaching" must be limited to mean "connecting." While there is room for doubt, the Court is constrained to construe "approach" to have a meaning different from "connect." The drafter apparently intentionally used "approaching" in Claim 1, as distinguished from "connect" in Claim 5. "Approaching" is not ambiguous, and is not synonymous with "connecting." Whether the specification adequately supports this construction, or whether the claim may be invalid, are matters for another day.

The parties also dispute whether the tapered sides (described as "diagonally approaching" the second set of parallel sides)
must be straight. Ethicon asserts that the plain meaning of "tapered" does not include nor require that the tapered side be straight. Ethicon admits that the specification and preferred embodiments depict a generally "straight" tapered, diagonal line. But Ethicon again argues that the claim cannot be limited by the specification or the preferred embodiment.

The Court previously construed "tapered" to mean progressively narrowed. While many things can "taper" (thunder storms, for instance, "taper" off), the question here is not the meaning of taper. The question is the construction of the phrase "diagonally approaches" to describe the tapered side's relationship to the second parallel side of the pocket.

Webster's Ninth defines the adjective diagonal as "joining two vertices of a rectilinear figure that are nonadjacent" or, "inclined obliquely from a reference line." When used as a noun, diagonal means a "diagonal straight line or plane." The Oxford English Dictionary similarly defines the words. "Diagonally" means "In a diagonal direction; so as to extend from one angle or corner to the opposite." "Diagonal" (n.) is defined as "Extending, as a line, from any angular point of a quadrilateral or multilateral figure to an opposite or non-adjacent angular point."

Every definition consulted, as well as common usage, confirms that "diagonal" is an obliquely inclined line that joins two defined points. The claim phrase "each tapered side diagonally approaching" is therefore construed as a generally (but not mathematically precise) straight line that lies at a measured angle of inclination from the first parallel side. This construction is also supported by the fact that "diagonally" describes a "side" of a pocket. "Side" commonly means a line or a surface that is more or less straight.

Ethicon argues that a construction requiring the diagonal, tapered lines to be "straight" imposes an extraneous limitation on the claim that finds no support in the patent language. The Court disagrees. There is nothing in the claim, or in the patent as a whole, that supports a construction other than that the tapered sides of the resultant pocket are generally straight.

B. "Each Within At Least One Compartment"

Claim 10 states that a heater comprises a housing that consists of: (1) "at least one" compartment or chamber and; (2) a plurality of heating elements "each within the at least one compartment for heating the water." Seitz asserts that the term "a plurality of electronically powered heating elements each within the at least one compartment for heating the fluid" means that each heating element must be within a compartment, and more than one heating element may be within a compartment, but not every compartment must contain a heating element. (Docket Entry No. 76 at 4-5). Envirotech asserts that the term means that if there is more than one compartment, each compartment must contain at least one heating element. (Docket Entry No. 78 at 2).

The plain meaning of the terms does not support Envirotech's argument. The words do not say that every compartment must have a heating element. Rather, the words say that there must be a plurality of electrically powered heating elements. Each of these heating elements must be within a chamber for heating the fluid. In other words, no heating element can be outside a chamber or compartment. If the housing consists of more than one compartment, Claim 10 requires that every heating element must be in a compartment, but does not require that every compartment must have a heating element. If the housing consists of only one chamber, all the heating elements must be within that chamber. But if there is more than one chamber or compartment, there does not need to be a heating element in every compartment.

Envirotech's reading would require that in a multi-chamber configuration, every compartment must have a heating element. The words of Claim 10 do not support this reading. Rather, the words of the claim require two or more heating elements and one or more compartments, with each heating element inside one of the compartments, but not that each compartment contain at least one heating element.

The specifications permit the more flexible construction offered by Seitz. Both the '971 and '880 Patent summaries include the general description, "The present invention provides a flow-through or tankless water heater having multiple heating elements powered by one or multiple power supplies." ('880 Patent, col. 4, ll. 58-60; '971 Patent, col. 4, ll. 57-59). The specifications reference "[a] first heating element" and then "successive and remaining heating elements." ('880 Patent, col. 5, ll. 18-21; '971 Patent, col. 5, ll. 17, 19-20). The '971 and '880 Patents both include the following language, "A preferred
embodiment of this invention uses four 7,000 watt heating elements connected electronically in parallel and arranged in series with respect to fluid flow through the water heater, as shown in FIG. 1." ('880 Patent, col. 17, ll. 52-55; '971 Patent, col. 17, ll. 52-55). The description refers to Figure 1, which shows a single heating element located in each heating chamber. In column 20 of the '880 and '971 Patents, however, the specifications state that although the described embodiments disclose "the use of multiple chambers each having a respective heating element therein," the control scheme could be applied to multiple heating elements in a single chamber or a single multi-section heating element. ('880 Patent, col. 20, ll. 28-37; '971 Patent, col. 20, ll. 28-34). This language permits flexibility on the number of chambers or elements in each chamber, limited only by the requirement that if there is only one compartment, it must contain two or more heating elements. If the patentee had wanted to require that at least one of the plurality of heating elements be located within one of a plurality of compartments, the language of dependent claim 16 would have been used: "a plurality of electrically powered heating elements each within a respective one of the plurality of compartments for heating the fluid." ('880 Patent, col. 24, ll. 3-5; '971 Patent, col. 22, ll. 50-52). Claim 10 is not so limited.

This court construes the term "each within one compartment" in Claim 10 of the '880 and '971 patents to mean that each heating element must lie within a compartment, but if there is more than one compartment, not every compartment must contain a heating element. The claim requires two or more heating elements and one or more compartments, and each heating element must be within a compartment. If the heater's housing contains only one chamber, all of the heating elements lie within that chamber. If the heater's housing contains more than one chamber, all the heating elements must lie within a chamber, but not within every chamber.

1296

a. Eccentric Weight Portion

APE maintains that "eccentric weight portion" in the claim language, given its "ordinary and customary meaning," refers to "that portion of the counterweight that contributes to the eccentric moment (i.e., it 'position[s] the center of gravity of the counterweight 40 radially away from its rotational axis' which creates eccentric moment)." Doc. 31, at 7, quoting '964 Patent, col. 3, ll 49-51. In other words, the term "eccentric weight" modifies the term "portion." "Eccentric weight portion" is defined, as is "cylindrical gear portion," by its purpose: just as the cylindrical gear portion is whatever portion of the counterweight that serves as a "substantially cylindrical" gear, the eccentric weight portion is whatever portion that serves to shift the centre of gravity radially outward from the axis of rotation of the counterweight.

J&G, on the other hand, argues for a delimited structural definition of the two terms that makes them definitely distinct: the cylindrical gear portion is the cylindrical gear structure and the eccentric weight portion is that structure extending forward from the front face of the cylindrical gear portion. Under J&G's definition, the claims set out that where one portion ends the other begins. Under APE's definition, it is possible for the two definitions to describe shared volume.

J&G first focuses upon the specification, which describes the "eccentric weight portion" as "[that] portion of the counterweight, which is formed integral with the gear portion, [and] extends forward from the front face of the gear portion." '964 Patent, col. 3, ll 49-51 (emphasis added). APE argues that the claim language nowhere requires the eccentric weight portion to protrude from the front face of the gear portion, and that the description in the specification is that of a preferred embodiment that does not limit the claims. Cf. Specialty Composites, 845 F. 2d at 987("[P]articular embodiments appearing in the specification will not generally be read into the claims.")

J&G counters that the language of the specification cannot be disregarded in the claim construction, but APE points out that the patent gives notice 6 that the specification describes a preferred embodiment of the invention and references five drawings (Figures 1, 2, 3A, 3B, and 4) of the preferred embodiment. '964 Patent, col. 3, ll 9-25. Because a description of the preferred embodiment in a specification cannot limit the patent claim, the language in the specification requiring the eccentric weight portion to protrude from the front face of the gear portion cannot be read into the claim. Electro Med. Sys., S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994). J&G argues that within the detailed description, which is illustrated by the drawings, the descriptive language going before Col 5, line 26 are not of the preferred embodiment, but of the invention. Doc. 27 at 11. It is only on line 26 that the description recites, "In the preferred embodiment. . . ." J&G argues that it is only the language following this specific statement that describes the preferred embodiment. J&G's assertions, first, ignore the language of column 3 that specifically states that the following detailed
description is of the preferred embodiment, and second, would have the Court construe the broad claim of the patent as the precise language of the specification. Such a construction would unduly read limitations in the specifications onto the claims. Phillips, 415 F.3d at 1323. The Federal Circuit in Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361, 1373 (Fed. Cir. 2007) compared the district court's task in distinguishing between reading the claims of a patent in light of the specification and improperly reading in a limitation from the specification to walking a tightrope. Given the fact that the Court's job in drawing the line between construing terms and importing limitations can be aided by focusing upon "understanding how a person of ordinary skill in the art would understand the claim terms" Phillips, 415 F.3d at 1323. Phillips goes on to point out that persons of ordinary skill in the art "rarely would confine their definition of terms to the exact representations depicted in the embodiments." Id.

6 "The present invention will be more clearly understood from the following detailed description of the preferred embodiment taken in conjunction with the attached drawings." '964 Patent, col. 3, 11 9-12.

APE also points to a rule of patent construction, which holds that two differently named elements may contain a common structure if at least some structure is different. Faber, Landis Mechanics of Patent Claim Drafting, Sec. 21 (4th ed. 1999). The claims' language does not preclude the cylindrical gear portion and the eccentric weight portion from having common structure, and the specification describes the gear portion as having structure that contributes to the dynamic forces, that is, eccentric moment, generated upon rotation of the gear portion about its rotational axis. '964 Patent, col. 5, ll 53-60. That structure of the gear portion, under the laws of physics, is an eccentric weight. APE argues that it follows that "even if no further weight were added to the counterweight," be it weight extending outward from the front face of the gear portion or weight from heavy metal inserts, "the counterweight would still contain an eccentric weight portion because the structure of the gear portion would contribute to moving the center of gravity of the counterweight radially away from its axis of rotation." Doc 26 at 9.

J&G argues that APE's assertion that "under the law of physics these apertures or cavities makes [sic] the cylindrical gear portion eccentric and eliminates [sic] the need for an 'eccentric weight portion' that extends forward from the front face of the gear portion," is contrary to law. Doc 27, at 13, referencing Doc 26 at 9. It is contrary to law, J&G argues, because the law grants the patentee a license to be his own lexicographer, and, as his own lexicographer, he can define a term through the specifications and the arguments made in the file history. Citing the file history at Reexamination Control No. 90/007,337 for U.S. Patent No. 5,355,964 File History--June 6, 2006 Reply to Office Action, page 4, attached at Exhibit A to Doc 27, J&E argues that APE made arguments to the Patent Office that prevent the volume rearward of the front face as being construed as the eccentric weight portion. Hockerson-Halberstadt, Inc. v. Avia Group Int'l, Inc. 222 F.3d 951, 956 (Fed. Cir. 2000) ("[S]tatements made during prosecution commit the inventor to a particular meaning of a claim term that is binding during litigation," citing CVI/Beta Ventures, Inc. v. Tura LP, 112 F.3d 1146, 1158 (Fed. Cir. 1997) ). Doc. 27 at 14.

When the '964 Patent was re-examined, the examiner issued a rejection of APE's application based on U.S. Patent No. 3,224,514 (Hornstein et al.). This patent disclosed four rotors geared together with each rotor having ten cavities. The three cavities on the bottom of each rotor could receive tungsten inserts, thus creating an eccentrically weighted gear for pile driving. J&G argues that in order to distinguish APE's application over the Hornstein Patent, APE responded to the rejection with a statement of the intended meaning for "eccentric weight portion."

As best seen in FIGS 3A and 3B, . . . [t]he eccentric weight portion 43 of the counterweight 40, which is formed integral with the gear portion 41, extends forward from the front face 96 of the gear portion. . . . In the preferred embodiment, the eccentric weight portion 43 has a substantially semi-cylindrical portion 100, and the bottom portion 104 constitutes over one-half of the area of gear portion 41. Accordingly, the counterweight 40 has a large mass of material integral to and projecting from the bottom portion 104 of the gear portion 41. . . .
J&G argues that APE's argument implies "that Hornstein's tungsten inserts were only in the gear, and because these gears did not include any materials extending forward from a front face, Hornstein did not obviate Plaintiff's claims." Id. J&G discounts APE's argument in its claim construction brief as being different from the argument made to the Patent Office at the time of the rejection. In its claim construction brief, J&G argues, APE is taking "a very different view . . ., [t]hat is, the eccentric weight portion does not just extend forward from the front face as stated in the specification and to the Patent Office during prosecution, but also extends rearward sharing a common volume with the gear portion." Id.

Further J&G points to Reexamination Control No. 90/007,337 for U.S. Patent No 5,355,964 File History--September 14, 2006 Reply to Office Action, page 9 (Attached as Exhibit B ('Ex. B')), an additional portion of the file history, that J&G argues includes APE's "argument that a cavity or aperture by itself cannot be an 'eccentric weight portion.'" Id. "Again, it is only after the prosecution has closed that Plaintiff is attempting to recapture this 'structure.'" Id.

APE addresses J&G's file history arguments in its Claim Construction Reply Brief, Doc. 31, making the point that "prosecution history estoppel does not modify the plain and ordinary meaning of the claim terms." Doc. 31, at 12. APE begins by stating the standard for argument-based estoppel. "To invoke argument-based estoppel, the prosecution history must evince a 'clear and unmistakable surrender of subject matter.'" Eagle Comtronics, Inc. v. Arrow Communication Labs., Inc., 305 F.3d 1303, 1316 (Fed. Cir. 1999) (citing Pharmacia Upjohn Co. v. Mylan Pharmaceuticals, Inc., 170 F.3d 1373, 1377 (Fed. Cir. 1999). APE argues that the standard cannot be met in this case because neither was the argument based on the issue of the asserted estoppel (citing Eagle Comtronics, 305 F.3d at 1316 and AquaTex Industries, Inc. v. Techniche Solutions 419 F.3d 1374, 1383 (Fed. Cir. 2005)), nor was the statement more than a mere clarification of the examiner's mistake. APE further points out, "[w]here a patentee disputes an examiner's statement on the record, and makes no amendment based on the examiner's statement, such statement usually [will] not be construed as a basis for argument-based prosecution history estoppel." Doc. 31, at 13, quoting Dow Chemical Co. v. Sumitomo Chemical Co., 257 F.3d 1364, 1382 (Fed. Cir. 2001).

APE explains that during the reexamination by the Patent Office, the examiner rejected most of the patent's claims, including each of the independent claims, 1, 6, 11, and 16 as anticipated, under 35 U.S.C. Sec. 102(b) by Hornstein '514. The examiner believed that every element of the claim was found in Hornstein '514 because a "claim is anticipated only if each and every element as set forth in the claim is found, either expressly or inherently described, in a single prior art reference.' M. P. E. P. Sec. 2131 (Rev. 6, Sept 2007)"), quoting Verdegaal Bros. v. Union Oil of California, 814 F.2d 628, 631 (Fed. Cir. 1989)." Doc. 31 at 14. APE responded to the rejection by arguing that not all of the elements were present in the Hornstein '514 Patent, making three alternative arguments. If any one of the three arguments were successful, the section 102 rejection would be overcome. APE sets out the three arguments made to the patent office, which it admits may have been "inartfully" made, but were made "without the intent to surrender subject matter." Doc. 31, at 14. The arguments were that Hornstein '514:

1) did not have an eccentric weight portion into which an insert could be inserted; 2) if the weighted inserts placed within the rotor of Hornstein '514 was considered to be the eccentric weight portion, then the eccentric weight portion was not integral with the cylindrical gear portion; and 3) if the weighted inserts placed within the rotor of Hornstein '514 was considered to be the eccentric weight portion, then the eccentric weight portion and the cylindrical gear portion were not of a first metal, but of different metals.

Id.

APE argues that the first argument points out that the eccentric weight portion moves the center of gravity of the counterweight radially away from its rotational axis and that the claimed invention had an eccentric weight portion before weighted inserts were inserted, in contrast to Hornstein '514, which disclosed a non-eccentric rotor, that is, one without eccentric moment, that became eccentric only when a weighted insert was inserted into the rotor. That weighted insert became "the eccentric weight portion because it was the only weight contributing to the eccentric moment of the device." Doc 31 at 14-15, referencing Doc 27, Exhibit B at 4-5.

The second argument 7 made to the patent office concerned the weighted inserts of Hornstein '514, which, if construed to be the eccentric weight portion element discussed above, were not "integral" with the cylindrical gear portion. Rather, the weighted inserts were "a separate element added to the rotor" Doc. 27, Exhibit B, at 6 "and did not have the integral, one
Perhaps unartfully, the patentee was arguing that the weighted inserts of Hornstein '514 could not be both the eccentric weight portion that is integral with the gear portion and also be the "solid insert member" of the claims that is positioned within the eccentric weight portion. The weighted inserts of Hornstein could not be both positionable and also have the integral, one-piece-nature of the eccentric weight portion.

Id.

Footnotes

7 The second and third arguments are more relevant to the disputed claim term "integral," but are placed with the first argument so that all three arguments may be viewed in context.

End Footnotes

APE characterizes the third argument as "corollary to the second argument." Again, "if the weighted inserts of Hornstein '514 were construed to be the eccentric weight portion, then the counterweight was not made of a first metal. The weighted inserts of Hornstein '514 were made of a heavy metal that differed from the metal of the rotor. The counterweight could not be made of a "first metal" if the weighted inserts that were required to make the rotor eccentric were made of a different metal. Id.

The Court finds that, concerning the disputed claim term, "eccentric weight portion," when the file history is considered in its entirety there is nothing contained therein that reveals APE's arguments in the prosecution history relinquished subject matter. "[A] competitor would not reasonably believe that the applicant has surrendered the relevant subject matter." Pharmacia, 170 F.3d at 1377. Accordingly, the Court finds that the ordinary and customary meaning of "eccentric weight portion" must be used, and, as such, APE's construction is adopted. "Eccentric weight portion" is construed to mean, "that portion of the counterweight that contributes to the eccentric moment of the counterweight. The portion is part of the whole counterweight, but need not be a separate component piece or part."

Eccentric Weight Portion

The phrase "eccentric weight portion" is found in asserted claims 1, 3, 6, 11, and 16, as well as unasserted claims 19, 21, 26, and 27. APE seeks to define the phrase functionally, which would allow for the eccentric weight portion to share common structure with the cylindrical gear portion, whereas Geoquip seeks to define the phrase structurally, which would require the eccentric weight portion to be physically distinct from the cylindrical gear portion. Specifically, APE proposes the following definition:

Eccentric weight portion -- is that portion of the counterweight that creates the eccentric moment of the counterweight.

The portion is part of the whole counterweight, but need not be distinct from the cylindrical gear portion.

The eccentric weight portion has one or more areas for receiving an insert.

In contrast, Geoquip proposes the following definition:

Eccentric weight portion -- The mass that extends forward from the front face of the bottom portion of the gear portion of the counterweight such that the counterweight has more weight at its bottom portion than its top portion.

Id.
The court begins its construction of "eccentric weight portion" by looking to the claims themselves. Claim 1, which is representative of the asserted claims, describes a "counterweight having a cylindrical gear portion and an eccentric weight portion integral with said cylindrical gear portion, said eccentric weight portion having at least one insert-receiving area formed therein." '964 Patent, col. 9, ll. 39-43. Although "eccentric weight portion" is used in a consistent manner in the remaining claims, the claims do not define the phrase explicitly. Thus, the court turns to the specification for additional guidance.

The specification provides the following description:

As best seen in FIGS. 3A and 3B, the gear portion 41 of the counterweight 40 is substantially cylindrical and has a rear face 94, a front face 96, and a plurality of gear teeth 98 around its perimeter. The eccentric weight portion 43 of the counterweight 40, which is formed integral with the gear portion 41, extends forward from the front face 96 of the gear portion. The gear portion 41 has a weight distribution with less weight provided by a top portion 102 and more weight provided by a bottom portion 104 as a result of the eccentric weight portion 43 being connected thereto. In the preferred embodiment, the eccentric weight portion 43 has a substantially semi-cylindrical portion 100, and the bottom portion 104 constitutes over one-half of the area of gear portion 41. Accordingly, the counterweight 40 has a large mass of material integral to and projecting from the bottom portion 104 of the gear portion 41, thereby forming a counterweight having a center of gravity located radially outward from the rotational axis of the gear portion.

Id. at col. 5, ll. 17-36 (emphasis added). In the portion of this passage that precedes the phrase "in the preferred embodiment," the patentee describes the eccentric weight portion structurally, as being that portion of the counterweight that extends forward from the front face of the gear portion. While the court does not presume that the phrase "in the preferred embodiment" automatically transforms the preceding language in this paragraph into claim limitations, the court does assume that the phrase was inserted to distinguish in some manner the preceding description from the one that followed. Indeed, the repeated invocation of the preferred embodiment throughout the specification must serve some purpose, namely that of distinguishing more general descriptions of the invention from more specific descriptions of the preferred embodiment itself. See, e.g., id. at col. 3, ll. 61-62; col. 5, ll. 27-28, 51, 65; col. 7, ll. 35, 55; col 8, ll. 32-33.

APE, in response, argues that all discussions of the figures in the specification refer to the preferred embodiment alone, relying on a boilerplate disclaimer found in the '964 Patent. See id. at col. 3, ll. 9-12 ("The present invention will be more clearly understood from the following detailed description of the preferred embodiment taken in conjunction with the attached drawings."). Although the court declines to accept this boilerplate language as decisive, see, e.g., Les Traitments Des Eaux Poseidon. Inc. v. KWI, Inc., 135 F. Supp. 2d 126, 135 (D. Mass. 2001) (assigning "little weight" to boilerplate language in specification indicating general description of invention was "non-restrictive"), the court is also wary of improperly reading limitations from the specification into the claims. See Phillips, 415 F.3d at 1323. Thus, the court looks to the specification as a whole to determine whether a person of ordinary skill in the art would conclude the eccentric weight portion to be structurally distinct from the cylindrical gear portion in every embodiment of the claimed invention. See Alloc, 342 F.3d at 1370.

In addition to the passage cited above, the court finds illustrative several other portions of the '964 Patent. First, the abstract of the invention indicates that the "counterweight has a cylindrical gear portion and an eccentric weight portion integrally formed therewith." '964 Patent, Abstract (emphasis added). The abstract does not say that the eccentric weight portion is integrally formed "therein" with respect to the cylindrical gear portion, but rather that it is integrally formed "therewith," which connotes a physical distinction between the two. 3 This description belies APE's assertion that the "eccentric weight portion," being any portion of the cylindrical gear portion to create eccentric moment, may be wholly contained within the cylindrical gear portion. Instead, the description supports Geoquip's characterization of the "eccentric weight portion" as being physically distinct from the gear portion.

3 Within the specification itself, the patentee uses the word "thereto," which like "therewith" suggests physically distinct components. '964 Patent, col. 5., l. 27. By comparison, the eccentric weight portion has "dense, solid, metal inserts 45 mounted therein." Id. at col. 3, ll. 47-48 (emphasis added).
In addition, the specification gives no indication that the "eccentric weight portion" was intended to include, as APE suggests, that portion of the gear portion containing unbalanced weight. When the specification refers to the apertures in the top portion of the gear portion that are designed to increase the eccentric weight found in the bottom portion of the gear portion, there is no mention of that offsetting weight being part of the "eccentric weight portion," as that phrase is used throughout the '964 Patent. See id. at col. 5, ll. 53-60. If the patentee intended the offsetting weight to be part of the "eccentric weight portion," a person of ordinary skill in the art might expect some indication to that effect.

Indeed, the specification's description of the balancing process further refutes APE's position that the "eccentric weight portion" is functionally defined:

Each counterweight 40 is balanced again on the balancing device to assure that the eccentric weight portion 43 hangs at its lowest point of a revolution when the counterweight is at the equilibrium position. If the eccentric weight portion 41 [sic] does not hang properly, metal may be removed from the eccentric weight portion to achieve a properly balanced counterweight.

Id. at col. 9, ll. 11-17. In order for the "eccentric weight portion" to be capable of hanging at "its lowest point," that phrase must be conceived of in a physical, structural manner, rather than in a functional one, as APE suggests. Thus, implicit within the specification is the understanding that the eccentric weight portion is defined structurally and is physically distinct from the cylindrical gear portion.

While the patentee could have defined "eccentric weight portion" in another manner if he had chosen to do so, the court finds that a person of ordinary skill in the art at the time of the invention would have understood the eccentric weight portion and the cylindrical gear portion to be physically distinct in every embodiment of the claimed invention. See Alloc, 342 F.3d at 1370. Nevertheless, although the court agrees with Geoquip that the eccentric weight portion extends outward from the cylindrical gear portion, the court does not agree that the eccentric weight portion must extend forward, as opposed to rearward. The court, therefore, construes the phrase "eccentric weight portion" to mean "that portion of the counterweight that extends either forward or rearward from the front or back face of the gear portion such that it shifts the center of gravity radially outward from the gear's rotational axis."

While the notion that the eccentric weight portion is physically distinct from the cylindrical gear portion is pervasive throughout the '964 Patent, the basis for limiting the eccentric weight portion to extending forward rather than rearward is limited to an isolated description in the specification. See '964 Patent, col. 5, ll. 20-23. As the court does not believe that extending forward rather than rearward is part of the "very character" of the claimed invention, the court refuses to limit the claims in that manner. See Alloc, 342 F.3d at 1370.
proposes the following construction for this term:

Eccentric weight portion -- is that portion of the counterweight that creates the eccentric moment of the counterweight.

The portion is part of the whole counter weight, but need not be distinct from the cylindrical portion.

The eccentric weight portion has one or more areas for receiving an insert.

Joint Disputed Claim Chart, Dkt. # 29-2, p. 1. Defendants propose the following construction:

Eccentric weight portion -- The mass that extends forward from the front face of the bottom portion of the gear portion of the counterweight such that the counterweight has more weight at its bottom portion than its top portion.

Id.

The term is first used in claim 1, describing a counterweight as "having a cylindrical gear portion and an eccentric weight portion integral with said cylindrical gear portion, said eccentric weight portion having at least one insert-receiving area formed therein . . . " '964 patent, col. 9 lines 39-43. Although not defined in the claims, the term is used consistently in subsequent claims, each time describing a portion of the counterweight. There is no expressed intent to give the term a different meaning in other claims.

At the Markman hearing, both parties referred to the specification to define the term. However, each side cited a different area of the specification. Plaintiff referred the Court to the introductory lines of the detailed description of the invention, wherein it states that

The vibratory assembly generates substantially vertical vibratory forces by rotating at high speeds two counterweights within a housing. Each counterweight has a gear portion and an eccentric weight portion that is integral to the gear portion. The eccentric weight portion has dense, solid, metal inserts 45 mounted therein to increase the mass of the eccentric weight portion, and to position the center of gravity of the counterweight radially outward from its rotational axis.

'964 patent, col. 3 lines 41-51 (numbered references to drawings omitted). Defendants referred the Court to language in the specification that describes a shape and location for the eccentric weight portion:

As best seen in FIGS. 3A and 3B, the gear portion of the counterweight is substantially cylindrical and has a rear face, a front face, and a plurality of gear teeth around its perimeter. The eccentric weight portion of the counterweight, which is formed integral with the gear portion, extends forward from the front face of the gear portion. The gear portion has a weight distribution with less weight provided by a top portion and more weight provided by a bottom portion as a result of the eccentric weight portion being connected thereto. In the preferred embodiment, the eccentric weight portion has a substantially semi-cylindrical portion, and the bottom portion constitutes over one-half of the area of gear portion. Accordingly, the counterweight has a large mass of material integral to and projecting from the bottom portion of the gear portion, thereby forming a counterweight having a center of gravity located radially outward from the rotational axis of the gear portion.

'964 patent, col. 5 lines 17-36.

Defendants contend that since language defining the location of the eccentric weight portion precedes the description of the preferred embodiment, it is broader in application than the preferred embodiment, and defines the location of the eccentric weight portion for all embodiments of the invention. However, the Court finds that adopting defendants' proposal would require that a limitation expressed in the specification be imported into the claims, where it does not appear. While the drawings and detailed descriptions thereof are helpful in understanding the preferred embodiment of the invention, they do not express the only embodiment. The claims themselves do not at any point suggest or limit the location of the eccentric gear portion within the counterweight, other than to specify that it is "integral with the cylindrical gear portion" (claims 1, 6, 11, 19, 21, 27). One claim describes the eccentric weight portion as "connected to said cylindrical gear portion at a position radially outward of the axis of said cylindrical gear portion" (claim 16), but this language does not specify whether it extends outward from the front or the rear of the cylindrical gear portion. Two claims describe a counterweight in which the
eccentric weight portion and cylindrical gear portion are "coaxially aligned" so that an aperture can extend through both (claims 21, 27), but again this does not limit the location of the eccentric weight portion to one side or the other of the cylindrical gear portion.

The Court therefore finds, after reviewing the claim language and the specification, that the phrase eccentric weight portion should be construed to mean "that portion of the counterweight that creates the eccentric moment of the counterweight by having unbalanced weight offset from the axis of rotation. The eccentric weight portion has one or more inset receiving areas."

1299

4. "Eccentric Weight Portion"

The phrase "eccentric weight portion" is found in asserted claims 1, 3, 6, 11 and 16, as well as in unasserted claims 19, 21, 26 and 27. APE argues that the phrase "eccentric weight portion" should be defined functionally as "... that portion of the counterweight that contributes to the eccentric moment of the counterweight. The portion is part of the whole counterweight, but need not be a separate component piece or part." 10 Doc. No. 37 at 4. ECA, however seeks a structural definition of the phrase, positing that it should be construed as "[t]he mass that extends forward from the front face or rearward of the rear face of the gear portion of the counterweight and causes an unequal weight distribution about the rotational axis." Doc. No. 41 at 1. After examining the papers and arguments in the Bay case, Judge Hamilton of the Northern District of California construed the phrase to mean "the bottom portion of the counterweight, which extends forward from the front face of the gear portion, containing more weight than the top portion due to its larger mass, including at least one insert-receiving area therein adapted to receive at least one solid tungsten rod." Bay, 632 F. Supp. 2d 956, 2009 WL 1684611, at *6.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

10 APE defines "eccentric moment" as being weight multiplied by the distance from the axis of rotation from the center of gravity. See Doc. No. 30 at 4, n.1. This term is not defined in the language of the claims or specification of the '964 Patent, but instead appears to be a term of art from the physical sciences. APE's definition of eccentric moment is not contested by ECA.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In order to construe this phrase, this court turns first to the language of the claims themselves. Claim 1 recites, inter alia: "[a] vibratory assembly for imparting a vibratory force to a pile, comprising . . . [a] counterweight having a cylindrical gear portion and an eccentric weight portion integral with said cylindrical gear portion, said eccentric weight portion having at least one insert-receiving area formed therein, said counterweight being made of a first metal." '964 Patent, col. 9, ll. 33-44. Throughout the claims, certain structural attributes are assigned to the eccentric weight portion: (1) it is part of the counterweight; (2) it is integral with the cylindrical gear portion; 11 (3) it is made of a first metal; and (4) it is designed to hold at least one insert-receiving area. The Court is satisfied that the meaning of "eccentric weight portion" is consistent throughout the claims. However, as there is no explicit definition of the term in the claims, this Court must turn to the specification for guidance.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

11 The Court takes notice that in claim 16, the eccentric weight portion is described as only being "connected to" the cylindrical gear portion, which implies a less complete form of joining than integral. See '964 Patent, col. 11, l. 13.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The specification states that vibratory pile driving / pile extracting apparati are able:

to generate extremely high driving and pulling forces by rapidly rotating large counterweights within vibratory [sic]
assembly. The counterweights are large cylindrical, eccentrically weighted gears, i.e., they have an uneven weight distribution around the body of the gear such that its center of gravity is radially outward from the gear's rotational axis.

'964 Patent, col. 1, ll. 23-29. The specification further provides:

The vibratory assembly 34 generates substantially vertical vibratory forces by rotating at high speeds two counterweights 40 . . . Each counterweight 40 has a gear portion 41 and an eccentric weight portion 43 that is integral to the gear portion. The eccentric weight portion 43 has dense, solid, metal inserts 45 mounted therein to increase the mass of the eccentric weight portion, and to position the center of gravity of the counterweight 40 radially outward from its rotational axis.

'964 Patent, col. 3, ll. 42-51. The two above sections of the specification demonstrate that the unbalanced, or eccentric, nature of the counterweight is a necessary part of this invention. Furthermore, these passages provide notice to the person having skill in the art that the "eccentric weight portion" is the part of the counterweight that, at least partially, provides that unbalanced, eccentric weight.

Central to ECA's argument that the eccentric weight portion is limited to structure extending from the gear face is the following passage from the specification:

As best seen in FIGS. 3A and 3B, the gear portion 41 of the counterweight 40 is substantially cylindrical and has a rear face 94, a front face 96, and a plurality of gear teeth 98 around its perimeter. The eccentric weight portion 43 of the counterweight 40, which is formed integral with the gear portion 41, extends forward from the front face 96 of the gear portion. The gear portion 41 has a weight distribution with less weight provided by a top portion 102 and more weight provided by a bottom portion 104 as a result of the eccentric weight portion 43 being connected thereto. In the preferred embodiment, the eccentric weight portion 43 has a substantially semi-cylindrical portion 100, and the bottom portion 104 constitutes over one-half of the area of gear portion. Accordingly, the counterweight 40 has a large mass of material integral to and projecting from the bottom portion 104 of the gear portion 41, thereby forming a counterweight having a center of gravity located radially outward from the rotational axis of the gear portion.

'964 Patent, col. 5, ll. 17-36. However, as was noted above, Figures 3A and 3B are explicitly stated in the specification to show only the preferred embodiment of the counterweight. See '964 Patent, col. 3, ll. 9-24. Given that the above passage, by reference, refers only to the preferred embodiment of the invention, this Court must determine whether a person having skill in the art would read the limited physical structure of the preferred embodiment onto the language of the claims. This Court believes that such a person would not do so.

The physical structure of the preferred embodiment of the invention in the '964 Patent, as exemplified in the specification, is not necessary for the invention, in general, to carry out its task in the manner described in the claims and the specification. For example, this Court can imagine a hypothetical construction of the claimed counterweight, in which the structure of the eccentric weight portion does not extend from a gear face, but is instead completely enclosed within the cylindrical gear portion. There is no evidence before this Court that such a hypothetical embodiment would necessarily behave in a substantially different way from the preferred embodiment described in the specification, or that it would read on prior art. As such, ECA's argument that a person having skill in the art would limit the eccentric weight portion to some physical structure that is attached to the gear face in the preferred embodiment is unpersuasive.

However, it is important to note that there is one significant limitation to the structure of the eccentric weight portion: it cannot be defined to include the solid, heavy metal member that is housed in the insert area. This limitation comes from the prosecution history. During the 2006 reexamination, the patent owner, in an attempt to differentiate the '964 Patent from the Hornstein patent, argued that the two inventions differed because the counterweight recited in the '964 Patent had eccentric weight independently of its inserts, and Hornstein's invention did not. See Doc. No 35-2 at 5. Since this argument was persistently made and eventually accepted by the examiner, this constitutes a clear and unambiguous disavowal of broader protection. See J.A. of Intrinsic Evidence, Ex. D (Doc. No. 38-5), at 10; see also APE's Compl., Ex. A (Doc. No. 1-3), at 14-15.

After weighing the above evidence, this court recommends that "eccentric weight portion" be construed as meaning: "the portion of the counterweight, being made of a first metal, that provides unbalanced weight to the counterweight with respect to the counterweight's axis of rotation, and with at least one insert-receiving area."
This phrase appears in asserted claims 1, 3, 6, 11 and 16. The phrase also appears in unasserted claims 19, 21, 26 and 27. APE contends that "eccentric weight portion" should be construed to mean "that portion of the counterweight that contributes to the eccentric moment of the counterweight. The portion is part of the whole counterweight, but need not be a separate component piece or part." Bay contends that "eccentric weight portion" should be construed to mean "the portion of the counterweight that extends forward from the front face of the gear portion as defined in the specification."

To begin its analysis, the court first turns to the claims themselves. The phrase "eccentric weight portion" is first introduced in claim 1, which provides: "A vibratory assembly for imparting a vibratory force to a pile, comprising: . . . a counterweight. . . . having a cylindrical gear portion and an eccentric weight portion integral with said cylindrical gear portion, said eccentric weight portion having at least one insert-receiving area formed therein, said counterweight made of a first metal; a solid insert member securely positioned in one of said at least one insert-receiving areas said solid insert member being made of a second metal . . ." Claim 2 provides that the first metal is steel and the second metal is tungsten. Claim 3 provides that the insert-receiving area is a bore in the eccentric weight portion and the solid insert is a tungsten rod.

As to the other claims in which the phrase appears, e.g., claims 6-9, 11-13 and 16-19, the relevant language is substantially similar to the language in claims 1-3 insofar as those claims indicate that the counterweight is comprised of an "eccentric weight portion" and a "cylindrical gear portion"; the "eccentric weight portion" has at least one "insert-receiving area"; at least one solid insert is inserted into an "insert-receiving area"; the counterweight is made of steel; and the solid insert is a tungsten rod.

Based on the court's review of the claim language, two things are evident. First, the term "eccentric weight portion" is meant to have the same meaning in each claim, since there is no indication that the phrase is to be given a specific definition in any one claim versus another, and no indication that the phrase has been particularly defined, or referred to in a materially different way, in any specific claim. Second, the claim language does not define the phrase, but rather describes that the "eccentric weight portion" is a portion of the counterweight with at least one insert-receiving area therein adapted for receiving at least one solid tungsten rod. Accordingly, the court must turn to the specification for added insight.

The specification explains that the "vibratory assembly of the present invention . . . generates substantially vertical vibratory forces by rotating at high speeds two counterweights 40. . . . Each counterweight 40 has a gear portion 41 and an eccentric weight portion 43 that is integral to the gear portion. The eccentric weight portion 43 has dense, solid, metal inserts 45 mounted therein to increase the mass of the eccentric weight portion, and to position the center of gravity of the counterweight 40 radially outward from its rotational axis." '964 Patent, col. 3, lines 39-51 (footnote added). The specification further provides:

As best seen in FIGS. 3A and 3B, the gear portion 41 of the counterweight 40 is substantially cylindrical and has a rear face 94, a front face 96, and a plurality of gear teeth 98 around its perimeter. The eccentric weight portion 43 of the counterweight 40, which is formed integral with the gear portion 41, extends forward from the front face 96 of the gear portion. The gear portion 41 has a weight distribution with less weight provided by a top portion 102 and more weight provided by a bottom portion 104 as a result of the eccentric weight portion 43 being connected thereto. In the preferred embodiment, the eccentric weight portion 43 has a substantially semi-cylindrical portion 100, and the bottom portion 104 constitutes over one-half of the area of gear portion. Accordingly, the counterweight 40 has a large mass of material integral
to and projecting from the bottom portion 104 of the gear portion 41, thereby forming a counterweight having a center of gravity located radially outward from the rotational axis of the gear portion.

'964 Patent, col. 5, lines 17-36.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -
2 "The preferred solid insert 45 is a tungsten rod . . ." '964 Patent, col. 6, line 5. "A tungsten rod is used as the preferred solid insert 45 because the metal is very dense and has a melting point temperature far greater than temperatures experienced by the counterweight 40 during operation of the vibratory assembly 34." '964 Patent, col. 6, lines 11-15.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

As the specification describes, and figures 3A and 3B illustrate, the counterweight has a top portion and a bottom portion. The bottom portion extends forward from the front face of the gear portion and contains more weight than the top portion as a result of the "eccentric weight portion," which has at least one dense, solid, metal insert, i.e., tungsten rod, mounted therein to increase the mass of the "eccentric weight portion." The specification teaches that the function of the "eccentric weight portion" is to create an uneven weight distribution around the body of the gear such that the center of gravity is located radially outward from the rotational axis of the gear portion, thereby allowing the counterweight to generate substantial vibratory forces upon rotation.

After reviewing the claim language and the specification, the court declines to adopt either party's proposed construction of the phrase "eccentric weight portion." Instead, the court construes the phrase "eccentric weight portion" to mean: "the bottom portion of the counterweight, which extends forward from the front face of the gear portion, containing more weight than the top portion due to its larger mass, including at least one insert-receiving area formed therein to receive at least one solid tungsten rod."

1301
c. "eccentrically coupled"

The term "eccentrically coupled" appears in claim 1. Boston Scientific Enhanced Coverage Linking argues that the term should be construed as "not concentrically coupled (with respect to the elongate member)." ev3 asserts that "eccentrically coupled" should be construed as "residing eccentrically about something to which the object is directly attached." The Court declines to construe the term "eccentrically coupled."

GO BACK

1302
1. "economy safe"

Tidel proposes this term means "a safe that is performing at a lesser capacity than the intelligent safe." FKI proposes the term means "safes comprised of just a safe and a bill validating unit, without a PC board and printer." The specification describes an arrangement where one central "intelligent safe" can be coupled to a plurality of "economy models of the safe." [4:23-30] Tidel points out that the specification describes that "economy models of the safe (i.e., comprised of just a safe and a unit 16, without a PC board and printer) can be placed at various locations throughout a retail establishment and coupled to the above-described 'intelligent' safe for processing of data by bill receiving unit and by totals." [4:22-34] Tidel argues, therefore, that "economy safes" need only perform at a lesser function than the "intelligent safes" that process data from them. Tidel argues the parenthetical is only a description of one embodiment, and that "economy safes" may, or may not, have a printer or PC board.

Tidel fails to meaningfully explain the applicant's choice of "i.e.," instead of "e.g." Tidel's argument that the parenthetical only shows an example of a preferred embodiment is unpersuasive. "[T]his interpretation of ‘i.e.’ is contrary to the literal
meaning of this abbreviation for the Latin id est, meaning 'that is'' Caritas Techs., Inc. v. Comcast Corp., 2:05-CV-339, 2006 U.S. Dist. LEXIS 98006 at *43 (E.D. Tex. 2006) (Folsom, J.) (citing Oxford English Dictionary). The Federal Circuit has found that "i.e." defined the meaning of a term. Abbot Labs. v. Novopharm Ltd., 323 F.3d 1324, 1330 (Fed.Cir. 2003). Only when the intrinsic evidence supports an alternate definition of the term preceding "i.e." has the Federal Circuit found that the definition following "i.e." does not control. See Pfizer, Inc. v. Teva Pharms., USA, Inc., 429 F.3d 1364, 1373 (Fed.Cir. 2005). The specification in Pfizer referred to "saccharides (i.e. sugars) . . ." Id. at 1373. The specification, however, also contained an entire section labeled "SACCHARIDES," with a detailed explanation. The Federal Circuit found, therefore, the definition of "saccharides" was not as narrow as what followed "i.e."

The '034 patent's specification has no alternate definition for "economy safe." Indeed, the term "economy safe" is not used but one time in the specification. Following that only instance is the parenthetical "(i.e., comprised of just a safe and a unit 16, without a PC board and printer)." The court, therefore, construes the term "economy safe" to mean a "safe comprised of just a safe and a bill validating unit, without a PC board and printer."

5. "Edge"

The parties dispute the meaning of the term "edge" and the following related phrases: "edge" (claims 1, 2, and 18 of '018 Patent and claim 7 of '493 Patent); "edge surface" (claims 2, 3, and 18 of '018 Patent and claims 7 and 12 of '493 Patent); "edge of said backer" (claims 17 and 22 of '493 Patent); and "vertical edge" (claim 12 of '493 Patent). Specifically, Plaintiff contends that "edge" means "a boundary where a thing begins or ends" and that "edge surface" means "a surface where the backer begins or ends that is generally perpendicular to the inner surface of the trailer side wall." Defendants argue that "edge" means "the end of the backer panel" and that "edge surface" means "the vertical surface at the end of the backer panel." The parties dispute whether an edge must be at the end of the backer or may be present anywhere a surface ends on the backer. The Court agrees with Plaintiff that a backer may contain edges not at the end of the panel so that an edge is a place where a surface on the backer begins and ends, but not necessarily where the backer itself begins or ends. The Court thus adopts Plaintiff's proposed definition of "edge": "a boundary where a thing begins or ends."

Based on their representations during the Markman hearing, the parties do not appear to dispute the general concept of "edge surface." In light of the Court's construction of the term "edge," the Court adopts Plaintiff's proposed construction and construes "edge surface" to mean "a surface where the backer begins or ends that is generally perpendicular to the inner surface of the trailer side wall." Also in light of the Court's construction of the term "edge," the Court finds that it is not necessary to construe the phrase "edge of said backer." With regard to the term "vertical edge," the Markman hearing revealed that there is no real dispute between the parties about the general concept of "vertical edge." In a nutshell, the vertical edge is the corner or boundary between the horizontal surface of the backer and the edge surface. The Court adopts Plaintiff's proposed definition: "a boundary where the backer begins or ends that is generally perpendicular to the ground on which the trailer is located."

3. "edge"

Floe asserts that "edge" should be construed as "border." Newmans, on the other hand, contends that this term should be construed as "boundary or point where a surface begins or ends." Both parties allege that the language in Claim 1 and dictionary definitions support their proposed constructions.

The Court rejects Floe's assertion that an "edge" may be the border of a surface, but that "edge" is not necessarily limited to surfaces. Here, Claim 1 requires a ramp member having:

a deck edge protecting surface extending upwardly from said deck support surface and having an upper edge, a lower portion having a longitudinal edge, and having a ramp surface disposed between said upper edge and said longitudinal edge.
at a predetermined angle less than ninety degrees to said deck support surface and arranged to protect an edge of a deck to be supported by said deck support surface.[.

('379 Patent, c. 6, l: 62-c. 7., l: 3.) Given this claim language, the Court finds that in order to have an "edge" there must be some surface that defines that edge. The Court notes that dictionary definitions are not particularly helpful because they support both parties' proposed constructions. Thus, consistent with the claim language, the Court construes "edge" as "boundary or point where a surface begins or ends."

1305

A "top substantially slanted edge" must be given its ordinary and customary meaning. From the plain meaning of the words and the context of the patent, it is clear that there must be some type of substantially sloping visible line from one corner of the top of the shape to the opposite corner. The term "edge" must mean the beginning or end of the shape itself and not some invisible line that may be imagined descending from one part of the shape to the other. Given this meaning, it is clear that the allegedly infringing device does not have a top slanted edge. It lacks a sloping line that connects two opposite corners at the top of the shape. Furthermore, such an edge does not exist at the top of the challenged plate. The top edges are straight, not substantially sloping, and are parallel to the other edges.

1306

Effective Cutting Face Backrake Angle(s)

Claims in the '249 and '715 Patents contain the terms "effective cutting face backrake angle(s)" and "negative effective cutting face backrake angle"; claims in the '631 Patent contain the term "effective backrake angle." Baker Hughes contends these terms should be construed to mean:

the net overall backrake angle of the cutting face as measured backward from a line placed perpendicular (at a ninety degree angle) to the formation to be cut by the cutter in the intended direction of drill bit rotation, and as determined by a combination of any one or more of the cutter backrake angle, the chamfer backrake angle, the chamfer angle, chamfer width, and depth of cut.

ReedHycalog contends the terms mean "the negative angle (expressed as a positive number) between a line oriented perpendicular to the subterranean formation to be engaged by a cutter and the portion(s) of the cutting face of the cutter that engages the formation during drilling, measured in the direction of intended bit rotation." At the claim construction hearing, ReedHycalog stated it was willing to replace "negative angle (expressed as a positive number)" with the term "angle."

The '249, '715, and '631 Patents specifications give little guidance. Fig. 11 of the '249 Patent, which is substantially identical to Fig. 11 in the '715 Patent, is helpful to determine the terms' meaning. With reference to Fig. 11 of the '249 Patent, annotated and depicted in Appendix C, the specifications appear to communicate the following. 1

1 Appendix C contains the Court's annotations of certain figures. Given the nature of these patents, the figures are extremely helpful in discussing some of the concepts presented in this Opinion.

At a shallow depth of cut ("DOC 1") where only the chamfers engage the formation, the effective cutting face backrake angle is the chamfer backrake angle, shown in Fig. 11 as [beta] [1]. '249 Patent col. 7:13-13; '715 Patent col. 10:39-49. At a deeper depth of cut ("DOC2") where the cutting face engages the formation, the effective cutting face backrake angle is [beta] [2], which in Fig. 11 appears to be the angle between the portion of the cutting face that engages the formation and a line perpendicular to the formation. '249 Patent col. 7:13-21, col. 7:48-56; '715 Patent col. 10: 49-57, col. 11:16-21. It also
appears that at some depth of cut deeper than DOC2, the effective cutting face backrake angle will converge to the cutter backrake angle [\(\delta\)], assuming the cutting face is oriented substantially perpendicular to the cutter's longitudinal axis. '249 Patent col. 7:48-56; '715 Patent col. 11:49-57, col. 11:16-21. Therefore, it appears [\(\beta\)_1] and [\(\delta\)], are, respectively, the upper and lower bounds of the effective cutting face backrake angle, and [\(\beta\)_2] lies somewhere between.

The Court agrees with ReedHycalog's modified construction. Thus, "effective cutting face backrake angle(s)," "negative effective cutting face backrake angle," and "effective backrake angle" mean "angle(s) between a line oriented perpendicular to the subterranean formation to be engaged by a cutter and the portion(s) of the cutting face of the cutter that engages the formation during drilling, measured in the direction of intended bit rotation." 2 At shallow depths-of-cut where only the chamfer engages the formation (DOC 1), this angle is the chamfer backrake angle. At some depth of cut, the effective cutting face backrake angle will converge to the cutter backrake angle, assuming the cutting face is oriented substantially perpendicular to the cutter's longitudinal axis.

### 1307

3. Effectively Occlude (Claim 1, '803 Patent)

Vnus argues "effectively occlude" should be construed as "significantly reduce the flow of blood through the treated hollow anatomical structure, including, but not limited to, full-lumen closure." Defendants argue "effectively occlude" should be construed as "to shrink the inner diameter of the [hollow structure/vein] to be no smaller than the electrode device, thus reducing but not eliminating the flow of fluid (e.g., blood) through the lumen after the electrode device is removed. The [hollow structure/vein] must maintain this smaller but non-zero diameter with a reduced but continued fluid flow for a lasting (i.e. non-temporary) period."

The Court, for the reasons stated by Vnus, finds "effectively occlude" is properly construed as "significantly reduce the flow of blood through the treated hollow anatomical structure, including, but not limited to, full-lumen closure."

---

### 1308

**A. THE "EITHER OF SAID CHAMBERS" ELEMENT**

Element (f) of Claim 27 defines "a vent means for venting either of said chambers to atmosphere." Quantachrome argues that this element is not literally found in the accused device.

Quantachrome argues that the claim language indicates that the vent means is capable of venting either the sample or the expansion chamber, each mutually exclusive of the other, to atmosphere. Quantachrome states that the accused device cannot vent either chamber mutually exclusive of the other. Rather, to vent the sample chamber of the accused device, one must also vent the expansion chamber. See Ultrapycnometer Flow Diagram, attached as Exhibit B. 2 The sample chamber vents to the expansion chamber which then vents to the atmosphere.

--- Footnotes ---

2 For purposes of clarification, the Court has labeled on Exhibit B what it refers to as the "sample chamber" and the "expansion chamber."

--- End Footnotes ---
Micromeritics argues that the "either of said chambers" language does not indicate a means for venting one chamber mutually exclusive of the other. Rather, Micromeritics argues that the "either" language means that in different embodiments of the invention, either the sample chamber or the expansion chamber is capable of being vented to atmosphere.

Section 35 U.S.C. 112 P6 provides direction in interpreting an element of a claim framed in what is commonly known as "means-plus-function" language. As the Federal Circuit stated in Pennwalt Corp.,

To determine whether a claim limitation is met literally, where expressed as a means for performing a stated function, the court must compare the accused structure with the disclosed structure, and must find equivalent structure as well as identity of claimed function for that structure.

833 F.2d at 934 (discussing 35 U.S.C. § 112 P6).

In the '146 Patent the specification discusses alternate embodiments of the invention. See '146 Patent, col. 2, lines 31-38. In the preferred embodiment, gas is introduced into the sample chamber and then eventually vented to atmosphere through the expansion chamber. '146 Patent, col. 2, lines 31-35; col. 4, lines 61-68. In an alternate embodiment, gas is introduced into the expansion chamber and then eventually vented to atmosphere through the sample chamber. '146 Patent, col. 2, lines 35-40. Thus, the Court finds that "either" means that either the sample chamber or the expansion chamber is capable of being vented to atmosphere depending on the embodiment.

This claim interpretation is strengthened upon further reviewing the description of the preferred embodiment discussed in the patent specification. '146 Patent, col. 4, lines 31-68. It is obvious from the specification that the means discussed is not capable of venting either chamber mutually exclusive of the other.

Also, Fig. 5, included in the '146 Patent, and attached hereto as Exhibit C, 4 unmistakably indicates that the invention vents only through one of the chambers. In that figure, it is plain that the '146 Patent invention vents in exactly the same manner as the accused device.

The Court has considered Quantachrome's other arguments presented in its briefs and at the hearing, and the Court is unpersuaded by any of these arguments that element (f) requires that each chamber be capable of venting mutually exclusive of the other.

Therefore, after carefully analyzing the language of Claim 27 in light of the patent specification, and comparing the Ultrapycnometer Flow Diagram (Exhibit B) with Fig. 5 of the '146 Patent (Exhibit C), the Court finds that Element (f) of Claim 27 of the '146 Patent ("vent means for venting either of said chambers to atmosphere") reads on the accused device.

Since this element is the only element of Claim 27 that Quantachrome asserts does not read on the accused device, the Court finds that Claim 27 as a whole reads on the accused device.
However, Quantachrome argues that even if Claim 27 reads on the accused device, there is no infringement because the '146 Patent is invalid as anticipated by the prior art.

2. The Ejection Limitation

Doyle argues that the district court erred in construing the ejection limitation of claim 21 to require a "direct" ejection from the mixing zone to atmospheric pressure. Doyle contends that the ejection limitation must be differentiated from the parallel limitation in claim 1 due to the absence of the "completely and instantaneously vaporizing" language in claim 21, which requires an immediate pressure drop from the mixing zone to atmospheric pressure. Doyle also argues that the ordinary meaning of "ejecting" does not require an ejection to be either "direct" or "indirect" (i.e., gradual in nature).

Crain responds that the plain language of claim 21 and the disclosure of only a "direct" ejection in the written description clearly supports the district court's construction of the pressure limitation. Crain further contends that the post-expansion of the foam produced by the reaction of water and the diisocyanate adequately explains the absence of the "completely and instantaneously vaporizing" language in claim 21.

Terms in a claim are to be given their ordinary meaning absent an express intent to impart a novel meaning. Renishaw PLC v. Marposs Societa' Per Azioni, 158 F.3d 1243, 1249, 48 U.S.P.Q.2D (BNA) 1117, 1121 (Fed Cir. 1998); see also Carroll Touch, Inc. v. Electro Mechanical Sys., 15 F.3d 1573, 1577, 27 U.S.P.Q.2D (BNA) 1836, 1840 ("The words of a claim are generally given their ordinary and accustomed meaning, unless it appears from the specification or the file history that they were used differently by the inventor."). In addition, "under the doctrine of claim differentiation, two claims of a patent are presumptively of different scope." Kraft Foods, Inc. v. Int'l Trading Co., 203 F.3d 1362, 1366-67, 53 U.S.P.Q.2D (BNA) 1814, 1817 (Fed. Cir. 2000) (citing Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1187, 48 U.S.P.Q.2D (BNA) 1001, 1005-06 (Fed. Cir. 1998)). Moreover, "where some claims are broad and others narrow, the narrow claim limitations cannot be read into the broad whether to avoid invalidity or to escape infringement." D.M.I., Inc. v. Deere & Co., 755 F.2d 1570, 1574, 225 U.S.P.Q. (BNA) 236, 239 (Fed. Cir. 1985).

We agree with Doyle that the district court erred in construing the ejection limitation of claim 21. The ordinary meaning of "ejecting" does not require the ejection to be direct, instantaneous, gradual, or otherwise. Webster's New World Dictionary 435 (3d ed. 1988) (defining "eject" as "to throw out; cast out; expel; emit; discharge"). Rather, given its ordinary meaning, "ejecting said mixture from said mixing zone to atmospheric pressure" merely requires that the mixture leave the mixing zone and end up at atmospheric pressure.

This interpretation of claim 21 is supported by the language of claim 1. Claim 1 has an ejection limitation, but adds the condition that the ejection "completely and instantaneously vaporize said blowing agent to provide substantially total expansion of said mixture," which makes it clear that a "direct" ejection is intended. '770 patent, col. 7, l. 67 to col. 8, l. 2. Thus, because that language is not in claim 21, there is a presumed difference in scope between the ejection limitations in claims 1 and 21. Comark at 1187, 48 U.S.P.Q.2D (BNA) at 1005-06. Accordingly, the "direct" ejection limitation of claim 1 may not be used to narrow the scope of the broader ejection limitation in claim 21. D.M.I. at 1574, 225 U.S.P.Q. (BNA) at 239.

Crain's assertion that the specification discloses only a "direct" ejection is belied by the fact that the Summary of the Invention section discloses both an embodiment containing the "completely and instantaneously" language and an embodiment without such language. '770 patent, col. 2, ll. 18-62. We therefore conclude that the ejection limitation is properly interpreted as encompassing both ejections that directly eject the mixture to atmospheric pressure, and those that do so in a gradual manner.
6. Element (e)

Element (e) of Claim 1 requires "Ejecting the plastic product into said guide conduit." Joint Statement at 12. Turn-Key argues that this element must be construed to require "Removing the plastic product from one of the mold parts" into the substantially enclosed conduit. Id.; Pl's Opening Brief at 14-15. Defendants conversely argue that the phrase means "forcefully discharging each molded plastic product from a surface of the mold cavity so that it enters the guide conduit and so that it is free to move within the guide conduit and is not held away from the walls of the guide conduit by any intervening structure." Joint Statement at 38; Crest's Responsive Brief at 15-16; KM, MC, & Concord's Brief at 10.

The dictionary defines "eject" as: 1. To drive or force out; expel. 2. To dismiss, as from office. 3. To evict. 4. To throw out or throw off. 5. To propel oneself from a disabled airplane, especially by an ejection seat. Random House Webster's College Dictionary at 419. In applying this definition to the '998 patent, the Court construes Element (e) to require that the plastic product be expelled or otherwise driven into the substantially enclosed conduit. 8 The Court, however, declines to construe Element (e) as requiring either that the plastic product be free to move within the guide conduit after its ejection or that it is not held away from the walls of the guide conduit by any intervening structure on the grounds that they represent extra limitations not present in the claim language. The patent's language does not disclose a specific ejection method to be utilized and the specification's references to particular methods (i.e. stripper plate) should not be read into the actual claim itself. See Laitram, 863 F.2d at 865 ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations."); see also '998 patent at Col. 5 ll 6-11; ll.15-17; 23-25 ("While the above description contains many specificities, these should not be construed as limitations on the scope of the invention, but rather as an exemplification of a preferred embodiment thereof . . . . Molds may also be employed which do not have a stripper plate, but where ejection is accomplished by some other means such as pins or sleeves . . . The scope of the invention should be determined not by the embodiments illustrated, but by the appended claims and their legal equivalents.").

During oral argument, Turn-Key insisted that the Court clarify its interpretation of "ejecting" so as to expressly allow for a pulling motion to be encompassed within the definition of the term. Defendants agreed that "ejecting" could encompass a pulling motion as long as force was applied. The Court concludes that "ejecting" can entail a pulling action and that the ordinary meaning of "pull" necessarily involves the application of force. See Random House Webster's College Dictionary at 1055. The Court notes that "force" is utilized in a broad sense here so that the application of gravity upon an object would constitute "force," as would the conventional means by which one removes dishes from a dinner table.

1311

c. The third disputed term in Claim 7: "Ejecting the washing machine basket . . . by separating the mold core and cavity cover member and shifting the cavity sidewall member away from the mold core"

i. Claim language. The third disputed claim term in Claim 7 of the '809 patent is "ejecting the washing machine basket . . . by separating the mold core and cavity cover member and shifting the cavity sidewall member away from the mold core." Claim 7, with the disputed term italicized, states the following:

7. A method of making an integral, smooth and uniformly constructed plastic washing machine basket having a base wall including a peripheral portion from which extends an annular sidewalk that diverges radially outwardly to a terminal edge in an apparatus including a mold core, cavity sidewall members spaced about the mold core which carry core pins each having a beveled tip portion adapted to abut the mold core during a molding operation and a cavity cover member spaced about an end of the mold core and abutting the cavity sidewall members so as to define a cavity between the mold core and both the cavity cover member and the cavity sidewall members comprising:

injecting a plastic material to fill the cavity while flowing around the beveled tip portion of each of the core pins to form a plastic washing machine basket having sidewalks provided with a plurality of spaced beveled apertures; and ejecting the washing machine basket from the apparatus by separating the mold core and cavity cover member and shifting the cavity
sidewall members away from the mold core.

The '809 patent, Claim 7 (emphasis added).

ii. The parties' definitions and arguments. The parties' proffered definitions of this term are shown below, with bold font indicating differences between their definitions. Also, the authority on which each party relies for its definition is shown just below that party's definition.

"EJECTING THE WASHING MACHINE BASKET . . . BY SEPARATING THE MOLD CORE AND CAVITY COVER MEMBER AND SHIFTING THE CAVITY SIDEWALL MEMBERS AWAY FROM THE MOLD CORE"

n12 Again, this is the statement of Electrolux's construction of this claim term in its initial Markman brief, rather than the somewhat different construction stated in the Corrected Joint Claim Construction Statement, because the court assumes that the construction in the Corrected Joint Claim Construction Statement included a typographical error. See supra, note 5.

In its initial brief, Maytag contends that the patent specification "sets the stage" for what is intended by "ejecting" at col. 6, ll. 3-48. Specifically, Maytag contends that, based on this portion of the specification, "ejecting" refers to the "initial ejection phase," in which the cavity cover member shifts away from the cavity sidewall members, and the cavity sidewall members also shift relative to the mold core, at which time a stripper ring pushes on one end of the basket until it reaches the "ejection position" shown in Figure 4, reproduced above at page 18. Only thereafter, in the second phase of "ejection," is the basket removed from the molding apparatus by a robot arm or similar device. Thus, Maytag contends that the patent specification makes a clear distinction between "ejecting" the basket from the mold core, which Maytag defines as preparing to remove the basket from the mold, and actually "removing" the basket from the molding machine. Maytag contends that it is the first step that is claimed in Claim 7. Maytag contends that dependent Claims 8 and 9 describe the details of the "ejection" step, but that the separate step of removing the basket from the molding machine is not part of the claimed invention. Maytag contends that Electrolux's construction ignores the distinction between "ejecting" and "removing" in the '809 patent.

In its initial brief, Electrolux argues that its construction is mandated by the words of the claim itself, because the ejection, i.e., the removal, of the washing machine basket from the molding apparatus is achieved by moving the cavity cover members and sidewall members away from the mold core. Electrolux contends that Maytag's construction rewrites the claim terms to mean "preparing" the basket for ejection, by performing steps "including at least" the steps stated in the claim. Electrolux argues that the plain language of the claim stands against construing "ejecting" to mean "preparing the basket to be ejected." Electrolux also argues that the Examiner rejected Maytag's present construction during the prosecution of the application for the '809 patent and that, in response, Maytag surrendered a "preparing" claim, which claimed "preparing for removal of the plastic washing machine basket from the apparatus by outward movement of sidewall assemblies with the core pins relative to the mold core," in favor of the current "ejecting" language. Thus, Electrolux argues that Maytag is
improperly attempting to recapture surrendered subject matter.

In its rebuttal brief, Maytag argues that Electrolux's construction completely ignores the context of the "ejecting" language in the '809 patent specification. First, Maytag reiterates that "ejecting" and "removing" have two distinct meanings in the context of the patent, specifically, that the washing machine basket must be "ejected" so that it can be "removed." Where Claim 6 uses "remove" and Claim 7 uses "eject," Maytag argues that the terms are presumed to mean different things, and that the patentee has also shown that it chose not to use the term "remove" in Claim 7. This same intrinsic evidence, Maytag contends, shows that there is no imperativeness in its own definition of "ejecting" as "preparing the basket for removal." Maytag also contends that Electrolux has blatantly misrepresented the prosecution history, because what the patentee did in response to the Examiner's rejection was to add a limitation requiring that the basket be removed from the apparatus after being prepared to be removed, and the Examiner withdrew his objection to the "preparing for removal" limitation. Maytag contends that the patentee subsequently cancelled the "preparing to remove" claim for unrelated reasons, but that the cancelled application claim was not the precursor of patent Claim 7. Maytag also contends that Electrolux is improperly attempting to limit the manner in which the cavity cover member is separated from the mold core.

In its rebuttal brief, on the other hand, Electrolux reiterates that Maytag's construction is improper, because it attempts to regain claim scope that was expressly surrendered during prosecution of the '809 patent and imports the limitation "at least," thereby rewriting the claim by removing the requirement that the step be performed "by" the stated movement of the molding apparatus, not "at least by" such movement. Electrolux contends that Maytag's arguments concerning "ejecting" and "removing" are a red herring, because Electrolux can accept the construction "moving the formed plastic washing machine basket from the mold core to the ejection position by the operation of moving the cavity cover member away from the mold core and shifting the sidewall members away from the mold core." What Electrolux cannot accept, however, is that this "ejecting" is accomplished by "at least" these steps, when the claim states that "ejecting" is accomplished "by" these steps.

In its surrebuttal, Maytag argues that Claim 7 states the method for making a washing machine basket "comprising," inter alia, the ejection process. Maytag asserts that it is black letter law that "comprising" before a list of elements does not exclude additional, unreified elements or method steps. Maytag contends that Electrolux is reading "comprising" to mean "consisting of," that is, to exclude any elements, steps, or ingredients not specified in the claim. Maytag contends that use of "comprising" means that the words "at least and potentially more" are inherently implied into each limitation of Claim 7. Electrolux's construction, Maytag argues, would exclude Claims 8 and 9, which are dependent claims stating additional steps in the ejection process, as Electrolux contends that the ejection must be accomplished only by the steps in Claim 7. Similarly, Maytag asserts that Electrolux's concession about "ejecting" and "removing" is just another moving target, but also cements Maytag's construction, "preparing the formed plastic washing machine basket for removal from the mold core," as the proper construction. In its surrebuttal, Electrolux reiterates that Maytag surrendered the "preparing to remove" construction to avoid rejection during prosecution of the patent by amending the claim to require actual removal of the basket and cannot now recapture such a meaning for the claim language.

The parties returned to construction of this claim at the Markman hearing oral arguments. However, the parties' oral arguments were in response to the court's proposed construction of this term in the tentative draft of this ruling circulated to the parties prior to the Markman hearing. Therefore, the court will address the parties' oral arguments below, in the context of the court's construction.

iii. Analysis. Beginning, as always, with the language of the claim in which the disputed language appears, see Nystrom, 424 F.3d at 1142 (construction begins with the words of the patent); Biagro, 423 F.3d at 1302 (same), the court finds neither party's construction of the first clause of this term to be entirely satisfactory. First, the court finds that the claim language "ejecting the washing machine basket from the apparatus," see the '809 patent, Claim 7 (emphasis added), simply will not support Maytag's construction of the term as "preparing the formed plastic washing machine basket for removal from the mold." The claim language plainly signifies something more that preparation to do something to the washing machine basket; instead, it plainly indicates doing something to or with the washing machine basket, specifically, "ejecting [it] from the apparatus." Maytag's construction does not indicate that the washing machine basket is even moved relative to the mold core, let alone "ejected" from the apparatus.

Nor is the court persuaded that nonasserted Claim 6, a dependent claim to Claim 5, necessarily teaches that "ejecting" means something different from "removing," as Maytag contends. But see Nystrom, 424 F.3d at 1143 ("When different
words or phrases are used in separate claims, a difference in meaning is presumed."). Claim 6, in its entirety, claims the following:

6. A method for manufacturing as set forth in claim 5 wherein the step of displacing the molded tub from the mold core is performed simultaneously with the step of displacing the mold side dies, and is followed by the step of extending a rod member to further remove the molded tub from the mold assembly.

The '809 patent, Claim 6 (emphasis added). The italicized language suggests a step of "dispelling" the molded tub from the mold core, which appears to be at least roughly analogous to "ejecting the washing machine basket from the apparatus," as stated in the disputed portion of Claim 7, and then indicates that the molded basket is "further removed" from the mold core by extending a rod member, which suggests that "removing" is the same as "dispelling" or "ejecting." It does not suggest that "removing" means only removal from the apparatus, while "ejecting" means displacement or separation from the mold core, nor does it suggest that the "ejecting" is only "preparation" for removal of the washing machine tub from the apparatus.

Moreover, the portions of the specification cited by Maytag do not support Maytag's construction. See Phillips, 415 F.3d at 1314-16 (the specification remains of "central importance" to determining the proper construction of the term and may even be "dispositive"). Rather, both cited portions of the specification support the notion that there is a two-step "ejection process" to remove the plastic washing machine basket, first, from the mold core and, second, from the apparatus. See the '809 patent, Summary Of The Invention, col. 2, 11. 15-23 ("After cooling of the plastic material, the various core pins are used to remove the molded plastic washing machine basket from the mold core during an ejection process by shifting the basket relative to the mold core through the interengagement of the core pins with the apertures formed in the sidewall of the basket. A stripper ring and an ejection system, are also provided to aid in removing the molded basket from the mold core."); Detailed Description, col. 6, 11. 3-48 (describing the method for removing the washing machine basket, first, from the mold core, and second, from the apparatus). The fact that the "ejection process" involves at least two steps in the Detailed Description does not necessarily mean that the first step is merely "preparation" for the other.

More specifically, the portion of the Detailed Description cited by Maytag does not support Maytag's construction of "ejecting" as "preparing the washing machine basket for removal," even though that portion appears to distinguish between steps for removal of the washing machine basket from the mold core and removal of the washing machine basket from the entire apparatus. Rather, it describes an "initial ejection phase" for the basket, involving "removing a molded article from a mold core," and a final stage in which the "basket 2 can be removed [from the apparatus] by means of a robot arm or other transport system." See the '809 patent, col. 6, 11. 3-42. Indeed, this portion of the specification describes both steps as involving "removing" the basket, albeit in the first instance from the mold core and in the second instance from the entire apparatus. Thus, Maytag is making a distinction in the use of words that is not apparent from the claims or the specification, even where the claims and the specification distinguish between the steps for "removing" the washing machine basket from the mold, and "removing" the washing machine basket from the entire apparatus. n13

n13 Because Maytag's "preparing" construction plainly is not supported by the plain language of the claims or by the specification, the court finds it unnecessary to consider the parties' dispute over whether the prosecution history reveals that Maytag surrendered a "preparing" construction.

At this point, because the court has not found that the patentee acted as its own "lexicographer" to provide a definition of "ejecting" that must govern, compare Phillips, 415 F.3d at 1316 (the patentee may act as lexicographer, and when the patentee does so, its definition must govern), and the court has not found the specification to be "dispositive" in this case, compare id. at 1314-16 (the specification remains of "central importance" to determining the proper construction of the term and may even be "dispositive"), the court finds it appropriate to look to a standard dictionary definition of "ejecting" to assist in discovering the commonly understood meaning of the word. See Free Motion Fitness, Inc., 423 F.3d at 1348 ("Phillips confirms that courts may "rely on dictionary definitions when construing claim terms" and that 'dictionaries . . . are often useful to assist in understanding the commonly understood meaning of words.") (quoting Phillips, 415 F.3d at 1322, in turn quoting Vitronics Corp., 90 F.3d at 1584 n.6). For example, definitions of "eject" include "to drive out especially by physical force," and "to throw out or off from within." See MERRIAM-WEBSTER'S COLLEGIATE DICTIONARY (10th ed. 1995) (definitions 1 a and 2 of "eject vt"). These dictionary definitions suggest that defining "ejecting" merely as "removing," as Electrolux has proposed, misses the point concerning the manner of removal, i.e., by force.
Thus, the court proposed in its tentative draft of this ruling that the ordinary meaning of "ejecting the washing machine basket from the apparatus," even to one of skill in the art reading the term in the context of the patent claim and specification, is "forcing the washing machine basket out of the apparatus." The court found that this construction of "ejecting . . . from" in Claim 7 as "forcing . . . out of" is reinforced by the language of Claim 8, which also pertains to "ejecting the plastic washing machine basket from the apparatus," this time specifically by "forcing the plastic washing machine basket to shift relative to the mold core." However, Maytag asserted at the Markman hearing oral arguments that the court's construction should be refined to be "forcing . . . from," rather than "forcing . . . out of," because the actual claim language is "ejecting . . . from," and "out of" improperly implies complete removal from the apparatus. Electrolux concurred in this amendment of the court's proposed construction, and the court sees the wisdom of closer adherence to the claim language. Therefore, the court finds that the ordinary meaning of "ejecting the washing machine basket from the apparatus," even to one of skill in the art reading the term in the context of the patent claim and specification, is "forcing the washing machine basket from the apparatus."

At the Markman hearing oral arguments, Maytag also asserted that the construction of this term should recognize that the "ejection" is only to an "ejection position," not completely out of the apparatus, which is accomplished in a subsequent step, for example, by a robot arm, but which is not actually claimed as part of the invention. Maytag contended that simply including "ejecting . . . from . . . to the ejection position" would suffice, as the "ejection position" is plainly shown by the "solid" washing machine basket partially out of the mold in Figure 4, not by the "dashed" washing machine basket shown fully out of the mold. See the '809 patent, Fig. 4 (reproduced above, on page 18). Electrolux concurred that some indication of the "ejection position" should be part of the construction of this term, but contended that "ejection position" should be defined as "a position from which the washing machine basket can be readily removed from the mold core." Maytag, however, rejected this further definition of "ejection position," because the claim does not define "ejection position," so that Electrolux's definition would improperly import a limitation from the preferred embodiment. Electrolux rejoined that the reading of the claims must be informed by the specification, and that the specification clearly states what "ejection position" means. The court is not persuaded that any further indication of the position to which the washing machine basket is "ejected" is required. Claim 7 unambiguously states that the washing machine basket is "ejected," at this step, "from the apparatus." See the '809 patent, Claim 7. As explained above, this step is distinct from "removing" the washing machine basket from the apparatus entirely, for example, by means of a robot arm. The court declines to import a limitation from the specification into what is unambiguous claim language. See Playtex Prods., Inc., 400 F.3d at 906 ("The court must take care in its analysis, when locating in the written description the context for a disputed term, not to import a limitation from that written description. It must use the written description for enlightenment and not to read a limitation from the specification [into the construction of the term].") (citing Comark Comms., 156 F.3d at 1186-87). Therefore, the court declines to add any specification of the position to which the washing machine basket is "ejected" in Claim 7.

The second clause of this disputed term concerns what element in the claimed invention actually does the "ejecting." Claim 7 states that the "ejecting" is done "by separating the mold core and cavity cover member and shifting the cavity sidewall members away from the mold core." Maytag contends that the "ejecting" is done "by performing steps including at least separating the mold core and the cavity cover member and moving the cavity sidewall members away from the mold core." Electrolux, on the other hand, contends that the "ejecting" is done exclusively "by the operation of moving the cavity cover member away from the mold core and shifting the sidewall members." Again, the court finds neither party's construction of this clause of the term to be satisfactory.

Maytag is correct that this claim of the '809 patent uses "comprising" before a list of elements. See the '809 patent, Claim 7 ("A method of making an integral, smooth and uniformly constructed plastic washing machine basket . . . comprising . . . ."). Maytag is also correct that "comprising," when used in a patent claim, is an "open' transition phrase" that "may cover devices that employ additional, unrecited elements," in contrast to "consisting of," which is a "closed' transition phrase" that is "understood to exclude any elements, steps, or ingredients not specified in the claim." AFG Indus., Inc. v. Cardinal IG Co., Inc., 239 F.3d 1239, 1244-45 (Fed. Cir. 2001) (explaining that this has been the "consistent" understanding of these phrases by the Federal Circuit Court of Appeals). Such an understanding of "comprising" does not bring the court to the conclusion Maytag intends, however. It is clear that the "method of making an integral, smooth and uniformly constructed plastic washing machine basket" is claimed in Claim 7 as "comprising" the "injecting" and "ejecting" steps, and thus, "may cover devices that employ additional, unrecited elements." Id. However, Maytag has cited no authority for its contention that the "open' transition phrase" "comprising" must also be read into each limitation of Claim 7. In other words, the "method of making an integral, smooth and uniformly constructed plastic washing machine basket" may ...
"comprise" additional, unrecited steps besides the "injecting" and "ejecting" steps expressly claimed, but that does not mean that each step as expressly claimed is not complete in and of itself.

Moreover, the court simply is not persuaded by Maytag's assertion that reading "by" to mean simply "by" in the disputed portion of Claim 7 instead of reading "by" to mean "by performing steps including at least," as Maytag advocates--somehow reads dependent Claims 8 and 9 out of the patent. Dependent Claims 8 and 9 claim the following:

8. The method of claim 7, further comprising: utilizing the core pins to aid in ejecting the plastic washing machine basket from the apparatus with the core pins forcing the plastic washing machine basket to shift relative to the mold core as the cavity sidewall members are shifted away from the mold core due to the engagement of the core pins in the beveled apertures of the plastic washing machine basket.

9. The method of claim 8, further comprising: aiding in ejecting the washing machine basket by substantially, linearly shifting a stripper ring, that engages the terminal edge of the plastic washing machine basket, relative to the mold core.

The '809 patent, Claims 8 & 9. These dependent claims do not claim that the "ejecting of the washing machine basket" is accomplished "by" anything other than "separating the mold core and cavity cover member and shifting the cavity sidewall members away from the mold core," as claimed in the disputed portion of Claim 7. Rather, dependent Claims 8 and 9 claim the method of Claim 7 (or Claim 8, in the case of Claim 9) "further comprising" limitations that only "aid[] in ejecting the plastic washing machine basket." See the '809 patent, Claims 8 & 9 (emphasis added). In other words, the additional limitations claimed in the dependent claims only assist "separating the mold core and cavity cover member and shifting the cavity sidewall members away from the mold core" in "ejecting the plastic washing machine basket." Maytag has cited no authority for the proposition that, where a patentee claims in one claim that certain means are sufficient, in and of themselves, to accomplish an end--in this case, that "separating the mold core and cavity cover member and shifting the cavity sidewall members away from the mold core" are sufficient to "eject[] the plastic washing machine basket," as the patentee has claimed in Claim 7 of the '809 patent--it would be inconsistent for dependent claims to claim additional structures on the elements ("core pins" on the "cavity sidewall members" in Claim 8) or even additional elements ("substantially, linearly shifting a stripper ring" in Claim 9) in an independent claim that "aid" in accomplishing the same end.

Finally, the court finds unpersuasive Electrolux's construction of this last clause as "by the operation of moving the cavity cover member away from the mold core and shifting the sidewall members." First, inserting "by operation of" simply adds unnecessary words to what is unambiguously claimed as "by separating" certain members (the mold core and cavity cover member) and "by shifting" other members away from each other (the cavity sidewall members away from the mold core). Furthermore, Electrolux's construction does not take into account the relative motion of the "sidewall members" when "shifting," which according to the unambiguous claim language is "away from the mold core." See the '809 patent, Claim 7 (emphasis added).

Therefore, the court construes the disputed claim term "ejecting the washing machine basket from the apparatus by separating the mold core and cavity cover member and shifting the cavity sidewall members away from the mold core" as follows: "forcing the washing machine basket from the apparatus by separating the mold core and cavity cover member and shifting the cavity sidewall members away from the mold core."

In the present case, the first step in the infringement analysis--claim construction--is relatively straightforward. The only claim-term relevant to Defendant's motion for summary judgment is "elastic," which is used in the '474 Patent to describe the invention's stimulator and polishing rods. In interpreting the term "elastic," the Court first looks to the words of the claim itself to define the scope of the patented invention. See Bell Communications Research, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 620 (Fed.Cir.1995). Unless otherwise specified, words in a patent claim are given their ordinary and customary meaning. Markman, 52 F.3d at 980. As Plaintiff notes in his brief in opposition to Plaintiff's motion for summary judgment, the adjective, "elastic," is generally understood as analogous to "flexible." Thus, an "elastic" material is one that is "capable of returning to an initial state or form after deformation." WEBSTER'S II NEW RIVERSIDE UNIV. DICTIONARY 421 (1994). Claim construction does not, however, end with reference to Webster's. The Court also
considers the prosecution history of the patent to determine the meaning of the claim-term. Markman, 52 F.3d at 980. As previously discussed, the Patent Examiner amended the claim specifically to exclude nylon from the definition of "elastic." Recognizing that nylon rods are "elastic" in the commonly understood sense of the term, the Patent Examiner specified that nylon is "not considered to be 'elastic' as recited by the claim." Therefore, in the specialized context of the '474 patent, the term "elastic" is used to describe any material, other than nylon, "capable of returning to an initial state or form after deformation."

A determination of infringement requires a proper interpretation of the scope and meaning of the claim followed by a comparison of the accused product to that claim scope. Omega Eng'g v. Raytek Corp., 334 F.3d 1314, 1320 (Fed. Cir. 2003); Carroll Touch, Inc. v. Electro Mech. Sys., Inc., 15 F.3d 1573, 1576 (Fed. Cir. 1993). In the context of a grant of summary judgment of no infringement, this court reviews the entire infringement inquiry without deference. Omega Eng'g, 334 F.3d at 1320. "Summary judgment is therefore appropriate when there is no genuine issue of material fact or when, drawing all factual inferences in favor of the nonmoving party, no reasonable jury could return a verdict for the nonmoving party." Omega Eng'g, Inc. v. Liberty Lobby, Inc., 477 U.S. 242, 248, 91 L. Ed. 2d 202, 106 S. Ct. 2505 (1986).

In construing claims, "this court … considers the prosecution history to determine whether the applicant clearly and unambiguously disclaimed or disavowed any interpretation during prosecution in order to obtain claim allowance." 3M Innovative Props. Co. v. Avery Dennison Corp., 350 F.3d 1365, 1371 (Fed. Cir. 2003) (internal quotations and alterations omitted); accord Omega Eng'g, 334 F.3d at 1324; Middleton, Inc. v. Minn. Mining & Mfg. Co., 311 F.3d 1384, 1388 (Fed. Cir. 2002); Standard Oil Co. v. Am. Cyanamid Co., 774 F.2d 448, 452 (Fed. Cir. 1985).

The first and only time the examiner discussed the "elastic" limitation was in the Examiner's Statement of Reasons for Allowance. The examiner did not at any time reject a claim of the '149 application containing the "elastic" limitation as anticipated or obvious in view of the prior art. Other than the remarks in the Examiner's Statement of Reasons for Allowance, the prosecution history does not contain any discussion of the "elastic" limitation by either the examiner or the applicant. Nonetheless, the district court excluded nylon from the scope of "elastic." Order at 5. Specifically, the district court found that the remarks in the Examiner's Statement of Reasons for Allowance "amended the claim specifically to exclude nylon from the definition of " elastic." Id. Thus, this appeal requires this court to decide whether unilateral statements of an examiner in stating reasons for allowance can create a clear and unambiguous disavowal of claim scope and give rise to prosecution history estoppel.

The regulations in force during the prosecution of the '149 application state:

If the examiner believes that the record of the prosecution as a whole does not make clear his or her reasons for allowing a claim or claims, the examiner may set forth such reasoning. The reasons shall be incorporated into an office action rejecting other claims of the application or patent under reexamination or be the subject of a separate communication to the
applicant or patent owner. The applicant or patent owner may file a statement commenting on the reasons for allowance within such time as may be specified by the examiner. Failure to file such a statement shall not give rise to any implication that the applicant or patent owner agrees with or acquiesces in the reasoning of the examiner.

37 C.F.R. § 1.109 (1996) (emphasis added). 3 These regulations offer the applicant an opportunity to respond to the examiner's unilateral reasons for allowance. The regulations also state, however, that the applicant does not acquiesce in those reasons if the applicant declines to respond.

This court has recognized that an Examiner's Statement of Reasons for Allowance "will not necessarily limit a claim." ACCO Brands, Inc. v. Micro Sec. Devices, Inc., 346 F.3d 1075, 1079 (Fed. Cir. 2003). Consequently, an applicant's silence regarding statements made by the examiner during prosecution, without more, cannot amount to a "clear and unmistakable disavowal" of claim scope. See 3M Innovative Props., 350 F.3d at 1373-74 ("Prosecution history … cannot be used to limit the scope of a claim unless the applicant took a position before the PTO. Schwing GmbH v. Putzmeister Aktiengesellschaft, 305 F.3d 1318, 1324-25 (Fed. Cir. 2002) (emphasis added). An applicant's silence in response to an examiner's characterization of a claim does not reflect the applicant's clear and unmistakable acquiescence to that characterization if the claim is eventually allowed on grounds unrelated to the examiner's unrebutted characterization."). After all, the applicant has disavowed nothing.

Procter & Gamble concedes that the law precludes drawing inferences from an applicant's decision to decline comment on an Examiner's Statement of Reasons for Allowance, yet argues that Mr. Salazar should be bound by "the message he sent to the public" by his silence.

Procter & Gamble supports its position with this court's language that, on its face, appears to support Procter & Gamble. However, a closer inspection of those cases reveals that Procter & Gamble either cites to dicta or to cases addressing issues different from this case. Procter & Gamble first quotes TorPharm Inc. v. Ranbaxy Pharmaceuticals, Inc., 336 F.3d 1322, 1330 (Fed. Cir. 2003):

"Whether the patentee chooses to dispute the examiner's view of matters is relevant to claim interpretation, for there a court may need to ascertain exactly what subject matter was actually examined and allowed by the PTO. Patent examination would serve little purpose unless the scope of the exclusive patent right correlated with the matter allowed by the PTO. Accordingly, in ascertaining the scope of an issued patent, the public is entitled to equate an inventor's acquiescence to the examiner's narrow view of patentable subject matter with abandonment of the rest. Such acquiescence may be found where the patentee narrows his or her claims by amendment, or lets stand an examiner's restrictive interpretation of a claim."

(Internal citations omitted) (emphases supplied by Procter & Gamble). TorPharm addresses a different issue from that before this court. In TorPharm, the applicant added limitations to claims to overcome an obviousness rejection. Later during litigation, the defendant discovered and showed that the added limitation was also in the prior art. The defendant asserted that the patentee had acquiesced in the obviousness of its invention by amending its claims. Therefore, according to the defendant, the patentee could not challenge its obviousness contentions. This court in TorPharm held that the applicant's " acquiescence" in the obviousness rejection by amending its claims did not preclude the patentee from contesting obviousness in litigation. Id. at 1331. Thus, TorPharm does not hold that a patentee's silence in the face of an examiner's unilateral statements in a Notice of Allowance amounts to a clear disavowal of claim scope.

Procter & Gamble next quotes the following passage from Inverness Medical Switzerland GmbH v. Princeton Biomeditech Corp., 309 F.3d 1365, 1372 (Fed. Cir. 2002):

Even where the ordinary meaning of the claim is clear, it is well-established that the prosecution history limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution. A broader definition may be disclaimed, for example, where the examiner adopts a narrow definition and the applicant does not object.
The parties only contest whether the applicant's silence to the examiner's remarks in the Examiner's Statements of Reasons for Allowance governed the construction of the claim term at issue. Id. at 1373.

Moreover, the cited quotations from both TorPharm and Inverness rely on Elkay. In Elkay, the examiner rejected some claims in the application for obviousness. 192 F.3d at 978. In response, the applicant did not substantially amend the claims, but overcame the rejection by arguing around the prior art cited by the examiner. Id. At trial, the patentee discounted its own prosecution arguments that had overcome the examiner's obviousness rejection. The patentee sought to show that those arguments were insignificant and should not provide a basis to narrow the scope of the claims. Id. at 979. This court rejected the patentee's argument. In crediting the applicant's narrowing arguments during prosecution, this court noted that the examiner expressly accepted those arguments in the Statement of Reasons for Allowance. Id. Thus, Elkay holds that the Examiner's Statement of Reasons for Allowance may help show that the applicant's own arguments during prosecution constitute a clear disavowal of claim scope. See also Lemelson v. Gen. Mills, Inc., 968 F.2d 1202, 1207 (Fed. Cir. 1992) (holding that a patentee acquiescing in an examiner's rejection of a broad claim by filing narrower claims cannot later regain the broader scope previously abandoned); ACCO Brands, 346 F.3d at 1079 (relying on comments made in an Examiner's Statement for Reasons of Allowance to limit claim scope because "in this case the examiner simply repeated the arguments that the patentee had presented").

In sum, Procter & Gamble does not present any case law that stands for the proposition that an examiner's unilateral statements in a Notice of Allowance constitute a clear and unambiguous disavowal of claim scope. Once again, the applicant has disavowed nothing. This court refuses to create a rule or presumption that the applicant in this case disavowed claim scope by silence.

Procter & Gamble admits that Mr. Salazar was not required to answer the examiner's statement, but argues that "it does not follow that the patent examiner's comments then should be ignored." Although unilateral statements by an examiner do not give rise to a clear disavowal of claim scope by an applicant, it does not necessarily follow that such statements are not pertinent to construing claim terms. Statements about a claim term made by an examiner during prosecution of an application may be evidence of how one of skill in the art understood the term at the time the application was filed. However, as explained above, an applicant's silence regarding such statements does not preclude the applicant from taking a position contrary to the examiner's statements when the claim terms are construed during litigation.

The district court relied upon the same remarks in the Examiner's Statements for Reasons of Allowance to find that prosecution history estoppel bars Mr. Salazar from asserting infringement of the "elastic" element under the doctrine of equivalents. Order 2003 U.S. Dist. LEXIS 26574, [WL] at 6-7. Although the claim language was not altered in response to the examiner's remarks in the Examiner's Statement for Reasons of Allowance, the district court found that the examiner's remarks "amended" the "elastic" element of the claim. 2003 U.S. Dist. LEXIS 26574, [WL] at 7. However, as previously discussed, this court finds that the examiner's unilateral remarks did not alter the scope of the claim. 4 An examiner's statement cannot amend a claim. Consequently, the district court clearly erred in finding that claim 1 was "amended." Moreover, as the regulation and this court's reasoning above discuss, the examiner's unilateral remarks alone do not affect the scope of the claim, let alone show a surrender of claimed subject matter that cannot be recaptured under the doctrine of equivalents. Thus, this court reverses the district court's holding that prosecution history estoppel bars Mr. Salazar from asserting infringement of the "elastic" element under the doctrine of equivalents.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

4 The parties do not dispute that introducing claim 7 based on the allowable subject matter of dependent claim 3 of the '149 application was not a narrowing amendment for purposes of patentability and, therefore, does not by itself give rise to prosecution history estoppel. See Festo Corp. v. Shoketsu Kinzoku Kogyo Kabushiki Co., 535 U.S. 722, 736, 152 L. Ed. 2d 944, 122 S. Ct. 1831 (2002) (stating that an amendment that is "truly cosmetic" does not give rise to prosecution history estoppel).

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - -

The parties only contest whether the applicant's silence to the examiner's remarks in the Examiner's Statements of Reasons...
for Allowance amounts to a clear disavowal of claim scope as found by the district court. Because such statements do not amount to a clear disavowal of claim scope by the applicant, this court vacates the portion of the district court's claim construction excluding nylon from falling within the scope of the "elastic" element. This court affirms the remaining portion of the district court's claim construction that "elastic" means "capable of returning to an initial state or form after deformation." Whether the accused products satisfy the "elastic" limitation in the asserted claims is a factual matter that this court leaves for the district court to resolve in the first instance.

1. Claim Construction

Claims 1, 11 and 34 recite a finished product, described in the abstract and titled in the 322 patent as a "Fitted Mattress Cover." Thus this finished product is comprised of each and every element of Claim 1, or Claim 11, or Claim 34 when constructed. Each claim must be read as an integrated unit of elements which together comprise that finished product.

The parties have spent a great deal of time parsing individual words in the claims, attempting to derive discrete definitions for each word. We do not view our task as claim constructionist to require that each term or phrase be defined in the classical sense of the term "definition." Rather, it is our task to ascertain each element as it exists in the claim. It is claim construction, not element definition, which we must perform. No element of a claim has any useful meaning to the court independent of the other elements of that claim, since it is the composite of all elements of the claim which comprise the finished product. We conclude, then, that we must construe each element as it exists in dynamic operation with the other elements of the claim. Only in this way can we determine the parameters of the claim elements.

Claim 11 (as well as product claim 1 and process claim 28) recites an "elastic material." The claim recites that this elastic material is "attached to [a] layer of material in a plurality of spaced apart parallel lines of attachment..." By contrast, Claim 34 recites "elongated elastic cords," and is therefore limited to that form of elastic material. The doctrine of claim differentiation prohibits the incorporation of a narrow claim limitation ("elongated elastic cords") into a broad one ("elastic material"). Therefore "elastic material" is not limited to elongated elastic cords.

We agree with this construction of this portion of Claim 11.

4. Elastic Means

Claims 7, 8, and 10-12 of the '828 patent refer to an "elastic means" which comprises a length of rubber-like material. The specification states that the elastic means is an elastic member, also referred to as the elastic compression means, which "elastically compresses the warmth-retaining means in such a manner as to reduce the cross-sectional area of the inner cavity." ( '828 Patent, col. 1, lines 45-47; col. 2, lines 44-50; figs. 1, 3-7.) The elastic means is "preferably" provided at least in the portion of the sleeping bag near the head opening, id. col. 1, lines 48-50, and is sewn to the inner or outer cloth lining sheet, or both. Id. col. 1, lines 54-56 and 66-col. 2, line 2.

According to the specification, when the sleeping bag is used, "the elastic member serves to press the portion of the warmth-retaining bag into resilient contact with the sleeper's body." Id. col. 3, line 4-7. The elastic means contracts the warmth-retaining means into close contact with the user, so that the gap between the user's body and the inner cloth lining sheet of the warmth-retaining means is reduced, thus suppressing the movement of air in the sleeping bag and lessening the dissipation of heat. Id. col. 2, lines 3-11. The prosecution history defines the elastic compression means as follows:

[The] elastic compression means cause radial compression of the [sleeping] bag at at least one point axially along its length. This allows the interior surfaces of the bag to be brought into close conformity with the user and reduces the loss of body heat that may result from a flow of air between the user and the interior surface of the bag. This feature . . . provides localized compression to inhibit air flow longitudinally within the bag.
The elastic members also allow the user to move around, without restriction, within the inner cavity. ( '828 Patent, col. 3, lines 21-27 and lines 40-44.)

In its claim construction brief, Mont-Bell claims that when the sleeping bag is used, the elastic means, if expanded, press the warmth-retaining bag into resilient contact with the user. (Pl.'s Br. Cl. Const. at 4-5.) Mountain Hardwear challenges this because, according to Mountain Hardwear, the sleeping bag device is "already" in resilient contact with the occupant prior to any expansion. (Def.'s Opp'n at 3.) Review of the specification suggests that, although some portion of the inner cloth lining sheet is necessarily in contact with the sleeper's body prior to any expansion of the elastic means, the elastic means serves to reduce the cross-sectional area of the inner cavity such that at least some remaining gaps between the sleeper's body and the inner cloth lining sheet of the warmth-retaining means are reduced, and movement of air is suppressed.

The Court finds that the specification and prosecution history clearly define the elastic means as those lengths of rubber-like material, sewn into the lining cloths of the warmth-retaining means, which, when the sleeping bag is in use, compress the warmth-retaining means into closer contact with the user's body, reducing the cross-sectional area of the inner cavity so that the gap between the body and the inner cloth lining sheet is reduced, but also allowing less restricted movement within the bag.

For the foregoing reasons, the Court construes claims 7, 8, and 10-12 of the '828 patent as claiming sleeping bags which have elastic means (or elastic compression means, or elastic members) which, when expanded, compress the inner lining of the warmth-retaining means, reducing the cross-sectional area of the inner chamber, which is in turn defined by the inner lining of the warmth-retaining means. The inner chamber of the sleeping bags serves to accommodate the user's body; and the head opening of the bags allows users to enter and exit the bags.

4. elastic stress response

The plaintiffs propose "a measure of the elasticity of a balloon calculated using the equation [shown in the '364 patent at 5:8]." The defendants propose "a value calculated according to the definition provided at 4:66-5:13 of the '364 patent."

Both parties agree that the correct equation for the "elastic stress response" is:

\[
\frac{\text{Balloon diameter at 5 bars after inflation to 10 bars/Balloon diameter at initial 5 bar inflation-1}}{\times 100}
\]

The disagreement between the parties is whether the claim should be limited to the conditions under which this measurement is made. The plaintiffs' proposal is that the term means the above equation without any qualification. The defendants argue that the following language from the specification should be used to define this term: "Elastic stress response is determined by inflating a balloon to 5 bars at about 37 [degree] C and measuring the balloon's diameter. The balloon is then inflated to a pressure of 10 bars in about 20 seconds and held for an additional 20 seconds at 37 [degree] C. The balloon's diameter is then measured. The internal pressure of the balloon is then decreased to 5 bars and the 'new' 5 bar diameter of the balloons is determined." '364 Patent at 4:66-5:5.

The plaintiffs contend that the passage cited by the defendants is just an embodiment and it would be improper to read in these limitation since the defendants do "not even attempt to apply the SciMed test." Plaintiffs' Reply Brief at 14. The defendants argue that a construction consisting of only the equation would be a partial and incomplete construction.

The court agrees that "[a] reasonable reading of the entire paragraph starting at col. 4, line 66 of the '364 patent… that the measurement conditions… are part of the definition." Defendants' Response Brief at 28. The phrase "for this invention" precedes the formula; however, the formula's parameters are explicitly defined prior to this phrase. Reading the paragraph as a whole, the patentee has chosen to define a measurement in specific terms with specific test conditions. In other words, the patentee is his own lexicographer for the term "elastic stress response."

Accordingly, the term "elastic stress response" means "a value calculated using the equation [shown in the '364 patent at
5:8] determined by inflating a balloon to about 5 bars at or about normal human body temperature and measuring the balloon's diameter. The balloon is then inflated to a pressure of about 10 bars in about 20 seconds and held for about an additional 20 seconds at or about normal human body temperature. The balloon's diameter is then measured. The internal pressure of the balloon is then decreased to about 5 bars and the 'new' 5 bar diameter of the balloons is determined."

12. Elastically Bendable Portion

Because the parties could not agree, they requested that the Court interpret "elastically bendable portion" as it appears in '836 patent claims 1 through 7, and claim 26. Unilin states "elastically bendable portion" means "a resilient portion of a coupling part." (Unilin Open. Br. 25-26.) Alloc states it has no substantial disagreement. (Alloc Resp. Mem. 13.)

Claim 1 states in pertinent part:

at least one of said coupling parts including an elastically bendable portion having a relaxed unbent position, and which, when in a coupled condition, is at least partially bent out of its normal relaxed position and thereby provides said biasing force; wherein the elastically bendable portion of said one of said coupling part comprises a lower lip defined at least in part by a lower side of the groove of said coupling parts, said lower lip cooperating with a mating portion of a tongue of a cooperating coupling part; wherein said lip when bent extends in a downward direction relative to the panel underside when the panel is coupled by cooperative complementary coupling parts to another one of said panel; wherein the panel comprises a core comprising a material selected from the group consisting of HDF and MDF board; said lower lip is substantially formed of said core; one of said locking elements comprises a recess in said lower lip, said recess having a lowermost bottom area; said groove having a deepest point within the panel; and wherein said elastically bendable portion of the lower lip comprises a portion of said lower lip located between the deepest point of said groove and the lowermost bottom area of said recess; wherein the bendable portion of the lower lip includes a side wall of said recess that slopes downwardly in a direction extending from a distally outer area of said lip towards a proximally inner area of said lip.

('836 patent, 14:12-40)(emphasis added.) Unilin's proposed construction is consistent with the language of the claims and the specification. Therefore, the Court adopts the definition of "elastically bendable portion" as meaning "a resilient portion of a coupling part."

G. Term 8: "elastically return to a predetermined shape"

The Court finds that it need not construe either the phrase "elastically return to a predetermined shape" in claims 17 and 28 of the '291 patent, or the related phrase "elastically returning to a predetermined shape" in claim 1 of the '291 patent.

AGA and the University have two distinct disagreements with respect to this claim language. First, they disagree about the meaning of "predetermined shape." According to AGA, "predetermined shape" means "a shape that is determined prior to placement of the device in the catheter." Am. JCCS Sched. B at 24. But a "predetermined" shape is necessarily a shape determined in the past, and thus AGA's proposed construction, at first glance, seems to add nothing to the claim language. A jury will be able to determine whether, once an accused device is deployed in a human body, that device returns to a shape that was determined beforehand --i.e., a predetermined shape.

Both the University and AGA, however, seem to interpret AGA's proposed construction as imposing some kind of exactness requirement. In other words, the parties seem to believe that, if AGA's proposed construction were adopted, it would require the "predetermined shape" to be a shape that is determined with great precision before the device is deployed. See Univ. Opening Br. at 41; AGA Opening Br. at 43-44. The Court doubts that AGA's proposed construction of "predetermined shape" would in fact impose an exactness requirement. More importantly, though, the patent does not support imposing such a requirement. The patent covers a device made of flexible materials, to be deployed inside a human heart. It is obvious to a
layman that the device's two disks, when deployed, will have to conform to nearby human tissue and will not be ideal, Platonic circles. Because AGA's proposed construction either does nothing at all (on the Court's interpretation) or imposes an exactness requirement not supported by the patent (on the parties' interpretation), the Court rejects AGA's proposed construction.

AGA and the University also disagree, with respect to claim 1 only, about what portion of the device must "elastically return" to the predetermined shape. According to AGA, the device's "membrane" itself must exert a force to return to a predetermined shape. AGA Opening Br. at 42. That is, AGA contends that claim 1 covers only a device made with a membrane that is itself elastic, and not a device made with, say, a non-elastic cloth membrane attached to an elastic frame.

The Court agrees with AGA that the thing in claim 1 that elastically returns to a predetermined shape is indeed the membrane. The relevant claim language covers a "disk comprising a . . . membrane capable of being collapsed for passage through a catheter and elastically returning to a predetermined shape . . . ." '291 patent claim 1. The words "capable of" modify "membrane," and the phrases "being collapsed" and "elastically returning" are parallel. Thus, it is the "membrane" in claim 1 that is "capable of being collapsed . . . and [capable of] elastically returning . . . ."

It is not obvious from the language of claim 1, however, that a membrane that is "capable of . . . elastically returning" to a shape must be a membrane that is capable of elastically returning to a shape itself-- that is, without any "help" from a frame or other external force -- as AGA would have it. One could say that a membrane "elastically returns" to a shape when the membrane is part of a structure that, as a whole, "elastically returns" to a shape. Suppose, for instance, that a small child is part of a family that is traveling by car across the country, and the child's father is doing all of the driving. It would be natural to say that the child is "driving cross-country," even though only the father is actually "driving," and even though the child is an infant.

In light of the '291 patent's specification, the Court finds that claim 1 of the '291 patent requires a membrane that elastically returns to a predetermined shape either through its own force or through some external force. The preferred embodiment that is discussed at greatest length in the '291 patent is a device with a spring-like external frame and a fabric-type membrane. See '291 patent col. 4:56 to col. 8:40. In such a device, the elasticity may (depending on the membrane) come from the frame, and not from the membrane (which might be made of "silk" or another inelastic fabric, '291 patent col. 4:60-67). Because the '291 patent is so clearly intended to cover a device with an elastic frame and an inelastic membrane, the Court rejects AGA's proposed construction of the phrase "elastically returning."
having a minimum of 3% heat-recoverable shape-memory, a yield strength greater than 30,000 psi and at least 3% elasticity.

1 The citation in the text is to the '955 patent at column 13, line 33 to column 14, line 5.

Each party has advanced a different interpretation of the claim term "3% elasticity." Plaintiffs assert that "elasticity" describes "the ability or tendency of a given material to recover or "spring-back" to its original shape, partially or completely, after a deforming force is removed." Pl. Mem. at 9. Defendants argue that the term elasticity describes the ability of a material to return completely and spontaneously to its precise original shape after a deforming force is released. Def. Mem. at 5.

As demonstrated by the undisputed evidence at trial, metallurgists use specific techniques for measuring the elasticity of metals. Simply put, the metal being tested for elasticity is pulled, and the pulling force, or stress, is then released. Measurements are made of the degree to which the metal is strained, or stretches when pulled, and the degree to which it recovers from that strain, or returns to its original shape, after the stress is released.

The parties agree that data developed by applying these measurement techniques are typically expressed in graphic form. These graphic depictions of elasticity are referred to as stress-strain curves. The stress to which the metal being tested is subjected, or the force with which it is pulled, is measured on the vertical axis of a stress-strain curve. The horizontal axis is used to plot the strain which the metal being tested exhibits at any given amount of force, or the degree to which it stretches when pulled and returns to its original shape when the pulling force is reduced or released. The strain is measured as a percentage of the tested item's original length. For example, a metal rod 100 centimeters long which stretches to 103 centimeters when pulled with 1000 pounds per square inch of force is said to exhibit 3% strain when subjected to a stress of 1000 pounds per square inch. Similarly, if the same rod, when pulled with a force of 1200 pounds per square inch stretched to 105 centimeters, the rod would be said to exhibit 5% strain when subjected to a stress of 1200 pounds per square inch. These percentages are calculated by dividing the change in the length of the rod (3 centimeters and 5 centimeters, respectively) by the original length of the rod, which in this example is 100 centimeters.

The difference in the definitions of elasticity advanced by the parties concerns the behavior exhibited when the stresses on the rod are released. Plaintiffs assert that the term 3% elasticity refers to the ability of a metal item to "spring back" or recover in an amount equal to 3% of its original length after being subjected to stress. For example, to exhibit 3% elasticity as interpreted by plaintiffs, a metal rod 100 centimeters in length, after being stretched to a length of 105 centimeters when stressed, must, when the stress is released, "spring back" by an amount equal to 3% of its original length, or 3 centimeters, to a length of 102 centimeters.

According to defendants, 3% elasticity requires that a metal item return precisely to its original shape after being strained by at least 3% of its original length. In other words, to exhibit 3% elasticity as interpreted by defendants, a rod 100 centimeters...
necessarily complete, power to return to their original shape nevertheless exhibit elasticity.

return to its original shape is extremely great." Tr. 1640-41. Suzuki's definition suggests that materials with great, but not necessarily to return precisely to its original dimensions. Tr. 571 (Krumme), 966-67, 1207 (Beshers). Even Suzuki, who was plaintiffs' trial expert, testified that the term elasticity, particularly when used in the context of shape memory alloys like those described in the suit patents, refers to the ability of material to spring back towards its original shape, and not those materials with great, but not necessarily to return precisely to its original dimensions. Tr. 571 (Krumme), 966-67, 1207 (Beshers). Even Suzuki, who was plaintiffs' trial expert, testified that the term elasticity, particularly when used in the context of shape memory alloys like those described in the suit patents, refers to the ability of material to spring back towards its original shape, and not necessarily complete, power to return to their original shape nevertheless exhibit elasticity.

Prior to trial, plaintiffs moved for summary judgment on infringement and asserted, among other things, that defendants' frames exhibited more than 3% elasticity over the sixty-degree temperature range required by claim 1 of the suit patents. By Memorandum and Order dated November 21, 1994, this Court denied plaintiffs' motion for summary judgment, and permitted the parties to proceed to trial and argue their competing contentions about the meaning of the disputed claim term to the jury. The verdict returned after trial indicates that the jury accepted plaintiffs' definition of the term.

After the trial of this case, the Federal Circuit issued its decision in Markman v. Westview Instruments, Inc., 52 F.3d 967 (Fed. Cir. 1995), cert. granted, U.S. , 116 S. Ct. 40 (1975). The Court held in Markman that it was improper to allow a jury to decide the meaning of disputed claim terms. Although the Court in Markman acknowledged that some of its prior holdings indicated that "claim construction may have underlying factual inquiries that must be submitted to a jury," 52 F.3d at 976, it nevertheless held that the meaning of a patent claim is a question of law and, as such, must be resolved by the Court.

This Court's Memorandum and Order denying plaintiffs' motion for summary judgment on infringement addressed the parties' dispute over the meaning of the term 3% elasticity. After reviewing the specifications and the prosecution history of the suit patents, the definition advanced by defendants was determined to be correct. As this Court has made clear in the course of prior proceedings in this action, however, because the decision was to deny summary judgment, it has little or no precedential significance. Moreover, since rendering that decision, the Court has had the opportunity to review the specifications and prosecution history at great length, to hear testimony from experts about the meaning of technical terms, including elasticity, and to consider additional arguments made by the parties, both at trial and in connection with the motions now pending. Accordingly, the meaning of the patent terms in dispute is now reviewed de novo, without regard or reference to the discussion in the Memorandum and Order issued prior to trial.

The Federal Circuit's decision in Markman, which now requires this Court to decide the meaning of the claims in the patents in suit, offers guidance to Courts attempting to construe technical terms in a patent claim. The primary sources for determining the meaning of a patent claim are the claim language itself, the patent specification and the prosecution history. In addition, the Court in Markman specifically held that "expert and inventor testimony … may be helpful to explain scientific principles, the meaning of technical terms, and terms of art that appear in the patent and prosecution history." 52 F.3d at 979-81.

B. The Language of the Patent Claims

The claims of the suit patents, quoted above, use the terms 3% elasticity and 4% elasticity without elaboration. Accordingly, standing alone, the language of the patent claims is of no assistance in resolving the definitional dispute between the parties.

Defendants assert that the commonly understood ordinary meaning of the term "elasticity" supports the definition they advance. In their memorandum, defendants recount the trial testimony of several witnesses, including John Krumme, Dr. Daniel Beshers, and Yuichi Suzuki, each of whom presented their own interpretation of elasticity. Def. Mem. at 6 n.6. Defendants assert that the testimony cited in their memorandum establishes that the term elasticity is typically used to refer to the ability of a strained material to return to its original shape when the stress causing the strain is removed.

The testimony relied upon by defendants, however, is taken out of context. Krumme, one of the two inventors, and Beshers, plaintiffs' trial expert, testified that the term elasticity, particularly when used in the context of shape memory alloys like those described in the suit patents, refers to the ability of material to spring back towards its original shape, and not necessarily to return precisely to its original dimensions. Tr. 571 (Krumme), 966-67, 1207 (Beshers). Even Suzuki, who was called as a witness on behalf of the defendants at trial, described elasticity as "meaning that the recovery power for it to return to its original shape is extremely great." Tr. 1640-41. Suzuki's definition suggests that materials with great, but not necessarily complete, power to return to their original shape nevertheless exhibit elasticity.
More importantly, the real issue of claim interpretation presented by this case is not the meaning of elasticity in the abstract, but rather the meaning of a measure of elasticity expressed as a percentage. In other words, whatever elasticity may mean, the term 3% elasticity clearly means something less than, for example, 100% elasticity. Thus, even assuming that defendants are correct in their assertion that the term elasticity refers in general to the ability of a material to return to its original shape, the question of what behavior constitutes 3% elasticity remains.

C. The Specifications of the Patents in Suit

As discussed above, elasticity measurements are frequently displayed in graphic form as stress-strain curves. The suit patents contain several such curves, labelled as figures 2A through 2H. The parties each contend that the graphs contained in the suit patents, as well as the patent specifications, support their respective definitions of the term 3% elasticity.

Footnotes

3 The same graphs appear in both the '112 and '955 patents.

4 The term "specifications" is used in the plural to refer to the specifications of both the '112 and '955 patents.

Defendants point in particular to figures 2F and 2H, and to passages taken from the specifications indicating that these graphs illustrate the properties of the invention described in claim 1 of the suit patents. Figures 2F and 2H depict materials which, having been strained by approximately 6% of their original length, return completely to their original shape when the stress upon them is released. The use of these figures in the patent specifications thus lends strong support to defendants' definition of the term 3% elasticity. Defendants further correctly assert that the patent specifications suggest that the behavior illustrated in figures 2F and 2H -- spontaneous return precisely to original shape from strains of up to 6% -- can be achieved by the claimed invention at temperatures as low as -20 [degrees] C.

While it is certainly appropriate to consider a patent specification when construing a disputed claim term, it is not proper to read limitations into a claim from the specification. SRI Int'l v. Matsushita Elec. Corp. of Am., 775 F.2d 1107, 1121 (Fed. Cir. 1985); see also Markman, 52 F.3d at 980 (noting that the specification "does not delimit the right to exclude. That is the function and purpose of the patent claims."); Electro Medical Sys. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994)(holding that "claims are not to be interpreted by adding limitations appearing only in the specification"). Figures 2F and 2H are therefore relevant only insofar as they inform the meaning of the term "3% elasticity," and not simply because the patent specifications in the suit patents suggest -- even if inaccurately -- that the behavior which these curves illustrate can be achieved by the claimed invention at temperatures as low as -20 [degrees] C.

Footnotes

5 In considering whether the discussion of figures 2F and 2H in the specifications inaccurately implies that the claimed invention can achieve a spontaneous return to original shape from 6% strains over a sixty-degree temperature range, it should be noted that the specifications state that figures 2F and 2H represent "ideal characteristics." 112:4:45-46; 955:5:19.
conclusion that 3% elasticity requires that a component return spontaneously and completely to its original shape.

6 Although there is a mention of the term "6% elasticity" at 955:6:24, it is clear from the context that this term is not being used to refer to the behavior depicted in figures 2F and 2H. Moreover, the complete phrase, "greater than 6% elasticity," could not possibly be describing the behavior shown in figures 2F and 2H, because these figures illustrate behavior which, even by defendants' definition, would constitute slightly less than 6% elasticity.

In fact, when carefully reviewed in their entirety, the specifications and figures in the suit patents in fact provide persuasive support for plaintiffs' definition of 3% elasticity. This support derives in particular from the language of claim 5 and the discussion of figure 2G in the specifications. In both the '112 and '955 patents, claim 5 uses the same term -- "3% elasticity" -- which appears in claim 1 of the '955 patent. 7 When describing the behavior constituting 3% elasticity in the context of claim 5, the specifications use this term precisely as do plaintiffs in connection with the motions now pending before the Court. For example, the '112 patent describes an embodiment of claim 5 which provides "a fully recoverable strain potential of at least 6%." 112:5:45-46. In the text immediately following, it is further explained that this 6% recovery is comprised of "a minimum of 3% heat-recoverable shape-memory … and at least 3% elasticity." 112:5:53-55. Thus, the '112 patent specification describes a component as exhibiting 3% elasticity even though the component retains a 3% strain recoverable only with the application of heat.

7 As noted above, claim 1 of the '112 patent uses the term "4% elasticity," but is in all other material respects identical to claim 1 of the '955 patent.

Similarly, the '955 patent, in discussing an embodiment of claim 5, describes a component which has been subjected to a 7.5% strain. This strain is completely recovered when, "upon unloading[,] the component gives 3.7% elastic spring back and imparts 3.8% shape memory recovery when heated." 955:6:60-62. The specification further states that "from the above, it can be seen [that eyeglass frame components may be made] . . . having a minimum of 3% heat-recoverable shape-memory . . . and at least 3% elasticity." 955:7:10-14. The reference to "3.7% elastic spring back" is the only behavior described in the text which could possibly support the conclusion that "from the above . . . 3% elasticity [can be seen]." A second embodiment of claim 5 using similar language and providing similar support for the definition of 3% elasticity advanced by plaintiff is described at 955:6:63-955:7:9.

Clearly, then, the 3% elasticity described in the cited text of the '112 patent, and the 3.7% "elastic spring back" described in the cited text of the '955 patent, are provided as examples of the 3% elasticity required by claim 5. It is also clear that this elastic behavior must be combined with at least 3% "heat-recoverable shape-memory" behavior before the components, having been subjected to strains of 6% and 7.5%, respectively, return to their original shape. Thus, the term "3% elasticity," as it is used in claim 5, plainly does not require that a component return spontaneously and completely to its original shape. The same claim term, 3% elasticity, is of course used in claim 1, and cannot be consistently construed to require that a component spontaneously return to zero.

Defendants contend that the portions of the specifications discussed above do not support plaintiffs' definition of 3% elasticity. Rather, according to defendants, the heat-recoverable shape-memory and elasticity described in claim 5 are separate and distinct characteristics, each of which must be measured independently by straining a component to about 3% of its original length.

The cited portions of the specifications discussed above, however, demonstrate that the shape-memory and elasticity components of claim 5 are intended to operate in tandem upon an eyeglass frame subjected to strains in excess of 6% of original length. This construction of the shape-memory and elasticity elements of claim 5 is further supported by the references to figure 2G in the specifications of the suit patents. Figure 2G depicts a component which has been strained.
slightly less than 8%. When the deforming stress is released, the component springs back by almost 5%, with a strain of about 3% remaining. This remaining 3% strain is then recovered with heat, which returns the component to its original shape. Consistent with plaintiffs' definition of the term 3% elasticity, the specifications describe the "spring back" of 5%, from 8% strain to the remaining 3% strain, as illustrating the component's elastic properties. 112:3:23-24; 955:3:47-48. Furthermore, the specifications make it clear that figure 2G is intended to illustrate the behavior of a component covered by claim 5. 955:6:26, 35.

As discussed above, the '955 specification uses the phrase "spring back" to describe the behavior of a component which meets the requirement of 3% elasticity in claim 5. Moreover, the suit patents each employ figure 2G, which illustrates only a partial return toward original shape absent heat, to depict the "at least 3% elasticity" described in claim 5. It therefore follows that the term 3% elasticity as used in claim 5 refers not to the spontaneous return of a component to its original shape, but rather to the ability of a component to "spring back" by an amount equal to 3% of its original length. Moreover, the term is used in claim 5 precisely as it is used in claim 1, and there is no reasoned basis to apply different definitions to the same term used in two claims of the same patent. See Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579 (Fed. Cir. 1995), petition for cert. filed, 60 U.S.L.W. 3250 (Sept. 19, 1995) (No. 95-475); Fromson v. Advance Offset Plate, Inc., 720 F.2d 1565, 1570 (Fed. Cir. 1983) (holding that "evidence of the scope of a particular claim can be found on review of other claims"). This Court concludes, therefore, that the specifications support plaintiffs' contention that the 3% elasticity requirement in the claims of the suit patents is satisfied by a component which, upon the application of force, is strained in excess of 3% of its original length, and which, when the deforming force is released, springs back by at least 3% of its original length.

D. The Prosecution History

Defendants next assert that the prosecution history of the suit patents supports their definition of 3% elasticity. Like a patent specification, a patent's prosecution history may properly be considered when construing the language of a claim, but may not be used to vary the claim's limitations. Markman, 52 F.3d at 980. Accordingly, as with the specifications, the prosecution history is relevant only insofar as it indicates how the term "3% elasticity" was defined by the inventors and understood by the Patent and Trademark Office (the "PTO"). To the extent the inventors asserted during the prosecution history that their invention could achieve results even more impressive than those described in the patent's claims, such assertions, whether accurate or not, are not in and of themselves relevant to the claim construction question defendants now raise.

Defendants rely upon cited passages from several documents generated during the prosecution history in which the inventors emphasized the highly elastic properties claimed for their invention by referring to figures 2F and 2H and to the term "optimized elasticity." Defendants argue that these passages demonstrate that the inventors attempted to persuade the patent examiners that frames made pursuant to their patent would spontaneously return to their original shape when a deforming stress was released.

The documents cited by defendants, however, do not purport to define the claim term 3% elasticity or otherwise express a measure of elasticity in percentage terms. 8 Indeed, when describing pseudoelastic behavior, the inventors did not refer to a percentage of elasticity, but instead used the phrase, "the strain will spontaneously return to zero." PX 3 at 14. 9 Similarly, when describing the behavior depicted in figure 2H during the prosecution history, the inventors did not describe that figure as illustrating 6% elasticity, but rather as depicting the behavior of "totally elastic" material. Id. Thus, when describing the ability of an item to return to its original shape -- a behavior characteristic of pseudoelasticity and depicted in figure 2H -- the inventors used terminology, such as spontaneous return to zero or total elasticity, which does not express elasticity as a percentage. The terms used by the inventors during the prosecution history thus support the conclusion that the claim terms, which do express elasticity as a percentage, do not require the complete and spontaneous return of an item to its original shape.

--- Footnotes ---

8 Defendants argue that the inventors used the term optimized elasticity to mean the same thing as pseudoelasticity, and defined pseudoelasticity as the spontaneous return to original shape. Defendants correctly describe the inventors' definition of pseudoelasticity. 955:1:48-55. Defendants' contention that the inventors used optimized elasticity to mean the same thing as pseudoelasticity, however, is incorrect. The '955 patent specification specifically states that optimized elasticity is achieved by combining the pseudoelastic and superelastic properties of shape-memory alloys, and emphasizes that the terms
pseudoelasticity and superelasticity refer to different properties. 955:1:36-44; 955:2:29-33. Similarly, at least once during the prosecution history, the inventors described optimized elasticity as a combination of pseudoelasticity at higher temperatures and other properties at lower temperatures. This is reflected in a document cited by defendants, in which the inventors discussed

the optimized elasticity combination of properties which utilize the soft pseudoelastic effect in concert with a resistance to turning weak and staying bent when deformed at a temperature below the material's transformation temperature.

DX 17B at 6-7. 9 PX 3 refers to plaintiffs' trial exhibit 3. DX is used herein to refer to defendants' trial exhibits.

The only discussion of elasticity expressed in percentage terms which the Court has found among the prosecution history documents cited by the parties supports plaintiffs' definition of the term 3% elasticity. In a request for reexamination, the inventors discussed a prior art reference referred to as the "Mercier article." The inventors described a stress-strain curve in the Mercier article as illustrating a component strained by a deforming force to 11.1% which returns, or springs back, approximately 8.1% after the deforming stress is released. The request for reexamination describes this curve as illustrating 8.1% elasticity at the expense of a 3% retained strain. PX 3 at 19. (The 3% retained strain refers to the difference between the 11.1% strain to which the component was subjected and the 8.1% spring back exhibited by the component when the stress upon it was released.) Clearly, the inventors' statement to the PTO, describing a component which recovered only partially when stress was released as exhibiting 8.1% elasticity, supports plaintiffs' interpretation of 3% elasticity.

Defendants argue in their reply that the inventors' discussion of Mercier was based upon an inaccurate reading of the defendants' position during the reexamination proceeding. More specifically, defendants contend that it was their position on reexamination that the Mercier curve did not depict any retained strain. Def. Reply at 23 n. 15. Even assuming that defendants are correct in this regard, plaintiffs' misunderstanding has no bearing on the proper construction of the claim term in dispute. The significance of the statements made by the inventors during the prosecution history about the Mercier curve does not depend upon the accuracy or persuasiveness of their arguments about the curve, but instead upon the meaning attributed by the inventors to the expression of elasticity in percentage terms. It is clear that, in the passage from the prosecution history cited above, the inventors argued to the PTO that the curve in Mercier depicted a retained strain, yet nevertheless characterized that curve as illustrating 8.1% elasticity. The description of a stress-strain curve which is understood to depict a component which only partially returns to its original shape as exhibiting 8.1% elasticity supports the definition of 3% elasticity advanced by plaintiffs.

E. The Extrinsic Evidence At Trial

As noted above, the Court in Markman specifically held that expert testimony may be helpful to explain scientific principles and the meaning of technical terms. 52 F.3d at 979-81. Dr. Daniel Beshers, who has been a professor of metallurgy and material science at Colombia University since 1957, testified for plaintiffs as an expert at trial. In the course of his testimony, Beshers stated that elasticity expressed as a percentage, particularly when discussing shape memory alloys, is widely understood to refer to the ability of a component to "spring back" upon the release of stress to a degree indicated by the percentage of elasticity stated. Tr. 966-67, 1157, 1160. 10 Beshers' expert opinion thus supports the definition of 3% elasticity advanced by plaintiffs.

10 The reference at Tr. 1157:21 to 97 millimeters should read "197 millimeters."

Defendants argue that, because Beshers is not one of ordinary skill in the art, his expert opinion should have no bearing upon the construction of the disputed claim language. Beshers, however, testified that the definition he gave at trial was "universal" and that "everybody would agree [to it]," and that it was "widely recognized" as an accurate definition in the context of shape memory alloys. Tr. 1157, 1160. Moreover, Beshers testified that he had little experience with or specialized knowledge of shape memory alloys and their properties before he was retained by plaintiffs, he devoted special study to the
subject, particularly in connection with the fabrication of eyeglass frames, after plaintiffs engaged him. Tr. 949-50, 952. Presumably, one of ordinary skill in the art -- a fabricator of metal eyeglass frames lacking detailed familiarity with shape-memory alloys -- would undertake a similar course of study and investigation. Finally, defendants offered no evidence at trial that one of ordinary skill in the art would, by virtue of training and experience, understand the term 3% elasticity differently than did Beshers. 11 Accordingly, I conclude that it is appropriate to consider Beshers' expert testimony about the meaning of the term 3% elasticity.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

11 The only expert testimony about the meaning of elasticity presented by the defendants at trial was the testimony of Walter Johnson. Like Beshers, Johnson had little or no experience with shape memory alloys prior to being retained in this case, and had no experience whatsoever with the fabrication of eyeglass frames. Tr. 2224-25. Accordingly, Johnson was no more one of ordinary skill in the art than was Beshers. Moreover, Johnson opined during his testimony in any event that "there [are] as many definitions of elasticity as there are metallurgists." Tr. 2236.

* * *

Based upon the language of the claims of the suit patents, the specifications and drawings they contain, the history of their prosecution and the extrinsic evidence at trial, this Court concludes that the term 3% elasticity is properly construed to refer to the behavior exhibited by a component which, when strained by a deforming force to a length in excess of 3% of its original length, springs back by at least 3% of its original length when the force is released. Defendants' contention that the evidence at trial was insufficient to support the jury's finding that their products exhibited 3% elasticity as required by claim 1 is premised upon the definition of that claim term advanced by defendants. That definition having been rejected for the reasons stated above, defendants' motion for judgment as a matter of law on this ground is denied.

II.

As seen above, the claim construction issue in this case centers on the "elasticity" limitations of independent claims 1 and 5 of the '112 and '955 patents. On appeal, Tura advances the same argument it raised before the district court. Thus, it contends that the "greater than 3% elasticity" limitation in claim 1 of the '955 patent describes the ability of an eyeglass frame component to return completely and spontaneously to its original shape after being stretched by more than 3% of its original length. Under Tura's construction of claim 1, the concept of "elasticity" requires complete recovery with zero residual strain - at least up to the point at which the component is strained to such an extent that it exceeds what we may call its "elastic limit." When the component is stretched to such an extent that it exceeds its elastic limit, it is permanently deformed. CVI/Marchon urges that the district court's claim construction - under which complete recovery to zero is not required - is correct.

In determining the proper construction of a claim, "the court should look first to the intrinsic evidence of record, i.e., the patent itself, including the claims, the specification, and if in evidence, the prosecution history," Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582, 39 U.S.P.Q.2D (BNA) 1573, 1576 (Fed. Cir. 1996). We have described such intrinsic evidence as "the most significant source of the legally operative meaning of claim language." Id. Extrinsic evidence (e.g., expert testimony) also may be used in claim construction. Id. However, when "an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term," it is improper to rely on extrinsic evidence. Id. at 1583, 39 U.S.P.Q.2D (BNA) at 1577.

As used in the '112 and the '955 patents, respectively, 4% and 3% "elasticity" are technical terms. We have stated that "[a] technical term used in a patent document is interpreted as having the meaning that it would be given by persons experienced in the field of the invention, unless it is apparent from the patent and the prosecution history that the inventor used the term with a different meaning." Hoechst Celanese Corp. v. BP Chems. Ltd., 78 F.3d 1575, 1578, 38 U.S.P.Q.2D (BNA) 1126, 1129 (Fed.Cir. 1996) Thus, "it is always necessary to review the specification to determine whether the inventor has used
any terms in a manner inconsistent with their ordinary meaning." Vitronics, 90 F.3d at 1582, 39 U.S.P.Q.2D (BNA) at 1577.

The claims of the '112 and '955 patents do not define the terms 4% and 3% "elasticity." We thus turn to the specifications. 5 In that regard, the patent drawings are highly relevant in construing the elasticity limitations of the claims. Of particular importance are Figures 2 F. 2G, and 2H, which are reproduced below:

The figures are graphs depicting, in the form of stress-strain curves, stress-strain behavior at different temperatures (T). In each graph, the stress (or the pulling force) to which the alloy being tested is subjected is measured on the vertical axis. The horizontal axis plots the strain which the alloy being tested exhibits at any given amount of stress. In other words, the horizontal axis shows the degree to which the alloy stretches when it is pulled and the degree to which it returns to its original shape when the pulling force is reduced or released. '112, col. 3, lines 20-27; '955, col. 3, lines 43-54. Figures 2F and 2H show, up to a certain limit, complete release of stress causing strain to return to zero. Although for different temperature ranges, Figures 2F and 2H both show an alloy (i) being subjected to stress resulting in a strain of approximately 6% and (ii) then returning to its original shape when the stress is released. Figure 2G shows partial return of strain to zero. Figure 2G shows an alloy (i) being subjected to stress resulting in a strain of between 6 and 8% and (ii) then returning to between 3 and 4% of its original shape when the stress is released. Figure 2G also shows strain returning to zero upon the application of heat. Referring to Figure 2H above, the specifications for both the '112 and the '955 patent state as follows: "Thus, throughout the temperature region of interest for eyeglass frames, the component acts completely elastically up to strains of 6% or more." '112, col. 5, lines 24-26; '955, col. 5, line 68-col. 6, line 3. The specification for the '955 patent continues in the immediately following paragraph to give an example of an embodiment of claim 1. The example states that a "suitable component" will "support a stress of over 150 ksi . . . at 4% tensile strain and show complete elastic spring back at room temperature." '955, col. 6, lines 5-14. The specification concludes the discussion of the indicated example by stating that "from the above, it can be seen that an eyeglass frame may be constructed with portions thereof exhibiting optimized elasticity, such portions . . . having greater than 6% elasticity over a temperature range from -20 C. to +40 C." '955, col. 6, lines 19-25.

5 The specification for the '112 patent contains a typographical error. Under the heading "DESCRIPTION OF THE PREFERRED EMBODIMENT," the reference in column 4 at line 64 to "FIG. 2g" should be to "FIG. 2f." This is clear from the context.

The specification for the '112 patent contains no examples of the claim 5 embodiment. Each example of a claim 5 component in the '955 patent specification exhibits some degree of retained strain, which is removed by heating. The first example is of a component which, after having been subjected to a 7.5% strain and then having the strain released, "gives 3.7% elastic spring back and imparts 3.8% shape-memory recovery when heated." '955, col. 6, lines 60-62. The second example is of a component which, when subjected to a 7.25% strain and then having the strain released, "gives 5.0% elastic spring back and imparts 2.25% shape-memory recovery" when heated. '955, col. 7, lines 3-5. Figure 2G above depicts the behavior of an alloy possessing both "elasticity" and "heat-recoverable shape-memory."

We turn next to the prosecution history. We have stated that "arguments made during prosecution regarding the meaning of a claim term are relevant to the interpretation of that term in every claim of the patent absent a clear indication to the contrary." Southwall Techs. Corp. v. Cardinal IG Co., 54 F.3d 1570, 1579, 34 U.S.P.Q.2D (BNA) 1673, 1679 (Fed. Cir.), cert. denied, 133 L. Ed. 2d 424, 116 S. Ct. 515 (1995). Prosecution history "limits the interpretation of claim terms so as to exclude any interpretation that was disclaimed during prosecution." Id. at 1576, 34 U.S.P.Q.2D (BNA) at 1676. See also Biodex Corp. v. Loredan Biomedical, Inc., 946 F.2d 850, 863, 20 U.S.P.Q.2D (BNA) 1252, 1282 (Fed. Cir. 1991) (a particular interpretation of a claim can be disclaimed by the inventor during prosecution).

We consider first statements made by the inventors during the prosecution of the '112 patent. Claims 1-16 in the application for the '112 patent originally were rejected by the examiner as being unpatentable over various Japanese patent references. In that regard, what was then an amended version of claim 1 was rejected under 35 U.S.C. § 103 as obvious over Japanese reference P56-89717 (the '717 reference). The '717 reference teaches eyeglass frames having at least a portion made from shape-memory alloy. It also teaches work-hardening as part of the fabrication process. The applicants amended claim 1
In its discussion of Mercier, CVI referred to excerpts from Mechanical Metallurgy by G.E. Dieter, Jr. (McGraw-Hill). CVI noted that the 3% permanent deformation would result in significant distortions in the original shape of the frame. CVI argued that a frame which is deformed by 3% strain yet exhibits 8.1% elasticity is to indicate how much a material can be elastically deformed. Once a material is plastically deformed, it no longer will return to its original shape. The material covered by Claim 1 of the '955 patent exhibits at least 3% elasticity over the temperature range of -20 C. to +40 C. Under these circumstances, CVI stated, "Mercier does not provide any suggestion of the unique combination of properties which can be obtained with nickel-titanium alloys in the work-hardened pseudoelastic state." CVI then contrasted the meaning of "8.1% elasticity" in Mercier with the "3% elasticity" of claim 1:

"Mechanical Properties of the Cold-Worked Martensitic NiTi Type Alloys" ("Mercier"). Among other things, Mercier discusses the pseudoelastic properties of nickel-titanium alloys. Tura LP argued that claims 1-4 of the '955 patent would have been obvious over Mercier because "Mercier et al. fully disclose the nickel-titanium based shape-memory alloy defined in claims 1-4.

In making its obviousness argument, Tura LP pointed to Figure 2H from the '955 patent. It asserted that Figure 2H illustrated "the behavior of the alloy in the work-hardened pseudoelastic state" and that "in this condition, the alloy is claimed to have greater than 3% elasticity over a temperature range from -20 C. to +40 C." It then turned to Figure 4 of Mercier, which is shown below:

[App. 7031]

Tura LP argued that curve EC'DE of Mercier "perfectly anticipates Fig. 2H of the Zider et al. patent." That curve, it elaborated, "shows an elasticity, between points C' and E of 8.1%, which anticipates 'greater than 3% elasticity' set forth in the patent." Thus, in the reexamination proceeding, Tura advanced the construction of the term "greater than 3% elasticity" which the district court adopted and which CVI/Marchon urges. This is so because Figure 4 of Mercier clearly shows (i) a deforming stress resulting in a strain of 11%, (ii) release of that stress, and (iii) a recovery of 8.1% (which is a recovery of more than 3% but not a return to zero.)

CVI responded by seeking to distinguish claim 1 of the '955 patent over Mercier. Noting that Figure 4 of Mercier exhibited a "3% retained strain" when the deforming stress was removed, CVI argued that

Figure 2H of the '955 patent shows how the work-hardened pseudoelastic material covered by claim 1 will behave at temperatures between Ms and M[d] and it can clearly be seen that the material is totally elastic when a stress of about 115 ksi is applied and removed. The sample of Mercier shown in Figure 4 clearly does not exhibit the properties shown in Figure 2H of the '955 patent when a load of 1150 N/mm is applied and removed.

CVI also argued that a person of ordinary skill in the art would not consider the test at 100 C. shown in Figure 4 of Mercier as being pertinent in designing eyeglass frames to be worn at temperatures of -20 C. to +40 C. Continuing in this vein, CVI asserted that Mercier provided no information as to what the properties of the sample tested at 100 C. in Figure 4 would be in the temperature range of -20 C. to +40 C. Under these circumstances, CVI stated, "Mercier does not provide any suggestion of the unique combination of properties which can be obtained with nickel-titanium alloys in the work-hardened pseudoelastic state." CVI then contrasted the meaning of "8.1% elasticity" in Mercier with the "3% elasticity" of claim 1:

The third party [Tura] contends that the 8.1% elasticity shown in Figure 4 anticipates the 3% elasticity of claim 1. The 8.1% elasticity shown in Figure 4 of Mercier comes at the expense of a 3% retained strain, that is, the material will not return to its original shape. The material covered by Claim 1 of the '955 patent exhibits at least 3% elasticity over the temperature range -20 to +40 degrees C. The elasticity set forth in Claim 1 is attainable prior to the onset of permanent deformation. Otherwise, the recited elasticity properly [sic] would be meaningless. That is, elasticity measurements are used to indicate how much a material can be elastically deformed. Once a material is plastically deformed, it no longer will return to its original shape. With respect to the data shown in Figure 4 of Mercier, if the sample prior to testing corresponded to a finished part, after applying a load of 1150 N/mm and releasing the load, the part would be deformed such that it exhibited 3% retained strain. In the context of eyeglass frames, a frame which is deformed by 3% strain yet exhibits 8.1% elasticity is of no value since the 3% permanent deformation would result in significant distortions in the original shape of the frame.

Finally, in its discussion of Mercier, CVI referred to excerpts from Mechanical Metallurgy by G.E. Dieter, Jr. (McGraw-Hill)
Experience shows that all solid materials can be deformed when subjected to external load. It is further found that up to certain limiting loads a solid will recover its original dimensions when the load is removed. The recovery of the original dimensions of a deformed body when the load is removed is known as elastic behavior. The limiting load beyond which the material no longer behaves elastically is the elastic limit. If the elastic limit is exceeded, the body will experience a permanent set or deformation when the load is removed. A body which is permanently deformed is said to have undergone plastic deformation.

In affirming the patentability of the claims of the '955 patent, the examiner rejected Tura LP's argument that Mercier anticipated claim 1. Considering Mercier, the examiner noted that Mercier involved a different alloy than the one in the '955 patent and that it exhibited "desired properties in a temperature range outside that limited by the claim." Under these circumstances, the examiner wrote, "the materials of Zider et al are not anticipated by Mercier et al. Further, since the results of a change in materials are unpredictable, there is no suggestion that such a change would have been obvious, or that such a change would produce desirable results."

III.

Having reviewed the patent specifications and the prosecution histories, we conclude that the district court erred in its claim construction. We conclude that, as used in claims 1 and 5 of the '112 and the '955 patent, the word "elasticity" refers to the ability of an eyeglass frame component to return completely and spontaneously to its original shape after it is subjected to stress and the stress is removed, provided that the stress to which the component is subjected does not cause the component to exceed its elastic limit. We also conclude that the percentages appearing before the word "elasticity" in claims 1 and 5 of the patents refer to the amount of strain to which the eyeglass frame component is subjected. Thus, "greater than 3% elasticity" in claim 1 of the '955 patent means that a 100 centimeter rod must fully return to its original shape when stretched to some length over 103 centimeters. By the same token, "at least 3% elasticity" in claim 5 of the '955 patent means that the same rod must fully return to its original shape when stretched to any length under 103 centimeters.

6 We view this as a case in which reliance on extrinsic evidence (e.g., expert testimony) is not necessary.

Even standing alone, the specifications suggest this construction. Figures 2F and 2H above plainly show complete return to zero after the release of stress. At the same time, the specifications for both patents refer to Figure 2H and use the term "completely elastically" when referring to the desired behavior of eyeglass frame components. '112, col. 5, lines 24-26; '955, col. 5, line 68-col. 6, line 3. Likewise, the specification for the '955 patent states that a "suitable component" will show "complete elastic spring back at room temperature." '955, col. 6, lines 5-14. Finally, the reference to complete elasticity "up to strains of 6% or more" in both patents, and the reference to a similar degree of elasticity "at 4% tensile strain" in the '955 patent support the conclusion that the percentages appearing before the word "elasticity" in the patents indicate the amount of strain to which the eyeglass frame component is subjected.

CVI/Marchon correctly notes that the specification for the '112 patent recites that Figures 2F and 2H "represent the ideal characteristics for use in eyeglass components," and that the specification for the '955 patent states that Figures 2F and 2H represent "the ideal characteristics for use in purely elastic eyeglass components . . . ." '955, col. 5, lines 19-21. CVI/Marchon argues that "neither the '112 nor the '955 patent claims are limited to the 'optimum' embodiment."

CVI/Marchon is correct that, as a general matter, the claims of a patent are not limited by preferred embodiments. See Sjolund v. Musland, 847 F.2d 1573, 1581, 6 U.S.P.Q.2d (BNA) 2020, 2027 (Fed. Cir. 1988) (noting that while claims are to be interpreted in light of the specification, it does not follow that limitations from the specification may be read into the claims); Constant v. Advanced Micro-Devices Inc., 848 F.2d 1560, 1571, 7 U.S.P.Q.2d (BNA) 1057, 1064 (Fed. Cir. 1988) ("Although the specification may aid the court in interpreting the meaning of disputed language in the claims, particular embodiments and examples appearing in the specification will not generally be read into the claims."). However, as discussed above, through statements made during prosecution or reexamination an applicant for a patent or a patent owner,
During the prosecution of the '112 patent, the inventors stated that "the memory plus elasticity properties of a claim 5 frame are depicted in Figure 2G of the '955 specification. Figure 2G shows "a combination of elastic 3% heat-recoverable shape-memory, a yield strength greater than 30,000 psi and at least 3% elasticity." The elastic frame of claim 5, on the other hand, is in "the work-hardened and heat-treated condition." It must show "a minimum of temperature range, respectively. According to the inventors, claim 1 frames embody the concept of "optimized elasticity."

We note first the statement made during the prosecution of the '112 patent that amended claim 1 of the application was "specific to Applicants' first embodiment of frame components with optimized elasticity" and that "the figure which illustrates this embodiment is Fig. 2H." Figure 2H clearly shows return to zero after the release of deforming stress. Thus, the inventors clearly tied "elasticity" in claim 1 of the '112 patent to the concept of total recovery. The statements in the '112 and '955 specifications that Figures 2F and 2H represent "ideal characteristics" are not inconsistent with this meaning for "elasticity."

We find compelling the statements made by CVI during reexamination of the '955 patent to overcome Tura LP's arguments that Figure 4 of Mercier rendered claim 1 obvious. As seen above, CVI responded that "Figure 2H of the '955 patent shows how the work-hardened pseudoelastic material covered by claim 1 will behave at temperatures between Ms and Md and it can clearly be seen that the material is totally elastic when a stress of about 115 ksi is applied and removed." CVI continued that "the sample of Mercier shown in Figure 4 clearly does not exhibit the properties shown in Figure 2H of the '955 patent when a load of 1150 N/mm is applied and removed." In our view, this statement could hardly be clearer. The only meaning we are able to draw from it is that CVI was telling the examiner, "Claim 1 relates to an eyeglass frame component where there is total spring back to zero after the removal of a deforming force, as seen in Figure 2H of the patent. That is not what is shown in Figure 4 of Mercier, because that figure shows 3% retained strain." That also is the thrust of CVI's additional statement that "the 8.1% elasticity shown in Figure 4 of Mercier comes at the expense of a 3% retained strain, that is, the material will not return to its original shape." In addition, CVI emphasized to the examiner that an eyeglass frame which was "deformed by 3% strain" would be "of no value" even if, as depicted in Figure 4 of Mercier, it exhibited "8.1% elasticity."

In support of its claim construction, CVI/Marchon points to claim 5. It argues that, as used in claim 5 in both the '112 and the '955 patents, the term "at least 3% elasticity" cannot require "full recovery." This is so, CVI/Marchon asserts, because claim 5 shows a combination of "3% heat-recoverable shape-memory" and "3% elasticity." Put another way, if a component is stretched and then does not recover through its "elasticity" alone, unaided by "heat-recoverable shape-memory," then necessarily "elasticity" cannot mean full recovery, as Tura urges. According to CVI/Marchon, claim 5 and the related portions of the '955 specification thus provide support for its argument with respect to the construction of claim 1 of the patents.

This argument is flawed. First, CVI/Marchon's proffered meaning of "elasticity" is squarely at odds with the meaning of the term that emerges from our examination of the specifications and the prosecution and reexamination histories, as detailed above. CVI/Marchon cannot now turn its back on the meaning of "elasticity" which it embraced for claim 1 during the prosecution of the '112 patent and during the reexamination proceeding relating to the '955 patent. At the same time, we are obliged to construe the term "elasticity" consistently throughout the claims. See Fonar Corp. v. Johnson & Johnson, 821 F.2d 627, 632, 3 U.S.P.Q.2D (BNA) 1109, 1113 (Fed. Cir. 1987) (the meaning of a term in a claim must be defined in an manner that is consistent with its appearance in other claims in the same patent).

Moreover, contrary to CVI/Marchon's suggestion, it is not inconsistent to have "elasticity," as it appears in claim 5 of both patents ("at least 3% elasticity"), mean total recovery. The eyeglass frame of claim 5 is different from the frame of claim 1. Taking the '955 patent, the frame of claim 1 is in "the work-hardened pseudoelastic metallurgical state." It must show complete recovery from "greater than" 3% strain "over a temperature range from -20 C. to +40 C." The elastic properties of a claim 1 frame are depicted in Figure 2H of the '955 specification. In Figure 2H, the temperature range limitation is indicated by the symbol Ms < T[2 ] > Md, where Ms and Md represent the lower and upper ends of the useful ambient temperature range, respectively. According to the inventors, claim 1 frames embody the concept of "optimized elasticity."

The frame of claim 5, on the other hand, is in "the work-hardened and heat-treated condition." It must show "a minimum of 3% heat-recoverable shape-memory, a yield strength greater than 30,000 psi and at least 3% elasticity." The elastic properties of a claim 5 frame are depicted in Figure 2G of the '955 specification. Figure 2G shows "a combination of elastic and shape-memory properties" at the low end of the useful ambient temperature range (T < Ms). '112, col. 3, lines 23-24; '955, col. 3, lines 47-50. During the prosecution of the '112 patent, the inventors stated that "the memory plus elasticity
embody[ment] [of the invention] is shown in Figure 2G.” The inventors continued by describing the advantage which flows from having heat-recoverable shape-memory in addition to work-hardening: "Conversely, if the same material were left in a fully work-hardened condition, the properties shown in Fig. 2F would result, and the component would be very springy but would not give a complete shape-memory recovery if deformed past the component's elastic limit." (Figure 2F shows stress at T < Ms.) In short, the heat-recoverable shape-memory limitation of claim 5 speaks to the situation in which an alloy is stressed to the point that its inherent elasticity is not enough to enable it to return to its original shape when the deforming force is removed. In other words, the alloy's elastic limit is exceeded. As noted above, this retained strain is seen in the examples in the '955 specification which discuss the embodiment of claim 5. That is not the case in claim 1. As CVI stated during reexamination of the '955 patent, "the elasticity set forth in Claim 1 is attainable prior to the onset of permanent deformation."

A claim 5 component has two distinct attributes at T < Ms, elasticity and heat-recoverable shape-memory. Thus, the component can fully recover its original shape if it is subjected to a deforming force which stretches it up to 3% of its original length. Up to that point, only the component's elasticity properties are in evidence. If, however, the component is subjected to a deforming force which stretches it more than 3% of its original length, so that its elastic limit is exceeded, as in the examples in the '955 specification, it draws on its shape-memory properties when heat is applied, thereby enabling it to return to its original shape. The meaning given to "elasticity" by the inventors works in both claims 1 and 5.

Finally, our interpretation of the claims is consistent with and furthers the purpose of the invention. Eyeglass frames normally are carefully fitted to the wearer's particular facial configuration. If the fit is not correct, the eyeglasses are unlikely to perform their vision-correcting function properly or to be comfortable or acceptable to the wearer. When the shape of the frames is suddenly altered, such as by dropping them or sitting on them, distortion of the shape makes the frames less useful or attractive to the wearer. A frame whose elasticity enables it to correct the entire change by returning the frame to its original shape would be the most useful and most desired by the wearer. In these circumstances, it is reasonable to conclude that the references to 3% and 4% "elasticity" in the claims was intended to describe an eyeglass frame that would have that desirable and important property. In construing claims, the problem the inventor was attempting to solve, as discerned from the specification and the prosecution history, is a relevant consideration. See Applied Materials v. Advanced Semi. Materials, 98 F.3d 1563, 1573, 40 U.S.P.Q.2D (BNA) 1481, 1488 (Fed. Cir. 1996).

7 In CVI/Beta Ventures, Inc. v. Custom Optical Frames, Inc., 1996 U.S. App. LEXIS 14763, Nos. 96-1070, 95-1486 (Fed. Cir. 1996), 1996 WL 338388, a different panel of this court, in a nonprecedential opinion, upheld the grant of a preliminary injunction against infringement of the '112 and '955 patents. See CVI/Beta Ventures, Inc. v. Custom Optical Frames, Inc., 893 F. Supp. 508 (D. Md. 1995). In so doing, the panel affirmed an interpretation of the 3% elasticity limitation which did not restrict the claim to complete recovery. In its opinion, the panel stated that it could not conclude "in the context of the preliminary injunction proceedings that the district court erred in rejecting Custom Optical's proffered claim construction." The panel noted, as well, that the parties would have the opportunity at the merits stage to expand their arguments and to present any additional arguments. In this appeal, we review a different trial court's final claim construction as part of our review of the judgment on infringement. Therefore, unlike the earlier appeal, this appeal required us to construe the asserted claims based upon the final and complete record in the case. See International Communication Materials, Inc. v. Ricoh Co, Ltd., 108 F.3d 316, 319 (Fed. Cir. 1997) ("We review only the district court's tentative claim construction and its resulting finding on the likelihood of successfully proving infringement, which form an adequate basis for our affirming its denial of the preliminary injunction.").
Otis proposes that the term be defined as "a material, usually synthetic, having elastic properties akin to those of rubber." Schindler asserts that "elastomer" should be interpreted as "a material, usually synthetic, having elastic properties."

Otis' proposed definition is taken verbatim from the LAROUSSE DICTIONARY OF SCIENCE. Relying on such a source is appropriate where a term is not defined by intrinsic evidence. See Markman, 52 F.3d at 980. Schindler responds that the prosecution history discredits rubber as a coating layer, and therefore the "akin to those of rubber" language should be removed. Specifically, it points to Otis' statement to the PTO that rubber "provide[s] adequate traction but does not provide adequate wear when subjected to the shear loads applied by the cords in an elevator application." This, however, is inapposite. The phrase "properties akin to those of rubber" simply provides an illustration of the elastic properties that are characteristic of elastomers-- the fact that natural rubber itself is not an effective coating layer does not make Otis' construction deficient. The Court will define "elastomer" as "a material, usually synthetic, having elastic properties akin to those of rubber."

"elastomer"

Xinyi proposes that the term "elastomer" be construed as "a high molecular weight polymer with the property of elasticity," drawing this definition from a technical dictionary. Saint Gobain says no construction is necessary. The Court agrees with Saint Gobain, finding that a person of ordinary skill in the relevant art is readily familiar with the meaning of the term "elastomer." Resort to extrinsic evidence from a technical dictionary is, under the circumstances, unnecessary.

A device as in claim 31 wherein the cover is formed of an elastomer material.

The parties agree that the cover is formed of an elastic rubber-like material. The court finds this limitation means "a device as in claim 31 wherein the cover is formed from a substance having the elastic properties of rubber."

F. Claim 37

a. "elastomeric ligature material"

Callicrate's proposed interpretation of the phrase "elastomeric ligature material" is "a length of ligature material having elastic properties." NAIC proposes the following meaning: "the band of rubber or surgical tubing." While NAIC seeks a different construction of the phrase than Callicrate, NAIC does not provide any argument to support its construction.

Claim language

As always, the Court begins by examining the language of the claim itself, giving terms their ordinary meaning. The ordinary meaning of "elastomeric" is "any of various elastic substances resembling rubber." 35 Unlike NAIC's construction of the term, the ordinary meaning does not restrict elastomeric ligature material to rubber or surgical tubing. Rather, the ordinary meaning of the term supports Callicrate's proposed interpretation.

Specification

The specification of the 329 patent sheds light on Callicrate's intended meaning of the phrase "elastomeric ligature material." The specification states as follows:

In a preferred embodiment, the endless loop is manufactured from an elastomeric material having resistance to e [sic] strength that is resistant to abrasion and tearing. More preferably, the elastomeric material is comprised of non-hollow rubber material either molded or extruded to produce a finished elastomeric product with ends. As such, one aspect of the present invention relates to an endless ligation loop wherein the endless loop comprises a non-hollow elastomeric material.

The specification's reference to non-hollow tubing also suggests that NAIC's proposed interpretation, which would limit the ligature material to hollow surgical tubing is in error. Thus, the Court adopts Callicrate's proposed construction of the phrase "elastomeric ligature material," and construes the phrase to mean "a length of ligature material having elastic properties."

Consistent with the claim language and its ordinary meaning and the specification, the court construes "elastomeric material" to mean "a material that is able to stretch or expand without breaking, and to return to its original dimensions."

Tessera defines "elastomeric material" as "a material that behaves like an elastomer, such as synthetic rubber or plastic, which can be stretched or deformed under stress, and after release of the stress, will return to its approximate original shape." Samsung's definition is "a rubber-like material that can be stretched or deformed under low stress at least two times its original length and, after the release of the stress, will return with force to its approximate original shape." Joint Claim Construction Statement at B1:15-16. The essential dispute between the parties is that Tessera insists on a reference to "synthetic rubber or plastic" and "Samsung" insists on "rubber-like." Samsung contends that its construction is more helpful to a jury because reference to synthetic materials is misleading and confusing. Samsung relies upon the McGraw-Hill Dictionary of Scientific and Technical Terms (4th ed.) for its proposals that the elastomer must be stretched to "at least two times its original length" and return to its original shape "with force." However, there is no basis in the claims or specifications for such limitations. The Court construes "elastomeric material" as "a material that behaves like an elastomer, such as synthetic rubber, which can be stretched or deformed under stress, and after release of the stress, will return to its original dimensions."
approximate original shape.'"

C. Term 4: Electric wall box (as used in claims 1 and 23).

Lutron contends that Term 4 means "An 'electrical wallbox' is a small, often metal box that is designed to be placed in a wall to mount light switches or other electrical controls. It is open on the front side, with dimensions prescribed by the National Electrical Manufacturers Association (NEMA)." 42 Control4 contends the term means "A box that is designed to contain one or more electrical components and is designed to be installed in a wall."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

42 "NEMA" refers to the National Electrical Manufacturers Association.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

Although a patent's specification cannot add a limitation to a claim, it can help define the meaning of a term. 43 Here, the background of the invention describes an electrical wallbox as that of standard size. 44 The summary of the invention discusses the confined space of a standard electrical wallbox. 45 Indeed, throughout the entire specification, the electrical wallbox is small, confined, and standard in size. 46

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

43 See Vitronics Corp., 90 F.3d at 1582.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -

Control4 contends, however, that the term should not refer to size because the electrical box can vary depending on the electrical device that is being controlled. The specification indicates that "the antenna of the present invention can be applied to the communication of signals relating to the control and status of other devices, for example, communication equipment, motors, security systems, appliances, HVAC systems (heating, ventilating and air conditioning)." 47 Because such electrical devices may be larger than NEMA-standard wallboxes, Control4 argues the size of the electrical wallbox should not be limited.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

47 '103 Patent, col. 1:40-46.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -
While it is true that different electrical devices may require larger electrical boxes, this patent pertains only to the electrical wallbox for the control device. The fact that the antenna may send signals to control larger electrical devices does not require that the electrical wallbox for the control device vary in size. The object of the patent is to have a control device of compact size that fits within "the small space available in electrical wallboxes. 48 Thus, the concept of "small" is inherent in the patent.

48 '103 Patent, col. 4:41.

The wallbox also is described as having an opening. 49 The embodiment describes the opening as outwardly facing. 50 Claims 1 and 23 refer to a "faceplate for an outwardly facing opening of said wallbox." 51 The Court therefore concludes the term means, "A box of a size and design generally used by the electrical industry to contain electrical switches for residential and office application."

51 '103 Patent, col. 15:42-44; 17:15-17.

5. "Electrically Conducting Fluid" and "Electrically Conductive Fluid."

Consistent with the ordinary definition, "electrically conducting fluid" and "electrically conductive fluid" shall be construed to mean "any fluid that facilitates the passage of electrical current." Examples of electrically conducting fluids are blood and saline.

We disagree, however, with the district court's construction of the claim term "electrically conductive fibers" to the extent that it encompasses carbon fibers. This court has recognized that "[w]here the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent, even though the language of the claims, read without reference to the specification, might be considered broad enough to encompass the feature in question." Scimed Life Sys. v. Advanced Cardiovascular Sys., 242 F.3d 1337, 1341 (Fed. Cir. 2001). It is true, as the district court noted, that the '879 patent's written description did not expressly define "electrically conductive fibers," as it did for "fuel injection system component." Nevertheless, based on the disclosure in the written description, which demeaned the properties of carbon fibers, we conclude that the patentee thereby disavowed carbon fibers from the scope of the '879 patent's claims.

The written description contains the following disclosure:

Stainless steel also has the advantage of requiring smaller quantities for providing the required conductivity than other conductive fillers, such as carbon black. '879 Patent, col.3 ll.56-60 (emphasis added).
Other electrically conductive fillers, such as the aforementioned carbon, act as stress concentrators and, at the relatively high filler loadings required to achieve conductivity, restrict the ability of the resin matrix to yield under stress. Id., col.4 ll.1-5 (emphasis added).

Also, stainless steel fibers are ductile and non-rigid unlike straight or metallized carbon fibers. . . . This allows stainless steel fibers to maintain their integrity better during melt-processing. Id., col.4 ll.5-10 (emphasis added).

Unlike the non-metallic fibers, stainless steel fibers also do not increase mechanical strength or stiffness of the base resin significantly. Other metal fibers with high aspect ratios can be satisfactorily substituted for stainless steel. Id., col.4 ll.10-14 (emphasis added).

In making the above statements, the patentee informed its readers specifically why carbon fibers would not be suitable as "electrically conductive fibers" in the claimed invention. If the written description could talk, it would say, "Do not use carbon fibers." There is no other way to interpret the written description's listing of all the reasons that metal fibers fare better than carbon fibers for use in the claimed invention, even though both materials are electrically conductive, viz., that metal fibers require smaller quantities to achieve the desired conductivity than carbon fibers, create less stress concentration, are more ductile, are less rigid, and increase the mechanical strength of the polymer housing. Contrary to the district court's understanding, the written description has gone beyond expressing the patentee's preference for one material over another. Its repeated derogatory statements concerning one type of material are the equivalent of disavowal of that subject matter from the scope of the patent's claims.

In reaching this decision, we reject Honeywell's argument in support of the district court's construction of "electrically conductive fibers." Honeywell argues that the written description did identify carbon fibers as electrically conductive fibers, and that stainless steel fibers were merely preferred embodiments. Honeywell's argument misses the point. It is precisely because the written description has identified carbon fibers as electrically conductive, and yet it denigrated carbon fibers' applicability to the claimed invention, that we find a disavowal of that subject matter. Moreover, it is irrelevant whether stainless steel fibers are a preferred embodiment of the claimed invention. We are not here modifying the district court's claim construction to limit its scope to stainless steel fibers. We only modify it to exclude carbon fibers from the scope of the '879 patent claims.

4. The "electrically conductive layer" limitation

The accused Nevamar products are of two classes: those using a phenolic resin and those using a melamine resin in the conductive layers. Making all reasonable inferences in favor of Charleswater, the resistivity of the conductive layers containing phenolic resin is as low at 4,200 ohms per square and the resistivity of the layers containing melamine resin is 145,000 ohms per square or greater.

2 Nevamar argues that the resistivity of the phenolic resin-impregnated paper is at least 88,000 ohms per square and that the resistivity of the melamine resin-impregnated paper is at least 108 ohms per square.

The district court construed the "electrically conductive layer" limitation to mean that the measured resistivity of the layer in the final product must be less than 30,000 ohms per square. The district court based this construction on the definition of "conductive" provided in the written description of the '040 patent as well as this court's previous construction of the term "nonconductive" as used in the '040 patent to mean "resistivity greater than 30,000 ohms [per square]." See Charleswater Prod. Inc. v. Spaulding Fibre Co., 12 U.S.P.Q.2D (BNA) 1916, 1918 (Fed. Cir. 1989) (nonprecedential). Based on this construction, the court concluded that the "electrically conductive" limitation does not read on the accused Nevamar products in which the alleged conductive layer comprises a melamine resin, either literally or under the doctrine of
equivalents, because the lowest measured resistivity of the layer in the finished product is higher than 30,000 ohms per square. The district court also concluded that a genuine issue of material fact exists as to whether this limitation reads on the accused products in which the alleged conductive layer comprises a phenolic resin and denied Nevamar's noninfringement summary judgment motion concerning those products. We hold that the district court's judgment concerning this limitation is correct with respect to both classes of products.

a. Literal infringement

Charleswater argues that the district court erred in construing the "electrically conductive" limitation and asserts that determining whether an alleged layer is electrically conductive is properly based on "indicia of conductivity." Charleswater also appears to argue in the alternative that determining whether a layer is conductive or not should be done by determining the relative conductivities of the alleged conductive and nonconductive layers. Both of these arguments fail.

The written description of the '040 patent states that a layer is conductive if its resistivity is less than about 30,000 ohms per square. See '040 patent, col. 1, ll. 15-17 ("approximately 30,000 ohms per square surface resistivity or less, for example, 5,000 ohms"); id. at ll. 38-42 ("less than about 30,000 ohms/square inch; for example, 10,000 or 5,000 ohms/square inch of surface resistance"). Charleswater cannot avoid this definition by its argument that "indicia of conductivity" is an equivalent or more accurate method of determining whether a layer is conductive, because the resistivity definition is in the written description and the "indicia" definition is not. Similarly, determining whether a layer is conductive or not by comparing its resistivity to the resistivity of the nonconductive layer is not discussed in the written description. Whether technically plausible or not, these arguments cannot overcome the resistivity measurement-based definition of a conductive layer provided in the written description. See Unidynamics, 157 F.3d at 1317, 48 U.S.P.Q.2D (BNA) at 1103 ("In defining the meaning of key terms in a claim, the court may refer to the specification, the prosecution history of a patent, prior art, and other claims.").

Viewing the evidence and making all reasonable inferences in favor of Charleswater, there is no genuine issue of material fact as to whether the "conductive layer" limitation literally reads on the accused products in which the conductive layer comprises a melamine resin because their lowest measured resistivity is 145,000 ohms per square. As a matter of law, this claim limitation does not literally encompass those products. However, because the lowest measured resistivity of the conductive layer in the accused products containing a melamine resin is less than 30,000 ohms per square, there is a genuine issue of material fact as to whether the "conductive layer" limitation literally encompasses those products.

3. The "polymeric, film-forming, particulate binder material" limitation

The district court appeared to construe the "polymeric, film-forming, particulate binder material" limitation in subpart (b) of the claim as excluding the use of paper as part of the conductive layer, stating that paper is not a film. The court concluded that this limitation does not read on the alleged conductive layer in the accused Nevamar products. This analysis is incorrect.

There is no dispute between the parties that the alleged conductive layers in the accused products consist of paper that has been "loaded" with carbon and impregnated with a polymer resin. There can be no reasonable dispute that paper itself is not a polymer and is not film-forming. However, there is no dispute that the paper-impregnating polymer used by Nevamar in the accused products, a phenolic resin or a melamine resin, is a film-forming polymer that essentially fills the interstices of the paper to act as the carbon particle binder material.

The construction issue concerning this limitation therefore simplifies to this: in a claim which uses "open" language (i.e., "comprises"), is the "electrically conductive layer of a polymeric, film-forming, particulate binder material" limitation met where paper is present in addition to a film-forming polymer that acts as a particulate binder? The answer must be affirmative, because an "open" claim is infringed by a material that embodies all of the claim limitations even if the material includes additional elements.

Therefore, viewing the evidence and making all associated reasonable inferences in favor of Nevamar, there is no genuine
issue of material fact precluding summary judgment concerning this issue and Charleswater is entitled to JMOL that the "polymeric, film-forming, particulate binder material" claim limitation encompasses the accused Nevamar products, even though the alleged conductive layers in the Nevamar products contain paper.

3. "Electrically Coupled to the Motor of the Shredder Mechanism"

The next issue is Claim 1's requirement that the "on/off switch" be "electrically coupled to the motor of the shredder mechanism," element 1(o). Fellowes proposes that this means that the "on/off switch" "transmits an electrical signal to the shredder mechanism's motor." Michilin and Intek both submit that it means that the "on/off switch is electrically coupled to the shredder mechanism's motor."

The differences between "electrically coupled" and "transmits an electrical signal" are seemingly immaterial and received scant attention in the parties' briefs. Both parties' constructions are consistent with the plain language of Claim 1, which reveals that in order to turn the shredder on and off, i.e. to operate it, the "on/off switch" must be capable of enabling and disabling the delivery of electric power to the motor. See '559 Patent, col. 6, lines 46-54 (describing the "on/off switch" as "movable . . . between at least (a) an on position wherein the switch enables delivery of electric power to the motor and (b) an off position disabling the delivery of power to the motor"). The Court adopts Fellowes' construction because it is consistent with the claim language, as well as the Court's construction of the phrase "provided on an exterior of the housing," and FINDS that "electrically coupled to the motor of the shredder mechanism," element 1(o), means "the on/off switch transmits an electrical signal to the shredder mechanism's motor."

--- Footnotes ---

5 Fellowes and Michilin briefly addressed the construction of "electrically coupled to the motor of the shredder mechanism" at the Markman hearing and in their opening briefs. Markman Hr'g Tr. 21-27; Fellowes' Opening Br. on Claim Construction 28; Michilin's Markman Proceeding Opening Br. 22-23. Although Intek discussed this element in its amended brief, Fellowes did not mention it in its response to Intek's amended brief. See Intek Br. 23; Fellowes' Resp. to Intek's Br.

--- End Footnotes ---

1. "A Modulating Electromagnetic Clutch Assembly"

Claims 10 and 17 recite, in part:

a modulating electromagnetic clutch assembly defining a sole torque transfer path between said primary output and said secondary output, said modulating clutch including a first plurality of clutch plates coupled to said primary output interleaved with a second plurality of clutch plates coupled to said secondary output.

The dispute over this claim is multi-faceted. Essentially, it involves whether the term "electromagnetic" can be read apart from the term "clutch." That is, whether "electromagnetic" is an adjective simply modifying "clutch" or "electromagnetic clutch" is, itself, a term of art with its own meaning. It would also seem to involve whether "electromagnetic clutch" can be read apart from the terms "modulating" and "assembly."

BorgWarner:

A "modulating electromagnetic clutch assembly" is a clutch that can transfer different amounts of torque from the primary output shaft to the secondary output shaft and that is actuated using an actuator that uses the principles of electromagnetism to convert electric current into a magnetic force. The modulating electromagnetic clutch assembly includes a disk-pack-
friction-plate clutch. The actuator can be any electromagnetic actuator including a coil and armature or an electric motor. (Plaintiff's Markman Brief, at 31; Plaintiff's Post Markman Hearing Brief, at 17).

NVG:

A disk-type clutch that is actuated by the electromagnetic attraction between a current carrying coil and a ferromagnetic clutch plate, i.e., armature. An electric motor actuated clutch is not an "electromagnetic clutch" because it does not use magnetic attraction between a coil and clutch plate, i.e., armature, to actuate the clutch. (Markman Brief of NVG, at 32).

In this claim dispute, the parties give a passing nod to claim interpretation and bolt ahead to infringement. Throughout the portion of the Markman hearing devoted to this claim, the argument was mostly over whether this patent claim reads on an electric motor actuator. (Markman Hearing transcript, at 379-458). Indeed, NVG's counsel admitted that NVG's arguments were focused on the issue of whether its device, which included an electric motor, infringed on the patent. (Id., at 422). This is, of course, beyond the scope of a Markman proceeding. "In claim construction the words of the claims are construed independent of the accused product." Embrex, Inc. v. Service Engineering Corp., 216 F.3d 1343, 1347 (Fed. Cir. 2000). Only after claim construction does the fact finder compare the properly construed claims to the accused device or process. Catalina Marketing International, Inc. v. CoolSavings.com, Inc., 289 F.3d 801, 812 (Fed.Cir. 2002). While there are cases where the issues of construction and infringement may collapse within one another, neither party has argued that such is the case here. The court will, therefore, focus on the interpretation of the claim rather than the issue of infringement.

According to BorgWarner:

The ordinary meaning of the term "clutch" is a device that provides an interruptible torque connection between two rotating elements. The term "modulating" further limits "clutch" to mean a clutch that can transfer different amounts of torque ranging from none to full lock up. Accordingly, the "modulating clutch assembly" refers to a modulating clutch. The ordinary meaning of the term "electromagnetic" is a device that operates on the principles of electromagnetism. In the context of a clutch, an electromagnetic device converts electricity into an actuation force using magnetism. Accordingly, the electromagnetic portion of this claim limitation refers to an electromagnetic actuator.

(Plaintiff's Markman Brief, at 32(citing Patent '488, col. 8, ls. 5-19; App. V, Ex. A, at 7)).

BorgWarner continues its argument by noting -- or stating the obvious -- that "the ordinary meaning of the term "electromagnetic" is a device that operates on the principles of electromagnetism. (Plaintiff's Markman Brief, at 33). A bit more helpfully, BorgWarner goes on to explain that:

(Plaintiff's Markman Brief, at 33)

NVG argues that the term "electromagnetic clutch" is a term of art, and relies on the definition from the McGraw-Hill Encyclopedia of Science and Technology (1992 edition):

Magnetic coupling between conductors provides a basis for several types of clutches. The magnetic attraction between a current carrying coil and a ferromagnetic clutch plate serves to actuate a disk type clutch . . . multiple interleaved disks alternately splined to the driving and driven shafts provide a compact structure. There are three basic types of electromagnetic clutches: magnetic fluid and power, eddy-current 8, and hysteresis.

(Markman Brief of NVG, at 32-33). NVG's expert interpreted an "electromagnetic clutch" to be a clutch actuated by the translation of an armature towards an energized electromagnetic coil due to the magnetic field caused by that coil. He submitted that:
the term 'modulating electromagnetic clutch assembly' requires at least an electromagnetic coil, a linearly translatable armature, and first and second pluralities of clutch plates, the plates being specifically recited in the claim. The electromagnetic coil, when energized with electric current, creates a magnetic field that attracts and causes linear translation of an armature, which in turn causes frictional engagement of the first and second plurality of clutch plates.

(Markman Brief of NVG, at 33; Ex. 9a, P 95).

--- Footnotes ---

8 At the Markman hearing, Borg Warner briefly argued that an eddy-current clutch was defined as employing a motor. It also conceded, however, that had no application to the patent. (Markman Hearing Transcript, at 412).

--- End Footnotes ---

When the issue of whether NVG's device, which apparently includes an electric motor, infringes on Borg Warner's patent is set aside, it is clear that the parties' definitions are not at all that dissimilar. Had the parties focused on the interpretation of the claim, rather than whether it construed to read on an electric motor, this question could have been resolved more convincingly. Their presentations and the record leave the court with the conclusion that "electromagnetic clutch" must be interpreted only as a disk-type clutch that can transfer different amounts of torque from the primary output shaft to the secondary output shaft and is actuated by the magnetic attraction between a current carrying coil and an armature.

1335
g. "Electromechanical Device" (Claim 33)

90. This term is not mentioned in the specification of the '656 patent. The only type of electromechanical device described in the specification is a solenoid. Thus, this term should be construed to be no broader than a solenoid and equivalent structures. Consequently, as used in the '656 patent "electromechanical device" means a device which imparts mechanical movement upon application of an electrical signal, such as a solenoid, to move the link element after entry of the combination.

1336
3. "Electronic Chip"

The district court provided the jury with the following construction of "electronic chip" (emphasis added):

"Chip" is not used in whatever technical sense it may have; here, it means the same thing as an electrical component, whether it is a complex integrated circuit of several subparts or a single resistor. A resistor itself is made of two leads, case, and resistant core, at a minimum, making it a packaged electronic component.

Although we do not agree with the district court's construction, for it appears from the definition given to the jury that the district court was confusing a "packaged electronic component" (i.e., the claimed invention as a whole) with an "electronic chip" (i.e., an element of the claimed invention), this aspect does not appear to have been material to the result, and any error appears to have been harmless.

1337
j. "Electronic Combination Lock" (Claims 3, 34, 35, 38, 39, 43)
93. The '656 patent specification states that the "invention relates generally to electronic combination locks". Col. 1, lines 6-7. The "electronic dial combination lock" is described as "a dial having divisions to enter a combination code to gain entrance to the secured area . . . . A circuit contained in the secured region senses the electrical connections and detects when a certain subset of connections has been made corresponding to the lock's combination and initiates an electrical signal within the secured region. The signal may be used, e.g., to operate a solenoid . . . .". Col. 1, lines 15-31. Throughout the specification, the lock is described in terms of its electronic and combination features, e.g., that the solenoid plunger is actuated "when the correct combination is entered into the printed circuit board and an appropriate signal is produced from an output on the printed circuit board to the coil 108 in the solenoid, as would be known to one skilled in the art". Col. 6, lines 39-43. Consequently, the entire specification of the patent describes the "invention" as part of an "electronic combination lock", not as a separate mechanical mechanism.

94. It is also appropriate to determine whether the term in the preamble serves to define the invention that is claimed or is simply a description of the prior art. Applied Materials Inc. v. Advanced Semiconductor, 98 F.3d 1563, 1573 (Fed. Cir. 1996). Here, the patentees used the preamble to define the "invention" itself, not simply to describe prior art.

95. The patentee chose to define its alleged "invention" as an "electronic combination lock", using both the preamble to define the electronic and combination aspects of the lock, as well as the remainder of the claim limitations. Consequently, the preamble forms a limitation of the claim.

96. Where the claim refers back to the preamble, e.g. by stating "said" [preamble], the preamble phrase becomes a limitation to the claim. Bell Communications, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 621 (Fed. Cir. 1995). The last paragraph of Claim 3 refers to "said combination". The claim language also refers back to electronic activation of the moving element. Claim 34 and the claims dependent on that claim (Claim 35, 38, and 39) refer back to "the combination" of the preamble. The body of Claim 43 similarly refers back to "the combination". Consequently, in all of the claims, if no "combination" is present, there is nothing to describe the function of the mechanical elements, and the claim would not define an operable device. Thus, "electronic combination lock" must be interpreted to form a limitation of each of the claims.
no other type of lock is mentioned in the context of the "invention".

98. The description "electronically operated lock" should also be interpreted as a limitation to the claim. In Claim 1, the "invention" is described as being "in an electronically operated lock". Consequently, the alleged "invention" cannot exist apart from the electronically operated lock. Further, the solenoid is described as "electronically actuated". If the lock were not electronic, this claim limitation would be meaningless. Thus, the preamble terms must be limitations to the claim since they are required to give meaning to the claim and properly define the invention. In re Paulsen, 30 F.3d 1475, 1479 (Fed. Cir. 1994). Claim 31 also defines the "invention" as "in an electronically operated lock". Thus, both the preamble and the body of this claim are also used to define the subject matter of the claimed "invention". Bell Communications, Inc. v. Vitalink Communications Corp., 55 F.3d 615, 620 (Fed. Cir. 1995).

Anascape contends that these limitations are not means-plus-function limitations under § 112, ¶ 6. Anascape states that if the court considers these limitations to be a means-plus-function limitation, it agrees with Microsoft that the corresponding function is the function listed after the "means for" language and that the corresponding structure is an "ASIC or microcontroller integrated circuitry, and equivalents thereof.

Each of the seven phrases incorporates the "means for" language that gives rise to a presumption that the patentee used the term advisedly to invoke §112 P6. Rodime PLC v. Seagate Tech. Inc., 174 F.3d 1294, 1302 (Fed. Cir. 1999), cert. denied, 528 U.S. 1115, 120 S. Ct. 933, 145 L. Ed. 2d 812 (2000). If a claim term recites no function this presumption disappears. Id. In each of these claims the phrase "means for" is followed by a verb describing what the "means" does - a function of the invention.

The court must next determine whether the claim language recites sufficient structure for performing the function. Id. Anascape argues that "electronics" preceding "means" in four of the claims, and "active electronic" preceding "means" in the other three terms sufficiently recite the structure.

In Rodime, the "means for" language was followed by a list of structural items, which together performed the function. See Rodime 175 F.3d at 1303. In the present case none of the seven claims at issue recites such a list. Similarly, "a pair of rotatable shafts projecting downwardly from said frame means and defining a biaxial plane" sufficiently describes "gearbox means for rotating said blade means." Allen Engineering Corp. v. Bartell Indus., 299 F.3d 1336, 1348 (Fed. Cir. 2002). The seven claims at issue do not have such a description.

The term "second baffle means" was held to recite sufficient structure because the word "baffle" is a structural term. Environco
Anascape points to claim 70 of the '991 patent in support of its argument that "electronics" recites sufficient structure. The means-plus-function presumption can be overcome only if the "claim itself" recites sufficient structure "to perform entirely the recited function." Sage Prods., Inc. v. Devon Indus., 126 F.3d 1420, 1427-28 (Fed. Cir. 1997). Claim 70 is a different claim that does not contain the "means for" language. Whether Claim 70 describes sufficient structure is irrelevant. Because the four terms that begin with "electronics means . . ." do not recite limited and definable structure, the court concludes that they are means-plus-function limitations. Given this finding, Anascape agrees with Microsoft that the structure is "ASIC or micro-controller integrated circuitry, and equivalents thereof."

The other three terms claims use "active electronic means for interpreting . . ." Anascape states that this discloses sufficient structure to overcome the means-plus-function presumption. The specification defines the term: "Active electronics 46 (i.e., ASIC or microcontroller integrated circuitry, etc.) which in addition to having normal circuitry of a typical game controller such as a prior art controller also has circuitry for interpreting the analog output of sensor material 36 and converting it into a digital signal. . . ." '991 patent, col. 11, ll. 10-15.

Microsoft argues that it is improper to look to the specification to determine whether a term in a phrase using "means" recites structure. A patentee can be his own lexicographer. There seems little difference between the Enviroco Court's discerning structure from a word with a common structural definition, such as "baffle," and making the same use of a phrase defined in the specification. Phillips could be used to argue that looking to the specification for a definition is preferable to consulting a general use dictionary.

As with "baffle" in Enviroco, "active electronic" imparts structure. The three claims that include "active electronic means" are not means-plus-function clauses. Evidently recognizing the definition in the specification, neither party argues for an alternative construction of "active electronic."

The World Wide Plaintiffs and AnazaoHealth have proposed two constructions of the term "element" as used in Claim 1, which differ primarily in the breadth to be ascribed to this term. The World Wide Plaintiffs ask the Court to construe this term as meaning "anything intended for use in brachytherapy, including radioactive seeds and/or spacers." The World Wide Plaintiffs argue that "seeds," "spacers," and "radioactive seeds" were simply illustrative examples of elements that might be used in a brachytherapy procedure. Instead, they maintain that if an object, material or device used in connection with the treatment of cancer is designed to fit inside a needle and is implantable, it should be included in the definition of "element."

AnazaoHealth proposes a more narrow definition of "elements," that is limited to "radioactive seed(s), spacer(s) and/or drug(s)." AnazaoHealth asserts that the language of the specification indicates that the "therapeutic elements" contained within the needle and implanted in the body are radioactive seeds and spacers. AnazaoHealth argues that the World Wide Plaintiffs' definition is overly broad and would encompass every aspect of brachytherapy treatment, including ultrasound probes or x-rays used to identify where the radioactive seeds were deposited or the materials used pre- and post-operatively to assist in a patient's treatment. It further submits that the term should not be construed to include "markers," which do not appear anywhere in the intrinsic evidence, and there is no indication that markers formed any part of the alleged invention. It maintains that there is no basis in the intrinsic record to conclude that the patentees had anything in mind other than radioactive seeds and spacers.

Claim 1 refers to "therapeutic elements" and "a line of elements." ('760 Patent col. 5, ll. 43, 45, 50-51.) Additionally, the term "element" appears in Claims 3, 9, 10, 11, and 16, which refer to a "line of elements," (id. at col. 5, ll. 54-55; col. 6, ll. 14-15, 17-18, 19-20, 23-24, 41), and in Claims 9 and 18, which refer to "therapeutic element(s)." Id. at col. 6, ll. 9, 51. A
person of ordinary skill in the art is deemed to read a claim term not only in the context of the particular claim in which the disputed term appears, but in the context of the entire patent, including the specification. Phillips, 415 F.3d at 1313. The purpose of the specification is to teach and enable those skilled in the art to make and use the invention and to provide a best mode for so doing, which is often done by example. Id. at 1323. The specification has been described by the Federal Circuit as the "single best guide to the meaning of a disputed term [and] the primary basis for construing the claims." Id. at 1315.

Here, the specification speaks in terms of "a line of therapeutic elements, for instance, radioactive seeds." (760 Patent col. 3, ll. 56-57 (emphasis added).) The specification makes clear that radioactive seeds are but one type of therapeutic element that might be implanted in a brachytherapy procedure using the patented device. Although several of the claims use the term "seeds" rather than "elements," from which one might infer that "elements" should be limited to "seeds," id. at col. 5, ll. 56; col. 6, ll. 21, 44, even AnazaoHealth concedes that the term "element" must encompass more than seeds and spacers and could include drugs. The Court finds no basis for including drugs yet excluding other substances or materials used in connection with the treatment of cancer and which are designed to fit inside a needle assembly for implantation into a patient. The invention itself relates to the device for implanting therapeutic elements. It is not limited to certain types of therapeutic elements. Thus, the Court rejects AnazaoHealth's definition that limits "elements" to radioactive seeds, spacers, and drugs.

When the term "element" is read in the context of the entire patent, the claims and specification make clear that an "element" within the needle assembly is something more than seeds and spacers and is something that is intended for implantation in the body for the purpose of treating cancer. See Phillips, 415 F.3d at 1321; Visto Corp. v. Sproqit Techs., Inc., 445 F. Supp. 2d 1104, 1112 (N.D. Cal. 2006). The World Wide Plaintiffs' definition includes the limitation "intended for use in brachytherapy." Therefore, the Court adopts the construction urged by the World Wide Plaintiffs, that being "anything intended for use in brachytherapy, including radioactive seeds and/or spacers."

2. "Element"

The parties agree that the ordinary meaning of "element" is "part" or "component" or, as Akeva proposes, "a constituent part." adidas, however, argues this broad definition cannot be used because it does not particularly point out and distinctly claim the subject matter of the invention, and applying ordinary meaning would cause the claim to fail the requirements of [1781]
35 U.S.C. § 112 2. Because all shoes have parts or components, this would not be enough to let others know what specific kinds of parts were being claimed. adidas also argues that the specification uses the term "element" in a much narrower sense than simply a "part" of the shoe, and the term should be given this more narrow definition. In the written description, this part is described as a "stiffening member[]. . . that may be used to increase the spring generated by the rear sole." See '471 Patent, col. 11, ll. 54-57.

Generally, matters of "ambiguity, undue breadth, vagueness, and triviality are matters which go to claim validity for failure to comply with 35 U.S.C. § 112 U 2, not to interpretation or construction." Intervet Am., Inc. v. Kee-Vet Laboratories, Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989). However, it is a familiar axiom of patent law that when a claim term is ambiguous, it should be construed to sustain its validity. Liebel-Flarsheim, 358 F.3d at 911. This axiom does not apply "unless the court concludes, after applying all the available tools of claim construction, that the claim is still ambiguous." Id. A court must look to the intrinsic evidence "to understand the claims before their breadth is limited for purposes of preserving validity." Nazomi Comms., Inc. v. Arm Holdings PLC, 403 F.3d 1364, 1368-69 (Fed. Cir. 2005) (emphasis added). "Otherwise the construing court has put the validity cart before the claim construction horse." Id. at 1369. In analyzing a claim of patent indefiniteness under 35 U.S.C., § 112 P 2, "a court must determine whether those skilled in the art would understand what is claimed when the claim is read in light of the specification." Bancorp Servs., L.L.C. v. Hartford Life Ins. Co. 359 F.3d 1367, 1371 (Fed. Cir. 2004). If a claim term's meaning is discernible, then it is not invalid for indefiniteness. Id. Even if a claim is determined to be ambiguous, the court may only construe the claim and may not rewrite it to preserve validity. Liebel-Flarsheim, 358 F.3d at 911. A court also may not add limitations from the specification that do not appear in the claim. Intervet Am., 887 F.2d at 1053.

Although it must be presumed that a claim is valid, 35 U.S.C. § 282, if a claim term is ambiguous, the court may choose the interpretation that preserves validity. A claim term is ambiguous if it is susceptible to more than one interpretation. In Claim 1 of the '471 Patent, the claim term "element" is followed by additional requirements of the object's location between the top and bottom walls and its structure that includes an interior sidewall. While the term is quite broad, it is not ambiguous because it is susceptible to one interpretation -- that of a component or part of the shoe that possesses the additional characteristics listed in the claim. adidas may be correct that this claim term is not sufficiently described to give one skilled in the art a clear idea of what the inventor intended, but it gives enough information to render the term unambiguous, and thus not amenable to added limitations. Any further issues of validity cannot be addressed at this time.

With regard to adidas' second argument, the descriptions in the specification cannot be used to limit this claim term. The language adidas references is an embodiment of the invention that appears to be intended as an example and not as any limitation on the claim's scope.

Therefore, the term "element" should be given its plain and ordinary meaning of "a constituent part."

b. "Article Feeder Element"

The Defendants also object to Special Master Harmon's decision not to construe the term "article feeder element" because they believe that the term requires means-plus-function treatment. Because the term does not include the word "means," this Court presumes it is not a means-plus-function claim element. See, e.g., Net MoneyIN, 545 F.3d at 1366.

The Defendants' primary argument is that the use of the term "element" in "article feeder element" cannot provide sufficient structure to avoid means-plus-function treatment. While terms like mechanism, device, and element alone do not provide sufficient structure to avoid means-plus-function treatment, an adjectival modifier to those terms may provide sufficient structure. See Welker Bearing, 550 F.3d at 1096-97 (holding "mechanism for moving said finger" did not disclose sufficient structure to avoid means-plus-function treatment); Massachusetts Inst. of Tech. & Elecs. for Imaging, Inc. v. Abacus Software, 462 F.3d 1344, 1354 (Fed. Cir. 2006) (holding that "color selection mechanism" did not disclose sufficient structure to avoid means-plus-function treatment since the adjective "color selection" was not defined in the specification, had no dictionary definition, and had no general understanding in the art); but see Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d 1580, 1583 (Fed. Cir. 1996) (holding "detent mechanism" disclosed sufficient structure to avoid means-plus-function treatment since the term "detent" was an understood structure in the art). When the term "element" is used, the...
focus turns to whether sufficient structure is disclosed in the adjectival modifiers or elsewhere in the claim. See Welker Bearing, 550 F.3d at 1096-97.

Special Master Harmon looked to Magistrate Judge Valdez's construction for the term "article feeder means" for guidance on whether "article feeder" recited sufficient structure to avoid means-plus-function treatment. He concluded that there was sufficient structure even when the word "element" is used. In the context of the claims, "article feeder element" refers to a structure within that article feeder means that is moved by a variable speed motor to feed sheet material articles. U.S. Patent No. 6,082,724 col. 15 ll. 1-2. This is a definite structure similar to the "detent mechanism" in Greenberg and is sufficient to avoid means-plus-function treatment. Thus, the Court overrules the Defendants' objection and adopts Special Master Harmon's decision to not treat the term "article feeder element" as a means-plus-function element.

Apart from their objection to the use of the word "element," the Defendants also object to Special Master Harmon's decision not to construe the term. Claim construction is not required for every limitation in a claim. U.S. Surgical Corp., 103 F.3d at 1568. A term can be given the ordinary meaning that it would have to a person of ordinary skill in the art. See Phillips, 415 F.3d at 1313. Here, the sole basis for the Defendants’ objection is their opinion that a jury will be confused by the term "article feeder element." Nevertheless, as described by its use in the claims, an "article feeder element" is that which is moved by a variable speed motor to feed sheet material articles. The Defendants do not point to, and this Court does not notice, any particular issue a jury would have with interpreting the term "article feeder element." Thus, the Court overrules the Defendants' objection and adopts Special Master Harmon's decision not to construe the term "article feeder element."

11. Claim 13: "elevated structure" "Elevated structure” is construed to mean "something constructed, such as a building, raised above the ground."

('861 Patent claims 1, 2, 3, and 11); ('465 Patent claims 1, 2, 3, and 10)

The critical distinction between the proposed constructions submitted by Plaintiff and Defendants is whether the "elevator control" must be "existing," i.e., "the identical elevator control that was in place before modernization." Defendants' position is that the Patents-in-Suit contemplate that the elevator control itself is not replaced as part of the modernization process, rather the same elevator control is reused during modernization. Defendants rely upon the prosecution history to the Patents-in-Suit, in which Plaintiff submitted amendments to the specification in order to distinguish its patents from prior art. These amendments state

The present invention, in contrast, is a modernizing device that is temporarily connected to an existing elevator installation (such as that shown in Fig. 1) having an elevator control that operates in response to call reports generated from hall call transmitters and car call transmitters. The modernizing device, a computing unit and floor terminals are temporarily connected to the existing elevator control for generating destination calls and converting the destination calls into call reports that can be used by the existing elevator control to operate the elevator during modernization. Once modernization of the elevator installation is complete, the modernizing device is removed.
Neither the Sirag Jr. patent nor Schuster patent shows or suggests the claimed modernizing device that is temporarily connected to an existing elevator control wherein destination call reports are generated and converted to call reports that can be used to continue to operate the existing elevator control during modernization.

(Defs.' Opening Markman Br. Appx. 116) (emphasis added). The "Sirag Jr." patent referenced above "shows a permanent elevator control with software for controlling car allocation in an elevator installation via destination call control." (Id. at 115.) The "Schuster" patent referenced above "shows a permanent elevator control that provides for user input of operating program modifications." (Id.)

Defendants rely upon this language in arguing that the Patents-in-Suit require re-use of the existing elevator control, such that new or modified controls are outside the scope of the patents. In order for statements in the prosecution history to limit a claim, the disavowal must be unambiguous. See Abbott Labs., 566 F.3d at 1288. Here, the amended submission to the PTO cited by Defendants makes clear that the Patents-in-Suit relate to an "existing" elevator control. Therefore, the Court finds that Defendants' limitation is proper based on Plaintiff's attempt to distinguish the Patents-in-Suit from the "Sirag Jr." and "Schuster" prior art. See Seachange Int'l, Inc. v. C-COR, Inc., 413 F.3d 1361, 1372-73 (Fed. Cir. 2005) ("Where an applicant argues that a claim possesses a feature that the prior art does not possess in order to overcome a prior art rejection, the argument may serve to narrow the scope of otherwise broad claim language.").

Furthermore, Defendants cite to the following two instances in which Plaintiff described the Patents-in-Suit with respect to an "existing" elevator control:

(1) The device reads the destination signal, converts it into at least one call report and controls an existing elevator control by the call report.

(2) In the present case, the existing elevator control 14, 14' is controlled by the computing unit 30 indirectly by way of the modernizing device 36, 36'.

(Id., col. 7:35-38.) (emphasis added).

These references support the construction that the elevator control contemplated by the Patents-in-Suit must already be in place prior to the modernization process, thereby precluding any new or modified elevator controls from being encompassed by the Patents-in-Suit.

Plaintiff appears to concede the point that the elevator control must be "existing" in its brief submitted for the Markman hearing. (See Pl.'s Opening Markman Brief 2) ("The computing unit executes the destination dispatch algorithm, assigns elevators to particular passengers, and controls the existing elevator control equipment via the modernizing devices.") (emphasis added); (id. 4) ("The destination signals are received by the modernizing devices 36, which in turn instruct existing elevator controls 14 to execute the appropriate instructions . . . .") (emphasis added); (id. 5) ("These call reports may then be issued to existing elevator control 14 by signal generator 362 over, for example, a plurality of electrical lines.") (emphasis added).

Based upon the prosecution history and implied definition provided by the abstract and specification, the Court concludes that the term "elevator control" means "an existing device that controls the operation of the elevator - the identical elevator control that was in place before modernization."

The term "elevator installation" is recited in Claim 1 of each of the Patents-in-Suit. In order to construe this claim, the Court will look first to the language of the claim itself, and then to the existing intrinsic evidence where the definition is not clearly stated in the claim itself.

The parties dispute whether this claim requires only one elevator control for the group of elevators or that each elevator be controlled by its own elevator control. The relevant claim language explicitly recites an elevator installation as "having at least one elevator and at least one elevator control for controlling the elevator in response to call reports." ('861 Patent, col. 11:7-10). Importantly, the claim language provides that the "elevator installation" includes an elevator control for "controlling the elevator." The singular form used by the claim language suggests that one elevator control is necessary for each elevator. Thus, as the claim language itself is at least ambiguous as to whether a separate elevator control is required for each elevator, the Court will review the available intrinsic evidence to resolve the ambiguity. See Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 1325 (Fed. Cir. 2002) ("The specification may assist in resolving ambiguity where the ordinary and accustomed meaning of the words used in the claims lack sufficient clarity to permit the scope of the claim to be ascertained from the words alone.")

Turning to the specification, the Background Section to the '465 Patent states that 
"[t]he elevator installation consists of a group of elevators that convey passengers in a building, where each elevator is controlled by an elevator control." ('465 Patent, col. 1:24-26.) (emphasis added). This phrasing is more consistent with Defendants' proposed interpretation that each elevator is controlled by its own elevator control. See Bell At. Network, 262 F.3d at 1271 ("[W]hen a patentee uses a claim term throughout the entire patent specification, in a manner consistent with only a single meaning, he has defined that term 'by implication.'") (quoting Vitronics Corp., 90 F.3d at 1582). Accordingly, the Court concludes that "elevator installation" means "a group of elevators that convey passengers in a building, where each elevator is controlled by an elevator control." 6

--- Footnotes ---

6 Defendants contend that the term "elevator installation" should be defined as the "entire group of associated elevators" since the entire elevator installation is to be modernized together. (See Defs.' Opening Markman Br. 39.) Defendants provide no citation in support of such an argument, and the Court refuses to read such a limitation into the claim where it is not contained in either the claim itself or the corresponding specification.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - -
Looking to the claim term itself, I find that the term "ellipse having a major diameter" unambiguously connotes the geometric definition of "ellipse", a shape defined by the formula:

\[ \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \]

where "a" and "b" are constants. The inclusion of the phrase "having a major diameter" invokes the very "mathematically precise" meaning that Bose now wishes to disavow. A "major diameter," as stated above, is the longest chord, or straight line segment, joining two points on a curve. The major diameter passes through the center of an ellipse.

The prosecution history supports this narrow interpretation of the phrase "ellipse having a major diameter." Bose amended claim 1 several times, and, at least in response to its last three amendments (Amendments D through F), the Examiner rejected proposed claims which would have been elliptical, broadly speaking, but which left room for a short, flattened section. In Amendment D, for example, Bose sought coverage for a port tube with "cross-sectional area progressively decreasing from each end toward the center for substantially the distance between each end and the center."

Bose offers alternative dictionary definitions of the term "ellipse" as meaning an "oval" or "elongated circle," as well as the affidavit of its electroacoustical engineer, Michael O'Connell, who asserts that "ellipse" is understood by O'Connell and those skilled in the art of speaker design to mean "an elongated circle or symmetrical oval, a portion of which corresponds to a section along the length of the continuously curved inside surface of the port that is of tapered cross section . . . ." As a threshold matter, courts may not look to extrinsic evidence to construe a claim term unless the intrinsic evidence is ambiguous or insufficient. See Bell & Howell Document Management Prods. Co. v. Altek Sys., 132 F.3d 701, 706 (Fed. Cir. 1997). Here, I find that the intrinsic evidence is sufficient to properly construe claim 1.

But even assuming that some ambiguity arose in the intrinsic evidence, Bose's proposed constructions fail on their own terms as well. As to the "oval" definition, the dictionary discloses definitions for "oval" which range from "a racetrack in the shape of an oval or a rectangle having rounded corners" to "having the shape of an egg . . . broadly elliptical." Merriam Webster's Collegiate Dictionary 827 (10th ed. 1993). The former definition of "oval" stands in contrast to Bose's repeated insistence that its port tube boundary is continuously curved. In fact, this is the basis upon which Bose distinguished the Furukawa prior art.

Both of the dictionary "oval" definitions are so broad that they would eviscerate the "having a major diameter" qualification in claim 1. The "major diameter" language undercuts Bose's argument that "ellipse" should not be confined, at least for literal infringement purposes, by its geometric definition. See Vitronics, 90 F.3d at 1584 n.6 (approving the use of dictionaries in construing claim terms, so long as dictionary definitions do not contradict meanings ascertained by reading the patent documents); Bai v. L & L Wings, Inc., 1997 U.S. Dist. LEXIS 12649, No. 95-10824, 1997 WL 527870, at *2 (S.D.N.Y. 1997) (finding that geometric definition found in dictionary was in accord with patent specifications, and concluding that "hemisphere" meant "less than a sphere, but nevertheless part of a sphere"), aff'd, 160 F.3d 1350 (Fed. Cir. 1998).

Finally, the "elongated circle" definition Bose proposes actually bolsters JBL's argument. JBL's expert Professor Robert Greene provides the following definition:

An ellipsis is, by definition, a closed plane curve generated by a point moving such that the sum of its distances to two fixed points (called "foci") is a constant (larger than the distance between the two fixed points). This definition is also exactly equivalent, however, to another characterization that is easier to understand intuitively and easier to check in practice. Namely, an ellipse is the curve obtained by enlarging a circle in one direction while leaving it unchanged in the perpendicular direction.

(emphasis added). Thus, an "elongated circle" is equivalent to an ellipse.

Having thus construed claim 1, I conclude that no reasonable jury could find that the JBL accused port tubes with LinearA and Exponential curves literally infringe the '721 patent. The literal infringement analysis here is straightforward: the port tube boundaries in JBL's accused products are not defined by ellipses with major diameters, but rather by the LinearA and Exponential curves. Since claim 1 of the '721 patent specifies that the port tube boundary of Bose's invention is "an ellipse having a major diameter," JBL's eleven disputed models do not literally infringe. 4
4 Of course, the JBL models that admittedly have port tube boundaries defined by an ellipse do literally infringe the ‘721 patent, since those port tubes also contain every other limitation of claim 1 of the ‘721 patent. As to these models, JBL relies upon successfully proving its affirmative defense of invalidity to avoid liability.

At the heart of the parties' disagreement is the meaning of the word "elliptical" in claim 4. The primary definition of elliptical is "of, relating to, or shaped like an ellipse." WEBSTER'S COLLEGIATE DICTIONARY, at 375. Cobra argues that claim 4's requirement of an "elliptical" hosel cross section shape means a cross section shape that is rounded and symmetrical along both the X and Y axes, with no flat or irregular surfaces. Fenton insists this definition unduly limits the meaning of elliptical, and that the term is broad enough to encompass a host of elongated, non-circular cross section shapes, not only those in the form of a mathematically perfect ellipse.

5 Courts may make limited reference to dictionary definitions even before moving to the extrinsic evidence stage of inquiry. As the Federal Circuit has explained, although technical treatises and dictionaries fall within the category of extrinsic evidence, as they do not form a part of an integrated patent document, they are worthy of special note. Judges are free to consult such resources at any time in order to better understand the underlying technology and may also rely on dictionary definitions when construing claim terms, so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents.

Resolution of this issue is appropriate on summary judgment. "A mere dispute over the meaning of a term does not itself create an issue of fact. This is true even where the meaning cannot be determined without resort to the specification, the prosecution history" or extrinsic evidence. Johnston v. IVAC Corp., 885 F.2d 1574, 1579 (Fed. Cir. 1989).

1. Claim Construction
   a. Intrinsic Evidence

Intrinsic evidence includes the language of the claims themselves, the language of the specification, and prosecution history. As discussed below, the court concludes that the intrinsic evidence in this case supports Cobra's argument that its product does not infringe claim 4.

i. Words of the Claims

Claim 4, the only claim that uses the term elliptical, does not expressly define the term. The other claims shed some light on the definition, however. Claim 3 reads, "The head portion of the golf club of claim 1, wherein the hosel has a cylindrical cross-sectional shape," (12M Ex. 2, at col. 12, ll. 55-59), and claim 9 reads, "The head portion of the golf club of claim 1, wherein an outside diameter of the hosel is in the range of from 0.250 inches to 1.250 inches." (Id. at col. 13, ll. 4-6.) Taken together with claims 3 and 4, claim 9 appears to be a catch-all to cover those irregularly-shaped hosel cross sections which are not either elliptical (claim 4) or cylindrical (claim 3). The existence of a claim with catch-all language would seem to be inconsistent with the notion that the term elliptical is intended to describe a broad spectrum of irregularly-shaped cross
ii. Specification

The specification describes several forms of the claimed invention. In particular, the specification notes that hosels are not only cylindrically shaped, and cites an elliptically shaped hosel as an alternative possibility. (Id. at col. 9, ll. 55-56 ("It is to be understood that the hosel may instead be of other shapes, such as elliptical.").) The specification makes reference to an illustrative drawing when it discusses hosels with an elliptical shape: it states that Figure 6 (here, Exhibit 1) "illustrates an elliptical hosel." (Id. Ex. 2, at col. 9, l. 60.) As noted, the illustration in Figure 6 shows a hosel with a symmetrical, rounded oval cross section shape.

These passages from the specification suggest two related points: 1) that hosels come in a variety of non-cylindrical shapes, only one of which is an elliptical hosel; and 2) that a hosel having an elliptical cross section looks like Figure 6. This implies that a hosel with an irregular, non-cylindrical shape is not elliptical, but rather is another of the "other shapes" referenced (though not enumerated) in the specification. This conclusion logically follows, and supports the interpretation urged by Cobra.

Fenton protests that "while examples disclosed in the preferred embodiment may aid in the proper interpretation of a claim term, the scope of a claim is not necessarily limited by such examples." (Pl. Resp., at 8 (quoting Ekchian v. Home Depot, Inc., 104 F.3d 1299, 1303 (Fed. Cir. 1997))). The rule cited by Fenton, however, is designed to prevent reliance on language that exists only in the specification as a basis for limiting the claim. See Intervet Am., Inc. v. Kee-Vet Labs., Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989) ("Limitations appearing in the specification will not be read into claims, and . . . interpreting what is meant by a word in a claim is not to be confused with adding an extraneous limitation appearing in the specification, which is improper.") (quotes omitted). Here, the term elliptical is part of the claim, and the use of this term in the specification sheds light on its proper meaning. See CCPI Inc. v. American Premier, Inc., 966 F. Supp. 276, 282 (D. Del. 1997) (permissible to use specification "to hone the meaning of murky language already in the claims").

Fenton also argues that the Figure 6 cross section is not actually symmetrical, because the illustration shows indentations on the outer wall of the hosel. This is technically true; however, the drawing also represents the overall shape of the cross section as symmetrical. In the court's view, the significance of Figure 6 is as an illustration of hosel shape notwithstanding indentations, since every hosel pertinent to the patent would have such indentations.

The only other mention of the term "elliptical" in the specification occurs in the discussion of hosels with an upper "male" portion (as opposed to those with a bore hole into which the shaft fits). In describing this variation of the invention, the specification observes that the first portion of the hosel "may be generally cylindric, elliptical or other form in shape." (12M Ex. 2, at col. 11, ll. 43-44.) According to Fenton, this means "the invention can be practiced by using hosel shapes other than those meeting the precise, mathematical formula of an 'ellipse.'" (Pl. Resp., at 9.)

There are two difficulties with this argument. First, this language in the specification is part of the narrow discussion of an alternative type of hosel configuration where the shaft fits over the hosel, so the court is reluctant to attach broad significance to it. Cf. Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1562 (Fed. Cir. 1991) (inventor may not avoid a limitation in the claim by stating in the specification an alternative lacking the limitation). Moreover, as the court reads it, the phrase "may be generally cylindric, elliptical or other form in shape" does not mean that the term "elliptical" should be broadly construed, but rather that, as a general matter, there exist cylindrical, elliptical, and "other form[s]" of hosels. That the specification indicates that the invention can be practiced by using various hosel shapes does not support Fenton's position that the definition of "elliptical" encompasses all those variations in cross section shape.

In sum, only one portion of the specification speaks to the meaning of the term "elliptical," and it does so by particular reference to Figure 6 as an illustration of an elliptical shape. Figure 6 is offered not as an example but as an illustration of the meaning of the term. The cross section in Figure 6 is oval, rounded, and appears symmetrical about both the X and Y axes. Therefore, the specification weighs strongly in favor of the definition of elliptical advanced by Cobra.

iii. Prosecution History

The record of proceedings before the PTO with regard to a patent may shed light on claim construction. The prosecution
history "cannot 'enlarge, diminish, or vary' the limitations in the claims," Markman, 52 F.3d at 980 (citation omitted); it only "limits the interpretation of the claim terms so as to exclude any interpretation that was disclaimed during prosecution." Southwall Tech., Inc. v. Cardinal IG Co., 54 F.3d 1570, 1576 (Fed. Cir. 1995). The court looks also to the history of the parent patent. See Jonsson v. Stanley Works, 903 F.2d 812, 818 (Fed. Cir. 1990) (prosecution history of parent application is relevant to understanding scope of claims issuing in a continuation-in-part application).

The history of the '109 patent and its parent do not support the broad reading of the word elliptical in claim 4 for which Fenton argues. The PTO rejected the parent application which used the term "generally elliptical," and cited prior art which indicated that hosels with "generally elliptical" shape were "old in the art." 6 (12 Ex. 5, at 6.) The '109 patent dropped the "generally" modifier, and utilized only the term elliptical. Fenton nonetheless urges that elliptical in the '109 patent essentially means generally elliptical. In fact, this parent prosecution history yields the opposite inference, i.e. that Fenton intended a term with a narrower scope when it used the word elliptical in the '109 patent, in order to distinguish the prior art cited by the PTO when it rejected the parent claims.

--- Footnotes ---

6 Fenton also finds significant that the PTO referred to two patents teaching teardrop shaped hosels as "having elliptical configurations." (12M Ex. 5, at 6.) The court disagrees. The PTO used the expression "elliptical configurations" as part of its discussion of "generally elliptical shape." In that context, the court perceives the expression to be shorthand, rather than a binding definition of the term elliptical, as Fenton argues.

--- End Footnotes ---

Additionally, in applying for the '109 patent, Fenton described two other patents as teaching a "tear-shape" or "tear drop shape" when disclosing pertinent prior art in the IDS submitted with its Petition to Make Special. Fenton contends that these statements in the IDS were "mere characterizations," not attempts to argue or distinguish the prior art, and therefore the court should accord them no weight. As Cobra notes, however, the purpose of this disclosure made in conjunction with the Petition to Make Special was to provide the PTO with details as to "how the claimed subject matter is distinguishable" from the prior art. See Mark I Marketing Corp. v. R.R. Donnelley & Sons Co., 66 F.3d 285, 290 n.5 (Fed. Cir. 1995) (discussing the requirements of a Petition to Make Special). Having offered the IDS to the PTO for this purpose, Fenton cannot now disclaim its references to prior art as meaningless characterizations. Indeed, if the IDS descriptions were not provided to differentiate the prior art from Fenton's claimed invention, they would seem to have no utility to the PTO. Thus, while Fenton's argument in the IDS was not extensive, Fenton plainly sought to distinguish prior art from what it claimed in the '109 patent on the grounds that the prior art was teardrop shaped. This significantly undermines Fenton's present contention that the term elliptical is broad enough to cover a hosel with a non-symmetrical cross section shape.

The prosecution history relevant to the scope and meaning of the term elliptical is not extensive, but neither is it ambiguous. Fenton's prosecution of the '109 patent and its parent militate in favor of a narrow definition of elliptical.

b. Extrinsic Evidence

For purposes of claim construction, extrinsic evidence generally includes expert testimony, inventor testimony, dictionaries, and technical treatises. Vitronics, 90 F.3d at 1584. Both Fenton and Cobra direct the court to evidence of this sort, in the form of secondary and tertiary dictionary definitions, citation to calculus textbooks, and testimony from several golf club designers. None of this evidence is particularly illuminating. For instance, designer Samuel Simmons, when asked if the King Cobra hosel cross section was elliptical, said "yes." (Simmons Dep., at 79, 81.) On cross, he agreed that the shape "appears like a cylindrical hosel, with something added on the back"; on re-direct he admitted, "I don't know exactly what [the hosel shape is] called. You people are confusing me." (Id. at 89.) He finally conceded, "A portion of it is elliptically shaped." (Id.) Rob Hirsch, Cobra Vice President of Research and Development, offered similarly equivocal testimony, stating that the allegedly infringing clubs "might look elliptical to me, but that doesn't mean by the technical definition it is an ellipse. Because an ellipse is a very definite equation." (Hirsch Dep., at 159.)

In any event, the court need not consider this evidence. Where the intrinsic evidence resolves any ambiguity regarding the meaning of a disputed claim term, reliance on extrinsic evidence is improper. Vitronics, 90 F.3d at 1583. Such is the case here, and consequently the court will not consider the extrinsic evidence submitted by each side.
c. The Meaning of Claim 4

Claim 4 reads, "The head portion of the golf club of claim 1, wherein the hosel has an elliptical cross-sectional shape." The claims, specification and prosecution history of the '109 patent lead to only one conclusion. For the reasons discussed above, the court construes "elliptical cross-sectional shape" to mean a rounded oval shape, symmetrical about both the X and Y axes.

1351

13. Claim 1 of the '101 patent describes a method of coiling three or more metal strands into uniformly tight coils. See PX 1 ('101 patent), col. 1 ("This invention relates to the rewinding of strands … into uniformly tight coils…"). The stipulated facts and extrinsic evidence supports Defendants’ assertion that the term "multiple strands" in Claim 1 is shackled to the meaning of the term of art "mults" which means three or more strands. The scope of the '101 patent encompasses the method of slitting steel into three or more strands and does not encompass splitting operations which produce two strands.

14. Claim 1 of the '101 patent further intended the strands to be selectively worked while moving through the process of reverse bending. See PX 1, col. 2 ("I preferably work the strands selectively by subjecting them to repeated reverse bending under tension less than the tensile yield strength of the metal.").

15. Recognizing that the tension of the pay-off reel, slitter, and recoiler alone is insufficient to elongate and thin the strands, Claim 1 of the '101 patent intends the stated sources of tension must be combined with repeated reverse bending of the strands to achieve the result of elongation and thinning of thicker strands relative to the thin. See PX 1, col.2 ("Tension in the strands … is a function of the current supply to the drive motors of the pay-off reel, slitter, and recoiler, the work of the slitting process, and the work associated with the repeated bending strain reversals… While tension alone below the tensile yield strength of the metal will not elongate and thin the strands, tension in combination with repeated bending reversals of the strands can elongate them and reduce their thickness."); PX 1, col.3 ("The net effect is to elongate and thin the thicker strands relative to the thin, which is an object of this invention.").

16. Claim 2 of the '101 patent is intended to specify that, utilizing the method of claim 1, the thicker strands are not permanently deformed to substantially the same thickness as the thinner strands. See PX 1, col. 2 ("…I selectively work the strands so as to elongate and simultaneously thin out the thicker strands more than the thinner strands."). There was much dispute by the parties as to this issue. Ultimately, the Court is persuaded by the language in the prior art statement that distinguishes the patent in suit from the Kinnavy patent. The language used to describe the '101 patent is:

The method of selectively working the strands comprises subjecting all strands to reverse bending while applying tension thereto less than the tensile yield strength of the strands. The thicker strands thereby elongated more than the thinner strands.

The Kinnavy patent discloses a method of permanently elongating strip by applying tension thereto and reverse bending it so as to exceed the yield strength of the metal. It does not deal with the tensioning of slit strip in multiple.

17. The Court finds this language to describe two primary distinctions between the patent in suit and the Kinnavy patent. First, the Kinnavy patent worked by permanently elongating strip, that is in the plastic range of the metal, while the '101 patent works by temporarily elongating the metal, that is in the elastic range. Second, the '101 patent method applied to multiple strands of slit metal, while the Kinnavy patent worked only with a single strip or uncut metal.

18. The Court is not persuaded by Plaintiff that the term "elongate" without a modifier means "permanent elongation" in the industry. The term can mean both permanent and temporary elongation. The language used by Mr. Fornataro in the prior art statement suggests he was describing his process as utilizing temporary elongation as opposed to Kinnavy's method utilizing permanent elongation.

19. Claim 3 of the '101 patent describes selective working of the strands, utilized in the method of Claim 1, as the combination of reverse bending and tension below the tensile yield strength of the metal. See PX 1, col. 2 ("I preferably
work the strands selectively by subjecting them to repeated reverse bending under tension less than the tensile yield strength of the metal.

20. Claim 4 of the '101 patent specifies that the reverse bending of Claim 3 is effectuated by passing the strands between an unspecified number of parallel but offset rolls. PX 1, col. 2 ("Those strands are passed through a strand tensioning apparatus comprising a plurality of parallel upper rolls, offset respectively in the direction of strand travel from a plurality of parallel lower rolls, but overlapping them in the path of strand travel so as to bend the strand downwardly and upwardly in reverse fashion as the strands pass through the rolls.").

21. Plaintiff's evidence fails to establish that the repeated reverse bending element of Claim 1 reads on the accused process. The '101 patent effectuates the elongation and thinning of metal strands by combining tensions from the pay-off reel, slitter, and recoiler with the tension created in the repeated reverse bending. The accused process cannot be found to read on to the '101 patent because the accused process achieves thinning and elongation through the application of sheer tension above the yield strength in the pull of the recoiler. Additionally, the '101 patent works the strands for elastic deformation while the accused process effectuates plastic deformation. Consequently, Plaintiff failed to prove by a preponderance of the evidence that the accused process literally infringes the '101 patent.

22. Neither has Plaintiff proven by a preponderance of the evidence that the accused process infringes the '101 patent under the doctrine of equivalents. The '101 patent effectuates the temporary elongation and thinning of metal strands by combining tensions from the pay-off reel, slitter, and recoiler with the tension created in the repeated reverse bending below the yield strength. Conversely, the accused process effectuates thinning and elongation through the application of sheer tension above the yield strength in the pull of the recoiler to achieve permanent elongation. The single up and down reverse bending in the accused process is insufficient to add any significant amount of tension, unlike the '101 patent where repeated reverse bending is necessary to effectuate the elongation. The accused process does not perform in substantially the same way to achieve the same result. Therefore, Defendants did not induce infringement of the '101 patent.

1352

"an elongate handle extending generally along a handle axis"

19. As an initial matter, the Court notes that in the first clause, the term handle axis is preceded by the indefinite article "a" while the second clause uses the definite article "the." This use of indefinite and definite articles in a patent claim indicates simply that the handle axis referred to in the second clause is the same thing as a handle axis referred to in the first clause, according to a universally recognized requirement for precise language in the drafting of patent claims. Def. Ontel Ex. HH ('846 patent) (Claim 1); Manual of Patent Examining Procedure, § 2173.05(e); Phillips, 415 F.3d 1323, 1338 (Fed. Cir. 2005); North Am. Vaccine, Inc. v. American Cyanamid Co., 7 F.3d 1571, 1575-76 (Fed. Cir. 1993) (citing Robert C. Faber, Landis on Mechanics of Patent Claim Drafting 351 (3d ed. 1990)); Baldwin Graphic Sys., Inc. v. Siebert, Inc., 2005 U.S. Dist. LEXIS 15527, at *10-15 (N.D. Ill. July 28, 2005) (citing MPEP § 2173.05(e)).

20. A "handle portion" for the aforementioned grooming tool would commonly be understood to one of ordinary skill in the art as the part of the grooming tool designed to be grasped by the hand. This meaning is consistent with the written description and drawing of the handle in the patent. See Def. Munchkin Ex. A, Porter Patent Figure 1; Col. 2, ll. 24-40. The specification also describes the "handle portion" consistently with the common dictionary definition of the term, which defines "handle" as "a part of a thing made specifically to be grasped or held by the hand." Def. Munchkin Ex. LLL, Random House College Dictionary 599 (Rev. ed. 1984).

21. The definition of the term handle axis is found in the language of the first clause--specifically, in the use of the words "elongate" and "extending" in "a grooming tool having an elongate handle portion extending generally along a handle axis." Def. Ontel Ex. HH ('846 patent) (col. 3, ll. 62-63); Phillips, 415 F.3d at 1313-14 (cannot look at claim terms in a vacuum; the context in which a term is used in the asserted claim can be highly instructive).
definite articles are used in patent claim drafting in order to define precisely when the second or third or tenth reference to a
axis can refer to one or many different possible axes. The Court rejects this argument. As described earlier, indefinite and
32. Finally, FURminator has argued that the indefinite article "a" in the phrase "a handle axis" means that the term handle
history of '846 patent).
31. Although FURminator has adopted the terms "lateral axis," "longitudinal axis" and "transverse axis" to support its
proposed claim construction in this litigation, there is no mention of any of these three axes anywhere in the claims,
specification or prosecution history of the patent. Def. Ontel Ex. HH ('846 patent); Def. Munchkin Ex. B (prosecution history of '846 patent).
30. Constructions that result in words of the claims being rendered meaningless or superfluous are almost certainly
Perkin-Elmer, 822 F.2d at 1533 n.8); Key Pharms. v. Hercon Labs. Corp., 161 F.3d 709, 716-17 (Fed. Cir. 1998) (citing
Markman, 52 F.3d at 981); Vitrionics Corp., 90 F.3d at 1584.
29. Further support for this construction of the term handle axis is found when it is compared to the construction suggested by FURminator.
Specifically, adopting FURminator's proposed construction of the term handle axis would mean that there are not one or
even three but an infinite number of possible axes extending in all possible directions from the elongate handle. This
construction leads to absurd results because if the handle axis extends in any possible direction, then other clauses in the
patent claims no longer carry any meaning, such as "pulling the handle portion generally along the handle axis" and
"extending away from the blade edge segments generally in a direction perpendicular to the handle axis." Def. Ontel Ex. HH
('846 patent) (col. 4, ll. 3, 49-51; col. 6, ll. 11-13).
28. At no point in either the specification or the prosecution history do the inventors ever mention or even suggest that the
handle axis might refer to some axis other than the one corresponding to the longest dimension of the elongate handle. Def. Ontel Ex. HH
('846 patent); Def. Munchkin Ex. B (prosecution history of '846 patent).
27. Support for this construction is also found in the specification itself, where the inventors make it clear
that the handle axis is the axis defined by or corresponding to the longest dimension of the elongate handle and is oriented
26. Support for this construction of the term handle axis is found in the specification itself, where the inventors make it clear
that the handle axis is the one specific axis that
In other words, the clause defines the handle axis as the one specific axis that corresponds to the longest dimension of the elongate handle.
25. Incorporating the plain language definitions of "elongate" and "extending" into the original patent claim, the clause becomes
"a grooming tool having a handle portion of greater length than width that is stretched or spread out to greater or
fullest length generally along a handle axis." In other words, the clause defines the handle axis as the one specific axis that
24. There are no special definitions of the terms "elongate" or "extending" shown in either the specification or prosecution
history of the '846 patent. Def. Ontel Ex. HH ('846 patent); Def. Munchkin Ex. B (prosecution history of '846 patent); Joint
Claim Construction Statement at 14-15, 23.
23. The ordinary, plain language meaning of the word "extending" is "stretching or spreading out (something) to greater or
fullest length." Def. Ontel Ex. W (dictionary); Def. Ontel Ex. tHH ('846 patent) (col. 2, ll. 32-34 and figs. 1-2); Def.
Munchkin Ex. G (dictionary); Joint Claim Construction Statement at 14-16, 23; Phillips, 415 F.3d at 1314.
22. The ordinary, plain language meaning of the word "elongate" is "having more length than width." Def. Ontel Ex. W
(dictionary); Phillips, 415 F.3d at 1314 ("In some cases, the ordinary meaning of claim language as understood by a person
of skill in the art may be readily apparent even to lay judges, and claim construction in such cases involves little more than
the application of the widely accepted meaning of commonly understood words. . . . In such circumstances, general purpose
dictionaries may be helpful.") (citation omitted).

the most rudimentary understanding of the English language understands that 'at least one piezo-electric crystal means quoting Kistler Instrumente AG v. United States, 224 Ct. Cl. 370, 628 F.2d 1303, 1318 (Ct. Cl. 1980) (“Anyone with even one’ means that there could be only one or more than one.” Rhine v. Casio, Inc., 183 F.3d 1342, 1345 (Fed. Cir. 1999) (also some of the dependent claims, refers to an invention with one or more such elongate members. “Use of the phrase ‘at least one retractable elongate member” described in independent claims 1, 8 and 12, and some of the dependent claims, refers to an invention with one or more such elongate members. "Use of the phrase 'at least one' means that there could be only one or more than one." Rhine v. Casio, Inc., 183 F.3d 1342, 1345 (Fed. Cir. 1999) (also quoting Kistler Instrumente AG v. United States, 224 Ct. Cl. 370, 628 F.2d 1303, 1318 (Ct. Cl. 1980) (“Anyone with even the most rudimentary understanding of the English language understands that 'at least one piezo-electric crystal means

33. FURminator has also argued that the term "a" in patent claim can also indicate "one or several in number." The Federal Circuit has found, however, that this construction of the article "a" is only permitted when there is some basis in the patent specification for concluding that "a" can mean "one or several in number." Conversely, when the patent specification describes a thing as being one in number, then the article "a" cannot mean "several." See Manual of Patent Examining Procedure, § 2173.05(e); MercExchange, LLC, 401 F.3d at 1338; North Am. Vaccine, 7 F.3d at 1575-76 (citing Faber, supra at 351).

34. Accordingly, the Court finds that the construction of the term handle axis offered by Ontel and Munchkin--that is, "the axis defined by the longest dimension of the elongate handle"--is the correct one.

35. The correct construction of the term handle axis leads to a finding of non-infringement in favor of Munchkin and Ontel, as described in greater detail below.

36. Finally, FURminator has also argued that, as a matter of claim construction, the words "as quickly and as effectively as the toothed blades disclosed in the '846 patent" must be added to the clause "to cause the blade edge to engage the loose hair of the pet and pull it from the pet without cutting or pulling the non-loose hair from the pet." There is no basis for adding this language to the patent claims. First, the "as quickly and as effectively as a prior art toothed blade" limitation does not appear anywhere in the patent claim itself--which means that adding this limitation in the course of claim construction would be undoubtedly incorrect as a matter of well-established law. The "as quickly and as effectively" limitation also does not appear anywhere in the specification or prosecution history of the patent. Adding the proposed language is incorrect as a matter of patent law and must be rejected. Def. Ontel Ex. HH ('846 patent); Phillips, 415 F.3d at 1312 (holding it would be unjust and an evasion of the law to construe claims in a manner different from the plain import of its terms; "It is a 'bedrock principle' of patent law that the claims of a patent define the invention to which the patentee is entitled the right to exclude"); Hoganas AB v. Dresser Indus., Inc., 9 F.3d 948, 950 (Fed. Cir. 1993) (rejecting district court's incorporation of a size limitation into the claim term 'straw shaped' and holding it is improper to add extraneous limitations to a claim); Texas Instruments, Inc. v. United States ITC, 988 F.2d 1165, 1171 (Fed. Cir. 1993) ("courts can neither broaden nor narrow claims to give the patentee something different than what he has set forth") (citation omitted).
lodged within said component means,' to mean one or more crystals. Certainly, if the patentees intended that claim 1 was to cover one and only one piezoelectric crystal, they would have changed the above-quoted language to read 'one piezoelectric crystal means lodged within said component means.'}). In the definiteness analysis above, this court concluded that the "retractable elongate member" of the claims is the same part as the "folding member 330" named in the patent specification.

The patentee acknowledges that portions of the specification appear to describe an invention with two elongate members. Figure 3 shows two sets of guide holes 323a and 323b set in the rotary bodies 320a and 320b to accommodate elongate members, and Figure 2 portrays two folding members 330. Yet SDS notes that the specification describes only a preferred embodiment of the invention -- and "particular embodiments appearing in a specification will not be read into the claims when the claim language is broader than such embodiments. . . . [a] limitation should not be read from the specification into the claims" Rhine, 183 F.3d at 1346; see also Specialty Composites v. Cabot Corp., 845 F.2d 981, 987 (Fed. Cir. 1988). Patentee explains that "if a need exists," two elongate members can be employed, but such is not required by the claims. See col. 6, ln. 8.

Further, SDS quotes from the specification at col. 3, Ins. 47-58: "The guide holes . . . are provided to insertably receive a folding member 330, to facilitate movement thereof . . . Although an example of the guide holes . . . is shown in the figures wherein each guide hole has a folding member set therein, it is preferable that only one folding member is set at a given time during operation." (Emphasis added.) And, at col. 4, Ins. 4-5: "Although two folding members 330 are shown in the drawings, for exemplary purposes, only one can be set." (Emphasis added.) Finally, Figure 5 shows only one folding member and maps its arc as it bends the cutting blade. SDS claims that, were a second folding member used while a first folding member was in operation, "one would interfere with the other." SDS Br. at 11.

Ken responds that the elongate member should be understood as a means-plus-function element under 35 U.S.C. § 112 P 6, a contention which the court will address below. Defendant continues: "The structure that performs [named] functions in the specification are the two folding members identified as item 330. The specification, along with Figs. 2, 4 and 6 indicate that retractable elongate member refers to each folding member. . . . The only structure taught by the specification is a unit that includes two folding units." Ken Br. at 27.

At this point, the court is persuaded by two maxims of patent construction to accept SDS' interpretation. First, the patentee follows clear authority that "the language of the claim frames and ultimately resolves all issues of claim interpretation." Abtox, Inc. v. Exitron Corp., 122 F.3d 1019, 1023 (Fed. Cir. 1997), and that claim language may not be narrowed to preferred embodiments disclosed in the specification. See Rhine, 183 F.3d at 1346; see also Transmatic, Inc. v. Gulton Industries, Inc., 53 F.3d 1270, 1277 (Fed. Cir. 1995). Second, "in construing a claim, claim terms are given their ordinary and accustomed meaning unless examination of the specification, prosecution history, and other claims indicates that the inventor intended otherwise." Transmatic, 53 F.3d at 1277. Following those guidelines, the court will call the disputed "rose" a "rose" unless persuaded otherwise by the prosecution history or the other claims (via the doctrine of claim differentiation).

ii. Claim Differentiation

As another clue, SDS looks to the dependent patent claims. Claim 1 describes a "metallic ribbon stock folding apparatus" comprising, inter alia,

- at least one retractable elongate member, said elongate member mounted for movement between a retracted position where said elongate member is disengaged from at least one of said rotary bodies and an extended position where said elongate member engages both said first and second rotary bodies. . . .

(Emphasis added.) In turn, dependent claim 3 reads in full: "The metallic ribbon stock folding apparatus as recited in claim 1 comprising two elongate members."

Dependent claims, which add limitations, are presumed narrower than the independent claims from which they spring. See, e.g., Wilson Sporting Goods Co. v. David Geoffrey & Assoc., 904 F.2d 677, 686 (Fed. Cir. 1990); Specialty Composites, 845 F.2d at 987-88 (holding that a limitation recited in dependent claims does not imply such limitation in independent claims: to the contrary, such is evidence that the broader independent claims do not contain the limitation). And, "where some claims are broad and others narrow, the narrow claim limitations cannot be read into the broad." D.M.I., Inc. v. Deere
8 Finally, the doctrine of claim differentiation teaches that "there is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims. To the extent that the absence of such difference in the meaning and scope would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference between claims is significant." United States v. Telelectronics, 857 F.2d 778, 783-84 (Fed. Cir. 1988) (citation omitted).

The court accepts SDS' claim differentiation argument. Dependent claim 3 tracks independent claim 1 in all respects, except that claim 3 describes exactly two elongate members. Because claim 1 is presumed both different from and broader than dependent claim 3, the court concludes that claim 1 must recite some number of elongate members other than, or in addition to, exactly two. This interpretation supports a reading of the "at least one" language to include an invention with only one elongate member.

iii. Prosecution History

Finally, the parties focus on the prosecution history of the '919 patent in suit, as well as of the parent '391 application which issued as the '750 patent. 9

9 Though SDS initially asserted infringement of the '750 patent, it later dismissed that infringement claim with prejudice. Only the '919 patent remains at issue in this suit.

Ken's argument stems from two events that occurred during SDS' prosecution of the parent '391 application. Claims submitted to the PTO in June 1996 included claim 2, describing a single "folding member," and dependent claim 3, "wherein said folding member is at least set with plural numbers." Gilman Decl. Exh. 2 at 35-36. On July 9, 1997, the patent examiner rejected all pending claims (claims 1-11) for various reasons, including:

Claims 1 and 9 are rejected under 35 U.S.C. 102(a), (b), (e) as being anticipated by Tyler (5,461,893). See Figure 5 where the first and second driving means is shown for revolving the folding means and moving the folding means in a straight line direction, i.e., in an "isolated position".

Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over Paine (3,584,660) in view of Tyler (5,461,893). See Figure 5 where the first and second driving means is shown for revolving the folding means and moving the folding means in a straight line direction, i.e., in an "isolated position".

Warshavsky Decl. Exh. S at 82-83. In response, on October 16, 1997, the inventor amended claim 1 to recite, inter alia, a folding means, "the folding means including at least two folding members." Warshavsky Decl. Exh. T at 90.
added). That amendment also referenced "a pair of rotary bodies, rotatably connected to the ends of the fixing body for revolving the folding members, said pair of rotary bodies having a pair of guide holes formed therein for revolving the folding members." Id. (Emphasis added). And in that submission, the inventor represented:

 applicant's, inter alia, 'folding means including at least two folding members . . .'. In contrast thereto, with the Tyler '893 device, as discussed above, the bending bar and the single bending tool must be withdrawn and disengaged completely from the metal rule so that the bending tool may be rotated to a second position. Advantageously in the present invention, two folding members are provided which may be alternatively positioned adjacent the cutting blade by the second driving means. Therefore, the cutting blade of the present invention remains within its guide member throughout the bending process.

Warshavsky Decl. Exh. T at 8-9 (emphasis added). In response to the inventor's October 1997 amendments, the examiner allowed the '750 patent to issue. See Notice of Allowability, Gilman Decl. Exh. 2 at 117. It is undisputed that the '750 patent includes the limitation "the folding means including at least two folding members." See '750 Patent, Gilman Decl. Exh. 2 at 14, claim 1; see also dependent claim 2 (". . . wherein the at least two folding members having [sic] a substantially triangular cross-section.").

From these events, Ken argues: "As used in the '919 patent specification, and the prosecution history of its parents, 'at least one retractable member' must be interpreted as two or more folding members. Otherwise, Tyler '893 anticipates the invention by disclosing one bending pin." Ken Br. at 30. The defendant charges that SDS is, by this motion, now attempting to reclaim subject matter that it expressly disclaimed in the prosecution history: an invention involving only one bending pin. Id. Ken thus relies on a variant of prosecution history estoppel: 10

Arguments made during the prosecution history are relevant in determining the meaning of the terms at issue." . . . The prosecution history of a patent contains: all express representations made by or on behalf of the applicant to the examiner to induce a patent grant. . . . Such representations include amendments to the claims and arguments made to convince the examiner that the claimed invention meets the statutory requirements of novelty, utility, and nonobviousness. Thus, the prosecution history (or file wrapper) limits the interpretation of claims so as to exclude any interpretation that may have been disclaimed or disavowed during prosecution in order to obtain claim allowance.

--- Footnotes ---

10 The doctrine of "prosecution history estoppel," sometimes called "file-wrapper estoppel," "precludes a patentee from obtaining in an infringement suit protection for subject matter which it relinquished during prosecution in order to obtain allowance of the claims." Lockwood v. American Airlines, Inc., 107 F.3d 1565, 1574 (Fed. Cir. 1997). It is typically invoked to bar or limit a patentee's assertions of infringement under the doctrine of equivalents. Id.; see also K-2 Corp. v. Solomon S.A., 191 F.3d 1356, 1367 (Fed. Cir. 1999). The doctrine is not squarely applicable to the claim construction context, but has a close variant: "Interpreting claims in view of the prosecution history applies as a preliminary step in determining literal infringement. Prosecution history estoppel applies as a limitation to the doctrine of equivalents after the claims have been properly interpreted and no literal infringement is found." General Elect. Co. v. Nintendo Co., 179 F.3d 1350, 1362 (Fed. Cir. 1999) (citation omitted).

--- End Footnotes ---

SDS disputes Ken's estoppel argument (which, as said, is based solely upon comments made during prosecution of the parent application) by reference to the prosecution history of the '391 application, which issued as the '919 patent in suit. The patentee cites claims submitted in its July 1998 preliminary amendment: One claim required two retractable elongate members, see dependent claim 12 ("The metallic ribbon stock folding apparatus as recited in claim 10 comprising two elongate members."). but several others were limited to "at least one," see, e.g., claim 10 (including "at least one retractable elongate member mounted for movement between a retracted position and an extended position"). See '391 Application, Gilman Decl. Exh. 4 at 44-48. In August 1998, the patent examiner issued his only official action which, in addition to
formal matters, rejected certain claims as unpatentable over prior art references Tuit (3,420,279) and Ritter (3,823,749). Id. at 53-59. The examiner did not cite to the Tyler patent as an invalidating prior art reference. Id.

SDS concludes that what made the '750 claims patentable was not, as Ken says, the presence of two elongate members. Instead, "it was the structure whereby the elongate member engages both the first and second rotary bodies [parts 320a and 320b of the preferred embodiment]." SDS Br. at 17. The crux of SDS' argument is that while the claims of the '750 patent, issued from the parent application, admittedly limited the invention to include two retractable elongate members, the claims of the '919 patent are not likewise narrowed.

The record supports the patentee's argument. The '919 patent claims that issued were closely modeled on claims suggested by the examiner in October 1998. See Gilman Decl. Exh. 4 at 77-82. The examiner's comments focused heavily on the physical relationship between a single elongate member and the two rotary bodies, but not on the number of elongate members. For example, he suggested the phrasing "a rotary assembly having first and second rotary bodies spaced to receive ribbon stock therebetween, said elongate member engaging both first and second rotary bodies when in the extended position;" and "at least one retractable elongate member, said elongate member mounted for movement between a retracted position where said elongate member is disengaged from said rotary bodies and an extended position where said elongate member engages both first and second bodies." Id. at 77-79, claim 10 (examiner's additions underlined). The prosecution history also contains an "interview summary" by the patent examiner, recording a telephone conversation discussing with the inventor the positioning of the elongate member. Id. at 70. Finally, the court finds compelling SDS' remark that the examiner failed to even mention the Tyler reference as prior art in his August 1998 rejection of the '919 claims. See '391 Application, Gilman Decl. Exh. 4 at 53-59. Such omission would be startling if, as Ken suggests, the Tyler prior art reference invalidated every diemaking machine equipped with only one elongate member/bending pin.

Ken's argument that SDS deliberately relinquished rights to an invention with only one elongate member fails. 11 Estoppel or limitation of the '919 claims to that effect would be inappropriate. The prosecution history leading to the '919 patent supports the court's initial finding that "at least one retractable elongate member" means one or more. See '919 Patent, independent claims 1, 8 and 12, and some dependent claims.

11 During the Markman hearing, Ken advanced for the first time the argument that the claimed invention would be inoperative if it used only one elongate member: it analogized such machine to a car that could turn in only one direction. The court finds that argument unpersuasive in light of the specification, which directs that "it is preferable that only one folding member is set at a given time during operation." See col. 3, ins. 53-54. Moreover, determinations of operability involve a separate inquiry from the Markman analysis.

As said, Ken makes one remaining argument concerning the elongate member: the defendant asserts that it must be understood as a means-plus-function element under 35 U.S.C. § 112, P 6, which states:

An element in a claim for a combination may be expressed as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof, and such claim shall be construed to cover the corresponding structure, material, or acts described in the specification and equivalents thereof.

Broadly stated, "a claim deserves means-plus-function treatment when 'expressed as a means . . . for performing a specified function without the recital of structure [or] material . . . in support thereof.'" Seal-Flex, Inc. v. Athletic Track and Court Constr., 172 F.3d 836, 848 (Fed. Cir. 1999) (Rader, J., concurring) (citations omitted); see also O.I. Corp. v. Tekmar Co. Inc., 115 F.3d 1576, 1583 (Fed. Cir. 1997) (paragraph 6 is implicated "only when means plus function without definite structure are present"). If defendant is correct, the statute acts to limit the elongate member claims to the structure disclosed in the patent specification or their structural equivalents. The Federal Circuit describes the quid pro quo encompassed in this means-plus-function provision:
[Paragraph 6] language permits a patent applicant to express an element in a combination claim as a means for performing a function. The applicant need not recite structure, material, or acts in the claim's means-plus-function limitation. . . . The second clause of the [] paragraph, however, places a limiting condition on an applicant's use of means-plus-function language. A claim limitation described as a means for performing a function, if read literally, could encompass any conceivable means for performing the function. This second clause confines the breadth of the protection otherwise permitted by the first clause. The applicant must describe in the patent specification some structure which performs the specified function. . . . [Paragraph 6] limits the applicant to the structure, material, or acts in the specification and their equivalents.

Valmont Indus. v. Reinke Mfg. Co., 983 F.2d 1039, 1042 (Fed. Cir. 1993) (citations omitted). SDS strenuously objects that the '919 patent contains no means-plus-function language; the court therefore addresses the issue.

Patent drafters conventionally invoke 35 U.S.C. section 112, Paragraph 6 "by using only the words 'means for' followed by a recitation of the function performed." Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531 (Fed. Cir. 1996). Thus, use of the word "means" in claims triggers a presumption that the inventor sought to invoke means-plus-function analysis. O.I. Corp., 115 F.3d at 1579. And, "when an element of a claim does not use the term 'means,' treatment as a means-plus-function claim element is generally not appropriate." Al-Site Corp. v. VSI Intern., Inc., 174 F.3d 1308, 1318 (Fed. Cir. 1999).

However, that analysis is deceptively simple: the dispositive issue is whether the claims recite structure. "Mere incantation of the word 'means' in a clause reciting predominantly structure cannot evoke section 112, P 6. Conversely, 'the recitation of some structure in a means plus function element does not preclude the applicability of section 112(6)." O.I. Corp., 115 F.3d at 1579 (citation omitted). Therefore, even if "means" language is present, "the presumption that § 112, P 6 applies is overcome if the claim itself recites sufficient structure or material for performing the claimed function." Al-Site Corp., 174 F.3d at 1318.

Ken argues that the '919 patent claims do not define the structure of the elongate member. Ken Br. at 25. "Indeed, there is no structure at all in this claim element." Id. Further, the defendant asserts that the elongate member is not defined either in the patent specification or in the prosecution history. Id. at 26.

SDS responds that the element is described as "elongate" and "retractable." And, plaintiff asserts, Ken's argument fails: "under Ken's analysis, the 'at least one retractable elongate member' is a means-plus-function element without a function!" SDS Reply Br. at 4. See generally Rodime PLC v. Seagate Technology, Inc., 174 F.3d 1294, 1302 (3rd Cir. 1999) (Paragraph 6 not invoked if claim either recites sufficient structure for performing stated function, or if it recites no function corresponding to stated means).

Initially, the court notes that the elongate member phrase nowhere includes the operative "means for" language -- all claims of the '919 patent are devoid of that phrase. Therefore, the court presumes that Paragraph 6 does not apply. And dictionary definitions, not to mention common sense, point to the word "member" (descriptive modifier notwithstanding) as a structural term. See Webster's New International Dictionary (2d ed. 1956) defining "member" as, inter alia, "... 5. A part of a whole; an independent constituent of a body, structure, or any organized thing, or a unit in a series ... 12. Engin. Any essential part of a framed structure." Analogously, the Federal Circuit, reviewing the phrase "detent mechanism," stated:

It is true that the term "detent" does not call to mind a single well-defined structure, but the same could be said of other commonplace structural terms such as "clamp" or "container." What is important is not simply that a "detent" or "detent mechanism" is defined in terms of what it does, but that the term, as the name for structure, has a reasonably well understood meaning in the art.

Following that reasoning, this court invokes its earlier analyses of the "elongate member," its equivalence to "folding unit," "folding device," or "folding means" 300 of the patent specification, and to Ken's proffered "bending pin." See also Envrco Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 1365 (Fed. Cir. 2000) (interpreting "second baffle means" element: 'The term 'baffle' itself is a structural term. The definition of the word 'baffle' is 'a device (as a plate, wall or screen) to deflect, check, or regulate flow.' Because the term 'baffle' itself imparts structure, meaning a surface which deflects air, its use in the claims rebuts the presumption that § 112, P 6 applies."") (emphasis added and citation omitted). The court finds no
support for Ken's proposition that the claimed elongate member connotes function without structure. Means-plus-function treatment of this element is inappropriate and denied.

1. "Elongate Members"

Millipore argues that the terms "elongate members" used in Claims 1 and 5 of the '477 Patent should be construed as "a part of extended length." Gore contends, however, that the proper construction of the "elongate members" is "a rigid and monolithic structure of extended length." Gore's argument is derived from the specification. See '477 Patent col. 4 ll. 57-58 ("[e]ach of the elongate members 30 are monolithic and rigid."). The issue is therefore whether such a limitation can be read into the claims.

Because the specification is highly relevant to the claim construction analysis, it is considered to be "the single best guide to the meaning of a disputed term." Phillips, 415 F.3d at 1315 (quoting Vitronics, 90 F.3d at 1582). Nonetheless, "[w]hen consulting the specification to clarify the meaning of claim terms, courts must take care not to import limitations into the claims from the specification." Abbott Labs. v. Sandoz, Inc., 566 F.3d 1282, 1288 (Fed. Cir. 2009) (en banc). The Federal Circuit has recognized that "the distinction between using the specification to interpret the meaning of a claim and importing limitations from the specification into the claim can be a difficult one to apply in practice." Phillips, 415 F.3d at 1323. In construing claim terms, "the court's focus [must] remain [] on understanding how a person of ordinary skill in the art would understand the claim terms." Id. For example, "although the specification often describes very specific embodiments of the invention," the Federal Circuit has "repeatedly warned against confining the claims to those embodiments." Id. In particular, "[w]hen the specification describes a single embodiment to enable the invention, [a] court will not limit broader claim language to that single application unless the patentee has demonstrated a clear intention to limit the claim scope using words or expressions of manifest exclusion or restriction." Abbott, 566 F.3d at 1288 (internal quotation marks and citation omitted).

Here, I find Millipore's intention to limit the claim term to "rigid and monolithic" elongate members to be clear from the language of the claims and the specification, as well as from the prosecution history. First, the term "rigid" is expressly provided in Claim 1 to describe the elongate members. See '477 Patent col. 8 ll. 42-43 ("rigid elongate members"). Second, the specification expressly emphasizes the need for elongate members to be rigid:

The mechanisms underlying the operation of the fluid sampling device 100 call for a certain rigidity in the configuration of elongate members 30. Aside from durability, the rigidity allows the members to be pushed through the shaft into their open positions with sufficient and appropriate force to overcome the frictional forces that create the liquid tight seal, without the elongate members flexing, bending, crumpling, or otherwise deforming, such circumstances potential leading to sampling failures, and/or more catastrophically, breach of extant sterile conditions.

Id. at col. 7 ll. 9-18. Third, Millipore's intention to limit the claim term is also reflected in the prosecution history record during which Millipore expressly distinguished the '477 Patent over the Arthun device, because that product "fails to teach a rigid and/or monolithic elongate member." '477 Patent, Prosecution History Record, p. 57. Similarly, Millipore stated in the prosecution history record that "Claim 13 [issued as Claim 1] requires a rigid monolithic elongate member which is neither taught nor suggested by Arthun." Id. at 58.

--- Footnotes ---

2 See Section II.B.10. infra for the construction of the term "rigid" used in Claim 1 of the '477 Patent to describe the elongate members.

--- End Footnotes ---

Consequently, I construe the claim term "elongate members" as "a rigid and monolithic structure of extended length."
The district court concluded that Delta's slitting line did not infringe Herr-Voss's patented method on two grounds. The first ground rested on the district court's interpretation of a disputed term in the claim. The claim recites the step of:

working the multiple strands selectively by reverse bending between the same rolls, so as to reduce and elongate the thicker strands more than the thinner strands.

(Emphasis added.) At trial, the parties vigorously disputed whether the elongation recited in the claim referred to elastic (i.e., temporary) or plastic (i.e., permanent) elongation. Under the former interpretation, Delta's slitting line does not infringe the claimed method since, as both parties concede, Delta's line effects plastic elongation of the strands.

At the conclusion of the trial the district court adopted Delta's proposed claim interpretation and held that the claimed method requires elastic elongation of the slit strands. The district court reached this conclusion primarily on the basis of a piece of prosecution history in which Herr-Voss distinguished its invention from an earlier patent issued to Kinnavy. As Herr-Voss explained to the patent office:

The method of selectively working the strands comprises subjecting all strands to reverse bending while applying tension thereto less than the tensile yield strength of the strands. The thicker strands are thereby elongated more than the thinner strands.

The Kinnavy patent discloses a method of permanently elongating strip by applying tension thereto and reverse bending it so as to exceed the yield strength of the metal. It does not deal with the tensioning of slit strip in multiple.

(Emphasis added.)

Generally speaking, applying tension to metal below the tensile yield strength results in only elastic deformation. The district court therefore inferred from the above representation that Herr-Voss's invention differed from Kinnavy in that Kinnavy concerned plastic deformation while the invention concerned elastic deformation.

Having reviewed the '101 patent and those portions of the prosecution history and trial transcript made part of the appellate record, and especially the testimony of the inventor, Fornataro, we are convinced that the district court erred in its claim interpretation. We hold that the term "elongate" in the claim refers to plastic, rather than elastic, deformation.

Most persuasive on this point is the sentence in the specification which states:

While tension [from the recoiling] alone below the tensile yield strength of the metal will not elongate and thin the strands, tension in combination with repeated bending reversals of the strands can elongate them and reduce their thickness.

As Delta's expert witness, Dr. Watson, conceded at trial, this sentence is incorrect if the elongation being described is elastic elongation because tension below the yield strength of the metal will elastically elongate the metal. Thus, the patent specification itself uses the word "elongate" to refer to plastic elongation.

The aforementioned representation made by Herr-Voss during prosecution is not inconsistent with our interpretation of "elongate." That representation merely states that in Kinnavy the combination of tension and reverse bending exceeds the yield strength of the metal, while in Herr-Voss's invention the tension by itself is less than the metal's yield strength. Consequently, it does not support the district court's holding that the word "elongate" refers to elastic elongation. Instead, as the district court also recognized, this representation was made to distinguish Kinnavy on the basis that the Kinnavy reference worked only with a single strip of uncut metal whereas the '101 patent applies to multiple strands of slit metal. We therefore cannot affirm the district court's holding of noninfringement on the first ground articulated by the district court.

In its second ground, the district court focused on the language in the claim requiring that the reverse bending of the strands contribute to their elongation ("reverse bending . . . so as to . . . elongate the thicker strands"). This limitation, the district court found, was absent from the method performed by Delta's accused slitting line. As the district court explained:
The '101 patent effectuates the elongation and thinning of metal strands by combining tensions from the pay-off reel, slitter, and recoiler with the tension created in the reverse bending. The accused product cannot be found to read on to the '101 patent because the accused process achieves thinning and elongation through the application of sheer tension above the yield strength in the pull of the recoiler.

In its brief, Herr-Voss argues that the record contains no evidence to support the district court's finding that Delta's slitting line stretches the thicker strands using "sheer tension . . . in the pull of the recoiler" rather than a combination of that tension with the reverse bending as claimed in the '101 patent. In fact, Herr-Voss adds, what evidence there is supports the opposite conclusion. Specifically, it points to testimony by Mr. Savariego, owner of Delta, in which he specifically admits that his slitting line employs reverse bending in order to decrease the amount of tension necessary to deform the steel. In response, Delta points to no evidence to support the district court's factual finding that reverse bending does not contribute to elongation of the thicker strands in Delta's slitting line. Consequently, we must conclude that this finding by the district court is unsupported by the evidence and is thus clearly erroneous. Since we find that both grounds of noninfringement relied on by the district court were erroneous, we vacate the noninfringement portion of the district court's judgment.

At oral argument, counsel for Delta sought to support the district court's decision on this point by arguing that the claim requires contributions of "tension" from both the reverse bending and the recoiler, while in Delta's slitting line, the reverse bending serves only to reduce the amount of tension required to permanently elongate the strands. In our opinion, this argument is more semantic than substantive. Whether one calls the contribution from the reverse bending "tension" or whether one views the contribution from the reverse bending as decreasing the amount of tension necessary to achieve permanent elongation, the method steps performed in practicing the invention are the same. Thus, in both the claimed invention and Delta's slitting line, a combination of reverse bending and tension from the recoiler is necessary to permanently elongate the strands.

1356
F. "an elongate, rod-like member"

Plaintiff proposes that this phrase be construed as a "shaft having a length." The Court finds that such a construction would be unhelpful to a jury, as it remains quite vague in its employment of the phrase "having a length." Defendants' proposal of "a long, slender rod-like structure" appears to be supported by the patent specification and the dictionary definition of elongate, and it also gives some additional definition to the phrase. Accordingly, "an elongate, rod-like member" shall be construed as "a long, slender rod-like structure."

1357
11. "elongated"

Floe contends that this term should be construed as "stretched out, extended, or lengthened." Newmans, on the other hand,
asserts that this term should be construed as "a web member that has a height from bottom to deck bearing surface that is greater than other frame members." Floe alleges that its proposed construction is consistent with the ordinary meaning of "elongated" and that Claim 6 uses this ordinary meaning. Floe also contends that its proposed construction is consistent with standard dictionary definitions that define "elongated" as "stretched out" and "extended; lengthened." See Merriam-Webster's Collegiate Dictionary 375 (10th ed. 2001); Random House Dictionary of the English Language 633 (2d ed. 1987).

Newmans, on the other hand, contends that its proposed construction is consistent with the specification's description of the preferred embodiment. Specifically, Newmans points out that the specification states, "[c]hannel member 18 can be 3.5 inch [sic] from bottom to deck bearing surface 72, and deck edge protection surface 76 will be high enough to cover the edge of the selected deck material." ('379 Patent, c. 5, ll: 35-38.) Additionally, Newmans points out that the specification refers to all frame members having the same height. Finally, Newmans contends that increasing the height of the web member, as compared to other frame members to be used, improves the visibility of the lights that are mounted to the elongated web member. For these reasons, Newmans contends that its proposed construction is consistent with the specification.

The Court finds that Claim 6 uses the ordinary meaning of "elongated." Here, Claim 6 requires, "an elongated web member having a predetermined length substantially coextensive with and below said deck support member and joined to said deck support member at a second predetermined angle." ('379 Patent, c. 7, ll: 52-55.) The Court finds that Newmans' proposed construction would limit the claim to the structure disclosed in the preferred embodiment. Thus, consistent with the ordinary meaning of "elongated," the Court construes this term as "stretched out, extended, or lengthened."

C. The Elongated Guide Means

Claim 24 recites a step of "conveying eggs . . . to elongated guide means." '505 Patent, col. 13, ln. 37-38. Plaintiffs argue that this limitation is recited in means-plus-function form and therefore should be interpreted in accordance with 35 U.S.C. § 112, P 6. But the claim recites no function linked to the "elongated guide means" limitation. The Court therefore rejects Plaintiffs' argument and construes "elongated guide means" in accordance with its ordinary meaning: any structural guide that is elongated.

9. "[E]longated magnet member"

This term is contained in two independent claims in the 386 patent, 123 an independent claim in the 539 patent, 124 and an independent claim in the 117 patent. 125

As to this term, the Court construes the following meaning: the actual, physical magnets themselves are elongated, rather than that they may be arranged in an elongated fashion. The drawings of all five patents support this interpretation, each showing explicit illustrations of a long magnet by itself, and also long magnets incorporated into representative drawings of the tool body. The Abstracts of the patents use the word longitudinal to describe the magnet members, 126 which also supports this interpretation. While this is a widely accepted meaning of a commonly understood word, and not a technical
term, out of an abundance of caution the Court also cites the Oxford English Dictionary definition of elongated: "1. Made longer; drawn out or extended to an unusual or unnatural length. 2. That is excessively long in proportion to its breadth, as if drawn out or extended." The Court is not persuaded that this term can be enlarged to encompass a series of completely round magnets that have been arranged in an "elongated" fashion, as the Plaintiff argues. The requirement that the language of the patent, when read as a whole, be full, clear, concise, and exact, so that inventors are protected but innovation is still permitted, demands that the plain language "elongated magnet member" means exactly that.

126 The Court notes that another embodiment of the tools calls for arcuate magnets, discussed later.
"member" does not mean "grip."

H&B further argues that if the Court construes "member" to mean "component," that construction could potentially encompass pads, which H&B claims the '091 Patent teaches against. (Opp. at 20.) In this case, if the specification were to disparage all pads generally, the claims could not be construed to encompass all pads generally. See Honeywell Int'l, Inc. v.ITT Indus., Inc., 452 F.3d 1312, 1319 (Fed. Cir. 2006) (where the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent, even though the language of the claims, read without reference to the specification, might be considered broad enough to encompass the feature in question). However, the '091 Patent does not clearly set forth what "resilient" materials are. McHugh offers several dictionary definitions for resilient, such as "that which returns to its original shape following a deformation in shape." Thus, the specification does not clearly set forth what "resilient" materials are. McHugh argues for a proposed construction of only the term "elastic" in the specification, but does not mention anything about "flexible material." Thus, the claim language indicates that the term "elongated" is not tied to a specific length limitation.

Next, the Court may look to external evidence for guidance. Surveying many dictionaries, McHugh finds a general consensus as to what "resilient," and the Court adopts this definition. The Court may look to external evidence for guidance. Surveying many dictionaries, McHugh finds a general consensus as to what "resilient" means. McHugh offers several dictionary definitions for resilient, such as "that which returns to its original shape following a deformation in shape." Thus, the specification does not clearly set forth what "resilient" materials are. McHugh argues that during the prosecution of the patent McHugh narrowed his claims in order to avoid prior art and therefore he should not now be allowed to broaden his claims to capture abandoned subject matter. Specifically, H&B points out that in prosecution of the patent, McHugh stated that "elongated member" means that the member has a total length greater than three times an average thickness and greater than three times an average width. (Opp. Br., Ex. 8.) Meanwhile, McHugh points out that in a response to an Office Action, McHugh stated that "elongated" means "long and narrow." (Reply at 5.) Ultimately, McHugh abandoned the length limitation language for the current width and thickness limitations at the recommendation of the examiner. (Brief, Ex. 9.) In this case, the Court does not need to look to the prosecution history because the claim language and the written description are sufficient to determine what "elongated" means.

Lastly, both parties dispute the meaning of "resilient." McHugh argues for a proposed construction of only the term "elastic" and H&B argues for a proposed construction of "plastic, rubber, or other flexible material." On this point, neither party's arguments are very persuasive. McHugh refers to extrinsic evidence such as dictionaries to support its proposed construction, without referring to any intrinsic evidence. H&B argues that the specification provides insight as to how "resilient" should be construed. The patent summary states that the "member can be constructed of plastic, rubber, or other material that provides flexibility and easily accommodates the user's fingers." Further, the written description states that "any type of resilient material, such as plastic or rubber, can be used for the invention." H&B attempts to hybridize these two statements to show that "resilient" means "plastic, rubber, or other flexible material." However, a close reading of the written description demonstrates that this interpretation is incorrect. First, limiting "resilient" to plastic or rubber is an improper limitation of the claim language. "Limitations from the specification (such as from the preferred embodiment) may not be read into the claims, absent the inventor's express intention to the contrary." Secondly, the patentee does describe "resilient material" in the specification, but does not mention anything about "flexible material." Thus, the specification does not clearly set forth what "resilient" materials are. McHugh offers several dictionary definitions for resilient, such as "that which returns to its original shape following a deformation in shape." In the absence of clear language in intrinsic evidence, the Court may look to external evidence for guidance. Surveying many dictionaries, McHugh finds a general consensus as to how a person would interpret "resilient," and the Court adopts this definition.
Accordingly, the Court construes the term "member" to mean: "long and thin component which returns to its original shape following a deformation in shape."

In this case, we have already completed the first step of the analysis by construing three elements of claim 4 of the '514 patent:

"Material for finishing" This claim element means a material that makes more durable the underlying surface of the floor, and is applied for that purpose.

"Elongated sheet" This claim element does not require the presence of material that covers the entire floor but instead can encompass material that covers less than the entire floor; nor does this claim element exclude a "panel" of material otherwise meeting the limitations of the claims.

"an elongated user support"

The parties agreed that this element required construction; they initially disagreed on the proper construction to give it.

As previously discussed, when a court is asked to construe a claim, it must first determine whether construction is necessary, giving the words of the claim their plain, ordinary meaning as understood by one skilled in the art at hand. Where, as here, the parties have agreed that construction is necessary, but disagree about the proper construction, the Court must consider the original language and the proffered constructions.

The Court agrees that construction of the language is necessary; greater specificity is needed. That said, Fitness Quest's originally proposed language was too narrow -- including a requirement relating to "prone back extension exercise" -- and Monti's originally proposed language was too broad.

Fitness Quest has modified its original proposed construction, as reflected in the attached Appendix B. Review of the transcript of the hearing reveals that the parties discussed the following construction: "A central support and stationary stabilizing member that is longer than it is wide." See Transcript of June 26, 2007 Markman Hearing ("Transcript") at 88, 93. Fitness Quest's post-hearing brief reflects essentially this construction. Doc. 43 at 5.

In his post-hearing brief, however, Monti argues that the word "stationary" should not be "read into" the claim. Monti Amended Post-Hearing Brief (Doc. 45) at 7. He further offers a single sentence stating that the words "main central" should not be included in the claim, either, but without any further discussion. Id.

This Court finds that a combination of the proposed constructions offered by the parties is appropriate, as follows: "a central support and stabilizing member that is longer than it is wide."

C. Interpretation and Infringement Analysis of the Term "Embedded" As Used in the Asserted Claims of the '981 Patent.

Claims 1 and 6 of the '981 patent explicitly contain the disputed term "embedded." Specifically, claim 1 states:

a gapless and seamless cylindrical inextensible layer over said compressible layer, said inextensible layer including a circumferentially inextensible material embedded in a second gapless and seamless tubular body of elastomeric material. . .
(‘981 patent, col. 12, lns. 25-29). Claim 6 states:

a gapless and seamless cylindrical inextensible layer over said compressible layer, said inextensible layer including a circumferentially inextensible material embedded in a gapless and seamless tubular body of elastomeric material. . .

(‘981 patent, col. 13, lns. 36-40).

In interpreting the above phrase, Mitsubishi and Harris both turn to the dictionary definition of the term "embed." WEBSTER'S II NEW RIVERSIDE UNIVERSITY DICTIONARY defines "embed" as "to fix securely in a surrounding mass." Further, both parties rely on the same examples in illustrating the correct interpretation of the term, namely, "a knife embedded in wood" and "a brick firmly embedded in mortar." However, in explaining the practical effect of the above definition, the parties’ positions diverge. Specifically, Mitsubishi contends that an object is only "embedded" in a given material if the object is totally surrounded on all sides by that material.

We disagree. While it is true that one way to "embed" an object in a material is to totally surround the object in that material, a review of the patent in its entirety convinces us that this was not the definition intended by the patentee. Specifically, in setting forth the preferred embodiments of the invention, the patentee provided several different methods for forming the inextensible layer. One of the embodiments requires the inextensible thread to be "impregnated" with the elastomeric material (‘981 patent, col. 7, lns. 9-13; col. 11, lns. 30-32), while another calls for the thread to be "encapsulated" in elastomeric material (‘981 patent, col. 9, lns. 46-48). Turning once again to WEBSTER'S, we are left with the following definitions: to "encapsulate" is to enclose in a protective coating or membrane, and to "impregnate" is to fill throughout or to saturate. WEBSTER'S II NEW RIVERSIDE UNIVERSITY DICTIONARY. In light of these distinctions, it is clear that, when the patentee intended for the thread to be completely surrounded by elastomeric material, he specifically provided for such treatment in the patent's specification. Thus, acceptance of Mitsubishi's argument would render meaningless and redundant the distinctions explicitly provided in the patent.

We adopt the dictionary definition advanced by the parties and hold that "embed" means "to fix securely in a surrounding mass." WEBSTER'S II NEW RIVERSIDE UNIVERSITY DICTIONARY. We further hold that an object is "embedded" in a material if the object is sufficiently surrounded by the material to be bonded to it.

As a result of the forgoing, we adopt the dictionary definition advanced by the parties and hold that "embed" means "to fix securely in a surrounding mass." WEBSTER'S II NEW RIVERSIDE UNIVERSITY DICTIONARY. We further hold that an object is "embedded" in a material if the object is sufficiently surrounded by the material to be bonded to it.

The plaintiff contends that no construction is needed. To the extent that a construction is needed, the plaintiff proposes "incorporated in a casing which surrounds internal parts of a device." The defendants propose "the claimed device is formed in a single housing and all components are either located in that housing or permanently attached to it." This phrase does not involve technical terms and can be understood through its plain and ordinary meaning. It does not require construction.
propose "at least one key that is permanently attached to the housing and that can be manually depressed." The defendants again cite only to a preferred embodiment in the specification to support its incorrect contention that a "key" can be "manually depressed" by the user. However, the plaintiff does agree with the defendants that a "key" attached via cable would not satisfy the limitation of "embodied in said housing." Accordingly, the court construes "at least one user interface key embodied in said housing" as "at least one user interface key permanently attached to the housing."

GO BACK

1366

14. at least one of which is not embodied in the housing

The plaintiff contends that no construction is needed. The defendants propose "one or more of the flash memory reader, the mass storage device, and the battery are not embodied in the housing." The court agrees with the plaintiff that the defendants' proposed construction merely reiterates the claim language. Accordingly, the court concludes that this phrase requires no construction.

GO BACK

1367

(2) "First Embossed Pattern of Depressions"

The parties also dispute the meaning of the term "first embossed pattern of depressions." While defendant claims that the first embossed pattern consists of depressions in the liner surface and that its ink deposits are embedded rather than embossed into the liner surface (Def.'s Opp. to 3M's Mot. for a Prelim. Inj. at 14), plaintiff fails to define this term. Instead, plaintiff states that "the point is that Avery subsequently presses these 'ink deposits' into the deformable release liner, and from that point on, the liner has a 'first embossed pattern of depressions.'" (P's Reply Mem. in Supp. of Mot. for Prelim. Inj. at 2.) Here, the specification of the 930 Patent expressly defines "embossed:"

"Embossed" means a topography on a web or on tooling having an effective three-dimensional pattern that generates a difference in surface planar dimension in the liner or the tooling.

(Adkisson Decl., Ex. A., Col. 1, In. 60-64.) Based upon this definition in the specification, the court concludes that the meaning of the term "embossed" is a topography created on material by impressing a corresponding inverse topography on its surface:

While the court need not look to extrinsic evidence to construe the term "embossed," technical dictionaries support this understanding of the term. See Bell Atlantic v. Covad Communns. Group, Inc., 262 F.3d 1258, 1267 (Fed. Cir. 2001) (providing that courts may rely upon scientific dictionaries). The TAPPI 1993-1994 Technical Information Sheets define "embossing" as "creating a finish or design imparted by compressing a material between matched rigid surfaces or rigid and ductile surface having the desired raised or depressed surface pattern." (Hadley Decl., Ex. 6.) Moreover, as defendant argues, plaintiff's own witness agrees with that definition of embossing:

Q. So embossing means creating a series of impressions which are the inverse of a pattern on the embossing tool?

A. That's the way I would define it.

(Hadley Decl., Ex. 7, Calisto Dep. at p. 101.)

GO BACK

1368

B

The district court also erred when it defined the term "embossed" by imposing a limitation related to the process by which
the embossed surface is made. See 3M I, 185 F. Supp. 2d at 1040-41 (defining embossed as "a topography created on material by impressing a corresponding inverse topography on its surface"). Because 3M expressly acted as its own lexicographer by providing a definition of embossed in the specification, the definition in the specification controls the meaning of embossed, regardless of any potential conflict with the term's ordinary meaning as reflected in technical dictionaries. See Tex. Digital Sys., 308 F.3d at 1204; Rexnord, 274 F.3d at 1342.

The specification expressly states that "'embossed' means a topography on a web or on tooling having an effective three-dimensional pattern that generates a difference in surface planar dimension in the liner or the tooling." '930 patent, col. 1, ll. 61-64. This definition defines "embossed" materials to include both the web and the tooling (a device that can be used to impress a pattern into a web), provided each has a "topography" that has "an effective three-dimensional pattern that generates a difference in surface planar dimension." 5 This definition is entirely structural. 3M defines an "embossed" material as one that has particular surface characteristics: a "topography" with an "effective three-dimensional pattern," the pattern creating "a difference in surface planar dimension."

--- Footnotes ---

5 If the district court's definition were correct, then the definition provided in the specification (which of course cannot be ignored) would create a problem of infinite recursion: the tooling itself would have to be created "by impressing a corresponding inverse topography on [the tooling's] surface"; the "corresponding inverse topography" that creates the tooling, itself a meta-tooling, would have to be created "by impressing a corresponding inverse topography on [the meta-tooling's] surface," etc. At oral argument, Avery argued that the definition in the specification must be ignored because it is nonsensical. Cf. CCS Fitness, 288 F.3d at 1367 (noting that a claim term will not be given its ordinary meaning if the term deprives the claim of all clarity). The only interpretation under which the definition of embossed provided in the specification is nonsensical is Avery's.

--- End Footnotes ---

The district court erred when it introduced a process limitation of embossed by requiring the topography to be created by impression of a corresponding inverse topography. The patent does not limit how the embossed pattern, as defined in the specification, is created.

1369
r. "outer surface that is embossed" Claim 8

According to the '514 Patent, "the surface of the rubber materials is embossed, so that the surface will have ridges and valleys which will give the materials a rough feel." ('514 Patent, col. 2, Ins. 19-20) While Green Edge provides a different definition from a dictionary, it is unnecessary to go beyond the intrinsic evidence of the Patent itself. Thus, the Court finds that "outer surface that is embossed" means "the outside surface with ridges and valleys which will give the materials a rough feel."

1370
1. Embossed Channels

K-C argues that "embossed channels" means "fold lines," but Tyco suggests instead that they are "passages or grooves made by compressing absorbent material, which do not act as a barrier to flow of fluid and which provide for the pooling of fluid." Thus, K-C wants to expand "embossed channels" by equating them to fold lines, whereas Tyco rejects this interpretation and seeks to limit the term still further by virtue of a functional qualifier.

I will begin with Tyco's preferred reading. As to the proposed functional limitation, Tyco argues that in the prosecution history and specification, K-C made it clear that the embossed channels did not act as fluid barriers and that they provided
instead for the pooling of fluid. That is, it asserts that K-C acted as its own lexicographer and narrowed the standard
definition of channels by disclaiming any channels that acted as a barrier. For instance, the specification clearly states that
the channels are not barrier lines: "It is relevant to note that these embossed channels or fold lines are not barrier lines, that
is, lines which are intended to stop the flow of body fluids beyond their boundary." Instead, the description continues, "the
embossed channels 3 of the present invention are designed to reduce leakage by pooling body fluids during use." (4:37-43.)
Although these statements make clear that the purpose of the channels is not to create a fluid barrier, to accept Tyco's
argument would be to import a functional limitation from the specification into the physical description contained in the
claims, a practice I have rejected above based on Federal Circuit precedent. "[T]he fact that the claimed composition was
designed to solve certain problems of the prior art and the fact that the patentee noted the functional import . . . does not
mean that we must attribute a function to the nonfunctional phrase." Ecolab, 264 F.3d at 1367. Moreover, even giving Tyco
the benefit of the doubt, its argument is based on a faulty premise. That is, the fact that K-C's invention was not intended to
be a barrier -- as the description states -- does not mean that any embodiment of the invention cannot have channels that act
as a barrier. Thus, even if K-C had specifically disclaimed a particular purpose of the channels, it does not follow that such a
purpose could not have been achieved in any embodiment.

Similarly, Tyco's attempt to describe the pooling function of the channels must also be rejected. Specifically, it argues that
K-C deliberately defined channels as channels that provide for the pooling of fluid. But again, the specification merely
states that the channels are "designed to" pool fluids and thereby reduce leakage. (4:42-43.) This description of the
invention's purpose and novelty cannot somehow serve as a narrowing limitation on the claims themselves. In fact, it is
presumed that the claims themselves are designed to achieve the purposes set forth in the description.

Finally, Tyco asks that "channels" be read as "passages or grooves." It asserts this interpretation based on a standard
dictionary definition as well as the inventors' repeated use of the term "grooves" during the patent's prosecution. 2 Although
the inventors use the term "groove" several times in the prosecution history, nowhere in the quotations Tyco cites did the
inventors suggest that the channels in the invention were to be viewed as though they were merely grooves. Instead, in each
instance, the inventors are discussing the groove-like properties possessed by the channels, i.e., the fact that they act as
hinges allowing the flaps to fold upwards. In that respect, it is true that the channels may be deemed grooves. But in other
respects, such as fluid-retarding or disbursing, they may also be viewed as channels. The fact that the channels may also be
deemed grooves does not mean that the inventors sought to limit "channels" to "grooves," and the few instances Tyco cites
in the prosecution history certainly do not suggest otherwise. Accordingly, I see no reason to alter the meaning of "channels"
in the manner Tyco suggests.

--- Footnotes ---

2 The citations from the prosecution history are found at Tyco's opening brief, p. 14, and its response brief at p. 2.

--- End Footnotes ---

K-C asserts instead that embossed channels are "fold lines." For support, it notes that on numerous occasions the
specification refers to the embossed channels or fold lines interchangeably. For instance, the description notes that the "fold
lines 3 which are embossed channels adjacent to the longitudinal edges 1 are formed by compressing the layers of the pad a
sufficient amount to remain intact throughout the intended use of the pad." (4:34-37.) In summarizing the invention, the
specification states that "the present invention concerns an absorbent sanitary napkin with fold lines or embossed channels."
(1:17-18.) In addition, K-C notes, the title of the invention is "Reduced Leakage Menstrual Pad With Built-In Fold Lines."
Finally, K-C argues that the entire purpose of the invention is to allow for the folding up of the flaps, or edges, to pool fluid.
Thus, it asserts, it has effectively redefined "embossed channels" as "fold lines."

Although the specification might refer to the embossed channels as fold lines -- just as it refers alternately to both channels
and grooves -- that merely means that the embossed channels are also fold lines. The channels are certainly a type of fold
line, but fold lines could presumably consist of grooves, creases or any other line that indicates a fold, a point K-C conceded
at argument. In other words, fold lines are a broader category than embossed channels, and nothing about the term "fold
lines" suggests that they must be embossed channels: the two terms are simply not synonymous, and nothing in the
specification suggests that the embossed channels may merely be fold lines. Thus, because nothing in the specification or
claims implies that any sort of fold line will do, I conclude that they must be embossed channels.
This is made clear by reference to the claims themselves. Specifically, claim 1 -- standing on its own -- already accounts for the fold-line properties and qualities K-C now cites. In particular, claim 1 states that the embossed channels are to allow "said napkin edges to fold upward at said embossed channels to form an occlusive volume." (6:13-15.) Read as a whole, the claim essentially sets forth an invention having (1) embossed channels that (2) act as fold lines. This explains why the specification might, at times, use the two terms interchangeably; but the fact remains that the claims describe not all fold lines but merely fold lines that are implemented through embossed channels. This is a limitation clearly set forth in the claims, and I therefore do not find K-C's attempt to expand the claim terms persuasive.

1. "Embossed channels" means "embossed channels."

A. Claim Construction

The claims of both the '577 and '543 patents recite layers of metal foil having "a plurality of embossments" that separate the layers and establish gaps of insulating air between the layers. Lydall's position is that its foil layers are not "embossed"; ATD argues that they are, and that the district court erred in its construction of this term, leading to error in the ensuing decisions of non-infringement.

The district court drew on the two patent specifications for the meaning of "embossments" as used in the claims. See Slimfold Mfg. Co. v. Kinkead Industries, Inc., 810 F.2d 1113, 1116, 1 U.S.P.Q.2D (BNA) 1563, 1566 (Fed. Cir. 1987) (claims are understood in light of the specification of which they are a part). When "the specification explains and defines a term used in the claims, without ambiguity or incompleteness, there is no need to search further for the meaning of the term." Multiform, 133 F.3d at 1478, 45 U.S.P.Q.2D (BNA) at 1433. However, when such definition is challenged it is often appropriate, despite facial clarity and sufficiency of the specification and the prosecution history, to receive evidence of the meaning and usage of terms of art from persons experienced in the field of the invention. See Fed. R. Evid. 702-706.

The specifications of both patents in suit define the embossments as "depressions" and "bumps or projections," the numbers referring to Fig. 2 supra:

The embossments 6 form depressions on one side of a respective one of the layers 2 and bumps or projections on an opposite side of the respective layer.

'743 patent, col. 7, lines 37-39; '577 patent, col. 7, lines 41-44. The district court observed that this definition is consistent with the dictionary definition of "emboss" as meaning to "raise in relief from a surface." ATD argues that this definition supports its position, since Lydall's foil layers have "bumps and indentations." ATD argues that there is no reason to believe that the inventor used the term differently from its dictionary meaning, leaving no ambiguity and thus no need for "claim construction." ATD states that the district court erred in law in construing "embossments" as also requiring that the bumps and indentations reach from layer to layer of the foil. Thus ATD argues that since the claims are not ambiguous, and since "embossments" has a clear meaning, it is incorrect to add to the definition of "embossments" the requirement that they also serve to separate the layers of metal foil by the depth of the embossments that contact the adjacent layer of foil.

The specifications teach that the embossments make point contact between the adjacent layers of foil:

The pad 1 can include two layers 2 only one of which includes the embossments 6. In a preferred embodiment, however, at least two of the layers adjacent to each other include a pattern of the embossments 6, the layers being offset with respect to each other such that at least some of the embossments are not aligned in the vertical direction. With this arrangement, the layers 2 can be provided in point contact to minimize heat transfer therebetween in the vertical direction A.

The pad 1 can include two layers 2 only one of which includes the embossments 6. In a preferred embodiment, however, at least two of the layers adjacent to each other include a pattern of the embossments 6, the layers being offset with respect to each other such that at least some of the embossments are not aligned in the vertical direction. With this arrangement, the layers 2 can be provided in point contact to minimize heat transfer therebetween in the vertical direction A.

'743 patent, col. 7, lines 9-17; '577 patent, col. 7, lines 13-21. The district court also reviewed the patent drawings, and correctly described them as showing "the embossments as being raised reliefs on the various layers such that the embossments come in direct point contact with adjacent layers (Figures 2 and 5 of the '743 and '577 patents.)" The court concluded that "embossments" as used in the claims require raised reliefs that separate adjacent layers of foil by point contact.
ATD states that the district court erroneously incorporated into the definition of "embossments" in the claims in suit the structural feature of "point contact" from non-asserted claim 11 of the '743 patent, which reads:

11. The pad of claim 1, wherein said pad is flexible and at least some of said embossments form depressions on one side of a respective one of said layers and bumps on an opposite side of said respective layer, said embossments providing point contact between the layers.

(Emphasis added.) ATD argues that point contact is described in the specification as simply a preferred embodiment, and is not a limitation to the claims that do not include it. ATD states that a definition of embossments without point contact is also supported by the description in the '743 and '577 specifications of an embodiment wherein layers of a heat-resistant mesh or scrim are interposed between foil layers. ATD states that since claim 1 is generic to the various embodiments shown in the specification, it was an error of law to restrict the broadest claim to the embodiment illustrated in Fig. 2 wherein the embossments are in point contact with adjacent foil layers.

Lydall responds that the mere fact that non-asserted claim 11 specifically states that the embossments are in point contact does not preclude the construction of claim 1 as requiring that the embossments separate the layers. Lydall points out that for the embodiment in which ATD uses mesh between some foil layers, the specification shows that at least some of the layers are separated by point contact of the embossments. Non-asserted dependent claim 14 of the '743 patent, which specifies one or more layers of scrim, also incorporates the claim 1 limitation of at least two "layers including a plurality of embossments therein separating said layers in said insulating area so as to provide gaps therebetween."

The separation of layers and ensuing provision of insulating gaps arise from the point contact. Thus we agree that the correct interpretation of the claims in suit is that, whether or not mesh is used between some of the foil layers, the embossments serve to separate at least some of the layers. The doctrine of claim differentiation can not broaden claims beyond the scope that is supported by the specification. Multiform Desiccants, 133 F.3d at 1480, 45 U.S.P.Q.2D (BNA) at 1434 ("claim differentiation can not broaden claims beyond their correct scope"); Tandon Corp. v. United States Int'l Trade Comm'n, 831 F.2d 1017, 1023, 4 U.S.P.Q.2D (BNA) 1283, 1288 (Fed. Cir. 1987) ("Whether or not claims differ from each other, one can not interpret a claim to be broader than what is contained in the specification and claims as filed.") The presumption that separate claims have different scope "is a guide, not a rigid rule." Autogiro Co. of America v. United States, 181 Ct. Cl. 55, 384 F.2d 391, 404, 155 U.S.P.Q. (BNA) 697, 708 (Ct. Cl. 1967).

ATD also argues that the district court improperly added a method limitation to the product claims when it interpreted the method claims as requiring the embossments to be made on the metal sheets before the assembly process. The district court held that "the specifications make clear that the 'embossments' as contemplated under the patents are made on the metal sheets prior to any assembly process" (district court's emphasis), and that "the '577 patent is very clear on pre-assembly embossment." The court cited the specification of the '577 patent:

The method according to the invention can also include a step of embossing a plurality of the layers 2 such that a plurality of the embossments 6 are formed therein, the embossing step being performed by simultaneously embossing a plurality of overlapping sheets 2 of the metal foil, each of the sheets after the embossing step comprising a respective one of the layers. The embossments can be provided in a random or uniform repeated pattern. It is also within the scope of the invention to emboss each sheet separately. The embossments can be provided by passing a single sheet or stack of sheets between a pair of rollers having the desired embossment pattern thereon.

'577 patent, col. 8, lines 32-44 (district court's emphasis).

This aspect is relevant to both the product and the method claims, for it was not disputed that in the Lydall pad a pattern of impressions is produced on the metal foil after the foil is assembled into layers, by compression of the foil against the intervening mesh. The specifications make clear that the "embossments" of the '743 and '577 patents are "something more than 'impressions' on the surface of the foil layers which are merely 'incidental,'" in the district court's words. The claims require that the "embossments" be deep enough to separate the adjacent layers of foil; the product claims are not dependent on how the embossments are made, and were not construed otherwise.

Upon plenary review we confirm the district court's claim construction. The '743 and '577 specifications show and the
claims require that the insulating gap between at least some of the metal foil layers is formed by the embossments that space apart the foil layers. In the patent specifications the presence of embossments making contact with adjacent layers of foil to separate the layers is described as a material aspect of the invention. The use of a mesh or scrim between some of the layers, even without "embossments" in those layers, does not defeat the requirement of even the broadest claims that the pad contain at least two layers of foil bearing embossments that separate the layers. Claim 1 of the '743 patent, correctly interpreted, embraces generically the use of mesh between some of the foil layers, but also requires that embossments on some of the foil layers make contact with and separate adjacent foil layers. All of the claims of both patents require embossments that serve this function, and the specifications make clear that this is essential to the patented invention. We conclude, as did the district court, that "embossments" as used in the '743 and '577 patents means depressions or bumps that separate and form a gap between at least some of the foil layers by point contact of the embossments with adjacent layers. This definition applies to all the claims in suit.

Step 3 of Claim 9 requires the emitting [of] said laser energy into the blood vessel through said laser emitting section of said emitting means, thereby decreasing the diameter of the blood vessel.

Diomed argues that this should be construed to mean "emitting sufficient laser energy at the bare tip of the fiber optic line to cause vessel wall tissue damage (e.g. fibrosis) to lead to a decrease in the diameter of the blood vessel." Diomed's Claim Construction Memorandum, at 18. Diomed's argues that the definition of Step 3 is straightforward. The term "thereby" signals how much laser energy should be emitted and the amount that is required is the amount that will "decrease the diameter of the blood vessel." No further limitations are disclosed.

Defendants for their part counter that Step 3 requires: emitting the amplified monochromatic light or other electromagnetic radiation into the interior surface of the artery, capillary or vein through the uncoated tip of the fiber optic line while maintaining the tip-interior surface physical contact to decrease the diameter of the artery, capillary or vein.

AngioDynamics' Claim Construction Motion, Exhibit 2, at 2. Defendants complain that Diomed's construction would eliminate the limitation requiring that the laser tip deliver energy directly to the wall of the vein, so long as the procedure ultimately succeeded in decreasing the diameter of the blood vessel. Defendants argue persuasively that the method described in the 777 patent requires that the laser emit energy into the cylindric walls of the blood vessel and not merely into the vein's interior or the blood within it. This is true, not only because Diomed said so in differentiating its invention from Goldman's, but also because the steps of Claim 9 are sequential. In the previous Step 2, the tip of the fiber optic line is inserted into the blood vessel and then "placed . . . into intraluminal contact with the blood vessel at a treatment site." Step 3 then requires that laser energy be emitted. It must be emitted into the blood vessel wall because that is where the fiber optic tip is to be placed to decreased the diameter of the vein. Consequently, the court will construe Step 3 to require the maintaining of the tip-interior surface in physical contact with the vessel wall while laser energy is emitted to decrease the diameter of the blood vessel. 6

6 Defendants' attempts to import additional limitations, for example, that the laser energy be "amplified monochromatic light or other electromagnetic radiation," has no support in the patent language.
Finally, the parties seek construction of the term "emptying" as it is used in dependent Claim 10. The claim states in pertinent part: "the method of claim 9, further comprising emptying the blood vessel prior to emitting said laser energy." Defendants argue that this phrase must be construed to mean "making the interior space of the artery, capillary or vein empty." AngioDynamics' Claim Construction Motion, Exhibit 2, at 2. Diomed maintains that the act of emptying is a process that embodies "removing some or all of the blood from the blood vessel," and does not require, as defendants claim, the application of the laser to an "empty" blood vessel. Diomed's Claim Construction Memorandum, at 19. I find the following observation in Kumar v. Ovonic Battery Co., Inc., 351 F.3d 1364, 1369 (Fed. Cir. 2003), to be instructive.

Precedent teaches that qualifications such as "completely" or "normally" are to be given significance in interpreting the specification. See E-Pass Techs., Inc. v. 3Com Corp., 343 F.3d 1364, 1369 (Fed. Cir. 2003) . . . There is [however] no indication in these passages or anywhere else in the specification that the term "completely amorphous" was used synonymously with the term "amorphous." The fact that the 686 patent refers to the "random atomic" structure or orientation of both amorphous and completely amorphous alloys does not indicate that the patent defines the terms interchangeably. The terms "random atomic structure" or "random atomic orientation" can themselves mean completely random or partially random.

In the same vein, the court will construe the term "emptying" in claim 10 to mean "the process of emptying most, but not necessarily all of the blood from the blood vessel," since the term "emptying" is not modified by the term "completely."

(1) Limitation (iii):

"Enabling Flexing" of the Shaft

(a) Claims Construction

(i) Patent Language and Specification

Limitation (iii) of claim 1 states that the 023 patent improvement consists of the stem shaft portion located between the affixation surface and the distal tip "having a diameter smaller than the corresponding diameter of the distal tip for enabling flexing in the shaft portion." Patent at 7:3-7.

Although the term "enabling flexing" is not defined in the patent specification, understanding the problems the patent sought to address and a reading of the patent specification enables the Court to interpret the meaning of the term.

In describing the problems which led to the invention, the patent states in its "Background of the Invention" that certain components of the forces exerted upon the prosthesis during use are transferred to distal portions of the stem, rather than being accommodated by the proximal portion of the prosthesis. This results in concentration of stresses at non-proximal portions of the femur and a corresponding reduction in stresses at the proximal portion of the femur, a condition described above as stress shielding. Moreover, forces on the ball of the prosthesis will tend to swing the prosthesis about the proximal end of the stem, "thereby exerting bending stresses on the stem and establishing forces tending to move the distal end of the stem" in a transverse direction relative to the femur, a condition described above as toggling, and axially relative to the femur. Patent at 1:31-36.

The patent specification explains that the invention's distal tip is essentially locked onto the distal end of the stem by a system of complementary tapers, so that movement by the distal end of the stem will result in a corresponding movement by the distal tip. By using a distal tip that is the same diameter as the reamed passage inside the femur, the distal tip engages or presses against the harder portion of cortical wall inside the femur. By so pressing against the wall, the tip prevents transverse movements of the stem within the reamed passage, i.e., prevents toggling, while at the same time allowing the transverse force at the distal end to be transmitted to the femur. Significantly, by creating a cylindrically shaped distal tip with a fixation-resistant surface that prevents the tip from affixing to the femur, the distal tip prevents stress shielding by (1) allowing the bending movements of the stem to displace the distal tip, and thus the distal end of the stem, axially upwards, (2) allowing the bending forces to displace the distal tip axially downward in certain cases, and (3) allowing the tip to rotate.
about its central axis in response to torsional forces. Patent at 4:4-44.

Moreover, in order to reduce the stress in the area of contact of the distal tip's surface and the cortical bone of the femur, the external surface of the distal tip must be of sufficient length to maintain a relatively low stress in that area. However, the length of the surface of the distal tip must also be short enough "to preserve flexibility in the shaft of the stem." As described in the specification:

Flexibility in the shaft enables the stem to respond in the manner indicated [bending, and moving axially upward] so that the combination of the prosthesis and the femur can manage the forces to be applied to the prosthesis. It is desirable that the shaft have sufficient flexibility to preclude excessive stiffening of the femur by the prosthesis along the implant site. In the preferred configuration, the diameter of the shaft of the stem above the distal tip is made smaller than the diameter of the external peripheral surface of the distal tip itself so as to render the shaft flexible, while still providing a contact area between the distal tip and the wall of the femur great enough to maintain relatively low contact stresses.

Patent at 5:44-57 (emphasis supplied).

Thus, in the Court's view the specification explains that shaft flexing is the ability of the shaft to bend in response to forces transmitted to the stem from loads applied to the femur, resulting in a corresponding axial movement of the distal end of the stem relative to the femur. Significantly, the specification also explains that the patent "enables flexing" by requiring the diameter of the stem shaft above the distal tip to be smaller than the diameter of the distal tip itself. By enabling such flexing, the proximal portion of the femur is kept rejuvenated and alive.

The patent's prosecution history (Plaintiff's Exh. 568; Defendant's Exh. AKR) corroborates this interpretation of the term "enabling flexing" found in the third limitation of claim 1. The language of the third limitation was found in claim 14 of initial disclosure of the patent filed with the Patent Office on January 19, 1988. The initial patent disclosure described the bending of the shaft and corresponding axial movement of the distal tip. (Plaintiff's Exh. 568 at 8-10, 24).

After reviewing the disclosure, the Patent Examiner rejected claims 1 and 14, along with other claims, in a letter dated July 14, 1988. The grounds for the rejection of the relevant claims were that claim 1 was anticipated by the Lord patent, and claims 1 and 14 were unpatentable over the Witzel and Freeman patents. (Plaintiff's Exh. 568 at 33, 35).

The Patent Examiner did not discuss the Lord patent. In discussing the Witzel patent, the Patent Examiner concluded that the Witzel device performed the same function as the 023 patent, because the stem of the Witzel patent moved axially within a distal tip:

Wherein Witzel's tip (25 resin) moves axially within the tip in response to axial and bending loads applicant's device, as claimed, has a tip (metal) fixed to the stem and the stem moves axially in the medullary canal in response to axial and bending loads. It is noted that both devices perform the same function: they both transfer and distribute stresses at the tip to the calcar bone . . . by permitting the stem of the prosthesis to move axially with respect to the bone thereby transferring and distributing bending stresses from the offset loading on the hip socket ball to the calcar bone through the tip.

(Plaintiff's Exh. 568 at 35).

With regard to the Freeman patent, the Examiner concluded that patent also performs the same function as the 023 patent:

Freeman discloses a typical stem-type femoral prosthesis made of metal with a substantially circular stem. End tip fits onto the tapered end of the stem with a matching taper surface. . . . It is also clear . . . that [the] stem is narrower (at least in portions) than the tip. . . . It is presumed that the taper surfaces of the tip and stem lock the two together. . . . It is also noted that Freeman also, as Witzel, uses the tip for stress distribution of the forces at the distal end of the stem due to the loading of the ball.

(Plaintiff's Exh. 568 at 37).
In response to the Patent Examiner's rejection, the 023 applicant responded by, among other things, amending claim 1 in the initial patent disclosure to include the language of limitation (iii) of the present claim 1. The applicant also distinguished the 023 patent from the Lord, Witzel and Freeman patents, based on stem shaft flexibility.

In distinguishing the 023 patent from the Lord patent, the applicant indicated that the Lord device failed to enable flexibility in the stem shaft, because the diameter of the Lord stem was greater than or equal to the diameter of the distal tip:

[\textit{W}hatever the function of the Lord distal tip, the distal tip disclosed in Lord has a diameter which is the same as, or less than, the diameter of the remainder of the femoral stem, and no part of the stem has a diameter less than any diameter of the distal tip. Accordingly, the reference does not contemplate flexing of the stem to flex in response to loads placed on the implant during service. The subject matter of the present claims includes structures which enable the femoral stem to flex in response to loads placed on the implant during service, and provides an uncoupled distal tip which is displaced axially within the medullary canal, relative to the bone of the femur, as the femoral stem is flexed, to accommodate the flexing without deleterious effects. Thus, all of the present claims set forth that the femoral stem includes a shaft portion with a diameter smaller than the corresponding diameter of the distal tip for enabling the aforesaid flexing of the shaft portion and axial displacement of the distal tip.]

(Plaintiff's Exh. 568 at 49-50) (emphasis supplied).

Similarly, in distinguishing the Witzel patent the applicant indicated that the distal sleeve in the Witzel device was fixed to the canal, and thereby did not provide any axial displacement of the sleeve. This results in relatively higher stresses at the distal end of the Witzel device:

In Witzel, a small sleeve of synthetic resin material is first secured in the medullary canal, and then the shaft of the femoral stem is inserted into the sleeve. The shaft can move relative to the sleeve, but there is no displacement of the sleeve relative to the bone of the femur during service. In the construction of the present claims, the distal tip is affixed to the distal end of the stem . . . and flexing of the shaft . . . during service is accommodated by displacement of the distal tip relative to the surrounding bone of the femur. The difference in structure yields several advantages. Among those advantages is the distribution of stresses during service. . . . Thus, in the Witzel construction, the articulating surfaces between the stem and the sleeve are of limited area, resulting in higher stresses[.]

(Plaintiff's Exh. 568 at 50-51).

With regard to the Freeman patent, the applicant explained that the Freeman device was not similar to the 023 patent, because it used a distal tip affixed to the bone that acted as a "stop" to centralize the stem shaft, and which was not intended to move during use of the stem. (Plaintiff's Exh. 568 at 52).

These claims were ultimately accepted by the Patent Office and the 023 patent was issued.

Thus a review of the patent's prosecution history corroborates that the term "enabling flexing" is construed as allowing the stem shaft of the prosthesis to flex and move axially upwards, by the use of a distal tip secured to the distal end of the stem which (i) is of a larger diameter than the stem shaft, and (ii) is not affixed to the bone.

(iii). Evidence from Extrinsic Sources.

The scientific principles of shaft flexing were also explained by DR. ALBERT H. BURSTEIN, who is a biomechanical engineer and expert in the field of hip implant devices. Dr. Burstein has "fabricated over 3,000 total joint implants" of which 25 percent were hip implants. Dr. Burstein is a person considered skilled in the art of the subject matter of the 023 patent during the relevant time period involved in this law suit.

During direct examination concerning the 023 patent teachings as compared to the APR II, he explained that the flexing movement of the shaft -- which is only on the order of a thousandth of an inch, i.e., less than a hair's breadth -- follows well established bio-mechanical principles:

A Now the way you prevent bending loads from being transmitted distally is to make the stem flexible. Then if it
deforms a little bit it doesn't transmit much bending load. The stiffer the stem, the more bending load it can transmit when the bone deforms.

So the patent teaches that the way you prevent the transmission of bending loads is to make a portion of the stem of diameter smaller than the sleeve so that it is flexible, so that you have enabled flexing of that portion of the stem that's above the sleeve.

Now when you load it, this portion flexes more freely than if it would have if it were a constant big diameter and transmit proportionately less bending load down here on the bone. It transmits more bending load up on the proximal area, it transmits more proximally. That's a well-known principle in biomechanics and taught by the invention and it shows you how to practice that invention by reducing this diameter.

Q What does the patent teach with respect to the surface characteristics of the sleeve or the tip?

A The patent teaches in order for this to work it must be free to move up and down in the bone in accordance with how much the prosthesis normally wants to move. That is, under load this prosthesis will move on the order of a thousandth of an inch or two, and it must be free to do so, and in order to do so, you cannot allow the distal end sleeve or tip to become fixed to the bone. If it becomes fixed to the bone it transects the bone. So by having an affixation resisting surface, that will not allow the bone to grow into or onto the surface, it becomes free to move up and down.

Q Dr. Burstein, would you look at Column 5, lines 34-44, and tell the Court in your own words what that means or what that teaching is?

A What the patent is . . . teaching . . . is it is telling the practitioner of the art [of] how long the sleeve can be made and still function according to this patent. It is saying the sleeve or tip has to be made long enough, that is, it must have some minimum length, so that when it is in the body and you put the load on the prosthesis [the tip] pushes against the side of the bone. . . . The tip should not create a stress condition on the femur that the femur cannot accept. In plain language it shouldn't push to hard.

The way you control it is to make the tip long enough so it has enough conduct [sic contact] area on the surface so it shouldn't push too hard.

[The patent] also says there's another limit. The longer you make it, the less stem there is left over to produce the flexibility you want. So don't make it so long as to not leave enough stem left over so that you have flexibility, and it tells you essentially the longer you make it, the more reduced the flexibility will be in the leftover portion of the system.

(Tr. at 131-135) (emphasis supplied). Dr. Burstein's elucidation of flexibility is consistent with the Court's interpretation of the patent limitation.

Enabling movement between first and second positions relative to said primary display

The Court construes the phrase as “allowing a secondary display to move between a first and second position relative to said primary display.” As with “rotation of . . . to said primary display,” the Court previously construed all the terms except for “enabling movement.”

MASS and Dell agree that the terms’ plain and ordinary meanings apply. Both parties agree that the term “movement” should be construed as “to move.” MASS proposes “enabling” be construed as “permitting,” and Dell proposes it be construed as “allowing.” Both parties’ constructions are commonly known synonyms. Accordingly, the Court construes the phrase as “allowing a secondary display to move between a first and second position relative to said primary display.”
Both Tessera and Samsung's experts agree that "encapsulant" is a term of art in the electronic packaging field. Qu Dec. P 70; Prince Dec. P 21. Tessera's proposed meaning of "encapsulant" is "a material used to seal up or cover an element or circuit for mechanical and environmental protection." Samsung's proposed meaning is "a material that is used to surround and encase by being in physical contact with." Joint Claim Construction Statement at B2:3-4. However, the '326 patent teaches that the encapsulant may merely cover, as opposed to surround, a single side of the element. '326 patent at 30:2-5. Similarly, Samsung has not referred to any place in the patent claims or specifications where physical contact between the element and the encapsulant is required. Accordingly, the Court construes "encapsulant" to mean "a material used to seal up or cover and element or circuit for mechanical and environmental protection."

5. "Encapsulated By and Encapsulating"

The phrase "encapsulated by" is construed to mean, "Enclosed by," and "encapsulating" is construed to mean, "Enclosing."

Plaintiff again argues that the plain meaning of these words suffices to construe them for the jury. I agree.

The phrase "encapsulated by" appears in claim 1 of the '207 patent as follows: "positioning said core in a laminator apparatus, and subjecting said core to a heat and pressure cycle. . . applying first pressure to said core for a second period of time such that said at least one electronic element is encapsulated by said core." (internal numerical references omitted). See also claim 17 of the '099 patent; claim 20 of the '367 patent; claim 1 of the '155 patent. Claim 16 of the '207 patent recites the term in the second step of the heat and pressure cycle "applying a second pressure uniformly across said core for encapsulating said at least one electronic element within said controlled plastic flow."

Defendant proposes that the phrase means:

that the 'core' must fully enclose the 'electronic element' which has been placed 'directly' between the 'first and second plastic core sheets' so that even the sides of the 'electronic element' are surrounded by the 'first and second plastic core sheets.' That is, if the 'electronic element' is not placed directly between the 'first and second plastic core sheets' or has been already encapsulated by other material, the 'first and second plastic core sheets' cannot encapsulate the 'electronic element.'

(Def. Br. at 31.)

Defendant again uses far too many words to define a simple phenomenon. Webster's non-technical definition of "encapsulate" is "to enclose in or as if in a capsule." (Def. Br. at 31.) "Capsule" is defined as "a compact often sealed and detachable container or compartment." (Id.) Thus, according to Defendant, when an element is encapsulated by something, that something fully encloses the element, as though it were contained within a sealed compartment. Defendant notes that in the '207 specification, for example, the electronic element is "fully" sealed in by the plastic core sheets after lamination, and that nothing "intervenes between the core sheets and the electronic element." (Def. Br. at 32-33.) Leighton apparently amended "encapsulated in said core" to "encapsulated by said core" during the prosecution of the '207 patent, a revision the Defendant views as highly significant. (Def. Br. at 33, citing Office Action Response, p. 75 (emphasis added).) According to Defendant, "encapsulated in" would allow an intervening material, such as "air." By contrast, according to Defendant, "encapsulated by" precludes air and requires that the plastic core sheets completely surround and make contact with the electronic element. (Id.)

All this is interesting, but when parsed (as we did at the Markman hearing), it is apparent that Defendant is again trying to read the specifications out of the definition -- and to render the patent meaningless. The patent discloses a process in which the first step is to place an electronic element between two sheets of plastic, thus making what the Court called "a
sandwich." In this sandwich, the element touches both sheets of plastic and is not shielded from them. However, for the plastic to touch every square millimeter of the electronic element at the moment the sandwich is made (which is while the plastic is still a solid, before it has been heated and liquefied), the element would have to be completely planar. The electronic elements shown in the disclosed embodiments -- such as microchips, wire coil antennas, circuit boards, transponders -- are not completely planar. They are three dimensional objects, and they can have irregular surfaces. This means that, when the "sandwich" is made by placing the element between the two sheets of plastic, it is possible that not every square millimeter of the element will be touching the plastic. But these infinitesimal pockets of air do not take the "sandwich" out of the ambit of the claims in suit, because they do not "protect" the element from the plastic (so that when the plastic melts it will touch every square millimeter of the element) and so do not cross the great divide between this family of patents and the prior art '024 patent, which placed the element in a little container before melting the plastic sheets.

The parties dispute construction of the term "encapsulating" of Claim 1. Marley contends that the term should be construed to mean "to provide a coating about the wood fiber particles with the polymer resin and prevent or minimize the penetration of moisture into the fiber particle." Mikron contends that the limitation should be construed to mean "completely enclosing each wood flour particle with polymer resin".

"Encapsulate" is defined as "to surround, encase, or protect in or as if to capsulate". Webster's Third New International Dictionary 745 (3rd ed. 1986). The specification states that "the present process is understood to encapsulate or provide a coating about the wood fiber particles with the polymer resin and prevent or minimize the penetration of moisture into the fiber particle."

Defendant attempts to add the requirement that the wood fiber be "completely" enclosed. However, such a requirement is not suggested by the ordinary and accustomed meaning of the term or supported by the patent specification. Accordingly, the term encapsulate is construed to mean "to surround or encase".

1) "Neck Encircling"

In claim 1 of the parent '619 patent, Garth claimed "an elongated neck encircling band . . . having front, side and back portions." In his reissue application, Garth attempted to claim simply "an elongated neck encircling band." [PX 522 at 13]. Eventually, after several rejections and amendments, Garth and the examiner settled upon "an elongated neck encircling band . . . having front, side and opposite side portions." Garth testified at trial that this change in claim language was motivated by Garth's belief that the patent should cover a cervical collar which had no back portion such as the NecLoc collar. The NecLoc collar was a two-piece collar which was sometimes promoted as being useable without the back portion. [Tr. 289:19-292:3].

Garth's trial testimony on this issue is precisely the sort of extrinsic evidence which the Markman decision found was not to be considered in construing patent claims. The relevant arguments are those made by Garth during the prosecution of the reissue application, not those made at trial. While Garth stated numerous times in the prosecution history that he sought to remove the limitation requiring that the band have a back portion, he never sought to alter or remove the limitation which required the band to encircle the neck. The Court finds that the plain and ordinary meaning of "neck encircling" is that the band must surround the patient's neck so that it forms a circle around the patient's neck.

The front and back band sections of the 911 collar clearly encircle a patient's neck. CalMed also contends, however, that the front band section, acting in concert with a velcro strap, would also constitute a neck encircling band. The Court finds that the front band section alone does not "encircle" the neck within the meaning of the '219 patent, and for that reason a
hypothetical Tecnol collar formed solely of the front band section and a Velcro strap would not be "neck encircling" unless the Velcro strap could be considered part of the "band". This issue is discussed below as part of the Court's discussion of the "entirely" limitation.

9. "A release sleeve encircling said second cylindrical surface." The term "encircling" shall be given its ordinary dictionary meaning "to form a circle around or surround." 6

Footnotes

The parties also dispute whether "on its end" refers to the end of the balloon, which is Cordis' construction, or the end of the catheter, AGR's construction. According to AGR, this limitation indicates that the catheter has both a collapsed inflatable balloon and a collapsed sleeve encircling the balloon on the end of the catheter. That is, the claim requires that each of those two elements -- the collapsed balloon and the collapsed sleeve-- be "on its end," referring to the catheter; otherwise, there would be no information as to where the inflatable balloon is located on the catheter. Thus, AGR argues, that, when properly read, the phrase indicates that this element of the claim includes a catheter that has both a collapsed inflatable balloon and a collapsed sleeve located at the end of the catheter.

Figure 9 from the '1,653 Patent specification shows that the sleeve and the balloon are both located at the extreme or last part lengthwise of the catheter, and not at or near an extremity. This picture of one preferred embodiment is the only intrinsic evidence that supports the meaning of end as "the extreme or last part lengthwise." There is no language in the Patent itself or in the specification or history that limits explicitly or implicitly the meaning of end to "the extreme or last part lengthwise." Therefore, the Court will not construe the term to include such a limitation.

Based on the drawing in Figure 9, the disclosed sleeve encompasses or covers the balloon, but is not on the end of the balloon; that is, the sleeve in the disclosed embodiment is located over the balloon and not at either end of the balloon. Moreover, there is other evidence contained within the specification that renders the "on its end" limitation applicable to the end of the catheter rather than the end of the balloon. In the description of the embodiment depicted in Figure 9, Dr. Rockey wrote "catheter 54 having a dilator annular balloon 50 at its free end [the end of the catheter that is not being "manipulated" by the user of the invention as indicated in the next claim limitation: "manipulating the catheter axially along the vessel to
cause the balloon and sleeve to enter the area to be treated"") and the sleeve 51 surrounding the balloon is threaded through
the vessel 52 from an incision made in the vessel…” (emphasis added). Here, too, he describes a catheter having a balloon
and a sleeve on the "free end" of the catheter.

The construction of the term "end" that is most consistent with the surrounding text and the specification is the part at,
toward, or near an extremity lengthwise. Accordingly, the phrase "encircling the balloon on its end" requires that the sleeve
encircle the balloon on a part at, toward or near an extremity of the catheter.

GO BACK

1382

i. "enclosed"

The term "enclosed" appears in the preamble of each of the asserted independent claims. CFMT argues that the term refers
to an apparatus that substantially prevents unwanted contaminants or substances from entering the apparatus from the
outside environment. YieldUP, on the other hand, argues that "enclosed" means not open to what surrounds it. YieldUP
bases its construction on the dictionary definition of "enclosed."

In the specification of the '532 patent, the inventors explain the importance of using an enclosed vessel to practice the
invention.

In addition to the wafer vessel and the wafer carriers disclosed in the above-identified copending application, enclosed
wafer vessels of other designs may be used. However, it is important for the processes of the present invention that the
wafer vessel be closed. That is, the wafer vessel should not be open to the ambient atmosphere except when it is opened to
load or unload wafers.

The evidence does not suggest, as CFMT argues, that "enclosed" refers to a process that "substantially" prevents
contaminants from entering from the atmosphere. Therefore, the court finds, as advocated by YieldUP, that the term
"enclosed" means not open to the ambient atmosphere.

GO BACK

1383

D. "an enclosed lamp envelope"

TLI asserts that the term "an enclosed lamp envelope" simply means an enclosure and should be given its ordinary and
customary meaning. See TLI's Br. at 13. Sylvania, however, contends that the term envelope should be construed to require
that the envelope be either elliptical or spherical in shape. In support of this construction, Sylvania argues that the only
envelope shapes disclosed in the '017 patent are spherical or elliptical, and therefore the patent should be limited to those
restrictions. See Sylvania's Br. at 11.

The description of the preferred embodiment or the invention provides that the "lamp envelope … preferably has a
substantially elliptical shape." '017 patent, col. 18, lines 57-59. (Emphasis added). The description of the preferred
embodiment further states that "[a]s will be apparent to those skilled in the art, regardless of whether the elliptical or
spherical shape is used, the geometry of [the] lamp envelope … provides the maximum amount of reflectance back to [the]
light-emitting element … and thus provides more heat to [the] element … to, in turn, generate more light." '017 patent col.
19 lines 19-25. (Emphasis added). Notably, the specification simply indicates a preference for an elliptical or spherical
shaped lamp envelope, but does not specifically limit the envelope to those two shapes. The specification describes only one
or two preferred or potential embodiments of the patented invention. See Northern Telecom Ltd. v. Samsung Electronics
Co., Ltd., 215 F.3d 1281, 1293 (Fed. Cir. 2000)(indicating that the Federal Circuit Court of Appeals "consistently declines to
construe claim terms according to the preferred embodiment.") Unless there is limiting language in the specification
suggesting that the patented invention would not work absent a sphere or ellipses, or that the sphere or ellipses is an
improvement over the prior art that warranted issuance of the patent, then any "enclosure," with its broadest ordinary
meaning supported by the specification, is acceptable. Because the specification and prosecution history of the '017 patent

- 1820 -
do not exclude or limit the shape of the lamp envelope in any way, I find that the term "an enclosed lamp envelope" means "an enclosure."

D. "Enclosed Spaces"

The phrase "enclosed spaces" appears in claims: 13, 16, and 18 of the '120 Patent; and 6 and 7 of the '982 Patent. Medinol contends that the phrase "enclosed spaces" is used consistent with its ordinary meaning, referring to "the area defined by the structural elements of a cell." Alternatively, Guidant construes this term as simply identifying "[a] cell."

Guidant's proposed definition is improper for at least two reasons. First, "enclosed space" is distinguished from "cell" in the patent specification. For instance, in describing Figure 4 of the '303 Patent, the patentee includes the following language: "When the stent expands, both meander patterns 11 and 12 expand (i.e. all loops 14-20 open up). As can be seen, the expanded stent has two types of enclosed spaces, a large space 42 between meander patterns 12o and 12e and a small space 44 between meander patterns 12e and 12o." As depicted in Figure 4, "enclosed spaces" refers to the area contained within first and second meander patterns. By contrast, the word "cell" is used to refer to the structural elements outlining the enclosed spaces. For example, in Figure 8, the invention is described as "an expandable stent defining a longitudinal aperture 80 having a longitudinal axis or extension 79 and a circumferential axis or extension 105, including a plurality of flexible connected cells 50 . . . . Each cell 50 . . . ."

Second, the language cited by Guidant as supportive of its definition does not amount to an unambiguous disavowal of the claim scope, justifying a departure from Medinol's plain meaning definition for "enclosed spaces." That is, the specification states:

FIG. 8 illustrates the pattern of FIG. 7 in an expanded format. Since there are no even and odd horizontal meander patterns, in the expanded format of FIG. 8, there are no large and small spaces. Instead, all spaces are of the same size, i.e., the stent is comprised of a plurality of spaces or cells 50 defining a uniform cellular structure.

But this passage does not clearly indicate that "enclosed spaces" and "cells" are interchangeable terms used to identify the same structure. One skilled in the art could have read the cited passage as suggesting that the uniform cellular structure is described as comprising either enclosed spaces or cells. Because the cited language is not a clear disclaimer of the
A. "Enclosing said bed surface"

Claims 1 and 10 of the '855 Patent claim an apparatus comprising a frame, bed surface, and "at least one side rail movably connected to said frame along said periphery of said bed surface for enclosing said bed surface." '855 Patent, Col. 7, Claim 1; Col. 8, Claim 10. The parties dispute the meaning of the claim term "enclosing said bed surface." Pedicraft argues that this term requires that the side rails "together extend completely around the periphery of the bed so as to leave no substantial gaps through which the patient can pass when all of the side rails are in the uppermost position." Dkt. 65, pg. 4. Stryker, in contrast, claims this phrase should be interpreted to mean "surrounding the bed surface sufficiently to prevent the patient from falling off the bed surface," in accordance with Webster's Third International Dictionary, pg. 746 (1986). Dkt. 66, pg. 32.

According to Pedicraft, its expert, David Lance Lockwood, testified that one skilled in the art and design of hospital beds would understand the phrase "enclosing said bed surface," when involving movable side rails such as the present invention, to mean not only to prevent the patient from falling out of bed but also to avoid entrapment between the rails. Dkt. 62, pp. 22-24. Pedicraft further contends that this interpretation not only comports with the ordinary meaning of the phrase, but is in accordance with the intrinsic evidence as well. Pedicraft highlights the Detailed Description section of the '855 Patent and illustrated embodiment as showing a "continuous" single side rail, and it points out that in response to inquiries from the Patent Examiner, it distinguished prior art as not containing side rails that sufficiently "enclose" the bed surface. Dkt. 65, pp. 5-6. Such intrinsic and extrinsic evidence therefore purportedly demonstrates that one skilled in the art would understand "enclosing" to mean not only the prevention of falling out of bed, but also side rails that "extend completely around the periphery of the bed so as to leave no substantial gaps through which the patient can pass when all of the side rails are in the uppermost position." Id.

Stryker contends that its construction of "enclosing said bed surface," requiring only that the patient be prevented from falling off the bed surface, comports with the ordinary dictionary meaning of "enclose" as "to close in" or "surround." Dkt. 66, pp. 32-33. Moreover, it claims that during the prosecution of the patent, Pedicraft actually distinguished prior art as not including side rails that sufficiently enclose the bed surface, thus "placing the patient at risk of falling off of the bed surface." Id. Stryker points out that Pedicraft's proposed construction of this phrase differs from Stryker's simply through its inclusion of the concept of preventing "entrapment" of the patient, yet nowhere in the patent itself or in the prosecution history is the concept of "entrapment" mentioned by the patentee. As such, Stryker argues that the public record conclusively supports its construction of the phrase "enclosing said bed surface," regardless of any extrinsic and unsupported testimony from the Plaintiff's expert, Mr. Lockwood.

The Court agrees that there is no intrinsic support for including the concept of "entrapment" of the patient in the ordinary meaning of the phrase "enclosing said bed surface." See Vitronics, 90 F.3d at 1585; Southwall, 54 F.3d at 1578. The Court will not rely on the extrinsic and strained testimony of Mr. Lockwood to contradict the ordinary definition of "enclosure," which only requires that the side rails "close in" or "surround" the entire peripheral bed surface. Accordingly, the Court finds that one of ordinary skill in the art of hospital bed designs and functions would understand the claim term "enclosing said bed surface" to mean that the side rails surround the surface sufficiently to prevent the patient from falling off the bed.
4. "Enclosure"

a. Parties' Positions

The parties propose the following constructions for "enclosure" which is present in claim 8 of the '631 Patent. The parties' main dispute is whether the construction should include the terms "housing," "fan/blower," and "mounted on an inner surface."

Plaintiff

A structure which generally encloses at least the fin structures and the gap between the fin structures

Defendants

A housing which encloses the heat sink assembly and a fan or blower, and to which the heat sink assembly is mounted on an inner surface

b. Court's Construction

Plaintiff asserts claim 8 of the '631 Patent provides that the fin structures must be in the enclosure, yet not totally enclosed, as there must be openings through which air flows in and out of the enclosure; the gap between fin structures must be adjacent to such an inlet. See Claim 8. Beyond that, Plaintiff asserts there is no requirement to employ any other particular shape or design of the enclosure, including any shape or design described in the preferred embodiments. ('631 Patent at 7:6-11).

Defendants' proposed construction is based on the description of the enclosure as implemented in the preferred embodiment. The preferred embodiment cannot, alone, serve to impart a restriction of claim scope. Phillips, 415 F.3d at 1323 ("[A]lthough the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments."). The Court will not import a limitation from the preferred embodiment into the claims. Simply put, there is no basis in the claim language for requiring the enclosure to be a "housing" nor is there any requirement that the heat sink assembly be "mounted" to the enclosure. Nor is there any requirement that the air source (e.g., a fan or blower) must be positioned within the enclosure. All of these are possible embodiments of the "enclosure," but no such embodiment is essential.

In light of the foregoing, the Court construes "enclosure" to mean "a structure which generally encloses at least the fin structures and the gap between said fin structures."

1387

F. "so that the heel portion of said user's foot travels in a path which does not encompass said pivot axis"

Precor states that this claim should be construed exactly as it is written, because the words are clear to an individual of ordinary skill in the art. Fitness Quest argues that these terms would be ambiguous to a lay jury, contrary to the guidance in Phillips, 415 F.3d at 1314. Fitness Quest proposes instead a broader interpretation that construes the claim as including any potential action where the user's foot crosses the vertical plane created by the pivot axis: "the user's heel never passes rearward beyond a vertical plane contain the pivot axis." Fitness Quest's construction reflects the purpose of the claim, which was proposed by the claim examiner as a way of distinguishing another patent.

However, Fitness Quest's proposed construction is problematic because it means something different than the meaning of the words in the claim. In fact, it is more broad. Fitness Quest's construction of the claim would include a variation of this
exercise device which allowed a user's heel to cross a vertical plane established by the pivot axis, but not encircle the pivot axis. Although it is not clear that such a motion is possible using the claimed device, it is preferable to use Precor's more limited instruction. Because "encompass" may be a non-obvious term to a lay jury, however, the Court will add the term "encircle" to clarify: "so that the heel portion of said user's foot travels in a path which does not encompass or encircle said pivot axis."

C. "end," "high front end," and "low back end"

Defendants contend that "end" should be construed to mean "either extremity of an object having length," that "high front end" should be construed to mean "the end of the wakeboard traction pad that has a height that is greater than the other end," and that "low back end" should be construed to mean "the end of the wakeboard traction pad that has a height that is less than the height of the high front end and is opposite the high front end." Messer suggests that "end" need not be construed independently of the claim terms in which it invariably appears, "high front end" and "low back end," and contends that "high front end" should be construed to mean "one end of the wakeboard traction pad, having a height," and that "low back end" should be construed to mean "located opposite from the front end, an actual or construed end located near the mid-point of the wakeboard, having a height that is equal to or less than the front end."

Both sets of proposed constructions suffer from the flaw that the two kinds of "end" are each defined as constituting an extremity of a "wakeboard traction pad," because Claim 21 describes the "wakeboard traction surface" as "defined between a high front end and a low back end," '051 Patent, 12:36-37, the terms must be construed as equally applicable to wakeboard traction pads and surfaces.

Moreover, Messer's proposed construction violates the ordinary and customary meaning of the words used in the claim terms, without any basis for doing so. Messer's construction would permit the high front end and low back end to be of equal height, whereas the patent claims clearly specify that the low back end shall have a height lower than the high front end.

For the foregoing reasons, I reject the construction proposed by Messer, and conclude instead that the term "end" should be construed to mean "one of the two opposite extremities either of an object having length or of a sloped surface," that the term "high front end" should be construed to mean "an end that has a height greater than the height of its opposite end," and that the term "low back end" should be construed to mean "an end that has a height less than the height of its opposite end."

"End" or "Strap End"

The parties also dispute the meaning of the term "end", as in "strap end." Defendant contends that "the end of a strap portion, member or element is that portion of the strap which terminates at the point of attachment on the golf bag." (Defendant's Opening Brief at 19) Plaintiff, on the other hand, maintains that "'ends' need not be 'ends' of separate straps but can be 'ends' of portions or members of a single strap. (Plaintiff's Responding Brief at 8). For example, plaintiff notes that claims 1 and 8 refer to at least 4 "ends," even though these are actually just points on a single strap. Plaintiff further states that strap "ends" need not "terminate" at an attachment location. For example, plaintiff notes that, as set forth in the patent, the "ends" of two separate sections of strap may actually form a unitary strip that passes through a "D" ring or other securing means.

The Court finds that the term "end" is used different ways at different times within the patent. For example, in claims 1 and 8, where the entire strap apparatus is comprised of a single strap divided into two main sections, the "ends" are the four portions of strap on either side of the two strap pads. Thus, while it is true, as defendant contends, that an "end" is the point at which a designated portion of strap may be said to "terminate", this does not necessarily mean that the strap physically ends there. Rather, the term "end" also refers to the point where one designated section of strap ends and another begins.
Moreover, a strap end need not be "affixed directly" to the golf bag itself as defendant suggests (Def. Brief at 19), but may, instead, be the point where the particular section of strap passes through or is attached to the securing means, such as a strap or ring, which is in turn attached directly to the golf bag.

"A First End, A Second End"

The parties' proposed constructions are set forth in Table 4.

Table 4 - Parties' Claim Constructions for Claim 92 of the '092 Patent

<table>
<thead>
<tr>
<th>Term, Patent, and Ind. Claim</th>
<th>Pl.'s Interp.</th>
<th>Def.'s Interp.</th>
</tr>
</thead>
<tbody>
<tr>
<td>a first end, a second end</td>
<td>&quot;the meaning of end includes the part of an area that lies at the boundary,&quot; which allows a round table to have &quot;ends.&quot; (Lifetime's Rep. in Supp. (30) at 14.)</td>
<td>Correll's interpretation: end means &quot;the extreme or last part lengthwise,&quot; which prevents a round table from having &quot;ends.&quot; (Correll's Mem. in Opp. (22) at 24.)</td>
</tr>
</tbody>
</table>

The ordinary meaning of "end" is "the last part or extremity, lengthwise, of anything that is longer than it is wide or broad," "a point, line, or limitation that indicates the full extent, degree, etc., of something; limit; bounds" and "a part or place at or adjacent to an extremity." Webster's at 641. The first definition--"the last part or extremity, lengthwise, of anything that is longer than it is wide or broad"--supports Correll's argument because round tables are not longer than they are wide. The remaining definitions, however, require only that an end be a limit, a boundary, or an extremity.

Correll argues that its round table cannot have ends. Lifetime responds that the word "end" merely means the part of an object near its boundary, and therefore a round table has ends.

Accordingly, the table top 12 and the frame 40 may be configured in a variety of shapes and configurations, including, but not limited to, a circle, polygon, square, rectangle, triangle, or any other suitable geometrical configuration.

(Sears Decl., Ex. A, '092 Patent at col. 7, ins. 13-17 (emphasis added).)

Correll's contention that the limited definition of end applies here is not persuasive in view of this instruction from the Federal Circuit: "If more than one dictionary definition is consistent with the use of the words in the intrinsic record, the claim terms may be construed to encompass all such consistent meanings." Texas Digital, 308 F.3d at 1203. Here, the broader construction--that end means the limit or boundary of an object--is proper because it encompasses, and is consistent with, the narrower construction advanced by Correll.

Based on the above, a first end and a second end mean the limit or boundary of an object, or in other words, at the edge of the round table.
By itself, the term "end" is undeniably ambiguous. Merriam Webster Online offers more than a dozen definitions for the noun form of the word. Plaintiff's definition is "concluding part." Initially, defendant's proposed definition was narrower, "the outside or extreme edge or physical limit; a boundary." In its reply brief and at the claim construction hearing, defendant wavered slightly, arguing that an "end" must at least include the extreme edge or tip, or what plaintiff refers to as the "very end."

There does not appear to be any dispute that the concluding part of an object includes the extreme edge or tip. However, to the extent that defendant adheres to its initial proposed construction, I agree with plaintiff that it is too narrow. To be sure, in some of the embodiments, the patentee appears to equate the "end" of a part with its extreme edge. See Pat. '194, col. 11, lines 57-59 (equating "first end" with "first opening" in Fig. 17). However, the claim language itself demonstrates that an "end" in the '194 patent may include more than just the extreme edge. For example, claims 1(c) and 2(c) disclose "a cylindrical body member having a first end and a second end, the first end of said cylindrical body member including a cylindrical sleeve." Thus, one "end" of the cylindrical body member includes the cylindrical sleeve, which the parties agree encompasses more than just the extreme edge of the cylindrical body member.

In sum, it appears that the patentee did not use the term "end" to mean the exact same length with respect to each object. Rather, depending on the context, an "end" could be as small as the tip of an object or as large as half of the object. The only definition of "end" that would be consistent with these different lengths is one similar to plaintiff's definition, which includes the extreme edge but is not limited to that portion. Accordingly, I construe the term "end" to mean "the concluding part."

Free Motion proposes that the meaning of the word end is the end region, not limited to the terminus. (Pl. Opposition II. at 15-16.) Nautilus proposes that the end is the "portion of an object having length that includes the terminus and does not extend beyond the terminus of the object." (Nautilus Brief at 11.) The Court is persuaded that the ordinary and accustomed use of the term end is the portion having length, not limited to the terminus.

The parties offer the following constructions for "end cap," which is present in claims 43 and 47. Dkt. No. 114.

RTI
Back end of the plunger

BD
A separate piece that caps the open end of the plunger

RTI contends that BD's proposed construction improperly limits this term. Dkt. No. 111 at 30-31. RTI believes that nothing in the specification requires the end cap be a separate piece or that it cap the open end of the plunger. Id. Instead, RTI contends that the "force fit plug" is the separate piece that caps the end of the plunger, while the end cap is a part of the plunger itself. Id. (citing '224, 7:22-24 & Figs. 1-7). In addition, one claim specifically recites that "the end cap has an
opening and a closure is installed in the opening." Id. (citing '224, 24:16-17 (claim 54)).

In response, BD contends that RTI's proposed construction does not make sense in light of the claim language. Dkt. No. 112 at 32. Specifically, the claims require a "back end with an end cap," and BD believes that RTI's construction would make this requirement nonsensical--a back end with a back end. Id. (citing '224, 22:65-23:9 (claim 43)).

b. Court's Construction

The Patent figures depict the end cap as a part of the plunger rather than a separate piece. See '224, Figs. 1-7. The Federal Circuit has held that an interpretation of a claim, which would not include a preferred embodiment disclosed in the specification, is "rarely, if ever, correct." Vitronics, 90 F.3d at 1583. This Court finds no reason to require the end cap to be a separate piece, as such a construction would not include the embodiments depicted in Figures 1-7. This Court, however, also finds no reason to limit the term to these embodiments, in which the end cap is a part of the plunger. The Patent could conceivably cover an alternative embodiment in which the end cap was a separate piece.

In addition, the Patent states that it is the "force fit plug" rather than the end cap that closes the retraction cavity--the open end--at the back of the plunger. '224, 7:33-36. The end cap itself has a "central opening for permanently receiving [the] force fit plug." Id. As such, the end cap, in contradiction with the plain meaning of the word "cap," does not necessarily close the open end of the plunger. Instead, it allows the force fit plug to accomplish that function once it is permanently installed within the end cap's opening. This Court, however, also finds no reason to limit the term to this one preferred embodiment--it is possible that the Patent could cover a syringe in which the end cap and force fit plug were a single piece, rather than two separate parts.

Finally, because it is located at the back of the plunger, the Patent describes the end cap as a portion of the plunger with which the thumb contacts during depression. Id. ("Plunger has end cap for depression of the plunger by the thumb.").

Accordingly, the Court finds that the term "end cap" means "a component at the back of the plunger, which may be contacted by the thumb during depression.

1394

E. "End Faces"

Ramsey contends that "end faces" should be defined as "exterior surfaces defining the ends of a structure." Ramsey notes that the claim uses the words "face" and "surface" interchangeably: "[a cylinder,] and having opposed end faces, one of which is disposed in a plane normal to the axis of the drum, said one end surface providing the brake surface. . . ." '255 Patent, 5:15-18. Because the end face provides a surface for braking, Ramsey contends that it cannot be located internal to the structure because it could not engage the brake pads there.

Warn contends that "end face" should be construed as an "outward facing planar surface." Warn observes that in the claim, the function of the end face is to be "the brake surface whereby axial movement of the braking member produces surface-to-surface braking engagement." '255 Patent, 4:18-20. Warn notes that the '255 patent uses the word "end" throughout to mean the end portion as opposed to the middle, and not to mean the outermost edge of the structure. As an example, Warn points to Figure 2, described in the specification as:

the winch includes a cable drum 10 that is supported in the winch housing at its ends by bushings 13. . . .

'255 Patent, 2:45-48. The bushings are at the end portions of the drum but are inset slightly from the very endpoint of the drum structure.

From the specification:

The cylindrical end faces of the stator define the braking surfaces.
Cylindrical faces 80, 82 at each end provide braking surfaces.

The cam actuator 56 and cam follower 48 have abutting end faces 68, 70 respectively that are cam shaped as illustrated in Fig. 3.

The specification also contemplates two end faces on the stator, and not more. '255 Patent, 2:17-18 ("to affect equal braking action of both pads against the two end surfaces of the stator").

I reviewed Research Plastics, Inc., 421 F.3d at 1297 (construing "rear end" of a tube to mean "a reference point defined by the rear edge of the tube" and not an undefined area or region). It provides some support for Ramsey's construction, essentially that the word "end" must be given some meaning, with which I agree.

Claim 1 specifies a cylinder having opposed end faces. The plain meaning would be the two circular ends of a cylinder, which are opposed. The specification contemplates that one brake pad is fixed and the other brake pad is cammed into the braking surface of the stator which pushes the stator into the fixed brake pad "to affect equal braking action of both pads against the two end surfaces of the stator." '255 Patent, 2:8-19. Warren's proposed "outward facing planar surface" describes a more complicated mechanism because there could be more than two. The proposal also does not give meaning to "end."

I conclude that the term "end faces" is defined as "exterior surfaces defining the ends of a structure."

There is only one term of the '211 Patent claims that is expressly in dispute. The parties disagree as to the meaning of the term 'end' as used to describe elements of the length of hair that is connected to the invention's elastic loop. The language at issue in the first claim reads: "a connection securing the first end of the length of hair strands to a portion of the elastic loop." '211 Patent, col. 6, ll. 48-9. The term 'first end' in the above limitation refers back to an earlier limitation of claim 1 that describes the "hair piece comprising: a length of hair strands having a first end and a second end." '211 Patent, col. 6, ll. 40-1. Defendant claims that "the 'first end' and 'second end' of the 'length of hair strands' must be the same as the collective ends of the hair strands themselves." Defendant's Memorandum at 5. Plaintiff contends that "the 'first end' recited in claim 1 be properly construed as the proximal end of a collection or bundle of hair strands and not as limited to end extremities of linear or unidirectional strands of hair." Plaintiff's Memorandum, at 6 (emphasis in original).

Neither party claims that this disputed language has a particular meaning to persons skilled in the art of designing artificial hair pieces. We turn, then, to the contextual clues in the claim itself. A requirement of claim one is that the hair piece consists of "a length of hair strands having a first end and a second end." In this language, the entire length of hair itself has two ends. There is no indication that the ends referred to are the specific ends of the particular, individual hair strands comprising the length of hair. It appears instead that one end of the entire length of hair is secured by a connection to a portion of the elastic loop.

Defendant relies for support of its interpretation almost exclusively on language in the specification. Defendant points to the Summary of the Invention which states that "[t]he apparatus comprises a length of artificial hair...having a plurality of individual hair strands. First ends of the strands are connected to a pony tail securing member. ...The opposite or distal ends of the strands can be free or can include a second securing member." '211 Patent, Col. 3, ll. 38-43. Claire's contends that "[t]hus, it is the ends of the strands that are attached to the pony tail securing member, not the middle of the strands as in a loop of doubled over hair. " Defendant's Memorandum at 6. In Defendant's view, the specification emphasizes that the invention "consists of non-doubled over hair." It does so, according to Claire's, because it mentions the "opposite or distal ends of the strands." Since there is no separation between the ends of the strands on the Accused Products, Claire's maintains that these ends cannot be deemed "opposite." But this simply begs the question of, what "ends" the specification
is referring to. It appears to the Court that the plain meaning of these words within the context of the claims and specification taken together is that one end of the length of hair is opposite to the other. The first end is attached to the elastic loop, the other hangs opposite to it (that is, distally from the elastic loop). The language of the claim, and indeed, the invention, are no more complicated than this. As the Federal Circuit has stated: "a patentee may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning, as long as the special definition of the term is clearly stated in the patent specification or file history." Vitronics v. Conceptron, 90 F.3d at 1582 (emphasis added).

Indeed, as Plaintiff emphasizes, the specification refers in multiple locations to a 'length' of hair, in the singular, again providing no support for the interpretation that one 'end' of the 'length' indicates the ends of each of the individual strands of hair. There are 14 separate instances in the specification referring to the "length" of hair strands, and not to individualized ends of strands. See Plaintiff's Memorandum at 7. These references in the specification reinforce the language of claim 1 itself, which comprises "a length . . . having a first end and a second end." It is the entire length of hair itself that has two ends, and not the ends of the individual hair strands. I construe 'end' in claim one to mean either extremity of the entire length of hair. The claim refers to the end that is proximal to the elastic loop as the 'first end' and the extremity of the length of hair that is distal to the elastic loop is described as the 'second end'.

Defendant attempts to overcome this plain meaning of the claim and specification language by pointing to the single instance in which the plural 'ends' is used in the Summary of the Invention. While the Summary of the Invention is "a pertinent place to shed light upon what the patentee has claimed," Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1345 (Fed. Cir. 2001), a statement in the Summary of Invention is not on its own determinative of the meaning of the terms of the claims. Defendant discusses several Federal Circuit opinions in support of its contention that "Courts that have found a statement limiting the invention in the Summary of the Invention have uniformly held that the statement limits the scope of the claims." Defendant's Reply Memorandum, at 4. However, the holdings in all the cases upon which Defendant relies do not support Defendant's statement of the law. None of the cited cases depends, as Claire's does here, on a singular use of language appearing only in the Summary of the Invention to limit the scope of the claims. Instead, each case reads the Summary of the Invention within the context of the patent as a whole, including claim language, specification, and prosecution history. Moreover, in each case the language relied upon in the Summary of the Invention is nowhere near the ambiguous statement that Claire's relies upon here. See Genzyme Corp. v. Transkaryotic Therapies, Inc., 346 F.3d 1094 (Fed. Cir. 2003) ("Throughout the...specification, the applicant consistently uses the term 'integrated' to refer to a foreign gene inserted into a host cell chromosome"); C.R. Bard, Inc. v. United States Surgical Corp., 388 F.3d 858, 864 (Fed. Cir. 2004) ("the patent unequivocally defines the claimed plug as having pleats"); Microsoft Corp. v. Multi-Tech Systems, Inc., 357 F.3d 1340, 1348 (Fed. Cir. 2004) (where court examined the Abstract, Statement of the Invention, other parts of the specification, as well as the prosecution history in supporting defendant's construction of claim language, court stated that specification "repeatedly and consistently describes the...claim inventions as communicating directly over a telephone line"); Cytyc Corp. v. TriPath Imaging, Inc., 2005 U.S. Dist. LEXIS 29850, 2005 WL 3177877 (D. Mass. Nov. 28, 2005) (disputed term appears one hundred sixty-one times throughout the whole patent "either implicitly or explicitly" indicating the court's construction).

Because the language of claim 1 must be construed to require only that the length of hair strands be connected to the elastic loop with a second extremity distal to that loop, Defendant's Accused Products are covered by the literal scope of the '211 Patent. By the terms of the Agreement between Claire's and Pony Pal, Claire's is liable for breach of contract for failing to pay royalties for sale of products covered by the '211 Patent. Complaint, Ex. B PP 1(b), 7.

1396

G. "located end to end" and "aligned"

Claim 1(c) requires that "said first rod set being located end to end with said second rod set so that said first and second spaces are aligned." Claim 1(d) also uses the term "aligned" and requires "an interchamber orifice . . . aligned with said first and second spaces." Claim 14's preamble similarly requires "first and second rod sets each comprising a plurality of rod means and defining longitudinally extending first and second spaces respectively located end-to-end with each other . . . ." The parties agree that because the first and second spaces are defined by area of the first and second rod sets, respectively, the terms "located end to end" and "aligned," as used in claim 1, are related. The court will therefore address them concurrently.
Micromass's proposed construction of "located end to end" 1 is "characterized by having the end of one object placed against the end of another." This construction of "located end to end" is described by Micromass as consistent with the plain meaning of "end to end." Its proposed construction of "aligned" is similar. Micromass argues that "aligned" must mean that the end of the first rod set or space is placed at or near the end of the second rod set or space so that the two abut. According to Micromass, this construction of "aligned" is required by the prosecution history of amended claims 25 and 26. Given these constructions, it is Micromass's argument that claim 1(c) and 14 would not be infringed if another structure separated the rod sets or spaces because the additional structure would prevent the rod sets or spaces from being "end to end" or "aligned."

AB/Sciex contends that "located end to end" and "aligned" do not prohibit the use of other intervening structures. The proper construction of "located end to end," according to AB/Sciex, is defined in functional terms by the claim itself as "so that first and second spaces are aligned." This is consistent, AB/Sciex explains, with the claim's recitation of the path of ions "through said inlet orifice, through said first space, through said interchamber orifice and through said second space." 736 Patent, Claim 1(d). AB/Sciex goes on to define "aligned" as requiring only that ions travel on the specified path.

AB/Sciex argues that Micromass's plain meaning arguments have no support in the patent itself. It contends that nowhere does the patent specification require that the two spaces or rod sets be adjoining or near one another, only that they be near enough to accomplish the patent's function of permitting an ion stream to proceed from the first rod set and space to the second rod set and space. Furthermore, AB/Sciex notes that the patent claims themselves require a wall and interchamber orifice between the rod sets and spaces, thereby proving that they need not abut.

As Micromass asserts, "end to end" is defined as "characterized by having the end of one object placed against the end of another." Webster's Third New International Dictionary, Unabridged 750 (1986). AB/Sciex does not propose an alternative construction, but rather argues that "end to end" only means "that the first and second spaces are aligned." Were the court merely evaluating which of these two constructions is most likely to be the plain meaning of "end to end," it would choose Micromass's proposed construction. But "end to end" is used in the context of the overall structure of claim 1. Thus, AB/Sciex responds to this "plain meaning" argument by noting that claim 1 requires a wall (36) that divides the two vacuum chambers (30 and 38), thereby preventing the rod sets (32 and 40) from being strictly "end to end," as Micromass suggests. This argument is a convincing rejoinder to Micromass's proposed construction. If the rod sets are separated by a wall, as required by claim 1(a), the end of the first rod set cannot be placed against the end of the second rod set. Similarly, in claim 14, the spaces described as "end to end" terminate at the end of each rod and are then separated from each other by an interchamber orifice. Thus, the two spaces cannot abut ends.

In further support of its argument that "end to end" means only that the first and second spaces are aligned and not adjacent, AB/Sciex points to Figures 1 and 12 in the patent specification, which not only show a wall (36) with interchamber orifice between the two rod sets (32 and 40), but also an undefined amount of space. Moreover, the initial description of the structure of the invention states that there must be "a first rod set in said first vacuum chamber extending along at least a substantial portion of the length of said first vacuum chamber," thereby explaining that the inventors did not believe the first rod set (32) was required to extend to the end of the first vacuum chamber (30). 736 Patent, Col. 1, Inn 63-65. AB/Sciex argues that the specification therefore contradicts Micromass's construction that the rod sets in claim 1 must be end to end.

Turning for a moment to the meaning of "aligned," it is readily apparent that construing the meaning of this term is not as difficult as "end to end." "Align" is defined as "to bring into line or alignment," or "to be in or come into precise adjustment or correct relative position." Webster's Ninth New Collegiate Dictionary 70 (1991). Nothing in the claims of the patent or the specification indicates that the claims use "aligned" any differently than its traditional definition.

1 Neither party attaches significance to the fact that "end-to-end" in claim 14 is hyphenated and "end to end" in claim 1 is not.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -
Micromass's position is thus a tenuous one. While it argues that "end to end" must mean that the ends of the elements are abutting, that construction of the term would seem to conflict with both the other terms of the claim and the patent specification. And while it asserts that "aligned" must mean that the end of the first rod set or space are placed at or near the end of the second rod set or space, the plain and ordinary meaning of "aligned" would appear only to require the elements be in precise adjustment or correct relative position.

Lacking other support, Micromass argues that the prosecution history of claims 25 and 26 support its proposed construction of "end to end" and "aligned." In rejecting claim 25, which added to claim 1 a limitation that the longitudinal axes created by the rod sets intersect, the PTO examiner took the position that "if the two rod sets are aligned, they are by definition parallel." The PTO examiner used the same reasoning to reject claim 26, which added a limitation that the longitudinal axes created by the rod sets be parallel. In distinguishing the limitations of claim 25 and 26 from the requirements of claim 1, MDS argued that "aligned" meant only that the elements "be in or come into precise adjustment or correct relative position." (citing Webster's Ninth New Collegiate Dictionary). Response After Final Office Action, 2. Therefore, AB/Sciex argued, the longitudinal axes of the rod sets (32 and 40) and the spaces they define could be aligned and at the same time either be non-parallel and intersect (claim 25) or be parallel (26). Micromass focuses on a statement made by MDS while making this argument. MDS stated, "the first and second spaces, for instance, may be 'aligned' when an end of the first space terminates near an end of the second space whereby ions can travel through the first rod set and into the second rod set." Id. at 3 (emphasis added). MDS also stated, "the first space could be at an angle relative to the second space and the two spaces could be aligned by having the ends precisely located relative to each other so that their ends abut." Id. at 4 (emphasis added).

Micromass argues that because MDS made these statements in arguing the definition of "aligned," and because "aligned" and "end to end" are related terms, both claims should be construed to require that the rods or spaces be near or abut. This argument is unpersuasive. First, in explaining the meaning of "aligned," AB/Sciex was not commenting on the meaning of "end to end," and thus it cannot be said that the prosecution history supports Micromass's proposed construction of that term. Second and more important, MDS did not disclaim any particular construction of "aligned" by making these statements. Indeed, it introduced each of the sentences that Micromass relies upon with language such as "for instance, may be . . ." and "could be." MDS was not describing the meaning of "aligned," but instead was describing how its invention might be structured if it were to use non-parallel rod sets. MDS never asserted that "abutting" rod sets and spaces was how the claims had to be construed. The court therefore does not find MDS disclaimed any particular construction of "end to end" or "aligned" in its prosecution history.

The court will therefore adopt AB/Sciex's proposed construction of "aligned." Micromass's proposed construction of the term lacks support in the claims themselves, the specification, or the prosecution history. In contrast, AB/Sciex's proposed construction, also explained during the prosecution of dependent claims 25 and 26, is consistent with the plain meaning of that term -- "being in or coming into precise adjustment or correct relative position."

The proper construction of "end to end" presents a more difficult question because its dictionary definition is contrary to the other claim limitations and the specification, which both show structures between the elements described as "end to end." But the correct construction of "end to end" is revealed by the claims, which require only that ions move "through" the elongated spaces formed by the rods. Indeed, the claims describe the transmission of ions from the inlet orifice, through the first space created by the first rod set, through the inlet orifice, and through the second space created by the second rod set. Thus, the claims adopt a functional description of the path of the ions that takes the ions longitudinally from one elongated space and through the next. Claims 1 and 14 do not require that the axes of the rod sets be parallel or on the same axis, only that the ions travel in this manner successfully. The prosecution history of dependant claim 25 even suggests that the longitudinal axes of the two rod sets in claim 1 might be both non-parallel and intersecting and still accomplish this function. Because functionality, and not any particular angle or distance is required by the claims, the court will therefore adopt AB/Sciex's proposed construction of "end to end" -- that the rod set (Claim 1) or space (claim 14) must be arranged in a manner that ions may be successfully transmitted from the end of the first rod set or space to the end of the second rod set or space.

GO BACK
A. The '802 Patent

The heart of the parties' disagreement as to the shape of the groove described in the 802 patent is whether the "end tract" is composed of cross-sections that are non-circular throughout, or non-circular only in part. Plaintiff contends that most cross sections of the end tract would be semi-circular on the bottom (in the parabolic area that has not yet begun to taper and that retains its semi-circular shape) and "roughly elliptical on their lateral portions" where the tapering has begun. Pl.'s Brief at 5. Plaintiff then contends that cross-sections taken closest to the exit edge of the end tract would be entirely non-circular, since the semi-circular parabolic region would have ceased by that point.

Defendants disagree with Plaintiff's characterization of what comprises the "end tract." Defendants assert that the patent claims and specifications define the "end tract" only as the tapered portion of the groove, marked on the patent's Figures by cross-hatched lines. Defendants recognize that the bottom of the groove, in the parabolic area, remains semi-circular. They do not, however, agree that this area should be included in the definition of "end tract." Therefore, Defendants claim that cross-sections of the end-tract do not include any semi-circular shapes, but rather include only the shape of the tapered area, which Defendants assert is purely elliptical.

The Court agrees with Defendants that the patent claims define the "end tract" only as the tapered area marked by cross-hatched lines. The Court finds, however, that the "end tract" as defined is entirely non-circular, but not "purely elliptical."

The language of Claim 1 of the 802 patent clearly defines the end tract as the tapered area of the groove, distinct and apart from the semicircular portion of the groove. The words "end tract" in the claim are always followed by "(2)," referring to the cross-hatched network of lines in Figure 1 that represent the tapered area, in contrast to the rest of the semi-circular shaped groove. Claim 1 itself never describes the end tract as including the semicircular portion of the groove. The language of the claim is supported by the specification, which states in pertinent part:

As can be observed in FIG. 1, the shaped groove countermatrix of the present invention has a semicircular section except in an end tract 2, shown by a network of lines. Such a tract, as can be observed from FIGS. 4 and 5, is tapered both in the transversal and in the longitudinal sense, according to substantially elliptical profiles.

802 Patent, Col. 2, lines 50-55. Therefore, the actual wording of the claim, as well as the language of the specification and the illustrative embodiments, supports Defendants' position that the "end tract" describes only the tapered area of the groove, and does not include the semicircular portion in the parabolic area.

Having concluded what constitutes the end tract, the Court must now construe the shapes of the end tract's cross-sections. The Court agrees with Defendants that the end tract does not include cross-sections that are circular in part. It does not follow, however, that the cross-sections of the end tract must be elliptical, as Defendants would have it. The claim describes the end tract as "being tapered, according to substantially elliptic profiles." The term "substantially," as Plaintiffs point out in their brief, "modifies the term 'elliptical' such that the elliptical portions of the cross-sections need not describe a mathematically exact ellipse." Pl.'s Brief at 6. The Court may not construe the claim as to read out the word "substantially." Therefore, according to the plain language of Claim 1 of the 802 patent, cross-sections of the end tract, while they may not include circular arcs, are not limited to purely elliptical shapes.

Preformed Endless Loop

The district court construed this term to mean "a loop of ligation material, regardless of size, having either a unitary, circular structure, or formed by joining the ends of a linear length of ligation material." Claim Construction Order, 217 F. Supp. 2d at 1112. While mostly correct, this construction is slightly too broad because it reads out the "preformed" limitation and thus transforms the limitation into simply an "endless loop."

As described in the summary of the invention, a "pre-formed" loop is limited to those loops which are "formed prior to insertion of any band material into a ligation device[,]” '329 patent, col. 2, ll. 63-64. "Use of a pre-formed loop . . . eliminates the need for cumbersome lengths of ligation material used in conventional ligation operations and enables an
operator to slip pre-formed loops over his/her arms or legs, thus facilitating easy access to such loops when performing multiple ligation procedures." '329 patent, col. 2, l. 63-col.3, l. 2. Thus, Callicrate expressly defined "pre-formed" in the specification and highlighted the significance of this distinction over other loops. The district court's interpretation does not limit "preformed endless loops" to those formed before insertion into the castration tool. To that degree, the district court's interpretation does not fully reflect the claim language. See Playtex Prods., Inc. v. Procter & Gamble Co., 400 F.3d 901, 909-10 (Fed. Cir. 2005) (claim construction was flawed in part because it read "substantially flattened" as "flat," effectively ignoring the "substantially" qualifier in the claim).

The district court properly construed the remaining "endless loop" portion of this term. Accordingly, the word "endless" restricts this term to loops without an end. The '329 patent discloses at least two "endless" loop embodiments in Figures 13 and 14. As shown in Figure 13, one such endless loop comprises a circle of ligature material similar to a rubber band:

GET DRAWING SHEET 1 of 4.

Unlike the loop of Figure 13 which literally has no end, Figure 14 forms an "endless" loop by joining the ends of a straight length of ligature material to prevent separation of the two ends:

GET DRAWING SHEET 1 of 4.

'329 patent, col. 9, ll. 47-53. The loop shown in Fig. 14 is "endless" despite its two cut ends, because it has a substantially circular structure when tracing a path through the grommet 32 and forward loop 108. The specification describes both of the loops in Figures 13 and 14 as "endless." Thus, the specification as well supports the district court's construction which covers both embodiments. Addition of the "pre-formed" limitation simply limits the district court's construction to those "endless loops" formed before insertion into the castration tool.

The district court also properly rejected a number of arguments that would construe "preformed endless loop" more narrowly. For instance, the claim language does not suggest that this term "is confined to a loop that is large enough to pass over the animal's scrotal pouch without stretching." Claim Construction Order, 217 F. Supp. 2d at 1111. This argument attempts to read great importance into comments made during prosecution of the '329 patent in traversing a rejection over U.S. Patent No. 2,125,404 (the '404 patent).

A careful reading of the prosecution history impeaches the argument that the applicant disclaimed and narrowed the "endless loop" limitation. In an Office Action dated March 26, 1996, the Examiner rejected various claims in the pending application as anticipated by the '404 patent. The '404 patent discloses a loop of elastomeric material attached to a ligation tool with a bow-like structure. Callicrate responded to this rejection: "The device described by [the '404 patent] is structurally distinct and considerably different than the claimed invention" and "functions in an entirely distinct way than the present invention. . . . [I]t does not teach any method for securing the loop so that it maintains pressure around the body part of an animal." These comments highlight differences between the castration tools. These comments do not, however, distinguish the preformed endless loop in the claimed tool from loops in the '404 patent. Thus, this exchange did not disclaim subject matter within the scope of the "endless loop" limitation.

In addition to distinguishing the '404 patent by argument, Callicrate also amended the claims to require the use of a grommet in securing the loop once tightened about a body part. This amendment limits the amended claims to applications with a grommet (or some other "securing means" as recited in claim 14); this prosecution history does not place any restriction on the size of the loop. In fact, the record actually suggests the exact opposite - a loop that is larger than the body part being ligated would need tightening and securing with some sort of securing means. Otherwise, the loop would apply no pressure to the ligated body part upon removal of the tool. Thus, the district court correctly refused to narrow the "endless loop" limitation.

The district court also correctly rejected an argument that a preformed endless loop must include a mechanical connection device (e.g., a grommet) attached thereto prior to installation in the castration tool. The only support for this argument was an amendment during prosecution to claims 1-6 and 8-10 of the '329 patent (which have not been asserted). The applicant amended these claims to traverse a prior art rejection over U.S. Patent No. 2,642,057 (the '057 patent) and U.S. Patent No. 5,459,905 (the '905 patent). Based on this amendment, Wadsworth argues that the preformed endless loop recited in claims 7, 11, 18, 19, 22, 25, 27, and 30 of the '329 patent should be narrowly construed as having a mechanical connection device
(grommet) attached thereto before installation in the castration tool. This argument, however, overlooks that claims 1-6 and 8-10 claim an entirely different embodiment than the asserted claims. Thus, the amendments to these claims, as the district court properly observed, have nothing to do with the claims asserted by Callicrate.

To be specific, claims 1-6 and 8-10 claim an endless ligation loop. They do not claim a castration tool (or use thereof) as recited in the asserted claims. During prosecution, the '329 patent applicant amended claim 1 to specifically claim the loop embodiment shown in Figure 14. The amendment distinguished the Figure 14 embodiment from loops in the '057 and '905 patents. As amended, the claim recites a deformable grommet slidably attached to an endless band of ligature material to form a loop by connecting the ends of the ligature with wire. This amendment was necessary because this focused claim lacked the other novel features of the castration tool or method of using said tool. Nonetheless the claims in the patent without the specific limitations of claim 1 are not necessarily limited to the Figure 14 embodiment.

Of course, this court interprets claim terms consistently throughout various claims of the same patent. See Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001). In this case as well, this court construes the term "endless loop" consistently throughout the '329 patent. Claims 1-6 and 8-10, however, contain additional limitations that limit those claims to the specific embodiment shown in Figure 14. In contrast, asserted claims 7, 11, 18, 19, 22, 25, 27 and 30 broadly claim castration tools that use endless loops such as those shown in Figure 13 as well as in Figure 14. In sum, the district court properly declined to limit the "endless loop" limitation.

Method claim 22 also includes language referring to the endless loop and a grommet. This language, however, does not limit this claim to preformed endless loops with a grommet attached before the loop enters the castration tool. Claim 22 recites:

22. A method for castrating an animal, comprising:

positioning a preformed endless loop of elastomeric ligature material into a receiving end of a tool, said endless loop having a forward end, a rearward end, and a grommet attached between said forward end and said rearward end; attaching said rearward end of said endless loop to a means for pulling said endless loop;

passing said forward end of said endless loop around the scrotum of an animal;

pulling said rearward end of said endless loop to cause said forward end of said endless loop to constrict around said scrotum of said animal; and

securing said forward end of said endless loop to maintain pressure around said scrotum of said animal.

'329 patent, col. 14, l. 65-col. 15, l. 12 (emphasis added). The highlighted language requires that the preformed endless loop contain a grommet. The claim language does not compel attachment of that grommet at any particular time. Rather, the language permits attachment of the grommet even after the preformed endless loop enters the tool body. To make this point clear, the specification notes a preference for pre-attached grommets, but specifically permits grommets attached later. See '329 patent, col. 3, ll. 2-4; col. 10, ll. 38-43. Thus, the district court correctly declined to limit claim 22 to preformed endless loops with a grommet attached prior to installation in the tool body.

"endless, moveable surface"

Claims 3, 4, 13, and 21 refer to an "endless, moveable surface." Precor urges the Court to adopt a means-plus-function construction of this claim element, while Life Fitness argues that the disputed element should be given its ordinary meaning. The Court concludes that this claim element includes terms which are clearly understood. No further construction is needed, and the Court construes this claim element as invoking its ordinary meaning. The ordinary meaning of this disputed element, as construed by one of ordinary skill in the art, can include a belt and/or a series of slats attached to a band. This construction is supported by the '951 patent itself. '951 patent at column 1, lines 31-39 (background of the invention).
This construction is also supported by the embodiments found in the prior art. See U.S. Patent No. 4,616,822 ("'822 patent") at column 1, lines 19-20 (Declaration of Ricardo Rodriguez, Ex. I); U.S. Patent No. 4,643,418 ("'418 patent") at column 3, line 13 (Rodriguez Dec., Ex. J); U.S. Patent No. 4,842,266 ("'266 patent") at column 2, line 47 (Rodriguez Dec., Ex. O); U.S. Patent No. 4,749,181 ("'181 patent") at column 2, line 16 (Rodriguez Dec., Ex. L); U.S. Patent No. 4,792,134 ("'134 patent") at column 2, lines 48-49 (Rodriguez Dec., Ex. N); U.S. Patent No. 4,708,337 ("'337 patent") at column 4, lines 1, 16, 25, and 39-41 (Rodriguez Dec., Ex. R).

1. Endoscope

The first disputed claim term "endoscope" is found in Claims 1 and 35 as set forth above.

Erbe's Proposed Definition: A flexible medical instrument having a plurality of working channels.  

Canady's Proposed Definition: A rigid or flexible device having at least one working channel for use in performing surgery and having reliable insulation both externally and in the instrument channel.

(Docket No. 42, pp. 2-3).

a. Flexible vs. rigid or flexible

To begin with, I agree with Defendants that the term "endoscope" is not limited in the claim to a flexible or rigid device. (Docket No. 42, Ex. 1, Claim 1). Furthermore, the specification notes that "[i]n accordance with the invention, an electrosurgical device for achieving coagulation of biological tissue preferably comprises an attachment….The attachment can be provided on a rigid or flexible endoscope…."

Docket No. 42, Ex. 1, col.2, II. 17-19, II. 46-47. The specification further notes that "[i]n accordance with another embodiment of the invention a tube out of electrically not conducting material is arranged in a movable manner in the working channel, which tube is preferably a flexible hose, so that in the case of a rigid and also in the case of a flexible endoscope a desired alignment of the distal end of the hose or a tilting of the end of the hose can be performed….." Id. at col. 3, II. 1-7.

Erbe suggests that the invention is specifically directed to endoscopic uses in the gastrointestinal tract. (Docket No. 54, pp. 16-17 and Docket No. 68, pp. 6-8). While it is true that the specification describes specific embodiments of the invention as concerning the gastrointestinal tract, such example is non limiting. See, Phillips, 415 F.3d at 1323 (warning against confining the claims to those listed in the embodiments). For example, Erbe directs the Court's attention to the following sentence in the specifications: "In the case of the invention which allows endoscopic use in the gastrointestinal tract……." Docket No. 68, p. 7, quoting, Docket No. 42, Ex. 1, col.6, II. 58-61. The plain and unambiguous reading of this sentence leads to the conclusion it may be used in the gastrointestinal tract, as well as other endoscopic surgeries. In fact, the specifications disavow limiting the term endoscope to a flexible endoscope: "Although the invention has been described with reference to a particular arrangement of parts, features and the like, these are not intended to exhaust all possible arrangements or features, and indeed many other modifications and variations will be ascertainable to those of skill in the art." Docket No. 42, Ex. 1, col. 11, II. 4-8. Consequently, I will not read such a limitation into the term endoscope. As such, I construe the term endoscope, in part, to mean a rigid or flexible medical instrument.

b. Plurality of working channels vs. having at least one working channel

The parties further dispute whether an endoscope comprises a plurality of working channels or has at least one working channel. Docket No. 66, p. 28; Docket No. 68, p 12. The claim language itself is unambiguous in defining an endoscope as having "a plurality of working channels…." Docket No. 42, Ex. 1, col. 11, I. 14 and col. 15. Because I find this language unambiguous, I need not look to any further intrinsic evidence to define the term. A plain, ordinary and customary reading of this language means that there is more than one working channel.

c. Reliable insulation both externally and in the instrument channel
Canady argues that the term endoscope should include reliable insulation both externally and in the instrument channel.

Docket No. 66, p. 29. The claim language itself does not reference insulation. Both parties agree, however, that the specification states: "For argon plasma coagulation only endoscopes should be used whose electric insulation is absolutely reliable both exteriorly and in the instrument channel." Docket No. 42, Ex. 1, col. 10, ll. 21-23. I recognize that there is a fine line between "using the specification to interpret the meaning of a claim and importing limitations from the specification into the claim…" Phillips, 415 F.3d at 1323, citing Comark Commun. v. Harris Corp., 156 F.3d 1182, 1186-87 (Fed.Cir.1998). I agree with Erbe that reading such a limitation into the claim term endoscope would be importing a limitation from the specification. Consequently, I will not read such a limitation into the term.

According, the claim term endoscope is construed to be a rigid or flexible medical instrument with more than one working channel.

Claim interpretation is a question of law amenable to summary judgment, Johnston v. IV AC Corp., 885 F.2d 1574, 1579-80 (Fed. Cir. 1989), and disagreement over the meaning of a term within a claim does not necessarily create a genuine issue of material fact. Becton Dickinson & Co. v. C.R. Bard, Inc., 922 F.2d 792, 797 (Fed. Cir. 1990).

Claim 36 of the '249 patent contains no dimensional limitations and would on its face apply to any endoscopic automatic multiple clip applier used in combination with a trocar cannula in which the jaws are sufficiently narrow to fit through a cannula without closing the jaws. In Claim 36, the trocar cannula is described only as "a tubular cannula having a given internal diameter." Likewise, no limitations are recited for the jaw member or the surgical clips referred to in the claim. Furthermore, there are no dimensional limitations in the specification or the drawings.

Plaintiff argues that a trocar of a "given" diameter in combination with an "endoscopic" clip applier means a 10/11 millimeter trocar and a clip applier capable of applying medium/large clips. The words of a claim must be given their ordinary meaning unless it appears that the inventor used the terms differently. "Although a patentee can be his own lexicographer, as we have repeatedly said, the words of a claim will be given their ordinary meaning, unless it appears that the inventor used them differently." Hoganas AB v. Dresser Industries, Inc., 9 F.3d 948, 951 (Fed. Cir. 1993); see also Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1387 (Fed. Cir. 1992).

The '249 patent contains no special definitions of the words "given" or "endoscopic." Therefore in construing Claim 36, the words "given" and "endoscopic" should be given their ordinary meaning. Thus, "a tubular cannula having a given internal diameter" would mean a tubular cannula having an assumed or hypothetical internal diameter, i.e. one of no fixed or specific diameter. See Webster's Third New International Dictionary. Likewise, "endoscopic" would mean any device capable of being used with an endoscope, an instrument for visualizing the interior of a hollow organ or body cavity. "Endoscopic" would not connote any size limitation, except perhaps the general limitation of a size sufficiently small to be able to be inserted into an orifice or incision in the human body.

Plaintiff argues that notwithstanding the absence of any special definitions of these words in the patent, one skilled in the art would understand that "given internal diameter" and "endoscopic," as used in Claim 36 signify that the cannula referred to in the claim is a 10/11 millimeter cannula and that the surgical clips referred to in the claim are medium/large surgical clips, since these are the standard in the field of endoscopic surgery. This argument is unavailing because it is undisputed that medium sized surgical clips are used in endoscopic surgery and are thus, "endoscopic." In fact plaintiff itself markets an endoscopic clip applier designed for use with medium sized surgical clips. 4 Plaintiff's contention that one skilled in the art would understand that Claim 36 includes the limitations of a 10/11 millimeter trocar and a medium/large surgical clip does not present a genuine issue of material fact. The Court likewise finds no merit in plaintiff's argument that testimony regarding the intent of the inventors or spatial relationships depicted in the unscaled patent drawings raise genuine issues of fact regarding size limitations in Claim 36.

--- Footnotes ---

4 It is also undisputed that there are minor variations in the sizes of trocar cannulas and surgical clips within categories made by various manufacturers and that there is no precise or uniform standard dimension for a medium or medium/large
surgical clip.

Plaintiff further argues that part of the prosecution history of the '249 patent includes representations regarding the dimensions of the trocar cannula and surgical clips which supply the limitations it wishes to read into Claim 36. Plaintiff refers to the remarks section of its Response to Office Action, Dated April 30, 1992 in which its patent counsel summarized an interview with the patent examiners. The remarks include, inter alia, the following description of a demonstration of plaintiff’s device at the interview:

As was demonstrated at the interview, applicant's commercial embodiment of applicant’s device is not only automatic, but can apply medium/large clips having about a 5.33 millimeter width between the outer surfaces of their legs. This permits the instrument to be used with a trocar having a cannula with an internal diameter of about 10 millimeters.

"It is elementary that resort must be had in the first instance to the words of the claim which define the metes and bounds of the invention." Envirotech Corp. v. Al George, Inc., 730 F.2d 753, 759 (Fed. Cir. 1984). Limitations not found in the language of a claim cannot be read into the claim. E.I. Du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430 (Fed. Cir. 1988), cert. denied, 488 U.S. 986, 102 L. Ed. 2d 572, 109 S. Ct. 542 (1988). Limitations appearing in the patent specification cannot be read into the claims. Id. Nor is it permissible to inject into claims limitations referred to in the prosecution history. Intervet America, Inc. v. Kee-Vet Labs, Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989).

While limitations contained in the specification or prosecution history may be used where necessary to interpret what the patentee meant by a word or phrase in a claim, see e.g., Minnesota Mining & Mfg. v. Johnson & Johnson, 976 F.2d 1559 (Fed. Cir. 1992), there is no warrant for resorting to the prosecution history for such a purpose in this case. The words of Claim 36 are plain, they do not include any dimensional limitations on the size of the trocar or the surgical clip. The absence of limitations and the use of the word "given" when referring to the internal diameter of the cannula reflect a conscious intent by the drafter of this claim to make it as broad as possible so as to include a trocar of any size in combination with a clip applier having jaws of any size. In oral argument on this motion, counsel for plaintiff admitted that Claim 36 was so intended:

There could be, the reason the claim is not written with specific numerical dimensions, art does change. Things may be available later on with the advent of better suturing, when you are coming out of the abdomen, you can use larger trocars, and then we could use larger jaws, larger clips, etc.

Likewise, in opposing defendant's motion for summary judgment of non-infringement, plaintiff said with respect to Claim 36:

In construing a patent claim, the focus must be on the language of the claim itself. That is crucial because it is the claim -- rather than statements in the prosecution history or the patent specification -- that defines the metes and bounds of the invention…

If, as is the case here, the claim was drafted so as to obtain the broadest coverage with the fewest "limitations" on the scope of coverage, it is entitled to be so construed.

Ethicon's Memorandum in Opposition to Richard-Allan's Motion For Summary Judgment, Doc. 48, pp. 17-18. Plaintiff offered in support of this proposition the declaration of John P. Milnamow, its outside patent counsel who prosecuted the application for the '249 Patent. Mr. Milnamow stated:

Thus, not only is this prosecution history consistent with my intent and the objective construction which a facial reading of Claim 36 compels, but it reinforces my intention to have this particular claim contain as broad coverage as possible. The only objective limitations in the claim are the jaws, which extend outwardly from the shaft and must be wide enough to receive the clip but narrow enough to be entered into a trocar without compressing, and the single trigger… It was my intent and it remains my professional opinion that any endoscopic multiple clip applier having these characteristics infringes this
The prosecution history plaintiff relies on to import limitations into Claim 36 consists only of a description of a demonstration of a device. There is no suggestion in the description that plaintiff's patent lawyers represented to the patent examiners that plaintiff intended that the claims of the patent would be limited to the dimensions of the device demonstrated. Even if the Court were persuaded that it was proper to consider this part of the prosecution history to interpret Claim 36, it would add nothing of value to the interpretation and would raise no genuine issue of fact relating to the existence of dimensional limitations in that claim.

Plaintiff solved the problem of designing an endoscopic automatic multiple clip applier for medium/large clips with jaws narrow enough to fit through a 10/11 millimeter trocar cannula with the jaws in the open position. It did so by incorporating a design feature in the jaws which plaintiff refers to as a "primary heel." The claims of the '249 patent relating to the jaw and other specific aspects of the Ethicon device may well be valid and enforceable. In this case, however, Ethicon has elected to assert only the broadest claim in its patent, Claim 36 which, by its own admission fails for obviousness in the absence of size limitations which do not appear in the claim and which the Court concludes cannot properly be read into the claim. Accordingly, defendant's motion for summary judgment on the issue of obviousness is well taken.
The language of claim 31 makes clear that "engage" means more than simply "make contact." Claim 31 uses the term "engage" in describing the interaction between the yoke and the barrel nut:

said U-shaped supporting yoke including engagement surfaces configured to cooperatively engage an outer surface of said barrel nut and thereby support said upper handguard piece relative to said barrel nut.

'465 Patent col. 17, ll. 9-13 (emphasis added). As engagement of the yoke and the barrel nut is meant to provide enough structure to support the upper handguard piece relative to the barrel nut, engagement must entail more than mere contact. However, defining "engage" as "interlock with" may go too far. The dictionary definition of "interlock" is "to unite or join closely as by hooking or dovetailing" or "to connect together . . . so that the individual parts affect each other." The American Heritage Dictionary of the English Language, supra. There is nothing in claim 31 to suggest a requirement of hooking or dovetailing, but claim 31 could encompass a connection such that the individual parts affect each other by working together to provide support. A proper definition must fall in between "contact" and "interlock," establishing contact between the yoke and barrel nut sufficient to provide support for the upper handguard piece. 3

3 This sentiment was shared by the Patent Examiner who conducted an Inter Partes Reexamination of the '465 Patent. "It is the Examiner's opinion that the term 'engage' or 'engagement' necessarily requires at most some type of mechanical interaction or interlocking of parts, or at least direct contact between two parts when configured in their final completed assembly." (Inter Partes Reexamination 6.) The Inter Partes Reexamination was not filed as an exhibit.

As used in claim 31 of the '465 Patent, "engage" means to make contact with another part such that the resulting interaction can provide support.

B. "Engage"

No claim in either patent defines the term "engage." The '932 and '799 patents' description of the preferred embodiment explains the engagement process as follows:

The adapter sleeve 62 has an external surface 70 that is dimensioned to fit inside the cylindrical collar 48 of the BNC connector 38 and engage in the electrical contact therewith. A pair of posts 72 project from the sleeve external surface 70 on diametrically opposite sides of the sleeve. The posts 72 are positioned on the sleeve to engage in the pair of slots 52 of the BNC connector collar 48 when attaching the connector to the adapter. The engagement of the posts 72 in the adapter collar slots 52 enables the BNC connector 38 to be attached on the external surface 70 of the adapter by merely rotating the BNC connector one quarter turn. Thus, the BNC connector 38 can also be disconnected from the external surface of the adapter 36 by turning the BNC connector one quarter turn in the opposite direction.

'932 patent, col. 5, ll. 36-49 (emphasis added); '799 patent, col. 6, ll. 12-26 (emphasis added).

Based on this part of the '932 and '799 specification, defendants urge the court to construe the term "engage" to mean a connection requiring a "quarter turn." But the term "engage" is simple and straightforward, and should be construed in accordance with its ordinary and customary meaning. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996); see also Altiris Inc. v. Symantec Corp., 318 F.3d 1363, 1369 (Fed. Cir. 2003) (dictionaries may be useful in determining a term's ordinary meaning). Of the forty-two claims in the '932 and '799 patents that require an adapter post to "engage" with the slot of a BNC connector, only three specifically require the engagement to occur through a one-quarter turn. See '932 patent, claims 8 and 9; '799 patent, claim 8. A narrowing limitation present in one claim should not be read
into other claims in which the limitation is absent. See, e.g., Karlin Tech., Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971-72 (Fed. Cir. 1999).

Webster's provides the following definitions, among others, for the verb "engage": (1) "to interlock with, to cause (mechanical parts) to mesh"; (2) "to bring together or interlock (weapons)"; and (3) "to come together and interlock (as of machinery parts)." Merriam-Webster

The court will construe the term "engage" to mean: "to come together and interlock." 

K. **Engage** (13i)

In the context of Claim 6, engage means come in contact with or attach to, to the extent there is any ambiguity in the word.

The phrase is to be construed as follows:

**come in contact with or attach to**

---

1407

Engage a Formation

Claims in the '930 and '631 Patents require a cutter to "engage" a formation or be in the process of "engaging" a formation. Baker Hughes contends a cutter engages a formation when the cutter to cuts into it. ReedHycalog claims the cutter must maintain continuous and uninterrupted contact with the subterranean formation to engage the formation but did not brief the term in its Response to Baker Hughes's Opening Markman Brief.

The '930 and '631 Patents use the term "engage," with respect to the cutters, synonymously with "cut into" and do not require the cutters to maintain continuous and uninterrupted contact with the formation. See, e.g., '930 Patent col. 2:55-61 ("PDC cutters of the bit are engaged with the formation to their design DOC"); '631 Patent col. 3:16-21 (same); '930 Patent col. 14:40-48 ("DOCC features will prevent . . . cutters from engaging the formation at too great a depth"); '631 Patent col. 4:58-62 ("PDC cutters are prevented from engaging the formation to a greater depth of cut"); id. at col. 18:46-53 ("DOCC features will prevent . . . cutters from engaging the formation to too great a depth"); id. at col. 24:64--col. 25:2 (stating cutters create a formation cutting, or chip, as "cutters engage the formation at a given DOC"). Thus, "engage" means "cut into," and "engaging" means "cutting into." 26

---

- 1840 -
3. Engage to form a positive stop

The parties also dispute the meaning of the phrase "engage to form a positive stop." Phoenix proposes, "contact to prevent," and Silgan proposes, "the abutting of a surface on one member against a surface on another member to preclude movement of one member in one direction relative to another member."

Read in context of the entirety of claim 3, Silgan's definition includes redundant language. It includes a description of how the abutting surfaces "preclude movement of one member in one direction relative to another member," though claim 3, following the phrase "positive stop," already reads, "to lower engagement of the cap with respect to the container." In other words, Silgan's definition includes words and ideas that are already present in other parts of the claim -- namely, preventing or stopping "lower movement of the cap with respect to the container." See Merck & Co. v. Teva Pharms. USA, Inc., 395 F.3d 1364, 1372 (Fed. Cir. 2005) ("A claim construction that gives meaning to all the terms of the claim is preferred over one that does not do so."). Silgan's definition is also unnecessarily complex insofar as it rejects Phoenix's simpler, "contact," for its own, "abutting of a surface on one member against a surface on another member." Because contact is synonymous with the phrase chosen by Silgan, we construe the claim language "engage to form a positive stop to" as follows: contact each other and prevent.

3. "Engageable"

Plaintiff argues the term "engageable" in claim 1 of the '685 patent means "[c]apable of working in contact to ensure coordinated action." (Doc. # 51, at 25). Plaintiff contends that the patentee's use of the term does not depart from the term's common and ordinary meaning. Plaintiff, therefore, relies on dictionary definitions to support its proposed construction.

Defendant argues that the term means "interlocking." (Doc. # 51, at 25). Defendant contends that the intrinsic evidence supports its proposed construction. Defendant refers the Court to the '685 patent specification, which states that "[t]he first free end 49 of the torsion spring 45 (FIG. 8B) engages the lever 15 while second free end 51 engages the housing 11 and intermediate connector 39. Thus, the torsion spring 45 is oriented to resist movement of the control structure 37 in a direction tending to open the ring members 35." (Doc. # 51-2, '685 patent, col. 7, lines 5-10). Defendant relies on Figures 9B and 11B in the specification to argue that "the spring is 'interlocking' with both the lever and the housing." (Doc. # 51, at 26). Defendant also asserts that its proposed construction is consistent with the dictionary definition of the term. Finally, defendant contends that its proposed construction will maintain the validity of claim 1 under 35 U.S.C. § 112, P 2.

The claim language, specification, and prosecution history do not make clear the definition of "engageable." Accordingly, the Court will consult a dictionary to determine the ordinary and common meaning of the claim term. The dictionary provides no definition for the word "engageable." However, the mechanical definition for "engage" is "to cause (gears or the like) to become interlocked; interlock with." RANDOM HOUSE DICTIONARY (1980). "Interlock" is defined as "to fit into each other, as parts of machinery, so that all action is synchronized." Id. The dictionary definition supports plaintiff's proposed construction. Therefore, the Court finds that the term "engageable" in the '685 patent means "capable of working contact to ensure coordinated action."
3. "Engageable"

Plaintiff argues the term "engageable" in claim 1 of the '685 patent means "[c]apable of working in contact to ensure coordinated action." (Doc. # 51, at 25). Plaintiff contends that the patentee's use of the term does not depart from the term's common and ordinary meaning. Plaintiff, therefore, relies on dictionary definitions to support its proposed construction.

Defendant argues that the term means "interlocking." (Doc. # 51, at 25). Defendant contends that the intrinsic evidence supports its proposed construction. Defendant refers the Court to the '685 patent specification, which states that "[t]he first free end 49 of the torsion spring 45 (FIG. 8B) engages the lever 15 while second free end 51 engages the housing 11 and intermediate connector 39. Thus, the torsion spring 45 is oriented to resist movement of the control structure 37 in a direction tending to open the ring members 35." (Doc. # 51-2, '685 patent, col. 7, lines 5-10). Defendant relies on Figures 9B and 11B in the specification to argue that "the spring is interlocking' with both the lever and the housing." (Doc. # 51, at 26). Defendant also asserts that its proposed construction is consistent with the dictionary definition of the term. Finally, defendant contends that its proposed construction will maintain the validity of claim 1 under 35 U.S.C. § 112, P 2. The claim language, specification, and prosecution history do not make clear the definition of "engageable." Accordingly, the Court will consult a dictionary to determine the ordinary and common meaning of the claim term. The dictionary provides no definition for the word "engageable." However, the mechanical definition for "engage" is "to cause (gears or the like) to become interlocked; interlock with." RANDOM HOUSE DICTIONARY (1980). "Interlock" is defined as "to fit into each other, as parts of machinery, so that all action is synchronized." Id. The dictionary definition supports plaintiff's proposed construction. Therefore, the Court finds that the term "engageable" in the '685 patent means "capable of working in contact to ensure coordinated action."

1412

1. Defining "Engageable." The term "engageable" is not defined in the patent. When considering the language of the claim, "there is a 'heavy presumption' that the terms used in claims 'mean what they say and have the ordinary meaning that would be attributed to those words by persons skilled in the relevant art.' Resonate, Inc. v. Alteon Websystems, Inc., 338 F.3d 1360, 1364 (Fed. Cir. 2003) (quoting Tex. Digital Sys., Inc. v. Telegenix, Inc., 308 F.3d 1193, 1201 (Fed. Cir. 2002)). "The ordinary and customary meaning of a claim term is the meaning that the term would have to a person of ordinary skill in the art in question at the time of the invention." Phillips, 2005 U.S. App. LEXIS 13954, 2005 WL 1620331 at *5. Ordinarily, "the inquiry into how a person of ordinary skill in the art understands a claim term provides an objective baseline from which to begin claim interpretation." Id. In this case, the court credits Pfizer's expert's assertion, uncontested by Ajx, that "the claim term 'engageable,' when read in context with the claim, specifically, 'thereby providing a releasable connection,' does not have a precise and generally understood meaning to one of ordinary skill in the art." Decl. of Dr. Mansoor Amiji [Doc. No. 139] P 24.

The court must, therefore, interpret the term "engageable." The court may first consider whether the ordinary meaning of claim language is "readily apparent even to lay judges" and whether this is a case that "involves little more than the application of the widely accepted meaning of commonly understood words." Phillips, 2005 U.S. App. LEXIS 13954, 2005 WL 1620331 at *6. The word "engage" has many meanings. The applicable definition in this context is "to fasten" or "to attach." Oxford English Dictionary (2d ed. 1989); see also Acromed Corp. v. Sofamor Danek Group, Inc., 253 F.3d 1371, 1382 (Fed. Cir. 2001) (construing the term "engage" to mean "to fit together"). While recent case law cautions against the use of dictionaries, dictionaries "are often useful to assist in understanding the commonly understood meaning of words." Phillips, 2005 U.S. App. LEXIS 13954, 2005 WL 1620331 at *15. Particularly in a case where a term does not have a generally understood meaning among those skilled in the art, the court ought to understand the common meaning of the term as it is most likely to guide an understanding of the inventor's intention is using that term. The term "engageable," then, would be commonly understood to mean "able to engage" and to describe an object that is able to or has the capacity to fasten or to attach.

The court next looks to the claim itself for instruction on the use of the term "engageable." See Phillips, 2005 U.S. App. LEXIS 13954, 2005 WL 1620331 at *6-*7. "Because claim terms are normally used consistently throughout the patent, the usage of a term in one claim can often illuminate the meaning of the same term in other claims." Phillips, 2005 U.S. App. LEXIS 13954, 2005 WL 1620331 at *7. The same is true of a term used twice in the same claim. The use of the term "engageable" to describe both the permanent and temporary locks strongly suggests that the term does not incorporate the
amount of force necessary to separate the locked components. Furthermore, the use of the term "releasable" to describe the connection between the "engageable" areas suggests that the term "engageable" is not intended to incorporate the amount of force necessary to separate the components. Were the term "engageable" to be read as Pfizer argues, the term "releasable" would be redundant. The court reads the term "engageable" to refer to the ability of the cap and body to connect, not to the amount of force necessary to pull them apart.

The specification, while it ought not be read into the claims, should be used as necessary and appropriate to construe claim terms. "Although it is improper to read a limitation from the specification into the claims, claims must be read in view of the specification, of which they are a part." Microsoft Corp. v. Multi-Tech Systems, Inc., 357 F.3d 1340, 1347 (Fed. Cir. 2004) (internal citations, quotations, and alterations omitted). "Though understanding the claim language may be aided by the explanations contained in the written description, it is important not to import into a claim limitations that are not a part of the claim." Resonate, Inc., 338 F.3d at 1364.

Pfizer urges the court to adopt an extremely specific definition of "engageable." According to Pfizer, the Preferred Embodiment requires the court to read the term narrowly. The Preferred Embodiment describes a number of different forces associated with effecting a preliminary and permanent lock and with releasing a preliminary lock. Specifically, the prefit force is defined as "the force which is needed to open a prelocked capsule for filling." 267 patent, col. 4, ll. 44-45 (emphasis added). The patent specifies that the prefit force "must neither be too high (otherwise separation problems will arise in the filling station) nor too low (danger of the capsule parts falling apart during transport)." 267 patent, col. 4, ll. 46-48. The patent describes a technique for measuring such forces and explains the role of the capsule's component parts on the prefit force. For example, Pfizer determined that a protrusion with circular crosssection resulted in reduced variation of prefit forces among capsules. 267 patent, col. 9, ll. 1-3. The patent further states that "in the present design, a reduction of the PREFIT force was desired" and that "protrusion heights in the range of 40 to 80 [microns]" reduced the prefit force by approximately 30% from that of the prior art. 267 patent, col. 9, ll. 36-38.

Given the importance of the prefit force to the '267 capsule, Pfizer argues that the term "engageable . . . is properly interpreted to mean that the pre-lock area on the body interacts with the pre-lock area on the cap so as to reduce the pre-lock force needed to separate the body and cap for filling (e.g., below approximately 21.6 grams." Pl.'s Memo. of Law in Opp. to Ajix's Mot. for Summ. J. of Invalidity and Infringement (hereinafter "Pfizer Br.") [Doc. No. 135] at 30.

This analysis is flawed in two fatal respects. First, the term "engageable" is used to describe both the prelock and the permanent lock. "The same word appearing in the same claim should be interpreted consistently." Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1345 (Fed. Cir. 1998). Therefore, the term "engageable" cannot be interpreted to specify the force required to separate the cap from the body in the prelock position because that force will be significantly greater with respect to the engageable permanent lock areas. The capsule, when in the permanent lock position, should not be easily separated. '267 Patent, Col. 1, ll. 47-52 (describing potential difficulties should capsule components separate after pharmaceutical material has been placed in the capsule).

Second, the definition of "engageable" put forward by Pfizer is simply counter to common definitions of the word. In the instant case, the term has no intelligible meaning to persons skilled in the relevant art. "To engage," when used to describe a physical action, means to attach or to fasten. To interpret the term "engageable" to refer to the separation of two objects is illogical. It is simply more reasonable to analyze the term to describe two objects' ability or capacity to attach to one another. The instant context--a patent teaching a capsule with two components designed to interact with one another--only buttresses this view. Counter to Pfizer's contention, the instant context does not support a finding that the term "engageable" defines the force needed to separate the cap from the body. Indeed, the term "releasable," '267 patent, col. 11, l. 67, would be redundant if "engageable" were interpreted as Pfizer insists.

The court exercises discretion in determining what evidence to consider and what weight to give that evidence when construing a claim. Phillips, 2005 U.S. App. LEXIS 13954, 2005 WL 1620331 at *11. This claim construction prioritizes intrinsic evidence, the language of the claim itself, over extrinsic sources, such as dictionaries and expert testimony. To read the term "engageable" as Pfizer suggests is to ignore the plain language of the claim itself and to allow Pfizer to read the specification into the claim.

GO BACK
The next claim term to construe is "pet engageable portion," which appears in claim 1 of the '540 Patent. Plaintiff suggests that this claim term means "portion of the grooming tool having a blade portion and a plurality of teeth." Plaintiff argues that this construction is consistent with the patent claims and the specification, which states, "[t]he pet engageable portion includes a blade portion and a plurality of teeth." ('540 Patent, doc. # 1-3, p.7 col.2 ll.5-6, p.8 col.3 ll.2-4). Defendants suggest an entirely different definition, "a one-piece blade for an electric animal hair clipper removed from the clipper, such as an Oster A5 40 or 50 blade." Defendants state that their proposed construction is based on similar language that appears in the '540 Patent specification. ('540 Patent, doc. # 1-3, p.7 col.2 ll.16-6-p.8 col.3 l.2). The Court finds that Plaintiff's proposed definition is more appropriate than Defendants' proposed definition, however, it is necessary to further define "plurality of teeth," another claim term that this Court construes in a subsequent section. See infra Section III(I). Accordingly, the Court will construe the claim term "pet engageable portion" to mean "portion of the grooming tool having a blade portion and more than one tooth."

This definition incorporates the actual language of the patent claims, as adapted to include the Court's construction of the claim term "plurality of teeth". For example, the definition adopts the language of claim 1 of the '540 Patent, which provides: "the grooming tool comprising . . . a pet engageable portion secured to the handle portion, the pet engageable portion including a blade portion and a plurality of teeth." ('540 Patent, doc. # 1-3, p.8 col.4 ll.19-24 (emphasis added)); see Phillips, 415 F.3d at 1314 (noting that the words of the claims "provide substantial guidance as to the meaning of particular claim terms"). The definition is also consistent with the patent specification, which states "[t]he pet engageable portion includes a blade portion and a plurality of teeth," ('540 Patent, doc. # 1-3, p.7 col.2 ll.5-6), and "[t]he pet engageable portion 24 includes a blade portion 30 (FIGS. 4 and 5) and a plurality of teeth 32." ('540 Patent, doc. # 1-3, p.8 col.3 ll.2-4); see Phillips, 415 F.3d at 1315 (noting that "claims must be read in view of the specification, of which they are a part").

Defendants' suggested construction of "pet engageable portion" is "a one-piece blade for an electric animal hair clipper removed from the clipper, such as an Oster A5 40 or 50 blade." The Court recognizes that this language is taken directly from the '540 Patent. However, the Court notes that the '540 Patent specifically provides that: "[t]he pet engageable portion may consist of a one-piece blade for an electric animal hair clipper, such as an Oster A5 blade (size 40 or 50, but preferably size 40) commercially available from Sunbeam Corporation." ('540 Patent, doc. # 1-3, p.7 col.2 ll.16-6-p.8 col.3 l.2 (emphasis added)). Thus, it appears that the language relied on by Defendants to support their construction is merely an example of what the blade portion could be, not a definitive statement of what it actually is. By adopting Defendants' suggested construction, this Court would be improperly limiting the patent claims to exclude certain blades that would otherwise be included. The Court declines to do so.

Thus, the Court will construe the claim term "pet engageable portion" to mean "portion of the grooming tool having a blade portion and more than one tooth."

SM filed suit against Procycle, alleging that claims 1, 7, and 11 of the '959 patent were infringed literally and under the doctrine of equivalents by all of the Procycle steppers, and that the Quantum steppers further infringed claim 9. In a Markman opinion, the district court construed the terms "engaged" and "engaging" in claims 11 and 7, respectively, to mean "any type of mechanical engagement capable of coming into contact, interlocking, or meshing [two separate components]." StairMaster Sports/Medical Prods., Inc. v. Groupe Procycle, Inc., 1998 U.S. Dist. LEXIS 8228, No. 97-396, slip op. at 30 (D. Del. May 20, 1998) ("StairMaster I"). The court held that the "means for engaging" limitation of claim 7 was in means-plus-function format, pursuant to 35 U.S.C. § 112, P6, and identified the claimed function as "engaging the transmission output with the dynamic brake means," and the corresponding structure disclosed in the specification of the '959 patent as continuous belt 148, which connects the transmission output and the brake in the preferred embodiment. Id. at 25-26; see also '959 patent, Col. 10, line 59 through Col. 11, line 2.
The parties filed cross-motions on summary judgment and, on July 29, 1998, the court granted Procycle's motion for summary judgment that the Procycle devices did not infringe claims 1, 7, or 11 of the '959 patent, either literally or under the doctrine of equivalents. See StairMaster II, 25 F. Supp. 2d at 276-77. With regard to claim 9, the court granted summary judgment of no literal infringement, and held that prosecution history estoppel barred application of the doctrine of equivalents. See id. at 281-82. Finally, the court denied Procycle's motion for summary judgment on invalidity, concluding that claims 7-11 of the '959 patent were not invalid under the reissue statute, 35 U.S.C. § 251. See id. at 291. This appeal followed, vesting this court with jurisdiction pursuant to 28 U.S.C. § 1295(a)(1) (1994).

II

We review the grant of summary judgment de novo. See Johnson Worldwide Assocs., Inc. v. Zebraco Corp., 175 F.3d 985, 987, 50 U.S.P.Q.2D (BNA) 1607, 1609 (Fed. Cir. 1999). The de novo standard also applies to this court's review of claim construction. See Augustine Med., Inc. v. Gaymar Indus., Inc., 181 F.3d 1291, 1297, 50 U.S.P.Q.2D (BNA) 1900, 1904 (Fed. Cir. 1999). Summary judgment is appropriate only if there is no genuine issue of material fact. See Fed. R. Civ. P 56(c). To this end, the court must draw all reasonable factual inferences in favor of the nonmovant. See Anderson v. Liberty Lobby, Inc., 477 U.S. 242, 255, 91 L. Ed. 2d 202, 106 S. Ct. 2505 (1986). In reviewing a grant of summary judgment of noninfringement, as with any infringement inquiry, we must first determine the correct claim scope as a matter of law. See Renishaw PLC v. Marposs Societa' per Azioni, 158 F.3d 1243, 1247-48, 48 U.S.P.Q.2D (BNA) 1117, 1120 (Fed. Cir. 1998). We then compare the properly construed claim to the accused device to determine, as a matter of fact, whether all claim limitations are present in the accused device, either literally or under the doctrine of equivalents. See id.

SM argues that the district court interpreted the term "engage" incorrectly and that, under the interpretation SM proffers, Procycle's steppers infringe claims 7 and 11, both literally and under the doctrine of equivalents. We disagree with SM. Terms in a claim are to be given their ordinary and accustomed meaning, within the context of the claim, unless (1) a different meaning is clearly set forth in the written description or the prosecution history; or (2) the meaning of the term is unclear from the context of the claim. See Johnson, 175 F.3d at 989-90, 50 U.S.P.Q.2D (BNA) at 1610. We have reviewed the language of the claims, the specification and the prosecution history of the '959 patent, and we agree with the district court's construction of the terms "engaged" and "means for engaging . . ." in claims 11 and 7, respectively. Because the single integrally-molded brake wheel of the Procycle steppers does not "engage" the transmission output and the brake input, or perform the identical function of "engaging" those components, the district court correctly concluded that the accused Procycle steppers do not literally infringe claims 7 and 11 of the '959 patent. See Laitram Corp. v. Rexnord, Inc., 939 F.2d 1533, 1535, 19 U.S.P.Q.2D (BNA) 1367, 1369 (Fed. Cir. 1991) ("The failure to meet a single limitation is sufficient to negate infringement of the claims.").

GO BACK

1415

1. "Determining when the cruise control is engaged"

With respect to the second element of Claim 1, Detroit Diesel contends that the cruise control must be either engaged or not engaged, that the cruise control is engaged when the on/off switch is closed, and is not engaged when the switch is open or the brake or clutch is depressed. To support the meaning it ascribes to the word "engaged," Detroit Diesel refers the court to the portions of the specification that explain that "when the switch 48 is closed, a signal is passed to the road speed limit and cruise control 44 to engage the cruise control mode of operation," col. 4, lines 29-31, and that "when either the brake pedal 52 or clutch 54 is depressed," the "cruise control mode of operation" is "disengaged." Detroit Diesel also refers the court to Figure 1 of the '597 patent, in which switch (48) is represented as "ON/OFF."

Caterpillar asserts that the cruise control is engaged when the on/off switch is activated, a vehicle speed is entered, and vehicle speed control is released from the throttle to the engine controller. To support its definition of "engaged," Caterpillar refers the court to the "set" step (50) in the patent's Figure 1, and to the affidavit of Michael Moncelle, the first named inventor of the '597 patent. Mr. Moncelle explains that "it is common and accepted knowledge to one of ordinary skill in the art for engine cruise control systems that an engine cruise control is 'engaged' when it is activated and capable of controlling the engine to maintain a specified vehicle speed," which occurs "only after the cruise control has been activated by turning the feature on, and the vehicle speed has been entered through the set or resume functions." Moncelle Aff., P 4. Caterpillar also cites the affidavit of its expert, James Amend, who explains that "the only interpretation of the word 'engage' in Claim 1
which is consistent with how a cruise control works, the purpose of the invention and the preamble to Claim 1, is that it means: on and set above the minimum, and not disengaged by depressing the brake or clutch." Amend Aff., P 29.

Although the portion of the specification that states that "when the switch 48 is closed, a signal is passed to the road speed limit and cruise control 44 to engage the cruise control mode of operation," col. 4, lines 29-31, appears to define the cruise control as "engaged" when the switch (48) is "on," reference to the entire specification confirms that the second element of Claim 1 uses "engaged" in its ordinary sense, i.e., "employed." American Heritage Dictionary of the English Language 433 (1981). The cruise control is engaged when it is operating to control the vehicle's speed. This definition is consistent with the patent's preamble, which describes the invention as a "method of operating a vehicle engine (12) equipped with a cruise control (44) which is engageable to control the speed of the vehicle . . . ." It is also consistent with the patent's purpose, described in the specification: "Thus, when the cruise control is engaged, a higher engine output power is available, if needed, so that an operator is less likely to have to downshift in order to provide the torque required to maintain the actual vehicle speed at the desired vehicle speed." The use of "engaged" in this context cannot simply mean that the on/off switch is closed; the purpose of the patent is to make more torque available when the cruise control is actually in use, i.e., controlling vehicle speed, to encourage the use of cruise control and decrease the need to downshift. These purposes would not be served if the higher torque were available simply based on the cruise control on/off switch.

The specification describes the cruise control's operation, see col. 4, lines 20-44, and Figure 1 shows the inputs the cruise control receives. The operation of the cruise control as depicted in the specification, including Figure 1, is consistent with the explanation of Caterpillar's expert James Amend. In his affidavit, Mr. Amend explains that one of ordinary skill in the art would know that a cruise control feature on a manual transmission vehicle could have six operational states: (1) activation switch off; (2) activation switch on; no vehicle speed set; (3) activation switch on and speed set, but the set speed is below a pre-programmed minimum set speed; (4) activation switch on and speed set above minimum, but operator pressed the clutch or the brake; (5) activation switch on and speed set above minimum, but operator used throttle to exceed set speed; and (6) activation switch on, speed set above minimum, and operator neither presses brake or clutch, nor exceeds set speed through use of throttle. Amend Aff., P 26; see also Moncelle Aff., P 4. The cruise control is "engaged," i.e. controlling the vehicle speed, only in the final state.

D. "Said Lower End and Said Capturing Bracket Engaged By a Fastener So As To Remain Engaged Despite Failure of Said Fastener"

As noted above, one of the improvements accomplished by the '515 Patent was to use two methods to secure the leg support rather than a single fastener. The leg support sits in the capturing bracket and also is held in place by a "fastener" going through the leg support and the capturing bracket. If the fastener breaks or otherwise fails, the capturing bracket continues to hold the leg support in place. The Court construes the term "said lower end and said capturing bracket engaged by a fastener so as to remain engaged despite failure of said fastener" in Claim 1 to mean that "the lower end of the leg support and the capturing bracket are engaged by the fastener so that if the fastener fails to perform its function, the lower end of the leg support and the capturing bracket remain in place and the capturing bracket continues to hold the leg support."

3. The phrase "said lower end and said capturing bracket engaged by a fastener so as to remain engaged despite failure of said fastener"
believes that the figures depict a U-shaped bracket.

The Court construes this phrase to mean:

The lower end of the leg support is inserted within the capturing bracket; a fastener connects the lower end and the capturing bracket to each other; and the lower end will remain within the capturing bracket even if the fastener breaks or fails.

This construction is consistent with the construction adopted in Forest Group, 2007 U.S. Dist. LEXIS 10487, at *11 (construing this phrase "to mean that the lower end of the leg support and the capturing bracket are engaged by the fastener so that if the fastener fails to perform its function, the lower end of the leg support and the capturing bracket remain in place and the capturing bracket continues to hold the leg support").

Warner does not propose any construction for this term, preferring instead to imply that it is somehow nonsensical. Joint Markman Subm. at 4. Forest proposes a construction that incorporates a definition of "capturing bracket," id., and Warner apparently does not object to Forest's proposed construction (except to argue that Warner's stilt does not infringe based on that construction). Pl. Markman Memo. at 10. But because "capturing bracket" is a separate term, the Court rejects Forest's proposed construction of this phrase, which would effectively require that "capturing bracket" be subject to two different constructions.

This particular phrase, which requires that the capturing bracket still confine the leg support if a fastener fails, was added by the patentee to overcome a rejection by the Patent Office. Pl. Markman Memo. Lacy Decl. Exh. D part 5 at 2 [Docket No. 43]. In particular, this limitation was added to distinguish the claimed invention from U.S. Patent No. 3,902,199 to Emmert (the '199 patent), which is incorporated by reference in the '515 patent. '515 Patent col. 1:22-23; Pl. Markman Memo. Lacy Decl. Exh. D part 5 at 1-2. Figure 2 of the '199 patent shows a leg support attached to a stilt at the top by a yoke, and at the bottom by a single bolt through the end of the leg support. If the single bolt at the bottom of the leg support broke, the leg support could rotate more-or-less freely about the single point of attachment provided by the yoke or could slide downward through the yoke.

A key purpose of the '515 patent was to improve upon the '199 patent's method of attaching the leg support; that purpose was achieved through this final phrase of claim 1 relating to the capturing bracket, the leg-support end, and the fastener connecting the two. As the patent states, "[t]he lower leg support attachment employing the capturing bracket and the yoke structure serve to prevent the leg support from accidently becoming detached from the stilt." '515 Pat. col. 1:61-64. By contrast, in prior-art stilts, "the leg support member had a tendency to loosen and become detached from the stilt. . . ." Id. col. 1:39-41. With respect to the fastener attaching the leg-support end to the capturing bracket, in particular, "[i]n the event that nut and bolt assembly 6 should come loose or break, capturing bracket 48 will still hold leg support lower end 46 in place." Id. col. 3:9-12.

Another phrase in contention in claim 11 is the term "engaged with." See Col. 12, lines 2 and 5. The relevant claim language recites:

... (e) a speed increasing transmission having an input and an output, said transmission input being engaged with said drive means; (f) a brake dissipating the work of the user in the form of heat, said brake being engaged with the transmission output . . .

Col. 12, lines 1-6 (emphasis added). Similar language has already been interpreted with regards to claim 7, clauses (f) and (h), in the interpretation of "means for engaging." See supra, at 24-27. As in clause (f) of claim 7, clause (e) of claim 11 also refers to a connection between the transmission input and the drive means. As in clause (h) of claim 7, clause (f) of claim 11
refers to a connection between a brake and a transmission output. However, because this language of claim 11 is not in
means-plus-function form, the interpretation of "engaged with" is not limited to the corresponding structure found in
the specification and equivalents thereto, as the "means for engaging" were. Instead the Court must consult the specification,
and any relevant prosecution history, in order to better understand the claim language.

While the specification mentions a chain for the first connection and a belt for the second connection, see Col. 6, lines 48-
50; Col. 6, lines 65-67, the claim language is not so limited where it is broader than the preferred embodiment and no
particular structure is required in the specification. See Specialty Composites, 845 F.2d at 987; Electro Medical, 34 F.3d at
1054; see also CVI/Beta Ventures, 112 F.3d at 1158. Being nothing in the intrinsic evidence which provides a special
meaning for "engaged with," the Court again employs the customary and ordinary meaning of "engage," as coming into
contact, interlocking, or meshing. As such, the Court construes the language "engaged with," found in claim 11, Col. 12,
lines 2 and 5, to mean any type of mechanical engagement capable of coming into contact, interlocking or meshing a drive
means and transmission input or a transmission output and a brake.

C. "Engagement Assembly"

The "engagement assembly," which is "carried" on the "extendable element," is, along with the "dumping assembly,"
included in the "assembly extendable to the curb side of the vehicle and carried by said intermediate container." See 245
Patent, col. 8, lines 1-5. The "engagement assembly" is described as "having motor powered means to hold the refuse
container during the emptying operation." See 245 Patent, col. 8, lines 9-11.

Plaintiff argues "engagement assembly" should be construed as "the structure that engages the curb side container, including
a hydraulic cylinder or other motor." (See Pl's Proposed Order at 2:8-9.) Defendant argues "engagement assembly" should
be construed as "an assembled collection of parts coming into contact or interlocking, which collection of parts must include
motor powered means to hold the refuse container during the emptying operation as interpreted below." (See Def.'s
Proposed Order at 2:16-18.)

As with "dumping assembly," the parties' respective constructions focus on the function of the claimed "engagement
assembly." The specification teaches that the function of the "engagement assembly" is to "securely attach[]" a curb side
refuse container before its contents are emptied into the intermediate container. See 245 Patent, col. 7, lines 10-15, Figs. 7b-
7d.

Accordingly, "engagement assembly" is construed as "the structure that securely attaches to a curb side container."

m. "Engagement Position" (Claim 31)

100. The specification of the '656 patent uses this term as synonymously with "detented position". See, Col. 6, lines 18-19.
Thus, "engagement position" means the location that the detent extends, projects or protrudes to by the solenoid by entry of
the combination so that the detent can be contacted by the detent engaging member on the cam.

1. "the engagement surface of the tension member"

Schindler proposes that "the engagement surface of the tension member" be defined as "an outermost layer or surface of the
tension member where the entire outermost layer or surface comes into contact with a corresponding surface of the sheave."
Otis proposes that the term be construed as "the portion of the tension member that is in contact with a sheave and receives
traction forces from the sheave." Each parties' definition imposes an extraneous limitation.

Schindler's proposed definition is too narrow. It provides that the entire outermost layer comes into contact with . . . the sheave." Schindler relies on the figures contained in the patent to support this proposition. The figures, however, depict preferred embodiments of the claims--they do not define the precise boundaries of the invention. See MBO Labs, Inc. v. Becton, Dickinson & Co., 474 F.3d 1323, 1333 (Fed. Cir. 2007); see also Kara Technologies Inc. v. Stamps.com Inc., 582 F.3d 1341, 2009 U.S. App. LEXIS 21120, at *13 (Fed. Cir. 2009). The entire surface of the tension member does not need to come into contact with the sheave in every potential embodiment of the invention.

Otis' definition requires that the tension member "receives traction forces from the sheave." This is also an extraneous limitation. The patent specification explicitly states that other secondary applications of the invention, also related to elevator systems, do not use a traction sheave. Accordingly, the term cannot include the "receives traction forces from the sheave" language proposed by Otis.

The Court will construe "the engagement surface of the tension member" as "the portion of the tension member that comes into contact with the corresponding surface of the sheave."

28. "[E]ngagement tab:" A locking tab or structure on the inside surface of the side walls that assists in the coupling of a hook arm to the connector." This construction finds support in the specification. (See col. 4:15-30) The court rejects plaintiff's proposed construction, which seeks to conflate additional language from the claims into this limitation, i.e., requiring that the locking tab (1) extend inwardly from the wing, (2) be partially formed by a cut-out in the wing, and (3) whose outward displacement and deflection is accommodated by a cavity in the wing.

At the claim construction hearing, AFT raised "engagement with" as a term requiring construction. Tr. (Dkt. No. 106) 48-49. The term appears in claims 1 and 10. AFT proposes the Court construe the term to mean "to interlock with." AFT's Post-Hearing Br. at 12. It asserts that this definition, found in the Merriam-Webster's Ninth New Collegiate Dictionary, is appropriate as the intrinsic evidence provides no alternative definition and no specialized meaning for the term exists in the pulp industry. 11 AFT's Post-Hearing Br. at 12. J&L counters that the Court should construe "engagement with" simply to mean "in contact with," stating that this definition is consistent with the intrinsic evidence, AFT's general use dictionary, and related definitions found in the McGraw Hill Dictionary of Scientific and Technical Terms. J&L Post-Claim Construction Hearing Br. (Dkt. No. 108) ("J&L Post-Hearing Br.") at 13-16. Under J&L's construction "engaged" components "remain
separate, in contact with one another, and capable of movement." Id. at 15.

11 The most relevant definition found in Merriam-Webster's Ninth New Collegiate Dictionary defines "engage" as "to interlock with: MESH; also: to cause (mechanical parts) to mesh." Dkt. No. 82, Ex. D.

The Court adopts AFT's proposed construction. "Engagement" does not appear to have any specialized meaning in the art. Thus, a general use dictionary provides valuable insight into the term's ordinary meaning. 12 "Interlock" comports with the specification and claims, whereas mere "contact with" fails to do so. The specification describes individual components firmly secured to one another as "engage[d]." '940 patent, Col. 3, Lns. 5-10 (explaining that by registering the backing and screening plates together, then securing one to the other, "[t]he backing plate thus engages the screening plate"); see also id., Col. 3, Lns. 28-31 (stating that "shrink-fitting one plate to the other may be itself sufficient to secure the plates to one another"); id., Col. 6, Lns. 41-53 (describing a method of manufacturing a preferred embodiment of the present invention that includes "shrink-fitting the cylinders into engagement one with the other"). The fact that the specification indicates that an additional fastener, e.g. a weld, rivet, or screw, is generally added does not require the limitation J&L suggests. Accordingly, "engagement with" means to interlock or mesh with.

12 The term is not defined in the technical dictionary J&L supplies.

The parties dispute the meaning of the term "engages" in limitation (g)'s claim that "the lid engages the liner so that the liner can be lifted from the outer container together with the lid." '111 patent col.16 ll.44-46. 3M argues that the Court does not need to construe the language because it carries its plain and ordinary meaning. In the alternative, 3M asks the Court to construe the term "engages" as "comes into contact, fits together, or interlocks with," resulting in a construction whereby "the lid comes into contact, fits together, or interlocks with the liner so that the liner can be lifted from the outer container together with the lid." Gerson argues that the Court should construe the term "engages" to mean "interlocks with and securely holds."

The Court begins with the claim language, which claims "removing the liner from the outer container together with lid, wherein the lid engages the liner so that the liner can be lifted from the outer container together with the lid." '111 patent, col.16 ll.43-46. The claim language thus depicts a type of engagement between the lid and liner "so that the liner can be lifted from the outer container together with the lid." '111 patent col.16 ll.45-47. The specification teaches a variety of engagements between the lid and the liner, and describes alternative embodiments for the claimed invention:

- "Advantageously, the lid . . . is formed with barbs . . . on its surface to engage and hold the top of the liner." '111 patent, col.6 ll.21-22.

- "As a further alternative, the lid . . . could be formed as an integral part of the liner . . . to which it could be connected by a hinge joint . . . . In that case, there is no need for the lid to fit inside the mouth of the liner to ensure that the lid and liner will be removed together from the container after use[,]" Id. col.7 ll.27-34.

- "If more positive engagement is required between the lid . . . and the liner . . . , the lid could be snap fit with the liner instead of push-fit as shown. The liner could, for example, be formed with an internal circumferential rib positioned to engage in a corresponding groove on the adjacent surface of the lid." Id. col.7 ll.42-47.
- "The form of the shaped portion . . . allows the lid . . . to be pushed into the mouth of the liner and also provides a recess . . . into which the edge of the liner can contract so that the lid is securely located." Id. col.7 ll.56-59.

The Court concludes that no construction of the term "engages" is necessary. First, "[a] claim construction that gives meaning to all the terms of the claim is preferred over one that does not do so." Merck & Co., Inc. v. Teva Pharms. USA, Inc., 395 F.3d 1364, 1372 (Fed. Cir. 2005). Construing "engages" to require that the lid "securely hold" the liner — as proposed by Gerson — would render superfluous the remainder of the claim language in limitation (g), i.e., "so that the liner can be lifted from the outer container together with the lid." See Gen. Am. Transp. Corp. v. Cryo-Trans, Inc., 93 F.3d 766, 770 (Fed. Cir. 1996) (rejecting a district court's claim construction because it rendered superfluous a claim requirement).

Second, the specification teaches a variety of potential embodiments and engagements between the lid and the liner, and describes varying degrees of strength of such engagement. Therefore, "engages" covers a broader range of connections between lid and liner than the term "interlocks with and securely holds."

Accordingly, the Court rejects Gerson's proposed construction and concludes that the term "engages" has its ordinary and plain meaning.

1. Disputed terms 1-3: "an upper portion of the height of the band extends above the upper edge of the pants or skirt and engages against the torso" (claim 2); "... engages against the body or underclothing" (claims 6 and 14) and "... engages against the body." (claim 9)

In its briefing, Plaintiff argued that the first disputed term should be construed as: "an upper portion of the height of the band extends above the upper edge of the pants or skirt and engages against the torso; but the pants or skirt need not be in direct contact with the woman's skin." Pl.'s Claim Const. Brf. at 5. Defendant proposed the following construction: "an upper portion of the height of the band extends above the upper edge of the pants or skirt and engages against the torso of the pregnant woman." (italics added). In these three claims, Plaintiff proposed that the following language to the disputed phrase be added: "but the pants or skirt [or band] need not be in direct contact with the woman's skin." Defendant disagreed. And in all three phrases, Defendant sought to insert the modifying term "pregnant" before the term "woman."

a. "But the pants or skirt [or band] need not be in direct contact with the woman's skin"

The Court addresses first the question of whether the disputed term requires the addition of the phrase "but the pants or skirt [or band] need not be in direct contact with the woman's skin." At the claim construction hearing held in this matter, the parties stipulated that there is no requirement in the patent that the pants or skirt have direct contact with the woman's skin. The Court concludes that the disputed phrase must be understood to include the concept that the band need not touch a woman's skin. However, the Court declines to construe this term as having any reference to whether the clothes of a woman must touch her skin.

The specification supports the interpretation that the band need not contact skin. The specification states "the band garment of the invention preferably is formed of smooth knit fabric which, with the elastic in the fabric, comfortably hugs a woman's lower abdomen, flattening and shaping any fabric underneath." '775 Patent, 3:8-21 (emphasis supplied). Because the patent specification refers to a situation in which there would be fabric beneath the band, rather than bare skin, insertion of the proposed language prevents a limitation that would be contrary to the patent specification. The specification also contains...
embodiments where the band is worn with a top tucked into the band, and where the band is stretched over the top of the pants. "775 Patent, 5:38-42 (claim 3); 2:67-3:3. In such an instance, the band would be placed on top of both the lower edge of the shirt or blouse, and the upper edge of the pants. Under this scenario, the band would not necessarily be touching the woman's skin.

However, the disputed phrases cannot be interpreted to include any reference to whether a woman's clothes touch her skin. There is nothing in the specification or the claims that makes any reference to this issue. Therefore, the Court rejects Plaintiff's request to interpret the claims in this manner.

b. The modifier "pregnant"

Next, the Court addresses whether the word "pregnant" must be inserted into the disputed phrases as proposed by Defendant in its claim construction brief. The Court concludes that it does not.

While Defendant is correct that the independent claims 1, 5, 8 and 13 (on which claims 2, 6, 9 and 14 depend) recite that the band is worn around the "pregnant" woman's torso or body, the Court is not persuaded that this requires the further addition of the word "pregnant" everywhere that the word "woman" appears in the patent. It is clear from the patent that the band is worn around the body of a pregnant woman. Moreover, at the hearing in this matter, Plaintiff stipulated that the wearer of the present device -- with respect to all claims in the patent -- is a pregnant woman. The addition of the word "pregnant" is redundant and superfluous. Claim construction is necessary when the terms of the patent require clarification for use in the determination of infringement. It is not "an obligatory exercise in redundancy." NTP, Inc. v. Research in Motion, 418 F.3d 1282, 1311 (Fed. Cir. 2005), cert. denied, 546 U.S. 1157, 126 S. Ct. 1174, 163 L. Ed. 2d 1141 (2006) (citation omitted).

The Court therefore declines to adopt Defendant's proposed modifier "pregnant." The Court construes the terms as follows:

"an upper portion of the height of the band extends above the upper edge of the pants or skirt and engages against the torso; but the band need not be in direct contact with the woman's skin." (Claim 2); "an upper portion of the height of the band extends above the upper edge of the pants or skirt and engages against the body or underclothing; but the band need not be in direct contact with the woman's skin." (Claims 6 and 14); "an upper portion of the height of the band extends above the upper edge of the pants or skirt and engages against the body; but the band need not be in direct contact with the woman's skin." (Claim 9).

74 See Phillips, 415 F.3d at 1314 ("Because claim terms are normally used consistently throughout the patent, the usage of a term in one claim can often illuminate the meaning of the same term in other claims.").
2. "engaging"

The district court construed "engaging" to mean "coming together and interlocking." Literal Infringement Op. 2007 U.S. Dist. LEXIS 78564 at *3-4. Felix argues for a broader construction of "contacting or bringing together." Appellant's Br. at 23. In support of this broader construction, Felix offers two arguments.

First, Felix argues that the dictionary definition of "engaging" should control, because the meaning of the term is not discussed in the claims, specification, or prosecution history. Felix then argues that "the dictionary defines 'engage' as 'to bring together'"--citing page 612 of the Joint Appendix. Id. at 24. This statement is false and misleading in several respects. First, there is no definition of "engage" on page 612 of the Joint Appendix; that page includes a dictionary definition of "mount." The only dictionary definitions of "engage" appear several pages later. Second, the only dictionary definition of "engage" anywhere in the Joint Appendix that includes "bring together" is--in full--"to bring together or interlock (weapons)." J.A. 618. Thus, for a second time, Felix's brief has omitted a parenthetical qualification--here, "weapons"--that significantly limits the quoted definition. But even more inexcusably, Felix's brief excluded the phrase "or interlock" from the quoted definition. This is particularly misleading because the only substantive difference between the district court's construction and Felix's proposed construction is that the district court's construction requires the additional element of "interlocking." We reject Felix's misleading dictionary definition argument. We further remind counsel of the importance of providing full, accurate, and undistorted quotations and citations in briefing before this court.

Second, Felix argues that the district court's construction excludes every embodiment of the invention of the '625 patent, because the drawings of the patent show the gasket merely coming into contact with the lid. This argument is without merit. The gasket limitation requires the gasket to engage the lid when the lid is "in its closed position." '625 patent col.6 l.2. Of the drawings, only figure 2 shows the lid in its closed position, and figure 2 does not depict the gasket at all. Id. fig.2. The remaining figures all show the lid in its open position. There is nothing in those figures that is inconsistent with the gasket "interlocking" the lid when the lid is closed.

Although we reject all of Felix's arguments, we nevertheless conclude that the district court erred by construing "engaging" to require "interlocking." The specification includes a single clause directed to the relationship between the lid and the gasket when the lid is closed: "a closed position (FIG. 2) with the gasket 18 sealingly engaging the lid 22 adjacent to its edges 22a-d on the lid lower surface 22." Id. col.3 ll.24-26 (emphasis added). The specification's use of the phrase "sealingly engaging" makes clear that the way that the gasket engages the lid is by forming a seal. This, of course, is the normal function of a gasket. See, e.g., Means Illustrated Construction Dictionary 275 (3d ed. 2000) (defining "gasket" as "[a]ny of a variety of seals made from resilient materials and placed between two joining parts (as between a door and its frame, an oil filter and its seat, pipe threads and their fitting, etc.) to prevent the leakage of air, water, gas, or fluid"); Don Goodsell, Dictionary of Automotive Engineering 97 (2d ed. 1995) (defining "gasket" as a "static seal used to contain pressure and prevent leakage . . ."). In contrast to "sealing," "interlocking" suggests that some part of the gasket must be constrained or in some manner held by some part of the lid, beyond simply being sealed to the lid. Like the specification, the prosecution history of the '625 patent nowhere suggests that "engaging" means "interlocking." Because we find no basis for such additional limitation in the specification or prosecution history, we modify the district court's construction of "engaging" as used in claim 6 of the '625 patent to mean "coming together to form a seal." Even though the district court erred in including "interlocking" in its claim construction, the error is harmless as it does not affect the district court's determinations of either literal infringement or infringement under the doctrine of equivalents.

I. Claim Construction

The question of literal infringement of claim 21 of the '567 patent turns entirely on the district court's construction of the term "engaging." Claim construction is a question of law reviewed de novo. Cybor Corp. v. FAS Techs., Inc. 138 F.3d 1448, 1454-56 (Fed. Cir. 1998) (en banc). Hunter's Specialties argues that the court erred in construing the term "engaging" in the
phrase "second roof-of-mouth engaging yieldable sealing portion" to mean "to come into contact with." According to Hunter's Specialties, the proper construction of the term "engaging" is "sealing" or "interlocking." As support for its construction, Hunter's Specialties notes that claim 21 uses the word "engaging" to describe a seal created between the edge of the frame and the roof of the user's mouth. Also, Hunter's Specialties observes that the specification describes the edge as "sealing" against the roof of a mouth. In addition, Hunter's Specialties finds support for its construction in a dictionary definition that describes "engaging" as "to come together and interlock." Hunter's Specialties points out that this definition is consistent with the way the term is used throughout the patent.

Primos responds that the district court correctly construed "engaging" as "to come into contact with." According to Primos, the intrinsic evidence does not support the selective dictionary definition put forth by Hunter's Specialties. In particular, the claims use both terms, "engaging" and "sealing," and thus each term is presumed to have a distinct meaning. Also, Primos asserts that to construe "engaging" as "sealing" or "interlocking" would exclude a preferred embodiment of the patent because the figures in the patent show the membrane as not interlocking with the roof of a mouth. In addition, Primos observes that while "interlocking" might be an appropriate construction of "engaging" for an invention relating to mechanical machinery with gears, it is not appropriate in the context of diaphragm mouth calls.

We agree with Primos that the district court correctly construed the term "engaging" to mean "to come into contact with." As this court explained in Phillips v. AWH Corp., we ordinarily construe claim terms to have their customary meaning as understood by a person of ordinary skill in the art. 415 F.3d 1303, 1312-17 (Fed. Cir. 2005) (en banc). In ascertaining the ordinary and customary meaning of a claim term, a court's primary focus should be on the intrinsic evidence of record, viz., the claims, the specification, and, if in evidence, the prosecution history. Id. Starting with the language of claim 21, the terms "engaging" and "sealing" are both expressly recited in the claim and therefore "engaging" cannot mean the same thing as "sealing"; if it did, one of the terms would be superfluous.

Turning to the specification, although the word "engaging" is not expressly mentioned in the specification, figures 1 and 3 aid our understanding of that term. Figure 3, as depicted below, shows a call device positioned in a user's mouth.

As shown in the figure above, there are several points of contact between the roof of a user's mouth (the top striped structure in the figure above) and the diaphragm mouth call— one such point is with the plate 24 and another is with the peripheral edge of the frame 12. That figure shows the plate touching the roof of the mouth, but does not reveal an interlocking relationship because there is no depicted means from which the frame can "interlock" with the roof of a user's mouth. The figure therefore supports a construction of "engaging" as to "come into contact with," while discouraging a construction of "interlocking." While we are mindful that we cannot import limitations from the preferred embodiments into the claim, we also should not normally interpret a claim term to exclude a preferred embodiment. See Burke, Inc. v. Bruno Indep. Living Aids, Inc., 183 F.3d 1334, 1341 (Fed. Cir. 1999). Interpreting "engaging" to mean "interlocking" would exclude the embodiment shown in the figure and is not consistent with the rest of the specification which does not suggest an interlocking relationship between the roof of a mouth and the mouth call. 2 We therefore agree that the district court's construction of the term "engaging" to mean "to come into contact with" is supported by the intrinsic record and is correct.

2 We do not discuss the prosecution history here because it is not relevant to the construction of the term "engaging."

The district court interpreted claim 5 of the '311 patent as a means-plus-function claim. The district court next construed the "means integral" as the body portion and tapering shoulder portion of the screw. The trial court then defined "engaging" as "fitting together." Danek argues that the district court's claim construction is incorrect and that under the correct claim construction, four of the five allegedly infringing screws do not infringe.
Danek asserts that "engaging" requires the narrow construction that the body portion of the screw forces cancellous bone tissue forward and radially outward into the thread space left behind by the screw thread or the tap. According to Danek, its four screws with a thread diameter larger than 5.5 mm cannot push bone with their body portions during insertion because this screw thread diameter is larger than the diameter of the screw body portion. Danek's expert, Dr. Pope, testified that these screws would not "ram in" and "displace material upwards and outwards" as described in the '311 patent.

The word "engage" means "to interlock" or "mesh." Webster's II New Riverside University Dictionary 433 (1988). This meaning matches the district court's construction that "engage" means to "fit together." The written description of the '311 patent does not depart from or narrow this meaning. The '311 patent uses "engage" to define three interfaces: (1) threaded engagement of the screw threads with the bone opening "to attach the bone screw to the bone," col. 2, ll. 68-69; claims 1, 5, 10, 15 and 16; (2) engagement of the body portion with a portion of the surface defining the bone opening "to restrict movement of the bone screw" and to block "fluid flow from the opening of the bone," col. 3, ll. 8-12; claims 4, 5, 15 and 16; and (3) engagement of the seat portion (top plane of the screw's body portion) with the connecting member (e.g., the spine plate) "to establish the axial location of the connecting member along the bone screw," col. 3, ll. 19-21; claims 14 and 16. These three uses of the term require a meaning broad enough to apply to each of these interfaces. Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1345 (Fed. Cir. 1998) ("The same word appearing in the same claim should be interpreted consistently."); Fonar Corp. v. Johnson & Johnson, 821 F.2d 627, 632, 3 U.S.P.Q.2D (BNA) 1109, 1113 (Fed. Cir. 1987) (holding that the meaning of a term in a claim must be consistent with its appearance in other claims in the same patent).

Contrary to Danek's assertion, "engage" cannot mean only "to push material forward and outward." In engaging a connecting member, one of the uses of the term, the seat portion of the screw does not push any part of the connecting member forward and outward. Accordingly, the interpretation "fitting together" best accommodates the various usages of the term in the patent. Thus, the seat portion of the screw has a flat surface that "fits together" with a spine plate to axially locate the spine plate along the bone screw. Likewise, the body portion and tapering shoulder portions "fit together" with the surrounding bone to restrict movement of the bone screw and to block effluence from the opening in the bone portion.

Further contrary to Danek's assertions, construing "engage" as "fit together" does not impede the function of the claims. Even if the body portion does not completely block all of the thread gaps left in the bone by the threaded portion, the tapered shoulder portion of these screws is wider in diameter and does block the bone opening, thereby restricting effluence.

3. "engaging"

Floe asserts that this term should be construed as "fitting together." Newmans, on the other hand, contends that this term should be construed as "coming into contact with." Floe contends that its proposed construction is consistent with the plain meaning of "engaging" as used in the claim. Newmans asserts that Claims 14 and 15 are instructive as to how the Court should construe the term "engaging." In particular, Newmans cites the description of the "lip means" in Claim 14, which provides "for engaging the loading surface when the frame structure is postured for loading." (379 Patent, c. 8, ll. 47-49.) Newmans also points out that Claim 15 states, "An improved loading frame member as in claim 14. [sic] wherein said angle for engaging the surface is approximately forty-five degrees." (Id. at ll: 50-52.) Further, Newmans cites the specification, which refers to figure 10 stating, "In this arrangement the lip surface 82 is in contact with the surface . . . ." (Id. at c. 6, ll: 35-37.) Therefore, according to Newmans, "engaging" means "coming into contact with."

The term "engaging" appears in the "edge protection means" limitation, which states, "edge protection means coupled to said trailer bed support means for protecting the edge of the loading portion of the trailer bed, wherein said edge protection means has an upper edge and is positioned above and substantially perpendicular to said trailer bed support means for engaging the edge of the loading portion of the trailer bed,[ ]" (379 Patent, c. 8, ll. 18-24.) Consistent with how "engaging" is used in the claims and the specification, the Court construes "engaging" as "becoming interlocked with."
5. Engaging

The parties dispute the proper construction of "engaging." Caponey proposes to construe "engaging" as receiving or aligning and receiving. (Pl.'s Claim Construction Br. 12.) ADA Enterprises proposes to construe engaging as interlocking or meshing. (Def.'s Claim Construction Br. 12.) The specification of the '400 Patent states that "[t]he forks . . . are aligned with and slidably received by the fork channels . . . ." (Id. Ex. A ('400 Patent, col. 5, lines 52-53).) Therefore, the court construes "engaging" as aligning with and being received by.

WMA finally argues that we should hold that the Glide-Traks do not infringe on the '201 patent's claim of having "a pusher member having . . . a pair of flanges engaging said rails." 9 This claim element describes the aspects of the 201's pusher member (a flat vertical surface that urges merchandise along the divider member towards the shelf's edge) that fits around the divider member's rails and allows the pusher to remain in continuous contact with and ride along the divider member's track rails. WMA offers two dictionary definitions of "flange" that are not disputed by RTC:

Random House (1988): 1. a projecting rim, collar, or ring on a shaft, pipe, machine housing, etc., cast or formed to give additional strength, stiffness, or supporting area, or to provide a place for the attachment to other objects.

Webster's New Universal (1983): 1. a raised or projecting edge, rib, or rim, for strength, as in a T-rail, for guidance, as on a rail to keep wheels in place, for connection with some other object, as in some pipes.

9 WMA does not dispute that both Glide-Trak models contain "pusher members." Our analysis will therefore focus on whether the pusher members contain a "pair of flanges engaging said rails."

WMA asks that we adopt the Random House (1988) definition of "engage" and interpret the word to mean: "8. Mech. To cause (gears or the like) to become interlocked; to interlock with." While RTC points to other dictionary definitions for "engage," that support a significantly broader reading of the term, for the sake of argument we will accept WMA's proffered definition. That being said, Webster's Third New International Dictionary (1981) defines "interlock" to mean: "to engage or inter-relate with one another . . . to connect in such a way that the motion of any part is constrained by another part." This definition is consistent with a '201's claim of its flanges allowing the pusher member to be "operationally slidable on the rails" of the divider member. However, as was discussed in our analysis of the rails, there is nothing in the ordinary meaning of the language of the claim, or in the specifications, to suggest that the "pair" of flanges be identical or mirror images of one another.

We thus construe "a pusher member having . . . a pair of flanges engaging said rails" to mean: A pusher member having two similar or corresponding projecting rims or edges that interlock or connect with the rails for the purpose of constraining and guiding the pusher member along the rails. This definition aptly describes the portion of the '201's pusher member that connects it to the divider member's track rails (by surrounding the top, bottom, and outer edge of each of the two rails) and restricts the pusher member's motion to moving either up or down the rails.

Claim 1 teaches a door having "vertically extending projection[s]" stretching along the vertical edge of the door's skins. (Id. Ex. A sheets 2-3 & col. 4-6) According to claim 1, the projections "engage" the frame of the door. (Id. at col. 4) Figure 5 and figure 6 make clear that the skins' projections engage the frame by forming complete, direct contact with the stile (the vertical part) of the perimeter frame. (Id. at sheet 3, Fig. 5 & Fig. 6) The contact depicted in figures 5 and 6 between the skin and the frame is neither indirect nor accidental nor partial. (Id.) Thus, the element "projection engaging said rectangular
frame" is interpreted as meaning that the projection and the frame form complete, direct, intentional contact with one another.

The Court's definition of the term "engage" as complete, direct, intentional contact is consistent with the '540 patent's specification. The portion of the specification that relates to the vertically extending projections reads:

A plurality of vertically extending projections 40 are positioned inwardly from the inner sides 28 of the skins 21,22. As best shown in FIGS. 5 and 6, the projections 40 engage the stiles 34 of the perimeter frame 23. In the present embodiment, a pair of the vertically extending projections 40 are provided or defined along each edge of the skin 21 or 22.

(McQuillen Decl. Ex. A Col. 3) In a separate portion referring to the relationship between the horizontal rails and the rail positioning members (also called rail stops), the'540 patent (referring to figure 9) directs: "the rails 33 abut the rail positioning members 38" and the "rail stops engage the rails[.]") (Id. col. 3, 4 & 6 & fig. 9 (emphasis added)) The fact that the term "abut" is used interchangeably with the word "engage" in the '540 patent's specification concerning the relationship between the rails and the rail stops lends further support to the Court's construction of the term "engage" as requiring direct contact, identical to an abutting relationship. The contact between a rail and a perpendicularly abutting rail positioning member or rail stop (whose role is to stabilize the rail) would be ineffective were the contact between the rail and the rail stop indirect. If an intermediary piece of material, such as a shim, were placed in between the rail and the rail stop such that the rail made indirect contact with the rail stop through the shim, the goal of dimensional stability would be thwarted, and the rail would no longer abut the stabilizing rail stop.

The claim language also distinguishes between the outer side and the inner side of the skin. (McQuillen Decl. Ex. A col. 4) The depictions make clear that the outer side of the skin on all sides of the door faces out toward the world, while the inner side of the skin faces the door's internal construction, and makes contact with the frame and the polyurethane foam. This distinction is important, because the claim specifically locates the vertical projection on the "vertical edge of said inner side" of the skin. (Id.) Furthermore, the claim requires the vertical projection to be positioned facing inward, toward the door's internal construction. (d.)

4. "Capable of Engaging the Support Surface"

PLC asserts that the words "capable of engaging the support surface," '693 patent, col. 4, ll. 46-47, mean that the recessed protrusion is "able to penetrate the support structure." Joint Claim Construction Statement, Attachment A at 4. Bidco, on the other hand, asserts that while the word "engaging" includes penetration, it does not require penetration and therefore, PLC's proposed construction improperly limits the scope of claim 1. The Court concludes that Bidco is correct.

In support of its proposed construction, PLC cites a dictionary definition of "engage" as meaning "to become meshed or interlocked." PLC Brief at 14 (quoting Webster's II New Riverside University Dictionary, 1994, at 433). PLC cites further to the written description, in which the word "engage" is used to connote penetration on at least two occasions. Id. (quoting '693 patent, col. 3, ll. 44-48 (describing a screw as "engaging" the supporting surface) and col. 3, ll. 9-13 (describing prongs as "engaging" the support surface). Finally, PLC cites the prosecution history, quoting the following statement by the inventor in response to the PTO's rejection of original claim 1:

Another advantage of the recessed protrusion is that when a screw or nail is placed in the recessed protrusion to engage a support surface, the protruding part of the support surface extending from the bottom of the clip . . . the protruding part can also engage the support surface to prevent the clip from moving around.

The Court is not persuaded that the word "engaging" is limited to penetration. First, the dictionary definition of "engagement" encompasses any kind of intermeshing or interlocking. Although penetration is one type of intermeshing or interlocking, it is not the only type of engagement. Second, although the inventor used the term "engage" in the specification to signify penetration by screws and prongs, the Court does not find a clear intent on the part of the inventor to limit the
result, the doctrine of prosecution history applies, and Greenkeepers cannot now construe "to enhance traction" more lateral stability and enhanced traction to the plane of a golf swing." (Defs.' Opening, Ex. N, at SS_00005888-89.) As a result, the doctrine of prosecution history disclaimer applies, and Greenkeepers cannot now construe "to enhance traction" more grass or turf to be engaged and hence, more traction," and thus, "[i]t is clear that the outward angulation . . . provides such as the Bouyer patents, that were not outwardly angled on the basis that the '047 Patent's outward angulation "permits prosecution history, however, demonstrates that Greenkeepers then sought to distinguish cleats covered by other patents, cleats covered by the '047 Patent with cleats covered by the Deacon patents for purposes of lateral stability and traction. The claim specification plainly indicates that Greenkeepers sought to compare "the object of the present invention is to provide an improved golf shoe cleat which has better traction and lateral stability," id., col.1, 11.21-38, and "the biggest complaints" of such patents, '047 Patent, col.1, 11.2-3, 15-17, & col.8, 11.16-17, the parties again dispute whether the presumption of definiteness applies. In addition, the parties dispute how to characterize cleats in relation to which the cleats provide improved lateral stability and traction.

1. The Parties' Contentions

Greenkeepers reassert that claim terms are entitled to a strong presumption of validity and definiteness, and that here, tests are available to test lateral stability and traction, as evidenced by a cleat test measuring cleats' relative traction on varying surfaces under different conditions that was conducted by MacNeill, one of the defendants in a related patent case brought by Greenkeepers that has since settled. (Pls.' Resp. 24-25.) According to Greenkeepers, the patent specification indicates that the covered cleats aim to provide "better" traction and stability than existing golf cleats, that being, the cleats referenced in the patent application. (Pls.' Opening 22-23.) Greenkeepers continue that the discussion in Defendants' proposed construction of "substantially similar cleats that are not outwardly angled" or "all types of teeth . . . that are not outwardly angled" has no basis in the intrinsic record and is a veiled non-infringement argument. (Pls.' Opening 23.)

Defendants respond that Greenkeepers have failed to articulate an objective measure for finding enhanced stability and traction or to show how outward angulation in fact provides an enhancement. (Defs.' Reply 12-14.) As for the MacNeill traction test, Defendants contend that this test found little statistical difference in traction among many cleats, because the cleats' performance changed when they were worn in different shoes. (Defs.' Reply 13-14.) Defendants further aver that the '047 Patent's background section cites to prior art patents that cover a wide range of cleats, including ones that were never made, and that Greenkeepers never compared its cleats to this prior art. (Defs.' Reply 11-12.) As for the relevant comparison group, Defendants argue that the claim language indicates that stability and traction are enhanced by the outward angulation of the spikes' outer surface. (Defs.' Opening 23-24;Defs.' Reply 11.)

2. Analysis

Turning first to definiteness, having found "lateral stability and traction through the swing of a golf swing" to be definite, the Court is not persuaded that merely adding the words "to enhance" renders the term indefinite. Greenkeepers have identified one test, the MacNeill test, that was able to objectively measure traction. (Pls.' Resp. 24-25.) Although the MacNeill test arguably showed that traction may also be affected by other factors such as the shoe in which the cleats are attached, this falls short of presenting "clear and convincing evidence," Cement Mfg., 587 F.3d at 1351, that the traction of the golf cleats themselves cannot be measured. As the Federal Circuit has clarified, a "patentee need not define his invention with mathematical precision in order to comply with the definiteness requirement." Oakley, 316 F.3d at 1341. Defendants, therefore, have not met their evidentiary burden and the definiteness presumption applies.

As for the relevant comparison group, the "Background and Brief Description of the Invention" section of the '047 Patent describes the prior art plastic Deacon patents and the "biggest complaints" of such patents, '047 Patent, col.1, 11.21-38, and then explains that "[t]he object of the present invention is to provide an improved golf shoe cleat which has better traction and lateral stability," id., col.1, 11.39-41. The claim specification plainly indicates that Greenkeepers sought to compare cleats covered by the '047 Patent with cleats covered by the Deacon patents for purposes of lateral stability and traction. The prosecution history, however, demonstrates that Greenkeepers then sought to distinguish cleats covered by other patents, such as the Bouyer patents, that were not outwardly angled on the basis that the '047 Patent's outward angulation "permits more grass or turf to be engaged and hence, more traction," and thus, "[i]t is clear that the outward angulation . . . provides more lateral stability and enhanced traction to the plane of a golf swing." (Defs.' Opening, Ex. N, at SS_00005888-89.) As a result, the doctrine of prosecution history disclaimer applies, and Greenkeepers cannot now construe "to enhance traction"
or "enhanced lateral stability and traction" as comparing cleats covered by the '047 Patent to only the plastic Deacon cleats, as opposed to prior art cleats that are not outwardly angled. Accordingly, the Court construes "to enhance traction" and "enhanced lateral stability and traction" to be "for the outward angulation of the tooth traction surface to provide more lateral stability and traction than prior art teeth that are not outwardly angled." The Court views this construction as being less confusing than Defendants' and ECCO's additional proposed constructions.

1. "An elongated cylindrical body having a pair of enlarged diameter cylindrical end portions." Consistent with the claim language, 23 and the specification, 24 the court construes "an elongated cylindrical body having a pair of enlarged diameter cylindrical end portions" to mean "a portion of each end of the elongated body has a larger diameter than the portion of the body containing the middle point of the body."

B. The Claims of the '902 Patent

Spotless claims that plaintiff's products infringe claims 1, 2, 17, 18 and 19 of the reexamined '902 patent. Claim 1 was deemed patentable with certain amendments; claim 2 is dependent on claim 1; claims 17, 18 and 19 were added in their entirety during the reexamination. See TX-23. The text of the claim 1, with the amendments effected during the reexamination in italics, is as follows:

1. In combination, a hanger for garments and other articles comprising:
   a hook having a top contour adapted to engage a rail or other supporting means, said hook having an enlarged display portion extending from the hook such that it projects above the top contour of the hook; and
   an indicating device having a hollow body attached to said display portion, wherein at least a part of the display portion is received within the hollow body of said indicating device; and said indicating device being readily visible when the hanger is in use by virtue of its position on said hook.

TX-23. Claim 2 is dependent on claim 1, and claims 17-19 are substantially similar to claim 1 except that they include the additional requirements that the hanger and indicator be made of molded plastic (both 17 and 18) and that the indicator be color coded (claim 18). 4

--- Footnotes ---

4 The text is as follows:

2. The hanger of claim 1, wherein said indicating device has a body portion formed with means for releasably attaching the said body portion to said display portion.

17. In combination, a molded plastic hanger for garments and other articles and a molded plastic indicating device, said combination comprising:
a hook having a top contour adapted to engage a rail or other supporting means, said hook having an integrally molded plastic flange which forms an enlarged display portion extending from the hook such that it projects above the top contour of the hook which engages said rail or other supporting means; and

said molded plastic indicating device which receives said molded plastic flange to attach said indicating device to said enlarged display portion, said indicating device being readily visible when the hanger is in use by virtue of its position on said hook.

18. In combination, a garment hanger and a color-coded size indicator which is readily visible when the hanger is in use, said combination comprising:

(a) a molded plastic garment hanger, said garment hanger having an integrally molded hook having a top contour to engage a rail or other supporting means;

(b) an enlarged display support integrally molded with said hook and extending upwardly from said hook above the top contour of the hook which engages said rail or other supporting means;

(c) a molded plastic size indicating device mounted on said enlarged display support, said device having a base and formed with a cavity defined within to receive said display support therewithin, said size indicating device being color coded and readily visible from all directions when the hanger is in use by virtue of its position on said hook; and

(d) means for releasably attaching said size indicating device to said enlarged display portion.

19. The hanger of claim 17, wherein said indicating device has a body portion formed with means for releasably attaching said body portion to said display portion.

All of these claims require that the hanger hook contain an "enlarged display portion." Plaintiff has consistently maintained that its products do not infringe the '902 patent because they lack an "enlarged display portion." See TX-179; Pl. Tr. Brief at 17; Tr. at 67. At trial, plaintiff's counsel acknowledged that if plaintiff's products did contain an enlarged display portion, then they would infringe the '902 patent. See Tr. at 512-13. Thus, the salient issue with respect to the infringement claim is what exactly comprises an "enlarged display portion" and whether plaintiff's products contain it. However, to resolve both this infringement issue, as well as the invalidity claim, it is necessary to analyze the prosecution history (or the "file wrapper") of the '902 patent.

C. Prosecution History of the '902 Patent

(1)

When Frank C. Lenthall initially submitted his application to the PTO it contained 17 figures. See TX-60 at 5-24. In the course of the first office action, the patent examiner informed the inventor that the application actually contained five distinct inventions (or species), only one of which Lenthall would be permitted to prosecute. Species A was embodied in figures 1-4, species B was embodied in figures 5-7, species C was embodied in figures 8 and 9, species D was embodied in figures 10-13, and species E was embodied in figures 14-17. See TX-60 at 26; Tr. 290-93.

In this original submission to the PTO, the inventor promulgated a definition of the phrase "enlarged display portion" in the abstract by reference to figure 12, part of species D, of the application. Specifically, he stated: "in the modification shown in Figures 12 and 13, the indicator is basically the same construction as the previous embodiment [figure 10] except that the hanger hook H is not formed with an enlarged display area A." TX-60 at 11. Figure 10 shows a hanger with a protuberance (which the defendants refer to as a "bump") on the side of the hanger hook and a sizer that fits on top of and totally overlaps the protrusion. See TX-60 at 19. Figure 12, by contrast, shows a hanger hook that is perfectly regular in shape, meaning that it lacks any protuberance and looks, quite frankly, like an unadulterated hanger hook. See id. The size indicator fits over the entirety of the hanger hook in figure 12 but extends beyond, or hangs outside, the contour of the hook. See id. As will be
discussed, plaintiff maintains that the protuberance comprises the "enlarged display portion," while defendants insist that it is not the protuberance, but a combination of other qualities that defines the "enlarged display portion."

Confronted with the dilemma of choosing among the five species contained in his original submission, the inventor decided to prosecute species E, which consisted of figures 14-17. The inventor canceled claims 1-14 (which described species A-D) and added claims 15-30. See TX-60 at 29-32. The examiner rejected new claim 15 on the basis of 35 U.S.C. § 102 as anticipated in light of the Ostroll patent, 5 and rejected new claims 16-22 on the basis of 35 U.S.C. § 103 as obvious in light of Ostroll in view of either the Bross patent 6 or the O'Keefe patent. 7 See id. at 36-37. The examiner withdrew from further consideration claims 23-30 "as not readable on the elected species." Id. at 36. Converted to plain English, this appears to mean that the claims were not encompassed within species E, the one the inventor chose to prosecute.

5 The Ostroll patent is TX-220. Ostroll shows (or "teaches") an indicator that is removeably secured to the hook of the hanger, but is positioned on the hook so that it is capable of being viewed from only one end of the hanger. See TX-220; TX-60 at 47.

6 The Bross patent is TX-212. Bross teaches a display card attached to a complex wire indicating guard that is then attached to a regular garment hanger.7 The O'Keefe patent is TX-215. O'Keefe teaches a device that extends above the top of a wire hanger hook to prevent the entanglement of the hangers. In addition to the fact that O'Keefe is restricted by its construction to hangers with wire hooks, it also "only incidently suggest[s] . . . that the device may be formed . . . to receive identifying indicia of various types." TX-60 at 48.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

In response to this office action, the inventor canceled claims 15-22 and added new claims 31-40. See TX-60 at 43-45. Proposed claim 31, on which plaintiff relies for part of its non-infringement argument reads as follows:

a hook adapted to engage a rail or other supporting means, said hook having a supporting means extending from the hook such that it projects above the top contour of the hook; and

an indicating device attached to engage a rail or other supporting means, said indicating device comprising a body formed with a cavity having an entrance opening which receives said supporting means, said indicating device being readily visible from all directions when the hanger is in use by virtue of its position on said hook.

Id. at 43. In the corresponding office action, the patent examiner finally rejected claims 23-30 because they were dependent upon canceled claims, and rejected the new claim 31, quoted above, as obvious "over Ostroll in view of O'Keefe or Conger (TX-217)." TX-60 at 57. According to the examiner: "Ostroll shows the hanger hook provided a support member to receive an indicating element as in the proposed invention and to merely locate it at the top contour of the hook would be obvious from O'Keefe or Conger." Id. at 57. Claim 32 was rejected for the same reasons; claims 33-39 were objected to because they are dependent on a rejected claim; claim 40 was allowed. The inventor then had an interview with the examiner; they discussed the Ostroll, O'Keefe and Conger patents and decided that claim 31 would be amended "to structurally distinguish over references." Id. at 58.

In the next go around, the inventor added proposed claim 41, which harkened back to claim 23 (part of his first submission). This claim reads:

a hook adapted to engage a rail or other supporting means, said hook having an enlarged display portion extending from the hook such that it projects above the top contour of the hook; and

an indicating device attached to said display portion, said indicating device being readily visible when the hanger is in use by virtue of its position on said hook.

TX-60 at 60. As noted, original claim 23 had been dependent on claim 15 (which had been rejected on November 6, 1980 because of anticipation). See id. at 56-57. 8 Claim 23 originally provided: "the hanger according to claim 15, wherein said
hook is formed with an enlarged display area at least adjacent the top of the hook, said display area being formed to
releasably receive said indicating device." TX-60 at 31. Ultimately, the '902 patent was issued by the Patent and Trademark
Office, with claim 41 appearing as claim 1 of the patent. See TX-22 at 5.

8 Although not inconsistent, it appears that claim 23 had been initially "withdrawn from further consideration as not
readable on the elected species" on April 16, 1980. TX-60 at 36. It is unclear to the court why claim 23, after being
withdrawn on April 26, was subsequently further considered and rejected on November 6, 1980. See id. at 56-57.

The inventor continued to press claims 31 and 32 (which did not contain the delimiting "enlarged display support"
terminology). See TX-60 at 62-71. However, in an Advisory Action dated April 27, 1981, claims 31 and 32 were rejected,
see id. at 71, and so the inventor finally abandoned these claims. See id. at 72-73.

To round out this history for purposes of claim construction, it is worth noting that the '902 patent cites six references to
prior art, four of which become significant in this litigation. See TX-22 at 1. In the detailed description of the invention of
the '902 patent, which was not altered upon reexamination, it is described as having one embodiment in which the indicator
is in the form of a trapezium, 9 and:

In another aspect the invention provides a hanger adapted for use with an indicating device, said hanger being
characterized by an enlarged display area attached to or forming part of the hanger and being visible when the garment is on
the hanger, said display area being formed to detachably receive an indicating device which imparts information regarding
the size and/or manufacturer and/or retailer and/or some other garment characteristics.

Id. at 4 (emphasis added). No further guidance is given in the original patent as to what constitutes an "enlarged display
area."

9 This trapezium embodiment is not at issue in this case and thus has not been a part of this discussion.

The history of the '902 patent does not end here, however. For on September 23, 1994, in response to the instant litigation,
defendant requested that the PTO reexamine the '902 patent. See TX-38 at 6-11. During the course of the reexamination,
defendants proposed (and after protracted discourse with the examiner) were permitted to add claims 17, 18 and 19 to the
patent, which are now being asserted against the plaintiff. See id. at 179-82. These claims essentially mirror claim 1, but add
the requirement that the hanger and size cap be made of molded plastic.

Interestingly, however, the reexaminer initially determined that original claim 1 was rejected as being anticipated by
Haimowitz, TX-208, being anticipated by Bruening, TX-209, being anticipated by Cohen, TX-211; claims 1 and 2 were
rejected was being anticipated by Conger, TX-217; and claims 1-4 were rejected as being anticipated by Bross, TX-212. See
TX-38 at 68-69. However, defendants amended these claims to include the requirement that the top sizer be hollow and be
received by the enlarged display portion and they were thereafter accepted by the examiner. See id. at 129, 144. In addition,
defendants had to amend claim 1 to include the requirement that the hanger have a top contour, so that there would be a
proper antecedent for the reference to a top contour later in the claim. See TX-38 at 119-20; 144-45.

Defendants also sought to add a new claim 21, which provided:

[A] hook having a top contour adapted to engage a rail or other supporting means; and an indicating device having a
hollow body formed to interengagingly receive a top portion of said hook; said indicating device being readily visible when
the hanger is in use by virtue of its position on said hook.
TX-38 at 127. However, the examiner rejected this claim, stating that it enlarges the scope of the patent because it "does not include the limitation that the hook has an enlarged display portion" and because it is anticipated by O'Keefe, TX-215, and Richardson, TX-221. TX-38 at 143-44.

During the course of the reexamination of the '902 patent, the PTO examined the following United States patent documents: Cohen, Ostroll, McAuley, Montan, Haimowitz, Bruening, Stuppell, Cohen, Bross, Magnuson, Solow, O'Keefe, Morrish, Conger, Haggar, Bachand, Ostroll, Richardson, Phillips, Johansson, Indelicato and Batts. See TX-23 at 1. The reexamination certificate was issued on January 2, 1996. See id.

1. Claim Construction

In order to engage in proper claim construction, courts must first look to the intrinsic evidence, i.e. the words of the patent claims themselves, the patent's specification and the prosecution history, to glean the meaning of claim terms. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996). According to the Federal Circuit, "[i]n most situations, an analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term. In such circumstances, it is improper to rely on extrinsic evidence [e.g. expert testimony]." Id. at 1583 (citations omitted).

"In construing a claim, claim terms are given their ordinary and accustomed meaning unless examination of the specification, prosecution history, and other claims indicates that the inventor intended otherwise." Nike Inc., 43 F.3d at 646 (citations omitted). It is an oft-repeated patent law maxim that an inventor may choose to be his own lexicographer and to give the terms in his claims special, uncommon meanings. See, e.g., Intellicall, Inc. v. Phonometrics, Inc., 952 F.2d 1384, 1387-88 (Fed. Cir. 1992). However, in order to vest a claim term with a special meaning (in contradistinction to its ordinary meaning) the inventor must "clearly state[] [the special definition of the term] in the patent specification or file history." Vitronics Corp., 90 F.3d at 1582. Moreover:

The place to [specially define claim terms] is in the specification of the inventor's application, and the time to do so is prior to that application acquiring its own independent life as a technical disclosure through its issuance as a United States patent. The litigation-induced pronouncements of [the inventor], coming nearly at the end of the term of his patent, have no effect on what the words of that document in fact do convey and have conveyed during its term to the public.

It should be noted that, in toto, this guidance somewhat begs the question of how precisely courts should determine a term's "ordinary and accustomed meaning" which is subsequently compared to some special meaning that may be vested in the claims, specification and file wrapper by the inventor. Courts seem to look to dictionary definitions for some semblance of clarity in the morass of semantic murkiness that penetrates claim construction. See Nike Inc., 43 F.3d at 647 (describing with approval the use of a dictionary definition by the district court).

Recently the Federal Circuit has instructed that, although dictionaries constitute extrinsic evidence, "judges are free to . . . rely on dictionary definitions when construing claim terms, so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents." Vitronics Corp., 90 F.3d at 1584 n.6; see General American Transp. Corp. v. Cryo-Trans, Inc., 93 F.3d 766, 769-70 (Fed. Cir. 1996) (describing with disapproval the use of a dictionary definition by the district court because it contradicted the definition provided by the prosecution history), cert. denied, Cryo-Trans, Inc. v. General American Transp. Corp., 137 L. Ed. 2d 493, 117 S. Ct. 1334 (1997). That said, according to Webster's Third New International Dictionary, "enlarged" is defined as: "larger or greater than that formerly, usually, or normally present." Thus, it will be assumed that this is the usual and ordinary meaning of the term "enlarged" (as in "enlarged display portion"). Now it must be determined whether or not this definition is consistent with that found in the claims, specification and prosecution history of the '902 patent.

Plaintiff urges that this usual definition is consistent with the intrinsic evidence. First, it argues that because claim 16 contains the term "display portion," then the use of the term "enlarged display portion" in claims 1, 2, 17, 18, and 19 goes to the issue of size and instructs that an enlarged display portion be bigger than a regular display portion. See Pl. Post Tr. Brief at 3-4 (noting that "each word in a claim must have some meaning") (citing Exxon Chem. Patents, Inc. v. Lubrizol Corp., 64
Next plaintiff argues that the prosecution history reinforces, rather than contradicts, the usual meaning of the term "enlarged display portion." In his original application to the PTO, the inventor distinguishes figure 12 from figure 10 by noting that it describes "the same basic construction . . . except that the hanger hook H is not formed with an enlarged display area A." TX-60 at 11, 19. In addition, plaintiff points out that during the reexamination of the '902 patent, the examiner cited five prior art references with what he contemplated as enlarged display portions: Haimowitz, TX-208, Bruening, TX-209, Cohen, TX-211, Conger, TX-217, and Bross, TX-212. See TX-38 at 68-69. All of these teach a display portion that is bigger, in either height or width, so that information can be displayed, than the usual shape of the hook. Thus, according to plaintiff, the intrinsic evidence supports the definition of "enlarged display portion" that requires some kind of protrusion, bump, or protuberance on the hanger hook.

--- Footnotes ---

10 It is agreed that portion and area mean the same thing here. See Def. Post Tr. Brief at 4 n.9.

--- End Footnotes ---

Spotless, however, states an entirely different definition for the term "enlarged display portion," one having nothing to do with size per se. Spotless urges that an enlarged display portion actually has six features:

1) To be formed integrally with the hook of a hanger.
2) The hook has a top contour which is the surface of the hook that engages a rail that supports the hook.
3) The enlarged display portion projects above the top contour of the hook.
4) The enlarged display portion is received in the hollow body of an indicator in a releasable manner so the indicator is detachable but yet restrained against undesirable movement.
5) The enlarged display portion must be large enough to display the indicator so the indicator is visible, i.e. to be seen and read by a normal customer when viewed from a normal distance and visible when the garment is on the hanger.
6) The enlarged display portion must be large enough, i.e. enlarged, to restrain against undesirable movement. In fact enlarged enough to inhibit movement of the indicator.

Def. Post Tr. Br. at 7-8. To justify this special definition, defendants point to the specifications of the '902 patent, arguing that they require only the above qualities, and not that there be any "enlargement" (in a deviating protuberance fashion) from a normal hook. See Def. Post Tr. Br. at 3-7.

Simply put, defendants' definition doesn't really work. In addition to the fact that this counterintuitive, special definition is not clearly stated in the claims, specifications, or prosecution history of the '902 patent, it also fails to account for the differentiation of "display portion" and "enlarged display portion." In spite of the fact that the inventor did not choose to prosecute species D, which contained figure 12 (whose only distinction from figure 10 is that it lacks the enlarged display portion), "through statements made during prosecution or reexamination an applicant for a patent or a patent owner . . . may commit to a particular meaning for a patent term, which meaning is then binding in litigation." CVI/Beta Ventures, Inc., v. Tura LP, 112 F.3d 1146, 1158 (Fed. Cir. 1997). It is also noteworthy that in the CVI case, because the patents did not define the term "elasticity," the Federal Circuit turned to the specifications and found that "the patent drawings are highly relevant in construing the claim. Id. at 1153.

--- Footnotes ---

11 Defendants have pointed out that the drawings are only illustrations and that they do not bind or supercede the claims. This is clearly true. See Def. Post Tr. Brief at 9 (citing Electro Med. Sys., S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994)). But it does not mean that it is improper to analyze the patent drawings during the course of claim.
construction in order to grasp what the inventor was telling the PTO, and the world, about his invention.

Spotless promulgates an inventive, intelligent, but ultimately unpersuasive attempt to tailor claim language to meet the needs of present litigation. In many ways, its complexity alone betrays its failure. One of the principal purposes of a patent claim is to put the world on notice of one's invention, and "competitors are entitled to review the public record, apply the established rules of claim construction, ascertain the scope of the patentee's claimed invention and, thus, design around the claimed invention." Vitronics Corp., 90 F.3d at 1583 (citation omitted). A special definition that requires so intricate a twisting of claim and specification language fails to achieve the proper function of a definition within the patent law on a macro level.

Thus, plaintiff's urged definition of the phrase "enlarged display support" will be accepted for purposes of this litigation. Because this definition comes clearly from intrinsic evidence, it would be improper to consider extrinsic evidence, such as the testimony of defendants' expert, on this issue. See Vitronics Corp., 90 F.3d at 1585 (finding that expert testimony regarding the proper construction of claims "may only be relied upon if the patent documents, taken as a whole, are insufficient to enable the court to construe disputed claim terms. Such instances will rarely, if ever, occur.")

As is often the case, Spotless's infringement argument turns on claim construction. Each of the asserted claims recites a hanger hook having "an enlarged display portion [or support]" that projects above the top contour of the hook and receives an indicating device. The district court construed the term "enlarged display portion," in accordance with the dictionary definition of the term "enlarged," to mean a display portion that is "larger or greater than that formerly, usually, or normally present." Despite Spotless's contentions to the contrary, the court found nothing in the claims, written description, or prosecution history of the '902 patent to suggest that the term "enlarged display portion" should be accorded a different meaning for purposes of the '902 patent. The court therefore rejected Spotless's proposed definition of the term "enlarged display portion," which did not require that the display portion be "enlarged" in the usual sense of that word, but required only (1) that the display portion be "large enough to display the indicator" and to "restrain against undesirable movement" by the indicator, and (2) that the display portion be "received in the hollow body of an indicator in a releasable manner but yet restrained against undesirable movement." Based on its claim construction, the district court found no literal infringement, because the display portion of Carlisle's products do not extend beyond the normal configuration of the hanger hook and thus lack an "enlarged display portion."

The district court's claim construction was correct. Although, as the district court noted, Spotless's proposed construction of the term "enlarged display portion" is "inventive," it does not comport with the ordinary meaning of the term, nor does it find any support in the language of the patent or its prosecution history. "Enlarged" is a relative term; to be "enlarged" means that the "enlarged" object must be larger than some reference object. Spotless's definition of "enlarged display portion" does not come to terms with this basic point. Rather than pointing to some reference object compared to which the claimed display portion is "enlarged," Spotless defines "enlarged" as meaning simply large enough to be inserted into the hollow portion of an indicator and to restrain the indicator from undesirable movement. That definition, however, could be satisfied by a display portion that did not extend beyond the normal contour of the hanger hook; indeed, Spotless's definition could even cover a display portion that was significantly smaller than the normal size of the hook. The district court properly rejected Spotless's definition in favor of the definition suggested by common usage of the term "enlarged."

Accepting the district court's claim construction, we must sustain the court's conclusion that the accused products did not literally infringe any of the asserted claims of the reexamined '902 patent. Spotless does not argue that Carlisle's products literally infringe if the court's claim construction was correct, and we hold that the court was not clearly erroneous in finding that the "display portion" of the accused products is not larger than the normal size of the hanger hooks on those products.
b. "Enlarged Heads"

Claim 1 requires a bone engaging fastener with an "enlarged head." Several claims of U.S. Patent No. 6,533,786 contain a similar limitation, "enlarged heads," which the Court construed in its Order on Cross-Motions for Partial Summary Judgment re: Infringement of the 786 Patent, issued simultaneously with this Order. (See Order at part II.A.2.g.) The Court adopts the same conclusion as to the 927 Patent. "Enlarged head" means a head with a diameter larger than the diameter of the shank. 1

--- Footnotes ---

1 The 927 Patent limits "enlarged heads" by requiring the heads to define "a partially spherical surface complementary to said spherical recess of said at least one hole." The parties do not dispute this portion of the claim.

--- End Footnotes ---

The Court disagrees with Plaintiff's assertion "enlarged head" in the 927 Patent means a head with a greater height than the head of a locking screw. Claim 1 does not refer to locking screws. Many limitations of the 927 Patent contain cross-references to elements of other claim limitations. This shows that, if the drafter of the 927 Patent wanted to compare the head of the bone engaging fastener to the head of the locking screw, he knew how to make such an express comparison.

7. "First Enlarged Interior Diameter"

a. Claim Term:

". . . a first enlarged interior diameter of said PVC pipe at said female end, said first enlarged interior diameter being larger than said predetermined interior diameter . . ."

b. Parties' Contentions

CertainTeed's proposed construction of "first enlarged interior diameter" is "a portion of the interior surface of the female end of the pipe which has an interior diameter greater than the predetermined interior diameter." CertainTeed asserts that this proposed construction is taken directly from the plain meaning of the phrase.

Modern Products' proposed construction of "first enlarged interior diameter" is "a portion of the interior surface of the female end of the pipe which, prior to having threads, has an interior diameter greater than the predetermined interior diameter." In support of this proposed construction, Modern Products states that Claim 1 describes the "first enlarged interior diameter" section as "having internal threads." Thus, it describes the "first enlarged interior diameter" in terms distinct from the "threads" themselves. Therefore, Modern Products avers that the relevant dimension is the interior diameter of this section prior to having threads. This construction is consistent with the surrounding words of the claim, and it is also consistent with the specification. In sum, Modern Products asserts that the threads are distinct from but carved into the first enlarged interior diameter.

c. Court's Construction

The Court concludes that "first enlarged interior diameter" means "a portion of the interior surface of the female end of the pipe which has an interior diameter greater than the predetermined interior diameter." The Court agrees with CertainTeed that this construction encompasses the plain and ordinary meaning of the term. This Court does not read the specification or the actual claim language to support Modern Products' assertion that the term "first enlarged interior diameter" is distinct.
from the "threads." In fact, the claim language states that the first enlarged interior diameter is (1) larger than said predetermined interior diameter and (2) has internal threads to mate. There is no indication from the plain meaning of this limitation that the first enlarged interior diameter is to be considered separate from its threads, when, as stated in the claim, having internal threads is one of the first enlarged interior diameter's defining characteristics. Further, as stated previously, it is improper to rely on the specification to read limitations into the claim, as Modern Products has attempted to do with this term. Liquid Dynamics Corp., 355 F.3d at 1368.

2. "Entering"

The claim language establishes that "entering" means "physically introducing" because the object that is "enter[ed]" is a physical object—the first "carrier." (Filing 64-3, Ex. C, Claim 1 ("entering the first carrier into the LAS . . . .") (emphasis added).) The "first carrier" plainly is a physical object because, among other things, it is marked with a code, the first specimen is placed into it, and it is directed to a workstation for specimen testing. (Id.)

Whereas the inventor used "entering" to refer to the physical introduction of the carrier, he used a different term—"inputting"—to refer to introducing information or data, such as specimen information and test results, into the LIS computer. (Id. ("inputting information regarding the specimen and tests to be conducted on the specimen into a computerized laboratory information system.").) Consistent with the plain claim language, the two terms should not be construed so as to cover the same activity.

Second, the court's construction is supported by dependent claim 2, which discloses the LAS "determining a subsequent location for the first carrier upon reentry of the carrier onto the LAS conveyor system." (Filing 64-3, Ex. C, Claim 2.) This language confirms that "entering" in claim 1 means "physically introducing" because "reentry" in claim 2 expressly refers to determining a (physical) location of the carrier after (physical) reentry of the carrier onto the LAS conveyor system.

Third, the specification further confirms the court's construction. For example, the specification confirms that a physical specimen is "entered" into the LAS in claim 1, not information or data, as would arguably be covered by Plaintiffs' construction: "The physical specimen(s) obtained from the patient is then entered in the laboratory automation system (LAS) designated generally as box 20." (Id. at 3:43-47 (emphasis added).) The specification is consistent with the claim language and further explains that the first carrier is "entered" when physically directed onto a conveyor, to which it is later physically returned.

The carrier is then entered into the LAS by directing the carrier onto a conveyor or other transport media connecting all of the workstations of the laboratory. . . . After completion of a test, a carrier is returned to the conveyor or other transport media of the LAS and directed to any subsequent workstations for other testing . . . .

(Id. at 2:56-68 (emphasis added).)

The preferred embodiment, including figure 2, also confirms that "entering" means the carrier's physical introduction onto the LAS conveyor system at the receiving station. The specification explains that it is "a schematic diagram of specimen movement throughout the laboratory automation system." As explained in the specification, "[t]he specimen arrives at a specimen receiving station 22, where the specimen is entered on a conveyor system designated generally at 24." (Id. at 3:56-59 (emphasis added).)

Finally, when describing the related "reentry" step of claim 2, the specification again confirms that "entry" is a physical introduction of the carrier. Specifically, it explains that after the carrier is physically moved on the system, "reentry" means a physical "reintroduc[tion]" of the carrier onto the conveyor system, followed by a physical "removal from [the] conveyor":

Carrier 26 is then reintroduced on conveyor system 24 to follow the closed loop around to the next workstation assigned to the specimen. Once the testing has been completed, the specimens are forwarded to the specimen archiving station 36 for removal from conveyor 24 and appropriate storage.
Accordingly, the claim language and specification repeatedly show that the carrier is an object that is physically introduced into the LAS, such that the term "entering" in the '415 patent means "physically introducing."

C. "entire outer surface"

Nichols asserts that the term "entire outer surface" should be construed to mean "the greater part of the surface which is exposed to light." In offering this construction, Nichols seeks to modify the term in two ways: first, by altering "entire" to mean something less than the whole and second, by defining "outer surface" of the lure body to mean only that part of the lure body that is exposed to light. The Court addresses each element separately below.

1. "entire"

In its pre-hearing Markman brief, Nichols explained that accessories such as plastic eyes, skirts, hooks, and shanks are often attached directly to the bodies of fishing lures. These accessories create small areas on the lure body that may not be covered by the glitter-containing coating. Thus, Nichols argues that "entire" cannot mean that every bit of surface area is covered by the coating; instead, it must mean that only the "greater part" of the surface of the body is covered by the coating.

Unlike the term "resin coating" construed above, the term "entire" is not ambiguous, nor does it appear from the specification that the patentee has qualified the term in any way. To the contrary, a plain reading of the specification shows that the word "entire" is intended in its ordinary sense. "Entire" means "having no element or part left out" or "complete in degree." Webster's Ninth New Collegiate Dictionary 415 (1987). According to the summary, the "resin coating is applied to all external surfaces of the body of the lure." ( '160 Patent, col. 2, lines 32-33.) Accordingly, claim 1 must be construed to mean that the outer surface of the body of the lure must be completely covered by the coating. In other words, no part of the external surface may be left uncovered by the resin coating.

2. "outer surface"

Nichols argues that the term "outer surface" means only that part of the surface of the lure that is exposed to light. In support of this argument, Nichols explains that the object of the invention is to produce a light-reflecting coating that reflects substantially all of the light incident on the body of the lure. Thus, Nichols argues, portions of the body of the lure that may not receive light because they are covered, for example, by a skirt of trailing plastic streamers, are not the "outer" surface of the body. In other words, only the portions of the lure body that are exposed to light constitute the "outer" surface.
Although this argument has superficial appeal, close examination reveals that it is not consistent with either the claim or the specification. First, even assuming that parts of the lure that are covered by a loose skirt of streamers are not exposed to light, which is by no means obvious, Nichols' interpretation is not supported by the language of the claim. The purpose of the term at issue is to indicate where the resin coating is to be applied—over the "entire outer surface"; it does not address the light-reflecting properties of the coating. (‘160 Patent, col. 5, line 25.) By contrast, it is the following clause that explains how the coating reflects light—by glitter particles. It states: "said glitter particles being substantially uniformly dispersed throughout said coating, whereby substantially all light incident on said body is reflected." (‘160 Patent, col. 5, lines 31-33.) This language demonstrates that the light-reflecting ability of the lure is a function of the amount of glitter in the resin coating and not a function of where the coating is applied.

When the claim is viewed in this way it is clear that Nichols' argument collapses two distinct elements of the claim: one, that the body is covered by the coating, and two, that the glitter in the coating reflects light. Thus, Nichols attempts to modify the first element by inferring a limitation applicable to the second, or in other words, to redefine "outer" surface by reference to the light-reflecting characteristic of the glitter. However, the Court is restricted to interpreting the words of the claim and to accept Nichols' construction would be to expand the claim beyond what the language supports.

Second, Nichols' construction is inconsistent with the specification. Figures 1 and 2, and the drawing on the first page of the patent all depict a lure having a skirt comprised of "a plurality of plastic streamers." (‘160 Patent, figs. 1, 2; ‘160 Patent, col. 3, lines 48-49.) The drawings show a skirt placed over portions of the body that have been covered by the glitter-containing coating (indeed, the skirt covers the entire head of the lure). Thus, it cannot be the case that coating is only applied to those areas of the lure that are not covered by a skirt.

In sum, the Court concludes that no modification of the term "outer surface" is warranted.

5. Claim 8, Element 1, "entirely plastic"

BMS offers no special definition of this term, but argues that it need not be separately defined. Endura proposes that the definition be "exclusively plastic with no non-plastic materials, such as metal screws or staples."

As noted above, the parties have agreed on the definition of "plastic." Nothing in the claim language, the rest of the specification, or the prosecution history, even hints that "entirely" has a special meaning or is a technical term. Endura's definition seems to be an attempt to incorporate its arguments on the types of joints that are permitted, into the definition of the non-wood "second" portion of claim 4. Some type of joint is anticipated, and the interpretation of the material of the second portion is not the place to impose limitations on the way the portions are connected.

"Entirely" is defined as "wholly or fully." Websters Encyclopedic Unabridged Dictionary of the English Language 476 (1989). It is also defined as "to the full or entire extent." Meriam-Websters Collegiate Dictionary 386 (10th ed. 2002).

The court will define this term as follows:

"entirely plastic" means: "made only of plastic."

5. Claim 2: "causing fuel to be entrained through the opening into the interior of the reservoir."

Claim 2 is construed to mean "that fuel is drawn through the opening into the interior of the reservoir."
a. The Envelope

The relevant language of the claim pertaining to the first issue is "an envelope formed of recycled synthetic plastic material encasing said tube throughout its length and outer surface, said envelope having an upper end, a lower end and an outer surface, said envelope upper end comprising an enlarged head adjacent said tube upper end." There is no indication that the term "envelope" was intended to have a novel meaning or that "envelope" is a term of art subject to various meanings. Thus, the Court must presume that the ordinary meaning of the term applies and may look to the dictionary definition of the term. Teleflex, Inc. v. Ficosa N. Am. Corp., 299 F.3d 1313, 2002 WL 1358720, at *7 (Fed. Cir. 2002).

The word "envelope" means "something that envelops; a wrapper, integument, or surrounding cover." The Random House Dictionary of the English Language 650 (7th ed. 1987). To "envelop" means "to wrap up in or as in a covering." Id. While the claim does not expressly state that the envelope is a single piece which includes the plastic sleeve and the enlarged head, the description of the envelope indicates that the enlarged head is an integrated part of the envelope, i.e., a single covering. The "envelope" consists entirely of "recycled synthetic plastic material," and has an upper and lower end, with the upper end consisting of "an enlarged head". The claim thus describes a single plastic piece which covers the entire length of the tube. This construction is consistent with the drawing and specification. Element 14 of the drawing depicts the envelope, which includes both the plastic sleeve, or lower end (26), and the enlarged plastic head (16), which is part of the upper end (22). The plastic covering is shown as a continuous piece. Similarly, the specification, which states that the "synthetic plastic envelope 14 … usually includes an enlarged head formed by the plastic material which may be in the illustrated spheroid configuration," suggests that the enlarged head is integral part of the envelope. The specification also states that "the synthetic plastic envelope 14 includes an upper end 22, upon which the head 16 is defined." Therefore, the Court concludes that the enlarged plastic head is part of the envelope, and Shane Group cannot demonstrate literal infringement.

5. "the envelope defined by the underwater cable"

This phrase is used in claim 7 of the ‘992 Patent. WG argues that this phrase is indefinite and should be struck. Ion argues that the phrase needs no construction and clearly refers to the physical boundary of the underwater cable. Ion maintains that its position is supported by intrinsic evidence within the claim term such as language regarding the reduction of drag and noise.

The Court recognizes that indefiniteness is a high standard, and that, in determining whether a claim is indefinite, all presumptions must be rendered in favor of the patentee. Bancorp Services LLC v Hartford Life Ins. Co., 359 F.3d 1367, 1371 (Fed. Cir. 2004). However, this Court is unable to assign any meaning or construction to this particular phrase as it is used in the claim in question. While Ion may be correct that this phrase was intended to refer to the physical boundary of the underwater cable, nothing in the claim language, the specification, or the prosecution history makes this meaning clear or even readily apparent. Moreover, even taking into account the many ways in which the term "envelope" may ordinarily be understood, the Court is unable to point to any extrinsic evidence that would make the meaning of this term more clear. The Court therefore agrees with WG's expert that the meaning of this phrase cannot be determined with any degree of specificity or definiteness. Accordingly, the Court will, under 35 U.S.C. § 112, P 2, strike the particular clause of claim 7 that contains this phrase, or "wherein the axes of rotation of the wings extends towards the envelope defined by the underwater cable."

3. Claim 6, Step (c)

Step (c) reads: "Forming a second circumferential incision in the epidermis about 3 millimeters cranial to the first circumferential incision, thereby severing at least some of the subcutaneous fascia from the ungual crest ...." Defendant argues that Step (c) is invalid for indefiniteness in two ways.

First, Defendant asserts that the phrase "about three millimeters" provides no instruction to those skilled in the art and is
thus indefinite. Defendant relies primarily on In re Oetiker, 23 U.S.P.Q.2d 1641 (Bd. Pat. App.1990) (finding indefinite the phrase "length on the order of 5 mm" to describe leg portions of a patent), and Ex parte Brummer, 12 U.S.P.Q.2d 1653, 1989 Pat. App. LEXIS 11 at *4 (Bd. Pat. App. 1989) (holding patent claims to a bicycle seat indefinite because the seat's measurements were based on a percentage of the rider's height and weight, reasoning "the same bicycle might fall within this language … when ridden by a rider or one combination of weight and build, but not when ridden by a rider of another"). Plaintiff, pointing to the specification, argues that this terminology has a clear meaning. The specification explains: "The position of the second incision 3 millimeters cranial of the first incision is based upon the average size of the household cat. For smaller animals the distance will be smaller, and for larger animals the distance will be larger." Id.

As stated above, when a "word of degree" is used in a claim, a court "must determine whether the patent's specification provides some standard for measuring that degree." Datamize, LLC, 417 F.3d at 1349. In In re Oetiker, the court held "have a length of the order of 5 mm" indefinite because "there are no guidelines in appellant's specification to enable one skilled in the art to determine whether or not a given leg portion has a length of the order of 5 mm." 23 U.S.P.Q.2d 1641, 1990 Pat. App. LEXIS 37 at *15. In contrast, the '579 patent's intrinsic evidence provides at least some guidance as to the second incision's location and purpose. The specification, which is accompanied by Figure 2, explains:

The traction in the direction T causes the epithelium to release from its distal attachment and permits a second circumferential incision of the redundant epithelium approximately 3 millimeters cranial from the first incision along the line B-B. This second incision allows slightly deeper subcutaneous fascia to be moved cranially over the ungual crest as well.

The position of the second incision 3 millimeters cranial of the first incision is based upon the average size of the household cat. For smaller animals the distance will be smaller, and for larger animals the distance will be larger.

The Federal Circuit, considering similar allegations of indefiniteness, has permitted approximate measurements if the words used are "as accurate as the subject matter permits." See Orthokinetics v. Safety Travel Chairs, Inc., 806 F.2d 1565, 1576 (Fed. Cir. 1986). In Orthokinetics, the court found valid the term "so dimensioned," which the patent used to describe the measurements of a pediatric wheelchair that helped disabled children in and out of cars:

In a wheelchair having a seat portion, a front leg portion, and a rear wheel assembly, the improvement wherein said front leg portion is so dimensioned as to be insertable through the space between the doorframe of an automobile and one of the seats thereof whereby said front leg is placed in support relation to the automobile and will support the seat portion from the automobile in the course of subsequent movement of the wheel chair into the automobile …

Id. at 1568 (emphasis added). The court acknowledged that "one desiring to build and use a travel chair must measure the space between the selected automobile's doorframe and its seat and then dimension the front legs of the travel chair so they will fit in that particular space in that particular automobile," but found that "the claims were intended to cover the use of the invention with various types of automobiles" and that the phrase was "as accurate as the subject matter permits, automobiles being of various sizes." Id. at 1576. The court emphasized that "patent law does not require that all possible lengths corresponding to the spaces in hundreds of different automobiles be listed in the patent, but that all that can be listed in the claims." Id; see also Andrew Corp. v. Gabriel Elecs., 847 F.2d 819 (Fed. Cir. 1988) (finding the words "approach each other," "close to," "substantially equal to" and "closely approximate," which described the configuration of a horn reflector microwave antenna used in long distance telephone and data networks, specific enough because "the same bicycle might fall within this language … when ridden by a rider or one combination of weight and build, but not when ridden by a rider of another"). Rosemount, Inc., 727 F.2d at 1547 (Fed. Cir. 1984) (finding the phrase "close proximity," which described the distance between a mounted transistor and high impedance material, acceptable because the description was "as accurate as the subject matter permits").

In light of Orthokinetics, Andrew Corp. and Rosemount, the Court finds that Defendant has not proved by clear and convincing evidence the phrase "about three millimeters" is indefinite. The claim could be more definite, but in light of the specification, Figure 2 and the variation inherent in cat sizes, the Court finds that one skilled in the art would know where to make the second incision. 8

8 At oral argument, Defendant presented an exhibit depicting five photographs of post-operative cat claws. Dr. Young
testified that he believed the cat claws numbered 3 and 5 were larger-than-average; yet, when defense counsel measured the distance between the striation marks of the first and second incisions, it was less than 3 millimeters. Defendant argues that this in-court exercise demonstrates the indefiniteness of the 3 millimeter estimate and the specification's statement that "for smaller animals the distance will be smaller, and for larger animals the distance will be larger." Although the specification contains the preferred embodiment, which states that the distance between incisions correlates to the size of the cat, the Court will not narrow Claim 6, step (c) accordingly. While the phrase "about three millimeters" is not as precise as possible, the claim avoids indefiniteness because it is not "insolubly ambiguous." Honeywell Int'l, 341 F.3d at 1338; see also Exxon Research & Eng'g Co. v. United States, 265 F.3d 1371, 1375 (Fed. Cir. 2001).

Second, Defendant contends that Step (c)'s use of the word "epidermis" renders it indefinite. Defendant queries how the epidermis, which it defines as "the surface layer of the skin," can be incised in Step (c) if the epidermis has already been incised in Step (a) ("forming a first circumferential incision … in the epidermis …"), 9 noting that the top layer of skin cannot be incised twice. The specification only adds to the confusion, Defendant asserts, because it instructs the surgeon to make a "second circumferential incision of the redundant epithelium approximately 3 millimeters cranial from the first incision." Defendant notes that a medical dictionary defines epithelium as "the covering of internal and external surfaces of the body." See DORLAND'S ILLUSTRATED MEDICAL DICTIONARY 400 (26th ed. 1981). In other words, Defendant argues that the definitions of epidermis and epithelium are mutually exclusive because cutting into the epithelium requires cutting through the epidermis and the underlying layers; thus, both terms cannot be used to describe the skin to be incised in Step (c). Plaintiff counters that "epithelium" and "epidermis" can be used interchangeably when referring to a feline's claw.

A word will not render a claim invalid if it can be given any reasonable meaning: "If the meaning of the claim is discernible, even though the task may be formidable and the conclusion may be one over which reasonable persons will disagree, we have held the claim sufficiently clear to avoid invalidity on indefiniteness grounds." Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1347 (Fed. Cir. 2005) (citing Exxon Research & Eng'g, 265 F.3d 1371, 1375 (Fed. Cir. 2001)). In this case, the '579 patent's subject matter, the other steps in Claim 6, the specification's language, and Figure 2, all taken together, adequately instruct a person skilled in the art that the word epidermis, as used throughout Claim 6, simply means "skin," and does not refer only to the skin's top layer. 10 The patent's intrinsic evidence conveys that the second incision must occur after the first incision during which some skin will have already been retracted. The intrinsic evidence also makes clear that the second incision's purpose is to retract more skin for covering the post-operative wound. Although the claim is certainly not an example of clear drafting, a person skilled in the art would be able to discern the meaning of the word "epidermis" as used in Step (c). Thus, the word does not render the claim indefinite.

10 Indeed, this more general definition has been used in at least one respected medical dictionary. See TABLER'S CYCLOPEDIC MEDICAL DICTIONARY (17th ed. 1993) (defining "epidermis" as "skin").
written in the Jepson 8 format that the phrase "equal flexion and extension gaps" recites a limitation on the scope of the claim. Defendants argue that the phrase "equal flexion and extension gaps" means "the flexion and extension gaps must be measured and formed equal to each other, as the instruments are used to make each resection."

8 A "Jepson" claim is so named after Exporte Jepson, 1917 C.D. 62, 243 O.G. 526. Such a claim is traditionally indicated when the transition phrase begins with the phrase, "wherein the improvement comprises:" Generally, a Jepson claim contains in the following order: "(1) a preamble comprising a general description of all the elements or steps of the claimed combination which are conventional or known; (2) a phrase such as "wherein the improvement comprises"; and (3) those elements, steps, and/or relationships which constitute that portion of the claimed combination which the applicant considers as the new or improved portion." See, 37 C.F.R. § 1.75(e) (1996).

The Language of the Patents' Claims Concerning "Equal Flexion and Extension Gaps."

The preamble of Claim 1 of the '885 patent recites:

1. In a system for making triplanar bone resections for total knee replacement, the system including a set of instruments for resecting the anterior and posterior femoral condyles, the proximal tibia, and the distal femur, the resections being made to provide equal flexion and extension gaps, (Claim 1 of the '885 apparatus patent, emphasis added).

Claim 1 of the '885 is an apparatus claim. Accordingly, the subject matter of claim 1 must be some tangible structure rather than a process. The act of creating equal flexion and extension gaps is a result of using some device. Thus, to provide equal flexion and extension gaps suggests a purpose of a device rather than a structure in a device. Further, the structural limitations in the body of the claim, the L-shaped guide rod and guide member, do not refer back to the phrase equal flexion and extension gaps in the preamble. Therefore, the limitations in the body of the claim are intrinsically set apart from the phrase "equal flexion and extension gaps" in the preamble.

The Specification's Use of "Equal Flexion and Extension Gaps."

The specification's use of phrase "equal flexion and extension gaps" implies that the gaps are a result or purpose of the invention. "The triplanar knee resection system of the present invention ensures equal flexion and extension gaps while providing for proper valgus alignment." (‘885 patent, Col. 8, Lines 37-40.)

The Prosecution History Concerning "Equal Flexion and Extension Gaps."

In the Amendment, plaintiff explained to the examiner that for the prosthesis to be stable in flexion and extension, the gap
between the femur and the tibia should be equal with the knee in both positions. However, plaintiff did not rely on this phrase in his arguments to overcome the cited art. Most notably, the examiner in making his rejection did not consider the phrase equal flexion and extension gaps as a limitation of the claim. In rejecting the '203 patent application, the examiner considered as limitations "inserting the L-shaped guide rod," "affixing the guide member having a slot," "resecting the distal femur," and "the sequential procedure of placing the knee in the flexion and extension position."

Plaintiff and Defendant both assert that the preamble of claim 1 of the '885 patent is written in Jepson form 10. Plaintiff asserts that the Jepson form preamble describes only the environment or purpose in which the claim limitations will function. Therefore, claim 1 is not limited by the phrase equal flexion and extension gaps. Further, plaintiff did not rely on phrase of equal flexion and equal gaps in distinguishing his invention over the reference art. Defendants rely on Rowe v Dror, 112 F.3d 473 (Fed. Cir. 1997), to argue that the preamble of the Jepson form claim is considered to positively and clearly include all of the elements or steps recited therein as limitations on the claimed combination. Rowe, 112 F.3d at 479. However, the Federal Circuit's reasoning in Rowe belies a blanket application of that rule to the instant case. In Rowe, the recited structure in the preamble was a balloon angioplasty catheter. Id. At issue was whether the term "angioplasty" as an adjective acted as a limitation on the balloon catheter. Id. at 477. The court reasoned that "the so-called 'Jepson' form [itself], suggests the structural importance of the recitations found in the preamble." Id. at 479. However in the instant case, the phrase "equal flexion and extension gaps" does not suggest a particular type of general structure; rather, the phrase describes a result achieved by use of the apparatus defined in the claim.

--- Footnotes ---

10 The transition phrase, "the improvement comprising:" signifies a traditional Jepson claim.

--- End Footnotes ---

Conclusion on the meaning of the phrase "equal flexion and extension gaps" located in the preamble of claim 1 in the '885 patent.

The court finds the phrase of "equal flexion and extension gaps" merely describes a purpose of the invention claimed in the '885 patent and does not act as structural limitation on the claimed invention.

1449

The parties dispute the meaning of equal surface area as used in claims 1 and 17 of the '197 patent. Hasbro, referencing a technical dictionary, observes that surface area is generally understood as "a measure of how much area the solid would have if you could somehow break it apart and flatten it out." Barron's Dictionary of Mathematical Terms 327 (Douglas Downing ed., 2d ed. 1995). This construction is important to Hasbro's claim because, under this definition, the facets of a die would not have surface areas equal to one another, as the '197 patent claims, unless those facets were flat. In other words, a die with indented indicia could not, as a matter of mathematics, have facets of equal surface area. See Merriam-Webster Dictionary 257 (1997) (defining "equal" as "of the same measure, quantity, value, quality, number, degree, or status as another."). This is because an indented indicium, whether an arabic numeral or a combination of pips, 4 augments the surface area of a given facet to a greater or lesser extent than another indented indicium. For example, if you were able to break apart a six-sided die, flatten out its facets, and compare them individually, you would see that the facet with six pips would cover more area than the facet with only one pip. No two facets have the same number of pips (the die would not randomly generate numbers otherwise), so it follows that no two facets would have the same surface area. According to Hasbro, because the plain meaning of equal surface area is readily understandable in light of the technical definition above, construction is at an end. Bowling responds that Hasbro's construction contradicts how a person of ordinary skill in the art of game playing would interpret equal surface area, ignores the specification, and, if accepted, would exclude the preferred embodiment of the invention.

--- Footnotes ---

4 A pip is a type of indented indicium that resembles a polka dot.
Without endorsing all of Bowling's characterizations of the '197 patent, the Court agrees that Hasbro's construction cannot withstand a fair reading of the specification, and that its reliance on the extrinsic evidence of dictionary entries is, under the circumstances here, misplaced.

The construction of patent claims is a matter of law properly subject to summary disposition. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 977-79 (Fed. Cir. 1995). "It is a bedrock principle of patent law that the claims of a patent define the invention to which the patentee is entitled the right to exclude." Innova/Pure Water, Inc. v. Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1115 (Fed. Cir. 2004). In construing claims, inquiring courts are to give claim terms "their ordinary and customary meaning," which is the meaning the terms "would have to a person of ordinary skill in the art in question at the time of the invention." Phillips v. AWH Corp., 415 F.3d 1303, 1312-13 (Fed. Cir. 2005). "In some cases, the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood words." Id. at 1314. On such occasions, general purpose dictionaries may assist the court in ascertaining the correct construction of the claims. Id.

Where, as here, the claim terms are not so readily susceptible to interpretation, Phillips outlines what sources the district court may consider and teaches how much weight a particular source deserves. First and foremost, the intrinsic record, which consists of the claims themselves, the specification, 5 sometimes referred to as the written description, and, where relevant, the prosecution history, 6 provides the best guidance as to a claim's meaning. Id. at 1313-15. Among the sources of intrinsic evidence, Phillips places primary importance on the claims themselves, but recognizes that the claims "are part of 'a fully integrated written instrument,' consisting principally of a specification that concludes with the claims." Id. at 1315 (quoting Markman, 52 F.3d at 978). For this reason, "claims 'must be read in view of the specification, of which they are a part.'" Id. (quoting Markman, 52 F.3d at 979). Indeed, "the specification 'is always highly relevant to the claim construction analysis. Usually, it is dispositive; it is the single best guide to the meaning of a disputed term.'" Id. at 1315 (quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996)); see Metabolite Labs., Inc. v. Lab. Corp. of Am. Holdings, 370 F.3d 1354, 1360 (Fed. Cir. 2004) ("In most cases, the best source for discerning the proper context of claim terms is the patent specification wherein the patent applicant describes the invention."); Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1478 (Fed. Cir. 1998) ("[t]he best source for understanding a technical term is the specification from which it arose, informed, as needed, by the prosecution history"); Standard Oil Co. v. Am. Cyanamid Co., 774 F.2d 448, 452 (Fed. Cir. 1985) ("The descriptive part of the specification aids in ascertaining the scope and meaning of the claims inasmuch as the words of the claims must be based upon the description. The specification is, thus, the primary basis for construing the claims.").

--- Footnotes

5 Section 112 of Title 35 of the United States Code defines the patent specification as follows:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same, and shall set forth the best mode contemplated by the inventor of carrying out his invention.

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

6 The prosecution history "consists of the complete record of the proceedings before the PTO [the Patent and Trademark Office] and includes the prior art cited during the examination of the patent." Phillips at 1317. Although generally not as useful in construing a claim as the specification, the court may consider the prosecution history if it is in evidence. Like the specification, the prosecution history "can often inform the meaning of the claim language by demonstrating how the inventor understood the invention and whether the inventor limited the invention in the course of prosecution, making the claim scope narrower than it would otherwise be." Id.; see also Chimie v. PPG Indus., Inc., 402 F.3d 1371, 1384 (Fed. Cir. 2005) ("The purpose of consulting the prosecution history in construing a claim is to exclude any interpretation that was disclaimed during prosecution.") (internal quotations and citation omitted). In this case, neither party uses the prosecution.
history of the '197 patent to support their respective construction of the disputed claims. Hasbro urges the Court to take judicial notice of the prosecution history (along with other material most of which need not be addressed), but did not formally move it into evidence. This writer's review of the material Hasbro submitted, if it constitutes the entirety of the prosecution history, has revealed nothing of significance to the present question.

Additionally, extrinsic evidence, such as dictionaries, treatises, and expert testimony, may provide guidance in certain circumstances, although such sources should be used with caution. In all its forms, extrinsic evidence is recognized as "less significant than the intrinsic record in determining the 'legally operative meaning of disputed claims language.'" C.R. Bard, Inc. v. U.S. Surgical Corp., 388 F.3d 858, 862 (Fed. Cir. 2004) (quoting Vanderlande Indus. Nederland BV v. Int'l Trade Comm'n, 366 F.3d 1311, 1318 (Fed. Cir. 2004)). Of particular relevance here, a dictionary definition cannot trump an inventor's definition of claim language in the specification if the two are irreconcilable. See Phillips, 415 F.3d at 1320-24; see also Autogiro Co. of Am. v. United States, 384 F.2d 391, 397, 181 Ct. Cl. 55 (Cl. Ct. 1967) ("Often the invention is novel and words do not exist to describe it. The dictionary does not always keep abreast of the inventor. It cannot."). Phillips discussed this point at length:

The main problem with elevating the dictionary to such prominence is that it focuses the inquiry on the abstract meaning of words rather than on the meaning of claim terms within the context of the patent. Properly viewed, the "ordinary meaning" of a claim term is its meaning to the ordinary artisan after reading the entire patent. Yet heavy reliance on the dictionary divorced from the intrinsic evidence risks transforming the meaning of the claim term to the artisan into the meaning of the term in the abstract, out of its particular context, which is the specification. The patent system is based on the proposition that claims cover only the invented subject matter.

Phillips, 415 F.3d at 1321. Accordingly, "a patentee may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning," Boss Control, Inc. v. Bombardier Inc., 410 F.3d 1372, 1377 (Fed. Cir. 2005), and, if he does, his lexicography governs. This is true whether the specification expressly defines, modifies, or redefines terms used in the claims, Texas Digital Sys., Inc. v. Telegénex, Inc., 308 F.3d 1193, 1204 (Fed. Cir. 2002) ("[T]he presumption in favor of a dictionary definition will be overcome where the patentee, acting as his or her own lexicographer, has clearly set forth an explicit definition of the term different from its ordinary meaning"), or whether the specification does so by implication, Vtronics Corp., 90 F.3d at 1582; see also Irdeto Access, Inc. v. Echostar Satellite Corp., 383 F.3d 1295, 1300 (Fed. Cir. 2004) ("Even when guidance is not provided in explicit definitional format, the specification may define claim terms by implication such that the meaning may be found in or ascertained by a reading of the patent documents.") (internal quotation marks and citation omitted); Bell Atl. Network Servs., Inc. v. Covad Comm'ns Group, Inc., 262 F.3d 1258, 1268 (Fed. Cir. 2001) ("[A] claim term may be clearly redefined without an explicit statement of redefinition.").

The critical question here is whether an ordinary artisan would read equal surface area in the '197 patent as a mathematical absolute, limited, as Hasbro maintains, only by the bounds of mechanical perfection. Or is equal surface area something less exacting, as Bowling contends? The claims themselves offer no guidance. Claim 2 states simply that "discrete facets include printed indicia," and a separate component of claim 17 says that "extension member facets having indicia thereon indicating a number," but these claims make no mention of indented indicia, or how such impressions (necessarily causing variances in surface area among facets) would affect claims 1 and 17.

The claims become more susceptible to interpretation when read in the contextual light of the specification. In pertinent part, the specification states: "Preferably, each of the discrete facets are identically shaped and have equal surface areas to each other. That is, each of [the] facets has a surface area which is equal to and no greater and no less than the surface area of any other of the facets," (emphasis supplied), and, further along, "Preferably, each of the facets has a surface area of about 0.0089 to 0.89 sq. in., typically about 0.089 sq. in." (Emphasis supplied.) A superficial read of the written description would seem to indicate that a die with flat facets is the preferred embodiment of the invention. However, the patent illustrations show that such a construction could not have been intended. The illustrations of Bowling's six-sided die, provided below, unmistakably display facets with indented arabic numerals. See, e.g., Permutit Co. v. Graver Corp., 284 U.S. 52, 60, 52 S. Ct. 53, 76 L. Ed. 163, 1931 Dec. Comm'r Pat. 745 (1931) (recognizing that "drawings may be referred to for illustration and may be used as an aid in interpreting the specification or claim"); Playtex Prods., Inc. v. Procter & Gamble Co., 400 F.3d 901, 909 (Fed. Cir. 2005) (examining patent illustrations to support the construction of a claim term); Autogiro, 384 F.2d at 397 ("In those instances where a visual representation can flesh out words, drawings may be used in
the same manner and with the same limitations as the specification."); cf. Vas-Cath Inc. v. Mahurkar, 935 F.2d 1555, 1565-67 (Fed. Cir. 1991) (noting that "drawings alone may provide a 'written description' of an invention"). Under Hasbro's strict construction, the claims would exclude the very die depicted below (not to mention the dice that Bowling has manufactured and marketed). This is an absurd result that this writer refuses to reach. Cf. Chimie, 402 F.3d at 1377 (refusing to read the claim "dust-free and non-dusting" in its hyper-literal sense, i.e., that the invention creates absolutely no dust, and instead construing the term to mean a very low level of dust because the former would not read on the preferred embodiment and there was no "highly persuasive evidentiary support" to suggest otherwise).

Even if perfectly flat facets were the preferred embodiment, this would not be the only embodiment that the '197 patent protects. Use of the word "preferably" would be superfluous were a die with facets of perfectly equal surface area the only (and not just the best) example of the invention. The very purpose of the specification is "to teach and enable those of skill in the art to make and use the invention and to provide a best mode for doing so." Phillips, 415 F.3d at 1323. "One of the best ways to teach a person of ordinary skill in the art how to make and use the invention is to provide an example of how to practice the invention in a particular case." Id. Often, these examples will be very specific to aid instruction. Confining the claims to those embodiments, without indication that the claims and the embodiments are to be strictly coextensive, would defeat this purpose. See, e.g., Nazomi Commc'n's, Inc. v. ARM Holdings, PLC, 403 F.3d 1364, 1369 (Fed. Cir. 2005) (noting the specification's different emphasis on subject matter); Playtex, 400 F.3d at 905-06 (consulting the specification is "for enlightenment and not to read a limitation from the specification"); Phillips, 415 F.3d at 1323 (observing that "although the specification often describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments"); Gemstar-TV Guide Int'l, Inc. v. Int'l Trade Comm'n., 383 F.3d 1352, 1366 (Fed. Cir. 2004) (same); Scimed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1340 (Fed. Cir. 2001) (reading a limitation from the specification into the claims is "one of the cardinal sins of patent law").

Hasbro argues that the indented indicia depicted in the illustrations could be filled in and made flush with the facets, thus complying with its proposed construction of the claims. This argument, although creative, is unsupportable and therefore rejected. Hasbro does not identify any intrinsic evidence to explain away the clear disconnect between its construction and the patent illustrations. (The claims are altogether neutral in this regard, as discussed above; the specification is the same: "]extension member 28 functions to display indicia such as polka dots, or numbers or digits.") As for extrinsic evidence, Hasbro points to three state regulations that establish minimum standards for dice used in table games, i.e., gambling. These regulations require that such dice contain indented pips (or an equivalent) that are filled in with a compound and made perfectly flush with the surrounding facet. 68 Ind. Admin. Code § 14-3-3 (1996); accord Mo. Code Regs. Ann. tit. 11, § 45-5.260 (1999); N.J. Admin. Code § 19:46-1.15 (1997). If anything, these regulations, which are, by definition, less reliable than the specification into the claims are "one of the cardinal sins of patent law").

Other extrinsic evidence cuts against Hasbro's position -- itself an observation that underscores the primacy of the intrinsic record in claims construction. See Phillips, 415 F.3d at 1318 ("[T]here is a virtually unbounded universe of potential extrinsic evidence of some marginal relevance that could be brought to bear on any claim construction question . . . . [E]ach party will naturally choose the pieces of extrinsic evidence most favorable to its cause."). For instance, Bowling's expert witness, Kevin Cook, who boasts the world's largest collection of dice, testified that the dice in the '197 patent are for role-playing games, like Dungeons & Dragons. These types of games do not require dice with the precision of gambling dice. As long as the die remains a "fair playing die," as specified in the written description, negligible variances in surface area are acceptable. Thus, according to Cook (and Bowling, who testified as well), the '197 patent covers both "precision dice" (dice with perfectly equal surface area that would be acceptable for table games) and "loose dice" (dice with negligible
variances in surface area commonly used in role-playing games).

--- Footnotes ---

7 Expert testimony is valuable for providing background on the technology at issue, explaining how an invention works, or describing a distinctive use of a term in a particular field. However, like dictionaries, expert testimony is less reliable than intrinsic evidence for the interpretation of claims. Phillips opined, for example, that expert testimony is "generated at the time of and for the purpose of litigation and thus can suffer from bias that is not present in intrinsic evidence." Phillips, 415 F.3d at 1318. The Court refers to expert testimony here simply to counter Hasbro's claim that the extrinsic evidence in this case supports its proposed construction.8 Cook testified via video deposition, which was admitted into evidence.

--- End Footnotes ---

Hasbro, of course, objects to the notion that the '197 patent covers anything other than precision dice. To support this argument, Hasbro relies upon the description of "center of symmetry," which the specification defines as follows:

By "center of symmetry", it is meant a point that is related to a geographical figure in such a way that for any point on the figure, there is another point on the figure such that a straight line joining the two points is bisected by the original point. Each of the surface area of discrete facets of extension member 28 are equal. The combination of the center of symmetry being the center and the equal surface areas of facets 32 provides for a fair playing die. That is, no one facet 32 is more likely to be rolled than any other of the facets 32.

For reasons that are not so easily explained, indented indicia distort a die's center of symmetry. However, this argument suffers from the same flaws as Hasbro's earlier argument. At best, precise center of symmetry is, like perfectly equal surface area, just the preferred (and not the only) embodiment of the invention. Additionally, the paragraph immediately preceding the discussion of center of symmetry reinforces Cook's commentary about role playing:

The inventor has discovered that the configuration of the die 20 is advantageous. In particular, the shape of the end caps 24, 26 provides for more bounce when dropping die 20 onto a surface. That is, to generate a random number, the user hold die 20 above a surface at a sufficient distance, such that when die 20 is dropped onto the surface, die 20 rolls before eventually resting upon one of the facets 32 of the extension member 28. . . . The shapes of the end caps 24, 26 provide for more bounce and randomness when die 20 is dropped onto a surface. The tapered, triangular shapes of end caps 24, 26 provide for surfaces which can abut and engage the surface on which die 20 is being dropped, to create a more interesting and amusing outcome.

In the final analysis, the intrinsic evidence, on the whole, rejects Hasbro's rigid construction of equal surface area. The technical dictionary, state regulations, and expert testimony (all extrinsic evidence) are either inconclusive or tend to support Bowling's construction. Accordingly, "discrete facets being identically shaped and having equal surface areas" shall be construed as discrete facets being identically shaped and having equal surface areas, without regard to negligible variances in surface area caused by indented indicia, and "extension member facets being equal in surface area" shall be construed as extension member facets being equal in surface area, without regard to negligible variances in surface area caused by indented indicia.

GO BACK

1450

11.1 The Claim Language of Claim 10

10. [The combination according to claim 1] Lighting apparatus including in combination:

- reflector means having a base end of first size and a light-emitting end of a second size larger than said first size and having a center line extending from the center of the base end to the center of the light-emitting end thereof;
lamp support means located within said reflector means at the base end thereof or supporting a plurality of compact fluorescent lamps substantially equally angularly displaced about said center line within said reflector means between the base end and the light-emitting end thereof; said lamp support means including at least two lamp support surfaces on said lamp support means on opposite sides thereof and angled toward the base end of said reflector means for causing compact fluorescent lamps supported thereby to extend outwardly at an angle from said center line toward the light emitting end of said reflector means to substantially parallel said reflector means;

means for supplying operating electric power to lamps supported by said lamp support means; and

wherein said lamp support means includes eight equally-spaced lamp support surfaces thereon.

11.2 Claim Interpretation Analysis

Claim 10 is identical to Claim 1 except for the following additional limitation: “wherein said lamp support means includes eight equally-spaced lamp support surfaces thereon.” Claim 10 should therefore be interpreted identically to Claim 1 except that it includes a further limitation requiring the presence of eight lamp support surfaces which are equally spaced relative to one another. “Equally spaced” means spacing which is equal and requires equal spacing between all eight lamp support surfaces.

1. Eschar 10

10 ConMed argues that I should define eschar "simply the same as the disputed term 'improved eschar'…." Docket No. 58, p. 12-13. I disagree. Where possible, I should try to give each term an independent meaning, such that no term is rendered superfluous. In doing so, I must construe the term eschar separate from the term improved eschar, since they appear separately in the claim. See, Docket No. 58, Ex. A, col. 36, ll. 67-68, and col. 37, l. 9.

The first disputed claim term "eschar" is found in Claim 1.

ConMed's Proposed Definition: A layer of tissue at its surface which has been altered by electrical current to promote a physiological seal against oozing blood and natural fluids.

Canady's Proposed Definition: A dry scab formed after a burn. 11

(Docket No. 58, Ex. B, p. 1; Docket No. 66, p. 47). After a review of the claim term itself, it is evident that one of ordinary skill in the art would understand the term eschar to mean a dry scab formed after a burn. See, The Random House College Dictionary, p. 450 (Revised Ed. 1980)(defining eschar as a hard curst or scab, as from a burn). This is supported by the specifications. Docket No. 58, Ex. A, col. 5, ll. 11-13. Consequently, I construe the term "eschar" to mean a dry scab formed after a burn.

11 Contrary to ConMed's position, Canady's proposed definition is not a raised scab formed after a burn but a dry scab formed after a burn. Compare, Docket No. 67, p. 12; with Docket No. 66, p. 47.
1452

F. Fills Essentially Completely

ICU's Construction    RyMed's Construction
(No construction necessary)

Fills all or almost all Fills all of or almost all of
the cavity adjacent to the opening to prevent fluid from leaking between the seal and the wall structure

The claim term "fills essentially completely" appears in claim 1 of the '866 Patent, and claims 1 and 2 of the '862 Patent. RyMed contends the claim term need not be construed, but that ICU had insisted it needs construction. (D.I. 116, at 32.) However, in its Answering Brief, ICU concedes that, "in an effort to reduce the number of terms for the Court to consider, and because it appears that this will not make a difference in the infringement or invalidity analysis, ICU can agree to the construction proposed by RyMed." (D.I. 172, at 20.) Thus, the Court concludes that "fills essentially completely" means "fills all of or almost all of the cavity adjacent to the opening to prevent fluid from leaking between the seal and the wall structure."

1453
c. ESSENTIALLY DEVOID: Intrinsic Evidence

Plastpro next argues that "essentially devoid" should be construed as "lacking or having an absence of, except for trace or residue amounts." Therma-Tru contends that the term is more appropriately defined as "virtually or in essence devoid," but offers no intrinsic or extrinsic evidence to support its construction. Therma-Tru reasons that while the phrase does not connote the absolute exclusion of glass fibers from the surface of the skin, the proper construction of the term must functionally prevent a surface that wicks stain. Plastpro objects to Therma-Tru's proposed meaning because its inherent ambiguity does not provide a meaningful standard against which infringement can be judged.

The intrinsic evidence does not contain an explicit definition of "essentially devoid." However, the '540 specification and the prosecution history do offer some helpful assistance. The '540 patent's enumeration of the supposed advantages of a fiber-free surface is prefaced by: "The elimination of glass fibers from the surface of the exterior side provides the present structure with several advantages." (McQuillen Dec., Exh. A, col. 3, ll. 16-18.) (emphasis added). Similarly, an amendment to the '549 CIP application contained the following Remark: "The combination of opposed SMC panels . . . where the exterior surface is devoid of glass fibers . . . results in a door assembly which is far superior to prior art doors." (Id., Exh. D, at 47) (emphasis added). In other words, the unqualified use of the terms "elimination" and "devoid" indicates a complete lack of fibers. A fair and plain reading of these descriptions suggests to a person skilled in the art that no glass fibers should be present in the outer 0.005 inch of the door skins.

Logically, then, "essentially devoid" must mean as near as possible to a complete absence, or at most trace amounts of glass fibers. Plastpro's cited dictionary references support such a meaning. See McQuillen Dec., Exh. AA, THE RANDOM HOUSE COLLEGE DICTIONARY 451 (listing "essentially" as synonymous with "fundamentally," "inherently," or "intrinsically"). Unlike Therma-Tru's "virtually or in essence devoid," Plastpro's construction is not only consistent with the specification and prosecution history, but lends itself to quantification and therefore provides a standard for infringement. If the meaning of "essentially devoid" is ambiguous, "virtually devoid" does little to clarify it. The phrase "essentially devoid" is interpreted as meaning "lacking or having an absence of except for trace or residue amounts."

Restated in light of these constructions, the fiber-free claim limitation becomes: "outside of said skin lacking or having an absence of glass threads or filaments or pieces thereof except for trace or residue amounts for a predetermined depth of at
least 0.005 inch." The Court need not construe the phrase "predetermined depth" because it is not necessary to resolve this infringement action.

1454

Essentially

This term is used in claim 16 of the '990 patent to describe the location of the means for nebulizing water (spray racks): "positioned essentially in said air duct constructed portion." (emphasis added). This term can be viewed in the context of the specification, column 8 at lines 59 through 61 and reference to Fig. 1, which depicts the various parts of the inlet air duct. According to the specification (column 11, line 67 through column 12, line 5), the spray rack can be positioned anywhere between the inlet air filter and the compressor inlet, but preferably in the constricted portion (137) of the inlet air duct.

Dow reads this term as meaning "inside the constricted portion of the duct or near enough to achieve the stated purpose." 2 Mee, however, contends that "essentially" as used in this context means "in or substantially in." Thus, the question becomes, does "essentially" mean that the spray rack needs to be at least partially within the constricted portion of the duct, or merely near it?

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

2 See '990 patent, column 12, lines 6 through 13.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -

The Court finds that as used in this context, "essentially" means that the spray rack must be located within the constricted portion of the inlet air duct or at least partially therein. 3 Otherwise, the claim would have referred to the means as positioned in or near the constricted portion. If the inventor intended the spray rack to simply be near the constricted portion, he could have easily said so. Thus, "essentially" must be read more narrowly.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 As commonly understood, something that is wholly outside a defined space (albeit near it) cannot be "essentially" in it. Dow has offered no evidence that anyone skilled in the art would assign a different meaning to the term.

- - - - - - - - - - - - End Footnotes - - - - - - - - - - - -

Accordingly, the Court finds that "essentially" means:

In or partially in.

1455

4. "A Structure That Is Essentially One Piece"

The phrase "a structure that is essentially one piece" is used in all of the independent claims at issue. Rhino argues that this phrase should be construed to cover a structure "that is basically, fundamentally, substantially or virtually a single piece in its basic form or use." (Doc. 31 at 11-12; Doc. 81 at 11-12.) Berg contends that the phrase means "a structure assembled from separate individual components using both screws and a waterproof glue type adhesive to form a permanent one-piece structure that cannot be disassembled." (Doc. 75 at 19-20.) Neither proposed construction is supported by the language of the claims and specification.
As discussed supra Part III.A.1, Berg's proposed "separate individual components" limitation is inconsistent with the entire '889 patent, which clearly discloses and claims a plastic molded ramp. Likewise, Rhino's attempt to define "essentially one piece" as referring to the structure while it is in use is unavailing. Within the claims of the '889 patent, this phrase is only used as part of the claimed function of the means-plus-function element, see supra Part III.A.3, as follows:

[Means interconnecting all internal interlocking longitudinal and transversal cross members with the sides, inclined, rear and top [plane or surface] of the structure to form a structure that is essentially one piece . . . .

(Doc. 1, Ex. A at cols. 5-6 (emphasis added)). As is clear and unambiguous from this claim language, "essentially one piece" does not refer generally to the ramp while it is in use; it refers to the ramp after it has been constructed or assembled with the corresponding structures defined supra Part III.A.3. This conclusion is buttressed by the language in the specification. Like in the claims, the specification's only reference to an "essentially one piece" structure involves the construction of the ramp: "All components are held together . . . making the entire structure essentially one piece." (Doc. 1, Ex. A at col. 3, lines 61-64.)

Accordingly, the court will construe "a structure that is essentially one piece" as "a structure that is basically, fundamentally, substantially, or virtually a single piece after being constructed or assembled with (1) screws and a waterproof glue type compound, (2) plastic, or (3) their equivalents."

1457

The second relevant clause in claim 1 of the '527 patent is found within limitation part '(c),' and provides for "establishing continuous fluid communication between the interior drainage space of the basket and a treated water outlet conduit." Contech argues that "establishing continuous fluid communication" between the drainage space and the outlet conduit commences only at the moment when "siphoning begins." (Pl.'s Opp. Mem. at 15.) According to Contech, "the moment of establishing continuous fluid communication, as explained in the specification of the '527 patent, corresponds to the moment at which siphoning begins when the interior drainage space fills with water to purge air." (Id. at 17.) BaySaver and AccuBid, however, argue that if the construction now offered by Contech is adopted, then a continuous fluid communication necessarily requires some kind of siphon priming valve, as demonstrated in the '527 patent specification. (See Def.'s Mem. at 17-19; see also '527 patent, col. 3, ln. 40-46.) Additionally, BaySaver and AccuBid appear to argue in the alternative a definition of continuous fluid communication that was offered by the plaintiff Stormwater Management, Inc. ("Stormwater"), Contech's predecessor, in the previous matter of Stormwater Management, Inc. v. CDS Techs., Inc. (Case No. CV 04-414) (the "Oregon litigation"). In that case, Judge Michael W. Mosman of the District of Oregon agreed with Stormwater and defined "establishing continuous fluid communication" as "to bring into existence or cause a stream of fluid without any interruptions breaking the stream into unconnected segments." Id.

Again, because there is no indication that the '527 patent defines the "establishing continuous fluid communication" clause in an idiosyncratic fashion, the words in the claim should be given their "ordinary and accustomed meaning." Frank's Casing, 292 F.3d at 1374. The construction offered by Judge Mosman provides the ordinary meaning of the clause, and is consistent with Stormwater's prior claim construction argument in the Oregon litigation. As Stormwater argued in that case, "establishing continuous fluid communication means establishing a stream of fluid from the interior drainage space to the treated water outlet conduit that is not completely interrupted by one or more gaps that break the stream into unconnected segments." (Def.'s Mem. at Ex. J, Stormwater Mem. at 16.) Finding no reason to stray from the ordinary meaning of the clause, "establishing continuous fluid communication" will be construed as meaning to bring into existence or cause a stream of fluid without any interruptions breaking the stream into unconnected segments.
Disputed Claim Language
Evacuating the chamber of gases from the chamber.

ASM's construction
Removing reactant gases

Genus's construction
Reducing the pressure in the chamber with a vacuum pump to remove the gases.

As with the '590 patent, the parties dispute whether evacuating the chamber of the reactant gases requires a vacuum pump, or should be more broadly construed to encompass any method of removing the reactant gases from the chamber.

There are only five places in the specification of the '365 patent that discuss evacuation. Twice during the discussion of the '430 patent, the specification states that the excess gaseous reactants are removed by "evacuating the chamber with a vacuum pump." ('365 patent 1:59-60; 1:67.) The other three uses of the word appear during the description of the preferred embodiment illustrated by Figures 1 and 2, where the specification repeatedly states that the reactor vessel is evacuated with a vacuum pump. (Id. 6:26-43.) Thus, the only explicit mentions of "evacuation" in the specification all refer to the use of a vacuum pump. The '365 patent's description of the flow system of the '973 patent does not use the word "evacuate," but instead states that in the invention of the '973 patent "the excess of each gas is removed by flowing a purge gas through the reactor between each exposure cycle." (Id. 2:12-14.)

The abstract of the '365 patent twice states that the excess reactants are removed by a pump. ('365 patent, Abstract). The summary of the invention describes only one embodiment, in which pumps are used to remove excess reactants. ('365 patent 5:9-20.) Figure 1 which describes one preferred embodiment, shows a vacuum pump to evacuate gases, and does not show any other method of emptying the chamber. ('365 patent 5:53-6:25.) Genus' expert, Dr. Oldham, also opines that a person of ordinary skill in the art would understand clearly that the specification's description of a chamber that is sealed with O-rings, flanges and valves describes a non-flow vacuum system. (Oldham '365 Expert Report at 6.) Similarly, Figure 2, which illustrates a process cycle, employs a vacuum pump. ('365 patent 6:27-43.) Figure 3, which describes another preferred embodiment, also shows no way of emptying the chamber other than by use of a vacuum pump. 5 The only other section of the specification where removal of the gases from the reaction chamber is mentioned in the context of the invention of the '365 patent also discusses the use of a pump to remove the gases. ('365 patent 7:52-59.)

5 Although the inventor, Arthur Sherman, testified at deposition that the radical generator and the vessels for the first reactant could be used to introduce inert gases into the chamber, he acknowledged that he did not describe that use in the patent. (Gasner Decl., Ex. 14, Sherman Dep. 65:7-16.)

In sum, the '365 patent uses the term "evacuate" only to describe removal of gases with a vacuum pump. In addition, every description of the removal of excess reactant gases in the context of the invention of the '365 patent also mentions the use of a vacuum pump.

ASM argues that because the '365 patent defines "sequential chemical vapor deposition" by reference to '973 patent, which does not use a vacuum pump to remove excess reactants, the patent is using "evacuation" broadly enough to encompass the method of the '973 patent. Although the Court agrees that "sequential chemical vapor deposition" is used broadly enough to encompass the '973 patent, it does not necessarily follow that "evacuation" is used so broadly. In fact, the claims define specific types of sequential chemical vapor deposition processes, in each of which the chamber is evacuated of gases. Nothing in the patent language itself suggests that "evacuation" is accomplished in any way other than by using a vacuum pump.

Other language in the claims also demonstrates that "evacuation" cannot be performed with a purging gas. Claims 1 and 16, and their dependent claims, all require "evacuating the chamber of gases" immediately after inserting the part into the reaction chamber, before any reactant gases are introduced into the chamber. (Id. 9:55, 11:13.) Thus, the gases that must be evacuated cannot be limited to the reactant gases, but must include all gases in the chamber. The same language,
"evacuating the chamber of gases," is used in each claim after the first reactant gas is introduced into the chamber, and after the second gas is introduced into the chamber. To be consistent, each step must require removal of all gases from the chamber, not just the reactant gases. Genus' expert, Dr. Oldham, states in his expert report that one of ordinary skill in the art would know that removal of all of the gases in the chamber would require a reduction of pressure in the chamber with a vacuum pump. (Oldham '365 Expert Report at 5.) If a purging gas is used to remove the reactant gases from the chamber, the purging gas obviously is in the chamber, and the chamber is not evacuated of all gases. Thus, this language also supports Genus' argument that evacuation must be used to refer to removal of gases with a vacuum pump.

ASM argues, to the contrary, that "evacuation" is just a synonym for "removal" because the patent specification describes both "evacuating the chamber with a vacuum pump" and "removing by vacuum pumps." (See, e.g., '365 patent 1:59-60, 2:22.) The prosecution history has similar language. (See, e.g., Sarboraria Decl., Ex. D at '365 FH-055.) This argument is unpersuasive. It is not disputed that by evacuating the chamber of gases, one is removing the gases from the chamber. The question is whether "evacuation" is limited to one method of removal, specifically, removing the gases with a vacuum pump, or whether it encompasses another method of removal, the use of a purging gas. There is no place in the patent language where using a gas to purge the chamber is referred to as "evacuation."

ASM also argues that because the claims of the '365 patent address processes, rather than apparatuses, they should not be limited to apply only to processes that use vacuum pumps to remove gases from the chamber. The Court's duty, however, is to determine the definition of the claim terms. Based on the intrinsic evidence, the Court concludes that, because the claim terms all use the term "evacuating," the claims are limited to processes in which gases are removed by means of a vacuum pump, and do not encompass processes in which reactant gases are removed by means of a purging gas.

Turning to the extrinsic evidence, Genus points to two 1999 internal memoranda from Raaijmakers, ASM's Chief Technology Officer, to other high ranking ASM executives, in which he discusses whether ASM should purchase the '365 patent from Sherman. (Sarboraria Supp. Decl., Exs. E and F.) In one memorandum, Raaijmakers states:

In my opinion the claims [of the '365 patent] are restricted to a "classic" ALCVD method, i.e. in which the chamber is pumped down between cycles. The claim does not foresee the use of radicals in a so-called "travelling wave reactor."

(Id., Ex. E.) It is the Court's understanding that a travelling wave reactor uses a continuous flow of gas in which pulses of reactant gases are separated by a flow of non-reactant gas. In the other memorandum, he states "we would not infringe in our traveling wave reactors," but "this could become an argument later." (Id., Ex. F.) The Court interprets these statements as an objective, pre-litigation, opinion that although the claims of the '365 patent cover only methods in which the chamber is pumped down between cycles, the patent might nonetheless be asserted against their traveling wave reactors later if they did not purchase the rights now. Raaijmakers acknowledged as much at his deposition:

Q: You understood that -- it was your understanding that the ASM reactors that do not perform a pump-down would not fall within the Sherman patent so they didn't need to pay a royalty; correct? I'm not saying that's what this says, but that's what you were understanding when you were making recommendations to senior management of ASM?

A: I recognized it could become an argument. That's probably what becoming the argument is, which is exactly the argument we are talking about now.

(Sun Decl., Ex. 7, Raaijmakers Dep. 125:7-16.) 6

6 Although Genus' supplemental claim construction brief at two points describes the Raaijmakers deposition testimony discussed in this section as relating to the '590 patent, it actually relates only to the '365 patent. The Court assumes the error was inadvertent.

It is undisputed that Raaijmakers is a person of ordinary skill in the art. These internal memoranda discuss whether ASM should attempt to acquire all rights to the '365 patent. At that time, ASM had every motive to view the patent carefully and...
objectively in these internal discussions. The Court finds that these prelitigation admissions by ASM are both reliable and highly probative of how the ordinary person of skill in the art would interpret the claims of the '365 patent. Raaijmakers' view of the '365 patent in this 1999 memorandum is in accord with the intrinsic evidence that "evacuate" means removal by use of a vacuum pump.

At deposition, Raaijmakers testified that "Sherman called me that he had this great invention and he disclosed that it was ALD with radicals and he disclosed also that it was a pump-down." (Sarboraria Supp. Decl., Ex. B, Raaijmakers Dep. 110:23-25.) Raaijmakers also testified that "I've gone through a process where initially I have thought evacuation to mean pump-down, whereas in a period of a year there was mounting evidence that evacuation also included purging." (Id. 157:22-25.) He now says he believes that "'evacuate' could include 'purge.'" (Id. at 117:24-25.) "'Evacuate' in the different applications could have different meanings. I am not sure whether we used the word consistently." Id. 157:18-20.)

Raaijmakers also testified that his opinion in these memoranda was only based on discussions with Sherman about his preferred embodiment, and were not intended to opine on the scope of the claims of the '365 patent. (Sun Decl. Ex. 7, Raaijmakers Dep. 104:12-21.)

I'm not representing what the scope of the claims are; I cannot do that. What I am saying is that in the opinion I formed during my long discussions with Art Sherman where he disclosed repeatedly his preferred embodiment to me, based on that opinion, I thought at that time, okay, he describes a pump-down process.

(Id.) He testified that he was describing the preferred embodiment that Sherman disclosed to him. (Id. 105:16-17.) He acknowledged, however, that he was able to view claims from the perspective of one skilled in the art, and that by using the term "the claims" he was referring to the claims of the patent. (Id. 105:7-9.) He acknowledged that he had read the claims when he prepared the memoranda, and that he made his best effort to understand what the claims covered. (Id. 106:2-22.) Raaijmakers also noted in his deposition that his view of the '365 patent at the time these memoranda were written was different from Sherman's view, and that their difference of opinion was over how to interpret the word "evacuate." (Id. 106:24-108:16.)

Genus points out that, despite Raaijmakers' current position that "evacuate" is not limited to pumping down with a vacuum, he has filed patent applications as recently as 2001, in which he has distinguished evacuation from purging excess reactants. Brown Supp. Decl., Ex. B at P 0080 (describing the use of a gas to purge the reaction chamber, and then noting that "in other arrangements, the chamber may be completely evacuated[.]"); id., Ex. C at P 0060 (similar language); Id., Ex. D at P 0065. Raaijmakers testified at deposition that his change of opinion about the meaning of "evacuate" was triggered by a statement by the Patent Cooperation Treaty office:

Sherman mentioned clearly that evacuation included purging, whereas was at the time of this, in September '99, I was of the opinion that it did not.

Later there were PCT applications filed from Sherman, and there was a clear reaction from the PCT office that evacuation included purging, and that made me change my mind.

(Sun Supp. Decl., Ex. 7, Raaijmakers Dep. 152:16-23.) This testimony is apparently a reference to PCT/US00/10267, a PCT written opinion issued on January 26, 2001, which appears to address an international patent application that is a continuation-in-part of the '365 patent. (Sun Supp. Decl. Ex. 2 at ASM 26681.) That opinion, without any written analysis, interpreted "evacuate" in the context of the '365 patent to refer only to purging. (Id. at ASM 26682.) As this opinion is devoid of analysis, the Court is unable to follow the analysis that led to this conclusion, but disagrees with it, for the reasons already set forth in this opinion.

The Court is not persuaded by Raaijmakers' attempt to explain away his earlier view of the '365 patent. Raaijmakers' objective view of the '365 patent before this litigation began, as one skilled in the art, was that "evacuate" meant pump-down, and that, therefore, the '365 patent covered only processes that used a vacuum to pump-down the reaction chamber. The Court finds that view more relevant and persuasive than his current, litigation-driven viewpoint. Raaijmakers' original view is in accord with the Genus' construction of the term "evacuate," and with the way the term is used in the intrinsic evidence.
Genus's expert, Dr. Oldham, states in his expert report that a person of ordinary skill in the art would understand "the claim language 'evacuating the chamber of gases' to mean pumping out the gases in the chamber, that is, reducing the pressure in the chamber with a vacuum pump to effect the removal of the gases." (Oldham '365 Expert Report at 4-5.) ASM's expert, Dr. Glew, states that in the context of the '365 patent, one of ordinary skill in the art would interpret the phrase "evacuating the chamber of gases" to mean "removing reactant gases from the chamber by any number of methods commonly known in the art the time including but not limited to evacuation through a pressure drop and evacuating by purging with an inert gas." (Glew Expert Report at 11.) The Court finds Oldham's explanation to be more persuasive, as it is based on a more detailed and careful analysis of the language of the '365 patent than is Glew's opinion.

Genus also points to documents produced by ASM, which appear to be materials used by Sherman to teach a course on atomic layer deposition. (Sarboraria Supp. Decl., Ex. G.) These materials contain a slide that describes ALD reactors as "vacuum pumped systems" and "flow purged systems." (Id. SHE 002281). They also contain a slide entitled "Evacuation vs. Flow Systems," which states that "flow systems use inert gas purging rather than evacuation[]." (Id. at SHE 002529.) Although Genus contends that these materials predate the litigation, they are undated, and Genus has not submitted any evidence to establish when they were prepared. Nonetheless, these materials suggest that Sherman himself distinguishes between evacuation and purging.

ASM argues that the Court should not consider these slides, citing North American Vaccine, 7 F.3d 1571 at 1578. In that case, the district court erred in limiting the scope of patent claims because of an article and speech in which the inventor discussed his research. Id. at 1578. The Court held:

A patent is to be interpreted by what it states rather than by what the inventor wrote in a scientific publication.

There is no inconsistency between writing a paper (or giving a speech) on a particular embodiment of an invention and then claiming one's invention more broadly in a patent application.

Id. That case is distinguishable, however, because Sherman's class materials do not address any particular embodiment, but demonstrate that he makes the same general distinction between purging and evacuation that is apparent from a close reading of the intrinsic evidence. The Court is not using the class materials to limit the scope of clear patent claims, but instead is reviewing it to confirm that one of ordinary skill in the art makes the distinction between the two terms that also appears from a close reading of the patent language.

Finally, Genus points to Sherman's inventor notebook for the '365 patent. This document was not used as an exhibit during briefing but only first presented at the claim construction hearing itself. ASM made no objection to the exhibit, however, and thus the Court will consider it. In that notebook, dated May 24, 1996, Sherman wrote:

An essential requirement of this new process is that it be done in a vacuum chamber, with each step of the process involving a dosing and then an evacuation. It would be much more difficult to do in a flowing system such as used by Suntola in Finland.

(Genus' illustrative exhibit 26, '365 claim construction hearing.) Sherman's inventor notebook also supports the Court's conclusion that the claims of the '365 patent are limited to processes in which the reaction chamber is evacuated with a vacuum pump.

For the reasons set forth above, the Court finds that, on the whole, the extrinsic evidence supports the meaning of "evacuate" that is apparent from the intrinsic evidence. The Court construes "evacuate" in the context of the '365 patent to refer to removal of gases with a vacuum pump. The term does not encompass the use of an inert gas to push gases out of the reaction chamber.

ASM asserts that Genus infringed claims 1 and 16 of the '365 patent. Claim 1 provides:
A process of growing thin film by a sequential chemical vapor
deposition process, comprising the steps of:

placing a part in a chamber;
evacuating the chamber of gases;
exposing the part to a gaseous first reactant, including a non-semiconductor element of the thin film to be formed,
wherein the first reactant adsorbs on the part;
evacuating the chamber of gases;
exposing the part, coated with the first reactant, to a gaseous second reactant of radicals, wherein the radicals convert the
first reactant on the part to one or more elements, wherein a thin film is formed; and

evacuating the chamber of gases.

Claim 16 is substantially identical to claim 1, differing only in ways that are irrelevant to the disputed claim terms. ASM
contends that the district court erred in construing the phrase "evacuating the chamber of gases."

The district court construed the phrase "evacuating the chamber of gases" in the '365 patent in the same way that it
construed the term "evacuation" in the '590 patent. Specifically, the court ruled that the phrase refers to removal of the gases
with a vacuum pump and does not encompass the use of an inert gas to push the gases out of the reaction chamber. ASM
claims that the court's construction is contrary to the evidence and improperly reads into the '365 patent a limitation from the
'590 patent that appears nowhere in the '365 patent.

ASM first contends that the district court improperly imported from the '590 patent the requirement that the evacuation be
accomplished by a vacuum pump. ASM argues that the district court should not have placed constraints on how the gases
are removed from the chamber. Under ASM's proposed construction, "evacuating the chamber of gases" could include using
an inert gas to purge the chamber.

ASM asserts that its construction is supported by the specification. In discussing the prior art, the specification states that in
a prior art patent, "the excess of each gas is removed by flowing a purge gas through the reactor between each exposure
cycle." '365 patent, col. 2, ll. 12-14. Therefore, according to ASM, the purge gas can be said to "remove" the gas.

That argument, however, ignores the plain meaning of the claim language and mischaracterizes the specification. Obviously,
the statement "evacuating the chamber of gases" means only that the gases in the chamber must be removed. We therefore
reject ASM's contention that the phrase includes the act of pushing more gas into the chamber. Additionally, ASM's
reference to the specification fails to acknowledge that the prior art patent to which ASM refers was describing removing a
specific type of gas; namely, excess reactant gas. That process, which involves removing a specific type of gas, is quite
different from evacuating all gases from a chamber.

ASM further asserts that the phrase "evacuating the chamber of gases" should be limited to mean evacuating the chamber of
reactant gases. Nothing in the specification or the claims, however, supports that interpretation. In the first place, the
language of the claim does not limit the type of gas that must be removed from the chamber. Additionally, the structure of
the claim supports the district court's construction. The term "evacuating the chamber of gases" appears three times in claim
1. The last two times, the phrase appears after reactant gases have been inserted into the chamber. However, the first time it
appears is prior to the introduction of any reactant gases. Presumably, there are no reactant gases to evacuate initially or else
the process would have already begun. Therefore, ASM's requirement that evacuation include the removal of only reactant
gases leads to a nonsensical result for the first instance of evacuation. For the term "evacuating the chamber of gases" to be
used consistently throughout the claim, the step must mean evacuating the chamber of all types of gases.

Moreover, nothing in the specification suggests that the patent claims a system that employs selective removal of certain
gases from the chamber. Rather, the specification repeatedly refers to the evacuation of the chamber of gases using a vacuum pump. See, e.g., '365 patent, col. 6, ll. 27-28; id. at col. 6, ll. 33-34. More importantly, the specification distinguishes between evacuation and purging with an inert gas. For example, the Background of the Invention portion of the specification describes both the ALD process that requires "evacuating the chamber with a vacuum pump," id. at col. 1, ll. 56-60, and, separately, the process that uses inert gas to carry away excess reactant gas, id. at col. 2, ll. 12-15. The extrinsic evidence further supports the conclusion that a person of ordinary skill in the art would believe that the term "evacuate" means to pump out the gases. For instance, when ASM was considering purchasing the '365 patent, the company's own Chief Technology Officer stated that the claims of the '365 patent were limited to processes "in which the chamber is pumped down between cycles," and that the claims did not cover the use of a purging gas to remove the reactants. Indeed, the evidence shows that even the inventor of the '365 patent, Dr. Arthur Sherman, considered evacuation to be different from the use of a purge gas. In his notebook for the '365 patent, Dr. Sherman wrote that "an essential requirement of this new process is that it be done in a vacuum chamber, with each step of the process involving dosing and then an evacuation." He distinguished that process from the prior art systems that used a flowing, inert gas to purge the chamber. That distinction is further supported by slides that Dr. Sherman used in teaching a class on ALD. The slides noted that there are two types of ALD systems: "vacuum pumped systems" and "flow purged system." In addition, the slides stated that "flow systems use inert gas purging rather than evacuation."

In sum, the district court was on firm ground in ruling that the term evacuate refers to the removal of gases with a vacuum pump and does not encompass the use of an inert gas to push gases out of the chamber. Because ASM does not contend that Genus's device infringes under that construction, we uphold the district court's summary judgment of noninfringement of the claims of the '365 patent.

ASM asks the Court to construe the following terms from the claims of the '590 patent.

<table>

</tbody>
</table>

The dispute here is whether evacuation requires the use of a vacuum to suck the reactants out of the reaction space (which the parties often refer to as "pump-down"), or whether it encompasses removal of the reactants by any means, including using another gas to push the reactants out of the reaction space (which the parties sometimes refer to as "purging"). Genus argues for the former construction, while ASM argues for the latter. ASM concedes, in its response to Genus' supplemental claim construction brief, that one common usage of "evacuation" is to describe a pump-down. ASM argues that "evacuation" is also commonly used as a generic term for removal, however, and that this latter definition applies in the context of the '590 patent.

The specification of the '590 patent expressly defines "evacuation."

In the context of the present invention, the term "evacuation" is used generally referring to the removal of reactant residues in the vapor phase. The evacuation of the reaction space can be accomplished by purging the gas volume of the apparatus by means of at least one pumping cycle capable of lowering the internal pressure in the apparatus to a sufficiently high vacuum. When required, the apparatus may be simultaneously filled with an inactive gas which promotes the purging of the reactant residues from the reaction space.

( '590 patent 3:64-4:5.) 1 This definition is somewhat ambiguous. On the one hand, it clearly states that "evacuation" is used generally to refer to removal of reactant gas. The second sentence makes it clear that evacuation can be accomplished by a pump-down. On the other hand, the next sentence does not make it clear whether the use of an inactive gas to purge the reactant gases from the reaction space is part of the evacuation step, or whether it is a separate event that takes place.

- 1888 -
simultaneously with evacuation.

--- Footnotes ---

1 Although the parties often refer to the use of an inert gas to push the reactant gas out of the reaction chamber as "purging," this definition also uses "purging" to describe a pump-down.

--- End Footnotes ---

The language of claim 1 suggests that evacuation is separate from the use of an inert gas to purge the reactant gases from the reaction space. Claim 1 provides:

> evacuating said reaction space between two successive vapor phase pulses by connecting the reaction space to a pump so that substantially all of said reactants remaining in said reaction space and adsorbed on inner walls of said reaction space are removed to a level of less than 1% prior to the inflow of a second pulse of said two successive vapor phase pulses; and

> feeding an inactive gas into said reaction space simultaneously with said evacuating step.

( '590 patent, 11:53-12:4 (emphasis added).) Although claim 1 does not specifically state that the pump must suck the gas out of the reaction space (as opposed to a bellows-like pump that pushes the gas out), the specification makes it clear that only a vacuum-type pump is used. "The invention can be implemented using any suitable pump capable of establishing a sufficient vacuum in the reaction space and having a sufficient capacity." ( '590 patent, 5:44-46.) The parties do not argue otherwise. As the claim language states that feeding the inactive gas into the reaction space occurs simultaneously with the evacuation step, it suggests that using the inactive gas is not part of the evacuation step.

Other language in the patent also distinguishes the evacuation step from the step of introducing an inactive gas to push out the reactant gases. At one point, the specification refers to "the evacuating steps and possible complementing step of flushing with an inactive gas." ( '590 patent 8:12-13.) The claims, of course, require both steps, but this language also supports Genus' contention that evacuation does not encompass the use of an inert gas to push the reactant gases out of the reaction space. The specification also provides that "an inactive gas may advantageously be introduced to the reaction space during the evacuation." ( '590 patent 11:37-39.) This language is a little more ambiguous, but adding the inactive gas during the evacuation does not necessarily mean that the addition of the inactive gas is considered to be part of the evacuation, particularly in light of the other language cited above.

There is also language, however, that can be read to equate evacuation with the use of the inert gas.

Advantageously, the interval between the successive pulses is kept so long as to permit the evacuation of the reaction space using at least a double or triple purging gas volume during the interval between the pulses. To achieve maximally efficient evacuation of reactant residues, the reaction space is purged with an inactive gas during the interval between the reactant pulses and the total volume of gas evacuated from the reaction space during the interval between the reactant pulses amounts to at least 2-10 times the volume of the reaction space.

( '590 patent 5:15-22.) This language arguably supports ASM's argument that "evacuation" simply means removal, and includes using an inert gas. It also can be read, however, to mean only that evacuation is enhanced by the simultaneous use of the inactive gas. In other words, although evacuation is the process of sucking the reactant gases out of the reaction space, that process works more efficiently when the reactant gases are also pushed out from the other side by adding an inert gas into the reaction space.

ASM also argues that the specification states that the apparatus of United States Patent No. 4,389,973 (the '973 patent) is suited to implement the invention. ASM contends that the '973 patent uses a traveling wave reactor in which the reactants are separated by a diffusion barrier of inert gas. If the '973 apparatus is suited to practicing the invention of the '590 patent, then, according to ASM, this shows that "evacuation" in the context of the '590 patent must be broad enough to include the use of an inert gas to clear the reaction space of reactant gases, because that is the only process the '973 patent uses. ASM's argument fails, however, because the '590 patent does not state that the '973 apparatus is suitable for practicing the invention of the '590 patent. Rather, the '590 patent states: "The ALE method is described in the FI patent publications 52,369 and
57,965 and in the U.S. Pat. Nos. 4,058,430 and 4,389,973, in which also some apparatus suited to implement this method are disclosed." ('590 patent 2:15-18.) In context, the reference to "this method" refers back to the "ALE method," and does not refer to the invention of the '590 patent. Thus, this language of the '590 patent simply makes the innocuous assertion that the '973 patent discloses an apparatus for performing ALE, which no one disputes.

Genus points out that the prosecution history distinguishes between evacuation and using an inert gas to push the reactant gases out of the reaction chamber. The patent examiner rejected certain claims as anticipated by, and obvious in light of, U.S. Patent No. 4,975,252 ("the Nishizawa patent"). (Gasner '590 Decl., Ex. 6 (Prosecution History) at 149). The patent examiner took the position that the Nishizawa patent taught the use of an ultrahigh vacuum to remove the reactant gases from the reaction space. Id. The inventors of the '590 patent responded that their invention was different because it used both a vacuum pump and the feeding of an inert gas into the chamber to evacuate the reaction space. Id. at 165. The inventors stated that:

Nishizawa teaches discharging the reactor by evacuating it to an ultrahigh vacuum. This necessarily indicates that a very low pressure must be maintained in the reaction chamber between successive pulses.

In contrast, by using the inactive gas and the evacuation technique taught by the claimed invention, the reactor space is discharged at pressure that is decades above the pressure required by the Nishizawa reference. Thus, the solution taught by the claimed invention can be implemented using pumps that are both smaller and more economical than the pumps employed with conventional methods.

This feature is disclosed in the specification. For example on page 8, lines 24-27, it is stated: "The invention can be implemented using any suitable pump capable of establishing a sufficient vacuum in the reaction space having a sufficient capacity ...." The ultrahigh vacuum required by Nishizawa is more difficult to achieve than the sufficient vacuum as described in the patent specification. Thus, Nishizawa does not teach nor suggest that a reaction space can be evacuated without using an ultrahigh vacuum.

In addition, Nishizawa does not teach nor suggest the use of an inactive or inert gas to be fed into the reactor space between successive pulses. Nishizawa only describes discharging the reactor by evacuating it to an ultrahigh vacuum. In contrast, the claimed invention teaches that by feeding gas into the reactor space between pulses, the inert gas pushes out the previous pulse from the reactor apparatus. Therefore, in contrast to the Nishizawa, an ultrahigh vacuum (i.e., ultra low pressure in the reaction chamber) between pulses is not required by the claimed invention.

Id. By referring to "the inactive gas and the evacuation technique taught by the claimed invention," the inventors appear to exclude the use of the inert gas from the definition of "evacuation." This language also supports Genus' contention that "evacuation" is limited to the use of a vacuum, i.e., a pump-down, and does not encompass purging the reaction chamber with an inert gas.

The fact that a vacuum pump is used does not require, as Genus contends, that there must be a pressure drop in the reaction space during evacuation, however, in the context of the invention of the '590 patent. Evacuation of the reaction space occurs simultaneously with the feeding of an inactive gas into the reaction space. Claim 1 and the specification make it clear that the gases in the reaction space are both pumped out and pushed out simultaneously. If the vacuum pump is stronger than the input feed for the inactive gas, then there will be a pressure drop. If the inactive gas is being fed into the reaction space at the same volume and rate or faster than the vacuum pump is sucking the gases out, however, then the gases will still be removed from the reaction space, but there will be no pressure drop. The inventors' statements to the patent examiner about using a "sufficient vacuum" only distinguished the ultrahigh vacuum, as used in the Nishizawa patent, from the invention of the '590 patent, which can evacuate the reaction space without using an ultrahigh vacuum.

It is true, as a matter of law, that "the prosecution history (or file wrapper) limits the interpretation of claims so as to exclude any interpretation that may have been disclaimed or disavowed during prosecution in order to obtain claim allowance." Pall Corp. v. PTI Technologies, Inc., 259 F.3d 1383, 1393 (Fed. Cir. 2001) (quoting Standard Oil., 774 F.2d at 452-53). "The public notice function of patents requires that a patentee be prevented from expressly stating during prosecution that the claims do not cover a particular device and then later suing for infringement by that same device." Id. Here, however, the inventors only disclaimed an evacuation process that uses an ultrahigh vacuum. They did not disclaim any other evacuation process. In other words, by stating that their process worked without an ultrahigh vacuum in the reaction space, they did not
disclaim a process that removed gases from the reaction space with a lesser vacuum or a process in which there is no pressure drop during removal of the reactants. As the invention of the '590 patent uses a vacuum pump at the outlet of the reaction space to remove reactant gases, coupled with a simultaneous inflow of an inert gas at the inlet of the reaction space, the pressure in the reaction space depends on the comparative partial pressures of the incoming and outgoing gases, as explained above, which may or may not create a pressure drop in the reaction space.

It is undisputed that all ALD processes operate in a vacuum. (See, e.g., Glew Expert Report at 4; Glew Rebuttal Expert Report at 3.) In all ALD processes, the vacuum pump is always operating so that the reaction chamber is always at a lower pressure than the outside atmosphere. (Glew Expert Report at 4.) Thus, it appears that every flow system includes both a purging gas and a vacuum pump. In order to distinguish flow systems from the system of the '590 patent, it is necessary to distinguish the vacuum used to suck the gases out of the reaction chamber from the ordinary vacuum that is always present in the reaction chamber. The relevant claim language requires "evacuating said reaction space between two successive vapor phase pulses by connecting the reaction space to a pump." ( '590 patent 11:53-55.) It appears to the Court that, in the '590 process, the vacuum pump must increase its suction between vapor phase pulses in order to evacuate the reaction space, that is, the vacuum pump operates at different rates at different times in the process. This does not necessarily create a pressure drop, however, because an inactive gas is simultaneously being fed into the chamber to purge the chamber of reactants. If the increase in suction is met by an identical increase in the flow of the inactive gas, there will be no pressure change in the reaction chamber, yet the chamber will still be emptied of reactant gases.

The parties also point to extrinsic evidence of the meaning of "evacuate" in some of the patents cited in the '590 patent, each of which uses "evacuate" to describe a pump-down. See Brown Decl., Ex. I, United States Patent No. 4,058,430 at 5:67-6:2 ("the reaction chamber being evacuated between consecutive steps by action of a vacuum pump (not shown) which draws the gas out"); Ex. J, United States Patent No. 4,975,252 at 3:33-34 ("evacuating means for evacuating the crystal growth vessel to a [sic] ultrahigh vacuum"); Ex. K, United States Patent No. 4,933,357 at 3:55-58 ("instead of supplying a flushing gas, the chamber may also be evacuated between the supplying of the compound of the element or elements"). The Federal Circuit has held that "prior art cited in the prosecution history falls within the category of intrinsic evidence." Tate Access Floors, Inc. v. Interface Architectural Resources, Inc., 279 F.3d 1357, 1371 n.4 (Fed. Cir. 2002). This intrinsic evidence also supports Genus' position.

Accordingly, the Court concludes from the intrinsic evidence that "evacuation" means removal by a vacuum pump, and does not include the use of inert gas to push the reactant gases out of the reaction space.
technical terms, as opposed to non-technical terms in general usage or terms of art in the claim-drafting art, such as 'comprising.' Indeed, a patent is both a technical and a legal document. While a judge is well-equipped to interpret the legal aspects of the document, he or she must also interpret the technical aspects of the document, and indeed its overall meaning, from the vantage point of one skilled in the art.

182 F.3d at 1309. A majority of the panel in Pitney-Bowes also noted that:

The process of claim construction at the trial court level will often benefit from expert testimony which may (1) supply a proper technological context to understand the claims (words often have meaning only in context), (2) explain the meaning of claim terms as understood by one of skill in the art (the ultimate standard for claim meaning), and (3) help the trial court understand the patent process itself (complex prosecution histories -- not to mention specifications -- are not familiar to most trial courts).

182 F.3d at 1314. Thus, after Pitney-Bowes, it is clear that the Court may consider trustworthy extrinsic evidence, even when the meaning of the disputed terms is clear from a review of the intrinsic evidence. It may not, however, rely on that evidence to contradict the meaning of claim terms that is clear from the intrinsic evidence. Id. at 1308; see also Bell & Howell Document Management Products Co. v. Altek Systems, 132 F.3d 701, 705-07 (Fed. Cir. 1997) (reversing claim construction because the district court relied on expert testimony to construe claim language in a manner that contradicted the clear and unambiguous meaning set forth in the intrinsic evidence).

In AFG Industries, Inc. v. Cardinal IG Co., Inc., 239 F.3d 1239 (Fed. Cir. 2001), the Circuit quoted at length from the deposition testimony of the president of the defendant's company, as a person of ordinary skill in the art, in determining the correct construction of certain claim terms. Id. at 1246. The deposition testimony supported the opposing party's claim construction. The court noted that "this case presents a good example of how extrinsic evidence can and should be used to inform a court's claim construction, and how failure to take into account the testimony of persons of ordinary skill in the art may constitute reversible error." Id. at 1249.

Earlier this year, the Federal Circuit held that "Courts may also use extrinsic evidence (e.g., expert testimony, treatises) to resolve the scope and meaning of a claim term." CCS, 288 F.3d at 1366. There, however, the Federal Circuit found that it did not need to examine expert testimony because the meaning of the term at issue could be determined by resort to the intrinsic evidence and dictionary definitions. Id. at 1368. The Court noted that even if it reviewed the expert testimony presented there, including that of the inventor himself, the expert testimony was not helpful because it was in conflict. Id. The Court noted, however, that the inventor was presumably a person of ordinary skill in the art, and thus suggested that consideration of the inventor's testimony would be proper. Id. This is consistent with the Federal Circuit's earlier decision, Voice Technologies Group, Inc. v. VMC Systems, Inc., 164 F.3d 605 (Fed. Cir. 1999), in which the court held that "an inventor is a competent witness to explain the invention and what was intended to be conveyed by the specification and covered by the claims." Id. at 615. The inventor cannot, however, "by later testimony change the invention and the claims from their meaning at the time the patent was drafted and granted." Id. at 615. Similarly, the Federal Circuit held in Solomon v. Kimberly-Clark Corp., 216 F.3d 1372 (Fed. Cir. 2000) that inventor testimony should not be used to invalidate a patent for indefiniteness under § 112 P 2 because once the patent issues, the claims and written description must be viewed objectively from the standpoint of a person of skill in the art. 216 F.3d at 1379-80. Thus, although inventor testimony, like other extrinsic evidence, may be considered by the Court, it may not be relied upon to contradict the meaning of patent language that is clear from the intrinsic evidence.

Despite this plethora of recent authority holding that the Court may consider trustworthy extrinsic evidence during claim construction, ASM contends that an earlier Federal Circuit decision, Water Technologies Corp. v. Calco, Ltd., 850 F.2d 660 (Fed. Cir. 1988), bars this Court from considering statements made about the patents at issue during the prosecution of later patents. In Water Technologies, the exclusive licensee of two earlier patents argued, during the prosecution of later patents on improvements to those inventions, that the claims of the earlier patents were limited in a certain way. Id. at 667. The Federal Circuit, in a cursory discussion, held: "We see no reason why arguments made by a later attorney prosecuting later patent applications for a different inventor should be used to limit an earlier-issued patent[..]" Id. (emphasis in original). The Federal Circuit noted that claims must be construed in light of the claim language, the other claims, the prior art, the prosecution history, and the specification. Id. (emphasis in original). The court did not even discuss, however, whether it could also rely on extrinsic evidence of the meaning of the claims by persons of ordinary skill in the art. The post-Markman cases cited above make it clear that the Court may, and sometime must, consider such evidence. To the extent that Water
Technologies holds that such statements can never be relevant to claim construction of the earlier patents, it is no longer good law. The law is now clear that the Court may consider trustworthy extrinsic evidence during claim construction, as long as it does not rely on such evidence to construe the claims in a way that contradicts the clear meaning of the claims as determined from a review of the intrinsic evidence.

Genus' expert William Oldham states in his expert report that the term "evacuate," in the semiconductor manufacturing industry, is not normally used to refer to any method of removing gases, but rather is used to refer to the reduction of pressure in an enclosed space to a vacuum. (Oldham Expert Report at 5.) "Specifically, 'evacuate' is used to describe the method in which the materials being moved are being sucked out (as opposed to pushed out or adsorbed onto the walls, for example)." Id. ASM's expert, Alexander D. Glew, does not opine in his expert report on how the term "evacuate" is generally used in the semiconductor manufacturing industry. Instead, he limits his expert opinion to how a person of ordinary skill in the art would interpret the term in the context of the '590 patent. (Glew Expert Report at 7.)

Genus also points to statements made to the Patent Office by patent counsel for ASM's Chief Technology Officer, Ivo Raaijmakers, in connection with a pending patent application. The Patent Office rejected certain claims in that application as obvious in light of the '590 and '365 patents. (Sun '590 Reply Decl. Ex. 2 at 7.) Raaijmakers' counsel filed a Response to Office Action on November 2, 2001, arguing that:

the present invention does not disclose evacuating the excess gas between sequential introduction of reactants. Rather, the present invention describes keeping carrier gas flowing over the substrate and providing concentration pulses of reactant gases in the carrier gas …. There is no evacuation of the chamber between pulses of reactant gases. This is a fundamental difference between the present invention and the references cited [the '590 and '365 patents].

(Id. at 8.)

Even if Suntola [the '590 patent] were combined with Sherman [the '365 patent], the present invention would not be obvious to one of ordinary skill in the art because neither Suntola nor Sherman utilizes a carrier gas that flows through the deposition process. Suntola and Sherman teach away from the present invention because both Suntola and Sherman require evacuation of the chamber between pulses of reactants.

Genus argues that ASM's argument that the '590 patent "teaches away" from the use of "a carrier gas flow that flows throughout the deposition process" because the '590 patent requires "evacuation of the chamber between pulses" is directly inconsistent with ASM's litigation position here that the term "evacuation" in the '590 patent is broad enough to encompass any type of removal, including removal assisted by the use of inactive gas. 3

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

3 Genus also argued that ASM should be judicially estopped from taking any position on the '590 and '365 patents that is inconsistent with the argument they made about those patents to the Patent Office in the Raaijmakers application. This argument was based primarily on the fact that the Patent Office had issued a Notice of Allowance on the Raaijmakers application, and thus ASM purportedly had obtained a benefit from its different interpretations of the '590 and '365 patents. As explained above, the representations made to the Patent Office are not inconsistent with ASM's position here. Moreover, this argument is now moot because ASM filed a Request for Continued Examination of the Raaijmakers application on June 14, 2002. The Court is disappointed that ASM failed to bring this to the Court's attention (or to Genus' attention) promptly, for example at the June 17, 2002 claim construction hearing, before the Court and Genus had expended time on a moot issue.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - -

While there is some tension between ASM's positions regarding the two patents, they are not completely at odds. As ASM points out, the invention described in the Raaijmakers application does not require removal of the first reactant gas from the reaction chamber before the second reactant gas is introduced into the chamber. One of the problems the invention sought to address was the time delay caused by evacuating the reaction chamber between pulses of reactant gases. (Glasner '590 Decl., Ex. 13 at 2:22-26.) The invention described in the Raaijmakers application uses sequential pulses of reactants in a flow of carrier gas, delivered with sufficient intervening delay times to minimize undesirable reaction between reactants in adjacent
pulses in the gas phase. (Gasner '590 Decl., Ex. 13 at 24:1-8.) "The use of reactant pulses separated in time and space in a carrier gas flow significantly increases the speed of processing because intervening chamber pump down steps are not required." (Id. 4:17-19.) In the invention described in the Raaijmakers application, there is no requirement that the reaction chamber be evacuated between pulses. In fact, one of the figures in the application explicitly shows that the first reactant gas has not yet left the chamber when the second reactant gas is introduced. (Gasner '590 Decl., Ex. 13 at 5:7-22; Sun '590 Reply Decl. Ex. 3, Fig. 3B). Thus, the language cited by Genus does not necessarily focus on a distinction between "evacuation" and using a carrier gas to remove reactants from the reaction chamber. It can be read as an attempt to demonstrate that the invention described in the application, unlike the inventions described in the '590 and '365 patents, does not require that each reactant be removed from the reaction chamber before the next pulse of reactant gas enters the chamber.

Genus also points to a statement in Raaijmakers' recent deposition in this case, which Genus contends shows that until this litigation began, Raaijmakers associated the term "evacuate" with "pump-down." Raaijmakers testified:

I've gone through a process where initially I have thought evacuation to mean pump-down, whereas in a period of a year there was mounting evidence that evacuation also included purging. It includes pump-down; it includes purging.

(Sarboraria Supp. Decl. Ex. B at 157:22-158:1.) His purported change of heart was not based on any change in the usage of the term by skilled practitioners in the semiconductor industry, however, and is too akin to a litigation conversion to be entirely persuasive. He also testified equivocally that the use of "evacuate" in different patent applications could have different meanings, and that "I am not sure whether we used the word consistently." (Id. 157:18-20.) Genus points to other recent patent applications filed by Raaijmakers to show that as recently as 2001, Raaijmakers distinguished evacuation from purging. Brown Supp. Decl., Ex. B at P 0080 (describing the use of a gas to purge the reaction chamber, and then noting that "in other arrangements, the chamber may be completely evacuated[,]" id., Ex. C at P 0060 (similar language). The parties do not dispute that Raaijmakers is a person of ordinary skill in the art. This evidence provides some modest support for Genus' position that "evacuation" does not include using a non-reactive gas to purge the reaction chamber of reactant gases.

Countering with its own extrinsic evidence, ASM points to a November 7, 2000 e-mail from Ofer Sneh, who was then a vice president at Genus, and general manager of its atomic layer deposition group. In evocative prose, Sneh wrote that he had just finished a "painful word by word reading" of the '590 patent, and thought that it claimed "the horizontal flow idea with a bunch of obscured engineering solutions." (Sun '590 Reply Decl., Ex. 4.) ASM argues that this statement goes against Genus' contention that "evacuation" must mean using a vacuum pump to pull the reactants from the chamber. Sneh is not opining about the meaning of "evacuate," however, but is discussing the '590 patent as a whole. Each of the claims of the '590 patent requires (1) evacuation of the reaction space by connecting the reaction space to a vacuum pump and (2) feeding an inactive gas into the reaction space simultaneously with the evacuation step. This combination of feeding an inactive gas into the reaction space while pulling the reactants out with a vacuum pump is essentially a hybrid of the vacuum pump-down and horizontal flow methods. ASM also points to Sneh's deposition testimony, but Sneh testified at deposition that "[a] pump-down system is a flow system, too, and it's all in the same direction[,]" (Sun Supp. Decl. Ex. 6 at 65:5-6.) Thus, ASM's contention that when Sneh referred to a "horizontal flow idea," he was necessarily distinguishing that concept from a pure pump-down system is unpersuasive.

ASM also cites the deposition testimony of Carl Galewski, Genus' former Director of Strategic Technologies. In discussing his own patent, United States Patent No. 6,398,954, Galewski was asked to interpret the phrase, "After ALD of the barrier layer 401, the barrier layer precursors are evacuated through the CVD process tool 500." (Sun Supp. Decl. Ex. 5 at 52:11-14.) He testified that "evacuated means removed in this case." (Id. 52:24-25.) When asked whether the precursors could be removed with a pump down step or a purge gas, Galewski responded: "Well, I'm speculating. If -- again, it calls for some speculation, you know, only reading this section; but evacuation can be purging the chamber or the pressure -- I mean pumping the chamber down or maybe a combination of the two." (Id. 53:14-19.) Later in the deposition, when asked whether the precursors could be evacuated with a pump down step, Galewski testified:

You can do that by pumping it down or flushing it with an inert gas or maybe a combination of the two. And they're all commonly used in the industry. Either steps or a combination of the two.

(Id. 57:1-12.) Late in the deposition, on examination by Genus' counsel, Galewski was asked what the word "evacuate" is ordinarily used to mean in the semiconductor industry. (Sarboraria Supp. Decl. Ex. C at 241:24-25.) Galewski responded
that "the ordinary meaning of it would be a pump down." (Id. 242:4-5.) He also testified that he used the term "evacuate" in a broader sense in the section of the patent discussed above. (Id. at 242:6-243:2.) No party has argued that Galewski is not a person of ordinary skill in the art. Thus, although Galewski's testimony supports Genus' position that "evacuate" means "pump-down," it also supports ASM's contention that "evacuation" can be used by persons of ordinary skill in the art as a general term meaning "removal," which can be accomplished by pump-down, purging, or a combination of the two.

In general, the extrinsic evidence supports the Court's conclusion, from reviewing the intrinsic evidence, that evacuation is accomplished by using a vacuum pump to suck the gases out of the reaction space. The vacuum pump does not operate at the same rate throughout the process, as may be the case in a pure gas flow system, but must operate at a higher intensity during the evacuation step. Evacuation does not encompass using an inert gas to push the gases out of the reaction space. There is no requirement that the pressure always drop in the reaction space during evacuation, however, because the claims of the '590 patent require simultaneously feeding in an inert gas to push the gases out of the reaction space.

While the specification makes clear exactly which portion of the ALD device must be evacuated, the evidence is more ambiguous as to what the term "evacuation" means. The district court construed the term evacuation as follows:

Evacuation is accomplished by using a vacuum pump to suck the reactant gases out of the reaction space. Evacuation does not encompass using an inert gas to push the reactant gases out of the reaction space.

ASM contends that this construction of evacuation does not accord with the plain meaning of the term and that it improperly reads limitations from the specification into the claim.

In the first place, ASM asserts, there is no indication in the claim that evacuation requires the use of a vacuum pump. Rather, the claim requires only that the evacuation occur "by connecting the reaction space to a pump"; it does not specify the type of pump used in the evacuation. That argument fails, however, for several reasons. First, it is clear that a person of skill in the art would understand the term "pump" to mean "vacuum pump." ASM's own expert, Alexander Glew, stated that all ALD technology uses a vacuum pump as a necessary component. The specification also supports that interpretation. In describing the invention, the patent discloses a "pump capable of evacuating the reaction space to a vacuum." '590 patent, col. 3, ll. 41-42. Furthermore, the specification states that the "invention can be implemented using any suitable pump capable of establishing a sufficient vacuum." Id. at col. 5, ll. 44-46. Finally, during prosecution, the patentee used "pump" and "vacuum pump" interchangeably, noting that the patent would allow a user to use "pumps that were smaller and more economical than the pumps employed" in the prior art because the patent required only a "sufficient vacuum," rather than an "ultrahigh vacuum." We conclude, therefore, that the district court correctly construed the term "pump" to be synonymous with "vacuum pump."

ASM's main argument on appeal is that the district court erred in construing the term "evacuation" to mean sucking the reactant gases out of the reaction space, and not to include using an inert gas to push the reactant gases out of the reaction space. In support of its argument that the definition of the term "evacuation" is broader than the definition given by the district court, ASM relies on the definition of "evacuation" given in the specification:

In the context of the present invention, the term "evacuation" is used generally referring to the removal of reactant residues in the vapor phase. The evacuation of the reaction space can be accomplished by purging the gas volume of the apparatus by means of at least one pumping cycle capable of lowering the internal pressure in the apparatus to a sufficiently high vacuum. When required, the apparatus may be simultaneously filled with an inactive gas which promotes the purging of the reactant residues from the reaction space.

'590 patent, col. 3, line 64, to col. 4, line 5. ASM argues that the quoted portion of the specification establishes that the term evacuation refers to any process that removes reactant gases from the reaction chamber.

When a patentee defines a term in the specification, that definition ordinarily controls. See Renishaw PLC v. Marposs

- 1895 -
Societa' Per Azioni, 158 F.3d 1243, 1249 (Fed. Cir. 1998); PPG Indus. v. Guardian Indus. Corp., 156 F.3d 1351, 1355 (Fed. Cir. 1998). ASM invokes that principle, but the proposed definition on which it relies does not support its claim construction.

The portion of the specification on which ASM relies states that evacuation can be accomplished by pumping the gas to a "sufficiently high vacuum." The next sentence states that an inactive gas can be used to purge the reactants from the reaction space, but it does not suggest that the purging step is part of the evacuation. Moreover, any doubt on that score is resolved by the language of claim 1, which sets forth evacuation and purging as two distinct steps. For the evacuating step, the claim requires evacuation "by connecting the reaction space to a pump so that substantially all of said reactants remaining in said reaction space and adsorbed on inner walls of said reaction space are removed." The claim then sets forth the purging step as "feeding an inactive gas into said reaction space simultaneously with said evacuating step." The patent clearly requires evacuation through use of a vacuum pump as well as an entirely separate step of feeding an inactive gas into the reaction space.

The distinction between the evacuating step and the purging step is further supported by the prosecution history, which provides a rationale for feeding the inactive gas into the reaction chamber. In distinguishing the invention in the '590 patent over a prior art patent to Nishizawa, the patentee stated that "Nishizawa teaches discharging the reactor by evacuating it to an ultrahigh vacuum. This necessarily indicates that a very low pressure must be maintained in the reaction chamber between successive pulses." The patentee then stated that "[i]n contrast, by using the inactive gas and the evacuation technique taught by the claimed invention, the reactor space is discharged at pressure that is decades above the pressure required by the Nishizawa reference." Thus, the patentee explained, a cheaper "sufficient" vacuum was all that was needed for the invention, rather than a more expensive "ultrahigh vacuum." See also '590 patent, col. 5, ll. 44-46. That explanation clearly illustrates that the patentee regarded evacuation as encompassing the act of discharging the reactant gas to a vacuum. By contrast, the insertion of inactive gas is intended to increase the internal pressure in the chamber to allow for a weaker pump to perform the evacuation. Thus, the introduction of the inactive gas is not part of the evacuation, but is an additional step that makes the evacuation more efficient.

ASM responds by pointing to the applicant's statement in the prosecution history that "in contrast [with Nishizawa], the claimed invention teaches that by feeding gas into the reactor space between pulses, the inert gas pushes out the previous pulse from the reactor apparatus." ASM argues that this statement bolsters its contention that the introduction of inert gases is part of the evacuation step. Additionally, ASM refers to portions of the specification that, when read alone, give the impression that inserting an inert gas is part of evacuation. For instance, the specification states that "the interval between the successive pulses is kept so long as to permit the evacuation of the reaction space using at least a double or triple purging gas volume." '590 patent, col. 5, ll. 16-18.

These arguments are unavailing, however, because when the specification and the prosecution history are read as a whole, it becomes clear that the insertion of inert gas may help render the process of evacuation more efficient, but is not part of the evacuation itself. For instance, the specification states that "the evacuation steps and possible complementing step of flushing with an inert gas also contribute to the efficient removal of molecules." '590 patent, col. 8, ll. 12-14. The specification also states that "an inactive gas may advantageously be introduced to the reaction space during the evacuation." Id. at col. 11, ll. 37-39. It is clear that the patent treats evacuation and the introduction of an inert gas as distinct concepts, which is why claim 1 lists evacuation and the introduction of inert gas as discrete steps. See, e.g., id. at col. 4, ll. 6-28 (listing other uses of introducing the inert gas into the chamber for reasons unrelated to evacuation). We therefore agree with the district court's definition of evacuation.

F. Evaluating

The preamble of claim 1 of the '196 Patent discloses 'a currency counting and evaluation device for receiving a stack of currency bills, rapidly counting and evaluating all the bills in the stack and then re-stacking the bills . . ." '196 Patent, Col. 31, ll. 41-46. Cummins argues that as a word in the preamble, the word "evaluating" should not be given any specific limiting meaning. To the extent it requires limitation, however, Cummins argues that the dictionary meaning of "evaluating" is synonymous with "denominating." Glory argues that this word means both the evaluation of the value of the bill and the
evaluation of the genuine vs. counterfeit bills. The parties agree that any construction of "evaluating" applies to both the '196 Patent and the '806 Patent.

While the word "evaluation" appears only in the preamble of claim 1 of the '196 Patent, the claims of the '806 Patent provide more guidance. The '806 Patent use both "evaluate" and "denominating" in the same independent claim, claim 16. When two terms are used together in the same claim, they are presumed to have different meanings. Bancorp Services, L.L.C. v. Hartford Life Ins. Co., 359 F.3d 1367, 1373 (Fed. Cir. 2004) (use of two terms in "close proximity in the same claim gives rise to an inference that a different meaning should be assigned to each"). Glory's position is consistent with this principle. Additionally, Cummins has claimed a patent for a machine that both (i) determines whether a bill is genuine or spurious, and (ii) attaches a denomination to those bills that the machine finds to be genuine. Given the presence of these two functions, the Court agrees with Glory that "evaluating" encompasses determining for each bill whether that bill's value can be determined.

1. "Excessive Manual Force"

Whether a claim term is sufficiently definite depends on whether the terms can be given "any reasonable meaning." Datamize, LLC v. Plumtree Software, Inc., 417 F.3d 1342, 1347 (Fed. Cir. 2005). General principles of claim construction apply: intrinsic evidence should guide the court, but courts are authorized to rely on extrinsic evidence as well. Id. at 1348. "When a word of degree is used the district court must determine whether the patent's specification provides some standard for measuring that degree." Id. at 1351 (citation omitted). "The scope of claim language cannot depend solely on the unrestrained, subjective opinion of a particular individual purportedly practicing the invention." Id. at 1350. Thus in Datamize, the claim term "aesthetically pleasing" was declared indefinite, because the term "does not just include a subjective element, it is completely dependent on a person's subjective opinion." Id.

Not all subjective or comparative terms, however, are impermissibly indefinite in a patent claim.

[W]ords of approximation . . . such as "approach each other," "close to," "substantially equal," and "closely approximate" are ubiquitously used in patent claims and [] such usages, when serving reasonably to describe the claimed subject matter to those of skill in the field of the invention and to distinguish the claimed subject matter from the prior art, have been accepted in patent examination and upheld by the court.

Anchor Wall Systems, Inc. v. Rockwood Retaining Walls, Inc., 340 F.3d 1298, 1310-11 (Fed. Cir. 2003) (citation omitted). "[W]hile ideally, all terms in a disputed claim would be definitively bounded and clear, such is rarely the case in the art of claim drafting." Id. at 1311. When considered in the context of the primary intrinsic evidence and the secondary extrinsic evidence, courts have found terms such as "generally parallel," id. at 1310-11; "substantially constant wall thickness," Verve, LLC v. Crane Cams, Inc., 311 F.3d 1116, 1119-20 (Fed. Cir. 2002); and "substantially uniform," Ecolab, Inc. v. Envirochem, Inc., 264 F.3d 1358, 1367 (Fed. Cir. 2001), to be sufficiently definite in a patent claim.

The term "excessive manual force" is similarly definite. While the term is "mathematically imprecise," Anchor Wall, 340 F.3d at 1310, the meaning of the term is sufficiently clear. The purpose of the invention as described in the specification (to "preclude[ the user from replacing standard steady-burning bulbs with non-standard twinkle bulbs") and the prosecution history (in particular, Sienna's efforts to distinguish its invention from the prior art GE light set) assists in providing a "reasonable meaning" to the claim term "excessive manual force."

The dictionary definition of the word excessive is entirely consistent with the obvious import of the term. "Excessive" is defined as "exceeding a normal, usual, reasonable, or proper limit." Am. Heritage Dictionary (4th ed. 2000). Considered in the context of the intrinsic evidence, the term "reasonably . . . describe[s] the claimed subject matter to those of skill in the field of the invention and . . . distinguish the claimed subject matter from the prior art." Anchor Wall, 340 F.3d at 1311.

Defendants argue that the term "excessive manual force" is too imprecise since not all individuals are equally strong. The defendants are impermissibly raising the standard that is required to meet definiteness; mathematical precision is not required. See id. at 1310. In the context of forcing a light bulb into a socket, the ordinary meaning of the word "excessive" is
Defendants further contend that the clause "notwithstanding the use of excessive manual force to attempt to overcome such interference" is an impermissible mix of statutory classifications. The Federal Circuit has recently held that "reciting both an apparatus and a method of using that apparatus renders a claim indefinite under [35 U.S.C.] section 112," because "a manufacturer or seller of the claimed apparatus would not know from the claim whether it might also be liable for contributory infringement because a buyer or user of the apparatus later performs the claimed method of using the apparatus." IPXL Holdings, L.L.C. v. Amazon.com, Inc., 430 F.3d 1377, 1384 (Fed. Cir. 2005). 3

3 In IPXL, a claim reading "[t]he system of claim 2, wherein the predicted transaction information comprises both a transaction type and transaction parameters associated with the transaction type, and the user uses the input means to either change the predicted transaction information or accept the displayed transaction type and transaction parameters," was held to impermissibly mix both a system and a method. IPXL, 430 F.3d at 1384.

On appeal, Koepnick argues that the district court's decision was based on an erroneous construction of the claim limitation "excising." According to Koepnick, by interpreting "excising" to mean "cutting out" rather than "removing tissue," the court failed to give the contested term its ordinary meaning, as defined in dictionaries and relevant patents and articles. Koepnick also contends that because the claims contain both the words "cutting" and "excising," they should be presumed to mean different things. Koepnick argues that the ordinary meaning of the term "excising" encompasses non-cutting mechanical techniques such as laser ablation and the court unduly narrowed the scope of the claims by importing the word "intact" from the specification into the element "excising a second disk" and relying on the statement in the specification that one advantage of the invention was "reversibility." Koepnick also maintains that its failure to dispute the PTO examiner's statement during prosecution that the invention relates to "cutting" two disks from the eye could not have restricted the scope of the claims because the statement was not directed to any specific claim or the scope of the claims. Finally, Koepnick argues that the failure of the ‘303 patent to describe how to use a laser to remove corneal tissue in a mathematically precise way to achieve emmetropia should not preclude recovery because, at the time the patent issued, the use of lasers in refractive eye surgery, although disclosed in the prior art, had not yet been perfected.

Alcon and B&L respond by essentially repeating the analysis contained in the district court's Claim Construction Order. Alcon and B&L assert that the claim language and specification consistently use "excising" to mean "cutting out," and the prosecution history confirms that understanding because the PTO examiner recognized that the invention required cutting the second disk. Alcon and B&L also note that the ‘303 patent specification contrasts "excising" with removal by laser "ablation" and distinguishes LASIK procedures as prior art. According to Alcon and B&L, the written description and drawings require the "excised" second disk to have a specific shape, which does not occur when eye tissue is removed by laser ablation. Alcon and B&L point out that the "Summary of the Invention" section supports this interpretation because it touts "reversibility" as one of the invention's many advantages over LASIK procedures. Finally, Alcon and B&L argue that the claim limitation "excising" cannot be read to encompass future improvements that were not possible when the ‘303 patent was filed, such as accurate removal of eye tissue with laser ablation.

We agree with Alcon and B&L that the district court properly construed the claim limitation "excising" to mean "cutting
out." Our primary focus in determining the ordinary and customary meaning of a claim term is to consider the intrinsic evidence of record, viz., the patent itself, including the claims, the specification and, if in evidence, the prosecution history, from the perspective of one of ordinary skill in the art. Phillips v. AWH Corp., 415 F.3d 1303, 1312-17 (Fed. Cir. 2005) (en banc). Here, the construction of "excising" that is consistent with the claims, specification, and prosecution history is "cutting out," and thus we give the claim limitation that ordinary and customary meaning.

We begin with the language of the claims. Claim 1 requires "excising a second disk, said second disk being shaped to provide said prescriptive correction." '303 patent, col. 15, II. 13-15. Claim 6 further requires that the second disk must have a "positive or negative meniscus shape." Id. at col. 15, II. 28-30. Because the claims make clear that the excised second disk has a defined shape, the scope of what constitutes "excising" is expressly limited to surgical techniques that create such a defined shape. Koepnick urges a construction of "excising" as "removing tissue." However, that interpretation is inconsistent with the requirements of the claim because it would encompass methods in which the "excised" tissue does not have a defined shape, such as laser ablation. As the district court correctly observed, "ablating with a laser cannot fall within the scope of the claim because the ablated tissue has been vaporized into a gas, and therefore, has no shape." Id. The claim therefore requires a construction of "excising" that excludes laser ablation.

The specification supports that interpretation of "excising" as "cutting out." The term "excising" is unambiguously used to mean cutting with a knife blade in both the "Abstract" and "Summary of the Invention" sections. '303 patent, Abstract; col. 2, II. 31-32. Further, every embodiment disclosed in the patent uses a knife edge to make a cut in the cornea. There is no evidence supporting Koepnick's assertion that "excising" also refers to laser ablation. Indeed, the specification makes clear that LASIK procedures are an existing surgical technique, i.e., that they are not the invention. The written description repeatedly distinguishes the invention from procedures involving lasers. Id., col. 2, II. 1-4; col. 13, II. 9-17. The "Detailed Description" section also contrasts "excising" with laser "ablation," noting that, in the prior art LASIK procedures, a disk is first "excised" before a laser is used to "ablate" the second disk of tissue from the eye. Id., col. 13, II. 9-17.

Moreover, the "Summary of the Invention" section explains that the "invention has many advantages over mechanical keratomes, radial lasers and radial keratectomy. One major advantage is that surgery utilizing the device is reversible . . . by simply replacing the [second] excised corneal disk or by excising another disk from a donor cornea using the same insert as used for the original operation." '303 patent, col. 2, II. 53-60 (emphasis added). Although a disk of tissue cut with a knife edge can be put back onto the eye as described in the specification, a disk of tissue that is vaporized by laser ablation cannot be replaced as contemplated in the specification. We conclude therefore that the specification does not support Koepnick's proposed construction of "excising" as encompassing laser ablation.

The prosecution history further confirms the district court's construction of "excising" as "cutting out." The PTO examiner asserted in the Notice of Allowance of the '303 patent that "the primary reason for allowance is that the prior art of record fails to teach or adequately disclose the steps of cutting two disks from the eye." J.A. at 3246 (emphasis added). Koepnick did not challenge the examiner's characterization of its invention. Indeed, Koepnick concedes that at the time of filing, the inventor did not believe that claim 1 encompassed LASIK procedures. Appellant's Br. at 29 (explaining that "lasers in 1995 could not remove corneal tissue in a mathematically precise way to achieve emmetropia."). Consistent with that understanding, the claims do not describe a surgical method of refractive eye surgery using lasers. Indeed, Koepnick disclaimed the only claim directed to LASIK procedures, claim 13, 3 by filing a statutory disclaimer in the PTO on July 22, 2003. Although we find the timing of the disclaimer on the eve of the lawsuit to be interesting, to say the least, we express no opinion as to the reason why Koepnick decided to disclaim claim 13, and whether it was related to issues of patentability or validity. Irrespective of the reasons for the disclaimer, the result of the disclaimer is to strip the claims of any reference to lasers, even though the technology was discussed elsewhere in the specification. 4 We therefore conclude that the claim language, specification, and prosecution history support a construction of "excising" as "cutting out."

--- Footnotes ---

3 Independent claim 13 reads as follows:

A method of performing refractive surgery comprising the steps of:

placing a keratome device on an eye, said keratome device having an element with surface portion recess the depth epithelium of said eye;
operating said keratome device such that vacuum is applied to said eye urging said eye into contact with said recess;

operating said keratome device in an automatic mode such that a knife edge traverses said element to excise a flap, said knife edge being stopped before said flap is severed;

removing said keratome device;

utilizing a laser to remove corneal tissue to produce a prescriptive correction; and

replacing said flap.

'303 patent, col. 16, II. 41-56 (emphasis added).

4 We have not yet addressed the issue whether a statutory disclaimer filed after the patent was issued is considered as part of the prosecution history during claim construction, and whether that statutory disclaimer may operate during claim construction to preclude a patentee from recapturing subject matter it has surrendered in certain instances. We will not decide that issue here because it is otherwise clear from the claims, specification, and prosecution history that the ordinary and customary meaning of "excising" does not encompass laser ablation.

1465

Construction of "Excising a Second Disk from Said Eye"

48. The real dispute here centers around the definition of the word "excising". The Court begins its analysis with dictionary definitions of the word.

49. The word "excise" is not a unique technical term in ophthalmology. Dictionary of Ophthalmic Optics does not include a definition of "excise" or "excision". Ex. 209. Non-medical dictionaries define excising to mean "cut out." The Oxford English Dictionary (2d ed., 1989) defines "excise" as to "cut out (a limb, organ, etc.)." Ex. 218. Webster's New World Dictionary & Thesaurus (1996) defines "excise" as to "remove by cutting out." Ex. 220. The Barnhart Concise Dictionary of Etymology (1995) defines "excise" to mean "cut out." Ex. 221.

50. Medical dictionaries define "excising" to mean "cutting out." Dorland's Illustrated Medical Dictionary (28th ed. 1994) defines "excise" as "to cut out" or "off" and defines "excision" as "removal, as of an organ, by cutting." Ex. 207. The American Heritage Stedman's Medical Dictionary (2002) defines "excise" to mean, "to remove by cutting" and defines "excision" to mean "surgical removal by cutting, as of a tumor or a portion of a structure or organ." Ex. 212. The Dictionary of Eye Terminology gives cutting out as a possible definition of "excision". Ex. 164.

51. The Court finds that "to cut out" is the customary meaning of the term excise. The Court further finds that defining excise to mean "to remove tissue" is inconsistent with the intrinsic record. As the Court stated above, the 303 patent consistently uses the term "excising" to mean "cutting out". The Parent and Grandparent Patents are also consistent with the ordinary meaning of "excising" as "cutting out". Further, the 303 Patent distinguishes prior art LASIK and uses the term ablate when referring to removing tissue by vaporization with a laser. Finally, the prosecution history of the 303 Patent is consistent with the ordinary meaning of "excising" as "cutting out".

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
52. Because the claim requires that the "second disk" have a particular shape, the scope of what constitutes "excising" is expressly limited. "Ablating" with a laser cannot fall within the scope of the claim because ablated tissue has been vaporized into a gas and therefore has no shape. Through the consistent use in the written description of "excise" to describe the action of a mechanical cutting device or method, and by contrasting it with "ablate" to describe the action of an excimer laser, the patentee has confirmed that the definition of "excise", as used in the patent, conforms with the term's ordinary meaning and therefore means cutting out. See Vitronics, 90 F.3d at 1582.

53. If the Court were to construe this claim limitation to include removal of corneal tissue by laser, then the invention's "major advantage" of reversibility is effectively read out of the description. See Toro Co. v. White Consol. Indus., Inc. 199 F.3d 1295, 1301 (Fed.Cir. 1999)(construing claim as limited to a "unitary structure" where the specification describes the advantages of the unitary structure as important to the invention.); see also O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1581 (Fed. Cir. 1997)(limiting claim construction to certain characteristics because the written description distinguished over the prior art based on these characteristics). Here, the patentee stated that a "major advantage" of his invention over refractive techniques using an excimer laser is reversibility, (Ex. 1, Col. 2, ll. 53-59). And in every disclosed embodiment in the 303 patent, reversibility theoretically can be achieved because there is an intact disk that can be replaced on the corneal stroma. On the other hand, when an excimer laser is used, tissue is vaporized and no longer exists and, as a result, that tissue cannot be replaced on the corneal stroma to achieve reversibility.

54. Where more than one claim construction is possible, the Court should not choose a construction that is broad enough to encompass prior art. ACS Hasp. Sys., Inc. v. Montefiore Hosp., 732 F.2d 1572, 1577 (Fed. Cir. 1984). If the Court were to construe the third element of Claim 1 to cover the reshaping of the cornea with an excimer laser, then the patent would be invalidated by the wealth of prior art LASIK procedures. See also SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1343 (Fed. Cir. 2001)(holding that the fact that the written description stated a particular feature that offered advantages over the prior art construction of the claims cannot be read so broadly as to encompass the distinguished prior art.)

55. The Court also finds that the patentee's failure to not dispute the examiner's sole stated reason for allowance -- "that the prior art of record fails to teach or adequately disclose the steps of cutting two disks from the eye" (Ex. 215) provides further support that the term excising should be interpreted to mean "cutting out". The examiner's view of the invention's breadth was restrictive, and the patentee allowed it to stand. The Court considers the patentee's lack of response as a factor in the prosecution history limiting the interpretation of the patent, Elkay, 192 F.3d at 979.

56. Plaintiff attempts to dismiss the examiner's reasons for allowance by citing to 37 C.F.R. § 1.104(c) and to the administrative decision of Ex Parte Yamaguchi, 61 U.S.P.Q.2d 1043 (Bd. Pat. App. & Int. 2001) for the proposition that, when Mr. Koepnick filed is patent application, a patent applicant had no duty to respond to "erroneous" statements in an examiner's statement of reasons for allowance. But irrespective of the duty to respond during the prosecution of the patent, Federal Circuit authority holds that a patentee's acquiescence in the patent examiner's reason for allowance, and the examiner's narrow view of the patentable subject matter, may nevertheless be relied on for purposes of claim construction. The Elkay case stands for the proposition that the Court may consider an examiner's statements in the reasons for allowance to interpret the claim terms. The Court notes that the examiner's statement in Elkay was filed, and the patent issued, during the same period that the version of the PTO rule cited by Plaintiff(37 C.F.R. § 1.104(c)) was in effect and before the examiner's statement was filed in the 303 patent's prosecution. (Ex. 214). In fact, Ex Parte Yamaguchi even cites Elkay as a warning that claim construction inferences may be drawn by a failure to respond to an examiner's statement of reasons for allowance. 61 U.S.P.Q.2d at 1047 n. 4. Thus, the examiner's statement in this case, that "the prior art record fails to teach or adequately disclose the steps of cutting two disks from the eye" and the fact that Plaintiff did not dispute it, may properly be used by this Court in construing the meaning of the term excise.

(5) "executing a clothes untwisting mode"

The parties also dispute the term "executing a clothes untwisting mode," which appears in Claims 1, 3, and 4. LG proposes
construing the term to mean "executing a mode to unbundle [i.e., evenly distribute] clothes." (Chart at 8.) Whirlpool proposes instead that the term be construed to mean "carrying out an operation for separating clothes that are entwined together." (Id.)

Claim 1 states that what is claimed is "[a]n apparatus for determining a twist of clothes being washed in a washer . . . ." (‘474 Patent, col. 9, ll. 43-44.) The apparatus comprises a "clothes twist sensing means," "correlation coefficient operating means," and "a microprocessor for performing a control for executing a clothes untwisting mode . . . ." (Id., col. 9, ll. 45-60.) The summary of the patent states that:

[a]n object of the invention is to provide an apparatus for and a method of determining a twist of clothes being washed in a washer, wherein a sensing signal indicative of the twist of clothes is analyzed, to determine whether the clothes twist signal is a meaningful signal or a noise, so that when the clothes twist signal is the meaningful signal, an operation in a clothes untwisting mode is carried out for minimizing a damage of the clothes . . .

(Id., col. 1, ll. 49-57.) The intrinsic evidence shows that the claimed invention determines whether to carry out an operation for untwisting clothes.

The Court will therefore construe the term "executing a clothes untwisting mode" to mean "carrying out an operation for separating clothes that are entwined together."

1467

"exercise surface"

Claims 3, 4, 13, and 21 of the ‘951 patent refer to an "exercise surface." Precor urges the Court to adopt a means-plus-function construction of this claim element, and argues that the "exercise surface" should be limited to the upper run of the "endless, moveable surface" discussed above. Precor provides no compelling basis for such a limitation.

The Court concludes that the disputed claim element is not in means-plus-function format, but is instead a feature of the "endless, moveable surface" recited elsewhere in the same claims.

1468

14. "Exerting force on said layers with said inflated balloon" requires exerting force with the inflated balloon, other than by balloon inflation, to cause dissection beyond that caused by the step of balloon inflation to create the open working space, such as by the act of moving the inflated balloon.

1469

1. Exit Station (Claims 1 and 21) 1

1 As to all of the terms construed, where the Court has adopted a party's proposed construction, that construction is set forth below without further discussion. Where the Court has adopted one party's construction, but with some modification, or has not adopted either party's proposed construction, an explanation is provided.

Plaintiff argues "exit station" should be construed as "a portion of the processing machine where wafers are moved after processing." Defendant argues "exit station" should be construed as "a place dedicated to the removal of the wafer from the
The Court finds "exit station" is properly construed as "a portion of the processing machine where wafers are moved after processing and from which said wafers exit the processing machine." 2

2 Unless otherwise indicated, the parties' respective proposed constructions as set forth herein are taken from the Joint Claim Construction Statement filed May 1, 2006.

The Court has not adopted either party's proposed construction. Plaintiff's proposed construction is overly broad because it does not require that wafers "exit" from the "exit station." Defendant's proposed construction is too narrow; assuming, arguendo, the "exit station" described in the specification is "dedicated" to the removal function, defendant fails to show why the claims are limited to the preferred embodiments.

Accordingly, the Court construes the term "expand" (and its variations) to mean: "to enlarge from a first to a second larger dimension."

8. "Expand" and variations.

Medtronic contends that the Court should construe this term, and its variations, to mean "enlarge from a first to a second larger dimension." Medtronic's proposed construction is in accord with the plain meaning of the term "expand." See, e.g., Webster's Ninth New Collegiate Dictionary at 436 ("to open up; to increase the extent, number, volume or scope of"). Gore, in contrast, argues that the Court should construe this term, and its variations, to require that the device expanded is a "low memory metal stent," which is expanded by a balloon rather than by its own resilience. For the reasons previously stated, the Court rejects Gore's proposed construction.

The Court finds further support for its conclusion from the claims of the '062 Patent, which do not contain the "balloon-expandable" limitation proposed by Gore. In contrast, dependent claim 2 of the '219 Patent does contain such a limitation, whereas independent claim 1 of that patent, does not. (See Bianrosa Decl., Ex. 6 ("219 Patent, 8:2-I 1.) Similarly, dependent claim 15 of the '828 Patent requires the use of a balloon, whereas claim 14 of the '828 Patent, from which claim 15 depends, contains no such limitation. (828 Patent, 8:29-59.) Moreover, the use of the balloon in the dependent claims is the only meaningful distinction from the independent claims. Thus, the presumption of claim differentiation weighs against Gore's proposed construction. See SunRace Roots, 336 F.3d at 1303.

Accordingly, the Court construes the term "expand" (and its variations) to mean: "to enlarge from a first to a second larger dimension."

"Expandable surface element"

Cytyc's proposed construction
(no construction required)
or
A device that can be expanded or inflated, such as an expandable cage or an inflatable balloon.

Xoft's proposed construction
Deflated balloon or collapsed cage.
Xoft's basic argument is that "expandable surface element" must be a deflated structure because once something is fully inflated, it is no longer expandable. Xoft also points out that part (d) of claim 1 refers to the "isodose profile" being "substantially similar in shape to the expandable surface element" without specifying whether the expandable surface element is fully expanded. It is apparent that the patentee intended "expandable surface element" to refer to a structure whether it was fully inflated or not. Xoft's proposed construction would have this element wink out of existence at full inflation, leaving the "outer spatial volume" unbounded and giving the "isodose profile" no shape. The court agrees with Cytyc that no construction of the term is necessary.

---

**Claim Language** | **Court's Construction**
--- | ---
"expandable surface element" | (no construction needed)

---

1472

a. "expanding the filter"

The phrase "expanding the filter" appears as part of a separate method step in claim 1. In pertinent part, claim 1 provides 

"[a] method for deploying a percutaneous medical instrument, comprising steps of: . . . expanding the filter downstream of the region of interest." Boston Scientific proposes that the phrase "expanding the filter" is readily understandable and needs no further construction. ev3 argues that the phrase should mean "expanding the filter by some additional action after and in addition to withdrawing the sheath." The Court declines to insert a limitation requiring manual action into the phrase "expanding the filter" and concludes that the phrase need not be construed.

---

6 Likewise, the phrase "expanding the filter" in the '505 Patent need not be construed.

---

1473

C. Term Two

As noted above, the second disputed claim term is "expands to conform to the shape and diameter of the inner lumen." As, expand, conform, shape, and diameter are common words, the ordinary meaning of the phrase is readily apparent to the Court. The phrase at issue is part of a broader claim which states that "a fragmentation member . . . automatically expands to conform to the shape and diameter of the inner lumen of the vascular conduit upon deployment of the fragmentation member." 191 patent Cl. 1. The ordinary definition of 'expand' is "to open up" or "to increase the extent, number, volume or scope of." Webster's New Collegiate Dictionary 436 (Merriam-Webster, 1986). To 'conform' is "to give the same shape, outline or contour to" or "to be similar or identical." Id. at 276. Thus, the expanding fragmentation member opens up to have the same shape, outline or contour as: (1) the diameter; and (2) the shape of the inner lumen. The specification states that the benefit of the invention is that it can accommodate for changes in the dimensions' of the vessel caused by the presence and removal of a thrombus in a three-dimensional vessel. 191 patent Col. 1 Ln. 62-66. Accordingly, the phrase describes the ways in which the fragmentation member changes to be the same as the inner lumen.

As a diameter is a chord passing through the center of a circle, diameter relates to the fragmentation member's expansion in a horizontal cross-section of a vessel. Thus, expanding to conform with the "diameter" means that the fragmentation member, looking at a cross-section, expands in such a way that it contacts the inner lumen in all directions and adjusts for the presence of a thrombus. That is, if the thrombus makes the vein less circular the fragmentation member compensates so that it touches the perimeter of the horizontal cross-section regardless of whether it forms a circle.

As claim components should not be interpreted to be redundant, Boeing Co. V. U.S., 57 Fed. Cl. 22, 28 n9 (Fed. Cl. 2003) (citing Ethicon Endo-Surgery, Inc. v. U.S. Surgical Corp., 93 F.3d 1572, 1578 (Fed. Cir. 1996)), conforming to the "shape"
relates to a different function of the fragmentation member. Conforming with the shape refers to the capability of the
fragmentation member to automatically adjust to remain in contact with the sides of the inner lumen along its length, i.e. a
'vertical' cross-section. See 191 patent Col. 3 Lns. 4-9 (describing a three dimensional basket expanding and applying
pressure against the thrombus). Indeed, as the specification notes that the device conforms to the inner dimensions of the
vessel lumen, the Court concludes that the device expands to be similar to the lumen in three dimensions. Id. Col. 2 Lns 65-
66. This means that if the vessel curves, then the fragmentation member curves and if a thrombus exists, then it
automatically expands to compensate for the varying size of the thrombus along the length of the vessel. Conforming to
the shape of the inner lumen means that the fragmentation member conforms to the diameter across many horizontal cross-
sections at once even though the individual cross-section diameters may vary. That is, looking at a cross section along the
'length' of the vessel, the fragmentation member conforms to that shape.

Datascope points the Court to Nystrom v. TREX Co., Inc., 424 F.3d 1136 (Fed. Cir. 2005), where the Court sought to define
the meaning of the noun, "board." That Court noted that the descriptions in the specification informed the construction of
the term "board" and to what it referred. The phrase at issue here, however, involves only function, there is no indication in
the claim or elsewhere that this particular phrase defines or somehow limits the structure which accomplishes that function.
The structure is left to the discussion above construing the term "fragmentation member." Accordingly, the phrase "expands
to conform to the shape and diameter of the inner lumen" means that the fragmentation member in the 191 and 551 patents
and the distal end in the 704 patent expands and adjusts to remain in contact with the inner lumen in three dimensions along
its length and width.

6. expansion chamber

Rose Art construes "expansion chamber" to mean "a concave structure at the outlet orifice of the nozzle that is designed to
accelerate the exiting stream from the airbrush." (Def. Pre-Markman Hr'g Br. at 41.) P&M agrees with this construction
except in so far as it imports an unnecessary functional limitation, "accelerating the exiting stream from the airbrush," from
the specification. 6 (Pls. Supp. Br. at 22-23.) The Court cannot add functional limitations appearing only in the specification
to the construction of the disputed claim term. Electro Med. Sys., 34 F.3d at 1054. Accordingly, the term "expansion
chamber" is construed to mean "a concave structure at the outlet orifice of the nozzle." Since the entirety of the intrinsic
evidence with regard to this term is not ambiguous, the Court did not consider the extrinsic evidence submitted by the
parties with respect to this term.

Footnotes

6 The specification describes the function of the expansion chamber as follows: "as the air enters and passes through the
expansion chamber it accelerates thereby inducing a swirling motion which ensures effective removal of liquid particles
from the nib 14 of the pen 2." ('300 patent, col. 3, ll. 32-38.)

End Footnotes

1. Construction

The parties dispute the meaning of the word "expelling" in claim 15; Smith & Nephew construes the term to mean pressure
that removes the anchor member from the needle, while Biomet appears to interpret the term to require the use of an
expelling member to propel the anchor member from the needle.

At oral argument, Biomet expanded its analysis of claim 15. Biomet asserted that "expelling" comes from within the
apparatus, not from some external means. A review of the specification, according to Biomet, supports this interpretation:
"[a] tube (16, 55) [that] fits within the needle (14, 54) and is pushed toward the needle tip to expel the anchor member (10, 50) into or behind the tissue to be manipulated or anchored." Ex. A, Abstract.

Smith & Nephew replies that Biomet is trying to read the disclosed embodiments into the claims. According to Smith & Nephew, Biomet's definition of "expelling" means "by the expulsion member," as in the preferred embodiments of the 691 patent. However, there is no mention of an expulsion member in the claim. The term "expel" was not given any particular meaning in the specification or in the prosecution history, and does not involve a term of art; it must be construed using the widely accepted meaning of the term.

According to Smith & Nephew, dictionary definitions suggest that "expel" means removing the anchor member from the needle by force, or forcing the anchor member out of the needle.

I agree with Smith & Nephew that Biomet's construction of the claim improperly inserts "by the expulsion member" into the claim. The claim calls for the expelling of the anchor member, but does not specify how that is accomplished. Although throughout the written description and in all of the embodiments, the anchor member is expelled from the hollow member in only one way-by the expulsion member, "this court has expressly rejected the contention that if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment." Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004). Since the patent does not in any way restrict the scope of the coverage, I do not read into the claim a requirement that the anchor member must be expelled by an expulsion member.

In addition, the term "expelling" is presumed to have its ordinary and customary meaning, unless the patent has clearly set forth a definition that is different from the term's ordinary and customary meaning. The patent is silent with respect to the meaning of "expel." Dictionaries almost uniformly define "expel" to mean to force out, eject, to drive out, or dislodge. See American Heritage Dictionary 644 (3d ed. 1996), Merriam Webster's Collegiate Dictionary 408 (10th ed. 1996), Webster's Third New International Dictionary 799 (1993), Webster's New World College Dictionary 478 (3d ed. 1996).

I find "expelling the anchor member" to mean that the anchor member is forced out, ejected, driven out or dislodged from the "hollow member."

--- Footnotes ---

15 Card USA correctly noted during the hearing that Fiala narrowed Claim 12 to require that the magnetic strip be exposed in order to overcome prior art. Tr. at 32-35. Therefore, there is no doubt that patent '909 excludes products covered by the prior art, where the magnetic strip lies unexposed within the boundaries of the package.

16 Based on its detailed and conscientious review of the record, the Court finds that Card USA does not advance a particular construction of this phrase of Claim 12. On the contrary, Defendant agrees with Plaintiff that Claim 12 requires that the "card having a data-encoded strip must project from some definable ascertainable periphery or outer perimeter of the package or panel holding the card." Tr. at 31. Instead, what Card USA actually asks the Court to do is to identify a particular point in time when the magnetic strip must be exposed. See Tr. at 34 (where Card USA argued "this flap [the Tracfone flap] means quite a bit. You have to look at the structure as it is made, as it is initially manufactured, and that if its manufactured to look like Hill and McIntire, it cannot fold. It does not then have this outer perimeter that was incorporated as a limitation at the end of the patent examination process for the express purpose of overcoming the references to Hill and McIntire.")

- 1906 -
The Court declines Card USA's request. Defendant's argument goes to the heart of the infringement claim. The language of Claim 12 does not specify particular time when the magnetic strip must be exposed, or demand that one be set. Thus, the Court will not read a time limitation into the text of Claim 12. Card USA must wait until the second stage of the analysis to raise this argument.

For instance, the Court concludes that the term "exposed" has its ordinary meaning of open to view, not shielded or protected. Webster's at 438. Similarly, the "at least" portion of the phrase takes its ordinary meaning to mean at a minimum. Id. at 756. Combined, the phrase requires that, at a minimum, a portion of the data-encoded strip must be open to view.

Additionally, the language of Claim 12 requires that the magnetic strip be "displaced externally". As with the previous terms, the word displaced takes its ordinary meaning. Id. at 365 (defining the word displace as "removing physically out of position"). The card must be displaced externally, meaning outside, the perimeter of the package. Id. at 440. The card is displaced externally remote "from the outer perimeter of said first panel." The term outer perimeter is used in its usual and customary sense to define the outer boundary. Id. at 874. In this case, the limit of the first panel or the border of the package.

The final requirement details the exact position of the card. Claim 12 demands that the card be placed in a direction "substantially parallel to the plane of said first card." All the terms in this phrase adopt their ordinary meaning. The Court agrees with Fiala that "there is no constraint placed [in this language] as to whether the first panel is coplanar with, or above, or below the first card, only that a portion of the data-encoded strip is outside a portion of the outer perimeter of the first panel in a direction substantially parallel to the plane of the first card." Pl.'s Brief at 25. All that is required is that the data-encoded strip be placed in a position as to be lying parallel to the edge of the package. The specifications confirm this interpretation. All the drawings depict an exposed card with an exposed magnetic strip, where the strip is parallel to the edge of the package. See U.S. Patent, Figs. 1, 5, 8, 12, 15, 20, 21, 27, 31, and 33.

In sum, the second subparagraph of Claim 12 requires, at a minimum, that a portion of the magnetic strip on the card be open to view, and that this magnetic strip be parallel to one of the edges of the package.

C. Terms in the '448 Patent

1. The term "exposing said food product to infrared energy" in claims 12 and 22 requires no construction. Cooper's proposed construction is "heating all of the outer surface which surrounds the food product by exposing the food product to infrared energy." Dkt. # 61-2, at 28. Unitherm argues that this term does not require construction or, in the alternative, proposes "exposing the food product to radiant energy in the infrared range." Dkt. # 60, at 22.

Again, Cooper attempts to read a limitation into the claims by requiring that all of the outer surface be exposed to infrared energy. This would directly contradict further language in claim 12, which describes a process for surface pasteurizing by continuously conveying a food product through an infrared oven "such that substantially all of said outer surface of said food product is directly irradiated with [ ] infrared energy." '448 Patent, col. 5, lns. 65-67 (emphasis added). "Substantially all" simply does not mean "all." The Court will not read the modifier "substantially" out of the claim. Further, Cooper's proposed construction would render the method of claim 22 impossible. Claim 22 is for a method of surface pasteurizing a food product by exposing it to infrared energy by continuously conveying said food product on a carrying run through an infrared oven. Id. at col. 6, lns. 38-43. The portion of the product's surface that rests on the carrying run would not be exposed to infrared energy. Therefore, "exposing said food product to infrared energy" cannot mean "exposing all of the food product to infrared energy."

The Court further finds that the term "infrared energy" does not require construction.
c. "Exposure"

Claim 1 recites:

the first blade defining a blade edge nearest the guard having a negative exposure not less than -0.2 mm, and the third blade defining a blade edge nearest the cap having a positive exposure of not greater than +0.2 mm, said second blade defining a blade edge having an exposure not less than the exposure of the first blade and not greater than the exposure of the third blade.

777 Patent col.4 11.7-14 (emphasis added). Claim 1 thus defines each of the "first, second, and third blades" in part by the term "exposure."

The specification contains an explicit definition of the term "exposure."

The blade exposure is defined to be the perpendicular distance or height of the blade edge measured with respect to a plane tangential to the skin contacting surfaces of the blade unit elements next in front of and next behind the edge. Therefore, for the three-bladed blade unit of the invention, the exposure of the first or primary blade is measured with reference to a plane tangential to the guard and the edge of the second blade, and the exposure of the third or tertiary blade is measured with reference to a plane tangential to the edge of the second blade and the cap.

777 Patent col.1 11.50-59 [hereinafter "the Specification Exposure Definition"]. In addition, the specification illustrates the progressive increase in blade exposure in Fig. 2 to the 777 Patent:

"FIG. 2 shows a schematic representation of a transverse cross-section through the preferred embodiment." 777 Patent col.2 11.60-62. As illustrated, the blade unit "has a frame 1 defining a guard 2 and a cap 3. As shown the cap comprises a lubricating strip 4 mounted on the frame. Carried by the frame are primary, secondary and tertiary blades 11,12,13 having parallel sharpened edges." Id. col.3 11.3-8. In the Fig. 2 embodiment, the primary (11), secondary (12) and tertiary (13) blades have exposures of -0.04 mm, zero, and +0.06 mm, respectively. See id. col.3 11.42-50.

The parties disagree on how the Court should construe the term "exposure." At issue is how "the exposure of the third or tertiary blade is measured with reference to a plane tangential to the edge of the second blade and the cap." Id. col.1 11.57-59. The Court addresses the intrinsic evidence first and refers to Fig. 2 and its labels in its analysis.

Gillette contends that the "exposure" of the third blade (13) is measured by drawing a plane tangential to the edge of the second blade (12) and the skin contacting surface of the cap lip, which is the skin contacting surface both closest to the third blade (13) and part of the cap (3). Gillette bases this construction on the phrase "plane tangential to the skin contacting surfaces of the blade unit elements next in front of and next behind the edge." Id. col. 1 11.52-53 (emphasis added).

Schick asserts, however, that the "exposure" of the third blade (13) is measured by drawing a plane tangential to the edge of the second blade (12) and the "topmost boundary" of the cap (3), which Gillette concedes could include the lubricating strip (4). Therefore, under Schick's proposed construction, if in Fig. 2 the lubricating strip (4) were constructed so that it extended vertically above plane P and the cap (3) remained unchanged, the "exposure" of the third blade (13) would be measured by drawing a plane tangential to the edge of the second blade (12) and the "topmost boundary" of the lubricating strip (4). 1 Schick bases this construction on a different interpretation of the same phrase used by Gillette: "plane tangential to the skin contacting surfaces of the blade unit elements next in front of and next behind the edge." Id. col.1 11.52-53. But under Schick's interpretation, "next in front of and next behind" refers to "the blade unit element," and "the skin contacting surface" means the entire portion of "the blade unit element."

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
Based on the intrinsic evidence, the Court finds that the term "exposure" is ambiguous. The phrase "next in front of and next behind" of the Specification Exposure Definition could modify "the skin contacting surfaces" (as Gillette contends), "the blade unit elements" (as Schick contends), or both "the skin contacting surfaces" and "the blade unit elements" (which would essentially be the same as Gillette's proposed construction). The dashed line that measures the "exposure" of the third blade (13) in Fig. 2 of the 777 Patent supports both proposed constructions because the plane touching the cap lip also touches the lubricating strip. Aside from the specification, none of the claims defines the term "exposure," and the parties have pointed to nothing in the prosecution history of the 777 Patent pointing in either direction. Therefore, the extrinsic evidence becomes critical for the Court to construe the term "exposure."

Pointing to dictionary definitions, Schick contends that the term "the skin contacting surface" means the entire portion of a blade unit element's skin contacting surface. (See Defs.' Markman Br. 12.) This definition would support Schick's proposed construction of the term "exposure" even if, as asserted by Gillette, the phrase "next in front of and next behind" of the Specification Exposure Definition modifies "the skin contacting surfaces." If the "exposure" of the third blade (13) were measured by drawing a plane tangential to the edge of the second blade (12) and the entire portion of the cap's (3) skin contacting surface, the dictionary definitions of the words "tangential" and "surface" would direct the plane to be drawn to the "topmost boundary" of the cap (3). See American Heritage College Dictionary (2d ed. 1982) (defining the word "tangential" as "of . . . or moving along or in the direction of a tangent," the word "tangent" as "making contact at a single point or along a line; touching but not intersecting," and the word "surface" as "the outer or the topmost boundary of an object").

The extrinsic dictionary definitions, however, do not resolve the ambiguity of the term "exposure." The crux of Schick's argument is that the use of a definite article in the term "the skin contacting surfaces" signifies that each blade unit element has one and only one skin contacting surface: "the' signifies that the phrase refers to the entirety of the blade unit element's skin contacting surface." (Defs.' Markman Br. 12.) The pertinent excerpt of the Specification Exposure Definition states, however, "plane tangential to the skin contacting surfaces of the blade unit elements next in front of and next behind the edge." 777 Patent col.1 11.52-53 (emphasis added). This language is ambiguous because it is unclear whether the plural word "surfaces" refers (a) to multiple surfaces on the same blade unit element or (b) to the combination of the singular "surface" on the blade unit element "next in front of" the edge and the singular "surface" on the blade unit element "next behind the edge." Therefore, Schick's argument based on extrinsic dictionary definitions is not conclusive.

More persuasively, Gillette points to extrinsic evidence in the form of another patent, deposition testimony from Schick's own expert, and Schick's own Quattro production specification as demonstrating that persons of ordinary skill in the art understand the term "exposure" under Gillette's proposed construction. Specifically, U.S. Patent No. 3,660,893 (filed Mar. 24, 1970) (issued May 9, 1972) ("the Welsh Patent"), which the 777 Patent cites as a reference, defines the term "exposure" as "the perpendicular distance from the cutting edge to the plane tangent to the skin-engaging surfaces disposed in front of and behind the cutting edge." Welsh Patent col.4 11.53-55. While Schick's briefs attempt to distinguish the Welsh Patent as defining a different "protocol" for measuring "exposure" based on the different language used, Schick's own technical witness, William Vreeland, testified that he understood that the Welsh method of measuring "exposure" was the same method disclosed in the 777 Patent. (Pls.' Surreply to Defs.' Markman Br. Ex. 1.) In addition, Schick's own production specification for the Quattro razor illustrates that in measuring the "exposure" of the blade closest to the cap, a plane is drawn tangent to the cap lip, which is the skin engaging surface next behind the blade as Gillette contends. The plane is not drawn tangent to the cap or the entirety of the cap's skin engaging surface as Schick contends. (See Pls.' Ex. 39.) This extrinsic evidence thus reveals that persons of ordinary skill in the art understand the term "exposure" under Gillette's proposed construction.

Therefore, the Court construes the term "exposure" according to the explicit definition of the specification, where the phrase "next in front of and next behind the edge" modifies "the skin engaging surfaces." With regard to the "exposure" of the third blade (13), the Court adopts Gillette's proposed construction, where the plane is tangential to the edge of the second blade (12) and the skin contacting surface that is both closest to the third blade (13) and part of the cap (3).
C. "Exposure to the Smoke Cooled to Between 0 [degree] and 5 [degrees] C."

Additionally, TPI and HISI disagree about the meaning of the Yamaoka Patent's claim to the process of "smoking the tuna meat at extra-low temperatures by exposure to the smoke cooled to between 0 [degree] and 5 [degrees]." HISI argues that this phrase should be construed so as to limit the Yamaoka Patent to processes in which the smoke is first cooled, and then the tuna is exposed to the already-cooled smoke. It argues that the Yamaoka Patent does not extend to cover a process by which the tuna is exposed to smoke, and then both the tuna and the smoke are simultaneously cooled to between 0 [degree] and 5 [degrees] C. TPI argues, however, that its claim should not be so limited and that the Yamaoka process does not require that the smoke be cooled prior to its exposure to the tuna.

TPI's position is contradicted by the plain language of the claim itself. First, the use of the definite article "the" in "the smoke cooled to between 0 [degree] and 5 [degrees] C" indicates that it is some particular smoke, not smoke in general, which is being referred to in this step. The only plausible referent for "the smoke cooled to between 0 [degree] and 5 [degrees] C" is the smoke discussed in the preceding step of the claim, which describes "cooling the smoke passed through the filter in a cooling unit to between 0 [degree] and 5 [degrees] C." Claims can require that their steps be performed in a certain order where "the sequential nature of the claim steps is apparent from the plain meaning of the claim language and nothing in the written description suggests otherwise." Interactive Gift Exp., Inc. v. Compuserve Inc., 256 F.3d 1323, 1342 (Fed. Cir. 2001). That is the case here. Smoke is cooled to between 0 [degree] and 5 [degrees] in one step; the subsequent step then describes how "the smoke cooled to between 0 [degree] and 5 [degrees]" is exposed to the fish.

Moreover, even disregarding the presence of the definite article "the," the use of "cooled" to modify "smoke" indicates that the smoke has already been cooled before the fish is exposed to the smoke. In other words, even if the claim had been written as "exposure to a smoke cooled to between 0 [degree] and 5 [degrees] C," it would still describe only a process in which the smoke has already been cooled prior to exposure. "Cooled" is a participial adjective that modifies the word "smoke." It is formed from the past participle of cool, which is "cooled," and then used as an adjective rather than a verb. Because it is derived from the past participle, rather than the present participle, the use of "cooled" as an adjective indicates that the action has already taken place or already been completed. Here, that means that the smoke has already been cooled to a specific temperature, namely, to between 0 [degree] and 5 [degrees] C.

With these principles in mind, we turn to the appropriate construction of one of the disputed terms. We turn to the third disputed limitation, that of "smoke cooled to between 0 [degrees] and 5 [degrees] C." TPI argues that the district court erred by construing that limitation as requiring a process that first cools the smoke and later applies the cooled smoke to the tuna. According to TPI, under the language of the claim, the smoke can be applied to the tuna first, and then cooled to the stated temperature range. In support of that interpretation, TPI notes that the "smoke cooled" limitation does not introduce the smoke using the word "said," which is traditionally used by claim drafters to reference previously-mentioned limitations. Here, the claim instead refers to the smoke as "the smoke cooled," which, in TPI's view, introduces a new element to the claim.

HISI, in contrast, urges us to affirm the district court's construction which requires the smoke to have been cooled before exposing it to the tuna. HISI interprets the phrase "the smoke cooled" as referring to the smoke filtered in the previous step of claim 1's method. According to HISI, the use of the past tense "cooled" precludes any reading that would permit the cooling and smoking steps to be performed simultaneously or in reverse order. Furthermore, HISI argues, the specification of the '619 patent confirms the order of the cooling steps in the smoking process.

We agree with HISI that to infringe the '619 patent, a method must cool the smoke before the smoke contacts the tuna. The plain language of claim 1 demonstrates that the district court was correct in placing a temporal limitation on the steps of the smoking method. As the district court noted, this case is one in which the "sequential nature of the claim steps is apparent
from the plain meaning of the claim language and nothing in the written description suggests otherwise." Tuna Processors, 2007 U.S. Dist. LEXIS 77396 at *19 (quoting Interactive Gift Exp., Inc. v. Compuserve, Inc., 256 F.3d 1323, 1342 (Fed. Cir. 2001)).

Claim 1 describes a multistep process of creating smoke within a particular temperature range and then cooling that smoke to another temperature range. In each step of the method, the smoke is referenced by using a past participle describing the action that occurred in the previous step. To illustrate this, the steps of the '619 patent are reproduced below with the smoke references underlined:

burning a smoking material at 250[degrees] to 400[degrees] C. and passing the produced smoke through a filter to remove mainly tar therefrom;

cooling the smoke passed through the filter in a cooling unit to between 0[degrees] and 5[degrees] C. while retaining ingredients exerting highly preservative and sterilizing effects; and

smoking the tuna meat at extra-low temperatures by exposure to the smoke cooled to between 0[degrees] and 5[degrees] C.

In the first step of claim 1, the smoke is "produced" by burning a smoking material. In that same limitation, the smoke is passed through a filter. The smoke filtration aspect of the first step, which must occur after the smoke is produced, refers to the smoke as "the produced smoke." The use of the past participle confirms that the smoke must be produced prior to being filtered. The second step of claim 1, the cooling step, refers to the smoke as "the smoke passed through the filter." Again, the use of the past participle "passed" leads to the conclusion that the cooling of the smoke occurs after the smoke has passed through the filter. In both the first and second steps, the smoke from a previous limitation is referenced using a past participle, indicating that the previous limitation must have occurred prior to the present limitation. In other words, "the smoke produced" must have been produced prior to filtration, just as the "smoke passed through the filter" must have been filtered prior to being cooled. In the same manner, the use of the past participle in "the smoke cooled" in the disputed third step requires that the smoke have been cooled prior to contacting the tuna meat for infringement to occur.

Nothing in the specification dissuades us from reading a temporal limitation in the third step of claim 1. Indeed, the specification confirms the appropriateness of such a temporal limitation. The second step of claim 1 states that the smoke is cooled in a "cooling unit." '619 Patent, Cl.1. The Summary of the Invention of the '619 patent instructs that the smoke from the "smoke-cooling unit" is exposed to the tuna in a separate location, "a smoking chamber." Id. col.1 ll.63, 65; see also id. fig.1, col.4 ll.13-14 (drawing of separate locations for the smoking chamber and smoke-cooling unit). The presence of two distinct locations for the cooling step and the exposure step eliminates the possibility of simultaneous cooling and exposure. The Summary of the Invention further indicates that the smoking chamber is where pieces of tuna are placed together and "exposed to smoke from the smoke-cooling unit." Id. col.1 ll.66-67. Thus, the smoke must have been cooled prior to being introduced into the smoking chamber. Numerous other references in the specification confirm this sequential ordering of steps. See id. col.3 ll.33-40 (teaching that the smoke from the smoke-cooling unit is "brought into contact" with fish in the smoking chamber); col.4 ll.66-col.5 l.1 ("The smoke-cooling unit 3 delivers the smoke cooled to between 0[degrees] and 5[degrees] C. through the pipe 32 to the smoking chamber 4.").

TPI's argument that the use of the definite article "the" in the third step somehow indicates that the smoke used in that step is different from the smoke in the previous step is without merit. As demonstrated above, all of the steps of claim 1 clearly refer to the same smoke. There is nothing in the claims or specification of the '619 patent that would indicate that smoke different from the filtered and cooled smoke of the first and second steps is introduced in the last step of the method. The '619 patent is concerned with creating smoke having a particular temperature, preservative ability, and flavor in order to optimally cure tuna fish. TPI's claim that a new type of smoke is introduced during the last step of the process runs contrary to the entire purpose and design of the '619 patent and its claims. It simply is an attempt to cloud the issue.

Furthermore, TPI's claim drafting argument misstates traditional claim drafting practice. Indeed, the introduction of a new element is accomplished through the use of an indefinite article, not through the use of a definite article. See, e.g., Robert C. Faber, Faber on Mechanics of Patent Claim Drafting, App. D-1 (6th ed. 2008) ("the definitive article THE is used to refer to an ELEMENT which has been established earlier in a claim."); see also 2 Manual of Patent Examining Procedure, ch. 2173.05(e) (8th ed. 2006) (giving an example of an indefinite claim caused by use of the term "the lever" without an
antecedent introduction of "a lever"). Thus, the use of the definite article in the third step of claim 1 supports our conclusion that "the smoke cooled" is the smoke from the previous step.

In light of all of the above, we conclude that the third step of claim 1 of the '619 patent must occur after the smoke has been cooled to between 0[degrees] and 5[degrees] C for infringement to exist. Having reached that conclusion, we affirm the district court's final judgment of noninfringement. It is not necessary for us to consider the other contested claim terms in light of the stipulation.

1481

The district court also construed the limitation of a "conductive rail being adapted to extend the length of the fixed device part" to mean the conductive rail must run the end length of the track to which it is attached. Initial Decision, slip op. at 10. Specifically, the district court construed the term "length" to mean "extent from end to end -- distinguished from width." Id. In other words, the district court applied the ordinary meaning to the term "length" and found that the plain meaning of the term referred to the full length of the fixed device part. Id. at 12. In the patent's roller coaster embodiment, this limitation would require the conductive rail to extend the entire length of the roller coaster.

In the claim, the "fixed device part" refers to the framework of the amusement device, i.e., the track for the roller coaster or tower drop. The "conductive rail" refers to a metal rail, part of which will have a conductive coating. The rail and the coating make up the conductive part. This "conductive part," in turn, passes through the array of magnets to generate the braking force or vice versa, depending on the configuration. This court must determine the meaning of "length" as a reference to the full length of the fixed device part, as the district court construed, or to the direction or orientation of the conductive rail.

The claim language uses the term "length" in the context of a longer phrase: "adapted to extend the length of the fixed device part." The verb "extend" already suggests that the "length" reaches from one end to another. Moreover, the term "length" imparts information about the "fixed device part," once again suggesting that the "length" will encompass the entire dimensions of that structure. In sum, the claim term "length" in context in the claim encompasses the full length of the fixed device part, as the district court correctly discerned.

The district court further recognized that the specification nowhere uses "length" to refer to direction or orientation. Initial Decision, slip op. at 11-12. Rather, the district court found correctly that the term referred to the entire length of the fixed device part. Id. at 12. The patent specification uses "length" consistent with its meaning as a distance, rather than merely a direction. Thus, the context supplied by the specification underscores the meaning of claim 1 of the '350 patent that expressly states that the conductive rail extends the length of the fixed device part.

For example, the '350 patent uses the term "length" to discuss the braking distance. '350 patent col.2 l.13; col.4 l.66. It also uses the term to refer specifically to the length of the magnetic elements. '350 patent col.5 ll.32, 34, 41-42. Both uses of "length" consistently refer to distance or dimension, quantitative applications of the term "length." In comparison, when the '350 patent references a direction as opposed to a distance, it uses language such as "along drop directions." '350 patent col.3 ll.36-38 ("Both the energizing and conducting parts (5,6) are designed in the form of a rail and stretch along the drop directions.").

Intamin argues that the intrinsic evidence supports its proposed claim construction because when the inventors were trying to convey an entire distance, they used a modifier such as "whole height." '350 patent, col.7 ll.37-40; col.4 ll.31-34. While Intamin argues that no modifier requires the length to extend the entire length of the fixed device part, the flip side of this argument also applies: no modifier instructs one skilled in the art to interpret the phrase as extending to only part of the fixed device. Thus, the context and word choice of the claim language itself establishes that "extend the length" means the length of the fixed device part. In other words, the intrinsic evidence confirms the meaning conveyed by the claim language.

Intamin argues that this interpretation would not permit the claim to read on embodiments of the invention specifically mentioned in the patent specification. For example, the patent discloses a roller coaster-type embodiment where the passenger car or movable device houses the conductive part. Under the proper claim construction with the conducting rail extending the length of the fixed device, the claim may well not cover this embodiment. Nonetheless, this court has
acknowledged that a claim need not cover all embodiments. See Telemac Cellular Corp. v. Topp Telecom, Inc., 247 F.3d 1316, 1326 (Fed. Cir. 2001) ("We conclude that only those embodiments involving communications established by the host processor meet the functional requirement of the claim."); see also Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1324-25 (Fed. Cir. 2003); Phillips Petroleum Co. v. Huntsman Polymers Corp., 157 F.3d 866, 875 (Fed. Cir. 1998). A patentee may draft different claims to cover different embodiments.

In addition, Intamin argues that the proper claim interpretation would render another claim, dependent claim 10, invalid. Dependent claim 10 addresses the embodiment where the conductive portion is connected to the movable device. With claim 1 specifying that the conductive rail extends the length of the fixed device, dependent claim 10 may well be improper. Thus, Intamin urges this court to construe claim 1 to retain the validity of claim 10. Under the proper construction of claim 1, dependent claim 10 erases entirely a limitation of the fixed device part and is thus an improper dependent claim. Of course, dependent claim 10 has that effect under any reading of "length" in claim 1. Because claim 1 requires the conductive portion to reach the length of the fixed device part and claim 10 places the conductive portion on the passenger car, claim 10 is an improper dependent claim. Thus, construing claim 1 to mean end to end length does not in itself render claim 10 invalid. In any event, the claim construction of claim 10 is not before this court. Thus, this court considers but gives no weight to Intamin's argument relative to claim 10.

Given this construction, the district court initially determined that Magnetar's Soft Stop brakes did not infringe because they placed the conducting rail on the passenger car. Initial Decision, slip op. 12. The district court determined it could not find on summary judgment that Magnetar's brakes would not infringe this limitation under the doctrine of equivalents. Id. However, the district court granted summary judgment to Magnetar because it determined that Magnetar did not contain an intermediary. Id. at 13. Intamin requested reconsideration and the district court determined that there was a triable issue as to whether Magnetar's brake system can be configured such that the conducting rail was attached to the track. Reconsideration Decision, slip op. at 4. Thus, this court remands to the district court for a determination of whether Magnetar's brakes would infringe this limitation, either literally or under the doctrine of equivalents. 2

2 The parties in this appeal discuss additional claim limitations that were not construed by the district court. This court encourages the district court to consider all of the limitations of claim 1 of the '350 patent on remand.

2. Analysis

This Court has the "power and obligation to construe as a matter of law the meaning of language used in the patent claim." Markman, at 979. The specific language at issue reads:
separate member including an extended flange that is positioned against a back surface of the raised panel portion, said extended flange being secured to the raised panel portion adjacent said unfinished edge during assembly of the shutter.

The specification contained in the patent and the prosecution history identify the "extended flange" as (1) an additional part, (2) that is positioned against the back surface of the raised panel portion, and (3) that provides a structural member for securing the separate panel end section. Additionally, the Court's examination of extrinsic evidence at a status conference further substantiates that an "extended flange" is a substantial and separate structural part. In considering the patent language, its specifications, and its prosecution history, the Court interprets an "extended flange" to mean a separate and substantial structural part that is positioned and secured to the back surface of the raised panel portion.

Plaintiffs construe the phrase "extended over" to mean "that at least some portion of each of the extensions reaches above and across the corresponding stud." JS, Exh. A at 23. Plaintiffs also contend that the phrase "can support" means "that the studs, either directly or indirectly, are capable of maintaining the extensions in position so as to keep them from falling, sinking or slipping." Id. at 25. Plaintiffs further contend that the term "prevent" means "to impede, obstruct or keep from happening." Id. at 27.

Conversely, Defendant contends that the entire phrase in question means that "the arms or extensions from the auxiliary frame contact and are supported on the upper side of the extensions [sic] 21 at the outer edges of the primary frame to prevent the auxiliary frame from moving downward with respect to the primary frame." JS, Exh. C at 109. Defendant's construction seeks to limit the instant phrase by requiring the extensions from the auxiliary frame to "contact" and be supported on the "upper side" of the studs at the "outer edges" of the primary frame.

In this case, it is clear from the language of claim 12 that the magnetic material in the auxiliary frame is located in the flange that extends downwards. See '747 Patent, Koo Decl., Exh. C, Col. 5, 11, 41-43. The Court has already held that the magnetic attraction between the magnetic material in the auxiliary frame and the magnetic material in the primary frame can take place with or without physical contact. See supra, section "III B 2 b (4)". As such, and since there need not be physical contact between the back side of the stud and the downwardly extending flange, there must be physical contact between the upper side of the stud and the extension; otherwise, it would be physically impossible to support the auxiliary frame on the primary frame.

Therefore, the Court construes the instant phrase to mean that at least some portion of each of the extensions reaches above and across the corresponding stud, and each stud is capable, with direct contact, of maintaining the corresponding extension in position so as to keep it from falling, sinking or slipping and thus prevent the auxiliary frame from moving downward relative to the primary frame. See Webster's, Nicodema Decl., Exh. 5 at 130, defining "extend" as "to stretch or spread out to
full length”; id. at 144, defining "over" as "[a]bove and across from one end or side to the other," id. at 155, defining "support" as "[t]o maintain in position so as to keep from falling, sinking, or slipping."

23 The Court does not find it necessary to construe the term "prevent."

The parties disagree about the proper construction of the term "extending." RYMSA argues that "extending" means "lengthening in one or more direction(s)," while Kathrein argues that "extending," as recited in Claims 1 and 24, should be given its ordinary and customary meaning, i.e., "lengthening." (See '130 Patent, Claim 1, Col. 5, ll. 61-67 & Col. 6, ll. 1-19; id., Claim 24, Col. 8, ll. 10-38.)

The Court agrees with Kathrein. Adding the limitation of "in one or more direction(s)" to the definition of "extension" is improper because the intrinsic evidence does not require such a limitation. Claim 1 claims "the second connection line is disposed with respect to the second stripline section by extending the first connection line which leads to the first tapping section," and Claim 24 claims "the respective connection line is disposed with respect to a next, further outward stripline section by extending an inward connection line which leads to a respective further inward tapping section." (Id.) In both claims, the term "extending" does not mean a lengthening of the connection line in one or more directions, but rather, it merely means a lengthening of the connection line to a tapping section. It would only be necessary to add the limitation "in one or more direction(s)" if, like the pointer element or point element, the first and second connection line were treated as one. However, unlike the pointer element or point element discussed above, the language of the claims shows that each connection line is its own.

The specification also supports this construction. The specification states

[t]he tapping element 25 includes a first connection line 31a. Connection line 31a extends from the coupling section 33 in the overlapping area of the center tap 29 to the tapping point 27a on the inner stripline segment 21a. The region which projects as an extension beyond this tapping point 28a forms the next connection section or connection line 31b.

(Id., Col. 4, ll. 24-29.)

Because the specification also states that each connection line is treated separately with regard to the exemplary embodiment shown in Figure 2, it is unnecessary to add the limitation "in one or more direction(s)" because it necessarily follows that the connection lines as depicted in Figure 5, which "shows two straight striplines . . . which are . . . offset with respect to one another through 180[degrees] with respect to the pivoting axis" (id., Col. 5, ll. 32-35), would also be treated as separate parts. (See id., Col. 5, ll. 43-44 ("Description of similarly labeled elements in FIG. 2 will not be repeated here.")

Thus, in Figure 5, connection line 31a extends from center tap 29 to the tapping point 27a and connection line 31b extends from center tap 29 to the tapping point 27b.

In sum, the claim language and the specification show that RYMSA's "in one or more direction(s)" interpretation is improper. Because it is possible to construe the term "extending" by examining the intrinsic evidence, contrary extrinsic evidence is not useful to the Court. Accordingly, the Court construes the term "extending" to mean "lengthening."
Bradford proposes that "extending" means "reaching or reach." Defendants propose that "extending" means "reaching, at least in combination with an additional component(s), completely from the bottom member to the top member." This term is a further limitation on "legs" in that the legs must extend between the top member and the bottom member. The dispute over this term is essentially the same as the disagreement over "spanning between" discussed, supra, Part IV.A.6. The Court rejects Defendants' construction of "extending" for essentially the same reasons.

The Court finds that the term "extending" is not limited to "at least in combination with additional components." Where a specification does not require a limitation that limitation should not be read from the specification into the claims. Lemelson v. United States, 752 F.2d 1538, 1551-52, (Fed. Cir. 1985).

The Court notes that in regard to the embodiment depicted in Figure 4, the specification states that the legs are "hingedly coupled to the base members 62 and top member 64 by appropriate fasteners, such as rivets or pins[]." '916 Patent, col. 12, ll. 31-33. The entire specification, however, does not limit this embodiment to attachment with only other components, such as fasteners. In regard to the embodiment depicted in Figure 5A, which employs telescoping legs, the specification states that the "bottom segment [of the telescoping leg] 88d is coupled to base member 62 while the top segment [of the telescoping leg] 88a is mounted to top member." Id. col. 13, ll. 53-55 (emphasis added). As the Court held supra at Part IV.A.2, "coupled to" means "linked together, connected, or joined." Figure 5A does not indicate that any additional components are required to connect or join the telescoping leg to the bottom member or mount it to the top member. Presumably, the legs could be connected to the bottom member by welding or brazing. The specification states that the top segment of the telescoping leg is fixed to the top member by a stand-off structure. Id. col. 13, ll. 55-57. It appears that the stand-off structure is not a separate component but rather is machined or formed so that it comprises a piece of the top member. See id. Drawing Sheet 5A. Connecting the legs to the members by such methods would not require the use of any additional components. Therefore, Defendants' proposed inclusion of the limitation "in combination with other components" is not required by the specification and should not be incorporated to limit the scope of the claim. Indeed, the specification demonstrates an alternative method for extending the legs between the members which does not require use of additional components. Consequently, Defendants' proposed construction of "extending" is rejected.

Accordingly, the Court holds that "extending" means "reach or reaching".
The structure of the claim supports Plaintiff's interpretation. 59 Claim 35 is separated into two clauses. The first clause says that the clip has a plurality of legs. The second clause states that those legs "extend[] about at least one side surface." By separating the limitations that there be two legs and that the legs extend from at least one side surface, the claim language indicates a requirement that there be a plurality of legs in total, and that those legs extend from a side surface as opposed to some other surface.

Defendant argues that its interpretation must be correct, because otherwise the requirement that the legs extend from at least one side would be meaningless. It is true that Plaintiff's interpretation simply requires a plurality of legs in total. But this requirement does not render the second clause meaningless. The prosecution history reveals that Plaintiff added the extra clause after the examiner objected to the original language on the basis of a prior art reference where a leg protrudes from the face of the clip. 60 In this way, the added claim language in the '004 patent simply identifies that the legs extend from one or more sides of the clip instead of from the face of the clip.

Defendant also argues that the patent specification supports its meaning. Figures 4A and 4B depict a clip with two legs on one side and one leg on another. But this figure is also consistent with Plaintiff's definition. It would be improper to read from the specification a limitation that there be more than one leg on one side, where the language and structure of the claim indicate that all that is required is a plurality of legs in total. 61

Because the structure of the claim reveals its meaning, and because the prosecution history and the specification are consistent with this meaning, the court adopts Plaintiff's construction and finds that claim 35 covers a clip with a plurality of legs in total where those legs extend from more than one side.

1488

1. "Extending Above a Top Surface"

Claims 1, 3, 19, 33, 39, 48 and 55 of the '874 patent, 11 and 23 of the '002 patent and Claim 1 of the '176 patent use this language. Three variants arise using the "above a top surface" language. Each variant requires a column, recess or similar means "extending above a top surface of one of said side walls." Claim 23 of the '002 patent uses "disposed" instead of "extending." Claims 39, 48, and 55 of the '874 patent add "at least" in front of the term "above a top surface of one of said side walls." Claims 1, 11, and 23 also use
"first" in place of "one" of the side walls.

a. Norseman's Position

Norseman argues that the language must be interpreted to mean that a column, recess or structure must extend higher than the peaks of the sinusoidally patterned side walls, i.e. the topmost surface of the side walls. Motion, at 13.

b. Rehrig's Position

Rehrig argues that the plain and proper meaning of this language requires "a column, recess or similar means that extends to a height above that of a top surface of one of the side walls of the bottle case. It is not required that the column, recess or similar means extend above the topmost surface of the side wall." Opposition, at 15.

C. Court's Construction

The debate between the parties' competing constructions centers primarily around the definition of "a top surface." Norseman's interpretation of the language requires a column or other structure that extends in height beyond the topmost surface of the side walls. Norseman contends that the language "a top surface" must be given different meaning: "the top surface." (Emphasis supplied). Rehrig argues that there are several top surfaces and that the language merely requires a column or structure extending above one of these "upper or top surfaces" of the side wall. Rehrig supports its position by citing cases indicating that Claims using the opening term "comprising," such as utilized in this Claim, are generally understood in patent claim parlance to allow for 'one or more' articles. See Elkay Mfg. Co. v. Ebco Mfg. Co., 192 F.3d 973, 977 (Fed. Cir. 1999). Additionally, Rehrig contends that the doctrine of Claim differentiation rebuts Norseman's construction because some claims use "top" and "topmost" in the same Claim, thereby implying that the language needed to express Norseman's construction was available and not consciously not utilized. Opposition, at 16.

The Court construes the language to mean that the column or recess must extend beyond above the topmost surface of one of the said side walls as opposed to simply extending beyond any top surface. For the purpose of determining the top of the wide wall, the column or recess is not part of the side wall.

The Court similarly construes language in Claim 31 of the '002 patent and Claim 4 of the '176 patent. Claim 31 uses the language that bottle supporting means includes "a portion extending above the height of a top surface of a first of said side walls." 10 Claim 4 of the '176 patent includes language that the structure "extends above said outer shell." For each of these claims, the Court construes the language to require the structure at issue to extend beyond the topmost surface of the side wall as opposed to any top surface, or indeed the top most surface of the crate as a whole.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

10 Claim 7 of the '176 patent uses similar language "a portion thereof which extends above a top surface of one of the said side walls."

GO BACK

1489

Insight and Glock dispute the meaning of "extending along" and "extends along" as used in phrases in claims 1 and 32. In both claims, the first structural member of the housing for the auxiliary device is described as "extending upward from a first side of the housing and extending along at least a portion of a length of the first side of the housing." The second structural member "extends along at least a portion of a length of the second side of the housing such that it is substantially parallel to the first structural member, and wherein both the first and second structural members are substantially parallel to a central, longitudinal axis extending along a length of the housing." The spring-biased mechanism is described as
"extending across and along a top surface of the housing." SureFire states that "the ordinary meaning of this term to a person of ordinary skill in the art is clear and does not require any construction by the Court." SureFire does not, however, articulate the clear meaning that it perceives.

1. Parties' constructions.
Glock and Insight concur that "extending across" as used in the disputed phrase to describe the spring mechanism means extending or spanning from one side of the top surface of the housing to the other. Put more simply, "extending across" means that the mechanism traverses or is perpendicular to the longitudinal axis of the housing. The parties agree that longitudinal means the long axis of the body. To the extent there is disagreement about whether "extending across" requires the mechanism to cover the entire distance from one side of the housing to the other, the phrase is construed to mean the orientation but not necessarily the size of the mechanism.

Glock contends that "extending along at least a portion of a length of the . . . side of the housing" should be construed to mean "spanning over at least a portion of the length (but not necessarily over the entire length) of the side of the housing." Glock contends, however, that "extending along," as used to describe the spring mechanism, means "spanning . . . over the length of (along) the top surface of the housing." In other words, Glock interprets "along" to mean length. Glock also contends that "extending along" means covering the entire length of the housing. In ordinary parlance, "along" does not necessarily incorporate the direction of length. 7 If Glock's construction of "extending along," which equates "along" with "length" and adds a size requirement, were added to the phrase pertaining to the structural members, it would make that description nonsensical: the structural member would span over the length, meaning the entire length, of at least a portion of a length of a side of the housing. Glock's two constructions of the same phrase are inconsistent and do not comply with the ordinary meaning of "extending along."

Insight contends that "extending along" as used to claim the spring-biased mechanism means "situated substantially parallel and close to the top surface of the housing." In other words, Insight construes the term to provide the location, close to the top of the housing, as distinguished from a location within or on the bottom of the housing, but also adds the requirement that the mechanism be parallel to the top of the housing. Insight uses the same concepts in interpreting the phrase in the context of the structural members: "the structural members must extend on a line or course substantially parallel and close to the surface of the side of the housing." The question Insight's interpretation raises is whether "extending along" is properly construed to mean both close to and substantially parallel to the top of the housing.

Both Insight and Glock argue that other parts of the specification support their differing interpretations of the phrase. Their arguments, however, are not persuasive. Therefore, the various uses of "extending" and "along" in the specification do not appear to solve or even provide substantial guidance on the appropriate meaning of the word as used in claims 1 and 32. 8

8 To the extent Glock relies on the magistrate judge's report and recommendation, denying Insight's motion for a preliminary injunction against SureFire, to show that "extending along" means covering the entire length of the top of the housing, its reliance is misplaced. See, e.g., Univ. of Tex. v. Camenisch, 451 U.S. 390, 395, 101 S. Ct. 1830, 68 L. Ed. 2d 175 (1981); Glaxo Group Ltd. v. Apotex, Inc., 376 F.3d 1339, 1346 (Fed. Cir. 2004); Jack Guttman, Inc. v. Kopykake Enters., 302 F.3d 1352, 1361 (Fed. Cir. 2002). Further, the court is not persuaded that Insight's position and the construction found by the magistrate judge there are necessarily inconsistent with the construction offered here.

The practical effect of the two constructions is to define the scope of claims 1 and 32 with respect to the spring mechanism.
Jump to: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

Glock's construction limits the claims to a mechanism using a cantilever spring, which extends down the entire length of the housing. Insight's construction would cover both a cantilever-spring mechanism and a leaf-spring mechanism, regardless of size. Therefore, the dispute focuses on the use of the phrase "extending along" to describe the spring mechanism.

2. Prosecution history.

The parties both point to the prosecution history to support their differing interpretations of the disputed phrase. "Like the specification, the prosecution history provides evidence of how the PTO and the inventor understood the patent." Phillips, 415 F.3d at 1317.

The patent examiner concluded that Insight's initial application included separate inventions, designated according to the figures as Species A (Figures 4 and 6), Species B (Figure 5), Species C (Figure 3B), and Species D (Figure 7). He required Insight, "under 35 U.S.C. § 121 to elect a single disclosed species for prosecution on the merits to which the claims shall be restricted if no generic claim is finally held to be allowable." 9 Ex. E at 2. 10 Insight elected Species A, which Figures 4 and 6 show to be the embodiment using a cantilevered spring in the second positioning mechanism, while Species B, based on Figure 5, used a leaf spring.

9 Section 121 provides in pertinent part:

If two or more independent and distinct inventions are claimed in one application, the Director may require the application to be restricted to one of the inventions.

10 Insight's exhibits referenced for the prosecution history are attached to its claim construction brief filed in Insight v. Glock, 03-cv-253, doc. no. 48.

After amendment, rejection, and further amendment, the application included claim 94 that claimed: "a spring-biased mechanism oriented substantially perpendicular to the central, longitudinal axis of the housing along a top surface of the housing, and wherein the bias of the spring forces the mechanism to move in a direction normal to the top surface of the housing." Ex. H at 2. In response, the examiner again imposed a restriction requirement, using the same language as quoted above. Insight again elected Species A and withdrew certain claims. Insight also amended that part of claim 94 pertaining to the spring-biased mechanism as follows: "a spring-biased mechanism extending across and along a top surface of the housing, and wherein the spring-biased mechanism is configured to be biased in a direction normal to the top surface of the housing." Ex. J at 3. As approved, claim 94 became claim 1 of the '901 patent.

Glock contends that by electing Species A, Insight abandoned Species B, the embodiment of the invention that used a leaf-spring mechanism, so that "extending along" is properly interpreted in a way that excludes the leaf spring embodiment. Insight agrees that two elections occurred in the course of the prosecution history but argues that it did not abandon the other embodiments, as shown in the figures of the '901 patent. Insight asserts that claim 1 and claim 32 of the '901 patent are generic and, therefore, overcame the species election as provided in the statement of the patent examiner.

"Because the prosecution history represents an ongoing negotiation between the PTO and the applicant, rather than the final product of that negotiation, it often lacks the clarity of the specification and thus is less useful for claim construction purposes." Phillips, 415 F.3d at 1317. That appears to be the situation in this case. While the prosecution history shows that Insight twice elected Species A over the other species of the invention, including Species B that claimed a leaf spring, the patent examiner left open the possibility that a generic claim would be approved that would cover the non-elected species. The question remains as to whether that occurred. 11

11 Glock's assertion that no generic claim was allowed because the patent examiner never so stated misses the point. If a generic claim was allowed in the '901 patent, as approved, no further statement is required.

3. The '901 patent.

The '901 patent describes the generic form of the invention as follows: "In generic form, the auxiliary device is attached to the weapon frame using a first positioning mechanism and a second positioning mechanism. The first positioning mechanism preferably comprise [sic] complementary engaging surfaces on the auxiliary device and weapon frame. . . . The second positioning mechanism preferably comprises a device which under normal conditions, sufficiently retains the auxiliary device in a predetermined position relative to the weapon frame." 8:46-50 & 8:63-66. Claim 1 and claim 32 are not as generic as the form described in the specification in that they include particular elements of the two positioning mechanisms. Importantly, however, the claims do not specify any particular spring or other biasing mechanism. Further,
neither claim 1 nor claim 32 references Figures 4 and 6 or excludes Figure 5. Therefore, claims 1 and 32 appear to be generic with respect to the nature of the biasing force used, albeit with the limitations that the spring-biased mechanism extend across and along a top surface of the housing and that the mechanism be biased "in a direction normal to the top surface of the housing." 10:66 -- 11:2.

In contrast, claim 25, a dependent claim for a "latching mechanism," is limited explicitly to a cantilevered spring. Dependent claim 24 claims "the auxiliary device of claim 1, wherein the spring-biased mechanism comprises a latching mechanism." Dependent claim 25 describes "the auxiliary device of claim 24, wherein the latching mechanism comprises a cantilevered spring, the cantilevered spring being operable to bias the latching mechanism into engagement with a complementary position associated with the weapon."

"The doctrine of claim differentiation creates a presumption that each claim in a patent has a different scope." Free Motion Fitness, Inc. v. Cybex Int'l, Inc., 423 F.3d 1343, 1352 (Fed. Cir. 2005) (internal quotation marks omitted). That doctrine provides a limited tool for claim construction, giving force to the presumption only as long as the resulting construction does not conflict with a clear meaning provided by the specification. Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 2006 WL 335609 (Fed. Cir. 2006)(only Westlaw citation is currently available). Under the claim differentiation doctrine, when dependent claims are limited to a particular meaning or scope, the independent claim is presumed to have a broader meaning and scope. Free Motion, 423 F.3d at 1351. In the context of this case, because claim 25 is explicitly limited to a cantilevered spring, presumably claim 1 is not so limited in scope.

The specification of the '901 patent supports a broader interpretation of "extending along" than Glock proposes and undermines the theory that Insight abandoned any species of the invention that would include the leaf spring in the spring-biased mechanism. In the specification, the embodiment depicted in Figure 5 is described as having a second positioning mechanism that includes "a transverse bar 6 which under the biasing force of the leaf-spring 60 is preferably securely positioned within an opening 64 formed in the top of the auxiliary device 10, and held in place in a suitable manner. The leaf-spring 60 normally biases bar 6 upwards and away from recess 64." 7:7-13. Therefore, Figure 5, a disclosed embodiment of the invention, includes a leaf spring, which is contrary to Glock's interpretation of "extending along" in claims 1 and 32. Further, the specification states: "The leaf-spring 60 of the embodiment of FIG. 5 and the cantilevered spring 70 in the embodiment of FIG. 6 are but two of many possible biasing mechanisms that may be used in the embodiments of the invention." 10:31-34.

"It is [ ] entirely appropriate for a court, when conducting claim construction, to rely heavily on the written description for guidance as to the meaning of the claims." Phillips, 415 F.3d at 1317. Further, "[a] claim construction that does not encompass a disclosed embodiment is rarely, if ever, correct." Medrad, Inc. v. MRI Devices, Corp., 401 F.3d 1313, 1320 (Fed. Cir. 2005). To construe a claim in a way that would eliminate a disclosed embodiment "would require highly persuasive evidentiary support." Johns Hopkins Univ. v. CellPro, Inc., 152 F.3d 1342, 1355 (Fed. Cir. 1998)(quoting Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996)). Glock falls far short of providing highly persuasive support for its interpretation of the disputed phrases, which interpretation would eliminate the embodiment described in the specification as depicted in Figure 5.

4. Construction.

Therefore, "extending along" must be construed in a way that would also claim a leaf spring as part of the spring-biased mechanism. The parties appear to agree that Glock's construction would exclude a leaf-spring embodiment. Insight's proposed construction would encompass the leaf-spring embodiment but imposes the additional requirement of parallelism, which is not evident in the claim language.

With respect to the use of "extending along" and "extends along" to describe the structural members of the housing, the terms provide the location of those structures with reference to the housing. That is, the two structures are located on either side of the housing, opposite each other and substantially parallel to each other, and span at least part of the length of the side of the housing. Similarly with respect to the spring-biased mechanism, "extending across and along a top surface of the housing" means that the mechanism both traverses the housing and is located on the top of the housing, although not necessarily in direct contact with the surface of the housing. 12

12 This interpretation is reinforced by the original version of claims 1 and 32. Claim 94 described a spring-biased mechanism "oriented substantially perpendicular to the central longitudinal axis of the housing along a top surface of the
housing." In claims 1 and 32, "oriented substantially perpendicular" was changed to "extending across," suggesting that term sets a transverse orientation while "extending along a top surface" was retained with the same meaning, setting the location on the top surface of the housing.

B. "Extending Along said Electrode so as to Provide a Path for Arcing"

Claim 1 also states that a '210 electrode must have at least one ridge "extending along said electrode so as to provide a path for arcing." '210 patent col. 6, 11. 53-54. Defendant proposes alternative contextual meanings for the term "along." First, it argues that dictionary definitions and the figures that illustrate the invention's preferred embodiment demonstrate that "along" means "lengthwise over the longest side surface." Somewhat less restrictively, it contends that the patent's prosecution history demonstrates that "along" means "over the side surface." I examine each argument in turn.

Neither party argues that "along" has a specialized meaning. Thus, general use dictionaries serve as a useful starting point for analysis. One such dictionary defines "along" as (1) "by the length; in a line with the length; lengthwise" and (2) "by the length of, as distinguished from across." WEBSTER'S REVISED UNABRIDGED DICTIONARY (1996). In another, "along" is defined as (1) "Over the length of" and (2) "On a line or course parallel and close to; continuously beside." THE AMERICAN HERITAGE DICTIONARY OF THE ENGLISH LANGUAGE (4th ed. 2000). A third defines "along" as (1) "through, on, beside, over, or parallel to the length or direction of, from one end to the other of" and (4) "by the length; lengthwise." THE RANDOM HOUSE DICTIONARY OF THE ENGLISH LANGUAGE (2d ed. 1987). In still a fourth, "along" is defined as "in a line with the length, parallel to the longest dimension or course (of something understood) . . . ." THE COMPACT EDITION OF THE OXFORD ENGLISH DICTIONARY (1971). Neither party disputes the validity of these definitions. Rather, they disagree first over which definition to invoke, and next over how that definition should apply in this case.

Although all of the above-cited dictionaries recognize that "along" generally connotes a lengthwise orientation, the definitions do not support defendant's more restrictive interpretation that a ridge extends along an electrode only to the extent that it extends lengthwise over the electrode's longest surface. An electrode may have many surfaces of varying lengths that together comprise an electrode that is longer than it is wide. In such cases, a ridge that extends lengthwise in a line over the electrode's entire surface from one end to the other will extend over multiple surfaces. Some of these surfaces may be parallel to the electrode's longest surface and others may not. Nevertheless, each segment of such a ridge has a lengthwise orientation with respect to the electrode as a whole regardless of whether the segment is on or parallel to the electrode's longest surface. The dictionaries cited by the defendant in no way foreclose such an interpretation because they do not require that the lengthwise orientation must be with respect to an object's longest surface rather than the object as a whole.

To further support its position, defendant points to figures depicting the invention's preferred embodiment. Although defendant correctly claims that these figures depict cylindrical electrodes that have ridges only on their cylindrical side surfaces, such figures cannot be used to read into the claim a limitation that it does not contain. See Fuji Photo Film Col, Ltd. v. International Trade Comm'n, 386 F.3d 1095, 1106 (Fed. Cir. 2004). Claim 1 is quite clear in stating that the ridges that comprise the invention must extend along the electrode rather than along the electrode's longest side surface. This usage leaves no room for defendant's narrower interpretation.

Defendant alternatively argues that the patent's prosecution history demonstrates that along means "extending over the side surface." This argument is based on the history of the amendment to the original application that added the phrase "extending along said electrode" to what ultimately became claim 1. The original application included a claim 1 ("original claim 1"), which was ultimately abandoned, and a claim 10 ("original claim 10"), which ultimately became what is now claim 1. Original claim 1 provided in pertinent part for "relief means on said side surface [of the electrode] extending over a portion of said side surface intermediate said ends so as to provide a path for arcing . . . ." Original claim 10 initially provided in pertinent part for an "electrode having at least one ridge formed thereon, said ridge being located substantially in said arc chamber." The examiner rejected both claims based in part on Patent No. 3,296,410 (the "Hedger Patent"), which describes an "induction plasma generator that has as one element an electrode with a barbed projection at one end. In response, the applicants explained that their claims differed from the Hedger Patent because they claimed a ridge which,
unlike the barb claimed in the Hedger Patent, provided a "definition of length" and a "path to direct the arc." They went on to state that

Since independent claim 1 already recites that the relief means on the side surface is "extending over a portion of said side surface intermediate said ends so as to provide a path for arcing between the electrode . . ." (emphasis added), it is believed that this amended claim defines over the Hedger reference. By this amendment, dependent claim 10 has been amended to recite that the ridge is "extending along said electrode means."

--- Footnotes ---

2 Although this reference refers to original claim 10 as a dependant claim, all other references to the claim in the prosecution history claim the claim as an independent claim. Moreover, the claim does not appear to be a dependant claim because it does not contain, as it must, a "reference to a claim previously set forth." 35 U.S.C. § 112. Accordingly, I assume for purposes of analysis that original claim 10 was intended to be an independent claim.

--- End Footnotes ---

Pl.'s Response to Oct. 16, 1987 P.T.O. Official Action at 3. Defendant argues that this passage demonstrates that the patentee incorporated original claim 1's side surface limitation into original claim 10 when it amended that claim.

I am unpersuaded by the defendant's argument. The Federal Circuit has repeatedly warned district courts that "it is inappropriate to limit a broad definition of a claim term based on prosecution history that is itself ambiguous." Mars Inc. v. H.J. Herz Co. L.P, 377 F.3d 1369, 1377 (Fed. Cir. 2004); Inverness Med. Switz. GmbH v. Warner, 309 F.3d at 1382. The prosecution history cited by the defendant does not come close to providing unambiguous support for its position. If, as defendant claims, the applicants intended original claim 10 to include original claim 1's side surface limitation, one would expect that the applicants would have explicitly included the side surface limitation in the amendment to original claim 10. Moreover, although the applicants' intentions are not clear, a fair reading of the above-cited passage suggests that they most likely intended the amendment merely to emphasize that their invention, unlike the Hedger Patent, taught a ridge that had a "definition of length" and therefore provided a path for arcing. In short, the evidence relied on by defendants is too weak to justify a reading of "along" that is contrary to its customary meaning. 3 Accordingly, I decline to adopt either of defendant's proposed interpretations of "along."

--- Footnotes ---

3 Plaintiff asserts that "along" is synonymous with "on." Thus, from its perspective, the orientation of the ridges is irrelevant. I decline to adopt this proposed construction because I am not satisfied that I must do so to resolve this case. I lack the power to give advisory opinions concerning the meaning that patent terms may have in cases that are not before me. Accordingly, until it becomes clear that I must either adopt or reject plaintiff's proposed interpretation to resolve this case, I decline to do so. It is sufficient at the present time to merely state that defendant's proposed interpretations are unjustifiably narrow.

--- End Footnotes ---

GO BACK

1491

A pivotal issue here is whether Claims 1, 4 and 7 require that the "stiff plastic member" recited in each claim extend along the bottom and both sides of the laptop carrying case. In interpreting a patent claim, "the general rule is, of course, that terms in the claim are to be given their ordinary and accustomed meaning . . . [A] court must presume that the terms in the claim mean what they say, and unless otherwise compelled, give full effect to the ordinary and accustomed meaning of claim terms." Johnson Worldwide Assocs., 175 F.3d at 989 (internal citations omitted).

Claim 1 reads in pertinent part as follows:

. . . said computer case further comprising relatively stiff members extending along said pair of sides and
said bottom of said case, said relatively stiff member being formed by a pair of substantially rigid elongated members with a stiff plastic member disposed between them . . . .

Claim 4 reads in pertinent part as follows:

. . . said case further comprising a relatively stiff member extending along all said sides and said bottom, said relatively stiff member being formed by a pair of wires with a stiff plastic member disposed between them.

Claim 7 reads in pertinent part as follows:

. . . said briefcase further comprising a relatively stiff member extending along said side edges of said briefcase and said bottom edge of said briefcase, said relatively stiff member being formed by a pair of wires with a stiff plastic member disposed between them.

Based on the ordinary and accustomed meaning of the terms, the proper conclusion is that the "relatively stiff member" extends along the bottom and both sides of the carrying case, and that the component parts of that "relatively stiff member" are a pair of wires (or in Claim 1, a pair of substantially elongated members) and a stiff plastic member, which is disposed between the pair of wires (or in Claim 1, a pair of substantially elongated members). Thus, it is also the proper conclusion that the components that form the relatively stiff member (i.e., the pair of wires (or in Claim 1, the pair of substantially elongated members) and the stiff plastic member) also extend along the bottom and both sides of the carrying case. The plain language of the claims allows for no other reasonable interpretation.

The plaintiff fails to proffer any interpretation of the claim language to dispute that urged by the defendant. Without addressing at all the defendant's analysis of the construction of the plain language of the claims, the plaintiff simply argues that the scope of each claim is "computer cases with 'relatively stiff members.'" (Plaintiff's Opposition (Doc. No. 80) ("Plaintiff's Opp.") at 12). However, such a construction reads out of the claims the explicit limitations that were added to overcome the PTO Examiner's rejection of the application.

The plaintiff also argues that the specification, which appears to narrow the scope of the claims by suggesting a preferred embodiment, should not be "read into the claims." 4 (Plaintiff's Opp. at 8) (citing Wenger Mfg. Inc. v. Coating Mach. Sys. Inc., 239 F.3d 1225, 1233 (Fed. Cir. 2001).) However, in arriving at the claims construction set forth above, the court did not read the preferred embodiment into the claims. There are no alternative theories presented here as to the plain meaning of the "stiff plastic member" limitation recited in Claims 1, 4 and 7 of the '806 Patent. It is therefore unnecessary to look to the specification and/or prosecution history for guidance in interpreting the claim language. The plain meaning of the language in the claims is what establishes that the "stiff plastic member" extends along the bottom and both sides of the case.

4 The specification to the '806 Patent contemplates a preferred embodiment in which "four bladders 514 are supported within a single continuous wrap around bendable, but relatively stiff plastic member 520, which extends completely around the perimeter of bag 510." (Speranza Aff., Ex. A) (emphasis added).

Accordingly, the court concludes, based on the ordinary and accustomed meaning of the terms set forth in Claims 1, 4 and 7, that each claim requires that the stiff plastic member extend along the bottom and both sides of the case.

1. Language in Dispute: "extending alongside said flow diversion means"
Does extending "alongside" said flow diversion means mean (1) that the extension tubes can extend on either opposite sides or the same side of the Y-connector or (2) that each extension tube extends on the opposite side of the Y-connector?

**Answer:** Extending "alongside said flow diversion means" means that the extension tubes can extend on either opposite sides or the same side of the Y-connector.

a). Claim Language

The claim language calls for the flexible extension tubes to extend "alongside" the "flow diversion means," the Y-connector, to form a bend. The Court having already determined the meaning of "flow diversion means," must now construe the word "alongside." The common and ordinary meaning of "alongside" is, next to a side or being positioned on a side. In other words, the claim language in claim 21 means the bent extension tubes must extend next to a side of the catheter, or be positioned on a side of the catheter. The word "alongside" does not specify which side; it can be the same side or the opposite side. Thus, the extension tubes can extend along opposite sides or on the same side and still fall within the ordinary and accustomed meaning of the term "alongside."

For example when sportscasters are announcing a horse race and they say "Point Given" and "AP Valentine" are coming around the turn right "alongside" "Congaree," it is possible that the two horses are both on the left side of "Congaree," that they are both on the right side of "Congaree," or that "AP Valentine" is on the left of "Congaree" and "Point Given" on the right and vice versa. Thus, the two horses may be alongside the predicted winner if they are on the same side or on opposite sides of "Congaree."

b). Written Description

The specification of the '561 patent supports construing the phrase "alongside said flow diversion means" as the extension tube can extend on either opposite sides or the same side of the Y-connector. The specification reads, "the extension tubes are bent back toward the distal end of the catheter, preferably extending along the sides of the catheter ..." ('561 patent, col. 5, lines 56-57). (Emphasis added). The term "preferably" conveys the message that a particular method is desirable or a first choice; it does not convey the idea that something is mandatory. Thus, Dr. Mahurkar prefers the tubes extend along the opposite sides of the catheter, but has contemplated embodiments where the two extension tubes can extend along the same side of the Y-connector.

c). Dictionary Definition

The dictionary definition also supports construing the claim language extension tubes "extending alongside said flow diversion means" as the extension tubes can extend on either opposite sides or the same side of the Y-connector. The dictionary definition of "alongside" is "along, near, at or to the side." (Webster's II New Riverside University Dictionary 95 (1994)). Again, there is no specification as to whether something must be on the same side or the opposite side. Thus, the extension tubes may extend along the same side or opposite sides of the said "flow diversion means."

2. Language in Dispute: "Extending Axially."

Does material "extending axially from the second opening to the distal end of said cylindrical tube" mean (1) material present in the second lumen between the inlet opening and the tip or (2) material to run continuously from the inlet opening through the tip?

**Answer:** Material "extending axially from the second opening to the distal end of said cylindrical tube" means material to run continuously from the inlet opening through the tip.

a). Claim Language
The issue in construing this language is whether the material must run continuously from the inlet opening through the tip. Dr. Mahurkar argues the term "extends axially" means that the material extends, or reaches toward the base of the conical tip from the inlet opening, but does not have to be continuous.

Arrow argues the claim language requires the relative concentration of material extend continuously from the second opening to the distal end of the cylindrical tube which has a conical tip. Therefore, the distal end includes the tip and the language extending axially from the second opening to the distal end requires there to be continuous material throughout. Thus, in order for the material to go from the opening through to the tip axially, in that direction, it must go continuously.

The Court holds the claim limitation requires the relative concentration of material to go continuously from the inlet opening to the tip. The use of the term "extends axially" describes both the direction and the fact that it is continuous in that direction. To extend means to straighten out or to stretch out to full length. (Webster's II New Riverside University Dictionary 456 (1994)).

b). Written Description

Figure 7 is the only illustration in the patent of the "relative concentration of material." Arrow argues this figure is consistent with its construction of claim 12 because it depicts a solid material which runs continuously from the opening of the inlet through the tip.

The specification regarding figure 7 says, "As shown in fig. 7, the inlet lumen 14 terminates at the inlet aperture 19 and in place of the inlet lumen the relative concentration of material extends axially from the aperture to the distal end of the tube at the truncated apex of the conical tip." ( '968 patent, col. 4, lines 21-25). The parties agree the specification calls for the relative concentration of material to be continuous, however Dr. Mahurkar argues this is one embodiment, and is not a requirement. The Court holds the written description accurately describes the claim.

c). Prior Litigation

In the earlier litigation, Judge Easterbrook stated that "extending axially" means " a relative concentration 'extending' from intake through outlet." In re Mahurkar, 831 F. Supp. at 1382. To demonstrate what the court meant by "extending axially," Judge Easterbrook provided the following example, "One would suppose that a highway 'extending' from Chicago to Milwaukee goes all the way: just so a relative concentration 'extending' from intake through outlet." Id. However, Judge Easterbrook noted in the opinion, "Because Mahurkar and Quinton would not be entitled to any relief under Claims 12 and 25 that they do not obtain under claims 1 and 19, it is unnecessary for me to decide who is right." In re Mahurkar, 831 F. Supp. at 1382. Thus, although Judge Easterbrook did not make a ruling, this Court finds his reasoning to be correct and adopts it.

1494

1. Claim 1 ("extending between")

Claim 1 (and dependent Claim 7) of the '407 Patent uses the term "extending between" in the following context: "[A] vibration coupler having a proximal and a distal end, the vibration coupler being positioned within the housing and extending between the elongated body portion and the handle portion." '407 Patent, Claim 1 (emphasis added). Plaintiff's proposed construction is "stretching from one object to another object" and defendant proposes "spanning the distance that separates." Defendant argues that while the patent repeatedly describes the vibration coupler as "extending through" the elongated body, it does not describe "any embodiment where the vibration coupler "extends between" the elongated body portion and the handle portion. See '407 Patent 4:49-51, 6:32-34, 8:65-9:3, 12:19-22. Defendant argues that accordingly, the claim term "extending between" must be construed as written, and thus as differentiated from the term "extending through," which is used in the specifications. See Def. Claim Construction Br. at 13. Plaintiff responds that defendant's definition "directly contradicts" prior claim language, which, plaintiff contends, "makes clear that [the elongated body portion and the handle portion] are connected" and therefore the "distance that separates" to which defendant refers in its proposed construction does not in fact exist. See Pl. Claim Construction Br. at 3 (referring to '407 Patent, Claim 1 ("An ultrasonic surgical instrumental comprising: a housing including an elongated body portion and a
handle portion")) (emphasis added). At the Markman hearing, plaintiff argued further that "there is nothing that precludes the handle portion and the elongated tube from being right up against one another, and still the vibration coupler would be going between the two or extending between the two." Markman Tr. at 20. Plaintiff compared the disclosure in Claim 1 to "the roadway on the Lincoln Tunnel or Holland Tunnel," reasoning, "it certainly extends between New Jersey and New York, but also New York and New Jersey touch one another. . . . Extending between doesn't require that there be a gap." Id. Because the Court agrees that nothing in the claim language or specification requires that there be any space ("the distance," as proposed by defendant) between the elongated body portion and the handle portion, the Court adopts plaintiff's construction, "stretching from one object to another object."

2. "extending between said guidewire and said distal tip"

With respect to the "connecting segment," the parties dispute the proper construction of the phrase "extending between said guidewire and said distal tip" as it is used in Claim 5. The dispute is whether the phrase should be construed to mean "located between" or whether it should be construed to include both "located between and connecting spatially."

It is clear from the language of the Claim that the phrase "extending between" is a limitation on the relationship among three components: the "connecting segment;" the "guidewire" and the "distal tip."

One of ordinary skill in the art would understand the phrase "extending between" to be composed of non-technical words which have ordinary and customary meanings. The phrase "extending between" uses the common preposition, "located between," meaning "in or through the space that separates two things." See Webster's New Twentieth Century Dictionary, 177 (2d ed. 1983). A common definition of "extending" is "stretched out." Id., 649. The Court finds that one of ordinary skill in the art would understand the phrase "extending between" to mean that the connecting segment is not only "between" the guidewire and the distal tip but that it also "extends" from the guidewire to the distal tip. In other words, a person of ordinary skill in the art would conclude that the connecting segment is attached at one of its ends to the guidewire and at its other end to the distal tip. This construction of the claim language is supported by a statement in the written description, describing an embodiment with these connections:

The stainless steel segment comprises a coil connected at its proximate end to the core wire and connected at its distal end to the tip portion of the guidewire.

(136 Patent, Col. 4:65-68.)

3. "extending distally of," "extend distally of"

Braun construes the terms "extending distally of" and "extend distally of" to mean "extends in a distal direction of." (D.I. 74 at 18) As part of its proposed construction, Braun also requests that the Court state that this disputed claim term "[d]oes not require the referenced arm(s) to be directly attached to the proximal wall." (Id.) Terumo takes the position that these terms require no construction beyond stating that the ordinary meaning applies. (D.I. 71 at 29) Further, Terumo argues "the claimed arms must be integral with or attached to the proximal wall based on the ordinary meaning of the claim as a whole (not just the phrase 'extending distally of')." (D.I. 155 at 1) I recommend largely adopting Braun's proposed construction, with some modification.

The issue in dispute in connection with the "extend[ing] distally of" claim terms is whether the arms are required to be attached to the proximal wall. (Tr. at 80) Looking at the claims as a whole, Braun emphasizes the distinction between claims 1 and 9, on the one hand, and claim 20 on the other:

Claim 1: "and two resilient arms of different lengths extending distally of the proximal wall"
Claim 9: "two arms that intersect one another and extend distally of the proximal wall"

Claim 20: "at least one arm attached to and extending distally of the proximal wall" (emphasis added)

('613 patent, col. 15 lines 31-32; id. col. 16 lines 13-14, 59-60) Only claim 20 expressly requires that an arm be "attached to and extending distally of the proximal wall" (emphasis added), suggesting that claims 1 and 9 do not contain the same requirement. (See D.I. 74 at 18-19; D.I. 160 at 2-4; Tr. at 68.)

--- Footnotes ---

10 As Terumo points out, claim 20 speaks of one arm "attached to" not "directly attached to." (Tr. at 77) (emphasis added) I see no basis to recommend the phrase "direct" attachment, which would import additional ambiguity (for Braun does not explain the implicit distinction between "indirect" and "direct" attachment).

--- End Footnotes ---

In opposing Braun's construction, Terumo points out that every embodiment in the specification shows arms attached to the proximal wall. (D.I. 71 at 30) (referencing '613 patent at Figures 1-14) Braun does not disagree. (Tr. at 70) However, again, there is no basis here to limit the claims to the embodiments disclosed in the specification. See, e.g., Kara Tech. Inc. v. Stamps.com Inc., 582 F.3d 1341, 1348 (Fed. Cir. 2009) ("The patentee is entitled to the full scope of his claims, and we will not limit him to his preferred embodiment or import a limitation from the specification into the claims.""); see also Acumed LLC v. Stryker Corp., 483 F.3d 800, 805 (Fed. Cir. 2007).

Terumo's principal argument against Braun's proposed construction is that the issue of whether attachment is required is not a matter for claim construction but, rather, a question of infringement, which should not be resolved at this point in the case. (Tr. at 78-79; D.I. 71 at 30; D.I. 155 at 1-2) I disagree. The parties have a fundamental dispute regarding the scope of these claim terms: whether or not they encompass products where the arms are not attached to a proximal wall. Braun says yes and Terumo says no. It is appropriate for the Court to resolve this dispute in connection with claim construction. See O2 Micro Int'l Ltd. v. Beyond Innovation Tech. Co., 521 F.3d 1351, 1362 (Fed. Cir. 2008) ("[C]laim construction is a matter of resolution of disputed meanings and technical scope, to clarify and when necessary to explain what the patentee covered by the claims, for use in the determination of infringement. When the parties present a fundamental dispute regarding the scope of a claim term, it is the court's duty to resolve it.") (internal quotation marks and citation omitted).

Relatedly, nearly one month after the Markman hearing, Terumo offered a "compromise position," stating that it "is willing to agree that the specific phrase 'extending distally of,' standing alone, does not require 'direct attachment' -- so long as the record is clear that Terumo's position is that the larger phrase 'and two resilient arms of different lengths extending distally of the proximal wall' does require the arms to be integral with or attached to the proximal wall." (D.I. 155 at 1, 3) 11 As Braun notes, "Terumo's new reliance on the 'larger phrase' in the claims is a distinction without a difference." (D.I. 160 at 2) The dispute as to whether the arms must be attached to the proximal wall remains. (See, e.g., D.I. 155 at 2 ("Terumo believes the Court's construction should make clear that the arms must be 'integral with or attached to' the proximal wall.").) That dispute has been placed before the Court in the context of a dispute as to the proper construction of the "extending distally of" terms. Hence, again, I believe the Court should address that dispute now, in the course of construing the disputed claim terms.

--- Footnotes ---

11 On March 5, 2010, nearly a month after the February 9, 2010 Markman hearing, Terumo filed an uninvited four-page single-spaced letter which "clarifies Terumo's position regarding whether or not 'direct attachment' is required by the disputed term 'extending distally of.'" (D.I. 155 at 1) During the hearing, Terumo's counsel had expressly stated "[w]e have never said direct attachment is required. . . We're not going to get up and tell the jury direct attachment is required." (D.I. 126 at 72) In the post-hearing letter, however, Terumo indicated it "wants to clarify that while it does not intend to argue the specific phrase 'extending distally of requires 'direct attachment,' it does intend to argue that the claimed arms must be integral with or attached to the proximal wall based on the ordinary meaning of the claim as a whole (not just the phrase 'extending distally of')." (D.I. 155 at 1) The Court provided Braun an opportunity to respond to Terumo's untimely post-
hearing submission (which Terumo did not seek leave to file), and Braun did so on March 15, 2010. (D.I. 160) The Court also offered Braun the opportunity to file a motion seeking additional relief (D.I. 157), but Braun chose not to do so.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

Based on the foregoing analysis, I recommend that "extending distally of" and "extend distally of," as those terms are used in claims 1 and 9, respectively, be construed as "extending [or extend] in a distal direction away from the proximal wall, without the necessity of being attached to the proximal wall." 12

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

12 The language I have recommended will, while remaining true to the claims and the specification, be easier for the jury to understand. "Extend[ing] of" is a grammatically awkward phrase. (See Tr. at 74.) While Braun has resisted "extend[ing] from" (even though it is less awkward), this resistance stems from Braun's concern that "extend[ing] from" would require a "direct attachment" between the arms and the proximal wall. (See Tr. at 69-70.) The addition in the construed claim of the phrase "without the necessity of being attached to the proximal wall" addresses this concern.

GO BACK

1497

The court adopts Simmons' proposed construction of this claim:

The claim term "first side portion extending in the longitudinal direction and extending downward from the first edge; a second side portion extending in the longitudinal direction and extending downward from the second edge"

The claim term "first side portion extending in the longitudinal direction and extending downward from the first edge" means a structure forming at least part of a lateral side of the ski which extends from a higher to a lower position from the first lateral edge of the snowmobile ski base.

The claim term "second side portion extending in the longitudinal direction and extending downward from the first edge" means a structure forming at least part of a lateral side of the ski which extends from a higher to a lower position from the second lateral edge of the snowmobile ski base.

Bombardier argues that the side portions need not be perpendicular to the ground. The court does not read the construction of Simmons to require such a limitation. However, the side portions do "extend[] downward" from an edge, thus suggesting that, in general, such side portions will be approximately perpendicular to the ground, as for example when a person falls "downward" off the "edge" of a cliff. A strong wind might carry such a person away from the cliff at the same time they are still falling downward so that there is some slope to their fall, however, such a person is still traveling downward. Thus, downward is defined as "from a higher place to a lower . . . moving or extending from a higher to a lower place." 15

More important, inasmuch as the court's prior definition of the words "base" and "edge" demonstrate that the "side portions" are a part of the base, i.e., "portion" (defined as "a part of any whole, either separated from or integrated with it . . . ." refers to a portion of the "base") Bombardier's other objections to the proposed claim construction disappear.

GO BACK
A. SHOULD THE TERM "EXTENDING FROM" IN CLAIMS 1 AND 37 BE LIMITED TO PRODUCTS THAT ARE MECHANICALLY CONNECTED OR SHOULD IT BE CONSTRUED TO ALSO INCLUDE PRODUCTS THAT ABUT EACH OTHER BUT HAVE NO MECHANICAL CONNECTION?

i. Patent Language Arguments

An analysis of the '925 patent language indicates that the term "extending from" is not limited to "integral or mechanically connected" structural relationships. Interpreting "extending from" as limiting the structural relationship between the secondary flange and the frac mandrel to being either an integral or mechanical connection, improperly confines the term "extending from" to specific embodiments of the invention. Phillips v. AWH Corp., 415 F.3d 1303, 1323 (Fed. Cir. 2005) (although the specification describes very specific embodiments of the invention, we have repeatedly warned against confining the claims to those embodiments.)

Cameron disagrees. Cameron first argues that the "extending from" language is not specifically defined in the '925 patent. Cameron asserts that a structural relationship characterized as an abutment, as opposed to being integral or mechanically connected, is not contemplated by the purported invention disclosed and claimed in the '925 patent. Cameron, however, fails to explain why the patent's failure to contemplate the structural relationship of an abutment limits the "extending from" clause to being integral or mechanically connected. In essence, Cameron requests that the court interpret the patent's "extending from" language to give it the meaning, "integral or mechanically connected," which goes beyond the patent's express language to add a meaning that is neither obvious nor required. The structural relationship of an abutment contemplates a relationship where two structures that abut (are in contact or adjacent to each other) "extend from" each other.

Cameron next argues that Duhn Oil's interpretation of "extending from" is inconsistent with the "wherein" clause and would render the claimed device inoperable. According to Cameron, Duhn Oil's interpretation only requires that the secondary flange be positioned "outward" of the frac mandrel with no requirement that the flange be connected to the frac mandrel, or even be touching the frac mandrel in any way. Cameron argues that this proposed definition is overbroad. According to Cameron, under Duhn Oil's construction there would be no way for the force to transmit from the frac mandrel to its secondary flange because it does not require that the secondary flange even touch the frac mandrel. It only requires that it be "positioned outward."

However, the "wherein" clause does not require that the "secondary flange" be mechanically connected to, or integral with, the frac mandrel as Cameron contends. The axial force could be reacted to independently by the "first tubular member flange" and the "secondary flange" if they are in contact without being integrally connected. Claim 12 8 states the wellhead assembly of claim 4 wherein the secondary flange is separate from the elongate annular member (frac mandrel). Since a dependent claim is narrower in scope than the independent claim on which it depends, claim 1 includes embodiments of the wellhead assembly wherein the secondary flange is either separate from or connected to the frac mandrel. Similarly, claim 46 claims the wellhead assembly of claim 37 "wherein the first tubular member and the secondary flange are fastened together," thereby demonstrating that claim 37 also claims embodiments of the wellhead assembly wherein the secondary flange is either separate from or connected to the frac mandrel. The construction of the term "extending from" taken in conjunction with the "wherein" clause of claims 1 and 37 is consistent with the scope of those claims and does not render either of those claims inoperative.

--- Footnotes ---

8 Claim 12 reads: "A wellhead assembly as recited in claim 4 wherein the secondary flange is separate from the elongate annular member (frac mandrel)."

9 Claim 4 reads: "A wellhead assembly as recited in claim 1 further comprising a seal between the elongate annular member second end portion and the first tubular member."

--- End Footnotes ---

- 1930 -
ii. Specification Arguments

When construing the "extending from" term in light of the specification, Figure 4b of the patent shows that the term is broader than Cameron asserts. For example, Fig. 4b depicts an embodiment of the claimed invention where the "lock screws 40...are threadedly retracted to allow unrestricted access through bore 92 defined through the secondary flange." Because the lock screws 40 are retracted in this embodiment, they do not interact with the annular groves 212, 214 of the frac mandrel 60, and therefore cannot be said to be "mechanically connected" to the elongate annular member 60 (frac mandrel). Fig. 4b, thus, explicitly discloses an embodiment of the present invention where the "secondary flange" is not integral with or mechanically connected to the frac mandrel 60."

[SEE FIG. 4B IN ORIGINAL]

Cameron argues that Duhn Oil's construction is inconsistent with the disclosure set forth in the '925 patent specification. According to Cameron the '925 patent specifications reveal that the use of the term is limited to reference to "integral" parts of a single structural component of the wellhead assembly described in the patent. For example, the '925 Patent describes an integral flange that connects to a fracturing tree as "[a] radial flange 208 [that] extends from an upper end of the wellhead isolation tool." Moreover, the non-integral secondary flanges 70 and 110 illustrated in the '925 Patent are never described as "extending from" the mandrel. Only in the claims of the '925 Patent is the secondary flange first described as "extending from" the mandrel. Thus, although '925 Patent describes non-integral alternatives for the secondary flange, interpreting the recitation "extending from" in a manner consistent with the written description suggests that this recitation is limited to an integral or one-piece relationship. Cameron also argues that term "extending from is never defined and there is no explanation of the term found in the prosecution history."

According to Cameron the relationship between the frac mandrel and the secondary flange is described in three different ways in the patent specifications:

1. Mechanically connected: Duhn Oil emphasizes that the secondary flange is disclosed as a separate part slid over the frac mandrel and positioned outwardly of the frac mandrel but fails to address the fact that the secondary flange is mechanically connected.

2. Integral: the secondary flange is described as being an "integral" part of the frac mandrel at Col. 3, lines 25-27, and at Col. 7, lines 22-24.

3. Threaded Connection: the "secondary tie down flange" described as secured to the frac mandrel with a threaded connection. (Col. 3, lines 28-37, and Col. 7, lines 17-22.)

Cameron argues that there are no other possible configurations contemplated or disclosed in the '925 Patent. There is no suggestion in the '925 Patent that the secondary flange is or may be disposed around but not connected to the mandrel. Cameron argues that the entire context of the '925 Patent evidences that the secondary flange is, at a minimum, mechanically connected to the mandrel. Lastly, Cameron argues that every described embodiment of the invention requires some sort of mechanical connection between the secondary flange and the mandrel and that the mechanically extending flanges are not just examples of flanges but are the only extending flanges contemplated and claimed in the '925 patent. According to Cameron, the only logical conclusion is to construe "extending from" as either integral or having a mechanical connection. Because Cameron's products merely abut each other, Cameron argues that they do not infringe.

Cameron correctly argues that the "extending from" language is not specifically defined in the '925 patent. However, it does not follow that an abutment relationship is not included merely because the term "extending from" is not defined. To determine the meaning of the term "extending from" an analysis of the term's use in the patent language and a comparison to the specifications is required.

Claim 1 describes a first tubular member flange "extending from" the first tubular member. In a separate provision, Claim 1 also describes "a plurality of fasteners fastening the secondary flange to the first tubular member flange." If the term "extending from" were to only contemplate a mechanical connection, then the term describing the relationship between the secondary flange and the first tubular member through a plurality of fasteners would not be necessary.
Claim 3 describes "a wellhead assembly as recited in claim 2 wherein said annular lip extends radially inward defining an opening having a first diameter, wherein the elongate annular member first end portion comprises an inner surface having a second diameter and wherein the portion of the production tubular member comprises an inner surface having a third diameter, wherein said first, second and third diameters are equal." An embodiment of this claim is found in Fig. 3. A close analysis of Fig. 3 shows the annular lip "extending" into the inner bore. There is no mechanical connection contemplated in this diagram or description. Both the diagram and the description show an abutment but not a connection.

[SEE FIG. 3 IN ORIGINAL]

Claim 37 describes, "A wellhead assembly comprising… a generally elongate annular member (frac mandrel) suspended in the first tubular member and said annular member having a first end portion extending above the first tubular member and a second end portion below the first end portion within the first tubular member 10, wherein the elongate annular member comprises an outer surface before the first and second ends, wherein a portion of a section of the outer surface of the elongate annular member mates with the smaller diameter inner surface section of the first tubular member."

An analysis of this claim and a comparison of Fig. 1 indicates that the lower portion of the frac mandrel is encased by the upper portion of the first tubular member flange. A visual assessment of Fig. 1 reveals that the upper portion of the frac mandrel abuts from the first tubular member. Further, the fact that the frac mandrel is "suspended" in the first tubular member indicates a relationship where the first tubular member is holding the frac mandrel in place by encasing it rather than through a threaded or mechanical connection. There is no description of any mechanical connection in either the language of this claim or in the visual description of the embodiment in Fig. 1.

Claim 50 describes "A wellhead assembly as recited in claim 37 further comprising a third flange extending from the generally elongate annular member spaced apart from the second flange." In Fig. 1 the third flange is indicated by no. 208 on the diagram. There is no mechanical or threaded connection contemplated in the relationship between the third flange and the frac mandrel. The third flange abuts the frac mandrel.

Claim 59 describes "A wellhead assembly as recited in claim 52 wherein a portion of the first tubular member extends within a casing head coupled to the casing, the wellhead assembly further comprising… an annular hanger suspended in the casing head... wherein the first tubular member comprises a lower section within the upper inner surface section of the annular hanger and wherein the second end portion of the elongate annular member extends to the intermediate inner surface section of the annular hanger sandwiching a portion of the first tubular member lower section between the outer surface of the elongate annular member and the upper inner surface of the annular hanger..."

Similarly, the language of claim 50 compared to Fig. 1 does not indicate a threaded or mechanical connection between the frac mandrel, the casing head, and the first tubular member. According to Fig. 1, all three components meet at the area of the inner surface section of the annular hanger. The components abut each other in Fig. 1 and have a relationship where some components are "suspended" by others in the relationship. Neither the language nor the diagram indicates any mechanical connection.

Based on a comparison between the language of the claims and the attached diagrams of the patent, it cannot be said that the term "extending from" was meant to only be limited to components that are mechanically connected.

iii. Prosecution History

The Patent Examiner who is skilled in the art, interpreted the term "extending from" to cover a wide variety of different structural relationships between the flange and the member it "extends from." The common feature of all these configurations is that the flange is "located or stretching outwardly from the frac mandrel." During the prosecution the
Examiner used the term "extending from" to cover various flange structures including a use where the structure was "integral," but he did not limit the application of "extending from" to that structure. Duhn Oil cites the Examiner's references to prior art in the prosecution history of the '925 patent.

For example in the Smith '194 patent The Examiner describes flange 20 threaded on member 19 as "extending from" that member. He also describes Flange 22 slipped over member 34 as "extending from" that member. (Doc. 40, Ex. 2, Part 6., P. 247, Office Action dated 10/05/2004).

In the Cornelssen et al '386 Patent, Flange 120, which rests on top of member 10 but has a wider diameter than member 10, is described by the Examiner as "extending from" that member. (Id.)

In the Van Bilderbeek '596 patent: The Examiner describes flange 330 as "extending from" the member of which it is an integral part. (Doc. 40, Ex. 2, Part 8, P. 316, Office Action dated 1/18/2005).

Based on the prosecution history of the patent, regardless of in what configuration the term "extending from" is used, all of the uses comprise a structure which is projecting from or abuts another structure. This is consistent with the ordinary meaning of "extending from" which describes the relative position of two components or portions of a component, not how they are connected.

Cameron disputes Duhn Oil's use of the prosecution history arguing that Duhn Oil's proposed construction is inconsistent with the arguments it made before the USPTO during the prosecution of the application that issued the '925 Patent and it should be estopped to deny the position it then took. Cameron first argues that Duhn Oil is precluded from asserting the "extending from" language of the Smith '194 patent and the Cornelssen '386 patent because the USPTO's references to the Smith '194 patent and the Cornelssen '386 patent were made in rejecting Duhn Oil's then pending patent claims. Cameron argues that the Examiner rejected a number of Duhn Oil's claims including claims 1 and 37 in the office action of October 5, 2004. Defendant asserts that Duhn Oil then "refused to agree that the flanges and frac mandrels identified by the Examiner disclosed the claimed 'secondary flange' and frac mandrel of the issued claims 1 and 37 in the '925 patent." According to Cameron, Duhn Oil effectively asserted that the "secondary flange" identified by the Examiner was not "extending from" the frac mandrel disclosed in the Smith and Cornelssen prior art patents because Duhn Oil referred to those flanges and frac mandrels as the "alleged" secondary flange and the "alleged" frac mandrel. 11 This argument does not follow. Referring to the secondary flange and the frac mandrel as "alleged" in the Smith and Cornelssen patents is not the logical equivalent asserting that those two components do not extend from each other.

11 In support of its argument, Cameron cites Cybor Corp. v FAS Technologies, Inc., 138 F.3d 1448, 1457 (Fed. Cir. 1998.) for the rule that when a patentee takes a position before the USPTO during prosecution of a patent application, the patentee should be barred from asserting an inconsistent position on claim construction. However, Duhn Oil did not take an inconsistent position during the prosecution of the case.

However, the secondary flange, which was added along with the "extending from" phrase and is one of the components that participates in the reaction to fracturing force, was the element added to overcome the rejection based on the Smith '194 patent. Duhn Oil argues that the presence of the secondary flange, and not its particular location, was the point of distinction. The amendment does not limit Duhn Oil's ability to claim the definition of "extending from" to include the relative location disclosed in the '194 patent.

iv. Extrinsic Evidence
In support of its argument, Duhn Oil refers to the dictionary meaning of the terms. The ordinary meaning of the terms "extend" and "from" are readily apparent, and it is proper to use a dictionary definition to ascertain their meaning. Phillips 415 F.3d at 1314 (in some cases, the ordinary meaning of claim language as understood by a person of skill in the art may be readily apparent even to lay judges, and claim construction in such cases involves little more than the application of the widely accepted meaning of commonly understood words… In such circumstances, general purpose dictionaries may be helpful.)

The term "extending" is commonly defined as "to jut out: stick out: protrude, project." (Doc. 45. Schwartz Decl., Ex. 3, Filed September 5, 2006.) Further the term "from" is commonly defined as "used as a function word to indicate a starting point." (Id.) Thus, the phrase "extending from" means to "protrude" from a "starting point." However, the definitions of "extending" or "from," separately or in combination do not require that whatever is "protruding" from the "starting point" be "integral or "mechanically connected" to the "starting point." The '925 patent only requires that one structure be positioned so as to stretch or protrude outwardly in relation to the other structure.

JVI argues that the phrase should be interpreted as "two faceplate returns extending from opposite ends of the faceplate, each of the faceplate returns forming an angle of approximately 90[degree] degrees with the faceplate." Universal originally argued that the phrase requires two limitations: (1) opposing faceplate returns that extend from the central faceplate, which returns are a different structure than the flattening bends/embedded legs; and (2) that the opposing faceplate returns extend from the central faceplate at approximately a 90[degree] degree angle from the faceplate, where the angle is the outer angle formed between the faceplate and the return. Contrary to Universal's original assertions regarding a different structure, the '897 patent refers to a "onepiece" steel member. The Court need not address this argument, however, because Universal abandons it in its Response stating that the returns are simply separate elements.

Therefore, the dispute is whether the 90[degree] degree angle is the outer angle formed between the faceplate and the return. JVI argues that the claim does not mention inner or outer angles. Likewise, neither the specification nor the prosecution history mentions inner or outer angles. Universal argues that since the claimed angle is formed between the faceplate and each return, it must be either the inner angle or the outer angle between the two claim elements. Since the angle is 90[degree] whether one measures the inner or outer angles, there does not appear to be a real disagreement on this phrase of the claim. Thus, the Court accepts JVI's definition because it is more in line with the plain meaning of the claim's words.
JVI's proposed construction is: first and second flattening bends that extend from the opposing faceplate returns. Universal proposes the phrase should be interpreted to require (1) that the flattening bends extend from opposing faceplates returns and (2) that the first flattening bend extends from the upper portion of the first faceplate return, and the second flattening bend extends from the lower portion of the second faceplate return.

In support of its proposed construction, Universal argues that throughout the specification, including the abstract, the figures, the summary of the invention and description of the preferred embodiment, only one description of the invention is given. That description is a configuration where one flattening bend extends from the upper portion of a faceplate return and the other flattening bend extends from the lower portion of the opposing faceplate return. Additionally, the specification refers to the configuration as the "present invention." In the specification, the inventor also distinguished the invention from other faceplates where both legs are either upward to downward. '897 Patent, Col.2, 11. 19-27. Thus, Universal argues, the configuration is not the preferred embodiment, but the only embodiment. See Honeywell Intern., Inc. v. ITT Industries, Inc., 452 F.3d 1312, 1318 (Fed. Cir. 2006).

JVI argues that Universal attempts to impermissibly import a limitation from the specification into the claims. It does not dispute that the preferred embodiment described in the '897 patent has one flattening bend that extends upward and one that extends downward. However, JVI argues that the preferred embodiment is merely one way to practice the invention. Further, JVI argues, the language of Claim 4 proves that such a limitation should not be imputed to Claim 1. Claim 4 is expressly limited to flange connectors in which one of the flattening bends extends from the upper portion of the return and the other extends from the lower portion. Aside from this limitation, Claim 4 is identical to Claim 1. Thus, JVI argues, Universal's construction violates the claim differentiation doctrine, which states that one should not read limitations of a dependent claim into an independent claim when doing so would render the dependent claim superfluous. Phillips v. AWH Corp., 415 F.3d 1303, 1315 (Fed. Cir. 2005).

The patent construction doctrine of "claim differentiation" refers to a presumption that an independent claim should not be construed as requiring a limitation added by a dependent claim. Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1379 (Fed. Cir. 2006). Although claim differentiation serves as a guideline, rather than a rule, the Federal Circuit has noted that it works best when dependent claims show a distinction over a related independent claim. Id. ("Indeed the statute stresses that a dependent claim must add a limitation to those recited in the independent claim."); see also, Fiber Optic Designs, Inc. v. Seasonal Specialties, LLC, 172 Fed. Appx. 995, 999 (Fed. Cir. 2006); Fantasy Sports Properties, Inc. v. Sportsline.com, 287 F.3d 1108, 1115-16 (Fed. Cir. 2002). In this case, the only distinction between Claim 1 and Claim 4 is the limitation in Claim 4 that the first bend extends from the upper portion of the first return and the second bend extends from the lower portion. Thus, reading this limitation into Claim 1 would make Claim 4 superfluous. As a result, the Court accepts JVI's interpretation of this disputed phrase.

III. "Extending from the Top Surface to the Bottom Surface"

With respect to the second phrase to be construed, the parties dispute whether the top and bottom of the pylons discussed above must be molded into the top and bottom surfaces of the docking section in order to "extend[] from the top surface to the bottom surface." The Defendants argue that the term at issue requires a "kiss-off" between the pylon and the top wall of the docking section; that is, the pylon must be molded into the plastic shell forming the top surface of the dock. For this assertion, they rely principally on statements in the specification and the prosecution history regarding the function the pylons serve; they "provide additional structural support for the docking member as well as preventing sagging of the deck under applied pressure," and offer rigidity to the docking member.

The specification again points up a difficulty with the Defendants' arguments. The specification states that, "the struts desirably include pylons with an arcuate top connected by slightly taller and wider pylons." For some pylons to be slightly taller than other pylons, it is evident that not all of the pylons can be the same height. If, however, the Defendants' proposed construction applied, such that all pylons must be molded into the plastic that forms the top surface of the dock, all of the pylons would be the same height. Thus, the Defendants' proposed construction of "extending from the top surface to the bottom surface" would exclude what the inventors indicated was a desirable embodiment of the patent. As discussed above, a party who advances a claim construction that excludes from its scope a preferred embodiment must come forward with
highly persuasive evidentiary support for that construction. Bowers, 302 F.3d at 1345. The Court has considered Defendants arguments, based on prior art references, and concludes that they are not highly persuasive evidence of EZ Dock's intent to claim only pylons that have been molded into the top surface of the deck.

Conclusion

Based on the foregoing and all of the files records and proceedings herein, IT IS ORDERED that

1. Defendants' Motion to Strike the Affidavit and Expert Report of EZ Dock's Patent Law Expert and Other Extrinsic Evidence (Doc. No. 106) is DENIED; and

2. The following claim terms in United States Patent No. 5,281,055 have the following meanings:

1502

. "base also extending in a lateral direction between a first and second edge thereof"

The court adopts Simmons' construction of the above terms with the exception of the additional word "approximately" and the substitution of the word "base" for "ski". The changes are noted in italics:

The claim term "base also extending in a lateral direction between a first edge and a second edge thereof" means the structure which supports all of the other claimed structures of the snowmobile ski (base) extends the width of the snowmobile ski in a direction approximately perpendicular to the longitudinal direction between first and second edges of the base. The term "edge" means the end or outermost lateral boundary of the snowmobile ski base.

The court agrees with Bombardier that "lateral" is not limited to being perfectly perpendicular to a longitudinal center line. For example, while longitudinal and lateral lines on a globe are perpendicular at the equator, they do not remain perfectly perpendicular around the surface of the globe. Thus, the limitation of "perpendicular" is not required by the claim language. However, it is clear that the claim terms "longitudinal" and "lateral" in the claim are referring to opposing directions so that the term "approximately perpendicular" gives the language its plain and ordinary meaning.

The primary dispute in this case is over the single word "edge." "Edge" can mean, as put forth by Simmons, "a line or border at which a surface terminates." 10 Thus, Simmons argues that "edge" must be the outermost lateral boundary of the snowmobile ski base. The court accepts this definition because of the context of the claim.

10 RANDOM HOUSE WEBSTER'S UNABRIDGED DICTIONARY at 620.

Bombardier would have this court define "edge" so as to make the side portions a component separate and apart from the base. It is true, as Bombardier argues, that the claim language clearly contemplates the base extending in a lateral direction between the two edges of the base and not necessarily the edges of the entire ski. Nevertheless, subsequent language in the claim makes clear that the base does in fact extend the entire width of the ski. The plain and ordinary meaning of the term base is something which "supports" a structure. Webster's defines "base" as "the bottom part of anything: the support or foundation . . . ." 11 When referring to the base of a particular structure (as is the case here) the plain and ordinary meaning of base is clearly something which generally bears the weight of that structure -- in this case, the weight of the ski. Thus, any ski which fits within the language of claim 1 is going to have "side portions" which are part of the "base" for the simple
fact that it is the side portions which will bear the weight of the ski. This is clear from the fact that the guide rods are "disposed on a bottom" of the side portions. The purpose of the guide rods requires that they touch the ground and have weight upon them while the ski is in use.

--- Footnotes ---

--- End Footnotes ---

"Claim language is given its plain, ordinary, or accustomed meaning to one of ordinary skill in the relevant art . . ." 12 Thus, in construing the plain meaning of this claim, the court must think of a person "of ordinary skill in the relevant art." If a "base" is something which supports a structure and the 594 patent describes a ski whereby the weight of the ski is going to be supported by the side portions with guide rods on the bottom of the side portions, clearly the side portions are a part of the "base." As such, the 594 patent clearly describes a "base" which extends laterally to the "edge" of the ski.

--- Footnotes ---

--- End Footnotes ---

Bombardier would have this court adopt a definition of base whereby the only portion of Simmons' Flexi-Ski (and the Fritz Ski upon which Bombardier demonstrates its definition of "edge") would have a base that would be the only portion of the ski not actually touching the snow and not bearing any weight of the ski. In other words, the "edges" which Bombardier identifies on the Fritz Ski may indeed be termed edges, but they clearly cannot be termed edges of the base of the ski. This would nullify the plain and ordinary meaning of the term base. Thus, "edge" must be defined in the context of the phrase of which it is a part because it "finds context in the surrounding words." 13 While a court cannot import limitations into the claim language, nor can the court interpret claim language so broadly as to negate the context it resides in. The construction put forth by Simmons is more in accord with the "ordinary and accustomed meaning of the claim terms." 14

1503

C. Does the PG1 Gearset Literally Infringe the Semicircular Lever Limitation?

Before the Court addresses whether the PG1 gearset literally infringes the semicircular lever limitation, it must first construe that limitation, which states: "said lever extending in a semicircle around said gear." Corsello Decl. Ex. A at 9, Col 6:11-12. JSB proposes that this limitation should be construed to mean that "the lever surrounds or encompasses a portion (approximately one-half) of the cylindrical internal gear." Joint Statement of Disputed and Undisputed Terms, Ex. A ("Disputed Terms") at 17. Bosch proposes that this limitation should be construed to mean that "the lever is formed, at least in part, in the shape of an arc that follows the outline of part of a circle." Id.

In construing disputed claim terms, the court should look first to intrinsic evidence. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1582 (Fed. Cir. 1996.). Intrinsic evidence includes the language of the claims, the specification and the file history, if in evidence. Id. The file history is often important intrinsic evidence because any interpretation that is either provided or disavowed in the file history affects the claim scope. Renishaw, 158 F.3d at 1249 n.3. In most situations, analysis of the intrinsic evidence alone will resolve any ambiguity in a disputed claim term. Vitronics, 90 F.3d at 1583.

Absent a special and particular definition created by the inventor, e.g., the inventor acted as his own lexicographer, terms in a claim are to be given their ordinary and accustomed meaning. Renishaw, 158 F.3d at 1249. The court must review the specification to determine whether disputed terms have been used by the inventor in a manner other than their ordinary meaning. Vitronics, 90 F.3d at 1582.

The Court agrees with Bosch that JSB's proposed construction of the semicircular lever limitation -- a lever that surrounds or encompasses a portion of the internal gear -- reads out of that limitation the words "in a semicircle." Were the Court to accept JSB's proposed construction, a rectangular or even pointed lever would also literally infringe the semicircular lever limitation. See Bosch's Markman Memorandum at 2 (illustrating a rectangular or pointed lever that would meet JSB's proposed construction of the semicircular lever limitation). This result is clearly incorrect and defies common sense. Moreover, it is a well-settled canon of claim construction that Courts should not read limitations out of a claim. Ethicon Endo-Surgery, Inc. v. U.S. Surgical Corp., 93 F.3d 1572, 1582 (Fed. Cir. 1996) (citation omitted). The Court agrees with Bosch's unremarkable proposition that the semicircular lever limitation requires that the lever have a shape that is semicircular.

Bai v. L & L Wings, Inc., 1997 U.S. Dist. LEXIS 12649, 1997 WL 527870 (S.D.N.Y. Aug. 22, 1997), aff'd, 160 F.3d 1350 (Fed. Cir. 1998), is directly analogous to the present case. There, the patent at issue recited, in relevant part, "a glove formed of a hemispherical dish-shaped rigid plastic member." 1997 U.S. Dist. LEXIS 12649, [WL] at *1. The defendant argued that its product did not literally infringe this claim "because the plastic glove member of the accused structure is not 'hemispherical.'" 1997 U.S. Dist. LEXIS 12649, [WL] at *2. Rather, the glove member of the accused structure was "not part of a sphere, having a perceptibly flattened surface." Id.

The plaintiff argued that, despite its use of the word "hemispherical" in the patent claim, it had chosen to be its own lexicographer because the drawings that accompanied the claims depicted a rigid glove that was less than a hemisphere. The court held that even though the drawings depicted the glove as being less than a hemisphere, they were, nonetheless, "a part of a sphere." Id. Because the defendant's glove member was not part of a sphere at all, the court concluded that defendant had not literally infringed plaintiff's patent.

Here, JSB advances a similar argument that it chose to be its own lexicographer because the preferred embodiment of the lever does not depict the lever as a perfect half-circle. Rather, the depicted lever has a stepped segment on either side of circular segment that is less than 180 degrees (i.e., less than a semicircle). See Corsello Decl. Ex. A at 5 (two drawings of the preferred embodiment of the lever claimed in the '833 patent). Although the claimed lever is less than a semicircle, it is, nonetheless, part of a circle. For the word "semicircle" to have any meaning (i.e., to avoid reading this term entirely out of the patent), the lever must contain at least part of a circle.

Under this construction, Bosch's PG1 gearset does not literally infringe the '833 patent. The lever in the PG1 gearset does not contain part of a circle. See Cotter Decl. Ex. D at 178 (side-by-side drawings of the claimed lever and the accused lever). Instead, it extends around the internal gear in a series of five straight line segments, and is in the shape of a semi-octagon (like the top half of a stop sign). Therefore, the Bosch drill does not literally infringe the semicircular lever limitation in the '833 patent.

It is well-established that, in interpreting the claims, the court should look to three sources: the claims themselves, the patent specification and the patent's prosecution history. Markman v. Westview Instruments, Inc., 52 F.3d at 979 (citations omitted); Stryker Corp. v. Intermedics Orthopedics, 891 F. Supp. 751, 766 (E.D.N.Y. 1995). The court may also consider expert testimony, "including evidence of how those skilled in the art would interpret the claims," in construing the claims at issue. Markman v. Westview Instruments, Inc., 52 F.3d at 979 (quoting Fonar Corp. v. Johnson & Johnson, 821 F.2d 627, 631 (Fed. Cir. 1987)). The prosecution history of the patent may be significant in that disclaimers made during prosecution limit the interpretation of the claims. Southwall Technologies, Inc. v. Cardinal IG Company, 54 F.3d 1570, 1576 (Fed. Cir. 1995) (citing ZMI Corp. v. Cardiac Resuscitator Corp., 844 F.2d 1576, 1580 (Fed. Cir. 1988); Senmed, Inc. v. Richard-Allan Med. Indus., Inc., 888 F.2d 815, 818-20 (Fed. Cir. 1989)); Stryker Corp. v. Intermedics Orthopedics, 891 F. Supp. at 767.

In the case at hand, the court already has determined the scope of the '647 Patent on American Permahedge's motion for an injunction. Specifically, the Court found: (1) the phrase "extending laterally" means that bristles extend perpendicularly from the wire twig; and (2) the phrase "planar array" refers to "the branches themselves, rather than the overall hedge." American Permahedge v. Barcana, Inc., 857 F. Supp. at 321-22. This decision was reached after evaluating the language of the claims, the patent specification and drawings, the patent's prosecution history and evidence presented at the hearing including expert testimony on the meaning of the relevant claim language. See id. at 320-22. The Court was also heavily persuaded by statements made by plaintiff during the prosecution of the '647 Patent. Specifically, the Court noted that, in distinguishing the '647 Patent from the Goodridge Patent:

The patentee stated that the needles of Goodridge "are bent permanently at an angle to the axis so that a planar array capable of forming shrubbery is not possible. As a result, Goodridge could not provide a densely packed contiguous planar array simulative of shrubbery."

Id. at 321-22 (quoting Amendment, dated Mar. 1, 1989, annexed to the Horwitz Aff. as exh. "H4"). The Court concluded that, based on the patentee's decision to restrict the scope of its claims to acquire the '647 Patent, American Permahedge "is estopped from now asserting that 'laterally extending' means anything other than perpendicular." Id. at 322.

Under Markman, this Court is now obligated to interpret the meaning of the claims as a matter of law. As this issue was thoroughly addressed in the 1994 Opinion, for the reasons set forth there and as briefly described above, the Court finds as a matter of law that (1) the phrase "extending laterally" means that bristles extend perpendicularly from the wire twig; and (2) the phrase "planar array" refers to the branches themselves, rather than to the overall hedge.

To determine whether American Permahedge can succeed on its literal infringement claim, however, the Evergreen Hedge must be compared to the claims as construed by the court. See Markman v. Westview Instruments, Inc., 52 F.3d at 976. In particular, to establish literal infringement, the plaintiff must establish that every element in the '647 Patent is present in the Evergreen Hedge. Southwall Technologies, Inc. v. Cardinal IG Co., 54 F.3d at 1575 (citing Becton Dickinson & Co. v. C.R. Bard, Inc., 922 F.2d 792, 796 (Fed. Cir. 1990)). Although American Permahedge correctly argues that such a comparison is essentially a factual determination, there is no genuine issue of fact that the test for literal infringement cannot be met here. 2 The parties do not dispute that the needles of the Evergreen Hedge extend at an angle from the wire twig rather than perpendicularly as set forth by the claims. Moreover, the Evergreen Hedge needles are twisted and therefore are incapable of creating the planar array described by the '647 Patent. As it is thus undisputed that every element in the '647 Patent is not present in the Evergreen Hedge, Barcana's motion for summary judgment dismissing American Permahedge's claim is granted to the extent its claim is based on a theory of literal infringement.

Footnotes

2 American Permahedge cites to Hilton Davis Chem. Co. v. Warner-Jenkinson Co., 62 F.3d 1512 (Fed. Cir. 1995), for the proposition that infringement is a question of fact. This is an accurate statement of the law in that, as set forth above, the second step of the analysis requires the factfinder to compare the accused product to the claims as construed by the court. This determination may in many instances require resolving factual issues. Contrary to Barcana's assertion, however, there
is no indication that the Hilton Davis court was overruling the clear holding of Markman which requires courts to construe claims in the first instance.

We first address the literal infringement issue with respect to the limitation that the needles "extend laterally of the axis" of the branch. The district court held that the limitation requires that the needles radiate at right angles from the branch, and found noninfringement because the accused Barcana product has the needles radiating at about a 45 degrees angle to the axis of the branch.

In construing a claim limitation, we look to the claim language, the specification and the prosecution history. Quantum Corp. v. Rodime, PLC, 65 F.3d 1577, 1580, 36 U.S.P.Q.2D (BNA) 1162, 1165 (Fed. Cir. 1995), cert. denied, 134 L. Ed. 2d 666, 116 S. Ct. 1567 (1996). As the district court properly found in reference to The American Heritage Dictionary (2d ed. 1976), the term "lateral" in its usual dictionary usage means "coming from the side." The court properly noted that there is nothing in the dictionary definition that would limit the term "lateral" to "perpendicular."

The specification confirms the above interpretation. The term "extending laterally" is used several times in the specification. The most illuminating passage on the issue is found at col. 4, lines 1-5 (emphasis added):

Each transverse element itself includes a pair of twisted wires 612 and 614 that support a plurality of densely packed laterally extending filaments 616, in all respects similar to filaments 16 described above.

The above passage describes the embodiment of the patent in Fig. 7. As shown in Fig. 7, filaments 616 extend from twisted wires 612 and 614 at an angle of about 45 degrees - definitely not perpendicularly. Thus, it is clear from the above passage that the patentee used the term "laterally extending" based on its ordinary meaning: extending sideways irrespective of the angle.

The district court, in reaching a contrary conclusion on the "extending laterally" issue, relied on the following passage from the specification: "Manual fluffing of the filaments 16 will tend to brush out any filaments 16 that remain other than essentially perpendicular from the support axis." The district court also relied heavily on the embodiment shown in Fig. 1 (and the accompanying text) that shows the needles extending out perpendicularly. However, that embodiment and the accompanying passage do not limit the claim term "extending laterally" to extending perpendicularly. Claims, not the specification embodiments, define the scope of the protection. See Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865, 9 U.S.P.Q.2D (BNA) 1289, 1299 (Fed. Cir. 1988) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations."). If anything, the text relied on by the district court simply demonstrates that the patentee used the word "perpendicularly" when he meant "perpendicularly."

The district court, in deciding the "extending laterally" issue, seems to have been most influenced by a statement made by American Permahedge during prosecution regarding a prior art patent to Goodridge. The Goodridge patent (U.S. Patent No. 3,343,357) discloses a new method of making an artificial Christmas tree branch. The branch disclosed in Goodridge is essentially a circular brush with the needles radiating in all directions and attached to the stem at an upward angle (rather than perpendicularly as in prior art Christmas tree branches) to simulate real Christmas tree needles more closely. During prosecution, American Permahedge sought to distinguish Goodridge by the following statement (emphasis added):

In Goodridge the fibers are bunched together in discontiguous clumps, leaving defined spaces between each clump at the root, i.e. where the wires are twisted. Further, the fibers are bent permanently at an angle to the axis so that a planar array capable of forming shubbery [sic] is not possible. As a result, Goodridge could not provide a densely packed contiguous planar array simulative of shubbery [sic]. Goodridge provides a tree branch but not shubbery [sic].

The district court interpreted the above statement to mean that the patent in suit could not cover any product that had needles extending at an angle other than 90 degrees. That was error. We think that by the above statement the patentee only represented the Goodridge tree branch as having needles permanently bent at a fixed angle, radiating in all directions so that
those needles cannot be flattened out to form a flat plane. Thus, as we discuss below, the above passage is pertinent on the "planar array" issue, but not on the "extending laterally" issue. We therefore conclude that the "extending laterally" limitation simply means extending from the side, with no limitations on the angle.

1506

1. "A projection extending laterally from a top wall of the offset power box"

There are six disputed phrases within Claim 1 requiring the Court's interpretation. Panduit asks the Court to construe the first disputed phrase, "a projection extending laterally from a top wall of the offset power box," as meaning that "the claimed 'projection' is formed integrally with a top surface of the offset power box. The projection extends laterally toward the trunking duct." HellermannTyton counters by arguing that "to require a projection that extends laterally from a top wall of the offset power box means that the top wall of the offset power box cannot be the extension itself, otherwise the 'top wall' would not have an extension." Thus, with respect to disputed phrase one, it appears the parties disagree about only one thing: whether the "projection" constitutes a separate piece from the top wall (HellermannTyton's interpretation), or is formed integrally with the top surface of the offset power box (Panduit's interpretation).

Panduit supports its claim by arguing that HellermannTyton's interpretation would exclude the preferred embodiment. HellermannTyton disputes this, claiming that the preferred embodiment has both a top wall and a separate lateral extension. After reviewing the illustrations that depict the '732 Patent's preferred embodiment, the Court agrees with Panduit. Based on these diagrams, the Court finds that the "projection" is integrated entirely with the "top wall," forming a single element.

As a result, the Court accepts Panduit's interpretation of disputed phrase one. Although HellermannTyton's reading has some linguistic appeal, "a claim construction that excludes a preferred embodiment is rarely, if ever, correct." Dow Chem. Co. v. Sumitomo Chem. Co., 257 F.3d 1364, 1378 (Fed. Cir. 2001). HellermannTyton has given the Court no reason to depart from this general rule. Therefore, the Court finds for Panduit as to the construction of disputed phrase one.

1507

4. "a fixed attachment extending laterally from the attachment plate at the top of the knife body in the implement plane"

Plaintiff proposes the fixed attachment is a part of the attachment structure, which in turn is part of the attachment plate and extends rigidly therefrom. The fixed attachment includes first and second portions between which the pivotable gate extends. The fixed attachment does not extend from the top of the knife body or from either of the sides of the knife, but is a part of, and extends from, the attachment plate at the top of the knife body.

Defendant proposes "a fixed structure used for attachment extending out laterally from the attachment plate at the top of the knife body in the implement plane."

The court finds this language to be clear on its face. Accordingly, no claim construction is necessary.

1508

Drive Shaft Extending Lengthwise

Here, the parties dispute whether the word "lengthwise" refers to the length of the discharge control member through which the drive shaft extends or simply to the orientation or direction of the drive shaft itself. For the following reasons, the Court will hold that the term refers to the length of the discharge control member. First, the Court finds that the phrase does not have a plain meaning and therefore it is necessary to consult the specification. The specification does not define either the phrase in issue or the term "lengthwise," although the Court notes that Figures 4 and 5 depict the drive shaft extending through the pivoting discharge control member along an axis which corresponds with the length, or greatest dimension of
the discharge control member. U.S. Patent No. 5,423,268 figs. 4-5 (filed Dec. 7, 1992). Having exhausted the intrinsic
evidence, the Court next looks to a dictionary definition. One popular dictionary defines "lengthwise" as being "[o]f, along,
or in reference to the direction of the length; longitudinally." The American Heritage Dictionary of the English Language
(4th ed. 2004). Finally, although the Court credits inventor testimony evidence with little weight, the inventor admitted in
his deposition that in this context, "lengthwise" refers to the drive shaft extending "[f]rom one end of the door to the other." (Bounds dep. 52:2-11, Aug. 15, 2007.) The Court concludes that the phrase "drive shaft extending lengthwise" means that
the drive shaft extends from one end of the pivoting discharge control member to the other.

1509

7. "Extending outside the opening"

Claim 9 includes "a contactor having a spring . . . and at least one contact. . ., the contact extending outside the opening of
the battery holder for electrical connection with the first terminal of the battery. . .." '900 Patent col.11.36-41 (emphasis
added). Invisible Fence's proposed construction asks us to read the phrase as "extending or protruding from the battery
holder," while Perimeter proposes the construction, "the electrically-conductive elongated arms of the contactor must extend
through and beyond the open end of the battery holder through which the battery is inserted." 21 (Joint Statement 5.)

21 The terms "contactor" and "opening" were construed supra, Part III.B.1 and Part III.B.3, and do not require further
discussion here.

Invisible Fence claims that the contact arm is not required to extend through the opening of the battery holder, arguing
instead that the contact arm must only "extend from the battery holder in an area outside the opening, such that the one or
more contacts can electrically connect with the electronic device." (Pl.'s Opening Br. 32.) In support of this argument,
Invisible Fence cites to language in the Summary, which provides that "the battery holder also includes . . . at least one
contact extending externally of the battery holder," while Perimeter proposes the construction, "the electrically-conductive elongated arms of the contactor must extend through and beyond the open end of the battery holder through which the battery is inserted." 22 '900 Patent col.2 1.11.

 Indeed, Invisible Fence's proposed construction would read the term "the opening" out of the claim, rendering it essentially
superfluous, whereas the claim itself necessarily entails that the contact arms will extend through the opening to reach
outside the battery holder.

Moreover, fig. 3 and the Description, when considered along with the language of claim 9, supports a construction requiring
the contact arm to extend through the opening. See Alloc, Inc., 342 F.3d at 1370. For example, the specification provides,
"When the contactor . . . is inserted into the battery holder . . . each contact arm . . . extends generally from the base . . . of
the battery holder beyond the opening of the battery holder . . . [.] The ends of the contact arms . . . that project from the
open end of the battery holder are rounded and flared. . .." 22 '900 Patent col.6 1.55-60.

22 The specification also describes two notches, which are "along the outer periphery of the retaining ring . . . to provide
passageways for the ends of the contact arms . . . projecting from the open end of the battery holder." '900 Patent col.7 1.32-
36. During the claim construction hearing, Invisible Fence argued that the notches ostensibly were not part of the opening,
suggesting that the contact arms could not possibly extend through the opening. This argument seemingly flows from their
previous claim, discussed supra Part III.B.1, that the central aperture and the opening are one and the same after the
retaining ring is attached. However, as we concluded above, the central aperture does not describe or define the opening.
Additionally, the specification ostensibly defines the notches as part of the opening, since the notches provide a
"passageway" for the contact arms to "project[,] from the open end of the battery holder." '900 Patent col.7 1.32-36.
Therefore, we construe the term "extending outside the opening" to mean "extending through and beyond the opening."

1. Receivers extending outwardly

   . Plaintiff's proposed construction: Portions of the face guard that extend rearwardly from the front portion or main body of the face guard.

   . Defendant's proposed construction: Wire members, projecting from the main body of a face guard, that extend rearwardly in order to be attached to the side of a helmet.

The primary dispute with respect to this term is whether the members only "extend" or whether they "extend and project" from the main body of the face guard. Both parties agree that the term "rearwardly" better describes the direction in which the receivers extend.

In support of its proposal, defendant relies on depictions of the receivers in the specification. However, nothing in the claims language or the specification dictates that the receivers extend and project. Defendant argues that "project" needs to be included to distinguish receivers from other portions of the faceguard that extend toward the back. I disagree. The terms "project" and "extend" have similar definitions. The common meaning of project is to extend or protrude beyond something else. Including both terms in the construction would be duplicative. Further, as plaintiff points out, claim 14 makes clear that the face guard consists of a plurality of intersecting members, including first and second receivers extending outwardly from the main body. The patent prosecution history shows that the claim's important distinction from the prior art is that the members are configured to engage the connector, not that they extend or project. Dkt. # 30, Exhs. R-T.

Accordingly, I conclude that the term "receivers extending outwardly" as used in claims 14-19 of the '151 patent means members of the face guard made of wire or other material that extend rearwardly from the main body of the face guard.

1511

As with the "having" term, plaintiff does not challenge defendant's suggestion that the terms "extending" and "outwardly" should be accorded their plain and ordinary meanings. Instead, plaintiff merely persists in his blanket assertion that the ridge is only limited by the language set forth in claim 4, (i.e., that the ridge (1) extends outwardly opposite the rear surface of the tongue, (2) that it extends across the tongue, and (3) that it is generally parallel to and in a spaced relation to the tooth.) Plaintiff's assertions are unhelpful, however, because they offer the court no assistance in construing those terms.

According to Webster's, "extending," the present participle of the verb "extend," is defined as "to cause to project in one or more directions: stick out," Webster's Third New International Dictionary 804, and "outwardly" is defined as "on the outside" or "toward the outside: in an outward direction." Id. at 1605. Taken together, and read in the context of claim 4, those words suggest--and, therefore, support the court's construction of the word "having" -- that the lower ridge is a part of the tongue structure itself, projecting from or sticking out in an outward direction from the tongue.

Absent any dispute or alternate definition of those terms, and further in light of the lack of any indication from the patent itself that Mr. Pehr intended otherwise, the court accepts defendant's proposed construction of the "extending outwardly" language to mean that the lower ridge must project from the tongue. As set forth above, this construction fully comports with the court's interpretation of the word "having," and, as was the case with that term, is consistent with the illustrations of plaintiff's invention as set forth in the patent specification.
II.

Sage's '728 patent discloses a disposal container that allows a user to deposit hazardous medical waste without touching waste already in the container. Figure 3 of the patent, reproduced below, illustrates the claimed features. The disposal container 10 includes a container body 12 with an elongated slot 16 at its top. A barrier, having a first constriction 18 and a second constriction 20, restricts access to the interior of the container body. Closure 28 closes the container.

[SEE ILLUSTRATION IN ORIGINAL].

The only independent claim of the '728 patent (with emphasis to highlight disputed elements) reads:

1. A disposal container comprising:
   a. a hollow upstanding container body,
   b. an elongated slot at the top of the container body for permitting access to the interior of the container body,
   c. barrier means disposed adjacent said slot for restricting access to the interior of said container body, at least a portion of said barrier means comprising
      i. a first constriction extending over said slot, and
      ii. a complementary second constriction extending beneath said slot, and
   d. a closure disposed adjacent said slot.

The district court properly interpreted "top of the container body" to mean the "highest point, level, or part of." The court also properly interpreted "extending over said slot" to require that the first constriction be "above" the elongated slot. The patentee nowhere indicated any intention to deviate from these ordinary meanings of the claim terms. Thus, they control. See York Prods., Inc. v. Central Tractor Farm & Family Ctr., 99 F.3d 1568, 1572, 40 U.S.P.Q.2D (BNA) 1619, 1622 (Fed. Cir. 1996) ("Without an express intent to impart a novel meaning to claim terms, an inventor's claim terms take on their ordinary meaning.").

3. "the cavity extending parallel to and spaced outwardly from the plane of travel of the blade"

Plaintiff argues this should be construed as

the recess or cavity in the handle has a dimension that extends parallel to the plane of travel of the blade. The plane of travel of the blade is the recited reference plane. Thus, the relative dimensions of the blade or handle and the cavity are not constrained by this claim.

Defendant argues this portion of the claim should be construed as "the cavity extending parallel to the length of the handle and spaced outwardly from the plane of travel of the blade."

The court finds this term is clear on its face, requiring no construction. The argument that the cavity must be parallel to the length of the handle is unpersuasive.

1514

Aspex maintains that "having two side portion extensions extending rearwardly therefrom" should be construed to mean "has two portions that extend outwardly and rearwardly of the sides of the lenses or the lens rims (if provided) to pivotally connect to the legs." Ps. Br. 10. E'Lite contends the limitation means "having extensions for pivotally coupling to a leg,
extending rearwardly from the sides of the primary spectacle frame." D. Br. 5.

The principal dispute over this limitation is the addition of "outwardly" to describe the direction in which the extensions extend. Aspex's proposed addition of "outwardly" to the disputed limitation rests on two arguments. First, it contends that the "configuration and location of extension 11 in the patent drawings" show that the "side portion extensions" extend both rearwardly and outwardly, not just rearwardly. Second, it maintains that E'Lite agreed with Aspex's proposed construction in an October 23, 2003 Joint Claim Construction Statement (the "2003 Statement").

E'Lite responds that "outwardly" should not be imported into the claim language, because the drawings are not enough to overcome the presumption that the plain claim language controls its meaning. E'Lite does not address Aspex's second contention.

E'Lite's proposed construction relies on the specification, drawings, and claim language. It posits that the specification identifies distinct extensions attached to the "outer rim portions" of the primary spectacle frame, and that these extensions are defined by the specification, drawings, and claims as being for "pivotally coupling a leg thereto." D. Br. 6. Aspex responds that E'Lite's proposed construction is imprecise, because it fails to acknowledge that the extensions extend outwardly as well as rearwardly, and it fails to define properly the "side portions" of the primary spectacle frame from which the extensions extend, because the "outer rim portions" can be located either at the sides, top, or bottom of the lens rims.

The court rejects Aspex's first basis for adding "outwardly" to the description of the extensions. This ground relies solely on the patent drawings and does not comport with the ordinary and customary meaning of the claim terms, as interpreted in light of the specification and claim language. Although drawings may aid in interpreting claim language, e.g., Autogiro Co. of America v. United States, 384 F.2d 391, 398, 181 Ct. Cl. 55 (Ct. Cl. 1967), drawings that depict a particular embodiment do not operate to limit the claims to that specific configuration. E.g., TI Group Auto. Sys. (N. Am.), Inc. v. VDO N. Am., L.L.C., 375 F.3d 1126, 1138 (Fed. Cir. 2004) ("[T]he fact that the drawings are limited to a particular embodiment does not similarly limit the scope of the claims."); Prima Tek II, LLC v. Polypap, S.A.R.L., 318 F.3d 1143, 1148 (Fed. Cir. 2003) ("[T]he mere fact that the patent drawings depict a particular embodiment of the patent does not operate to limit the claims to that specific configuration"). Therefore, the court will not limit the scope of the claimed invention by interjecting "outwardly" into the construction on the sole basis of the patent drawings. See, e.g., Hockerson-Halberstadt, Inc. v. Avia Group Int'l, Inc., 222 F.3d 951, 956 (Fed. Cir. 2000) (rejecting patentee's argument that patent drawings define precise proportions of claim elements).

Nor can the court accept Aspex's second ground. The 2003 Statement is not a binding party admission regarding the construction of claim 18. In the 2003 Statement

[[the Parties were only able to reach agreement . . . [that] the phrase "two side portion extensions" as used in Claims 12 and 16 [should be interpreted to mean] those portions of the primary spectacle frame which extend outwardly and rearwardly of the lenses or lens rims (if provided) to pivotally connect to the legs.

Ps. Br. Ex. 11 at 1 (emphasis added). E'Lite did not agree to a construction of "two side portion extensions," as that term is used in claim 18. Because the 2003 Statement applied only to claims 12 and 16, E'Lite is not bound by this construction in the context of claim 18.

The court recognizes that "claim terms are normally used consistently throughout the patent." E.g., Phillips, 415 F.3d at 1314 (citing Rexnord Corp., 274 F.3d at 1342). But the 2003 Statement is extrinsic evidence regarding the construction of claim 18. See Markman, 52 F.3d at 979 ("To ascertain the meaning of claims, we consider three sources: The claims, the specification, and the prosecution history." (emphasis added) (citations omitted)). "If the meaning of a claim is unambiguous from the intrinsic evidence, then a court may not rely on extrinsic evidence for purpose of claim construction." Avia Group, 222 F.3d at 955. The intrinsic evidence unambiguously excludes importing "outwardly" into this disputed limitation. Thus it would be improper to consider extrinsic evidence, including the 2003 Statement, to alter the meaning clearly conveyed by the intrinsic evidence. 8

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -
Moreover, Aspex has failed to explain adequately why the court should adopt the same construction of the term as it is used in claim 18.

Having determined that this limitation should not be construed to provide that the extensions extend "outwardly," the court now considers the parties' disagreement concerning the place from which the "side portion extensions" extend. Aspex argues that the extensions extend from "the sides of the lenses or the lens rims (if provided)." Ps. Br. 10. E'Lite maintains that the extensions extend from "the sides of the primary spectacle frame," although it later argues that they extend from "the outer rim portions of the frame." D. Br. 5.

Claim 18 speaks of "a primary spectacle frame having two side portion extensions extending rearwardly therefrom." D. App. 9. "Therefrom"—the place from which the "side portion extensions" extend—refers to the primary spectacle frame. The plain language of the claim does not support Aspex's contention that "side portion extension" could extend directly from the lenses. Moreover, neither party adequately explains the introduction of the phrase "lens rims" into this claim. Thus the court adopts E'Lite's proposed construction that comports most closely with the original claim language: "sides of the primary spectacle frame."

The parties both propose adding language to this limitation concerning the coupling with the legs. The parties' proposed constructions ("for coupling to a leg" and "to connect to the legs") convey essentially the same meaning, and the parties do not challenge this portion of their proposed constructions in their briefs. The court therefore construes "having two side portion extensions extending rearwardly therefrom" to mean "having two extensions extending rearwardly from the sides of the primary spectacle frame to pivotally connect to the legs."

The phrase "extending therefrom" describes the direction of the two spaced apart and resilient leg portions of the head portion. The legs are displayed in Fig. 7 as 76 and 78. They are an integral part of the head portion of the female fastener 46 at one end, and extend downwardly from it through the seat shell aperture 38. The specification describes them in col. 7, ll 45-47 as follows:

Resilient legs 76, 78 pass through aperture 38 and extend into inner portion of seat shell 14.

There is no ambiguity in the phrase. It simply describes the direction in which the legs point, i.e., downwardly, from the head portion of the female fastener through the seat shell aperture into the inner portion of the seat shell.

The phrase is to be construed as follows:

The downward direction of the leg portion of the head portion.

The parties next dispute the meaning of the phrase in Claim 1: "wires, including conductor wires from said light emitting source, extending through one of said housing walls."

a. Claim language

Maxconn argues that the ordinary meaning of the claim language indicates that the conductor wire from the light emitting
source itself extend through a wall of the housing with no intervening connections. Plaintiffs, conversely, argue that the claim contains no limitation that the wire be formed of one continuous strand originating at the LED. They say that regardless of whether the wire is formed of one continuous strand or more than one strand joined end-to-end, it remains a conductive wire from the light emitting source.

The Court agrees with Maxconn that the claim language itself suggests that a single strand of conductive material extends from the LED itself out through an opening in the housing wall. While it is common knowledge that the term "wire" includes materials that are in actuality composed of more than one piece of conductive filament laid more or less end to end (e.g., telephone wires, cable wires, and electrical wires), this particular claim relates to a very short segment of wire, not one stretching over feet, yards, or miles. While two pieces of wire joined end-to-end may serve the precise functional equivalent of a single wire, the ordinary meaning of the claim is that one continuous piece of wire extends from the LED out through the housing.

b. Specification

Maxconn argues that the specification describes a continuous LED wire passing through, along, or above various walls in the connector and plugging into the printed circuit board. Plaintiffs do not genuinely dispute this, but argue that the limitations of the specification should not be read into the claim. The Court agrees with this point of law. See E.I. DuPont De Nemours, 849 F.2d at 1433 (limitations of the specification should not be read into a claim).

Plaintiffs also argue that the specification states explicitly that the internal wiring can be accomplished in a variety of ways and is not a limitation to the invention. The Court disagrees. While it is true that the specification provides that "RJ connector[s] [are] available in a variety of sizes and internal configurations and may be molded in a number of ways commonly known in the art and is not a limitation to the present invention," Pocrass '317 patent, col. 4:24-27, this language refers explicitly to configurations of RJ connectors "commonly known in the art," and not to the novel and nonobvious improvements contained in the Pocrass '317 patent. The key novel and nonobvious improvement is the incorporation of an LED connected to a wire which extends through the connector housing. Accordingly, the quoted passage from the specification does not explicitly refer to LED wiring methodologies.

c. Prosecution history

Maxconn argues that the prosecution history reveals that the patentees, to promote the goal of achieving certain rigidity and spacing, specifically called for the patent to include one piece of wire running from the LED to the printed circuit board. Plaintiffs on the other hand argue that rigidity and spacing features refer to the relationship between the wires and the housing wall, and not to any requirement that the wires each be of one-piece construction.

The Court has no trouble agreeing with Plaintiffs. The prosecution history reveals that Pocrass distinguishes his invention from the Clark device by pointing out that the LEDs in Clark are positioned directly on the printed circuit board such that no wires from the LEDs go through a wall of the connector housing which is simply slid over the LEDs. Pocrass states: "The conductor wires from the LED device of Clark et al. do not extend through a wall of the device as required in the present claims." Amendment mailed December 28, 1989, at 7. "This claimed feature provides rigidity to the conductor wires and provides the required predetermined spaced array for subsequent insertion in a like array of holes presented in a printed circuit board." Amendment mailed December 28, 1989, at 7.

Accordingly, the prosecution history, while it does not develop Plaintiffs’ proposed construction, also fails to support Maxconn’s proposed construction.

d. Extrinsic evidence

The parties have not submitted any extrinsic evidence which illuminates the meaning of this disputed phrase.

e. Interpretation

The Court concludes that nothing in the specification or prosecution history serves to alter the plain meaning of the subject phrase. Accordingly, the Court construes the terms as meaning that a continuous wire extends from the light source out
Claim 8:
1. "wherein there is a push rod extending through the cavity and connecting the blade to the spring"

Plaintiff's proposed construction is a rod that has a portion of its length in the cavity and another portion outside the cavity so as to transmit the force of the spring to the blade. The spring does not itself need to connect to the blade. Rather, it is the push rod, which is positioned between the spring and the blade, that serves to provide the connection of the spring to the blade.

Defendant's proposed construction is "wherein there is a thin straight bar, which is pushed back and forth along its long axis, extending through the cavity and connecting the blade to the spring."
Defendant argues that the push rod is always integral with the spring, so if the push rod is connected to the blade, the spring is also connected. Defendant's argument ignores the specific language of this claim, which sets out that the push rod connects the spring to the blade. If the spring and push rod were always one unit, then the description of the push rod as "connecting the spring to the blade" would be meaningless.

The specification is the "single best guide to the meaning of a disputed term." Vitronics, 90 F.3d at 1582. Here, the specification indicates that the push rod and spring may be, but are not required to be, integral:

The bias element can be a material such as spring, wire or equivalent thereof as shown in each of FIGS. 2-6 and 8-10. Furthermore, the bias element or spring may include an integral pushrod as shown in FIGS. 3-6, 9 and 10. As seen spring, wire or equivalent thereof and may include an integral pushrod, as seen in FIG. 3 [sic].

Moreover, claim forty-four establishes the more narrow embodiment defendant argues is established in this claim. In claim forty-four the bias element includes a push rod and spring that are one integral unit. If this claim established that the spring and push rod were one integral unit, claim forty-four would be superfluous.

Defendant's construction also includes the requirement that the movement of the push rod must be back and forth along its long axis. However, the specification of the patent teaches both axial and perpendicular movement for its push rods, without specifying or requiring a particular directional force.

The court concludes that the proper construction is "A push rod that has a portion of its length in the cavity and another portion outside the cavity so as to transmit the force of the spring to the blade. The push rod connects the spring to the blade."

F. "extending upwardly therefrom"

The court will construe "extending upwardly therefrom" as "rising in an upward direction from the top surface."

Claim 1 describes a "top surface" with a "supporting structure extending upwardly therefrom." Defendant would construe "extending upwardly therefrom" as "rising in an upward direction from the top surface wherein the supporting structure is symmetrical about the longitudinal axis of the mounting base." Defendant argues that the supporting structure is identified with the mounting base, which Defendant argues is subject to a requirement of longitudinal symmetry. However, the court will find that the claim does not impose a requirement of symmetry and will therefore reject Defendant's construction as too limiting. The court will adopt Plaintiff's proposed construction, as set forth above.
The '974 patent contains eleven claims. Claims 1 through 9 require:

- a groove having a predetermined depth…formed in the end surface of said flange opposite said shank portion such that said groove extends along the outer circumference of the base end of said chuck sleeve

'974 patent, col. 13, lines 24-30. Claims 10 and 11 require:

- a ring shaped groove therein immediately adjacent said chuck sleeve, the ring-shaped groove having a circumferentially arranged inner cylindrical surface which joins with the outer circumferential surface of the chuck sleeve immediately adjacent said ring-shaped groove.

'974 patent, col. 14, line 64 - col. 15, line 2. Heartech argues that the accused device does not infringe the '974 patent because it does not contain a groove that "extends along the outer circumference of the base end of [the] chuck sleeve" or is "immediately adjacent said chuck sleeve.

"In construing claims, the analytical focus must be centered on the language of the claims themselves, for it is that language that the patentee chose to use to 'particularly point[] out and distinctly claim[] the subject matter which the applicant regards as his invention.'" Interactive Gift Express, Inc. v. Compuserve, Inc., 256 F.3d 1323, 1331 (Fed. Cir. 2001) (quoting 35 U.S.C. § 112, par. 2). There is a heavy presumption that the terms used in the claims have the ordinary meaning that would be attributed to those words by persons skilled in the relevant technology. See CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1366 (Fed. Cir. 2002); see also, K-2 Corp. v. Salomon S.A., 191 F.3d 1356, 1362-63 (Fed. Cir. 1999). A claim term is to be given the full range of its ordinary meaning as understood by persons skilled in the relevant technology unless there is a compelling reason not to do so. See Rexam Corp. v. Laitram Corp., 274 F.3d 1336, 1342 (Fed. Cir. 2001); see also Johnson Worldwide Assoc's., Inc. v. Zebco Corp., 175 F.3d 985, 989 (Fed. Cir. 1999).

The Federal Circuit has recently indicated that a court can and should consult dictionary definitions in construing claim terms. Texas Digital Systems, Inc., v. Telegenix, Inc., 308 F.3d 1193, 1202 (Fed. Cir. 2002). Dictionaries that are publicly available when the patent was issued "are objective resources that serve as reliable sources of information on the established meanings that would have been attributed to the terms of the claims" by persons skilled in the relevant technology and thus "may be the most meaningful sources of information" to be used in claim interpretation. Id. at 1203.

Because particular words may have multiple dictionary definitions, some of which may have no relation to the claimed invention, the intrinsic record must always be consulted to identify which of the different possible dictionary meanings of the claim terms in issue is most consistent with the inventor's use of the terms. Texas Digital, 308 F.3d at 1203. The intrinsic record must also be examined to determine whether the presumption of ordinary and customary meaning is rebutted. If, for example, the specification contained in the patent uses a term in a manner "clearly inconsistent" with the ordinary meaning as shown by a dictionary definition, then the dictionary definition must be rejected. Id. It is inappropriate, however, to consult the intrinsic record to determine the meaning of claim terms before attempting to discern the ordinary and customary meanings attributed to the words themselves. Id. To do so would violate the rule that limitations from the specification may not be imported into the claims so as to limit their scope. Id.; see generally Transmatic, Inc. v. Gulton Indus., Inc., 53 F.3d 1270, 1277 (Fed. Cir. 1995) ("[A] patent claim is not necessarily limited to a preferred embodiment disclosed in the patent."); SRI Int'l, Inc. v. Matsushita Elec. Corp., 775 F.2d 1107, 1121 n. 14 (Fed. Cir. 1985) (en banc) ("That a specification describes only one embodiment does not require that each claim be limited to that one embodiment.")

Heartech's motion for summary judgment turns on the meaning of the term "along" found in claim 1 of the '974 Patent. Heartech argues that a groove extending "along" the base end of the chuck sleeve requires that the groove come in contact with the outer surface of the chuck sleeve. By contrast, Lyndex contends that the ordinary meaning of the word "along" does not require the groove to touch the outer surface of the chuck sleeve. The Court agrees with Lyndex.

Consistent with Texas Digital, a court should "resort initially to the relevant dictionary definitions to determine the ordinary meaning of the [disputed] term." E-Pass Technologies, Inc. v. 3Com Corp., 343 F.3d 1364, 1367 (Fed. Cir. 2003). The American Heritage(R) Dictionary of the English Language says that "along" means "on a line or course parallel and close to; continuously beside: rowed along the shore; the trees along the avenue." American Heritage Dictionary of the English Language 50 (4th ed. 2000). This definition and the illustrative examples it provides reflect that an object can be "along" another object even if the two do not come in contact. Rather, the two objects need only be "parallel" and "close to" each
The next question is whether the context in which the term "along" is used in the claim indicates a departure from the term's ordinary meaning. E-Pass, 343 F.3d at 1368. It does not. Nothing in the context suggests that the groove must touch the outer surface of the chuck sleeve.

There is a heavy presumption that the term "along," as used in the claim, should carry its ordinary meaning. E.g., E-Pass, 343 F.3d at 1368; Sunrace Roots Enterprise Co. v. SRAM Corp., 336 F.3d 1298, 1302 (Fed. Cir. 2003). As indicated in Texas Digital, however, we next look to the specification to see if the presumption has been rebutted. Texas Digital, 308 F.3d at 1204; E-Pass, 343 F.3d at 1369. This occurs when the patentee "acted as his own lexicographer and imbed the claim terms with a particular meaning or 'disavowed or disclaimed scope of coverage, by using words or expressions of manifest exclusion or restriction.'" E-Pass, 343 F.3d at 1369 (quoting Texas Digital, 308 F.3d at 1204). Such is not the case here. It is true, as Heartech points out, that the specification and the diagrams accompanying the patent show the groove to be in contact with the outer circumference of the chuck sleeve. But the specification is simply the "preferred embodiment" of the patent, see '974, col. 6, line 35, there is nothing to suggest that it describes the patent's sole embodiment, or to put it another way, that the patentee intended to restrict the claims in this manner. The Federal Circuit has aptly pointed out that "interpretation of descriptive statements in a patent's written description is a difficult task, as an inherent tension exists as to whether a statement is a clear lexicographic definition or a description of a preferred embodiment." 343 F.3d at 1369. But in this case it is clear that the latter is what was intended, not the former; Heartech points to nothing in the description of the preferred embodiment that reflects an intent or effort by the patentee to define the term "along", as opposed to simply describing a particular embodiment of the patent. See id. Under the circumstances, to read the term "along" in the manner urged by Heartech would improperly limit the patent to its preferred embodiment.

In its reply brief, Heartech argues that the groove's function in the patent can be accomplished only if it is in contact with the chuck sleeve. This argument is forfeited because it was not made in Heartech's opening brief, but even if not forfeited it would be meritless, as Heartech has failed to provide any factual support for its assertion (aside from an attempted interpretation of the preferred embodiment, which is improper for the reasons previously discussed).

Literal infringement exists when the accused device contains every limitation in the asserted claims. E.g., Kraft Foods, Inc. v. International Trading Co., 203 F.3d 1362, 1370 (Fed. Cir. 2000). The absence of even one such limitation compels a finding of non-infringement. See, e.g., Watts v. XL Systems, Inc., 232 F.3d 877, 884 (Fed. Cir. 2000). In arguing that it is entitled to summary judgment on the issue of literal infringement, as to claims 1-9, Heartech relied exclusively on its proposed construction of the claim term "along." Because the Court has rejected that construction, Heartech is not entitled to summary judgment of non-infringement on these claims. Under the circumstances, no purpose would be served by addressing at this time its arguments regarding literal infringement as to claims 10 and 11 and infringement under the doctrine of equivalents.

II. "wherein said pin extends into said security slot"

In the earlier round of claim construction briefing that took place in 2005, plaintiff construed the term "extends" to be an intransitive verb, while defendants construed the term as an active verb and having a temporal scope. In the present claim construction, defendants change their position, asserting that the concept of a pin "extend[ing] into said security slot" is "clear on its face and does not require a special construction." Def. Resp. at p. 1. This is indeed the initial position of plaintiff, who has stated that the claim terms are "unambiguous and should not be construed." Pl. Opening Brief at 1 n.2.

Absent a showing to the contrary, the Court finds that the term "extends" is an intransitive verb as it is used in the '794 patent. First, nothing in the claim term "wherein said pin extends into said security slot" suggests that the verb "extends" is active or contains a temporal scope. It is therefore improper to add extraneous limitations to the claim by construing the term in such a way. Second, the embodiments in the specification, including Figures 11, 13A and 13B, show the pin to extend into the security slot before the locking member is placed into a locked position, thereby supporting the construction that "extends" does not carry with it a temporal meaning. Lastly, plaintiff's construction is supported by the prosecution history of the '794 patent, which shows that the Patent Examiner explicitly required the term "extends into" in claim 73.
(which later became claim 1 of the '794 patent) to be limited by physical and spatial restrictions, but omitted any temporal restriction on the placement of the pin. In sum, plaintiff's construction of the claim term "extends" is supported by the claim language and other intrinsic evidence.

10. "[A] magnet protector that extends outwardly from an exterior of said tool body"

This phrase is contained an independent claim in the 386 patent, 127 and an independent claim in the 117 patent. 128

As to this phrase, the Court construes the following meaning: each magnet protector extends beyond the outer circumference of the tool body in such a manner as to create an uneven surface on the exterior of the tool. The drawings accompanying all five patents support this interpretation, illustrating a cross section of the tool with a near pinwheel appearance. The patent specifications, as addressed in numbers four and five above, explicitly explain that the protectors are taller, or farther out from the tool body, than are the magnets, to deflect the striking force of particles and to create trap spaces for secondary settling areas during rotation of the tool. Conformity with previous constructions of phrases associated with magnet protectors supports this interpretation. The requirement that the language of the patent, when read as a whole, be full, clear, concise, and exact, so that inventors are protected but innovation is still permitted, demands that the plain language "extending outwardly" means exactly that and no less.

E. "Extends toward"

Defendants contend the following phrase should be subjected to claim construction: elongated weather stripping at least some of which extends toward the adjacent insert track. Their proposed construction is: looking at a vertical section of the door frame in cross-section, at least one of the opposing pieces of weather stripping that resides in the screen track has a discernible directional orientation that points toward the adjacent insert track in the cross-sectional plane of the door frame. Defendants' proposed construction is a strained, narrow construction of the phrase "extends toward" that is not supported by the claim language, specification or prosecution history.

The Court finds the phrase "extends toward" is in its simplest form and does not require claim construction.

K. "Extension"

"Extension" must be defined for purposes of claims 28 of the '303 Patent and 51 of the '018 Patent. 136 Medinol would define "extension" to mean "dimension." 137 Guidant views this term as equivalent to "an axis." 138
Defining "extension" as an "axis" makes little sense in light of the claim language. Claim 51 of the '018 Patent recites, in relevant part:

A generally longitudinally extending tubular stent which is substantially uniformly flexible with respect to its longitudinal axis, said stent consisting essentially of: a plurality of flexible cells, each having a longitudinal extension parallel to said longitudinal axis and a circumferential extension parallel to an arc of a circle around the circumference of the stent . . . .

The use of the words "axis" and "extension" in the same clause indicates that Medinol intended for these words to have different meanings. It is thus clear that "extension" does not mean "axis." The ordinary understanding of extension is "the property of a body by which it occupies space," or "dimension." Because this definition is consistent with the intrinsic record, there is no reason to depart from it and therefore, "extension" is defined as dimension.

The appellee argues that, even if the terms "modular" and "stem extension" do not limit the stem extension to a single piece, the prosecution history evidences a disclaimer of a one-piece stem extension, relying particularly on an amendment in the course of prosecution. The examiner rejected claim 1 (among other claims) as being anticipated by U.S. Patent No. 4,963,155 to Lazzeri, et al. ("Lazzeri"). The applicant amended claim 1 by adding the phrase "central longitudinal" before the word "axis" both times it appeared in the claim. The applicant noted that "the first and second longitudinal axes of applicant's Claim 1 are both in the stem extension component" but also stated that the claim was patentable over Lazzeri because "the first and second axes are offset from each other, . . . not coincident with each other." (J.A. at 187, 189.) Thus, the distinction between the '313 patent and Lazzeri is the offset between the axes, not whether the stem extension includes one or more pieces. The applicant's statements therefore do not rise to the level of a clear and unambiguous disclaimer of a stem extension containing more than one piece. See, e.g., Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1324 (Fed. Cir. 2003) ("We have . . . declined to apply the doctrine of prosecution disclaimer where the alleged disavowal of claim
We hold that the term "stem extension" in claim 1 encompasses both one-piece and multiple-piece stem extensions. We thus conclude that the district court erred in reading a one-piece limitation into claim 1.

3. extension arm

Free Motion argues that the "extension arm" is "a part similar to a human arm, such as a long part projecting from a central support, and specifically includes structure that comprises the arm's locking means." (Pl. Brief I at 11.) Cybex posits that the extension arm cannot be read to include the casting of the FT 360 because they do not extend away from the exercise apparatus for use by the exerciser. (Cybex Reply at 7.) Nautilus submits that the extension arm includes all of the parts that extend from the frame including the swivel assembly (or casting). (Nautilus Brief at 16.)

The '061 patent states that "the cable crossover apparatus 110 includes a pair of extension arms 112, 114 positioned to facilitate a wide range of lifting type exercises." ('061 Patent, col. 7, lines 30-32.) Claim 8 states that each extension arm includes a locking means for selectively locking the extension arm in various positions. ('061 Patent, col. 8, lines 54-60.) Thus, Claim 8 and its specification suggest that the casting that houses the locking means is also part of the arm. 4

--- Footnotes ---

4 The specification describes the locking means: "the first extension arm 112 includes a locking hole 170 located adjacent a pivot hole 172 through which a pivot point pin 174 passes to pivotally couple the first extension arm 112 to the semicircular flange assembly 178, and ultimately, the weight stack 124. The locking hole 170 is aligned with a series of flange holes 176 formed in the semicircular flange assembly 178 of the weight stack 124. In practice, and as those skilled in the art will readily appreciate, a locking pin 180 is passed through an aligned locking hole 170 and flange hole 176 to lock the first extension arm 112 at a desired angular orientation relative to the weight stack 124. ('061 Patent, col. 6, line 65 - col. 7, line 9.)

--- End Footnotes ---

The Court construes the "extension arm" to include both the extension device and the casting which locks the extension arm in various positions.

3. extension arm

(3) "two side portion extensions" of the primary spectacle frame (claims 12 and 16):

Plaintiffs contend that "two side portion[s]" means "those portions of the primary spectacle frame beginning at the point where a line drawn through the midpoints of the lenses and lens rims (if supplied) would intersect the top and bottom of the primary spectacle frame, and terminating at the pivot point where the legs are attached to the extensions." JS, Exh. B at 4. Additionally, Plaintiffs state that "extensions" means "those portions of the primary spectacle frame which extend outwardly and rearwardly of the lenses or lens rims (if provided) to pivotally connect to the legs and which secure the first magnetic members." Id., Exh. B at 7.

Conversely, Defendant construes the phrase "two side portion extensions" as "essentially bars which extend outward from the outer edge of the lens rims." Id., Exh. D at 1.

In this case, the two side portion extensions are described as follows in the specification of the '545 Patent: "The primary spectacle frame 10 includes two side portions each having an extension 11 extended rearward therefrom for pivotally
coupling leg 12 thereto." Koo Decl., Exh. B, Col. 2, 11. 33-36. The Court finds Defendant's use of the term "bar" to describe each side portion extension to be somewhat vague. Additionally, Plaintiffs' use of the midpoints of the lenses and lens rims to define the instant phrase is also vague and confusing. 7 Moreover, the Court does not find it necessary to bifurcate the construction of the instant phrase as Plaintiffs suggest. Instead, and based on the specification and the drawings of the '545 Patent, the Court construes "two side portion extensions" to mean those portions of the primary spectacle frame which extend outwardly and rearwardly of the lenses or lens rims (if provided) to pivotally connect to the legs.

7 Specifically, Plaintiffs define the starting point of each side as follows: where a line drawn through the midpoint of the lens and lens rims (if provided) would intersect the top and bottom of the frame. The Court notes that since each lens is, geometrically speaking, not a line or an arc, it is not clear where its midpoint would be (or that of the lens rim). See Webster's Encyclopedic Unabridged Dictionary of the English Language, defining "midpoint" as "a point at or near the middle of or equidistant from both ends as of a line," and "the point on a line segment or an arc that is equidistant when measured along the line or the arc from both endpoints."

19 Ref. No. 22 of Appendix B contains the disputed term "disposed substantially at the radius" and its construction.

The '930 Patent claims include the terms "exterior structure," "exterior surface," "exterior feature," "bearing segments," "bearing area," and "at least one feature." ReedHycalog contends the claims should be limited to structures that rotationally precede the associated cutters. Baker Hughes contends the '930 Patent is not limited to structures that rotationally precede the associated cutters, as the claims of the '930 Patent do not contain the term "rotationally preceding."

Baker Hughes argues the doctrine of claim differentiation indicates there is no limit on the rotational placement of the bearing structures in independent claims. As stated above, courts presume a difference in meaning and scope when a patentee uses different phrases in separate claims. Phillips, 415 F.3d at 1314-15. The presumption is especially strong when a party seeks to limit an independent claim with language that appears in a dependant claim. Liebel-Flarsheim Co., 358 F.3d at 910. However, the doctrine of claim differentiation is not a "hard and fast rule," and courts cannot use the doctrine to broaden claims beyond their correct scope, determined in light of the intrinsic record and relevant extrinsic evidence. Seachange Int'l, Inc., 413 F.3d at 1369; see also Phillips, 415 F.3d at 1312-15.

Claims 1 and 17 of the '930 Patent claim an "exterior structure" or a "feature" to limit the depth of cut of at least one superabrasive cutter. '930 Patent col. 15:42-48, col. 16:64--col. 17:2. Claim 2 requires the "exterior structure" claimed in claim 1 to comprise "a plurality of bearing segments." Id. at col. 15:49-59. Claim 18 requires at least one "feature" claimed in claim 17 to comprise "a plurality of bearing segments." Id. at col. 17:3-13. Claims 3 and 19 require at least some of the "bearing segments" claimed in claims 2 and 18, respectively, to rotationally lead, in the direction of bit rotation, one superabrasive cutter of the plurality of superabrasive cutters. Id. at col. 15:60-64, col. 17:14-17.

ReedHycalog's construction renders claim 3 redundant with claim 1 and claim 19 redundant with claim 17. Therefore, ReedHycalog's construction raises the presumption that the "bearing segments" claimed in claims 2 and 18, and the associated "exterior structures" and "feature" claimed in claims 1 and 17, are not limited to structures that rotationally lead the cutters. The presumption of claim differentiation also applies to similar terms in claims 37, 42, 44, and 49 ("exterior feature"), claim 47 ("exterior surface feature"), and claims 52, 53, 55, and 57 ("bearing area"), as these structures function almost identically to the "bearing segments" in claims 3 and 19. Id. at col. 15:49-59 (claiming "a plurality of bearing
segments having bearing surfaces . . . wherein a combination of bearing surfaces of the plurality exhibits sufficient surface area"; id. at col. 17:3-13 (substantially similar use of "bearing segments" and "bearing surfaces"); id. at col. 18:49-64 (claiming "at least one exterior feature . . . sufficient to support the bit thereon under a weight on bit at least as great as the total weight on bit without failure of the at least one formation . . . "); id. at col. 19:29-43 (substantially similar use of "at least one exterior feature"); id. at col. 20:8-21 (claiming "at least one exterior surface feature . . . sufficient to preclude plastic failure of the at least one formation under at least the total weight on bit"); id. at col. 20:53-63 (claiming "a bearing area . . . to distribute the excess weight on bit sufficient to achieve a unit load by the bearing surface area on the formation less than a compressive strength of the formation"); id. at col. 21:11-23 (substantially similar use of "bearing area"); id. at col. 20:64--col. 21:6 (claiming "a bearing area . . . 21:28-22:4 (substantially similar use of "bearing area").

The '930 Patent specification rebuts the presumption of claim differentiation. The specification describes Figs. 10A, 10B and 12, which depict bearing surfaces that rotationally lead their associative cutters, as "according to the present invention." Id. at Figs. 10A, 10B, 12, col. 4:49-51, col. 4:55-59. In total, the '930 Patent only discloses embodiments where the depth of cut control structures rotationally lead their associative cutters. Id. at Figs. 1, 10A, 10B, 12.

The specification also distinguishes between the prior art and the present invention in terms of the rotational location of the depth of cut limiting structures. The specification describes Fig. 4 as a comparison between prior art following structures and leading structures "according to the present invention." Id. at Fig. 4, col. 4:26-30. The specification further distinguishes the rotationally leading placement "according to present invention" from the prior art, as the rotationally leading placement reduces cutter and depth of cut limiting structure wear and vertical misplacement in comparison to the rotationally trailing placement of depth of cut limiting structures known in the prior art. Id. at col. 8:51--col. 9:40.

In total, the specification shows that application of the doctrine of claim differentiation would improperly broaden the claim terms. See O.I. Corp. v. Tekmar Co., 115 F.3d 1576, 1582 (Fed. Cir. 1997) ("Although the doctrine of claim differentiation may at times be controlling, construction of claims is not based solely upon the language of other claims; the doctrine cannot alter a definition that is otherwise clear from the claim language, description, and prosecution history."); see also SciMed Life Sys. v. Advanced Cardiovascular Sys., 242 F.3d 1337, 1341 (Fed. Cir. 2001) ("Where the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent, even though the language of the claims . . . might be considered broad enough to encompass the feature in question."). Thus, the "exterior structure," "exterior surface," "exterior feature," "bearing segments," "bearing area," and "at least one feature" must rotationally precede the respective associated cutters. 20

1528

Designed to the Particular Formation to be Drilled

ReedHycalog claims the "exterior structure," "bearing segments," and "features" claimed in the '930 and '631 Patents must be "tailored" to or "designed" for the particular subterranean formation to be drilled. Baker Hughes argues a "tailored" or "designed" limitation should not be read into the claims.

ReedHycalog bases its construction on the '930 and '631 Patents specifications, which note the failure of prior art depth of cut limiting structures to implement an "engineered approach" to achieve a target rate of penetration and a predictable, stable bit performance. '930 Patent col. 2:36-41; '631 Patent col. 2:53-57. Further, ReedHycalog supports its construction with language from the '930 and '631 Patents specifications which state the invention provides a bit design that may be tailored to specific compressive strengths. '930 Patent col. 2:46-51; '631 Patent col. 3:2-7.

ReedHycalog also bases its construction on statements Baker Hughes made to the U.K. Patent Office during prosecution of the U.K. counterpart to the '930 Patent. In response to a rejection by the U.K. Patent Office Examiner, Baker Hughes stated...
it was "the first to recognize the need to tailor the area of the bearing surfaces to the compressive strength of a particular subterranean formation to be drilled so as to optimise the rate of penetration by obtaining a controlled depth of cut . . . ."

ReedHycalog's Response to Baker Hughes's Opening Markman Brief, Exh. 12 at 1-2. Further, Baker Hughes stated "the present invention is not limited to any particular type of formation but rather lies in matching the depth of cut controlling features of the drill bit to the formation drilled, by reference to the compressive strength of the formation." Id. at 2.

Nothing in the '930 or '631 Patents indicates the claims should contain a "tailored" or "designed" limitation. The claims themselves do not contain a "tailored" or "designed" limitation. The specification states the prior art failed to implement an "engineered approach" and mentions that the bit design may be tailored, but these statements are not sufficient to import a "tailored" or "designed" limitation into the claims.

Baker Hughes's statements to the U.K. Patent Office also do not justify importation of a "tailored" or "designed" limitation, as "differences in international requirements for patent prosecution could make reliance on representations before foreign patent offices inappropriate" in the context of claim construction. Burns, Morris & Stewart Ltd. v. Masonite Int'l Corp., 401 F. Supp. 2d 692, 698 (E.D. Tex. 2005) (Clark, J.) (citing TI Group Auto. Sys. (N. Am.), Inc., v. VDO N. Am., L.L.C., 375 F.3d 1126, 1136 (Fed. Cir. 2004)). To clarify its statements to the U.K. Patent Office Examiner, Baker Hughes added "through a formation of determined or predicted compressive stress" to the claims of the U.K. counterpart patent. ReedHycalog's Response to Baker Hughes's Opening Markman Brief, Exh. 12 at 2. This, or similar, claim language is not present in the '930 or '631 Patent claims. Therefore, the terms "exterior structure," "bearing segments," and "features" do not contain a "tailored" or "designed" limitation.

21 Ref. No. 23 of Appendix B contains the disputed terms and their constructions.

--- End Footnotes ---

1529

1. "External Threads"

a. Claim Term:

"... a male end of said PVC pipe which has external threads . . . ."

b. Parties' Contentions

CertainTeed's proposed construction of "external threads" is "helical or spiral ribs or grooves on the outer surface of the male end of the PVC pipe." Pl's Markman Brief at 10. In construing this phrase, the parties agree on two issues: (1) the word "threads" should be construed to mean "helical or spiral ribs or grooves;" and (2) the word "external" should be construed to mean that the threads are "on the outer surface of the male end of the PVC pipe." Id. However, this is where the agreement ends. CertainTeed contends that Modern Products, in support of its proposed construction, relies on extrinsic evidence, namely a specification from the American Society for Testing and Materials, to go beyond the scope of the unambiguous and ordinary meaning of this term. Further, CertainTeed argues that Modern Products' proposed construction is inconsistent with the specification of the '480 patent and the sole preferred embodiment disclosed therein, as the specification does not draw or suggest any distinction between those male end threads that engage the female end threads and those that do not. If Modern Products wanted the term "external threads" to mean only those threads which actually engage the female end threads, it would have made that distinction explicit.

Modern Products' proposed construction of "external threads" is "helical or spiral ribs or grooves on the outer surface of the male end of the PVC pipe which mate with corresponding helical or spiral ribs or grooves disposed within the interior
surface of the female end of a similar adjacent PVC pipe." In support of this contention, Modern Products states that only threads which can mate with and engage the opposite threads of a similar adjacent PVC pipe qualify as "external threads" as specified in the claim. This construction is necessitated by the context of the surrounding words in the claim. For example, Claim 1 recites that the "external threads" are intended for "threading." "Threading" means interlocking. Def's Claim Construction Brief at 23. Therefore, only interlocking or mating threads are contemplated by the term "threads." The specification also contemplates that external threads are intended for threading. Specification, Col. 3, Lines 46-48. Further, the ordinary meaning of the word "thread" as defined in dictionaries, supports Modern Products' claim that threads are only those which "screw together" or are "connecting and holding together." Def's Claim Construction Brief at 24.

c. Court's Construction

This Court concludes that the term "external threads" means "helical or spiral ribs or grooves on the outer surface of the male end of the PVC pipe which mate with corresponding helical or spiral ribs or grooves disposed within the interior surface of the female end of a similar adjacent pipe." This term is construed in accordance with the claim and specification, and dictated by its ordinary and customary meaning. The Court agrees with Modern Products' proposed construction because it is supported by the claim language, in the context of the entirety of the invention, and construed in accordance with the specification. See Markman v. Westview Instruments, Inc., 52 F.3d 967 at 979 (Fed. Cir. 1995) (stating that claims must be read in view of the specification of which they are a part.). Claim 1 qualifies the term external threads by their ability "to mate with each other." Claim 1 also recites that the external threads are threading. CertainTeed has agreed that threading means interlocking. Def's Claim Construction Brief at 23. The Claim mentions mating and/or threading; mating or threading, after all, is the only functional purpose of the threads. Further, the specification states, "threads of second end are intended for threading onto threads to provide this water tight connection." Specification, Col. 3, Lines 46-48. Consequently, only threads that can mate with and engage the opposite threads of a similar adjacent PVC pipe qualify as external threads, as specified in the claim.

1530

"Externally mounted" Intercooler

The parties do not dispute that an intercooler is a heat exchanger. The dispute is what it means that the intercooler is "externally mounted." Rice proposes that it simply means that the heat exchanger is mounted anywhere outside either the low pressure compressor or the high pressure compressor. Rolls-Royce proposes that the heat exchanger must be not only outside the compressor structures but also that it must be located away from them in a separately supported arrangement.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

2 Defendant's proposed construction adds "for cooling air flow between compressors" but the Court finds the additional language unnecessary that can be ascertained from the rest of the claim.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

In support Rice argues for a plain meaning. In addition, Rice points to characterizations of the prior art made by an examiner during the prosecution of the '204 patent, which is not at issue in this litigation. Specifically, Rice notes that the examiner there characterized prior art structures as being for "external mounting." See Rice Br. at 16. The particular prior art was the '745 Price patent (U.S. 2,563,745). Def's Surreply Br. 1-3; Exh. 16. The intercoolers 23 in the '745 Price patent are located outside the engine housing 40. While the examiner's comments during the prosecution of the '204 patent are not controlling as to the construction of the claim language in the '499 patent, as Rice notes, it would be reasonable for a person of ordinary skill in the art to conclude that an "externally mounted" intercooler is one such as shown in the '745 Price patent. Rice Br. 16.

Indeed, the '499 specification shows in Figs. 2 and 3 depictions of an intercooled gas generator "of the present invention." Col. 5, lines 40-45. As shown in them, the flanges on the ducts 36 and 42, which are to be connected to the intercoolers 38 and 40 (not shown), establish a mounting location that is outside the casing 72. This indicates to one skilled in the art that the externally mounted intercooler is not only outside either compressor but is also outside the casing. However, the
proposal by Rolls-Royce that the intercooler be "located away" from the compressors does not capture with sufficient specificity the meaning that should be accorded the term.

The prosecution history, as an additional piece of intrinsic evidence, provides further insight into the meaning to be ascribed to the term "externally mounted intercooler." During the prosecution, claim 69 was rejected as being anticipated by Hull (U.S. Patent No. 3,273,340) in an Office Action dated April 11, 1989. The examiner specifically identified Hull as having an intercooler 16. In Hull, the intercooler 16 is shown inside the casing 11 of the engine, which encloses the compressors. Rice filed a response on July 7, 1989, amending claim 69 to include the further limitation that the recited intercooler was "externally mounted." Rice then remarked that "Hull uses annular ducting and intercooler and not separate piping to an externally mounted intercooler." Resp. 8. The scope of Rice's disclaimer during prosecution goes only to locating the intercooler outside the engine casing. Rice made no comment as to the mounting arrangement for the recited intercooler in contrast to the intercooler 16 of Hull.

Accordingly, the Court construes the term "externally mounted intercooler" to mean "a heat exchanger located outside the casing containing the low and high pressure compressors."

The parties have three main disputes with respect to the "extinguish" terms. First, they dispute whether the preambles containing the word "extinguish" are limiting. Second, they dispute whether extinguishment requires complete cessation of burning, or only partial cessation. Third, the parties dispute whether the surface temperature must be reduced to 90 degrees in order for a mine fire to be extinguished.

"In general, a preamble limits the invention if it recites essential structure or steps, or if it is necessary to give life, meaning, and vitality to the claim. . . . A preamble is not limiting where a patentee defines a structurally complete invention in the claim body and uses the preamble only to state a purpose or intended use for the invention." Vizio, Inc. v. Int'l Trade Com'n, 605 F.3d 1330, 1340 (Fed. Cir. 2010) (internal citations and quotations omitted). In dispute are the preambles of claims 1, 4, and 9 of the '965 patent, and claim 1 of the '336 patent. The '965 patent, claims 1, 4, and 9 all recite essential structure in the preamble. In claims 1 and 9, the preamble recites "mine shaft," which reappears in the first step as "said mine shaft."

Likewise, in Claim 4 of the '965 patent, the preamble recites "poorly ventilated area," which provides the antecedent basis for "said poorly ventilated area" in the last step of the method. Moreover, the phrase "extinguishing a fire" is "the essence or fundamental characteristic of the inventions. See id. at 1341 (finding that "decoding" as used in the preamble "was properly construed as a claim limitation . . . because [the term] is the essence or a fundamental characteristic of the claimed invention"). The Court will construe the preambles.

The next issue for the Court to resolve is whether "extinguishing a fire" requires complete extinguishment, as Defendants contend. Defendants rely on statements in the prosecution history, arguing that the patentee overcame a prior art reference in which "a mine cavity could [not] be completely filled to smother hot spots on the sides and top portions of [a mine] shaft." Amendment, Sept. 1, 2005. This language does not support Defendants' argument. The language merely shows that the invention provided a superior manner of covering and smothering a fire, not that the fire needs to be extinguished completely. Nonetheless, the Court finds support in the specification for Defendant's position. Explaining the problems associated with confined areas, the specification recites, "providing additional combustible material to feed the fire . . . make[s] extinguishing of such a fire, other than letting the fire burn itself out, even more difficult if not impossible." '965 patent, 3:1-3. If a fire need only partially cease burning to be extinguished, "letting the fire burn itself out" is an excessively limited view of available options in the absence of a seal to keep air out of the burning area. A partially extinguished fire that has been allowed to "burn itself out" will refuel if the confined area is opened to permit miners to reenter. Moreover, the quote from the "Mine Fires" book also indicates that extinguishment, as understood by the patentee, must be complete. 

"[H]igh expansion foams have not yet extinguished a real mine fire." '965 patent, 4:11-12. Certainly some foams had been able to cease at least some burning, i.e., "extinguish" according to US Foam. Upon reading this sentence, one of ordinary skill in the art would understand the invention to be directed toward complete extinguishment, or ceasing the burning of combustible materials in whole. The Court declines to include "in whole or in part" as part of the construction for any of the "extinguish" related terms.

Finally, with respect to the 90-degree limitation, Defendants argue that a fire is only extinguished when the surface
temperature is reduced to 90 degrees or lower. Defendants rely on the patentee's pervasive statements throughout the '336 patent that "90 degrees Fahrenheit is the temperature that is accepted as the point at which the fire is considered to be extinguished." '336, 5:52-57. See also '336, 6:30-35; 9:42-46; 10:53-59; 9:65-10:1; 11:1-4. The Court must be careful not to import a limitation from the specification, "[b]ut 'the line between construing terms and importing limitations can be discerned with reasonable certainty and predictability if the court's focus remains on understanding how a person of ordinary skill in the art would understand the claim terms.'" ICU Medical, Inc. v. Alaris Medical Systems, Inc., 558 F.3d 1368, 1375 (Fed. Cir. 2009) (internal quotations omitted). In light of the repeated statements that a fire is extinguished only if it reaches 90 degrees, one skilled in the art would understand "extinguished," as claimed in the '336 patent, to require just such a reduction in temperature. See id. See also Chamberlain Group, Inc. v. Lear Corp., 516 F.3d 1331 (Fed. Cir. 2008) (finding that the patent restricted "binary code" to a narrower meaning than otherwise understood).

Ordinarily, the same claim term appearing in related patents would carry the same meaning. See Boss Indus., LLC v. Yamaha Motor Corp., 333 Fed.Appx. 531, 536-37 (Fed. Cir. 2009) ("[B]ecause each patent-in-suit is derived from the same parent application and shares many common terms with its sister patents, the district court correctly interpreted [the disputed term] consistently across all of the asserted patents.") (citing NTP, Inc. v. Research In Motion, Ltd., 418 F.3d 1282, 1293 (Fed. Cir. 2003)); Omega Eng'g., Inc. v. Raytek Corp., 334 F.3d 1314, 1334 ([W]e presume, unless otherwise compelled, that the same claim term in the same patent or related patents carries the same construed meaning."). The '336 patent is a continuation-in-part of the '965 patent and, the specifications have significant differences that are material to the Court's construction of "extinguish." The '965 patent makes no mention whatsoever of any temperature limitations, let alone a 90-degree limitation for extinguishment. Reading the '965 patent independently of the '336 patent, a person of ordinary skill in the art would not understand "extinguish," as used in the '965 patent, to require a reduction in temperature to 90 degrees or below. By defining "extinguish" in the '336 patent, the patentee chose to give the continuation-in-part a narrower scope than its parent. This is a rare case where the same claim term in two related patents does not share the same meaning.

What causes the Court concern, however, is the Defendant's introduction of "borehole temperature readings" to the definition of "extinguish." The term "borehole" never appears in the specification and Defendants resort to extrinsic evidence to support the additional limitation. While Defendants may be correct that coal miners customarily check the temperature at the surface of the mine by reading borehole temperatures, there is no support in the intrinsic record for limiting the manner in which miners measure temperature. The Court construes "extinguishing a fire," as used in the '336 patent, to mean "ceasing the burning of combustible material, as shown by mine surface temperatures of 90 degrees Fahrenheit or less." The Court construes "extinguishing a fire," as used in the '965 patent, to mean "ceasing the burning of combustible material." "Fighting a coal mine fire" means "attempting to extinguish a coal mine fire." "Initiate the suppression of the fire" means "to begin extinguishing the fire."

B. The '962 Patent - Claim 10

Claim 10 provides:

The catheter wire of claim 1 wherein although prebiased said detachable coil is extremely soft and its overall shape is easily deformed such that, once advanced from a microcatheter into said cavity, it will loosely deform to said interior shape of said cavity.

The parties dispute the proper construction of the phrase "extremely soft." Claim 10 is a dependent claim of Claim 1. The disputed phrase is a limitation on the detachable coil, namely that it be extremely soft.

The word "soft" is a commonly used adjective meaning "giving way easily under pressure, easily shaped, delicate. See Webster's New Twentieth Century Dictionary, 1728 (2d ed. 1983). The word "extremely" is a commonly used adverb meaning "in the utmost degree; exceedingly." Id., 652. The language of Claim 10 ("overall shape is easily deformed" and "will loosely deform to said interior shape of said cavity") supports construing the phrase in accordance with these commonly understood definitions.

Although the phrase "extremely soft" can be given a commonly understood definition, the issue becomes whether the phrase
is so broad and so subjective as to make Claim 10 indefinite under 35 U.S.C. § 112 p. 2. Because the patent claims perform the fundamental function of delineating the scope of the invention, the purpose of the definiteness requirement is to ensure that the claims use language that adequately notifies the public of the inventor's rights to exclude. Honeywell Int'l, Inc., v. Int'l Trade Commission, 341 F.3d 1332, 1338 (Fed. Cir. 2003). In evaluating whether or not a phrase such as "extremely soft" is so broad and so subjective as to make the claim indefinite, 20 the Court examines the intrinsic evidence for any description which would add meaning to the scope of "extremely soft."

20 Consideration of whether a patent claim meets the definiteness requirement is normally a part of later proceedings after the claim has been construed. However, it is an appropriate consideration during claim construction because the Court must construe the claim consistent with the scope of the words used in the claim. The Court may decline to construe a broadly worded, subjective claim if it is so broad as to be ambiguous and its scope cannot be ascertained. The Court examines the written descriptions for definitive language in light of these considerations.

In the written description, one embodiment of a detachable coil is described as "soft" and another embodiment is described as "extremely soft." The coil depicted on Figure 1 is described as "extremely soft:"

The distal end of secondary coil 28 is provided with a platinum soldered tip 30 to form a rounded and smooth termination to avoid puncturing the aneurysm or tearing tissue.

Although prebiased to form a cylindrical or conical envelope, secondary coil 28 is extremely soft and its overall shape is easily deformed. When inserted within the microcatheter (not shown), secondary coil 28 is easily straightened to lie axially within the microcatheter. Once disposed out of the tip of the microcatheter, secondary coil 28 forms the shape shown in FIG. 1 and may similarly be loosely deformed to the interior shape of the aneurysm.

('962 Patent, Col. 7:52-63.)

The coil depicted in Figure 3 is described as "soft:"

Turn now to the third embodiment of the invention as shown in FIG. 3. FIG. 3 shows an enlarged side view of a wire, generally denoted by reference numeral 42, disposed within a microcatheter 44 shown in cross-sectional view. Like the embodiment of FIG. 1, a stainless steel coil 46 is soldered to a conical portion 48 of wire 22 at a first bonding location 50. A thin threadlike extension 52 is then longitudinally disposed within stainless steel coil 46 to a second bonding location 54 where stainless steel wire 46 and threadlike portion 52 are soldered to a soft platinum coil 56. Platinum coil 56 is not prebiased, nor does it contain any internal reinforcement, but is a free and open coil similar in that respect to stainless steel coil 36 of the embodiment of FIG. 2.

('962 Patent, Col. 10:54-67.)

The description of coil 28 as "extremely soft" is accompanied by a description of the composition material, diameter, shape, and length of coil 28:

The distal end of stainless steel coil 26 is soldered to the distal end of threadlike portion 18 of wire 10 and to the proximal end of a platinum secondary coil 28 at second bonding location 22. Secondary coil 28 itself forms a spiral or helix typically between 2 to 10 mm. in diameter. The helical envelope formed by secondary coil 28 may be cylindrical or conical. Like wire 10 and stainless steel coil 26, secondary coil 28 is between approximately 0.010 and 0.020 inch (0.254-0.508 mm) in diameter. The diameter of the wire itself forming stainless steel coil 26 and coil 28 is approximately between 0.001-0.005 inch.

('962 Patent, Col. 7:41-51.)

Similarly, the written description of coil 56, described as "soft" is accompanied with a description of some of its parameters:
Platinum coil 56 is not prebiased, nor does it contain any internal reinforcement, but is a free and open coil similar in that respect to stainless steel coil 36 of the embodiment of FIG. 2.

However, platinum coil 56 is particularly distinguished by its length of approximately 1 to 50 cm. and by its flexibility. The platinum or platinum alloy used is particularly pliable and the diameter of the wire used to form platinum coil 56 is approximately 0.001-0.005 inch in diameter. The distal end of platinum coil 56 is provided with a smooth and rounded platinum tip 58 similar in that respect to tips 30 and 40 of FIGS. 1 and 2, respectively.

('962 Patent, Col. 8:64-9:8.)

Absent any extrinsic evidence to the contrary, the Court concludes that these descriptions would provide a person of ordinary skill in the art with an understanding of what kinds of features were meant by the inventors as making a coil "soft" or "extremely soft."

Notwithstanding the disclosure of features of a preferred embodiment which is called "extremely soft," the stated parameters of the embodiment should not be adopted into a construction of the phrase as a limitation on Claim 1. Ordinarily, if a claim element is stated in general words, even if the written description of a preferred embodiment contains parameters such as a range of values which would add a measure of specificity, unless that embodiment is the only embodiment of the claim, the Court should not read the numerical range into the claim. See Modine Manufacturing Co., 75 F.3d at 1551.

The Court construes "detachable coil is extremely soft" to mean: 21

The material composition, dimension and other configuration of the coil make it exceedingly deformable to the interior shape of the cavity with substantially no influence from any inherent shape.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

21 The fact that the Court finds the phrase sufficiently specific for definition is not intended by the Court as a final ruling that the phrase meets the definiteness requirement.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

GO BACK

1533

4. Extruded

The final claim term in dispute is "extruded." According to AVI, extruded means foam created by using the well-known extruder apparatus that uses a screw-device to continuously force pressurized polymer gel through a die into a lower pressure area. Dow's definition, by contrast, is that of forcing a polymer gel through a die under a compressive force.

Essentially, the point of disagreement between the parties is whether extruded should be limit to any one type of process or to the use of any specific apparatus. As to this construction issue, I side with Dow. The language in the specifications of the perforation patents does not limit the term extruded to a specific type of process and apparatus. See Du Pont, 849 F.2d at 1433; American Standard Inc., 722 F. Supp. at 93; Hoganos 9 F.3d at 950. Rather, the specifications state, in pertinent part:

Providing the plastic foam comprises blending of various components, including a resinous melt of a foamable polymer and a blowing agent, under pressure to form a foamable plastic gel and extruding the foamable gel through a conventional die (not shown) to a region of lower pressure to form the foam. The blending of various components of the foamable gel may be accomplished according to known techniques in the art. Suitably a mixer, extruder, or other suitable blending device (not shown) may be emphasized to obtain homogeneous gel. The molten foamable gel is then be [sic] passed through conventional dies to form the foam.

'016 patent, col. 4, lines 16-27 and '058 patent, col. 4, lines 33-44 (emphasis added). Furthermore, no limitation on the term
is provided anywhere in the patents or the prosecution histories. Although the example in the '016 patent utilizes an extruder apparatus that appears to be of a conventional screw-type, it is improper to read this extraneous limitation in the specification into the claims. See, e.g., Du Pont, 849 F.2d at 1432; Intervet, 887 F.2d at 1056.

Accordingly, I find that extruded means forcing a polymer gel through a die under a compressive force.

1534

2. What is the Proper Construction of the Terms "barrel" and "die" in the '092 and '948 Patents?

Claim 1 of the '092 patent and claim 1 of the '948 patent contain the terms "extruder barrel" and "die." KXI and Culligan dispute where the "extruder barrel" ends and the "die" begins. KXI contends in both patents the "extruder barrel" and "die" are co-joined tubes, the "extruder barrel" the part that houses the extrusion screw, and the "die" the part that does not house the extrusion screw. Essentially, KXI's position is that the die begins where the helical flights of the extrusion screw end. Culligan contends in both patents the "die" is a distinct structure from the "barrel." Culligan contends the "die" is the structure that imparts shape and form to the feed mixture, and the "barrel" is the structure that houses the feed screw.

In support of its construction, KXI cites column 3, lines 2-5, 19-20, and 35-42 of the '092 patent, and column 3, lines 8-11, 25-26, and 41-48 of the '948 patent. Here, the specifications state:

The feed bin 10 feeds into an extruder barrel 12 which contains a feed screw 14. The feed screw 14 comprises a solid core 16 surrounded by conventional helical flights 18 . . . . The output end of the extruder barrel 12 feeds the input end of a die assembly 24 . . . .

KXI argues this passage defines the term "extruder barrel" as the structure containing the feed screw.

In support of its construction, KXI cites a 1996 letter written by Joseph Jochman, Esq. to Plymouth. Jochman was Plymouth's outside patent counsel at the time. The letter concerned changes Plymouth contemplated making to its carbon block extruder. Plymouth had contemplated removing flights from the extrusion screw. Jochman stated "the removal of a few downstream flights from the extruder screw would result in a de facto extension in the upstream direction of the die cavity. In other words, the flightless part of the extruder barrel in effect becomes part of the die." KXI argues the Jochman letter is extrinsic evidence, and should be considered to show that Culligan, through its patent counsel, agrees with KXI's interpretation of the terms "extruder barrel" and "die."

In support of its construction, Culligan cites figures 1 and 3 accompanying the '948 and '092 patents, reproduced supra. These figures depict the extruder, including the extruder barrel, referred to as "12," and the die, referred to as "26." Culligan argues that the figures depict the extruder barrel (12), and the die (26), as two separate tubular structures. Culligan argues the separate structures are distinguished by the beginning and end of their respective tubes, and not by the ends of the extrusion screw's flights. Culligan argues the position of the "input end of the die" as depicted in the figures accompanying the '948 and '092 patents is downstream from the expansion flange (56) and well downstream from the points where the flights on the feed screw terminate in the barrel (12).

Culligan argues KXI's definitions of the terms "extruder barrel" and "die" are inconsistent with the '948 and '092 patents' specifications. According to Culligan, the patents describe the extruder barrel and die as two structures, and do not define either one by the extrusion screw. Culligan cites the '092 patent at column 3, line 2-5 and the '948 patent at column 3, lines 8-11, which state that the extruder barrel "contains a feed screw 14" and that the feed screw "comprises a solid core (16) surrounded by conventional helical flights 18." Culligan cites the '092 patent's specification at column 3, lines 25-26 and the '948 patent's specification at column 3, lines 31-32, which state that "the input end of the die 26 is provided with heating elements 28[.]"

Culligan argues that KXI's interpretation of the meaning of the terms "extruder barrel" and "die" is not supported by the prosecution history. During the prosecution of the '948 patent, the application was rejected over the prior art Zavasnik extruder, which does not contain a feed screw. Culligan points out that both the patentee and the examiner described the Zavasnik extruder as having an "extruder barrel (11)" and an "extruder die (26)." Culligan argues this description "directly
undercuts plaintiffs' current logic, which would define the entire Zavasnik extruder as a 'die' because no portion of the extruder tubes contains a screw."

KXI responded that Culligan's argument is based on a mistake. The Zavasnik patent includes figures that depict the invention, reproduced supra. The different parts of the invention are numbered in the figures. According to KXI, during prosecution of the '948 patent, the examiner called the structure denoted as "11" the "barrel," and the patentee called it the "die." KXI argued that throughout the prosecution, the patentee's position was that "11" represented the "die." According to KXI, however, the patentee accidentally adopted the examiner's terminology and called "11" the "barrel" "once, maybe twice" during the prosecution.

Culligan argues that KXI defines the terms at issue contrary to the common meaning of "die." As support for its position, Culligan cites the McGraw Hill Dictionary of Scientific and Technical terms which defines "die" as "[a] tool or mold used to impart shapes to, or to form impressions on, materials such as metals and ceramics." McGraw-Hill Dictionary of Scientific and Technical Terms (4th ed. 1989).

The court finds there is no reason to define the term "extruder barrel" by where the extruder screw ends. The court gives the ordinary meaning to the terms. Accordingly, the court will construe "extruder barrel" and "die" as separate structures, the "extruder barrel" being the structure that houses the feed screw, and the "die" being the structure that imparts shape and form to the extrudate.

I. Construction of "Extrusion"

Neither party asserts that the patents express an intent to impart a novel meaning to the term "extrusion" or that the term lacks clarity. Instead, each contends that the language of the claims and other intrinsic evidence support its construction. Velcro interprets "extrusion" to mean simply "material exiting extruding equipment," while Paiho interprets it as "a form produced by an extruding process that holds a shape defined by the extruding die after exiting the extruding die."

To support its reading, Paiho points out that claims 7 and 22 of the '028 patent refer to the extrusion as "strip-like," while claim 7 also describes it as the product of "forming." Paiho further notes that both of these claims, as well as claim 1 of the '243 patent, use "extrusion" as the object of "directing" between the rollers or "between said forming roller and said pressure means," in the case of claim 22. Velcro, on the other hand, emphasizes that the claims uniformly refer to the extrusion as being "of molten plastic material" that "fills [the] hook-forming cavities" after its direction through the rollers or between the forming roller and the pressure means.

The court agrees with Velcro that "Paiho fails to explain how material that is 'molten' could 'hold a shape' for some unidentified period after exiting extruding equipment." Velcro Repl. at 3-4. Moreover, "a form . . . that holds a shape defined by the extruding die" could not "fill" the cavities on the forming roller as the claims describe. Yet an extrusion could be "strip-like," the product of "forming," and the object of "directing" without having to maintain a shape imparted by the die. The adjective "strip-like" conveys a suggestion of configuration, rather than a defined shape; "forming" can denote mere creation, rather than casting in a defined shape; and an object need not have a defined shape to undergo "directing." The language of the claims therefore does not bear Paiho's narrow construction of "extrusion." To imbue the term "extrusion" with "the full breadth of [its] ordinary and customary meaning[]," NTP, 392 F.3d at 1345, the court must construe it as Velcro suggests, i.e., simply "material exiting extruding equipment." 3

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

3 Indeed, the court notes that this construction hardly differs from the one that Paiho specifically asserts is supported by the plain language of the claims: "a form produced by an extruder that can be directed between a forming roller and a pressure roller." Paiho Cl. Constr. Br. at 9, 13. Again, Paiho does not explain why an extrusion needs to hold its shape in order to be directed.

- 1963 -
Having thus concluded that the definition of "extrusion" is clear from the language of the claims, the court peruses the remaining intrinsic evidence for the sole purpose of "determining if a deviation from the clear language of the claims is specified." 4 Interactive Gift, 256 F.3d at 1331. Paiho argues that the specification makes clear that the extrusion must hold its shape after passing through the die by indicating the preferred thickness and width of the extrusion. '028 patent, col. 9, lines 7-10. Paiho also characterizes the drawings in the patent as rendering the extrusion "as a form that is holding a shape defined by [the] extruder head . . . ." Paiho Cl. Constr. Br. at 10, 13. According to Paiho, this "disclosure teaches that the extrusion has an ascertainable shape and size." Id.

--- Footnotes ---
4 The court also cannot use the dictionaries and technical treatises offered by Paiho to contradict the clear meaning of "extrusion" mandated by the claims. E.g., Vitronics, 90 F.3d at 1584 n.6. Because those sources provide definitions of the term that vary with each other and with Paiho's proposed interpretation, compare Paiho Cl. Constr. Br. at 8-9 with Velcro Reply at 2-3, the court does not consider the dictionaries and treatises instructive on the construction of "extrusion."

--- End Footnotes ---

Specifying the dimensions of the extrusion, however, does not mean that it has a defined shape, for the same reason that describing it as "strip-like" throughout the claims does not require that interpretation. Furthermore, like the claims themselves, the specification repeatedly alludes to the extrusion as molten or as filling the cavities in the roller. See, e.g., '028 patent, col. 2, lines 60-61; col. 3, lines 21-24, 31-33, 42-48, 61-64; col. 5, lines 26-29; cols. 7, lines 60-68. The drawings also refer to "an enlarged 'bank' . . . formed just upstream of the interface" of the rollers (and downstream of the extruder head), the creation of which "assures the presence of an adequate supply of molten plastic material for complete filling of the hook-forming cavities." Id. col. 8, lines 9-17. Taken in their entirety, then, the written description and drawings are consistent with the language of the claims. See Innova/Pure Water, 381 F.3d at 1120-1122.

In any event, as Velcro points out, the specification attributes dimensions to the extrusion only in describing the "preferable" way of using polypropylene plastic material to run the process, id., col. 9, lines 7-10, and notes that nylon can also be used. Id. col. 8, lines 57-65. A preferred embodiment of the invention noted in the written description does not serve to restrict the meaning of a term in the claim. 5 See, e.g., Arlington Indus. v. Bridgeport Fittings, Inc., 345 F.3d 1318, 1327 (Fed. Cir. 2003); Altiris, Inc. v. Symantec Corp., 318 F.3d 1363, 1370 (Fed. Cir. 2003). Accordingly, even if the specification supported Paiho's reading of "extrusion" by giving its dimensions, it is clear that those dimensions describe only the preferred embodiment of the process and therefore do not limit the scope of "extrusion" as used in the claims. See SuperGuide Corp. v. DirecTV Enters., 358 F.3d 870, 875 (Fed. Cir. 2004) ("The written description … is not a substitute for, nor can it be used to rewrite, the chosen claim language.")

--- Footnotes ---
5 "Similarly, the mere fact that the patent drawings depict a particular embodiment of the patent does not operate to limit the claims to that specific configuration." Anchor Wall, 340 F.3d at 1306-1307.

--- End Footnotes ---

Finally, Paiho argues that the prosecution history of the '028 patent supports its construction, noting that it contains "no indication . . . that the term 'extrusion' does not mean a form produced by an extrusion process that holds a shape defined by the extrusion die after exiting the extrusion die." Paiho Cl. Constr. Br. at 10. Because the claims themselves do not bear that interpretation, however, the fact that the prosecution history does not contradict it is irrelevant. See, e.g., Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1342-43 (Fed. Cir. 2001) (describing consultation of prosecution history as "confirmatory measure" undertaken "to confirm that the patentee's use of the disputed terms is consistent with the meaning given to it [sic]

by the court").

Paiho also suggests that an amendment to Fischer's application to the '028 patent "acknowledged the difference between" the "extrusion" described in the claims and "the direct injection of a plastic melt directly onto a molding drum." Paiho Cl. Constr. Br. at 11, 13-14. In the amendment, Fischer referenced an existing patent cited by the examiner and granted to one
Rochlis, explaining that it called for "moldable material" to be applied directly to the "molding drum" through a nozzle and then "forced into the cavities by way of [a] belt and roller arrangement." Amendment rec'd Feb. 22, 1988, at 16-17. Fischer offered this explanation in response to the examiner's concern that the Rochlis patent and another existing invention could be combined to render Fischer's claims obvious. Id. at 16.

In Nystrom v. Trex Co., 374 F.3d 1105 (Fed. Cir. 2004), the Federal Circuit rejected an argument nearly identical to Paiho's. The patentee had submitted an amendment in response to the examiner's contention, like that of the examiner of the '028 patent, that a combination of existing inventions would make the patentee's claims obvious. Id. at 1113. Based on the patentee's statement in the amendment that one of the existing patents was "clearly not concerned with materials made from wood," the defendant argued that the term "board" in the patent-in-suit should be construed to exclude "boards that were not made from wood cut from a log." Id. The Federal Circuit disagreed, reading the statement "not as a disavowal or disclaimer that [the patentee's] claimed invention is limited to wood decking boards, but as an argument against the examiner's obviousness rejection." Id. The court therefore held the statement "insufficient to restrict the scope of [the] claims." Id.

Like the Federal Circuit in Nystrom, this court declines to read Fischer's response to the examiner's concerns over obviousness to limit the scope of the term "extrusion" in the way Paiho suggests. The court concludes that neither the specification nor the prosecution history warrants a departure from the ordinary meaning of "extrusion" as used in the claims. Indeed, the meaning of term is clear from the language of the claims themselves. Accordingly,

the court construes "extrusion" to mean "material exiting extruding equipment," rather than "a form produced by an extruding process that holds a shape defined by the extruding die after exiting the extruding die."

Footnotes

6 The court therefore does not consider the extrinsic evidence submitted through the conflicting affidavits of the parties' expert witnesses. CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1368 (Fed. Cir. 2002).
This court reviews the district court's claim interpretation without deference. See Cybor Corp. v. FAS Techs., Inc., 138 F.3d 1448, 1454-56, 46 U.S.P.Q.2D (BNA) 1169, 1172-75 (Fed. Cir. 1998) (en banc); Markman, 52 F.3d at 979-81. This court has delineated several rules for claim drafters to invoke the strictures of 35 U.S.C. § 112, P 6. Specifically, if the word "means" appears in a claim element in combination with a function, it is presumed to be a means-plus-function element to which § 112, P 6 applies. See Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1427, 44 U.S.P.Q.2D (BNA) 1103, 1109 (Fed. Cir. 1997); Greenberg v. Ethicon Endo-Surgery, Inc., 91 F.3d at 1580, 1583, 39 U.S.P.Q.2D (BNA) 1783, 1785 (Fed. Cir. 1996). Nevertheless, according to its express terms, § 112, P 6 governs only claim elements that do not recite sufficient structural limitations. See 35 U.S.C. § 112, P 6. Therefore, the presumption that § 112, P 6 applies is overcome if the claim itself recites sufficient structure or material for performing the claimed function. See Sage, 126 F.3d at 1427-28 ("Where a claim recites a function, but then goes on to elaborate sufficient structure, material, or acts within the claim itself to perform entirely the recited function, the claim is not in means-plus-function format."); York Prods., Inc. v. Central Tractor Farm & Family Ctr., 99 F.3d 1568, 1574, 40 U.S.P.Q.2D (BNA) 1619, 1623 (Fed. Cir. 1996); Cole v. Kimberly-Clark Corp., 102 F.3d 524, 531, 41 U.S.P.Q.2D (BNA) 1001, 1006 (Fed. Cir. 1996).

Although use of the phrase "means for" (or "step for") is not the only way to invoke § 112, P 6, that terminology typically invokes § 112, P 6 while other formulations generally do not. See Greenberg, 91 F.3d at 1583-84. Therefore, when an element of a claim does not use the term "means," treatment as a means-plus-function claim element is generally not appropriate. See Mas-Hamilton Group v. LaGard, Inc., 156 F.3d 1206, 1213-15, 48 U.S.P.Q.2D (BNA) 1010, 1016-18 (Fed. Cir. 1998). However, when it is apparent that the element invokes purely functional terms, without the additional recital of specific structure or material for performing that function, the claim element may be a means-plus-function element despite the lack of express means-plus-function language. See, e.g., Cole, 102 F.3d at 531 ("Merely because an element does not include the word 'means' does not automatically prevent that element from being construed as a means-plus-function element."); Mas-Hamilton, 156 F.3d at 1213-15 (interpreting "lever moving element" and "movable link member" under § 112, P 6).

Under this established analytical framework, the "eyeglass hanger member" elements in the claims of both the '345 and the '726 patents do not invoke § 112, P 6. In the first place, these elements are not in traditional means-plus-function format. The word "means" does not appear within these elements. Moreover, although these claim elements include a function, namely, "mounting a pair of eyeglasses," the claims themselves contain sufficient structural limitations for performing those functions. As noted above, claim 1 of the '345 patent describes the eyeglass hanger member as "made from flat sheet material" with an "opening means formed . . . below [its] upper edge." This structure removes this claim from the purview of § 112, P 6. Similarly, according to claim 1 of the '726 patent, the eyeglass hanger member has "an attaching portion attachable to a portion of said frame of said pair of eyeglasses to enable the temples of the frame [to be opened and closed]." This structure also precludes treatment as a means-plus-function claim element. The district court therefore improperly restricted the "eyeglass hanger member" in these claims to the structural embodiments in the specification and their equivalents.

2. Eyelet strip

Claim 1 recites a "first flap carrying a first eyelet strip having a set of lace eyelets, and second flap carrying a second eyelet strip having a set of lace eyelets." (Emphasis added). Similarly, claim 10 recites "an eyelet carrier strip." (The parties do not contend that there is any difference between the terms "eyelet strip" and "eyelet carrier strip.") Plaintiff contends that an "eyelet strip" means "a strip that is part of the removable flap, which has or contains one or more eyelets." Defendant argues that an "eyelet strip" is "a part of each flap that is comparatively long and has multiple eyelets." To the extent that the parties' definitions refer to the number of eyelets on the eyelet strips, their dispute is derivative of their arguments regarding construction of the word "set" and need not be revisited. However, defendant maintains that in accordance with the ordinary meaning of the word "strip," the court should define an eyelet strip as being a "comparatively long" part of the removable flaps. As noted above, claim construction analysis begins "with the ordinary meaning of the disputed claim term." It "is well settled that dictionary definitions provide evidence of a claim term's ordinary meaning." Inverness Medical Switzerland v. Warner Lambert Co., 309 F.3d 1373, 1378 (Fed. Cir. 2002); see also Vanguard Products Corp. v. Parker Hannifin Corp., 234
F.3d 1370, 1372 (Fed. Cir. 2000) ("A dictionary is not prohibited extrinsic evidence, and is an available resource of claim construction."). Because the parties do not suggest that the term "strip" has any specialized or technical meaning for practitioners of the relevant art, "standard dictionaries of the English language are the proper source of [the] ordinary meaning of the phrase." Id.

A "strip" is "a long, narrow piece of cloth, paper, plastic or some other material: a strip of linen." The New Oxford American Dictionary at 1687; see also The American Heritage Dictionary of the English Language at 1716 ("strip" defined as "a long narrow piece, usually of uniform width: a strip of paper, strips of beef"). This definition is consistent with the drawings in the patent specification, which show a comparatively long, narrow strip "corresponding in length from top to bottom" with the main body of the brace. See '002 Pat. figs. 1, 3, 6 and 7; col. 3, lines 43-45. Plaintiff suggests no reason why the term "strip" should not be defined in a manner consistent with its ordinary meaning. Accordingly, I conclude that the term "eyelet strip" means a part of each flap that is comparatively long and narrow and has two or more eyelets.

---

4. "Facial Features"

Hoodlums defines "facial features" as "[p]ertaining to the face, including but not limited to the forehead, nose, mouth and cheekbones, etc. as shown in Figures 5 through 9 of the '972 patent." (Doc. 37, Ex. B at 4.) Redtail defines "facial features" as "[p]rominent and distinctive characteristics of the face." (Id.)

As noted above, the court defined "skull facial features" as "pertaining to the bones of the face, including, but not limited to, a mouth feature and a nose feature, as shown in Figures 5 through 9 of the '972 patent." When construing terms in a claim, there is a "presumption that the same terms appearing in different portions of the claims should be given the same meaning" unless the specification and prosecution history clearly indicate otherwise. Fin Control Sys. Pty, Ltd. v. OAM, Inc., 265 F.3d 1311, 1318 (Fed. Cir. 2001). In this case, the specification and the prosecution history do not provide a different meaning to the term "facial features."

Between "skull facial features" and "facial features," the latter lacks only the "skull" modifier. This context can be highly instructive; a term's usage in one claim often illuminates that same term's meaning in another claim. See Phillips, 415 F.3d at 1314 (explaining that the term "steel baffles" strongly implied that the term "baffles" did not inherently mean objects made of steel). Removing the "skull" modifier removes the "bones of the face" phrase from the definition.

Mindful that identical terms should be given the same meaning even in different claims, the court defines "facial features" as "pertaining to the face, including, but not limited to, a mouth feature and a nose feature, as shown in Figures 5 through 9 of the '972 patent."

---

II

In the proceedings below, a primary dispute between the parties was the proper construction of "facilitate positioning" in claim 1. OPW argued that the term means to "assist in positioning and support," JA at 96, whereas Franklin argued that it "means only that the opening be large enough to 'allow' a spill collector to be positioned in the hole," JA at 20. The district court, after noting that "the ordinary meaning of the word 'facilitate' is to make easier or to assist," began its analysis by looking to the language of the claim itself for guidance. Franklin Elec. Co., Inc. v. Dover Corp., No. 05-598, slip op. at 17, 2006 U.S. Dist. LEXIS 27247 (W.D. Wisc. May 4, 2006)("SJ Decision"). In so doing, the court observed that the upward and downward extensions must mate to form "at least one access hole being of proper size, shape and orientation to facilitate positioning of a spill collector therein." Id., slip op. at 17-18, 2006 U.S. Dist. LEXIS 27247; see also '257 patent col.6 ll.9-14, col.6 ll.22-30. Based on that observation, the court inferred an "intent by the inventor that the internal surface of the downward extension assist in positioning the spill collector," SJ Decision, slip op. at 17, 2006 U.S. Dist. LEXIS 27247, and that "the opening formed by the mated extensions play a role in positioning the spill collector," id., slip op. at 18,
The district court sought additional guidance by looking to the figures and the specification. Most persuasive to the court was "the only depicted embodiment," Figure 7 (reproduced above), "which . . . illustrates that the spill collector is inserted into the space formed by the mated extensions where it contacts and is held in position by both the upward and downward extensions." Id. The court found this to be consistent with both "the claim requirement that both extensions facilitate positioning," as well as "[t]he related specification language . . . specifying an o-ring to form a seal where the spill collector contacts the downward extension." Id.; see also '257 patent col.4 ll.61-68, col.5 ll.15-19. The court also looked to the inventor's use of "similar language to mean the same thing in a different context . . . in describing the relationship between the sump and the sump shield which rests on it: 'Such positioning allows frame 18 to overlap extension 17 of containment sump 11 and facilitates proper positioning of sump shield 16 to effectively eliminate water intrusion into containment sump 11.'" SJ Decision, slip op. at 18-19,2006 U.S. Dist. LEXIS 27247 (emphasis added by district court). This further confirmed the court's construction because, "[a]s illustrated by figure 7 to which the language refers, 'positioning' is 'facilitated' by physical contact between the frame, sump and shield in identical manner to the way positioning is facilitated by physical contact between the upward extension, downward extension and spill collector." SJ Decision, slip op. at 19, 2006 U.S. Dist. LEXIS 27247.

As a final step in its claim construction analysis, the district court reviewed the prosecution history. Here, too, the court found confirmation of its construction in the inventor's comments accompanying his amendment to overcome the examiner's obviousness rejection. The court reasoned that "[t]he argument in support of allowance that the containment assembly 'acts as a housing for containing and supporting a spill collector' which would eliminate the prior art need that the collector 'be concreted into the ground' leaves no doubt that the ['facilitate positioning'] limitation was intended to require physical communication between the spill collector and the extensions and that contact between the extensions and the spill collector was a basis on which the device was distinguished from the prior art in order to obtain allowance from the examiner." Id. (quoting JA at 369). Thus, the district court rejected Franklin's proposed construction in favor of the construction proposed by OPW.

The court then proceeded to explain that, based upon its construction of "facilitate positioning," summary judgment of noninfringement was appropriate:

"There is no question that the claim element requiring the upward and downward extensions to "facilitate positioning" of the spill collector is absent from the accused product. The optional water shroud boot of defendant's containment system is the structure analogous to the mated upward and downward extensions of claim 1. [n.2: the Court makes no finding concerning whether the water shroud boot embodies these additional elements.] However, the water shroud boot plays absolutely no role in positioning the spill collector. The water shroud boot is optional and need not be present on the device. When it is included in defendant's containment system it is added only after the spill collector has been fully positioned and installed. It is soft and pliable and does not come into contact with the spill collector. There is no reasonable sense in which the water shroud boot could be said to assist in the positioning of a spill collector. Its presence or absence is irrelevant to the positioning of a spill collector. Because defendant's device lacks this element of the only independent claim of the '257 patent its accused containment system does not infringe and it is entitled to summary judgment.

SJ Decision, slip op. at 20-21, 2006 U.S. Dist. LEXIS 27247 (footnote in original). Accordingly, OPW's motion for summary judgment was granted, and final judgment was entered against Franklin. Franklin subsequently appealed to this court. We have jurisdiction pursuant to 28 U.S.C. § 1295(a)(1).

III

"We review the district court's claim construction and the grant of summary judgment based thereon without deference." Novartis Pharm. Corp. v. Eon Labs Mfg., 363 F.3d 1306, 1308 (Fed. Cir. 2004). "Summary judgment is appropriate if there is no genuine issue as to any material fact and the moving party is entitled to a judgment as a matter of law." Honeywell Int'l, Inc. v. ITT Indus., 452 F.3d 1312, 1317 (Fed. Cir. 2006) (citing Fed. R. Civ. P. 56(c)). "The evidence of the non-movant is to be believed, and all justifiable inferences are to be drawn in his favor." Honeywell, 452 F.3d at 1317 (quoting Anderson v. Liberty Lobby, Inc., 477 U.S. 242, 255, 106 S. Ct. 2505, 91 L. Ed. 2d 202 (1986)).

IV
We read the district court's claim construction of "facilitate positioning" to impose two requirements: (1) both extensions must physically contact the spill collector, and (2) the upward and downward extensions must assist in the act of positioning the spill collector. As to the first requirement, OPW conceded at oral argument, and we agree, that nothing in the language of claim 1 requires physical contact between the extensions and the spill collector. See Digital audio recording: Oral Argument in Case No. 2006-1442, at 16:30 (Feb. 8, 2007) ("Oral Argument"). Likewise, we find no such requirement in the specification. To be sure, some uses of the word "facilitate" in the specification lend arguable support to OPW's position. In the two uses identified by the district court, the phrase "facilitate[s] proper positioning" arises in the context of creating a tight seal between certain parts of the assembly. '257 patent col.4 ll.24-26, col.5 ll.30-34. And, as the district court also pointed out, the specification twice discusses the formation of a seal via contact between the downward extension and the spill collector. Id. col.4 ll.65-68, col.5 ll.15-19. It is therefore clear from these examples that the "facilitate positioning" language of claim 1 does not preclude physical contact between the extensions and the spill collector.

It does not necessarily follow, however, that the term "facilitate positioning" requires physical contact. In fact, the specification uses the term "facilitate" in several ways to describe interactions in which physical contact is unnecessary. For example, the specification provides that the "[s]ump cover 13 may include one or more lids 14 and 15 to facilitate entry into containment sump 11." '257 patent col.2 ll.64-66 (emphasis added). In no sense does entry into the containment sump through an uncovered hole in the sump cover require physical contact with the lid; once the lid is open, entry is continuously facilitated with no contact whatsoever. Similarly, the specification explains in another section that "one or more upward extensions 19 and/or 21 may be provided to facilitate access for filling and/or evacuation of pipes or instrumentation." Id. col.3 ll.21-24 (emphasis added). Again, the hole defined by the upward extensions continuously facilitates access without any contact. In yet another example from the specification, it is stated that:

Hole 25 is provided in sump cover 13 to facilitate insertion of threaded section 28 of bolt 90 there through. Hole 25 may include a counter sink 41 to facilitate use of a bolt 90 with a countersink-type head 42, as shown in FIG.5, or may include a counter sink 48 as shown in FIG. 6 to facilitate use of a bolt 90 having a hex head 29 as shown.

'257 patent col.4 ll.4-10 (emphasis added). As before, neither holes nor counter sinks require physical contact in order to "facilitate" their associated tasks. In the case of a tapered counter sink-type head, while physical contact between the head and the contours of the counter sink is likely preferred, that possibility does not mean physical contact is an absolute necessity for the counter sink to "facilitate use" of such a bolt. Indeed, in the case of a hex-headed bolt, physical contact between the head and the contours of the counter sink is likely undesirable if there is a need to accommodate a wrench around the head.

Perhaps the most notable aspect of the specification is that although it contemplates contact between the downward extension and the spill collector, there is no mention of contact between the upward extension and the spill collector. Admittedly, figure 7 appears to depict contact between the right side of the spill collector and the upward extension. Yet, a close examination of figure 7 also reveals that any such contact might be incidental because, on the opposite side of the spill collector, there is a small but distinctive space between the upward extension and the spill collector. The only arguable contact in that portion of the figure is provided by an ambiguous line extending from the top of the upward extension to the side of the spill collector. That line might have been intended to indicate a connection, it might have been accidental, or it might have been intended to indicate something else altogether.

We need not resolve the ambiguity here because patent figures are generally not intended to convey such detail. Cf. Hockerson-Halberstadt, Inc. v. Avia Group Int'l, 222 F.3d 951, 956 (Fed. Cir. 2000) ("Under our precedent . . . it is well established that patent drawings do not define the precise proportions of the elements and may not be relied on to show particular sizes if the specification is completely silent on the issue."). Moreover, even if figure 7 unambiguously depicted contact between the upward extension and the left side of the spill collector, as it seems to depict between the upward extension and the right side of the spill collector, we would not necessarily conclude that such contact is a required
limitation of the claims because figure 7 is merely a preferred embodiment of the invention. '257 patent col.5 ll.42-48. See Burke, Inc. v. Bruno Indep. Living Aids, Inc., 183 F.3d 1334, 1341 (Fed. Cir. 1999) ("[A]n attribute of the preferred embodiment cannot be read into the claim as a limitation."). Put simply, any contact inferable from figure 7 is not relevant to our claim construction analysis. Accordingly, we find nothing in the specification indicating that the term "facilitate positioning" requires physical contact.

At oral argument, counsel for OPW stated that the inventor's remarks during prosecution in response to the examiner's obviousness rejection provide the best support for his client's position. Oral Argument, at 18:05. In particular, counsel concentrated heavily on the following passage:

[W]hen the pipe connecting the spill collector and the gas tank fails, the sump cover containment assembly of the present invention prevents intrusion into the surrounding soil. Thus, the invention of amended claim 1 is capable of much more than is the prior art of record. It acts as a housing for containing and supporting a spill collector, as well as acting as a secondary containment system which facilitates access for maintaining a spill collector utilized therewith. Thus, the spill collector no longer needs to be concreted into the ground as was previously required.

JA at 369 (emphasis added). According to counsel, because the amendment related to the interplay between the extensions and the spill collector, the word "It" must refer to the upward and downward extensions. And since "It" serves "as a housing for containing and supporting a spill collector," OPW argues that the inventor explicitly disclaimed any apparatus in which the upward and downward extensions (i.e., "It") do not provide such housing and support.

We find this argument unpersuasive. The word "It" plainly refers to "the invention of amended claim 1," see JA at 369 (emphasis added), and therefore encompasses the entire claimed assembly; "It" does not refer to the upward and downward extensions alone. At most, the inventor disclaimed any apparatus in which the spill collector is not supported by something within the assembly. However, there is no requirement that the support be provided by physical contact with both the upward and downward extensions. The mere fact that the preferred embodiment depicted in figure 7 shows physical contact between the spill collector and the downward extension does not mean that such contact is a claim limitation, see Burke, 183 F.3d at 1341, and it certainly does not mean that contact between the spill collector and the upward extension is a claim limitation.

Counsel for OPW also contended that we should infer physical contact from the inventor's statement that "the sump cover containment assembly of the present invention prevents intrusion into the surrounding soil" "when the pipe connecting the spill collector and the gas tank fails." JA at 369. Although we do not fully understand the argument, counsel seemed to be saying that there must be physical contact in order to prevent the spill collector from becoming displaced in the event that the pipe below breaks. If that is in fact the argument that was being made, then it amounts to nothing more than a restatement of the argument rejected above that only physical contact with both extensions can be the source of support for the spill collector. Just as it might be the case that the upward extension could add nesting support for a tapered spill collector, it might also be the case that a sufficiently tight o-ring seal between the spill collector and the downward extension could render such additional nesting support unnecessary. Therefore, we reject the physical contact limitation imported into the claim by the district court.

As to the second requirement of the district court's construction-that the upward and downward extensions must assist in the act of positioning the spill collector-we note that claim 1 is an apparatus claim, and as such, it contains no "positioning" step with which the extensions might assist. Consequently, it does not matter when a space is created to house the spill collector; a structure can still infringe claim 1 if the space only exists after the full device is constructed. Howmedica Osteonics Corp. v. Tranquil Prospects, Ltd., 401 F.3d 1367, 1375 (Fed. Cir. 2005). While it may be true that an apparatus claim could recite a limitation merely capable of assisting with an anticipated assembly process, we discern no indication from the portions of the intrinsic record before us that the inventor intended to provide the extensions as a means of overcoming some difficulty in the prior art with the act of positioning the spill collector. Rather, the comments submitted in response to the examiner's rejection reveal that the inventor was principally concerned with providing a secondary housing for the spill collector separate from the containment sump itself. See JA at 369 ("Thus, the invention of amended claim 1 is capable of much more than is the prior art of record. It acts as a housing for containing and supporting a spill collector, as well as acting as a secondary containment system which facilitates access for maintaining a spill collector utilized therewith."). Therefore, we hold that the extensions need not assist with, or even be capable of assisting with, the act of positioning the spill collector.

Instead, we agree with Franklin that the upward and downward extensions need only "allow" the spill collector to be
positioned in the hole.

OPW argues that even if we hold--as we do--that Franklin's proposed construction of "facilitate positioning" is correct, summary judgment of noninfringement is still appropriate because the water shroud boot of the accused device, which is only optionally installed after the proper placement of the spill collector, "plays no role whatsoever in positioning" the spill collector. Appellee's Br. at 36. For the sake of clarity, we repeat our holding announced above that the extensions need not assist with, or even be capable of assisting with, the act of positioning the spill collector. A necessary corollary to this holding is that a proper infringement analysis requires a comparison of the limitations of the claims to the accused device, regardless of what process was used to assemble the device.

20. Facing

The Plaintiffs request construction of the term "facing" as the term is used in claim 39 of the '410 patent, 21 and in claim 1 of the RE '439 patent. They propose that "facing" be defined as "to look forward or in the direction of." (Pls.' Open. Br. 35-36.) Pergo has not responded to the definition proposed by the Plaintiffs.

--- Footnotes ---

21 The Court has not located the term "facing" in claim 39 of the '410 patent. It does appear in claim 49 of the '410 patent.

--- End Footnotes ---

Claim 1 of the 'RE '439 patent states in relevant part:

the locking device comprising a strip integrated with the second edge of each of said building panels, said strip extending throughout substantially an entire length of the second edge and being provided with a locking element projecting from the strip, such that when two adjacent building panels are joined together, the strip projects from the rear side of the second edge of the panels with its locking element received in the locking groove of an adjacent building panel, the building panels, when joined together, can occupy a relative position in said second direction where a play exists between the locking groove and a locking surface on the locking element that is facing the first and second edges and is operative in said second mechanical connection, the first and the second mechanical connections both allow mutual displacement of the building panels in a direction of the first and second edges, and the second mechanical connection enables the locking element to leave the locking groove if the respective building panel is turned about its first edge angularly away from the strip.

(RE '439 patent, 10:52-67; 11:1-7.) (Emphasis added). Facing is defined as to be turned or placed with the front toward a specified direction. Webster's II New Riverside University Dictionary 459. Since the term refers to inanimate objects, the Court has replaced "look" with "oriented." Having considered "facing" in the context of the claims, the Court defines "facing" as "oriented in the direction of."

---

F. "Facing" and "Facing One Another"

Claims 1 and 17 use the terms "facing" and "facing one another" in the following manner:

1. . . . said housing including a waveguide . . . said waveguide including a planar portion facing said leaf spring portion.

17. A coaxial jack device according to claim 16 wherein a plurality of said projections are fin-shaped, each having a planar portion facing one of said moveable portions of said switch.
'378 patent at 10:32-35, 14:16-19 (emphasis added). Claims 1 and 16 use the phrase "facing one another" in the following phrase:

an electronically grounded housing having a rear end, a front end, a top wall, a bottom wall, and two side walls defining generally planar surfaces facing one another, wherein said front and rear ends, and said top, bottom and side walls form an enclosed housing.

Id. at 13:27-31.

Switchcraft asks the Court to adopt the third definition in Webster's New Collegiate Dictionary for "facing": "to bring face-to-face." Supra at 406. Switchcraft argues that, to ensure the term is used consistently in each claim, the term "facing" must mean "face-to-face." In support of its argument, Switchcraft notes the platform waveguide illustrated in the specifications is "well below the leaf springs, such that no face of the platform sees a leaf spring, as is the case with [fin-shaped waveguides.]" Def.'s Markman Brief [Docket No. 46] at 13. Switchcraft argues it would be inconsistent to construe facing to cover such a configuration. Switchcraft also notes "the specification establishes that not all of the disclosed waveguide embodiments are "facing" a leaf spring." Id. Based on language that "each waveguide defines a generally planar surface facing at least partially toward each leaf spring member in the preferred embodiment," Switchcraft concludes its interpretation of "facing" is correct. '378 patent at 8:61-67 (emphasis added). It interprets the "facing at least partially toward" phrase to indicate that the patent modified "facing" when it did not want it to mean "face-to-face."

ADC argues "facing" is a non-technical term with a commonly understood meaning and does not require construction. However, in the event construction is necessary, ADC argues "facing" should be interpreted to mean "oriented toward." ADC notes dictionaries broadly define "facing" as "occupying a position with the face toward" and "to stand or sit with the face toward; to have a front oriented toward." The American Heritage (R) Dictionary of the English Language, 632 (4th ed. 2000); Merriam-Webster's Collegiate Dictionary, supra at 447. ADC argues Switchcraft's proposed definition of "face-to-face," fails to consider that one object may face the back or side of another. ADC argues "facing" as used in the '378 patent, encompasses a broader meaning than face-to-face, as evidenced by the phrase "facing at least partially towards."

The Court finds "facing" should be interpreted as "with the face oriented toward." This interpretation corresponds with the definitions listed in the dictionaries cited by both parties and is in keeping with the use of the term in the patent claims and specifications. In addition to the definition proposed by Switchcraft, Webster's New Collegiate Dictionary also defines "facing" as "to have the face or front turned in a specified direction." Supra at 406. Both dictionary definitions cited by ADC note it is the "face" that is oriented towards something. ADC's proposed definition, "oriented toward," does not convey this important facet of the definition.

Switchcraft's proposed definition, "face-to-face," would improperly narrow the definition of facing, which clearly permits one object to face another even if the second object is itself facing in another direction. Switchcraft's proposed interpretation would render the phrase "facing one another" redundant. Furthermore, the language of claims 1 and 17 clearly state that all waveguides include a planar portion facing either a leaf spring portion or a movable portion. The preferred embodiment shows seven waveguides (six fin-shaped waveguides and one platform waveguide), each of which is "facing at least partially toward" the leaf springs. The use of "facing" in the specification indicates that "facing" in the claims has a broader meaning than "face-to-face." Adopting Switchcraft's construction would require a finding that the platform waveguide described in the specification as "facing at least partially toward" an object is not facing the object. "A claim interpretation that excludes a preferred embodiment from the scope of the claim is 'rarely, if ever, correct.'" On-Line Techs., Inc. v. Bodenseewerk Perkin-Elmer GmbH, 386 F.3d 1133, 1138 (Fed. Cir. 2004) (quoting Globetrotter Software, Inc. v. Elan Computer Group, Inc., 362 F.3d 1367, 1381 (Fed. Cir. 2004). The construction "with the face oriented towards" best captures the meaning of facing reflected in the claims and the specification.

For the same reasons as set forth for "facing," the Court also interprets "facing one another" to mean "with the faces oriented towards one another."

1. Fasteners
Plaintiff contends that "fasteners" should be limited to threaded fasteners. Defendants argue that the term "include[s] any mechanism used for attachment" and should be defined as "a device for attaching or connecting elements."

Figure 4 of the '451 Patent shows fasteners being inserted through openings (in 34) and into holes (in 31):

To support its more limited interpretation, Plaintiff argues that the fasteners in Figure 4 appear to be threaded, and the specification mentions fasteners being inserted into threaded holes. '451 Patent col. 4, ll. 16-17.

The language of claim 1, however, is unlimited by the word "threaded." Plaintiff's argument is a transparent effort to import limitations from the specification into the claim, contrary to the rules of claim interpretation. The meaning of "fasteners" is clear from the language of the claims, as a means of attachment for two components of the device.

As used in claims 1, 6, and 10 of the '451 Patent, 

"fastener" means a device for attaching or connecting elements.

9. Fastening Part/Element

a. The Parties' Constructions

LPL asserts that based on the claim language, "fastening element" should be construed as an element that provides the capability of mounting one component to another. Defendants point to the common specification to limit their constructions of the term to specific structures, such as a hole together with the material defining the hole, pegs, screws, hooks, bolts, ribs, nails or other similar fasteners including a fastener with a compressible head. ViewSonic asserts that LPL's construction introduces redundancy into the claim and improperly converts the term into a means-plus-function.

b. The Special Master's Constructions

Initially, the Special Master agrees with the parties that "fastening element" and "fastening part" are interchangeable. For simplicity, only fastening "element" is discussed.

That the term itself connotes a function, i.e., fastening, cannot be dismissed as mere redundancy. The function of fastening is supported in the Special Master's view by the context of the claims which recite that the flat display panel is fixed to the housing via the fastening element. See claims 35, 55, and 56 of the '641 patent and claim 33 of the '718 patent. Moreover, "where a claim recites a function, but then goes on to elaborate sufficient structure, material, or acts within the claim itself to perform entirely the recited function, the claim is not in means-plus-function format." Sage Prods., Inc. v. Devon Indus., Inc., 126 F.3d 1420, 1427-28 (Fed. Cir. 1997). In this case, sufficient structure is recited in the claims. Given the stipulated construction of the term "fastening," the Special Master's construction is as follows: 20

<table>
<thead>
<tr>
<th>CLAIM TERM</th>
<th>SPECIAL MASTER CONSTRUCTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>fastening element/part</td>
<td>An element that provides the capability for attaching firmly or fixing securely so as to be supported, one component to another component</td>
</tr>
</tbody>
</table>

20 Because the terms first frame and fastening element/part have been construed, the phrase "the first frame having a fastening element/part" does not need to be defined.
10. Fastening Hole

a. The Parties' Constructions

LPL's asserted construction of a "fastening hole" is similar to its construction of "fastening element" in that it incorporates the function of fastening. Defendants construe "fastening hole" simply as any hole.

b. The Special Master's Construction

The Special Master concludes that like the term "fastening element," the term "fastening hole" requires the function of fastening. This is supported by the claim language itself. For example, dependent claim 36 (incorporated into independent claim 35) recites the "first frame … being fixed to a housing … through the fastening hole at the rear surface of the first frame." Thus, the "fastening hole" is not just any hole, but instead must fasten one component to another. Additionally, during prosecution of the patents, the inventors amended the common specification in response to an objection by the examiner. In doing so, the inventors described "fastening hole" relative to "fastening element"; that is "a fastening hole … which together with the material defining the hole may be … a fastening element." See 4:60-64 of the '641 and '718 patents.

Thus, to meet the function of fastening, one skilled in the art would understand that the "fastening hole" necessarily includes the material defining the hole. Coupled with the common and ordinary meaning of a "hole," the Special Master's construction is as follows:

<table>
<thead>
<tr>
<th>CLAIM TERM</th>
<th>SPECIAL MASTER CONSTRUCTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>fastening hole</td>
<td>An opening, together with the material defining the opening, that provides the capability for attaching firmly or fixing securely so as to be supported, one component to another</td>
</tr>
</tbody>
</table>

Presuming the jury found literal infringement, J. Baker contends that such a finding was necessarily made in relation to a claim interpretation that cannot be sustained. Maxwell argued the term "fastening tab" as used in the patent claims does not merely designate a tab separate from the shoe but also encompasses shoe parts. The evidence at trial focused on the element in claim 3 that requires a part of the "fastening tab" extend "horizontally between the outer sole and the inner sole of the shoe and [be] firmly secured thereto" and the element in claim 1 that requires the first part of the "fastening tab" extend "horizontally between the inside surfaces of the outer sole and inner sole of the shoe and [be] firmly secured thereto."

Maxwell's patent expert, Malcolm Moore, opined that the loop and the counter pocket or lining together perform like the "tab" described in the patent claims. Relying on the reference in the claims to the fastening tab as an "integral sheet," Moore stated that the counter pocket and shoe lining are properly considered part of the fastening tab. Moore opined that the loop, combined with the portion of the counter pocket or upper lining which is stitched to the loop and extends between the soles of the shoes, provides a "tab" within the literal meaning of claims 1 and 3. Because the counter pocket or lining to which the loop is attached extend horizontally to the bottom of the shoe and are secured between the inner and outer soles, Moore concluded that the accused systems include "fastening tabs" secured where claims 1 and 3 literally require.

The claim language, specification and prosecution history all belie Maxwell's claim interpretation. Maxwell's interpretation differs from the ordinary meaning of "tab." The fastening tab, both as described in the claims and depicted in the drawings, is an item separate from the counter pocket, the lining or the upper of the shoe. There is nothing in the patent language to indicate that the term "tab" is used in an uncommon way. Nor does the patent language indicate that "fastening
"tab" includes other shoe parts.

- - - - - - - - - - - - Footnotes - - - - - - - - - - - -

3 The dictionary may be consulted to establish the "ordinary" meaning of a disputed term. Hoganas AB v. Dresser Indus., Inc., 9 F.3d 948, 951 & n.8 (Fed. Cir. 1993). See Webster's II New Riverside University Dictionary (1984) (defining "tab" as "a projection, flap, or short strip attached to an object to facilitate opening, handling or identification."); Random House Dictionary of the English Language (1969) (defining "tab" as "a small flap, strap, loop, or similar appendage, as on a garment, used for pulling, hanging, decoration, etc.").

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - -

The specification of the '060 patent does not indicate that Maxwell intended the term "tab" to have another meaning. In fact, the opposite is true. The statement in the specification that the patented system "comprises in combination a pair of shoes, each of which has a fastening tab firmly secured thereto" indicates that the tab is a separate item and does not encompass shoe parts. Maxwell patent, col. 1, lines 49-50. The specification also states that "each fastening tab is formed from elongated narrow strong sheet material, such as synthetic resinous plastic material and each fastening tab has two parts." Id. col. 1, lines 55-58.

The specification notes that, "[although shown as rectangular, the tab may obviously have rounded ends or may be in the form of an elongated oval, or the like." Id. col. 3, lines 10-12. Moreover, the statement that the second part of the tab "extends upwardly along the inside surface of the upper body of the shoe, but spaced therefrom," demonstrates that the tab is an item different from the lining or upper. Id. col. 1, lines 64-66. The statement that "the tabs may be stitched into a lining seam of the shoes at the sides or back of the shoes," also indicates that neither the lining, the upper nor the counter pocket are part of the fastening tab itself. Id. col. 2, lines 41-43. 4

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

4 See also Maxwell patent, col. 1, lines 59 & 62-63 ("one end of the elongated tab … the opposite end of the elongated tab"); Id. col 1., line 68 and col. 2, line 1 ("loops caused by doubling the tabs"); Id. col. 2, lines 21-26 ("At the time of manufacture, each shoe is provided with a fastening tab … [the tab] is thin flat and elongated formed from strong sheet material, such as plastic impregnated cloth, polyester film such as Mylar, or similar strong material which is resistant to tearing."); Id. col. 3, lines 5-7 ("typically the fastening tab may be between about 1/4 to 3/4 inch in width and 1 1/2 to 3 inches in length"); Id. col. 3, lines 8-10 ("Approximately one-half of the length of the tab should be secured between the inner and outer soles."); Id. abstract ("The tab comprises a length of narrow strong sheet material having a hole or loop at one end for receiving a fastening filament.").

- - - - - - - - - - - - - - End Footnotes- - - - - - - - - - - -

The use of the term "tab" in the prosecution history also undermines Maxwell's interpretation. See Maxwell's Amendment under Rule 111 filed February 4, 1985 ("Claim 1 requires a tab on the inside of the shoe upper as opposed to [an] outside tab"); Id. ("once the fastening element is cut from the shoes, there is no disfiguring remainder. The shoes are ready to be worn. The tabs simply rest along the inside surface of the shoe upper."); Maxwell's Amendment under Rule 111 filed May 8, 1985 ("the present invention as defined by claim 1 wherein the ends of a piece of material are held under the insole and a loop projects upwardly along the interior sidewall of the shoe.").

If Maxwell wished or intended to use the term "tab" in some particular way other than that understood by one of ordinary skill in the art at the time the patent application was filed, she must have defined it in the patent prior to issuance. This she did not do. Nothing in the patent or the specification would have put one of ordinary skill in the art on notice that the term "tab" meant other than what it says. Thus, the term "tab" must be given its ordinary meaning. Accordingly, other parts of the shoe -- including the counter pocket, the shoe upper, the upper lining and the sock lining -- cannot be considered part of the "fastening tab" described in the '060 patent.

Maxwell's argument that the counter pocket and top line systems literally infringed the '060 patent turned on her claim interpretation. Having rejected Maxwell's interpretation, the court also concludes that the claims as properly construed are
not literally infringed by the counter pocket and top line systems and that no reasonable jury could so find. The patent claims require that a part of the "fastening tab" extend horizontally between the inner and outer soles of the shoe and be firmly secured thereto. The tabs in the counter pocket and top line systems are secured in a different location within the shoe. There is no literal infringement as the tabs in those systems are not secured between the inner and outer soles of the shoe as required by claims 1 and 3 properly construed.

There is substantial evidence to support a finding of literal infringement based on J. Baker's use of a shoe connection system identical to the one described in the patent. Between 1985 and 1990, J. Baker ordered pairs of shoes connected together with a filament passed through loops "under the sock." The evidence, taken in favor of Maxwell, showed that in response the vendors provided J. Baker shoes with loops secured between the inner and outer soles rather than with loops secured between the sock lining and the inner sole. The court concludes that a reasonable jury could find that the "under the sock" system in practice was identical to the patented system. Accordingly, the jury's finding of literal infringement based on shoe connection systems used by J. Baker, other than the counter pocket and top line systems, is supported by substantial evidence.

1. Claim Construction

Both parties agree that the key claim limitation for purposes of this appeal concerns Claim 1's requirement that a "fastening tab" extend "horizontally between the inside surfaces of the outer sole and inner sole of the shoe." Col. 3, ll. 34-36. The district court construed the claim language to require that the fastening tab extend from between the inner and outer shoe soles. Moreover, the court construed the claim to require that the fastening tab be a separate piece from any other shoe part, including the counter pocket, the shoe lining, and the sock lining. Maxwell, 875 F. Supp. at 1379-80. On appeal, J. Baker does not challenge the court's claim construction. However, Maxwell asserts that its claims are broader than the district court's claim construction. In particular, she argues that the term "fastening tab" should be construed to cover a loop connected to a counter pocket lining, or other interior lining structure, which extends from between the shoe's soles.

We disagree with Maxwell's attempt to expand the claims. Claim 1 requires the tab to extend "from one edge of the inner sole and vertically upward along but spaced from the inside surface of the shoe upper." Claim 3 requires the tab to extend "upwardly along the inside surface of the shoe upper." Thus, both claims require a separate tab that extends along the shoe upper. Moreover, as Figure 2 of the patent illustrates, one of ordinary skill in the shoe industry would recognize that a shoe upper includes the outside portion of the shoe and the inside lining of the shoe. See also Cuccinelli, Maribeth, The Art and Science of Footwear Manufacturing 64 (Norman V. Germany ed., 1974) (defining a shoe "upper" as "all of the upper parts of a shoe stitched together and ready for lasting and bottoming. It includes both the outside and lining of the shoe."). Thus, to accept Maxwell's claim interpretation that the inside lining of the shoe is part of the tab, we would have to ignore the claim limitations that require the tab to be separate from and extend along the shoe upper, which includes the inner shoe lining. See Texas Instruments Inc. v. United States Int'l Trade Comm'n, 988 F.2d 1165, 1171, 26 U.S.P.Q.2D (BNA) 1018, 1023 (Fed. Cir. 1993) ("To construe the claims in the manner suggested by TI would read an express limitation out of the claims. This we will not do . . . ."); see also Unique Concepts, Inc. v. Brown, 939 F.2d 1558, 1563, 19 U.S.P.Q.2D (BNA) 1500, 1504 (Fed. Cir. 1991) ("Our interpretation gives full effect to the recitation of two distinct elements in the claimed structure: linear border pieces and right angle corner border pieces.").

Neither the patent specification nor the prosecution history indicates that the claims should be interpreted differently. To the contrary, the specification makes clear that the claims, as properly construed, require the fastening tab to be separate from the inside shoe lining. The specification indicates that "the [fastening] tab extends around the edge of the inner sole of the shoe and vertically upwardly along the inside surface of the upper body of the shoe, but spaced therefrom." Col. 1, ll. 62-66. In addition, the specification suggests that the fastening tab, as an alternative to placing it between the inner and outer soles, may be "stitched into a lining seam of the shoes at the sides or back of the shoes [emphasis added]." Col. 2, ll. 42-43. Accordingly, Maxwell must have contemplated that the tab be separate from the shoe's lining seam in order for the tab to be stitched into the lining. Thus, the court properly construed the claims to require the fastening tab to be a separate piece from the counter pocket lining or other inside shoe lining.

- 1976 -

1547
3. On December 22, 2000, the court issued its construction of disputed claim terms as follows:

a. "Aluminum alloy sheet product." As understood by one of ordinary skill in the art, an aluminum product with a maximum thickness of 1/4 inches.

c. "Clad" and "cladding." Structures containing an outer layer that provides protection against corrosion. Claims without reference to "clad" or "cladding" apply to both clad and unclad products.

d. "Minimum" and "maximum." A level referring to guaranteeable property values established by repeated testing of many pieces of metal to establish consistent, uniform values.

e. "Long transverse yield strength." As understood by one of ordinary skill in the art, the stress, applied across the width of a product, that a product can sustain before yielding or breaking.

f. "Fracture toughness." Consistent with the understanding of one of ordinary skill in the art, resistance to extension of a crack, often measured in terms of the stress-intensity factor (K) at which applying progressively greater stress to a structure that contains a pre-existing crack causes the onset of rapid catastrophic propagation of that crack.

g. "Fatigue crack growth rate." Consistent with the understanding of one of ordinary skill in the art, the rate of crack extension caused by cycles of stressing and relaxing, expressed in terms of average crack extension per cycle (da/dN).

6. "feather angle mode"

This phrase is used in claim 7 of the '017 and '607 Patents, claim 8 of the '967 Patent, and claims 1, 2, 18, and 19 of the '520 Patent. WG seeks to construe this term as "a control mode that attempts to set and maintain each streamer in a straight line offset from the towing direction by a certain feather angle." Ion seeks to construe the term as a "mode wherein the global control system attempts to keep each streamer in a straight line offset from the towing direction by a certain feather angle." The primary difference between these proffered constructions is that Ion seeks to construe the term so that it is the global control system that acts to affect the streamer positions when the feather angle mode is triggered.

WG points out that the '017, '607, and '967 Patent claims in which this phrase is used explicitly state that the global control system is the actor in implementing the feather control mode. However, as the phrase is used in the '520 Patent, no mention is made of the global control system. Instead, the claims refer only to a "control system." According to WG, absent a clear and unmistakable disavowal of the claim scope, the construction of the term should not be limited according to how the phrase is used in some but not all of the patent claims. Ion, however, points out that the specification, when describing the control modes of the inventive system as a whole, teaches that the feather angle mode is where "the global control system attempts to keep each streamer in a straight line offset from the towing direction by certain feather angle." ('017 Patent, col. 9 ll. 55-58.)

The Court once again holds that, although Ion's description tracks the language used in the specification to describe how the feather control mode is implemented, it must read the specification in the context of the patents as a whole. Absent a clear and unmistakable disavowal or limitation on the claim scope, the Court will not impose the claim limitation that Ion proposes. While it is clear that the preferred or typical embodiment of the patent will involve the global control system acting to implement the feather control mode, the Court must acknowledge that several of the claims teach a method of implementing the feather control mode wherein the global control system is not mentioned. Innova/Pure Water Inc., 381
F.3d at 1117 (stating that "[p]articular embodiments appearing in the written description will not be used to limit claim language that has a broader effect"). Therefore, because it is consistent with the meaning revealed through the claim language as well as the specification description, the Court will adopt WG's construction of this term and finds that it should be construed as the "a control mode that attempts to set and maintain each streamer in a straight line offset from the towing direction by a certain feather angle."

C. "Feed assembly"

The parties agree on the construction of the term "feed assembly" and the Court finds this construction is consistent with the claim language, the specification and the prosecution history. Accordingly, the construction of "feed assembly" in the '998 Patent is: a structure at the free end of the screen that helps to guide the screen in the screen tracks.

83. The court construes the third additional limitation of claim 24, "a compressor feed line supplying said [nitrox] component to a compressor inlet," as follows: a line which connects the permeate outlet of the permeable membrane gas separator to the inlet of the immediately above-described compressor.

As for independent claims 1 and 5, the evidence shows that Dr. Jacob administered to human patients a nonzero amount of MSM that does not occur naturally in, and is in addition to, food actually eaten. The only argument MSM Investments makes against anticipation is that the Jacob Clinic activities do not meet the claim terms "feeding" and "increasing the amount of metabolizable sulfur." MSM Investments's argument rests completely on the premise that these terms include a temporal limitation and a nutritional use limitation. Because the Court interprets claims 1 and 5 as not including these limitations, the Court finds no merit in MSM Investments's argument. The terms "feeding" and "increasing" are not limited temporally and do not require the performance of acts on an ongoing or habitual basis. See Claim Construction Order, at 9:12-11:11.

Because the nutritional use limitation was not raised or addressed in the Court's Claim Construction Order, the Court addresses this limitation herein. At the hearing on this motion, MSM Investments pointed to the ordinary meaning of "feed" and the '878 patent specification as supporting a use limitation requiring nutritional, as opposed to pharmaceutical, use. According to MSM Investments, the reference to "nourishment" in the dictionary definition of "feed" indicates a nutritional purpose. In addition, MSM Investments argues, the '878 patent specification teaches using MSM for nutritional purposes as a dietary supplement. The Court does not find support in either the claim language or the specification for this limitation. The term "feeding," on its face, simply does not suggest any limited purpose and certainly does not exclude giving food or supplying nourishment for pharmaceutical purposes, as MSM Investments suggests. MSM Investments's reliance on "nourishment" is completely unsupported. And, while the '878 patent specification teaches taking MSM as a dietary supplement, it also teaches taking MSM for pharmaceutical or pharmacological purposes (see e.g., '878 patent, col. 13:53-14:62). Based on the claim language, the '878 patent specification, and file history, the Court interprets the term "feeding" in claim 1 as not limited to using MSM for nutritional purposes, as proposed by MSM Investments.

5 MSM Investments argued that the term "feeding" includes a nutritional use limitation for the first time after the Court issued its Claim Construction Order. The parties previously agreed that the ordinary meaning of "feed" is "to give food to; to supply nourishment." See Claim Construction Order.
A. "Felt"

 Defendants' proposed construction of the term "felt" is also wrong as a matter of law. (See Reply, at 6:22-12:5.) There is nothing in the language of Claim 1 or the patent's specification to suggest a particularized definition of "felt" that differs from the term's ordinary meaning, as follows: a fabric made directly from fibers, in which the fibers are held together through the physical entanglement of the fibers, chemical bonding, or thermal bonding, rather than through knitting or weaving. (See Ex. 2; Ex. 19 [Fairchild's Dictionary of Textiles]; Ex. 20 [Dictionary of Fiber & Textile Technology published by KOSA]; Ex. 21 [Textile Institute's Textile Terms & Definitions]; Ex. 22 [American Society for Testing Materials]; Ex. 23 [IWDA Nonwovens Glossary]; Ex. 24 [Needlepunch Nonwoven Primer].) 1

--- Footnotes ---

1 For purposes of construing the disputed terms of Claim 1 of the '971 Patent, the Court has avoided reliance upon expert declarations in light of the following legal principle: it is "only when the claim language remains genuinely ambiguous after consideration of the intrinsic evidence," that a trial court may resort to "extrinsic evidence" to further elucidate the claims' meanings. Bell & Howell Doc. Management Products Co. v. Altek Systems, 132 F.3d 701, 706 (Fed. Cir. 1997). Such extrinsic evidence is that evidence which is external to the patent such as expert testimony. Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1584 (Fed. Cir. 1996). In the instant case, the disputed claim term language (i.e. felt, adhere, etc.) is not ambiguous from viewing the claim itself and the specification. This finding is further supported by reference to dictionaries.

--- End Footnotes ---

Defendants' contention that a felt requires roughly equal numbers of fibers pointing in all directions, and that it be of roughly equal strength in all directions, lacks support and is without merit. Defendants rely on a single source, the website of Resil Chemicals Private Limited of Bangalore India. (Ex. 53, at 9, 29; Ex. 30, at 2.) As Plaintiffs assert, the definition provided on the Resil website refers specifically to wool felts. Moreover, the definition on which Defendants rely specifically states that the fibers of a felt are "non-directional," i.e. the fibers point in all directions. (Ex. 30, at 2.) A reading of the definition nowhere requires an equal number or approximately equal number of fibers to point in all directions. Instead, the language makes specific reference to some fibers pointing in all directions. (Ex. 30, at 2.) Moreover, none of the six technical dictionary definitions on which Plaintiffs rely require that the fibers in felt point in roughly equal numbers in all directions (Exs. 19-24); and Defendants do not challenge any of the dictionary sources relied on by Plaintiffs.

Defendants also assert that a felt that has been saturated in polyurethane is no longer felt. (Ex. 51, at 107:15-25.) However, none of the definitions of felt provided by either party include any restriction on the materials that may be incorporated among the fibers of a felt. (See Exs. 19-24, 30.) To the contrary, the source dictionaries relied on by Plaintiffs explain that felt may include binders among the fibers to both bind the fibers and increase the strength of the felt. (Exs. 19, 23, 24.) Moreover, none of the intrinsic or extrinsic evidence excludes as felt materials that have been saturated in polyurethane or other materials. In fact, both parties agree that felt saturated in asphalt is still felt. (Vaughn Decl. PP 6, 3641; Exs. 19-24, 31; Ex. 51, Meirowitz Depo., at 107:7-15; 108:23-109:7.)

The '971 Patent does not suggest a particularized definition of felt that differs from the term's ordinary meaning. The patent does not, for example, require or even suggest that a felt must have a roughly equal number of fibers oriented in all directions. (Ex. 2.) The patent also does not suggest that a felt may not be saturated in another material, such as polyurethane. (Ex. 2.) Defendants attempt to limit the construction of the term "felt" in ways that do not comport with either the intrinsic or extrinsic evidence. Accordingly, the Court adopts the standard and widely accepted industry definitions that provide for a general construction of felt as a fabric made directly from fibers without weaving or knitting, and the Court construes the term without limitations on fiber number, orientation, or incorporation with other materials, as neither the intrinsic nor extrinsic evidence support such constructions.

GO BACK
B. A Female Fastener (5d)

The female fastener is clearly a structure with an opening which is designed to receive a second structure, in this case, the stud. The two in combination secure the insert with the seat shell. All of this is described in col. 5, ll 37-41 and col. 5, ll 45-48 as follows:

While sliding seat rearwardly studs are lowered and inserted through central aperture of their respective female fastener

* * *

the cooperative arrangement between studs and their respective female fasteners acts to securely retain the forward portion of seat insert to seat shell

ASC's interpretation of the phrase includes the word "fastener" and is circular.

A straight forward construction of the phrase is as follows:

A structure, female in form, that receives a stud, male in form, which together along with other elements, secures the insert to the seat

GO BACK

6. ferromagnetic (claims 1, 2); magnetic material pins (claim 5); unmagnetized magnetic material (claim 8)

Fargo ferromagnetic: of or relating to a class of substances characterized by abnormally high magnetic permeability, definite saturation point, and appreciable residual magnetism and hysteresis magnetic material pins: pins made of a magnetic material unmagnetized magnetic material: magnetizable material that is not permanently magnetized

Iris ferromagnetic: a material that exhibits ferromagnetism, but is not magnetized magnetic material pins: pins made of a material that is capable of being magnetized, but is not magnetized unmagnetized magnetic material: material that is capable of being magnetized but, in the absence of an applied external magnetic field, is not magnetized

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

n5 Iris offered this proposed construction at oral argument.

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The focus of Iris's arguments regarding these terms is that, within the context of the patent, they all refer to material that is capable of being magnetized, but is not magnetized. Iris highlights evidence in the prosecution history where the applicant sought to distinguish prior art on the basis that the supply rolls have "no magnets." (Fink Aff., Ex. C, pt. 4, at C61-C62.) The document states:
Claim 11 [issued Claim 8] is specific to the positioning of the identifier indicia, using an unmagnetized magnetic material. This feature is very important, again, from a pollution control standpoint, because there are no magnetic materials that are utilized on the roll, but yet the reliability of a magnetic sensor can be utilized using one stationary detector of the present invention.

* * *

With the present invention the magnetic material pins are cheap, they are non-polluting, and since there are no magnets, there are no plurality [sic] requirement. They can be placed on the supports or inserted into the apertures without regard to polarity.

The doctrine of prosecution disclaimer prevents a patentee from recapturing a specific meaning that it disclaimed during prosecution. Omega Eng'g, Inc. v. Raytek Corp., 334 F.3d 1314, 1323 (Fed. Cir. 2003). The disclaimer must have been clear and unambiguous for the doctrine to apply. Id. at 1324. Fargo argues that there is no clear and unmistakable disavowal of the ordinary and customary meaning of "magnetic material pins." The problem with Fargo's argument, however, is that its proposed construction for "magnetic material pins" is "pins made of a magnetic material." Yet the prosecution history clearly indicates that the "invention" has "no magnets." Neither Fargo's arguments nor its proposed definition help explain how "material" that is "magnetic" is nevertheless not a "magnet."

At oral argument, Iris offered a new definition for "unmagnetized magnetic material" to counter any objection that its previous definition might have excluded the pins in the patent because they are briefly magnetized as they pass through the magnetic field that is part of the sensor. The resulting definition, "material that is capable of being magnetized but in the absence of an applied external magnetic field is not magnetized," is a better definition than Fargo's because it avoids the ambiguity of the word "permanent." In light of the prosecution history indicating that the supply rolls have "no magnets," the Court will adopt this definition for "unmagnetized magnetic material" and a similar definition for "magnetic material pins:" "pins made of material that is capable of being magnetized but in the absence of an applied external magnetic field is not magnetized." In so doing, the Court is aware that it is defining different terms to have essentially the same meaning. Although a patentee's use of different terms normally indicates that it intended those terms to carry different meanings, a reading of the patent and prosecution history does not reveal what that difference might be in this case, and Fargo's objections to Iris's proposed definitions ignore the clear statement in the prosecution history regarding the lack of magnets.

Finally, in light of that same prosecution history, the Court will adopt Iris's definition of "ferromagnetic," modified as follows: "a material that exhibits ferromagnetism, but, in the absence of an applied external magnetic field, is not magnetized." Because Iris concedes that Fargo's definition of "ferromagnetic" is correct "in the abstract," the Court will adopt Fargo's definition of "ferromagnetic" insofar as it is necessary to define the word "ferromagnetism" in Iris's definition of "ferromagnetic."

B. Dictionary Definitions Compel the Conclusion That "Fiberfill" Means Synthetic Fiber

With these legal principles in mind, the Court turns, then, to the first step of the claim construction process. The parties provide a number of helpful definitions for the term "fiberfill" from a variety of objective sources. The Dictionary of Composite Materials Technology (1989) defines "fiberfill" as "synthetic fibers with a specified linear density, cut length, and crimp for use as a filling material." (Docket Entry No. 46 at 296.) Resil's Textile Dictionary similarly defines the term as "virgin man-made fibers especially engineered as to linear density, cut length, and crimp for use as a textile filling material." (Id. at 298.)

The Dictionary of Fabric Terms states "fiberfill" is "specially engineered manufactured fibers, which are used as filler material in pillows, mattresses, mattress pads, sleeping bags, comforters, quilts, and outerwear." (Id. at 300, 362.) The American Heritage(R) Dictionary of the English Language (4th ed. 2000), defines "fiberfill" as "lightweight synthetic fiber used as filling or insulation, as in comforters, pillows, and outerwear." (Id. at 301, 302.) Encarta(R) World English Dictionary, North American Edition defines "fiberfill" as "synthetic material used for stuffing or insulation, for example, in cushions, comforters, or clothing[.]" (Id. at 303.)
Random House Collegiate Dictionary defines "fiberfill" as "synthetic fibers, as polyester, used as a filling or (sic) insulating cushions, comforters, winter garments, etc." (Id. at 304.) The Random House Dictionary of the English Language (2d ed., unabridged, 1987) gives the same definition and adds a notation suggesting the words "fiber" and "fill" were added together to make a new word sometime between 1960 and 1965. (Id. at 307.) Internet dictionary services, such as Infoplease and Fact Monster provide the same definition. (Id. at 308, 309.) Merriam-Webster Dictionary (online) also defines "fiberfill" as "synthetic fibers used as a filling material (as for cushions)." (Id. at 310.)

The DuPont Sleep Products Glossary (online) defines "fiberfill" as "filling for sleep products consisting of manmade polyester fibers; available in different types for different properties." (Docket Entry No. 46 at 341, 343.)

The United States International Trade Commission recognizes that polyester staple fiber, "a synthetic fiber similar in appearance to cotton or wool fiber when baled" is "known in the industry as 'fiber for fill,' as it is primarily used as polyester fiberfill." (Id. at 311.) The Commission notes the "subject fiber is distinguished from other staple fiber by its diameter, 3 denier or more; length, 1 to 5 inches; and in some cases by the finish and the 'crimp' of the fiber." (Id.) The United States Customs Service lists "fiberfill" as a "Fiber Trade Name," for the generic term, "polyester." (Id. at 325.)

The online glossary at rtwear.com suggests the term "fiberfill" may be used as a generic term "for all stuffing fibers or materials used in battings, quiltings, sleeping bags, pillows etc." (Docket Entry No. 52, Ex. 9.) Hawley's Chemical Dictionary defines "fiberfill" as a "fiber designed specifically for use as a filling material in such products as pillows, comforters, quilted linings, furniture battings, e.g., sisal, jute." (Docket Entry No. 52, Ex. 7.) Sisal and jute are natural fibers derived from plants. 6 (Batra Dep., Docket Entry No. 52, Ex. 16 at 37.)

6 According to Dr. Subhash K. Batra, Defendant's expert, the Hawley's definition is similar to what Dr. Batra calls the "colloquial definition" of "fiberfill." Dr. Batra also testified coconut husk produces a fiber called "coir" which is used as a cushioning material. (Batra Dep., Docket Entry No. 52, Ex. 16, pages 37-38.) (Id.)

The American Textile Manufacturers Institute defines "fiberfill" as a "filling specially prepared for use in pillows, comforters and furniture upholstery. Most fiberfill produced today is made of polyester. Polyester is used predominantly for fiberfill since it retains its loft longer and better than natural fibers." (Docket Entry No. 52, Ex. 11.)

All but two of the objective definitions listed above classify "fiberfill" as synthetic fiber. While the parties disagree which of these definitions should be applied, a dispute over the ordinary and customary meaning of a term does not imply that such a meaning does not exist. K-2 Corp. v. Salomon S.A., 191 F.3d 1356, 1365 (Fed. Cir. 1999).

The Court concludes as a matter of law that the ordinary and customary meaning of "fiberfill," as viewed by a person of ordinary skill in the art, is synthetic or man-made fiber, most commonly polyester, that has a specified linear density, cut length, and crimp making it ideal for use as a filling material in various products.

That the term "fiberfill" may also be used colloquially to include filling material comprised in whole or in part of natural fiber does not change the Court's legal conclusion. The broader, colloquial definition of "fiberfill" is not consistent with the intrinsic record of this case, as discussed more fully below. See Teleflex Inc., 299 F.3d at 1325; Vitronics Corp., 90 F.3d at 1582.

C. The Intrinsic Evidence Confirms the Ordinary Meaning of "Fiberfill" is Synthetic Fiber

Once the Court has arrived at the ordinary and customary meaning of a claim term, the Court must examine the specification of the patent to decide if the patentee rebutted the ordinary and customary meaning. Intellectual Property Dev., Inc., 336 F.3d at 1316; Texas Digital Sys., Inc., 308 F.3d at 1204. "The presumption will be rebutted where the patentee, acting as his or her own lexicographer, has clearly set forth a definition of a claim term that is different from the term's ordinary and customary meaning." Intellectual Property Dev., Inc., 336 F.3d at 1316. The presumption is also rebutted if,
during the patent prosecution process, the inventor disavowed or disclaimed the scope of the claim coverage by using words or expressions of manifest exclusion or restriction, representing a clear disavowal of claim scope. Id. Notwithstanding the fact the claims must be read in view of the specification, the Court may not read limitations from the specification into the claims. Prima Tek II, L.L.C., 318 F.3d at 1148.

The intrinsic evidence in this case does not rebut the heavy presumption that the ordinary and customary meaning of "fiberfill" is synthetic fiber. See Texas Digital Sys., Inc., 308 F.3d at 1203. The '977 patent specification and drawings do not define "fiberfill," nor do they disclose any express intent of the patentee to give the word "fiberfill" a novel meaning, including the colloquial meaning of the term. See Teleflex, Inc., 299 F.3d at 1325.

To the contrary, the specification in the '977 patent states that "commercial fiberfill" maybe used in the embodiments of the invention. As supported by the dictionary definitions listed above, those persons of ordinary skill in the art would assume, if not know, that "commercial fiberfill" refers to synthetic fiber. This seems especially true in light of the specification in the '977 patent which emphasizes that certain forms of synthetic "fiberfill" used in the garments will provide higher protection from the extreme temperatures of fire or from physical impacts than will other forms of synthetic fiberfill.

D. The Patent Prosecution History Confirms the Ordinary Meaning of "Fiberfill" is Synthetic Fiber

Having examined the specification, the Court must perform the same exercise with regard to the patent prosecution history. Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1343 (Fed. Cir. 2001). The prosecution history must be applied to exclude any interpretation of a claim the patentee may have disclaimed or disavowed during prosecution to obtain the patent. Teleflex, Inc., 299 F.3d at 1326.

The '977 patent prosecution history confirms the Court's analysis that "fiberfill" means synthetic fiber. The patent examiner initially rejected Claims 1 and 9 of the '977 patent as anticipated by the Zafirogou '297 patent. The Zafirogou patent specified fiberfill batting material made of a mixture of synthetic polymer pulp or wood pulp.

In response to the examiner's rejection and to obtain the '977 patent, Plaintiff distinguished the Zafirogou '297 patent on the ground that it failed to "disclose or suggest the fiberfill batting and polymeric fibers and/or particles of the composite material in the claimed method." Also, Plaintiff contended the '297 patent disclosed "a compress that is made from an elastic fabric and comprises a hydrogel-forming polymeric material. The absorbent polymer filler material maybe particulate, and may be accompanied by a diluent filling material." Persuaded by Plaintiff's remarks, the patent examiner withdrew the rejection and allowed the Claims of Plaintiff's '977 patent.

Plaintiff now insists that Vizorb(R), the product Defendant uses in the absorptive layer of its evaporative cooling garments, is manufactured from a mixture of natural wood cellulose and synthetic fibers. Yet, Plaintiff seeks to hold Defendant liable for contributory infringement despite Plaintiff's earlier successful action in disavowing or disclaiming similar aspects of the Zafirogou patent. "Claims may not be construed one way in order to obtain their allowance and in a different way against accused infringers." Southwall Technologies, Inc., 54 F.3d at 1576. The patent prosecution history confirms the Court's legal construction of the term "fiberfill" as a synthetic fiber.

Because the Court is able to construe the claims as a matter of law by observing the ordinary and customary meaning of the term "fiberfill," as confirmed by the intrinsic evidence of record, the Court cannot, and will not, consider the extrinsic expert and lay opinion testimony submitted in depositions and affidavits. See Northern Telecom Ltd. v. Samsung Elecs. Co., 215 F.3d 1281, 1288 (Fed. Cir. 2000) ("The use of extrinsic evidence to construe the scope of a claim is improper where the ordinary and accustomed meaning of a claim term does not render the scope of the claim unclear and where the patentee has not chosen to be his own lexicographer."); Markman, 52 F.3d at 983 (noting conflicting views of experts do not create genuine issues of material fact and cannot bind court or relieve court of its obligation to construe claims according to tenor of patent), aff'd 517 U.S. 370, 134 L. Ed. 2d 577, 116 S. Ct. 1384 (1996).
whether Vizorb (R) constitutes "fiberfill" as required by the '977 patent for literal infringement because Vizorb (R) contains a combination of natural and synthetic fibers. Whether Techniche is liable for contributory infringement depends upon this issue.

Turning to the specification of the '977 patent, we examine the context of the term "fiberfill" in the claims themselves. Both claims 1 and 9 call for a method of cooling a person by evaporation through use of "a multi-layered, liquid-retaining composite material comprising a fiberfill batting material, and hydrophilic polymeric fibers [particles in claim 9] . . . " As used in this context, the fiberfill batting material, in conjunction with other polymeric fibers or particles, must be capable of liquid retention and evaporation. The claims, however, offer little guidance as to the underlying composition of "fiberfill batting material" apart from the functions it must be capable of performing.

The written description, on the other hand, does provide guidance as to the composition of "fiberfill batting material." In the detailed description of the invention, AquaTex dictated that "the particular fiberfill is not known to be critical. That is, any commercial fiberfill may be used as long as it does not adversely affect the performance of the end composite." '977 patent, col. 3, ll. 47-50. From this statement, the patentee has informed the public that any commercial fiberfill that is capable of performing the claimed functions will suffice. The written description continues by describing numerous examples of commercial grade fiberfill, all of which are comprised entirely of synthetic materials.

Because AquaTex chose to incorporate by reference the teachings of three United States Patents to define the scope of the term "fiberfill," these publications are highly relevant to one of ordinary skill in the art for ascertaining the breadth of the claim term. In United States Patent No. 4,304,817, the specification teaches that "polyester fiberfill is used commercially in many garments and other articles because of its desirable thermal insulating and aesthetic properties . . . . Most commercial polyester fiberfill has been in the form of crimped polyester staple fiber." col. 1, ll. 11-16. Similarly, the remaining two patents describe "fiberfill" in terms of a synthetic, normally polyester, fiber for use as a filling material. None of the patents discusses the possibility of using natural fibers as commercial fiberfill batting.

"In addition to consulting the specification . . . a court 'should also consider the patent's prosecution history, if it is in evidence."' Phillips, 415 F.3d at , 2005 U.S. App. LEXIS 13954 (quoting Markman v. Westview Instr., Inc., 52 F.3d 967, 980 (Fed. Cir. 1995) (en banc)). In interpreting "fiberfill," the trial court relied heavily upon statements made during prosecution of the '977 patent as a clear disavowal of natural fibers for use as "fiberfill batting material." The prosecution history, however, is ambiguous and does not directly address the composition of "fiberfill." Thus, we disagree with the trial court that AquaTex's arguments foreclose potential compositions of fiberfill, and we decline to give the prosecution history much weight. See Phillips, 415 F.3d at , 2005 U.S. App. LEXIS 13954 (because the prosecution history represents an ongoing negotiation, "it often lacks the clarity of the specification and thus is less useful for claim construction purposes"). Particularly, the examiner represented that the prior art '297 patent contained a blend of fiberfill batting comprised of synthetic polymer pulp and wood pulp. Instead of addressing the composition of the fiberfill batting in the prior art, AquaTex chose to traverse the rejection by distinguishing how the overall composition of materials was used, and by pointing out that the prior art composition of materials was designed to retain liquid for long periods of time. The representations made during prosecution neither support nor discredit any particular meaning of the term "fiberfill." They are not a clear disavowal of claim scope.

The extrinsic evidence of record, in the form of technical dictionaries, supports construing "fiberfill" as a purely synthetic fiber because it is consistently defined as such. The definitions given in all but one of the dictionaries relied upon by the trial court define "fiberfill" as either a synthetic fiber or as a man-made material used as a filler for various items. The contradictory source was a chemical dictionary that simply gave two examples of natural materials that could constitute "fiberfill." Other extrinsic industry sources examined by the trial court lend support to construing "fiberfill" as a synthetic or polyester fill material. The United States Customs Service, in its publication "Fiber Trade Names and Generic Terms" Nov. 1999, lists "Fiberfill" as a "Fiber Trade Name" for the generic term "Polyester." Similarly, the United States International Trade Commission issued a ruling that polyester staple fiber is known in the industry as "fiber for fill." Certain Polyester Staple Fiber from Korea and Taiwan, Investigation Nos. 731-TA-825-826 (Final) (May 5, 2000).

While we adhere to the adage that limitations from the specification must not be imported into the claims, see, e.g., Nazomi Communications, Inc. v. ARM Holdings, PLC, 403 F.3d 1364, 1369 (Fed. Cir. 2005), based upon the teachings of the specification, one of ordinary skill in the textile manufacturing industry would understand that commercial "fiberfill batting material" is made of synthetic or polyester fibers. The combined teachings within the specification of the '977 patent, the
patents incorporated by reference, and the consistent interpretations in the industry publications would lead one skilled in the art to this conclusion. Therefore, we affirm the district court's determination that the accused Techniche products do not literally infringe claims 1 and 9 of the '977 patent.

14. **Fibers**

FieldTurf's Proposed Construction: "Synthetic ribbons fabricated from polypropylene, polyethylene, nylon and plastic"

SCG's Proposed Construction: "Chemical compositions such as polypropylene, polyethylene, nylon and plastic used to make strips of sheet"

**The Court's Claim Construction: "Material"**

Claim 17 reads as follows: "A synthetic grass assembly according to claim 1, wherein the synthetic ribbons are fibers selected from the group consisting polypropylene, polyethylene, nylon and plastic." The term "fibers" is used in the "Background of the Art" section of the specification to refer generally to the materials used to simulate grass on an artificial playing surface. '689 patent, 3:56-4:26. In other words, a ribbon is one type of fiber that allows a granular infill between the fiber. '689 patent, 4:13-26; 11:3-8. FieldTurf's proposed construction is therefore more appropriate, except that it is redundant to include "synthetic ribbon" in the construction or to state that the fiber is "from the group consisting of polypropylene, polyethylene, nylon and plastic." Accordingly, the Court will construe "fiber" as a "material."

15. **Fibrillated**

FieldTurf's Proposed Construction: "To split apart ribbon ends or portions of ribbon"

SCG's Proposed Construction: "Splitting or fraying a flat sheet with a brush"

**The Court's Claim Construction: "Split or frayed"**

Claim 18 of the '689 patent states as follows: "A synthetic grass assembly according to claim 1, wherein the upper portion of the synthetic ribbons are fibrillated into individual strands of a width in the range between 1.0 to 15.0 mm." The dispute over fibrillated is actually fairly minor. Both SCG in its claim construction and FieldTurf in its claim construction and brief agree that fibrillated means to "split or fray." As for the remainder of FieldTurf's claim construction, it is not incorrect but it is duplicative of the remainder of the claim language. Thus, the only dispute is whether to include "a flat sheet with a brush" in the claim construction. The Court declines to do so. First, this is a dependent claim and the ribbons have already been defined. There is simply no reason to reinsert SCG's "flat sheet" argument into this dependent claim. Second, the reason a flat sheet is in the claim is because SCG wishes to import a method of manufacture--brushing a flat sheet--into a structurally-defined product claim. As with a number of other claim terms discussed above, SCG fails to provide any proper support for doing so. Accordingly, the Court construes "fibrillated" as "split or frayed."

4. **"Fibrous Absorbent Layer"**

Claim 16 of the '693 patent refers to a fibrous absorbent layer. Claim 16 provides in part, "a foldable sheet having a water-vapor-impermeable polymeric layer disposed between a printable layer and a fibrous absorbent layer. . . ." Fort James suggests that this term has plain meaning to a POSITA and need not be interpreted. 48 Coating Excellence suggests the
following: "a fibrous layer having a distinct sublayer of fibers bearing foraminous hydrophobic water-vapor permeable pellicle and a sublayer having highly absorbent material comprising an ionic complex of two essential ingredients: a water-soluble anionic polyelectrolyte, and a polyvalent metal cation."

48 Plaintiffs' Final Proposed Claim Constructions [Dkt No. 175] at pp. 3-4.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - - -

Coating Excellence, in short, asserts that the abstract and certain other references in the specification require the finding that each reference to absorbent layer in the claims of the '693 patent is a reference to an absorbent layer containing highly absorbent material. Coating Excellence also asserts that the absorbent layer must be a "sublayer." In response, Fort James takes the view that, while certain embodiments encompass highly absorbent material in the form of the sublayer, claim 16 is not so limited and claim differentiation supports the point. 50

51 Defendants' Amended Claim Construction Statement [Dkt. No. 176] at Ex. A, p. 7 contains no reference to the file history or any extrinsic evidence; therefore, none has been considered.

- - - - - - - - - - - - - - End Footnotes - - - - - - - - - - - - - - -

Coating Excellence correctly notes that the title of the patent refers to "Highly Absorbent Wrap Material" and that the abstract indicates that the "absorbent layer will include highly absorbent material." There also is at least one specification reference linking the invention to the highly absorbent material. (E.g., '693 patent, col. 6, lines 38-58.) However, these intrinsic record references do not end the analysis.

As noted above, the Background of the invention describes the invention without any mention of highly absorbent material. The sandwich wrap of the present invention provides greatly improved moisture control while decreasing adhesive tendencies between sandwich components and the absorbent inner layer by interposing a foraminous hydrophobic water-vapor-permeable pellicle on fibers positioned between the sandwich and the moisture-vapor-impermeable polymeric layer." (Id., col. 1, lines 60-66.) The specification then goes on to describe how, "In preferred embodiments, highly absorbent materials are included in at least a portion of the absorbent layer." (Id., col. 2, lines 3-5.) Similarly, at the beginning of the section entitled "Description of the Preferred Embodiments," the inventors first describe the invention in part by stating that it has a first absorbent layer bearing the pellicle. (Id., col. 4, lines 29-32.) Then, the inventors go on to describe a certain type of highly absorbent material that may be present in preferred embodiments. (Id. at col. 4, lines 34-37; see also col. 3, lines 1-17."In a preferred embodiment, at least a portion of the [absorbent material] layer will also include highly absorbent material. . . .")

In summary, the undersigned finds that the intrinsic record as a whole makes clear that the highly absorbent material is just one aspect of the invention (i.e., part of the preferred embodiments) and should not be construed to be a limitation of claim 16. See Seachange Int'l, Inc. v. C-Cor Inc., 413 F.3d 1361, 1377 (Fed. Cir. 2005) (noting that it is improper to import
limitations from a preferred embodiment into a claim); Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 908 (Fed. Cir. 2004) ("The fact that a patent asserts that an invention achieves several objectives does not require that each of the claims be construed as limited to structures that are capable of achieving all of the objectives."). 52 Microsoft Corp. v. Multi-Tech Systems, Inc., 357 F.3d 1340, 1348 (Fed. Cir. 2004), relied upon by Coating Excellence, is distinguishable. In that case, the patent specification repeatedly referred to data transmission via telephone lines and no where referred to the use of a packet switching network. Consequently, in light of the specification as a whole, the court found that the communications must be via telephone. Id. Here, in contrast, the '693 patent plainly indicates that the use of highly absorbent materials is one embodiment of the invention, but not required for all embodiments of the invention. ('693 patent, col. 4, lines 34-37; col. 3, lines 1-25.)

52 Fort James also notes that certain other claims specifically include a limitation describing one form of highly absorbent material, supporting the notion that the inventors understood how to draft such limitation when they so desired. For instance, claim 20, which is dependent upon claim 16, contains a limitation directed to the highly absorbent material described in the specification. Reading "highly absorbent material" into claim 16 would violate the theory of claim differentiation, which requires that an independent claim not be construed to contain a limitation added by a dependent claim. Curtiss-Wright Flow Control Corp. v. Velan, Inc., 438 F.3d 1374, 1380-81 (Fed. Cir. 2006).

The undersigned likewise rejects Coating Excellence's attempt to read a "sublayer" limitation into claim 16. Again, as was the case with the pellicle, there is support (e.g., Fig. 4) for the existence of sublayers of highly absorbent material and pellicle bearing fibers residing in separate sublayers in certain embodiments of the invention, but claim 16 is not so limited. The word "sublayer" does not appear in claim 16 and should not be read into claim 16. Finally, Coating Excellence suggests that "fibrous absorbent layer" be construed to be a sublayer comprised of a certain type of highly absorbent material: "a water-soluble anionic polyelectrolyte, and a polyvalent metal cation." 53 While this may describe a specific embodiment of the invention, there is no intrinsic support for limiting claim 16 to such absorbent material.

For the above reasons, the undersigned finds that no construction of the term "fibrous absorbent layer" is necessary or appropriate. See Biotec, 249 F.3d at 1349.

A. Fibrous batt of fibers

With regard to the term "fibrous batt of fibers," Lydall argues that the district court incorrectly believed that there was only one embodiment disclosed in the '260 patent. In making this error, Lydall contends, the district court applied its own Honeywell decision instead of following our decision in Phillips. Lydall asserts that the claim language is clear and unambiguous and does not suggest that the batt must be layered. Lydall argues that, in addition to describing the claimed invention, the specification uses the term "fibrous batt" to describe the prior art, which included single-layer batts. Lydall contends that the specification expressly teaches that organic fibers may be used throughout the batt and that the binding fibers and the insulating fibers can be made of the same material, thus indicating that the term "fibrous batt of fibers" includes a homogenous batt made of one material. Lydall asserts that the specification expressly states that the drawing reference numerals used in the claims are not meant to be limitations and that the file history expressly indicates the same. Lydall also argues that the prosecution history indicates that the inventors intended to cover a homogenous batt in claim 1,
which uses the same language as claim 45. Finally, Lydall asserts that claim differentiation of dependent claim 48, which includes a limitation for a three-layer, non-homogenous batt, requires a presumption, which Lydall argues is unrebutted, that claim 45 does not include such a limitation.

In response, Federal-Mogul argues that Lydall has failed to acknowledge that this court upheld the district court's decision, including its claim construction, in Honeywell after we issued the Phillips decision. Federal-Mogul asserts that, as in Honeywell, the '260 specification disclosed only one invention: a multi-layered composite batt of fibrous materials with tufts of fibers formed on each side by two-sided needling. Federal-Mogul contends that all references in the specification to "batt" describe an insulating layer sandwiched between binding layers. Federal-Mogul argues that the broadest configuration in the specification is an insulating layer that is "at least in part" organic, but even that configuration, Federal-Mogul asserts, does not indicate that the term "fibrous batt of fibers" encompasses a single-layer, homogenous batt of all organic fibers. Federal-Mogul contends that Lydall cannot rely on its statements during the reissue prosecution to expand the scope of the '260 patent when the specification clearly limits the invention to a narrower scope. Finally, Federal-Mogul argues that claim 45 has only one interpretation, so claim differentiation does not apply because the written description and claims overcome the presumption of claim differentiation. Regardless, Federal-Mogul asserts that claim 48 also contains other limitations that distinguish it from claim 45.

We agree with Federal-Mogul that the specification of the '260 patent discloses a single embodiment of the invention, viz., an insulating shield that includes a fibrous batt consisting of an insulating layer sandwiched between two binding layers that is, as discussed infra, needled on two sides. Although Lydall is correct in saying that the claim language "fibrous batt of fibers" does not, in isolation, suggest a layered batt, Lydall's arguments completely ignore the consistent use of the term "batt" in the specification. It is fundamental that we give due weight to the specification when construing this claim term. Phillips, 415 F.3d at 1315.

We have stated that "when the preferred embodiment is described in the specification as the invention itself, the claims are not necessarily entitled to a scope broader than that embodiment." Chimie v. PPG Indus., 402 F.3d 1371, 1379 (Fed. Cir. 2005); see Honeywell, 452 F.3d at 1318 (construing claim term to include fuel filter because "[o]n at least four occasions, the written description refers to the fuel filter as 'this invention' or 'the present invention'"); SciMed, 242 F.3d at 1343 (construing term to include feature characterized as "the present invention"). In other words, when a patentee consistently describes one embodiment as "the present invention," "[t]he patentee is entitled to a presumption that the claims are limited to the embodiment as described in the specification." Honeywell, 452 F.3d at 1318; see also SciMed, 242 F.3d at 1341 ("Where the specification makes clear that the invention does not include a particular feature, that feature is deemed to be outside the reach of the claims of the patent, even though the language of the claims, read without reference to the specification, might be considered broad enough to encompass the feature in question."). Such is the case here. The specification identifies a three-layered batt as "the present invention." '260 patent col.6 ll.55-56. In addition, the specification repeatedly describes the batt as having an insulating layer disposed between two binding layers. See id. col.6 ll.63-65, col.9 ll.24-25, col.13 ll.19-23. Lydall's consistent description of "the present invention" as including a three-layered batt makes clear that the claimed "fibrous batt of fibers" must have three layers, an insulating layer sandwiched between two binding layers. The fact that the specification discloses that the insulating fibers may "at least in part" be made up of the same organic fibers as the binding layers does not dissuade us from our conclusion. It may be that the insulating layer and the binding layers are made from the same material, but the batt still has three layers. It is not, therefore, a single, homogenous layer.

We also agree with the district court that Lydall's reliance on the prosecution history and the doctrine of claim differentiation is unpersuasive. "Representations during prosecution cannot enlarge the content of the specification." Biogen, Inc. v. Berlex Labs., Inc., 318 F.3d 1132, 1140 (Fed. Cir. 2003). Thus, when the prosecution history appears in conflict with the specification, any ambiguity must be resolved in favor of the specification. See id. The specification is the "best source for understanding a technical term," to be supplemented, "as needed, by the prosecution history." Phillips, 415 F.3d at 1315 (quoting Multiform Desiccants, Inc. v. Medzam Ltd., 133 F.3d 1473, 1478 (Fed. Cir. 1998)). Here, the specification is clear. The sole embodiment of the invention includes a batt that has three layers.

The patentee's efforts during the prosecution of the reissue patent to enlarge the claims beyond what the specification discloses also must fail. Similarly, Lydall cannot rely on claim differentiation to expand the scope of the claim term. See Nystrom v. Trex Co., 424 F.3d 1136, 1143 (Fed. Cir. 2005) ("[S]imply noting the difference in the use of claim language does not end the matter. Different terms or phrases in separate claims may be construed to cover the same subject matter where the written description and prosecution history indicate that such a reading of the terms or phrases is proper.").
addition, as Federal-Mogul asserts, claim 48 can be differentiated from claim 45 by other limitations. Thus, we conclude that the district court properly construed "fibrous batt of fibers" as "a composite batt having a layer of insulating fibers sandwiched between layers of binding fibers."

1562

C. "Field and Commutation Portions"

The term "field and commutation portions" appears in independent Claim 9 of the '028 patent. Similar terms "field magnet portion" and "commutation magnet portion"-are also included in Claim 1. Rotron argues that the Court should construe these terms in the following manner:

The terms "field magnet portion" and "commutation magnet portion" require the field and commutation portions to be axially displaced portions on an integral magnet. The "commutation magnet portion" of the integral magnet is the portion of the integral magnet that takes the place of separate commutation magnets, and provides a magnetic field to effect commutation. The "field magnet portion" of the integral magnet is the portion of the integral magnet that takes the place of separate field magnets, and is that portion of the remainder of the integral magnet that provides a magnetic field to effect rotation of the magnet. The claims do not preclude the commutation magnet portion from also having an effect on rotation of the magnet, and do not preclude the field magnet portion from having an effect on commutation.

Rotron argues that its functional construction is supported by the intrinsic evidence and notes that the limitations of dependent claims such as 6 and 7, which describe the magnetization patterns of the field and commutation magnet portions, should not be used to limit the term in Claim 9. Rotron also argues that extrinsic evidence-the expert testimony and prior art-indicate that its definition reflects the ordinary meaning of the term.

Nidec contends that the following construction should be adopted: "The terms 'field magnet portion' and 'commutation magnet portion' mean axially displaced and non-overlapping portions of an integral rotor magnet, each having a different magnetization pattern. The 'field magnet portion' is coextensive with the stator and the 'commutation magnet portion' is adjacent to the Hall device." Nidec reasons that because the novelty of the '028 patent is that two areas of different magnetization-the field and commutation portions-are formed on a single piece of magnetized material rather than from separate magnets, the proper construction of those terms should emphasize their distinctness. In support of its proposed construction, Nidec notes that the preferred embodiment and prosecution history discloses axially displaced magnetized portions which indeed have different magnetization patterns. Finally, Nidec argues that the field and commutation portions should be defined in part by their location to distinguish the prior art.

Claim 9 describes the position and certain characteristics of the field and commutation portions. In particular, it states that the portions are

- at axially displaced first and second locations, said commutation portion comprising integral alternating oppositely radially magnetized commutation magnet sectors in close succession around the annular commutation magnet portion and the field magnet portion comprising integral oppositely radially magnetized field magnet sectors and integral substantially magnetized sectors of substantial angular length angularly adjacent radially magnetized sectors in the field magnet portion and defining null sectors.

'028, col. 6, ll. 54-63. "Although words in a claim are generally given their ordinary and customary meaning, a patentee may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning, as long as the special definition is clearly stated in the patent specification or file history." Vitronics, 90 F.3d at 1582. Here, it may be possible to interpret Claim 9 as an attempt by the patentee to define the term "field and commutation portions." However, the Claim does not contain explicit language indicating that the patentee intended the phrases following the term "comprising" to be construed as a definition, see, e.g., Hoechst Celanese Corp v. BP Chems. Ltd., 78 F.3d 1575, 1578 (Fed. Cir. 1996) (discussing a specification that contains the language "By the term 'stable,' it is meant . . ."). and neither party argues that the patentee intended such a meaning. Further, the term "comprising" means that the invention includes the listed elements, but does not exclude others. See Moleculon Research Corp. v. CBS, Inc., 793 F.2d 1261, 229 U.S.P.Q. (BNA) 805, 812 (Fed. Cir. 1986). Thus, the Court will interpret the term "field and commutation portions" according to the ordinary meaning of
the words by one skilled in the art, in light of the recited description and other intrinsic evidence.

The intrinsic evidence indicates that several distinct features characterize the "field and commutation portions." First, as both parties agree, the "field and commutation portions" are axially displaced portions on an integral magnet. This construction is supported by the language of the claims, see, e.g., '028 pat., col. 5, l. 57 (describing the commutation magnet portion at a second location "axially displaced" from the first location); col. 6, l. 11 (describing the field and commutation portions as axially displaced"; col. 6, l. 48-51 (stating that "the first and second locations of the field and commutation portions are at opposite ends of the annular one piece magnet"), and is confirmed by the prosecution history. See Defs.' Ex. 6, at 11 (stating that Claim 25, which was eventually re-numbered as Claim 9, "emphasizes the axial displacement of the two portions of the annular magnet").

The intrinsic evidence also indicates that the field and commutation portions are defined-and in fact distinguished-by the unique "null sectors" of the field magnet. Claim 9 clearly describes the magnetization of each area and indicates that the structural feature that distinguishes between them is the "substantially unmagnetized sectors of substantial angular length" that are "angularly adjacent" to the magnetized areas of the field magnet. See '028 pat. col. 6, ll. 52-63. The importance of this feature is confirmed by other portions of the specification. See, e.g., '028 pat. col. 1, l. 61- col. 2, l. 15 (describing the patterns of magnetization); col. 3, l. 64 - col. 4, l. 43 (same). At the same time, however, it would be improper to read any specific magnetization pattern from the preferred embodiment (aside from the field magnet's null sectors contained in Claim 9 itself) into the definitions of "field and commutation portions," see Renishaw, 158 F.3d at 1248, particularly given the fact that the preferred embodiment itself states that "The number and lengths of the unmagnetized and magnetized segments of the field portion, and the number and relative sizes of the commutation segments will differ with the number of poles of a particular DC motor and the particular commutation circuit, for example." '028 pat. col. 4, ll. 38-43. Thus, while the construction of the term "field and commutation portion" should include the substantially unmagnetized sectors of the field portion, the Court will not define the magnetization pattern with any further specificity. 7

7 Still, Nidec's proposed construction, which states that the "field and commutation portions" should be defined in part by the fact that they "each have a different magnetization pattern," misconstrues the novelty of the '028 patent. While the patterns do appear to be different, the distinguishing feature are the nulls contained in the field portion.

Still, structural characteristics alone do not fully describe the full meaning of "field and commutation portions." The evidence indicates that Rotron's functional constructions accurately reflect the meaning of this term. The summary of the invention indicates that the magnetic sections are "of the required size, angular extent and polarity for its particular purpose," and states that commutation magnet interacts with the Hall device. '028 pat., col. 1, ll. 48-54. The specification further notes that the "commutation magnet sections of an integral magnet secured on the rotor regularly alter the condition of the Hall device to effect commutation," '028, col. 3, ll. 54-58, and that "the Hall device is "located proximate the commutation portion of the magnet and circuit means for altering the energization of the winding in dependence on the annular position of the commutation magnet portion." '028 pat., col. 6, ll. 33-36. This functional understanding of the term commutation portion is further supported by the extrinsic evidence, as Dr. Alexander Kusko confirms in his deposition that the commutation portion "provides the magnet field which is sensed by the Hall element to provide the commutation switching signal." Pl.'s Ex. 1 at 43. Similarly, Claim 6 states that the motor includes at least one "stator field winding for establishing a stator field in the location of the field magnet portion of the integral magnet." This description suggests that the purpose of the field magnet is to interact with the windings by way of the stator field. Kusko's deposition also indicates that a functional definition of a field portion is consistent with the ordinary meaning of the term as understood by someone of ordinary skill in the art. See Pl.'s Ex. 3 at 385 (characterizing Nidec's magnet as a field portion "since the magnetic flux from the entire rotor magnet interacts with the stator poles").

Nidec correctly points out that the specification, extrinsic evidence, and prior art repeatedly describe the proximity of the field portion and the commutation portion to the stator and Hall device, respectively. However, the exact location of each magnetic area with respect to these features is not meaningful in and of itself. Instead, it is apparent from the specification language quoted above that the significance of the positioning is the purpose that each will effect. This understanding is also suggested by at least two examples of prior art. For instance, Claim 3 of U.S. Patent No. 3,988,654 to Takahashi
("Takahaski '654") describes the two magnetized segments of the assembly according to their purpose, stating that the "permanent magnet rotor" has "a first magnetization portion magnetized through a first magnetization angle for interaction with said selectively energized driving coils and a second magnetization portion magnetized though a second magnetization angle for selective activation of said magnetically responsive element means." '0654 pat., col. 6, ll. 12-18. Similarly, in the Japanese Laid-Open Patent Application No. 53-23008 ("JLOPA '008"), the equivalent of the commutation magnet is actually referred to as the "Hall element-driving magnet," in contrast to the "rotor magnet" which effects rotation. Defs.' Ex. 21, at 6. Thus, the functional definition appears to be appropriate in light of the prior art.

Finally, the evidence suggests that the term "field and commutation portions" should be construed to distinguish those areas from the separate field magnets and commutation magnets disclosed in the prior art. See, e.g., '028 pat., col. 5, ll. 52-54 (claiming "an integral annular [sic] field and commutation magnet for a brushless DC motor formed on a single piece of permanently magnetized material"); col. 1, ll. 30-54 (distinguishing the '028 patent from other magnets whose parts are separately made and magnetized); col. 2, ll. 23-26 ("The flux conducts flux through the single piece of permanently magnetizable material that becomes the integral field and commutation magnets."); col. 3, ll. 7-10 ("By providing a one piece unitary magnet . . . the number of parts is reduced and the relationship of the commutation segments and field magnets is always the same.").

Accordingly, the Court adopts the following construction of the term "field and commutation portions":

The terms field and commutation portion mean axially displaced portions of an integral rotor magnet. The commutation portion takes the place of separate commutation magnets, and provides a magnetic field to effect commutation. The field portion takes the place of separate field magnets, and provides a magnetic field to effect rotation of the magnet. The field magnet is comprised in part of substantially unmagnetized sectors of substantial angular length.

1563

D. "Fills Essentially Completely"

Alaris's proposed claim construction for this term is "fills almost entirely a portion of the cavity adjacent to the opening to prevent fluid from leaking between the seal and the wall structure." At the Markman hearing in connection with this Order, attorneys for ICU indicated that they were amenable to this definition provided that the words "fills almost entirely" be replaced with "fills all of or almost entirely," and the word "swabbing" be inserted before the word "fluid." To the court's knowledge, no final agreement was reached between the parties. Nevertheless, the court will use the proposed ICU changes to the Alaris definition as a basis for discussing the construction of the claim.

The issue with respect to ICU's first proposed change is easily resolved. The words "essentially completely," while embracing a seal that allows for a slight gap between the seal and the wall so long as leakage is prevented, certainly does not foreclose the possibility of a complete seal. As to ICU's second proposed change, while swabbing fluid is likely to be the main concern in terms of leakage, the court finds no compelling reason why the seal function should not - and in fact would not - also apply to blood, pharmaceuticals, water, or any other fluid matter.

The proper construction of "fills essentially completely" is thus "fills all of or almost entirely a portion of the cavity adjacent to the opening to prevent fluid from leaking between the seal and the wall structure."

1564

2. Film

A film is a thin layer of material. A film may have voids, cracks, or other discontinuities.
Dandy first argues that the court erred in not requiring the terms “filter” and “porous material” to mean a single or unitary structure. Dandy asserts that the claims, specification, and the prosecution history all consistently use "an" or "a" or refer to "the filter." Such references are not enough to limit the claims to a unitary structure. KCJ Corp. v. Kinetic Concepts, Inc., 223 F.3d 1351, 1356, 55 USPQ2d 1835, 1839 (Fed. Cir. 2000) ("An indefinite article 'a' or 'an' in patent parlance carries the meaning of 'one or more' in open-ended claims containing the transitional phrase 'comprising.'"). Further, there is no language in the patent or prosecution history that disclaims multiple structures or expressly defines the filter as a single or unitary structure. See, e.g., Teleflex, Inc. v. FICOSA N. Am. Corp., 299 F.3d 1313, 1327, 63 USPQ2d 1374, 1382 (Fed. Cir. 2002). Dandy also argues that the purpose of the invention -- providing an environmental filter system that is easy to install and maintain -- would be frustrated were multiple pieces to be used. This is because, Dandy asserts, filling several gravel bags is time-consuming and each of the multiple bags is heavy to lift and install. Dandy does not, however, explain why multiple pieces would so completely frustrate the purpose of the invention as to take such products outside of the claim language. Indeed, it seems that multiple, smaller bags could have some maintenance advantages, such as ease of cleaning, and installation advantages, such as being adaptable to drains of multiple sizes. In sum, Dandy has not shown that non-unitary structures were disclaimed.

3. "filter," "porous medium," "interposing," "positioning"

In certain embodiments of the invention, the patents-in-suit contemplate a "filter" being "positioned" or "interposed" in the flowpath. For example, claim 8 of the '835 patent recites a parts washing system wherein the "parts washer further includ[es] a filter interposed within [the] flowpath." '835 patent, col. 9, ll. 21-22; see also id., col. 10, ll. 3-4 (same); '125 patent, col. 9, ll. 11-12 ("the step of] positioning a filter within the flowpath"); id., col. 10, ll. 33-34 ("the step of interposing a filter within the flowpath"). In the separately prosecuted '226 patent, the Applicant placed a similar limitation on the parts washing method. Claim 1 of that patent recites a method of washing parts, including a step of "passing the cleaning fluid that has contacted the part through a porous medium." '226 patent, col. 10, ll. 27-28. At the Markman hearing, the parties agreed that "filter" and "porous medium" were equivalent terms. Thus, the Court will construe "filter" with the understanding that "porous medium" shall have the same construction.

Plaintiff argues the "filter" terms should be construed as "a porous material through which a liquid is passed in order to separate the fluid from suspended particulate matter." Defendant argues the terms should mean "a webbed and/or woven material having a spacing of 10 or more microns positioned between the drain and the tank in the course followed by the fluid from the drain to the tank." Defendant also makes several arguments that relate to its position that the flowpath must be defined by reference to structure.

The specification describes the filter pad as serving as a mechanical filter. 6 Its purpose is to trap particulate matter while allowing the hydrocarbons and microorganisms to pass through and deposit in the tank so that biodegradation may take place. See, e.g., '110 patent, col. 6, ll. 55-57 ("The filter pad 60 preferably functions to trap the particulate matter and allow the organic contaminants and cleaning fluid 72 to pass therethrough."); see also id., col. 6, ll. 47-51 ("The cleaning fluid 72, organic waste, and remaining particulate matter then encounter the filter pad 60. Subsequently, the fluid 72 and organic contaminants pass through the support grid 58, and drain hole 52 to deposit into the tank cavity 44."); id., col. 4, ll. 63-66 ("The microorganisms . . . readily pass through the filter pad 60."); id., at col. 6, ll. 57-59 ("Because the filter pad 60 does not collect the organic contaminant, it is capable of being disposed of as a solid waste.").

6 The specification also explains that the filter may serve "as an initial transport medium for the microorganisms," see generally '110 patent, col. 5, ll. 23-64, but this feature of the filter pad is not at issue.
Any construction of filter must take into account these dual purposes. The parties would generally agree with this proposition (see Pl.'s Opening Brief at 31 (“[T]he Court should construe 'filter' and 'porous medium' broadly to encompass all known types and structures of filters as long as they: (i) allow the cleaning fluid, microorganisms, and hydrocarbons to pass through; and otherwise (ii) trap 'particulate' matter.”) (internal footnote omitted)), but Defendant seeks to impose additional limitations to serve these objects. Namely, Defendant requests the Court restrict the "filter" terms to "a webbed and/or woven material having a spacing of 10 or more microns." These proposed limitations come not from the claims, but directly from the specification's description of the preferred embodiment. See '110 patent, col. 5, 26-31 ("The filter pad 60 is acceptably constructed, for example and not limitation, from cotton, cellulose, polyolefin fibers, polyester fibers, fiberglass, or the like. . . . Further, the filter pad 60 is acceptably a ten micron filter or larger."). Examples set forth in the specification may not be used to narrow the scope of the claims, unless the Applicant intends the claims and the preferred embodiment to be "strictly coextensive." Phillips, 415 F.3d at 1323; see also Vulcan Eng'g, 278 F.3d at 1376 ("This court has often explained that the claims are construed in light of the specification, and are not limited to a designated 'preferred embodiment' unless that embodiment is in fact the entire invention presented by the patentee.").

It is apparent that the materials discussed in the specification, on which Defendant relies in arguing for these further limitations, are merely examples of materials that would effectuate the purposes of the filter and were not intended to constrain the claims. Thus, the Court declines to import the proposed limitations into the claims. The Court construes "filter" to mean "a porous material through which the cleaning fluid is passed in order to trap particulate matter while allowing the cleaning fluid, hydrocarbons, and microorganisms to pass through."

The Court has previously rejected Defendant's argument regarding the requirement of structure and does so here as well. The claim phrases related to "interposing" or "positioning" a filter in the flowpath carry their plain and ordinary meaning and are thus construed to mean "placing a filter in the flowpath."

a. "filter"

ev3 proposes that the term "filter" be construed consistently across all patents-in-suit and given its plain and ordinary meaning as a "device for separating suspended particulate matter from liquid that can be made from a variety of materials." Boston Scientific argues that the term "filter" is used in an ordinary, generic fashion in the Boston Scientific patents-in-suit and need not be construed. Because the Court discerns no ambiguity as to the meaning of the term "filter" and because "filter" is readily understood, the Court declines to construe the term as it is used in the '520 Patent.

1 Likewise, the Court declines to construe the term "filter" in all of the Boston Scientific patents-in-suit and will not address the term in each patent separately.

3. "filter" and "filter element" (as used in the ev3 patents-in-suit)

The terms "filter" and "filter element" appear throughout the claims of the ev3 patents-in-suit. 12 ev3 suggests that "filter" is a commonly understood term that should be construed as "a device for separating suspended particulate matter from liquid that can be made of a variety of materials." Boston Scientific disagrees and asserts that both "filter" and "filter element" as used in the ev3 patents-in-suit should be construed as "filter made of resilient metal fabric."
12 Each ev3 patent-in-suit is entitled "Method and Device for Filtering Body Fluid" and is a continuation of a series of patent applications originating with a parent application filed July 8, 1994. The ev3 patents-in-suit share the same specification. Because the ev3 patents-in-suit derive from the same parent application and share many common terms, the Court interprets the claims consistently across them. See NTP, 418 F.3d at 1293.

There are references in the specification to a filter made from a resilient metal fabric. 13 Consistent use of a term throughout the specification can narrow a claim term. See Nystrom v. Trex Co., 424 F.3d 1136, 1144-45 (Fed. Cir. 2005). In addition, when a term is characterized in the specification as part of the "present invention," it serves as strong evidence that the claims should not be read to encompass an opposite structure. SciMed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc., 242 F.3d 1337, 1343 (Fed. Cir. 2001); see Honeywell Int'l, Inc. v. ITT Indus., Inc., 452 F.3d 1312, 1318 (Fed. Cir. 2006). However, it is also well established that patent claims may cover embodiments other than those revealed in the specification. See Phillips, 415 F.3d at 1323 (rejecting the contention that the claims of a patent must be construed as being limited to the preferred embodiment of the specification). Here, ev3 concedes that the common specification only teaches the use of metal in connection with "filter," but argues that the claims of its patents-in-suit cover a broader range of filters. The Court agrees and determines that "filter" and "filter element" have not acquired the meaning proposed by Boston Scientific. Instead, "filter" and "filter element" are not limited to filters made of "resilient metal fabric."

The present invention provides a reproducible, relatively inexpensive method of forming devices for use in channels in patients' bodies, such as vascular channels, urinary tracts, biliary ducts and the like, as well as devices which may be made via that method. In forming a medical device via the method of invention, a metal fabric 10 is provided.

13 For example, the Summary of the Invention refers to a metal fabric: "The present invention provides a method for forming intravascular devices from a resilient metal fabric and medical devices which can be formed in accordance with this method." '103 Patent, col. 2, ll. 53-56; '019 Patent, col. 2, ll. 53-56; '375 Patent, col. 2, ll. 53-56. The Detailed Description of the Preferred Embodiments does the same:

The present invention provides a reproducible, relatively inexpensive method of forming devices for use in channels in patients' bodies, such as vascular channels, urinary tracts, biliary ducts and the like, as well as devices which may be made via that method. In forming a medical device via the method of invention, a metal fabric 10 is provided.

Looking first to the claim language, the Court notes that the independent claims of the ev3 patents-in-suit recite a "filter" without indicating that it be comprised of any particular type of material. For example, claim 1 of the '019 Patent provides in part: "A device for filtering fluid through a lumen defined by the wall of an anatomical structure comprising: . . . a filter element carried on a distal portion of the guidewire . . . ." Similarly, the independent claims of the '375 and '103 Patents recite a "filter device," "filter element," or "filter." In contrast, the ev3 patents-in-suit also contain dependent claims that limit the "filter" to those made of "metal mesh" or "filter mesh." For example, claim 14 of the '019 Patent recites "]the device of claim 1 wherein the filter element comprises a metal mesh." Under the doctrine of claim differentiation, the presence of the dependent claim reciting a "metal mesh" raises the presumption that the "metal mesh" limitation is not present in the independent claim. See Phillips, 415 F.3d at 1315; Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir. 2004).

Although the claim-differentiation presumption here is challenged by the repeated reference to metal filters in the specification, an examination of the prosecution history supports the conclusion that the term "filter" is not limited to resilient metal fabric. The ev3 patents-in-suit are continuations of U.S. Patent No. 6,605,102 ('102 Patent). The specification of the '102 Patent is the same as the specification shared by the ev3 patents-in-suit. Unlike the claims of the ev3 patents-in-suit, however, two of the '102 Patent's independent claims recite a trap made of metal fabric. 14 The omission of the term "metal fabric" from the independent claims of the ev3 patents-in-suit supports ev3's argument that those claims are not limited to filters made of resilient metal fabric. The prosecution history also reveals that the use of both metallic and non-metallic materials in filters was well known to one of ordinary skill in the art before the ev3 patents-in-suit were granted. As part of the prior art, ev3 disclosed filters made with a wide range of materials, including polyester fabric mesh, woven or
braided fabric made from polymeric or natural fibers, porous membranous material, woven or braided fibers, microporous membrane or other suitable filtering or netting type material, and porous resilient fabric.

14 Claim 1 of the '102 Patent provides "[a] trap for trapping particulate matter entrained in a fluid within a channel of a patient's body, comprising . . . a metal fabric, the metal fabric having a first end carried by the distal segment and a second end slidable along the guidewire." Claim 3 of the '102 Patent recites "[a] trap for trapping particulate material entrained in a fluid within a channel of a patient's body, comprising . . . a resilient metal fabric and a cover, the metal fabric having a first end carried by the distal segment and a second end slidable along the guidewire."

Taking into consideration the entirety of the intrinsic evidence, including the prosecution history, the Court concludes that one of ordinary skill in the art would find that the terms "filter" and "filter element" as used in the ev3 patents-in-suit are not limited to a "filter made of resilient metal fabric." Because the claim language is not limited by the specification and creates no ambiguity as to the meaning of "filter" or "filter element," the Court declines to construe the terms.

8. Filter Assembly

The term "filter assembly" only appears in one independent claim in the '609 patent, the '958 patent, and the '674 patent. See '609 patent claim 5 at 20:6-7; '958 patent claim 1 at 17:60-61; '674 patent claim 1 at 26:43-44. Looking at claim one of the '958 patent, which is illustrative of the other patents, it states in pertinent part:

A filter assembly for use with a regulator device, said filter assembly comprising:

a housing defining an internal passageway having a gas inlet opening near an upstream end of said housing, and a gas outlet opening spaced from said gas inlet opening, said housing having a first attachment portion configured for connection of an upstream end of said filter assembly to a pressurized source of breathable gas and a second attachment portion configured for connection of a downstream end of said filter assembly to said regulator device, said gas inlet opening defining an upstream rim which is substantially flush with or upstream of an upstream end of said first attachment portion.[

Claim 1 at 17:60-18:6 (emphasis added). Thus, "filter assembly" appears in the preamble of those claims and a preliminary question arises again as to whether the preamble is a separate limitation. As it did for "fluid flow control valve," Aqua-Lung argues that "filter assembly" in the body of the claims is a limitation and its use in the preamble acts as the antecedent basis.

For the same reasons mentioned above for "fluid flow control valve," however, Aqua-Lung's argument similarly fails here. "Filter assembly" is not a claim limitation, but instead provides nothing more than context for the body of the claim. "Filter assembly" can be excised from the body of the claims without any resulting collapse in understanding them.

Having determined that the preamble does not add any limitations, the remaining step is to construe the term. As noted above, the term "filter assembly" only appears in one independent claim in each of the patents-in-suit. See '609 patent claim 5 at 20:6-7; '958 patent claim 1 at 17:60-61; '674 patent claim 1 at 26:43-44. The term also appears in a number of dependent claims. See '609 patent claims 6-17; '958 patent claims 2-7; '674 patent claims 2-8. It does not appear in the original '130 application and was therefore added by amendment during the prosecution of the '609 patent.

Aqua-Lung proposes that "filter assembly" be defined as: "A valve, including a housing which defines a central passageway having gas inlet and outlet openings, a gas pressure-responsive closure element disposed within the passageway for selectively opening and closing of the inlet opening to gas flow in response to gas pressure exerted thereon at the inlet opening, a spring that urges the gas pressure responsive closure element toward its closed position, a filter disposed within the passageway and a c-clip that holds the closure element, spring and filter within the passageway against the spring force." This is the same definition proposed for "fluid flow control valve." Two Forty seeks to have the term defined as "a device,
or collection of parts, which includes a portion through which a gas or fluid (such as air or water) can flow, but which prevents passage of particles or impurities."

Aqua-Lung's proposed definition seeks to incorporate the limitations that follow "comprising," as explained above, and attempts to move all such limitations into the definition of the preamble term itself. For example, the portion of Aqua-Lung's proposed definition that reads, "passageway for selectively opening and closing of the inlet opening to gas flow in response to gas pressure exerted thereon at the inlet opening" goes beyond the filter assembly itself to describe a "passageway." If Aqua-Lung's proposed definition was adopted, "filter assembly" would be read with its definition followed by a claim that is redundant and nonsensical as it would repeat the previous definition. In light of this problem, Aqua-Lung represented at the hearing that its proposed construction could be simplified considerably to include just the main components or elements from the claim body. Their amended construction would read "a valve, which includes the housing that defines the passageway, the pressure-responsive element, bias exerting mechanism, filter, and retainer device." Such a rendering still is too narrow.

Two Forty alleges that its proposed construction is based on the claim language as well as the use of the term within the specification. First, there is a problem with construing "filter assembly" under the claim language as meaning "any collection of parts including a filter" given that what the patentee invented was a valve with a set number of specified parts. Regarding the alleged support for their definition in the specification, Two Forty quotes two passages from the '609 patent where the term language supposedly appears in the specification, yet these refer to a prior art scuba regulator. See '609 patent 3:53-54, 7:40-41. In fact, the term "filter assembly," appears nowhere in the specification as filed. While "filter assembly" is not used outside of the claims, nothing in the intrinsic record indicates that the "filter assembly" is anything other than what is described in each of the disclosed embodiments.

The end result is that neither construction proposed by the parties is adequate. While the claim is limited by everything to the right of the word "comprising," any definition should not import unnecessarily those limitations into this introductory term. Nor will it render the limitations following "comprising" as superfluous. Any other reading would seem contrary to the intent of the inventor. See Phillips, 415 F.3d at 1316 (stating that claim interpretation should comport with the inventor's intent). Accordingly, the Court construes "filter assembly" to mean "a device consisting of parts through which a gas or fluid can flow, but which prevents passage of particles or impurities."

Turning to the merits of the claim construction, we hold that the trial court improperly construed the claim terms "filter bed" and "first particulate filter media" as requiring multiple layers. The court erred in improperly importing limitations of the specification into claims of the '124 and '630 patents and erred in reading limitations of narrower or dependent claims of the '124 patent into a broader independent claim.

(1) The '124 patent

Claim 1 of the '124 patent teaches a method of washing an upflow filter that includes "a filter bed having a non-buoyant particulate media filter layer." Claim 7, another independent claim, teaches a similar method that provides a filter bed "having a non-buoyant particulate media filter layer and a particulate non-buoyant static flocculation layer." Claim 12, which depends from claim 7, also includes "a transitional layer of particulate material between the flocculation layer and the filter layer." In the specification, the '124 patent discloses a filter bed 26, a flocculation layer 52, a transitional layer 54, and a filter layer 56. '124 patent, Fig. 1. In "the most preferred embodiment of the invention," the filter bed 26 "includes a lower static flocculation layer 52, a transitional support layer 54 and a clarifier or filter layer 56." Id. col. 6, ll. 21-25.

The district court interpreted the term "filter bed" and concluded that "filter bed" in the '124 patent must encompass flocculation, transitional, and filter layers. Finding that the term was not defined in independent claim 1, the court stated that it "must review the other claims to determine whether the term 'filter bed' has been further defined." RF Delaware, CV-01-PT-0348-M, slip op. at 40. The court thus incorporated a flocculation layer from claim 7 and a transitional layer from claim 12. Id. at 41. Next, the court examined the specification and determined that the written description and drawings were
consistent with its conclusion that the filter bed was multi-layered. Moreover, "the Description of the Preferred Embodiment of the Invention" section further dictates this conclusion" because "in this section RFD provides that 'the most preferred embodiment of the invention includes a lower static flocculation layer 52, a transitional support layer 54 and a clarifier or filter layer 56.' Id. at 43. To refute RFD's argument that the court should not consider the preferred embodiment, the district court emphasized that "the preferred embodiment describes the claimed invention" because description of the preferred embodiment corresponds to various dependent claims. Id. at 44.

It is well established that, generally, patent terms are given their plain, ordinary, or accustomed meaning to one of ordinary skill in the relevant art. Rexnord Corp. v. Laitram Corp., 274 F.3d 1336, 1341, 60 USPQ2d 1851, 1854 (Fed. Cir. 2001). Under the doctrine of claim differentiation, "each claim in a patent is presumptively different in scope." Wenger Mfg., Inc. v. Coating Mach. Sys., Inc., 239 F.3d 1225, 1233, 57 USPQ2d 1679, 1685 (Fed. Cir. 2001). Although claim differentiation is not a "hard and fast rule of construction," it is applicable where "there is a dispute over whether a limitation found in a dependent claim should be read into an independent claim, and that limitation is the only meaningful difference between the two claims." Id. Moreover, claims are not necessarily and not usually limited in scope simply to the preferred embodiment. See Altiris, Inc. v. Symantec Corp, 318 F.3d 1363, 1370, 65 U.S.P.Q.2d 1865, 1870 (Fed. Cir. 2003) (holding that the district court improperly read limitations from the specification into the claims). Thus, when a claim term is expressed in general descriptive words, it typically will not be limited to a numerical range that may appear in the written description as referring to a preferred embodiment or in other, narrower claims. Modine Mfg. Co. v. U.S. Int'l Trade Comm'n, 75 F.3d 1545, 1551, 37 USPQ2d 1609, 1612 (Fed. Cir. 1996).

Here, the language of claim 1 is clear on its face that the filter claimed includes "a filter bed having a non-buoyant particulate media filter layer." Nowhere in this claim do words appear that could refer to a flocculation layer or a transitional layer. In the specification, the filter bed, filter layer, flocculation layer, and transitional layer are separately described, each given different numeric designations and plainly describing the "most preferred embodiment." To construe the "filter bed" of claim 1 as including a flocculation, a transitional, and a filter layer conflicts, moreover, directly with the claim language of "a filter bed having a . . . filter layer." Such construction also renders redundant or meaningless the limitation "a flocculation layer" in claim 7 and the limitation "a transitional layer" in claim 12. Furthermore, such construction is not supported by the doctrine of claim differentiation, especially as the only meaningful difference between claims 7 and 12 is the limitation regarding a transitional layer, and a major difference between claim 1 and claim 7 is the latter's addition of a flocculation layer.

The district court also erred in reading the limitations of the specification incorporating the "most preferred embodiment" into the claim limitation "filter bed." A basic claim construction canon is that one may not read a limitation into a claim from the written description. Renishaw PLC v. Marposs Societa' Per Azioni, 158 F.3d 1243, 1248, 48 USPQ2d 1117, 1120 (Fed. Cir. 1998). Although one may look to the written description to define a disputed term already in a claim limitation, "the resulting claim interpretation must, in the end, accord with the words chosen by the patentee to stake out the boundary of the claimed property." Id. Here, to the extent there is any dispute regarding the plain meaning of the term "filter bed," to interpret it as requiring a filter layer, a flocculation layer, and a transitional layer runs afoul of the patent boundaries expressly set by the patentee with different claims. The patentees chose to use the limitation "filter layer" for a filter bed in claim 1, the limitations of "filter layer" and "flocculation layer" for a filter bed in claim 7, and the limitations of "filter layer," "flocculation layer," and "a transitional layer" for a filter bed in claim 12. A court may not use the specification to reset the clearly defined boundaries of the different claims.

The district court concluded that the preferred embodiment described the entire claimed invention, because it found correlation between the teachings of the preferred embodiment and the various dependent claims. However, the opposite conclusion would follow from the court's findings. An independent claim usually covers a scope broader than the preferred embodiment, especially if the dependent claims recite the precise scope of the preferred embodiment. 4 Thus, although claim 12 recites the "most preferred embodiment" taught by the specification, in which a filter bed includes a filter layer, a flocculation layer, and a transitional layer, the court may not import the same limitations to the filter bed in claim 1 or 7, as the patentee clearly set a different boundary by claiming a filter bed with only "a" filter layer in claim 1 and a filter bed with only a filter layer and a flocculation layer in claim 7.

--- Footnotes ---

4 Although Pacific points out one sentence in the specification, which indicates that a filter bed with a flocculation layer is
more effective than one without the flocculation layer, that sentence alone does not lead to the conclusion that the filter bed in claim 1 is inoperative without a flocculation layer. Whether a filter bed with only a filter layer can work goes to validity of the claim (not in issue here), not how it is construed, because in the present case the claim language is clear on its face.

The district court also noted that a "filter bed in accordance with this invention" was described as including a flocculation layer in the Summary of the Invention. The relevant sentence reads:

A filter bed in accordance with this invention includes an upstream, static flocculation layer of particulate, non-buoyant material having a porosity and particle size for providing a velocity gradient in the range of approximately 40-60 reciprocal seconds at liquid flow rates in the range of 10-15 gallons per minute/sq.ft., to thereby promote the mixing and flocculation of the coagulated liquid influent.

'124 patent, col. 4, ll. 42-49. In the Summary of the Invention, the first paragraph describes a filter bed having a filter layer only. The next seven paragraphs, which precede the sentence regarding the flocculation layer, all refer to "the most preferred embodiment." Thus, the description of the flocculation layer, in the last paragraph of the Summary of the Invention, seems to logically refer to the most preferred embodiment, especially in view of the specificity of the description. Moreover, the description of the flocculation layer quoted above correlates precisely with the limitations of claim 17. To read the above description of the flocculation layer into the term "filter bed" in all claims of the patent renders claim 17 meaningless.

We thus conclude that the "filter bed" of the '124 patent has its ordinary meaning of being a structure with filtering functions. The filter bed of claim 1 has "a non-buoyant particulate media filter layer." The filter bed of claim 1 does not require a flocculation layer or a transitional layer, although the filter beds of claim 7 and its dependent claims have a filter layer and a flocculation layer, and the filter bed of claims 12-13 is multi-layered with the filter, flocculation, and transitional layers.

(2) The '630 patent

Claim 1 of the '630 patent teaches a method for clarifying water using a filter system which allows influent water to be "passed upwardly in a first zone through first particulate filter media" and "providing said first particulate media with a filter layer." The district court "turned to the Specification for a detailed written description and visual depiction of the invention." RF Delaware, CV-01-PT-0348-M, slip op. at 47. From examining the written description and drawings, the court concluded that the first "filter media" must have a multimedia, non-buoyant filter bed containing multiple layers: a flocculation layer, a transitional support layer, and a clarifier or filter layer.

Again, we hold the court improperly imported limitations from the specification into the broad claim. Claim 1 provides the first particulate media with a filter layer, which is clearly described and indicated as element 56 in the specification. Although the specification teaches that the most preferred embodiment contains a multi-layered filter bed 26 having a flocculation layer 52, a transitional layer 54, and a filter layer 56, the patentee only chose a single filter layer for the first particulate media filter to set the boundary of claim 1. The district court interpreted claim 1 as requiring a multi-layered filter bed because "the Specification describes the process of Claim 1 in detail," "the preferred embodiment includes three layers," and "these three layers are visually depicted in Figures 1 and 2 of the patent." Id. at 47-48. However, courts may not use the teaching of the specification to contradict the clear language of the claims. To require the filter media of claim 1 to be multi-layered would impermissibly read limitations from the specification into the claim. See Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1187, 48 USPQ2d 1001, 1005 (Fed. Cir. 1998) (declining to limit the term "video delay circuit" to the specific function disclosed in the preferred embodiment).

We therefore conclude that the term "filter media" must be construed as requiring only one filter layer as is taught by claim 1 of the '630 patent.

II

An infringement analysis involves two steps in which the court first determines the correct claim scope, and then compares the properly construed claim to the accused method or device to determine whether all of the claim limitations are present.
either literally or by a substantial equivalent. Renishaw, 158 F.3d at 1247-48. Although claim construction is a question of law, infringement, either literal or under the doctrine of equivalents, is a question of fact. Bai v. L & L Wings, Inc., 160 F.3d 1350, 1353, 48 USPQ2d 1674, 1676 (Fed. Cir. 1998). Thus, viewing the facts and inferences in the light most favorable to RFD, summary judgment of non-infringement is proper only if no genuine issues of material fact remain. Bell Atl. Network Servs., Inc. v. Covad Communications Group, Inc., 262 F.3d 1258, 1266-67, 59 USPQ2d 1865, 1869 (Fed. Cir. 2001).

A

We hold that the district court improperly granted summary judgment of non-infringement. The district court granted summary judgment of non-infringement based on its incorrect interpretation of the claim terms "filter bed" and "first zone through first particulate filter media" as requiring multiple layers. The court found that use of Pacific's Version 1 or 2 did not literally infringe the methods of the '124 or the '630 patents because they lacked the flocculation and/or the transitional layer. The court also found that use of Version 1 or 2 did not infringe under the doctrine of equivalents because these devices were not insubstantial or unimportant changes from RFD's three-layer filter bed, and a finding of equivalent infringement would allow the patent claims to encompass the monomedia sand filter in prior art as described in a 1968 article by Carl Hamann and Ross E. McKinney, and finding infringement without the presence of a transition layer would violate the "all elements" rule.

Having determined that the filter bed in claim 1 of the '124 patent and the filter media in claim 1 of the '630 patent do not require layers other than a filter layer, we conclude that the district court's infringement analysis was premised on an erroneous claim construction. The court required a filter bed or media to be multi-layered, even though neither the flocculation nor the transitional layer is a limitation of claim 1 of either of the patents. As a result, the court's finding of substantial difference was not legally supportable as it was comparing the alleged infringing method to a patent claim that required a filter bed having all of the filter, flocculation, and transitional layers.

The district court's application of the "all elements" rule also fails. Under the "all elements" rule, there can be no infringement under the doctrine of equivalents if even one limitation of a claim or its equivalent is not present in the accused device or method. Kustom Signals, Inc. v. Applied Concepts, Inc., 264 F.3d 1326, 1333, 60 U.S.P.Q.2d 1135, 1140 (Fed. Cir. 2001). Here, the district court conducted its "all elements" rule analysis on the premise that claim 1 of the '124 and '630 patents requires a three-layer filter bed. Finding that Pacific's system did not have RFD's three-layer filter bed or its equivalent, the court concluded that there could be no equivalent infringement. Again, the court's conclusion based on the "all elements" rule is erroneous because the element it found lacking from the accused infringing system is not a limitation of claim 1 of the '124 and '630 patents.

The district court further improperly adopted Pacific's practicing prior art argument. To prove that it was merely practicing prior art, Pacific needs to establish that its method is in the prior art. Fiskars Inc. v. Hunt Mfg. Co., 221 F.3d 1318, 1323, 55 U.S.P.Q.2d 1569, 1573-74 (Fed. Cir. 2000). There is no evidence in the record to show that the single article cited or any of the upflow filters disclosed in the article anticipate or render obvious the patented invention covering the accused infringing method. 5 Simply because a filter having a monomedia filter layer is in the prior art does not establish that the remaining limitations of the claimed invention are also in the prior art.

5 RFD notes that Pacific did not raise the prior art defense until after the district court issued a draft opinion on the issue of equivalence of the filter bed. RFD states that it was never provided any discovery on the issue. On remand, the district court may allow the defense to be properly raised and discovery conducted.

Thus, we reverse the district court's summary judgment of non-infringement as based on the improper claim interpretation of requiring a filter bed or media to contain all of the filter, flocculation, and transitional layers, and remand the case for trial or further analysis consistent with the proper claim construction.
Pacific argues that regardless of whether its devices infringe the '124 or the '630 patent when being used, it committed no infringing acts because, as a manufacturer and seller of water treatment equipment, it does not perform the methods that are covered by the patents. Pacific also argues that it did not have knowledge of the RFD patents at the time it sold its products to be liable for inducement of infringement or contributory infringement. The district court granted Pacific's motion for partial summary judgment of no infringing acts without specific findings.

"A method claim is directly infringed only by one practicing the patented method." Joy Techs., Inc. v. Flakt, Inc., 6 F.3d 770, 775, 28 U.S.P.Q.2d 1378, 1382 (Fed. Cir. 1993). "Although not direct infringement under 35 U.S.C. § 271(a), a party's acts in connection with selling equipment may, however, constitute active inducement of infringement or contributory infringement of a method claim under 35 U.S.C. § 271(b) and (c)." 6 F.3d at 774. If the court finds on remand that one who uses Pacific's products infringes the '124 or '630 patent, Pacific may be liable for inducement of infringement if it actively induces the infringement. 35 U.S.C. § 271(b) (2000). In the event that direct infringement exists, Pacific could also be found liable for contributory infringement if it knows the products to be "especially made or especially adapted for use in an infringement of such patent, and not a staple article or commodity of commerce suitable for substantial noninfringing use." 35 U.S.C. § 271(c) (2000).

RFD contends 6 that Pacific directly infringed the '124 and '630 patents by testing its products at a pilot plant and by starting up its products at the specific installations of its customers. RFD notes a declaration by Pacific's president, Michael Morris, that Pacific "trains the operators, starts up the plant and verifies the quality of the water treated by the equipment." RFD also argues that Pacific committed inducement or contributory infringement because it manufactured and sold its allegedly infringing products knowing the products were patented and infringing. Mr. Morris stated at his deposition that sometime in 1999 he discussed with people at IDI a patent infringement suit between RFD and IDI. On October 4, 2000, a director at Pacific's parent company sent a facsimile to IDI mentioning discussions with Mr. Morris about "the Roberts Filter Patent Dispute." Attached to that facsimile were figures 1 and 2 of the '124 and '630 patents and claims 1-3 of the '124 patent.

6 RFD did not address this issue until Pacific filed its response brief, although RFD in its opening brief mentions that it believes the district court based its summary judgment on its claim construction and would reply to the "no acts of infringement" issue if Pacific raises it in its brief. Pacific rightly complains that this is improper and biases it because it will not have a chance to respond to RFD's arguments made only in RFD's reply brief. However, in this particular case, we find RFD's improper briefing is not material to the conclusion of the case.

We conclude that there are genuine issues of material fact regarding whether Pacific tested or started up any infringing equipment, thereby committing direct infringing acts. There are also genuine issues of material fact concerning whether Pacific sold systems knowing about the '124 and '630 patents and that its equipment would infringe when used.

Thus, the district court erred in granting summary judgment of non-infringement on the ground that no infringing act was committed. We note, however, liability for either active inducement of infringement or for contributory infringement is dependent upon the existence of direct infringement by customers. Joy Techs., 6 F.3d at 775. "Either form of 'dependent infringement' cannot occur without an act of direct infringement." Id.

CONCLUSION

We hold that the claim terms "filter bed" and "filter media" as used in claim 1 of the '124 or '630 patent only require a single filter layer. In construing the terms as requiring a filter layer, a flocculation layer, and a transitional layer, the district court erred in importing limitations of the specification and of narrower or dependent claims into broad, independent claims. As a result, we reverse the court's grant of summary judgment of noninfringement, which was premised on erroneous claim construction, and remand the case for infringement analysis consistent with the proper claim interpretation. We also reverse the district court's grant of summary judgment of no infringing acts because genuine issues of material fact remain. However, further proceedings on indirectly infringing acts are not needed if the court finds no direct infringement by customers when the accused infringing system is in use. Accordingly, the judgment of the district court is, in all respects challenged on appeal,
B. Filter element support

Claims 1, 3-6, 8, 10-13, 15, 16, and 18 require that the claimed device have a "filter element support" which is "located within the housing and centrally disposed with respect to the substantially toroidal flow path." The term "filter element" is defined in claims 4 and 11 as follows:

The filter element comprises: a layer of highly porous material and a layer of fine, porous filter material adjacent the highly porous material to form a layered filter sheet, the layered filter sheet being pleated into a substantially cylindrical configuration.

(Col. 8, Ins. 53-59; col. 9, Ins. 49-55) This definition is consistent with the language of the specification:

In the preferred embodiment, the filter element 16 is formed of multiple layers of filter material. The filter material 16 includes a sheet of webbed netting material layered adjacent a thin, finely-pored filtered fabric. The webbed, netting layer comprises the inner layer of the pleated sheet. The smooth, finely-pored filter fabric comprises the outer filter screen. The smooth finish of the outer filter screen obviates the need for harsh, rigorous and prolonged agitation which would otherwise be required to dislodge bubbles trapped in a large-pored material, such as the netting screen, during a priming process or during actual filtration use.

(Col. 5, Ins. 43-54) The specification describes the filter element as being substantially cylindrical in shape and located concentric with the central longitudinal axis of the housing:

The cylindrical filter element 16 is contained inside a filter element chamber defined by the cylindrical housing 12. The filter element 16 rests on the housing bottom 26 and extends approximately to the housing lip 24, where the filter housing 12 meets the housing cover 14. The filter element 16 is concentric with the central longitudinal axis of the housing such that the central cavity of the cylindrical filter element 16 encircles the fluid outlet port 28 located at the center of the bottom 26 of the housing 12.

(Col. 5, Ins 24-32)

The term "support" should be given its ordinary meaning: "To bear the weight of, especially from below; To hold in position so as to keep from falling, sinking, or slipping." (D.I. 77, Ex. G) The language in the specification of the '474 patent is consistent with the dictionary definition of "support."

Unlike certain conventional arterial filters which require a central support shaft or core for supporting a filter element, the upper and lower potting configurations 30 of the illustrated embodiment provide[] secure retention of the pleated cylindrical filter media, obviating the need for an additional support structure.

(Col. 6, Ins 59-64)

The prosecution history includes the following relevant information. As noted above, the Examiner initially rejected all of the claims, citing the Siposs '135 patent. In response to the Examiner's rejection, Bard argued that its claims were patentable over the Siposs patent. Among other arguments, Bard stated:

Siposs employs a center cone 26 extending upward from the bottom of the filtered chamber to hold the end plates 34 and 28. The filter element is, therefore, fully supported by the center cone 26 and need not be supported by the central indentation in the cap. Thus, Siposs provides no suggestion or motivation for providing a central indentation, much less enhancing a filter element support with a central indentation, as suggested by the Examiner.

(D.I. 71, Ex. E at 13) (emphasis in original). In an Office Action dated January 11, 1995, the Examiner stated that having fully considered Bard's arguments he was again rejecting all claims in the continuation application. The Examiner did
indicate that claims 25, 42, and 33 would be patentable if amended to include additional limitations. At that point, Bard's patent lawyer held an interview with the Examiner. The Examiner's Interview Summary Record states:

No agreements. Examiner did however indicate that he would reconsider rejection and claim 25 would be allowable if amended to include limitations in claims 26 and 27 and filter element support means centrally located in the toroidal flow path.

(D.I. 71, Ex. G at 1) Medtronic argues that the phrase a "filter element support means centrally located in the toroidal flow path" limitation was substituted for "a central indentation, centrally located with respect to the substantially toroidal flow path" limitation. According to Medtronic, the new language describes the limitation functionally as opposed to structurally, an interpretation consistent with the specification which describes one function of the central indentation as such:

The indentation is coupled to the top of the cylindrical filter element to support and hold the filter element in place within the filter housing, . . .

(Col. 2, Ins 39-41)

There is no dispute that the central indentation described in the preferred embodiment "enhances" the filter element support, as evidenced by the prosecution history. Neither the specification nor the claim language require that the filter element be supported by such a structure, however. Indeed, the specification expressly provides that the upper and lower potting alone provide secure retention of the filter element. (Col. 6, Ins. 59-64) Thus, it is appropriate and consistent with the specification to interpret the "filter element support" to include the upper and lower potting material, but not support from the top by a structure descending from the housing cap.

4 This interpretation is also consistent with the legal principle that claims should not be limited by what is disclosed in the preferred embodiment. See, e.g., Minnesota Mining & Mfg. Co. v. Johnson & Johnson Orthopaedics, Inc., 976 F.2d 1559, 1566 (Fed. Cir. 1992) ("In defining the meaning of key terms in a claim, reference may be had to the specification, the prosecution history, prior art and other claims . . . . This is not, however, to be confused with reading into a claim a limitation appearing in the specification but not in the claim."); Intervet America, Inc. v. Kee-Vet Lab, Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989) ("Limitations appearing in the specification will not be read into the claims, and . . . interpreting what is meant by a word in a claim 'is not to be confused with adding an extraneous limitation appearing in the specification, which is improper.'"); Laitram Corp. v. Cambridge Wire Cloth Co., 863 F.2d 855, 865 (Fed. Cir. 1988) ("References to a preferred embodiment, such as those often present in a specification, are not claim limitations.")

GO BACK

The district court also construed the "filter element support located within the housing and centrally disposed with respect to the toroidal flow path" limitation, although it focused on the term "support" and did not construe the location of the support. The court determined that the term "support" included "the upper and lower potting material," but did not require "support from the top by a structure descending from the housing cap." C.R. Bard, Inc. v. Medtronic, Inc., 1998 U.S. Dist. LEXIS 23197, at *23, C.A. No. 96-589-SLR, slip op. at 20 (May 7, 1998) (Memorandum Order).

Medtronic argues that this claim limitation should have been construed as requiring a filter element support provided at the top of the filter element and centrally disposed within the toroidal housing. Medtronic asserts that the district court's construction is erroneous because the court failed to give weight to the recitation that the filter element support be "centrally disposed with respect to the toroidal flow path," and because the '474 patent does not suggest that potting material alone can support the filter element. Medtronic contends that the only filter element support described in the '474 patent comprises the central indentation in the housing lid.

Medtronic also points to the prosecution history of the '474 patent as supporting its construction of this claim limitation.
Specifically, Medtronic argues that this limitation was added to distinguish U.S. Patent No. 4,806,135 to Siposs ("Siposs"). Because Siposs discloses a filter element support where potting material is used at the upper and lower ends of the filter element, Medtronic argues that the filter element support of the '474 patent should not be construed as requiring only upper and lower potting material.

Bard's primary response to Medtronic's arguments is that Medtronic's construction would impermissibly limit the scope of the claims to the preferred embodiment described in the '474 patent and recited in claim 2. Bard also cites column 6, lines 59-64, of the patent as supporting the district court's construction that potting material alone provides secure retention of the filter element:

Consequently, unlike certain conventional arterial filters which require a central support shaft or core for supporting a filter element, the upper and lower potting configuration 30 of the illustrated embodiment provides secure retention of the pleated cylindrical filter media, obviating the need for an additional support structure.

Bard also argues that the prosecution history cited by Medtronic relates to the "central indentation" limitation of claim 2, not to the "filter element support" limitation. Bard therefore contends that this prosecution history is irrelevant to the proper construction of the "filter element support."

A careful review of the '474 patent reveals that it discloses only one embodiment of the filter element support. In this embodiment, the filter element support is formed by the indentation in the housing cap that forms the center of the toroid. See, e.g., '474 pat., col. 3, ll. 3-16, col. 5, ll. 15-23, col. 5, ll. 36-41, col. 6, ll. 19-23, col. 6, ll. 42-64. Although the patent teaches that potting material is used to adhere the filter element to the central indentation, it does not suggest that the potting material itself is a "support." The full paragraph of the passage cited by Bard states:

Thus, the pleated cylindrical filter element 16 is supported and firmly retained in place by adhering the ends of the filter element 16 to the indentation 22 and the housing bottom 26. This adhesive support arrangement prevents shifting or collapse of the filter element 16 during use as fluid impinges upon the filter material. Consequently, unlike certain conventional arterial filters which require a central support shaft or core for supporting a filter element, the upper and lower potting configuration 30 of the illustrated embodiment provides secure retention of the pleated cylindrical filter media, obviating the need for an additional support structure.

Id. at col. 6, ll. 53-64 (emphasis added). When the sentence referring to the "potting configuration" is read in context, it is clear that the referenced configuration consists of the potting material, the central indentation and the housing bottom, not the potting material alone. Indeed, potting material alone would not act as a support--the potting material must adhere the filter element to some supporting structure. Thus, the district court erred when it construed the "filter element support" as requiring upper and lower potting material alone.

The district court's construction also ignores the recitation that the support be "centrally disposed with respect to the toroidal flow path." The prosecution history surrounding the addition of this limitation to the claims indicates that the support must be in the toroidal flow path, which is at the top of the filter element. During prosecution of the patent, the claims were rejected over Siposs, alone and in combination with another patent. The examiner indicated that the claims would be allowable if amended to include, among other limitations, a "filter element support means centrally located in the toroidal flow path." In response to this suggestion, Bard amended the claims to include the filter element support limitation.

Although Bard chose language somewhat different from that proposed by the examiner, it indicated in its amendment that it had amended the claims "in the manner suggested by the examiner." The language used by the examiner, "filter element support means centrally located in the toroidal flow path" (emphasis added), clearly requires a support that is located in the center of the toroidal flow path. The language used in the claim, "filter element support . . . centrally disposed with respect to the toroidal flow path," also indicates that the support is located in the center of the toroidal flow path. Because the toroidal flow path exists at the top of the filter element, in the space between the filter cap and the ceiling of the housing cap, in order to be located in the center of the toroidal flow path the support must be at the top of the filter element.

In view of the teachings in the '474 patent and the prosecution history surrounding the addition of this limitation to the claims, we construe the "filter element support" limitation as requiring a structural support for the filter element (not just potting material) that is centrally disposed with respect to the toroidal flow path, at the top of the filter element.
Because the jury verdict as to Medtronic's infringement of the '474 patent and the district court's denial of Medtronic's request for JMOL of noninfringement were based on an erroneous claim construction, we vacate the judgment of infringement and the denial of Medtronic's JMOL of noninfringement, and remand for a determination of the infringement issue under the correct claim construction.

6. The term "filter support" (claim 9)

The Court agrees with WIMCO that this term does not need to be construed. Both "filter" and "support" are ordinary words used in their ordinary senses.

WIMCO proposes to define "filter support" to mean "[t]he portion of the erosion control housing that holds up, serves as a foundation for, serves as a prop for, or braces the filter." JCCS at 3; Pl. Claim Constr. Br. at 18. The Court rejects this proposed construction because it does little more than provide a series of synonyms for the word "support." The synonyms are accurate enough, but they add nothing useful to already-straightforward claim language. 12

12 Indeed, WIMCO says as much, and offers its proposed construction of this term while noting that the term's meaning "should be sufficiently clear from its plain language . . . ." Pl. Claim Constr. Br. at 18.

7. The term "filter support to support a filter to filter water entering the open top and exiting the drain opening" (claim 9)

The Court agrees with WIMCO that this term does not need to be construed. The Court has already held that it need not construe the individual terms "filter support" and "drain opening" within this longer term. The remainder of this longer term simply uses ordinary language to describe the functions of the filter support: It "support[s] a filter"; that filter, in turn "filter[s] water"; the water first "enter[s] the open top"; and, after that, the water "exit[s] the drain opening."

The only word in this term that could conceivably benefit from additional construction is the word "filter." Indeed, it appears that Lange would like the Court to construe "filter" in this phrase to mean "filter sock," although Lange has buried this proposed construction within a proposed construction of the term as a whole that is somewhat inconsistent with Lange's proposed construction of "filter support" standing alone. Lange contends that a "filter support" is a "standpipe." JCCS at 3; Def. Claim Constr. Br. at 37-38. If that were true, a "filter support to support a filter to filter water" would be a "standpipe to support a filter to filter water." But Lange asks the Court to define a "filter support to support a filter to filter water" as a "filter sock around a standpipe to filter water." JCCS at 4; Def. Claim Constr. Br. at 39. It seems that Lange intends to argue that a "filter support to support a filter to filter water" should be construed to be a "standpipe [i.e., a filter support] to support a filter sock [i.e., a filter] to filter water."

The Court will not construe "filter" in this term to mean "filter sock." The claim language is not so limited, and there is no more reason to limit a "filter" to a preferred embodiment (a "filter sock") than there is to read a "standpipe" limitation into the claims. Given that a standpipe would necessarily be fitted with a filter around its circumference, i.e., a filter sock, Lange's argument that "filter" means "filter sock" is really just a different way of arguing that "filter support" means "standpipe." That argument has already been rejected.
3. The term "a filter supported in the basin below a top opening of the open top receptacle" (claim 6) 7

--- Footnotes ---

7 Lange asks the Court to construe the entire phrase "a filter supported in the basin below a top opening of the open top receptacle" and then to separately construe the words "top opening" within the phrase. The Court sees no need to do so. In construing the phrase as a unit, the Court necessarily construes the components of the phrase.

--- End Footnotes ---

The Court construes this term to mean:

a filter supported in the basin below the open top of the receptacle.

Lange argues that this means "a filter sock supported on a standpipe, having a top opening, extending from the bottom of an open top erosion control basin." JCCS at 2; Def. Claim Constr. Br. at 33. WIMCO proposes a construction that repeats the claim language, but provides an additional gloss on the term "open top receptacle," defining it as "the erosion control basin." JCCS at 2 (proposing this construction: "A filter supported in the basin below a top opening of the open top receptacle, the open top receptacle also being known as the erosion control basin."). The Court adopts neither proposed construction.

Lange's proposed construction rests largely on the fact that the patent discloses only basins with standpipes. Def. Claim Constr. Br. at 33-34. For the reasons already given in connection with the term "filtered drain from the erosion control basin," the Court declines to limit otherwise broad claim language (in this term, the words "filter supported in the basin") to the preferred embodiments disclosed in the '207 patent.

The Court also disagrees with Lange's contention that the words "top opening" must be construed as the top of a standpipe because the specification refers to "the top of the drainpipe" and provides that the "upper opening of the tube, which forms a standpipe type structure, is left open . . . ." See Def. Claim Constr. Br. at 33-34; '207 Patent Abstract; '207 Patent col. 1:47-48. The "top opening" of the standpipe is not the only "top opening" disclosed in the patent; the basin itself obviously has a top opening. Just as obviously, it is the basin's top opening to which the disputed language in claim 6 refers; after all, as described at length above, claim 6 does not even require a standpipe.

The Court rejects WIMCO's proposed construction because it is inconsistent with the language of claim 6. As noted above, claim 6 is directed to an "erosion control basin comprising" three things: an "open top receptacle," a "filtered drain," and a "deflector wall." '207 Patent col. 4:37-43 (emphasis added). Because the "open top receptacle" is but one component of the "erosion control basin," the Court cannot construe the "open top receptacle" to be identical to the "erosion control basin," as WIMCO proposes.

Nonetheless, the Court agrees in substance with WIMCO that the "top opening of the open top receptacle" is the top opening of the receptacle portion of the basin, not the top opening of a standpipe within the basin. Claim 6 (which, again, does not require a standpipe) provides that the "top opening" at issue is the top opening "of the open top receptacle." The Court's claim construction is dictated by this language.

The Court's claim construction does, however, appear to conflict slightly with one aspect of the claim language and with an amendment made during the prosecution history. Wimberger originally proposed claim language almost identical to the Court's claim construction. The now-disputed language, which reads "a filter supported in the basin below a top opening of the open top receptacle," originally read "a filter supported in the basin below the open top." Westman Decl. Ex. N (Amend. Oct. 25, 1995) at 4 (emphasis added). It was the patent examiner, in a telephone conversation with the patent prosecutor, who required that "below the open top" be replaced with "below a top opening of the open top receptacle." Smith Decl. Ex. G (Examiner's Amend./Cmt.) at 2 [Docket No. 29]. Admittedly, the Court's construction effectively reverses this amendment. But a full review of the prosecution history -- along with an understanding of the sometimes-strange dialect and customs of claim drafters -- establish that the Court's construction is nonetheless correct.

- 2005 -
The patent examiner, in his summary of his telephone interview with Wimberger's patent lawyer about this amendment, said that Wimberger's lawyer authorized the amendment to overcome an indefiniteness problem under 35 U.S.C. § 112, paragraph 2. Examiner Int. Summary Nov. 18, 2005, available at http://portal.uspto.gov/external/portal/pair (search for U.S. Patent No. 7,052,207, then select tab labeled "Image File Wrapper"). How was the phrase "below the open top" in the claim as originally submitted indefinite under § 112, paragraph 2? Most likely, a "layperson" would not have found "below the open top" to be indefinite at all. The claim, before the examiner's amendment, referred to "the open top receptacle including a filter supported in the basin below the open top . . . ." Westman Decl. Ex. N (Amend. Oct. 25, 2005) at 4 (emphasis added). The typical lay reader would undoubtedly conclude that "the open top" below which the "filter is supported" must be the same "open top" found in the phrase "open top receptacle."

Patent drafters and examiners, however, speak their own peculiar dialect. In that dialect, the noun phrase "the open top" (following the preposition "below") must have some "antecedent basis" -- that is, it must refer back to an earlier use of that noun phrase. See Robert C. Faber, Landis on Mechanics of Patent Claim Drafting § 3:11 at 3-49 (2007) ("To avoid such a problem [i.e., rejection for indefiniteness], be sure that every reference-back word -- whether "said," "the," or others that might be used, like "this," "each," and "every" -- has the actual antecedent which the reference-back word implies."). A linguist would recognize that the words "open top" in the phrase "the open top receptacle" is, in fact, a noun phrase being used as an attributive modifier, and not an adjective (as it might appear to most nonlinguists), and that "the open top" in the phrase "below the open top" therefore does have a clear antecedent. 8

8 See Rodney Huddleston & Geoffrey K. Pullum, The Cambridge Grammar of the English Language Ch. 6 § 2.4.1(a) at 537 (discussing attributive modifiers), Ch. 19 § 3.3(b) at 1643 ("School grammars tend to say that in expressions like the Clinton policy the word Clinton is (or 'is used as') an adjective but . . . this is to confuse the word-category adjective with the function modifier of a noun. Any noun (other than a pronoun) can occur in this function, given a suitable head noun, so the appropriate way to handle such data is in terms of syntax (the distribution of nouns), not in terms of word-formation (the creation of new words.").

But patent drafters and examiners are not linguists, and they expect noun phrases like "the duck" to refer back to "a duck" that has already been defined. The word "duck" used as an attributive modifier (as in "duck blind") does not identify "a duck" in a way that satisfies the expectations of patent drafters and examiners. The leading treatise on drafting patent claims instructs as follows:

The first time an element or part is mentioned, it should not be preceded by a definite article ("the") or by "said." Instead the indefinite article ("a" or "an") should be used . . . : "a container," "a base," etc. . . . When each previously identified element or part is referred to again, the definite article should be used, as "the container," "the base" . . . .

Id. at § 3:11 at 3-48 (footnote omitted); see also id. at § 10:7.4 at 10-44 ("A new element or step is introduced with an indefinite article 'a' or 'an.' . . . On the other hand, when a previously identified element or step is repeated, it is introduced by a definite article 'the' or 'said.'").

Recall that the patent examiner changed "below the open top" to "below a top opening of the open top receptacle." Smith Decl. Ex. G (Examiner's Amend./Cmt.) at 2 (emphasis added). This change follows naturally from the practice, in drafting patent claims, of always using the indefinite article the first time a claim element is introduced, and of considering the claim element "the duck" to be indefinite if it has not already been introduced as "a duck." Claim 6, as originally drafted, referred to "the open top" without ever having recited "an open top." Westman Decl. Ex. N (Amend. Oct. 25, 2005) at 4. The examiner's amendment corrected this fancied defect in the original claim language. 9 The examiner's interview notes make clear, however, that this was a technical change, not a substantive one. The Court's construction simply rephrases the claim language in a way that a layperson can understand, without changing that language's meaning.

- 2006 -
A different examiner's amendment introduced an error into claim language that had previously been correct. Claim 11, as originally submitted, was drawn to a basin designed to "support a slatted grate that overlies the grate frame." Westman Decl. Ex. K (Amend. Jun 16, 2005) at 5. The examiner required Wimberger to changed "slatted grate" -- i.e., a grate with slats -- to "slated grate," which demonstrates that the examiner overlooked principles of English orthography. See Westman Decl. Ex. L (PTO Office Action Summary July 26, 2005) at 3.

The term "filtered drain from the erosion control basin" (claim 6)

3 Lange asks the Court to construe separately the whole term "filtered drain from the erosion control basin" and the words "filtered drain" within that term. JCCS at 2. The Court sees no need to do so. In construing the entire term, the Court necessarily construes the term's components.

The Court agrees with WIMCO that this term does not need to be construed. See JCCS at 2. The words in this term are ordinary words, used in their ordinary sense, and any further definition or paraphrasing would serve no useful purpose.

Lange contends that "filtered drain" means "standpipe with filter sock." JCCS at 2; Def. Claim Constr. Br. at 30-31. Lange also contends that "from the erosion control basin" means "located in the interior of the erosion control basin." JCCS at 2; Def. Claim Constr. Br. at 32. Both of these contentions flow from the same premise: Lange contends that the intrinsic evidence compels the conclusion that the claims of the '207 patent cover only basins that incorporate a filtered drain made up of a perforated standpipe covered with a filter sock and located inside the basin, even if the claim language does not seem to be so limited. The Court disagrees.

Lange relies primarily on two sources for its contention that a "filtered drain" must be a "standpipe with filter sock." First, Lange points out that this is the only type of drain described in the patent. Def. Claim Constr. Br. at 30-31. Second, Lange argues that the prosecution history mandates Lange's claim construction because Wimberger, during the course of prosecution, distinguished the claimed invention from the prior art on the basis that the claimed invention had a standpipe with filter sock. Id. at 31. Although both the patent specification and the prosecution history provide some support for Lange's proposed construction, these two sources do not provide enough support to overcome the straightforward claim language.

Claim 6 is directed to an "erosion control basin comprising [1] an open top receptacle . . . [2] a filtered drain from the erosion control basin to filter water draining from the open top receptacle including a filter supported in the basin below a top opening of the open top receptacle, and [3] a substantially imperforate deflector wall along one side of the erosion control basin . . . ." '207 Patent col. 4:37-43. This claim language does not limit the basin's "filtered drain" in any way. In this respect, claim 6 contrasts sharply with claim I, which covers an erosion-control basin having "a drain from the basin comprising an upright pipe . . . said upright pipe having a wall with a plurality of openings therethrough, and a sock filter surrounding said upright pipe . . . ." '207 Patent col. 3:45-51 (emphasis added). Under Lange's construction, the generic claim term "filtered drain" in claim 6 should be limited to the very specific type of drain claimed in claim 1. Both the doctrine of claim differentiation and simple common sense render it unlikely that the term "filtered drain" in claim 6 has such a narrow meaning. 4 Claim I leaves no doubt that Wimberger knew how to claim a standpipe with a sock filter and easily could have done so in claim 6 had he wanted.

4 See Andersen Corp. v. Fiber Composites, LLC, 474 F.3d 1361, 1369 (Fed. Cir. 2007) ("Th[e] doctrine [of claim differentiation] is based on 'the common sense notion that different words or phrases used in separate claims are presumed
to indicate that the claims have different meanings and scope.' Karlin Tech. Inc. v. Surgical Dynamics, Inc., 177 F.3d 968, 971-72 (Fed. Cir. 1999). 'To the extent that the absence of such difference in meaning and scope would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference between claims is significant,' Tandon Corp. v. U.S. Int'l Trade Comm'n, 831 F.2d 1017, 1023 (Fed. Cir. 1987).

Lange also notes that every one of the embodiments described or depicted in the '207 patent features a filter sock around a standpipe. Def. Claim Constr. Br. at 30-33. But it is black-letter law that patent claims are not, as a rule, limited to preferred embodiments. Innova/Pure Water, Inc. v. Safari Water Filtration Sys., Inc., 381 F.3d 1111, 1122 (Fed. Cir. 2004) ("[T]he law does not require the court, where an applicant describes only a single embodiment, to construe the claims as limited to that one embodiment. Indeed, such a construction is not encouraged or presumed.") (citations omitted). Further, the section of the '207 patent in which the preferred embodiments are described concludes with an express reminder that the preferred embodiments do not limit the claims: "Although the present invention has been described with reference to preferred embodiments, workers skilled in the art will recognize that changes may be made in form and detail without departing from the spirit and scope of the invention." '207 Patent col. 3:30-34.

Lange's strongest argument with respect to the patent specification is that, in describing the invention as a whole, Wimberger characterizes it as featuring a standpipe with a filter sock. For example, the patent's "Abstract" section describes the "erosion control basin" and says that "[a] filter is formed around an upright perforated drain pipe that is on the interior of the basin and which opens to an outlet." '207 Patent Abstract. Moreover, the "Summary of the Invention" section provides: "The present invention relates to a drain catch basin . . . . The catch basin has a center perforated tube forming a drain tube, that is covered with a filtration sock, or fine mesh, to filter out large debris but yet let water pass through for draining as necessary. The upper opening of the tube, which forms a standpipe type structure, is left open . . . ." '207 Patent col. 1:41-48 (emphasis added).

Lange correctly notes that when a patent specification describes "the invention" as a whole in narrow terms, claim language is sometimes construed narrowly to cover only the specific thing that is identified as "the invention" in the specification. Def. Resp. Claim Constr. Br. at 9-12 [Docket No. 38]; see C.R. Bard, Inc. v. U.S. Surgical Corp., 388 F.3d 858, 864 (Fed. Cir. 2004); Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1348 (Fed. Cir. 2004); Alloc, Inc. v. Int'l Trade Comm'n, 342 F.3d 1361, 1370 (Fed. Cir. 2003) ("[W]here the specification makes clear at various points that the claimed invention is narrower than the claim language might imply, it is entirely permissible and proper to limit the claims."). The Court finds, however, that the '207 patent specification does not expressly limit the claimed invention to a basin that features a standpipe. The broad language of claim 6 plainly covers structures that are not standpipes with filter socks, while the narrow language of claim 1 just as plainly covers only structures that are standpipes with filter socks. Further, as noted above, the specification asserts that "changes may be made in form and detail without departing from the spirit and scope of the invention." '207 Patent col. 3:32-34. Claim 6 of the '207 patent therefore differs significantly from the claims of patents that the Federal Circuit has held to be limited to particular embodiments by virtue of narrowing language in patent specifications. Cf. C.R. Bard, 388 F.3d at 864; Multi-Tech Sys., 357 F.3d at 1348; Alloc, Inc., 342 F.3d at 1369-70.

The '207 patent's prosecution history does not change the Court's analysis. Lange argues that, in the course of prosecution, Wimberger disclaimed coverage of anything other than a basin with a standpipe, and that claim 6 must be construed accordingly. Although the general principle of prosecution disclaimer is relevant to claim construction, application of that principle does not mandate the construction advocated by Lange. 5

5 Prosecution disclaimer is related to, but distinct from, prosecution-history estoppel. See Ventana Med. Sys., Inc. v. Biogenex Labs., Inc., 473 F.3d 1173, 1182 (Fed. Cir. 2006) (explaining and applying "the doctrine of prosecution disclaimer"); see also 5B Donald S. Chisum, Chisum on Patents § 18.05[4][b] (2007). The doctrine of prosecution disclaimer provides that if a patentee clearly disclaims certain claim scope in the course of securing a patent, the patentee's claims cannot be construed to literally cover the disclaimed material. Prosecution disclaimer is therefore a doctrine that limits claim construction. The doctrine of prosecution-history estoppel (also known as Festo estoppel), however, provides that when a patentee clearly disclaims certain claim scope in the course of securing a patent, the patentee cannot, when attempting to prove infringement, use the doctrine of equivalents to effectively reacquire the claim scope that the patentee
disclaimed. Prosecution-history estoppel is therefore a doctrine that limits infringement analysis. See 5B Donald S. Chisum, Chisum on Patents § 18.05[4][b] at 18-1159 (2007) ("Interpreting claims in view of the prosecution history applies as a preliminary step in determining literal infringement. Prosecution history estoppel applies as a limitation to the doctrine of equivalents after the claims have been properly interpreted and no literal infringement is found.").

Claim 6 was not added until quite late in the prosecution of the '207 patent. The patent application as it was first considered by the U.S. Patent and Trademark Office ("PTO") included five claims: four apparatus claims directed to a basin with a standpipe and one method claim directed to a "method of constructing a storm drain" that was not limited to using a basin with a standpipe. Westman Decl. Ex. A (Patent Application) at 7-9, Ex. B (Preliminary Amend.) at 2-3.

The patent examiner understood that the apparatus claims in the '207 patent application, as first considered by the PTO, were limited to basins with standpipes. Indeed, the examiner required Wimberger to restrict his application to either the apparatus claims or the method claim, because the method claim "can be practiced by another materially different apparatus [i.e., one other than the device claimed in the apparatus claims], such as a filtering basket in the basin without the upright drain pipe wrapped around with filtering material." Westman Decl. Ex. C (PTO Office Action Mar. 17, 2004) at 2 (emphasis added).

In response, Wimberger elected to pursue only the apparatus claims. Wimberger also responded to arguments that the examiner had made in rejecting a related patent application (which issued as U.S. Patent No. 6,609,852), although the examiner had not yet raised those arguments in connection with the application that issued as the '207 patent. Wimberger argued that his apparatus claims were patentable over two prior-art references, Williamson (U.S. Patent No. 6,287,459) and Singleton (U.S. Patent No. 5,843,306). Wimberger asserted that there was no suggestion in the prior art that would lead to his invention, i.e., "a basin that has a peripheral wall that encircles the basin, and surrounds an upright drain pipe." Westman Decl. Ex. D (Amend. Apr. 19, 2004) at 5 (emphasis added). Wimberger repeatedly emphasized the importance of the standpipe to his claimed invention, and distinguished it from the prior art on the basis that "the present device . . . has a bottom wall with an upright pipe in the bottom wall, and with a filter around the upright pipe to accomplish filtering of silt and debris before being transferred out through an opening in the bottom wall." Id. at 7.

6 In addition, Wimberger argued:

[T]here is no suggestion in the Williamson patent that a filter that filters round a pipe that is spaced from the peripheral walls would be possible, or desirable. . . . In fact, there is no suggestion that the basin of Williamson would support an upright pipe connected on a bottom wall . . . . The open bottom of the filter frame shown in Figure 3 of Williamson will not support an upright pipe that has openings and a filter around the pipe. . . . Since there is no bottom wall in the Williamson device that can support an upright pipe with a filter around it, if the unit shown in the Singleton patent was placed into that frame [i.e., the frame disclosed in the Williamson patent], water would flow out around the corners, and [the unit] would not work for its intended purpose."

These remarks make clear that, as initially conceived, the invention claimed in the '207 patent covered only a basin with a standpipe. But at the time that Wimberger made these remarks, the only claims before the PTO were apparatus claims that expressly included a standpipe -- claims that eventually issued as claims 1 through 5 of the '207 patent. There is no dispute that claims 1 through 5 cover only basins with standpipes, and those claims have not been asserted in this case.

The examiner disagreed with Wimberger's arguments about the prior art and, on June 23, 2004, rejected what are now claims 1 and 5 as obvious in light of the prior art. Westman Decl. Ex. F (PTO Office Action June 23, 2004) at 3-4. The examiner also rejected all of the claims as obvious in light of Wimberger's related patent, U.S. Patent No. 6,609,852 (the '852 patent), but advised Wimberger that this ground of rejection (obviousness-type double patenting) could be overcome if
Wimberger filed a terminal disclaimer to limit the term of what became the '207 patent to the term of the '852 patent. Id. at 4-7.

Meanwhile, before he received word of the PTO's June 23 rejection, Wimberger again amended his claims, adding for the first time apparatus claims that were not expressly directed to a basin with a standpipe. Those new claims, which were directed to an erosion-control basin with "a filtered drain," eventually issued as claim 6 (an independent claim) and claims 7 to 8 (dependent claims based on claim 6). See Westman Decl. Ex. E (Suppl. Amend. June 21, 2004) at 4. In submitting the new claims, Wimberger did not mention that they covered basins without standpipes. Instead, he asserted that the new claims "relate specifically to an erosion control basin of the type present in [what was then] claim 8" -- i.e., in current claim 1, which includes a standpipe. Id. at 5. Wimberger pointed out only one difference between the new, non-standpipe-specific claims and the earlier standpipe-specific claims, asserting that "[t]he feature of the new claims is the deflector wall that aids in controlling overflow water and diverts or deflects water from an overflow opening forming part of the storm sewer inlet on a lateral side of the grated frame." Id. (emphasis added).

In August 2004, in response to the amendment including these new claims, the patent examiner reiterated his earlier rejection of the standpipe-specific claims as obvious in light of the prior art, as well as his earlier rejection of those claims based on obviousness-type double patenting (a rejection that could be overcome by a terminal disclaimer). Westman Decl. Ex. G (PTO Office Action Aug. 27, 2004) at 3-8. But as to the new, non-standpipe-specific claims, the examiner did not reject them as obvious (apparently because of the inclusion of the deflector wall); rather, he found that they would be allowable if Wimberger filed a terminal disclaimer. Id. at 8. The examiner did not mention anything about the fact that the new claims were not drawn to basins with standpipes.

If the prosecution history had ended at that point, the Court would likely agree with Lange that, based on the prosecution history, Wimberger disclaimed coverage of basins without standpipes. Wimberger first distinguished his invention from the prior art on the basis that the prior art did not disclose a standpipe. Westman Decl. Ex. D (Amend. Apr. 19, 2004) at 5-7. He then described his non-standpipe-specific claims as "of the type present" in claims that featured standpipes, and pointed out a single difference -- a deflector wall -- in the new claims without pointing out an arguably more-significant difference -- the lack of a standpipe. Westman Decl. Ex. E (Suppl. Amend. June 21, 2004) at 5.

WIMCO argues that Wimberger described the new claims as "of the type present" in the earlier-submitted, standpipe-specific claims only to point out that they were apparatus claims, in contrast to the abandoned method claim. Pl. Reply Br. Supp. Claim Constr. at 7-8 [Docket No. 35]. Perhaps this was Wimberger's subjective intent, but that subjective intent is irrelevant. The doctrine of prosecution disclaimer is grounded in the notion that the public should be able to rely on statements made by a patentee in the course of obtaining a patent. The public does not have access to the subjective intentions of a patentee or his lawyer; accordingly, only the objective import of the patentee's statements is relevant. See Vitronics Corp. v. Conceptor, Inc., 90 F.3d 1576, 1583 (Fed. Cir. 1996) ("The claims, specification, and file history, rather than extrinsic evidence, constitute the public record of the patentee's claim, a record on which the public is entitled to rely. In other words, competitors are entitled to review the public record, apply the established rules of claim construction, ascertain the scope of the patentee's claimed invention and, thus, design around the claimed invention.").

By the time Wimberger added the non-standpipe-specific claims, he had already abandoned the method claim. See Westman Decl. Ex. D (Amend. Apr. 19, 2004) (electing to prosecute apparatus claims). Thus it is highly unlikely that an objective reader of the prosecution history would construe Wimberger's statement that the non-standpipe-specific claims were drawn to a basin "of the type present" in current claim 1 to mean merely that they were apparatus claims (something that was readily apparent from the face of the claims and that did not need to be pointed out to the PTO). Rather, an objective reader would take that statement to mean that the new claims were drawn to an apparatus like the apparatus that had already been claimed, with one difference (the only difference noted by Wimberger): The new claims featured a deflector wall.

The prosecution history did not, however, end at this point. Wimberger responded to the examiner's August 2004 rejection of the standpipe-specific claims by again emphasizing the standpipe, but he emphasized it only in connection with the standpipe-specific claims, and not in connection with the new, non-standpipe-specific claims. Westman Decl. Ex. H (Amend. Nov. 19, 2004) at 6-9. At the same time, Wimberger filed a terminal disclaimer to overcome the rejection of the non-standpipe-specific claims. The PTO then allowed, without comment, all of the previously rejected claims, both standpipe-specific and non-standpipe-specific. Westman Decl. Ex. J (Notice of Allowability Mar. 23, 2005).
A few months after the PTO's allowance of the claims, Wimberger filed a "Request for Continued Examination" to reopen prosecution of the patent and to amend it by adding additional claims. Westman Decl. Ex. K (Request for Cont. Exam. June 16, 2005). Specifically, the main purpose of the amendment was to add four new non-standpipe-specific claims, which eventually issued as claims 9 through 12. In response, the examiner not only rejected the new claims, but he also rejected the non-standpipe-specific claims that he had previously allowed. Westman Decl. Ex. L (PTO Office Action Summary July 26, 2005). In doing so, the examiner clearly demonstrated his understanding that the non-standpipe-specific claims were drawn to a basin that did not necessarily include a standpipe. The examiner rejected the claims that eventually issued as claims 6 through 12 as either anticipated or obvious in light of U.S. Patent No. 5,405,539 to Schneider, which discloses an L-shaped, mesh-covered structure for filtering water at storm-sewer inlets. See Westman Decl. Ex. L (PTO Office Action Summary July 26, 2005) at 3-5; U.S. Patent No. 5,405,539. The structure disclosed in Schneider filters water through two flat, mesh-covered surfaces, the first of which is parallel to the ground and the second of which is perpendicular to the first. Schneider includes nothing even vaguely resembling a standpipe.

Wimberger responded to this rejection by making minor amendments to his claims and by distinguishing the rejected claims from Schneider. In distinguishing Schneider, Wimberger emphasized that his claimed basin had a different frame from the Schneider invention and featured a deflector wall and an overflow opening that were not found in Schneider. Westman Decl. Ex. N (Amend. Oct. 25, 1995) at 7-9. The examiner was apparently persuaded, because he allowed the challenged, non-standpipe-specific claims, which issued as claims 6 through 12.

The examiner's rejection of Wimberger's non-standpipe-specific claims in light of Schneider put the world on notice that Wimberger's patent was not limited to basins with standpipes. That rejection (which Wimberger eventually overcame) also establishes that Wimberger did not secure allowance of his claims by misleading the PTO as to their nature. Even if Wimberger, early in the prosecution history, tried to distract the patent examiner from the fact that some of his claims did not require a standpipe, the examiner was well aware of this fact by the time he allowed the claims that issued as the '207 patent. The doctrine of prosecution disclaimer does not, therefore, mandate construing the broad term "filtered drain from the erosion control basin" in claim 6 to cover only the narrow embodiment of a "standpipe with filter sock located in the interior of the erosion control basin," as Lange contends.

1. "Filtering"

HISI contends that "filtering" includes "not just the use of filters, but also settling of taste causing components by cooling and/or storage over time, or aging of the smoke so as to allow time for the taste causing components to settle or weaken in strength." (HISI Brief 19.) TPI argues, however, that the specifications of the Kowalski patent distinguish "filtering" from cooling and settling, and so "filtering," as used in Claim 67, cannot be read to encompass these other terms. TPI points to the statement in the specifications that "complete super purification of smoke can be accomplished using one method, or a combination of methods, in current practice, including filtering, separating, distilling, scrubbing, cooling, freezing, inertial impact, centrifugal force, or settling." (Kowalski Patent, Col. 12, at 13-17.) TPI argues that because "filtering," "cooling," and "settling" are each listed as distinct means of achieving "super-purification," the word "filtering" cannot be read to include cooling and settling when used in Claim 67.

In response, HISI points to other places in the specifications where cooling and settling are included within the definition of filtering. These include the Kowalski Patent's discussion of prior art techniques that include "cooling" and "settling" as types of "filtering methods," 3 (Kowalski Patent, Col. 12, at 24-26), as well as its explanation that "allowing the phenols, and any other remaining carcinogens, in the smoke to settle, or 'age' . . . is the final backup filtering step in the process," (Kowalski Patent, Col. 14, at 19-23). Moreover, the Kowalski Patent's preferred embodiment discloses a process in which the smoke is "partially filtered by the ice" through cooling and condensation (Kowalski Patent, Col. 18, at 33-34), and is then eventually put through a final "settling step of aging the smoke" (Kowalski Patent, Col. 19, at 43).

3 This discussion, in its entirety, reads as follows.
The amounts of tar, soot, ash, char and other microscopic particulates have been filtered and minimized by many methods in current practice including tar settling systems, baffling systems, and washing systems in the line form the smoke generator to the smoking chamber. In addition, cooling and storage reduces the concentrations of phenolic particulate through settling. Some of these filtering methods . . .

(Kowalski Patent, Col. 8, at 19-26 (emphasis added).)

There is little doubt that the Kowalski Patent discloses settling and cooling processes to remove certain particles from smoke; the issue is whether the word "filtering," as used in Claim 67, encompasses these processes. The Court finds that it does. While the specifications do occasionally use "filtering" in its narrow sense, they more often use it in a broader sense that does include both cooling and settling processes. This is particularly so when the specifications are read as a whole, in context, from beginning to end. The overview of different filtering processes discussed in the "Background Art" section of the specifications recognizes cooling and settling as two types of filtering. And while filtering is initially used in its narrow sense early in the "Summary of the Invention" section, the later parts of the summary make it clear that "filtering" is a much broader term. (See Kowalski Patent, Col. 14, at 19-23.) Thus, viewed in their entirety, the Kowalski specifications demonstrate that "filtering" is a broadly-defined process including not only passing a gas or liquid through a porous material, but also the cooling and settling of the smoke.

Lifestream adds that the district court appeared to unduly limit the claim scope because of concern that the claim language was overly broad. We disagree that such concern, if present, lead to it to erroneously conclude that the arguments of the patent applicant should apply to the claims at issue.

Each side levels charges that the other has waived arguments that both press on appeal. We find the charges are either without merit or moot. Lifestream also complains that the district court improperly relied upon testimony from Polymer Tech's expert, Dr. Smith, to support the claim construction. As far as we can tell, the district court neither cites nor mentions Dr. Smith as a basis for its analysis. We find no merit to Lifestream's complaint.

Lastly, Lifestream contends that the district court, as a result of clerical error, confused the definition of "test membrane" with the term "filtering membrane." 2 Polymer Tech submitted no argument to rebut Lifestream's contention. We agree that it appears that the district court confused the two types of membranes. The '716 patent informs us that the filtering membrane blocks "LDL and VLDL precipitates and prevents them from reaching the plasma collecting test membrane." '716 patent, col. 4, ll. 23-25. "Its function is to block the precipitated particles from reaching the test zone." Id., col. 3, ll. 26-31. Thus, Lifestream is correct in asserting that the filtering membrane "receives blood or plasma, retains LDL and VLDL precipitates from the blood or plasma, and passes filtered plasma to the next adjacent level." By contrast, the test zone, corresponding to the test membrane, "contains enzymes and chromogens for cholesterol assay so that plasma reaching it (now devoid of LDL and VLDL components) reacts with the reagents in plasma collecting test membrane 6, producing a colored reaction, the intensity of color being proportional to HDL cholesterol concentration." Id., col. 4, ll. 34-41. In other words, the test membrane "gathers filtered plasma without LDL or VLDL precipitates and performs a measurable reaction with the filtered plasma." We agree with Lifestream that the district court confused "filtering membrane" with "test membrane." The term "filtering membrane" should have been construed to mean: "A thin, soft pliable layer that receives blood or plasma, retains LDL and VLDL precipitates from the blood or plasma, and passes filtered plasma to the next adjacent level."

2 The district court had construed "filtering membrane" to mean:

A thin, soft pliable layer that gathers filtered plasma without LDL or VLDL precipitates and performs a measurable reaction
with the filtered plasma.

2. "Fin structure"

a. Parties' Positions

The parties propose the following constructions for "fin structure" which is present in claims 2 and 3 of the '631 Patent. Here, the primary dispute is whether the claim term should include a sheet material requirement and whether there is a "vertical stacking" requirement as urged by Defendants.

Plaintiff
An arranged grouping of fins

Defendants
A structure formed from sheet material and defining plural, vertically stacked air passages extending parallel to the second surface

b. Court's Construction

Plaintiff asserts a "fin structure" contemplates an arranged grouping of fins. According to Plaintiff, "fins" and "fin structures" refer to the technology used in heat sinks in which metal protusions extend from the surface of the heat sink in order to increase its surface area, thereby facilitating greater heat dissipation. ('631 Patent at 1:20-52).

Defendants propose that there must be "vertically stacked air passages extending" from the surface of the heat sink, "parallel" to the surface. Defendants' reference to a fin structure which incorporates "vertically stacked air passages" stems from a particular embodiment of the invention described in the specification. The specification discusses an embodiment involving a "serpentine"-style fin structure. ('631 Patent at 6:50-58). The "primary structure" of this particular fin style employs "a series of integral vertically extending fin supports," resulting in vertically stacked air passages. Id.

However, this feature of this particular embodiment is not described as a necessary feature of any claim. ('631 Patent at 6:7) (discussing this embodiment as merely "one particular version of the third embodiment of the invention"). The specification acknowledges that the vertically-extended "primary structure" of this serpentine-style embodiment is not a feature of the other embodiments. ('631 Patent at 5:43-46) ("[A] third embodiment of the invention, which is disclosed in FIGS. 6-9, differs from the first two embodiments not only in fin structure but also in the primary structure which supports the fin material."). While the specification recognizes that the invention permits vertical stacking, ('631 Patent at 2:62-64), Defendants' proposal would require vertical stacking. Not only does the specification undercut Defendants' proposal that vertical stacking be construed as a general limitation on the claim language, but the claims themselves also fail to reference "vertically stacked air passages."

Defendants argue that "optimal" fin spacing and length are requirements of the '631 Patent. (Defendants' Response at 11). According to Defendants, the patent discloses three configurations of fin structures-- honeycomb, corrugated and serpentine--that achieve the patent's stated objectives. Defendants assert each of these configurations includes vertically stacked air passages that extend parallel to the second surface. Although acknowledging the patent is not limited to the three embodiments, Defendants assert the vertical stacking permits the optimality required of the essential transverse flow, minimizing the air flow path while increasing the air flow cross section. Thus, Defendants argue the patent is limited to structures that include vertically stacked passages because only those structures are capable of providing the surface area needed to dissipate heat over such short fin lengths as contemplated in the '631 Patent. However, Defendants' argument ignores the specification's references to how the invention does not guarantee optimality, but merely seeks to approach it more closely. ('631 Patent at 1:55 - 2:23 & 3:14-16).
Although the specification discusses vertical stacking as an attractive option, nowhere is vertical stacking described as essential. The Court is also not convinced the structures must be formed from sheet material. Rather than utilize Plaintiff's proposed construction, "an arranged grouping of fins," the Court construes the term "fin structure" to mean "an arrangement of fins and air passages."

1580

A. "Finger"

1. Parties' contentions

The patent documents describe the various components of the workstation as having a "finger" that engages longitudinal slots along the rail extrusions to support the component and to permit its horizontal adjustment along the length of the console.

TBC proposes that "finger" be defined as: "A member, projecting from and part of a first object and designed to interface with a second object so as to limit or direct movement of the first object with respect to the second object."

Forecast agrees with TBC that a "finger" is ",[a] member that projects from the a first object to effect, direct, or restrain motion when brought into contact with the second object." Forecast, however, rejects that part of TBC's proposal, which limits the definition of "finger" to a member that must be "part of" the first object. Instead, Forecast proposes that the definition of "finger" be clarified to provide that a "finger may be formed integrally with the first element or may be permanently or removably fitted thereto or therethrough. 8

8 The parties use the example of a removable "bolt" to give content to this latter concept.

The parties thus disagree as to whether a finger must not only project from the first object, but must also be an integrated part thereof. As set forth below, the Court discerns no such limitation on the meaning of "finger" in the context of the Forecast patents. 9

9 Forecast and TBC both assert in their memorandums that it is unnecessary for the Court to consider extrinsic evidence in construing the claim terms. The Court agrees, and does not find particularly helpful in its analysis either the general usage dictionary definition of "finger" submitted by Forecast or the "Bosch" product catalogue submitted by TBC as part of the parties' claim construction papers.

2. Intrinsic evidence

a. Claim language

The term "finger" is found in claims 1, 6, 8, 9, 13, 15 of the '712 patent; claims 1, 5, 7, 9, 11, 12 in the '088 patent; and claims 1, 7, 9, 11, 13 of the '803 patent. The language in those claims dictates that a "finger" is (1) a member that projects from the first object (often, a component); (2) which engages a longitudinal slot found on the second object (here, the rail extrusion); (3) so as to support the component and to permit its horizontal adjustment along the length of the console. The claim language does not suggest, much less require, that a finger must also be "part of" the component object from which it projects.

b. Specification
The Court next turns the Forecast patents’ specification. TBC argues that the Forecast patents’ specification demonstrates an intention to limit the definition of finger to a device that must be part of the object from which it projects. According to TBC, the patents’ illustrations represent a finger as a physically integrated member, not as a member that must be fitted or fastened to the component object. According to TBC, a physically integrated finger is not merely a preferred embodiment of the Forecast invention, it is its only intended embodiment. The Court disagrees.

The Federal Circuit has expressly rejected the contention that “if a patent describes only a single embodiment, the claims of the patent must be construed as being limited to that embodiment.” Phillips, 415 F.3d at 1323; see Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004) (collecting cases). The question instead is whether the patentee intends for the embodiment to define the outer limits of the claim term. Phillips, 415 F.3d at 1323. As set forth below, the Court discerns no such intention from the patent documents.

First, TBC is, in any case, incorrect that the Forecast patents strictly limit the concept of a "finger" to an integrated member. Claim 9 of the '088 patent recites that a vertical support stand - used for horizontally translating a piece of audiovisual equipment, such as a monitor, along the length of the console - has a "finger" engaged in a longitudinal slot on the upper surface of the first rail extrusion. The disclosed structure for supporting the vertical support stand is a T-shaped "bolt", which, the parties agree, is the paradigm for a non-integrated (that is, permanently or removably fitted) member. TBC's proposed definition of finger would exclude the Forecast patents' preferred embodiment of the device used to attach the vertical support stand recited in claim 9. 10 Such a construction, the Federal Circuit teaches, is "rarely, if ever, correct." Vitronics, 90 F.3d at 1583.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

10 The specification in relevant part recites that the "vertical support stand [76] includes a leg [78] having a T-shaped finger or fitting [70] fixed thereto, for example, by a bolt." (Col. 7, lines 9-12 (emphasis added).) The number "70" is a typo, however, as the "T-shaped finger or fitting" referred to is the structure labeled as "80" in the relevant drawing. (Fig. 4.)

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

Finally, when read as a whole, the Forecast patents do not disclose an intention that TBC's proposed limitation be a part of every embodiment. The premise of the Forecast patents are that "in all embodiments" the components of the workstation are "mounted to the master rail system to permit their horizontal adjustment along the length of workstation." ( ’712 patent; col. 4, lines 7-10.) The specification's detailed description of the invention does not suggest that this adjustment is always or necessarily accomplished by a finger that is part of the component object. 11 The "very character of the invention" does not require the finger to be so constructed. Alloc, Inc. v. Int’l Trade Comm’n, 342 F.3d 1361, 1370 (Fed. Cir. 2003) ("[T]his court looks to . . . whether the specification read as a whole suggests that the very character of the invention requires the limitation to be a part of every embodiment."); see Sunrace Roots Enter. Co. v. SRAM Corp., 336 F.3d 1298, 1305 (Fed. Cir. 2003) (recognizing that although "the patentee was primarily focused on an [particular] embodiment of the invention . . ., nothing in the patent limits the claims to that embodiment").

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

11 The Federal Circuit's analysis in Toro Company does not, as TBC contends, indicate a contrary result. In Toro Company v. White Consol. Indus., Inc., 199 F.3d 1295, 1300-01 (Fed. Cir. 1999), the specification and drawings of the patent at issue showed a restriction ring as "part of" and "permanently attached to" the air the blower cover at issue. The court found that the patent required the cover and ring be a single component. But, in doing so, the court relied on the specification, which described the restriction ring as "buil[t] . . . as part of the air inlet cover," and further described "the advantages of the unitary structure as important to the invention." Id. Here, the specification does not describe the "finger" as part of the component, nor does it describe any of the perceived benefits of such a unitary structure.

- - - - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

The very character of the Forecast invention requires only that a member finger project from the component and engage a longitudinal slot, to support the component and permit its horizontal adjustment. Thus, the Court construes "finger" to mean;
"A member that projects from a first object to effect, direct, or restrain motion when brought into contact with a second object. A finger may be formed integrally with the first object or may be fitted thereto or therethrough." 12

12 The Court notes that this definition eliminates certain aspects of the Forecast proposal that could inject unnecessary ambiguity into the definition; namely, its use of the word "element" in place of "object," and its use of the adverbs "permanently or removably" to modify "fitted" in the definition's last sentence.

A. Finger Placement Indicia

Defendant asks the court to construe the "finger placement indicia" language of claim 1 to mean "markings placed on the surface of a single baseball cover to indicate location of the index and middle fingertips for both right and left handed pitchers." Plaintiff disagrees. According to plaintiff, the claim language should be interpreted literally. That is, the plaintiff disclaims any interpretation of "indicia" that requires markings applicable to both right and left handed pitchers or that is limited to fingertips.

The court agrees with the plaintiff and adopts a literal reading of the unambiguous claim language; claim 1 discloses a baseball that has markings for left handed students, right handed students, or both. The court's conclusion is grounded in the plain language of claim 1. Nothing in the claim limits its scope to both right and left handed indicia. Moreover, the court's conclusion is grounded in the doctrine of claim differentiation, which presumes that there is a difference in scope among the claims of a patent. See Comark Communications, Inc. v. Harris Corp., 156 F.3d 1182, 1187 (Fed. Cir. 1998) ("There is presumed to be a difference in meaning and scope when different words or phrases are used in separate claims. To the extent that the absence of such difference in meaning and scope would make a claim superfluous, the doctrine of claim differentiation states the presumption that the difference between claims is significant." (citation omitted)). Claim 1 describes finger placement indicia which need not, on the face of the claim, apply to both left and right handed pitching students. Claim 3, dependent upon claim 1, alters claim 1 only by adding the further limitation that the finger placement indicia include markings for left and right handed pitching students. Under the doctrine of claim differentiation, the court presumes that the finger placement indicia of claim 1 are not limited to indicia for both left and right handed pitchers because to so find would render claim 3 superfluous.

The defendant argues against the court's reading by pointing to the patent specification, which makes multiple references to the "both-right-and-left-handed" concept. See, e.g., '193 patent, col. 2, lines 7-10 ("indicia . . . for both left and right handed students"); '193 patent, col. 1, lines 48-50 ("for both left and right handed students of pitching"). The court hesitates to so limit claim 1, however, because "while . . . claims are to be interpreted in light of the specification and with a view to ascertaining the invention, it does not follow that limitations from the specification may be read into the claims." Sjolund v. Musland, 847 F.2d 1573, 1581 (Fed. Cir. 1988). The Federal Circuit has recognized "that there is sometimes a fine line between reading a claim in light of the specification, and reading a limitation into the claim from the specification." Comark Communications, Inc., 156 F.3d at 1186 (finding the defendant's sought claim construction without merit because the disputed term had a clear and well-defined meaning and because the defendant sought to borrow a limitation appearing directly in the preferred embodiment section of the specification).

Although the question here is much closer than it was in Comark Communications, the court does not believe the '193 patent specification language is sufficient to overcome the presumption that claim 3 is not completely superfluous. Cf. ATD Corp. v. Lydall, Inc., 159 F.3d 534, 541 (Fed. Cir. 1998) (claim differentiation presumption overcome where dependent claim was not rendered completely superfluous by defendant's proposed interpretation, patent specification specifically referred to defendant's proposed interpretation, and text of independent claim itself implicitly supported defendant's proposed interpretation). Defendant's reliance on the '193 patent specification carries some appeal because, unlike Comark Communications, it is based not merely on the preferred embodiment of the '193 patent but on the background and summary of the invention, as well. On the other hand, the language of the claim itself here, although not entirely precise, unlike ADT
Corp. and like Comark Communications, is not ambiguous. The court believes that a person of reasonable skill in the art would understand the "finger placement indicia" limitation not to exclude baseballs having only indicia for right or left handed students. Moreover, like Comark Communications and unlike ADT Corp., nothing on the face of claim 1 implicitly supports the defendant's proposed interpretation.

The defendant also relies on the prosecution history, which, according to the defendant, indicates that the plaintiff relied on the both-right-and-left-handed concept before the Patent and Trademark Office and the Board of Patent Appeals and Interferences. As an initial matter, the court rejects the defendant's argument because the defendant has not sufficiently demonstrated on the record before the court that the plaintiff understood or otherwise represented during the patent's prosecution that "finger placement indicia" refers only to both-right-and-left-handed indicia. The defendant asks the court to find that the case here is akin to Gentry Gallery, Inc. v. Berkline Corp., 134 F.3d 1473, 1479-80 (Fed. Cir. 1998) (reversing bench trial factual finding that patent was not invalid for failure to comply with written description requirement of § 112 par. 1 where original disclosure was not broad enough to support broad reading advanced by plaintiff). Whatever the merits of this argument, however, it is premature because a determination of validity under § 112 par. 1 is an issue of fact and is thus inappropriate for determination in a Markman proceeding. See Tronzo v. Biomet, 156 F.3d 1154, 1158 (Fed. Cir. 1998); Gentry Gallery, Inc., 134 F.3d at 1479. Although the Federal Circuit has explained that where, after all intrinsic-evidence-based canons of claim construction have been exhausted, "there is an equal choice between a broader and a narrower meaning of a claim, and there is an enabling disclosure that indicates that the applicant is at least entitled to a claim having the narrower meaning, we [will adopt] the narrower meaning," see Athletic Alternatives, Inc. v. Prince Mfg., Inc., 73 F.3d 1573, 1581 (Fed. Cir. 1996), cited in Digital Biometrics v. Identix Inc., 149 F.3d 1335, 1344 (Fed. Cir. 1998) (canon applies only after consideration of intrinsic evidence fails to resolve doubt about the exact meaning of the claim terms), the canon has no application here. As explained above, consideration of intrinsic evidence leaves the court confident that the finger placement indicia limitation of claim 1 does not require both-left-and-right-handed markings.

Finally, the defendant claims that its reading of the disputed language must be adopted because adopting the plaintiff's reading would cause claim 1 to read directly on United States Patent 2,925,273, issued in 1960 to Pratt (the "Pratt patent"), and cited in the prosecution history of the patent in suit. 2 When construing a claim, it is appropriate to consider prior art patents that have been cited in the prosecution of a patent in suit. See Eastman Kodak Co. v. Goodyear Tire & Rubber Co., 114 F.3d 1547, 1555 (Fed. Cir. 1997), overruled on other grounds by Cybor Corp. v. FAS Techs., 138 F.3d 1448, 1456 (Fed. Cir. 1998) (en banc). The court must endeavor to construe claims in such a way that their validity will be upheld. Quantum Corp. v. Rodime, PLC, 65 F.3d 1577, 1584 (Fed. Cir. 1995).

The court rejects the defendant's Pratt-based argument because the court does not believe it can conclude that the construction adopted today reads on Pratt as a matter of law. See 35 U.S.C. § 102(b); Electro Med. Sys., S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1052 (Fed. Cir. 1994) (anticipation requires the presence of each and every element of a claimed invention within a single prior art disclosure); Lewmar Marine, Inc. v. Barent, Inc., 827 F.2d 744, 747 (Fed. Cir. 1987) ("That which would literally infringe if later in time anticipates if earlier than the date of the invention.") (emphasis omitted). Specifically, Pratt may not have "means for indicating the orientation of the baseball relative to the palm of the hand" as required by claim 1. During prosecution of the '193 patent, the Board of Patent Appeals and Interferences of the Patent and Trademark Office concluded that Pratt does not disclose orientation means. Ex parte McGinley, No. 94-1121, slip op. at 15 (Bd. Patent App. Feb. 10, 1994) (expressly overruling patent examiner's conclusion that Pratt discloses orientation means). Of course, the defendant may litigate in this case whether Pratt discloses orientation means, but the issue is not appropriate for determination in this Markman proceeding because it is an issue of fact—not law. See Electro Med. Sys. S.A., 34 F.3d at 1052; Haney v. Timesavers, Inc., 900 F. Supp. 1375, 1378 (D. Or. 1995) (narrow claim construction based on asserted prior art anticipation under broad reading is inappropriate where anticipation is a disputed issue of fact); Elf Atochem North America, Inc. v. Libbey-Owens-Ford Co., 894 F. Supp. 844, 860 (D. Del. 1995) ("to preserve Atochem's right to a jury trial on the [disputed] issue of anticipation, this court will not look to the [prior art] patent in construing the words in claim 1 of the [patent in suit]").
finger plate

It is Plaintiff's position that the term "finger plate" is unambiguous and is readily comprehensible to the finder of fact. Defendants provide the following definition of finger plate: "[S]urface area of the lever to which the user's finger will come in contact during operation."

Plaintiff argues that Defendants' construction does not add clarity and will, in fact, confuse the finder of fact. Plaintiff further argues that "during operation" is unclear.

Although the Court agrees that the term "finger plate" requires no definition, the Court's reasoning differs from that of Plaintiff. Defendants' definition will not confuse the fact finder because the term "finger plate" speaks for itself. Moreover, the operation of a finger plate is obviously to open the binder. This is not unclear.

The specifications provide that the release lever includes a "thumb or finger plate." ('729 patent, col. 3, ll. 36-37.) The claim language teaches that the finger plate is sized to receive a finger of the user. (Id. at col. 5, ll. 1-3.) Defendants cite the prosecution history which repeats what is in the patent claim and specification -- the finger plate is sized to receive the finger of a user, allowing for greater leverage. (Pl Ex. A at 57.)

The Court finds no mystery here. Therefore, the Court declines to define this unambiguous term.

3. Claim 3

The parties seek construction of the following highlighted term of Claim 3: "Apparatus as claimed in claim 1 wherein the locating surfaces comprises a plurality of fins extending inwardly from the casing interior." ('300 patent, col. 4, ll. 47-49.) P&M construes "fins extending inwardly from the casing interior" as "long, narrow longitudinally-extending locating surfaces." (Pls. Opening Mem. at 30.) Rose Art construes "plurality of fins" as "three wing-like ridges" because the specification refers to "three fins." (Def. Pre-Markman Hr'g Br. at 43.) Although the specification refers to three fins in describing a preferred embodiment, the Court cannot limit the claim to one preferred embodiment. Electro Med. Sys., 34 F.3d at 1054. Moreover, the word plurality, used to describe the number of fins comprising the locating surface, means two or more, not necessarily three. Dayco Prods. Inc. v. Total Containment, Inc., 258 F.3d 1317, 1327-28 (Fed. Cir. 2001) ("In accordance with standard dictionary definitions, we have held that "plurality," when used in a claim, refers to two or more items, absent some indication to the contrary.") (citation omitted). Accordingly, the term "plurality of fins extending inwardly from the casing interior" is construed as "two or more long, narrow longitudinally-extending locating surfaces."

C. "first" and "second"

Claims 1 and 14 of the 736 patent use "first" or "second" to modify various claim elements, such as "vacuum chamber," "rod set," and "space." The construction of "first" and "second" is important because the tandem mass spectrometer asserted as prior art is alleged to have elements similar to those in the 736 patent, but in a different order of ion travel. The construction is also important because Micromass's Quattro Ultima has an empty vacuum chamber before the hexapole ion bridge chamber alleged by AB/Sciex to be the "first vacuum chamber" in the 736 patent. Thus, the construction of "first" and "second" could dictate which element must come first in the claimed invention and the order in which subsequent elements must follow.
Micromass proposes that the plain meaning of "first" is "preceding all others in time, order, or importance," and the plain meaning of "second" is "next to the first in place or time." Webster's Ninth New Collegiate Dictionary 466, 1060 (1991). In the context of the 736 patent therefore, "first" and "second" sets where each element is located in the path an ion travels in the device. For example, the "first vacuum chamber" must be "the very first vacuum chamber encountered by the ions" and "second vacuum chamber" must be "the very next vacuum chamber encountered by the ions." In this way, Micromass contends "first" and "second" dictate the absolute position of each particular element in the device.

AB/Sciex proposes that "first" and "second" only identify separate, but distinct, elements. That is, the 736 patent discloses two vacuum chambers and the terms "first" and "second" should be understood as separately identifying "a vacuum chamber" and "another distinct vacuum chamber," respectively, without specifying a particular order.

AB/Sciex's position that "first" and "second" do not establish positions in the claimed invention and are mere identifiers is premised on the following three arguments. First, AB/Sciex argues that it is well-established practice among the patentees to use "first" and "second" as identifiers of similar, but distinct, elements. It notes that numerous cases and treatises demonstrate that patent drafters use the terms "first" and "second" to identify separate elements. See, e.g., Envrco Corp. v. Clestra Cleanroom, Inc., 209 F.3d 1360, 1365-66 (Fed. Cir. 2000) (distinguishing "the 'second' from the 'first baffle means'"); Canon Computer Sys., Inc. v. Nu-Kote Intl, Inc., 134 F.3d 1085, 1089-90 (Fed. Cir. 1998); Neomagic Corp. v. Trident Microsystems, Inc., 98 F. Supp. 2d 538, 544 (D. Del. 2000); Robert C. Faber, ed., Landis on Mechanics of Patent Claim Drafting, § 19, at III-16 (4th ed. 1999); 2 Irving Kayton et al., Patent Practice § 10.22 (f) (6th ed. 1998). None of the cases or treatises cited, however, state that "first" and "second" are only identifiers and that they do not also explain the position of elements. Indeed, most of the cases and treatises have no discussion of the meaning of "first" or "second," or the terms thereby modified, at all. Thus, it is not clear that patent drafters using "first" and "second" do not also intend to impart positional significance to those terms.

Second, AB/Sciex notes the claims state, for example, either "first and second vacuum chamber" or "a first rod set" and "a second rod set." The claims do not state "the first rod set" or "the second rod set." AB/Sciex argues that because the claims do not use the definite article "the," the claims cannot be interpreted to mean "the very first rod set" or "the very next rod set." This argument is unpersuasive, however, because AB/Sciex does not explain how the use of either no article, the indefinite article "a," or the definite article "the" explains how "first" and "second" should be properly construed.

Looking only at these arguments, Micromass's reliance on the plain meaning of "first" and "second" might be persuasive. Were "first" and "second" merely identifiers, as AB/Sciex suggests, the drafters of the 736 patent could just as easily have said, for example, "a vacuum chamber" and "another vacuum chamber," or "vacuum chamber A" and "vacuum chamber B." Either would have identified separate vacuum chambers without also suggesting a positional hierarchy.

But relying on the plain meaning of "first" as "preceding all others in time, order, or importance" and the plain meaning of "second" as "next to the first in place or time" does not necessarily provide a correct construction of the use of those terms in the patent. Nowhere in the claims themselves is it stated that "first" must mean "preceding all other in the path of ion travel," as opposed to, for example, "preceding all others in importance." While the use of "first" and "second" in the patent is consistent with "first" and "second" in the path of a traveling ion, this construction is not required by the claims themselves. Therefore, Micromass's plain meaning argument does not necessarily support its contention that "first" and "second" establish the absolute position of the elements.

Importantly, Micromass's proposed construction of "first" and "second" as setting the absolute position of elements is inconsistent with one of the preferred embodiments in the specification. Were the court to adopt Micromass's position that "first" and "second" must mean "the very first" and "the very second," Figure 12 would be excluded from coverage under the claims. While Figure 1 of the 736 patent shows the more basic embodiment of the invention with only two vacuum chambers (30 and 38), Figure 12 presents a slight variation in which an empty vacuum chamber (70) is added, after the ionization chamber (16') but before the ion guide chamber (30'). If the term "first vacuum chamber" is construed to mean the very first vacuum chamber in the path of ions, the preferred embodiment in Figure 12 would be excluded from coverage by the claims because claim 1 requires "a first rod set in said first vacuum chamber." AB/Sciex correctly notes that a claim construction that excludes a preferred embodiment "is rarely, if ever, correct and would require highly persuasive evidentiary support." Vitronics Corp., 90 F.3d at 1583.

[SEE FIGURE IN ORIGINAL]
Micromass argues that regardless of whether Figure 12 is covered by the claims, its construction is compelled by the prosecution history. See Elekta Instrument S.A. v. O.U.R. Scientific Int'l, Inc., 214 F.3d 1302, 1308 (Fed. Cir. 2000) (preferred embodiment may be excluded from patent's claims when patentee disclaimed the construction that would cover the embodiment). Micromass contends that when MDS distinguished the tandem mass spectrometer references during reexamination, it adopted a construction of "first" and "second" inconsistent with the position it now takes. As noted previously, ions traveling in a tandem mass spectrometer first encounter an AC-DC rod set in a low pressure vacuum chamber, then an AC-only rod set in a high pressure collision cell, and finally another AC-DC rod set in a low pressure vacuum chamber. In distinguishing this structure, MDS stated:

The French application also differs from the system of the invention in other ways. For instance, whereas the first rod set in the invention receives essentially an AC-only voltage, the first section in the French application receives both AC and DC voltages. Whereas the first vacuum chamber of the invention has a product of its pressure with the length of the first rod set equal or greater than 2.25 x 10^{-2} torr cm, whereby the pressure is at least 1.5 millitorr for a 15 cm rod set, the first section in the French application states that the pressure must be maintained low, typically at 10^{-5} torr. Further, whereas the second rod set in the invention receives both AC and DC voltages to act as a mass filter, the second section in the French application receives an AC only voltage and is for inducing dissociation of ions. The second chamber of the invention is at very low pressure while the French application states that the pressure in the second section may be varied from 0.1 millitorr to 10 millitorr.

Request for Reexamination at 13-14 (emphasis added); see also id. at 16 (Finnegan abstract), 19 (Finnigan paper), and 21 (Caldecourt article). Because MDS distinguished the tandem references based on which elements were "first" and "second," Micromass argues that the correct meaning for those terms must be "preceding all other elements in the path of ion travel" and "next to the first element in the path of ion travel."

It is apparent from the manner in which MDS uses "first" and "second" in the above passage that it intended to refer to "first" and "second" in the path of ion travel relative to each other. If MDS were only using "first" and "second" as identifiers of separate elements, and not the order of those elements, MDS's distinction would fail because the mere presence of the elements, in any order, would satisfy the claim limitations. Indeed, MDS made clear that it was using "first" and "second" as positions in the order of ion travel in distinguishing the Finnigan abstract, another tandem mass spectrometer reference.

The Finnigan abstract does not disclose or suggest that ions having a relatively low kinetic energy travel through an inlet orifice into a first vacuum chamber having a first rod set for receiving essentially only an AC voltage. The Finnigan abstract further does not disclose or suggest that ions then travel through an interchamber orifice to a second chamber having a second rod set receiving both AC and DC voltages.

Id. at 16 (emphasis added). From these statements, it is clear that MDS is relying on positional differences to distinguish the tandem references, and therefore disclaimed a more broad construction that the terms are mere identifiers of separate elements. In such cases, the Federal Circuit "has endorsed narrowing the interpretation of the claim to be consistent with a narrow claim scope urged by the applicant during the prosecution of the patent." Pall Corp. v. PTI Techs., Inc., 259 F.3d 1383, 1392-93 (Fed. Cir. 2001).

Although MDS disclaimed its proposed construction of "first" and "second" as mere identifiers, this "disclaimer" does not compel the court's adoption of Micromass's "absolute position" construction. AB/Sciex, in explaining its comments from the reexamination, set forth an alternative construction -- that "first" and "second" only define where in the invention the element is located relative to the other listed element. That is, regardless of how many vacuum chambers and rod sets there might be in the structure and where they are, the invention only requires that "first" come before "second." Or, put simply, the ion guide elements must precede the mass filter elements. MDS did not disclaim this construction of "first" and "second" on reexamination and, in fact, its comments were consistent with this construction.

This "relative positioning" construction of "first" and "second" is persuasive because it would cover Figure 12. The existence of an empty vacuum chamber prior to the vacuum chamber containing the ion guide is immaterial to whether the "first vacuum chamber" claimed in the invention precedes the "second vacuum chamber" claimed in the invention. Thus, the court will construe "first" to mean "an element" and "second" to mean "an element coming after, in the path of ion travel,
the first such element." This construction sets a relative relationship between the "first vacuum chamber" and "second vacuum chamber" consistent with the plain meaning of those terms and the reexamination history. The court does not believe that this construction reads the word "first" out of the claims. Rather, the court's constructions of "first" and "second" together establish the relative positions of those elements listed in the claims without regard to the existence or placement of similar elements not mentioned in the claims.

Therefore, the court finds that the construction of the terms "first" and "second" that best comports with the plain meaning of those terms, the patent's specification, and the reexamination history, is that they define the position, in the path of ion travel, of the elements in the invention relative to the similar elements also mentioned in the claims. Thus, "first" is construed to mean "an element." "Second" is construed to mean "an element coming after, in the path of ion travel, the first such element."

1. "first vacuum chamber" and "second vacuum chamber"

Consistent with the court's conclusion, it will further define the specific applications of "first" and "second" in the various elements. The court construes "first vacuum chamber" as "a vacuum chamber." The court construes "second vacuum chamber" as "a vacuum chamber coming after, in the path of ion travel, the first vacuum chamber." The parties agree that the term "vacuum chamber" means a chamber held at a pressure lower than atmospheric pressure.

2. "first rod set" and "second rod set"

The court construes "first rod set" as "a rod set." Similarly, the court construes "second rod set" as "a rod set coming after, in the path of ion travel, the first rod set."

Other than the adjective "first," Micromass raises two additional limitations that it argues are in the term "rod set." First, Micromass argues that "rod set" must be comprised of just that -- rods -- and that other shapes of electrodes, such as the rings of the latest Quattro Ultima design, cannot infringe the claims. It maintains that MDS, in distinguishing the ion trap references that use AC-only voltage during reexamination, disclaimed that the term "rod set" permits anything other than "rods." AB/Sciex agrees, but believes such a construction by the court to be unnecessary because "a rod is a rod." The court agrees and believes the proper construction of rod to be self-evident.

Micromass also contends that the "rod set" must be arranged as a quadrupole. It notes that the patent specification repeatedly refers to the arrangement of rods as a quadrupole in the preferred embodiment. See 736 Patent, Col. 4, ln. 21-23. Nowhere, however, do the claims of the 736 patent use the word quadrupole. Instead, claim 1 only requires "a plurality of elongated parallel rod means spaced laterally apart a short distance from each other." Claim 14 has a similar requirement. It is well-established that limitations not existing in the claims cannot be imported from specification. See Dayco Prods., Inc. v. Total Containment, Inc., 258 F.3d 1317, 1326 (Fed. Cir. 2001) ("although we construe claims in light of the teaching of the specification, we do not treat characteristics of a preferred embodiment as claim limitations"). Thus, the court finds that the term "rod set" in the claims of the 736 patent require only a plurality, meaning two or more, of rods in each rod set and do not require a quadrupole.

3. "first space" and "second space"

Claim 1(c) of the 736 patent discusses a space within each vacuum chamber and rod set such that "each rod set comprising a plurality of elongated parallel rod means spaced laterally apart a short distance from each other to define an elongated space therebetween extending longitudinally through such rod set." The preamble of claim 14 is similar. The court construes "first space" in both claims as "a space." Similarly, the court construes "second space" in both claims as "a space coming after, in the path of ion travel, the first space."

A. "a first and a second foot link, each having a foot engaging portion"

The Court adopts Precor's proposed construction of this term, which is the exact words that are used in the claim: "a first
Where the claim terms are susceptible to an ordinary meaning, that is the meaning the Court should adopt. Phillips, 415 F.3d at 1312-13. Fitness Quest does not suggest that someone of ordinary skill in the art would interpret the term any differently. Johnson Worldwide Assocs., Inc. v. Zebe Corp., 175 F.3d 985, 989 (Fed. Cir. 1999). Instead, Fitness Quest supports its construction of the phrase by arguing that the phrase "foot supporting link" that engages the "user's" foot is more accurate. This is because the "supporting" function is logically implied by the other claims, and suggested by the figures. Thus, including a few additional terms and re-organizing the phrase would simply make what is clear to someone of ordinary skill in the art also clear to the lay jury, as required by Phillips, 415 F.3d at 1314. Fitness Quest's proposed construction goes beyond this innocuous proposal by reading additional limitations onto this claim based on the specifications. The Court must not read limitations into a claim simply because they might be suggested in the specifications or figures. Comark Commun. v. Harris Corp., 156 F.3d 1182, 1186 (Fed. Cir. 1998).

28. The words "first and second impervious fluoropolymeric end caps" in the context of the claims of the 465 patent means that each end cap is a unitary structure that is applied to respective unsealed ends of a "filter arrangement." In the context of the Miller 465 patent, the filter arrangement is an element having a generally annular cross-section and includes a cylindrical microporous fluoropolymeric filter (e.g., PTFE membrane) and a cylindrical fluoropolymeric structure adjacent the filter for supporting the filter (e.g., core). In other words, each claimed "impervious end cap" cannot comprise two separate components, wherein the first component is welded to one end of an unsealed filter arrangement to provide a liquid-tight sealed end, and the second component is welded onto the previously-formed sealed end. Tr. 508-09.

29. The words used in claims 1 and 9 of the Miller 465 patent other than "impervious fluoropolymeric end caps" should be afforded their plain and ordinary meaning.

30. The claimed end caps function to support the filter arrangement and to prevent the destructive fluid from bypassing the filter arrangement. PTX 1 at col. 3, lines 15-17.

31. This claim construction is consistent with an embodiment of the filter disclosed in the drawings and written description of the Miller 465 patent. PTX 1. Figure 1 of the patent is set forth below:

[SEE FIG. 1 IN ORIGINAL]

PTX 1. The written description of the patent identifies the various components included in the figures (e.g., Figure 1) as follows:

As to the remaining disputes about the shape of the patented device, Medtronic’s construction is again too narrow. Medtronic would limit the apparatus to a three-dimensional, disk shape with parallel upper and lower surfaces and with an aperture going through the entire device running in a north-south direction. But the patent requires neither a disk shape nor parallel upper and lower surfaces. It simply mandates a shape with three surfaces (upper, lower, and outer). The terms "first and second longitudinal directions" mean simply opposing directions, and not anything more specific, such as 180-degree angles. A "cavity" is simply an opening in the aperture -- regardless of whether the aperture is fully enclosed -- which houses the cam member and whose width is larger than the opening of aperture to prevent the cam member from falling out.

First and second positions relative to said primary display

The Court construes the phrase to mean “two different positions relative to the primary display.”

MASS proposes that the phrase means “a first position for viewing by a user while the primary and secondary displays are in use, and a second position in which the secondary display is retracted to lie flat against the primary display when not in use.” MASS is attempting to narrow the independent claims by incorporating limitations from dependent claims.

“Claim differentiation . . . is clearly applicable when there is a dispute over whether a limitation found in a dependent claim should be read into an independent claim, and that limitation is the only meaningful difference between the two claims.” Wenger, 239 F.3d at 1233. MASS’s proposed “second position” is a limitation found in claim 21, which depends on claim 20. See ‘170 patent, Col. 6:50–56 (“a top edge of said secondary display extends along a side of said primary display for compactness”). The only “meaningful difference” between independent claim 20 and dependent claim 21 are claim 21’s requirements for “first position” and "second position.”14 See id. Thus, a strong presumption exists that claim 20 does not include claim 21’s position limitations. MASS has not overcome this presumption.

As discussed above, the first and second positions required in independent claims 15 and 20 are broader than the dependent claims. The written description describes the first and second positions as “during and before use.” See id., Abstract; Col. 1:65–2:1. As no special meaning is ascribed to either term; their plain and ordinary meanings apply. See Enercon, 151 F.3d at 1384. Here, the descriptors “first” and “second” simply refer to two distinct positions, but those positions are not specifically defined. Accordingly, the Court construes “first and second position relative to the primary display” as “two different positions relative to the primary display.”

First Cylindrical Stage

Claim 1 of the ‘644 Patent recites "the first cylindrical stage presenting a first mating surface for mating with the filter apparatus manifold . . ." ‘644 Patent at 6:61-6:63. The parties dispute whether the mating surface presented by the first cylindrical stage includes the horizontal surface from which the second cylindrical stage depends. Plaintiffs argue Claim 3 of the ‘644 demonstrates that the said horizontal surface is not a "mating surface" presented by the first cylindrical stage. Claim 3 recites:

The filter cartridge of claim 1 wherein the connecting wall between the recess first cylindrical stage and recess second cylindrical stage has a tapered projection thereon, the tapered projection acting to engage a valve disposed in the filter apparatus manifold, said engagement opening said valve when the filter cartridge is brought into operable engagement with the filter apparatus manifold.
Id. at 7:12-7:18. Claim 8 of the '644 Patent also refers to a "connecting wall": "the second stage diameter being less than the first stage diameter and having a first end operably coupled to the second end of the first cylindrical stage by a connecting wall and having an opening being defined at the second end thereof . . . ." Id. at 8:32-8:37. Claim 14 of the '884 Patent uses identical language in referring to a "connecting wall." '884 Patent at 8:51-56.

Plaintiffs contend that Claim 3 of the '644 Patent shows that the horizontal "connecting wall" is between, and therefore not part of, the recess first and second cylindrical stages. Accordingly, Plaintiffs argue that: (1) the horizontal connecting wall is not a mating surface, and (2) the horizontal connecting wall is not presented by the first cylindrical stage of the two-stage recess. Plaintiffs' first argument requires little analysis. Plaintiffs conclusorily assert that the horizontal connecting wall does not present a surface for mating. Pls.' Mem. in Opp'n at 21. However, regardless of whether the horizontal connecting wall is part of the first cylindrical stage of the two-stage recess, the horizontal connecting wall is a "mating surface" because it fits with the manifold. Plaintiffs fail to explain how the vertical cylindrical walls of the two-stage recess mate with the manifold and yet the horizontal connecting wall does not.

Plaintiffs' second argument is that the horizontal connecting wall is not presented by the first cylindrical stage of the two-stage recess. This argument requires a limited claim construction of whether the term "first cylindrical stage" includes a horizontal surface. Again, Plaintiffs rely on the language in Claim 3, which depends from Claim 1, that the connecting wall is between the first and second cylindrical stage. However, Claim 6 of the '644 Patent, which also depends from Claim 1, and Claim 9 contradict Plaintiffs' argument. Claim 6 of the '644 Patent recites:

The filter cartridge of claim 5 wherein the inlet/outlet means includes a flow inlet and a flow outlet, the flow inlet being at least one bore intersecting the recess first cylindrical stage and depending therefrom to define a depending flow passageway to the filter means, the flow outlet being defined by the recess second cylindrical stage, the recess second cylindrical stage forming a flow passageway in flow communication with the filter means.

'644 Patent at 7:31-7:38 (emphasis added); see also '644 Patent Claim 9. The illustration of the preferred embodiment in the specification of the '644 Patent makes clear that the flow inlet "bore" intersects the horizontal surface that connects the vertical cylindrical walls of the recess first and second cylindrical stages. See '644 Patent Figure 1 (35 - inlet port). Under the plain language of Claims 6 and 9, the horizontal surface that the flow inlet bore intersects is part of the recess first cylindrical stage. This horizontal surface is the "connecting wall" referred to in Claim 3. Thus, Claim 3 and Claims 6 and 9 of the '644 Patent are inconsistent regarding whether the connecting wall is part of the first cylindrical stage: in Claim 3, the horizontal connecting wall is "between the recess first cylindrical stage and recess second cylindrical stage," whereas in Claims 6 and 9 the horizontal connecting wall is part of the recess first cylindrical stage.

"Claims are not interpreted in a vacuum, but are part of and are read in light of the specification." Slimfold Mfg. Co. v. Kinkead Indus., Inc., 810 F.2d 1113, 1116 (Fed Cir. 1987). The '644 Patent's Description of the Preferred Embodiment supports the conclusion that the horizontal connecting wall is part of the recess first cylindrical stage of the two-stage recess. For example, the preferred embodiment states that "[p]rojecting from the first of the 2 stages 36, 49 at the recess 8 is a raised, tapered projection 72 that engages the stem valve 60 with the fitting and the rotation of the cartridge 10 to the manifold 4 . . . ." '644 Patent at 4:37-4:40. Figure 3 of the specification demonstrates that the "raised, tapered projection" projects from a horizontal surface. Id. Figure 3 (72 - tapered projection). Therefore, according to the specification, the first cylindrical stage of the two-stage recess contains a horizontal surface. This horizontal surface corresponds to the "connecting wall" referred to in Claim 3 of the '644 Patent.

The Court finds that the claims and the specification of the '644 Patent demonstrate that the horizontal connecting wall referred to in Claim 3 is part of the first cylindrical stage of the two-stage recess. This limited construction of "first cylindrical stage" as including the horizontal connecting wall is also consistent with the claims of the '844 Patent. For the purpose of Defendants' Motion for Summary Judgment, it is unnecessary to further define the term "first cylindrical stage."
a. The Parties' Constructions

LPL argues that based on its ordinary meaning and when read in context of the claim, the term "first frame" broadly means a structure enclosed by the housing supporting the flat display panel. Defendants, on the other hand, define the first frame more specifically as a rear structure that alone or together with the second frame sandwiches and assembles multiple layers to form the device. Both LPL and Defendants construe the "second frame" in relation to the "first frame." LPL, however, merely requires that the second frame be located such that the flat display panel is between the first and second frames. Commensurate with their construction of "first frame," Defendants argue that the second frame is a front structure that together with the first frame sandwiches and assembles multiple layers to form the device.

b. The Special Master's Constructions

Read in context with the claim language, the Special Master concludes that the first frame is at the rear of the flat-panel display device. In this regard, for example, each of claims 35, 55 and 56 of the '641 patent requires that the flat display panel be mounted to a housing "through a fastening part at the rear surface of the first frame." Given that the claims recite that the flat-panel display device is "rear mountable," it follows that the first frame, which, by the claim language, includes the fastening part at its rear surface for that rear mounting, must be at the rear of the device. And because the flat display panel is between the first and second frames, the second frame (located opposite to the first frame) is necessarily at the front of the device. In the Special Master's view, the common specification supports this construction through its consistent description of the frames in relation to each other, and the depictions of the first and second frames as the structures at the rear and front, respectively, of the device. '641 patent, Figs. 4A-4C, 8, 9, 12-14, 4:21-22.

Finally, as discussed above, the plain claim language locates the flat display panel between the first and second frames. Nothing in the claim language, however, specifically requires multiple layers or that the frames assemble the layers or components of the device.

Accordingly, the Special Master's constructions are as follows:

<table>
<thead>
<tr>
<th>CLAIM TERM</th>
<th>SPECIAL MASTER CONSTRUCTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>first frame</td>
<td>The structure at the back of the flat-panel display device that together with the second frame structure sandwiches at least the flat display panel</td>
</tr>
<tr>
<td>second frame</td>
<td>The structure at the front of the flat-panel display device that together with the first frame structure sandwiches at least the flat display panel</td>
</tr>
</tbody>
</table>

2. "first layer" and "second layer"

"[F]irst Layer" found in Claims 1, 5, 16, and 18 of U.S. Patent No. 5,745,922; Claims 1, 2, 9, and 16 of U.S. Patent No. 6,098,203; Claims 1 and 5 of U.S. Patent No. 6,260,211; and Claims 19, 20, 26, and 27 of U.S. Patent No. 7,000,260, and "second layer" found in Claims 4, 5, 7, 17, 18 and 20 of U.S. Patent No. 5,745,922; Claims 1 and 2 of U.S. Patent No. 6,098,203; and Claims 19, 20, 26, and 27 of U.S. Patent No. 7,000,260 are both in dispute. KC argues "first layer" and "second layer" should be construed to mean "first operative layer" and "second layer that may or may not be a contiguous," respectively. In response, First Quality proposes they be given their ordinary and customary meaning.

After review, we agree with KC's construction of "first layer", but decline to adopt KC's proposed construction for "second layer." First, the specification teaches that the "first layer" is an "operative layer, generally extending functionally from the first edge through the crotch to the second edge." U.S. Patent No. 5,745,922, col. 2, ll. 24-27. Furthermore, the language of Claim 1 instructs that a "garment blank subassembly" is comprised of "a first layer, extending from the first end through the crotch to the second end." U.S. Patent No. 5,745,922, col. 16, ll. 19-21. When viewed as a whole, the above language
indicates that a "first operative layer" is synonymous with a "first layer," and thus a "first layer" must be a "first operative layer." This construction of the claim term does not import a limitation into the claim language that is not supported by the intrinsic evidence nor does it alter the meaning of the word "layer". Instead, it gives the claim term the meaning that the term would have to a person of ordinary skill in the art. In contrast, KC's proposed construction for "second layer" seeks to add a limitation that is not supported by the specification or claim language. As the specification makes clear, "an unsecured space' may include an area where the front layer element and the back layer element of the second layer may or may not be contiguous." U.S. Patent No. 5,745,922, col. 2, ll. 60-62 (emphasis added). This permissive language, on which KC relies, only indicates that an "unsecured space" could include areas of the front and back layer elements that may or may not be contiguous. The above language does not support the construction that a "second layer" itself may or may not be contiguous. Based on this reasoning, we decline to adopt KC's construction of "second layer," and thus will give it its ordinary and customary meaning.

1592

15. first location on said wall ('875 patent, claim 32)

Crown's proposed construction is "first location on the can end wall." 70 Rexam's proposed construction is "[t]he point on the wall of the can end that becomes the lowermost extent of the double seam." 71

70 Id. at 5.

71 Id.

The court adopts Rexam's proposed construction.

Crown's prosed construction provides no additional information to the claim language being construed whereas Rexam's construction provides additional clarity to the disputed phrase and is supported by the claim language.

Claim 32 of the '875 patent is directed at "[a] method of forming a double seam between a can body and a can end." It describes a can end having a "peripheral cover hook comprising a seaming panel to be formed into a portion of said double seam during a seaming operation." The can end also has "a circumferentially extending wall comprising a first and second portion." The first wall portion is "to be formed into another portion of the double seam [along with the seaming panel]." The first wall portion extends from the "seaming panel to a first location" on the wall. The wall has a "second wall portion extending from said first wall portion at said first wall location to a second location on said wall, whereby said first and second locations form end points of said second wall portion, said second wall location being the lowermost point of said wall." During the seaming operation of claim 32, the "seaming panel of said cover hook and said first wall portion and said body flange" are deformed into a double seam. After the seaming operation, the first location on the wall forms the transition from the double seam to the second wall portion. 72

72 '875 patent, claim 32.

The claim language demonstrates that the first location is at the lowermost part of the first wall portion which portion is formed part of the double seam. Rexam's proposed construction is consistent with the claim language and is adopted by the court: "the point on the wall of the can end that becomes the lowermost extent of the double seam."
3. "first manipulation of a first operator input device"

Plaintiffs' construction: a first operation of an operator input device

Defendant's construction: first manipulating a first keyboard, trackball, pushbutton, knob, or other device, such as a "Print/Store" button, which a user manipulates to provide input to the imaging system

Neither parties' proposed construction of the term "first manipulation of a first operator input device" is helpful. Plaintiffs turn immediately to a general dictionary to define the term "manipulation" as "operation." Defendant cites the patent specification, which identifies "a keyboard, a trackball," "pushbuttons" and "knobs" as examples of "operator input devices" '327 pat., col. 6, lns. 64-68. Although I agree with defendant that these are examples of operator input devices, including this list of examples into the claim language is of little value, especially because the patent specification explains that "other input devices" are used as well. Id. at ln. 67. Therefore, I conclude that both parties' proposals are flawed and that the term "first manipulation of a first operator input device" would not benefit from either construction.

4. "First member." Consistent with the specification and the claims, "first member" shall mean the male member of the two member coupling assembly.

5. "Ridge." This term shall be construed with its ordinary meaning, no further construction is necessary.

6. "Ramp." This term shall be construed with its ordinary meaning, no further construction is necessary.

7. "Apex." Consistent with the specification and the claims, "apex" shall mean "the uppermost surface of the ramp and may be pointed, radiused, cylindrical or flat."

8. "Shoulder." This term shall be construed with its ordinary meaning, no further construction is necessary.

9. "Second member." Consistent with the specification and the claims, "second member" shall mean the female member of the two member coupling assembly.

6. first pivot point

The appropriate legal meaning of the term "first pivot point" is chronological. Cybex and Nautilus correctly argue that the first pivot point is construed as an expression of location, specifically the first pivot point is chronologically the first point that pivots on the end of the extension arm where the arm is supported by the frame. (See Cybex Brief at 5; Nautilus Brief at 17.) Free Motion asserts that the first pivot point is not the first chronological point, rather the first point that pivots in the same functional capacity as the one described in the '061 patent-where the pivot rotates on a parallel axis (See Pl. Brief I at 14, 19-20.) However, the Court finds that the ordinary and accustomed reading of this term simply describes the first chronological point 5 about which the arm turns.

5 Described in specification as "pivot hole 72 through which a pivot pin 74 passes," about which the arm turns. ('061 Patent, col. 4, lines 22-25.)
2. Claim 4, Element 2, "first portion and a second portion"

Claim 4 deals with "construction components," rather than "frames." BMS's proposed definition is:

"'First portion' referring to a construction component that has at least two discrete portions wherein the first portion has at least one surface in contact with a second portion."

"'Second portion' referring to a construction component that has at least two discrete portions wherein the second portion has at least one surface in contact with the first portion such that the second portion substitutes a material other than natural wood for what would otherwise be natural wood."

This definition tries to describe the entire claim in the definition of two terms. There is nothing in the claim language, nor in the rest of the specification that indicates that these are technical terms, or an intent to ascribe any special meaning to first portion or second portion.

"Portion" has been defined as: "a part of any whole, either separated from or integrated with it." Websters Encyclopedic Unabridged Dictionary of the English Language 1120 (1989). "First" and "Second" are not used in any sense of place or space, such as upper and lower, and merely denote that there are separate portions. Therefore the court construes these terms as follows:

"first portion" means: "a part of the whole, which is less than the whole, and is distinguishable from the 'second portion.'"

"second portion" means: "a part of the whole, which is less than the whole, and is distinguishable from the 'first portion.'"

B. "Annular Inner Surface Having At Least A First Portion Extending Inwardly and Upwardly"

Claim 1 recites an impact pad with an outer wall including an "annular inner surface having at least a first portion extending inwardly and upwardly" toward the opening at the top of the impact pad. D.I. 36 at Exh. A, col. 7, ll. 51-53. There are two subsidiary disagreements regarding this phrase. First, the parties differ over the meaning of an "annular inner surface," despite an explicit definition provided for "annular" in the specification. Second, API and CCPI diverge on whether the "first portion" of the impact pad must itself be annular.

1. "Annular Inner Surface"

Both sides agree on what an "inner surface" is for purposes of the '551 patent; their dispute centers on the meaning of "annular." Fortunately, the specification provides some guidance. Annular, as used in the '551 patent, is "not meant to denote any particular shape but is meant to indicate a fully enclosing, endless boundary structure." 4 D.I. 36 at Exh. A, col. 3, ll. 7-10 (emphasis added). API contends the word "endless," as used to define "annular," is ambiguous and this vagary, by implication, clouds the meaning of "annular." "Endless" should be defined, urges API, just as the inventor of the '551 patent, Karl J. Saylor, coined it; that is, "endless" means "without a definite beginning or ending." 5 D.I. 37 at Exh. 4, p. 375.

4 "Annular" is ordinarily defined as "of or relating to a ring: forming a ring: shaped like a ring." WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 88 (1971). The Court is not bound by this definition, of course, as "a patentee may choose to be his own lexicographer and use terms in a manner other than their ordinary meaning, as long as the special
definition of the term is clearly stated in the file history." Vitronics, 90 F.3d at 1582.5 The Court recognizes this is extrinsic evidence; given the disposition of this issue, however, the nature of this evidence is trivial.

Extrapolating from its definition of "endless," API suggests "annular" should be redefined to signify "a fully enclosing, endless boundary structure without a definite beginning or ending." D.I. 37 at 1. While this may seem mere semantic quibbling, API's true motivation is revealed in the inference it draws from its proposed definition. According to API, a structure without a definite beginning or ending is "without surface discontinuities." D.I. 48 at 2. In other words, API interprets "endless" to limit the meaning of an "annular inner surface" to an inner surface that is "continuous" and is "not interrupted by intermediate structures." Id. CCPI, on the other hand, does not cavil about "endless"; it simply argues an "annular inner surface" can be any shape, so long as, when viewed from above, it surrounds an inner space or cavity.

API's most powerful argument in support of its interpretation is that CCPI's reading elides the word "endless" from the definition of "annular." To reiterate, "annular" indicates "a fully enclosing, endless boundary structure." D.I. 36 at col. 3, ll. 7-10. Requiring an annular structure merely to surround an interior space when viewed from above, API contends, ascribes to "endless" the same meaning as the phrase that immediately precedes it--"fully enclosing." 6 API points to the specification statement "any geometric shape which fully encloses or defines an[ ] endless boundary" will suffice under the '551 patent. Id. at col. 7, ll. 34-39. According to API, this disparate use of "fully enclose" and "endless" illustrates "fully enclosing" and "endless" cannot have the same meaning. API's proposal, it submits, does not make "endless" surplusage; as API puts it, its interpretation "breathes life and meaning into the term 'endless.'" D.I. 48 at 2.

6 Of course, "fully enclosing" does not mean the impact pad has no ingress or egress for the stream of molten metal; otherwise, the impact pad would be useless. Rather, the specification and patent makes clear that a "fully enclosing" structure is one which, when viewed from above, surrounds an interior space or cavity. See, e.g., D.I. 36 at Exh. A, col. 5, ll. 1-6; col. 7, ll. 2-7.

The short answer to this is API wants to resuscitate a term that already has too much animation and too many uses; "endless," as strewn haphazardly throughout the '551 patent and its prosecution history, seems to mean many things, yet nothing, and certainly not the limiting effect API gives it. For example, in the summary of the invention, the specification describes an "endless annular side wall" of the impact pad. D.I. 36 at Exh. A, col. 2, ll. 53, 57. The use of "endless" there is tautological, of course, since an annular wall is, by the specification definition, "endless." The pad is later described as including "an endless annular . . . outer side wall having an annular . . . inner wall surface . . . ." Id. at col. 6, ll. 2-4. Again, for the same reason, "endless" becomes so much wasted typeface. Finally, in the file wrapper, CCPI stated, "While the impact pad of the present invention may be formed with different shapes when viewed from above, in each case there is an endless side wall, or, in other words, a sidewall which surrounds an interior space or volume of the pad." D.I. 36 at Exh. C., p. 36 (emphasis added). According to CCPI, this statement shows "endless" was employed as a synonym for "fully enclosing."

This indiscriminate use of "endless" 7 only serves to highlight the principal flaw in API's position: API attributes limitations to the claims from a word found nowhere in the claim itself, but only as subsumed in "annular." When the claims are examined in conjunction with the specification and prosecution history, the limitations API would impose--no discontinuities or intermediate structures on the inner surface--cannot be found; they cannot be discerned in "endless" as it hopscotches throughout the specification and they cannot be imputed to the broader definition of "annular inner surface." As noted earlier, the specification repeatedly disavows the notion "annular" is meant to denote a particular shape. See D.I. 36 at col. 3, ll. 7-10. Indeed:

While the impact pad of the present invention is preferably circularly shaped and while one alternative shape has also been shown and described [a rectangle], many shapes for the side walls of the impact pad are possible and fall within the scope of the present invention. Any geometric shape which fully encloses or defines an[ ] endless boundary for an interior space of the pad and redirects the incoming molten metal flow back into itself and creates a flow pattern away from the
ladle shroud will perform similarly to the illustrated embodiments.

D.I. 36 at col. 7, ll. 29-39 (emphasis added). API's definition would run contrary to these teachings; it would limit the shape of the walls of the impact pad. Accordingly, it is unnecessary to define "endless"; it does not disturb the meaning of "annular."

--- Footnotes ---

7 "Endless" appears nine times in the specification; five times in connection with the "annular side wall" (which can be the outer or inner wall of the impact pad), see D.I. 36 at Exh. A, col. 2, ll. 49, 53, 56-57, col. 3, l. 6, col. 5, l. 66; twice as a description of the outer side wall (once in connection with the "annular" outer side wall), id. at col. 5, ll. 1-2, col. 6, ll. 2-3; once, of course, in the definition of "annular" itself, id. at col. 3, l. 9; and once to describe a "boundary for an interior space of the pad[.]", id. at col. 7, ll. 35-36.

--- End Footnotes ---

Even if the Court defined "endless" in accordance with its usual meaning, i.e., without an end, 8 this definition would not engender API's proposed limitations on the shape of "annular inner surface." To elaborate, one can trace with a pencil an outline of a circle or rectangle--which are the preferred embodiments of the inner surfaces of the '551 impact pads when viewed from above, see D.I. 36 at Figures 3-5--and API concedes this outline is "endless," or "without a definite ending." API seems to argue the inner surface fails to qualify as "endless" as soon as an irregular portion of the inner surface protrudes into the interior cavity of the pad; for example, API presumably characterizes the inner surface of an impact pad, when viewed from above, that forms a square with a triangular protrusion in each corner as lacking an "endless" quality. But this assertion is misplaced. First, as rehearsed earlier, the specification allows for any shape. Second, a continuous outline can be traced along such an inner surface--the pencil never reaches an ending point--despite the surface irregularity.

--- Footnotes ---

8 This differs from API's proposed definition of "without a definite beginning or ending."

--- End Footnotes ---

Accordingly, the Court concludes CCPI's definition of "annular inner surface" is correct; that is, so long as an inner surface, when viewed from above, surrounds an interior space or cavity, that surface will be considered "annular."

2. "First Portion Extending Inwardly and Upwardly"

At oral argument, the parties added a new wrinkle to their dispute: regardless of the interpretation of "annular," the parties also disagree as to whether the first portion of the annular inner surface which extends inwardly and upwardly must itself be "annular." See D.I. 52 at 117, ll. 18-20. Or, put another way, the Court must decide whether "annular" modifies "first portion" as well as "inner surface" in the claims. 9 Id. API contends the first portion must be annular, while CCPI maintains the first portion need not be annular so long as it extends upwardly and inwardly toward the opening of the impact pad and achieves the other functional elements of the claim.

--- Footnotes ---

9 To reiterate, claim 1 recites:

A tundish impact pad formed from a refractory composition capable of withstanding continuous contact with molten metal, said pad comprising a base having an impact surface and an endless outer side wall extending upwardly therefrom and fully enclosing an interior space having an upper opening for receiving a stream of said molten metal, said outer wall including an annular inner surface having at least a first portion extending inwardly and upwardly toward said opening, whereby when a downwardly directed stream of molten metal from a ladle outlet disposed above said impact pad strikes said impact surface, said stream is directed outwardly toward said annular inner surface and then redirected upwardly and inwardly toward the incoming ladle stream.

- 2030 -
D.I. 36 at Exh. A, col. 7, ll. 45-60 (emphasis added).

(a) Claim language

Claim interpretation begins, of course, with the claim language itself. Eastman Kodak Co., 114 F.3d 1547 at ..., 1997 U.S. App. LEXIS 11831, 1997 WL 261364, at *3. The word "portion" has an ordinary and well-recognized meaning. 10 The most natural reading of the claim supports the view the first portion must itself be annular. In common parlance, a portion most often possesses the attributes of the whole. 11 Nevertheless, the Court recognizes there are instances this may not be true. Accordingly, resort to the specification is necessary to give context to the claim language.

10 Portion is defined as "a part of a whole." WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY 1768 (1971). The Federal Circuit Court of Appeals has characterized dictionaries as a higher species of extrinsic evidence, with the caveat that judges "may . . . rely on dictionary definitions when construing claim terms, so long as the dictionary definition does not contradict any definition found in or ascertained by a reading of the patent documents." Vitronics, 90 F.3d 1576 at 1584 n.6. See also Eastman Kodak, 114 F.3d 1547 at , 1997 WL 261364, at *3 (employing dictionary in claim construction).

11 For example, consider the following statement: There is a wooded park, having a portion extending into the lake. It is clear in this instance the portion which extends into the lake must itself be wooded.

(b) Specification

The specification states "one annular portion of the inner side wall surface curves outwardly and upwardly" from the base of the impact pad "and meets another annular portion which curves concavely inwardly and upwardly to a vertical inner wall surface." D.I. 36 at Exh. A, col. 5, ll. 6-11 (emphasis added; references to figures depicted in patent omitted). A little later, the specification describes "one or both of the annular surface portions" as potentially "flat and angled outwardly and inwardly, respectively, instead of curved[,]" and states, "Each of these alternative designs still includes an annular side wall inner surface portion extending inwardly and upwardly toward the opening [of the impact pad] to create the desired flow pattern described herein." Id. at col. 5, ll. 16-25 (emphasis added). Every one of the preferred embodiments displays a fully enclosing portion that extends upwardly and inwardly. 13 See id. at Figures ("Fig.") 1-6. Finally, as noted earlier, there is a declaration in the specification that "any geometric shape which fully encloses or defines and [sic] endless boundary [i.e., is annular] for an interior space of the pad and redirects the incoming molten metal flow back into itself . . . will perform similarly to the illustrated embodiments." Id. at col. 7, ll. 34-39. Each of these references, then, describes the portion of the inner surface which extends upwardly and inwardly as annular.

13 Both parties agree "annular" means, at minimum, fully enclosing.
CCPI tries to spin this seemingly damaging language to its own benefit. According to CCPI, these references show CCPI recognized its ability to use the word "annular" when it so desired; in the claims, it chose not to modify "first portion" with "annular." Therefore, CCPI asserts, the "annular" limitation of "first portion" in the specification should not be read into the claim.

There is a fine line between the use of the specification to clarify otherwise cloudy terms in the claim and the extraction of limitations from the specification to impose those limitations on the claims. The first is encouraged, the latter impermissible. CVI/Beta Ventures, Inc., 112 F.3d 1146 at 1997 WL 214809, at *11 ("As a general matter, the claims of a patent are not limited by preferred embodiments."); Electro Med. Sys., S.A. v. Cooper Life Sciences, Inc., 34 F.3d 1048, 1054 (Fed. Cir. 1994) ("Claims are not to be interpreted by adding limitations appearing only in the specification."); In re Van Geuns, 988 F.2d 1181, 1184 (Fed. Cir. 1993) ("Limitations are not to be read into the claims from the specification."); Intervet Am., Inc. v. Kee-Vet Labs., Inc., 887 F.2d 1050, 1053 (Fed. Cir. 1989) ("Limitations appearing in the specification will not be read into claims, and . . . interpreting what is meant by a word in a claim is not to be confused with adding an extraneous limitation appearing in the specification[]. . . ."); Fonar Corp. v. Johnson & Johnson, 821 F.2d 627, 632 (Fed. Cir. 1987) (using specification to interpret ambiguous term in claim); Roll Sys., Inc. v. Wallace Computer Sys., Inc., 901 F. Supp. 389, 392 (D. Mass. 1995) (quoting above language from Intervet court).

This is an instance when a claim term--specifically, "portion"--is ambiguous, and the specification implies a meaning other than the one urged by CCPI. Each reference in the specification reinforces the most natural reading of the claim. Accordingly, the specification is not being used to import an extraneous limitation to the claims; instead, it is used to hone the meaning of murky language already in the claims.

The Court concludes, therefore, the "first portion extending inwardly and upwardly," as that term is used in the '551 patent, must itself be annular.

1598
c. first position / second position

With respect to the first and second orientations described in these terms, LGD argues that the first supporting portion or position must be located near an upper edge of the frame. LGD and AUO generally agree that the second position is determined by reference to the first position, but to the extent LGD's construction of the second position depends from its upper frame requirement of the first position, AUO contends that LGD's construction is incorrect. According to AUO, there is no upper edge location requirement and the first position is simply an initial position. D.I. 1383 at PP 513-516.

The Court agrees with AUO and concludes that no such upper edge limitation exists in the claim. In the Court's view, adopting LGD's proposal in this regard would improperly limit the claims to the preferred embodiments. Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 906 (Fed. Cir. 2004). Accordingly, the Court concludes that a first position means "an initial position of a liquid crystal display unit" and a "second position" means "the position determined by reference to the angle of rotation between the first and second position."

1599

8. "First Pressure," "First Ram Pressure," "Second Pressure" and "Third Pressure"

Claim 1(c) of the '207 patent recites these terms in the following manner:

(i) heating said core for a first period of time; (ii) applying a first pressure to said core for a second period of time such that said at least one electronic element is encapsulated by said core; (iii) cooling said core while applying a second pressure to said core.
'207 patent, col. 6:32-36.

Claim 16(c) recites:

(i) heating said core in said laminator, in the presence of a minimal first ram pressure, to a temperature which causes controlled flow of said plastic which makes up said first and second plastic core sheets; (ii) applying a second pressure uniformly across said core for encapsulating said at least one electronic element within said controlled flow plastic; (iii) subsequently cooling said core in conjunction with the concurrent application of a third pressure uniformly across said core.

'207 patent, col. 8:22-32.

The issue here is whether the terms "first," "second" and "third," as used in this and other claims, refer to the sequential order in which the steps are to be performed -- so that, in claim 1, step (c)(ii) must be performed before step (c)(iii), and in claim 16, step (c)(i) must be performed before step (c)(ii), which must be performed before step (c)(iii) -- or whether these words are used simply to differentiate between like elements (three different applications of pressure), without intending any sequential limitation, so that the steps can be performed in any sequential order.

It is of course well settled that "comprising" language renders a claim open-ended. Invitrogen Corp., v. Biocrest Mfg., 327 F.3d 1364, 1368 (Fed. Cir. 2003). And in many patents, the words "first pressure," "second pressure," and "third pressure" would indicate nothing more than that there are several different levels of pressure, which readers of the patent would have to distinguish among as they parsed the patent.

It is also true, however, that the terms "first," "second" and "third" can be read to denote the order of steps. See Applera Corp. v. Micromass UK Ltd., 186 F. Supp. 2d 487, 505 (D. Del. 2002), aff'd without published opinion, 60 Fed. Appx. 800 (Fed. Cir. 2003). While the terms "first," "second," and "third" are commonly used to identify separate claim elements, nothing precludes finding that the terms also specify temporal or positional relationships. Id. Where the language of the claim, the specification and the prosecution history logically indicate a sequential process, recited steps in a claim must be read to require a sequential order. See, e.g., Loral Fairchild Corp. v. Sony Electronics Corp., 181 F.3d 1313, 1322 (Fed. Cir. 1999); Mantech Envtl. Corp. v. Hudson Envtl. Services Inc., 152 F.3d 1368, 1376 (Fed. Cir. 1998).

The context of these terms in the patents in suit makes it abundantly clear that the terms are used to denote the relative order of the steps -- that is, their order vis-a-vis each other. Indeed, counsel for Plaintiff admitted as much at the Markman hearing. For example, in claim 1, step (c) of the '207 patent, the pressure that is applied during cooling must follow the pressure that is applied to "encapsulate" the element in plastic. In claim 16 of the same patent, the "minimal ram pressure" that is applied during the process of heating the core and melting the plastic necessarily precedes the application of the "second pressure" which encapsulates the element in liquefied or partially liquefied plastic, which in turn necessarily precedes application of the "third pressure" as the hot, molten plastic cools. 10 Thus, the words "first," "second" and "third" both distinguish among three distinct steps in the claimed process and denote the order in which the three steps outlined in the claims are to be performed relative to one another.

- - - - - - - - - - - - - - Footnotes - - - - - - - - - - - - - -

10 Plaintiff conceded in its Markman presentation that in claim 16, step c(iii) must follow step c(ii), pointing to the use of the word "subsequently" in step c(iii).

- - - - - - - - - - - - End Footnotes- - - - - - - - - - - - - -

However, Defendant would have me go further. Oberthur argues that these terms should be construed so that "first pressure" and "first ram pressure" would be limited to "the very first pressure applied during the heat and pressure cycle." The term "second pressure" would be limited to "the next pressure applied after the first pressure during the heat and pressure cycle." And the term "third pressure" would be limited to "the next pressure applied after the second pressure during the heat and pressure cycle." (Def. Br. at 37.) Defendant's proposed construction precludes the application of any pressure prior to the application of whatever pressure is designated as "first" and the insertion of any pressure between the step involving the "first pressure" and the step involving the "second pressure." In other words, Defendant argues that the words "first," "second," and "third" indicate not only the relative order of the claimed steps vis-a-vis each other, but also the absolute order
Defendant has not presented any convincing reason why the words "first," "second" and "third" as used in the cited claims mean connote absolute order as opposed to relative order. Defendant's counter-arguments based on the purported "main objective" of the patent is not persuasive; neither does the patentee's use of the phrase "highly coordinated" process indicate that "first," "second" and "third" mean "very first" and "next one after the very first," etc.

Moreover, language taken from a dependent claim strongly suggests that the words ought not to bear the limiting meaning assigned to them by Defendant. Dependent claim 18 of the '367 patent recites, "The process according to [independent] claim 1 wherein the pressure on said core in step (c)(i) is less than 10 p.s.i." Step (c)(i) in claim 1 recited heating the core for "a first period of time." It is not until step (c)(ii) of claim 1 that "a first pressure" is applied. Indeed, in the '207 provisional application, claim 1 expressly indicated that no pressure was to be applied to the core at the beginning of the first heat cycle. (That restriction was removed from the final '207 application.) Thus, dependent claim 18 of the '367 patent narrows claim 1 by reciting an application of very light pressure (less than 10 p.s.i.) prior to the application of "a first pressure."

But Defendant argues that claim 18 does not help Leighton because the claim itself is indefinite under the "Lack of Antecedent Basis" doctrine as set forth in the Manual of Patent Examining Procedure (MPEP) § 2173.05(e).

Dependent claim 18 recites "the pressure" to be applied during a certain step (step (c)(ii)) as disclosed in claim 1. Step (c)(i) in claim 1 does not mention any application of pressure. Therefore, according to Defendant, "the pressure on said core in step (c)(i)" (emphasis added), as recited in claim 18, has no antecedent, and Leighton is trying to read something into that claim that is not there.

Plaintiff responds that claim 1 and claim 18 of the 367 patent disclose two different embodiments of a single invention, and that as long as the two or three pressures disclosed in the patent claims are part of an enclosure/lamination process, that process is covered by the patent.

On reflection, I reject defendant's argument as too narrow a reading of the "lack of antecedent basis" doctrine.

Section 2173.05(e) of the MPEP reads, in pertinent part,

A claim is indefinite when it contains words or phrases whose meaning is unclear. The lack of clarity could arise where a claim refers to "said lever" or "the lever," where the claim contains no earlier recitation or limitation of a lever and where it would be unclear as to what element the limitation was making reference...

However, the Manual goes on to read:

Obviously, however, the failure to provide explicit antecedent basis for terms does not always render a claim indefinite. If the scope of a claim would be reasonably ascertainable by those skilled in the art, then the claim is not indefinite. . . The totality of all the limitations of a claim and their interaction with each other must be considered to ascertain the inventor's contribution to the art.

Considering the "totality of all the limitations" of claims 1 and 18 of the '367 patent, Defendant's interpretation cannot be correct. Step (c)(ii) of claim 1 recites, "applying a first pressure to said core." As noted above, "a first pressure" does not necessarily mean that no pressure was applied during a prior step. While step (c)(i) does not specifically state that pressure must be applied, it does not preclude the application of pressure, either. Dependent claim 18 is most reasonably interpreted to limit claim 1 to the situation where pressure on the core in step (c)(i), if any, is less than 10 p.s.i. And I note that "less than 10 p.s.i." of pressure encompasses no pressure whatsoever.

Courts interpreting patents routinely avoid indefiniteness by interpreting language to provide for an antecedent basis. See, e.g., Astra Aktiebolag v. Andrx Pharms., Inc. (In re Omeprazole Patent Litig.), 222 F. Supp. 2d 423, 458 (S.D.N.Y. 2002) (interpreting an antecedent phrase, "alkaline reacting compound," to include by definition the phrase in question, "micro-environment," in order to (i) find antecedent basis for "the micro-environment" and (ii) avoid indefiniteness for lack of antecedent basis) (emphasis added). Most particularly, in Digital Biometrics, Inc. v. Identix, Inc., 149 F.3d 1335, 1344 (Fed. Cir. 1998), the Federal Circuit noted that if a claim is "susceptible to a broader and narrower meaning, and the narrower one
is clearly supported by the intrinsic evidence while the broader one raises questions of enablement under [the MPEP], [the court must] adopt the narrower of the two." See also Rhine v. Casio, Inc., 183 F.3d 1342, 1345 (Fed. Cir. 1999) (if a claim is susceptible to two interpretations, one of which renders it valid and the other of which renders it invalid, the claim must be construed to sustain its validity).

Outside the patent context, there are cases concluding that use of the definite article "the" particularizes the subject and narrows the possible class of possible antecedents. For example, in Freytag v. Commissioner of Internal Revenue, 501 U.S. 868, 902, 111 S. Ct. 2631, 115 L. Ed. 2d 764 (1991), Justice Scalia, in a concurring opinion that did not command a majority on the Supreme Court, concluded that use of the definite article "the" in the phrase "the Courts of Law" (which appears in the Appointments Clause of the Constitution, Art. II, § 2, cl. 2) narrowed a class to specific "envisioned" members. Similarly, while engaging in statutory construction in the context of a patent case, the Federal Circuit concluded that Congress's decision to say "the use" rather than "a use" meant "a specific" use rather than a "previously undefined" use. Warner-Lambert Co. v. Apotex Corp., 316 F.3d 1348, 1356 (Fed. Cir. 2003) (citing Freytag, 501 U.S. at 902). Finally, in American Bus Association v. Slater, 343 U.S. App. D.C. 367, 231 F.3d 1, 4-5 (D.C. Cir. 2000), the D.C. Circuit called the notion that the article "the" particularizes its subject "a rule of law."

But none of these pronouncements involved patent claim construction, which has its own specialized rules, the first of which is that, wherever possible, a claim is to be construed to make sense of the claim. No case has been cited to the Court, and I have found none, that applies Justice Scalia's Freytag analysis to render a patent claim indefinite. I conclude that the cases cited in the preceding paragraph are inapposite here. 11

--- Footnotes ---

11 I am bolstered in this conclusion by the fact that Oberthur did not cite these cases in its brief. My law clerk found them while we were exploring Oberthur's argument.

--- End Footnotes ---

Therefore, considering the "totality of the limitations," I find claim 18 has antecedent basis in claim 1, step (c) as a whole, and is not indefinite.
Similarly, the specifications discuss the "first," "second," and "third" regions with regard to the characteristics of cutters located in those regions. In particular, the '249 Patent states:

The cutters themselves, as disposed in first region 226, are backraked at 20 [degrees] to the bit profile at each respective cutter location, thus providing chamfers 124 with a 65 [degrees] backrake. . . . Cutters . . . disposed in second region 228 . . . are themselves backraked at 15 [degrees] on nose 232, providing a 60 [degrees] chamfer backrake, while cutter backrake is further reduced to 10 [degrees] at the flank 234, shoulder 236 and on the gage 207 of bit 200, resulting in a 55 [degrees] chamfer backrake.

'249 Patent col. 6:10-23.

Likewise, the '715 Patent specification describes the regions in the three-region embodiment in terms of the cutters located in those regions:

[A]t least one of the plurality of the cutters located in first region . . . exhibit respective effective cutting face backrake angles which may be characterized as being relatively nonaggressive . . . . In contrast to the generally less aggressive cutters positioned generally in first region . . . , at least one of the plurality of the cutters, and preferably at least a majority of the cutters located in second region . . . , exhibit respective effective cutting face backrake angles which may be characterized as being relatively aggressive . . . . [T]hird region 228' is provided with at least one cutter . . . exhibiting respective effective cutting face backrake angles which may be characterized as being relatively aggressively in comparison to the cutters positioned generally in first region 226 and second region 228.

The '249, '715, and '631 Patents only disclose drill bits with cutters located on the drill bit blades. While the "first," "second," and "third" regions could encompass other areas on drill bit, such a construction would make little sense, as the patents only use the first, second, and third regions to identify cutter attributes of cutters in each region, and such cutters are located on the drill bit blades.

Further, figures in the '249 and '715 Patents support limiting the "first," "second," and "third" regions to the area defined by the drill bit blades. Fig. 10 of the '249 and '715 Patents, which depicts the two-region embodiment, shows the "first" and "second" regions located along the profile of the drill bit. The bit profile, as discussed above, is defined by the drill bit blades. Thus, the "first" and "second" regions extend along the blades.

Similarly, Fig. 13 of the '715 Patent, which depicts the three-region embodiment, shows the "first," "second," and "third" regions along the bit profile, which is defined by the drill bit blades. Finally, Fig. 12 of the '715 Patent, an oblique face view of the three-region embodiment, shows the three regions along the blade of the bit. Thus, "first region," "second region," and "third region" extend along the blades and do not extend around the circumference of the bit face.

Whether Regions Are Limited to Certain Areas on Drill Bit Face

Baker Hughes contends the "first region" is located "generally on the center of the bit face or on leading end of the bit radially closest to the centerline or longitudinal axis of the drill bit body." It contends the "second region" is located "generally radially distant or remote from the centerline or longitudinal axis of the drill bit body between the first region and the outer region at the maximum or outermost diameter of the face or leading end of the bit." Lastly, Baker Hughes contends the "third region," if it is present, is located "generally radially in between the fist and second regions." ReedHycalog argues these terms do not need construction and the regions are not limited to specific areas on the bit face.

The '249 and '715 Patents disclose the "first region" closest to the center, a "second region" radially more distant than the first region, and a "third region," if present, located radially between the first and second regions. E.g. '249 Patent Fig. 10; '715 Patent Figs. 10, 12, 13.

The '631 Patent only mentions the regions in the claim language and uses the regions to distinguish the cutters located in each region. '631 Patent col. 26:3-13, col. 26:16-17. The '631 Patent only discloses cutters secured on the drill bit blades, one cutter per radial location. Id. at Figs. 1, 2, 2A, 14A, 15A, 15B. As a result, one region is radially closer to the centerline of the drill bit than the other region, and the label of each region only matters with regard to the characteristics of the cutters.

- 2036 -
located in each region. It is consistent with the dependant claims of the '631 Patent and the '249 and '715 Patents specifications to label the inner region as "first region" and the outer region as "second region." Id. at col. 36:13-50; '249 Patent Fig. 10; '715 Patent Figs. 10, 12, 13.

Therefore, "first region" means "area or region defined by the blades of the bit, located generally on the center of the bit face or on the leading end of the bit radially closest to the centerline or longitudinal axis of the drill bit body, labeled 226 in Fig. 10 of the '249 Patent and Figs. 10, 12, and 13 of the '715 Patent." 11 "Second region" means "area or region defined by the blades of the bit, located generally radially distant or remote from the centerline or longitudinal axis of the drill bit body between the first region and the outer region at the maximum or outermost diameter of the face or leading end of the bit, labeled 228 in Fig. 10 of the '249 Patent and Figs. 10, 12, and 13 of the '715 Patent." 12 "Third region" means "area or region, if any, defined by the blades of the bit, located generally radially in between the first and second regions, labeled 226' in Figs. 12 and 13 of the '715 Patent." 13

--- Footnotes ---

11 Ref. No. 10 of Appendix B contains the disputed term "first region" and its construction.

12 Ref. No. 11 of Appendix B contains the disputed term "second region" and its construction.

13 Ref. No. 12 of Appendix B contains the disputed term "third region" and its construction.

--- End Footnotes ---

However, these constructions do not connect "first region," "second region," or "third region" to the terms "cone," "nose," "flank," "shoulder," or "gage." Courts presume a difference in meaning and scope when a patentee uses different phrases in separate claims. Phillips, 415 F.3d at 1314-15. Where a party seeks to limit an independent claim with language that appears in a dependant claim, the presumption is especially strong. Liebel-Flarsheim Co. v. Medrad, Inc., 358 F.3d 898, 910 (Fed. Cir. 2004). However, the doctrine of claim differentiation is not a "hard and fast rule," and courts cannot use the doctrine to broaden claims beyond their correct scope, determined in light of the intrinsic record and relevant extrinsic evidence. Seachange Int'l, Inc. v. C-COR, Inc., 413 F.3d 1361, 1369 (Fed. Cir. 2005); see also Phillips, 415 F.3d at 1312-15.

The independent claims in the '249 and '715 Patents do not limit any of the regions to a particular location on the bit face. Only the dependant claims define the first, second, and third regions of the bit face with the terms "cone," "nose," "flank," and "gage." '249 Patent col. 8:64-67 (claiming rotary drag bit "wherein the first region lies within a cone . . . and the second region extends at least over a nose and flank . . . ."); '715 Patent col. 20:29-33 (claiming a rotary drag bit "wherein the first region lies within a cone . . . , the second region extends over at least a flank . . . . , and the third region extends over at least a nose . . . ."); '249 Patent col. 9:1-2 (claiming a rotary drag bit "wherein the second region extends to a gage of the bit body"); '715 Patent col. 20:34-35 (claiming a rotary drag bit "wherein the second region extends to the gage of the bit body"); '631 Patent col. 36:25-29 (claiming a rotary drag bit "wherein the first region comprises a cone region and the second region comprises at least one of the group consisting of a nose region, a shoulder region, and a flank region"). Though these terms do not explicitly include the "shoulder region," the "second region" necessarily includes the "shoulder" if the "second region" extends to the "gage" of the drill bit face. E.g. '249 Patent Fig. 10; '715 Patent Figs. 10, 13.

Constructions of "first region," "second region," and "third region" that include the terms "cone," "nose," "flank," "shoulder," or "gage" would render dependant claims 2 and 3 of the '249 Patent redundant with independent claim 1 of the '249 Patent, would render dependent claims 2 and 3 of the '715 Patent redundant with independent claim 1 of the '249 Patent, and would render dependent claim 68 of the '631 Patent redundant with independent claim 64 of the '631 Patent. Therefore, it is presumed "first region," "second region," and "third region" do not include "cone," "nose," "flank," "shoulder," or "gage" limitations.

The '249 and '715 Patents specifications state "first region" "may be said to comprise the cone 230," "second region" "may be said to comprise nose 232, flank 234, and generally includes shoulder 236 of profile 224," and "third region" "generally corresponds to nose 232." '249 Patent col. 5:65--col. 6:2; '715 Patent col. 9:35-39, col. 13:2-5. This permissive language is not sufficient to rebut the presumption that "first region," "second region," and "third region" are not so limited. See Gillette Co. v. Energizer Holdings, Inc., 405 F.3d 1367, 1371 (Fed. Cir. 2005) (transition "comprising" is presumptively not limited.
to recited elements, and can include additional elements not recited).

In addition, any definitions of "first region," "second region," and "third region" that include the terms "cone," "nose," "flank," and "shoulder" either exclude an embodiment of the inventions or may confuse a jury. In the two-region embodiment, the "first region" contains the "cone" and the "second region" contains the "nose," "flank," and "shoulder" regions of the bit profile. '249 Patent col. 5:65--col. 6:2; '715 Patent col. 9:35-39. In the three-region embodiment, the "second region" contains the "flank" and "shoulder" regions, while the "third region" contains the "nose." '715 Patent Fig. 13, col. 12:55--col. 13:9. An accurate construction of "second region" that contains "nose," "shoulder," or "flank" would therefore take into account both embodiments, which would be unnecessarily wordy and confusing.

3. The next disputed phrases are "a first rigid frame positioned at one end of said container" and "a second rigid frame positioned at the other end of said container."

The court adopts the construction of the special master which is "A separate skeletal structure designed to shape or support that is made up of parts fitted or joined together. The front frame must help support the weight of the container body."

9. "First" and "Second" Stitch

The terms "first" and "second" are used to describe stitches in both the method and product claims of the patents-in-suit. For example, in Claim 1 of the 779 Patent, a method claim, step (c) of the seam manufacturing process requires "sewing the first and second garment components and the bonding element together by a first set stitch running along the seam" and step (f) requires "sewing the first and second garment components and the bonding element together by a second stitch running along said seam." 779 Patent at 6:37-39, 6:47-49 (emphasis added). In Claim 20 of the 779 Patent, a product claim, the seam is defined as comprising "a first set stitch running along a first side of the seam and traversing through the bonding element . . . the first garment component . . . and . . . the second garment component . . ." and "a second stitch running along a second side of the seam and traversing through the . . . first garment component . . . the bonding element . . . and the second garment component." 779 Patent at 8:25-30, 8:31-36 (emphasis added). The 615 Patent uses "first" and "second" to describe stitches in Claims 1 and 19, method and product claims, respectively. 615 Patent at 6:44-47, 6:56-60, 8:17-26. In contrast to step (f) in Claim 1 of the 779 Patent, step (f) in Claim 1 of the 615 Patent references both stitches and speaks of "sewing a second stitch running along a side of the seam opposite the first stitch. . . ." 615 Patent at 6:56-57 (emphasis added).

Both parties agree that the "first stitch" is a set stitch and that the "second stitch" is a top stitch. See, e.g., Taltech's Supplemental Brief, docket no. 137, at 15; Esquel's Supplemental Brief, docket no. 140, Ex. A at 2. 6 The parties' dispute is not over whether these stitches are different types of stitches but whether these stitches must come in a particular order. Taltech asks the Court to construe "first stitch" to mean "one stitch" and "second stitch" to mean "another stitch different from the first stitch." Taltech relies on the claims and on the specifications. Esquel asks the Court to construe "first stitch" to mean "the very first stitch made in the seam manufacturing process" and "second stitch" to mean "the next stitch made in the seam manufacturing process after the first set stitch." Esquel relies on the claims, on the specifications, on the prosecution history of the 779 Patent, on dictionary definitions of "first" and "second," on Taltech's "tutorial" (Taltech's Markman Ex. 7), on the Esquel animation (Esquel's Markman Ex. 3), and on admissions made by Taltech's counsel at the Markman hearing.

The patents use "first stitch" and "first set stitch" interchangeably. The prosecution history of the 779 Patent shows that the word "set" was added to Independent Claims 17 and 34, which became Independent Claims 1 and 20, to clarify that the "first stitch" is a "set stitch." 779 Prosecution History, March 11, 1996, Amendment Filed Under 37 C.F.R. § 1.115, docket no. 85, Ex. D (part 2) at 13. This change, however, was not consistently applied throughout the patents-in-suit. As a result, sometimes the patents refer to the "first stitch" and other times to the "first set stitch." The Court uses "first stitch" to mean "first set stitch."
While it is true that "[t]he use of the terms first' and second' is a common patent-law convention to distinguish between repeated instances of an element or limitation," see 3M Innovative Props. Co. v. Avery Dennison Corp., 350 F.3d 1365, 1371 (Fed. Cir. 2003), the patents-in-suit do not use the terms "first" and "second" to distinguish between repeated instances of the same thing. Rather, the patents-in-suit use the terms "first" and "second" to distinguish between different types of stitches. As a result, the 3M "common patent-law convention" does not apply in the present case.

The Court first looks to the claims to construe "first stitch" and "second stitch." Step (f) in Claim 1 of the 615 Patent speaks of "sewing a second stitch running along a side of the seam opposite the first stitch such that..." 615 Patent at 6:56-57 (emphasis added). This claim language shows that the first stitch must be sewn prior to the sewing of the second stitch. Taltech admits this by way of its proposed construction of "a method . . . comprising the steps." See Taltech's Supplemental Brief, docket no. 137, at 8 (arguing that the language and logic of Claim 1 of the 615 Patent requires step (f), the sewing of a second stitch, to occur after step (e), the folding of the first garment component, which in turn must occur after step (d), the sewing of a first set stitch).

In multiple instances, Taltech has admitted that the first set stitch is sewn prior to the second top stitch. Taltech's "tutorial" described how the armhole seam is created in "three steps":

First, the sleeve is attached, or set' to the shirt body with the set stitches [first and additional stitches]. The body panel is folded over the set stitches and a top stitch [second stitch] is applied. Next, the sides of the sleeve and shirt body are sewn together with the side seam.

Taltech's 'tutorial' (Taltech's Markman Ex. 7 at 11). During the Markman hearing, Taltech described how the second top stitch comes after the first set stitch in the preferred embodiments:

This set stitch 38 [first stitch] goes through the first and second garment components and fixes them together and has to do that before this is folded over and the top stitch 40 [second stitch] is applied. You just asked me about the top stitch 40 [second stitch], does it have to take place after the set stitch 38 [first stitch], and I said yes.

Markman Hearing Tr., docket no. 130, at 84.

The specifications indeed show that the first set stitch 38 is sewn prior to the second top stitch 40 in the preferred embodiments. See Figs. 3a-3b, 4a-4b. Although the preferred embodiments alone are insufficient to impose a limitation on the claims, their depiction of the first set stitch preceding the second top stitch is consistent with the language of step (f) in Claim 1 of the 615 Patent.

The Court must construe "first stitch" and "second stitch" in light of all of the claims, including Claims 17 and 18 of the 779 Patent and Claim 18 of the 615 Patent, which describe sewing an "additional stitch" "prior to the step of sewing the ... second stitch. ..." 779 Patent at 7:59-8:2; 615 Patent at 7:61-67; see Vitronics, 90 F.3d at 1582 (considering other claims of the patent in question). Esquel's proposed construction -- which requires "first stitch" to mean "the very first stitch made in the seam manufacturing process" and "second stitch" to mean "the next stitch made in the seam manufacturing process after the first set stitch" -- precludes the sewing of an additional stitch prior to the second stitch, which cannot be correct. Esquel argues that its proposed construction is consistent with the "additional stitch" claim language because the first set stitch and the additional stitch are sewn simultaneously. The Court rejects this argument because the first and additional stitches are not necessarily sewn simultaneously. Claim 18 of the 779 Patent requires the first and additional stitches to be sewn simultaneously, implying, under principles of claim differentiation, that this is not the case in Claim 17. 779 Patent at 7:57-8:2. Thus, the additional stitch may be sewn prior to, at the same time as, or after the first stitch. To the extent the additional stitch occurs after the first stitch, Esquel's proposed construction does not work because this construction would require the second stitch to be the "next" stitch after the first stitch.

The Court must construe the terms "first stitch" and "second stitch" consistently across all method and product claims. Taltech argues that any temporal limitation is meaningless with respect to its product claims because a product claim may not be limited by its disclosed method of manufacture. See Cordis Corp. v. Medtronic AVE, Inc., 339 F.3d 1352, 1357 (Fed. Cir. 2003) (declining to superimpose a process limitation on the product claims at issue). The imposition of a process limitation on Taltech's product claims is unavoidable here because the intrinsic evidence compels the imposition of a temporal limitation.

Taltech's proposed construction is too broad, and Esquel's proposed construction is too narrow. Accordingly, the Court
adopts a construction that combines concepts from both of the parties’ proposed constructions, and construes the term "first stitch" to mean "one stitch" and the term "second stitch" to mean "another stitch after the first stitch, but not necessarily the next stitch after the first stitch."

6. "With the first terminal of the battery"

Claim 9 includes "a contactor having a spring . . . and at least one contact for electrical connection with the first terminal of the battery." ‘900 Patent col.11 1.36-41 (emphasis added). Invisible Fence proposes that the "first terminal of the battery" is "one of the two terminals of the battery," while Perimeter argues that a proper reading should be that the "first terminal of the battery is "the anode terminal of the battery that is positioned adjacent to the base, i.e., opposite the open end of the cup-shaped battery holder through which the battery is inserted." 18 (Joint Statement 5.)

Perimeter provides no scientific or technical reason for why the first terminal must be the anode terminal, and instead relies on the Description. 19 See, e.g., ‘900 Patent col.7 1.14-18 ("The battery . . . is orientated inside the battery holder . . . so that the anode terminal faces the battery base . . . and the cathode terminal faces the opening of the battery holder . . . "). Because the language of claim 9 does not require that the first terminal be the anode terminal, the Court declines to read that limitation into claim 9. See Ekchian, 104 F.3d at 1303.

Perimeter’s inclusion of "opposite the open end of the cup-shaped battery holder through which the battery is inserted" was rejected supra, Part III.B.1, and therefore will not be considered here.

Although the first terminal is not limited to the anode terminal, the patent does limit the orientation of the first terminal, specifically positioning it at the closed base. Although claim 9 does not explicitly furnish this limitation, the Summary provides that "the retaining ring includes a central aperture through which the second terminal of the battery is exposed at the opening . . . ." ‘900 Patent col.2 1.22-24. With the second terminal exposed at the opening, the first terminal must necessarily be positioned at the closed base. Unlike purported limitations made in the Description, statements found in the Summary can be used to limit claim language. See C.R. Bard, Inc. v. U.S. Surgical Corp., 388 F.3d 858, 864 (Fed. Cir. 2004) ("Statements that describe the invention as a whole [such as the Summary], rather than statements that describe only preferred embodiments, are more likely to support a limiting definition of a claim term."); Microsoft Corp. v. Multi-Tech Sys., Inc., 357 F.3d 1340, 1348 (Fed. Cir. 2004) ("Those statements, some of which are found in the 'Summary of the Invention' portion of the specification, are not limited to describing a preferred embodiment, but more broadly describe the overall inventions. . . .").

The proposition that the cited language in the Summary limits the entire patent is supported by the numerous claims which describe the second terminal as exposed either at the opening or the central aperture. See ‘900 Patent col. 10 1.13-14 (claim 1), col. 10 1.24-25 (claim 2), col. 11 1.7-8 (claim 7), col.11 1.52-54 (claim 10), col.13 1.27-29 (claim 21). Moreover, the claims that specifically provide for the spring to make electrical connection at the base of the battery holder via a resilient center portion provide that this connection is made with the first terminal of the battery. See ‘900 Patent col.10 1.33-36 (claim 4), col.10 1.59-60 (claim 7), col.12 1.61-64 (claim 10), col.13 1.5-12 (claim 21). Accordingly, the patent read as a whole suggests that the "very character of the invention" requires the first terminal to be positioned at the base. 20 See Alloc, Inc., 342 F.3d at 1370.
20 Although one could argue that the doctrine of claim differentiation creates a presumption that the cited claims are narrower than claim 9, this presumption is easily overcome. Claim differentiation "can not broaden claims beyond their correct scope, determined in light of the specification and the prosecution history and any relevant extrinsic evidence . . . Claims that are written in different words may ultimately cover substantially the same subject matter." Seachange Int'l, 413 F.3d at 1369 (quoting Multiform Desiccants, Inc. v. Medzam, Ltd., 133 F.3d 1473, 1480 (Fed. Cir. 1998)). Given that the Summary and the cited claims above all describe the orientation of the second terminal of the battery as exposed at the opening, and since the specification states nothing to the contrary, it is apparent that the very nature of the invention requires this limitation.

For the foregoing reasons, the Court construes the "first terminal of the battery" as "the terminal positioned at the closed base of the battery holder."

1604

21. The '870 patent

80. The expression in claim 1 of the '870 patent that the socket section is dimensioned to "fit snugly over" the mount section, or in claim 14 that the connecting section is dimensioned to "interfit snugly with" the mount section, does not require actual contact between those sections. The claim language "fit snugly over" or "interfit snugly with" is simply to be given its ordinary meaning in the English language. Defendant did not present any evidence that these expressions have any special or unusual meaning.

81. The dictionary meaning of "snug" is "fitting closely and comfortably <a coat>." Webster's Ninth New Collegiate Dictionary (1990); "fitting closely: That coat is a little too snug." The World Book Dictionary L-Z Volume Two (1971) (Clarence L. Barnhart ed.). Using the ordinary dictionary meaning of "snug," the '870 claims are construed to mean that the inside surface of the socket section is located close to the outside surface of the mount section. There is no requirement that they touch, nor is there any requirement for a precision fit along the length of the mount section.

82. The '870 patent indicates that the fit can vary along the length of the two sections. Thus, the patent shows in Fig. 4 a preferred embodiment in which at least major portions of the mount and socket sections do not touch (the width of the screw head 148 that forms part of the mount section is smaller than the width of the socket 166 in the coping 160).

83. There is no need for the mount and socket sections to touch unless they are also serving to prevent relative rotation between the two members, and the patent makes it clear that the anti-rotation feature is optional. In col. 4, lines 1-6, the patent states:

When two or more abutments are available on which to construct a restoration, there is no need to provide anti-rotation between the restoration and the abutments, or between the restoration components. In such a situation, the post, coping and implant may be free to rotate around a common axis relative to each other.

Consequently, construing the claims to require "touching" would be contrary to the express teachings found in the patent itself.

84. The '870 patent also suggests that the term "fit snugly" should not be construed to require a precision fit between the mount and socket sections along the entire length of the mount section. For example, Fig. 4 of the patent shows a hexagonal socket section 166 which is shorter than the combined lengths of the hexagonal sections of the abutment post 130 and the screw 134 that combine to form the mount section. Thus, part of the hexagonal section of the post 130 will be within the socket 166, but another part will lie within the tapered conical cavity 162 of the coping 160, which is not a precision fit. The
85. The expression in claim 1 of the '870 patent that the mount section extends "supragingivally from said second end on a substantially uniform cross-section," or in claim 14 that the mount section is "of substantially uniform cross-section at said second end," does not require a cross-section having exactly the same cross-sectional shape and dimensions along the entire length of the mount section. The word "substantially" is commonly used in patent claims for the purpose of avoiding overly restrictive constructions. The Federal Circuit has expressly approved the use of the word "substantially" in patent claims, and has specifically addressed the ordinary meaning of this word, as follows:

Ordinarily, therefore, "substantially" means "considerable in … extent," American Heritage Dictionary Second College Edition 1213 (2d ed. 1982), or "largely but not wholly that which is specified," Webster's Ninth New Collegiate Dictionary 1176 (9th ed. 1983). Thus, the modifier "substantially" conveys that the ridge members extend over most of the "entire height" of the sidewall portions.

York, 99 F.3d at 1573.

86. Applying the above ordinary meaning of "substantially" to that word as used in the '870 claims, it is clear that the claims should not be construed as being restricted to a mount section that has the same cross-section along its entire length. The term "substantially" should be given its ordinary meaning so that the claim requires only that the similarity of cross-sections through the mount section be "considerable in … extent," or "largely but not wholly" uniform.

87. The claim language does not require that the "substantially uniform cross-section" be present continuously all the way along the entire length of the mount section from one end to the other. The claims simply say that the mount section extends "from said second [upper] end [of the supragingivally-extending section] on a substantially uniform cross-section." The claims do not say that the "substantially uniform cross-section" extends along the entire length, or from end to end.

88. Nor is there any evidence of any functional or technical reason for construing the claims to require that the "substantially uniform cross-section" extend along the entire length of the mount section. As can be seen in the drawings of the '870 patent, the mount section is an extension of the supragingivally-extending section. One of the functions of this mount section is to receive the screw that attaches the coping to the abutment post, and another function is to receive a tool such as a wrench for rotating, or preventing rotation of, the abutment post during installation. Neither of these functions requires that the "substantially uniform cross-sections" extend along the entire length of the mount section.

89. The expression in claims 1 and 14 of the '870 patent that the supragingivally extending section "tapers in cross-section from said trans-tissue section to a smaller cross-section at its second end," does not require that the taper be continuous and uninterrupted along the entire length of the section. The portion of the post above the gum line ("supragingivally extending") generally "tapers" so that the top end of the post has a smaller diameter than the bottom of the post. A taper as a matter of simple use of the English language does not require that the taper be continuous and smooth, but simply that the shape has a wide end and a narrow end. Looking at the matter as one skilled in the art, a variety of tapers, some continuous and some interrupted, would be recognized.

90. Webster's New Collegiate Dictionary defines "tapers" as meaning "to become progressively smaller toward one end" or "to diminish gradually." There is no requirement in the definition that the reduction in size proceed in any particular manner. A candle, for example, can be tapered and yet have steps or rings or spirals along the way. It still "diminishes gradually."

91. Nor is there any evidence that any technical justification exists for superimposing additional requirements on the ordinary dictionary definition of the word "tapers." The only reason for the taper in the supragingival section of the '870 abutment is to enable that portion of the abutment to fit within the flared portion of the coping. When the flare angle of the coping is smaller than the taper angle of the abutment, as in the embodiments of Figs. 1 and 2, there is actually a gap between the opposed surfaces of these two members. Thus, the shape of the taper is obviously not critical. The only technical requirement is that the size of the abutment diminish fast enough that it is always at least as small as the internal size of the coping, so that the abutment and the coping can telescope over each other with enough clearance to permit sealing contact between them at the wide end of the coping.

92. The expression in claims 1 and 14 of the '870 patent that the coping includes a 'socket ['connecting' in claim 14] section
at the smaller end of said flaring section" does not require separate socket and flaring sections. The "socket section" and the "hollow flaring section" in the '870 patent are merely different regions of the hollow coping or sleeve. In column 3, lines 1-5, the '870 patent explicitly states that "The coping 60 is a generally cone-shaped hollow body having a flaring section 62 . . . and at its narrower end 64 a socket section 66 . . . ."

1605

1. Fitment

The defendant argues that the term "fitment" in the '550 Patent should be construed to mean a fitment comprising a single piece. The defendant notes the plaintiff's admission that "the '550 fitment is a single piece." (Mattes Decl. P 5 & Ex. 213.)

In addition, although not raised by the parties, the Court notes that language in the '550 Patent supports this construction. Claims 1 and 15 describe the claimed product as comprising a "rigid fitment member" and a "rupturable membrane." (Mattes Decl. Ex. 2 at 52, 53.) This language, although suggesting that the fitment and membrane are separate elements, is ambiguous as to whether the elements are separate pieces. However, Claim 14 clearly describes a "fitment member . . . comprising aseptic rupturable membrane means." (Id. at 53.) The section "Objects of the Invention" also describes the claimed device as having "a fitment including a rigid neck and a frangible membrane." (Id. at 45.) Finally, Claims 7-10 clearly describe a membrane "joined," "sealed to" and "formed integrally with" the other portions of the fitment member. Accordingly, the defendant's construction of the term "fitment" is consistent with the patent claims.

In a separate motion to strike, although not in its opposition, the plaintiff notes that the '550 Patent specification describes an "alternate two piece type of membrane." (Mattes Decl. Ex. 2 at 47.) However, this phrase does not imply that the term "fitment" composes two pieces. As described in the specification, the alternate membrane is a separate polyethylene foil disk which, apparently during manufacturing of the fitment, is heat sealed to the fitment neck prior to joinder of the fitment to the plastic bag. (Id. (emphasis added).) The preferred and alternate membranes operate the same "in all other respects." (Id.) Thus, although the alternate membrane would be formed separately, the fitment would function as a single, inseparable piece.

1606

(3) Limitation (v): A Fixation Resistant Surface-Finish

(a) Claims Construction.

(i) Patent Language, Specification and Prosecution History

Limitation (v) of claim 1 provides in relevant part that the distal tip have a "fixation-resistant surface-finish on the external peripheral surface" for the purpose of maintaining the distal tip unaffixed to the cavity wall of the femur, whereby allowing axial movement relative to the wall of the femur. By remaining unaffixed to the femur, axial displacement of the distal tip and the distal end of the stem is permitted in response to forces applied to the prosthesis during its use.

The defendant contends that the term "fixation-resistant surface finish" means that the finish on the distal tip's external surface must be a "very smooth" surface finish, with surface characteristics at least as smooth as those which are achieved by buffing and polishing cobalt-chrome metal. In support of this contention, the defendant cites to the following language in the 023 patent's specification: "[T]he fixation-resistant finish on the external peripheral surface is a very smooth finish, such as that which is attained by polishing and buffing the cobalt-chrome steel alloy." Patent at 3:67-4:3.

According to the defendant, the APR II sleeve does not have such a finish. The defendant claims that when manufactured, the APR II sleeve contains "circumferential markings," and that the sleeve's outer surface was not polished or buffed until June 1992. Moreover, the defendant contends that the current buffing of the sleeve is unrelated to the flexation or axial movement of the stem, and that even after buffing there is a surface roughness that does not follow the patent's teachings.
Defendant's Post-Trial brief at 9-10.

The Court disagrees with the defendant's interpretation of this claim limitation, because it impermissibly seeks to add an external limitation from the specification to the broader claim language. See Electro Medical, 34 F.3d at 1054. Nothing in the claims language states that the surface must be "very" smooth. Rather, 023 patent claims 11 and 12, referring to the fixation-resistant surface finish identified in claim 1, provide that the finish "is a smooth finish on the external peripheral surface of the distal tip . . . wherein the distal tip is constructed of a metal alloy and the fixation resistant finish comprises a polished surface." Patent at 8:24-29 (emphasis supplied).

In describing the preferred embodiments, the patent specification states:

The external peripheral surface is provided with a fixation-resistant surface finish so that the distal tip will not be affixed to the wall of the femur and will remain unaffixed to the femur during use of the prosthesis. [The] distal tip is constructed from a bio-compatible material, one such material being a cobalt-chrome steel alloy, and the fixation-resistant surface on the external peripheral surface is a very smooth surface finish, such as that which is attained by polishing and buffing the cobalt-chrome steel alloy.

Patent at 3:61-4:3.

Thus, according to the language of the claims, and as elucidated by the patent's specification, the external peripheral surface finish must (i) be a smooth finish that comprises a polished finish, and (ii) be for the purpose of maintaining the distal tip unaffixed to the femur. The claim limitation language does not require that the surface actually be polished or "very" smooth; only that it constitutes ("comprises") a polished surface.

This construction of the term "fixation-resistant surface finish" is supported by the patent's prosecution history. In discussing the Freeman patent, the Patent Examiner noted that one of the types of tips used by the Freeman device had an outer surface that was smooth. According to the Patent Examiner, "[i]t is presumed that all non-fixating surfaces are smooth, typically polished surfaces." (Plaintiff's Exh. 568 at 36-37). The Patent Examiner also concluded that it would be obvious to anyone skilled in the art that such smooth surfaces prevent affixation to the bone: "It would have been obvious to one with ordinary skill in the art to make the non-affixing surfaces of the Freeman device polished and smooth to prohibit bone ingrowth (i.e. fixation to the bone)." (Plaintiff's Exh. 568 at 37).

Although it seems clear that the kind of surface finish described by the patent claim is a smooth finish comprising a polished surface, neither the 023 patent claims nor the patent description define what is meant by "smooth" and "polish." These definitions were, however, provided by extrinsic evidence offered to help the Court understand some of the fundamental metallurgy involved.

(ii) Extrinsic Evidence.

Dr. Burstein explained how the terms "smooth" and "polish" are used in the context of machining metals. He referred to Plaintiff's Exhibit 704, which is a publication by the American Society of Mechanical Engineers ("ASME") entitled: An American National Standard, Surface Texture (Surface Roughness, Waviness, and Lay), dated April 30, 1986. Appendix B of the publication includes the specification for producing various surface textures. (Plaintiff's Exh. 704 at 23).

According to the Appendix, "[s]moothness and roughness are relative, i.e., surfaces may be smooth or rough for the purpose intended; what is smooth for one purpose may be rough for another." (Plaintiff's Exh. 704 at 23). A chart is then provided in the Appendix, which indicates that a polished surface is defined as a surface having a relative roughness of 32 microinches or less. Thus, according to the ASME, a surface is smooth for the purpose of constituting a polished surface if its relative roughness is 32 microinches or less.

Dr. Burstein described the smoothness limitations of 023 patent's distal tip, and related it to the ASME standard:

Q What does the patent teach with respect to the surface characteristics of the sleeve or the tip?

A The patent teaches in order for this to work it must be free to move up and down in the bone in accordance with how
the prosthesis normally wants to move. That is, under load this prosthesis will move on the order of a thousandth of an inch or two, and it must be free to do so, and in order to do so, you cannot allow the distal end sleeve or tip to become fixed to the bone. If it becomes fixed to the bone it transects the bone. So, by having an affixation resisting surface, that will not allow the bone to grow into or into the surface, it becomes free to move up and down and also free to twist ... and you do that, the patent says, by providing smooth surfaces. And the patent gives an example. It says if, for example, you are using cobalt-chrome, you might want to have the surface polished. Well, if you are using titanium, which is another material you might or might not use the same processing, but you are going to finish it so that it has the same surface finish, that is, it has a smooth surface finish.

Q Would you explain what [the ASME standard] is?

A This is a standard which is practiced by the American National Standards Institute and the American Society of Mechanical Engineers in noting the types of surface finish that can be provided by different manufacturing processes.

In simple words, if an engineer wants to provide a certain surface finish and wants to know how to go about doing it, he can [look at the standard] and determine what type of manufacturing process will provide those surface finishes.

Q What microinches are referred to after polishing?

A Polishing starts at 32 microinches and then goes down to a half microinch.

Q So polishing ranges from 32 [microinches] down?

A 32 [microinches] down would fall under the specification of a polished surface.

Now, an affixation [resistant] surface is certainly achieved with a 32 microinch finish; that you can see machining marks or any other marks on [the surface], is simply indicative of the specification of 32 microinches.

If you look with a high enough power, you will see the hills and valleys and ups and downs that constitutes a 32 microinch finish. But it is the number itself that tells you how smooth it is and the specification calls for a smoothness which certainly would promote, which certainly would provide an affixation-resistant surface.

(Tr. at 132-33, 145, 147).

Significantly, Dr. Burstein's explanation of how "smooth" and "polish" are defined within the context of the claim limitation was not refuted by the defendant during Burstein's cross-examination or by the introduction of other evidence.

Accordingly, the Court interprets the claim limitation as requiring the distal tip's external peripheral surface finish to be (i) a smooth finish that comprises or is consistent with a polished surface, i.e. a surface finish of 32 microinches or less in accordance with the ASME standard, and (ii) for the purpose of maintaining the distal tip unaffixed to the femur.

C. "Fixation System"

Plaintiff argues two limitations in independent claim 50 are means-plus-function limitations. The first states, "a first fixation system for fastening the plate and a first portion of the spinal column in a fixed position." The second provides, "a second fixation system for fastening the plate and a second portion of the spinal column in a translatable position."

A claim without the word "means," such as claim 50, triggers a rebuttable presumption the claim is not a means-plus-function claim. CCS Fitness, Inc. v. Brunswick Corp., 288 F.3d 1359, 1369 (Fed. Cir. 2002). The presumption may be rebutted if the claim does not recite sufficiently definite structure or if it recites a function without reciting sufficient structure for performing that function. Id.
Here, "fixation system" does not recite sufficiently definite structure. "System" is defined as (1) a set or arrangement of things related or connected to form a whole, or (2) a method of arrangement. Webster's New World Dictionary Third College Edition at 1359. This does not require any particular structure. The two claim limitations are means-plus-function limitations.

Infringement analysis of means-plus-function limitations has four steps. First, the Court must identify the claimed function. Cardiac Pacemakers, Inc. v. St. Jude Med., Inc., 296 F.3d 1106, 1113 (Fed. Cir. 2002). Second, "the court must . . . determine what structure, if any, disclosed in the specification corresponds to the claimed function." Id. Third, the Court determines "whether the accused device . . . performs an identical function to the one recited in the claim." IMS Tech., Inc. v. Haas Automation, Inc., 206 F.3d 1422, 1430 (Fed. Cir. 2000). If so, the Court decides "whether the accused device uses the same structure, materials, or acts found in the specification, or their equivalents." Id. The question is whether the accused device "performs the function in substantially the same way to achieve substantially the same result." Id. at 1435.

Here, the claimed function is to fasten the plate to a portion of the spinal column in a fixed (for the first "fixation system") or translatable (for the second "fixation system") position. The structure disclosed in the specification corresponding to this function are bone engaging fasteners, embodied as bone screws. The C-Tek Slotted performs the identical function of fastening the plate to a portion of the spinal column in a fixed (for the first pair of screws) and translatable (for the second pair of screws) position.

Finally, the C-Tek Slotted uses an equivalent structure as the bone screws disclosed in the specification. Even assuming, as Plaintiff argues, the heads of the C-Tek Slotted bone screws are different than those disclosed in the specification, the screws extend through the holes and slots in the plate, are retained by the locking plate so they cannot back out, and screw into vertebrae to attach the plate to the bone. The C-Tek Slotted screws perform the function "in substantially the same way to achieve substantially the same result." IMS Tech., 206 F.3d at 1435. The C-Tek Slotted infringes these limitations of claims 50-56.

1608

BACKGROUND

Gentry owns the '244 patent, which is directed to a unit of a sectional sofa in which two independent reclining seats ("recliners") face in the same direction. Sectional sofas are typically organized in an L-shape with "arms" at the exposed ends of the linear sections. According to the patent specification, because recliners usually have had adjustment controls on their arms, sectional sofas were able to contain two recliners only if they were located at the exposed ends of the linear sections. Due to the typical L-shaped configuration of sectional sofas, the recliners therefore faced in different directions. See '244 patent; col. 1, ll. 15-19. Such an arrangement was "not usually comfortable when the occupants are watching television because one or both occupants must turn their heads to watch the same [television] set. Furthermore, the separation of the two reclining seats at opposite ends of a sectional sofa is not comfortable or conducive to intimate conversation." Id. at col. 1, ll. 19-25.

The invention of the patent solved this supposed dilemma by, inter alia, placing a "console" between two recliners which face in the same direction. This console "accommodates the controls for both reclining seats," thus eliminating the need to position each recliner at an exposed end of a linear section. Id. at col. 1, ll. 36-37. Accordingly, both recliners can then be located on the same linear section allowing two people to recline while watching television and facing in the same direction. Claim 1, which is the broadest claim of the patent, reads in relevant part:

A sectional sofa comprising:

a pair of reclining seats disposed in parallel relationship with one another in a double reclining seat sectional sofa section being without an arm at one end . . .,

each of said reclining seats having a backrest and seat cushions and movable between upright and reclined positions . . .,

a fixed console disposed in the double reclining seat sofa section between the pair of reclining seats and with the console

- 2046 -
and reclining seats together comprising a unitary structure, 

said console including an armrest portion for each of the reclining seats; said arm rests remaining fixed when the reclining seats move from one to another of their positions, 

and a pair of control means, one for each reclining seat; mounted on the double reclining seat sofa section . . .

Id. at col. 4, line 68 to col. 5, ll. 1-27 (emphasis added to most relevant claim language). Claims 9, 10, 12-15, and 19-21 are directed to a sectional sofa in which the control means are specifically located on the console.

In 1991, Gentry filed suit in the District Court for the District of Massachusetts alleging that Berkline infringed the patent by manufacturing and selling sectional sofas having two recliners facing in the same direction. In the allegedly infringing sofas, the recliners were separated by a seat which has a back cushion that may be pivoted down onto the seat, so that the seat back may serve as a tabletop between the recliners. In response to Gentry's complaint, Berkline moved and was granted a transfer to the District of Massachusetts of its earlier-filed action in the United States District Court for the Middle District of North Carolina seeking a declaration that the patent was invalid and not infringed. After that declaratory judgment action was consolidated with Gentry's infringement suit, Berkline added a counterclaim asserting that the patent was unenforceable because of inequitable conduct. The district court granted Berkline's motion for summary judgment of non-infringement, but denied its motions for summary judgment of invalidity and unenforceability. In construing the language "fixed console," the court relied on, inter alia, a statement made by the inventor named in the patent, James Sproule, in a Petition to Make Special (PTMS). See 37 C.F.R. § 1.102 (1997). Sproule had attempted to distinguish his invention from a prior art reference by arguing that that reference, U.S. Patent 3,877,747 to Brennan et al. ("Brennan"), "shows a complete center seat with a tray in its back." Gentry I, 30 U.S.P.Q.2D (BNA) at 1137. Based on Sproule's argument, the court concluded that, as a matter of law, Berkline's sofas "contain[] a drop-down tray identical to the one employed by the Brennan product" and therefore did not have a "fixed console" and did not literally infringe the patent. Id. The court held that Gentry was also "precluded from recovery" under the doctrine of equivalents. Id. at 1138.

Gentry then requested that final judgment be entered so that it could immediately appeal the non-infringement decision. Berkline requested that its invalidity and unenforceability counterclaims proceed to trial on the authority of Cardinal Chemical Co. v. Morton International, Inc., 508 U.S. 83, 26 U.S.P.Q.2D (BNA) 1721, 124 L. Ed. 2d 1, 113 S. Ct. 1967 (1993). The court agreed with Berkline, stating "that further proceedings will be necessary on the issues of invalidity and inequitable conduct." After a bench trial, the court held that the patent was not invalid under 35 U.S.C. §§ 102 or 103 (1994), and that the claims in which the location of the controls is not limited to the console (claims 1-8, 11, and 16-18) are not invalid under 35 U.S.C. § 112, P 1 (1994). See Gentry II, 939 F. Supp. at 101-06, 41 U.S.P.Q.2D (BNA) at 1348-52. The court also held that Berkline had failed to prove that the patent was obtained by inequitable conduct and in so ruling noted that "the evidence at trial was not even close." Id. at 101, 41 U.S.P.Q.2D (BNA) at 1347. The court denied Gentry's motion for the attorney fees it had incurred in overcoming Berkline's allegation of inequitable conduct. The court expressed "sympathy for Gentry, especially in view of Berkline's insistence on pressing the case after prevailing on the infringement issue," but nonetheless concluded that "these circumstances do not permit consideration of an award of fees."

Gentry appeals from the decision of non-infringement and the court's refusal to award attorney fees. Berkline cross-appeals from the decision that the claims are not invalid under §§ 103 or 112. We have jurisdiction pursuant to 28 U.S.C. § 1295(a) (1) (1994).

DISCUSSION

A. Infringement

Gentry argues that the district court erred in construing the claim terms "fixed" and "console" in granting summary judgment of non-infringement. Gentry asserts that the term "fixed" merely requires that the sofa section be rigidly secured to the adjoining recliners and that the term "console" refers to any sofa section that separates two recliners and can function as a tabletop. Accordingly, Gentry argues that on the undisputed facts it, not Berkline, is entitled to summary judgment on the issue of infringement. Berkline argues that summary judgment was properly granted because the term "fixed" requires that no part of the console be movable, while Berkline's sofa has a center seat back that can pivot. Berkline also argues that Gentry effectively defined a center seat with a retractable seat back as not a "console" when it distinguished the Brennan
reference in the PTMS. On the basis of Berkline's second argument, we agree that it is entitled to judgment as a matter of law that it does not infringe the '244 patent.

We review a district court's grant of summary judgment de novo. See Conroy v. Reebok Int'l, Ltd., 14 F.3d 1570, 1575, 29 U.S.P.Q.2D (BNA) 1373, 1377 (Fed. Cir. 1994). Summary judgment is appropriate when there is no genuine issue as to any material fact and the moving party is entitled to judgment as a matter of law. See Fed. R. Civ. P. 56(c); Johnston v. IVAC Corp., 885 F.2d 1574, 1576-77, 12 U.S.P.Q.2D (BNA) 1382, 1383 (Fed. Cir. 1989). A determination of infringement requires a two-step analysis. "First, the claim must be properly construed to determine its scope and meaning. Second, the claim as properly construed must be compared to the accused device or process." Carroll Touch, Inc. v. Electro Mechanical Sys., Inc., 15 F.3d 1573, 1576, 27 U.S.P.Q.2D (BNA) 1836, 1839 (Fed. Cir. 1993).

Because there is no dispute concerning the structure of the accused device, our infringement analysis involves only claim construction, a question of law which we review de novo. See Markman v. Westview Instruments, Inc., 52 F.3d 967, 979-81, 34 U.S.P.Q.2D (BNA) 1321, 1329-31 (Fed. Cir. 1995) (in banc), aff'd, 517 U.S. 370, 116 S. Ct. 1384, 38 U.S.P.Q.2D (BNA) 1461, 134 L. Ed. 2d 577 (1996). The proper construction of claims is based upon the claim language, the written description portion of the specification, the prosecution history, and if necessary to aid the court's understanding of the patent, extrinsic evidence. See id. Our present analysis of infringement under the doctrine of equivalents involves prosecution history estoppel, also a question of law which we review de novo. See Southwall Techs. Inc. v. Cardinal IG Co., 54 F.3d 1570, 1579, 34 U.S.P.Q.2D (BNA) 1673, 1679 (Fed. Cir. 1995).

We agree with Gentry that the term "fixed" requires only that the console be rigidly secured to its two adjacent recliners. The term "fixed" and the explanatory clause "with the console and reclining seats together comprising a unitary structure" were added during prosecution to overcome a rejection based on a sectional sofa in which the seats were not rigidly attached. Thus, because the term "console" clearly refers to the complete section between the recliners, the term "fixed" merely requires that the console be rigidly attached to the recliners. Moreover, Berkline's interpretation of the term "fixed" unnecessarily excludes from the claim Sproule's preferred embodiment, in which the console can be opened by pivoting its lid. See Vitronics Corp. v. Conceptronic, Inc., 90 F.3d 1576, 1583, 39 U.S.P.Q.2D (BNA) 1573, 1578 (Fed. Cir. 1996) (noting that a claim interpretation that excludes the preferred embodiment "is rarely, if ever, correct"). Accordingly, as there is no dispute that Berkline's center seat and recliners form a unitary structure, we conclude that the "fixed" limitation is met by Berkline's sofas.

Plaintiffs propose a construction that the base "is fixed or 'fitted' into the neck of the flask." Plaintiffs note this interpretation is directly supported by the language of the specification and its use of the word "fitted." See '061 patent, 3:66-67.

Defendants seek a stricter construction that the base be "securely fastened" into the neck of the flask. Defendants note that the word "fixed" only appears in claims 12 and 14 and nowhere else in the patent. Thus, Defendants argue, the specification cannot provide any guidance as to any particular meaning intended for the term. Defendants then point to the ordinary meaning of the word "fix" or "fixed" to supply the necessary construction: "to make firm, stable or stationary" or "to give a permanent or final form to." Merriam-Webster Online, Doc. 58, Ex. 2, at 12-13. Thus, Defendants submit, based upon the ordinary meaning of the term "fixed," the term should be construed as requiring the base to be "securely fastened" to the neck.

The specification clearly recites that the base be "fitted" inside the neck of said flask. See '061 patent, 3:67. The specification suggests that the base "can" be crimped around an annular enlargement of the neck. Id., 4:2. While it may be possible that the invention may allow for a base element that is securely fastened into the neck of the flask, if it is crimped around the neck as described above, it is not a requirement of the invention, and is certainly not required in the recitation of claim 12.
The parties also dispute the term "said washing tub including a fixed bottom wall." LG proposes construing the term to mean "the washing tub including a fixed bottom wall [i.e., fixed wall at a bottom portion of the washing tub]." (Chart at 12.) Whirlpool proposes instead that the term be construed to mean "the washing tub includes a bottom wall that remains stationary." (Id.)

The background section of the patent states that the claimed invention relates to "an improved structure in [low frequency vibration type] washing machines for prevention of jamming of clothes in a gap between a low frequency vibrating disc and the inner bottom of a washing tub." ('886 Patent, col. 1, ll. 9-14.) According to that section, the typical washing machine "has a problem in that some of the clothes are often jammed in a gap between the vibrating disc 2 and the inner bottom of the washing tub 1." (Id., col. 1, ll. 49-52.) The summary section states that it is "an object of the present invention to provide a low frequency vibration type washing machine . . . whose shielding means totally or partially shields the gap between the low frequency vibrating disc and the tub bottom from the outside." (Id., col. 1, ll. 60-67.) Figures 2, 3, and 4 are embodiments of the claimed invention, and each one depicts the bottom wall as the inner surface of the bottom wall. This intrinsic evidence suggests that the term "bottom wall" refers to the bottom wall of the washing tub, as Whirlpool argues, rather than a wall at a bottom portion of the washing tub, as LG argues.

The parties also refer to the prosecution history. The examiner originally rejected Claim 1 because it was anticipated by a patent that the parties refer to as the German '789 patent. (Def.'s Ex. 8 at 2.) Figure 1 of the German '789 patent disclosed a washing machine that included a washing container having a bottom "which is designed as a membrane." (Def.'s Ex. 10 at 2-3.) "When power is applied to the shaker device, the bottom membrane M is set into a strong and rapid up and down movement . . . ." (Id. at 2.) LG acknowledges that "[b]y amending the claim to distinguish the prior art, the applicants narrowed the scope of the claim [sic] invention to exclude coverage for washing tub bottoms that were membrane-like (i.e., soft and flexible) and that moved up and down." (Pl.'s Br. at 25 (emphasis added).)

The Court therefore construes the term "said washing tub including a fixed bottom wall" to mean "said washing tub including a bottom wall that remains stationary."

2. "Fixed Handgrip"

Claim 16 recites that the shift actuators disclosed in the '291 patent are "mounted on and engaged over an outside of the handlebar inboard of a fixed handgrip on an end of the handlebar." '291 Reexamination Certificate, col. 5, ll. 2-4. AD-II asserts that the district court erred in limiting the term "fixed handgrip" to a separate handgrip situated over a handlebar, arguing that the term "fixed handgrip" should also include the normal grip space on the handlebar itself, as is disclosed by the embodiment depicted Figure 2. SRAM counters that, in reciting that the handgrip is "on an end of the handlebar," claim 16 distinguishes between the handgrip and the handlebar such that the handgrip cannot be construed to include the handlebar.

We conclude that the district court correctly construed the term "fixed handgrip on the end of the handlebar" to mean a separate handgrip situated over a handlebar, and not a part of the handgrip space on the handlebar itself. Claim 16 recites a handgrip situated "on" the handlebar, rather than a handgrip that is part "of" the handlebar. Moreover, claim 16 recites a "fixed" handgrip, which, as disclosed in the specification, refers to "conventional handgrips" that are separate features "located on the ends of [the] handlebar" and are depicted in Figure 45. '291 patent, col. 30, ll. 19-27, Fig. 45.

The prosecution history supports that the "fixed handgrip" limitation of claim 16, which was added during reexamination in light of the Foster reference, was meant to capture the embodiment depicted in Figure 45 rather than the embodiment depicted in Figure 2. The applicant explained that "[f]or the disclosure of these limitations in the patent [i.e., including the
"fixed handgrip" limitation], the Examiner is referred to the descriptions of the 'Inboard Handgrip Shift Actuators' starting in line 15 of column 30 of the '291 patent." That portion of the '291 patent specification is the portion addressing mountain bikes, and specifically refers to "conventional handgrips" or "fixed handgrips at the ends of the handlebar" as structures distinct from the handlebar itself. '291 patent, col. 30, ll. 19-22, Figure 45.

d. "Fixed Orientation"

The final disputed limitation of claim 1 reads:

[S]aid second intermediate portion [of a second bone engaging fastener] having a substantially cylindrical portion with a fourth diameter that is approximately equal to said second diameter [of an opening at the bottom surface of the plate], whereby said second head of said second bone engaging fastener cannot be pivoted within said recess portion of said at least one hole so that said second bone engaging fastener can assume a fixed orientation relative to said bottom surface of said plate.

(Kravetz Decl. Ex. 1 at col. 13, Ins. 44-52.)

Plaintiff argues Medtronic acted as its own lexicographer and defined "fixed orientation" in the specification as "no micro-motion or angular movement relative to the plate." (Kravetz Decl. Ex. 1 at col. 2, Ins. 30-31.) Medtronic contends the phrase "approximately equal," which describes the relative diameters of the intermediate portion of the fixed angle screw and the hole in the plate, necessarily contemplates some movement, but not movement rising to the level of pivoting.

The ordinary meaning of "approximately" is "to come near; be almost the same." Webster's New World Dictionary Third College Edition 68 (1988). The ordinary meaning of "equal" is "of the same size." Id. at 458. "Fixed" is defined as "firmly placed or attached; -- not movable." Id. at 512.

The specification shows the diameters of the fixed angle screw and the hole in the plate are different enough so the screw can fit inside the hole, but close enough so, once inside the hole, the screw cannot move. This, coupled with the ordinary meaning of the claim language, shows the limitation "approximately equal" should be construed as "almost the same," and "fixed orientation" should be construed as "not movable once inserted through the hole."

A. CLAIM CONSTRUCTION

The Court finds the testimony of Dr. Corbett and Mr. Witherspoon to be persuasive on the issue of claim construction. The dispute is over the following limitations which Combustion contends are not present in its RT Kiln, the terms at issue being underlined: (1) "for the continuous electric heating and/or fusion..."; (2) "a...conical extension fixed to one end thereof"; and (3) "a crane support mounted upon each said housing and removable conical extension for lifting and tilting the housing to remove the contents thereof." [PTX 533 and 534].

CONTINUOUS

Dr. Corbett testified that the term "continuous" modifies "heating", not "fusion" such that electric heating without interruption, as well as fusion, takes place in the patented furnace [Tr. II(2)(Corbett), 30-31, 33-34 and 38-40]. Based upon this testimony, the court finds that term "continuous" modifies "heating and not "fusion" for purposes of claim construction in regard to this limitation.

CONICAL EXTENSION FIXED TO ONE END THEREOF
The dispute with respect to this limitation revolves around the meaning of the word "fixed" in Claims 3 and 4. Dr. Corbett testified that "fastened" is a synonym for "fixed", and that "fixed" means "securely fastened" such that, when the main portion of the housing is lifted, the end follows [Tr. II(2), 40-41]. The court finds that terms "fixed", "fastened", and "securely fastened" are synonyms for purposes of claim construction in regard to this limitation. This interpretation is supported by the reading of the claim, the testimony of witnesses, as well as the prosecution history. DTX 180, PTX 460, p. 277.
